# **INSTALLATION, MAINTENANCE AND CLEANING GUIDE**

## General Instructions

Applicating is very easy and just as simple as fixing other material such as ceramic and natural stone.

Check the wall's load capacity where the part is going to be placed. In the technical drawing page, you can check the weight of each piece.

Before starting the installation, it is essential that the wall is in a completely dry condition with minimum period of 6 weeks, whether wall of brick or concrete.

The wall or panel on which is going to be installed must be smooth, without any irregularities, and must be rigid without flexing

When the wall need to be painted, we suggest to paint first before application

Installation must start from the ground upwards, row by row in order that the load is progressively transferred from the ground.

## Fixing and adhesives

There are two adhesive solution for placing:

### OPTION 1

Adhesive based on hybrid polymer

The option of gluing with polymer putty is cleaner and faster. Adhesive should only be applied on the back of the piece to be installed, carefully leaving a width of 1-2cm around the edge of the piece so that when the piece is placed and pressed against the wall, no adhesive overflows at the joins.

Should adhesively ooze from the joins, clean the excess from joints immediately, but never with abrasive or rough sponges. For cleaning always use cotton rags or other soft fabric with clean water.

## OPTION 2

Make the mixture according to the instructions recommended by the mortar manufacturer.

Apply the mixture with a spatula on only the back of the piece to be installed, carefully leaving a width of 12cm around the edge of the piece so that when the piece is placed and pressed against the wall, no adhesive overflows at the joints.

Should adhesive ooze from the joints, clean the excess from joints immediately, but never with abrasive or rough sponges. For cleaning always use cotton rags or other soft fabric with clean water

