

Mattia Ferrari Fenini

PRODUCT DESIGNER

PORT  
FOLIO

# Mattia Ferrari Fenini

I recently completed a three-year degree specialising in Product Design and Technologies.

I have an enterprising and determined personality, I can count on a strong motivation and desire to grow professionally as a Designer, contributing proactively to the achievement of individual and team goals.

I have experience in team management as a leader in the realization of a start-up, where I learned negotiating skills and strong technical vision combined with a spirit of adaptation and solid management skills.

I have experience in research and development of a product up to the actual business plan and the production and sale of the product.

In addition, I have also had presentation experiences with several professional investors.

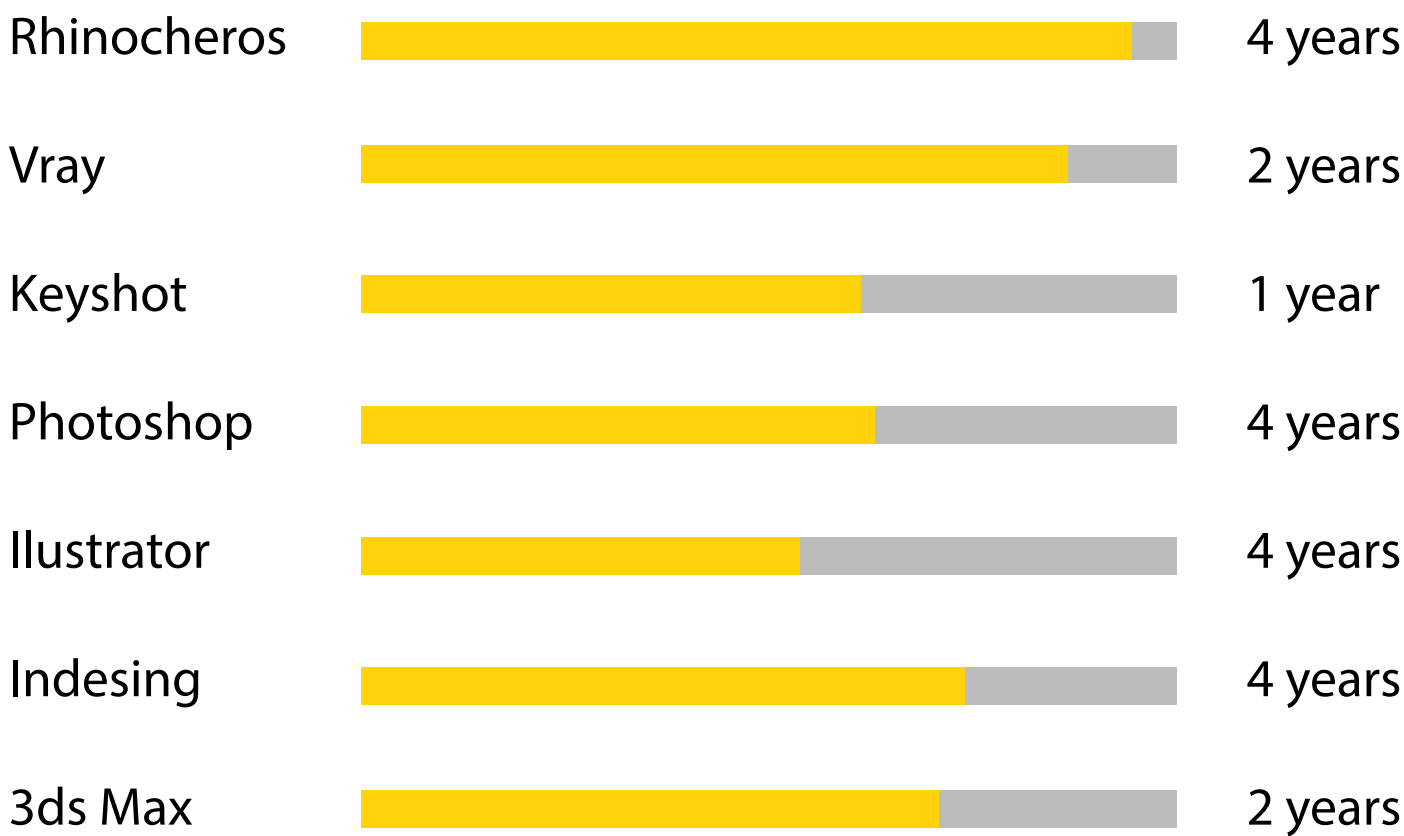

- Team working ability

Group organization

Good in free speeches
- Technical drawing and 3d modelling

Technical knowledge of components

Hand craft and 3d printing prototyping

# Project 01

## Cantilever Cork

Completely made out of renewable material Easy to manufacture, easy to transport, easy to assemble ...

With all the comforts of a cantilever chair.

