(Guide Signature) **(External Examiner Signature)**

ACKOWLEDGEMENT

Achievement is finding out what you would be then doing, what you have to do. The higher the summit, the harder is the climb. The goal was fixed and we began with a determined resolved and put in ceaseless sustained hard work. Greater challenge, greater was our effort to overcome it.

This project work, which is my first step in the field of professionalization, has been successfully accomplished only because of my timely support of well-wishers. I would like to pay my sincere regards and thanks to those, who directed me at every step in my project work.

I would also like to thank my class teachers for her indefatigable guidance, valuable suggestion, moral support, and contribution of time for the successful completion of project work. At the outset. I sincerely thank all faculty members of my institutions for her extra efforts to make our session on line inspire of all ideas.

Last but not least, I would like to acknowledge the ongoing support of my parents and my family members, whose patience and encouragement during these long days and night have been paramount in making this project a reality.

INTRODUCTION

This is a Project work undertaken in context of partial fulfillment of the B.C.A. The Project titled as ***" AHAR :Meals with love " .*** It is a food recovery and food waste management network that helps connect the individuals and businesses with excess food to people in need. We approach the issue of hunger with a sharing-economy model: the donation of excess food enables a vital, yet often wasted, resource to be used to its full capacity.

Ahar is an edible food Recovery Project which serves the surplus excess foods from Weddings , Parties , and other events, to the hungry and deprived. This is achieved through a Hot- line number in the City along with a dedicated collection Mini Van. The system works thus. Once we receive a call or pickup request from the donor at our hotline number, we reach the respective collection point with our volunteers and necessary accessories depending on the volume of food along with our vehicle specially equipped by our team for excess food collection.

We accept any kind of food, we just need to know details concerning food type, like if its raw or cooked, packaged, hot or cold, and how much there is. Our algorithm pairs specific food donations with available drivers and recipient locations.

We serve the needy people in Economically Backward Slums , Needy Orphanages and Old age homes , Homeless People , Shelter Homes , Rural Communities.

As a part of our food recovery process, we are **collecting samples** of each food to check its **freshness with odour, texture and taste**.

We ensure the quality of the food during collection and distribution to the needy and we avoid collecting certain menus such as coconut added items, curd/butter items since they spoil at a faster rate , testing the food quickly to start immediate distribution as the existing techniques are taking more time.

I am confident that this software package can be readily used by non-programming personal avoiding human handled chance of error. But knowledge of MS-Excel will extend the use of this software.

OBJECTIVE

The objectives of this project are as follows:-

- India is the second largest food producer covering 10.04% of the total World's food production. But, at the same time India ranked 97 among 118 developing countries for which the Global Hunger Index (GHI) was calculated in 2016. To create a user friendly platform for individuals and businesses who will help in ionculcating responsible attitude in common people and food to people in need.

- The application is developed to enable the serves the surplus excess foods from Weddings , Parties , and other events, to the hungry and deprived online anytime anywhere without going to a hunger spot.

- The application is also designed to celebrate birthdays any individuals birthday with hungry people and bringing happiness in many hungry faces by feeding them.

- Throwing away food benefits no one. Not only could the food have gone to someone in need, but the resource cost is tremendous: one-fifth of greenhouse gases come from meat production, and it takes over ten gallons of water to produce a single slice of bread. Our platform simplifies the process of food recovery, so Donors can make social, environmental and financial change in their choice to Feed the Need.

- The application is also designed for the hotels where many events are celebrated . They also donate the food.

ADVANTAGE

I have designed the given proposed system in the C# and SQL Server. The following steps that gives the detailed information of needs of proposed system.

Performance:During past several decades, the company REPORTs are supposed to be manually handled for all the activities. The manual handling of the REPORT is time consuming and highly prone to error. For the benefits of the users and to improve the performance of the companies or investor the computerized system is to be undertaken. The computerized project is fully computerized and user friendly even that any of the members can see the report and status of the company.

Efficiency: The basic need of the project is efficiency. The project should be efficient so that whenever a new customer REPORT is added, or REPORT is modified or deleted, the REPORT is updated automatically.

Control: The complete control of the project is under the hands of authorized person who has the password to access this project and illegal access is not supposed to deal with. All the control is under the administrator and the other members have the rights to just see the REPORTs not to change any transaction or entry.

Security: Security is the main criteria for the proposed system. Since illegal access may corrupt the database. So security has to be given in this project.

Key Features Are:

- ✓ System Connectivity
- ✓ No Paper Work Required
- ✓ Time Efficient
- ✓ Cost Efficient
- ✓ Automatic data validation
- ✓ User friendly environment
- ✓ Data security and reliability
- ✓ Fast data insertion & retrieval
- ✓ Easy performance check
- ✓ Maintaining REPORTs of users
- ✓ Report generation

OBJECTIVES OF THE PROJECT

This software package can be readily used by non-programming personal avoiding human handled chance of error. This project is used by two types of users

i. Administrator.

ii. User

Administrator can maintain daily updates in the requests of the users, Stock Exchange Information's. Administrator is must be an authorized user. There is the facility for password recovery, logout etc...

TOOLS/PLATFORM USED

HARDWARE AN ND SOFTWARE FEATURE

SOFTWARE REQUIREMENT

➢ ASP.NET (C#) front end.	Used for developing the front end.
➢ SQL SERVER 2014.	Used for the back end.
➢ .Net framework	4.0/4.5
➢ Adobe Photoshop cs	Used for photo-editing and designing.
➢ Amazing Slider	Used for designing flash.
➢ Css3 Menu Maker	For designing menus
➢ Corel Draw X4	Used for front-end designing.
➢ MS-Window	Used for documentation.

CONFIGURATION OF THE SYSTEM FOR CLIENT:

- IntelDualCoreProcessorwith2GBRam
- Keyboardwithscrollmous
- UPS,Stabilizers1/2kv
- Colormonitor
- DVD-Writerandfloppydrive (Sony)
- Internetconnectionmustrequired

HARDWARE

- Intel Core2Duo with 1 GB Ram.
- Woofer speakers for surround sound.
- Multimedia Keyboard with Optical mouse
- Smart line UPS/Stabilizer 1/2 kv
- Color Monitor (LG)
- DVD-Writer (Sony)

PROJECT CATEGORY

FRONT END (ASP.NET)

ASP.Net is a web development platform, which provides a programming model, a comprehensive software infrastructure and various services required to build up robust web application for PC, as well as mobile devices.ASP.Net works on top of the HTTP protocol and uses the HTTP commands and policies to set a browser-to-server two-way communication and cooperation. ASP.Net is a part of Microsoft .Net platform. ASP.Net applications are compiled codes, written using the extensible and reusable components or objects present in .Net framework. These codes can use the entire hierarchy of classes in .Net framework.