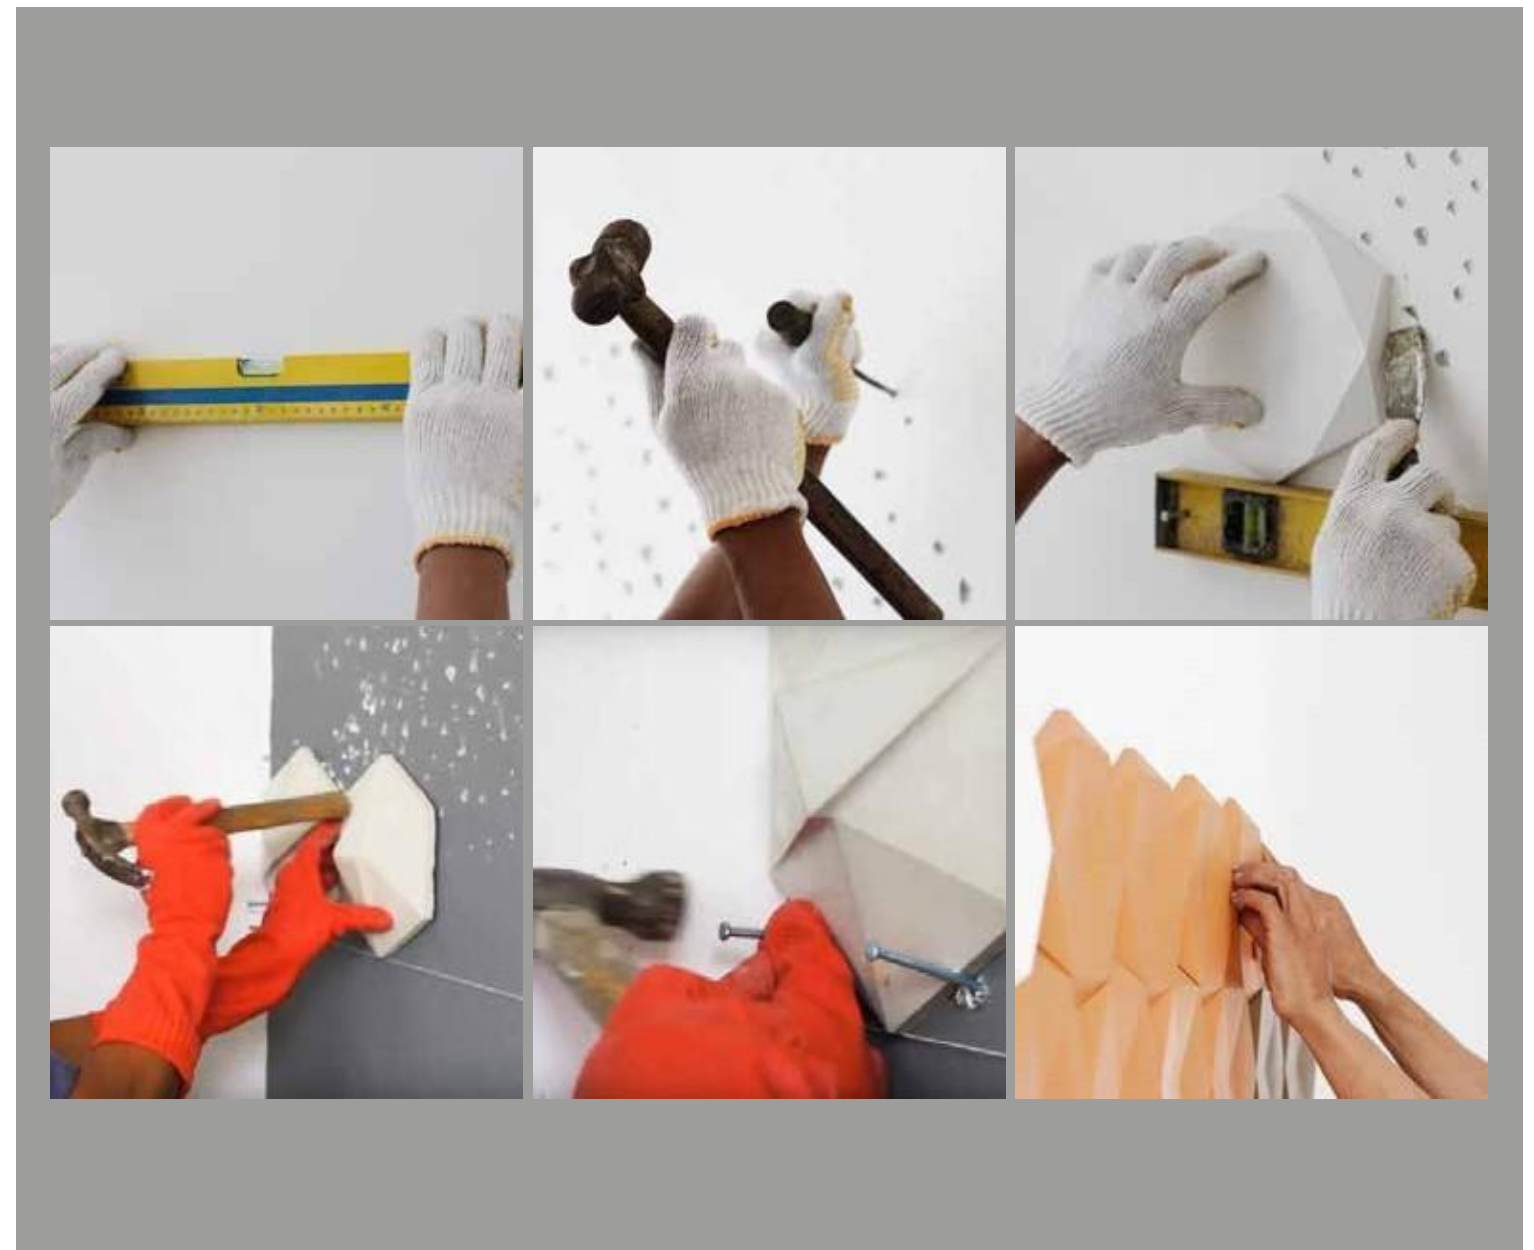

## Placement

Always start the placement from the bottom by completing the first row along first. When the placement cannot be initiated from the ground, use some nails or a level wooden strip to help begin the placement as shown in the following image

## Cutting

It can be easily cut with Angular grinder, with 1-2mm diamond disc at low speed 4000rpm. However, the profile of the cut will be aesthetically different.

