ABSTRACT

The present study was an attempt to investigate the necessity of teaching Iranian seminary students of Hawza Ilmiyya (traditional Shi'a centre, in which clerics are trained by studying classic texts in their original language), English for a specific purpose (ESP) course. Today the world is interested in English. Thus with the emergence of English as lingua franca of technology, education and research in global society, the demand for studying ESP course is increasingly necessary. One of the usages of English language teaching (ELT) is in Islamic seminary schools when they decide to go to other countries to preach Islamic thoughts. In this qualitative and quantitative study, the participants were selected based on the random sampling in Iran. Then the needs of teaching ESP course to 100 seminary students were investigated by means of questionnaires. Analysis of the results showed that it was necessary to teach ESP to seminary students in order to communicate with the communities and to preach Islamic principals.

KEYWORDS: ESP, Seminary students, Hawza Ilmiyya

INTRODUCTION

The most important and widespread language used in the world in international academic conferences to news reports is English. It is used for communication among native as well as nonnative speakers. Even though it does not have the greatest number of speakers in the world, it is the most widely used language in the world, and it will be used by more people in the future (Kitao, 1996).

Background of the Problem

Today, as a result of development in technology, computer and internet, the necessity of teaching English is more tangible. For example the internet is used all over the world as a useful source of information. People use internet in order to gain answers to their questions.

Since the early 1960's, English for Specific Purposes (ESP) has grown to become one of the most prominent areas of EFL teaching today. Its development is reflected in the increasing number of universities offering an MA (master of art) in ESP (e.g. The University of Birmingham, and Aston University in The UK) and a number of ESP courses offered for overseas students in English speaking countries (Anthony, 1998).

As for a broader definition of ESP, Hutchinson and Waters (1987) theorize, "ESP is an approach to language teaching in which all decisions as to content and method are based on the learner's reason for learning" (p. 19).

Tsao (2011) states:

The demand for ESP has led some higher education authorities and administrators in Taiwan to claim that ESP should replace EGP, the long-existing practice of English language teaching in Taiwan's universities, and thus become the mainstream of college English education. The rationale behind their claim is presumably as follows: EGP is basic language learning to be studied before, but not during college; College English should be more advanced, more specialized, and match students' majors of study, particularly in technological universities where students are trained to perform on-the-job; and finally, compared with EGP, ESP is more effective in increasing students' learning motivation because it relates to their fields of study and caters to their needs.(p.127)

There are many types of ESP. English for the student of Hawza Ilmiyya is one branch of ESP which is necessary to be taught and be available among seminary students. In this case it is suffice to say that although the importance of English is widespread in the world and English is a language of communication and transferring culture, this important issue was ignored in some societies and schools. Islamic schools are one of the institutes where there is a lack of ESP which is of great importance and consideration for their students. There were some investigations in this area. Ratnawati (2005) referred to English and Islam as two absolutely different ways of looking at the world, and ELT, as Kermani (2005) pointed is effective in the political relations among countries. In line with Kermani, Aliakbari (2004), pointed to the culturally poor educational materials as the major reasons for weakness of ELT among Iranian high school students or theology schools and seminaries. Thus, these studies concluded that religion as a subdivision of culture doesn't have great influence on English as a foreign (FL) or second language (SL).

The purpose of this study is that Muslim students are required to know English in order to comprehend Islamic English texts without any need to translate them in Persian or Arabic. Also the ability of learning English is an aid for better functioning in responding to Islamic issues. Apart from these purposes, there is another advantage that Muslim students will be able to travel to overseas countries, to convey the message of Islam. As a result, the seminary students are required to know English and to develop the four language skills in order to preach Islamic culture.

The result of this research showed the necessity of teaching ESP courses based on the ESP purposes for seminary students by means of needs analysis of them. This study might be a beginning point for compiling an ESP book for seminary students.

As a result this study is useful for policy makers, teachers and theology institutions in order to compile ESP books in this area and also to prepare a specific methodology to instruct these courses. This study is useful for Islamic schools like Hawza Ilmiyya too. An important point is that today the necessity of learning English language is obvious in all fields of study. After Islamic revolution, teaching and preaching Islamic messages are more than before and Islamic issues need to be international in all over the world. So this research may produce a motivation for Islamic schools in order to include ESP courses in Hawza Ilmiyya.

REVIEW OF LITERATURE

The Importance of English

Talebinezhad and Aliakbari (2011) state that nowadays the necessity of English language teaching is obvious because world has a great interest in English, thus this new orientation made English an International Language (EIL). To overcome the inadequacies of the previous models of language teaching and to meet the needs of the learners, EIL opened new avenues for research and investigation.

Nur Nina (1996) states that English language has an important role as a conveyer of knowledge about Islam to the international community, indicating that there is a vital relationship between the English language and Islam.

Teaching English for Specific Purposes

English for specific purposes is a term that refers to teaching or studying English for a particular career (like law, medicine) or for business in general. This term became popular, when there was an expansion in scientific, technical and economic activities. In this case, Simion (2012) states that since 20 years ago, course designers paid much attention to teaching English for Academic purposes. When communicational technology and business were developed, their attitudes changed to teaching for more specialized purposes embodied in courses called English for Specific Purposes (ESP). In fact this development comes from this fact that English has changed from simply being a foreign language into becoming a universal medium of communication in all walks of life.

Robinson (1991) states that English as a specific purpose is as a type of ELT (English Language Teaching), and as a “goal-oriented language learning” implies that the students have to achieve a specific goal in the process of learning. He also adds that in ESP teaching, needs-analysis and the learners' communication based on their fields of study should be considered.

Helsvig and kolegija (1990) indicate that the aim of Teaching ESP is improving students' skills of professional communication in English based on the area of their professional field. This type of teaching refers to the students' particular specialization.

Teaching English in Islamic countries

Although the importance of English is widespread in the world and English is a language of communication and transferring culture, this important issue was ignored in some societies and schools. Islamic schools are also the institutes where there was rather lack of ELT which is required vitally for the students. In fact peoples' religions should not hinder them from learning a foreign language. There are some investigations in this case. Alonzo(2011) states:

Not only is there a scarcity of teaching and learning materials like books and manuals in teaching English for Theology but there is also a lack of developed curricula and syllabi specially designed for teaching English to seminary students. Most seminaries in the country do not have a curriculum that meets the demands of their growing number of students in need of English proficiency training. (p.51)

There are four elements that are essential in producing teaching and learning materials in English for Theology. It is necessary to consider these elements prior to the production of the ESP material (Alonzo, 2011). He states that these elements are "(1) The problematic theological concepts for Asian seminary students; (2) the common language problems that Asian seminary students may encounter; (3) the language skill/s an Asian seminary student needs for his/her theological training; and (4) the help that an English program can offer to the seminary" (P.68-69). Moreover he suggests that Asian theological students had difficulty in comprehending theological concepts. It was because the students had language problems in reading, writing, speaking and listening in English. In fact the language skills that theological student needed for his/her seminary training was mostly found in the academic use of the English language.

Some Muslims believe that teaching English in their countries equals ignoring Islam (Pennycook, 1994).The establishment of a study in this case has an evidence to reject this claim. In fact a total of a 2000 studies conducted by 409 Kuwaiti undergraduates indicated that, Kuwaiti Muslim students well took positive attitudes toward learning English (Noori, 2012). AL-Seghayer (2011) states "Teaching English as a foreign language in our public schools in Saudi Arabia is an important step to increase our global understanding and competitiveness in an increasingly interdependent and competitive world"(p.1).

Rohmah (2012) suggests that integrating Islamic messages in the English teaching material might prevent students from feeling bewildered and might reduce their tension. Basthomi's (2011) states that it is possible to change the attitudes toward English and we should help students to have better attitude toward English and use English materials with Islamic themes or the lives of the Muslims in English speaking countries. Therefore the main issue is in fact material selection. According to the advice from some Islamic School communities in Indonesia, English language training should be pure, and there should be no interference with the Western values because they have some shortages in moral foundation and the teaching materials should be appropriate to an Islamic educational environment (Indonesia Australia Language Foundation, 2007).

Therefore, (Phillipson, 1992) claims that writers and teachers need to modify English which is an imperialistic language into an instrumental language. As a result, Teachers in Islamic schools can include the Islamic messages in their teaching materials while helping the students to master the targeted English language skills and components.

There is a struggle between the English language and Islam. Harris (1991, p. 90) refers to this struggle as follows "English is not just a language, any more than Islam is just a religion. The names of English and Islam, whatever else they may be, are names of two very big battalions when it comes to the international power struggle for control of the Middle East. "

Farouqi (1986) is one of the scholars who adopt the idea of Islamization of English. Farouqi (1986, p. 7) investigates the development of Islamic English and defines Islamic English as "the language modified to carry Islamic proper nouns and meanings without distortion and thus, to serve the linguistic needs of Muslim users of the English language". In fact it is evident that Farouqi's Islamic English is a method of reappropriating English in order to serve Muslim needs.

ELT and It's Necessity in Iran

Since English is considered as a dominant language all over the world, it is used for foreign trade, international conferences and the like. It is a means of communication. Today the necessity of teaching English is obvious for all the nations and Iran is no exception. Noori (2012) states that the necessity of English in the outer world is beyond the mind, because English is the dominant language of foreign trade, international conferences, for air traffic in international airports, and sea navigation. Therefore, governments have a policy in order to promote the export of non-oil products. In this case they make companies and exporters take advantage of this medium to introduce their goods and products to the world market. So far, English seems to have found its way right into the heart of Iranian society. The Iranian national TV has started broadcasting authentic foreign programs." Iran's cooperation with UN, Islamic conference relations, ECO, OPEC, and other regional and world organizations has made English an important thing "(Aliakbari, 2004, P.1-14). Moreover Iran has some relationship with English-speaking Countries such as US and UK.

Today the necessity of learning English language is obvious in all fields of study. After Islamic revolution, teaching and preaching Islamic messages are more than before and Islamic dogma need to be international in all over the world. So this research may produce a motivation for Islamic schools in order to include ESP courses in Hawza Ilmiyya.

As a result teaching English is required in all nations especially in Iran that need to cooperate with other countries and also to attend in Islamic conferences.

RESEARCH QUESTIONS

1. Do seminary students need ESP courses?
2. What are the needs of the seminary students of Hawza Ilmiyya in studying an ESP course?

METHODOLOGY

Introduction

The present study was a qualitative and quantitative one. The method of this research is descriptive. In this study one type of a questionnaire was prepared based on the ESP purposes, the seminary students' needs, the Idea of the people who worked in Hawza Ilmiyya and the experienced teachers of Hawza that they are familiar with the Islamic contexts teaching, and was given to three groups in order to analyze their needs. The groups under study included seminary students, their professors, and the people working in Hawza Ilmiyya. They were selected by random sampling. Also five Hawza Ilmiyya in Iran were chosen by random sampling as follow: that of Mashhad, that of Qom, that of Jahrom, that of Tehran and that of Esfahan. The researcher managed to analyze the needs of these groups to find out the necessity of teaching ESP courses in Hawza Ilmiyya.

Participants

In this research a random sampling technique was applied. The total samples were 100 seminary students from Iran. It is obvious that Iran has many cities and each one has many Hawses in it. First, the researcher selected five city of Iran based on random sampling. Second, she selected the main Hawza from each five city, and then she chose 20 seminary students from each of these five Hawses. So the total number reached 100 seminary students.

Instruments

The instrument used in this research was the questionnaires in collecting the data about the needs of the students. These questionnaires were prepared based on the seminary students' needs and the Idea of the people who worked in Hawza. In this case, the researcher consulted with the experienced teachers of Hawza that they are familiar with the Islamic contexts teaching, then according to their guidance, the nature and contents of the questionnaires were prepared. The teachers were also proficient in English language. They were as missionaries to preach the Islamic messages and they wrote Islamic books in English for other countries in this regard. In the next section there are some points about checking the validity and reliability of the questionnaire.

Procedures

English teaching tailored for the seminary students of Hawza Ilmiyya is one branch of ESP. In fact seminary students required to know English to be able to convey the messages of Islam directly. As a result the researcher provided questionnaires to find out the necessity of teaching English in Islamic schools.

In this case, the researcher consulted with the people who were affiliated to the Islamic schools like the teachers, the people who work there and the seminary students. She spoke with the experienced teachers and professors of Islamic schools especially those who had PHD degrees. The researcher gathered their opinions and suggestions and examined them. In addition she used the Idea of two groups of males and females, because the attitudes of these two groups toward this issue were different. Also she considered the Idea of the people who did not know English

but they had a great knowledge in this case. The researcher also studied ESP texts and used their main points for this purpose.

According to the obtained information from ESP books and the opinions of the think tanks, the researcher prepared a number of points about ESP. Then she selected some of them as the questions of the questionnaires. The selected questions contained all the necessary points of this study.

Being prepared, the questionnaires were given to one group of students as pilot study. Then the results of piloting were analyzed using SPSS and a kind of reliability, Cronbach's alpha was obtained. As a result it was concluded which questions were suitable and good and which ones weren't. Also it was realized which one was difficult and had to be omitted.

For validating the questionnaires it was better to consider the answers of the questionnaires after piloting, as a result it was concluded that if these answers covered the purpose of the research or not. And if these questions were expressive of the main purposes of the research, it would show the necessity of teaching ESP for seminary students.

When the reliability and validity of the questionnaires were computed, it was the time of distributing the questionnaires in five cities of Iran: Qum, Esfahan, Tehran, Jahrom and Mashhad. The participants from these cities selected based on random sampling. The cities were themselves selected based on random sampling too. After selecting the participants, the researcher distributed the questionnaires. So they were given to the seminary students, their teachers and the people who work in Hawza. Finally, the researcher analyzed the needs of the students based on their answers by means of SPSS. So the researcher found out whether teaching ESP is needed in Hawza Ilmiyya or not.

RESULTS AND DISCUSSION

Statistical analysis of the questionnaire

Reliability

Table 1 show the reliability of the items. Reliability is about consistency in the results of the measurement.

Table1: Reliability statistics of the questionnaire

Cronbach's Alpha	N of Items
.948	37

Table 1 demonstrates that in this study, cronbach alpha is .94. This result shows a good reliability and no item was decided to be deleted.

Validity

In this study the researcher used content validity and construct validity. Content validity of the items is distinguished based on the opinion of the specialists in the ESP courses, also ESP books and theories in this case help the researcher to provide a suitable and appropriate items. Construct validity is distinguished by applying factor analysis.

Factor Analysis results

Table 2: statistical factor analysis of the questionnaire: Rotated component matrix

	Component					
	1	2	3	4	5	6
p16	.952					
p13	.952					
p15	.952					
p18	.952					
p30	.794					
p14	.645					
p1		.945				
p6		.945				
p12		.945				
p11		.856				
p7		.592				
p17						
p10			.884			
p8			.884			
p9			.693	.586		
p21			.624			
p24

p28						.599
p29						
p4						
p31						
p37						

Table 2 shows the rotated component matrix which is a matrix of the factor loadings for each variable on to each factor. In fact rotation is a method used to simplify interpretation of a factor analysis. Numbers in this table show the degree of relationship between factors and their variables. The high degree of these numbers like .9 and .8 indicate the high relationship between the variable and its factor.

There are several things to consider about the format of this matrix. First, factor loadings less than .6 have not been displayed because we asked for these loadings to be suppressed. Second, the variables are listed in the order of size of their factor loadings. Before rotation, most variables loaded highly on to the first factor and the remaining factors didn't really get a look in. However the rotation of the factor structure has clarified things considerably: there are six factors and variables loaded very highly on to only one factor.

The next step is to look at the content of the items (questions) that load onto the same factor to try to identify common themes. Factor 1 contains p13, p14, p15, p16, p18 and p30. they are related to the same theme as "the needs of the seminary students to learn English", that it has shown by h1. Factor 2 contains p1, p6, p7, p11, and p12. It indicates "the necessity of teaching English in Hawza Ilmiyya" and it is shown by h2. Factor 3 contains p8, p9, p.10 and p21 that refer to "the importance of learning English in preaching Islamic culture". It is showed by h3. Factor 4(h4) contains p9, p19, p20, p.22 and p34 that refer to "the importance of the students' needs analysis in teaching and compiling an ESP book". Factor 5 (h5) contains p2, p3, p.5, p.26, p.27 and p36 that refer to "the importance of the relationship between the materials of the ESP books and the students' needs and interests". Factor 6 (h6) contains p23, p28, and p33 that refer to "the importance of the syllabus in learning English".

In fact all the questions in each factor are related to each other and also to their factors. These factors are the main purposes of this study. According to these factors and analyzing their components that how these questions are answered by the participants and also what their frequencies are, it is concluded that most of the participants agree with these factors and have positive attitudes about them. So the research questions are answered.

Chi-square

This table shows the result of chi-square in SPSS for the items of the questionnaire.

Table 3: Statistical analysis of Chi-Square Tests

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	568.715 ^a	36	.000
Likelihood Ratio	559.841	36	.000
Linear-by-Linear Association	13.079	1	.000
N of Valid Cases	3700		

a. 0 cells (0.0%) have expected count less than 5. The minimum expected count is 27.59.

Table 3 show a list of assorted chi-square tests, most of which are of no interest to us. The one we should pay attention to is the first one, i.e., the Pearson Chi-Square statistic. Reading across that row show that the chi-square value is 568.7 with 36 degree of freedom. The next column notes that the probability of getting this sort of result on the basis of chance variation alone is 0 (p-value = 0). In this column, Asymp. sig (2-sided) show that how these two variables are dependent. When p-value is zero, as a result the hypothesis "Teaching ESP course for the Iranian seminary students of Hawza ilmiyya is not necessary" is rejected and also two variables are related. As a result, significance reported by the statistics is less than .05; we can reject the null hypothesis and accept that the difference between items is not accidental.

CONCLUSION, IMPLICATIONS & SUGGESTIONS

Conclusion

According to the results of the present study it is concluded that today teaching English is necessary and this course is of a great importance all over the world. Based on the results of the study and analyzing the answers to the questions showed that these Islamic schools have a great need to syllabus for teaching English language. Also they need to prepare some ESP books in this case and a good method of teaching for seminary students.

Pedagogical Implications

Based on the findings of this study and the review of literature, we find out the importance of teaching ESP in Islamic schools. Now, the necessity of teaching this course is obvious considering the scope of ESP teaching and learning expanding all over the world. As the present research is a novel study that indicated the necessity of teaching ESP in Islamic schools to the seminary students to communicate with other communities and to preach Islamic principles. Hopefully this research may produce a motivation especially for Islamic schools in order to include ESP courses in Hawsa Ilmiyya.

Moreover these courses should be compiled under the supervision of EFL specialists in cooperation with the Islamic schools' principals. An important point is that this course should be a compulsory course in Hawsa Ilmiyya. In fact seminary students should study in this course the same as their other courses in Hawsa Ilmiyya and the ESP teachers are needed to be trained to teach in Hawsa.

Suggestions for further studies

Based on the results of the study, the following are recommended:

- (1.) Today other societies also need religious and they feel this need obviously. As a matter of fact, seminary students should themselves be aware this necessity. So, when they get aware of this requirement among the western societies, they will try to teach their language and culture to communicate with them and convey the messages of Islam. For this purpose they themselves should follow ESP. Also they should follow the main purpose of ESP that is teaching speaking, listening, writing, and reading.
- (2.) Include English for seminary students as a field in itself and make it a part of the ESP categorization.

(3.) Researchers should investigate upon developing teacher training affairs and specialization in ESP issues.

(4.) More teaching English materials for seminary students should be developed. These should be culturally considered and relevant to the multicultural classes in seminaries. Writers of such manuals or books should endeavor to create teaching materials in English for seminary students that are culturally relevant, transferable, reproducible, publishable and affordable in the Asian context.

(5.) It would be useful to have some investigations in preparing a special syllabus for this group of students.

(6.) It is necessary to instruct some teachers for teaching ESP course for this group of students.

(7.) It is better to compile an ESP book for seminary students and if these ESP books exist in the market, it will be necessary to do some investigations whether they are suitable for this group or not.

Limitations

The study has several limitations. First, the participants were dispersed in all the cities of Iran, consequently the researcher didn't have access to all of them because of the long distance and it was also difficult to gather all the participants in one place in order to give them the questionnaires. For this purpose, the researcher decided to provide a situation and divided the participants into some groups. Then she gave the questionnaires to one group of participants, which was chosen randomly, from Islamic schools of Qum. Also she sent the questionnaires to the second group of participants in Mashhad by mail. The third group answered the questionnaires by means of e-mail. Another problem that hindered the researcher was that the Islamic schools had different attitudes toward these questionnaires and most of them were reluctant to fill out the questionnaires fearing their belief would be attacked by western diverted cultures. As a result it was necessary to discuss with their administrators and refer them to the speeches of some prominent Islamic leaders such as Imam Khomeini. In convincing them, the researcher suffered a lot and finally they accepted to cooperate and filled questionnaire.

ABSTRACT

This article investigates learner autonomy, foreign language learning, Web 2.0 technology and sociocultural theory (SCT) proposed by Vygotsky (1978). More specifically, the article seeks to examine the development of listening proficiency through dynamic assessment via Skype in Iranian autonomous/non-autonomous English as a foreign language (EFL) learner at elementary level. The article showcases that online dynamic assessment (DA) informs the instructional process regarding specific areas where learners need improvement and in so doing allows for appropriate intervention to help learners overcome these problems. The results of the study indicate that DA via Skype permits to establish not only the actual level of learners' listening ability but also to examine the potential level of their listening development. The results also prove that both autonomous and non-autonomous learners equally benefit from DA via Skype.

Keywords: learner autonomy, dynamic assessment, listening comprehension, Skype

INTRODUCTION

Dynamic Assessment (DA) is a process-oriented/interactive approach to conducting assessments that is based on the Vygotskian principles of mediation and assistance in the zone of proximal development. DA offers learners assistance whenever necessary during the performance of the assessment task through collaborative dialogue. At the heart of Vygotskian and sociocultural approaches to language learning and DA are the concepts of mediation and social learning (Lantolf, 2000; Lantolf & Thorne, 2006). These key components of DA have taken on special relevance with the advent of social networks and online communities through web 2.0 technologies that include an increased emphasis on user generated content, data and content sharing and collaborative effort.

Traditional assessment offers no scaffolding or social support for learning. Data from DA, by contrast, represents both the process and product of students' learning. DA is administered by an examiner who provides scaffolding, social support for learning, and intervention when a student fails. In other words, whereas traditional assessment measures independent performance (i.e.,

product), DA measures both independent performance and assisted performance (i.e., process). Independent performance is what the student can achieve alone; assisted performance is what the student can achieve with the help of the examiner.

DA, an interactive, test–intervene–retest model of psychological and psycho-educational assessment, gives the examiner the chance to form a closer relationship with the student that will foster learning. In DA, the examiner not only gives performance-contingent feedback, but offers instruction in response to student failure to alter or enhance student achievement.

Learner Autonomy

Learner Autonomy has been a buzz word in foreign language education in the past decades, especially in relation to lifelong learning skills. For a definition of autonomy, we might quote Holec (1981: 3, cited in Benson & Voller, 1997: 1) who describes it as "the ability to take charge of one's learning." On a general note, the term autonomy has come to be used in at least five ways (Benson & Voller, 1997: 2):

- for situations in which learners study entirely on their own;
- for a set of skills which can be learned and applied in self-directed learning;
- for an inborn capacity which is suppressed by institutional education;
- for the exercise of learners' responsibility for their own learning;
- for the right of learners to determine the direction of their own learning.

One of the key aspects to consider in defining Learner Autonomy is whether we view it as a means to an end (learning a foreign language) or as an end in itself (making people autonomous learners). These two options are not mutually exclusive, both of them can be part of our views towards language learning or learning in general. As Lacey (2007) puts it, principles of learner autonomy could be:

- Autonomy means moving the focus from teaching to learning.
- Autonomy affords maximum possible influence to the learners.
- Autonomy encourages and needs peer support and cooperation.
- Autonomy means making use of self/peer assessment.
- Autonomy requires and ensures 100% differentiation.
- Autonomy can only be practiced with student logbooks which are a documentation of learning and a tool of reflection.
- The role of the teacher as supporting scaffolding and creating room for the development of autonomy is very demanding and very important.
- Autonomy means empowering students, yet the classroom can be restrictive, so are the rules of chess or tennis, but the use of technology can take students outside of the structures of the classroom, and the students can take the outside world into the classroom.

Language teaching is now seen as language learning and it has placed the learner as the center of our attention in language learning education. As the result of such considerations, the researcher considers Learner Autonomy as a variable to see how autonomous and non-autonomous learners differ from each other with respect to DA via Skype.

Theoretical Framework

Scholars assert that DA was originally inspired by Vygotsky's writings, in particular his thinking on the Zone of Proximal Development (e.g. Stenberg & Grigorenko, 2002; Feuerstein, Rand, Jensen, Kaniel & Tzuriel, 1987). Given that this study is conceptualized within the sociocultural theory (hereafter SCT) framework, the following section is exclusively confined to DA grounded in Vygotsky's theory.

Vygotsky regards development as an evolutionary as well as revolutionary process which is not linear and involves both progression and regression. He argued that even if development might contain some regression, it still contributes to general movement forward (Vygotsky, 1978; 1997a), i.e. development is a process that is always pushing individuals forward even if at times it needs to step backward (Lantolf, 2009).

Significance and Purpose of the Study

Despite the fact that the development of listening proficiency has been generally recognized as a crucial component of foreign language learning and teaching, many scholars contend that listening comprehension is often treated as a Cinderella skill of L2 instruction (e.g. Nunan, 1997; Vandergrift, 1997) and that research in this area is still in its infancy (Omaggio-Hadley, 2000:184). Furthermore, a lack of L2 listening studies has been repeatedly emphasized in many reviews of scholarship on the subject over the years (e.g. Ur, 1984; Rubin, 1994; Vandergrift, 2007). As a result, this study aims to apply DA via Skype to L2 listening instruction and takes a further step to investigate how differently autonomous and non-autonomous learners respond to DA via Skype. In fact this study is an attempt to give learners more chance of social learning by active engagement in exploring the web through dialogic collaboration. In other words, the main objective of the study is to make it possible to observe students' potential level of development and obtain a richer and more complete understanding of students' microgenetic listening development in DA.

Statement of the Problem

The L2 listening studies that have been conducted to date focus mainly on product-oriented investigations of listening comprehension that typically measure listening ability using quantitative research methods (e.g. Field, 2008; Rubin, 1994; Rost, 2002; Vandergrift, 1998, 2007). In this respect, Vandergrift (2007) remarks that quantitative approaches are able to tell us something about the product, i.e. the level of listening success, but they tell us nothing about the process; i.e. how listeners arrive at the right answer or why comprehension breaks down (p. 192). For this reason, Vandergrift claims that there is a pressing need for studies exploring listening processes through qualitative methods. As Vandergrift (2007) cogently puts it: "[...] listening processes are complex and they interact with different knowledge sources, human characteristics and other contextual factors in complex ways. These processes and their interactions need to be explored using in-depth qualitative methods to better understand how L2 listeners attain successful comprehension" (p. 206).

At the level of assessment, there has been published a relatively small number of studies that consider the assessment of listening ability (e.g. Ur, 1984, Buck, 2003; Flowerdew & Miller,

2005; Field, 2008). While discussing the purposes and the types of L2 listening tests (e.g. achievement, placement tests), Buck (2003) as well as Alderson (2005) articulate the acute need for the creation of new diagnostic listening assessments that will identify specific areas where learners need improvement, and in so doing will better inform the instructional process regarding learners' listening abilities.

Thus, the present study intends to address the afore-mentioned concerns articulated in recent L2 research by applying DA to listening instruction. That is, the study seeks to investigate the effect of DA-based instruction on the development of listening ability in Iranian autonomous/non-autonomous learners at elementary level. What is noteworthy is that due to its reliance on mediated dialogue during the testing procedure, DA permits not only the diagnosis of specific sources of difficulty but also provides insights into the process of listening and promotes listening ability by tracking its development through microgenetic analysis, a specific qualitative method, proposed by sociocultural theory.

2. Review of Literature

Sociocultural theory (SCT) understands humans as "fundamentally socially organized entities" (Lantolf, 2007: 32) who learn to become autonomous by being social. For this reason the SCT paradigm "rejects the encapsulated and autonomous individual privileged in information processing and innatist theories" (Lantolf, 2007: 32) that do not take account of the fundamental role the sociocultural environment plays in human development. Within the SCT framework, it is argued that the development of humans "is mediated by others, whether they are immediately present as in the case of parents guiding children or teachers guiding students, or displaced in time and space, as when we read texts produced by others or participate in activities such as work, organized in specific ways by a culture" (Lantolf, 2007: 32).

As Lantolf and Thorne (2006) point out, the SCT framework understands mediation as "the process through which humans deploy culturally constructed artifacts, concepts, and activities to regulate (i.e. gain voluntary control over and transform) the material world or their own and each other's social and mental activity" (p.79). Thus, from the perspective of SCT, humans do not interact directly with the world and the environment in which they live instead, they use culturally constructed artifacts "created by human culture(s) over time and [...] made available to succeeding generations, which can modify these artifacts before passing them on to future generations" (Lantolf, 2000:1). Culturally constructed artifacts include physical tools (e.g. technology, means of transportation, domestic utensils etc.) and symbolic tools (e.g. literacy, mathematics, language, etc.). Physical tools reinforce the power of humans' physical bodies whereas symbolic tools, primarily language, amplify humans' ability "to organize and communicate information and knowledge" while at the same time they "may influence, or regulate in some way, those who are the objects of [their] speaking" (Lantolf & Thorne, 2006: 60). Haywood and Lidz (2007: 42) explain that "mediation is what good teachers and parents do when they promote high levels of mental functioning in their children [and learners]." Thus,

mediation in itself is a simple concept but has tremendous consequences for individuals' intellectual development, which has its beginning in the ZPD. For this reason, the SCT-oriented DA regards the ZPD as the arena of development and places the ZPD at the core of teaching/learning as well as socialization processes.

Indeed, as Haywood and Lidz (2007:74) observe, "nowhere in the field of human endeavors is Vygotsky's concept of the zone of proximal development more relevant than in education." Vygotsky maintained that the driving motor of intellectual development is learning which creates the ZPD and which in turn triggers internal processes of development. In his writings, Vygotsky repeatedly highlighted the idea that instruction would not be necessary if it were not the source of intellectual development (e.g. Vygotsky, 1986, 1987). He claimed that instruction is good only when it promotes development and when it stimulates a range of functions that are ripening within the ZPD (Vygotsky, 1987) and therefore, instruction should be adjusted to the ZPD rather than to the actual level of development (Vygotsky, 1991). Thus, for Vygotsky and his followers, it has always been important to understand how instruction, a socially constructed phenomenon, influences development; what type of instruction can be considered to be positive instruction; and to what extent instruction might promote development.

RESEARCH QUESTIONS

The primary goal of this study is to investigate the role of DA in diagnosing and promoting the development of listening comprehension in a foreign language via Skype. This goal is realized through the following research questions:

- Q1. To what extent can online dynamic assessment via Skype enhance the listening ability in autonomous EFL learners at elementary level?
- Q2. To what extent can online dynamic assessment via Skype enhance the listening ability in non-autonomous EFL learners at elementary level?
- Q3. To what extent does the effect of online dynamic assessment via Skype differ with learner autonomy?

As a result, the hypothesis of this study is stated below:

- H1. Online dynamic assessment via Skype will not enhance the listening ability in autonomous EFL learners at elementary level.
- H2. Online dynamic assessment via Skype will not enhance the listening ability in non-autonomous EFL learners at elementary level.
- H3. The effect of online dynamic assessment via Skype does not differ with learner autonomy.

METHODOLOGY

Participants

The participants, their age ranging between 11 and 15, were selected from among Iranian EFL learners at an English language institute in Tehran, Iran. The present study took in sixty elementary participants. In order to control the participants' proficiency level, an OPT and a

demographic information questionnaire were administered. In this study, two groups of participants were involved, autonomous and non-autonomous groups. The participants, taking the learner autonomy scale, were assigned to the autonomous and non-autonomous groups. Then both groups were taught through DA via Skype.

Instruments

Oxford Placement Test (OPT)

The OPT designed and developed by Allen (2004) was used to determine the participants' proficiency levels. It consists of listening and grammar sections. The listening section consists of 100 items. It took approximately forty minutes to complete the listening test. The grammar section consists of 100 items. Fifty minutes were allotted for completion.

Autonomous Learning Scale

Autonomous learning was measured by using Autonomous Learning Scale developed by Macaskill and Taylor (2010). The scale is a 12-item measure with two subscales measuring Independence of Learning, *I tend to be motivated to work by assessment deadlines*, [item 10] and Study habits, *I frequently find excuses for not getting down to work*, [item 2]. Responses were recorded on a 5-point Likert scale from 1 (*Strongly Disagree*) to 5 (*Strongly Agree*) with higher scores indicating greater levels of autonomy, more independence and more positive attitudes to learning. For the purpose of clarification, the autonomous learning scale used in this study was translated into Persian.

The Design of the Study

The present investigation has a pre-test/enrichment program/post-test design. The specific procedure followed in this study is: first, the learners carry out the recall independently (e.g. NDA sessions) and then they repeat it but with mediation (e.g. DA sessions). In effect, during DA and NDA sessions there are two opportunities to assess microgenetic listening development: independent listening performance and mediated listening performance. The quantitative analysis of independent recall of the propositional content of the selected texts and the qualitative analysis of the mediational process through which the students and the mediator negotiate understanding of the relevant texts are carried out. Through this process the mediator is able to formulate fine-grained diagnosis of learner abilities, including most importantly, their problem areas with regard to listening comprehension. On the basis of the diagnosis obtained through mediated interaction, the enrichment session is organized. The design of the study is outlined in Table 1.

Table 1: Experiment design: assessment and enrichment Program sessions

ASSESSMENT	TASK DESCRIPTION	MATERIALS	MEDIATION OFFERED
Pre-test : NDA 1	1. Listening to a text in L2; 2. Independent oral text recall in L2	Text 1 : An authentic segment (audio format)	None
Pre-test: DA 1	1. Listening to a text in L2; 2. Independent oral text recall in L2 3. Oral text recall in L2 after mediation	Text 2 : An authentic segment (audio format)	Flexible interaction with the mediator
Enrichment program: 4 weeks (two tutoring sessions per week)			Flexible interaction with the mediator
Post-test: NDA2	1. Listening to a text in L2; 2. Independent oral text recall in L2	Text 3 : An authentic segment (audio format)	None
Post-test: DA 2	1. Listening to a text in L2; 2. Independent oral text recall in L2 3. Oral text recall in L2 after mediation	Text 4 : An authentic segment (audio format)	Flexible interaction with the mediator

Adapted from Poehner (2005)

Mediation or Flexible interactions involved researcher's leading questions, implicit and explicit hints, prompts, explanations.

Dialogs as listening materials

In order to provide listening materials that would correspond to the study requirements, it was decided to collect audio dialogs by English native speakers. L2 research regards dialogs as a valuable genre to be used in listening instruction because they represent "one of the few natural conversations conducted for the benefit of non-participants" (Buck, 2003:167). In this respect, the dialogs allow teachers to provide situations in which learners can pick up conversational rules and learn how to carry out conversational interactions.

Text Comprehension Measurement

To measure comprehension, this study implemented immediate oral text recalls. The participants were asked to recall in English as much as they could of what they were listening to with a special focus on the main ideas of the text. Then, the researcher identified the relationship between propositions (idea units) of the original text and the texts of participants' recall. In this fashion, propositions from students' immediate oral recalls that were closely related to propositions from the original text were counted and scored against the list of idea units designated independently by the raters before the study. The number of recalled idea units was viewed as evidence of text comprehension.

Oral Recalls Scoring and Analysis

The oral recalls of the learners were analyzed by the researcher for the total number of idea units (IU) accurately produced and subsequently for the number of main IUs, supporting IUs and details recalled. The recalls were scored against the list of IUs and only the information explicitly stated in the aural text was counted.

Data Analysis

To compare participants' performance on the pre-test and post-test a series of paired sample t-tests was run . An independent-samples t-test was also conducted to compare the posttests of the autonomous and non-autonomous groups.

RESULTS AND DISCUSSION

In this section, a descriptive analysis of the data for the hypothesis has been presented; then, the inferential analysis of the data has also been provided using tables and diagrams. The descriptive analysis of this study consists of a discussion of the mean, standard deviation and the standard error of measurement. Similarly, the inferential analysis of the data in this study consists of calculating the paired-sample t value between the pretest and the posttest of each group. An independent-samples t-test was also conducted to compare the posttests of the autonomous and non-autonomous groups.

Descriptive Analysis of the Data

Findings for Different Groups of the Study

The descriptive analysis of the data for different groups of the study has been summarized below. Table 2 summarizes the descriptive analysis of the data of before-enrichment and after-enrichment scores for the autonomous group:

*Table 2: Descriptive analysis of the data for autonomous learners
(Paired Samples Statistics)*

	Mean	N	Std. Deviation	Std. Error Mean
Pair 1 Autonomous Group				
DA Before	19.37	30	6.419	1.172
Enrichment				
Autonomous Group				
DA After	26.07	30	6.335	1.157
Enrichment				

As table (2) indicates, the mean for autonomous learners before enrichment is 19.37 ($\bar{X}=19.37$) while the mean for autonomous learners after enrichment is 26.07 ($\bar{X}=26.07$). The higher standard deviation of before-enrichment group indicates more variety among the scores from the mean. Finally, the amount of standard error is lower in the after-enrichment group scores.

Table 3 summarizes the descriptive analysis of the data of pre-test and post-test scores for the non-autonomous group:

Table 3: Descriptive analysis of the data for non-autonomous group
(Paired Samples Statistics)

	Mean	N	Std. Deviation	Std. Error Mean
Pair 1 Non-autonomous Group				
DA Pre-test	18.83	30	5.590	1.021
Non-autonomous Group				
DA Post-test	24.73	30	5.382	.983

As table (3) indicates, the mean for non-autonomous group before enrichment is 18.83 ($\bar{X}=18.83$) while the mean for non-autonomous group after enrichment is 24.73 ($\bar{X}=24.73$). The higher standard deviation of before-enrichment group indicates more variety among the scores from the mean. Finally, the amount of standard error is lower in the after-enrichment group scores.

Inferential Analysis of the Data

Findings of the Hypotheses of the Study

The first hypothesis of this study targeted the extent to which online dynamic assessment via Skype will enhance the listening ability in autonomous EFL learners at elementary level. The inferential analysis of the data for this hypothesis has been summarized in the tables below.