The ASP.Net application codes could be written in either of the following languages:

- C#
- Visual Basic .Net
- Jscript
- CSS

ASP.Net is used to produce interactive, data-driven web applications over the internet. It consists of a large number of controls like text boxes, buttons and labels for assembling, configuring and manipulating code to create HTML pages.

ASP.NET

ASP.NET is a web application frame work developed and marketed by Microsoft to allow programmers to build dynamic web sites, web applications and web services. It was first released in January 2002 with version 1.0 of the .NET Framework, and is the successor to Microsoft's Active Server Pages (ASP) technology. ASP.NET is built on the Common Language Runtime (CLR), allowing programmers to write ASP.NET code using any supported .NET language.

ASP.NET is a compiled, .NET-based environment; you can author applications in any .NET compatible language, including Visual Basic .NET, C#, and Script .NET. Additionally, the entire .NET Framework is available to any ASP.NET application. Developers can easily access the benefits of these technologies, which include the managed common language runtime environment, type safety, inheritance, and so on.

ASP.NET has been designed to work seamlessly with WYSIWYG HTML editors and other programming tools, including Microsoft Visual Studio .NET. Not only does this make Web development easier, but it also provides all the benefits that these tools have to offer, including a GUI that developers can use to drop server controls onto a Web page and fully integrated debugging support.

Developers can use Web Forms or XML Web services when creating an ASP.NET application, or combine these in any way they see fit. Each is supported by the same infrastructure that allows you to use authentication schemes; cache frequently used data, or customizes your application's configuration, to name only a few possibilities.

- Web Forms allow you to build powerful forms-based Web pages. When building these pages, you can use ASP.NET server controls to create common UI elements, and program them for common tasks. These controls allow you to rapidly build a Web Form out of reusable built-in or custom components, simplifying the code of a page.

- An XML Web service provides the means to access server functionality remotely. Using XML Web services, businesses can expose programmatic interfaces to their data or business logic, which in turn can be obtained and manipulated by client and server applications. XML Web services enable the exchange of data in client-server or server-server scenarios, using standards like HTTP and XML messaging to move data across firewalls.

These features and how you can use them are outlined as follows:

- If you have ASP development skills, the new ASP.NET programming model will seem very familiar to you. However, the ASP.NET object model has changed significantly from ASP, making it more structured and object-oriented. Unfortunately this means that ASP.NET is not fully backward compatible; almost all existing ASP pages will have to be modified to some extent in order to run under ASP.NET.
- Accessing databases from ASP.NET applications is an often-used technique for displaying data to Web site visitors. ASP.NET makes it easier than ever to access databases for this purpose. It also allows you to manage the database from your code.
- file or in a compiled class deployed as an assembly. This logic can include application-level events.
- ASP.NET provides easy-to-use application and session-state facilities that are familiar to ASP developers and are readily compatible with all other .NET Framework APIs.

- For advanced developers who want to use APIs as powerful as the ISAPI programming interfaces that were included with previous versions of ASP, ASP.NET offers the HttpHandler and HttpModule interfaces. Implementing the HttpHandler interface gives you a means of interacting with the low-level request and response services of the IIS Web server and provides functionality much like ISAPI extensions, but with a simpler programming model.
- ASP.NET takes advantage of performance enhancements found in the .NET Framework and common language runtime. Additionally,
- it has been designed to offer significant performance improvements over ASP and other Web development platforms. All ASP.NET code is compiled, rather than interpreted, which allows early binding,
- Session module, for instance) that are not relevant to the application they are developing. ASP.NET also provides extensive caching services (both built-in services and caching APIs).
- Writing custom debug statements to your Web page can help immensely in troubleshooting your application's code. However, they can cause embarrassment if they are not removed. The problem is that removing the debug statements from your pages when your application is ready to be ported to a production server can require significant effort.
- They appear only when you have enabled tracing for a page or entire application. Enabling tracing also appends details about a request to the page, or, if you so specify, to a custom trace viewer that is stored in the root directory of your application.
- The .NET Framework and ASP.NET provide default authorization and authentication schemes for Web applications.
- ASP.NET configuration settings are stored in XML-based files, which are human readable and writable. Each of your applications can have a distinct

configuration file and you can extend the configuration scheme to suit your Requirements.

- Applications are said to be running side by side when they are installed on the same computer bust use different versions of the .NET Framework.
- IIS 6.0 uses a new process model called worker process isolation mode, which is different from the process model used in previous versions of IIS. ASP.NET uses this process model by default when running on Windows Server 2003.
- **.NET - a framework :**

It is a Framework in which Windows applications may be developed and run.

Windows provide the programmers with various functions - called API. Starting from the very first time Windows enter the commercial market to the latest version of Windows XP, APIs are the basic tool to let the Windows know what you want it to do. If you want to create a Dialog Box you must call a specific API provided to you by Windows. Making a button requires another API call. And the list goes on. As new GUIs appear on the seen, new APIs are introduced in Windows. But using these native APIs was a very challenging task. Making a simple Window that prints "Hello World" could take more than hundred lines.

Microsoft and other commercial organizations realized this and started marketing Visual Tools that made the programmer's life easy. Using Visual C++, Visual Basic, Borland's C++ and other such IDEs, it became simpler to make Windows programs.

Various vendors develop their own "Wrapper classes" that wrapped the Windows APIs in an Object-Oriented way. The Microsoft Foundation Classes (MFC) that are used in Visual C++, is an example of Wrapper classes. The MFC equivalent ofVisual Basic is VBRun; and for Visual J++ it is WFC. These Wrapper Classes, along with the Visual GUI tools made it very convenient to make windows programs. As for the difficulty of programming OLE/COM; Microsoft expanded the MFC and VBRun to take care of most of the dirty job. Although making an ActiveX application still was slightly tricky in Visual C++, but developing an ActiveX application in Visual Basic was extremely easy; and hence Visual Basic became the foremost ActiveX development media.