Care and maintenance

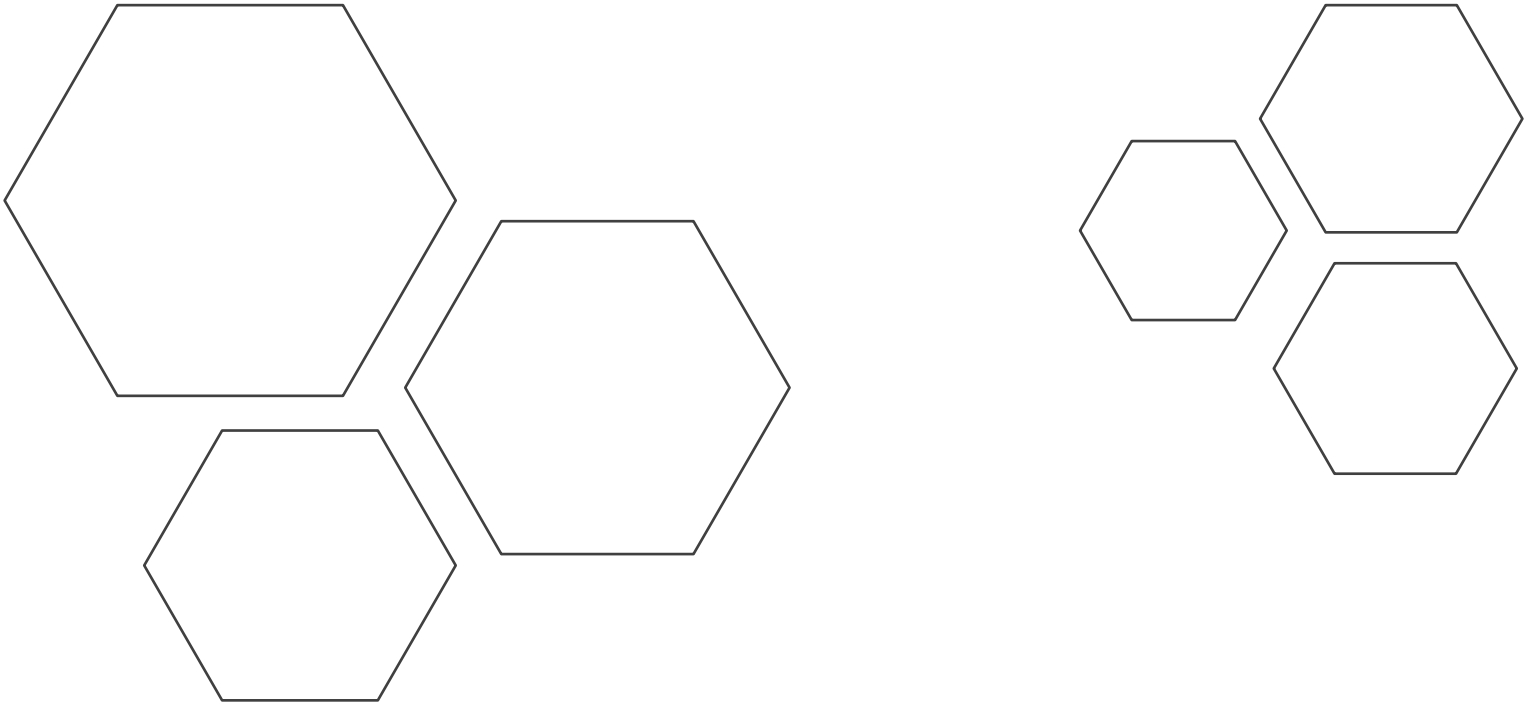

Doesn't require any special maintenance. For cleaning, simply use a cotton cloth with water, or a duster

Avoid contact with cleaning products that are acidic or corrosive.

Avoid hitting the piece with hard object or sharp element.