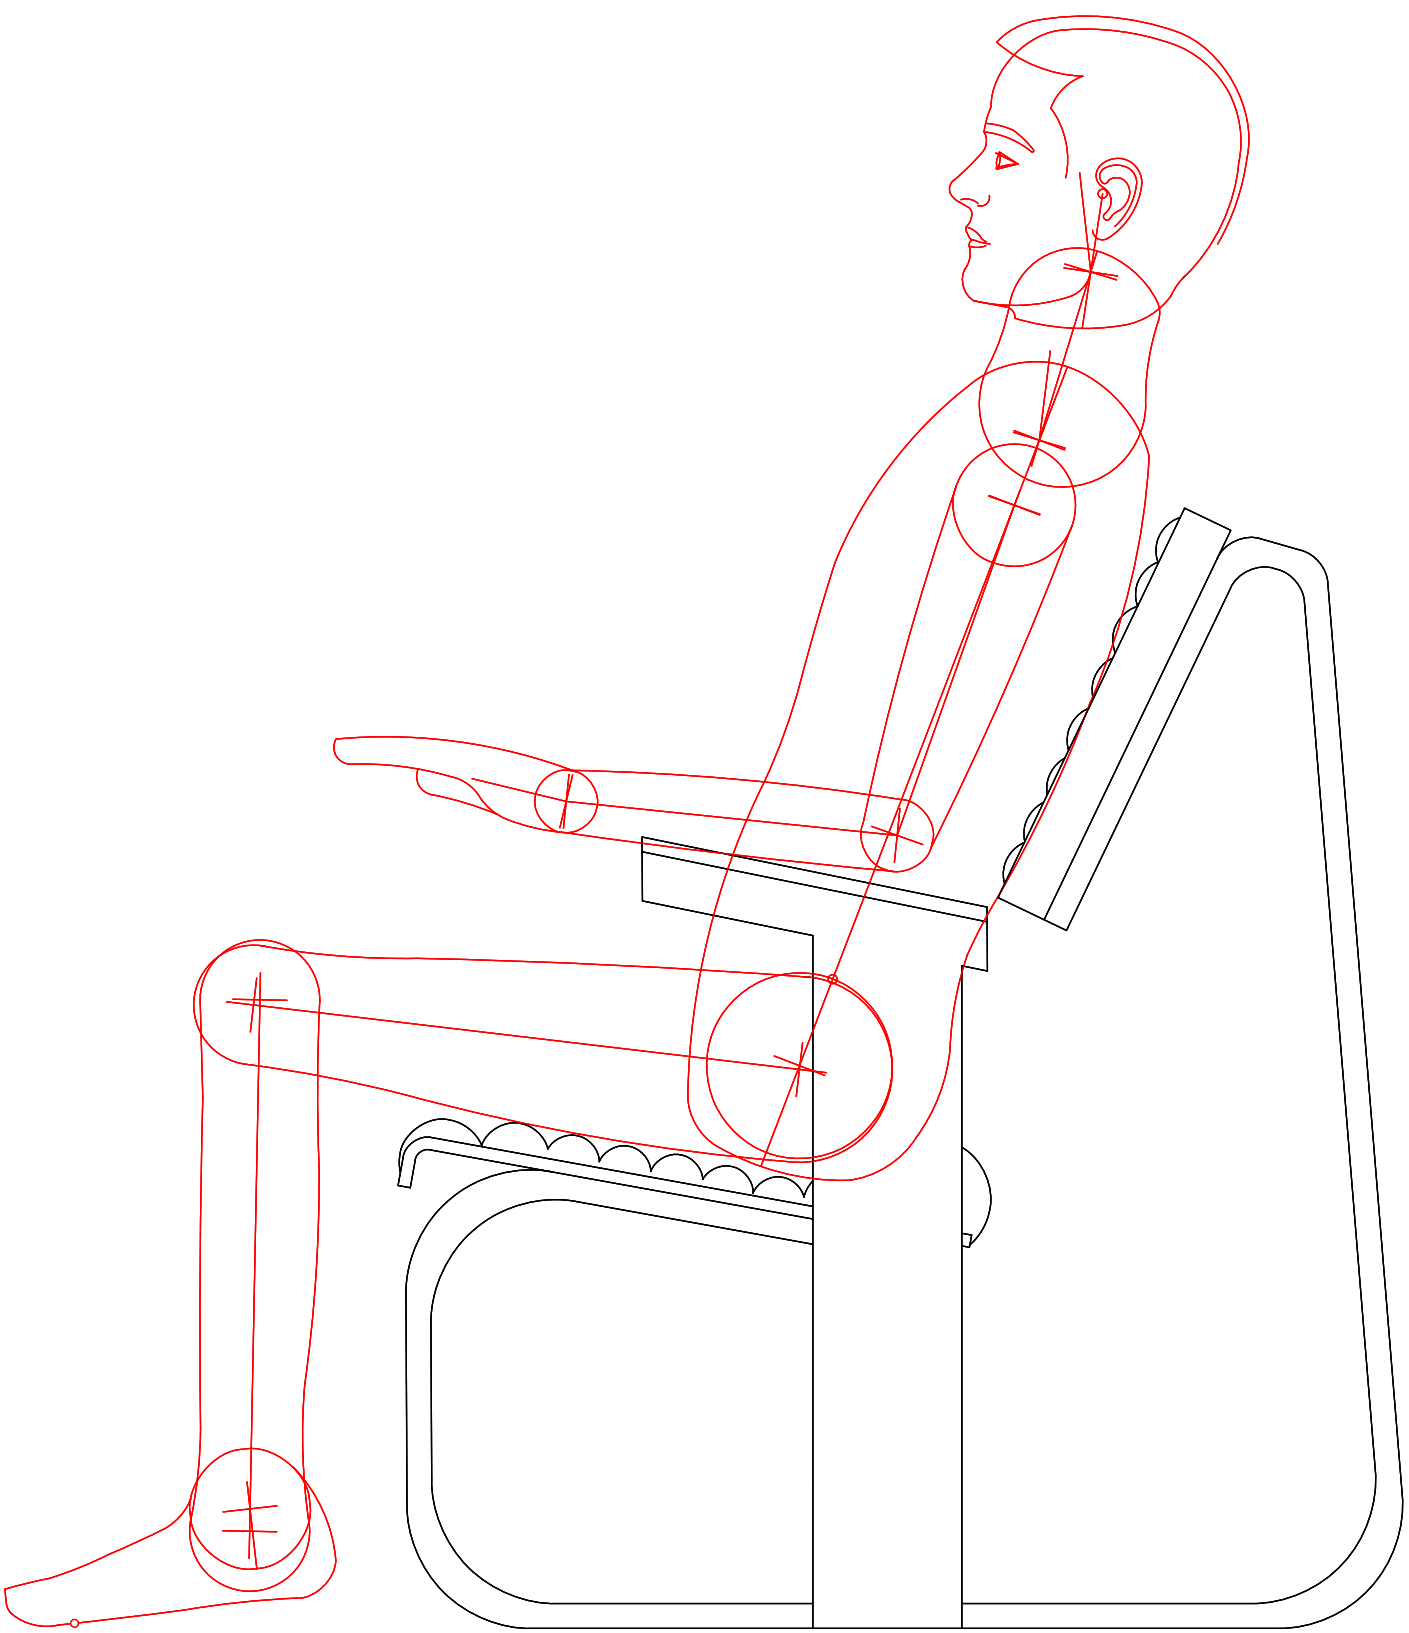

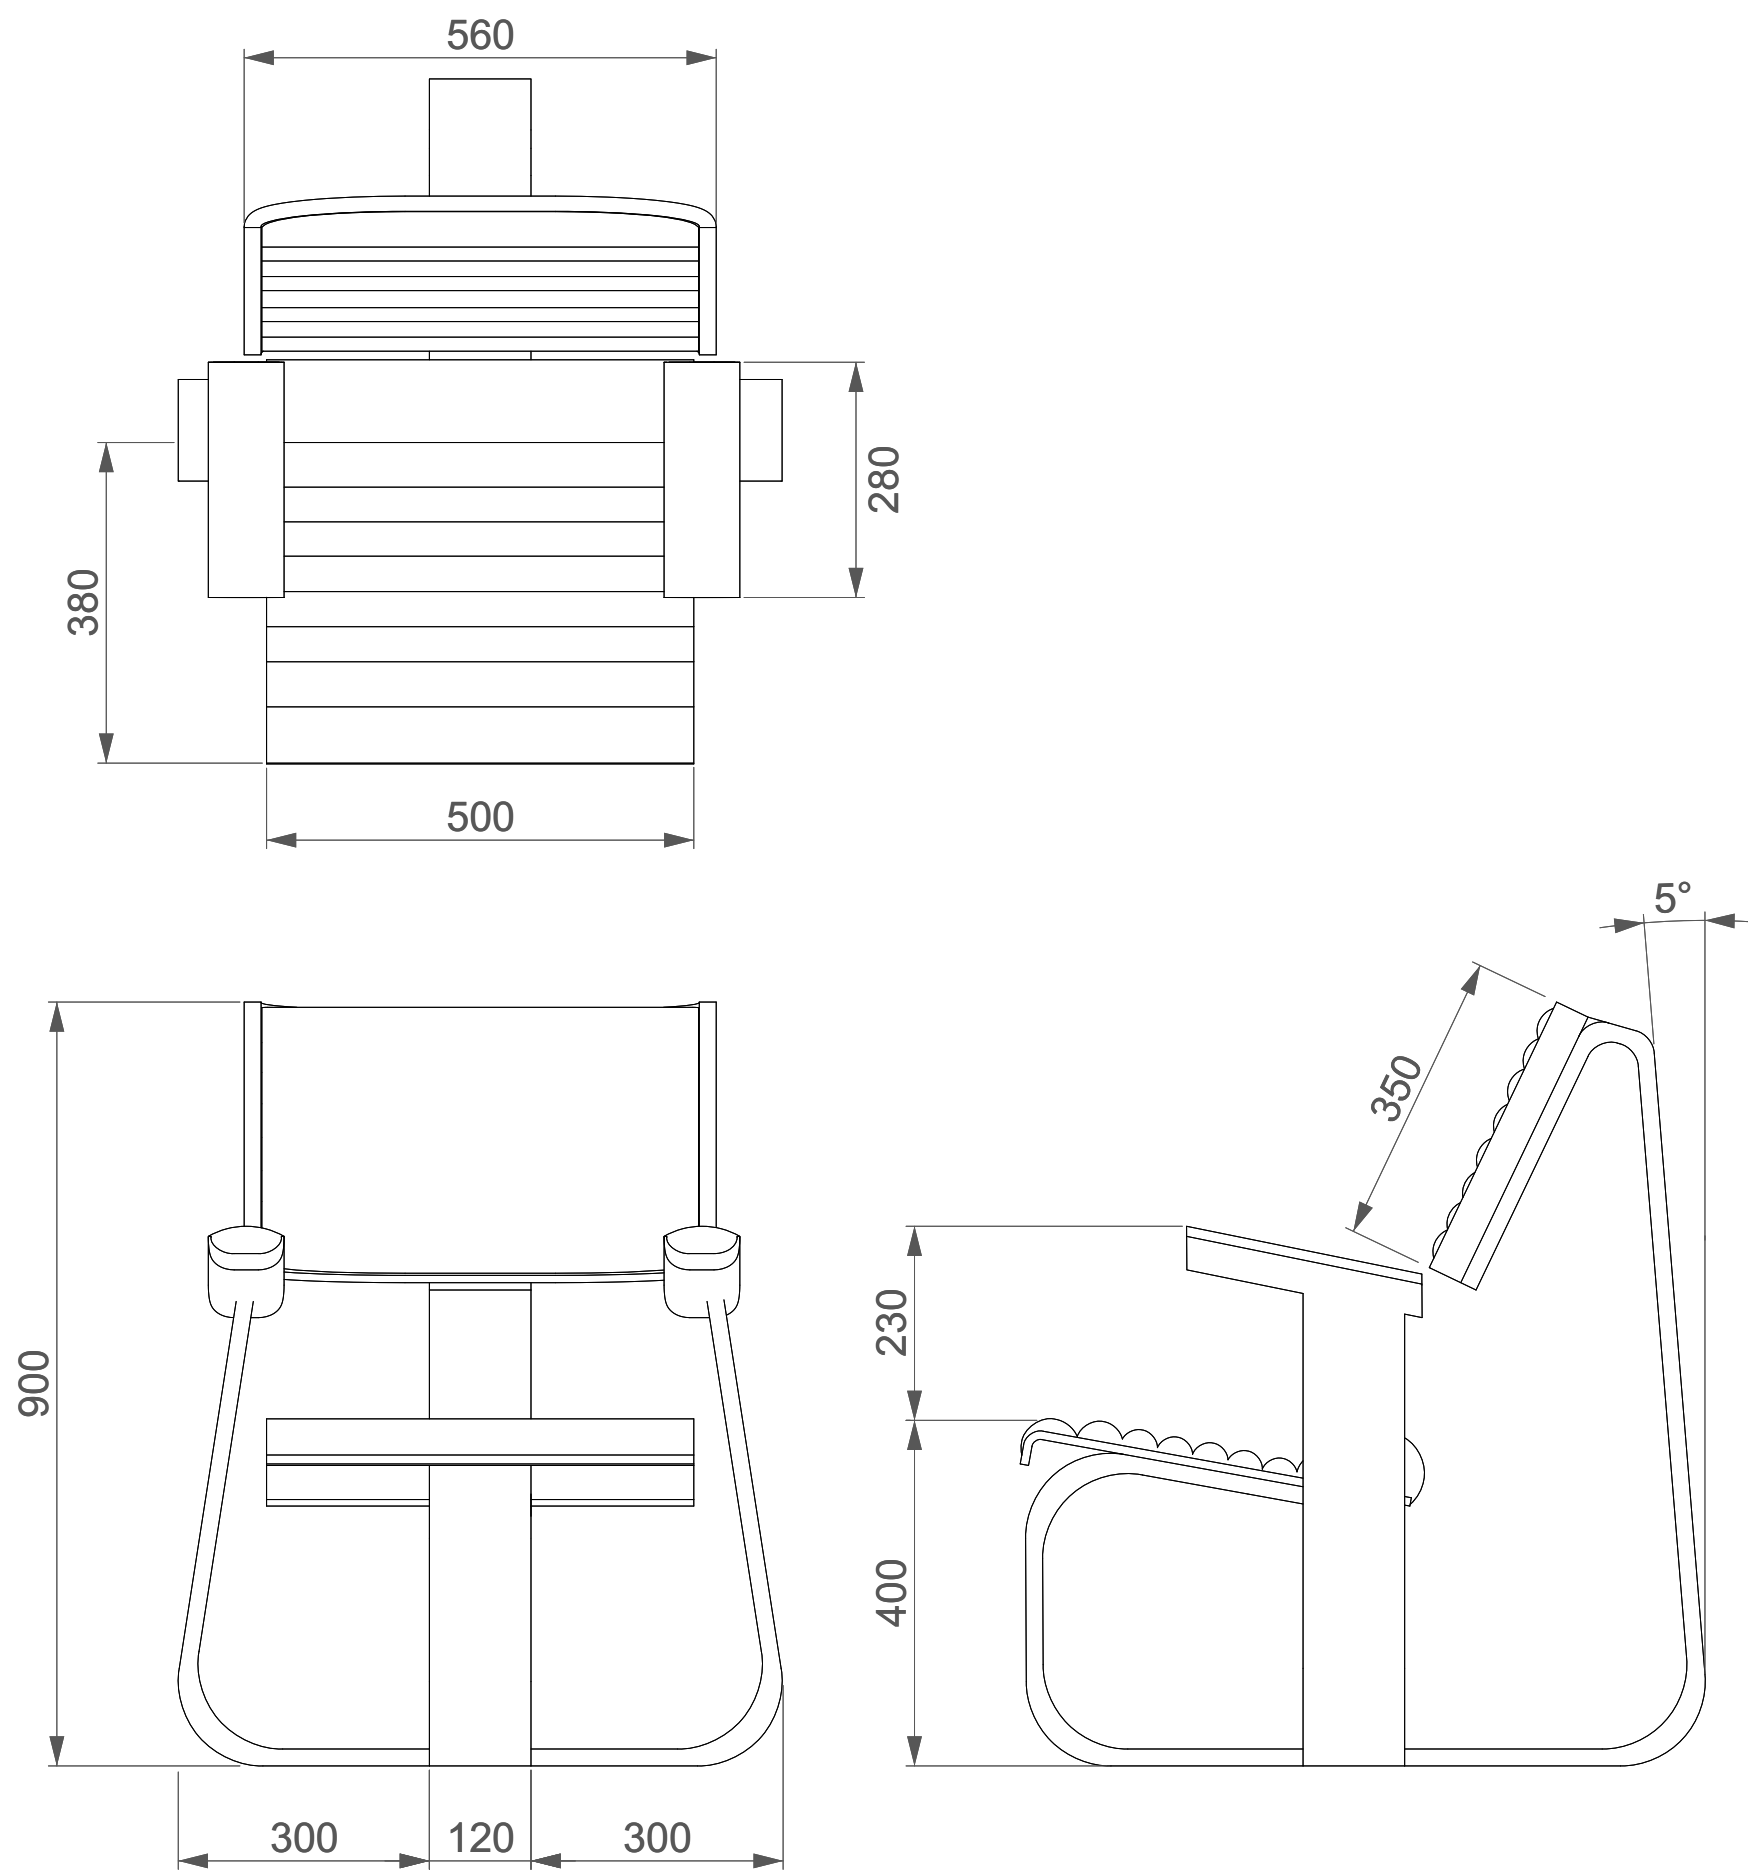

## Sketches

# Tech Drawings

As we can see from the following drawings the chair doesn't have a to complex geometry and by doing the section we can understand that the structure is made by ash bars all of the same size and thickness.

# Disassembly

Not only the material are thought to be environmental friendly but also the packaging and transportation are thought to minimize the footprint.

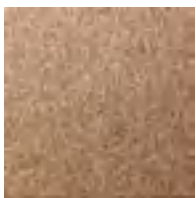

The chair can be packaged in a flat pack this means that in one single van there can fit a whole stack of chair.

This means that there are less van needed for the transportation.

## Material

## Holand Kitchen

Build your own kitchen  
Start from small and make it  
adjust to your changes

## Functionality

Detachable modules, to be modified when you want as you want.

Thanks to the completely disassemblable and readjustment modules, the kitchen be adjusted also after its assembly from the user or from our service.

Modules arrive in flat packs easy to assemble.