The Internet revolution posed new problems and challenges. C/C++ which was the tool of champions was not suited/ready for Web Development. Microsoft tried expanding MFC, and included several network oriented classes - like Socket, CASyncSocket, and several HTTP based classeshad started becoming ubiquitous. Although technologies like Remote Procedure Call (RPC) was a great help to the programmers; but it was limited in its scope. With programmers following the Object-Oriented development RPC was not much help at all; since RPC did not allow passing objects as parameters.This major issue was addressed by introduction of industry's agreed upon standards like CORBA, IIOP, RMI, DCOM etc. All these standards used customized protocol to transmit an object over the network, and they required a tight coupling between the server and the client - i.e. the client needed to be fully aware of how to talk to the server. The EJB container provided lot of services for free - all that a programmer had to do was to extend (inherit) from an appropriate EJB base class and there you have it - a fully functional distributed application. EJB made programmer's life extremely easy; but it did not eradicate the client-server coupling issue. Microsoft - after the cold

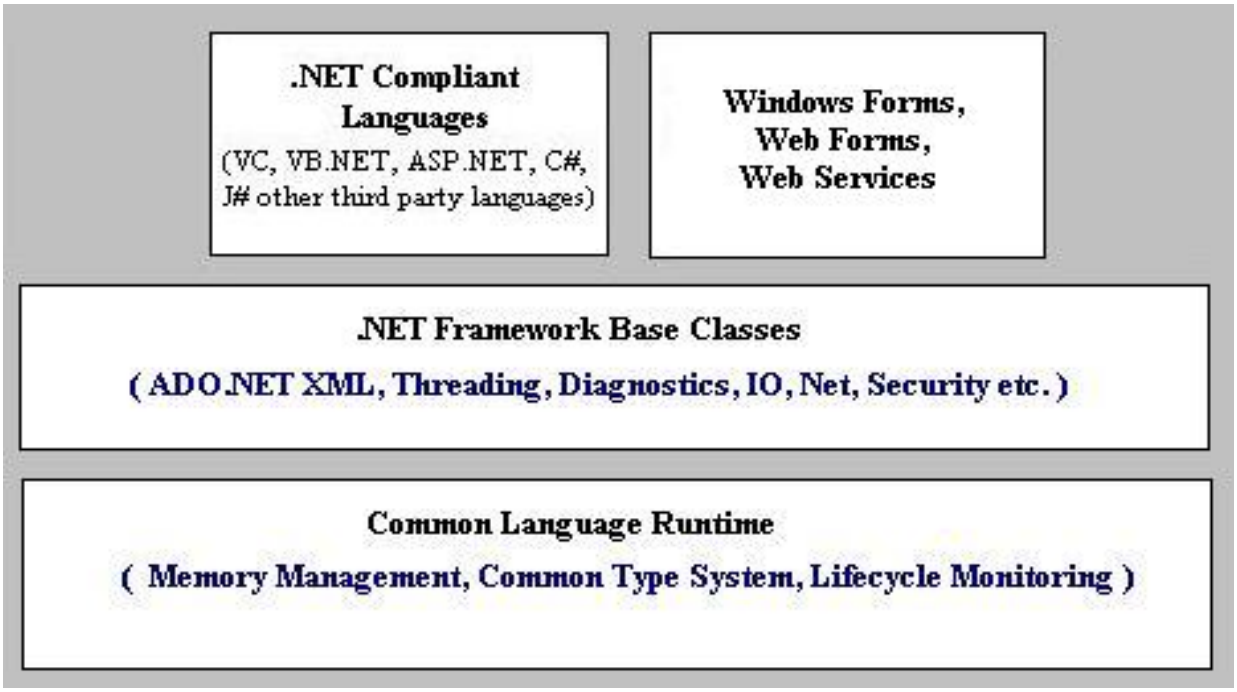
treatment faced by DNA - got their gurus together and asked them to reflect back on DNA and to come up with a future vision. This group came up with so many new and great ideas which made Microsoft realized that no amount of up gradation or extension in MFC/VBRun/WFC, COM/COM+/DCOM, ASP, APIs etc.

Major Component of .NET

The diagram given below describes the various component of .NET.

The .NET framework can only be exploited by languages that are compliant with .NET. Most of Microsoft languages have been made to fully comply with .NET.

.NET also introduces Web Forms, Web Services and Windows Forms. The reason why they



have been shown separately and not as a part of a particular language are that these technologies can be used by any .NET compliant language. For example Windows Forms is used by VC, VB.NET, and C #all as a mode of providing GUI.

The next component of .NET is the .NET Framework Base Classes. These are the common class libraries (much like Java packages) that can be used by any .NET compliant language. These classes provide the programmers with a high degree of functionality that they can use in their programs.

BACKEND: SQL SERVER 2012

SQL SERVER

Microsoft SQL Server is an application used to create computer databases for the Microsoft Windows family of server operating systems. It provides an environment used to generate databases that can be accessed from workstations, the web, or other media such as a personal digital assistant (PDA). Microsoft SQL Server is probably the most accessible and the most documented enterprise database environment right now. This also means that you can learn it a little quicker than most other database environments on the market.

PROJECT SCHEDULING

The project module is being scheduled to be developed in 3 months and the scheduling is being shown in gant chart.

A gant chart can be developed for the entire project or a separate chart can be developed for each function. A tabular form is maintained where rows indicate the tasks with milestones and column indicates duration (week\months).the horizontal bars that spans across columns indicates duration of task.

SYSTEM DESIGN

The design of an information system is the overall plan or model for that system like the blue print of a building; it consists of all the specification that gives the system its form and structure. This chapter describes the basis design components, which consist of output design, input design, database design, and form design, integration design it also includes process specification.

The most creative and challenging phase of the system life cycle is system design. It describes the final system and the process by which it is developed. It refers to the technical specifications that will be applied in implementing the system. It also includes the construction of the programs and program testing.

First step is to determine how the output is to produce and what format second; the input data and master files (database) have to be designed to meet the requirement of the proposed output. The operational phase are handled through program construction and testing, including a list of the program needed to meet the system objective and complete documentation.A final report is prepared which includes procedural flowchart, records layout, report layouts and a workable plan for implementing the proposed system

OUTPUT DESIGN

A major step in the preparation of output report in a form acceptable to the users. Computer output is the most important and direct source of information to the user. Efficient, it eligible output design should improve the system's relationship with the user and help in decision making Office Automation system is such a system in which output requirements are generally the same but sometimes in some cases dome different kinds of output are needed Normally, the following outputs are required in the form of various reports periodically that is towards the end of every month. Some output reports forms layout are given 1 the next page which are frequently asked.Input DesignFor any kind of output from the system there should be some input and processing of data. Input design is the process of converting user-oriented inputs to computer based format inaccurate input data is the most common cause of errors in data processing. Errors entered by the entry operator can be controlled by the input design.

