**QUALITY UNCOMPROMISED**

[www.nikavi.in](http://www.nikavi.in)

# Company Profile

NIKAVI is a worldwide provider of the highest quality car accessories, car care chemicals, car wash accessories, motorcycle parts , motorcycle accessories ,. NIKAVI has established a worldwide name in the motorcycle accessories, motorcycle parts, car care, car wash, detailing, and car care industry. Our teams combined experience has gained us a better understanding of the industries desires and helped us tremendously in gaining a solid insight into our customer's needs.

NIKAVI was founded with a goal of providing the community, businesses, business professionals, clients, auto enthusiasts and friends with the highest quality car and moto accessories at good price. Throughout the years, we have remained dedicated to providing our patrons uniquely efficacious car and moto accessories products, accessories and knowledge. Each of us at NIKAVI is committed to serving our customers and communities alike through the highest service standards.

NIKAVI is proud to be the leading choice worldwide for many OEMs, factories, dealerships, detailing facilities, body shops and car wash. NIKAVI Family grows larger in size and greater in knowledge. By combining our ever extensive ability in manufacturing, development and innovation with a passion for knowledge,

# DISC BRAKE PADS

Brake pads convert the kinetic energy of the vehicle to thermal energy through friction. Two brake pads are contained in the brake with their friction surfaces facing the rotor. When the brakes are hydraulically applied, the caliper clamps or squeezes the two pads together onto the spinning rotor to slow and stop the vehicle. When a brake pad heats up due to contact with the rotor, it transfers small amounts of its friction material onto the disc, leaving a dull grey coating on it. The brake pad and disc (both now having the friction material), then "stick" to each other, providing the friction that stops the vehicle.

A disc brake is a type of brake that uses calipers to squeeze pairs of pads against a disc or "rotor" to create friction. This action slows the rotation of a shaft, such as a vehicle axle, either to reduce its rotational speed or to hold it stationary.

The energy of motion is converted into waste heat which must be dispersed. Hydraulically actuated disc brakes are the most commonly used form of brake for motor vehicles, but the principles of a disc brake are applicable to almost any rotating shaft.

A Bendix drive is a type of engagement mechanism used in starter motors of internal combustion engines. The device allows the pinion gear of the starter motor to engage or disengage the flywheel of the engine automatically when the starter is powered or when the engine fires, respectively.

Aerosol spray is a type of dispensing system which creates an aerosol mist of liquid particles. It is used with a can or bottle that contains a payload and propellant under pressure. When the container's valve is opened, the payload is forced out of a small hole and emerges as an aerosol or mist. As propellant expands to drive out the payload, only some propellant evaporates inside the can to maintain a constant pressure. Outside the can, the droplets of propellant evaporate rapidly, leaving the payload suspended as very fine particles or droplets.

A horn is a sound-making device that can be equipped to motor vehicles, buses, bicycles, trains, trams and other types of vehicles. The sound made usually resembles a "honk" (older vehicles) or a "beep" (modern vehicles). The vehicle operator uses the horn to warn others of the vehicle's approach or presence, or to call attention to some hazard.

A self-starter or starter motor is a device used to rotate (crank) an internal-combustion engine so as to initiate the engine's operation under its own power. Starters can be electric, pneumatic, or hydraulic. In the case of very large engines, the starter can even be another internal-combustion engine.

A One Way Gear is a rotating machine part having cut teeth, or in the case of a cogwheel, inserted teeth (called cogs), which mesh with another toothed part to transmit torque. Geared devices can change the speed, torque, and direction of a power source. Gears almost always produce a change in torque.

A ball bearing is a type of rolling-element bearing that uses balls to maintain the separation between the bearing races. The purpose of a ball bearing is to reduce rotational friction and support radial and axial loads. It achieves this by using at least three races to contain the balls and transmit the loads through the balls. In most applications, one race is stationary and the other is attached to the rotating assembly (e.g., a hub or shaft). As one of the bearing races rotates it causes the balls to rotate as well. Because the balls are rolling they have a much lower coefficient of friction than if two flat surfaces were sliding against each other.

In internal combustion engines with pistones, the camshaft is used to operate poppet valves. It consists of a cylindrical rod running the length of the cylinder bank with a number of lobes, one for each valve. The cam lobes force the valves open by pressing on the valve, or on some intermediate mechanism, as they rotate.

A spark plug is a device for delivering electric current from an ignition system to the combustion chamber of a spark plug-ignition engine to ignite the compressed fuel/air mixture by an electric spark , while containing combustion pressure within the engine, A spark plug has a metal threaded shell, electrically isolated from a central electrode by a porcelain insulation. The central electrode, which may contain a resistor, is connected by a heavily insulated wire to the output terminal of an ignition coil or magneto.