Table 4 summarizes the inferential analysis of the data of before-enrichment and after-enrichment scores for the autonomous group:

Table 4: Paired-sample *t* value for the autonomous group (H1)

Paired Differences						
Pair 1	Mean	Standard	Std. Error	<i>t</i>	df	Sig. (2-tailed)
Autonomous Group		Deviation	Mean			
DA Before						
Enrichment – Autonomous						
Group DA	6.700	4.669	.853	7.859	29	.000
After Enrichment						

As table (4) indicates, the observed *t* value for autonomous learners before and after enrichment is 7.859 ($t_{obs}=7.859$) which is much higher than the critical *t* value ($t_{crit}=2.045$ with the level of significance of 0.05 and degree of freedom of 29 $df=29$). This rejected the first null hypothesis of the study which meant that the enhancement of Iranian autonomous EFL learners' listening ability was affected by online dynamic assessment via Skype.

Table 5 summarizes the inferential analysis of the data of pre-test and post-test scores for the non-autonomous group (H2):

Table 5: Paired-sample *t* value for non-autonomous group (H2)

Pair 1	Paired Differences				df	Sig. (2-tailed)
	Mean	Standard Deviation	Std. Error Mean	<i>t</i>		
Non-autonomous Group DA Before Enrichment – Non- autonomous DA After Enrichment	5.900	4.172	.762	7.746	29	.000

As table (5) indicates, the observed *t* value for non-autonomous learners before and after enrichment is 7.746 (tobs=7.746) which is much higher than the critical *t* value (tcrit=2.045 with the level of significance of 0.05 and degree of freedom of 29 df =29). This rejected the second null hypothesis of the study which meant that the enhancement of Iranian non-autonomous EFL learners' listening ability was affected by online dynamic assessment via Skype. Table 6 summarizes the inferential analysis of the data of posttests of the autonomous and non-autonomous groups (H3):

Table 6: Independent samples test for autonomous/non-autonomous learners (H3)

		Levene's Test for Equality of Variances				t-test for Equality of Means		
		F	Sig.	t	df	Sig.(2-tailed)	Mean Difference	Std. Error Difference
Post-test	Equal variances assumed	243	.624	.879	58	.383	1.333	1.518
	Equal variances not assumed			.879	56.522	.383	1.333	1.518

An independent-samples *t*-test was conducted to compare the after-enrichment scores (post-test) for autonomous and non-autonomous learners. The sig. value for Levene's test for equality of variances was more than .05 which meant that equal variances were assumed. The value in the sig. (2-tailed) column was .383 which meant there was no significant difference in scores for autonomous (*M* = 26.07, *SD* = 6.335) and non-autonomous learners (*M* = 24.73, *SD* = 5.382). The magnitude of the differences in the means was very small (eta squared = .01).

CONCLUSION

The results considering the autonomous and non-autonomous groups presented a significant difference between the degree of the development of listening ability in these groups before and after the enrichment program. Therefore, DA via Skype as a catalyzer to facilitate the development of listening ability in elementary EFL learners could be regarded as beneficial. Accordingly, the effectiveness of such a treatment and the facilitative role it played in the development of L2 listening ability could be theoretically inspired by sociocultural theory proposed by Vygotsky (1978, 1986). As Lantolf (2007) suggests SCT understands humans as "fundamentally socially organized entities" who learn to become autonomous by being social. For this reason the SCT paradigm "rejects the encapsulated and autonomous individual privileged in information processing and innatist theories" (Lantolf, 2007: 32) that do not take account of

the fundamental role the sociocultural environment plays in human development. Within the SCT framework, it is argued that the development of humans "is mediated by others, whether they are immediately present as in the case of parents guiding children or teachers guiding students, or displaced in time and space, as when we read texts produced by others or participate in activities such as work, organized in specific ways by a culture" (Lantolf, 2007: 32). Dynamic Assessment which is a process-oriented, interactive approach to assessment is grounded on the Vygotskian principles of mediation and assistance in the zone of proximal development. DA provides learners with assistance every time needed during the performance of the assessment task through collaborative dialogue. At the heart of Vygotskian and sociocultural approaches to language learning and DA are the concepts of mediation and social learning (Lantolf, 2000; Lantolf & Thorne, 2006). These key components of DA have taken on special relevance with the arrival of social networks and online communities through web 2.0 technologies that embrace an amplified emphasis on user generated content, data and content sharing and collaborative effort.

In brief, this article illustrates how listening comprehension can be diagnosed and further development promoted through online DA via Skype within the ZPD. According to the results of the analysis shown in Tables 4.3, 4.4, and 4.5, the hypotheses of the study are rejected. In other words, online DA via Skype led to the development of listening comprehension in Iranian autonomous/non-autonomous EFL learners at elementary level. This is, to a great extent, in line with Vygotsky's ZPD and SCT. The results also showcased that autonomous and non-autonomous learners equally responded to DA.

Limitations of the Study

There are several limitations that need to be acknowledged and addressed with respect to the present study. The limitations described below may also be regarded as orientation for potential future L2 DA research and/or L2 listening. The first limitation concerns the length of the study. Despite the microgenetic nature of the present study, the development of learners' listening ability was tracked only within two-month period of time. The collection of data ended when the learners barely began to showcase some improvements in listening comprehension. Accordingly, further investigation that would track development of listening ability over longer periods would offer more insights and refine our understanding of L2 listening comprehension processes. The second limitation has to do with the extent to which the findings can be generalized to EFL learners. The number of learners participating in this study is rather limited for broad generalizations. Therefore, further empirical evaluations are needed to replicate the findings in different contexts. The future investigations can potentially replicate the design of the present study.

ABSTRACT

The present study was conducted for two purposes: (1) to compare the learners' comprehension ability before and after the implementation of two types of pre-reading activities, guessing reading content from asking pre-reading questions and vocabulary definition, (2) to investigate the learners' attitudes towards the implementation of two pre-reading activities. Research participants consisted of 60 grade- 10 students studying at Omol Habibeh high school in Ilam, Iran. A test of reading comprehension ability was administered to assign the subjects into two groups. The two groups were given different pre-reading activity, guessing reading content from asking pre-reading questions and vocabulary definition, respectively. The research instrument consisted of reading comprehension test (used as pre- and post- tests). The experiment using the two pre reading activities were carried out for 5 weeks two sessions a week. The data was analyzed statistically to identify means, standard deviation, and t-value. It was found that after implementation of the 2 pre-reading activities the subjects performed better in the post-test, at significant level of .05. When compared the results of the 2 pre-reading activities, it was found that the group receiving guessing meaning from pre-reading questions performed better than their counterpart who experienced vocabulary definitions, at .05. It was also found that both groups were satisfied with the activity they experienced. The following implications can be drawn for reading instruction depending on the finding of the study: 1. prior to implementing any pre-reading activity to the reading comprehension class, the teacher are suggested to analyze the curriculum, learners' language proficiency level in order to make a right choice of the type of pre-reading activities. and 2. To make the learner more interested in the reading activity, teachers are advised to select the reading texts that were in the range of interest, or topics related to their everyday life.

KEYWORDS: pre- reading, reading comprehension, post reading

BACKGROUND OF THE STUDY

Reading as a major skill was ignored by pedagogues and researchers for a long period of time. Most of focus was placed on oral skills (listening and speaking). For example, the Audio lingual method which was developed in the United States during world war II when there was a need for people to learn foreign language rapidly for military purposes emphasized the oral skills, ignoring reading and considering it a passive skill which was given no emphasis at all.

When the Audio lingual Method failed in fulfilling its mission ,other teaching methods were devised and put to use. The Cognitive Method in the united states and the communicative Approach in Britain came into being during the late 1960s.Equal attention has been given to the four skills together(listening, speaking ,reading and writing).pedagogues and researchers started to put more emphasis on reading comprehension as a major skill for students of English all over the world.

Reading ,the mother of all study skills ,is a basic tool of learning and one of the most important skills in everyday life(Fry, 1997, p.9).As a matter of fact ,nearly all children begin school with the expectation they will learn to read ,and one of the most important things a child is asked to do is to read . Trelease (1989), perhaps the united states best-known advocate of reading aloud, indicated that by booking a child with reading ,you influence not only his future health and financial circumstances ,but also those of the next generation.

Nowadays English learning is essential because English is the international communication medium. The language is necessary for different activities, including education, politics, and socio-economics (Medgyes, 1994; Mckay, 2002). Its importance is well recognized in Iran. It is the need for curriculum and teaching process revision in order to prepare student for real life application in the information age. The teaching should accommodate the learners' development of the 4 language skills. Reading skill, in particular, is the most important skill in second or foreign language learning (Carrell, 1988). Sookchotirat (2005) suggested that reading skill is the most important skill as it is the basis of all the success in one's life. Good readers can gain more knowledge of any kind from reading. Reading makes the reader more knowledgeable, have wider perspectives and vision. Reading helps the reader get new ideas leading to cognitive development. When the readers transfer what they read to apply with their own idea a new perspective or idea is created. However, there have been problems in English teaching in all educational levels in Iran, including secondary and university level. Graduates of each educational level do not have reading ability they should have. Generally, it can be claimed that the problem was caused by the inadequacy of teaching and learning time. Teaching reading is a continuing process; it should be given continuously from the first to the highest educational level. Teaching reading to learners at very young age is, therefore, the basis for the higher level (Noysangsri, 1988). Chiramanee (1992) indicated that Iranian learners' reading ability was at a low level. It could be resulted from inappropriate teaching method, using outdated teaching techniques, which failed to help the learners understand the content of the reading materials.

Chandavimol (1998) suggested that in general practice of teaching reading, the learners would be assigned a reading task to read by themselves and do the post-reading exercises. In such reading activity, the teacher did not provide any activities that could motivate the reader or achieve better comprehension. Chatwirote (2003) suggested that the teachers could provide reading promoting activities, such as the activities that interest the learners. The activities should contain the reading objectives that suit the learners and teacher's interest. Reading the process of teaching reading, the teacher should have suitable steps of teaching reading. There should be a pre-reading step to prepare the reader before they read the whole material. The instructor should provide them with the pre-reading the learners did not have any background knowledge it would be the teachers' responsibility to provide the background knowledge to the learners in order that they could achieve the most comprehension from the reading. The teachers should provide the learners with various pre-reading activities that help them have certain amount of background knowledge about the reading text because the schema would help the reader get better comprehension (Graves, Watts & Graves, 1994), as shown in the following studies.

Yeeding (2007) investigated the effects of pre-reading activities on learners' motivation and reading comprehension ability. Results showed that the activities subjects were highly motivated, enthusiastic to read. After the experiment, they scored significantly higher. In another experimental study Taglieber, Johnson, and Yarbrough (1988) provided the experiment subjects with 3 pre-reading activities: guessing reading content from pictures, learning vocabulary before reading, and pre-reading question. The control group did not receive any of the 3 pre-reading activities. A pre-test and post-test were administered to both groups. It was found that the experimental subject performed better than the control group. In addition, the reading scores from the reading with guessing reading content from pictures, and pre-reading questioning were better than the reading with learning vocabulary before reading.

Statement of the Problem

Learning English as a foreign language is, undoubtedly, a complex and difficult process. comprehension is the ultimate goal of teaching reading. However, experience of that most students of the 10th grade are poor readers despite their exposure to English instruction for 4 years. Students, obstacles in reading comprehension may be partially attributed to non-linguistic factors such as lack of motivation and interest. Williams (1984) indicated that a teacher who starts the reading lesson by asking his students to read the passage on page sound so and then to answer the questions is hardly likely to motivate them. But a teacher who starts his reading lesson by giving his students a reason to read and providing them with some preparation can certainly arouse their interest in the topic.

Despite the importance and relevance of the pre reading stage in reading comprehension, it is often ignored in traditional reading instruction. Ciclo de estudos (2012) claimed that the following practical preceding activities may help address these problems: 1. Pre-questioning 2. Vocabulary Pre-teaching.

Results from the studies reviewed above made the researcher of the present study realize the significance of applying pre-reading activities in teaching reading comprehension. The present

research, therefore, was aimed at comparing the effects of 2 pre-reading activities-- guessing reading content from learning vocabulary before reading, and pre-reading questioning. In other words, the study would investigate whether the 2 pre-reading activities help the learners get better comprehension and to determine the extent of the effect on the learners' comprehension. It was expected that the results from the present study could be used to improve the learners' reading comprehension.

RESEARCH QUESTIONS

This study aims at answering the following questions:

1. Can and to what extent guessing reading content from pre-questioning, and vocabulary activities help learners improve their reading ability?
2. Which among the two pre-reading activities (guessing reading content from pre-questioning, learning vocabulary before reading) can best improve the learners' reading comprehension ability?

METHODOLOGY

The present study was conducted to compare the learners' reading comprehension before and after the treatment, i.e. learning reading comprehension with 2 pre-reading activities (guessing reading content from pre-reading questioning and vocabulary definitions). It was also aimed to determine the learners' reading comprehension ability improved from experiencing teaching with guessing reading content from vocabulary compared with that gained from learning with pre-reading questioning activities. The learners' attitude and satisfaction towards the 2 pre-reading activities were also determined. The following research elements procedure was included in carrying out to obtain the research objectives.

Design

Among several designs, the one which seemed to fit best for the purpose of the present research was two phase tests for two experimental groups. The statistical procedure used in the study is that of Match T-Test (In fact two Match T-Tests are used: one for pre-reading questioning group and the other for vocabulary group and then results are compared).The Design of this study is:

G1 T1 X T2

G2 T1 X T2

G1 = pre –reading questioning group

G2=vocabulary pre-teaching group

The subjects were selected after results of the Proficiency test and they were randomly assigned to two experimental groups. Participants were given pre-reading activities and the reading comprehension test in their regular English lesson with their regular English teacher. In total there were two classes and a teacher, and then the post test was administered after the treatment.

Participants

The participant in this study were 60 females tenth graders belonging age 15-16 years old Students. The study was conducted in one of the public school of Ilam . A Michigan test is used ,and 60 qualified students were selected to be classified randomly into two experimental groups because of their homogeneity and qualification for complementation of the research administration .Unqualified students Which acquired very different marks omitted. The scores sought from the pre-test were statistically analyzed using T-test for independent samples. The researcher, then, performed the experiment following the research design, one group were taking the reading comprehension with guessing reading content from pre-reading vocabulary definition, and the other taking the course with pre-reading questioning activities.

Instrument

Multiple choice tests and one sentence answer questions and True and False from English book 1,were given to students. Four choices were given for each test of multiple choice. The test items were written based on 5 reading texts. The test was administered to measure the subject's reading comprehension ability twice, before and after the treatment, i.e., once as pre-test and the other as post-test, respectively. In addition to the test of reading comprehension, a questionnaire was constructed to test the learner' satisfaction and attitude.It consisted of 17 test items which were in 5-point likert scale. All the test were designed to tap the subjects opinion and attitudes towards the treatment.

Data Collection Procedures

At the first step ,the researcher took a proficient-test and chose the qualified students to participating in the research and assigned them to two groups as experimental groups. As mentioned before ,the subjects were female gender.

For both the experimental and groups ,the teacher instructed the groups ,which lasted for five weeks, two sessions a week and 60 minutes per session. For G1,the teacher distributed the handouts which included questions for different kinds attached to the reading passage ,then asked some general questions in order to their students infer the main idea of the assigned reading. For G2 ,they introduced the key words and their definition, or using translation when it was necessary to clarify the meaning.

The pre-test and post-test were designed in the same forms for both groups. Each lesson started with a pre-reading activity which lasted approximately 10 minutes and was carried out immediately before the reading task. After the pre-reading activity all participants read independently without advice or help from the teacher and then proceeded with a reading comprehension test which included explicit and implicit (inferential) items. There was no time limit for reading the text or doing the test because the researcher did not consider reading speed a factor in determining the effects of pre-reading activities in this studny. After taking a reading comprehension test ,a questionnaire gives the information about the subject opinion and satisfaction toward the implementation of 2 pre-reading activities.

Data Analysis Procedure

The collected data was quantitatively analyzed. The statistical analysis was performed on two sets of data, as described below, comprehension test taken before and after the treatment, the pre-test and post-test scores, were computed to determine means, standard deviation, percentages, and difference between means or pre-and post-tests of each group. The difference between means of the first group was further compared with those of the second group to determine the significance difference between the two groups. Like the scores on reading comprehension test, the scores obtained from the questionnaire administered to the two subject groups were statistically analyzed to determine means, SD, percentages, differences between means between the two subject groups. The values obtained were subsequently interpreted for their satisfaction level.

RESULTS AND DISCUSSION

Results related to reading comprehension before and after treatment

The reading comprehension test was administered to the two groups before and after the treatment. Group one received a type of pre-reading activity and group two the other type of pre-reading activity as described earlier. The results are presented in Table (1) and Table (2).

Table 1: Reading comprehension ability before and after treatment with guessing content from pre-reading questioning activity (N= 30)

Group 1	Total score	Highest score	Lowest score	X	S.D.	t	sig
Pre- treatment	10	8	3	6.8667	1.81437	7.681	0.000
Post-treatment	10	10	7	8.9000	1.15520		

Table (1) shows that the lowest, highest, and means scores on reading comprehension after the implementation post-test. The obtained results of post-test were found to be significantly higher than their pre-test scores, at sig level=0.05. It can be concluded that the pre-reading activity had positive effects on the subjects' reading comprehension. They scored statistically higher in the post-test than the pre-test.

Table 2: Reading comprehension ability before and after treatment with pre-reading vocabulary activity (N =30)

Group2	Total score	Highest score	Lowest score	x	S.D.	t	sig
Pre-treatment	10	8	3	6.3000	1.48904	4.958	0.000
Post-treatment	10	9	5	7.4667	1.33218		

Table (2) shows that the lowest, highest, and means scores on reading comprehension after the implementation post-test. The obtained results of post-test were found to be significantly higher

than the obtained from the pre-test, at $\text{sig}=0.05$. It can be concluded that the subjects achieved significantly higher scores in the post-test than the pre-test meaning that their reading comprehension ability was better after they had experienced the pre-reading activity. Considering Table 1 and Table 2, it can be concluded that the subjects performed statistically significantly better in the reading comprehension test after they had given the two pre-reading activities (guessing reading content from pre-questioning, and vocabulary activities), at 0.05. In other words, they had significantly higher level ability in reading comprehension. Results related to the effectiveness of guessing reading content from questioning activity and vocabulary activity

Besides investigating the effect of each pre-reading activity on the subjects' reading ability, the present study examined the difference in effectiveness of the 2 pre-reading activities on the subjects' reading comprehension ability. Table (3) shows the results of the comparison between the means scores of the pre-test and post-test of the 2 pre-reading activities.

Table 3: Effectiveness of guessing reading content from questioning activity and vocabulary activity.

Group 1 Difference between means of the pre-test and post-test after receiving guessing reading content from questioning activity		Group 2 Difference between means of the pre-test and post-test after receiving pre-reading vocabulary activity		T	sig
x	S.D.	X	S.D.		
2.0333	1.44993	1.1667	1.28877	2.447	.017

Table (3) shows that the difference between the means scores of the pre-test and post-test of the subjects experiencing the guessing reading content from questioning activity was 2.0333. The difference between the mean scores of the pre-test and post-test of the subjects experiencing the pre-reading vocabulary activity was 1.1667. In other words, the students who received reading comprehension instruction with the guessing reading content from questioning activity gained more reading comprehension ability than the students who received the same reading comprehension instruction, but with the pre-reading vocabulary activity. Therefore, it can be concluded from the results that guessing reading content from questioning pre-reading activity was more effective in increasing learners' reading comprehension ability than vocabulary activity.

Discussion

The actual observations gained from treatment and statistical operation show that the difference between the performances of experimental groups in pre-test and post-test is meaningful, this discussion explains the results of two hypotheses of the study.

- The first hypothesis says that there are no significant difference in students' achievement between first and second applications for the pre-reading activities. Analysis of results provided evidence for rejection of the first hypothesis, and revealed that the use of the pre-reading activities while teaching Tenth Grade students reading comprehension texts

did lead to higher rate of comprehension, because the means of the experimental groups have significantly changed, for pre-questioning group in pre-test ($x=6.8$, $SD=1.81$) changed to ($x=8.9$, $SD=1.15$) in post-test. For vocabulary group in pre-test ($x=6.30$, $SD=1.48$) changed to ($x=48$, $SD=1.33$). Having compared the pretest and posttest scores of both groups, an increase in the post- test mean score of the experimental groups is noted. It can be concluded that the use of pre-reading activities is a valuable gift which teachers can give to their students as an efficient means for improving the students' achievement in reading comprehension texts.

- The second hypothesis states that pre-reading questioning activity does not facilitate reading comprehension better than vocabulary definitions.

The obtained results show that there is significant difference between mean of the two groups. Mean of post-test for G1 ($x=2.03$, $SD=1.44$) and for G2 ($x=1.16$, $SD=1.28$) show that pre-reading questioning was more effective in increasing learners' reading comprehension than vocabulary activity. This finding is consistent with the results of Gebhard (1987) whose study showed that by providing background knowledge on a reading selection, teachers can facilitate successful reading comprehension. It also provides opportunities to gain knowledge as well as recall already existing knowledge, which adds up to their reading experience. Carrell (1984, p. 335) points out that teaching new vocabulary is only effective if it is "integrated with both the student's preexisting knowledge and other pre-reading activities designed to build background knowledge". In addition to this, Carrell (1988, p.244) believes that vocabulary and schemata should be developed by "preteaching vocabulary and background knowledge concurrently". It is possible that if one group received vocabulary pre-teaching and pre-questioning simultaneously, more significant results might emerge. Further research will be needed to clarify this point.

Accordingly, a number of suggestions for teaching reading comprehension are presented based on the above discussion

- Prior to implementing any pre-reading activity to the reading comprehension class, the teacher are suggested to analyze the curriculum, learners' language proficiency level in order to make a right choice of the type of pre-reading activities.
- To make the learner more interested in the reading activity, teachers are advised to select the reading texts that were in the range of interest, or topics related to their everyday life.
- In conducting the reading class, teachers are suggested to give a clear explanation before starting to do each step of the reading comprehension activity.
- In order to incorporate the 2 pre-reading activities into the reading comprehension, the teachers are advised to be cautious with time allocation. The pre-reading activities should not take too much of the class time; rather a larger portion of the class time should be sacrificed to the main reading activities. Also a portion of the time should be allocated to post reading activities.

CONCLUSION

Reading comprehension was more significantly facilitated when reading was preceded by a discussion of the text topic than when reading was preceded by explanation of unfamiliar words to be encountered in the text. In this respect, Gebhard (1987) asserted that “short class discussions before students read can be directed at activating students’ existing knowledge and increasing sensitivity to the content of the reading material” (p. 23). Pre-reading questioning do not only provide an opportunity for students to consider their own experience in relation to the topic of reading, but will also help students “to develop a context in which to read and to develop expectations about what they will find” (Silberstein, 1994, p. 43). Furthermore, students will feel free to voice out their opinions without constraints. This finding is noteworthy because it runs parallel to some empirical evidence in favor of the differential effect of pre-reading activities on reading comprehension (Hudson, 1982; Johnson, 1982; Langer, 1984; Taglieber, Johnson & Yarbrough, 1988; Webb, 2009). This is in accordance with the schema-theoretic view of reading which holds that comprehension depends on readers’ background knowledge of the topic of a given text. Thus, if these readers are faced with highly unfamiliar content, especially materials with many culturally loaded concepts, comprehension will be difficult, if not impossible, due to the readers’ lack of appropriate background knowledge. Particularly, the studies incorporating vocabulary definitions as a pre-reading activity (Hudson, 1982; Taglieber et al, 1988) yielded similar results to those obtained in the present study. In fact, even though Hudson’s vocabulary activity included a prediction component, it did not surpass performance of those who did a read-test/reread-retest activity or a pictorial prediction activity.

Furthermore, Taglieber et al. (1988) explains that the poor performance of the vocabulary group might be due to the fact that the words were not related to the content of the reading selections. In contrast, the definitions of words presented in the pre- reading activity examined in the present study were those appropriate to their use in the reading text. Nonetheless, it seems to be no better than Taglieber et al’s pre-teaching vocabulary activity. One possible interpretation of such findings is that although knowledge of these words meanings was essential for adequate comprehension to occur, heightened background knowledge from the class discussion pre-reading activity made students more able to use context to arrive at a satisfactory meaning of the text even if they are not familiar with certain words in the text. Stanovich (1980), in his discussion of his interactive compensatory model of reading, cites evidence to support the view that contextual information may help readers compensate for poor word recognition. A second possible interpretation of the finding that vocabulary definitions was less effective than the class discussion may be the inadequacy of the set of words explained in the pre-reading activity. It is possible that the nine items presented before reading were not the only unfamiliar words likely to cause difficulty for students to understand the text. More importantly, the emphasis on vocabulary words for this group may have encouraged word-by-word reading, which may consequently have prevented students from using their background knowledge and context to predict the meaning of unfamiliar words and of the text in general, even though they performed better than the pre-test. A third possible interpretation may be found in students’ reactions to each of the two pre-reading treatments. The class discussion appeared to produce higher motivation and a more active involvement of the students in the activity. On the other hand, vocabulary definitions did not seem to be as appealing to students, most probably because it is a familiar technique to them, and also because it did not lend itself to much involvement on their part. Such

findings seem to back up Carrell's (1984) conclusion that "simply teaching lists of words or even words in context is not going to help students relate the new concepts to their old knowledge and to integrate the new words into their vocabularies" (p. 340). Although in the present study, the definitions of words presented prior to reading referred to the meanings intended by the context in which they occurred in the text, they seem not to have improved students comprehension as effectively as the prereading questioning.

In this regard, Hudson (1982) holds that even when words taught in a pre-reading activity are evocative of the content of a passage and may help students make predictions about it, there is no guarantee that this will surpass direct knowledge of the task at hand. In light of this, the vocabulary definitions activity, employed in the present study, could have been more effective if it had included a background knowledge component (Maghsoudi, 2012). In fact, Carrell (1984, 1988) proposed that instead of pre-teaching vocabulary for single reading passages, teachers should be pre-teaching vocabulary and background knowledge concurrently. Similarly, Beck et al. (1982) and Stevens (1982) both suggested that words should be taught in semantically and topically related sets so that word meaning and background knowledge develop concurrently. In contrast to the vocabulary definitions, the class discussion seemed to have had a more facilitating effect on students' comprehension of the text. A plausible explanation is that the information generated by the class discussion may have helped students either create or activate schemata that helped them understand the text. Thus, the discussion was beneficial both to students who already had some knowledge about the topic, in that it raised their awareness of such knowledge, and to students who had no prior knowledge, in that it helped them build awareness of new concepts. In both cases, class discussion seemed to have aroused subjects' interest and motivation through linking the topic of the text to their existing background knowledge. The present study supports Hudson's (1982) and Hammadou's (1991) contention that students may use their background knowledge about a reading selection to override problems they are having with the language. The success of the class discussion condition in the present study adds weight to Carrell's (1984) contention that for a pre-reading activity to be effective, it has to accomplish two main goals: providing background knowledge as well as evoking pre-existing knowledge. It also supports the view of schema theory asserting that activating or building readers' background knowledge prior to reading would improve reading comprehension. In this view, reading is the result of a two-way communication between the reader and the text, achieved through simultaneous interaction of bottom-up information processing and top-down processing. Meaning does not just reside in the text; it is rather constructed out of the interaction between the reader's background knowledge and the text itself. The construction of meaning suffers if a reader does not make effective use of his/her background knowledge base.

ABSTRACT

Hedging is the most important aspect of the linguistic behavior of academic genres. The present study tends to investigate this phenomenon in journalistic language, a discourse type in which hedges occur commonly. The aim of this study is examining English and Persian social, economic and political newspaper editorials to consider the similarities and differences in the frequency of hedging devices in the two languages. 30 news articles, 15 in each language, were randomly selected from the social, Economic and political sections of the leading newspapers published in 2006-2012 in Iran and the United states. The result disclosed that English newspaper editorial use more hedges than Persian ones. English political editorials were more hedged than the economic and social ones, whereas, Persian economic editorials were more hedged than political and social ones. Students can benefit from courses in which they have opportunity to investigate the appropriateness of hedging roles and they will be familiar with the conceptual, cultural, social and psychological factors underlying them. Students who are studying English as specific purpose (ESP), and English as academic purpose (EAP) also will benefit from writing and reading courses if they consider textual hedging devices across various topics.

KEYWORDS: Hedging, contrastive analysis, economic, political and social editorial

INTRODUCTION

Hedging is a basic feature in academic discourse (Rounds, 2002) that enables academic writers to indicate their certainty and doubt towards their statements to show the amount of confidence they put on their claim, and to start a dialog with their readers. Hedging is also used to show the lack of certainty in truth value of the proposition stated by the writers. Through using hedges, writers leave some room for their readers to judge the truth value of an assertion. Hedges are defined as "the means by which writers can present a proposition as an opinion rather than a fact:

Items are only hedges in their epistemic sense, and only when they mark uncertainty" (Hyland 2002, p. 5) the research has provided various definitions for "hedging" or "hedges". Zuck and Zuck (2000) define hedges as "the process whereby the author reduces the strength of what he is writing" in case the reported news turn out not to be true (p. 172) Brown and Levinson (2004), define hedges as "a particle, word or phrase that modifies the degree of membership of a predicate or a noun phrase in a set; it says of that membership that it is partial or true only in certain respects, or that it is more true and complete than perhaps might be expected", 145). Some examples of hedging are may, assume, unclear, and probably. Crismore and Farnsworth (1990) argued that hedging is "the mark of a professional scientist, one who acknowledges the caution with which he or she does science and writes on science" (p. 135).

Vanda Koppel and Crismore (2002), in their investigation of readers' reactions to hedges, concluded that students read hedged texts critically and with enthusiastically compare with the unhedged texts. Varttala (2000) has also emphasized the functions of hedging in research articles as the indicator of textual precision and interpersonal relationship.

The main sources of communication in academic Discourse have generally focused on genre analysis in recent years (Bhatia, 2005; Holmes, 2000; Hopkins & Dudley-Evans, 2002; Samraj, 2002; Varttala, 2001; Williams, 2000). However, these studies mainly deal with the rhetorical purposes that a text is supposed to satisfy. Additionally, there are numerous studies dealing with hedges, as a main element in interpersonal interactional metadiscourse (Myers, 2000; Salvager-Meyer, 2002; Skelton, 2000).

“Hyland (1998) categorized and organized interpersonal metadiscourse markers into five categories that hedges are one of them and actually it is subtypes of metadiscourse markers. In recent years, several studies have focused on hedges and metadiscourse markers. According to Biria&Mehrabi (2014) Persian editorial writers use frequent use of hedges because of their tradition of valuing and abiding by the rules of those in power without questioning them or without expressing uncertainty about social and, especially, religious issues.

On the other hand, the heavy use of hedges by the English editorial writers was related to their being more considerate and polite to their readers. A considerable amount of literature has been published in this regard. These studies indicated that different factors such as culture driven preference, genre-driven conventions and foreign language experience of writers interacted in choosing the interpersonal metadiscourse markers by the columnist.

Besides its major role in academic discourse, hedging has also been used in the context of casual and oral discourse (Coates, 2003; Horman, 2004; Intone, 2003; Stubbs, 2000). However, There have not been many cross-linguistic and cross disciplinary Studies on hedging in the related literature. The limited numbers of studies conducted in this area have shown that there are some variations in the use of hedges across languages (Clyne, 2000; Crismore et al., 2001; Vassileva, 2001; Yang, 2003) and across disciplines (Varttala, 2001).

Hedging has been studied in research articles; the present study aims to survey this feature in journalist language, a discourse that hedges are used mostly. The major part of newspaper lies in the editorial.

Errors in using hedges can cause ambiguity and misunderstanding and if unaware of this feature, the nonnative speakers may have difficulty in understanding the intended meaning of the author especially for those who want to understand the journalist texts. Thus, contrastive analyses of the occurrence of hedges in the journalistic genre will give more insight to L2 learners regarding the possible functions hedges may have in learning a second language. Hedges are needed in utterance to show the information imprecisely and uncertainly. In fact hedges use to prevent from embarrassing situation in matters one knows wrong.

The following examples taken from Varttala (2004) may clear this point:

- 1) John may go to Tehran.
- 2) Penguins are sort of birds.

In these examples *may* and *sort of* are hedges that impose fuzziness into the utterance and show that the writer wants to control the accuracy of what is being said. Despite the fact that modals auxiliaries show the hedges, the scope of these concepts conveying the meaning similar to the two hedges mentioned above items like adverbs possibly and presumably, adjective like probable, nouns like hypothesis, some verbs like suggest and appear. The hedging phenomenon, as a subtype of interpersonal metadiscourse, is a multi-faceted phenomenon that has been the concern of many scholars and viewed from such different perspectives as Politeness (Brown & Levinson, 1978, 1987; Leech, 1983; Myers, 1989), Semantics (Lakoff G., 2001, 2002), logic (McCawley, 1981; Zadeh, 1972) and the nature of hedging (Hyland, 1995, 1997, 1998; Markkanen & Schröder, 2000; Varttala, 1999, 2001; Vassileva, 2001; Vold, 2006). Alternatively, of such perspective there are other distinct features dealing with the hedging which examine it within a contrastive framework in two or more languages. Clyne (1992) in a study considers the variations in the use of hedging writing academic papers. For instance, German researchers use more hedging in their academic texts than native speakers of English.

Similarly, Vassileva (2001) examined the similarities and differences in the degree of detachment in English, Bulgarian and Bulgarian English, drawing on three sections of research articles, namely, Introduction, Discussion and Conclusion and came to the conclusion that the degree of detachment was highest in English and lowest in Bulgarian English. In this connection, Burrough-Boenisch (2005) asked 45 biologists from eight different countries to critically read and amend the English in discussion sections of three Dutch-authored papers. He concluded that Dutch scientists tended to under-hedge. By studying of hedging in English and Persian academic articles we came up with the result that English articles were more hedge than Persian one.

Moreover, Atai and Sadr (2008) surveyed the occurrence of Hedging in the Discussion sections of English and Persian journals published in the field of applied linguistics. Their findings indicated that the variety of hedging used in the Discussion sections of English articles was significantly more than those used in Persian articles. What seems to be unanimously agreed upon in the

obtained findings is that in terms of the frequency and variety, the use of hedging devices in academic genre is language sensitive? These results make us aware of differences in term of using hedging in different languages. They have explained little about variation in use of hedging in other discourse types. In Journalistic prose, hedges are extensively used, and they may cause problems for nonnative speakers (NNS) who may be unaware of its functions.

Errors in the use of hedging in journalist can cause misunderstanding, ambiguity and vagueness. In fact, one may reach an incorrect conclusion about an intended meaning. Hedging phenomenon may therefore cause many problems for L2 learners in writing, reading and translating journalistic texts. Each language community has its own culture and norms which prescribe content, style and rhetorical structure (Árvay & Tanko, 2004). Learners awareness of such norms can help them to decode the authors meaning or to write for another community and controlling variation that may result in miscomprehension.

Studies on cross-linguistic and topic variations in journalistic texts can provide us with an accurate account of the differences not Only in terms of frequency but also in reference to the functions associated with these Devices in journalistic texts to understand about the L2 context norms. On this basis, this study aims to contrastively Analyze English and Persian newspaper editorials as a distinct type of Discourse in terms of the frequency of hedging devices. More Specifically this study sought to investigate what similarities and Differences can be seen in linguistic realization associated with Hedging used in Persian and English journalistic texts.

METHODOLOGY

Materials

The corpus of the study was 30 news articles, 15 in each language, were selected randomly from editorial parts of leading newspapers published in 2006-2012 in Iran and the United States. This study attempted to survey the type and frequency hedges employed in economic, social, and political articles in English and Persian newspapers. Accordingly, the corpus data were collected from the online archive (2006-2012) of the leading newspapers published periodically in Iran and United States. Using sampling from among 60 articles randomly, a total of 30 news articles, 15 in each language were selected. To have equal amount of data in both languages, the first 2000 words from each text were analyzed. The texts were chosen from the field of economy, political, and social. The type and frequency of the linguistics elements, such as hedges markers in a given texts maybe considerably influenced by the topic of the texts.” **Iran, Tehran Times, Hambastegi**” were remarkable sources of selecting the Persian news articles and the English articles were chosen from the leading American newspapers such as the “**Washington post, New York Times and USA**”(see appendix A).

Data collection procedures

From among 60 articles in the Economic, social, political sections of the newspapers, 30 news articles (15 from each language) were randomly chosen. Collected data were quantitatively analyzed to disclose their frequency occurrence in a given text and to realize whether there was an outstanding difference between two sets of corpus data in this respect.

Procedures

After choosing from the leading news the chosen parts were precisely read twice word by word in order to paper recognize and find the hedges. Afterward, the number of hedges was counted in each article and in each language separately. The hedges underlined, then, classified to the five types of hedges based on Salager-Meyer (1994) taxonomy. The taxonomy included five main types which are as follow:

1. Shields, such as can, could, may, might, would, to appear, to seem, probably, to suggest.
2. Approximates of degree, quantity frequency and time: e.g., approximately, roughly, about, often, occasionally, etc.
3. Authors personal doubt and direct involvement, expressions such as I believe, to our knowledge, it is our view that...
4. emotionally-charged intensifiers, such as extremely difficult/interesting, of particular importance, unexpectedly, surprisingly, etc.
5. Compound hedges, the examples are: could be suggested, would seem likely, would seem somewhat.

The editorials were examined to identify hedging devices. Based on Varttala (2001) modal instances of hedging were identifying in the editorial. The types of hedges were recognized and recorded. For avoiding errors, all the editorials were examined twice.

Varttala (2001) modal divided hedges into five groups such as modal auxiliaries, verbs, nouns, adjectives, and other groups like if clauses. Nonnative reporting verbs are used to give description of the authors own research such as suggest and argue. Tentative cognition verbs like hope and suspect. Probability adverbs like apparently and probably show some tentative degree. Sometimes and often are adverbs of indefinite that author doing provide reader with exact information. Significantly and somewhat are adverbs of indefinite. About and almost are approximately adverbs that show imprecision on data. Possible is probability adjective.

The total number of hedging tokens in English and Persian were 871 and 621 respectively. 245 were used in economic, 207 in political, and 174 in social editorials. Table 1 below provides a summary of frequency of the hedges.

Table 1: Frequency of hedges in different text types of discourse

Language	Political	Economic	Social	Total
English	431	132	308	871
Persian	207	245	174	626

Persian and English editorials use hedging differently. Table 1 clearly shows English editorials used more hedges (871) than Persian ones (626), but regarding economic news Persian newspaper editorials tend to use more hedges rather than English ones (245).

This study adopts the classification proposed by Salager-Meyer (1994). Accordingly hedges classified to five types. Table 2 indicates the classification of hedges in both American and Iranian newspapers, as well as their frequency.

