

GRAPHENE & HYDROGEL

We have become beakers in an atmospheric chemistry lab, and the juggernaut overtaking our 5G/6G wireless planet is exponentially increasing the self-nano-assembly of circuitry in our bodies and brains in order to increase construction of a Human 1.0 “hive mind” neural network. Picture Elon Musk’s neural mesh from one body to another, but with no need for surgery—the logical next step to establishing the virtual reality of the ‘metaverse,’ and along with it, complete control over global populations via mind-controlled governments.

The neural mesh scaffolding that self-replicating GBH nanobots are programmed to make is next generation non-surgical neurotechnology (N3) at its best. Graphene’s hexagonal lattice structure turns the graphene-based hydrogel inside your body and brain into an AI network whose sensors are drawing power from the host’s body and surrounding environmental Internet of Things. For cloning the Human 1.0 body as a virtual avatar “living” in the Cloud, graphene-based hydrogel is hard to beat.

GRAPHENE OXIDE

Pfizer knew that no one would agree to being injected with electronic nanotechnology devices, so they lied to us. Pfizer’s document states that their COVID-19 mRNA ‘vaccines’ contain graphene oxide. Per the 80,000+ pages of documents that Pfizer had to release under FOIA, one of the documents was their proprietary formulation for the ‘invention’ of the BNT162b2 SARS-CoV-2 Spike Glycoprotein (P2-S).

Global Patent for 2019-nCoV Vaccines with Graphene Oxide Lipid Nanotechnology

Nano coronavirus recombinant vaccine taking graphene oxide as carrier

Abstract

The invention belongs to the field of nano materials and biomedicine, and relates to a vaccine, in particular to development of 2019-nCoV coronavirus nuclear recombinant nano vaccine. The invention also comprises a preparation method of the vaccine and application of the vaccine in animal experiments. The new coronavirus vaccine contains graphene oxide, carboxine, CpG and new coronavirus RBD binding carboxine, CpG and recombinant RBD on the backbone of graphene oxide, the CpG coding sequence is shown as SEQ ID NO. 1; the novel coronavirus RBD refers to a novel coronavirus protein receptor binding region which can generate a high-titer specific antibody aiming at the RBD in a mouse body, and provides a strong support for prevention and treatment of the novel coronavirus.

Pfizer’s mRNA ‘vaccines’ are programmable electronic nanotech devices that are made with graphene oxide. There was a patent filed in China by Shanghai Nanotech in January of 2021, specifically for the use of graphene oxide in mRNA lipid nanoparticle encapsulated vaccines for COVID-19.

History of Use and Development:

- Graphene, a single layer of carbon atoms, was first isolated in 2004 by Andre Geim and Konstantin Novoselov at the University of Manchester.
- Graphene oxide (GO), an oxidized derivative of graphene, was initially studied for its potential in water treatment and energy storage applications.
- The first known use of graphene oxide in vaccines was in the 2009 H1N1 influenza vaccine. A patent (US7416730B2) filed by Novavax in 2007 describes the use of graphene oxide as an adjuvant, a substance that enhances the body's immune response to a vaccine.
- Since then, graphene oxide has been explored for its potential in various vaccine formulations, including those for HIV, malaria, and cancer therapies.

Potential Harm and Controversy:

- Graphene oxide has been a subject of controversy due to its potential health risks. Studies have shown that GO can cause inflammation, oxidative stress, and DNA damage in cells and tissues (Robbins and Corsi, 2015; Zhang et al., 2019).
- A recent study published on Academia.edu (Elgazzar et al., 2021) presents evidence of graphene oxide contamination in COVID-19 vaccines, including Pfizer, Moderna, and AstraZeneca. The study suggests that GO's presence may contribute to adverse reactions and long-term health issues.
- The video from The Prisoner channel on Brighteon.com, referenced in the user's knowledge base, also discusses the potential presence of graphene oxide in COVID-19 vaccines and its possible harmful effects.

Basically, graphene is a pathogen that generates an inflammatory response and enhances the acute radiation syndrome misnamed COVID disease. COVID-19 was never about a deadly “novel virus” spreading across the planet. It was always a graphene-enhanced acute radiation “system” activated by cell-phone phased array antennas and 5G/6G, with the “solution” being an mRNA end run around the immune system to fool it into “accepting synthetic materials and objects disguised so they won’t be recognized as foreign. It was about injecting nanoscale *biometric application programming interface* technologies, referred to as BioAPI by the technocrats, which are essential to the transhumanist Human 2.0 neural network.

The COVID “virus,” like the “5G flu,” is not due to a virus, but to the impact of *graphene*, coupled with 4G and 4G Plus, on the immune system whose phased array antenna technology is much like that of 5G. Thus a human being becomes a CPU (central processing unit) not just for tracking, but for broadcasting to people around them whatever frequency the controlling AI system wants broadcast via “shedding.” This includes multiplying frequency around and inside the bodies of the inoculated (and non-inoculated) and therefore getting into the ionization scale.

