

VILLA RITA~CYPRUS

ELECTRICITY

Power cuts are rare but do happen for various reasons.

Should you experience a power cut, firstly check the main circuit breaker on the wall next to the downstairs toilet. If main breaker is OFF, please turn off all appliances and turn main breaker back on to isolate which appliance is causing the issue.

If all breakers are in the ON position, please go to the main supply box situated at the top of the complex – turn LEFT out of the villa, walk up to the top of the road where it bears right and on the right you will see a series of cupboards.

Open first cupboard.

Breaker box with number 20 is for the villa. Please check the BLACK button is fully depressed. It will probably have popped out as a safety action.

This is likely the issue.

If it won't depress without popping back out or there is still no power at the house, please contact Chris on 0044 7958731515.

WATER SUPPLY

The mains water supply is controlled by 3 stopcocks accessible in a small cupboard to the LEFT as you enter the driveway.

As pictured here they are all in the ON position.

The first red lever is from the MAIN supply coming FROM THE STREET.

The second controls water going INTO THE HOUSE.

The third supplies the swimming pool top-up and should be left on at all times.

Should you find the stopcocks in this arrangement, the water supply to the house will be OFF.

This may be for safety, when the house is not in use.

Should you need to turn water supply to the house ON, you may need to firstly move the red stopcock to the 9 o'clock position to enable the middle stopcock to move down into the 6 o'clock (ON) position. Remember to return the red stopcock to its original position!