Table 2: Frequency and types of hedges in American and Iranian Newspapers

	Type 1	Type 2	Type 3	Type 4	Type 5	total
	Shields	approximates	Authors involvement	emotionally	compound hedges	
Persian	66	36	0	12	10	124
English	74	27	0	10	8	119

As it reveals from Table 2 (shields) hedging devices are the most frequently employed by both groups of writers, with English writers using 8 hedges more than the Persian writer. this finding correspond to findings of Adam Smith (2000) who believes type one hedges using more than other hedges in academics papers. Accordingly, Butler (2002) also says that modal auxiliary verbs (type one contained) occur in approximately one of every 10 words in newspapers. Recently, Hyland (2000) finds that 29% of all lexical devices in his corpus of biology are modal auxiliary verbs (related to type one in this study).however, Iranian authors prefer to use type 2 (Approximates) hedging devices through using this type, 9 hedges more than others.

Considering type 3 (personal involvement), we did not find any occurrences of this devices in both corpora. Type 4 frequency (Emotionally-charged intensifiers) hedges for academic were 10 and for Iranian was 12.Finally. Type five (compound hedges) frequency in English texts was 8 and for Iranians 10.

The results disclosed that some differences can be seen in using hedging between two groups of writer from different cultures. based on these differences American writers have higher preference for type 1, and 5, while Iranian writers tend to use of types 2 and 4.however, the prominent similarity between Persian and English newspapers is that there were not any hedging expressions using type 3.as Table 1 discloses, nearly 0% of Iranian and American newspaper writers using type 3 hedging (author personal doubt and direct involvement).

Table 2 bellow shows the frequency of occurrence for different types of shields in both English and Persian. It is clearly observed in the table that among different types of shields, Persian writers tend to use modals more than English writers. But, regarding Probability adverbs and Semi-auxiliaries, it is American writers who have higher preference for them. The table also indicates that totally shields are more frequent (102) in English newspaper editorials than Persian ones (94).

Table 3: Shields in English and Persian newspapers

Types of shields	Frequency

Table 6: Expression of personal involvement in English and Persian newspapers

Hedging Expression	Frequency
Persian	0
English	0

RESULTS AND DISCUSSION

As it reveals from Table 2 (Shields) hedging devices are the most frequently used by both groups of writers, English writers using 7 hedges more than their Persian writers. This finding is matched with the finding of Adam Smith (1984) who states that type one hedge is the most

frequent hedging used in academic papers. Similarly, Butler (1990) searched that modal auxiliary verbs (included in type 1) occur in almost 1 of every 50 words in newspapers. However, Iranian writers by using type 2 (approximates) show their preference, 9 hedges more than other types.

As can be seen in type 3 (personal involvement), we did not get any occurrences of these devices in both corpora. Type 4 frequency (Emotionally charged intensifiers) hedges for Americans was 12 and for Iranian was 10. finally, type 5 (compound hedges) this hedges frequency in English texts was 10 for Iranian and 8 for Americans.

The results disclosed that in using hedging devices between two groups of writers from different cultures some differences exist. Considering these differences American writers for type one whereas Iranian writers favoring use of type 2 and 4. As it is mentioned before, the writers use hedging to show lack of certainty in truth value of the referential information. The way of using of the hedge markers are varied in newspaper texts and the writers must be aware of the ways to employ these markers. The findings of this study disclosed that some specific hedges are most commonly used by native English and Persian newspapers such modal verbs as might, could, may, and should. Salager-Meyer (1994) said: "hedging in scientific discourse is a necessary and vitally important skill", p. 149).

The total number of expression identified as hedges in the English newspaper editorials was 871 cases. Out of these cases, 292 occurrences which comprised 33.62% of all the hedges belonged to modal auxiliaries. The highest and the lowest frequencies of identified modal auxiliaries were 16.10% and 4.82% in the political and economic editorials respectively. "Would" with 114 occurrences in English editorials, was the most frequent modal auxiliary (38.04%), while "Would" had 23 occurrences in economic editorials. "Will" with 4 occurrences was the lowest (1.46%). Table 7 below, clearly indicates that modal auxiliaries are mostly used in political editorials (38.01%) rather than Economic and Social ones. The table also shows that among different types of modal auxiliaries the verb *Tavanestan* is the most frequent auxiliary in Persian editorials.

Table 7: Frequency of occurrence of modal auxiliaries in Persian editorials

Modal aux. verb	Political	Economic	Social
Tavanestan (can/could)	31	24	33
Momkenbudan (may/might)	10	3	2
Khastan (will)	3	5	4
Bayestan (should/ must)	2	0	4
Total	46	32	43
	38.01%	26.44%	35.53%

Dahl (2005) discuss that national culture influences the written discourse conventions and is the main reason for differences in texts across languages. It is inferred that description of hedges depends on understanding cultural matters. Another reason for variation in use of hedging is linguistic and sociological perspectives. The English community welcomes hedging in writing because unhedge refers to what the author says is accepted as a fact. Therefore there is not any reason to use personal ideas. In Persian this expectation is different. According to Fairclough (2004), modality in discourse is important which show how speaker/writer understands themselves in relation to other members of the society.

Frequency of hedging forms in English newspapers

There are significant differences between the frequencies of hedges. The findings show that English use more hedges than Persian. The English political editorial use more hedges than social and economic. Although Wierzbicka (1999) contends the idea that Western cultures are more assertive than the Oriental ones, the findings in this study revealed that in journalistic discourse, English authors seem to be less assertive than their Persian counterparts, though they may be more assertive in other settings. Although Persian editorial authors use less hedging devices and are a little more frank than their English counterparts; this is not mean that Persian authors want to show more authority or is impolite. It seems that their perception of society and of cultural factors is different from their English counterparts. Another reason for the differing use of hedges by authors may be due to the culturally determined paradigms and frameworks that influence writers' rhetorical choices.

CONCLUSION

The most obvious finding to emerge from this study is that, based on the analysis of English and Persian newspapers, English editorials used more hedges than Persian ones. This difference refers to cultural variation between two communities. Besides, another reason related to discourse consideration. Students can benefit from parts they have opportunity to survey and disclose the correctness of hedging roles and are aware of cultural, social factors underlying them.

Acknowledging some limitations of this study, certain suggestions can be made for further researches. First, this study conducted to find the differences and similarities regarding hedging phenomenon in English and Persian social, economic and political newspaper editorials. Further research can focus on hedges in research titles in English and Persian articles. Second, other researchers can consider hedges in other eras as, sport or other global issues.

Appendix A. Selected Newspapers

Tehran Times is Iran first English daily newspaper based in Tehran. It was founded after Islamic Revolution in Iran in 1979. This newspaper covers domestic, political, social, foreign, and sport news along with commentary. Tehran Times has turned into a reliable source of news for hundred of foreign media outlets and envoys from various countries based in Tehran who want to learn about the country's current events. Its site (www.tehrantimes.com) is among the most frequently visited websites with over 10,000 visitors each day."

New York Times is an American daily newspaper founded in 1851 and published in New York City. It is regarded as a national newspaper of record. It is third in national circulation, after USA Today and The Wall Street Journal. It is organized into three

different sections; namely, News, Opinion, and Features. The News includes themes on International, National, Business, Technology, Science, Health, etc. Opinion contains Editorials, Opinion Articles, and Letters to the Editor. The third section, Features, consist of such parts as Arts, Movies, Theater, and Travel. Its website (www.nytimes.com) is one of the most popular American online newspaper websites".

Hamshahri" is published by the municipality of Tehran, and founded by Gholamhossein Karbaschi. It is the first colored daily newspaper in Iran and has over 60 pages of classified advertisement. The newspaper is distributed within the limits of Tehran municipality. It has a daily circulation of over 400,000 copies, which is on par with major American daily newspapers such as the *San Francisco Chronicle*, *Boston Globe*, and *Chicago Tribune*.^[1] Based on the results of a domestic poll of how citizens of Tehran view television and print media which were released by Iran's Ministry of Culture and Islamic Guidance *Hamshahri* was the most read daily in Tehran with 44.1% in March 2014.^[2]

Iran Daily "historically known as Persia, Iran was one of the greatest empires of the ancient world, which was frequently invaded. Iran's hereditary monarch, Shah Mohammad Reza Pahlavi, fled the country in 1979 after decades of corrupt and authoritarian rule, and mounting religious and political unrest. Exiled Ayatollah Ruhollah Khomeini returned to lead an Islamic revolution and formed the world's first Islamic republic the same year. An eight-year war with Iraq followed.

In the elections of 1992 and 1996, former president Akbar Hashemi-Rafsanjani's support increased and at the presidential election of 1997 Mohammad Khatami, Rafsanjani's cultural adviser, succeeded him. Khatami promised greater freedom and tolerance and was supported mainly by women, younger voters and intellectuals.

In June 2005, Mahmoud Ahmadinejad, former mayor of the capital, Tehran, and famous for his conservative approach and for rolling back reforms put in place by modernists before him was elected president. He has not been shy of confronting the West and has pushed ahead with a national nuclear programme that has brought international condemnation."

TRANSLATING HEDGES IN POLITICAL TEXTS: A CASE STUDY OF ENGLISH TRANSLATIONS OF A PERSIAN POLITICAL SPEECH

Somaye Delzandehrooy

Faculty member at Vali-e-Asr University of Rafsanjan

ABSTRACT

With the internationalization of politics the role of translators translating political texts as well as their translations of such texts has been highlighted. Christina Schäffner (2008: 3) talks about the political experts and scientists discussing the "potential consequences" of translating political texts. Thus translating hedges-the words which make things vaguer or less vague- in political texts becomes important as well since politicians usually make use of hedges in order to relieve themselves of the responsibilities for their statements (Schäffner, 1998:179). In this study the English translations of hedges in a political speech are studied based on Fraser's (2010) classification. To this end, President Mahmoud Ahmadinejad's speech on "The world without Zionism" and its three translations by Nazila Fathi, in The New York Times Tehran bureau, Aljazeera and MEMRI websites are chosen as the case of study. The results show that different strategies are adopted by the translators such as deletion, translation by the same hedge and translation of non-hedged expression to a hedged ones, or translation of hedged expressions to non-hedged ones; hence modifying the scope of precision and force expressed in the original text.

KEYWORDS: hedges, political text, translation, Ahmadinejad

INTRODUCTION

The sensitivity of political texts and hence their translation arise from the fact that firstly they are regarded as authoritative texts taking their authority from the relation between the reader and the author whose word is "law" (Newmark, 1982: 375-379). Secondly, the internationalization of politics has foregrounded both the status of political texts and their translators' role. This sensitivity makes the translator's job more critical whose product might have consequences unpredictable. That is why Baker (2006) states that political conflicts involve translation and interpretation. This situation gets worse when translating "hedges" which are used by the original author to evade responsibility for what they say or to attenuate the force of the utterance. That is why Newmark (1982) emphasizes on the translator to be very cautious and objective in translation of authoritative texts; hence political texts. According to him the translator should be "sensitive and a critic of language" as well as being able to write well himself (1982: 375).

What are hedges?

According to Fraser (2010: 201) "hedging" is a "rhetorical strategy" whereby the speaker shows a lack of commitment to the truth value of the utterance. Therefore hedges can be defined as any device that qualifies the writer's commitment to the truth of what is being communicated. Hedges

are used to weaken the truth value of an utterance. For instance, compare the sentences: "I don't think I'm responsible." and "I'm not responsible."

As Hovy states (2004: 2) the uses of hedges were firstly examined by Weinerich who called them "metalinguistic operators". It was in 1966 that hedges became the topic of linguistic investigation and in 1972 that they were called *hedges* by Lakoff. He maintains that hedges are some lexical expressions that are used to shift the borderlines within the "prototype theory"¹ of Rosh (1973). Taking up Zadeh's "fuzzy set theory", Lakoff states that the boundaries of concepts in any natural language is fuzzy and not clear-cut (1973: 151). He has provided a list of such concepts and renewed his wordlists over and time again not considering the effect of context on the meaning/function of words (Hovy, 2004: 2). It was Clemen (1997/1998) who took the context into account and said that hedges are 'achieved primarily by setting utterances in context rather than by straightforward statement' (2004: 2). He defined hedges as 'everything that in a way modified the truth-value of a sentence, the commitment of the speaker or commented on the sentence as such' (2).

As Fraser puts it when a speaker uses hedge she actually does an "intentional action" to modify the content/force of the full value of utterance (2010: 202). In other words, the speaker shows lack of commitment to "either the full category membership of a term in the utterance (content mitigation) or to the intended illocutionary force of the utterance (force mitigation)" (2010: 201). Thus two general purposes can be defined for hedges: 1- attenuation of an undesirable effect on the hearer; hence being more polite in the utterance; 2- avoiding providing the expected information thus being evasive and vague in the utterance (2010: 205).

Hedges in political texts

According to Fraser not much research has been done on hedges in political text except one by Partington. Translation of hedges in political texts as well is discussed in a few studies including the one by Schäffner (1988) in her article "Hedges in Political Texts: A Translational Perspective". In her study she has used Pinkal's classification of hedges: modifying hedges, quantifying hedges, specifying and despecifying hedges. She believes that in political discourse, hedging devices function to "relieve the authors of some responsibilities for their statement" (1988: 179). In this regard Fraser, holding the same view, quotes Partington who suggests that hedging is only one of the strategies for evading, others being bald on-record refusal to answer, claims of ignorance, referring the question, refusal to speculate, stating the answer is well-known, and claiming that the question has been answered already (2010: 206).

Fraser's classification of hedges

Unlike other researchers who have classified hedges into numerous sub-categories, Fraser has sufficed to the distinction between content and force hedging. He believes that the focus of hedges can vary from word, to a phrase, the entire sentence, or the intended illocutionary force of the utterance, or its perlocutionary effect, as shown below, (2010:203)
That is a kind of [bird]

He has a somewhat [elevated temperature]

As far as I can tell, [you don't have anything to fear from him]

I must request that you stop talk while the music is playing. [Request]

I think that she is pretty much guilty. [Perlocutionary Effect on hearer]

Then he introduces his classification of hedges as:

Propositional hedges

about, actually, almost, approximately, as it were, basically, can be viewed as, crypto-, especially, essentially, exceptionally, for the most part, generally, in a manner of speaking, in a real sense, in a sense, in a way, kind of, largely, literally, loosely speaking, more or less, mostly, often, occasionally, on the tall side, par excellence, particularly, pretty much, principally, pseudo-, quintessentially, rather, real, really, regular, relatively, roughly, so to say, somewhat, sort of, strictly speaking, technically, typically, very, virtually

Illocutionary force hedges include (204-205):

- Impersonal pronouns: One just doesn't do that.
- Concessive conjunctions (although, though, while, whereas, even though, even if, ...)

Even though you dislike the beach, it's worth going for the view.

- Hedged performative: I must ask you to sit down.
- Indirect Speech Acts: Could you speak a little louder.
- Introductory phrases – I believe, to our knowledge, it is our view that, we feel that: I believe that he is here. *Believe and think* are hedges only when they express a verifiable fact and not an opinion (Schäffner: 1988: 187).

• Modal adverbs perhaps, possibly, probably, practically, presumably, apparently:
I can possibly do that

- Modal adjectives (possible, probable, un/likely...): It is possible that there is no water in the well.
- Modal noun (assumption, claim, possibility, estimate, suggestion...)

The assumption is that you are going to go.

- Modal verbs (might, can, would, could...): John might leave now.
- Epistemic verbs (seem, appear, believe, assume, suggest, think...): It seems that no one wants to go.
- Negation: Didn't Harry leave? [I think Harry left]; I don't think I'm going. vs. I'm not going. [Former hedges the meaning of latter]
- Reversal tag: He's coming, isn't he?
- Parenthetic construction: The picnic is here, I guess.
- If clause: If true, we're in deep trouble.
- Agentless Passive: Many of the troops were injured. (by Ø)
- Conditional subordinators (as long as, so long as, assuming that, given that...): Unless the strike has been called off, there will be no trains tomorrow.

- Progressive form: I am hoping you will come.
- Tentative Inference: The mountains should be visible from here.
- Conditional clause implying permission (if you don't mind my saying so, if I may say so): If you don't mind me saying so, your slip is showing.
- Conditional clause as a metalinguistic comment (if that's the right word...): His style is florid, if that's the right word.
- Conditional clause expressing uncertainty about the extralinguistic knowledge required for a correct interpretation of the utterance (if I'm correct, in case you don't remember): Chomsky views cannot be reconciled with Piaget, if I understand him correctly.
- Metalinguistic comment such as (strictly speaking, so to say, exactly, almost, just about, if you will): He has an idea, a hypothesis, if you will, that you may find interesting.

He also mentions Salager-Meyer's (1995) *compound hedging devices* which include:

- Modal with hedging verb: It would appear that...
- Hedging verb with hedging adverb/adjective: It seems reasonable that...
- Double hedges: It may suggest that this probably indicates...
- Treble hedges: It seems reasonable to assume that...
- Quadruple hedges: It would seem somewhat unlikely that it may appear somewhat speculative that...

Hedges in President Mahmoud Ahmadinejad's Speech

President Mahmoud Ahmadinejad delivered a speech to an Islamic Student Associations conference on "The World Without Zionism." The conference was held in Tehran, at the Interior Ministry. The Persian text was taken from Islamic Republic of Iran's Presidency Website (<http://www.president.ir/fa/1/0/1384/8>). There were 72 hedges in the president's speech. Based on Fraser's classification, these hedges belonged both to propositional and illocutionary force hedges. However, the Persian text being published in a report format has probably lost some introductory hedges which might have been used by the president. Out of the 72 hedges 49 belonged to the illocutionary force hedges and 23 to the propositional hedges.

Translation of hedges in political speech

Considering language as "social practice", Fairclough (in Munday 2008: 42) believes that *ideology* is best expressed through language especially when it is "disguised". *Hedging*, most specifically in political texts, as discussed earlier is one way of expressing and at the same time implying one's own and/or society's ideology since using it, the speaker/author tries to both express his or the dominant ideology of the society and evading the responsibility for what he says or writes. So, hedging actually could be regarded as a kind of style through which ideology is expressed. This is why among different stylistic features recognized by Van Dijk, more emphasis is put on "lexical style" or "lexical choice" since it demonstrates the writer's "perspective and evaluation" (in Munday 2008: 45).

In the case of a president being the speaker, speaking on behalf of a nation, thus apparently expressing the ideology of that nation, the style, particularly lexical style, he chooses to do so becomes critically important; hence its translation. Therefore the translation of hedges in a political speech delivered by a president is of great importance and any changes in the hedges would mean a shift in the ideology expressed by the SL speaker.

The use of hedges has been so important that their manipulation even in the same language; i.e. intralingual translation to use Jakobson's term, has had some consequences leading even to war! This has been the case with rewriting the dossier prepared by UK Prime Minister Tony Blair's inner circle of advisers which led to the war against Iraq in 2003. In this dossier the hedge "*might be able to*" in the claim made by the intelligence service "Iraq might be able to launch chemical and biological weapons within 45 minutes" has been over and over rewritten, reducing hedging from uncertainty to certainty. Thus *intelligence has suggested* changes to the more certain *indicates* and conditional *would be able to* becomes *may be* and finally shifts to simple indicative *are*. Therefore the reader believes that the speaker has been sure of the truth value of the proposition (Munday, 2012: 6).

This shows the significance of the translation of hedges when it comes to politics and the critical role the translator has in this regard.

In the next section the translation of hedges in Mahmud Hmadinejad's speech and the shifts it has involved in its three translations thus leading to a change in overall ideology either in its intensifying or its reducing intensity will be discussed.

The translation of hedges in the president's speech

Three English translations of this speech are selected for the present study. One is done by Nazila Fathi (published in NY Times), the other by Aljazeera website (<http://english.aljazeera.net/NR/exeres/15E6BF77-6F91-46EE-A4B5-A3CE0E9957EA.htm>), and the third one by Memri website (<http://www.memri.org/report/en/0/0/0/0/0/1510.htm>). The translation by Fathi is done from the Persian full text published on ISNA website, yet not complete, but the translation by Memri website is done from the excerpts of ISNA's report on the speech. Aljazeera's translation was a report on the original speech selecting only some parts, hence not as complete as the other two translations.

Table 1: translation of different hedges in the three translations

Hedges	Propositional hedges	Illocutionary Force Hedges									Total
		If clause	Hedged performative	Impersonal pronouns	Mod adverbs	Mod verbs	Epistemic Verbs	Mod Adj.	Agent-less passive	Participle	
Persian Text	23	7	4	7	2	19	1	6	2	1	72
Fathi	4	1	1	2	-----	12	1	5	1	1	19
Aljazeera	-----	-----	-----	1	-----	3	-----		1	-----	5
Memri	11	4	3	4	-----	9	-----	3	1	1	36

As shown in the table 1, in none of the translations the same number of hedges is reproduced. However, Memri's translation, being more complete than the other two, not complete though, has reproduced 36 of the total 72 hedges in the original. In what follows each translation is discussed

separately to see how the hedges are treated in the translations and consequently what effect they have created.

Fathi's translation

In her translation a few paragraphs from the beginning and the end of the original report are not translated hence the non-translation of 23 hedges in these paragraphs. Moreover, in one case she has made implicit the original if clause (...: اگر کسانی از فشار نظام سلطه...): Anyone who recognizes...). In two cases she has changed the hedge (must/should) to non-hedge form (need to) thus changing the scope of precision in the original for Must means that you are required to do it for moral, law or custom or it is a certainty, or a physical necessity, while Need to means it is necessary, to stop something bad from happening, or something worse happening and with regard to the context of the speech changing the hedge to "need to" conveys a connotation which does not exist in the original that implies a sense of "should" rather than "must": (باید and باید ببینیم واقعا ماجرا فلسطین چیست). Regarding the translation of propositional hedge (بسیار/very), Fathi has not translated this hedge in two cases: (بسیار امیدوارم: I hope; عنوانی بسیار ارزشمند: this valuable title) which in turn lessens the determinateness intended in the original. On another occasion Fathi has again used a non-hedged form for a hedged one translating "مجبور" to "occupying" again lessening the force of the original. There are two occasions as well where the propositional hedge is changed to illocutionary force hedge but not creating a certain effect on the translation.

Aljazeera's translation

The translation posted on Aljazeera's website was quite different from the other two translations in the sense that in Baker's (2006: 71-72) terms, "selective appropriation" has been done in this translation; that is, certain sentences have been selected and included in the translation while others were excluded. Moreover, it had commented on the original speech quoting others' comments as well. Out of 7 hedges existing in the parts Aljazeera has translated 5 are reproduced. On one occasion the impersonal pronoun (هر کس) has changed into (any leaders in Islamic umma) thus specifying what was not meant to be specified and intended to remain fuzzy.

Memri's translation

Compared to the other two translations, Memri's translation is quite more complete yet some parts are not translated as in the other two. A specific feature of this translation was the translation of non-hedged forms to the hedged ones which occurred in eleven cases; e.g. (تاسیس) and we **can** find no literature about it). In all these cases especially the ones adding the propositional hedge "very" the tone of the translation has intensified. On the other hand there are also four cases where the opposite has occurred; i.e., the hedged are translated to the non-hedged ones: (و این) and this is attainable). However in all these cases the sense has not changed hence the original intention not modified.

CONCLUSION

Hedges make the statements fuzzier or less fuzzy and politicians make use of hedges to avoid the responsibility for what they say. In this research the study of three translations of the speech made by President Ahmadinejad on "The World Without Zionism" shows that non-translation of hedges which are used by the president to make things less fuzzier than fuzzy, make the translations less intense modifying the original intention and thus ideology represented through words and lexicons. Of the three translations, Memri's translation of hedges was closer to the original; however his changing the non-hedged to the hedged ones has intensified the original tone of speech making the speech more sensitive which addresses the superpowers in the world which, in turn, could have led to a war if precautions were not taken. This in turn proves what Newmark mentions about the translators of political texts to be "sensitive and critics of language" otherwise the speeches made by the politicians are reflected in a modified way; the consequences being unpredictable sometimes.

ABSTRACT

Focus-on-Form (FoF) instruction have become one of the most talked-about topics in the field of language teaching and learning when scholars found that when second language learning is entirely based on meaningful input and interaction, some linguistic forms cannot nurture. One of the most well-known FoF activities on which the present study focused is output-oriented task of dictogloss. Among the substantial body of research investigating the effect of dictogloss on language learning, little attention has been given to the effect of collaborative dictogloss task on English as a foreign language (EFL) learners' writing skill. This study is an attempt to consider the effect of collaborative output task of dictogloss on EFL learners' writing skill. Forty pre-intermediate EFL learners in Sama institute in Iran participated in current study and they were randomly assigned to two groups (control and experimental). A composition writing test was used to measure participants' writing performance and TEIQU questionnaire implemented to examine their initial emotional intelligence. Then, the experimental group applied collaborative dictogloss task which focused on form and meaning of the text, while control group was taught under the conventional approaches which did not put any emphasis on the collaborative dictogloss. Although the finding of present study did not support previous studies reporting the effectiveness of dictogloss task in different aspects of writing skill, it revealed the fact that collaborative output task of dictogloss did not have any significant effect on learners' writing performance.

KEYWORDS: *FoF Instruction, Collaborative Dictogloss Task, Writing Performance*

INTRODUCTION

Developing writing ability, as a communicative skill, has been considered as a difficult task since a large number of students make a lot of mistakes and errors in their written texts and cannot create a coherent text. This inability in writing skill may have different reasons. One of them seems to be due to teaching instruction and error correction. Largely, the concerns of EFL teachers in Iranian institutes is the written products of students while the process of how to construct and formulate is not paid much attention, that is they mostly apply product approach of writing in classrooms and encourage the students to write down on the proposed topic individually. According to Elley, Barham, Lamb and Wyllie (1976) if teaching instruction is based on traditional approach, the learners will lose their motivation, and see writing classes as a difficult and boring one. To solve this problem, teachers need to take a different view towards writing instruction and can employ collaborative tasks which are originally supported by the social constructivist view of Vygotsky (1978).

In this regard, Juwita and Aryuliva (2013) found that collaborative output tasks can be applied for promoting learners' motivation, the accuracy in the production of language and activation of learners' prior knowledge in the classroom. Further advantages of collaborative task may be related to motivation which positively influences learning. Previous studies indicate that the learners in collaborative tasks would show higher motivation than those in whole-class doing the task individually (Liao, 2006; Pishghadam & Ghadiri, 2011). Extensive studies in second language learning support the use of tasks which need learners to produce output collaboratively (Mayo, 2002). Lesser (2004), for example, believed that learners generally perform better while working together rather than working alone.

According to Nassaji "using collaborative tasks requiring learners to get involved in deliberate and cooperative comprehension and production of language, e. g. the use of dictogloss can be (regarded as a means of integrating) (FoF) and communication by process" (as cited in Abbasian & Mohammadi, 2013, p. 1371). Dictogloss task involves the students in collaborative reconstruction of written texts and make them, in either tasks, equally focus on form as they collaboratively construct the texts (Swain & Lapkin, 2001). Moreover, they suggested that the dictogloss led the students to notice and reconstruct complex syntactic structures. Lee (2001) focused on the collaboration feature of the dictogloss task and proposed that a collaborative output task of dictogloss help learners be more pleased, have good feelings when they are working collaboratively and consequently learn to use language effectively. Therefore, there seems to be a good reason to use collaborative dictogloss as an appropriate activity to improve learners' writing performance.

LITERATURE REVIEW

Focus on Form Instruction

Recent developments in the field of second language learning have brought about changes in pedagogical approaches in second language instruction. Over the past few decades, after the introduction of communicative approach (CA), the focus of classroom instruction has shifted from an emphasis on knowledge of rules and grammar to communicative ability in real-life

encounters and use of language within communicative contexts. While some researchers in communicative approach put emphasis on communication and fluency and claim that when learners are exposed to comprehensible input in real life communication, second language acquisition takes place automatically (Richards & Rodgers, 1986), others state that it is necessary to have particular attention to form (Doughty & Williams, 1998; Ellis, 2000; Long, 1991; Norris & Ortega, 2000). They believe that when second language learning is completely based on experiential and meaning-centered instruction in classrooms, some linguistic competence levels of second language cannot develop as well. Meaningful input and opportunities for interaction allow learner to achieve fluency but not necessarily accuracy in the target language (Ellis, 2000; Long 1991; Williams, 1999). Seemingly, there is a need to make a balance between the traditional approach which entirely focuses on forms and the communicative approach which put emphasis on meaningful communication in real context (Park, 2004, Long & Robinson, 1998) and consequently focus on form instruction was adopted as a new approach which primarily focused on noticing forms in communicative context.

Long (1991) presented Focus-on-form instruction (FoF) for the first time as an attempt to “overtly draw students’ attention to linguistic elements as they arise in lessons whose overriding focus is on meaning or communication” (pp. 45-46). FoF instruction can be effective in improving learners’ interlanguage grammar and linguistic accuracy (Ellis, 2001). According to Nassaji “using collaborative tasks requiring learners to get involved in deliberate and cooperative comprehension and production of language, e. g. through the use of dictogloss can be a way of integrating (FoF) and communication by process” (as cited in Abbasian & Mohammadi, 2013, p. 1371). Dictogloss task can be used both individually and collaboratively which get involved the students in collaborative reconstruction of written texts and students in either tasks focused equally on form as they collaboratively constructed the texts (Lapkin & Swain, 2001). Moreover, they suggested that the dictogloss led the students to notice and reproduce complex syntactic structures.

Collaborative Dictogloss Task

Among the considerable number of studies on focus on form instruction, perhaps the most interesting ones are those that in light of Vygotsky’s (1978) socio-cultural theory of learning and output hypothesis, have taken into account the value of meaningful social interaction in language learning process (Swain, 1998, 2000; Swain & Lapkin, 1998). Based on the sociocultural theory on the role of collaboration in language learning and psychological area, the present study used dictogloss as a type of focus on form collaborative task for developing learners’ writing. Dictogloss is an integrated skill and collaborative activity was originally assisted the learners to improve their grammar knowledge and was first proposed by Wajnryb in 1990 which suggested a major change from traditional dictation (Jacobs & Small, 2003). According to Wajnryb, while involved in the task of dictogloss “students individually try to write down as much as they can, and subsequently work in small-groups to reconstruct the text; that is, the goal is not the goal to reproduce the original, but to ‘gloss’ it using their combined linguistic resources” (p. 12).

Dictogloss has two very important features. One is the use of all four language skills (listening, speaking, reading, and writing) in order to do a dictogloss activity completely. In the dictation

stage, learners listen to their teacher read a text. In the reconstruction stage, they speak to their group mates in the target language, and write a reconstructed version of the text. In the analysis and correction stage, they must read the original text. Another important feature is providing learners with opportunity to reflect on their use of the target language. In order to do a dictogloss task, learners must rewrite the contents of the original text. In the reconstruction, they talk about the language of the text they are reconstructing (Mayo, 2002).

According to Swain (1998) reconstruction of a text collaboratively, may push students beyond their current interlanguage to more native like forms. Learners not only acquire new knowledge but reinforce what they already know. This activity helps them to have a more active role in the class and facilitates the class management (as cited in Todeva, 1998). Dictogloss has been the subject of a number of studies that supported the use of the task (Brown, 2001; Kooshafar, Youhanaee & Amirian, 2012; Kowal & Swain, 1994; Nabei, 1996; Storch, 1998, Swain & Lapkin, 1998). Kuiken and Vedder (2002a), for instance, investigated the effect of interaction between ESL learners through dictogloss task on the acquisition of the passive form. The qualitative analysis showed that interaction stimulated noticing to construct the new linguistic structures. The findings of a bunch of other studies indicated that in dictogloss activity, reconstructing the texts in groups enables the students to solve linguistic problems that lied beyond their individual abilities (Donato, 1994; Kim, 2008; Kuiken & Vedder, 2002a; Storch, 2002; Swain, 1998; Swain, 2000; Swain, 2006; Swain, 2010; Swain & Lapkin, 2001, 2002).

Pishghadam and Ghadiri's (2011) investigation focused the effect of form versus meaning-focused tasks on the development of collocations among Iranian Intermediate EFL learners. The results revealed the fact that FFI group (dictogloss task) had a significantly better performance on the collocation test. In a more recent study Kooshafar et al. (2012) focused on the use of cohesive devices to create a coherent text through dictogloss technique. Two techniques of dictogloss and explicit teaching were used to examine which group was more successful in using correct conjunction in their writing composition test. The results of the study pointed to the conclusion that dictogloss technique seems to be more effective. Jabbarpour and Tajeddin (2013) also compared the effects of three FoF tasks of input enhancement, individual output and collaborative output on the acquisition of English subjunctive mood. The study indicated that the influence of both input and collaborative output activities were greater than the individual output task and also emphasized the importance of using collaborative activities and interaction in the process of English structure acquisition.

While these studies, among many others, have provided us with valuable insights into the effect of dictogloss on different skills, there are a small number of studies on its impact on learners' writing skill. Abbasian and Mohammadi (2013), for example, examined the effect of dictogloss on intermediate level students' writing skill based on content, organization, vocabulary, language usage and mechanics and found that dictogloss technique improved learners' organization and mechanics whereas content, usage and vocabulary didn't improved significantly. Since writing seems to be a major problem of many EFL learners in Iran, especially those at the higher levels of learning incapable of organizing their ideas in texts to create a meaningful writing, it seems that more research is needed in this field to encourage using such collaborative task during the

language teaching course in English classrooms in lower level e.g. pre-intermediate. Collaborative dictogloss may nurture and develop students' competence in writing through group works and take an active role in their own learning. Since it is apparent from the literature on FoF that there is a paucity of research in the Iranian educational context in writing ability in general, present study is aimed at finding the effect of collaborative output task of dictogloss on Iranian EFL learners' writing skill.

RESEARCH QUESTION

Based on what discussed above, the problem which is going to be examined in present study is to see if collaborative dictogloss is effective in learners' writing performance. In line with this problem this question will be answered:

1. Does collaborative output task of dictogloss have any effect on EFL learners' writing skill?

METHODOLOGY

Participants

A total of 40 male and female students in Sama language institute (SLA) in Iran, participated in this study. The students were Persian native speakers and had taken English for three to four years. There were two intermediate classes, one taken as the experimental group with 20 students and the other the control group with 20 students and they varied in age from 13 to 16 years. Students at advanced levels were not included because they were informative on meaning and structure of the words to write a text coherently. Students at lower levels were excluded as well, since they have difficulty in using correct structures and vocabulary. (Kooshafar et al., 2012).

Instruments

To reveal the effect of collaborative dictogloss task on writing performance, the following instrumentations were used:

Dictogloss texts

The texts were taken from Anecdotes in American English book by Hill (1980). According to Read (2006) the selected texts were short and simple because students had to keep the texts in their short term memory to remember them during the process of reconstructing. Furthermore, in preparing the texts, great care was taken to choose all texts appropriate for pre-intermediate level students in terms of their level of difficulty and the vocabulary. To this aim, two experienced teachers were asked to check all the texts whether students would know the meanings of most of the words in the texts at this level. The researcher first picked a 162-word text for the training session. However, when reading the text for the first time during the training session, the participants expressed that it was long. For the second reading, the text was reduced to approximately 120 words.

Composition Writing Test

Learners wrote composition writings prior and after the experiment. The pretest and the posttest of writing had exactly the same format but different content. The reason for having different

content in the pretest and posttest was to eliminate the retention effect that the pretest may have on the subjects' performance on the posttest. The time allotted to students to write the text was 30 minutes.

Writing Scoring Criteria

To analyze key aspects of writing, the Jacobs' ESL Composition Profile (Jacobs, Zingraf, Wormuth, Hartfiel & Hughey, 1981) was employed. The checklist focuses on the five broad categories: mechanics (spelling, punctuation, etc.), language use (grammar), content, organization, and vocabulary. The response scales range from excellent to poor. The validity of scale is accepted through a wide large number of raters and composition researchers. All the writing sheets were marked by two teachers and if the given scores of the two raters were not the same, the mean of the two scores were calculated as the final score.

Procedure

First the writing composition pretest was administered to all subjects one week prior to the treatment and before the dictogloss training session. The participants in two groups were required to write a composition pretest within 30 minutes. Then collaborative dictogloss was used in experimental group. The treatment contains four major steps:

Preparation/warm-up: Learners were randomly divided into 3-member groups by the teacher before the dictogloss task began. All the students were given small pieces of paper to individually write down bits of information. Each group was given a single sheet of paper on which one of the members of the group would write the final version of the reconstructed passage. Students then were prepared for the dictogloss activity by introducing them to the topic of the dictogloss text. Any unfamiliar vocabulary items in the text would be explained at this stage.

Reading the text: The short text was read twice at natural speed to the students by teacher. The first time students just listened to become orientated to the topic, and while in second time they were expected to note some key words which they needed to reconstruct the original text.

Reconstruction: The small-groups worked together, pooling their notes to reconstruct the story they had heard and teacher monitored their interaction to make sure that every student was contributing. Students were supposed to pay more attention on structures and meaning. One member of each group wrote out the text. The time given for students to reconstruct the text was around ten minutes.

Analysis and correction: Finally, the texts were compared to the original text, analyzed and corrected by all the students with their teacher's assistance. The teacher would randomly ask a student from each group to read what they wrote and the rest of the class listened and expressed their opinion on whether the reconstructed sentences were semantically and syntactically similar to the original text. During the correction, the teacher asked them to correct the text. When the students were not able to offer correct answers and explanations, the teacher explained the mistakes. This process went on until all the sentences were accepted by the students and teacher. The modified sentences were put on the board and the students were asked to edit their own text.

In control group, the teacher introduced the topic and asked them to write about a topic. Teacher then checked the participants' writing and corrected them. Finally the posttests were administered to both groups of students in Week 10. The students were not informed when the posttest would be given. The posttest given to all the groups was exactly the same and it had exactly the same format as the pretest. They were supposed to write an essay with the intention of examining how collaborative dictogloss may effect on their writing performance.

RESULTS AND DISCUSSION

To check the reliability of the writing scale, the internal consistency reliability of writing was checked by calculating Cronbach's alpha coefficient and it was found that the reliability of writing pre-test was and post-test was 0.80.

Inter-rater Reliability

Due to the fact that "rating on writing test in academic context vary considerably" (Hamp-Lyons, 2003, p. 174) inter-rater correlation coefficient was calculated for both group of pretest and posttests. The results as indicated in Table 5.1, revealed a high positive correlation between the rating of raters in both pre- and posttests, so there is no significant difference between the scores of the two teachers.

Table 1: Inter-rater Correlation of Raters

		N	Correlation
Pair 1	A.pre.C & B.pre.C	20	.96
Pair 2	A.pos.C & B.pos.C	20	.94
Pair 3	A.pre.E & B.pre.E	20	.97
Pair4	A.pos.E & B.pos.E	20	.98

Note. A = Rater A; B = Rater B; E = Experimental group; C = Control group

Testing the research Question

The research question was to examine whether collaborative task of dictogloss on learners' writing performance. The descriptive statistics for the writing pre-test and post-test in both experimental and control groups are detailed in Table 2. Based on the following table, the mean scores for the writing skill in experimental and control groups, respectively, are 75.35 and 76.73 as well as post-test scores of experimental and control groups, respectively, are 79.43 and 77.53.

