

Orange in Nature

Ama loved drawing colorful pictures of nature. One sunny afternoon, she visited a butterfly sanctuary filled with flowers, trees, and fluttering wings. As she walked along the garden paths, beautiful orange butterflies danced through the air all around her.

Ama watched as the butterflies landed on bright flowers and gently floated from place to place. Some had spots on their wings, while others had stripes and unique patterns. She carefully observed each butterfly and tried to remember what made them different.

Ama sat quietly on a garden bench and sketched the orange butterflies she had seen in her notebook.

“Pretty!” said Ama.
“There are so many beautiful orange butterflies in nature!”

Orange Butterflies

Can you help Ama identify the orange butterflies?

Read each butterfly description. Cut out the butterfly pictures at the bottom of the page and match each one to the correct description. Glue the butterflies in the correct spaces to complete the activity.

The monarch butterfly has bright orange wings with black lines and white spots. It is famous for traveling long distances during its migration journey.

Monarch

The Gulf Fritillary has orange wings with black spots. If you look underneath its wings, you can see shiny silver spots that sparkle in the sunlight.

Gulf Fritillary

The Julia butterfly has long, narrow orange wings. It glides smoothly through the air and looks different from many other butterflies because of its unique wing shape.
