Co-Founder & CEO
MBA, MN, RN, NE-BC

Jade and **Llyod**, two experienced registered nurses having little engineering knowledge contacted **Silstone Health** with the idea of launching a software-as-a-service platform - PlusRN focused on accelerating clinical nursing development.

In the early stages of **PlusRN**, we thought we could design and code our products by ourselves. After creating a prototype and testing it, it was clear **we needed a professional team with the expertise and experience to help us reimagine our apps and take us to the next level.**

That is when we found **Silstone Health** and they were the perfect fit! As a team of nurses developing technology for nurses, we needed our software development partner to understand the world of inpatient care.

Silstone's diverse background in developing healthcare technology for all types of healthcare professionals made the onboarding process of our project very seamless. They understood what we were trying to accomplish and they were able to devise an actionable plan.

There was an instantaneous comfort level with their team and we trusted they could guide us through all of the development steps and ensure we didn't make any missteps. Their communication was always timely and they were flexible to meet with us when we were available.

As our company continues to grow, we will remain with Silstone Health. **We truly believe we have found our long-term software development partner!**

Jade Chase

Requirements

The Solution included real-life experiences described by nurses, with physician and peer oversight, that will be educational and guide a clinical nursing practice.

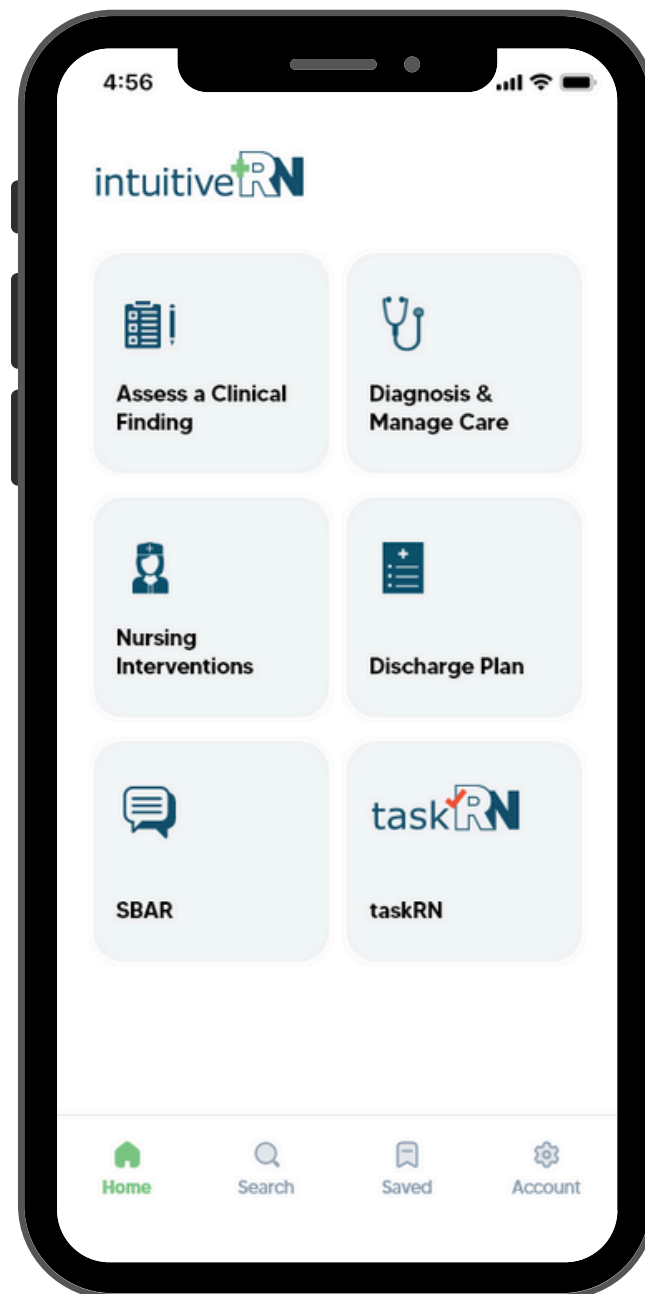

The client believed, experienced nurses often develop an intuition that allows them to excel in their profession and provide the highest level of patient care. They wanted this intuition to be incorporated into the form of a functional platform.

We made it happen by building an education platform backed and supported by 2 user-facing mobile applications. Introduced search hints as nurses assess unfamiliar clinical findings. Provided link assessment data to a clinical diagnosis, build a plan of care, and perform nursing interventions. Also introduced a SBAR tool to keep communications succinct.