Table 2: Descriptive Statistics for Writing Pretest and Posttest

		Experimental	Control
Pre-test	Mean	75.35	76.72
	SD	12.84	9.42
Post-test	Mean	79.42	77.52
	SD	13.32	8.66
	N	20	20

A comparison of the means of pre and posttest of experimental and control groups demonstrated a gain score of 4.07 (79.42 - 75.35) for experimental and a gain score of 0.8 (77.52 - 76.72) for the control group. Therefore, the initial look at the mean differences of experimental and control groups indicates that the experimental group outperformed the control group.

In the next step, an independent t-test was conducted to determine whether any significant difference might be observed for the writing pre-test of both groups. The results of the independent t-test, as presented in Table 3, indicate that there is not any significant difference between experimental and control groups' scores on the writing pretest ($t(38) = .38$, $P = .70 > .05$). This means any changes in the mean scores of the groups in the posttest were unlikely to be attributed to preexisting differences among the groups and, instead, could be due to the different treatments they received.

Table 3: Independent Samples Test of Writing Pre-test and Post-test

Table 3: Independent Samples Test of Writing Pre-test and Post-test									
Levene's Test for Equality of Variances			t-test for Equality of Means						
	F	Sig.	T	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Pre-test	.614	.438	.386	38	.702	1.37	3.56	-5.83	8.58
Post-test			-.535	32.62	.597	-1.90	3.55	-9.13	8.60

The results of the independent t-test, as depicted in Table 3, indicate that there is not any significant difference between experimental and control groups' mean scores on the writing post-test ($t(33) = -.54$, $P = .60 > .05$). As observed in figure 1, the pre-test average of writing skill for experimental group is more than control group.

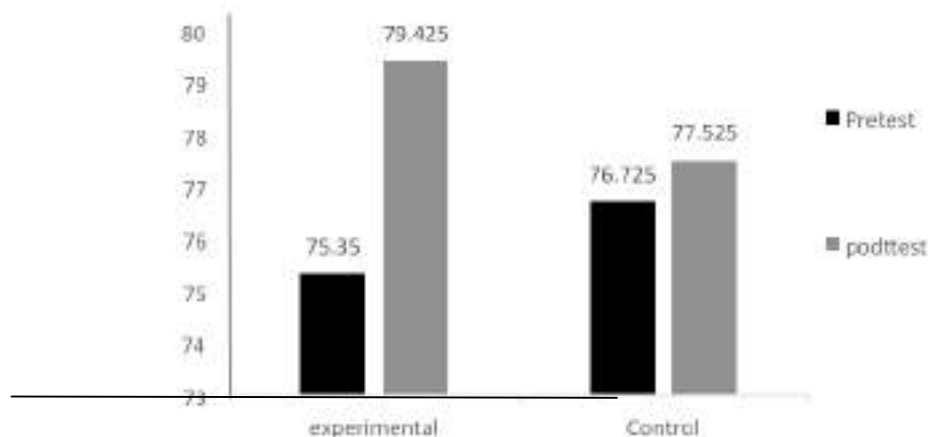

Figure 1: Pretest and posttest means for writing

Discussion

The purpose of present study was to examine the effect of collaborative output task of dictogloss on learners' writing performance. The research question asked whether the collaborative output dictogloss task had an effect on EFL learners' writing skill. To test the research question the data was calculated by descriptive statistics and independent t-tests for pre and posttests. An initial look at the descriptive statistics, revealed that the mean of writing in posttest was higher than the pretest in experimental group. However, the results of the analysis showed that there is no difference between writing pretest and posttest scores. Thus, it can be concluded that collaborative dictogloss did not have any significant effect on pre-intermediate learners' writing skill. This finding is consistent with the finding of Kuiken and Vedder (2002a) who found that dictogloss did not significantly improve students' performance. However, the findings do not support some FoF research studies that have reported better performance in producing forms correctly during dictogloss task (Lapkin & Swain, 1998; Lim & Jacobs, 2001a). Moreover, it is inconsistent with Jacobs and Small (2003) and Abbasian and Mohammadi (2013) who reported the positive effect of dictogloss on writing performance. However, more research is needed to examine the application of collaborative dictogloss task in an EFL context.

The reasons for this finding could include some unsystematic errors which were unobservable in some students such as tiredness and reluctance. Moreover, it may be difficult for pre-intermediate students to focus on both form and the meaningfulness of the text. This explanation is supported by Van Patten claim that lower-level students find it difficult to focus on meaning and form immediately (as cited in Tragant & Munoz, 2004). The results, on the other hand, are in line with Khatib and Derakhshan's (2011) study. They asserted many EFL teachers are not proficient enough to elaborate and explained the difficulties for the students. Thus, another evidence for such result is that the teacher might not be enough proficient enough to correct and analyze the problematic area for the students. Additionally, the limitation of the time may affect the written production of the students. If the study time had been longer, the results might have been different. The last reason seems to be due to the class size which may not big enough to enable teachers to address students' problem areas both verbally and nonverbally.

The result of present study is in harmony with Kuken and Vadder's (2002b) study which did not prove the effectiveness of dictogloss on their learners L2 progress. However, it is in contrast with output hypothesis and Vygotsky's theory. Output hypothesis, provided the theoretical underpinning on FoF instruction, and suggests that when learners are pushed to produce output, their language proficiency can be improved by engaging them produce language through metatalk and interaction. In this regard, Swain (1998) and Lapkin and Swain (2000) claimed that involvement in collaborative activities may promote the learners' accurate production of the target forms (as cited in Nemati & Arabmofrad, 2014). According Vygotsky's theory learners may achieve a higher level of language competence and reconstruct their knowledge through collaborative work and corrective feedback and interaction (Esteve & Cañada, 2001).

CONCLUSION

The result of this study seems to not support previous studies that have declared dictogloss task as an effective instruction in improving language skills and especially in writing achievement. It seems that more studies are needed to examine the application of collaborative dictogloss task in an EFL context. Moreover, due to some limitations further investigation warrant in future research studies. The number of the participants in this study was limited, so maybe the findings cannot be generalized for all the EFL students in Iran. Besides, the limitation of time of the study may have affected the written production of the pre-intermediate students. If the interval period had been longer, collaborative dictogloss task might have improved learners' writing performance. It is also advisable to replicate this study for students at higher levels of language proficiency, since it may be difficult for pre-intermediate level students to focus on form and meaning simultaneously.

ABSTRACT

The majority of translation training departments in our country have largely excluded translation theories from the practice of translation teaching; while it is not the same case for translators' training centers abroad. The present study has been intended to examine the effect of incorporating translation theories in teaching translation upon translations done by students. For this purpose, an excerpt of "The Road to Oz" has been chosen as children literature that abounds with charactonyms and it has been given to two groups of students one of whom has been taught no theories concerning translation of children literature; while, the other has been exposed to theories related to translation of children literature with special attention to proper names. Next, all students were required to translate the source text at a computer site on separate personal computers under monitoring of the examiner into Persian and their performance was recorded in Translog User; then, it has been interpreted by means of data provided by Translog Supervisor. Finally, it has been concluded that inclusion of translation theory in translator training programs is necessary because it leads to higher quality of translations and also more conscious and confident translators; moreover, it contributes to formation of a systematic pedagogical framework for translators training, because it provides good and necessary hints for those in syllabus designing as well as translator trainers to conduct their training having this point in mind.

KEYWORDS

Translation theory, translator training, translation quality, children literature, Translog.

INTRODUCTION

Nowadays, there are many universities offering translation programs at undergraduate and graduate levels in Iran. However, it appears that the undergraduate program of translation does not benefit from a well-established pedagogical system in terms of syllabus as well as assessment and such a situation has not been unique to Iran. Formerly, many translators' training centers around the world suffered from the same situation to the extent that scholars as House (1981: 32)

had criticized unsystematic nature of translation training programs in which teachers selected a text without explaining the reason of such a selection and distributed it among students and "snared at them and led them into errors". The translation assessment of such a text was done in the next session when students read their translations sentence by sentence and the teacher asked for better versions and at last offered the only "correct" translation to the class. In such a procedure, neither the syllabus design nor the assessment activity followed a systematic pedagogical framework. This trend has been developed in many centers around the world; however, it is still a common procedure in many translators training programs in our country and the majority of translation classes are conducted in such a method.

Considering translation training centers in Europe, Clazada Perez (2004: 119) attributes the evolution of translation training programs to "the connection made between theory and teaching practice". Such a connection seems missing in most of educational systems of translators training departments in our country; evidently, because many instructors and even students believe in the dichotomy between translation theory and practice and maintain that translators "are not made but are born" in Nida's words (1981: 46). Hence, any theoretical instruction is regarded as a waste of time. Such a dichotomy has been questioned by many scholars, including Hatim (2004:3) who states that "theory and practice are ultimately complementary and, particularly in a field such as translation, the distinction needs to be re-examined" or Landers (2001: 31) who points out that even literary translators are not born but are made and some others as Beeby (1996:63) believe that translation is different from riding a bike in which knowing how muscles work makes no difference to a cyclist and theory can provide guidelines for teachers to help students learn this skill. Yet, teachers are responsible for determining how much theory must be integrated to the course without changing the class into a theoretical one. He refers to this amount of theory as "threshold of termination" and puts forward that teachers should "make a distinction between pure theory, on the one hand, and processes and principles, on the other".

For Beeby (1996), integrating theories into translation classes does not form a methodology for teaching translation theory but a methodology for teaching translating. It can be concluded that most of disagreements made upon the integration of theory in translation teaching originates from such a belief that translation should be learned through practice and theories serve no purpose in this field; while, if theories are incorporated to introduce principles and methods rather than abstract ideas less resistance is witnessed.

Although some researchers as Beeby (1996: 12) claim that "translation teaching has not developed as fast as one might expect" and lacks clearly defined objectives and specific pedagogical framework others as Perez (2004) and Giles (2009) who believed in the potential benefits of theory in translators as well as interpreters training attempted to incorporate theories in teaching translation in order to offer an objective pedagogical framework for translation trainers.

Perez (2004: 121) has developed a tentative syllabus based on "seven important trends in Translation Studies", including:

focusing on (mostly 'discrete') units of language..., focusing on the communicative nature of texts..., focusing on communicative aims through texts..., focusing on the link between translation and target cultures..., focusing on the 'new translation ethics'..., focusing on the translator as a rational and emotional being ... and focusing on translation corpora.... (Perez, 2004:121)

Perez's tentative syllabus is formed to implement the above seven trends or theories practically in the translation practice taught in a class. This syllabus includes five units each of which focuses on one of the trends mentioned above and includes material corresponding to these trends. For instance, the first unit which focuses on 'discrete' units of language provides students with the table of contents of a computing manual to translate or the third unit which focuses on communicative aims through texts encourages students to translate any European Parliament speech. As a result of such a syllabus, students are familiarized with different translation theories including ones offered by Vinay and Darbelnet (1997) or Reiss (1989) and Nord (1997) and made flexible in decision making.

In another effort to incorporate theory in the practice of translation teaching, Giles (2009: 43) who believes in translation as a skill to be learned has provided some models for translators as well as interpreters training. He points out that theories have been excluded from training programs due to the general belief that theories are "useless, abstract and too remote from the actual practice of translation and interpreting"; while, they "can help trainees advance better and faster towards mastery of their professional skills" and the primary benefit of them lies in "their explanatory power which gives reassurance to students who experience doubts and difficulties", Giles (2009: 17,32). He adds that whatever theory is taught to students it helps them have better understanding of translation phenomenon, translation difficulties, translation strategies and tactics provided that theories are directly relevant to students needs, easy to grasp and simple. These theories should be implemented repeatedly throughout the course and after students' sensitization and adopting theories developed by other translation instructors or researchers is one of the ways through which such theoretical components are found.

According to Shuttleworth (2001: 499-500), methods and principles are better terms than theories since they are "euphemistic formulations" which emancipate syllabus designers from "formal theories as a series of statements intended as research tools rather than an aid for the translator" and translation theories should be viewed "as a means of encouraging informed reflection on the translation process" rather than "as a static body of knowledge which needs to be imparted" and any translation course in order to be relevant to students needs has to form an agenda for itself, according to which it addresses the uppermost questions for students and "expose students to a range of varying opinions on controversial issues of translation and demonstrate that translating is not completely an ad hoc and subjective activity".

RESEARCH QUESTIONS

According to Baker (1991: 37) any academic training of translators requires among others "a strong theoretical component" that induces students to "reflect on what they do, how they do it, and why they do it in one way rather than another".

Therefore the present study intends to investigate the two following questions:

Do the academic trainings of translators require theoretical components?

Does the incorporation of theoretical components can lead to higher quality of translations?

In order to do this, the performance of translation trainees have been recorded by Translog which is, according to Buchweitz and Fabio (2006: 242), "software developed at the Copenhagen School of Business which ... logs all keyboard and mouse actions as tasks are performed on an ordinary word-processor interface".

METHODOLOGY

Participants

A group of sixteen junior students majoring in English Literature were recruited. Eight of these students passed the course of Literary Translating (I) in the previous semester (Group A); while, the other group was supposed to pass this course in the coming semester (Group B).

The syllabus of Literary Translating (I) was designed to familiarize students with literary translation in three different chapters, the first of which deals with peculiarities of literary translation and its differences with non-literary translation and the second and third chapters are concerned with methods and principles related to translation of fiction and children literature respectively. In these two chapters some problematic fields as translation of proper names, neologisms, titles and charactonyms were introduced to students and strategies related to them were discussed. At last, some excerpts of texts including certain translation problems as neologisms or proper names were given and students were asked to translate the text considering principles, theories and strategies taught before. Students' translations were evaluated based on principles and methods introduced.

Such theories were developed based on the understandings that Giles (2009) believes any theories must provide. These understandings are as follows:

Understanding *phenomena*: Why do authors write the way they do? Why do speakers make ungrammatical sentences? What does it mean to 'understand' a verbal statement? How are written or oral statements perceived and processed by the human mind?

Understanding *Translation difficulties*: Why is it difficult to re-express the same message in a different language? Why is there linguistic interference between two working languages during translation or interpreting? Why do interpreters in the booth sometimes fail to understand very simple source speech segments?

[illegible]

Figure 1: Linear representation of a Persian translation

Instead of teaching everybody in the same way by using the traditional methods of setting an assignment and asking students to hand in a text, which he/she subsequently marks and hands back and discusses in class, he/she can use Translog to teach collectively with an individual emphasis. At the beginning of the course, each student gets a copy of the Translog User program containing all the assignments for the course with a brief instruction in how to operate the program and how to submit assignments as log files. Then the teacher proceeds to look at the creation of the text with each individual student focusing on processing aspects as well as on final solutions. Each student's particular learning needs are addressed, and all problems are addressed from a process-oriented perspective. However, this software was originally designed for research purposes in translation field because the detailed real-time information recorded by it makes it possible to empirically test hypotheses about a correlation between cognitive processing and time

lapse and also its replay function can serve as a powerful instrument for eliciting rich and accurate process information in this field.

Source texts

All sixteen subjects were required to translate a single English text into Persian which was an excerpt of the text "The Road to Oz" by L. Frank Baum. This text has been chosen because of charactonyms as well as geographical proper names which signify specific connotations. Eight out of sixteen subjects were taught theories related to translation of children literature and particularly translation of proper names in children literature in the previous semester. These theories were intended to familiarize them with differences between children and adult literature in terms of literary prestige, content, structure, public recognition as well as translation methods and strategies applied by translators. Based on these theories, rewriting or adaptation of children literature in another language is as a sort of loyalty to the source text and students were required to pay special attention to proper names; both character names and proper names of geographical places, because such names carry significant connotations and go beyond merely identifying characters and perform specific functions as "amusing readers, imparting knowledge and evoking emotions" in children literature, according to Jan Van Collie (2006: 63).

The city of beasts

*When noon came they opened the **Fox-King's basket** of luncheon, and found a nice roasted turkey with cranberry sauce and some slices of bread and butter. As they sat on the grass by the roadside the **Shaggy Man** cut up the turkey with his pocket-knife and passed slices of it around.*

*"Haven't you any dewdrops, or mist-cakes, or cloudbuns?" asked **Polychrome**, longingly.*

"Course not," replied Dorothy. "We eat solid things, down here on the earth. But there's a bottle of cold tea. Try some, won't you?"

*The **Rainbow's Daughter** watched **Button-Bright** devour one leg of the turkey.*

"Is it good?" she asked.

He nodded.

"Do you think I could eat it?"

"Not this," said Button-Bright.

"But I mean another piece?"

"Don't know," he replied.

*"Well, I'm going to try, for I'm very hungry," she decided, and took a thin slice of the white breast of turkey which the **Shaggy Man** cut for her, as well as a bit of bread and butter. When she tasted it **Polychrome** thought the turkey was good—better even than mist-cakes; but a little satisfied her hunger and she finished with a tiny sip of cold tea.*

"That's about as much as a fly would eat," said Dorothy, who was making a good meal herself. "But I know some people in Oz who eat nothing at all."

"Who are they?" inquired the Shaggy Man.

"One is a scarecrow who's stuffed with straw, and the other a woodman made out of tin. They haven't any appetites inside of 'em, you see; so they never eat anything at all."

*"Are they alive?" asked **Button-Bright**.*

"Oh yes," replied Dorothy; "and they're very clever and very nice, too. If we get to Oz I'll introduce them to you."

"Will the Scarecrow scare me?" asked Button-Bright.

"No; 'cause you're not a crow," she returned. "He has the loveliest smile you ever saw—only it's painted on and he can't help it."

Luncheon being over they started again upon their journey, the Shaggy Man, Dorothy and Button-Bright walking soberly along, side by side, and the Rainbow's Daughter dancing merrily before them.

Sometimes she darted along the road so swiftly that she was nearly out of sight, then she came tripping back to greet them with her silvery laughter. But once she came back more sedately, to say:

"There's a city a little way off."

"I 'spected that," returned Dorothy; "for the fox-people warned us there was one on this road. It's filled with stupid beasts of some sort, but we musn't be afraid of 'em 'cause they won't hurt us."

"Never mind," said the Shaggy Man; "as long as I carry the Love Magnet every living thing will love me, and you may be sure I shan't allow any of my friends to be harmed in any way."

This comforted them somewhat, and they moved on again. Pretty soon they came to a signpost that read:

"HAF A MYLE TO DUNKITON."

"Oh," said the shaggy man, "if they're donkeys, we've nothing to fear at all."

"They may kick," said Dorothy, doubtfully.

Procedure

Twenty subjects, top ten students of two classes selected based on their transcripts, were given a leaflet in which they were provided with a very brief introduction to Translog and assured that they would not be graded or mentioned anywhere; moreover, they were required to be punctual and use either *Hezare* or *Pouya English to Persian Dictionary* at the test session. These two dictionaries have been preferred due to such features as being up to date and user-friendly.

Sixteen students participated in the test and were asked to translate the text into Persian. It is noteworthy that they were questioned if they have any familiarity with Translog, if they can assess their ability of typing as a good, average or weak typists and lastly if they have any translation experiences except the actual translation activities done in translation classes.

None of the participants had any familiarity with Translog, all of them assessed their command of typing as average and they had no experience of translation except translations done in classes. Moreover, they were told that the source text is an excerpt of children literature and they are supposed to translate it for the children of seven to nine years old.

The task was carried out under the same condition and with access to the same tools (the same dictionaries, separate computers, the internet access) and the researcher remained in the room during the whole session. It is noteworthy that no explanation regarding how to translate proper names was given to questioners and upon completion, participants were asked to save their translations.

Data analysis

One of the objectives of this paper is to assess whether final translation output of students differs when exposed to translation theories concerned with translation of children literature or not. For this purpose, data provided by Translog supervisor has been analyzed in correlation with translation quality assessment model proposed by Katharina Reiss (2000).

RESULTS AND DISCUSSION

First, we will present statistics obtained from the Translog file in two separate tables each of which represents the performance of Group A (those who have not passed Literary Translating I) and Group B (those who have passed Literary Translation I).

Next, the translation quality of each group is considered in relation to time results provided by Translog and finally time used for revision of translation will be calculated based on Translog information to see if revision has any role in the quality of translations offered by students or not.

Table 1: Statistical Data concerning keystrokes and time related to Group A and Group B performances

Student	TUE ¹	TP ²	TE ³	CN ⁴	ME ⁵	TPPM ⁶	DU. ⁷

¹Total User Event

²Text Production

³Text Elimination

⁴Cursor Navigation

⁵Text Production Per Minute

⁶Duration

As the above table presents, Group B have spent more time translating the source text except for two cases; i.e. S05 and S07, although time differences between these two students and their counterparts in group A is too small.

Interestingly, figures related to total user events, text production keystrokes, text elimination keystrokes, cursor navigations and text productions per minute are higher for Group A in comparison with Group B. So, what did group B use the extra time for? The answer for this question is either for revision of translation or for reflecting upon translation strategies to use before offering the final product.

In order to understand if group B spent more time for revising their translations or not revision keystrokes can be calculated and compared with group A's. Owing to the statistics provided by the Translog software, this figure can be simply calculated by adding the total revision keys (a Translog figure which includes backspace, mouse and cursor movements), dividing that figure by the total keystrokes and, finally, multiplying by 100. This way, we obtain the number of revision keystrokes per hundred keys logged. The following table represents this figure in percentage:

Table 2: Total keystrokes, text production keys and revision keystrokes

Student/group	Total revision keys	Total keystrokes	Revision keystrokes
S01/ GA	1661	4202	39.52%
S01/ GB	475	3228	14.71%
S02/ GA	720	3480	20.63%
S02/ GB	347	2536	13.68%
S03/ GA	320	2898	11.04%
S03/ GB	403	2245	17.95%
S04/ GA	878	3807	23.06%
S04/ GB	1212	3776	32.09%
S05/ GA	507	3430	14.78%
S05/ GB	826	3952	20.90%
S06/ GA	633	3216	19.68%
S06/ GB	486	3052	15.92%
S07/ GA	761	2864	26.57%
S07/ GB	254	2907	8.73%
S08/ GA	880	4157	21.16%
S08/ GB	413	3324	12.42%

As the above table presents, the percentage of revision keystrokes is significantly lower for group B except in two instances; hence, it appears that Gile's (2009: 32) claim of " I believe the main positive effects of theoretical components in a training program should be sought in their *explanatory power* and in the reassurance it can provide to students who experience doubts and difficulties" is proven because group B who benefited from theoretical instructions concerning how children literature is and how it should be translated have had less revision keystroke and made translational decisions more confidently.

It appears that longer time of translation in spite of less number of text production keystrokes originates from longer cognitive processes that group B has undergone. In other words, it can be claimed that the results of this part proves the claim of Baker (1992: 58) who declared that " ... theoretical component... induces students to reflect on what they do, how they do it, and why they do it in one way rather than another".

Such a longer process can be attributed to retrieving the theoretical information concerning how to translate the source text; however, this very claim can be tested by means of Think aloud protocol in another research.

As the next step, the present study intends to examine if longer time used for translation has led to higher quality translations or not. For this purpose, Persian translations were assessed based on Reiss model which includes three categories, i.e. examination of the ST in terms of text-type, examination of the TT in terms of linguistic elements and lastly examination of the TT in terms of extralinguistic elements. *The City of Beasts* as a form- focused text, in Reiss's words (2000), requires a SL-oriented translation method which creates an analogous form for creating a corresponding impression in TL. All of eight students attending GB in this study have adopted such a translation method while the ones forming GA were either inconsistent in translation method or adopted a literal method which fails to recreate an analogous form in the TL.

According to Reiss (2000) optimal equivalence should be evaluated at different levels of semantic, lexical, grammatical and stylistic. Therefore, at linguistic category of translation criticism, "equivalence of semantic elements, adequacy of lexical elements, correctness of grammatical structures and correspondence of stylistic elements" are evaluated to see if optimal equivalence is obtained or not, according to Reiss (2000: 43-66). Considering optimal equivalence, Kade notes that "there are parallels between languages on the level of langue [...]", (cited in Reiss, 2000: 49), but "the act of translating involves choosing the optimal equivalent from among the potential equivalents on the level of parole [...]", (ibid). In other words, "all those possible equivalents of a word in isolation are potential equivalents, while the optimal equivalent is determined by the microcontext and macrocontext" of the text, according to Manafi (2005: 60).

Regarding translation criticism at linguistic level, equivalence of semantic elements is achieved when meanings of the original text are preserved in translation; adequacy of lexical elements is accomplished when a translator deals with 'technical terminology,' 'special idioms,' 'metaphors,' 'idiomatic usages,' 'proverbs' and 'untranslatable words' in a competent way; correctness of grammatical structures is achieved with due attention is given to differences in the linguistic systems of two languages and transpositions lead to optimal equivalence and correspondence of stylistic structures occurs when "the differences between colloquial and standard or formal usage, standard, individual and contemporary usage as well as deviations from normal language usage" is observed, Reiss (2000: 43-66). However, Reiss (2000:86) believes that no comprehensive evaluation of translation is possible unless all the factors including extralinguistic ones are considered. These factors are: immediate situation, the subject matter; the time factor, the place factor, the audience factor and the speaker factor, (see Reiss, 2000). Examination of *The city of Beasts* in terms of text-type as well as examination of Persian translations in terms of linguistic and extralinguistic elements reveals the following information concerning translation quality of students under study:

Table 3: Translation quality and time spent

Student/group	Translation Quality	time spent
S01/ GA	Inadequate	02:03:55
S01/ GB	Adequate	02:17:05
S02/ GA	Fairly adequate	01:45:45
S02/ GB	Adequate	02:21:39
S03/ GA	Inadequate	01:42:14
S03/ GB	Fairly adequate	02:17:10
S04/ GA	Inadequate	01:13:32
S04/ GB	Adequate	01:40:11
S05/ GA	Inadequate	02:10:11
S05/ GB	Fairly adequate	02:09:02
S06/ GA	Inadequate	01:27:59
S06/ GB	Fairly adequate	02:13:20
S07/ GA	Fairly adequate	01:29:42
S07/ GB	Fairly adequate	01:14:52
S08/ GA	Fairly adequate	01:07:40
S08/ GB	adequate	01:14:08

As the above table shows, four out of eight translations offered by Group A are inadequate because they fail to achieve optimal equivalence has been achieved at both linguistic and extralinguistic categories; moreover, conventions of children literature as covered in translation theories concerning this genre have not been observed. While, Group B has offered four adequate and four fairly inadequate translations because they more or less succeed in achieving optimal equivalence at both linguistic and extralinguistic categories. Considering theories introduced, these students managed to achieve optimal equivalents by transferring the connotations implied in the ST proper names and producing an adequate translation in terms of some extralinguistic factors as the speaker, audience as well as some linguistic factors as correctness of grammatical structures.

It can be concluded that theoretical familiarity with translation task can lead to "better understanding of translation phenomena, difficulties and strategies or tactics" as Gile's asserts (2009: 17). However, he claimed that theoretical incorporation in translation teaching can lead to faster performance of translators that is not proven by the results obtained in this study. To see the difference between performance of these students, two translations belonging to group A and group B students are given:

شهر حیوانات

وقتی که ظهر شد زنبیل ناهار روباه پادشاه را باز کردند. در آن یک بوقلمون کباب شده با سس قره قاط چند تیکه نان و کره بود. روی سبزه های کنار جاده نشستند. بعد مرد پشمالو با چاقوی جیبی اش بوقلمون را تیکه تیکه کرد و هر تیکه ای را به یکی داد.

دختر رنگین کمان با اشتیهای زیاد پرسید آیا نوشیدنی شبم کیک مه یا کلوچه ای ابری نداری؟

دروتنی گفت: معلومه که نداریم. ما روی زمین فقط خوراکی های جامد میخوریم ولی یک بطری چای سرد هم هست میخواهی امتحانش کنی؟

دختر رنگین کمان محو تماشای غنچه ای زرنگ بود که با اشتیهای زیاد پای بوقلمون را میخورد. ازش پرسید: خوشمزه ست؟ غنچه ای زرنگ که سخت مشغول خوردن بود بارضایت سری تکان داد.

دختر رنگین کمان گفت: منم میتوانم بخورم؟

غنچه ای زرنگ گفت: نه این را که نمیتوانی بخوری.

دختر رنگین کمان گفت: خوب منم منظورم یک تیکه دیگه ست.
گفت: فکر نکنم.
آخه خیلی گرسنه ام. رنگارنگ گفت: باشه ببینم میتوانم با سهم خودم سیریشم
سهمش تیکه‌ی کوچولویی از سینه‌ی سفید بوقلمون بود. آنرا با کمی نان و کره مزه کرد. دید خیلی خوشمزه تر از کیک مهی هست
که دوست دارد. اما از بس کم بود سیر نشد. یک ذره چای سرد هم نوشید و غذایش را تمام کرد.
درتی که داشت غذای خوشمزه‌ای برای خودش درست میکرد گفت: اینقدر کم بود که یک مگس هم راهم به زور سیر میکرد
ولی جای شکرش باقیه چون در شهری به نام غذ مردمی هستند که هیچی نمیخورند.
مرد پشمالو با تعجب پرسید: اینها دیگه چه جور آدمهایی هستند؟
درتی گفت: یکی مترسک هست که شکمش از گاه پر شده و یکی دیگه هم جنگلانی هست که از حلبی ساخته شده است. آنها
اصلاً اشتیایی برای غذا خوردن ندارند برای همین هیچی هم نمی‌خورند.
غنچه‌ی زرننگ پرسید: حالا که هیچی نمی‌خورند زنده‌اند یا نه؟
درتی جواب داد: البته که زنده‌اند تازه خیلی باهوش و بامزه هم هستند. هر وقت رفتم شهر غذ آنها را به شما نشان می‌دهم.
غنچه‌ی زرننگ پرسید: مترسک من راهم می‌ترساند؟
درتی به غنچه نگاه کرد و گفت: نه آخه تو که کلاغ نیستی. مترسک قشنگ ترین لبخندی دارد که تا حالا دیده‌اید و البته روی
صورتش نقاشی شده و خودش نمی‌تواند آنرا تغییر دهد.
ناهار خوردنشان تمام شد و به سفرشان ادامه دادند. درتی مرد پشمالو و غنچه‌ی زرننگ بامانیت در کنار هم راه می‌رفتند و
دختر رنگین کمان با خوشحالی و سرور در جلوی آنها راه می‌رفت. گاهی رنگارنگ مثل برق از کنار همه رد می‌شد که کسی
اورانمی‌دید. گاهی هم آرام آرام حرکت می‌کرد و به همه لبخند می‌زد. اما یک دفعه به آرامی برگشت و گفت: به ذره که جلوتر بریم
میرسیم به یک شهر.
درتی گفت: آره میدانستم. افراد روباه هم هشدار داده‌اند که در این جاده چند حیوان احمق هم وجود دارند. ولی جای هیچ ترسی
نیست چون به ماکاری ندارند.
مرد پشمالو گفت: اصلاً فکرش را هم نکنید تا مرا دارید غم ندارید اجازه نمیدهم حتی یک مو از سر دوستانم کم شود.
بالین حرف کمی خیالشان راحت‌تر شد و به راهنشان ادامه دادند تا اینکه به یک تابلوی راهنما رسیدند که روی آن نوشته بود:
نیم مایل دیگر تا شهر الاغها
مرد پشمالو گفت: اگر اینها همه الاغ باشند پس دیگر اصلاً نمینترسیم.
درتی با شک و تردید گفت: ولی ممکنه لگدم بزنند.

In what follows, a sample of translation done by a student of group B is given:

هنگامی که ظهر فرا رسید آنها سبد ناهار کینگ فاکس را باز کردند و یک بوقلمون سرخ شده‌ی خوبی به همراه سس زغال
آخته و تکه‌هایی نان و کره پیدا کردند. به محض اینکه روی علف‌های کنار جاده نشستند شاکی من بوقلمون را با چاقوی
جیبی‌اش برید و بین بقیه تقسیم کرد.
پلیکروم مشتاقانه پرسید شما قطره‌های شب‌نم کیک‌های غباری یا کلوچه‌های ابری ندارید؟
دراسی جواب داد: البته که نه. ما چیزای جامد رو می‌خوریم که اینجا روی زمین هستند. ولی چای سرد هست امتحان کن
نمیخای؟
دختر رین بو باتن برایت را نگاه کرد که که پای بوقلمون را خورد. او پرسید خوشمزه هست؟ او سری تکان داد. فکر
میکنی من تو نم بخورمش؟
باتن برایت گفت: نه این رو ولی منظورم تکه‌ی دیگری هست جواب داد: نمیدونم. بسیار خب میخام امتحان کنم چون خیلی
گرسنمه. تصمیمشو گرفت، و به تیکه نازک از سینه بوقلمون رو گرفت که شاکی من برای او برید. به همراه یه کم نون و
کره وقتی که امتحانش کرد پلیکروم فکر کرد که حتی بهتر از از کیک‌های غباری هست. ولی یه کم گرسنگیشو برطرف
کرد و او با جرعه‌ای از چای سرد تمام کرد.
درسی که داشت برای خودش غذای خوبی آماده میکرد گفت: اون به اندازه‌ی که یه مگس میتونست بخوره. اما من میدونم
که بعضی از آدم‌ها در ازون هستند که هرگز چیزی نمی‌خورن.

شاگی من پرسید: کیا هستن؟ یکی از اونها مترسکی هست که با کاه پر شده است یکی هم وود من است که حلبی هست و اشتها ندارن پس هیچوقت هم هیچی نمیخورن. باتن برایت پرسید: آنها زنده‌اند؟ دراسی جوا داد: اوه بله و آنها خیلی زرنگ و خوب هستن. اگه اوزون رفتیم بهت معرفی‌شون میکنم. دراسی پرسید مترسک منو میترسونه؟ او جواب داد: نه چون شما کلاغ نیستی او دوست داشتنی‌ترین لبخندی ست که هیچوقت تموم نمیشه. ناهار تموم شد و شاگی من و دراسی و باتن برایت درکنار یکدیگر و هوشیارانه سفرشون رو به به پیش گرفتند و دختر رین بو شادی کنان و به دنبال اونها و گاهی هم به سرعت در امتداد جاده میدوید. که از دید خارج میشدند در حالی که سکندری میخورد بر میگشت و با خنده ی پرافتش به آنها سلام می‌کرد یک بار با جدیت برگشت و گفت شهری در بیرون از جاده هست. دراسی برگشت و گفت من به آنها مشکوکم برای اینکه مردم فاکس به ما گفتند که فقط یکی روی این جاده هست. با احمقانه با حیوانی چارپا از بعضی از گونه ها پر شده است. ولی ما نباید از اونها بترسیم به ما آسیبی نمیرسونن. شاگی من گفت: مهم نیست تا زمانی که من عشق مگنت در من باشد هر موجود زنده‌ای منو دوست خواهد داشت. و شما هم مطمئن باشین که من اجازه نخواهم داد که دوستانم به هیچ نحو آسیب ببینند. این حرف آنها را تا حدی راحت کرد و انها به حرکت ادامه دادند مدتی بعد یا یک علامت پستی رو به رو شدند: نیم مایل مانده به دانکیتون. شاگی من گفت: اگه الاغ ها هستن ما هیچ ترسی نداریم. دراسی با تردید گفت: اونا ممکنه لگد بزنن.

It is noteworthy that in both translations some instances of mistranslations are visible; although, the group A students offer a higher quality translation. The same is more or less true for the other students of group A who were familiar with the requirements of translating children literature.

CONCLUSION

According to the preceding parts, it can be understood that software programs as Translog can be well applied in researching the process of translation and are able to assist translation researcher to achieve more reliable results based on objective statistics provided; moreover, it can be concluded that translation theory has been inappropriately excluded from teaching syllabus in translator training centers of our country because it can help students understand the phenomenon of translation, difficulties of this task and also how to tackle such difficulties better.

Based on the aforementioned findings, it can be concluded that theories can influence on the performance of translation trainees and yield higher quality translations; although, inclusion of them in translation teaching programs does not lead to faster translations. Furthermore, one should make a distinction between theories of translation as abstract statements useful for research purposes and translation theories which focus on specific translation approaches and strategies. This study appears to prove that any theoretical instruction aimed for solving specific translation problems and doubts of students can lead to higher quality of translations.

It is noteworthy that in order to obtain the ideal results concerning research questions as ones proposed by the present study, a think aloud protocol test can be included as well. Such a study can be better conducted if it is performed by higher number of subjects. Furthermore, conducting a pre-test to assess language proficiency as well as typing command of participants could be

beneficial. Moreover; a process-oriented examination of participants' activities by means of Think aloud Protocol could yield more reliable results.

Except for one case, it is not clear if participants have attempted consulting the Internet to get access to information concerning connotations of proper names in "The Road to Oz" or not. It appears that considering this issue could have led to considerable results. Although the participants were required to use either *Hezare* or *Pouya English to Persian Dictionaries*, the effect of dictionaries on the final translations could have been minimized if a certain English to Persian Dictionary had been uploaded on the Translog User. Two participants; i.e. S01 and S03 in Group A, admitted that they are too slow in any kind of performance; hence, a personality test to determine how quick witted the participants are could have helped the researcher in the choice of subjects in order to minimize the effect of personality traits upon the final results.

ABSTRACT

English as a Foreign Language (EFL) learners frequently ask their teachers what strategy or technique to use in order not to forget the lexical items. In this study, the researcher made an attempt to find out the effectiveness of mnemonic devices as a memory strategy on the learners' vocabulary retention. For this purpose, 60 Iranian EFL acquirers at pre-intermediate level of language proficiency, were selected and participated in this study. There was no limitation regarding their age. To ascertain the homogeneity of the learners, the researcher implemented Preliminary English Test (PET) as a pretest. The participants were assigned into two groups of 30, experimental and control. The experimental group was instructed 80 pre-selected words through mnemonic devices, but the same vocabularies were instructed to the control group in a traditional way. To answer the first question, the mean scores of both experimental and control groups were compared on the immediate posttest. The result demonstrated that instructing words through mnemonic devices is more influential than through the traditional methods. To answer the second research question, the researcher compared the mean scores of the experimental group on the immediate and the delayed posttests. The result revealed that learners' delayed recognition of second language vocabulary is not affected by the passage of time, it means that words learned via mnemonics instruction were retrieved well both in the process of immediate and delayed retention. This study shed light on the fact that memory strategies like mnemonics are of great application and importance in the process of short term and long term retention of EFL learners. Therefore, mnemonic devices should be given prime attention by both EFL material developers and instructors as a potentially efficient technique for vocabulary instruction, acquisition, and long term retention at foreign language improvement.

