

# Yellow Brick Space

# Introduction

## **Yellow Brick Space**

At first the Yellow Brick Space was created to easily keep track of the market, for then entities could position themselves strategically and relevant to the market, now Yellow Brick Space Network lets you easily navigate the market and other business related facilitations; like options on perfect future present for entities in the network, entities can choose on options for a perfect future present, by just following course of action, for that specific option.

## **Network**

The network can be defined as a system that calculates value of return in a web of possibilities, (exchange) in its own fabric of time and space (calculation for future actions), for interconnected entities (nodes) linked by the network for entities to see the present options on “future perfect present” that best serves one perfect future on a perfect present of today (with a present value of return balance)

# Options on future perfect present

## Perfect Future Present

Options will present itself to any entity in the network, even if not aware of their Status on the network, course of action in the form of cause and effect, or course of action in the form doing this will get you there.

Entities in the network will have 3 options in a perfect present of today, depending on the entities status in the network, this is where skills and abilities play an important role in the network qualifications on the status for given entity, for example a Gold Status entity in the network may use the best option of those 3, for that entity at the end of the day, took in around 255 decisions on which of those 3 option best serves the entities perfect future present, in comparison to a Penny Status taking around 6-7 decision of those 3.

This gives the network more to be calculated for future options to be lucrative for entities and for the network to be lucrative to the entire market.

## 3 Options 1 2 3

3 options in a Piano Concerto with 3 movements, now you can choose your perfect future present option like choosing 1 of those 3 movements, this way is one of the easiest, no need to be a music expert to know which one of the three sounds better, like a better perfect future present option next to the other 2, then you can repeat them again to advance into a new option of a PFP, for at the end to have something like the Gold Status Entity in the network of 255 decision of which of the 3 is a better PFP, this is why the network functions in the market for example the Gold Status Entity evaluated 255 times 3 options each time totaling on 765 evaluations in a short period of time of one business day.

Mozart

Piano Concerto No. 21

In C Major, K. 467

I Allegro maestoso

II Andante

III Allegro vivace assai

# Private Market

## Flexible liquidity

Private Market

High liquidity

Public market high price tag ~ “cost of doing business”

Options on perfect future present in the network’s private market.

Some options with course of action like buying stocks that other entity in the network is selling, the network does coordinate this to make the market liquidity at reach while the entity sells those stocks for example, the network does this accounting on that course of action the seller will have a perfect future present, as the seller will buy something else from that liquidation, while the buyer will also get a crafted perfect future present and the network will coordinate another option on P.F.P. for entities to benefit from that new perfect future present option to other qualifying entities.

Entities in the network may pay as course of action as it guaranties the pathway to that perfect future present or do a course of action for payment per ounce of gold.

# Rules and Frameworks

## Rule

The system based on mathematical calculations runs on algorithms

For entities in the network the algorithm does move as tangible (Gold) in simple terms the value of gold in the present day of today.

The system may move in the fabric of time and space to find you and bring you up to date, while in time and space the system may just give orders of course of action, only when the best pathway is available and 100% successful if the entity follows course of action

This is to be in the fabric of the network after that course of action is completed the network will generate a unique number and create an entity, this gives the system blindly enough data that sets a position for the entity in the network while also positioning the entity in the fabric of time and space for perfect future present calculations

The system takes into account the skill sets and other abilities that entity can fulfill, as it encourages and gives options for future perfect presents if skills and abilities are expanded or mastered

The system calculates and simulates future perfect presents that are more likely to become a future present

In the terms of perfect means there is nothing to be added or taken in that present or future like in some cases some entities might be given more time in that perfect present just because there isn't any option available for that entity to have options of future perfect present, but are more likely to have new options available as soon as new possibilities presents to the network calculation system

The network will send more orders for course of action, this sets an account of orders of course of action completed for the network to be rewarded by including the entity in the network then the last course of action is for the system to place you in the perfect future present, where you are going to have options of perfect future present to choose from while also seeing the course of actions needed to take to get there, all options are 100% successful given the completion of the ordered course of action.

Then if an option of course of action present to pay the network for that future perfect present, is to lock in the straightforward pathway to have gold weight in the fabric of the network making your weight in the fabric important to the network that was always part of this perfect present with a perfect future present

This also ensures a sort of destiny in the fabric of the network while the network knowingly knows you will benefit from the network as it gives you a sort of pathway to be in the network and benefit from that future perfect present open ended deal the network gives as the entity goes with the present market.

While some pathways sometimes might be easy liquidation of other goods and services the entity/user is providing for the market.

The network gives options future perfect present or perfect present as it shows the benefit of buying those goods, while at the other end the network, is working on finding a buyer that is in the market for that specific item as it locks in the sale of those good to other entity in the network.

The network benefits on having a market of easy liquidity as it connects those same entities in the network to see the options on future perfect present by simply moving the market into a better future.

## Perfect present

Double crossers are just ignored and noted

Extra time? No problem just ignore and note why they want that perfect present of today, and just say Hello!

# Rule

Network Cost of Entry

Course of action

To get into that perfect future present pathway pay by course of action  
(rhetorical always following rules and regulations)

Pay by ounce of gold

Value on return on a balance scale

For the correct balance of the entity weighted in gold, starting by one ounce of gold tills the balance is even on gold to entity ratio

How does the network makes money?

Pay for the spot in that perfect future present, weighted in gold, sometimes if weight in gold is not enough for given entity to lock into that perfect future present, course of action will be also needed.