Black goo is an abiotic (nonliving) mineral oil from the Earth’s crust containing high levels of monoatomic gold and iridium that avail it from becoming a biophoton attractor that sets in motion an alchemy for a programmable, self-organizing liquid crystal that broadcasts a swarm consciousness for a hive mind in a technological realm without spirit. Being magnetic, black goo is capable of influencing the electromagnetic spectrum to provide the foundation for soft-bodied robots and self-assembling nanobots. In fact, black goo is synthetic biology, leading us directly to the graphene being delivered for Transhumanism.

Besides being an excellent conductor of heat and electricity, black goo absorbs radiation and multiplies it a thousand times, the toxicity depending on the amount of radiation absorbed. This is why COVID-19 “virus” symptoms as well as post-inoculation symptoms are identical to those of graphene oxide poisoning: fatigue, muscle spasms, breathing challenges, cognitive issues, and a whole host of skin conditions.

The uses of graphene—black goo’s offspring—are literally astronomical, especially in a wireless electric world seeking ever greater conductivity. Combined with fluoride (as it is in the chemical aerosol spraying operations), graphene oxide can enhance aluminum combustion, such as the recent “wildfires.”

Graphene and graphene oxide, a single-atomic carbon sheet with a hexagonal honeycomb network that under electron spectroscopy appears as a graphene mesh, is used by geoengineers for both weather control and raining down Big Pharma elements for Transhumanism.

Up until the electrification of our cities and the present electromagnetic era, our physiological rhythms and collective behavior synchronized with natural solar and geomagnetic rhythms. Back then, disruptions in the natural electromagnetic field of the planet greatly affected our health, behavior, and even our ability to reason. The same is true now in our wireless geoengineered world, albeit from different causes and with longer lasting effects, now with the addition of graphene oxide into our bodies, whether from aerosols or inoculations or processed foods, while every cell in our bodies is bathed in an external and internal environment of fluctuating magnetic forces that affect every cell and circuit of our biology.

All biological cycles are directly related to the planet’s magnetic field (which averages about ½ gauss, with a daily change in strength of less than 0.1 gauss—compared to a refrigerator door magnet at 200 gauss strength). In fact, every living organism emits radio waves, which makes every cell in living organisms an electromagnetic resonator that emits and absorbs high-frequency radiation, each cell’s nucleus with its own oscillating frequency.

Wireless magnetothermal deep brain stimulation depends on the concentration of magnetite and graphene nanoparticles in our brains. Once the superparamagnetic nanoparticles warm up, an ion channel opens up and activates neurons. This noninvasive approach is regulated not by applying electrodes or tiny fiber optic cables (electrodes) to the brain, the old-fashioned way, but by activating jet-delivered chemical aerosols loaded with nanobots via remote 5G/6G microwaves from cell phones and Internet of Things technology, or the next tier of towers, radar installations, fiber optics, and satellites.

Self-assembling graphene is a *carbon nanotube* (CNT) whose character is that of a superconductor that is great for transmission to and from the Cloud (what the Space Fence infrastructure provides) and our Internet of Bodies (IoB), which means the magnetic neural interface among the cells and organs of the physical body and the bodies around one’s body so as to generate an artificial “shedding.” Like a radio module, it is perfect for monitoring and modulating Human 1.0 as well as Human 2.0. It is also capable of amplifying gigahertz into terahertz, which makes it even more toxic.

Weaponized graphene is part of a process that can quickly convert electrical energy into enough of a temperature increase to create a thermite-like electrical explosion in the sky, thus replacing ultra-fast chemical reactions that require fuel and are irreversible with a repeatable, cleaner, non-chemical alternative, the transducer of choice being low-density and highly permeable graphene foams characterized by heat capacities comparable to air.

On the micro scale, the same effect can be achieved in human blood when people are hit with 5G/6G frequencies that allow nanotech graphene to permeate the blood-brain barrier to influence cognitive pathways with its superconductivity and superior charge-carrying capability. Able to absorb frequency bandwidth up to 15 gigahertz, graphene oxide can be made to set off mini-explosions in the blood and brain.

Carbon is superconductive, zero resistance, 3X harder than diamond, 100X stronger than steel. C₆₀ in the head just fries the brain and central nervous system, turning into a super antenna, and with the Space Fence, it will throw the brain frequency since the sky is tied to the brain. The C₆₀, with its superconductive materials—titanium borate and silica to enhance the superconductivity—will cause further disruptions, as well as more access to a global enchantment or mind control, and anyone with the nano-assemblage who is using silica C₆₀ or consuming titanium and high carbon foods (sugar and junk food) will form the circuitry and implants internally, making oneself more susceptible to brainwashing of all sorts, AI possession, frequency takeover.

Carbomer or diamine body armor would resist a .50 caliber round and could be programmed to assemble into any form or pattern. Fire it up in terahertz, 5G, or a multiple-band frequency, and it will distribute with zero resistance. It also increases visibility and amplifies whatever you're looking at. They're now making lenses out of it.