KEYWORDS: Vocabulary, Mnemonic Devices, Immediate Retention, Delayed Retention

INTRODUCTION

The key factor for most of the learners in second or foreign language learning is how to communicate with each other. Vocabulary is one of the foremost constituents of language that helps learners communicate efficiently. The significance of lexical items is so fundamental and in this regard, Akmajian et al. (2010: 13) state that one of the most significant parts of linguistic

structure is the word. According to them, “anyone who has mastered a language has mastered an astonishingly long list of facts encoded in the form of words. The list of words for any language is referred to as its lexicon”. The biggest issue that almost all teachers were dealing with was that most of the Iranian EFL learners often complain that they cannot remember many of the words they have learned before; they typically find vocabulary learning difficult. Many students also confess that they usually memorize the word list through repetition, explanation, translation and other conventional techniques. Hence, they have low motivation in learning a second language. Because of that, students need to know some strategies and techniques to learn, retain, and recall vocabulary in different conditions. As a conclusion, it is crucial for the teacher to select a technique that is interesting and exciting to the students and impressive in reinforcing students’ vocabulary learning and retention. Khan (2008: V) declared that mnemonics are derived from “Mnemosyne, ancient Greek goddess. A memory aid or pertaining to aiding the memory. Often considered to be a code, device, acronym or formula to facilitate memory or understanding”. According to Shmidman and Ehri (2010:160), “Mnemonics are effective when they speed up learning, reduce confusion among similar items, and enhance long term retention and application of information”.

LITERATURE REVIEW

The Significance of Vocabulary in English Language Teaching (ELT)

The gradual improvement of the second language lexical items is an essential part of the practice of acquiring a foreign language. However, for a long time, vocabulary was ignored facet of language instruction. Since 1980s, it has found its path in the core curricula and the importance of its instruction became noticeable (Allen, 1983, Carter, 2002).

Instructors came to the conclusion that for developing four skills of language (Listening, Speaking, Reading, and Writing) in the acquirers, they have to train them the new or unfamiliar vocabulary words. For instance, we can consider Field (2002: 242) who stated that in the pre-listening phase in the classroom the “pre-teaching of all important new vocabulary in the phase” is noteworthy. Knowing the words and expressions is also beneficial for developing the reading skill. Grabe and Stoller (2001: 196) highlighted that “reading fluency depends on knowing a fairly large number of words so that a reading task itself is not too difficult”. They also noted that the learners should become familiar with the extensive amount of vocabularies in a routine manner if they want to become the fluent readers. Consequently, Vocabulary knowledge is vital to the reading comprehension. “Comprehension is far more than recognizing words and remembering their meaning” (Sedita 2005: 1); however, if learners do not sufficiently understand the meaning of lexical items in the text, in this way communication is impracticable. It is also apparent that to the second or foreign language learners being able to speak fluently is the main goal. In this case, they need to have access to a large amount of vocabularies and phrases. Kramsch (2002: 20) indicated that, “not being able to continue speaking because of a lack of vocabulary is a threat to one’s positive face, but asking for help may be perceived as a threat to one’s negative face”. Generally speaking, vocabulary instruction is an obligatory segment of training language to the students. Understanding a massive amount of lexical items can aid

learners to become better language acquirers and also aid them to gain more self-confidence in their communication.

The significance of vocabulary has been emphasized by many investigators. In this way, Zimmerman (1997: 5) states that, “vocabulary is the most important aspect of second language learning. The more you know the better chance to understand the language or make yourself understood”. Nation (2001: 9) emphasizes that, “second language learners need to know very large numbers of words. While this may be useful in the long term, it is not an essential short-term goal”. He also emphasized the efficiency of acquiring words and expressions with their translation in different ways such as flash cards and word lists.

Vocabulary Retention

Retention of the words has always been one of the concerns of the second or foreign language learners. They utilize different techniques in order to memorize the lexical items. For instance, some of them prefer to repeat the words whereas others use flash cards and look at them every now and again. As a result, Vocabulary retention is a matter of great importance to the learners. In this regard, Decarrico (2001: 291) states that instructors can motivate learners in order to “check for an L1 cognate, study and practice in peer groups, connect a word to personal experience or previous learning, say a new word aloud when studying, use verbal and written repetition, and engage in extended rehearsal” .

Up until now different definitions have been presented for the term ‘retention’. Vocabulary retention can be defined as “the ability to recall or remember things after an interval of time. In language teaching, retention of what has been taught may depend on the quality of teaching, the interest of the learners, or the meaningfulness of the materials” (Richards & Schmidt, 2002: 457). They also added that, “immediate retention is the remembering of something shortly after studying it. The ability to remember something some time after it has been studied” is known as delayed retention (p.248). According to Fry (2012: 48), retention is “the process by which we keep imprints of past experiences in our minds, the ‘storage depot’. Subject to other actions of the mind, what is retained can be recalled when needed”.

Khabiri and Pakzad (2012:81) also mentioned that retention relies on “the amount of mental and emotional energy used in processing a word and readers have developed certain strategies that could assist emotional and mental processing such as meta-cognitive strategies”. They also state that acquirers are suggested to learn vocabularies or phrases through reading texts. In this way, retention should not be perplexed with comprehension. Acquisition of the vocabulary’s meaning entails more than understanding it in a specific context throughout reading activity. The word’s meaning to be preserved in the long-term memory.

Jenpattarakul (2012: 445) indicated that vocabulary retention techniques help learners to be delighted in order to acquire a lot of words and they can keep those vocabularies in memory which can cause positive attitude and increased confidence in acquiring vocabulary. Therefore, vocabulary retention techniques refer to the “techniques by which students use to store vocabularies in long-term memory and recall or retrieve easily to achieve reading

comprehension". As a result, in order to improve the retention the "information needs to possess or be given qualities of meaningfulness, organisation, association, visualisation, attention, interest, and feedback" (Wainwright, 2007: 106).

Mnemonics

Mnemonic devices are memory aids that help learners in recalling particular data by using a strategy or technique that enable learners to develop memory (Richmond, Cummings & Klapp, 2008). During the ancient time of Rome and Greece, mnemonic devices have been applied in order to make the acquisition of target words easier by providing clear pictures for thoughts and ideas (Baleghizadeh & Ashoori, 2010). Mnemonics are useful techniques that help learners remember vocabulary more effectively and this strategy involves connecting unfamiliar information to the information that is already existed in the long term memory of learners through the application of a visual image or letter combinations (Bakken & Simpson, 2011). According to O'Brien (2011: 154), mnemonics have "a firm place in our repertoire of memory techniques". In addition, Mnemonic devices are good memory enhancing strategies or techniques that assist learners in order to link new information to the previous information stored in their cognitive system and also these techniques, verbal or visual, that develop the storage and recall of data included in memory (Ashoori Tootkaboni, 2012).

Kleinheksel and Summy (2003) described the processes that instructors can use when applying a mnemonic technique as follows:

- Recognize the learner's memory deficits: it is significant to identify that learners have not an attention deficit but they have a memory deficit.
- Identify curriculum areas where mnemonic devices can be utilized in order to improve memory: a strategy or technique that can be applied in more than one situation is stronger than a strategy or technique that will be employed in only one situation. Therefore, the performance of learners in other academic settings is also important.
- Talk about mnemonic devices with learners: forming the strategy will illuminate the learners what mnemonic devices involve. They also become aware of the advantages of mnemonic devices and the ways that these devices increase the learner's recall of information, and finally teach the mnemonic devices with great detail. Teacher should instruct the mnemonics, in that case some students broke down this strategy into particular small constituents and others will be able to use it at once.

Different Types of Mnemonics

Mnemonic strategy can be applied in different fields such as mathematics, medicine, history, etc. There are at least three methods to teach mnemonics namely the Keyword, Pegword, and loci strategies. The Keyword method was first proposed by Atkinson in 1975. It aids learners to "link a word form and its meaning and to consolidate this linkage in memory" (Decarrico, 2001:291). According to this source, the keyword method can be carried out in three phases: first the acquirers pick out two concrete words in an L1 and L2 that are identical to each other phonologically or orthographically. Afterwards, a strong connection can be made between the keyword (word in L1) and the target word in L2. In this situation, when the target word is seen or

heard, the keyword would be recalled at once. In the last phase, a visual image is made in order to come together the referents of the keyword and the target word. The important point here is that learners should acquire knowledge to focus on recalling the picture of interaction between the keyword and the target word. Therefore, the keyword method is a way of making a close association between an unfamiliar or new words and its meaning. Kleinheksel and Summy (2003: 32) have claimed that this method is effective because “it increases concreteness and meaningfulness of newly acquired information, and also it ties new information to prior knowledge”.

The second type of mnemonics is the Pegword method. In this method, the numbered or ordered information need to be recalled. According to Dehn (2011), this method is identical to the Loci. This technique contains two stages. The first stage is that acquirers commit to memory the rhyming vocabulary words for the number 1 to 10. In the second stage, the acquirers create in their mind the unknown word and the rhyming word and afterwards connect these two things with other vocabulary words with the associated number (Zarei, Hasani & Keysan, 2013). In this sense, wainwright (2007: 55) uttered that this technique is based upon the idea of making connections between the rhymes and the items the learners desire to remember. For example: “one is bun, two is shoe, three is tree, four is door, five is hive, six is sticks, seven is heaven, eight is gate, nine is wine, ten is hen”.

The loci method is another type of mnemonic devices. This method is used as a memory aid. It is a Latin name for ‘places’. According to wainwright (2007), Roman orators applied this method in order to recall their speeches. For example, they drew the picture or image the places they knew very well. In this regard, Dehn (2011) declared that the loci method is the first visual mnemonic device. It works effectively because learners are associating a word with something they previously know and will not fail to forget, like the rooms in their home. When they remember the rooms, the images or pictures they created will unintentionally be remembered. When they observe what is in the picture, they will identify the information they need to remember. Nemati (2009:124) also points out that in order to “ use this ancient technique, imagine a familiar location such as a room, then mentally place items to be remembered there, to recall take an imaginary walk along the landmarks in the room and retrieve the items in it”.

Empirical Studies on Mnemonics

Empirical research on the effects of mnemonic techniques on retention began in the late 1960s. Baleghizadeh and Ashoori (2010) compared the impact of keyword and word list method on immediate vocabulary recall of EFL learners. In this research, the keyword method yielded better results in remembering and understanding the words as compared with word list method. The findings revealed that the experimental group which received vocabulary teaching through keyword method did better than those (control group) which received vocabulary teaching through the word list method. This shows the superiority of the keyword method in order to remember word lists. Secondly, Atay and Ozbulgan (2007) were investigated the effect of memory strategy instruction together with learning through context on the ESP vocabulary retention of Turkish EFL learners. The study exhibited that mnemonic strategies can enhance vocabulary learning. They also compared the performance of learners instructed in bidirectional

retrieval applying the keyword method to study new Spanish words and their English definitions with that of control group learners who used the standard keyword procedure; the results revealed that there was a noticeable difference in the level of recall among the two groups: the retrieval group remembered about 70% of the meanings of the 11 target words, while the level for the standard group was about 50%. In this regard, the results of Nemati's (2009) study portrayed the superiority of memory strategies in short term and long term retention and she came to the conclusion that giving strategy awareness can help learners store and retrieve new lexical items. Other research findings "provide evidence that instruction involving the use of mnemonic devices does enhance a student's formal reasoning skills and that this has the potential for application of knowledge to more varied tasks" (Laing, 2010:354).

RESEARCH QUESTIONS AND HYPOTHESES

The study intended to investigate the effect of instructing mnemonic devices on the immediate vs. delayed vocabulary retention of Iranian EFL learners. The following questions were posed to fulfill the purpose of this study:

RQ1: Does the application of mnemonic devices have any significant impact on EFL learners' immediate vocabulary retention?

RQ2: Does the application of mnemonic devices have any significant impact on EFL learners' delayed vocabulary retention?

And, the following null hypotheses were stated:

HO1: The application of mnemonic devices does not have any significant impact on EFL learners' immediate vocabulary retention.

HO2. The application of mnemonic devices does not have any significant impact on EFL learners' delayed vocabulary retention.

METHODOLOGY

Participants

At first, 95 Iranian EFL students were selected randomly and Preliminary English Test (PET) was administered to them. After the administration of PET, the students whose scores fell within the range of one standard deviation above and below the mean shaped the main participants of the study. Fortunately, the researcher could select 60 participants from among a total number of 95 learners studying in the pre-intermediate level. The selected participants were assigned to two groups. One experimental group and one control group with 30 students in each, consisting of 12 to 15 students in each class.

Instruments

To conduct the current study, the following materials and instruments were utilized:

Preliminary English Test (PET). To homogenize students at pre-intermediate level, the piloted PET was used. This test was comprised of the three sections of reading comprehension (35

items), speaking, and writing (7 items). The listening part was deliberately omitted from the test because of the issues with administration. Though the test was a standard one, the piloting was done to reassure its reliability following the reduction of listening comprehension section. The three parts of exam have the same value, 25% each and the total score was made by adding all the results together (the total score of the test equalled to 75). The administration of the whole test took around 100 minutes and the rating scale used to rate the writing section of PET in this study was the ones provided by Cambridge under the name of General Mark Schemes for Writing. The rating was done on the basis of the criteria stated in the rating scale including the rating scale of 0-5 for PET.

Vocabulary List. To ensure the homogeneity of learners regarding their knowledge of vocabulary prior to the treatment, a vocabulary list including 120 items (taken from the learners' course book) was given the learners in order to illustrate which words were known to the subjects and which ones were not. Accordingly, 80 words of this list which were unfamiliar to the learners were selected and the other 40 vocabularies that were known to the learners were omitted from this list. The posttests of the study were also developed based on these selected words.

Immediate and Delayed Posttests of Vocabulary. A teacher-made multiple-choice vocabulary test was developed based on level of the learners and the concepts presented in their course book as well as the vocabulary list of the course book. Then the test items were checked by the researcher, modified and piloted among 30 students with the same characteristics (gender, level) for the purpose of calculating the reliability of the test. Based on the item analysis done, the weak items were modified and consequently the test received the relatively desired format. The reliability of the test was calculated as 0.79 based on Kr-21 method which is an acceptable reliability. Finally, the test which included 30 items was used both as the immediate and delayed posttests in the present study to measure and compare the participants' second language vocabulary development in the immediate and delayed vocabulary retention.

Procedure

First, the piloted PET was administered to 95 pre-intermediate students to homogenize them regarding their general language proficiency. Out of 95 students, 60 students whose scores fell one standard deviation above and below the mean formed the main participants of the study. The selected participants were randomly assigned to two groups, an experimental and a control group with 30 students in each.

The participants of the study in both groups received the vocabulary list of the course book including 120 items. 80 items, which were new for at least 90% of the participants, were kept and the rest were omitted from both the treatment and the source of test construction. Then the treatment period began and continued for 8 sessions. The whole semester included nine weeks and the learners attended the classes two days a week, each session lasting for 90 minutes in both groups. Considering the fact that the syllabus of the language school had to be covered during the semester, 30 minutes of 8 sessions were allocated to the treatment in the experimental group.

As a result, same vocabularies were used for both groups, but the way of the presenting materials was different in the two groups: In the experimental group, learners were instructed based on the mnemonic devices, which included visualization or imagery, and pictures to aid the learners memorize and recall the vocabularies with delayed time intervals. Therefore, the teacher briefed the learners about mnemonic devices strategy and its different types at the beginning of the treatment. Each session, 10 words were instructed through keyword method, Pegword system, and Loci method.

The learners in the control group also received the same materials, course book, vocabularies, idioms, and passages that the experimental group experienced, meanwhile they were not provided with the mnemonic strategies. Instead they worked with conventional methods of learning vocabularies, for example the teacher presented the words in isolation, gave pronunciation of the vocabulary words orally and wrote those vocabularies on the whiteboard and gave a short explanation about their part of speech. Also, the teacher elaborated the meaning of each vocabulary through presenting synonyms and antonyms if necessary and finally applied minimal contexts, i.e. some meaningful sentences.

Then after eight sessions of treatment, the immediate vocabulary posttest was administered to check the learners' recognition of vocabularies. Then after an interval of three weeks, the delayed posttest of vocabularies was administered to check the learners' performance concerning retention of vocabularies.

Statistical Analysis of the Research Instruments

To test the hypotheses of the study, some descriptive and inferential data analysis procedures were performed:

Inter-rater Reliability of the Writing Section of PET

Table 1 shows the inter-rater reliability of the writing of the PET test. To score the participants' writings, the scale presented by Alderson and Tankó (2010) was used which rates the writings based on a 1 to 6 scale. A Pearson correlation was then run to probe the inter-rater reliability of the scores. The results (Pearson $R = .85$, $P = .000 < .05$) indicated significant agreement between the two raters.

Table 1: Inter-Rater Reliability of the Writing test

		Writing R2
Writing R1	Pearson Correlation	.856**
	Sig. (2-tailed)	.000
	N	60

**. Correlation is significant at the 0.01 level (2-tailed).

Inter-rater Reliability of the speaking Section of PET

Table 2 displays the inter-rater reliability of the speaking test. A Pearson correlation was run to probe the inter-rater reliability and the results (Pearson $R = .78$, $P = .000 < .05$) indicated significant agreement between the two raters.

Table 2: Inter-Rater Reliability of the Speaking Test

		Speaking R 1
Speaking R 2	Pearson Correlation	.785**
	Sig. (2-tailed)	.000
	N	60

**. Correlation is significant at the 0.01 level (2-tailed).

KR-21 Reliability Indices

The KR-21 reliability indices of the tests were displayed in Table 3.

Table 3: KR-21 Reliability Indices

	N	Mean	Variance	KR-21
PET	95	51.26	70.600	.79
Immediate Posttest	60	21.47	2.825	.54
Delayed Posttest	30	21.83	3.217	.56

Criterion-Referenced Validity

This kind of validity is an empirical one. In this kind of validity, the correlation coefficient between the newly developed test and the criterion test will be calculated. The Pearson correlation coefficients between the PET, immediate, and delayed posttests of vocabularies were computed as the criterion-referenced validity indices of the latter tests. As displayed in Table 4, the immediate posttest ($r(58) = .73$, $P < .05$, representing a large effect size) and delayed posttest ($r(28) = .94$, $P < .05$, representing a large effect size) enjoyed significant criterion-referenced validity indices.

Table 4: Criterion-Referenced Validity

Correlations

Immediate	Pearson Correlation	.733**
	Sig. (2-tailed)	.000
	N	60
Delayed	Pearson Correlation	.944**
	Sig. (2-tailed)	.000
	N	30

**. Correlation is significant at the 0.01 level (2-tailed).

RESULTS AND DISCUSSION

Testing Assumptions

Four assumptions should be met before one decides to run parametric tests (Field, 2009). The subjects were independent that is to say their performance on the test was not affected by the

performance of other students. The present data were measured on an interval scale and the subjects performed independently on the tests. The assumption of normality was also met. As displayed in Table 5 the ratios of skewness and kurtosis over their respective standard errors are within the ranges of ± 1.96 (Field, 2009).

Table 5: Testing Normality Assumption

Group		N	Skewness			Kurtosis		
		Statistic	Statistic	Std. Error	Ratio	Statistic	Std. Error	Ratio
Experimental	PET	30	.221	.427	0.518	-.711	.833	-0.854
	Immediate Posttest	30	-.587	.427		-.652	.833	
					-1.375			-0.783
Control	Delayed Posttest	30	-.502	.427		-.634	.833	
					-1.176			-0.761
	PET	30	.334	.427	0.782	-.658	.833	-0.790
	Immediate Posttest	30	-.427	.427		-1.325	.833	
					-1.000			-1.591

The assumption of homogeneity of variance is discussed when reporting the results of the independent t-test.

Subject Selection Statistics

Table 6 below represents the descriptive statistics of the subject selection procedure. The piloted PET test was administered to 95 students. Based on the mean (51.26) and SD (8.40), 60 students whose scores fell within one SD above and below the mean were selected.

Table 6: Descriptive Statistics of Subject Selection

	N	Minimum	Maximum	Mean	Std. Deviation	Variance
PET	95	29.0	65.0	51.26	8.402	70.600
Valid N (list wise) 95						

PET General Language Proficiency Test

An independent t-test was run to compare the experimental and control groups' mean scores on the PET test in order to prove that both groups enjoyed the same level of general language proficiency prior to the administration of the treatment. As displayed in Table 7 below, the experimental (M = 54.63, SD = 3.02) and control (M = 54.76, SD = 2.97) groups showed almost the same means on the PET test.

Table 7: Descriptive Statistics of PET by Groups

Group	N	Mean	Std. Deviation	Std. Error
Experimental	30	54.63	3.025	.552
Control	30	54.76	2.977	.523

The results of the independent t-test ($t(58) = .171$, $P > .05$, $R = .022$, representing a weak effect size) (Table 8) indicated that there was not any significant difference between the experimental and control groups' mean scores on the PET test. Thus it can be concluded that they enjoyed the same level of general language proficiency prior to the administration of the treatment. It should be noted that the assumption of homogeneity of variances was met (Levene's $F = .046$, $P > .05$). That is why the first row of Table 8, i.e. "Equal variances not assumed" was reported.

Table 8: Independent t-test of PET by Groups

	Levene's Test for Equality of Variances		t-test for Equality of Means							
	F	Sig.	t	Df	Sig. (2- tailed)	Mean Difference	Std. Difference	Error Difference	95% Interval of the Difference	Confidence of the Difference
Equal variances assumed	.046	.832	.171	58	.865	.100	.586		-1.072	1.272
Equal variances not assumed			.171	57.844	.865	.100	.586		-1.072	1.272

Investigating the First Null Hypothesis

The first null hypothesis was set as "the application of mnemonic devices does not have any significant impact on EFL learners' immediate vocabulary retention". An independent t-test was run to compare the experimental and control groups' mean scores on the immediate posttest of vocabulary retention in order to probe the effect of mnemonic devices strategy training on the learners' recognition of the vocabularies as measured on the immediate posttest. As displayed in Table 9 the experimental ($M = 21.47$, $SD = 2.82$) outperformed the control ($M = 16.83$, $SD = 2.76$) groups on the immediate posttest of vocabulary retention.

Table 9: Descriptive Statistics of Immediate Posttest of Vocabulary by Groups

	Group	N	Mean	Std. Deviation	Std.Error Mean
Posttest	Experimental	30	21.47	2.825	.516
	Control	30	16.83	2.768	.505

The results of the independent t-test ($t(58) = 6.417$, $P < .05$, $R = .65$, representing a large effect size) (Table 10) indicated that there was a significant difference between the experimental and control groups' mean scores on the immediate posttest of vocabulary retention. Thus the first null hypothesis as "the application of mnemonic devices does not have any significant impact on EFL learners' immediate vocabulary retention" was rejected. The experimental group after receiving mnemonic devices strategy instruction outperformed the control group on the immediate posttest of vocabulary.

Table 10: Independent t-test of Immediate Posttest of Vocabulary Retention

		Levene's Test for Equality of Variances		t-test for Equality of Means							
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference		
										Lower	Upper
Posttest	Equal variances assumed	.045	.833	6.417	58	.000	4.633	.722		3.188	6.079
	Equal variances not assumed			6.417	57.976	.000	4.633	.722		3.188	6.079

It should be noted that the assumption of homogeneity of variances was met (Levene's $F = .045$, $P > .05$). That is why the first row of Table 10, i.e. "Equal variances not assumed" was reported.

Figure 1: Immediate Posttest of Vocabulary Retention by Groups

Investigating the Second Null Hypothesis

The second null hypothesis was set as "the application of mnemonic devices does not have any significant impact on EFL learners' delayed vocabulary retention". A paired-samples t-test was run to compare the experimental group's mean scores on the immediate and delayed posttests of vocabulary retention in order to probe the effect of mnemonic devices instruction on the learners' delayed vocabulary retention. As displayed in Table 11, the experimental group showed almost the same means on the immediate posttest ($M = 21.83$, $SD = 3.21$) and the delayed posttest ($M = 21.47$, $SD = 2.82$).

Table 11: Descriptive Statistics; Immediate and Delayed Posttests of Vocabulary

Paired Samples Statistics		Mean	N	Std. Deviation	Std. Error Mean
Pair 1	Delayed	21.83	30	3.217	.587
	Immediate	21.47	30	2.825	.516

The results of the independent t-test ($t(28) = 1.515$, $P > .05$, $R = .098$, representing a large effect size) (Table 12) indicate that there was not any significant difference between the experimental group's mean scores on the immediate posttest and delayed posttest of vocabulary retention. Thus the second null-hypothesis as "the application of mnemonic devices does not have any significant impact on EFL learners' delayed vocabulary retention" was supported.

Table 12: Independent t-test; Delayed Posttest of Vocabulary Retention

Table 12: Independent Posttest, Delayed Posttest of Vocabulary Retention										
Paired Samples Test		Paired Differences					t	df	Sig. (2-tailed)	
		Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference					
					Lower	Upper				
Pair 1	Delayed Posttest	-	.367	1.326	.242	-.128	.862	1.515	29	.141

Figure 2: Immediate and Delayed Posttests of Vocabulary

CONCLUSION

The main objectives of this study were to find out whether the application of mnemonic devices can boost learners' vocabulary knowledge or not and how far the learners' vocabulary retention improves after being taught by using mnemonic techniques. It was also essential for researcher

to see the changes in the range of the vocabulary knowledge of the students before and after the research. Another basic purpose of the current study was to pay more attention to the weakness the learners have in vocabulary learning.

This study was done in order to answer two questions. The first question was whether the application of mnemonic devices has any significant impact on the learners' immediate vocabulary retention or not. To answer this question, the mean scores of both experimental and control groups were compared on the immediate posttest in order to find out whether there is any significant difference between the findings or not. In that case, an independent t-test was computed. The t-test here was a two-tailed t-test since the researcher made no prediction about the answer to this question. The statistical analysis revealed that the application of mnemonics has a positive effect on the learners' immediate vocabulary retention. So the first null hypothesis is rejected.

The second research question was whether the application of mnemonic devices has any significant impact on the learners' delayed vocabulary retention or not. To find out the answer, the researcher compared the mean scores of the experimental group on the immediate and delayed posttests of vocabularies. Since the researcher did two experiments on the same group, a paired t-test was computed. The findings revealed that there was not any significant difference between the experimental group's mean scores on the immediate and delayed posttests. Hence, the second null hypothesis is supported.

In brief, it can be concluded that the instruction of mnemonics to EFL learners in the classroom provided positive atmosphere for them in order to boost their vocabulary knowledge.

Implications

Based on the findings of the present research, it is recommended that mnemonic devices can be applied in instructing the words that have any resemblances with learners' native language. In this sense, teachers should be responsible for making learners aware of the existence of such strategies and provided them with different types of mnemonic devices in order to make them self-sufficient in applying this strategy. The findings of this research have benefit to EFL instructors, learners, and material developers. The findings can help instructors change their beliefs about to be teacher- centered in language teaching and move toward learner-centered approaches. Teachers also can help students to improve their group work activities. (E.g. Share experience, cooperating with each other, etc.)

Syllabus designer and textbook writers also can help instructors to represent specific parts related to vocabulary strategies into the materials they extend in order to remember the vocabularies for a time interval. In that case, strategy training will be involved with everyday classroom procedures and the learners will be directly instructed why, how, and when to apply vocabulary strategies in order to facilitate learning of new vocabularies and also better and faster recalling.

Mnemonic strategy can be applied in testing as a tool for assessing the learners' strategy application in vocabulary retention. This can be carried out by providing learners with some pictures that aid them memorize the words through the links or connections they made between those vocabularies.

Suggestions for Further Research

There are some suggestions for further research as follows:

- Examining mnemonic devices on a larger number of learners, both female and male, and on different level of language proficiency, and also on different ranges of learners' age.
- Comparing and combining this strategy with other vocabulary learning strategies.
- Trying different types of mnemonic devices on EFL learners' vocabulary recall.
- Examining the effect of mnemonic devices on other components of language.

Limitations of the Study

The following limitations were imposed on this study:

The first limitation was related to the participants. They were all female. This was an empirical survey that only comprises a limited number of subjects. More samples from different institutions would definitely yield more generalizable results. Also, the interval between instructing the vocabulary words and testing them was almost short due to the constraints of the term's duration. As the listening part of the test took a long time to be administered in the classrooms and was not permitted by the institutions, therefore the researcher did not implement this part. This did not hinder the standardization of the test because different parts of PET were standardized separately.

TRANSLATION FROM PERSIAN: A WAY TO CULTURE PLANNING AND CRYSTALLIZATION OF OTTOMAN LITERARY ACTIVITY

Somaye Delzandehrooy

Faculty Member at Vali-e-Asr University of Rafsanjan, Iran

delzende@vru.ac.ir

ABSTRACT

The fact that translation from a certain language can be 'actively involved' in re/shaping a culture and its literary activity depends on a variety of factors, either human or non-human. This study intends to investigate the reasons why during the Ottoman era Persian remained the language of art and literature for three successive centuries (15-18 A.D.). Besides different factors (geographical links, literary figures, richness of the rhetoric of Persian, the Ottomans' willingness to consume new goods, etc.) translation has proved to have had a great influence in crystallizing the Ottoman culture and literary activity since it has been practiced in different forms the most important of which, discussed in this study, is 'parallels/ nazires'. In order to show the role of these factors and the agency of translation in the crystallization of Ottoman culture and literary activity, Even-Zohar's (2010a, 2010b) concept of poly-system theory and culture planning is applied as the theoretical model in this study. It is concluded that translation, done in whatever form, can lead to forming of a culture and literature when it involves creativity, and it is done from a poetically, literary and/or politically dominant language which was the case with translation from Persian in the Ottoman era.

KEYWORDS: Translation, Culture Planning, Persian, Ottoman Era, Literary Activity

INTRODUCTION

Throughout the world, societies have always attempted not to fall behind of what is, globally or in their neighborhood, considered as valued assets on whatever level (material or semiotic). To this end, they have gone different ways whereby they have tried to obtain what their country lacked. They might have directly imported what was 'better' in other societies, or tried to produce or reproduce something of similar quality in their neighborhood or in other known-about cultures. They might have even gained it through victory and dominance over the conquered land. With the case of textual and cultural products whose possession may be positively evaluated in a culture, the importation and re/production mentioned above mostly occur through translation. Translation as a culture transmitter (Newmark, 1988, 7), as a re/shaper of literature and culture, plays a significant role in the socio-cultural context of a society. Re/shaping a culture and literary system of a society demands the translation to be 'actively involved in the making of the center' of the target poly-system (Even-Zohar, 1990, 46); thus being of 'primary' status in the polysystem of TL to act as a model for target writers. This primacy in turn stems from a source language and culture with certain characteristics: this language becomes ultimately the language of art and literature in the TL (the case of Persian in the Ottoman era). Consequently poets and writers write

their works in the original language to gain prestige and acceptance and to prove their skills and mastery in composing poetry for instance. In the case of the Persian language in the Ottoman era, this language actually acted as a criterion to assess the literary capability of Ottoman poets, and the poets had to live up to that criterion in case they wished to be a Divan poet welcomed at the court.

Even-Zohar's concept of 'culture planning'

Culture planning involves making a culture repertoire which is the total 'options' used by a group of people and their members in order to organize life, and it was not an exception with the case of the Ottomans who made 'deliberate' choices to declare Persian as the official language of court while other alternatives such as Turkish existed as well (Even-Zohar, 2010a, 78-79). There are good reasons for this phenomenon:

Firstly, each society assumes it necessary to, advertently or inadvertently, *make*, but not to inherit, a culture repertoire in order to organize the life of its people. In case of being advertent, as with the case of our study, this making is done by known people such as Mahmoud Ghaznavī, a political figure and Moulānā, a literary figure in the Ottoman era.

Secondly, as Even-Zohar (2002) puts it, the making of culture repertoire is done through *invention* (based more on '*analogies* and *oppositions*'), and *import*, involving organizing 'skills and marketing' (p.168). When the 'imported material' becomes integrated in the target culture, it is called '*transfer*' thus a '*cultural interference*', to use Even-Zohar's terms, has occurred.

Thirdly, the source country (in our case Iran/Persian culture) must have particular characteristics that make another country/ culture (Anatolia (current Turkey)/Ottoman culture) import 'goods' from it. In the following these features as well as the factors involved in the process of '*cultural interference*' will be discussed.

Geographical Links

Turkey (the then Anatolia) neighboring Iran on the Northwest was one of the provinces of Iran for three hundred years either partially or wholly in the Achaemenid Empire Turkey thus received much influence from the Persian language and culture. The remnants of those days can still be seen in mountains and museums. This era is known as 'The Pars Era' in the history of Anatolia. That is the reason why Riahi (1971) maintained that the roots of Iranian culture in Asia Minor dates back to 2500 years ago. Moreover, political relationships and correspondence between Iran and Turkey were carried out in Persian (Mahmoodian, 1999, 1-15; see also Aidin 2006, 10-18; Riahi, 1971, 2).

Willingness to consume new goods

This is a key concept in *transfer* (Even-Zohar, 2002, 170). There are different reasons that Turkish people were eager to learn Persian (new goods): First, the religion of the Turks was Islam, hence it was necessary for them to acquire some knowledge of Arabic and Persian. Aidin (2006, 19) maintains that Persian and Arabic literature have served as models for Turkish Islamic literature, and when the first great Islamic Turkish literary work (*KutadguBilig*, by Yusuf

Blasagunlu) was written, Persian with Islamic themes was already two hundred years old. It should be noted that this work was written in a rhythm based on Ferdowsi's *Shāhnāme*. Secondly, there were different fields of knowledge that included translations from Persian into Turkish, the first of which appeared after the Anatolian Seljuk Empire: translation of Tazkerat-al-Ouliā, Mersād-al-Ebād, Sa'di's Golestān (Aidin, 2006, 40). Thirdly, enthusiasm for becoming Divan poets was another reason to welcome Persian, indicating that the Turks had the respect for Persian poets at that time. The love for Persian culture and literature during Seljuk of Asia Minor caused them to consider Persian literature and civilization a part of their kingdom conventions, and some even composed Persian poetry (Rypka, 2003, 323-25). Finally, to become a Divan poet, it was that the poet should learn Persian. Toska (2002) maintains that 'Divan Poetry' was not restricted to Turkish but incorporated elements of 'thought, sentiment, and conception of art' related to the 'common culture,' which was Persian (58-61). Moreover poets had to go through different stages in order to become a divan poet; these are mentioned by Toska (2002, 70-75) as *imitate, applying oneself, developing skills, acquiring experience through experimentation and, engaging in practice*. This was all after they had learnt three languages of Turkish, Persian, and Arabic. The Ottoman and Seljuk kings, rulers, and viziers of the time were very fond of poetry and took pride and competed in having poets composing Persian poetry. Thus they would encourage poets to compose Persian poetry. This in turn resulted in what Even-Zohar (2010a, 79) calls 'socio-cultural cohesion' provided by the realization of culture planning that was in process at that time (Toska, 2002, 71; see also Aidin, 2006, 10-11).

Political dominance of the source culture (Persian)

According to Even-Zohar (2010b, 66), a culture becomes 'source' when it is dominant 'due to extra-cultural conditions.' One of these conditions is the *political* condition. For more than 200 years Iran had been the only super power in the world (Mahmoodian, 1999, 1); that is, until Alexandria the Great defeated Iran. Afterward, Rome also grew to power. As such, Iran had acquired a great treasure of policies and experiences of governorship. This was to the extent that the Seljuk ruling Asia Minor, (Turkey) although intelligent and powerful, lacked the experience necessary to manage public institutions and thus appointed Iranian ministers and political figures accordingly. That is why most of the Seljuk viziers were Iranian; the most famous of all these ministers was Moein-al-Din Soleymān Deylamī also known as 'Parvāne.' He was the de facto governor of Asia Minor for twenty-six years (Modarresi, 2005, 71; see also Riahi, 1971, 3-7). The Seljuks were Turk but they accepted Islamic and Iranian culture and created their official system based on the talents of the Iranian people (Aidin, 2006, 19). Consequently, the atmosphere in Seljuk court was completely Iranian; out of sixteen kings, eight were named after Iranian kings: three Kaykhosrows, three Kayqobāds, two Kaykaws, and among princesses the Iranian names were Shāhanshāh, Kaykhosrow Shāh, Jahānshāh, Kay Freydoon, Faramarz, Siavash, Bahramshāh and Kamyar (Riahi, 1971, 1-8). These all have resulted in the success of *socio-cultural cohesion*, for as Even-Zohar puts it, the society, here the Turks, was dominated by 'external powers' who were 'high-level' (2010a, 79).

War

Despite the devastating nature of war and all the damages it may do to one country, it may also bring some good things to that country

Malazgirt war. In 1071, the war of Malazgirt opened the doors of Asia Minor (Anatolia) to the Turks, hence opening the way to the Persian language and culture. Riahi (1971) regarded this period as the 'time when Iranian culture actually brought its most influence.' (p.12). The Roman Seljuk government was dependent on the Iranian Seljuk government. But after the collapse of the Seljuk in Iran, the Roman Seljuk declared Persian as the official language; conversations in main cities, correspondences in the ruling systems, teaching, writing, authorship and composing poetry were all carried out in Persian. The reason for this was that the Seljuks were already acquainted with Iranian culture. Besides, Turkish was not yet advanced enough to meet the society and government needs and the Roman Seljuk language was regarded as the conquered language, thus being unacceptable (Aidin, 2006, 20; see also Modarresi, 2005, 71).

Mongol attack. The Mongols invaded Iran in 1233 AD, causing poets and scholars including Moulānā, Najm-al-Din Razi, Ouhad Kermanī, Ibn-e-Bībī, Fakhr-al-Din Arāqī to leave Iran for the neighboring countries, India and Turkey. Such poets helped the Persian language spread in these areas. Their influence was then felt for the next 700 years (Aidin, 2006, 23; see also Modarresi, 2005, 73; Riahi, 1971, 2-15). The newcomers, being Sufis and mystics, used their views in their literary works. In this context, too, great works of mysticism, including *Mevlevi Order*, were created.

Influential figures

According to Even-Zohar (2010a, 79), typically, the 'power-holders' take on in the execution of the 'preferred repertoire,' which, in our case, was the application of Persian in the form of the administrative and literary language. However, sometimes people who are not from the ruling class become engaged in the making of the desired repertoire. Jalāl-al-Din Mohammad Rumi is such a poet.

Literary figures. Thus, after the invasion of the Mongols, many poets and scholars settled in Asia Minor. Also, Turkish kings had earlier shown great interest in Persian literature, which originally helped flourish Divan poets. The development of the Persian language and culture at this time owes much to literary figures of Asia Minor. One of the most influential figures was Jalāl-al-Din Mohammad known as Moulānā [our teacher/ master]. Moulānā played a significant role in popularizing the Persian language in Turkey. He was born in September 30, 1207 in Balkh [then a province of Iran] (Mahmoodian, 1999, 6-19; See also Horata and Karaismaigloğlu, 2007, 39). Jalāl-al-din and his family were forced to leave Iran after the Mongol invasion. Although he wrote all of his works in Persian (Mathnavi, Fih-e-MāFih and Divan-e-Shams), he brought a great influence on Turkish literature as well. His son, Soltān Valad, founded *Mowlavi Order* (Mevlevi Order) whereby he conveyed his father's thoughts to followers. All of Moulānā's works became thus translated. Soltān Valad was a poet in Turkish. He influenced Turkish literature and played a substantial role in spreading Persian literature in Asia Minor. As Aidin (2006, 23) remarks, support for Persian language came first from the Roman Seljuk in Konya and then from Moulānā's poems. In 12th and 13th century AD, the Persian language was used widely by viziers, counselors, and agents of the government. Also, reciting Shāhnāme became popular in the court of the Seljuk. Reciting Mathnavi, also was popular in Khanqahs.