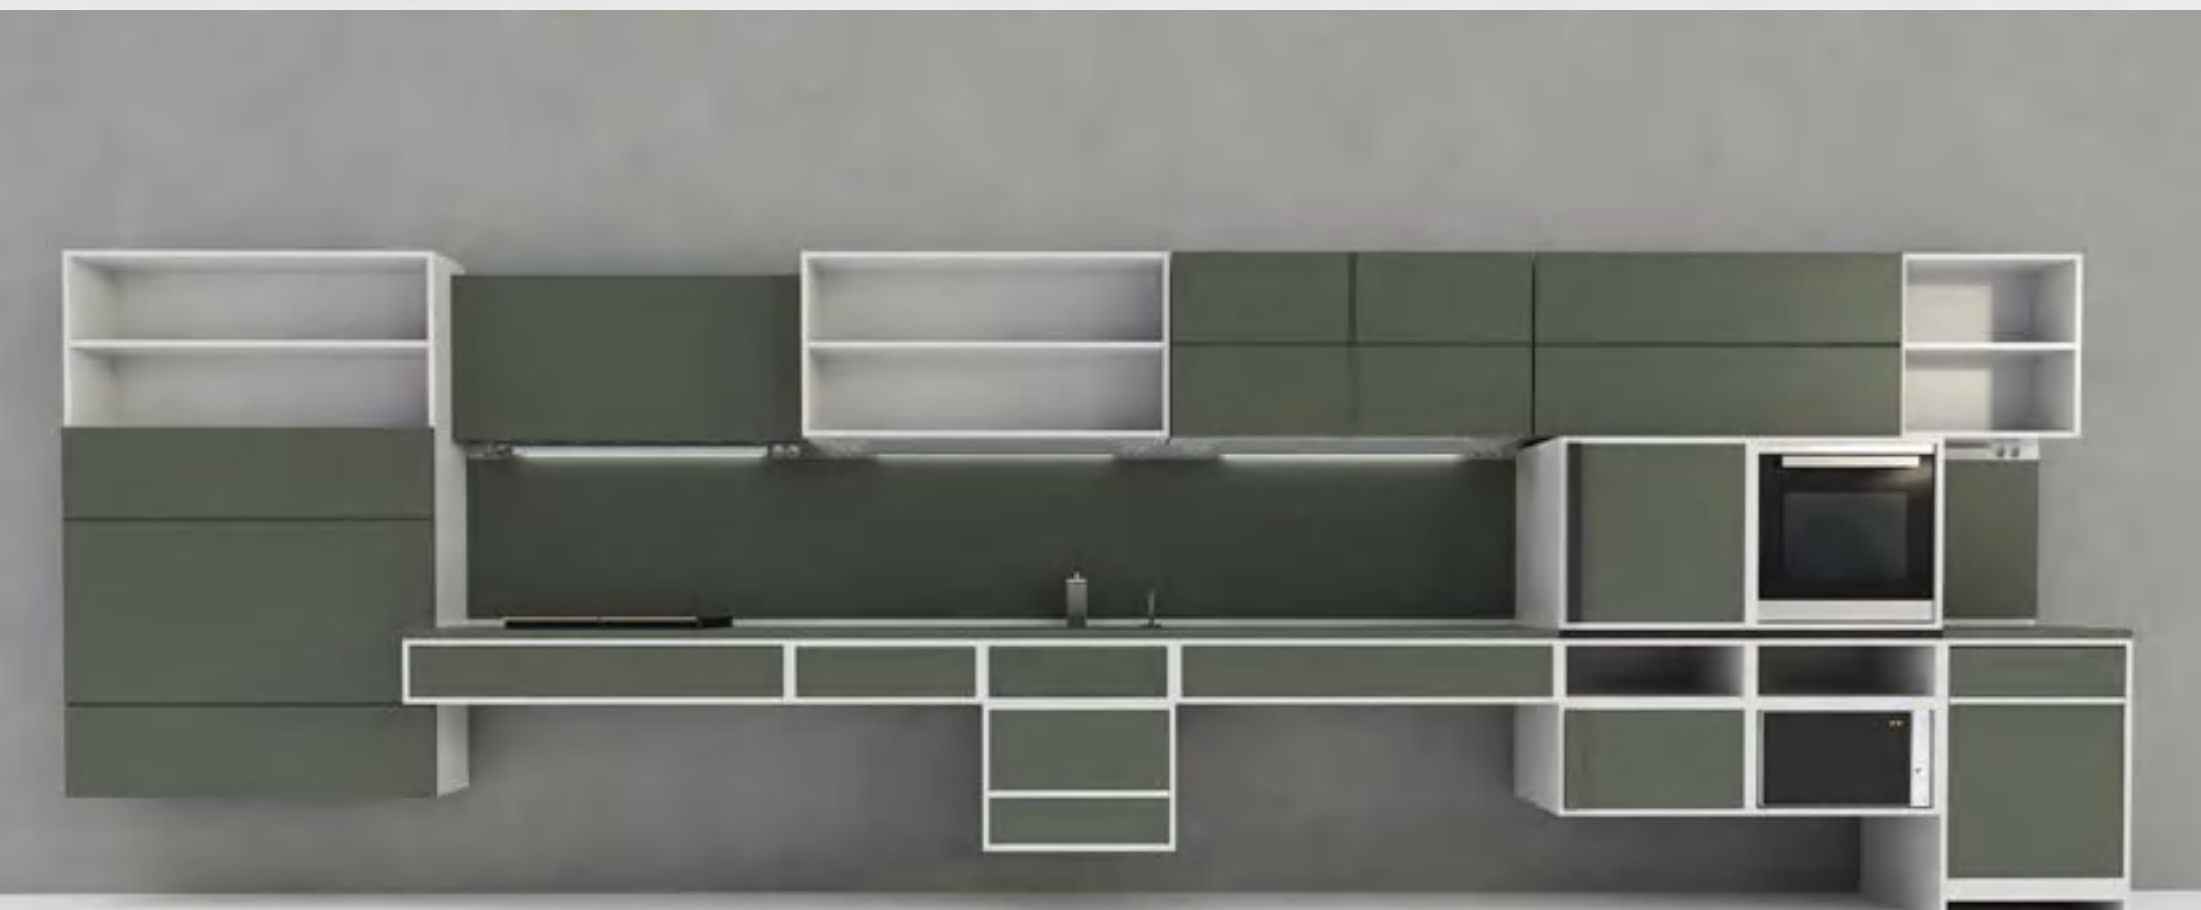

## Functionality

To give the most work space possible i decided to make the hobs foldable dependently and adjustable.

## MoonShell

Feel always protected with a modern  
and stylish outlook

Filled with air  
Small pump to fill the air chamber and make the hat fill the head. In addition it will absorb the shock D30 could give.

## Concept

MoonShell is a foldable bike helmet which feels soft to the touch like a normal sun hat. The idea was to make a bike helmet which at first sight would not look like a helmet. While on the other side it is equipped with different technology's to aloud a safe road.

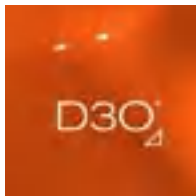

Thanks to the app you can personalize the 3 buttons to add any function like music, maps or for answering the phone.

## Functionality

Si-stem is able to collect water from the humidity thanks to the improved radiator able to collect 250 ml of water every day is present in the air.

Its disassemblable to allow the users to clean the inner parts from dust and pets hair.

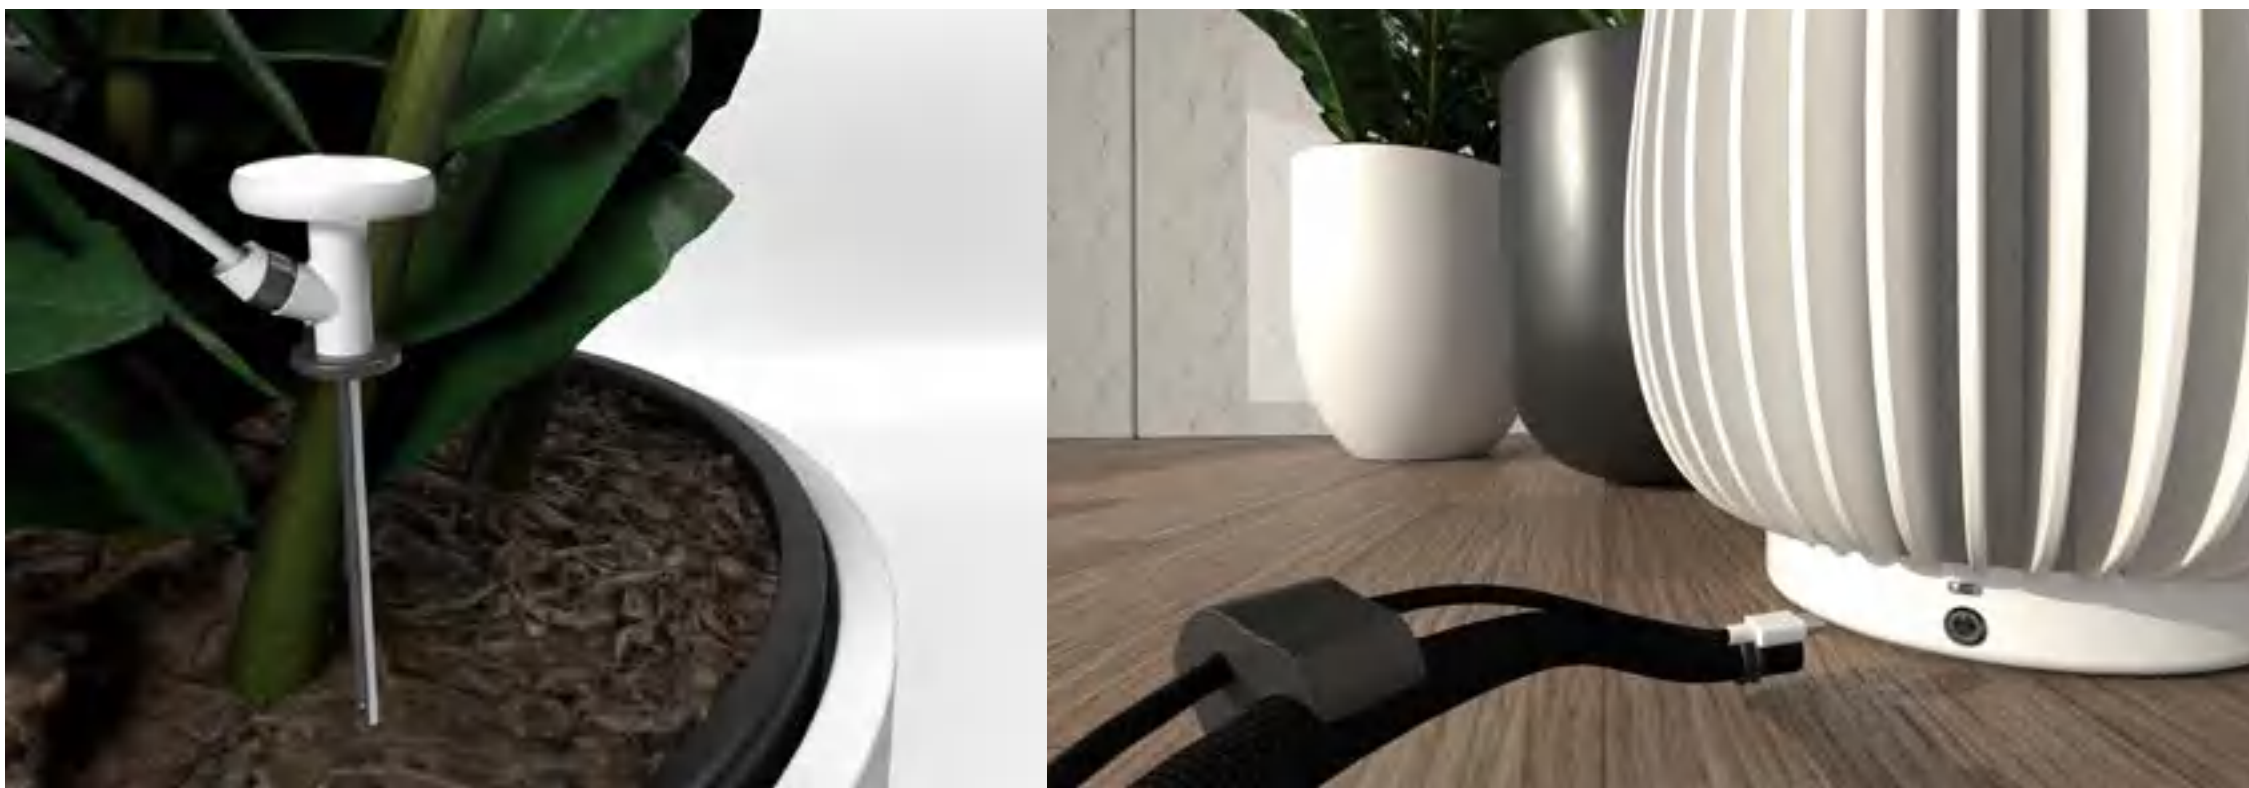

## Functionality

Si-Stem is a smart watering system with a advanced redesigned condenser which is able to collect the amount of water to take care of a maximum of 4 plants.

Its a smart device thanks to its feature which is able to recognize what plant its watering and dependently to the plant it will adjust and water it in the right way.

So you basically dont have to do

# Start-up Project

## Remi

Remi is the first digital photo album, the first MetaAlbum.