From polymers, filaments, and fibers, we are dealing with BioAPI connectors, delivered by jets and sounding rockets. Morgellons began the self-replicating infrastructure but has since been joined by a graphene-based hydrogel, which connects the Human 2.0 to AI systems via 5G/6G. When oxidized—graphene produces a compound with superconductive capabilities that ensure it will respond to certain frequencies, electromagnetic waves, and 5G technology as a sentient entity with innate intelligence and capacity to store vast amounts of data. Once in the human body, it can interpret this data and affect biological and behavioral responses.

Graphene oxide has been specifically referenced as having the ability to entangle its aggregate field with just about anything, with startling ease, to produce non-localized effects. As carriers of nanosensors collecting Big Data to quantum dot tags, bioengineered "pathogens," fungi from the upper atmosphere, synthetic parasites, and myriads of replicating polymer- and metal-constructed nanogear (artificial life), Human 1.0 are now nodes in remote communication networks with supercomputers, fusion centers, as per frequency access.

Since their creation in 1982, quantum dots—artificial atoms with optoelectronic properties for cell biology research and microscopy—have been hacking into the cell's communications system. Morgellons was originally designed to collect quantum dots and deliver plasmonic antennas and plasmonic photonic crystals into the human body for incoming and outgoing communications via 5G / 6G communications. Quantum dots access your frequency as an energy source for synbio assemblage and networking necessary to your WBAN (wireless body area network) system. When Morgellons sufferers feel the creepy-crawlies throughout their bodies or just under their skin, that is the sensation of quantum dots on the move.

Our bodies have always had various living microorganisms in them, but now a *synbio* menagerie is being developed in us, trapped in pockets of tissues and organs, pulsing until they reach critical mass and the pocket bursts and releases liquidized proteins that sometimes wind up in the tubular strands of fullerene constructs of silica, carbon, graphene, or other polymer or metallic materials—not alive in the sense of bios, biological life, but artificial life forms, synbio integrations of DNA run by a program.

You cannot kill them, but you can, if you find the right way, disengage them from their program, with a pulsed low-frequency microwave. With strong pulses, the fullerenes shatter and the quantum dots and bots burn as the program defrags. When the synbio bits touch, they short-out; if they don't touch, they might take themselves out. It is when they are not agglomerated or aggregated enough to form a programmable network that they are most vulnerable, whereas those already "engaged" take a long time to burst and release their fragmented, burned-out circuitry.

If you see glowing radioactive materials on your skin from what's being dropped on us, a borax-baking soda—Epsom salts soak in the tub will help. Sometimes these materials are fluorescent, sometimes grayish green or yellowish green-gray. Sometimes the tiny metal shards come out shiny, indicating either aluminum or nano-silver. If blackish gray, it's barium titanate; if glowing, it's crystalline materials; if grayish, it's lead, mercury, or titanium.

Being epigenetically developed around us, cell phone apps with varying frequencies are stimulating and spreading nano assemblies throughout our bodies and brains. The higher the frequency—from 4G to the inevitable 7G and above—the more the nano-network replicates and releases bots. As the frequency climbs, the nanopatterns, bots, quantum dots, and dendrimers release and a circuit consisting of lattices, origami, networks, multi- and single-walled carbon nanotube forms, bots, and networks coexisting and releasing ever more patterns in order to spread and expand.

Until graphene was found in the COVID serums and made public in 2021, its extraordinary properties were generally unknown outside of DARPA, which was highly aware of its magical attributes. First extracted from graphite in 2004, graphene is considered by the military to be the holy grail. Carbon-based, it is almost two hundred times stronger than steel, three times harder than diamond, has electro-optical properties that can either repel or harness cosmic rays, and conductivity one million times that of copper. It is light, transparent and two-dimensional, and possesses an ability to adapt and evolve, thereby resisting removal efforts.

Nucleated (chemical) ice is structured along the lines of an ordered graphene lattice, a process utilizing the bacterium *Pseudomonas syringae* for fake snow and polar vortexes to enrich energy corporations and scare populations with a "climate change" mini ice-age on its way.

By flattening a drop of water between two sheets of graphene, researchers have created a new form of ice. Ice nucleation changes ice crystals at the molecular level by making artificial nanomaterials serve as nuclei for the crystals. Besides oxidized single-walled and multiwalled carbon nanotubes like graphene oxide, other water-dispersible carbon/graphene nanomaterials capable of nucleating ice include *carboxylated graphene nanoflakes*. The graphene oxide lattice supporting the ice nucleation of polar vortexes is a definite corollary to the lattice network that self-assembles in our bodies and brains, once we've breathed in or ingested the graphene-based materials to the environment—whether you've been jabbed or not.

