

The possibility of Time Travel as travel between dimensions=parallel universes that split periodically to different “frequencies” - “lengths” of space-time

1. Quantum physics recognizes the real possibility of parallel universes [more so after the double slit experiment]. These universes or simulations, operate at a different space-time frequency or different base code, so they exist within the same reality but do not [in most natural cases] interact with each other.

2. I am proposing the theory of universes [or simulations] that periodically split from others [from a universe closer to the “base” universe]. These splits probably occur from time to time and under special conditions [possibly in case of proximity to the effects of a black hole]. A minute in our [U1] universe could equal 60 minutes in the U2 universe. A second that passes us quickly by, could pass in a minute in U2. Plus, space would be “built” on another frequency – on a different “code base”, thus our 2 universes never interacting [maybe only in very special conditions- if future generations could figure them out- they could build machines to replicate these conditions and thus travel between universes. Maybe this space-time travel can only occur during special periodic cosmic conditions]. Perhaps a split occurs only in conjunction to physical cosmic event and a spiritual- evolutionary event.

The split and past replication between parallel universes [or simulations] are probably not continuous- creating trillions of universes every minute, because this would be redundant, and nature uses its energy, forces and phenomena in an efficient way [view Occam's razor and Fresnel's razor]

https://he.wikipedia.org/wiki/%D7%AA%D7%A2%D7%A8%D7%95_%D7%A9%D7%9C_%D7%A4%D7%A8%D7%A0%D7%9C

3. The famous paradoxes we read about and see in movies, where someone meets his past self or when someone goes back in time and kills his ancestor, thus making his existence illogical- are mute in this theory.

Once the split occurs- the past of both universes are the same [replication of the "base" universe] but the present and future will always be different [in however slight a way].

Going back in time from U2 universe to U1 universe and killing whoever, won't have any effect on the lives of the [now separate] U2 universe. A time traveler will have "no skin in the game".

4. This is related to spiritual and various religious teachings. So called "angels" who come to visit [in the Holy Scriptures and the Bible] could be visitors from a more advanced [spiritually and physically] human civilization from the future parallel universe.

This theory also relates to various ancient teachings [Buddhist, Hindu etc.] that speak of the journey of the soul to ascension, nirvana etc.

Sighting of "aliens" could be our future species from a parallel space-time universe. These "time travelers" would take great care not to intervene in our universe except on important occasions [for our sake- not knowing how even minute interactions would affect our future (but not theirs)], thus "alien" sightings would be few and partial.

I realize this sounds like science fiction but:

1. It is backed and based on physical science.
2. One must not fully reject these notions just because they are not mainstream or seem incredible. Our universe, and the whole of creation is much greater, perfectly simple and amazingly complex, than any science fiction story that could ever be written.

Take care of yourselves. Be well...
