Climbing Holds  
and Volumes Design.

Vertex Volumes

Vertex volumes are made of fibreglass. This material is used in the aeronautics and marine industries. The process consists of laying several layers of fibreglass or carbon fibre material, depending on mechanical constraints, into a mould. The layers are bonded by polyester resin to form a composite substance. This technology enables the production of lighter macros that are very resistant to bending. The fibreglass process also opens up the opportunity for creating innovative shapes. Fibreglass volumes have what is called a « positive » texture, unlike most holds from PU and PE, which currently have a negative texture. The advantage of positive texture is its abrasive surface, which does not tend to clog.