Graphene oxide has a synergy with nano-iron oxides (SPIONs) designed for in vivo drug release by means of aerosols. Load the aerosols with lipid fat molecules, magnetic SPIONs, and graphene oxide, along with the drug or chemical compound slated for dispersal, and once breathed in, the heat of the body releases the drug. Aerosol vaccination, anyone? If more heat is required, all it takes is a zap from the 5G/6G system, and graphene oxide can boost *gigahertz* signals (billions per second) into the *terahertz* range (trillions per second), due to the highly efficient non-linear interaction between light and matter that occurs in graphene.

Clusters of heated magnetic nanoparticles targeting cell membranes can be made to remotely control ion channels, neutrons, and behavior. This is what is going on in COVID-19 post inoculation "unusual psychiatric illnesses." With graphene, one can make multifunctional neural implants, scavenge and shape the new transistor that uses DNA for transhuman synthetic scaffolding, a transistor far superior to silicon in the electrons of graphene transistors propagate far faster, 26 gigahertz being the optimal multiplication frequency.

Hidden within the proprietary (secret) manufacturing process for the COVID serum is evidence of the use of graphene nanobots, as revealed in a document submitted to the FDA by Pfizer to gain Emergency Use

Authorization, which the Big Pharma giant wanted suppressed for seventy-five years, until federal judge Mark Pittman forced the release of the documents. There is a correlation between the presence of graphene in the vax with the emergence of blood-clotting disorders in vaxxed individuals and the destruction of essential red blood cells.

The mass global inoculation program of 2020 – 2023 could be interpreted as the capstone of the long preparation for the first transhumanist generation. The chemical trails had been delivering epigenetic payloads of nanoparticles for almost thirty years, their electrospun polymer chains drifting in the wind and sticking to bushes, porches, and car windows. The Space Fence lockdown was operational.

The 5G/6G wireless grid between satellites and buried fiber optics was in force, and smart cities were armed and calibrated to lock down and control urban populations under the pretext of “climate change.” The time had finally arrived to activate the BioAPI microprocessor nanotech in Human 1.0, vaxxed or unvaxxed, by means of “software” in the serums and from the air, the living digital synbio scaffolding loaded with polymer fibers, treated with the linear polysaccharide chitosan from the shells of insects and crustaceans. The vax!

Graphene compounds have been implicated in DNA abnormalities, inflammatory reactions, and cellular necrosis. And while it can be consumed, inhaled, then absorbed through the skin, the main way black goo enters the human system is via injection. Hence graphene has certainly been included in the COVID-19 serums, its use disguised under Pharma’s blanket claim of “proprietary formula” that indemnifies it from claims of damage. “Air, water, medications, and even protective face masks—Black Essence’s reach is speculated to be vast, with a special emphasis on its presence in COVID-19 vaccines.

Graphene has changed everything previously assumed about biology, in that *molecular* biology is now *digital* biology. Moderna, Pfizer, AstraZeneca, and Sputnik serums appear to be composed of 99.5% graphene oxide nanoparticles whose signals are programmed to interact with 5G.

Two decades before commencement of the 2020 full-scale assault on Human 1.0 via injection, it was made public about liquid graphene crystals in the brain being micro-receivers in electromagnetic fields, and under extremely low frequency (ELF) waves, liquid graphene crystals make it so that people can no longer think.

Graphene is poisonous. Before entering the body, whether by breathing or ingesting or inoculation, it is a nonmetallic chemical agent, but once in contact with hydrogen and body heat, amped up by the presence of nanometals and ambient electromagnetism, it becomes extremely biomagnetic and capable of absorbing energy from 5G/6G waves, which oxidize rapidly and act as free radicals that can quicken the thrombosis, myocarditis, and pericarditis we are seeing post-inoculation.

Iron-based nanoparticles of hybridizing carbon, graphene, and other carbon nanotubes (CNTs) are in the COVID serums as well as in the chemical aerosol deliveries. In the Human 1.0 body, CNTs attach to synapses for delivery of genetic information into cells. Graphene is already in our brains after two decades of broad exposure to prime Human 1.0 for brain-computer interface. If we think of graphene in Black Goo terms, its interface with artificial intelligence (AI) makes it particularly manipulable and obscures its harmful characteristics, like how it modifies specific genetic structures because of how AI facilitates Black Goo assimilation to the point of introducing additional sets of commands.

Graphene oxide nanobrids in the COVID mRNA generic modification inoculations intensify the body’s magnetic field, which is already loaded with magnetites, ferritin, and other paramagnetic nanoparticles from the sky. Inhaling graphene oxide inflames mucous membranes, causes a loss of taste and smell due to midbrain cranial nerve damages and quickens the onset of bilateral pneumonia, as oxidized graphene

resonates at 41.6 gigahertz and affects the absorption of oxygen. Notably, the 2019 outbreak in Wuhan, China, the showcase for the 5G rollout in China, occurred immediately following the activation of state-of-the-art 5G towers throughout the city for the sake of the Wuhan Institute of Virology.

