Scientific TI Experience (Observation):

I lived in Brigham City, Utah in a beautiful apartment beside the bird sanctuary and the mountains north of Salt Lake City. I chose the 3rd floor of brand new apartments to get exercise and see the flight of the birds at a height you can see them close up as they fly by.

Before I moved into my apartment, I was allowed to go inspect it on my own. Upon entering the front door, I saw insulation that had fallen from the ceiling in the hallway where someone had gone up into the attic and let the insulation fall all over the floor - a great deal of it. Also, there were snippets of wire around the outlets. This told me that this apartment had an installation of surveillance devices just for me. I refused to take the apartment and they refused to give me another one. I was desperate to stop sleeping in my car so I moved in.

From the first night I spent in the apartment, someone went in the empty apartment below me and used the same device they used on me when I slept in my truck. They use an acoustic device that's a small box with two large circular speakers in it. I do have a picture of one I spotted in a truck next to mine when I stopped at a MacDonald's for a rest in Missouri. I woke from my nap shaking from head to toe. They would park vehicles next to me while I was sleeping with that

box in them. I checked the surrounding cars to see what devices I could see. The vibration device was in a transparent grocery bag in the back seat of the truck right next to me and I took a picture of it. The vibration was the very same effect upon waking in my truck and in my apartment, so I knew what it was causing this.

I also experienced stalking by someone who took things from my apartment and placed them neatly right beside my truck parallel to the stripes on the parking lot and parallel to my truck. Also, my truck driver's seat was rearranged all the way back and the steering wheel would be turned all the way one way or the other.

There is a great restaurant in Salt Lake City called the Chuck-A-Rama. You have to stand in line and it takes a while to get through and get your dinner. Knowing that, stalkers got in my truck and moved it to another place in the parking lot. That was the first night I got to Salt Lake City. They had the keys to my truck and my apartment. Sometimes, the odometer showed it had been driven during the night.

I asked my neighbors to watch the apartment below me and call me if they saw someone in there. They did. It was my neighbor across the landing - Ian. He was in the apartment below me every night with that acoustic device. When he was leaving, he would slam the door as hard as he could and bound up the stairs and go into his apartment as fast as he could. I put a camera under my stairwell to get a record of the noise harassment. Someone stole that camera. I put a camera in my laundry basket inside my own apartment and left the door open to get a picture of Ian. He used tools and came home dirty every day. He used a huge backpack. Some people say "its not your neighbors", that's not true, sometimes it is your neighbors.

Ian lived with his brother Doug. They got dressed like good little Mormon boys every Sunday dressed in dark pants, short sleeved white shirts and a dark tie. I only witnessed this, I did not get a picture of that. -- a true TI story

LEGAL TIP:

As a TI and you are ever in a situation where an authority is trying to make you sign a paper in order to release you from a situation like a hospital or jail, sign with this caveat:

Performance or Acceptance Under Reservation of Rights. A party that with explicit reservation of rights performs or promises performance or assents to performance in a manner demanded or offered by the other party does not thereby prejudice the rights reserved. **Such words as "without prejudice," "under protest," (often written near a signature) signals this reservation and are sufficient to signify that you are signing under duress.**

- The application of **UCC-1-308** which is a section of The Uniform Commercial Code (UCC) does not generally apply to accord and satisfaction, real estate transactions, service or employment contracts, criminal law, traffic citations, or court orders.

UNAUTHORIZED INJECTIONS ARE MISUSE OF TECHNOLOGY - This is Nazi/Marxist/Socialist actions against citizens.

The video below came up when researching injectable BCI's (brain computer interfaces). If you've never had brain surgery, how did your brain get connected to the internet?

Have you ever gone for a blood test to Quest Labs and found your arm being injected instead of having your blood taken? The nurse had a huge metal container with a needle at the end of it. She stuck it in the TI's arm three times in three different directions. It all happened so fast, it was done before the TI understood what was going on. Then the phlebotomist took the blood draw with a totally different kind of needle as normal. When you have a medical procedure, you show trust in the person treating you. You put your body into their care because you trust them. What would a phlebotomist inject you with? Who would give them something to inject in someone and then tell them who to inject it into? What can you do about it when you realize what's happened? This is such a violation on so many levels.

One paper that shows **true self-assembling polymerization of conductive particles assembling in the brain** of various test animals. It is so technical even a doctor would find it difficult to read the description of supplies and materials. Synthetic polymerization is not a natural process. It usually takes place in a lab. However, there has been much experimentation to create Morgellons in which polymerization is responsible for creating fibers. Here it is if you dare:

- **Metabolite-induced in vivo (in the body) fabrication of substrate-free organic bioelectronics**

<https://pubmed.ncbi.nlm.nih.gov/36821679/>

Quote: "We demonstrate in vivo (in the body) electrode formation in zebrafish and leech models, using **endogenous metabolites to trigger enzymatic polymerization of organic precursors within an injectable gel**, thereby **forming conducting polymer gels with long-range conductivity**. This approach can be used to target specific biological substructures and is suitable for nerve stimulation, paving the way for **fully integrated, in vivo-fabricated electronics within the nervous system**." This is a way of turning tissues into conducting matter by synthesizing an electrically conducting soft polymer in living tissue (your brain)." Materials and Methods [Download](#)

Another article much easier to understand which gives you an idea of how an already assembled chip can be injected into the arm and it finds its way to a particular part of the brain and can be wirelessly controlled. This method is injected but attaches to cells and becomes part of your brain and can also be controlled by neuromodulation remotely:

New therapeutic brain implants could defy the need for surgery

MIT researchers created microscopic wireless electronic devices that travel through blood and implant in target brain regions, where they provide electrical stimulation.