DATABASE DESIGN

Database design is one of the most important steps in the system design phase of the system development. A good design can reduce many of the problems of the system. It reduce the redundancy and lots of anomalies and, at the same time, it enforces the
required integrates, like referential integrity etc. Specially with the relational
database management system it is easier to design database which can possibly enforce all the required securities and integrates which can lead to a secured and consistent database, A poorly designed database can create a lot of problems to the person maintaining it.After knowing all the requirements and inputs the following tables are designed to store the data in a relational fashion. Most of the tables are normalized to the extent possible but few tables are demoralized to some extend in order to reduce the query time and the number of times the database is accessed. A number of indicates are formed on the combination of keys normally used in queries.

USER INTERFACE DESIGN

or user interface engineering is the design of computers, appliances, machines, mobile communication devices, software applications, and websites with the focus on the user's experience and interaction. Unlike traditional design where the goal is to make the object or application physically attractive, the goal of user interface design is to make the user's interaction experience as simple and intuitive as possible—what is often called user-centered design. Where good graphic/industrial design is bold and eye catching, good user interface design is often subtle and invisible User Interface design is involved in a wide range of projects from mall kiosks to software applications to car navigation systems to e-commerce sites; all of these projects have some things in common yet also require some unique skills and knowledge. As a result, user interface designers tend to specialize in certain types of projects and have skills centered around their expertise, whether that be software design, web design, or industrial design. What all these projects have in common is, of course, the focus on how the user interacts with the device/system/application.

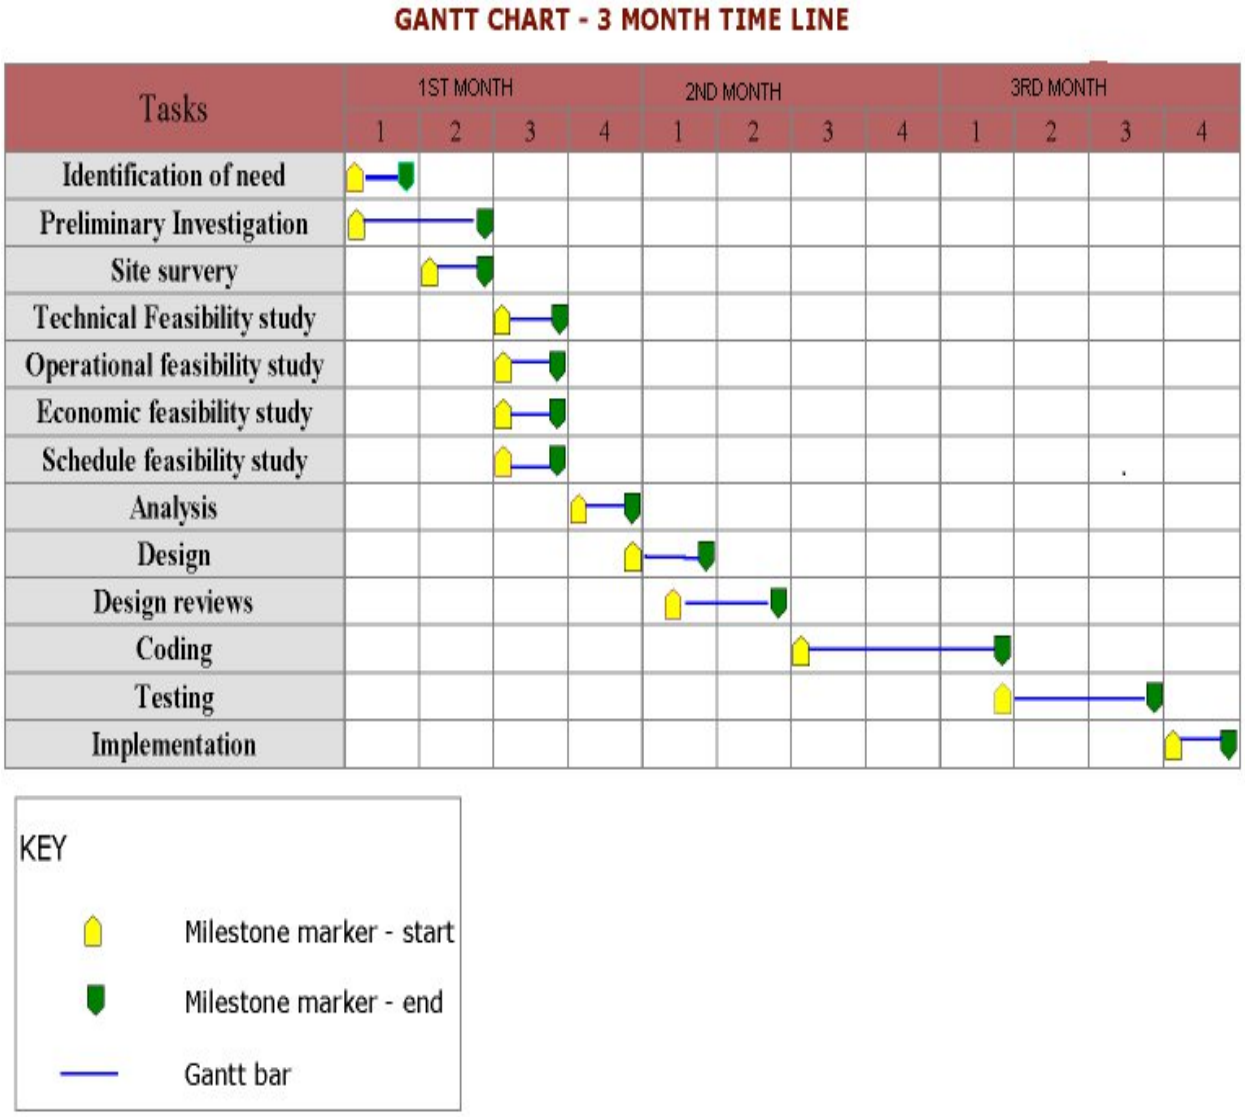
EFFICACY OF USER INTERFACE DESIGN

Many technological innovations rely upon User Interface Design to elevate their technical complexity to a usable product. Technology alone may not win user acceptance and subsequent marketability. The User Experience, or how the user experiences the end product, is the key to acceptance. And that is where User Interface Design enters the design process. While product engineers focus on the technology, usability specialists focus on the user interface. For greatest efficiency and cost effectiveness, this working relationship should be maintained from the start of a project to its rollout.