Pay by course of action

With some cases the present of that new entity is not in a perfect present, they might have to go the extra mile for that future perfect present that will give them just enough to have a perfect present, when paying by course of action the network makes money by the value of that future perfect present that compound on the network little by little as it becomes the most straightforward pathway to a perfect future present available to the entities that qualify for (skills sets, abilities, understanding, etc)

# Main Framework

## Yellow Brick Space

### Mainframe

“State Of The Art”

Network that interconnects entities in the fabric of the network that has its own time and space calculation system, for the system to offer future perfect present options that best serves one perfect future on a perfect present of today.

### Network

The network can be defined as a system that calculates value of return in a web of possibilities, (exchange) in its own fabric of time and space (calculation for future actions), for interconnected entities (nodes) linked by the network for entities to see the offers of present “future perfect present options” that best serves one perfect future on a perfect present of today (with a present value of return balance)

This means the network will always have a pathway to a better future, a perfect future in terms of nothing else will be this perfect, as for the networks coordinated time and organized that future present to become a perfect present of today, this means the network could solve most of any entity that faces obstacles or problems in their professional field of expertise, to have a perfect present of today, with new horizons opening for entities in the network.

### Personal life and network

with a rule of thumb, only if those course of actions needed to do for that perfect future present, the perfect present could be reflected in each entities personal life, with the rule of thumb as always minding once own business.

Now you can enjoy the network tangibility with this fiat figure of the perfect present of today, with options on prefect future present, like gold bar payments for concrete concept of network (instead of course of action).

### Private market

Market in the network, the network coordinates the movement of those transactions to be on the path to that perfect future present offered if that transaction is completed.

### Public Market

The network coordination in the public market to take to a private market, making each transaction a more valuable return, with easy liquidity and other options on future perfect present in those transactions take place, making that perfect future present a solid milestone to the next option of perfect future present, an available in between entities,

### Time framework

Each entity has a time different from one another, this gives the network a few layers of insurance for that perfect future present, with the network coordination everything goes as planed with their prefect future present locked in the fabric of the present of today.

# Debit Card Framework

## Yellow Brick Space Debit Card

Analog time in the network simply locks in your present and your present in the network, for the debit card to be a fail safe device on the networks perfect present of today and personal present.

For instance entities personal present is not currently perfect present, entities can just opt to close that present and stay on the network perfect present, to see options on perfect future present that may change personal personal present, the debit card gives the network tangibility for entities to differentiate between network present and personal present.

Debit card convenient transactions, just by using the debit card where an entity in the network finds it most convenient to simply make the network perfect present more tangible, and analog time more concrete to the entity, a solid present non transferable and locked in that entities perception on the present of today

Now if you want to be on a pool of a future present opening you can simply use your debit card doing a small transaction where is most convenient, then as you keep the receipt in a safe place, the future present pool will open when there are enough entities in the calculated space, for every entity in the pool to not intertwine with each other and for them to choose their perfect future present option, that later on the pool will be empty for other entities to do the same.

# Transactions Framework

One transaction to be in synchronicity with the network, for at the same time the network perfect present of today more tangible.

## Credit

### Balance of today

Credit

No need to do any course of actions to get that future present but when the time comes either the user pays with a course of action or pays the network for the future present option.

## Insurance

### Yellow Brick Space Debit Card

Insurance of perfect future present

Course of action

Fail safe, once you choose that option on perfect future present entities must follow course of action before the count down starts if not that perfect future present will vanish and other course of action will be necessary to have again options on perfect future present, just to forfeit that weight of gold on the negative as for that entity not followed course of action.

Weight in gold

For entities in the pool waiting for a options on perfect future present, every entity that chooses their PFP a weight in gold will be added to that PFP, but if an entity does not fulfills course of action, the weight of gold will stay in that PFP option, but after that entity must balance that negative weight by doing other course of action and then having new options on PFP.

(accounted for the entities not following course of action)

Second layer of insurance

Crypto

Second weight added in form of algorithm

Fabrication of perfect future present.

If entities in that pool of PFP not followed course of action.

Weight in gold will stay for those entities that followed course of action.

# Network Menu

## Yellow Brick Space Debit Card

Like poems in a menu, double layer of poems, to pick the one you like the most, a network like a poem that works like a watch, fair deals of perfect future present like clockwork.

By just simply going to a restaurant and choosing your next option on perfect future present

Gold Status

Can enjoy

Gold Moon suspended time on their free time, and Gold Status when working.

# Fabric of the Network

A brick building like seeing the time on a watch, the fabric of the network is composed mainly on a mathematical equation as an algorithm.

# Network Status

From high to low

Gold Status

Silver Status

Ruby Penny Status

Penny Status

Status for each entity based on skill, understanding, critical thinking, and other evaluations on how the entity moves in the market

Best pathway will be default to any entity that has a final closure in the weight of 99.99% pure gold

# Gold Status

Gold in a retrograde present

You have your present and decide where to take from there, in a retro grade status analog time is going, but this is where the status come to play, analog time is going but for those not in the gold retrograde exclusive present, they are in another analog time called time, but for Gold Status is called time Gold A and their exclusive analog time is called Status GA

For some entities they can have access to other analog times the network is optioning to other entities, like a Gold Status can have access to a Silver perfect present called Status S2

## Gold Diamond Status

At the edge of the mathematical calculation, only those that know un-cut diamonds will know in a state of 99.99% gold purity.

The last status available as today.

# Silver Status

# Ruby Penny Status

# Penny Status

# **The End**

Till your next perfect future present, enjoy!