With remi we try to give a new purpose to the photos that take part in the construction of us our identities, allowing him to meet us and thus stimulating us to approach these photos in a whole new experience, creating a new emotional dimension between us and our photos

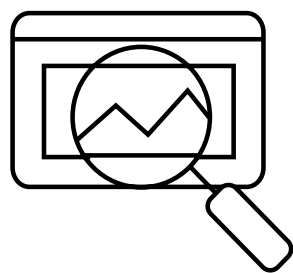

Remi is built on an analogy with the albums of yesteryear:

Silent and ever present, it has the function of keeping your photos in perfect condition until the moment when you decide to let yourself be welcomed inside that ethereal place of memories where you can reconcile with the past.

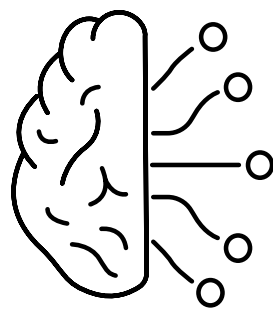

By imitating gestures and practices, and adapting them to what is considered normal today, making a healthy and joyful practice part of our daily lives.

Technology used

Metadati

Artificial intelligence

Metadata is additional information, contained within digital images, containing technical details of the photo and identifying the equipment used and the photographer who took the photo. But in other cases we can also have metadata of location, weather, travel speed and of course audio if there is one.

Artificial intelligence instead is able to pull out data and information from photos. Image recognition is a generic term to describe a collection of related artificial vision activities involving the identification of objects in digital photographs.

These two together can perfectly understand the environment of the photo taken.

## Buisness model canvas

In this part of the project we had to make estimates with various suppliers to understand how much the molds for the production and all the components would cost. In addition we also had to calculate the development costs of the ap and all the personnel that would be needed in addition to the R n D

## Air-blow

Let Air-blow take care of your house

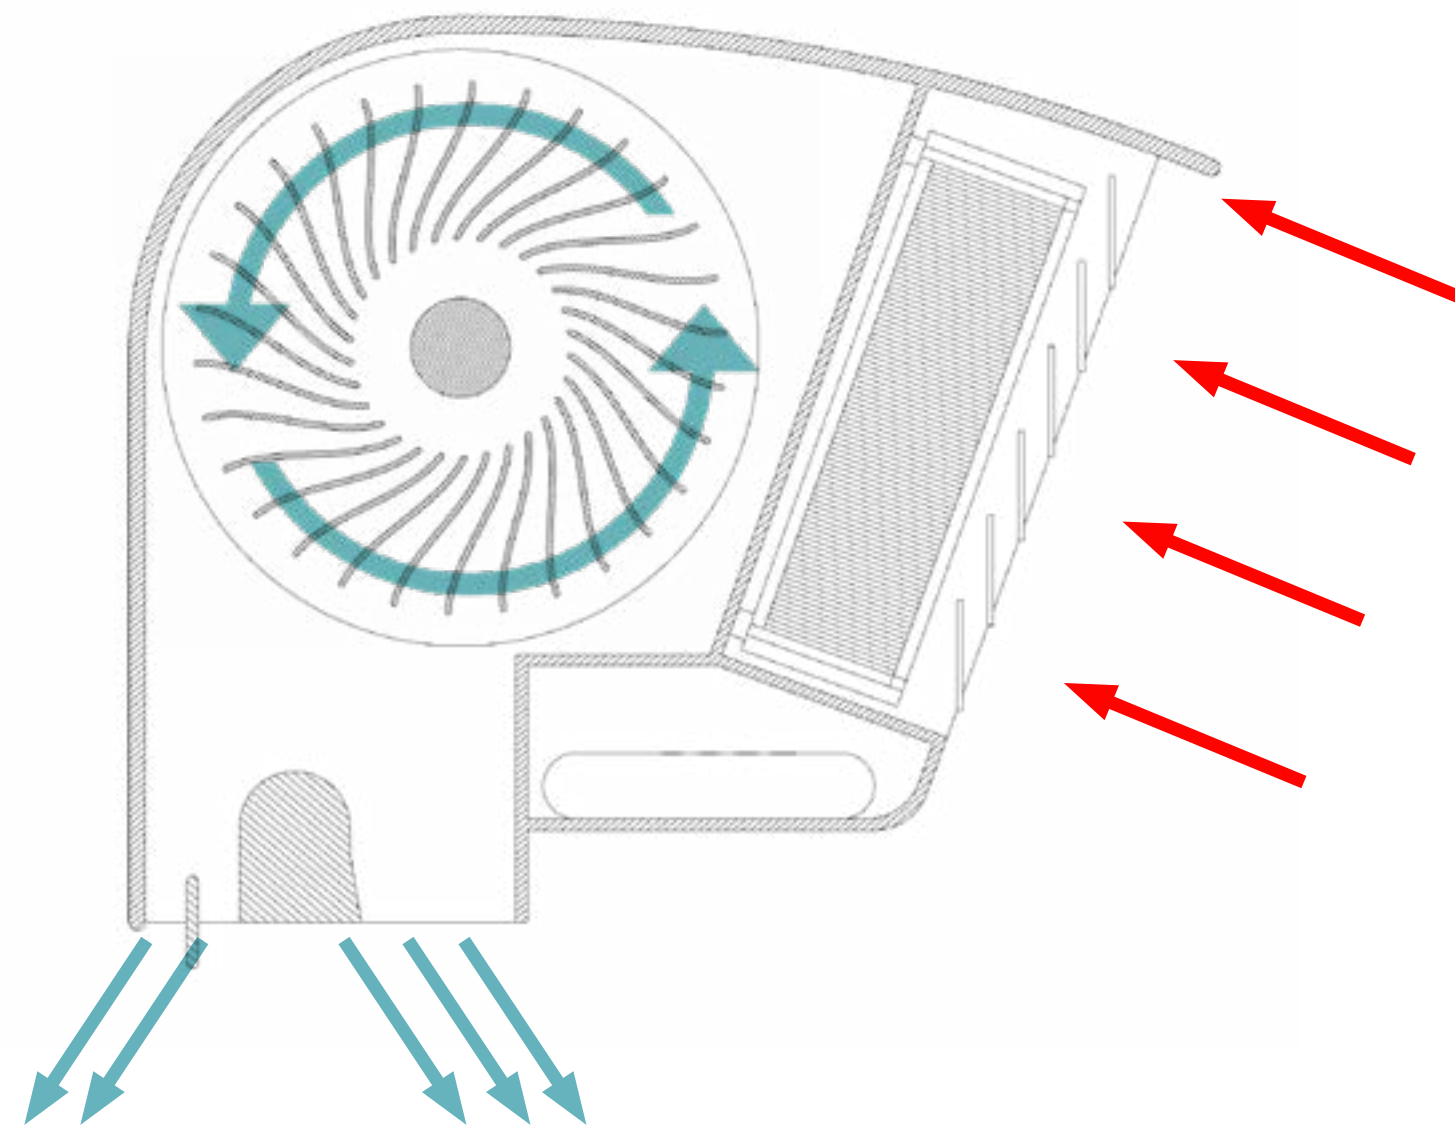

## What it does?

Windblow is able to generate an air barrier that is able to stop any dust particles and allergens from entering the house. In this way, we have to put less effort into cleaning the house and obtaining fresher and healthy air inside the house.

It is completely automatic thanks to the self-cleaning air filters and all the needed sensors, such as the pm sensor, and wind, and movement sensors. Also, the power generated from the solar panel is completely auto-sufficient.