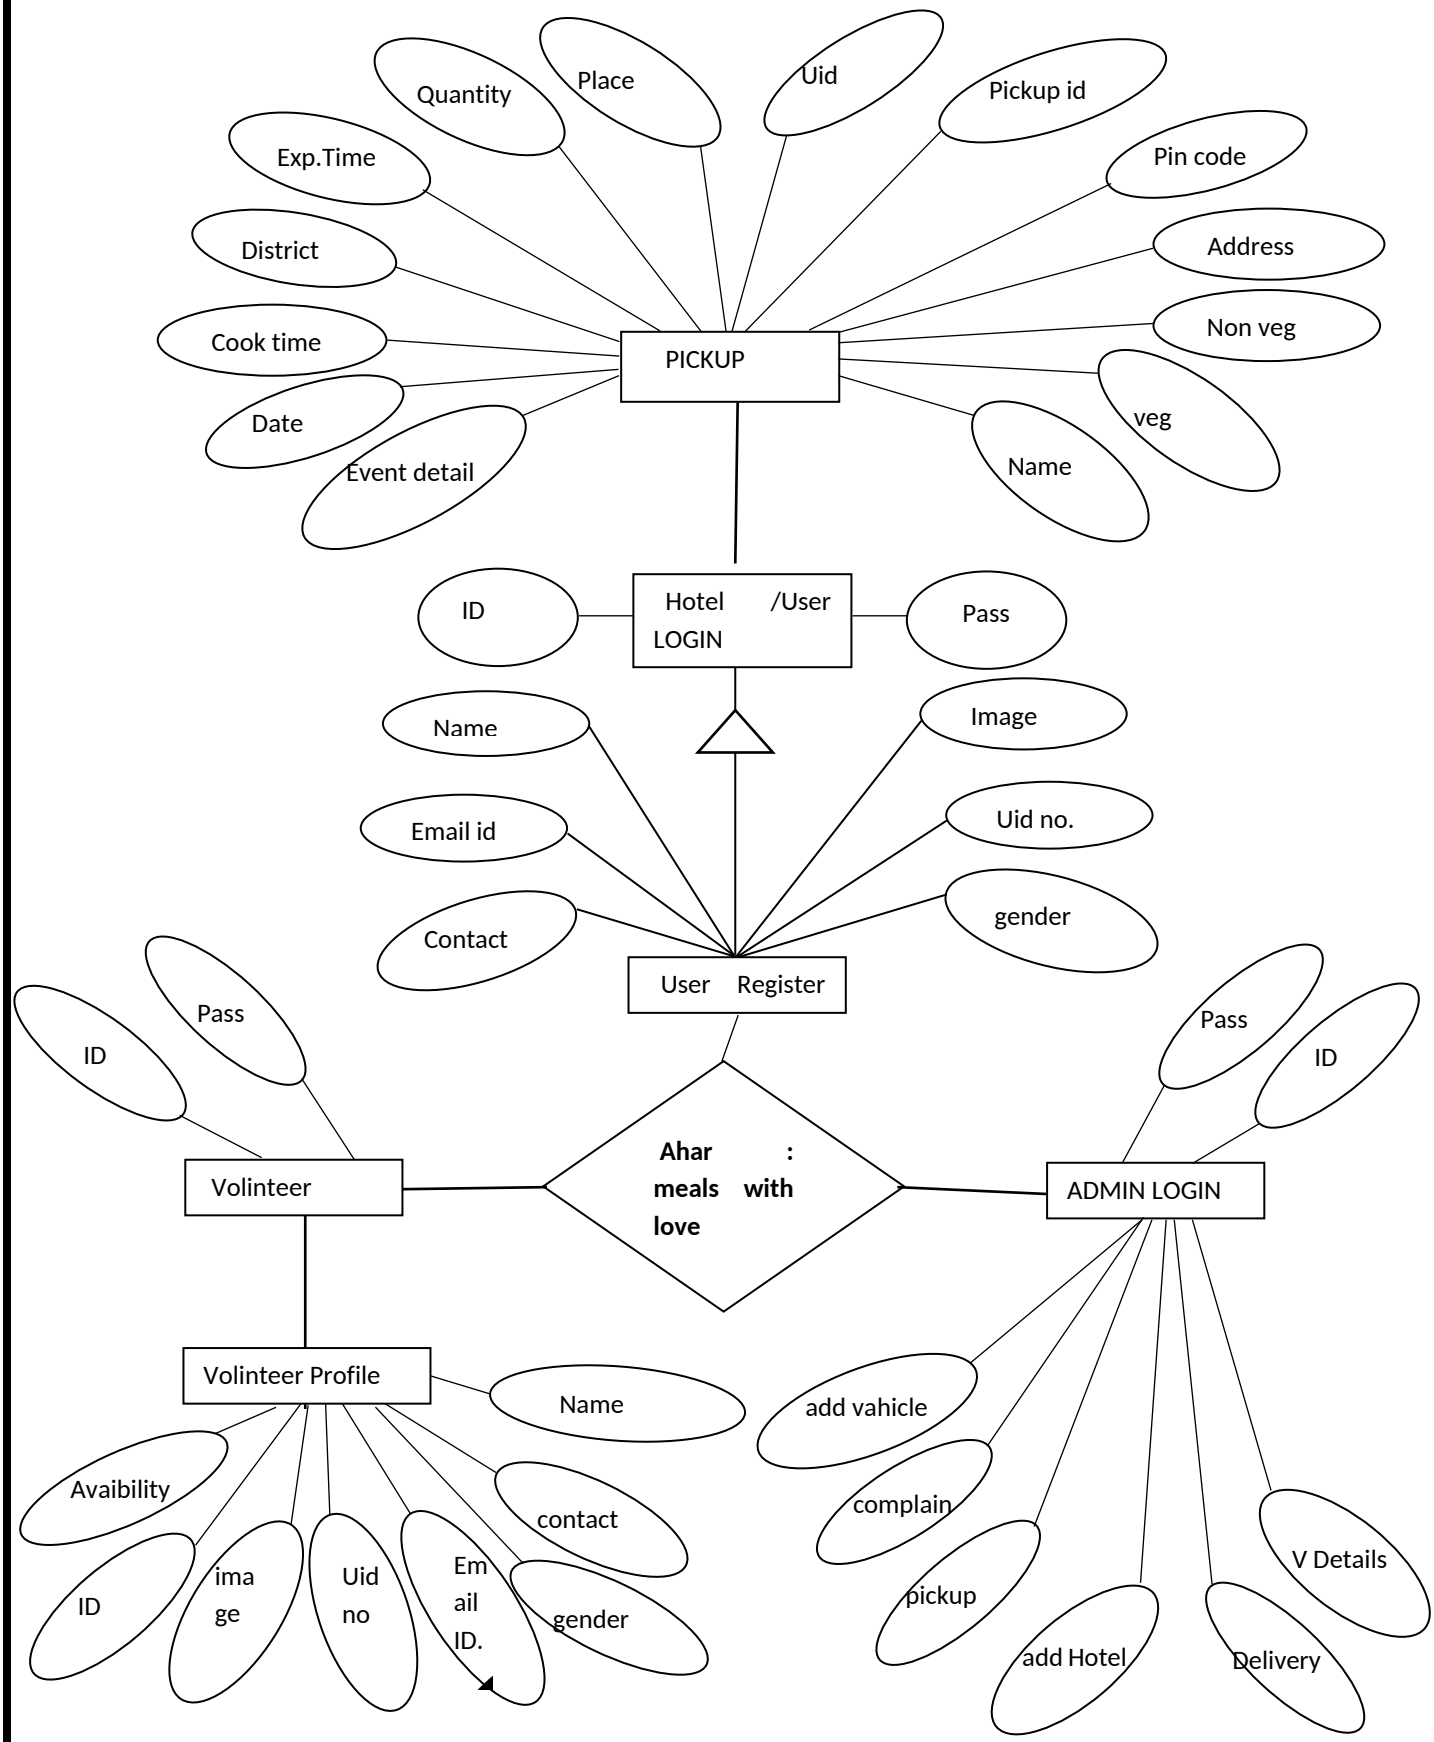
When applied to computer software, User Interface Design is also known as Human-Computer Interaction or HCI. While people often think of Interface Design in terms of computers, it also refers to many products where the user interacts with controls or displays. Military aircraft, vehicles, airports, audio equipment, and computer peripherals, are a few products that extensively apply User Interface Design.