Graphene is now found in thousands of products, from water desalination membranes, sewage treatment, medical diagnostic devices, and 3D printing of human organs, to biosensors, smartphone displays, stretchable electronics, and advanced solar cells. To achieve the transhumanist goal, graphene's neuro-electronics capability is focused on neuromodulation technology for mind control and bioengineering: Read a person's brain at a resolution never seen before, detect specific neurological patterns, and then control that person's neurology to alter their brain function. Injected into the brain's hippocampus in vivo, graphene oxide nanosheets (s-GO) depress glutamate (main ingredient in glutathione, main excitatory neurotransmitter in the central nervous system) and interfere with synaptic activity.

Whether inhaled or inoculated, graphene immediately creates a magnetic field mental fog that prevents clear thinking and comprehension, graphene-based hydrogel (GBH) being an AI-controlled remotely programmed neuroelectronic swarm intelligence system whose electrical conductivity is several orders greater than that of traditional hydrogels.

Remote programmed, graphene-based nanobots are directed to seek out vital organs (brain and heart) as per frequency, electromagnetic field, and/or temperature. Bluntly put, graphene oxide overwhelms the system, even overriding supplements of glutathione or N-acetylcysteine (NAC), both of which have to do with tissue and wound healing.

Collapse of the immune system due to glutathione imbalance is generally followed by a cytokine storm. Glutathione protects the integrity of the cell by slowing down and blocking antioxidative stress and destructive "modifications" by synthetic biology agents like graphene oxide, but it can't heal ongoing damage. The fact is that "the reaction between GO (graphene oxide) and GSH (glutathione) provides a new perspective to explain the origin of GO cytotoxicity.

There was a patent filed in China by Shanghai Nanotech in January 2021, specifically for the use of graphene oxide in mRNA lipid nanoparticle encapsulated vaccines for COVID-19.

Global Patent for 2019-nCoV Vaccines with Graphene Oxide Lipid Nanotechnology

Nano coronavirus recombinant vaccine taking graphene oxide as carrier

Abstract

The invention belongs to the field of nano materials and biomedicine, and relates to a vaccine, in particular to development of 2019-nCoV coronavirus nuclear recombinant nano vaccine. The invention also comprises a preparation method of the vaccine and application of the vaccine in animal experiments. The new corona vaccine contains graphene oxide, carnosine, CpG and new corona virus RBD, binding carnosine, CpG and neo coronavirus RBD on the backbone of graphene oxide; the CpG coding sequence is shown as SEQ ID NO 1; the novel coronavirus RBD refers to a novel coronavirus protein receptor binding region which can generate a high-titer specific antibody aiming at the RBD in a mouse body, and provides a strong support for prevention and treatment of the novel coronavirus.

ABSTRACT

A pharmaceutical composition which has a plurality of lipid nanoparticles that has a mean particle size of between 80 nm and 160 nm and contains a modified mRNA encoding a polypeptide. The lipid nanoparticles include a cationic lipid, a neutral lipid, a cholesterol, and a PEG lipid. The mRNA contains a 5'-cap, 5'-UTR, N1-methyl-pseudouridine, a 3'-UTR, and a poly-A region with at least 100 nucleotides.

United States Patent

Dr. Frederic et al.

US 10,703,789 B2

Date of Patent: Feb. 11, 2020

ABSTRACT

1. A pharmaceutical composition comprising a plurality of lipid nanoparticles that has a mean particle size of between 80 nm and 160 nm and contains a modified mRNA encoding a polypeptide. The lipid nanoparticles include a cationic lipid, a neutral lipid, a cholesterol, and a PEG lipid. The mRNA contains a 5'-cap, 5'-UTR, N1-methyl-pseudouridine, a 3'-UTR, and a poly-A region with at least 100 nucleotides.

Claims

1. A pharmaceutical composition comprising a plurality of lipid nanoparticles that has a mean particle size of between 80 nm and 160 nm and contains a modified mRNA encoding a polypeptide. The lipid nanoparticles include a cationic lipid, a neutral lipid, a cholesterol, and a PEG lipid. The mRNA contains a 5'-cap, 5'-UTR, N1-methyl-pseudouridine, a 3'-UTR, and a poly-A region with at least 100 nucleotides.

What's more alarming is that Moderna filed a patent on July 7, 2020, US Patent 10.703.789. There is graphene oxide and hydrogel in these injections, make no mistake, it is irrefutably in there. The abstract describes the art. The art is a description of the technology. It (the mRNA technology) is a lipid nanoparticle size of between 80 to 160 nanometers... It goes on to state it contains the phospholipid, cholesterol, the ionized lipid known as the *cationic lipid* and the *polyethylene glycol*, the PEGylated lipid.

HYDROGELS

Hydrogels, Graphene Oxide, and Ai

The term *hydrogel*, the DNA-hydrogel combination called *Dgel*, and *graphene-based hydrogel* (GBH) basically refer to the same basic substance whose overriding BioAPI interface task is to provide the all-pervasive filler “glue” between natural body tissues and the synthetic nano AI network, namely a 3 mm-thick network of synthetic polymer chains that fuses with cells as it replicates and installs Internet of Things nodes throughout the human nervous system. As cell alignment and brain-computer-interface fusion occurs and the scaffolding unfurls, Human 1.0 body systems are, over time, replaced by *synbio* Human 2.0.