Master Cylinder As piston(s) move along the bore of the master cylinder , this movement is transferred through the hydraulic fluid , to result in a movement of the slave cylinder(s) . The hydraulic pressure created by moving a piston ( inside the bore of the master cylinder) toward the slave cylinder(s) compresses the fluid evenly.

# FRONT MASTER CYLINDER LEVER

24

Master Cylinder Lever Assly, also called linked braking system (LBS), is a system for linking front and rear brakes on a motorcycle or scooter. In this system, the rider's action of depressing one of the brake levers applies both front and rear brakes. The amount of each brake applied may be determined by a proportional control valve. This is distinct from integrated brakes, where applying pressure to the rear brake pedal only applies some braking force to the front brake.

The carburetor is probably the most misunderstood mechanical part on a motorcycle and many small engine machines. All engines require a proper mixture of air and fuel for combustion; the strange device known as the carburetor controls the ratio of the fuel/air mixture entering the engine.

A starter relay acts as an electrical circuit completer or circuit breaker in between the vehicle's battery and the starter motor. It helps to boost the battery's current so that not as great a current is required at ignition. The starter relay is sometimes, but not always, used in addition to a starter solenoid.

The ignition coil on a motorcycle serves to step up the relatively low battery voltage to the high voltage needed to fire a spark plug. Coils are generally a sealed, water-tight component. As such, they are generally not a repairable item. Routine checks on a coil are not necessary.

The purpose of a bike fuel pump is to convey the required quantity of fuel from the tank to the engine at the necessary pressure. A fuel pump is used to transfer fuel from the tank to the carburetor or fuel injector. A pump is required when the fuel tank is below the fuel system and the force of gravity is insufficient to get fuel to the carburetor.

**BRAKE SHOE** - The brake shoe carries the brake lining, which is riveted or glued to the shoe. When the brake is applied, the shoe moves and presses the lining against the inside of the drum. The friction between lining and drum provides the braking effort. Energy is dissipated as heat.

NIKAVI Clutch Shoe materials are bonded to the brake shoes, or in the case of clutches, to the clutch shoes. When centrifugal force comes into play, pressing the clutch shoes against the inside wall of the clutch housing, the roughness of the linings provides a good grip, preventing slippage between the shoes and the housing.

Speedo Meter HUB Drive is held toward zero by a fine torsion spring. The torque on the cup increases with the speed of rotation of the magnet. Thus an increase in the speed of the car will twist the cup and speedometer pointer against the spring. The cup and pointer will turn until the torque of the eddy currents on the cup are balanced by the opposing torque of the spring, and then stop. Given the torque on the cup is proportional to the car's speed, and the spring's deflection is proportional to the torque, the angle of the pointer is also proportional to the speed, so that equally spaced markers on the dial can be used for gaps in speed. At a given speed, the pointer will remain motionless and pointing to the appropriate number on the speedometer's dial.

A motorcycle handlebar is a tubular component of a motorcycle's steering mechanism. Handlebars provide a mounting place for controls such as brake, throttle, clutch, horn, light switches and rear view mirrors; and they help to support part of the rider's weight. Even when a handlebar is a single piece it is usually referred to in the plural as handlebars.

# HANDLE GRIP (set of 3)

41

A Handle TwistGrip - Set of 3 is a handle that can be twisted to operate a control. It is commonly found as a motorcycle's right handlebar grip to control the throttle . A great way to keep motorcycle grips from slipping and sliding on the handlebar is by using hairspray. Simply spray the inside of the grips and on the handlebar, slide the grips on when they're still wet, and they should stick after you leave them on overnight.

# CYLINDER BLOCK KITS

42

A cylinder block is the structure which contains the cylinder and pistons. In the earliest decades of internal combustion engine development, cylinders were usually cast individually, so cylinder blocks were usually produced individually for each cylinder.

Following that, engines began to combine two or three cylinders into a single cylinder block, with an engine combining several of these cylinder blocks combined together.

The brake drum itself is frequently made of cast iron, though some vehicles have used aluminum drums, particularly for front-wheel applications. Aluminum conducts heat better than cast iron, which improves heat dissipation and reduces fade.

Fork Oil Suspension Fluid is a lubricating and cooling bath for the dampers and bushings of the fork and shock to function in, the suspension fluid is the medium that is used to provide damping in a modern system. Essentially, the oil is forced through an orifice or past a spring loaded shim to creating a resistive force to the action of the shocks. Aside from other changes that effect damping, the viscosity of the oil and how the viscosity changes as the oil heats up will be large factors in the system.

Kick start is a method of starting an internal combustion engine (usually that of a motorcycle) by pushing a ratcheting lever with one's foot. Kick start mechanisms were almost universally a part of motorcycle engines .Before starting, kickstart levers are generally unfolded from the side of the motorcycle so that the rider can clear the side of the engine as it rotates. As the lever begins to descend under the riders foot, the ratchet engages a gear linked to the crankshaft causing it to spin past top dead center so that an ignition spark can ignite the compressed fuel mixture. Upon starting, the ratchet disengages and the rider folds the lever back.

