

SafePave – “Injury protection for raised floor Pavers and Tiles.”

What is SafePave?

SafePave is a system that strengthens tiles that are used in pedestal and floating deck installations to make them stronger and safer to protect any services or waterproof membrane underneath. The added strength also broadens the range of tiles that can be used in these applications.

SafePave:

1. Reduces the incidence of tiles breaking due to impact,
2. Increases the crack resistance of the tiles - tests show tiles are up to 90% stronger
3. Prevents “tile breakthrough” – (where an object or person falls through a tile as it breaks.)
4. Reduces risk of injury from falling through or cuts from breaking tiles.
5. Reduces installation costs – no centre pedestal required
6. Prevents damage to under tile services such as HVAC, plumbing and electrical.
7. Prevents damage to waterproof membranes caused by breaking tiles
8. Allows natural stone to be used – no problems with flaws in the stone
9. Can be cost-effectively retrofitted to existing installations

Why use SafePave?

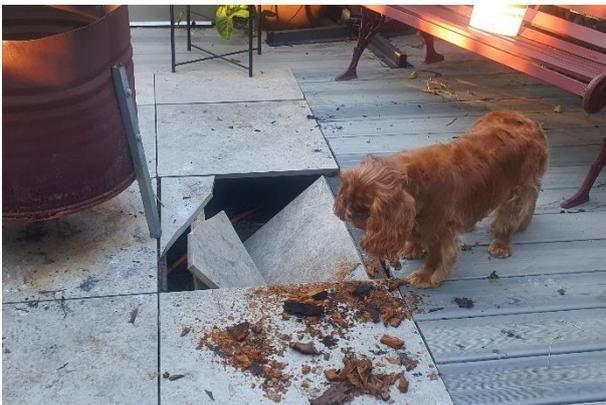

Like toughened glass, tiles used in a raised floor or decking application can shatter or crack with even a small impact in the right place. This leads to the risk of injury from the sharp edges of the tile, or even major injuries from someone falling through. The broken tile can also damage sub surface services and waterproof membranes

SafePave reduces these risks by laminating a high strength, anti-vibration, reinforced protective layer to the underside of the paver or tile. This layer is strong enough to support a weight of up to 2.8Kn* even after the tile is broken.

A tile or paver may still break, but **SafePave** will reduce or eliminate the major consequences

SafePave can be added to ANY tile or paver, even natural stone, increasing the options available to you for your project. Ultimately, **SafePave** provides a balance of performance, safety and cost-effectiveness that benefits every project stakeholder and future user of the tiled area.

For absolute peace of mind and safety, insist on Safe Pave for your next pedestal installation project

A CAR SITTING ON A BROKEN TILE.

We can apply the **SafePave** protection either at your site or ours. The process is quick and quiet.

How do I get SafePave

Existing tiled decks or raised tile installations.

- We will come and lift the tiles, treat them and reinstall. This process can be done without major disruption, as each tile is lifted individually and immediately reinstalled after treating. (a very quick process) The tile treatment is undertaken in the area that is being treated. No need to close a business.

New Tiles, Option One – On site

- We will attend your worksite and treat the tiles prior to installation. (pallet to pallet).

New tiles, Option Two – Our workshop

- Have your tiles delivered to our facilities and we will treat the tiles and have them delivered to site.

How much does it cost

- You will be surprised. There is no known method of achieving the same advantages that comes close to SafePave in cost-effectiveness. The cost is usually only slightly higher than what the centre pedestal would have cost.