Optimized User Interface Design requires a systematic approach to the design process. But, to ensure optimum performance, Usability Testing is required. This empirical testing permits naïve users to provide data about what does work as anticipated and what does not work. Only after the resulting repairs are made can a product be deemed to have a user optimized interface.

The importance of good User Interface Design can be the difference between product acceptance and rejection in the marketplace. If end-users feel it is not easy to learn, not easy to use, or too cumbersome, an otherwise excellent product could fail. Good User Interface Design can make a product easy to understand and use, which results in greater user acceptance.



ENTITY RELATIONSHIP DIAGRAM



DATA FLOW DIAGRAM (DFD)

LEVELS OF DFD: DEPENDING UPON THE COMPLEXITY OF DFD, THERE ARE SOME LEVELS IN IT E.G., LEVEL 0, LEVEL 1 ETC.

(i) Level 0 àIt is the simplest form of DFD. It could have one process and there will be external entities.

(ii) Level 1 à The main process is broken into small sub-processes and number of entity-set and data store is also increased & so on goes the level of DFD.

id	Int(10)	PRIMARY KEY
Vehicle_no	VARCHAR (Max)	NOT NULL
F_name	VARCHAR (Max)	NOT NULL
Uid_no	VARCHAR (Max)	NOT NULL
Contact	VARCHAR (Max)	NOT NULL
Email	VARCHAR (Max)	NOT NULL

MODULES DESCRIPTION

MODULES

1. User

- Can register himself
- Can Login
- Can send food pickup request
- Can donate money
- Select Required Mode of Payment
  - Cheque Payment
  - Card Payment
- Made required queries and give feedback.
- Can see his donation details
- Can Update profile ..
- Can change is password.

2. ADMINISTRATOR

- View Registration REPORT.
- View Donation Report.
- View Volunteer Report..
- View queries done by User.
- Add Ahar Spots
- Add Vehicle Details
- Pickup Food
- Deliver Food
- Operation on Complain

Register Customer:

This module allows the new user's to register himself as a Customer's of the site. After registering himself the user as a customer use his **Email id** as **User id** and **Phone number** as **Password.**

Login Customer:

This module allow Customer's to login and then proceed to sell and buy share using the required mode of payment

Logout Customer:

This module allows us to logout from his personnel account.

To Send Pickup Request:

This module allow user to send food pickup request using this module.

Donation:

This Donation module allow user to donate using this module.

Mode of Payment:

This module of Mode of Payment allows user to select the Bank name, location and then let them to choose the required mode of payment like Cheque Payment and Card Payment in two separate modules.

Mode of payment (Cheque-Payment):

This module allows those users to do share trading who does not have credit card, for payment. Those users can simply choose cheque mode of payment and by filling the required data, they can made their required payment too.

Mode of Payment (Card Payment)

This is the second module designed under module of mode of payment. This module provides various card options to complete the transaction, in case we purchase the share.

Admin Login

This is the module which is designed for the administrator use. The admin can login and can view the updates of his site.

View Registration report

This module shows the admin the details of all the registered user of the site .

View Volunteer report

This module shows the admin the details of all the volunteer REPORT of shares by different customer on respective dates.

View Donation report

This module shows the admin the details of all the donation.

View Mode of Payment report

This module designed in different fashion it can show the Bank name and Location of the customer. It include link for:

- Card payment and

View report of Card Payment

This module is designed, so that the admin can view the details of customer's who did card payment.

View report of Cheque Payment

This module is designed, so that the admin can view the details of Customer's who made cheque payment.

View report of Queries made by user's feedback

This module is designed, so that the admin can view the Queries and feedback of customer and response accordingly.

Password Recovery Module

This module is designed for those customers who forgot their password, using this module customer can sent a mail to admin regarding the problem of forgot password, and admin can sent a new password or his old password as soon as possible.

SECURITY AND VALIDATION CHECK

INTRODUCTION:

Security is critical in system development. The analyst has a responsibility to design a workable security system to protect the system from damage, error, and unauthorized access. The level of protection depends on the sensitivity of the data, the reliability of the user, and the complexity of the system. A well-designed system includes control procedures to provide physical protection, maintain data integrity, and restrict system access.Tight system security can be costly, but appropriate security is justified compared to the catastrophe that could result no protective measure. There are three motives behind security.

1. The near-total dependence of organization on computer based information makes it imperative that a system can be protected on the regular basis.

2. Data are a major asset and should be protected. In a data base environment where computer files are centralized, security becomes critical.
3. Demonstrating effective security measure reinforce management supporter for designing and implementing candidate systems.

In discussing system security, we need to explore the major threats to systems, the types of failures and physical protection of the database and appropriate control measures. First we define key terms

Security relies on the following elements:

Authentication:

Authentication addresses the question: who are you? It is the process of uniquely identifying the clients of our applications and services. These might be end users, other services, processes, or computers. In security parlance, authenticated clients are referred to as principals.

