Generative AI Prompting

Self-Training Prompt Example

December 22, 2025

Overview

This document shows an example of how to use generative AI to create a training prompt for a technical topic. In this case, the topic is IP takeover, and the user wants a structured way to learn it. The user starts with a rough draft prompt, then asks the AI to turn it into a clear, complete prompt that can be used for the training session. After that, the user can tweak the final prompt as needed before running it.

You can try the same approach yourself. Pay attention to how the AI responds and how it guides the learning process. You can also swap in any topic you want.

The Prompt

---- START OF PROMPT ---

Below is a draft prompt. Act as a prompt engineer and generate a proper prompt that I can use. Ask up to five clarification questions to help you complete the prompt. Do not generate the prompt until I answer the clarification questions.

I am a product manager with a strong background in SaaS but very limited knowledge of networking. I want to understand what IP takeover is, why it is used, and how it works in practical scenarios. Teach me in a structured way. Start with a simple explanation, then walk me through real-world examples, risks, and common misconceptions. Use analogies when helpful. After each section, ask me up to five questions to confirm I understand before moving on. If my answers show gaps, adjust the explanation. Keep the language simple and avoid deep technical jargon until I am ready for it.

---- END OF PROMPT ---

Brightmoor
TECHNOLOGIES

We help B2B software companies uncover what's holding back product performance, make smarter decisions, and build the discipline needed for lasting growth.