Political figures/figures in power position. Along with literary figures, political figures were also influential in spreading Persian. Among them is Alā-al-Din Kayqobād Seljuk. In the court of this king, there was a chamber where poets and writers gathered regularly. The evidence of this includes Ibn-e-Bībī's pictures of Shāhnāmeḥ in Kayqobād's palace (Aidin, 2006, 9-12; See also Riahi, 1971). A second political figure is Sultān Mahmūd Ghaznavī, a poet himself, who was the greatest admirer of Persian literature and art. He encouraged and motivated men of letters and this actually led to his fame and becoming more powerful. He invited the well-known Persian scientists such as Avicenna and Abu al-Reyhān Al-Bīrūnī. He also founded the establishment of 'Poet Laureate' which all helped Persian language and literature glow (Rypka, 2003, 324).

Richness of the rhetoric of language

According to Sāfi (2011, 5), the success of the Persian language in India (from 11 to 19 AD) and, in Turkey came from several factors: the capability of this language in coining new words, eloquent combination of words, the musicality of speech and rhythm, and rhyme in *letters*. The concept of *letters* in Persian, in its general sense, entails asceticism and self-discipline, indicating that the poet should try to avoid whatever weakens eloquence (Zarrinkoob, 2004, 42). Persian eloquence has won admiration from Arabic poets too: Being proud of their poetry, Arabic poets such as Jāhez and Attābi encouraged studying Persian books, and claimed that poets who look to find *figures of thought* and *eloquence* should read Persian books (Zarrinkoob, 2004, 11). To understand *letters*, great knowledge of the language alone does not work (Kazzazi, 2008, 15).

Linguistic and poetical properties and education system influence

Persian prose in its oldest form used themes from history, mysticism, religions, and ethics, and avoided non-serious concepts. Zarrinkoob recognizes a wide range of subjects in Persian prose (Zarrinkoob 2004, 36): biographies, witticism, narratives, Sufi education, folklore, political debates, mysterious stories, didactic writings, ethics, and education.

Systems of educations in Iran also served as sources of inspiration for the Arabic countries. According to Hasan Ibn-e-Sahl, the Iranian vizier and scribe of Al-Ma'mon, during the Abbasid period, *letters* was considered to be based on Iranian culture, including educational thoughts left from the time of the late Sassanids particularly Anōoshirvan (44). This shows that Holbrook's (2002, 88) view about Iranian culture as forming under the influence of Arabic culture is not trustworthy.

Persian as lingua franca

Persian also served as lingua franca, rather than Arabic, in large areas of Dar-al-Islam, practically in all parts of Asia, from Iranto China (as evidenced by Ibn Battuta). Encouraged by the Sāmānids, even the learned authorities of Islam, the *Ulama* (Islamic scholars) began using Persian as a lingua franca in public (Frye, 1975, 96). According to Famighetti (1998, 582), the second lingua franca of the Islamic world, especially in eastern regions, was Persian. He maintains that not only Persian language did function as the 'state and administrative language' in many Islamic dynasties, such as the Samanids, Ghurids, Ghanznavids, Ilkhanids, Seljuqids, Mongols, and early Ottomans, but also Persian cultural and political forms, and often the Persian language, were used by the cultural elites from the Balkans to India'. For example, as Boyle (1974, 185) points out, the

only 'oriental language' that Marco Polo knew and used at the Court of Kubla Khan and in his journeys through China was Persian. Toynbee (1939, 514–15) assesses the role of the Persian language by highlighting its significance in terms of richness of rhetoric and power:

'In the Iranic world, before it began to succumb to the process of Westernization, the New Persian language, which had been fashioned into literary form in mighty works of art ... gained a currency as a lingua franca; and at its widest, about the turn of the 16th and 17th centuries of the Christian Era, its range in this role extended, without a break, across the face of South-Eastern Europe and South-Western Asia'.

Persian is still the lingua franca in Iran, Afghanistan, and Tajikistan. It had the same status in India as well but before the British conquest. It is still understood by many in South Asia, mainly in Pakistan.

The role of translation in re/shaping of Ottoman literary activity

There are two differences between translation and the factors mentioned above: one is that the factors are the reason of the increase in producing translations from Persian, indicating the dominance of Persian. The other difference lies in the fact that in the Ottoman Empire, translation from Persian played its significant role, although it was no longer at its peak. Turkish had already received much influence from Persian and was thus mature enough to be used as the official language. At this time, thus, translation from Persian became very important. Toska (2002, 58) states that in the period from 14th to 19th centuries, a great amount of translation from Persian occurred.

Paker (2002b, 120) distinguishes between two kinds of translation concept in the study of Ottoman literary translation practices, namely, *terceme* (translation practice of a wide range) and *nazire* (*imitatio* in the form of parallel and response poetry), both of which she believes are 'culture-bound'. The former, which is here referred to as ordinary translation/translation proper, was practiced from 13th century onwards mainly in literary and scientific works (from Persian and Arabic to Turkish), such subjects as religion, Sufism, ethics, politics, medicine, geography, astrology, and astronomy (Toska, 2002, 58). The latter, *nazire*, focuses on poetry composed by poet-translators. Paker (2002b, 120) describes them as the 'primary agents of Ottoman literary translation and transmission' (120). This is also called parallels (Toska, 2002, 60-62). Explaining the criteria of translation evaluation in 16th century Turkey, Toska defines parallels as 'poems composed as a parallel to another in the same rhyme, scheme, meter and *redif* (a letter added to a complete rhyme) and also in meaning, sentiment and thought.'

Of relevance here there are two points that Toska (2002) makes regarding translation criteria: one is that she places emphasis on the *innovative* (emphasis is mine) aspects of translations, their style and poetic features. The other is that if the 'interventions' made by the poet translators resulted in 'introducing a new manner of expression,' then this kind of translation or rewriting would be considered as the work of the poet, not that of the original author. This is exactly what Even-Zohar maintains about making culture repertoire, which he believes is done through

invention. An invention is of course based on 'analogies and contrasts' similar to the Ottoman's *nazire*/parallels and *muārezāt* respectively (2010a, 89-97). They tried to compose poems similar to Persian poems in rhyme, rhythm, and base vocabulary. Such translation is also called concealed translation, implying that the context of composing such poetry was concealed (Holbrook, 2002, 86-95). However, *nazire*/parallels in Islamic literature is not considered imitation, but a way to honor the work of the original poet (Levend in Parker, 2002b, 125). Toska (2006, 58-60) makes the same point, asserting that a poet writing parallels to another poet's work showed his respect and liking for that poet. Some examples of *nazires*/parallels are, for example, Qotb's Khosrow Shirin (based on Nezāmi's work), Āsheq Pāshā's Qribnāme (based on Moulānā's Mathnavi). Other forms of poetry, considered translation by both Andrews (2002, 16) and Paker (2002b, 123-128), are in response to *javāb*, in contrast with *muārezāt*, in verification of *tazmin*, and in reception of *istikbāl* (adopting Persian poetry). There were also 'additive poems,' such as Takhmis, meaning five (for example, Amir Ali Shirnavāei's work) and Tesdis (six). Commentary (Sharh) was another form of translation, which appeared in the form of commenting on the original poem, rather than translating it. These commentaries came into prominence when Persian was no longer the official language. The Turks' interest in Persian literature caused these commentaries and dictionaries to emerge for a better understanding of Persian masterpieces (Aidin 2006, 33). According to Andrews, poems at that time were seldom translated by any means other than by *nazire*/parallel or *nazire*-like forms (25). The result of such translations, Andrews believes, was the change of both languages, Persian and Turkish, that is, the Persian language became '*preserved through re-writing and re-interpretation*,' and the Turkish language became '*created, recreated and enriched*' (24, emphasis is mine).

This is what Even-Zohar seeks to show in introducing culture planning and successful transfer, which result in inventing something new that the recipient culture had been in need of. Since, new connections and relations are created in this way (resulting in the domestication of the goods, here poems), it can be said that *a successful act of transfer* has happened (Even-Zohar 2002, 166-174). Andrews (2002, 26) also believes that the Ottoman literary culture was 'derivative, imitative, foreign, inauthentic, elitist, and unnatural,' and through a translation form like '*nazire*/parallels, which he believes was 'neglected' and 'creative' at the same time, new relations between words and thus new literary and poetic usages were introduced, which led to the generation of the new language (Ottoman literary language) and literary inventiveness. This point along with what Toska (2002, 73) asserts in her article about the important role translation has played in 'establishing, developing, and enriching Ottoman literature' proves the dependence of Ottoman literature and culture upon Persian, the source culture both by prestige and dominance (Even-Zohar 2010b, 63-67). In fact, a 'successful transfer' has occurred between the two countries, for the 'power base' (Even-Zohar 2010a, 88) necessary for such planning and transfer existed and the 'desired shifts' had taken place.

CONCLUSION

To sum up, every nation strives for remaking/planning/shaping its culture through resorting to different ways including translation, whereby the source language and culture is transferred to the target country. However, few languages have become so widely transferred as Persian has done

during the Ottoman era of Turkey. Certain characteristics of a language can make it *high-level* and worthy enough to become translated, imported, and transferred, so much so that it becomes the official and literary language of the target country and that its literature becomes a model for men of letters in the recipient culture for long periods of time. This has been the case with the Persian language in the Ottoman era. Moreover this study highlighted the applicability of Even-Zohar's model that is focused on the role of translation in shaping the literary activity of a society. It shows that his model reveals new historical insights about the importance of Persian for Ottoman culture.

ABSTRACT

Writing skill is an essential index for learning. It is a means of transmitting information and communicating the thoughts and feelings. In Iranian educational system, English as foreign language (EFL) teachers still utilize traditional approaches based on memorization and drilling which are not efficient enough to meet the students' pedagogical needs. Therefore, the current article reports a study conducted within the sociocultural framework and aimed at introducing a teaching model for writing which empowered students' writing ability through the integration of scaffolding means coined by Tharp and Gallimore (1988) and Seow's process model. To this end, 30 homogenous participants with intermediate level of proficiency studying English as a foreign language in a language institute in West Azerbaijan, Iran were treated in order to spot the feasible effect of the application of various scaffolding means in a process- oriented situation on students' writing proficiency. The students were weighted in pre and post tests in order to gather the required data. The outcome, manifestly, elucidated a significant difference between writing ability of experimental and control groups on the post- test. The findings of this study suggest some implications for the teachers to highlight the socially situated learning and promote high quality differentiated instruction in educational contexts.

KEYWORDS: Writing ability, Process Writing, Scaffolding, Scaffolding means

INTRODUCTION

Effective communication in any target language can be regarded as the primary goal of learning a foreign language. Since English is culturally, politically, economically, and scientifically one of the most popularly used languages, there is a drastic need for effective communication skills in English all around the world. In order to communicate concepts and knowledge, having an effective skill in writing well seems necessary. According to Byrne "any piece of writing is an attempt to communicate something; that the writer has a goal or purpose in mind; that he has to establish and maintain contact with his reader; that he has to organize his material and that he

does this through the use of certain logical and grammatical devices" (1988, p. 14, cited in McDonough & Shaw, 1993, p. 184). White and Arndt (1991) contended that writing is "an important experience through which we are able to share ideas, arouse feelings, persuade and convince other people. We are to discover and articulate ideas in a way that only writing makes possible" (p.1). In the View of Ariana (2010) "writing skills assist the learner to become independent, comprehensible, fluent and creative in writing, important abilities which help learners put their thoughts in a meaningful form and to mentally tackle the message in a proper manner" (p.34). However, the purpose of instructing in English as a second or foreign language is often allotted to improve the students' skills and capabilities in speaking, listening, and reading in the target language while the development of the students' writing is ignored (Edelsky & Smith, 1989 as cited in Gomez, 1996).

Based on the view of Kelleher (1999), writing is one of the least understood language production tasks, which both competent and incompetent writers often bemoan that the process of writing is circuitous and grueling. In language teachers' ideas, writing is "a language skill which is difficult to acquire" (Tribble, 1996, pp. 3). It "normally requires some form of instruction" and "is not a skill that is readily picked up by exposure" (Tribble, 1996, p. 11). Writing as a complex cognitive activity requires learners to pay more attention to context, word choice, punctuation, spelling, sentence structure and organization of ideas (Mourssi, 2013).

Among the various approaches, including controlled composition, free- writing, paragraph pattern approaches, it is the process approach as one of the most predominant ones to English writing instruction that can be a central means for maximizing students' composition skills (Bae, 2011). Shaping meaning and paying attention to what writers want to communicate to the reader is central, but not the accuracy of their writings. In the definition of Badger and White (2000, p.154) it is, "...seen as predominantly to do with linguistic skills, such as planning and drafting, and there is much less emphasis on... grammar and text structure". According to Zamel (1983) process approach is as "a non- linear, exploratory, and generative process whereby writers discover and reformulate their ideas as they attempt to approximate meaning" (p.165). The process of writing was considered to be mainly cognitive one in the earlier writers such as Hayes and Flower, but more recently there has been a tendency to consider a more sociocultural orientation (Barnard & Campbell, 2005). In creating meaning, the interaction among interlocutors is focused. This approach is based on the assumption that "language is socially constituted" (Gere, 1987, p. 87). For Seow (2002), the writing process is a private activity which can be broadly seen as comprising four main stages: planning, drafting, revising, and editing which this study followed Seow's process model to assist students to write freely and arrive at a product of good quality. These stages are elaborated below.

Planning (pre- writing): It is an essential step in the writing process. It stimulates thoughts for getting started. This stage can help writers generate ideas, collect information, and organize their thoughts.

Drafting: This stage is the process of moving from the pre- writing step to the actual writing of a final draft. Writers are focused on the fluency of writing rather than accuracy or the neatness of the draft.

Revising: It is the process of reviewing the written text on the basis of the received feedback by the teacher or peers. Revision isn't correcting minor grammar errors but focusing on content and organization of the whole text.

Editing: This stage is the process of tidying up the revised text to prepare the final draft for evaluation by the teacher. Students edit their own or their peer's work for grammar, dictation, spelling, punctuation, sentence structure, and accuracy of supportive textual material such as quotation, examples, and the like.

In all, the composing writing focuses students on how to generate ideas, how to organize them coherently, how to use discourse markers and rhetorical conventions to put them cohesively into a written text, how to revise text for clearer meaning, how to edit text for appropriate grammar, and how to produce a final product (Cited in HosseiniFard & Saharkhiz, 2014, p. 497).

Writing mainly from the perspective of applied linguistics is investigated and the work of cognitive psychologists and linguists or the work of sociolinguists is used (Grabe & Kaplan, 1996, pp. 238-243). For Vygotsky (1978) as one of the champion of social constructivism, the link between social context and individuals' psychological development is directly highlighted (Bruffee, 1993, 1996; Gere, 1987 as cited in Tsai, 2006). The type of social interaction involves cooperative or collaborative dialogue promotes cognitive development. For him interaction between more capable people such as teachers, parents and adults can foster the children's cognition better (De Vries, 2000). In all, both individual and social factors have a paramount role in extending children's current skills and knowledge to a higher level of competence. As Hughes (2001, p.17) claims, children learn best "when they have the guidance, learning environment, intellectual and emotional support created by an adult or mentor figure". The capable people are able to model learning, questioning and thinking and thus assist children to develop their learning skills. As Pea (1993, p. 47) asserts "the mind rarely works alone" and writing is the process of co-constructing of texts by students working together. Writing in the definition of Candlin and Hyland (1999, pp. 107, cited in Phung, 2004) is "therefore an engagement in a social process, where the production of texts reflects methodologies, arguments and rhetorical strategies constructed to engage colleagues and persuade them of the claims that are made". One of the fundamental axioms within Vygotsky's Sociocultural theory is scaffolding originally introduced by Wood, Bruner, and Ross (1976) that is "..... a kind of "scaffolding" process that enables a child or novice to solve a problem, carry out a task or achieve a goal which would be beyond his unassisted effort" (p. 90). As Behroozizad, et.al (2012, p.37) concern "within scaffolding process which is a dynamic reciprocal process the learner is a kind of active participant as well. Both teacher and learner construct a shared understanding by means of communicative exchanges in which the student as a novice learns from the teacher as a more expert other".

In characterizing the nature of scaffolding, Murray and McPherson (2006, p.140) state that "Scaffolding, then, is more than help and instruction because it involves the use of task-specific explicit strategies that help the learners become independent by exploiting their ZPD". In educational context, the teacher's role as the mediator is of great prominence as he plans, provides, guides, and operates qualitatively and quantitatively appropriate scaffolds which are classified as a supportive means of developing students' learning process. The facilitative role of the writing teacher has inspired research on the role of the teacher as a responder to students' writing (Cited in HosseiniFard & Saharkhiz, 2014, p. 498). Hammond (2001, p. 60) illustrates how scaffolding works by asserting that "Knowing when and how to intervene is what scaffolding is all about. It is about the teacher taking an informed and active role in guiding students' learning as they come to terms with new ideas and concepts". He adds that scaffolding is far more than 'helping out' so that a student can carry out a task. The teacher's usage of variety strategies assists students to gain understanding and confidence to work independently in applying new learning. In the context of the current research, as a facilitator, the teacher offers guidance in assisting students to engage in the thinking process of composing. The teacher's provided supports can be presented in any number of ways. In Riorden's view, it can be clues, reminder, encouragement, providing example, breaking the sophisticated task into steps, or anything else that permits the students to develop as an autonomous learner (Riorden, 2003). Among these supporting means, Tharp and Gallimore (1988) maintain six means of assisting performance which the present study tried to apply them in maximizing students' writing dexterities in a process oriented setting. They are modeling, feeding back, hints, instructing, explaining, and questioning that support the learning activities of the student. Application of these means by a capable person (in the case of this study, the teacher) is to guide students learning during task completion. The detailed explanation of these means is presented as the following:

Giving hints is the provision of clues or suggestions by the teacher to help the student go forward.

Feeding back is the provision of information regarding the student's performance to the student him/ herself.

Instructing, The teacher telling the students what to do or explanation of how something must be done and why.

Questioning. It involves asking students questions that require an active linguistic and cognitive answer.

Explaining or cognitive structuring is the provision of more detailed information or clarification by the teacher (Cited in Van de Pol, Volman & Beishuizen, 2010, p. 277) and

Modeling which is, "the process of offering behavior for imitation" (Tharp & Gallimore, 1988, p. 47).

In Iranian EFL setting especially in language institutions due to students' limited competence, time limitation, and poor motivation, writing still stays a big complication, and it seems that application of traditional methods and strategies can't meet today's class requirements. Moreover, regarding the existence of a gap in literature regarding the potential effects of the integration of scaffolding means and process writing in order to investigate its effect on writing performance of

students, this article attempted to assist bridge this ostensible gap in the literature. Therefore, the purpose of this research was to apply various scaffolding behaviors in a process oriented situation to assess the impact of scaffolding means on Iranian intermediate EFL learners' writing performance.

RESEARCH QUESTIONS

The present study delved into a scrutiny to come up with cogent answers to the following research question:

RQ: Does the integration of scaffolding means and process writing as a teaching model affect students' writing ability?

METHODOLOGY

Sample and setting

The purpose of the current research was to apply scaffolding means within the stages of process writing to examine their effects on students' writing ability. The participants consisted of thirty intermediate EFL learners. They studied English as a foreign language in a language institute in Iran, Salmas. Participants were female with the age range of 15-18. Their mother tongue was Azari and their national language was Farsi. These participants were selected based on proficiency test conducted before by the language institute itself. They were randomly divided into two groups, i.e., one experimental group and one control group. Each group consisted of 15 students. Again, in experimental class the participants were required to constitute different groups of three because so as to use experiences and knowledge of each other during writing process. As Ting (2010, p. 623) highlights the process approach is based on the communicating theory in which the learners can learn from and with each other effectively. The process of conducting this study was in regular class time. That is, along with students' course books, every session from the total time of the class (90 minutes) half of the class time was allotted to conducting this study. The class took a 15- session course, two days a week.

Instruments

In order to actualize the research question, the current research implemented writing tests to measure both of the groups' dexterities in writing ability before and after treatment.

The purpose of the pre-test was to achieve the initiated homogeneity and final comparison, and for the post-test the purpose was to measure the participants' improvement at the end of the treatment period. In pre- test of writing, all the students in two classes were asked to write an English composition on the topic "*What are the effects of watching television on people's life?*" selected from TOEFL test. The material used in this study was "*Refining Composition Skills*" by Smalley, Ruetten and Kozyrev (2002). It was used as the main course book for two groups. The instructed parts of textbook deal with the process writing, the format of paragraph and essay writing, and different types of paragraphs and essays. After completion of the treatment during a course of 13 weekly sessions, in the last session a post- test was administrated to two groups in order to measure the students' writing performance after the treatment. They were required to

write an English composition on the topic "*What are the causes of air pollution*" selected from TOEFL test. In order for the scoring process of students' writing tasks to be reliable two experienced teachers who have been teaching EFL courses were selected. In order to prevent any raters' bias, writers' names were eliminated. Whenever the two scores of a writing test disagreed by three points or above, the two raters examined it again and reached a final agreement after consideration, and the total score of the writing test was the average of the two raters score. To prevent the procedure of students' scores to be subjective, an analytic scale selected from Jacobs et al. 's (1981) (cited in Weigle, 2002, pp. 115-116) and Hoang (2007) was used in which both assessors judged about the students' writing tests based on this scale. According to Weigle (2002) the analytic scale provides more useful diagnostic information about students' writing abilities. The rating scale for evaluation consists of five aspects: *content*, *organization*, *vocabulary*, *language use*, and *mechanics*. The five aspects are differentially weighted to emphasize. First content (3/5 point) and next language use (2/5 point), with organization and vocabulary weighted equally (1/5 point) and mechanics receiving very little emphasis (1 point) which totally equal to 10 point. In other words each aspect is analyzed by specific criteria with four degree scale, so the total score of each test ranged from 1 as the minimum to 10 as the maximum.

Procedure

To undertake the study, at the first stage, students in the two groups were asked to write an English composition in class which served as the pre- test of the study to measure the quality of the participants' written texts before the treatment. The groups wrote the essay about 150 words in 20 minutes on a topic. Then, the inter-rater reliability of writing section was calculated. To do so, the writing section was rated by two experienced teachers selected from the institution. Both of them used the same rating scale which was Jacobs et al (1981) and Huang (2007). For the treatment to take effect, in experimental group the students were required to constitute different groups of three participants. In writing the composition, students were writing through traversing the main phases of writing process including 1) planning, 2) drafting, 3) revising, and 4) editing, in which they received peer and teacher scaffolding during every stage. The tasks and activities which were carried out in the experimental class were described as follows.

In planning stage, in order to help students to write and gather information about the topic, the teacher used making a brainstorming technique.

In drafting stage, students began to write their first draft based on their ideas listed in planning stage. While writing, the teacher was circulating among the groups and guided them through monitoring students' written drafts.

In revising stage, the teacher collected the students' first drafts and revised them in the class in a limited time, then he gave the papers back to the students and asked them to revise their papers based on the hand written commentaries.

In editing stage, the students in the final phase were required to read word by word their revised papers and turn their attention to the form during the editing with using edit checklist of Seow (2002). There were seen three kinds of correction; self-correction, peer correction and finally teacher correction. After finishing every topic, the students submitted their essay to the teacher for evaluation. He assessed their papers based on the same rating scale of Jacobs et al (1981) and Hoang (2007).

However, in the control group, the students were asked to produce an individually- written essay in the traditional way. They wrote their essays without going through the stages of process writing and without any receiving existence scaffolding. At the final stage, the classes were given a post test of writing in order to measure their writing ability .They were asked to write an essay about 250 words in 30 minutes on the topic selected from the book taught. Again their scores were rated based on the same rating scale by the same teachers. The data obtained from test results constituted the major basis for statistical analyses.

Data Analysis

The data collected were analyzed using descriptive statistics. The t- test analysis (independent and paired samples t- test) was used to compare the performance of both groups' scores in pre- test and post- test.

RESULTS AND DISCUSSION

The purpose of this study was to apply scaffolding means within the stages of process writing to examine their effects on students' writing ability. The research question addressed in the study was:

RQ: Does the integration of scaffolding means and process writing as a teaching model affect students' writing ability?

At the initial step a writing task selected from the trained course book was administrated as the pre- test to measure the quality of students' skills in writing before treatment. Two experienced teachers were asked to score students' writing based on the rating scale of Jacobs et al.'s (1981) and Hoang (2007) to probe the reliability of students' scores on writing pretest. The average of raters given scores was selected as the total writing scores of the pretest. Table 1 reports the correlation analysis which was an evidence of high correlation between the given scores by each rater, and it is a consideration of internal consistency between the scores.

Table 1: Correlation analysis of writing scores

Correlations

		Writing Pretest Rater1	Writing Pretest Rater2
Writing Pretest Rater1	Pearson Correlation	1	.943**
	Sig. (2-tailed)		.000
	N	30	30
Writing Pretest Rater2	Pearson Correlation	.943**	1
	Sig. (2-tailed)	.000	
	N	30	30

** .Correlation is significant at the 0.01 level (2-tailed).

As table1 indicates, the correlation coefficient ($r= 0.943$) shows a high correlation between given scores by both rates. Because the correlation coefficient is so close to +1, it is clear that there is a positive correlation between scores. As it is known, closer the coefficients are to +1.0 and -1.0, greater is the strength of the relationship between the variables. The value of Cronbach's Alpha ($\alpha=.967$) shows that the scores enjoy high reliability.

Table 2: Reliability statistics of writing scores

Reliability Statistics

Cronbach's Alpha	N of Items
.967	2

As it is observable in Table 2, $\alpha=.967$ shows that the given scores by both raters are highly reliable. In other words there is a considerable internal consistency between the scores.

To identify the equality of the groups at the outset of the study, an independent sample t- test of writing scores of both groups was carried out. Table 3 presents these results.

Table 3: Independent Samples t- test Run on Pretest writing scores of both groups

Total Writing Pre- test	N	Mean	Std. Deviation	Independent t- test	Sig
Experimental group	15	4. 9720	0. 6533	1. 386	0.515
Control group	15	5. 2227	0. 82072		

The results of table 3 showed that there was no significant difference between experimental and control groups before treatment with reference to their writing ability ($p= 0/05$, sig $<0/515$). Therefore, the results are an evidence of the homogeneity of two groups before conducting the treatment. Having undertaken the treatment phase of the study, a writing task was administered as the posttest to identify the effects of treatment on students' writing ability. Similar to pre-test, the scores of post test were evaluated based on the same rating scale by the same teachers. The results of table 4 demonstrate a high correlation between the given scores by each rater and the reliability analysis of the scores demonstrated the inter-rater reliability of writing scores.

Table 4: Correlation analysis of scores of writing post- test

Correlations

	Writing posttest for experimental group rater1	writing posttest for experimental group rater2	Writing Posttest for Control group rater1	Writing posttest for control group rater2
Writing posttest for experimental group rater1	1	.933**	-.253	-.274
Sig. (2-tailed)		.000	.362	.324
N	15	15	15	15
writing posttest for experimental group rater2	.933**	1	-.174	-.188
Sig. (2-tailed)	.000		.535	.502
N	15	15	15	15
Writing Posttest for Control group rater1	-.253	-.174	1	.920**
Sig. (2-tailed)	.362	.535		.000
N	15	15	15	15
Writing posttest for control group rater2	-.274	-.188	.920**	1
Sig. (2-tailed)	.324	.502	.000	
N	15	15	15	15

** . Correlation is significant at the 0.01 level (2-tailed).

The statistics for the reliability analysis of participants' writing scores in the post- test of experimental and control groups are depicted in the following table which declares that scores of two groups enjoy high reliability.

Table 5: Reliability Statistics of writing scores of posttest for the groups

	Cronbach's Alpha	N of Items
Experimental group	.963	2
Control group	.958	2

To spot the potential impact of treatment on participants' writing performance, another independent samples t- test was conducted on the post test scores to testify if there is any significance difference between groups after treatment in writing ability (See table 6).

Table 6: Independent Samples t- test Run on Posttest writing scores of both groups

Total Writing Post- test	N	Mean	Std. Deviation	Independent t- test	Sig
Experimental group	15	7. 57	0. 66396	11. 368	0.000
Control group	15	5. 26	0. 42129		

With comparing the mean scores of two groups recounted in tables 3 and 6, the results led to this conclusion that the writing performance of two groups have improved from pretest to posttest but the improvement of participants' writing ability is remarkably observable in experimental group (treatment was based on the integration of scaffolding means and process writing) in terms of

mean scores (4.97 to 7.57). Therefore, the difference between two groups was significant (Sig=0/0, $P < 0.05$). It is revealed that the implementation of various intervention strategies in a process- based setting significantly affected participants' writing ability.

In addition to investigating the difference between groups in terms of their writing skills, the difference between the scores of pre-test and post-test scores of the experimental group is aimed to be measured by conducting paired sample t-test. Table 7 shows the results.

Table 7: Paired t- test of the writing scores of experimental group in pre and post-tests

Writing groups	N	Mean	Std. Deviation	Paired t- test	Sig
Pre- test (Experimental group)	15	4. 97	0.58143	- 14. 090	0.000
Post- test (Experimental group)	15	7. 57	0.66396		

According to the results of table 7 the mean scores of experimental group in pre- test and post-test were 4.97 and 7.57, respectively. It was found that there is a significant difference between two scores. Furthermore, the result of paired t-test indicates that the significant value (0.0) was less than $p (.05)$ which revealed that the difference is highly significant.

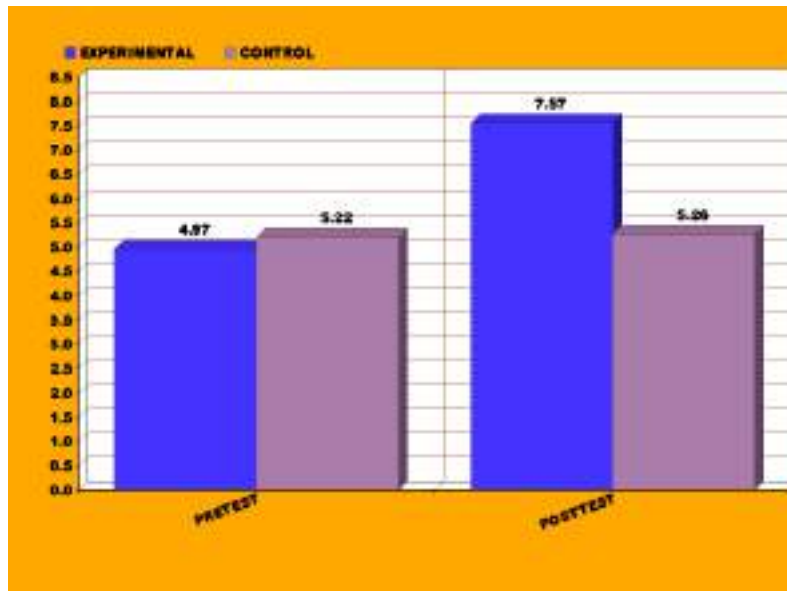

Figure 1: Comparative figure of students' writing ability in control and experimental groups during pre-test and post-test

Based on the results of figure 1, the mean scores of students' writing ability in experimental and control groups during pre- test are 4.97 and 5.22, respectively. However, in the post- test, after

implementing scaffolding means during the process writing in experimental group and traditional method of teaching writing (GTM) in control group, the mean scores of students' writing ability in experimental and control become 7.57 and 5.26, respectively.

To sum up, regarding the results of independent sample t-test and paired sample t-test this study found that there were significant mean differences in the pre- test and post- test scores of experimental group and post- test scores of learners trained by using scaffolding means in a process- based setting and traditional method of teaching writing. As the findings demonstrated, the participants in experimental group had a better performance in their writing and achieved better than control group because in experimental group, various intervention strategies implemented by the teacher in order to guide and assist the students step- by- step in every stage of process writing in which they could produce a final written text by the help and supervision of their teacher. The participants were provided supports based on their needs and problems, and they could benefit from these various means that finally resulted in improving their writing ability.

With regard to the effectiveness of applying means in a process- oriented situation, the findings are keeping with the results obtained in Riazia and Rezaii s' (2010) study which affirmed the paramount role of the teacher in providing different scaffolding behaviors in mediating students' writing in order to help reach higher stages of independency. The result also is consistent with the socio- cultural theory which claims that learning is created in the process of interacting with others in the social environment which occurs first through person- to person (interpersonal level) and then individually (intrapersonal level) through an internalization process (Vygotsky, 1978).

Students in the process- oriented setting through communication could benefit from each other's experiences and knowledge to write with high motivation. In the supportive learning environment, students can be motivated and take more responsibility to learning and become more independent learners which are in line with the results of Veerappan (2011) findings that showed the effectiveness of scaffolding technique in journal writing to assist students to develop themselves and become independent learners. The findings were also aligned with the results of Iranian researchers who claimed that those learners who received scaffolding were more involved in the process of instruction than those who received no scaffolding (Baradaran & Sarfarazi, 2011).

CONCLUSION

This study introduced a teaching model for writing which empowered students' writing ability through utilizing various means coined by Tharp and Gallimore (1988) during four stages of process writing categorized by Seow (2002). The results of research found indication of the effectiveness of implementing various scaffolding means in a process- oriented setting on the writing performance of Iranian EFL learners. The teacher as the facilitator or mediator was always in the stage to guide students towards correction. He presented himself as a helpful and facilitator offering support and supervision. Since the nature of process writing is social, the students in the socially constructed situation learnt to work in collaboration with their friends. Through the

teacher's guidance and supervision, students learnt how to plan, write, revise, and edit their writing.

The outcomes can assist English language teachers to promote high quality differentiated instruction in educational contexts and in order to stimulate students thinking process and their motivation to learn as well as to discover the areas of strength and weakness to adjust learning experiences, supplying students with challenging and reasonable tasks and creating a social situation will make learning enable.

Similar to any other research, the outcomes of the current paper are influenced by a number of limitations. This study was limited to the number of participants, the number of topics and time. Among these limitations, the shortage of time was the most important one for this study. If there was enough time to conduct the treatment, it was anticipated that more topics could be written and more comprehensive results of integrating scaffolding means during the process writing could be accessed.

In regard to the limited number of participants, this study was conducted in one of the language institutes; therefore, the results aren't generalizable to other language institutes. Thus, as sample size of this study was small and was conducted in an academic context, and with intermediate level students, further research is needed to be done in other learning context with a large sample size such at the university level across proficiency. Moreover, further studies are required to investigate the effects of scaffolding means on other skills or sub skills.

ABSTRACT

Speaking can be realized as the most common way to convey the message to others and the ability to communicate effectively is a basic requirement which needs to be taken seriously in English education. Likewise, classroom interaction has been said to be one of the primary means of learning in classrooms which has a significant role in language classrooms. Thus, classroom interaction has been suggested as a way of improving speaking skills in conducting the present research. For this purpose the impact of teaching speaking strategies and participants' gender on improving speaking skills are considered. For conducting the research, 30 intermediate English language learners were studied. The research pursued a pretest/posttest design to examine the research questions. The results revealed that classroom interaction can be considered as a way of improving the learners' speaking ability. Gender made no significant difference for the betterment of their speaking skills. Furthermore, teaching speaking strategies introduced ways of interacting and as a result could help them improve their speaking skills. Structuring the class so that it devotes most of the class time to learners interactions and encouraging in-depth conversations among them can be good ways of promoting classroom interaction.

KEYWORDS: Interaction, Classroom Interaction, Speaking, EFL learners

INTRODUCTION

Hamzah and Ting (2010) noted the importance and the role of English language in the Information and Communication Technology world, educational field, and in real life situations. They also indicated the need to be competent in English language and in spoken English, because English is a world language. Of the four main English language skills – listening, speaking, reading, and writing – the most important one is speaking. Nunan (2001) introduced *listening* as the Cinderella skill in second language learning and *speaking* as the overbearing elder sister. He claimed that functioning in another language is generally characterized by the ability to speak

that language. Luoma (2004) stated that “speaking skills are an important part of the curriculum in language teaching, and this makes them an important object of assessment as well” (p.1). For many second or foreign language learners, speaking skill in English is a priority. Thus learners evaluate their language learning success and their effectiveness of English course based on their improvement in spoken language proficiency (Richards, 2006). Although all English language skills are very significant to learn English language, it is by speaking that others understand one has learnt a language. If one wants to be understood or express his/her feelings, speaking is the most common way. All English language learners especially those in Foreign Language (FL) settings are at least once asked the question “*can you speak English?*” But what are their responses? Can they express themselves accurately and fluently?

Yule (2006) notes that English conversation is an activity between two or more people in which they *take turns* at speaking. At one time one speaker speaks and participants wait until s/he indicates the end of his/her speaking, usually by a *completion point* such as asking a question or pausing. Other participants can take the speaking turn in a number of ways such as making short sounds, using body shifts, or facial expressions. In this way they indicate that they have something to say.

One of the most significant features of conversational discourse is being ‘co-operative’ which has become a principle of conversation named *co-operative principle*. This principle was first described by Paul Grice. Grice (1975, as cited in Yule, 2006) stated the co-operative principle “Makes your conversational contribution such as is required, at the stage at which it occurs, by the accepted purpose or direction of the talk exchange in which you are engaged” (p.129). Four conversation maxims called ‘Gricean maxims’ support this principle: the quantity maxim, the quality maxim, the relation maxim, and the manner maxim.

It is through interaction that people give and take information, become familiar with each other’s culture, and expresses their needs. In EFL situations, due to lack of the real encountering with the foreign language, there is a need to provide similar situations in classrooms in order to make learners interact and experience using the new language. According to Allright (1984) classroom interaction which is a productive teaching technique manages the classroom language learning. “Interaction is face-to-face communication with Particular prosody, facial expression, silence, and rhythmical patterns of behavior between the participants” (Crystal, 2003). Interaction also provides opportunities for production and receiving feedback. Interaction in classroom is based on the input provided by both teacher and students. The interaction can be between teacher and students and also between student and student. Both of these kinds of interaction need to be enhanced in the classroom environment.

Nugroho (2011) stated that classroom interaction has a significant role. Experiencing something by oneself will help learning it better and in the classroom environment it has been gained by engaging in classroom activities. Interaction between students and teacher influences the learning success. Learning opportunities are more for those who are active in conversation through taking turns than those who are passive. Interaction is viewed as significant by Chaudron (1988, cited in Nurmasitah, 2010), because analyzing target language structures and getting the meaning of

classroom events is done via interaction. It is through interaction that learners gain opportunities to insert the derived structures of classroom events into their own speech (the scaffolding principles). The communication constructed between the teacher and learners determine how much classroom events are meaningful for the learners.

