OUR PRODUCTS:

GRANITE

Granite is a coarse-grained igneous rock primarily composed of quartz, feldspar, and mica. It forms from the slow crystallization of magma beneath the Earth's surface. Granite is known for its durability, strength, and aesthetic appeal, making it a popular choice for construction and decorative purposes, such as countertops and monuments.

MARBLE

Marble is a metamorphic rock that originates from limestone. It is primarily composed of calcite or dolomite crystals and is formed through heat and pressure over time. Marble is known for its fine grain and ability to take a high polish, making it a popular material in sculpture and architecture.

SANDSTONE

Sandstone is a sedimentary rock composed mainly of sand-sized mineral particles, primarily quartz and feldspar, cemented together by mineral matter, such as silica, calcium carbonate, or iron oxide. It is characterized by its layered appearance and can vary in color, texture, and porosity.

LIMESTONE

Limestone is a sedimentary rock primarily composed of calcium carbonate (CaCO_3), usually in the form of the mineral calcite. It can form through biological processes, such as the accumulation of shells and coral, or through chemical precipitation from water. Limestone is typically light-colored, ranging from white to grey, and can contain various impurities that give it different hues and textures.
