## ACADEMIC HISTORY

---

<b>Ph.D. in Finance</b> , Louisiana State University	2020-2025
<b>M.S. in Physics and Mechanical Engineering</b> , Michigan Technological University	2011-2013
<b>B.S in Mechanical Engineering</b> , Motilal Nehru National Institute of Technology	2006-2010

## RESEARCH AND TEACHING INTERESTS

---

Investments, Corporate Finance, Fintech, Information Economics, Market Microstructure, Derivatives, Money and Banking, Finance Analytics

## RESEARCH PAPERS

---

**Job Market Paper: Exogenous Stress and runs on perpetual futures: A global games approach.** [Link](#)

*Abstract:* We illustrate the corrosive effects of marginal increase in adverse selection costs in the perpetual futures market and show how it can lead to a run on open interest. Using the global games reduced framework, we model investors' stay-or-exit decisions as functions of public signals (spot volatility) and private signals (adverse selection costs) and identify volatility thresholds over which a marginal increase in adverse selection costs triggers a run on perpetual futures. Our main contribution is to highlight the importance of marginal changes in adverse selection costs in triggering runs, once the spot volatility threshold is breached. Our findings on the run mechanism can be generalized for any asset class.

**Arbitrage Effectiveness and Stablecoin Run.** [SSRN Link](#) R&R JFM

*Presenting 2025: University of Chicago, University of Sydney, IIM-C, CCPF, SEC*

*Abstract:* Arbitrage is one of the most critical mechanisms in well-functioning financial markets. Stablecoins, designed to maintain dollar parity through arbitrage, provide a natural laboratory to study this mechanism under stress. This paper uses extremely granular data to study Terra stablecoin's arbitrage failure, which occurred 48 hours before the May 9, 2022, 5 PM depeg. I develop a generalized methodology applicable to all safe assets, using stablecoin pricing data, to measure arbitrage effectiveness in stablecoins. I further show that the declining collateral value and increasing marginal trading costs in Terra's blockchain acted as frictions to arbitrage effectiveness. I use order book data to show the microstructure of the run dynamics that followed. I show that liquidity vanished first on smaller exchanges and persisted longest on Binance, the deepest market. Results are consistent with arbitrage-run tradeoff models under extreme arbitrage concentration: unlimited participation supports price correction but amplifies run risk. My results have important implications for the stability of safe assets in general.

## Information Dynamics and Run on Stablecoin: [SSRN Link](#)

*Presentations: University of Sydney SBFC, 9th Rutgers–ATP India Symposium, IIM Bangalore*

*Abstract:* Information costs, borne by both liquidity providers and takers, are pivotal to studying run dynamics. When beliefs turn noisy, market makers price in much higher information risk: the spike in adverse selection signals heightened caution and willingness to quote only at wider spreads. This paper uses extremely granular trade data from major crypto exchanges to estimate hourly adverse selection of various cryptocurrencies around the May 2022 Terra run episode. I show that stablecoins can rapidly transition from information-insensitive to information-sensitive assets. In calm markets, assets like Bitcoin naturally command higher information costs than stablecoins. Terra exhibits very low adverse selection costs among major cryptocurrencies (0.34 bps), behaving as an information-insensitive asset. However, during the run on May 7, its costs surged to 101.9 bps, surpassing those of fiat-backed stablecoins (USDT: 2.5 bps; USDC: 0.15 bps) and even Bitcoin (25.6 bps), signaling severe information asymmetry. I show that flight-to-safety dynamics occur during run episodes in the stablecoin market, similar to the dynamics observed in runs on Money Market Mutual Funds (MMMF).

## The Internet and the Housing Market with Carlos Slawson

*Abstract:* I study the effect of broadband access on the price and availability of mortgage credit. Results of my study suggest that with the increase in broadband access, the interest rate decreases while the loan amount increases. I also analyze whether the broadband usage will increase the competition among the mortgage lenders, but I find no support for this idea. I describe several mechanisms that could be driving the results. Overall, my results shed light on the correlation between broadband access and the housing market.

## WORK IN PROGRESS

---

### Regulation, Market Efficiency, and Risk Segmentation in Bitcoin

*Abstract:* I examine how two opposing regulatory shocks—China’s cryptocurrency ban restricting market access and the U.S. SEC’s Bitcoin futures ETF approval facilitating institutional adoption—affected Bitcoin’s market efficiency and risk structure. Using high-frequency cross-jurisdictional and intra-jurisdictional Bitcoin trade and order book granular data from various exchanges, I analyze price distortions, arbitrage opportunities, trading frictions, and the concentration or dispersion of risk. My initial findings provide empirical evidence on how regulatory interventions shape decentralized markets, influencing price synchronization, liquidity, and risk structure of Bitcoin. This study contributes to the literature on financial regulation and market microstructure, offering insights for policymakers and investors.

## PUBLICATIONS

---

**Valuation when disaster risks increase at an increasing rate**, with Kelly Pace and Rajesh Narayanan, *Economics Letters* Volume: 224 (2023) ISSN: 0165-1765.

**An exposition on Friedmann cosmology with negative energy densities**, with Robert J. Nemiroff and Bijunath R. Patla, Published in *Journal of Cosmology and Astroparticle Physics*, Volume 2015, June 2015.

## LSU TEACHING

---

FIN 4910: Introduction to FinTech and DeFi – 20 students. (3.6/4)

FIN 3715,3716: Corporate Finance – over 400 students. (3.1/4)

FIN 3826: FUND OF ASSET MGMT – 13 students. (3.3/4)

FIN 7708: FINANCE ANALYTIC – 80 students (current class) Currently Teaching

## AWARDS

---

Louisiana State University: *Doctoral Scholarship, Manuel Miller Scholarship*

Kendriya Vidyalaya Rank 2: National Math Olympiad

Awarded Rs 10000 for Math Olympiad by Kendriya Vidyalaya Sangathan (KVS).

## WORK EXPERIENCE

---

**Louisiana State University** — Instructor of Finance 2025 – Present

- Teaching Graduate-level Finance Analytics Course at LSU.
- Working on research projects.

**General Motors: Michigan** — Senior Machine Learning Engineer, ADAS 2021 – 2024

- Developed path planning and localization algorithms, deployed in 1M+ vehicles.

**Ford Motor Company (LUXOFT): Michigan** — Software Engineer 2018 – 2020

- Drove end-to-end data architecture between vehicle systems and cloud platforms.

**Fiat Chrysler Automotive: Michigan-** Product Development Engineer 2014 – 2018

- Worked as a Mechanical Engineer responsible for the product development of exhaust and power-train systems for Chrysler vehicles.

**Cummins: Indiana-**Mechanical Engineer 2014 – 2014

- Worked as a Mechanical Engineer responsible for the product development of high-horsepower engines.

## SKILLS

---

Python, R, SAS, Stata, Machine Learning, NLP, LLMs, Agent-to-agent communication