The brake pedal is the pedal that you press with your foot in order to make a vehicle go slower or stop. When the driver puts his foot on the brake pedal, the system automatically applies the optimum pressure required to avoid hitting the vehicles in front.

# GEAR LEVER

50

A gear lever is the lever that you use to change gear in motorbikes. It disengages and engages the power from the engine to the rear wheel. Using your left hand to squeeze the clutch lever fully disengages the power from the engine to the rear wheel, preventing the motorcycle from moving forward regardless of how much you roll on the throttle.

A petrol tank lock is a safe container for flammable fluids.

Though any storage tank for fuel may be so called, the term is typically applied to part of an engine system in which the fuel is stored and propelled (fuel pump) or released (pressurized gas) into an engine. Fuel tanks range in size and complexity from the small plastic tank of a butane lighter to the multi-chambered cryogenic Space Shuttle external tank.

Direction-indicator lamps or turn signals, informally known as "directional signals", "directionals", "blinkers", or "indicators", are blinking lamps mounted near the left and right front and rear corners of a vehicle, and sometimes on the sides or on the side mirrors of a vehicle, activated by the driver on one side of the vehicle at a time to advertise intent to turn or change lanes towards that side. As the lamps draw more current than the heating element, the heating element has lesser current and cools, causing the leaf spring to push the bimetallic strip away and opening the circuit and this cycle keeps repeating until the turn is canceled.

A bumper is a structure attached to or integrated with the front and rear ends of a motor vehicle, to absorb impact in a minor collision, ideally minimizing repair costs. Bumpers are increasingly being designed to mitigate injury to pedestrians struck by cars, such as through the use of bumper covers made of flexible materials.

Roller weights are all set up between the variator and the ramp plate. Starting from the spinning of the scooter engine, the variator set spins. Once you open the throttle, the roller weights inside are going outward because of the centrifugal force.

Most vehicles have rubber fuel hoses connecting the fuel pipes on the chassis to the fuel pump or carburetor on the engine. Rubber hoses are flexible and can be cut to length as required, but they have a tendency to perish over time and can rub through if not properly secured.

Fork oils belong to the function fluids of motorcycles and are similar in composition to hydraulic oils.

They are also referred to as shock absorber oil.

The fork oil of ADDINOL is used for the lubrication of motorcycle forks, suspension struts, shock absorbers and other spring elements.

Using a face driver allows the machinist to turn the full length of a workpiece from end-to-end. It eliminates the tedious step of reversing and re-chucking the part to reach the end of the workpiece that was being clamped. The results are higher machining efficiency and a more precise process.

An inner clutch assembly consists of a clutch housing, a clutch hub, a clutch centre, clutch plates (friction plates and steel plates), a clutch lifter, clutch springs and bolts. The clutch assembly disengages/engages with the crankshaft of the engine to transmit power to the input shaft of the gearbox.

The capacitor discharge ignition system has a short transient response, a fast voltage rise (between 3 to 10 kV/  $\mu$ s) compared to inductive systems (300 to 500 V/  $\mu$ s), and a shorter spark duration (about 50-80  $\mu$ s). The fast voltage rising makes CDI systems unaffected to shunt resistance.

# SILENCER PLATE

74

The Silencer guard is used to protect the silencer from the mud, grime, etc. Silencer guard should be applied as a silencer coating for the vehicles.

Corrosion Protection is possible only through using products like silencer guard, etc.

Silencer guard is made of aluminum, zinc, modern resins, etc.

The fan belt is used to transfer rotational power from one place to another in the engine.

It works in a very similar way to the timing belt  
the only real difference is that it connects a different set of rotating shafts together.

Front baskets provide a convenient storage area for carrying various items while riding.

They can accommodate groceries, bags, purses, small packages, picnic essentials, and more. Weight distribution. Placing the basket on the front allows for even weight distribution on the front and rear wheels.

Drum brakes allow simple incorporation of a parking brake. Drum brakes are also occasionally fitted as the parking (and emergency) brake even when the rear wheels use disc brakes as the main brakes. Many rear disc braking systems use a parking brake in which the piston in the caliper is actuated by a cam or screw.

A bike headlight visor is a small accessory attached to the front of a bicycle or motorcycle headlight. Its primary purpose is to serve as a visor or shield for the headlight, offering several potential benefits. The Visors offered by us are very effective in protecting the headlight from damages like scratches, nicks & bangs caused by fling stones and dust particles.

These are used on off road/dirt bikes and require more frequent maintenance due to their use in dirtier conditions and the fact the foam is more porous. But foam filters are fairly simple to access, remove, clean and reinstall.