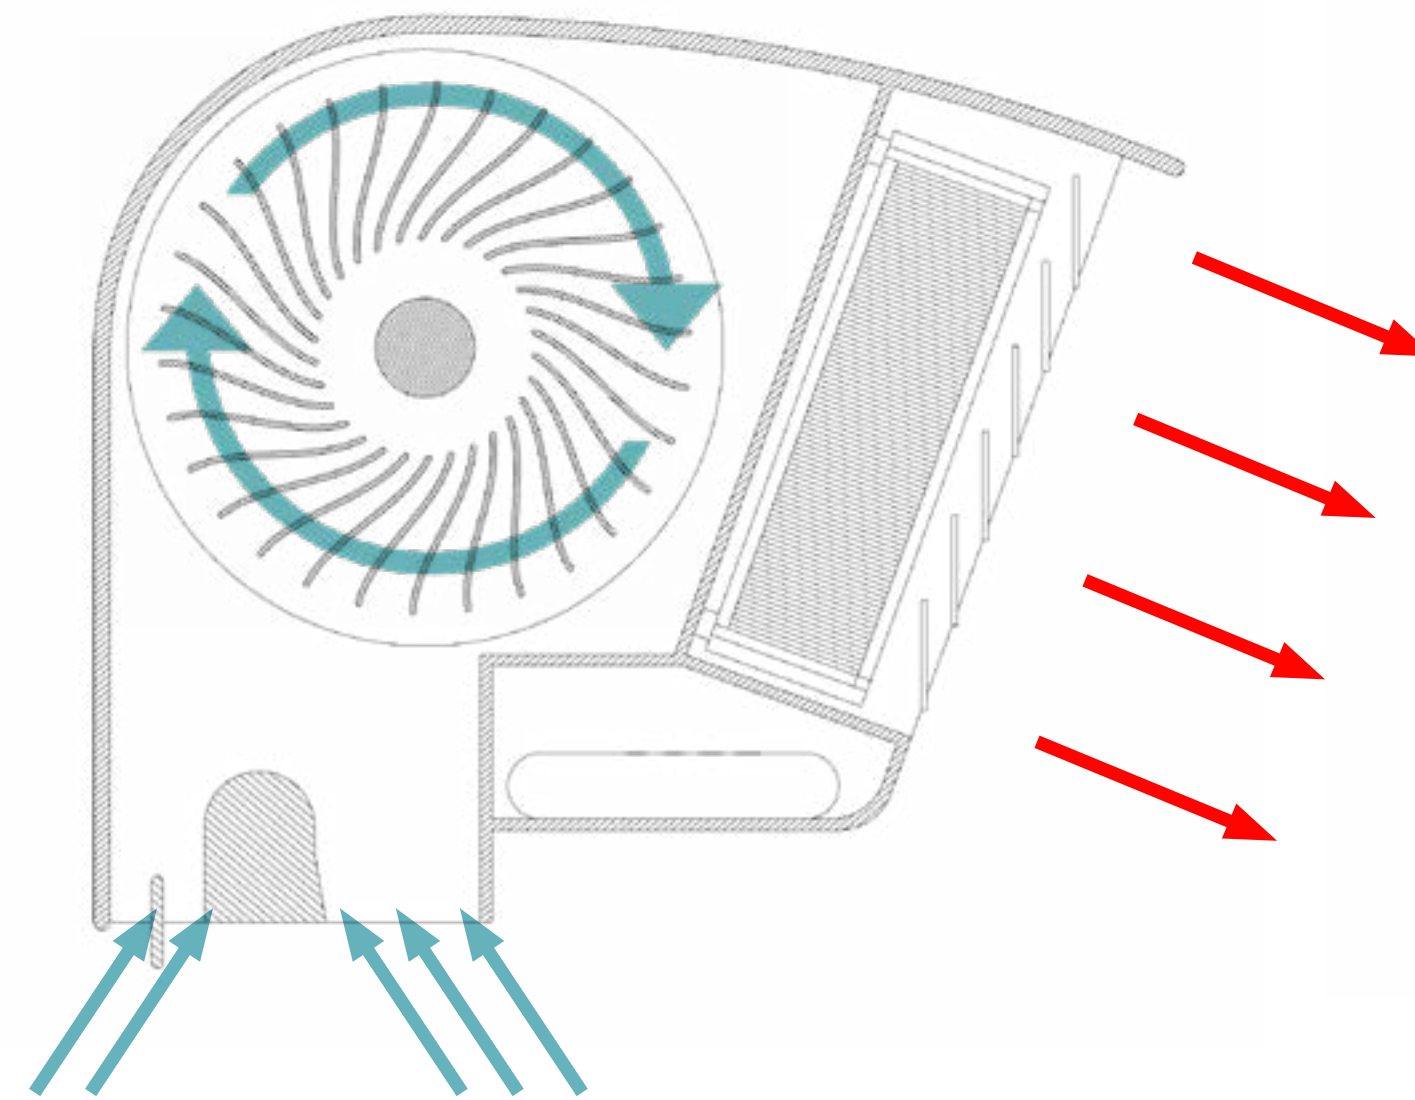

## How does it work

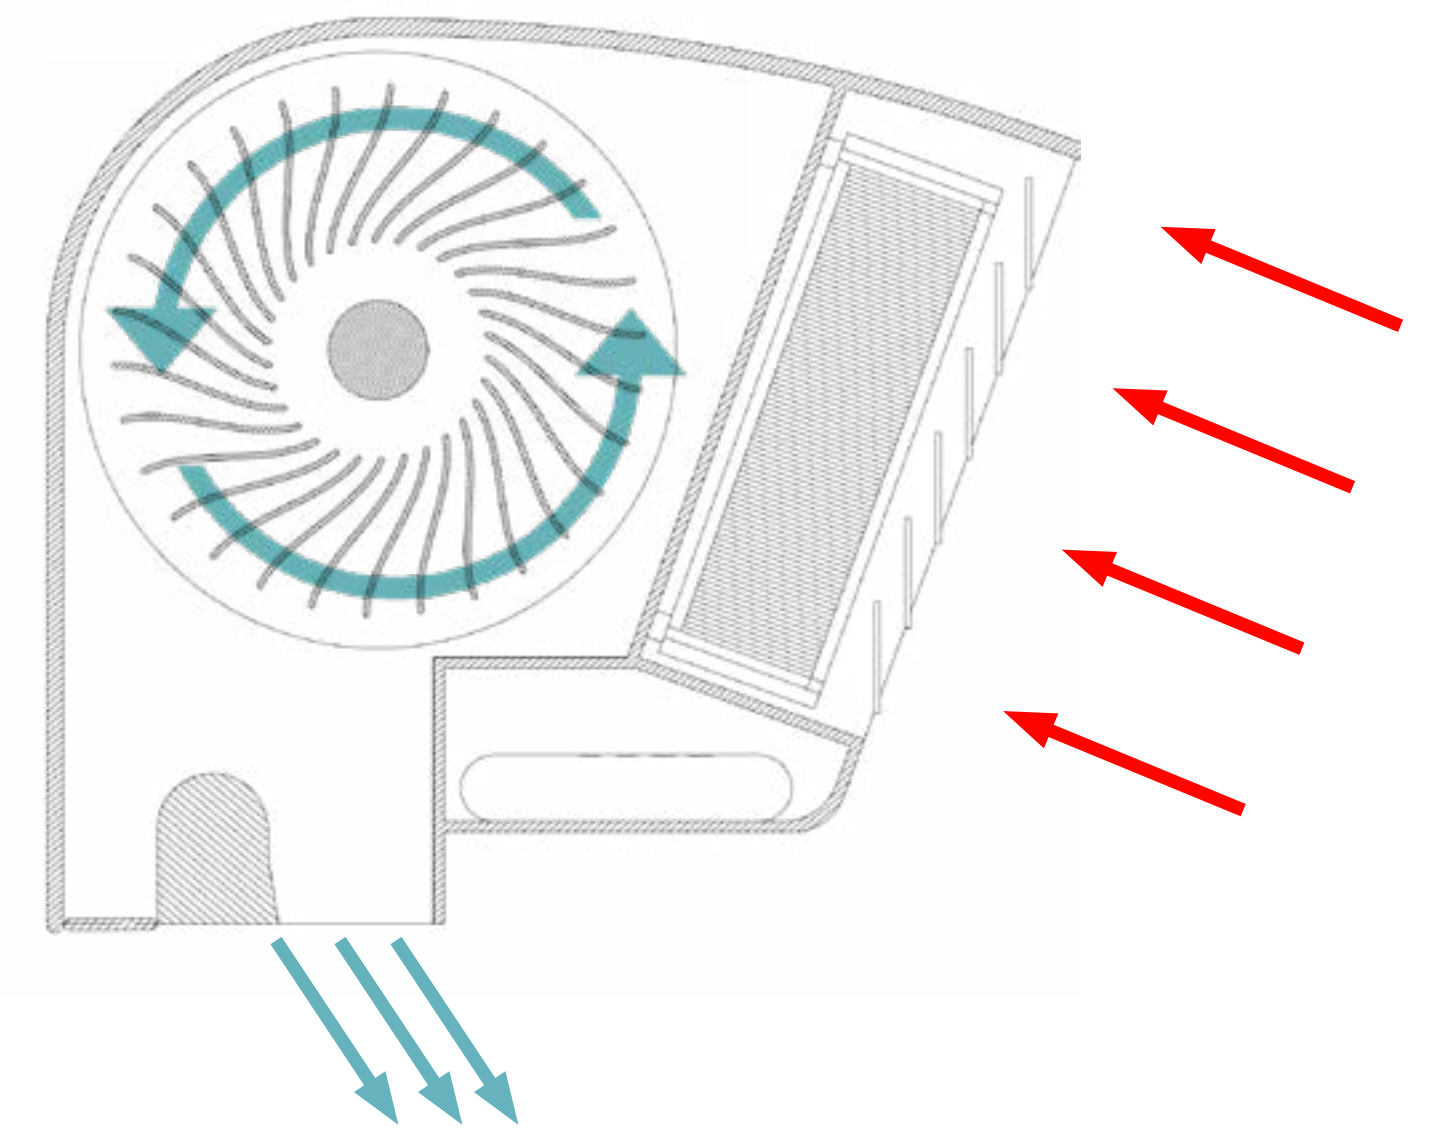

### WORKING MODE:

on one side Wind-Blow will create a barrier which will prevent the dust to enter in your house, while on the other side it will throw fresh air inside of your house

### AUTOCLEANING MODE:

thanks to the vibration motor and the changing of the rotation of the turbine, the product will clean the filter by itself