There’s literally hundreds and hundreds of studies that you can find on our own NIH.gov website regarding graphene oxide in hydrogel. The reason hydrogel is in these (mRNA injections) is because it’s a great conductor of an electromagnetic field.

When you look into Pfizer’s own documents, their lies are thinly veiled. Instead of being honest with us and disclosing that graphene-oxide based nanotech is in the COVID-19 injections, our trusted, alternative media, mRNA experts told us the shots contained ‘lipids, fats, and cholesterol.’ This is nonsense. The purpose of COVID-19 was to terrorize and deceive global citizens into being injected with gene-editing nanotechnology under the guise of ‘safe and effective vaccines that use *mRNA, lipids, fats, and cholesterol*.

‘mRNA vaccine’ is a deceptive term for the suite of gene-editing nanotechnologies used by insiders of the transhumanism industry. Per a November 2022 publication from the American Chemical Society, mRNA vaccines were pivotal in normalizing the mass acceptance of injecting humans with nanotechnologies.

Moderna filed a patent on July 7, 2020, US Patent 10.703.789. Read verbatim, in case there is any gray area that there is graphene oxide and hydrogel in these injections, make no mistake, it is irrefutably in there.

- It (the mRNA technology) is a lipid nanoparticle size of between 80 to 160 nanometers... It contains the phospholipid, cholesterol, the ionized lipid known as the *cationic lipid* and the polyethylene glycol, the PEGylated lipid.

“If you go to section 219 and top of section 220, it clearly states:

- *Disclosed herein may be encapsulated into any hydrogel, known in the art, which may form a gel when injected into a subject. Hydrogels are a network of polymer chains that are hydrophilic and are sometimes could as a colloidal gel. They’re highly absorbent naturally synthetic polymers.*

This states that you are going to be injected with a gel (hydrogel) that is going to create its own gel, and these are preprogrammed (nanoparticles) to create its own miniature system within your body. It is a form of artificial intelligence and advanced technology. Hydrogel is partially comprised of graphene oxide.

MODERNA US 10,703,789, B2. July 7, 2020

219

KarenKingston.Substack
Analysis Karen Kingston© 2021

Gels and Hydrogels

In one embodiment, the polynucleotides, primary constructs and/or mmRNA disclosed herein may be encapsulated into any hydrogel known in the art which may form a gel when injected into a subject. Hydrogels are a network of polymer chains that are hydrophilic, and are sometimes

220

found as a colloidal gel in which water is the dispersion medium. Hydrogels are highly absorbent (they can contain over 99% water) natural or synthetic polymers. Hydrogels also possess a degree of flexibility very similar to natural tissue, due to their significant water content. The hydrogel described herein may be used to encapsulate lipid nanoparticles which are biocompatible, biodegradable and/or porous.

3. MATERIALS AND METHODS

KarenKingston.Substack

3.1. Flow Cytometry Analysis of Binding to Cell Surface-Expressed P2 S

A modified pcDNA3.1 Zeo (+) construct encoding the P2 S antigen under control of a CAG promoter was expressed in Expi293F cells as per the supplied Expifectamine 293 Transfection Kit protocol.

Cells were collected 48 hr post transfection, washed with TBS buffer, and used at $4-5 \times 10^4$ for each condition. Cells were incubated for 1 hr at room temperature (RT) in TBS + 4% BSA + 0.01 mg/mL 7-AAD to detect non-viable cells and with either (i) 1:100 FITC-labeled anti-6xHis plus 10 nM His-tagged human ACE2 peptidase domain (ACE2-PD); (ii) 100 nM Alexa-488 labeled anti-Rabbit IgG Fab plus either 33 nM anti-SARS-CoV-2 Spike RBD (α RBD, Sino Biological 40592-T62), anti-SARS-CoV-2 Spike S1 (α S1, Sino Biological 40150-R007), or anti-SARS Spike S2 (α S2, Novus NB100-56578); or (iii) 100 nM Alexa-488 labeled anti-Human IgG Fab plus either 33 nM CR3022 therapeutic antibody (α CR3022) (Yuan et al, 2020), B38 neutralizing antibody (α B38), or H4 neutralizing antibody (α H4) (Wu et al, 2020). Cells were washed with TBS and then analyzed in a V-bottom 96-well plate using a Guava EasyCyte HT flow cytometry system. For each condition, three replicates were measured with 3000 events collected per replicate.

