

## Web3 TLDs: Decentralized Domains with Utility

Forget dot com. These are dot mission.

---

### Core Concept:

Each TLD represents:

A functional module of Web3MAP

A mintable namespace (ENS-style)

A token-gated gateway to NFTs, missions, tools, and maps

Subdomains (like max.web3map or trees.mintstation) become:

User-owned portals

Smart contract identifiers

Token-claim anchors

DAO governance units

---

### TLD Breakdown

---

#### .web3map

> The meta-layer. Identity + location + dashboard.

Own your map: berlin.web3map, max.web3map

Shows your GeoNFTs, Drop.me inbox, rNFT layers, SDG score

Token-gated subportals (e.g., DAO map, affiliate links, quests)

ENS logic + NFT logic = place-bound profiles

---

 .mintstation

> The physical world meets Web3. Airdrop portals everywhere.

Each subdomain = a minting terminal (QR-linked, location-tied)

streetart.mintstation, station5.mintstation

Used in shops, city tours, festivals, campaigns

Can be embedded in posters, AR apps, or smart poles

ZK-enabled mint trigger (POP required)

---

 .opengeodata

> The civic and scientific spine.

Hosts verified layers: CO2 zones, pollution data, SDG heatmaps

hamburg.opengeodata, co2tracker.opengeodata

Public-private projects stake GeoNFTs and stream updates

AI agents (POSI) access open layers for decision-making

Replaces opaque ESRI stacks

---

 .latinoamerica

> A glocal expansion zone.

Regional branding, campaigns, and community governance

mexico.latinoamerica, rio.latinoamerica

Use with NGO missions, urban pilots, rural development

Spanish/Portuguese onboarding layer + SDG mapping

Could use regional token variant (optional)

---

 .liveweather

> Real-time geo-oracles for impact NFTs

stormwatch.liveweather, uganda.liveweather

Binds weather data to dynamic NFT states

Great for climate data drops, local resilience games

Auto-updates rNFT layers depending on live sensors

Could link to DePIN nodes (e.g., Helium-style)

---

☕ .basedcoffee

> Web3 native culture & meme commerce

maxsroast.basedcoffee, degencafe.basedcoffee

Mints as vouchers, rNFTs, and event triggers

Used by local businesses (IRL verification + token drop)

Could also serve as Drop.me campaign domains

Fun, meme-worthy, product-tied Web3 on-ramp

---

🏠 .geoconsult

> B2B & municipal bridge layer

stadtplan.hamburg.geoconsult, uganda-sdg.geoconsult

Interface for consultants, planners, GIS firms

SDGquest deployment, GeoDAO voting setup

Connects QGIS workflows, token-based incentive logic

Used in public tenders, EU pilots, UN missions

---

## Tech Stack

Follows ENS-compatible or CNS-style registry

Each subdomain is a minted NFT with smart contract logic

Can trigger:

Dashboard access

Drop.me inbox

PoP activation

Token/mission unlocks

Hosted via IPFS + optional cloud/mesh fallback

---

## Strategic Use

Subdomain sales = revenue stream

Custom portals = community + identity layer

DAO-governed registries possible (GeoDAO owns TLD logic)

Integrated with Flashloan-funded onboarding flows

Easy entry point for non-crypto orgs

---

## TL;DR:

> These aren't just domains. They're portals, campaigns, and command centers. You don't just visit a site—you claim your space in the Web3MAP.