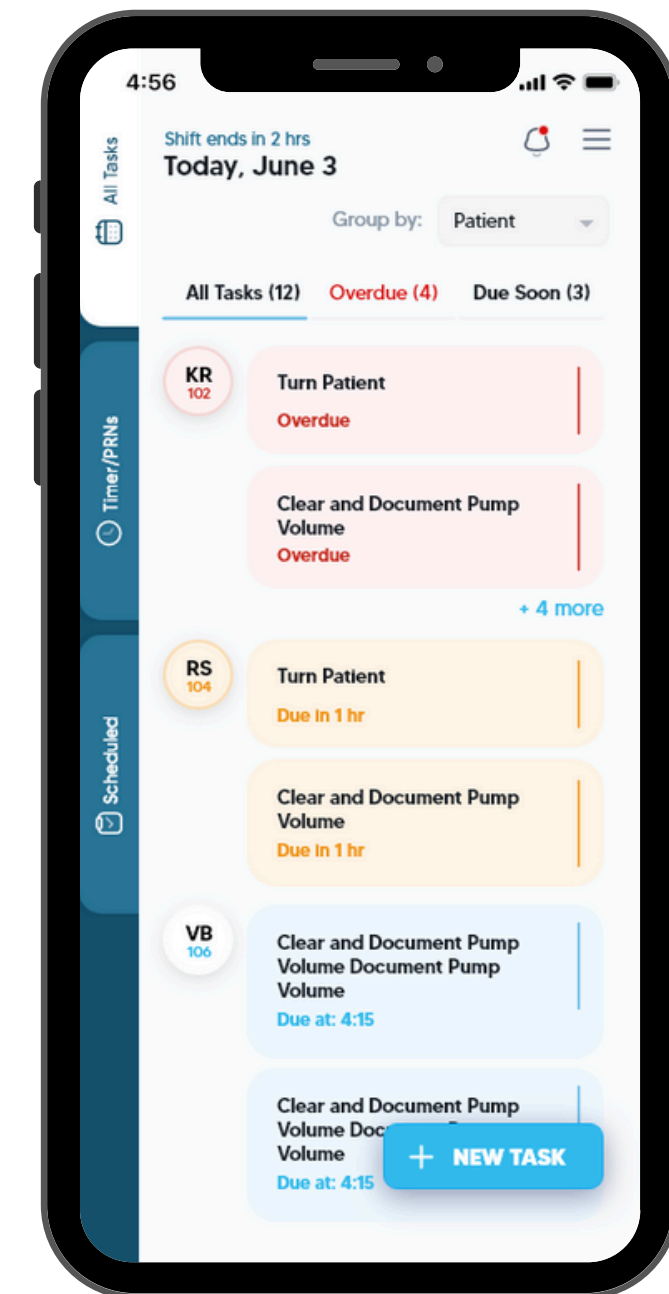

Scope of work

We built two mobile applications, PlusRN and TaskRN, to support the operational needs of nurses in inpatient facilities.

While PlusRN helped closed the education gaps.

Task RN focussed on the operational gaps such as patient management, scheduling tasks and managing shifts.

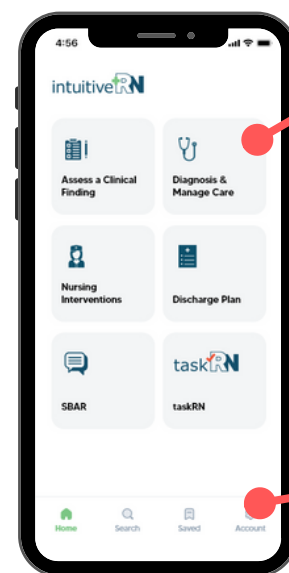

Design

Healthcare-focused mobile app, designed to be clean, minimal, and to the point.

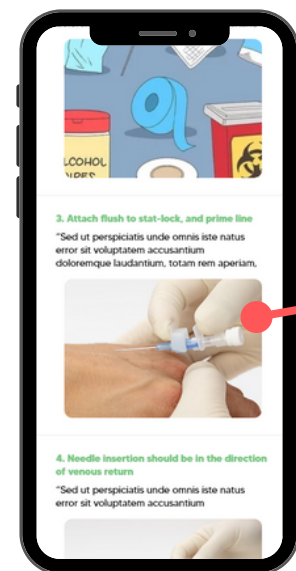

Tutorial shows the user what to expect

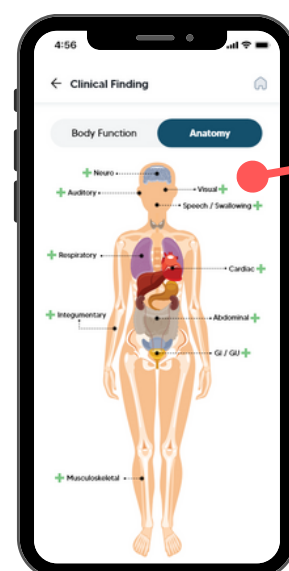

The UI is easy to read, augmented by icons

Quick access menu for easy navigation

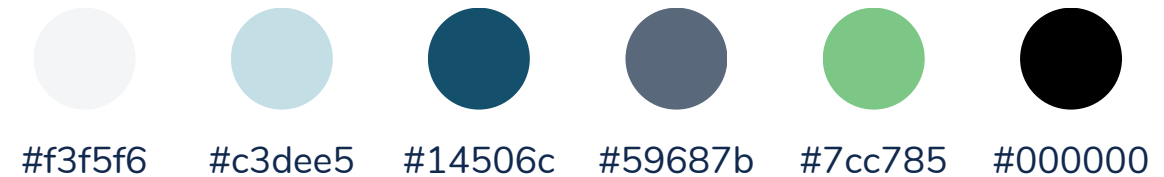

Use of custom images where necessary

Interactive visual representation for easy recording of clinical findings