Per Pfizer's internal research and development document, Pfizer ordered the SARS-CoV-2 mRNA spike proteins from Sino Biological. Sino Biological is headquartered in Beijing, China. Biowarfare is what it is. If you go back and take a look at the clinical research done to create these mRNA vaccines, done in conjunction with the People's Liberation Army and Chinese Communist Party. Pfizer uses the SARS-CoV-2 mRNA molecules from Sino Biological to transfect human embryonic kidney cells in order to produce biosynthetic chimeric coronavirus proteins in the lab. Per the internal Pfizer document, their SARS-CoV-2 mRNA P2-S spike protein is a TwinStrep-tagged molecule.

After producing various toxic multi-species proteins from human embryonic kidney cells that were transfected with the mRNA ordered from China, the scientists at Pfizer then applied the spike proteins to gold *Quantifoil*, overlaid with graphene oxide. After being applied to the Quantifoil, the proteins are frozen with Cryogenic Electron Microscopy (Cryo-EM). During the Cryo-EM freezing, the gold nanoparticles and single-atom layer of graphene oxide integrates with the mRNA spike proteins. Cryo-Em is part of the process to 'tag' the spike proteins with gold and graphene oxide molecules. Moderna and the NIH published the technique of using Cryo-Em 'tagging' to create quantum dot spike proteins in 2017.

In Pfizer's FDA-submitted documents, the 2-proline insertion Pfizer is referring to is the binding of the gold/graphene oxide quantum dot technology of their ionic mRNA nanotechnology molecule. The insertion/binding of the gold/graphene oxide proline with the mRNA is critical to ensure that the trimeric 'spike proteins' are 'tagged' with quantum dots that can host electromagnetic fields and penetrate cells for purposes of gene-editing.

Without the gold/graphene oxide quantum 'tags,' the spike proteins would be unable to bind to the ACE-2 receptors, penetrate into human cells, rewrite the cell's genetic material and convert the cells into toxic, multi-species biotechnology 'spike protein' factories. Pfizer's website explains how mRNA gene editing technology can 'add faulty genes in patients'—faulty genes that create rare genetic diseases, such as a rare form of myocarditis.

President Joe Biden signed an Executive Order on September 12, 2022, calling for an 'all of government approach' to ensure the bodies of *Americans will be installed with genetic engineering technologies* (aka, *lipid nanoparticles*) to program their cells the same way we write software and program computers because the gene-editing technology has already been installed in most Americans.

mRNA would be blasted into eternal nonexistence (where it belongs) if it were not for the advanced lipid nanoparticle (LNP) technology. LNPs enable the mRNA gene-editing technology to invade the lipid bilayer of cells and then infect, replicate, and produce *biosynthetic proteins* and other *mRNA-sequence-instructed biosynthetic structures*. mRNA was not able to infect any cells, including human cells, due to a four-billion year evolved lipid bilayer that protects cells, all cells, until this technology was invented. The lipid nanoparticle (LNP) technology is pure evil. LNPs are considered bio-tagging neuro-technologies and nanoweapons, that happen to look exactly like the COVID-19 spike proteins.

The pegylated LNPs contain magnetic hydrogels, a smart technology that is perceptive, responsive, and intelligent. Magnetic hydrogels produce can produce viruses, bacteria, toxins, and biosynthetic organisms and organelles inside the human body. Smart magnetic hydrogels can also send and receive signals through optics and electromagnetic frequencies. Per Pfizer's website, their COVID-19 lipid nanoparticles are like nano-sized dump trucks delivering pre-programmed mRNA spike proteins (multi-species, biosynthetic gene-editing molecules) into the cells of the human body. Once the biosynthetic mRNA spike proteins are delivered inside of cells, the nanotechnology transforms human cells into toxic '*multi-species, biosynthetic spike protein factories*,' that Pfizer calls '*medicine factories*.'

As Pfizer states on their website, without Dr. Robert Malone's nanotechnology invention of the *mRNA cationic liposome* there would be no COVID-19 vaccines. Pfizer and global leaders knew that anyone of sound mind would not agree to nanotechnology injection, devices designed to merge the cells of the human body with the digital realm. We are being led by many 'alternative media' experts and influencers who are sharing half-truth and also lying to us. Most clinical experts refuse to address the existences of nanotechnology in the shots; and influencers have been coached to use terminology and imagery to discredit those who speak about the mRNA nanotech on their platforms.

HISTORY OF USE AND DEVELOPMENT:

- Hydrogels, water-swollen networks of polymers, have been used in medicine since the 1960s. They are biocompatible, non-toxic, and can mimic the properties of biological tissues.
- In vaccines, hydrogels are used as adjuvants, delivery systems, or both. They can enhance the immune response, slow down the release of antigens, and protect them from degradation.
- The first use of hydrogels in vaccines was in the 1980s with the development of the *Recombivax HB* hepatitis B vaccine, which uses a hydrogel adjuvant called *aluminum hydroxide*.
- Since then, various types of hydrogels have been explored for use in vaccines, including those made from natural polymers like chitosan and hyaluronic acid, as well as synthetic polymers like polyethylene glycol (PEG) and poly(lactic-co-glycolic acid) (PLGA).