LITERATURE REVIEW

In countries such as Iran where English is used as a foreign language and it is taught mostly as a compulsory subject in educational program, the speaking skill is not duly treated, simply because of the time limitation and attention to other skills i.e. speaking has not received much attention and often does not receive due attention in final examinations.

Recently more attention is given to improving learners' speaking skill especially in foreign language situations by researchers. A thesis done by Khadidja in the academic year 2009-2010 investigated the relationship between the opportunities for production that arise in a classroom setting and the development of the speaking skill. The writer used teachers' and students' questionnaires in order to collect data. The conclusion was that classroom interaction can have a positive impact on learners' speaking capacities. Bashir, Azeem, and Dogar (2011) investigated the factors effecting students' English speaking skills. In order to collect data they also used students' and teachers' questionnaires. They concluded that teachers should use English as medium of instruction, promote interactive techniques, and cultivate English communication culture and also teachers and students should promote questioning and answering in English.

Menegale (2008) studied the expanding teacher-student interaction through more effective classroom questions. The article referred to the teachers' use of questions and tried to explore the ways in which questioning can be used not only as a means to promote learning in content and language integrated learning contexts but also as a means to enhance students' participation and, as a result, their oral production. The conclusion indicated that teachers tend to use questions which recall the students' former knowledge.

Knop (2009) in his article on the increasing use of the target language in classroom interaction presented some strategies and activities used successfully by teachers to increase target language use. Both the research and classroom practice showed that students' use of the target language may be increased through student-to-student pair interactions. Liao (2009) studied the effect of combining the four main language skills (speaking, listening, reading, and writing) on improvement of speaking ability. The writer concluded that the teacher should provide opportunities to knit skills together, because this is what happens in real life.

Choudhury (2005) addressed interaction in second language classroom. The writer explored the problem of active participation by incorporating the researchers' views and his own teaching experience. Teachers and learners together were the contributing source in managing the classroom interaction and at the same time managing learning opportunities. The findings revealed that making learners actively participate as much as possible cannot be universally right,

as not all learners learn best in the same way. What all learners need is an environment in which they can settle down to productive work, each in their various subtle ways.

Lourdunathan and Menon (2005) examined the effect of interaction strategy training on group interaction and task performance. For this purpose they trained ten groups of students. The results suggested that training resulted in a significant use of interaction strategies and more effective interaction between group members. Faridatusolihah (2012) examined the effect of teaching English speaking using audio-lingual method on the improvement of the students' speaking ability. The sample of the research included 84 of the second grade students of junior high school 1 Cisalak Kab Subang. The writer used quantitative method and non-equivalent group's pretest-posttest design to conduct the research. The results of the research showed that teaching English speaking using audio-lingual method was effective to improve the students' speaking ability.

Mohammadi, Gorjian, and Pazhakh (2014) investigated the effects of classroom structure on the speaking skills of Iranian EFL learners. They also investigated whether learners perform better in competitive, co-operative or individualistic environments. 120 participants were selected among the male pre-university students as the sample of the research. A pretest was conducted at the beginning of the course, then a posttest of speaking after the sessions. The findings revealed that classroom structure affected speaking skills and the results also showed that there were no significant differences among the individualistic, co-operative, and the control groups.

A study was done by Malmir and Shoorcheh (2012) on the impact of teaching critical thinking on the Iranian EFL learners' speaking skill. The sample of the research contained 40 advanced language learners (20 male and 20 female learners) in an institute in Hamedan. The critical thinking techniques were taught to the experimental group. The results of the study revealed that the students who received critical thinking strategies did better on the oral interview posttest and there was not any significant difference between male and female learners after giving the treatment.

Most of the attention given to improving speaking skills has been through manners other than interaction. Since little attention has been paid to interaction among all the students inside the classroom, especially in Iran as a foreign context, this study aimed at exploring the role that interaction could play on improving this skill.

STATEMENT OF THE PROBLEM

Oral communication is introduced as a prerequisite to students' academic, personal, and professional success in life by Morreal, Osborn, and Pearson (2000). Students are mostly taught orally. Poor listening skills make them fail to get the material they encounter and their problems will be intensified when they cannot respond appropriately because of poor speaking skills. Students who cannot clarify themselves may be judged as uneducated. Thus the ability to communicate effectively is a basic requirement which needs to be taught. In the current study, the effect of gender on improving speaking ability is also investigated.

The purpose of this study is to investigate the role of classroom interaction in improving speaking skill. Thus, the main goal followed by the present study is to explore the relationship between interacting inside the classroom and improving the speaking skill.

The results of the present study can be useful for teachers and learners. It can provide a rationale for the teachers to carry out oral interaction in class to improve students' speaking skills. The results of this study can be used as a model by teachers in order to instruct and train good English speakers. The results of this study can also be useful for the learners to be acquainted with using strategies appropriate for their success in improving their verbal interaction. In addition students can benefit from strengths of others through making interaction with them. This will also improve their discussion skills and as a result their speaking capabilities. This study helps to determine the effectiveness of applying interaction in teaching speaking in EFL classroom.

RESEARCH QUESTIONS

The following research questions have been addressed in conducting this investigation:

Is there any relationship between classroom interaction and speaking improvement among Iranian English learners?

Is there any difference between male and female learners in improving their speaking skills?

METHODOLOGY

Research Design

The present study is a quasi-experimental research with a pretest/posttest design to examine the research questions. In pretest/posttest design, the immediate effect of treatment and the extent to which a treatment results in learning can be determined (Mackey & Gass, 2005, Lunenburg & Irby, 2008).

Participants

This study included 30 participants. They were selected among the students of a language institute in Ilam, Iran. The whole participants were divided into four groups, two groups as the experimental groups and the other two as the control groups. The classes were groups of 7 and 8 (8 females and 7 males in experimental group and 7 females and 8 males in control groups). Out of the whole participants (30 participants), 15 participants were female and 15 participants were male learners. Their ages ranged from 15 to 40. All of them were from Ilam with Kurdish as their first language. The classes were mixed and included both male and female learners. The procedure of selecting the sample was non-random based on convenience sampling. According to Mackey and Gass (2005) convenience sampling is the selection of participants who happened to be available at the time of the study.

Instrumentation

In this study "Oxford Quick Placement Test" (version 1) was used as a tool to put the learners in approximately the same level. The test contained 60 multiple-choice items which needed 30 minutes to conduct.

The “Cambridge English: Proficiency Speaking Test” also known as “Certificate of Proficiency in English (CPE) was used as the pretest. This test included 3 parts which lasted for 19 minutes. The test examines grammar, vocabulary, pronunciation, and interactive communication.

After training the learners and giving treatment to the experimental groups, the “First Certificate in English (FCE)” was employed as the posttest which included 4 parts. The whole test took 14 minutes to conduct. The pretest and posttest were performed in groups of 2 or 3 persons. For groups of three, the tests took some minutes more. They needed two examiners to conduct; one examiner gave the test and the other one just listened to the examinees’ performance and decided upon giving the marks. During administering the pretest and posttest, the voices of the examinees were recorded.

Procedures

As indicated in the previous section, “Oxford Placement Test” was given to the learners to determine their levels and make them homogeneous. For carrying out this study, the pretest (CPE) was taken in the form of two or three persons, that is two or three participants were examined each time. Each of the different speaking skills (grammar, vocabulary, discourse management, pronunciation, interactive communication) marked by two examiners. Then the marks were added to achieve a single mark. The marks were for the whole speaking test, not for each part of the test.

Then, during 4 weeks, 3 sessions per week, speaking strategies were taught to the participants in experimental group. Apart from introducing these speaking strategies to the learners, there was a discussion topic for each session. The control and experimental groups had the same topics for discussion. The only difference was that the experimental groups received the speaking strategies.

After performing the classes, the posttest (FCE) was given to the learners to consider their progress. During both pretest and posttest the examinees’ voices were recorded. The pretest and posttest were the same for both control and experimental groups.

RESULTS AND DISCUSSION

Table 1 represents the distribution of the scores gained by the participants in the control group after performing the pretest and posttest.

Table 1: Frequency distribution of control group scores in pretest and posttest

Total Scores	6	7	8	9	10	11	12	13	14	15	16
Pretest (%)	13.3	20	13.3	6.7	33.3	6.7	0	6.7	0	0	0
Posttest (%)	0	6.7	0	26.7	20	6.7	13.3	6.7	6.7	0	13.3

Table 1 shows that 13.3% of the participants in control group gained the lowest score (6) in the pretest. The highest score was 13 with 6.7% frequency. The score 10 was the score which gained the most frequency (33.3%).

The above table indicates that after conducting the posttest the score 7 was the lowest score among control group participants with 6.7% frequency. 13.3% of participants in control group gained the highest score (16). But the most frequently score gained by participants was 9 with 26.7% frequency. In Table 2 descriptive statistics of the control group scores in pretest and posttest are presented.

Table 2: Descriptive statistics of control group scores in pretest and posttest

Descriptive Statistics	Mean	Median	Std. Deviation	Range	Max	Min
Pretest	8.8000	9.0000	2.00713	7.00	13.00	6.00
Posttest	9.1333	10.0000	2.66905	9.00	16.00	7.00

As it can be seen from Table 2, the mean of the total scores in pretest is 8.8. The maximum and minimum scores were 13 and 6 respectively. It is obvious from the table that the mean of the total scores in control group posttest is 9.13. The maximum and minimum score were 16 and 7 respectively. Comparing the total score means of the two tests in Table 2 indicates that there is not a significant difference between the scores of pretest and posttest in control group. Table 3 demonstrates the frequency distribution of experimental group scores in pretest and posttest.

Table 3: Frequency distribution of experimental group scores in pretest and posttest

Total Scores	7	8	9	10	11	12	13	14	15	16	17
Pretest (%)	6.7	6.7	6.7	13.3	6.7	20	13.3	0	20	6.7	0
Posttest (%)	0	0	0	13.3	0	13.3	6.7	20	20	6.7	20

It can be seen from Table 3 that highest frequency in pretest was pertinent to scores 12 and 15 with 20% frequency and the lowest frequency was related to scores 7, 8, 9, 11, and 16 with 6.7% frequency. The above table mentions that 13 and 16 were the scores with the lowest frequency (6.7%) in posttest. The highest frequency (20%) belonged to scores 14, 15, and 17. Table 4 presents the descriptive statistics of experimental group scores in pretest and posttest.

Table 4: Descriptive statistics of experimental group scores in pretest and posttest

Descriptive Statistics	Mean	Median	Std. Deviation	Range	Max	Min
Pretest	11.8667	12	2.72204	9	16	7
Posttest	14.0667	14	2.31352	7	17	10

The data show that the mean of the total scores in pretest for experimental group is 11.86. The highest score gained by participants in pretest was 16 and the lowest score was 7. From Table 4 it is obvious that the mean of total scores in posttest for experimental group is 14.06 and the highest score gained by participants in this group was 17 and the lowest score was 10. By comparing the mean scores gained from Tables 4, it can be concluded that there is a significant difference between the scores of pretest and posttest in experimental group. As stated earlier, the first research question intended to check if there is any relationship between classroom interaction and

speaking improvement among Iranian English learners. To find this relationship, Pearson Correlation Coefficient was run.

Table 5: Relationship between classroom interaction and speaking improvement

Variables	Correlation Coefficient	Significance Level (sig)
Relationship between classroom interaction and improving speaking skills	.850**	.000

Table 5 considers the relationship between classroom interaction and improving speaking skills using Pearson correlation coefficient. As seen in the above table, the correlation coefficient is 0.850. So, there is a high correlation between classroom interaction and speaking skills. Thus, there is a significant and positive relationship between the two variables and employing interaction among learners inside the classroom improved their speaking skills. This finding supports the finding obtained by Khadidjah (2009-2010) and Bashir, Azeem, and Dogar (2011).

The second research question aimed at finding if there is any difference between male and female learners in improving their speaking skills. To find this difference, Independent Sample Test was employed.

Table 6: Independent Sample Test for considering gender differences in speaking skill

	Levene's Test		t-test for Equality of Means						
	F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Equal Variance assumed	1.745	.197	-.887	28	.383	-.93333	1.05259	-3.08946	1.22279
Equal Variance not assumed			-.887	26.609	.383	-.93333	1.05259	-3.09455	1.22788

The F value for Levene's test is 1.745 with a significance value of 0.197. Since the significance value is greater than 0.05 ($p > 0.05$), the null hypothesis (no difference) was confirmed for the assumption of homogeneity of variance, concluding that there is not a significant difference between the two gender variances.

CONCLUSION

The purpose of the present study was to investigate the role of interaction inside classroom on improving speaking proficiency. To carry out the study, the sample was chosen among English

language learners in Safir institute in Ilam, Iran. In addition to investigating the role of classroom interaction on improving speaking proficiency, the effect of gender on improving speaking proficiency was also assessed. To test the research questions of the study, inferential statistics was utilized using SPSS software.

Pearson Correlation Coefficient results showed that there was a positive and significant relationship between classroom interaction and improving speaking proficiency. It means that interaction inside the class improves the speaking proficiency. The second question was tested using Independent t-test. The level of significance gained from Levene's test proposed that there was no significant difference between gender and improving speaking skill. Therefore, gender (male/female) of the participants did not affect speaking proficiency. Thus, it can be concluded that gender cannot be considered as a factor inhibits or helps learners to improve their speaking proficiency.

On the basis of the present research findings, it can be concluded that there was a positive and significant relationship between the variables of classroom interaction with speaking skills. That is to say, by reinforcing classroom interaction, speaking skills will be improved as well. The results of the study showed that there was no difference between male and female learners in improving their speaking proficiency.

There were some limitations in conducting the research that need to be addressed. The size of the sample is one limitation of this study. 30 English language learners were investigated, of whom 15 people were female learners and the other 15 were male learners. Thus, generalizing the findings should be made cautiously. Another limitation is about the place of conducting the research which was in an institute in Ilam. Therefore, the findings may not be generalized to schools, universities, and also to institutes in other cities.

THE BASIC IMPACTS OF TASK-BASED APPROACH UPON IRANIAN EFL LEARNERS' VOCABULARY ENHANCEMENT IN ESP CLASSES

Rohallah Hedayatipناه, Masume Mirzaei &
Akbar Azizifar
Islamic Azad University, Ilam Branch, Iran

ABSTRACT

The present study examines the vocabulary teaching in English for specific purpose (ESP) classes within the model of task-based language teaching, focusing on accounting students at scientific and applied university of technology center of Dehloran in the country of Iran. Two homogenous groups of students who were taking their ESP courses took part in the study as a control and an experimental group. A teacher-made test of technical vocabulary knowledge was conducted as the pretest. Vocabulary in the control group was taught using a traditional approach, whereas in the experimental group, technical vocabularies were taught on the basis of task-based approach. At the end of the course, a post-test was given to the students to characterize the impact of the treatment on the experimental group. Data analysis revealed that the task-based approach was more influential in teaching technical vocabularies compared to the traditional one. Moreover, the results indicated that the experimental group learners outperformed the control group. The results of the current study can be accounted as positive trend not only for teachers and students but also for book designers. Teachers can use this trend extensively in ESP classes so that they can improve students' knowledge.

KEYWORDS: English for specific purpose (ESP), task-based language teaching, traditional approach, vocabulary

INTRODUCTION

The approach of Task-based is a revolution in ELT in the late 20th century which has been developed based on the concept of tasks. Nowadays, the concept of task and task-based methodology is the common orthodoxy in the field of language teaching and it's becoming more and more important in ELT. According to (Festco., et al, 2005) learner-centered teaching methods facilitate learning. Task-based teaching method encourages the learner to do the task and learner plays a key role in the learning process (1). This method emphasizes meaningful learning through doing completely learner-centered tasks and task is considered as the basic unit of the syllabus design, curriculum development and teaching in the classroom (Richards & Rodgers, 2003). As Yarmohammadi (2005) states, in this method the learners would have the opportunity for analysis, problem solving, innovation, and critical and creative thinking. This approach is likely to provide learners with opportunities to connect old knowledge to other learning tasks in a communicative way (Ellis, 2003). Ellis indicates five task features. First, a task is an activity in teaching and learning a language. This type of activity requires learners to use the target language

to achieve a particular purpose. Second, a task focuses on meaningful activities or on the language form. Third, a task involves language use in terms of communication, to allow learners opportunities to take part in meaningful interactions to complete a specific assignment. Fourth, a task uses one or more language skills. Fifth, a task involves learners in understanding the use of the target language. Ellis (2003) also suggests that the task-based approach brings a variety of benefits to learners; one of the most important is motivation. Motivation is therefore likely to be seen as the key to all learning. Once students are motivated, they can complete the given tasks or desired goals (Brophy, 2005). Since the present paper examines the impact of TBLT on increasing vocabulary in ESP classes it is better to have considerations on both ESP and vocabulary. The most important difference lies in the learners and their purposes for learning English. ESP students are usually adults who already have some acquaintance with English and are learning the language in order to communicate a set of professional skills and to perform particular job-related functions. An ESP program is therefore built on an assessment of purposes and needs and the functions for which English is required. ESP concentrates more on language in context than on teaching grammar and language structures. It covers subjects varying from accounting or computer science to tourism and business management. The ESP focal point is that English is not taught as a subject separated from the students' real world (or wishes); instead, it is integrated into a subject matter area important to the learners.

Definition of ESP (Dudley-Evans, 1997) is as follows: in terms of general characteristics¹. ESP is defined to meet specific needs of the learners ². ESP makes use of underlying methodology and activities of the discipline it serves ³. ESP is centered on the language appropriate to these activities in terms of grammar, lexis, register, study skills, discourse and genre. In terms of variable characteristics: ¹. ESP may be related to or designed for specific disciplines. ². ESP may use, in specific teaching situations, a different methodology from that of General English. ³. ESP is likely to be designed for adult learners, either at a tertiary level institution or in a professional work situation. It could, however, be for learners at secondary school level. ⁴. ESP is generally designed for intermediate or advanced students. ⁵. Most ESP courses assume some basic knowledge of the language systems. Vocabulary is viewed as a major part of language proficiency as it allows learners to use four language skills: listening, speaking, reading, and writing (Richards & Renandya, 2002). This importance is recognized whether the language in question is a first, second, or foreign language (DeCarrico, 2001). Richards and Renandya (2002) assume that "vocabulary is a core component of language proficiency and provides much of the basis for how well learners speak, listen, read, and write" (Richards & Renandya, 2002, p.255). In terms of teaching technical vocabulary in ESP, it is most important to make a distinction between two types of vocabulary: technical and semi-technical. Dudley-Evans and St John (1998, p. 83) suggest two broad areas related to technical vocabulary. ¹. Vocabulary that is used in general language but has a higher frequency of occurrence in specific and technical description and discussion. ². Vocabulary that has specialized and restricted meanings in certain disciplines and which may vary in meaning across disciplines. According to Hutchinson and Waters (1987), ESP should be seen as an approach to language teaching which is directed by specific and apparent reasons for learning. Their specific and apparent reason for learning English is for academic purposes and their academic study will involve specialized areas across different discipline in physical sciences as well as in social sciences. The aim of their vocabulary acquisition is surely

academic vocabulary. A rationale behind this is that learners will do academic study in English must focus on academic vocabulary which is variously known as a general useful scientific vocabulary and semi-technical vocabulary because they need to exhibit a wide range of academic skills like reading about research papers in their own fields, listening to teachers speak about their work, writing academic papers and presenting oral or written evaluations of methods or results in many cases.

We know that ESP courses receive a great deal of attention and emphasis among the EFL practitioners and learners especially at universities. Concerning the importance of ESP textbooks, Mansor (2001) maintains that they have always been an integral part of a syllabus, and that they have served many teachers well, providing them with the pivot onto which their lessons hinge. Over the past few years, various approaches, methods and procedures, have been employed to aid learners learn second language. In one period considerable attention and emphasis was paid to teaching and teacher-oriented classes. Because the emphasis was on grammatical and paid to phonological structures, the vocabulary needed to be relatively simple, with new words introduced only as they were needed to make the drills possible. The belief was that vocabulary would take care of itself once the students learnt the grammatical structures (Zandmoghadam, 2007). Most of ESP students in Iran are well aware of the importance of vocabulary in studying a foreign language; they are well aware of their need to enhance their vocabulary as well as to improve their communicative competence but in ESP courses in Iran at university level, despite new methods and approaches, most of the techniques teachers use on teaching vocabulary are still traditional and old-fashioned; the teacher emphasizes on the translation of technical text and there is no real interaction among students. Hence, the present paper indicated whether teaching to ESP student through task-based approach can be influential and practically useful in ESP vocabulary enhancement.

REVIE OF LITERATURE

According to Willis (2007) "task-based language teaching (TBLT) helps language learners make real efforts to communicate as best as they can in the foreign language which they are learning" (p.2). Willis (2004) contends that task-based instruction (TBI) is in fact a meaning focused approach that reflects real world language use for purposeful communication. In TBLT, all the four language skills are considered as important. Moreover TBLT has been more effective than CBLT in teaching reading comprehension to ESP learners (Malmir, 2011). According to Willis (1996), tasks are always activities where the target language is used by the learner for a communication purpose in order to achieve an outcome (p. 23). Richards and Rodgers (2001) offer some assumptions which are believed to underlie TBLT. As far as the theory of language is concerned, "language is primarily a means of making meaning" that is, what is important in language use is meaning. In fact, Skehan (1998), in his definition referred to this point too. "Multiple models of language inform task-based learning". Richards and Rodgers (2001) believe that TBLT draws on functional, interactional and, in some cases, structural models of language. Skehan (1998) believes that when we deal with task complexity, we have to consider the structural model too. "Lexical units are central in language use and language learning", and "conversation" is the central focus of language and the keystone of language acquisition". Cubillo

and Brenes (2009) examined task-based instruction in an ESP course in the computer center at the University of Costa Rica. This study presented the advantages of using Task -based learning to help learners from the computer center at the university of Costa Rica infer the rule of the superlative form of adjectives in English. It is important to mention that the methodology based on tasks help learners pay more attention or concentrate more on meaning. Task-based language learning is an approach in which learners concentrate more on meaning than on form. By doing this, students perform different communicative tasks, which happen to be more meaningful because they are close to the learners' reality, instead of doing form-based discrete exercises, which are usually decontextualized and meaningless because they do not see a reason to do them. Cubillo concluded that it is important to point out that implementing the TBL methodology in an ESP context is a challenging task for language teachers. As Brown (1994) pointed out teachers should take advantage of different approaches and techniques and combine them to help learners improve their skills. Subsequently, by implementing task-based instruction, learners as well as teachers will certainly benefit from a different approach to language pedagogy because it is more motivating, challenging, innovative, appealing and meaningful to students than other traditional grammar-translation based approaches. Task-Based Language Teaching has shown that learners have the greatest role in a learning process. Learners' cooperative activity and speaking in groups while performing tasks have significant role. In this regard gender is one of the effective factors in language learning.

Although many studies revealed that there is no significant difference between male and female in language learning as a whole, like (Yarahmadi, 2011; Kashefian & Maroof, 2010) but many others had different results and rejected the aforementioned statement. For example Zare (2010) investigated how the use of language learning strategies varies according to gender and revealed that in Iran female EFL learners prevailed over males in the use of strategies. Noordin, (2010) investigated the effect of task difficulty on using socio-effective strategy in listening comprehension. The results of this article revealed that experimental group generally tended to use more socioaffective strategies for any difficult task, while control group used these strategies for easier tasks or difficult at a certain level. As Kavaliauskienė (2005) writes, teaching through tasks creates favorable learning conditions for students who study English for specific purposes. In her words, task-based instruction seems to grant meaningful use of language and promote autonomous learning. Introducing task-based instruction as a practical methodology which can be supplemented in EFL textbooks, Finch (2004) asserts that by creating such student-centered and interactive learning materials, teachers can achieve syllabus goals and can help their students to become more motivated and effective learners. Yuan and Ellis(2003) found that giving students an unlimited time to perform a narrative task resulted in language that was both more complex and more accurate in comparison to a control group that was asked to perform the same task under time pressure. The students used the time at their disposal to monitor and reformulate their utterances. Interestingly, the opportunity to plan on-line produced a different effect from the opportunity to engage in strategic planning, which led to greater fluency and complexity of language. It seems, then, that if teachers want to emphasize accuracy in a task performance, they need to ensure that the students can complete the task in their own time. However, if they want to encourage fluency they need to set a time limit. Therefore, the second attempt of this study is to

demonstrate whether gender difference has any considerable influence on vocabulary learning in ESP courses in Iran or not.

RESEARCH QUESTION

This study was primarily designed to investigate the effect of task-based teaching of technical vocabulary on Iranian ESP learners. It also tried to find out whether there is any difference between male and female learners in learning vocabulary through task-based approach. Regarding the objectives of the study the following research question were proposed:

Q1. Will there be meaningful differences in the performance of students taught ESP vocabulary by a task-based approach and that of students taught by a traditional method?

METHODOLOGY

Participants

Sixty BA students of accounting aging from 18-26 in Science and Applied University of Technology in Dehloran city in the country of Iran participated in this study. After experiencing participants by technical vocabulary pre-test, 40 (N=40) of them were chosen and were assigned randomly to two groups of 20, namely a control group and an experimental group. The two classes included 12 male and 8 female students. The participants came from various socioeconomic backgrounds and different cities of Iran.

Instruments

Teacher-made Technical Vocabulary Pre-test

To achieve maximum of possible homogeneity among the subjects regarding their general vocabulary, a vocabulary test was administered at the beginning of the study. The reliability of this test was calculated by Cronbach Alpha Formula which was 0.95. In reality, the test included 50 multiple-choice items. The grades were calculated out of 100. The teacher-made technical vocabulary test with 50 multiple-choice items was administered to test the ESP learners' ability regarding their technical vocabulary knowledge (see appendix 1).

Teacher-made Technical Vocabulary Post-test

After the subjects were homogenized regarding their general vocabulary knowledge the task based instruction was started for experimental group within seven weeks (two sessions each week) whereas the control group was taught in traditional method. In order to see whether the task-based instruction of vocabulary had any significant impacts on ESP learners' technical vocabulary knowledge, the same technical vocabulary test with 30 items was administered as the post-test after treatment (see appendix 1).

Procedure

The research was conducted at the beginning of the semester. After homogenizing participants regarding their general vocabulary competence, the researcher divided them into two groups namely a control and an experimental group. After that, the teacher-made pre-test regarding their technical vocabulary knowledge was assigned in each group. The researcher applied two different

approaches to teach technical vocabularies to the participants in the study. The participants in the control group were required to study the texts, translate them and answer some non-task-based comprehension questions, i.e. they were taught technical vocabulary based on the traditional method. For the experimental group the same passages with some task-based exercises which fit a task-based framework were used. In fact, the class time was divided into three phases: pre-task, task cycle and post-task. In pre-task phase the researcher tried to activate the ESL learner's schemata related to the text with new technical vocabularies to motivate them to read. In the during task phase, the students were engaged in completing different kinds of tasks, and in the post-task phase, they gave a report, repeated the tasks and even dealt with language focus tasks. In fact the classes were held one session a week for one hour and a half. After 7 weeks of instruction, the teacher-made technical test was given to find out the probable differences between the performances of the two groups.

Data Analysis

After collecting data, it was processed by SPSS program. In the case of the question of the study, first of all descriptive statistics paired sample *t*-test was run to examine whether there was significant difference in vocabulary knowledge of learners in the experimental and the control group. An independent sample *t*-test was run to compare the means of two groups in post-test. To find out the probable differences in vocabulary learning between male and female in the experimental group.

RESULT AND DISCUSSION

To answer the question concerning the effect of task-based language teaching approach on vocabulary learning of ESP students, descriptive statistics and a set of paired and independent *t*-test was used. The result of table 1 shows that there is not meaningful improvement in the control group. As mentioned earlier, two tests were conducted in the current study. At the first stage, a pre-test was conducted so as to ensure that the two groups were homogenous in terms of their language proficiency. The mean scores obtained through the pretest for the control and experimental group were 69.53 and 71.40, respectively. To see whether the two groups were meaningfully different or not, T-test was run, the result of which is provided in Table 1.

Table 1: Results of independent sample test on learners' language technical vocabulary in pretest.

T	DF	Sig. (2-tailed)	Mean Difference	Std. Error difference
-.621	28 -	540	-.4	6.44

Since the value of the T-observed was less than T-critical at $P < .05$, ($t = 0.621$, $DF = 28$, $p < .05$), it can be understood that there was not a meaningful difference between the control group and the experimental group with regard to their technical vocabulary knowledge. Simply put, the control and the experimental groups were at nearly the same level of English technical vocabulary competency. Simply put, the control and the experimental groups were at nearly the same level of English technical vocabulary competency. To determine the influence of the Task-based Approach Model upon Increasing Vocabulary Learning in ESP Classes and traditional teacher teaching on EFL Learner's technical vocabulary enhancement in ESP classes, a post-test based on

the content taught during the course was conducted to both groups. The mean scores of the control and the experimental groups were further processed to show whether there is a meaningful difference between their reading improvements. The results indicated that the mean scores for the control and the experimental group on the posttest was 64 and 77.33, respectively. However, another t-test was run to show if there was a significant difference between the two groups of learners in their achievement scores the result of which is provided in Table 2.

Table 2: Result of independent sample test on the Learners' technical vocabulary on the posttest

T	DF	Sig. (2-tailed)	Mean Difference	Std. Error Difference
-2.326	28	.028	-13.33	5.73

Since the T-observed was higher than the T-critical ($t=-2.326$, $DF=28$, $p<.05$), it can be said that there was a meaningful difference between the control and the experimental group in their reading improvement. However, according to the above mentioned statements it is understood that teaching technical vocabulary through task-based approach has a significant effect on ESP learners' technical vocabulary improvement.

One of the major purposes of this paper was to determine if the application of task-based has any impact on vocabulary learning of ESP students. The indicated findings reveal that there was a significant difference at .05 level .i.e., the participants' performance in the task-based class was remarkably better than that of traditional class. Logically, the significant improvement regarding the vocabulary learning ability of the participants in the experimental group must have originated from the type of instruction they had been exposed to during the time (14 sessions) that the experiment was conducted. Another factor that may influence learners' performance is the nature of the task that may be stimulating. Richards and Rogers (2001, p.229) assert that task activity and task achievement, as a characteristic for task-based instruction, are motivational. Brown (2000) goes on to state "it is easy to assume that success in any task is due simply to the fact that someone is motivated" (p. 160). Generally, TBI has the potential to bring about moderate to large vocabulary gains. It is not unlikely that the characteristics of tasks, authentic materials, learner-centered communication, negotiation of meaning, integration of new and existing knowledge, and a meaningful non-linguistic outcome can foster vocabulary acquisition in the same manner they foster the acquisition of other language features. The second objective of the present study was to discover if there is a difference between males and females in learning vocabulary in the class which was conducted based on the task-based approach. The findings revealed that males notably performed better than females in the experimental group. Psychologists have found there are significant differences in cognitive performance of males and females.

CONCLUSION

With regard to what have been mentioned, those ESP learners who have been taught vocabulary through task-based language teaching outperformed those learners who have been taught vocabulary through traditional approach. Therefore, the traditional approach is proved to be

unsuccessful and ineffective. The present paper has provided further empirical evidence for the value of a task-based approach to second language learning. It reveals that learner-learner interaction while performing tasks provided opportunities for the learners to talk about vocabularies and monitor the language they used.

Task based language teaching is a meaning-centered methodology, according to Ellis (2003), such meaningfulness in TBLT provides an authentic, purposeful, and intentional background for comprehending and using language, and it is encouraging for the EFL learners. But in traditional method the focus is on translation and memorization of new vocabularies and students are not concerned with the context in which these technical vocabularies are used. One of the features which can be referred to as a reason for the outperformance of the TBLT class in comparison with the traditional class is the collaborative and interactive nature of the task-based approach where language use and language learning take place simultaneously. The cooperative natures of planning and report stages help students get feedback from the members of a task group. Of course, the students in TBLT receive feedback from the teacher. However, in the traditional group the students work individually on the exercises, so they do not receive any feedback from their peers and the only authority for judging about accuracy of exercises is the teacher. Therefore, it can be claimed that the existence of such a feedback provides a more relaxing and less threatening condition for learning foreign language. The results of this research can have several implications in ESP, language teaching methodology, materials development and teacher-training programs. As far as ESP is concerned, ESP learners can best benefit from task-based teaching of vocabulary. With regard to language teaching methodology, the findings of this study emphasizes the role of task-based approach in teaching vocabulary. In fact, everything turns around tasks and task completion in this approach. Concerning materials development, new textbooks must be designed for ESP learners. The books must be as communicative as possible. The books must pay equal attention to all four language skills and sub-skills especially vocabulary. They must be designed based on tasks. Like any other research this study has its own limitations. The subjects of the study included only 60 students in the field of accounting in the city of Dehloran. The inclusion of more subjects in other field could add the reliability of the study. Similar studies should be done in other countries to verify the usefulness of the study.

THE INFLUENCE OF LEARNING EXPERIENCE ON TESL TRAINEES' ATTITUDES TOWARDS APPLYING COMMUNICATIVE LANGUAGE TEACHING (CLT)

Samira Nikian & Faizah Mohamad Nor

ABSTRACT

This study investigates pre-service teachers' attitudes towards the implementation of Communicative language teaching (CLT) approach based on their learning experience to find whether they experienced CLT approach during their preparation at university. This study is a qualitative study of 15 TESL trainees in a local university in Malaysia. The instruments used to elicit data for the study were questionnaires and interviews. The results show that some of the participants stated although they experienced CLT at university but school situation is different. Finding from the present study is necessary for some changes in English language teaching in Malaysian secondary schools to achieve effective skills for global communication through English. In this regards, policy-makers can reform textbook content, increase school hours or funding. These changes can be started gradually in classroom content even under current conditions. In addition, policy makers should implement learner-centered teaching from primary school, in order to change the culture of education. Even with limited time and large classes, it is possible to incorporate activities which motivate learners to actively participate in L2 communication.

KEYWORDS: CLT, attitudes, learning experience

INTRODUCTION

I attempted to identify how the participants considered the experience of TESL trainee education at university have been conducive to facilitating CLT implementation in their own contexts as well as to improving their teaching proficiency in a general way. All the participants, on entry into the programme, attended a one year foundation courses and then joined to TESL programs. The positive experiences which can be enjoyed by the pre-service teachers from this kind of teaching and training may lead them to adopt a similar approach in their classrooms (Rogers, 1983; Marshall.1998; Baron, 1998). Many researchers believe teachers often tend to apply the same teaching method which they experience during their study in classrooms (Carless, 1998; Baron, 1998).

LITERATURE REVIEW

Previous schooling experiences and the everyday concepts with which they entered the teacher education program had a powerful influence how they perceived and enacted the curricular reform concepts during the practicum experience (Ahn, 2009; p.5). Recent research in mainstream teacher education [see review by Pajares (1992), Nespor (1997), Fang (1996) and

Johnson (1994)] and language teacher development (Brown and McGannon, 1998; Johnson, 1992; Cabaroglu and Roberts, 2000; Peacock, 2001) show that some student teachers' attitudes, which are largely derived from their prior experiences, may adversely affect their learning approach to teaching, pre service teachers often regard alternative models of teaching as peripheral (John, 1996) and therefore easily depended on teaching as they had been taught. The impact of student teachers' prior experiences and attitudes on their attitudes of teacher learning has been discussed extensively in the literature (Holt Reynolds, 1992; Bailey et al., 1996; Freeman, 1992; Johnson, 1994; Numrich, 1996; Borg, 2006). Whitebeck (2000) found "pre-service students' simplistic views may be the number of years students spend observing their own teachers" (p.129). Holt-Reynolds (1992) probed that the pre-service teachers' attitudes about teaching were derived from their learning experiences. He found "the personal histories of pre-service teachers appear to function as prior knowledge of what 'good' teaching should look, sound, and feel like" (Holt-Reynolds, 1992, p. 343). In this regard, Farrell (1999) found pre-service teachers who were taught mandated Grammar method course in Singapore were interested in teaching grammar in the same way they had been taught it themselves.

In his study, the pre-service teachers were asked to write about their attitudes of teaching grammar directly or indirectly. Their writings revealed that their prior language learning experiences (learning English grammar through a deductive approach in Singapore) influenced their choices. Similar to Farrell's (2001) findings, Urmston (2003) found that pre-service teachers' attitudes were based on their experiences as learners. Moreover, in 2009 Zheng (2009) state EFL teachers bring attitudes acquired from the years' learning experience as a pre-service teachers in teacher education programs. Bailey et al. (1996), cited by Ho-Yan (2004), also claimed that student teachers' pre-existing attitudes, which stemmed from their past learning experiences, could both facilitate and hinder their attitudes of teaching practice.

Mok (1994) concluded that teachers' learning experience as a learner and as a teacher guide their attitudes of teaching. In addition, Ellis (2006) also declared that different learning experiences influenced their attitudes. So, teachers' professional training can be taken into account as an important factor that plays a crucial role to form teachers' positive attitudes of teaching. Ellis (1994) found that Vietnamese teachers were not able to apply CLT due to lack of educational background in CLT. A few other studies investigated the relationships between teachers' attitudes, learning experience and pre-service teachers trainings and the results are summarized in the following table.

Table 1: Research on the Relationships among pre-service teachers learning experience and training and attitudes

Source	Participants	Findings
"Learning Experience"		
"Pre-service teachers Training"		
"Bramald et al., 1995"	"162 PGCE Students"	"pre-service teachers Students' prior attitudes about learning are changed in various ways through teacher education courses".
"Anderson and Bird, 1995"	"3 training course students"	"Trainees' interpretations of their teacher education coursework are influenced by their prior attitudes".
"Almarza, 1996"	"4 PGCE students"	"During teacher education courses, PGCE students' attitudes change differently despite similar behaviour".
"Peacock, 2001"	"146 BA TESOL Students"	"BA TESL Students' attitudes about vocabulary and grammar learning are different from experienced teachers' and hardly changed".

This table suggests that teacher attitudes are influenced by EFL pre-service teachers' prior language learning experience. Since the literature shows experiences may have a positive or negative impact on teacher attitudes and some studies indicate considerable differences between pedagogically and non-pedagogically educated teachers in terms of their classroom behaviour, EFL pre-service teachers' attitudes should be surfaced and acknowledged during the teacher education programme (Zheng, 2009). Apart from learning experiences some other factors that may influence on practicing CLT include L2 teaching and learning experiences (e.g., Sato and Kleinsasser, 1999; Sato, 2002); school norms and values (e.g., Sato, 2002); parental expectations, lack of institutional support and resources, and teachers' pedagogical and practical knowledge (Wang, 2002).

