

# CANCER AND PARASITES

Dr. Brian Ardis shared that 50% of all cancerous tumors that he saw in his practice were actually PARASITE egg sacks. That's absolutely alarming!

How many people do you know that are currently suffering from that life draining disease? How many of them have been enduring months of chemo and radiation... and possibly even surgery, in an effort to keep their lives.

Meanwhile behind the scenes it could possibly be this *hidden enemy* that's masking itself as cancer. And it's not only devious, it's also incredibly selfish. It steals the VERY nutrients and energy that are meant to give your body strength. And help your body flourish, it takes it all for itself! Leaving your body fighting for the scraps.

No wonder life feels like it's draining out of you when these tiny invaders are wreaking HAVOC inside you!

You might feel:

- Persistently exhausted, like your energy is sapped away
- Body aches
- Constantly battling inflammation
- Digestive issues

Your immune system, if it's overwhelmed by these invaders, *could even start attacking your own tissues*. Which leads to autoimmune diseases like rheumatoid arthritis, lupus and more. Even your mental health could take a toll...making it hard to enjoy life. But the good news is that there is something that you can do to rid these horrid organisms from your body!

There is a NATURAL solution that can help your body regain control. And it WILL put life into your years.

The hidden nature of these parasites is what makes them so dangerous, because they can live inside you for YEARS without obvious symptoms, which is especially concerning for families with children, whose developing immune systems are more vulnerable.

Think about how small a grain of rice is—some of these parasitic eggs are HUNDREDS of times smaller than that. They sneak into your body with every bite of sushi, every sip of tap water, every pet you touch. That's why so many people struggle with "mystery" health problems nowadays.

People in their 40s are constantly exhausted. Folks in their 30s are dealing with chronic bloating. And 20-year-olds are experiencing brain fog. These are all health issues you'd normally chalk up to "stress." Or maybe you'd blame it on a "busy lifestyle." Or poor sleep habits. While, in reality, the root cause of these issues might be parasites living inside your gut.

If you keep ignoring it, it can eventually lead to autoimmune disorders, chronic fatigue, and even depression as these parasitic invaders release toxins that disrupt your entire system. And sadly, you can't escape these parasitic threats. Because every time you eat at a restaurant, drink tap water, or pet your dog, you expose yourself to potential infection.

Of course, the human body is resilient, and a small exposure won't do much harm, but because these parasites have been accumulating in our food supply for DECADES, and they're only multiplying in number.

These microscopic invaders quickly establish colonies in your body. It's like the old saying: "One or two might not be a big deal, but it's *"Death By A Thousand Paper Cuts"* that gets you. You won't even notice at first. Maybe you're more tired than usual, or your stomach just feels "off" after eating, but then, it can get more serious.

You start to experience persistent bloating and gas, your skin begins breaking out in mysterious rashes, and you find yourself getting sick more frequently, leaving you feeling like a vibrant spirit trapped inside a sluggish body. And to make things worse, some toxins found in industrial chemicals, which we know are dangerous, are also present in the waste products these parasites release inside your digestive tract.

So while you instinctively avoid chemical cleaners and processed foods due to their toxicity, unknowingly, parasites inside you have been releasing toxic waste into your system for DECADES. And it doesn't stop there. You're being exposed to these parasites every day.

What is the medical establishment going to do about it? The answer is simple: Nothing. Parasitic infections generate BILLIONS in revenue for companies that profit from treating symptoms rather than root causes, which translates to HUGE profits from keeping people sick instead of actually healing them.

It's a sad reality. If you poison one person with parasites—you might get sued. But if you allow a billion people to become infected, you'll probably retire with generational wealth from selling symptom-management drugs. And chances are, you and everyone around you are the ones being affected.

But don't worry, Because you can take matters into your own hands.
