

## NASAL / AURAL POLYPECTOMY

1. A specimen measuring XXX cm is received // X polypoid fragments measuring XXX cm respectively are received // a multifragmented specimen measuring XXX cm in aggregate is received.
2. Externally, the specimen shows a sessile / polypoid / flattened morphology, with a whitish / brownish coloration and a rough / smooth surface, without an identifiable stalk / with an identifiable stalk.
3. On serial sectioning / bisection, the cut surface is homogeneous, without other remarkable features.
4. The specimen is entirely submitted in X blocks.

### POINTS TO CONSIDER

- Polypoid lesions from the head and neck region. These are minor resections, generally with limited prognostic significance.
- Measure and describe the external surface of the specimen.
- Section and describe the cut surface.
- Submit representative sections:
  - If the lesion is large (5–10 mm) and a stalk is identified, bisect and submit entirely.
  - If the lesion is small (< 5 mm), submit entirely.
