

## Task 1

- 1) A new social media app launches with 500 users. If the number of users grows at a rate of 12% per month, how many users will there be after 18 months?
- 2) A farmer has a population of 200 rabbits. The population decreases by 5% per month due to predators. How many rabbits will there be after 2 years?
- 3) An investment account starts with £1,200. The balance increases by 4% per year. How much will be in the account after 2 years?
- 4) A car's value is £28,000 when new. The value depreciates by 18% each year. What will be its value after 6 years?
- 5) A country's population is currently 2 million and grows by 1.6% annually. How long will it take for the population to reach 3 million?
- 6) A rare plant population in a nature reserve is 1,000. Due to climate change, its population decreases at a rate of 7% per year. How many years will it take until the population falls below 500?
- 7) A music streaming service currently has 60 million subscribers. If it grows by 2.5% per quarter, how many subscribers will it have after 5 years?
- 8) The number of active volcanoes in a region is decreasing at 4% per decade. If there are currently 45 volcanoes, how many will there be in 100 years?

- 9) A stock worth £120 grows by 1.5% per week. How many weeks will it take for the stock to double in value?

- 10) A scientist is studying bacteria that doubles in quantity every 5 hours. If there are 80 bacteria at the start, how many will there be after 1 day?

## Task 2

- 11) The function  $P(t) = 200 \times 1.05^t$  models a town's population (in thousands) after  $t$  years.
  - a. What is the initial population of the town?
  - b. What is the growth rate as a Percentage?
  - c. Estimate the town's population after 15 years.
- 12) The function  $V(t) = 30,000 \times (0.88)^t$  represents the value of a car after  $t$  years.
  - a. What does  $V(0)$  represent?
  - b. After 5 years, what is the value of the car?
  - c. What percentage does the car depreciate each year?
- 13) The graph of  $y = ab^x$  passes through the points (0, 12) and (3, 96).  
Work out the values of  $a$  and  $b$ .
- 14) The graph of  $y = ab^x$  passes through the points (0, 6) and (4, 1536).  
Work out the values of  $a$  and  $b$ .
- 15) The graph of  $y = ab^x$  passes through the points (0, 8), (2, 18), and (5,  $p$ ).  
Work out the value of  $p$ .
- 16) The graph of  $y = ab^x$  passes through the points (0, 7), (2, 63), and ( $p$ , 5103).  
Work out the value of  $p$ .

### Challenge

- 17) A population of rare birds is modelled by  $y = ab^x$ , where  $y$  is the number of birds and  $x$  is the number of years since the study began.

The population is 240 when  $x = 2$  and 1920 when  $x = 5$ .

Work out the values of  $a$  and  $b$

- 18) The value of a vintage car is modelled by  $y = ab^x$  where  $y$  is the value in pounds and  $x$  is the number of years after 2010.

The car was worth £12,000 in 2012 and £16,200 in 2014.

Work out the value of  $a$  to the nearest thousand and the value of  $b$  to 3 decimal places. Then, interpret what they mean in this context.