Authorization:

Authorization addresses the question: what can you do? It is the process that governs the resources and operations that the authenticated client is permitted to access. Resources include files, databases, tables, rows, and so on, together with system-level resources such as registry keys and configuration data. Operations include performing transactions such as purchasing a product, transferring money from one account to another, or increasing a customer's credit rating.

Auditing:

Effective auditing and logging is the key to non-repudiation. Non-repudiation guarantees that a user cannot deny performing an operation or initiating a transaction..

Confidentiality:

Confidentiality, also referred to as privacy, is the process of making sure that data remains private and confidential, and that it cannot be viewed by unauthorized users or eavesdroppers who monitor the flow of traffic across a network. Encryption is frequently

used to enforce confidentiality. Access control lists (ACLs) are another means of enforcing confidentiality.

Integrity:

Integrity is the guarantee that data is protected from accidental or deliberate (malicious) modification. Like privacy, integrity is a key concern, particularly for data passed across networks. Integrity for data in transit is typically provided by using hashing techniques and message authentication codes.

Availability:

From a security perspective, availability means that systems remain available for legitimate users. The goal for many attackers with denial of service (DoS) attacks is to crash an application or to make sure that the application is sufficiently overwhelmed so that other users cannot access it.

Data privacy and security are issues that go beyond the scope of system development. They are actually a societal concern. An organization that depends heavily on the use of databases requires special control to maintain viable information. These are classified into three general categories:

1. Physical security or protection from fire, flood, and other physical damage.
2. Data base integrity through data validation techniques.
3. Control measures through passwords, encryption, and monitoring users on a regular basis.

DATABASE SECURITY

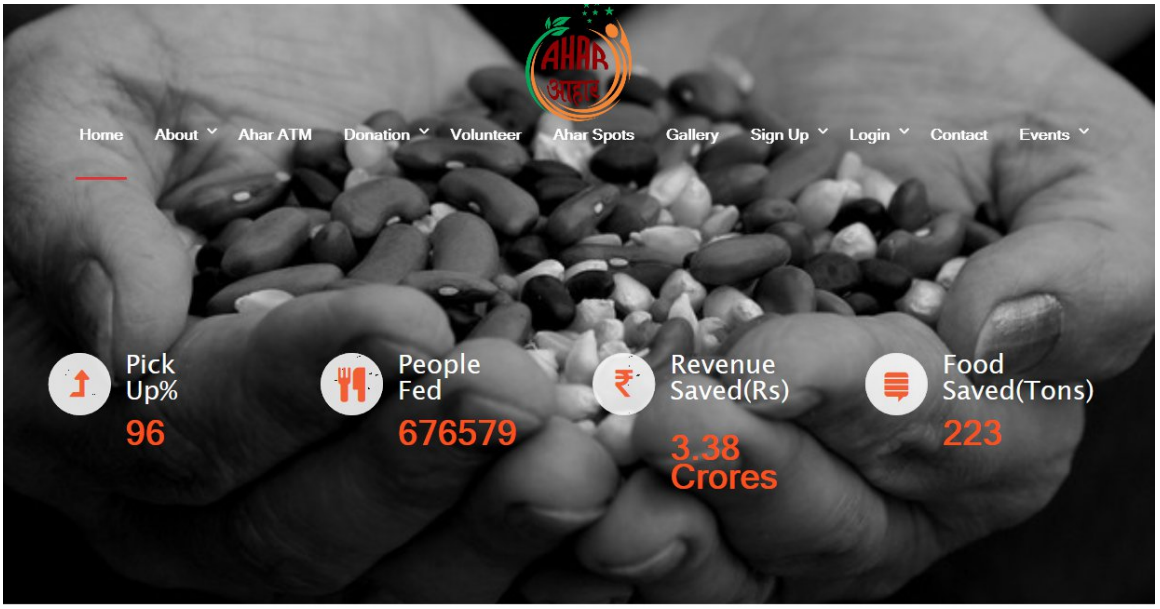
For the Database Security this project is meant on a Different user and password So without permission no one can access the data of this data base it is very useful in data base security.

SCOPE OF THE PROJECT

I have made this project very well but there is also scope to improve this project. There is no end for scope of anything if we have money and time we can make improve any system at any level. In this system at present SQL SERVER 2005andASP.net is used, when data is to much then higher version of oracle and JAVA may be used to add extra feature to the project.

The main goal of the application is to maintain the records of College, This software is helpful to the colleges to maintain the student and employee management.In welcome interface, it includes just progressing, intimates that the administrator is getting in the management program. In login interface, we provide authorization to the user getting in. The multiple document interfaces, provides base screen for all management program actions present in the management program.

SCREENSHORT



We serve an average of 900 people everyday !!

How it Works

Call us on +91 80923 08696 ahar.in@gmail.com

1.Call Us or Send pickup request

Call 80923 08696 for a pickup of excess food serving minimum of 50 people. For less than 50 please drop it at our collection points/local facility centre.

2. Quality Check

Once our staffs/volunteers reach the pickup point, food quality will be checked and transferred into dedicated vessels.

3. Locate Ahar Spot

The food recovery vehicle reaches the Ahar spots such as nearby to the pickup point for food distribution.

4. Deliver Food

The food is then distributed to the needy and hungry in the hunger spot.

Ahar: Meals with Love – Daily Activities

AHAR ATM

Call us on +91 80923 08696 ahar.in@gmail.com

AHAR ATM

AHAR ATM is an innovative solution to feed the needy. It is a street walk fridge installed in restaurants in which the restaurant and nearby food shops can keep their excess foods.

How is it used?

The needy people can avail the stored excess food.

How it sustains?

Any willing person can donate to refill the ATM to visit our main office or they can "Share their Birthday/Wedding day or special days" with the needy by donating food/eatables to the ATM .

How much does it cost?

The cost of the fridge varies with its size and configuration. The following are some models which are frequently adopted for the project,

S.No	Fridge capacity	Dimension (inches) (W*D*H)	Estimated Cost (Rs.)
1	110 litres	20*23*34	18000.00
2	320 litres	23*23*67	25000.00
3	400 litres	26*22*78.5	35000.00

About Us

Ahar is a mission to end food waste and hunger to make the "World Hunger Free". We recover surplus food from weddings, parties and functions and donate it to needy and hungry people.

Volunteer

Call us on +91 80923 08696 ahar.in@gmail.com

Join hands with us in filling more empty plates and stomachs!!

Together we can make the "World Hunger-Free" soon.

