

VASECTOMY

1. A vasectomy specimen measuring XXX cm is received.
2. Externally, the specimen shows a tubular morphology and a brownish coloration, without other remarkable features.
3. On serial sectioning, no well-defined lesions are identified // a lesion measuring X cm is identified, located X cm from the margins.
4. Representative sections are submitted in one block.

POINTS TO CONSIDER

- Resection of the vas deferens performed for male sterilisation purposes, generally of limited therapeutic significance.
- Specimens are usually received from both sides and generally do not show relevant macroscopic or histological abnormalities.
- Measure and describe the external surface of the specimen.
- Serially section and describe the cut surface.
- Submit representative transverse sections measuring approximately 5 mm in length.