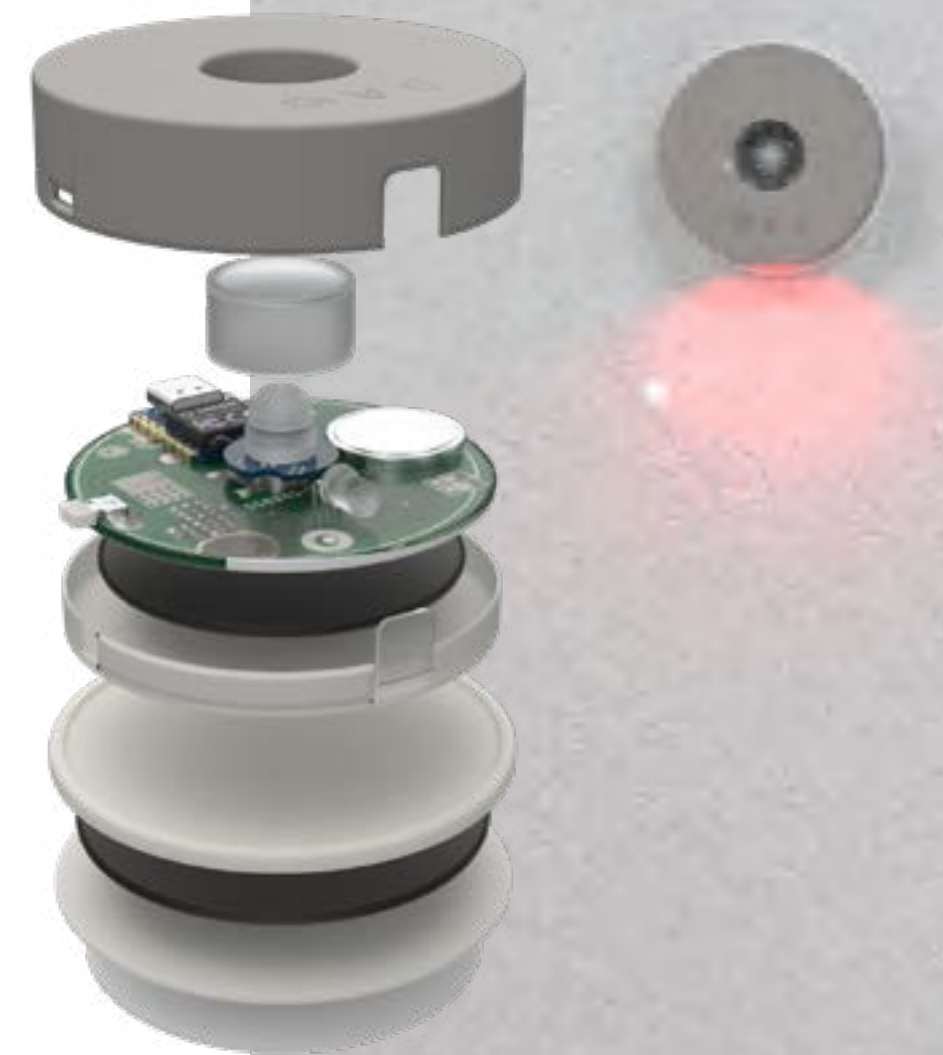

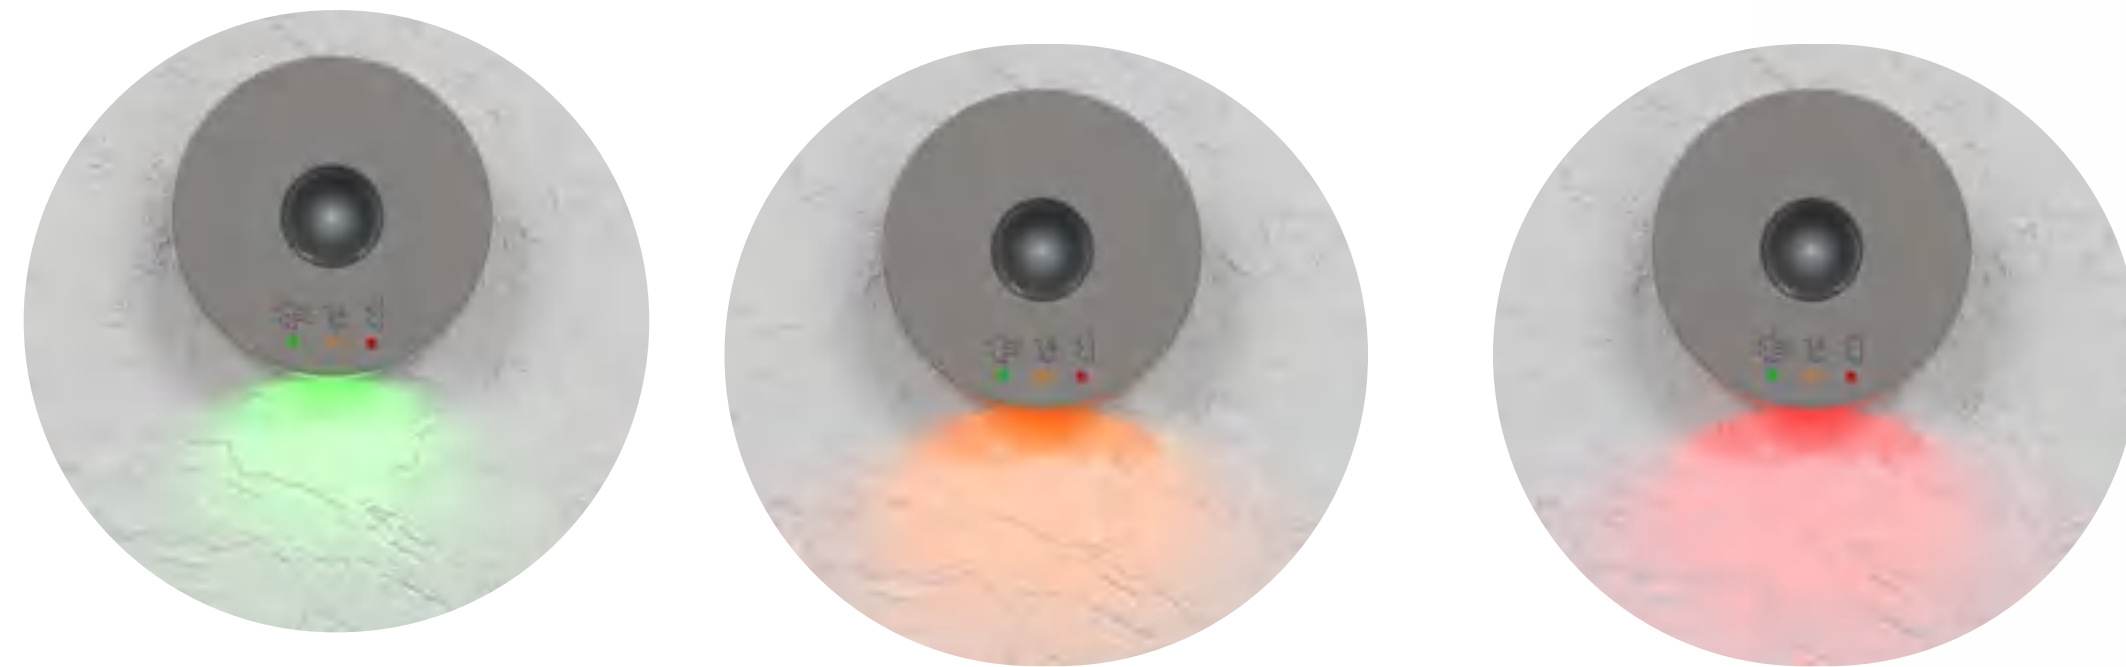

### SAFETY MODE:

the device is able to analyse the amount of the pollutants in the air and close the wind entrance when it can't guarantee a perfect work

## Desing

On the inside, there will be a sensor showcasing the current status of the air barrier. This light will be only activated when the person is approaching the window thanks to the movement sensor. The device is detachable from the wall and it can be recharged trough type c.

## Sisma

Beat the quake and learn how to bring your  
creativity to action  
Who survives wins !

"Toys are children's  
words and play is  
their language"

GARY L. LANDRETH

## Our Vision

Construction is a field in which the kids experiment through failing.

We aimed to create an interactive game where kids could enjoy an exciting experience with a spark of education.

Sisma is a competitive - two opponents game in which kids can understand the logic of basic constructions against the power of nature.

## Story

There has been a challenge from years ago to build a high, stable castle on the two most dangerous islands in the world.

No one has ever succeeded to build a structure able to overcome the supreme forces of the island.

The man able to build the highest castle that could withstand all the challenges will conquer the island.

## How to play

### ROLL A DICE

Number on dices indicates how many shapes you can use.

### BUILD WITH SHAPES

Click on the button after each turn.

