

6. Bond Valuation

- ① Coupon Interest will always be calculated on face value.
- ② Coupon rate is not return for investor because coupon % is calculated on face value but return % is calculated on market price.
- ③ Price of bond = Present value of inflow receivable
- ④ Types of Bond
 - (a) Perpetual Bond → In this bond, investors receive equal interest at the end of each year till indefinite period. No redeemable value received by investors.
 - (b) Amortisable Bond → Company pays redeemable value equally each year over the life of bond.
 - (c) Callable Bond → If bond contains call feature then company can redeem the bond before its maturity.

$$\textcircled{5} \text{ Current Yield} = \frac{\text{Interest over next 1 yrs period}}{\text{Current price}} \times 100$$

$\textcircled{6}$ Holding period return = Return to an investor from purchase date to sale date is known as holding period return.

$$\frac{\text{Inflow} - \text{outflow}}{\text{outflow}} \times 100$$

$$\textcircled{7} \text{ Average YTM (Average yield to maturity)} = \frac{\left[\text{Annual Interest net of taxes} + \left(\frac{RV - NP}{\text{Life}} \right) \right]}{\left(\frac{RV + NP}{2} \right)} \times 100$$

RV = Redemption Value

NP = Net Proceeds

$\textcircled{8}$ (a) Revised return $>$ YTM $\rightarrow$ overvalued Bond

(b) Revised return $<$ YTM $\rightarrow$ undervalued Bond

$\textcircled{9}$ Indifference between taxable bond and tax free bond.

yield from taxable bond = yield from tax free bond.

⑩ Convertible bonds

These bonds can be converted into pre-determined number of equity shares at the option of investor.

$$(a) \text{ Conversion value} = \frac{\text{No of equity share per bond}}{\text{share per bond}} \times \text{Price per share}$$

$$(b) \text{ Conversion premium } (\%) = \frac{B_0 - CV_0}{CV_0} \times 100$$

(c) Floor value (also known as straight value of bond)

$$\left[\frac{\text{Annual Interest}}{\text{Interest}} \times \text{PVIFA}(RR, n) \right] + \left[\frac{\text{Redemption value}}{\text{value}} \times \text{PVIF}(RR, n) \right]$$

(d) % of downside risk

$$\frac{B_0 - \text{Floor value}}{B_0} \times 100$$

(e) Conversion parity price of share

At parity,

$$\text{Price of bond} = \text{Value of share}$$

$$(6) \quad \frac{\text{Total Favourable Income difference}}{\downarrow}$$

$$\text{Coupon Interest} - \text{Dividend on share}$$

$$(9) \quad \frac{\text{Premium}}{\downarrow} \quad \frac{\text{payback period}}{\downarrow}$$

$$\frac{\text{Total Conversion premium}}{\text{Annual Favourable Income difference}}$$

$$(11) \quad \text{Dirty price} = \text{Clean price} + \text{Accrued Interest}$$

$$(12) \quad \text{If price of bond \& redeemable value is equal to face value then Coupon rate will be equal to YTM.}$$