Quote:

"What if clinicians could place tiny electronic chips in the brain that electrically stimulate a precise target, through a simple injection in the arm? This may someday help treat deadly or debilitating brain diseases, while eliminating surgery-related risks and costs.

MIT researchers developed microscopic, wireless bioelectronics that could travel through the body's circulatory system and autonomously self-implant in a target region of the brain...after injection, these miniscule implants can identify and travel to a specific brain region without the need for human guidance. Once there, **they can be wirelessly powered** to provide electrical stimulation to the precise area...the electronic devices are integrated with living, biological cells before being injected, they are not attacked by the body's immune system and can cross the blood-brain barrier...this technology, which they call "circulatronics,"...the **implants can provide localized neuromodulation** (Neuromodulation is a therapeutic technology that uses targeted electrical stimulation or medication to alter, stimulate, or inhibit nerve activity directly.) deep inside the brain... circulatronics technology holds the potential to make therapeutic brain implants accessible to all [whether you need them or not].

The electronic devices, each about one-billionth the length of a grain of rice, are composed of organic semiconducting polymer layers sandwiched between metallic layers to create an electronic heterostructure. They are fabricated using CMOS-compatible processes in the MIT nano facilities, and then integrated with living cells to create cell-electronics hybrids. To do this, the researchers lift the devices off the silicon wafer on which they are fabricated, so they are free-floating in a solution.

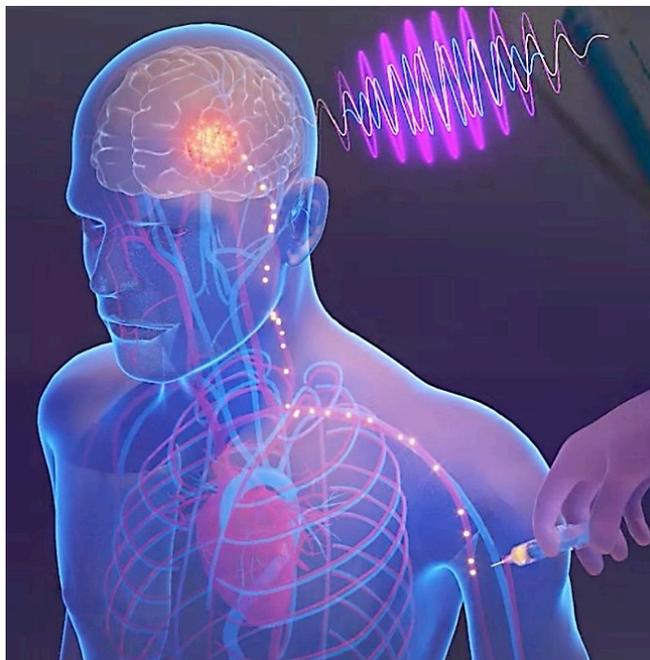

Key to their operation is the **high wireless power conversion** efficiency of the tiny electronics. This enables the devices to work deep inside the brain and still harness enough energy for neuromodulation.

After the devices have self-implanted in the target region, a clinician or researcher uses an external transmitter to provide electromagnetic waves, in the form of near-infrared light, that power the technology and enable electrical stimulation of the neurons."

[Surgery-Free Brain Implant for Brain-Computer Symbiosis](#)

Researchers at MIT have developed nanoelectronic devices that can autonomously travel through the body, cross the blood-brain barrier, and self-implant in targeted brain regions—all without invasive surgery. These sub-cellular sized, wireless electronic chips merge seamlessly with brain tissue, creating a natural brain-computer symbiosis that delivers precise electrical stimulation.

[Why I'm Deleting My Google Account in 2026 \(And What I Use Instead\)](https://www.givesendgo.com/Endtargetingandabuse)

The following is the link and brief billboard information:

Your donation fuels a Wisconsin highway billboard (education = survival) The Goal is to raise \$7,500 for two months exposure of billboard. Darkness thrives in

silence. Help us shine the light.

Thank you and welcome to [TargetedHumans.org](https://targetedhumans.org). We invite all TI's to join our organization. There is no room in the TI community for competition. In communities who have shared experiences and need to collaborate, competition breaks the implicit trust that holds the culture together. It turns teammates into, at best, rivals, and at worst, enemies, destroying the "all in this together" mentality that drives research or non-profit organizations. Please encourage others in the TI community to organize for shared benefits. Everyone has something to contribute. Our newsletters are downloadable online at <https://targetedhumans.org/newsletters>.