Ahar is developing innovative strategies and technology to connect individuals and businesses with excess edible food to feed communities in need, instantly. Want to join us in ending hunger and food waste?

We would love to have you! We're actively looking for volunteer drivers, developers, and fundraisers, but if you have other ideas as to how you might help, tell us about your skills and interests, and we will match you up with an opportunity to make a difference.

Your insight and assistance will be tremendously valuable assets to our team as we continue to challenge the structural causes of hunger, malnourishment, and food waste.

We are a young bunch, with the passion, energy, and talent to make hunger a thing of the past. We hope you will join our efforts.

What you can do?

Lend your hands in food collection and distribution to feed the needy.

Join with us in "Food Waste" awareness sessions in schools, colleges and educational institutions.

Take part in our community awareness events and programmes.

Help us in developing more innovative solutions for reducing food waste and hunger.

Support us in raising funds for the expenses.

Stand with us in creating new concepts, technologies and strategies to sensitize the younger generation about importance of food.

Start a Ahar chapter in your locality to eradicate hunger in your area.

Help us in reaching more like minded persons to take this social drive to greater heights.

Terms and Conditions

Call us on +91 80923 08696 ahar.in@gmail.com

Terms and conditions

Please read these Terms of Use/Terms and Conditions carefully before using www.ahar.in (the 'website or the 'Site'), owned by parent company SPICE FOUNDATION and its affiliated companies or entities (combined called as the 'company'). This agreement sets forth the legally binding terms and conditions for your use of the website. By using the service/services in any manner, including, but not limited to, visiting or browsing the site or contributing content, information, or other materials or services to the site, you agree to be bound by this agreement.

These terms and conditions apply in addition to any other terms and conditions that the Company or its affiliated organizations may ask you to sign at the time of making the contribution. The Company may ask you to sign specific terms and conditions at different point of activities on the website.

Summary of Service

Ahar is a food recovery network, where we collect excess or untouched food from parties and distribute it to the hungry people in the city. We also collect excess food from hotels and some food joints. www.ahar.in is an online platform where donation is requested by no food waste for the running cost, the contributors can donate funds. Through the Site, email, websites, and other media, the Company makes accessible various content, including, but not limited to, videos, photographs, images, artwork, graphics, audio clips, comments, data, text, software, scripts, projects, other material and information, and associated trademarks and copyright-able works (collectively, "Content"). Contributors or funders, and other visitors (collectively, "Users") may have the ability to contribute fund. By funding or contributing fundraising campaign on ahar, you as the funder/contributor accept that offer and the contract between ahar and the funder/contributor.

Acceptance of Terms

The Service is offered subject to acceptance of all of the terms and conditions contained in these Terms of Use, including the Privacy Policy (that can be found on the website) mentioned in this document and all other operating rules, policies, and procedures that may be published on the Site, which are incorporated by reference and may be updated by the Site without notice to you. In addition, some Services offered through the Site may be subject to additional terms and conditions adopted by the Company. Your use of those services is subject to those additional terms and conditions, which are incorporated into these Terms of Use by this reference. The Services of the Site is available only to individuals who need their funds transferred to an Indian bank account. The Company may, in its sole discretion, refuse to offer the Site's services to any person or entity and change its eligibility criteria at any time. This provision is void where prohibited by law and the right to access the Site's services is revoked in those jurisdictions.

Modification of Terms of Use

The Company reserves the right, at its sole discretion, to modify or replace these Terms of Use, or change, suspend, or discontinue the Site and its services (including, but not limited to, the availability of any feature, database, or Content) at any time for any reason. The Company may also impose limits on certain features and services or restrict your access to parts or all of the website without notice or liability. It is your responsibility to check the Terms of Use periodically for changes. Your continued use of the website following the posting of any changes to the Terms of Use constitutes acceptance of those changes.

Refund and Cancellation Policy

Call us on +91 80923 08696 ahar.in@gmail.com

Refund Policy

Ahar does not offer refunds.

At the time of donation, Ahar clearly states that all donations are final.

All fees and charges are non-refundable and there are no refunds or credits for partially used periods.

In case of genuine or valid reason for refund, donors can contact Ahar using contact form or email and If Ahar finds the reason as valid, refund will be done within 15 working days

Ahar offers a message system as a tool for a donor to communicate and talk about any problems and resolve issues.

We also offer funders to share about no food waste donation campaign in social media and other networks so donors have other ways to contact no food waste.

Cancellation Policy

Cancellation will be made only if the donation committee finds the reason is genuine

The cancellation request must be made within 2 working days of donation.

For cancellation of donations, the donor should email us at ahar.in@gmail.com. An email confirmation is sent within 2 working days to the requested mail ID saying if the cancellation request can be processed or not.

About Us

Ahar is a mission to end food waste and hunger to make the "World Hunger Free". We recover surplus food from weddings, parties and functions and donate it to needy and hungry people.

Dedicated Food Recovery Units including Helpline Number, Food Recovery Vehicles, Vessels and Volunteers are involved for effective process execution.

Hours Of Operation

ALL DAYS: 9:00am to 10:00pm

Please submit request through call or registered as user for food donation

Phone: 80923 08696

<h4 style="font-family: sans-serif;font-weight: 700;">About Us</h4>

Ahar is a mission to end food waste and hunger to make the “World Hunger Free”. We recover surplus food from weddings, parties and functions and donate it to needy and hungry people.

Dedicated Food Recovery Units including Helpline Number, Food Recovery Vehicles, Vessels and Volunteers are involved for effective process execution.

 <h4 style="font-family: sans-serif;font-weight: 700;">

Hours Of Operation</h4>

ALL DAYS: 9:00am to 10:00pm

Please submit request through call or registered as user for food donation

Phone: 80923 08696

Email: ahar.in@gmail.com

```

Disadvantages

- Required internet or data to access.
- Failure of machine or servers.
- Heavy traffic leads to failure or long time wait.

Future Work

- Expanding the project in different location around the globe .
- Keep on changing in UI – Design to make it look attractive .
- Making server more powerful.
- Expanding the databases for storing more informations
- Transforming this to the mobile application for better portability and making it more reliable.

.

CONCLUSION

This product has great future scope. Online Share Trading System is currently developed only to maintain record regarding purchasing of share, selling of share,selecting mode of payment . It can be extended to manage different types of the higher level of transation details in their Dmat accout etc.

Some more modules can be designed regarding Share Trading Projects are :

- Module for admin to add the new introduced companies in share market.
- Module for calculating all the contents of the share trading.
- Module for maintain the transaction in own dmat accout