### EARTHQUAKE IS COMING

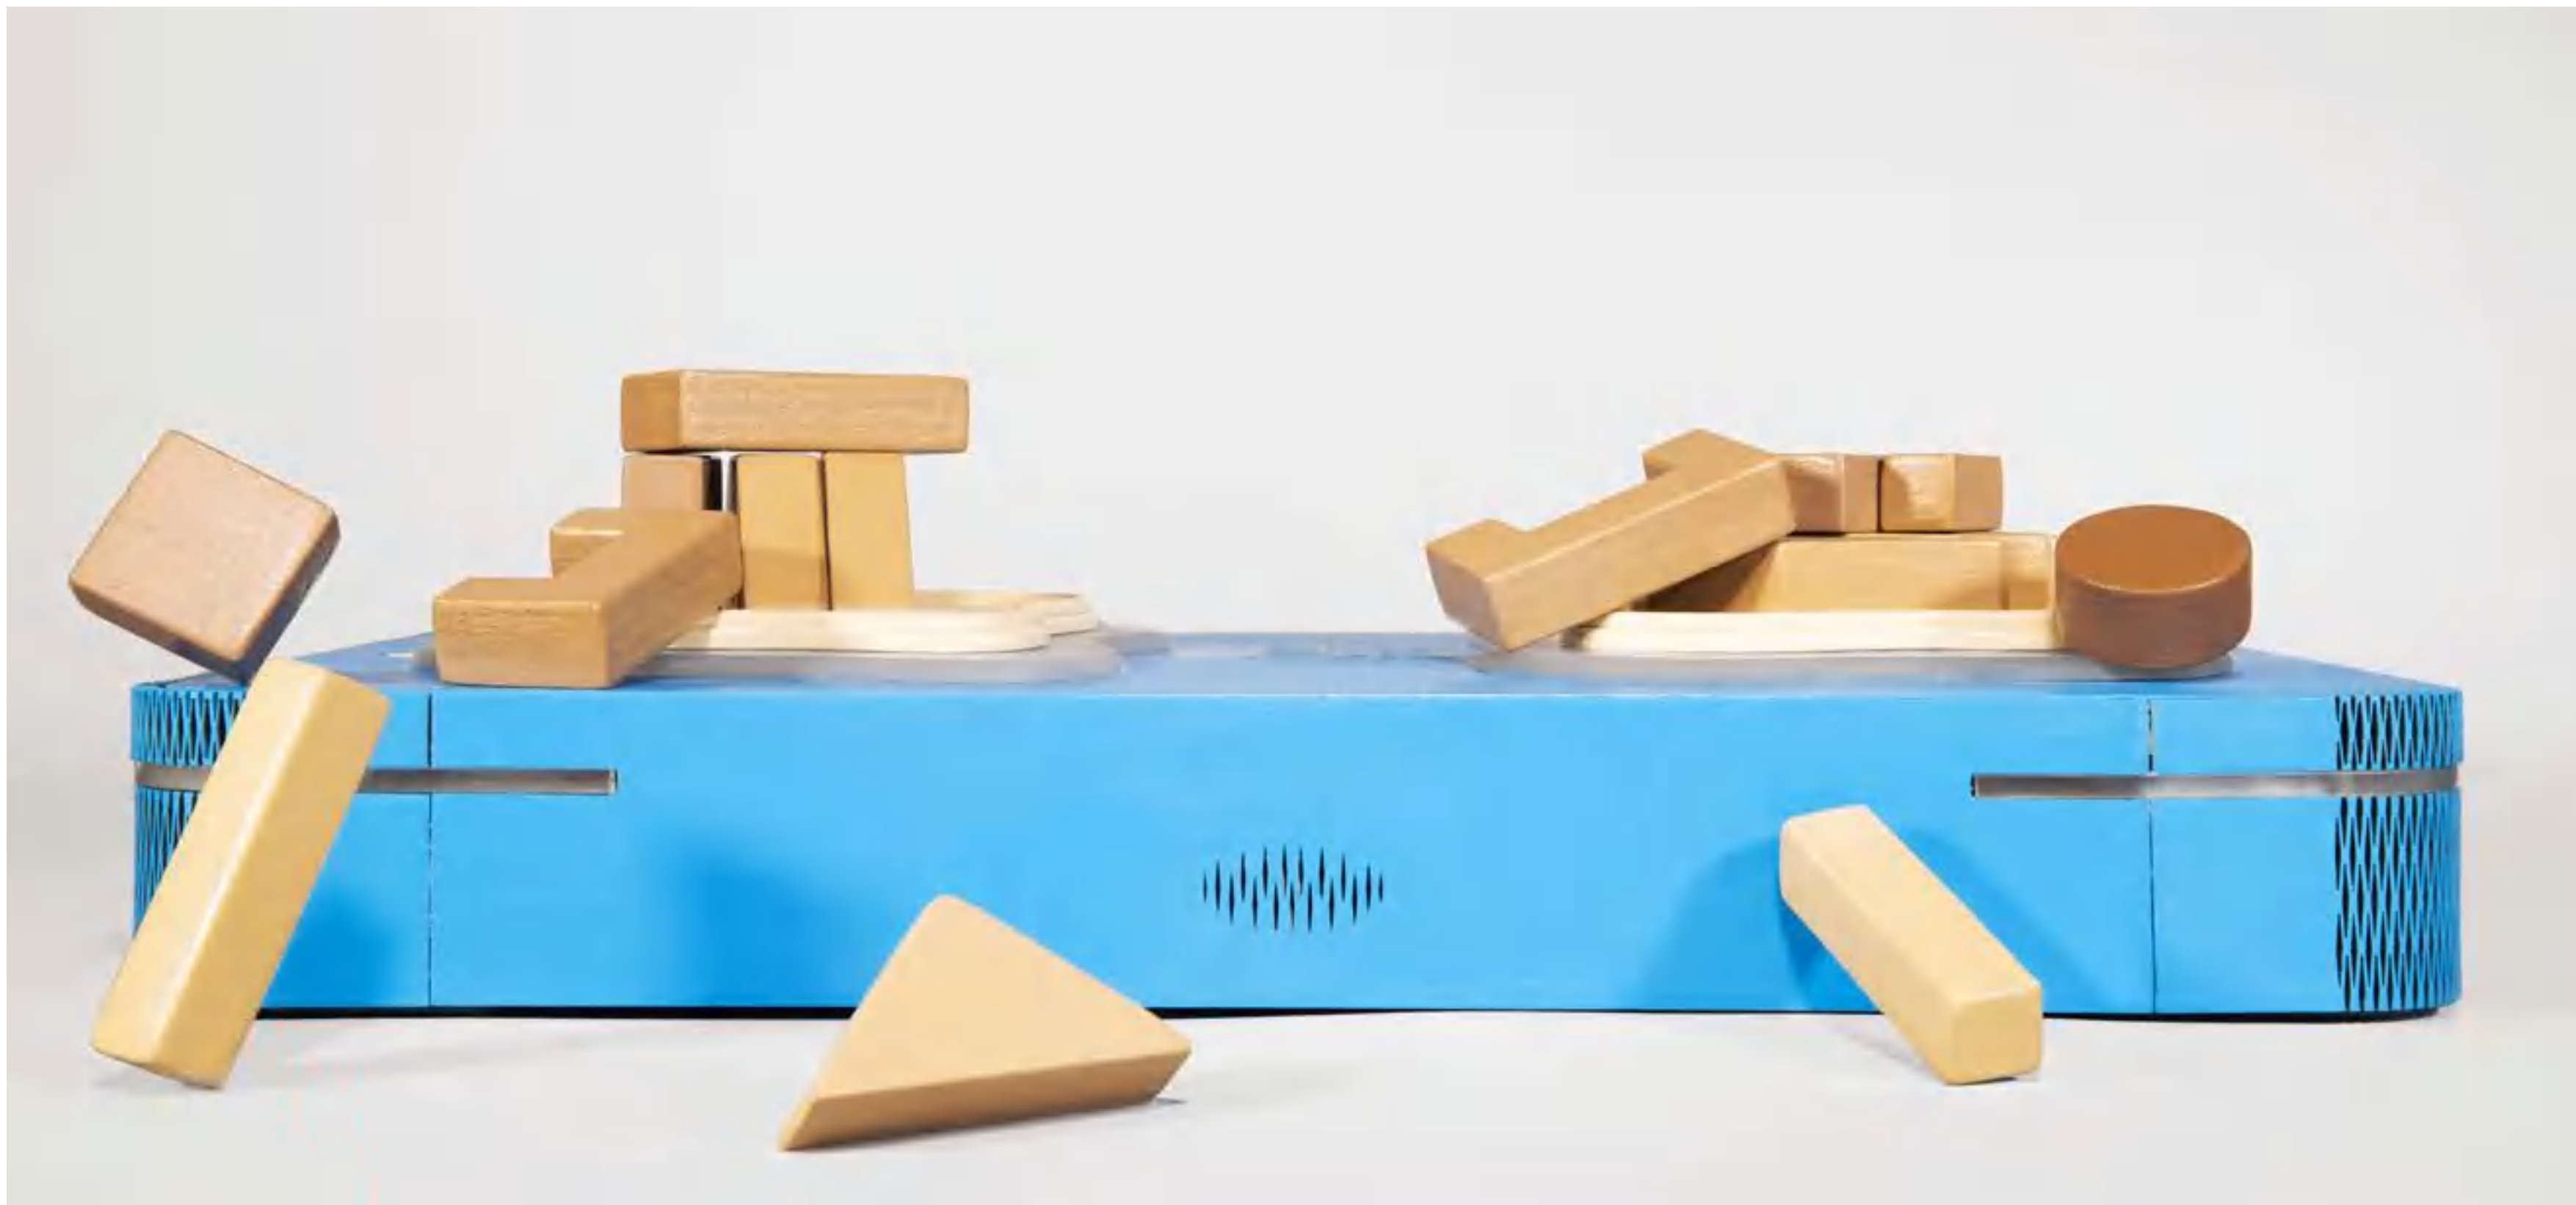

Your castles will have to overcome unexpected earthquakes.

### HIGHEST WINS

The winner is the one who stays with the highest, most stable castle.