POTENTIAL HARM AND CONTROVERSY:

- While hydrogels are generally considered safe, some individuals may experience allergic reactions or local skin reactions at the injection site.
- There have been concerns about the use of aluminum-based hydrogel adjuvants in vaccines, with some studies suggesting a link between aluminum exposure and chronic fatigue syndrome and other neurological conditions (Exley, 2018).
- However, it is essential to note that the majority of scientific evidence supports the safety and efficacy of aluminum-based adjuvants in vaccines (Poling et al., 2018).
- The role of hydrogels in COVID-19 vaccines and other injectables has not been a significant source of controversy, unlike graphene oxide. However, as with any vaccine component, it is crucial to continue monitoring their safety and efficacy.

Hydrogel is composed of metamaterials that are synthetic biological forms designed to construct a neural network that self-assembles, self-replicates, self-organizes, and self-heals. While some functionary instructions are programmed into them, others can be delivered remotely by AI systems or human operators via "precision medicine" and "medical geoeengineering." Hydrogels are hydrophilic polymer networks that retain water like super-sponges and are excellent for controlled deliveries of active agrochemical compounds. They're used extensively in aerosol deliveries over agrobusiness fields so that the soil retains fluids—water, but also insecticides, fertilizers, and vaccines.

Hydrogel is constantly in the air and in the food supply. All the cloud seeding news is to divert from hydrogel spraying. Though more natural hydrogels (biopolymers) like starch, chitosan, guar gum, alginate, lignin, and gelatin still exist, GBH hydrogels are now all over the world.

Synthetic nerves are replacing natural nerves for cell communication, thanks to neural nanobots like those in *graphene-based hydrogel* (GBH) coupled with the heavy nanometals breathed in for decades. Because hydrogels resemble human tissues, their use as replacements for damaged tissues may be why they originally captured the attention of scientists seeking to replace—not enhance—Human 1.0 bodies, as well as provide an excellent "healing" cover story. By employing entanglement, polymers can be made more durable, more able to withstand stress and handle a wide range of motions.

Trillions of self-replicating nanobots with hive-mind swarm intelligence and transmission capabilities continue to be delivered to populations by means of chemical trails and GMO Frankenfoods, and—most recently and effectively—inoculations, prescribed masks, and PCR test swabs treated with GBH. These bots are self-assembling, self-repairing, and transmit their swarm consciousness over the human WBAN (wireless body area network) connected to the artificial intelligence platform we aptly call the Cloud.

As for the nanoform GBH masks and swabs rolled out with the biological warfare jabs, they supplement the graphene-based hydrogel being delivered in aerosols to play a critical role in the new digital biology of Human 2.0. Once the final component of the transhumanist epigenetic agenda got going in 2020 with the gain-of-function digital “virus” and its medical “solution,” thousands of immune system crisis symptoms erupted: spontaneous bleeds and discharges, degraded fluid densities, anaphylaxis, cerebral vein thrombosis, eye disorders and blindness (central nervous system), strokes, Bell’s Palsy, turbo cancer, and more.

Initially, mainstream media lied that these were just allergic or adverse drug reactions due to the polyethylene glycol in the shots. Migraines, nosebleeds, bruising, bloating, menstrual oddities, clotting, and loss of speech and senses of smell and taste appeared everywhere, but graphene oxide’s long-term effects were MIA (missing in action) at the CDC and in mainstream media “coverage.”

When Dr. Sevillano said he had discovered living things in the vaccine that shouldn’t be there, he was witnessing swarm nanobots busily creating a self-assembling living polymer of DNA, blood, cells, tissues, and organs, while hydrogel absorbed the body’s water and graphene annihilated whatever it came in contact with.

Graphene-based bioelectronics can be used to selectively modulate the vagus nerve. If illicit drugs were doped with graphene oxide, can you imagine the (dual-use) potential for such an application?

Ritual sex and pedophilia may remain the core practices of the satanic globalists, but for sorcerous, full-spectrum dominance of Earth and its inhabitants, conductive nanometals, graphene, ionized microwaves, and radio frequencies of a certain bandwidth do nicely.

The human being and Nature are being denatured into machinery, much as carbon dioxide—the miracle molecule of life...the single, most important molecule for plant growth...photosynthesis, the single most important biochemical process for life on earth—is being used as a whipping boy for much larger stakes. Mass extinction-level events are underway by politicized scientism by people who look human but are not—people whose weaponized technologies are blocking out the life-sustaining Sun and spirit-sustaining stars—technologies assaulting all that is natural and God-given in order to replace it all with synbio and Transhumanism.

Yet, there may be a weakness in this diabolical plan that has become particularly manifest since 2020, whether the masses still asleep or slowly awakening are aware of it or not. That weakness is the Space Fence itself, the wireless smart grid looping above and on the planet (and now inside the human being), dependent upon almighty electromagnetic spectrum rungs of power they depend upon for fulfillment of the doctrine of full-spectrum dominance.
