There has been a complete turnaround in global coal markets over the last couple of years. While a booming economy led China to turn from being a net coal exporter into a net importer, Japanese nuclear closures contributed to additional demand for steam coal imports. A weakening USA dollar led exporters to further nudge prices northwards. As a result, global coal prices jumped from about \$25 per tonne in 2003 to over \$60 per tonne by July 2004. Above all Chinese demand for commodities sent bulk cargo freight rates to dizzying heights of \$25-30 per tonne. While there has been some moderation in coal prices, since July 2004, prices effectively remained above \$50 per tonne during the first half of 2005. In the ensuing scenario, the rationale for large scale imports of coal needs to be revisited. In fact, citing high prices, utilities are shying away from importing coal as per the schedule plan for 2005-06. This has led to additional pressure on indigenous coal companies, already stressed with enhanced production targets.

- 21. Japan's nuclear closure did not have an effect on the rise in coal prices worldwide.
- 22. In the changing scenario Indian utility companies are considering other options to coal for their energy requirements.
- 23. Import of coal was a preferred option by the utility companies prior to 2004.
- 24. China has become the largest coal importer in the world.
- 25. Coal prices have increased by about 100% in the recent past.