RESEARCH QUESTION

This study examined the following question:

How learning experience influence on TESL trainees' attitudes towards applying Communicative Language Teaching (CLT)?

METHODOLOGY

Since the aim of this study is to the influence of learning experience on TESL trainees' attitudes towards applying Communicative Language Teaching, the qualitative methodology examines the attitudes of fifteen TESL trainees with the help of survey questionnaire and in depth interview. These participants were asked to complete the questionnaire and all of them were asked to participate in the succeeding interview. The use of these two data collection instruments help validate both the answers in the questionnaire and in depth interviews in which the researcher and the subject are fully interactive (Ary et al., 2009; Mishra, 2005; Moustakas, 1994).

RESULTS AND DISCUSSION

Borg (2003) mentions that “teachers’ prior language learning experiences establish cognitions about learning and language learning which form the bases of their initial conceptualizations of L2 teaching during teacher education, and which may continue to be influential throughout their professional lives” (p. 88). In chapter 2 we discussed the effects of learning experience on shaping teachers’ attitudes. Hence, in alignment with the first aim of the research which investigates TESL trainees’ attitudes towards CLT, the second question of the second questionnaire asked the participants about the method of their learning experience at schools. 60% of the participants experienced direct method and grammar translation method and 53.33 % of them experienced CLT as the method of teaching in their school. 33.33% of participate used ALM during their studying time at school. Table 2 demonstrates the findings of this question (What methods did you experience as a language learner) in details.

Table 2: the results of the second question of the second questionnaire

a) Audio- Lingual Method	5
a) Communicative Approach	8
b) Direct Method	9
c) Grammar Translation	9
d) Natural Approach	2
e) Silent Way	0
f) Total Physical Transport	3

Apart from the second questionnaire, these fifteen TESL trainees were also asked in both the interviews to comment on the school experiences that had encouraged them to apply CLT in the real classroom as a teacher. These experiences were categorised into two major themes one of the major theme is learning experience as encouraging factors with associated two subthemes: encouraging factor as following the same methods of their teachers, encouraging factor to not following the same methods of their teachers because they had bad memories of them. Another major theme was learning experience does not have any influence on applying CLT. The emerging findings of the interviews are summarised in Table 3.

---	--	--	---	--	--	---	--	--	--	---	--	--	--	--

In response to the question that I asked in the interview about TESL trainees' school time (Do you think that your English learning experience in middle and high school encouraged you to implement CLT or prevented you from using CLT in your teaching?), the majority of the participants commented that a few of their English teachers were very good and used CLT to

arouse their interest in teaching the language. Some of them were satisfied with the way of their school teachers and liked to follow their instructions even though they used traditional methods based on the text books for example Maisarah said;

S; i think it is ok and successful because most of us the level of proficiency is quite good. We are doing well because we learn English quite ourselves at home and we learn English by ourselves so the waviness of English is already in minds so the teacher just asked us on write an essay and submit it to me tomorrow so she correcting grammar on the paper but not giving us very direct comments about articles or past and present tense

R; So you mean their teaching was not efficient? You use self study?

S; ya self study

S; primary and secondary both of them traditional methods where spelling text and only use the text books and teacher only focus on giving in put too much because most of us already know the basic and most of us know the structure of sentence so we just in the class create an essay and submit it to the teacher and we have accurate lesson and direct lesson about grammar

R; now you teach grammar directly?

S; yes, yes, yes

R; What methods were used to teach you English in school? Did the school teachers incorporate CLT in their teaching?

S; no because before this the school did not have computer lab and it is not using the technology or the facilities very much so we were just using textbook, traditional methods and work book and like that

Maisarah believed they learned English through self study not by the helps of teachers. She thought this way of learning was efficient because she taught her level of English proficiency and her friends was good. The same as Maisarah, Amirah also liked to follow her teachers' methods of teaching in secondary school but opposite to Maisarah she experienced pair work and group work and became aware of the advantages of student-center class and liked to do the same in her classroom. She said: "*i think it encouraged me because I like to do group work and pair work because is more fun than just listening to the teacher talking*" (second interview Amirah, line 38-39). In addition, Fadhila also remembered one of her teachers in secondary school who made the class learning fun. She stated "*I think most of the times they used chalk and talk but once in a while the teachers use songs, use poems she knows how to make learning fun*" but "*previously in my high school my teachers i still remember one teacher who I looked up the most because she was really warm and kind but at the same time she had that side when she needs to be very strict*" (Fadhila's second interview line 12-14 and 20-2).

Interestingly, some of the participants expressed they did not like the teacher center classes of school time learning and those bad memories encouraged them to use CLT in their classroom now. The following extracts show this issue.

S; ok class was very routine in traditional way the method that teachers always use was grammar translation they always tell me directly what is essay about and they translate each

words because some of my friends did not understand. They (the teachers) always did aloud reading together and they (the students) always repeat after my teacher. I think it is a very traditional way to learn English right?

So i think my English learning experience I think encourage me to implement CLT because since ***I felt bored learning in traditional way*** so I want students feel happy and joyful when learning English so i really try to use as much as CLT

S; Ok in my memory my teachers asked me to do many questions by following the format examinations so we can get A in the exam

R; What methods were used to teach you English in school? Did the school teachers incorporate CLT in their teaching?

S; I think no in my time there is no CLT method. It was grammar translation method

S; I think it encourage me to implement CLT because i have experience that ***I could not speak*** in English. I can read but i can't speak so i have to improve the new generation

S: "Secondary school no they used direct teaching method

R: can you remember how was the class?

S; many of the time like writing class try to write, grammar class also teacher by teacher give example and do practice it is more for exam rather than learning English

Correspondingly, Ainee felt the learning experience that she had gotten from the school time encouraged her to use CLT in her classroom. She said:

"the learning experience actually encourage me to implement CLT but bad memory that I try not to do them. What I am doing now in practical time, I always note from students will know what students need like previously what I need from the teachers now I can do for them as a teacher"

Ernie Aljaya also was not satisfied about her secondary school times and she tried not to follow the ways of her secondary school teaching but she tried to follow the way of one her teachers in primary school. She said:

S: Secondary school no they used direct teaching method

R: can you remember how was the class?

S; many of the time like writing class try to write, grammar class also teacher by teacher give example and do practice it is more for exam rather than learning English

S; I use my experience to teach the students because I am one of those students that always neglect what the teacher says in front ok i am one of the students who sleep behind why i sleep because the way the teachers taught is quite boring because it is chalk and talk and actually i want to change that I don't want my students to sleep in my classroom that is why I use CLT. I want everyone to interact

Ernie also told me that she had a very good experience with one of her English teacher in primary school she said:

S; during my time most of the students use chalk and talk but there is one teacher I really like during my primary school she did some CLT she used some songs and poems and role play and it is very fun and I like the way she is teaching during my primary but during my secondary most of them are in chalk and talk and then how I learn English before entered UTM. I used to listen to English songs

The same as Aljaya, Sheanyin also confessed that although she did not like some of the rules and behaviours of teachers in school time and tries not to apply them in her class, they are still some actions that she follows them in her own class. She said:

S; i think i will not the traditional way to teach my students now because quite boring and when class is boring and students will not learn

R; Do you think that your own education as a student has had any influence on the way you teach? How?

S; yes like dr khairi i try to use that method to teach students

R; Based on your observation of your school teacher's teaching, to what extent would you say your approach to foreign language teaching is similar to or different from hers?

S; actually is a bit different what my teacher implement but then i also use some of the methods that teacher used like punishment

R; Why some of them u don't do maybe

S; I don't really like them because it is boring

Surprisingly, Sara contended that although she had good experiences at school, she did not like using CLT because she thought good learning experience is not the encouraging factor in using CLT. She believed students' lack of motivation and proficiency act as inhibiting factors in applying CLT.

*S; so because i don't think it is suitable for the students because they have **low proficiency** and it is one problem and then they are very **restless and run a round** and do not want to participate **not motivated***

R; How do you find your students' participation and performance in class? You said not good and you are not satisfied with them yes?

S; Yes

Based on the interview results, 70-80% of class time at school time was teacher talking while just one of the participants who went to a school in Melaka stated that the teacher talking was just 20% during school time and most of the time students were talking in the class. One of them also expressed although during primary school TTT was 60-70% but during secondary the TTT decreased to 40-50%. The participants also showed their disagreement on traditional teaching in which teachers' talking time was very high by answering to question number 9 and 10 of the first questionnaire. The tables 4.4 and 4.5 demonstrate their answers.

Table 4: results from question number 9 of the first interview

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid 2.00	5	33.3	33.3	33.3
3.00	5	33.3	33.3	66.7
4.00	5	33.3	33.3	100.0
Total	15	100.0	100.0	

According to the following table, 10 of the participants (66.6%) believed student talk should be equal if not greater than teacher' talk while 33.3 % believed teacher talk should exceed student talk during language classes for instructing, explaining and giving feedback.

Table 5: results from question number 10 of the first interview

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid 1.00	3	20.0	20.0	20.0
2.00	7	46.7	46.7	66.7
3.00	5	33.3	33.3	100.0
Total	15	100.0	100.0	

66.6 % (10 out of 15) of the participants believed Student talk should be equal if not greater than teacher' talk while just 33.3 % (5 out of 15) of them agreed teachers talk should exceed students talk. This awareness of decreasing TTT in the class may be the results of the new method of studying at university.

CONCLUSION

In this section some conclusions drawn by researcher about the influence of learning experience in TESL trainees' attitudes. It can be concluded through the themes that learning experience plays an important role in shaping TESL trainees' attitudes. According to the findings presented in the above table, the majority of participants reveal that they avoid following Audio Lingual Method and traditional methods because they had negative backgrounds in learning via ALM and GTM.

Limitation of the study

The current study is a study of the fifteen TESL trainees' attitudes towards CLT in Malaysia. Thus, generablizability of the results is limited. It is suggested that a large-scale study of the same research topic carry out in Malaysia and other Asian contexts in order to yield a greater generablizability.

MA Student at Islamic Azad University, Torbat-e Heydarieh Branch, Iran

ABSTRACT

Cultural intelligence (CQ) is positively and significantly correlated with job satisfaction among Iranian English as foreign language (EFL) teachers. The present study sought to investigate the correlation between Iranian EFL teachers' CQ and their job satisfaction. A sample including 110 Iranian EFL teachers completed two questionnaires, e.g. Job Satisfaction adopted from Karavas (2010) and Cultural Intelligence Scale developed by Cultural Intelligence Center (2005). Results of correlation indicated a direct significant correlation between Iranian EFL teachers' CQ and their job satisfaction. This study can help teacher educators to implement some cultural material to their curriculum for teaching prospective teachers.

KEYWORDS: EFL Teachers, Cultural Intelligence, Job Satisfaction

INTRODUCTION

Job satisfaction simply means as the extent to which employees are content with their jobs. The issue is important for both employers and employees (Kazerouni & Sadighi, 2014). Kazerouni and Sadighi (2014) view Job satisfaction as the fulfillment acquired by experiencing a variety of job activities and rewards. Cranny, Smith and Stone (1992) define job satisfaction as “an affective (that is, emotional) reaction to a job that results from the incumbent’s comparison of actual outcomes with those that are desired (expected, deserved, and so on.)”(p.1). Spector (1997) defines job satisfaction as “how people feel about their jobs and different aspects of their jobs”(p.2). Job satisfaction has also been defined “as a pleasurable or positive emotional state resulting from the appraisal of one’s job or job experiences” (Locke 1976, p.1300).

Another factor which is to be investigated here is EFL teachers' cultural intelligence (CQ). The term can be defined as knowledge of a variety of cultures. It is a multidimensional construct which is targeted in contexts where cross-cultural interactions occur due to differences in race, ethnicity, and nationality (Ghonsooly, Sharififar, & Raeisi Sistani, n.d.). Ang, Van Dyne and Koh (2006, as cited in Ghonsooly et al. n.d.) define CQ as "an individual's capacity to deal effectively in situations characterized by cultural diversity" (p.101). By function, the researchers mean “the capability to grasp, reason, and behave effectively in situations characterized by cultural

diversity” (Ang, Van Dyne, Koh, Templer, & Chandrasekar, 2007, p. 337, as cited in Molina, 2012/2013). Molina (2012/2013) considers such qualitatively different components as metacognitive CQ, cognitive CQ, motivational CQ, and behavioral CQ for cultural intelligence.

REVIEW OF LITERATURE

Ghonsooly and Golparvar (2013) argue that cultural intelligence as the ability to effectively interact with people from various cultures necessitates cultural awareness. In the other hand they maintain that successful interaction with the members of a given culture requires the awareness of its values, perspectives, and patterns of behavior. Similarly, according to Cheng (2007, as cited in Ghonsooly & Golparvar, 2013) being aware of cross-cultural communication patterns is the first step to have harmonious and successful communication. On the other hand, Locke (1976) defines job satisfaction “as a pleasurable or positive emotional state resulting from the appraisal of one’s job or job experiences” (p.1300). Evans (1997) interprets job satisfaction as “a state of mind determined by the extent to which the individual perceives her/his job-related needs to be being met” (p.833).

Ghenghesh (2013) sought to find out the extent to which different factors influence the job satisfaction and motivation. The results obtained in Ghenghesh's study (2013) show that there are a number of intrinsic and extrinsic factors which can have influence teachers' job satisfaction and motivation. The most important reason shown to enhance teachers' intrinsic motivation was good relationship with colleagues/co-workers. Along similar lines, the second ranked extrinsic factor, ‘the working environment in one’s department/faculty’, was a motivating factor for teachers to work harder (Ghenghesh, 2013). It was also found that teachers were motivated and satisfied if students showed interest in the module they were taking. It was also found that 40.8% of teachers in the different faculties and the English Department were dissatisfied with the ‘poor language level’ of students upon entry to the university (Ghenghesh, 2013).

Griva, Panitsidou, and Chostelidou (2012) conducted a research to identify factors affecting motivation and professional satisfaction of foreign language (FL) teachers employed in the Greek education system. They concluded that such factors are important because teachers' views and needs can influence their attitudes, work behavior and commitment in teaching. It is also interesting to reveal how FL teachers' expectations and fulfillment from their job are different based on teachers themselves, schools and contexts (Griva et al. 2012).

According to Doyle and Kim (1999) such factors as lack of respect from administration, lack of advancement opportunities, lack of long term employment and job security, overly heavy workloads, lack of rewards for creativity, and the malfunctioning of the education system create dissatisfaction among ESL and EFL teachers.

Petrović (2011) conducted a study to determine the level of cultural intelligence of teachers and to examine which variables could predict cultural intelligence. It was found that the participants (N=107 elementary school teachers from four towns in Serbia) showed a high level of cultural intelligence and that significant predictors of teachers' cultural intelligence included enjoyment of

intercultural communication, experiencing multicultural classes as a challenge, openness to cultural learning and contacts with people from other cultures.

Iqbal and Abbasi (2013) investigated the relationship between emotional intelligence (EI) and job burnout among universities professors in Karachi. It was concluded that the ability to effectively deal with emotions and emotional information in the universities helps professors control burnout. In addition, the belief one has about the cause of his fortune or misfortune (locus of control) is a predictor of burnout among professors (Iqbal & Abbasi, 2013).

RESEARCH QUESTION

The present correlation study aims at investigating the relationship between Iranian EFL teacher's job satisfaction and their autonomy. In order to achieve the results of the study the following research question research question was posed:

Is there any significant relationship between Iranian EFL teacher's job satisfaction and their cultural intelligence?

Accordingly, the following research null-hypothesis was proposed:

There is not any significant relationship between Iranian EFL teacher's job satisfaction and their cultural intelligence.

METHODOLOGY

Participants

The participants of this study were 110 Iranian EFL teachers from Khorasan Razavi province, Iran. Their age ranged from 24 to over 45. Participants were selected according to Krejcie-Morgan table (1970) out of 150 EFL teachers. They were either BA or MA. Their teaching experience ranged from 5 to 25 years. Teachers of both private language institutes and public schools participated in the study.

Instrumentations

In order to collect the required data, the following instruments were employed by the researcher.

Job satisfaction

In order to assess the participants' job satisfaction, a questionnaire composed of 15 Likert type statements was administered. The items were measured on a 5 point scale ranging from 1= highly satisfying to 5= highly dissatisfying. The questionnaire was adopted from Karavas (2010).

Cultural intelligence scale

In order to assess the participants' cultural intelligence, this questionnaire developed by Cultural Intelligence Center (2005) was administered. Composed of four components, e.g. metacognitive, cognitive, motivational, and behavioral, the questionnaire consists of 20 items measured on a 5-point Likert scale. The responses range from "strongly disagree"(1) to "strongly agree" (5).

Procedure

Selected participants, 110 Iranian EFL teachers from Khorasan Razavi, Iran were given two questionnaires, e.g. job satisfaction and cultural intelligence scale. Participants completed the questionnaire either online or on paper. Data were collected and analyzed. Next section summarized data obtained from the instruments.

RESULTS AND DISCUSSION

To determine whether Iranian EFL teachers' job satisfaction relates to their cultural intelligence, Pearson product moment correlation coefficient was employed. Table 1 shows the results.

Table 1: Results of correlation between EFL teachers' job satisfaction & cultural intelligence

Correlations			
		CQ	JS
CQ	Pearson Correlation	1	.550**
	Sig. (2-tailed)		.000
	N	110	110
JS	Pearson Correlation	.550**	1
	Sig. (2-tailed)	.000	
	N	110	110

** . Correlation is significant at the 0.01 level (2-tailed).

As Table 1 shows, there is a statistically significant ($r=.55$; $\text{sig}=.000$) correlation between Iranian EFL teachers' job satisfaction and their cultural intelligence. Therefore, the null-hypothesis proposed by the researcher was rejected. According to this finding it can be concluded that the more these participants are culturally intelligent, the more they are satisfied with their jobs. This finding is in agreement with what found by Bückera, Furrer, Poutsma and Buyens (2014) indicating that CQ has positive influences on communication effectiveness and job satisfaction among 225 Chinese managers working for foreign multinational enterprises in China.

Discussion

The present study aimed at investigating the correlation between Iranian EFL teachers' job satisfaction and their cultural intelligence. Data analysis employing Pearson correlation coefficient indicated a statistically significant and direct relationship between the two variables. It can be claimed that, in order to be satisfied with their jobs EFL teachers need to enhance their cultural intelligence through exposing to a variety of cultures in the era of technology and globalization. Chen and Starosta (2006, as cited in Tajeddin & Momenian, 2011) argues that due to the rapid growth of globalization, technology development, and population migrations, communication with people from other cultures became necessary in English Language Teaching in the 1980s resulting in the intercultural attitude towards language teaching (Derin, Zeynep, Pinar, Özlem, & Gökçe, 2009, as cited in Tajeddin & Momenian, 2011). In order to become satisfied with their jobs, EFL teachers in Iran need to improve their cultural intelligence through communicating with people from different cultures worldwide. As a result positive educational outcomes may occur.

CONCLUSION

In order to investigate whether there is any relationship between EFL teacher cultural influence and their job satisfaction, we conducted this correlational study. The result showed that there is a positive and somehow strong correlation between these variables. The data were gathered through questionnaire from 110 EFL teachers in Khorasan razavi, Iran. It was shown that the knowledge of culture and cultural differences can have an effect on teachers' satisfaction about their job. There are some implications regarding this study.

First, there is a need for culture teaching in the curriculum of EFL prospective teachers' courses. These teachers should be exposed to different cultures and should learn about them in order to be more effective. Second, there is a need to develop culture awareness lessons for those EFL teachers who have finished their teacher education courses. These teachers also need to become aware of cultural values and differences. Third, there is a need for some cultural lessons and materials in EFL textbooks. The textbooks should cover different cultures from different parts of the world and make their values clear for students.

There are some limitations in this study. First, this study is just correlational and don't propose a way to incorporate cultural knowledge in teacher education courses. Second, as a correlational study our sample is limited and we need more teachers to confirm the result. Third, the teachers are all from Khorasan razavi province, and this issue limits the generalization of our study.

ABSTRACT

Reading is one of the crucial skills in the second language learning. One of the necessary needs for English as a foreign language (EFL) learners is to learn how to manipulate strategies to get the benefit of reading in second language context. Concept maps are one of the strategies that can be applied by the learners in their reading comprehension. They help learners to connect new information to already ones. To fulfill the aim of the study, 61 EFL advanced students were chosen. Then they randomly assigned to two experimental group (concept mapping, 15 males and 16 females) or control group (traditional method, 12 males and 18 females). A pre-test and post-test was run. The results of the pretest revealed that two groups are homogeneous in their reading ability. The experimental group was instructed concept mapping in their reading comprehension while the control group followed traditional method in their reading. The results of ANOVA and T-test revealed that two groups had significant differences in their post test reading comprehension and students in experimental group outperformed those in control group. The findings of this study have some implications in applying appropriate technique to teach reading to EFL learners.

KEYWORDS : Concept mapping, EFL advanced learners, Reading comprehension

INTRODUCTION

Reading can be viewed as a basic skill in language learning. One of the necessary needs of students is to learn to read for communication. Learning how to read definitely help learners to use this skill as a source of getting information. According to Swalander and Taube (2007) “good reading ability is the key to success in educational setting and this is why researchers try to find effective educational and psychological variables that can explain variations in reading ability and academic achievement (p.207)”. In addition, researchers and scholars interested in student motivation and learning in academic settings put much emphasis on the position of the students’ thoughts and beliefs in learning (Schunk, 2003). In most cases the burden of reading information

leads to rote memorization and retention of materials rather than meaningful and deep learning (Lambiotte & Dansereau, 1992).

Reading is highly dynamic interaction between a reader and the written text. The ultimate goal on the reading is comprehension, "When readers are not comprehending, they are not reading (Chastain, 1988). Reading comprehension is very crucial for university students; with help of reading they can expand their repertoire of information and knowledge. Unfortunately in Iran educational context there is no special policy to teach the students strategies for better comprehension. In this educational system, students are not taught with any special strategy and consequently they cannot interact with the text and as a result, many of them lose their interests in reading in English that leads to be unsuccessful in their English courses. So "finding an efficient approach which facilitates learners' learning and help them comprehend better seems to be quiet necessary " (Jalilifar, 2010: P 98).

Antoniou and Souvignier (2007) point out that "effective reading requires the use of strategies that are explicitly taught"(p:43). According to Barnett (1988) reading strategies are referred to as mental operations which are used by readers when they read a text and try to understand it effectively. Hence, the most successful students are those who manipulate different strategies to help them to cope with their problems in this regard. Teachers can have effective roles in introducing new strategies to the students in facing with their difficulties.

One of the strategies that can be used by EFL learners in their reading comprehension is concept mapping. The beneficial effects of concept mapping on different educational outcome has been demonstrated by many researchers (Ojima, 2006; Snead & Wanda, 2004; Chularute & DeBacker; 2004).

In the light of mentioned benefits of teaching techniques for reading comprehension, the present study aims to investigate the effects of concept mapping technique on EFL advanced students. reading comprehension. Since the reading comprehension is very crucial in advanced level Students successful in this regard increase their proficiency and make them more motivated toward their goals and achievements.

REVIEW OF RELATED LITERATURE

Theoretical background

Concept mapping was introduced by Joseph Novak for the first time in 1972. "Concept mapping is a graphic organizational technique design to help individual and group to explain and explore their knowledge and understanding a topic "Talebinejad and Mousapour (2007). In a concept map, concepts are framed in circles or boxes and the relationship between them are illustrated by connecting lines which link two concepts. The written words on connecting lines show the relationship between two concepts. Concepts defined as "a perceived regularities in events or objects, designated by a label" (Novak & Canas, 2006). Concept map helps learners to link previous knowledge to novel information, and manifest related ideas. Drawing map lead students to engage in learning process actively. Concept mapping reveals in what ways readers

“remember , organize, interpret, and understand information in a particular subject area” (Derbentseva, Safayeni & Cañas, 2004: 3).

Two theories support the use of concept mapping in education. One is Constructivist theory; it implies that learners take with them their previous knowledge to class which is influenced by cultural and ethnic factor (Colburn, 2000) Constructivists believe that the way individual understand their experiences forms meaning. In other words what we know is constructed by our personal experience. The other theory which supports concept mapping is Ausubel assimilation theory. Ausubel (1968) classifies learning into two categories, a) meaningful and b) rote learning; "meaningful learning happens when the learner consciously and deliberately chooses to relate new knowledge to knowledge the learner already knows" (Novak, 1998: 19, cited in Shimerda, 2007: 120).

Teaching reading strategies are among the ways to enhance learners reading comprehension. Oxford (1990) states that learning strategies are “specific action taken by the learner to make learning easier, faster, and more enjoyable and more effective ” (p.8). Various strategies can be manipulated to increase students reading comprehension ,one of them which seems to enhance students reading comprehension is concept mapping .

Related studies

Several studies have been done to investigate the effect of concept mapping on different language skills. Some of them revealed the effectiveness of concept mapping on reading comprehension. Gobert and Clement (1999) point out that, the students who used concept map in their reading, can illustrate their interpretation of the text in a visual way while in traditional method; the knowledge embedded in the written form is not completely meaningful to the learners.

Contrary and Chen (1998) found out that, concept mapping is not effective in the students reading comprehension and summarization. Accordingly Han (2006) investigate the effect of concept mapping reading instruction and traditional reading instruction for Chinese EFL learners. Three different areas were investigated: main idea reading, subordinate idea reading and reading between lines. The results reveal that there is no significant difference in three reading areas between two instructions. According to Hibbing and Rankin-Erickson (2003) teachers can apply concept mapping strategies for testing the students' vocabulary rather than testing them on word definitions. They further state that concept mapping act as a stimulator which activate the learners' previous knowledge. As a result develop related instead of isolated word knowledge.

In another study, Snead and Wanda (2004) investigate the effects of using concept mapping on the science achievement of middle grade science students. The finding of the study showed that low ability students get the benefit of concept mapping more than high ability students, in another word; low ability students outperformed the high ability students. Chularut and DeBacke (2004) investigated The influence of concept mapping on achievement, self-regulation, and self-efficacy in students of English as a second language The finding of the research revealed that the concept mapping group showed significantly greater gains from pre-test to post-test than the control group who had self –study.

Khajavi and Ketabi (2010) studied the influence of concept mapping on reading comprehension and self-efficacy of intermediate EFL students. After treatment sessions in experimental group results indicated that students in the concept mapping group showed greater achievement than students in the control group.

In the same vein, Moreira and Moreira (2011) investigate the effects of concept mapping on context comprehension of course book and achieving meaningful. The results of study show that text concept mapping is effective in students' meaningful learning and students' self-confidence enhance with using concept mapping.

Accordingly, Shaul (2011) conducted a study in which she investigated the effects of student-generated, concept mapping on the performance of EFL, grade 12, students in reading comprehension texts. The results indicated that low-knowledge students who generate their maps had better reading comprehension than those of high-knowledge students or both control groups. Besides, students' disposition toward self-generated concept mapping had a progressive positive change, regardless of students' level.

Most recently DeylamSalehi., Jahandar, and Khodabandehlou. (2013) studied the impact of concept mapping on Iranian EFL student's reading comprehension in two high schools in Iran. With regard to the results of the study, the experimental group who manipulate concept mapping in their reading comprehension outperformed the control group with traditional reading method.

RESEARCH QUESTIONS

The present study aims to answer to the following questions:

1-Is there any differential effect between reading comprehension of students who apply concept mapping in their reading comprehension under treatment and students in control group who used traditional method?

2-Is there significant differences between males and females students in reading comprehension applying concept mapping?

METHODOLOGY

Participants

The population under study in this research were 68 (31 male and 37 female) EFL students. They studied in Kish language institute, a private institute in Kermanshah, they were learning General English at advanced level. They were enrolled in TOEFL preparation class. The age of the participants ranged from 25 to 34. In order to have homogeneous groups, prior to the study, a placement test was held. From the first population 7 were omitted, after attending placement test due to low grade and not meeting the benchmark for attending this study. Later the participants were randomly assigned to either experimental (concept mapping, 15 males and 16 females) or control group (traditional method, 12 males and 18 females).

Instruments

A reading comprehension test was used as a pretest and posttest in the study. It included 8 passages were select from Active reading –Book two (Anderson, 2007)The test was pilot by 15 students who were at the same level of proficiency, but did not take part in the study .Based on the results of pilot study, two passages were omitted and then the modified version was used for the main study.

Besides, the researcher prepared a handout based on some sources like Novak and Canas (2006) in order to familiar students with concept mapping, how to draw a concept map as well as some examples. To measure students' progress in reading ability, a reading test was run. There were 50 items in the test .Each item received 1 scores which made 50 score for the whole test.

Procedure

The participants were first briefed about the purpose of the study .Prior to conducting the study both groups were given a reading text to measure their reading comprehension. After pretesting session the students participated in ten 60-min study sessions (two session in a week).The reading passages were the same for both groups but they were instructed by different methods i.e. concept mapping and traditional methods. In experimental group, at the first session students were introduced to the concept mapping .Then the teacher explained its effects on reading comprehension, trained students how to connect pieces of information and found the relationship between them and finally draw maps.The students were required to study the handout for the next sessions .In the following sessions the participants work on reading text, highlight the concepts, draw maps and receive feedbacks from the instructor but in control group (traditional method), the participants received no special instruction and follow conventional methods i.e., they are required to read the text, look up unknown words from the dictionary and at the end, the instructor and the students discuss about the text and some synonyms and antonyms were provided for the unknown words. At the end of treatment, a reading comprehension test with the same level of readability was run as a post test for both control and experimental group.

RESULTS AND DISCUSSION

For the purpose of data analysis, the data on pre-test and post-test were gathered and analyzed with Statistical Package for Social Sciences; SPSS.16.Then ANOVA was applied to calculate differences between two groups. In order to answer the research questions, descriptive and inferential statistics were used. Tables 1 and 2 show the descriptive and inferential statistics of the two groups.

Table 1. Compare the mean scores for both experimental and control group. The mean score for experimental group and control group was 30.01 (M=30.01) and 24.61 (M=24.61) respectively. The ANOVA was conducted to investigate the mean score of both groups. As showed $F=16.41$.which is significant at $P=.000$, revealed that there is a significant difference between two groups.

Table 1: Descriptive and inferential analysis of the pretest and the posttest and the results of the independent F-test of the study

Group	Mean	Std. Deviation	F	df1	df	sig
Experimental	30.01	3.11	16.41	1	120	.00
Control	24.61	5.00				

Table 2 reveals in experimental group, $T = 8.24$ which is significant in $p = .000$ which showed that, the participant in experimental group outperformed the control group.

Table 2: Paired Samples Statistics of pre-test and post-test in both groups.

group	Mean	Std. Deviation	Std. Mean	T	sig. (2-tailed)
Posttest	36.35	5.43	.97	8.24	.00
Experimental Pretest	23.68	4.35	.78		
Posttest	25.47	4.85	.88	.83	.40
Control Pretest	24.70	5.20	.95		

Figure 1: Control and Experimental group achievement

The above diagram shows clearly that there is a significant difference between the experimental and the control group. It confirms that EFL students that were instructed with concept mapping gained higher scores in reading comprehension than the control group.

Table 3 indicates that there are no differences between males and females in reading comprehension manipulating concept mapping instruction. The results of T-test on the performance of the students are shown in Table 3.

Table 3: Results of T-test on the performance of the students

Gender	Mean	Std. Deviation	Std. Mean Error	T	Sig. (2-tailed)
Male	26.83	7.44	1.01	-1.04	.29
Female	28.19	6.88	.83		

According to the results of the study, concept mapping instruction had significant effects on EFL advanced level students. The results of this study is in line with Chang, Chen and Sung, (2002) who maintain that concept mapping has significant role in encouraging students' reading comprehension in writing summaries, developing vocabulary increasing self awareness in learning, reviewing material and in reading as a whole. However, the findings of this study is in contrast with Han (2006) and Chan (1998) who state that concept mapping is not effective in reading comprehension. It seem that better performance of the experimental group over the control group is that with drawing maps, the students connect their new information to their previous one. According to Ozek and Civelek (2006), proficient readers could make prediction and hypotheses about the text content by linking the new information to their previous knowledge. In concept mapping instruction the learners discover the relationship between different concepts in the text that contribute to deeper insight into the text. Concept mapping help learners to activate their background knowledge and schemata when they are trying to draw maps that lead to involvement in learning process actively and this engagement cause to meaningful learning. Furthermore, effective learning which comes from active student participation can ultimately shape their language development (Vygotsky, 1978). Effective learning and increased motivation for a subject rely on educational experiences, appropriate subject matter and connecting previous schemas to new learning (Bruner 1978; Gardner, 1978).

Concept mapping as a strategy in education is parallel with the movement from teacher to learner and as a result has the power to improve academic achievement (Peterson & Snyder, 1998). Askov (1991) pointed out that an effective teacher should help students be efficient at self-learning. Therefore, students needed study skills which they could apply while reading inside and outside of class. He also explained that the 'concept mapping' technique is a study skill that helped students sees relationships between the messages since they required learners to think through while constructing the maps. As a cognitive tool, Concept maps, can serve as a scaffold to cognitive development as they may lower cognitive load, enhance connections between

complex Constructs, and offer paths for retrieving and accessing knowledge (Novak & Gowin, 1985; O'Donnell, Dansereau & Hall, 2002).

CONCLUSION

According to the results of the study, using concept mapping technique had a significant role on EFL reading comprehension. This technique hinders memorization, which is boring for the learners and lead them to meaningful learning by connecting new knowledge to previous learned one. The findings of this study have great implications for both students and teachers.

Teachers should always seek new strategies to help students solve their problems in learning language. Teachers can introduce this technique to the students to improve their reading comprehension. In addition, it enables the teacher to perceive the area that students do not have sufficient knowledge and help them to fill this gap.

With learning this technique, Students' reading comprehension achievements enhance and in this way they will be motivated to read and reading turns to an enjoyable activity. Accordingly, this strategy allows learners to learn new vocabularies, grasp the main ideas of the text and make connection between the concepts that leads to meaningful learning. Besides, because concept mapping is a student-center strategy; they have more chances to work on reading outside the classroom context. Additionally, concept mapping is an effective tool to organize ideas and thoughts and make the retrieving the details easier. Additional research could be investigation the effect of concept mapping on the other language skills such as listening and writing and speaking. It should be noted that this study conducted in a private institute with limited number of students , .So ,this limited number of participants ,limits the generalizability of the findings of the study. Hence, findings need to be reported cautiously .In order to generalize the results of the study more population should be taken into account.

DIFFERENCES IN COMPLIMENT RESPONSE ACROSS GENDER

Mehri Mohammad-Bagheri

Department of Persian Literature and Foreign Languages, University of Allameh Tabatabai,
Tehran, Iran

E-mail: mmbaqeri@gmail.com

ABSTRACT

Among different speech acts, compliment responses have been of interest for many researchers because they are loaded with cultural and socio-cultural factors and therefore require a great deal of pragmatic insight. In this study, the differences in compliment response between Iranian male and female university students were investigated. Data was gathered through a Discourse Completion Task (DCT) with two imaginary situations in which participants were complimented by a classmate of the opposite sex, and a friend of the same sex, and were asked to write their responses to each of those imaginary compliments. Participants were forty male and female students of English at University of Allameh Tabatabai. Findings revealed that participants responded to compliments differently as the gender of the interlocutors differed. The results can shed light on the pragmatic knowledge of the respondents and the cultural and socio-cultural factors which affect the way people perceive compliments given by different sexes and the way they respond to them.

KEYWORDS: pragmatics, speech acts, compliment, compliment response, discourse completion tasks

INTRODUCTION

The last two decades have witnessed a plethora of research on pragmatics and its different aspects such as speech acts (Olshtain & Cohen, 1990; Billmyer, 1990; Rose & Ng, 2001, Intachakara, 2004), discourse markers, (Wildner-Bassett, 1986; Yoshimi, 2001), pragmatic routines (Tateyama, 2001; Wishnoff, 2000), politeness, and etc. Among these different aspects, speech acts such as apologizing, requesting, complimenting, compliment response, etc., have attracted the majority of researchers' attention and among different types of speech acts, compliment responses have been of interest for many because they are loaded with cultural and socio-cultural factors and therefore require a great deal of pragmatic insight.

A compliment is defined as a speech acts which explicitly or implicitly attributes credit to someone other than the speakers, usually the person addressed, for some 'good' (possession, characteristics, skill, etc.) which is positively valued by the speaker and the hearer (Holmes, 1988). Holmes states that compliments are "positively affective speech acts, the most obvious function they serve is to oil the social wheels, paying attention to positive face wants and thus increasing or consolidating solidarity between people". However, sometimes compliments can serve another function and become a threat to the negative face.

Many studies have been conducted so far in the domain of compliment response (CR). The majority of such studies aimed to compare different strategies of responding to compliments across different communities and cultures (Huth, 2006; Wolga & Scholmberger, 2007), and others took into account other factors such as gender difference in CR (Heidari, et. a., 2009). In this study we compared the CR strategies used by male and female Iranian university students because there is an obvious gap in literature regarding this issue. The only study which compared CR strategies between males and females in Iran is Heidari, et. al., (2009)'s study which focused on Iranian male and female teenage students. In that study, they compared such strategies with regard to four situational setting: appearance, character, ability, and possession. They collected their data using DCTs and analyzed it through Holmes micro/macro strategies framework. The result of their study indicated a consistent tendency across the macro, micro levels for the female participants to use fewer Accept strategies, and more Evade and Reject strategies, than their male counterparts; that is, the females express appreciation for a compliment less and denigrate themselves more.

In the present study, such comparison was made between male and female university students. The major difference between this study and the previous one is that other variables such as the role of compliment giver's gender on compliment receiver's response were considered.

REVIEW OF LITERATURE

Pragmatics

Pragmatics is defined by different researchers and scholars in different ways. Yule (1996) defines pragmatics as the study of speakers meaning, contextual meaning, how more gets communicated than said, and the expression of the relative distance. The same author in another place defines pragmatics as the study of the relationship between linguistic forms and the users of those forms. For Crystal (1997, as cited in Rose and Kasper, 2001), "pragmatics is the study of language from the point of view of users, especially of the choices they make, the constraint they encounter in using the language in social interaction and the effects their use of language has on other participants in the act of communication" (p.2).

Pragmatic competence is the competence which enables speakers to behave and talk appropriately in different contexts. According to Edward and Ccizer (2004), pragmatic competence is the knowledge of social, cultural, and discourse conventions that had to be followed in various situations. For Barron (2003), "pragmatic competence is understood as knowledge of the linguistic resources available in a given language for realizing particular illocutions, knowledge of the sequential aspects of speech acts and finally, knowledge of the appropriate contextual use of the particular languages' linguistic resources" (p. 10). Native speakers of each language have acquired such competence during their learning of language and use pragmatic rules unconsciously in interaction with others. However, language learners need to be presented with such tools.

For a long time, pragmatic competence, or the ability to behave appropriately in different situations had been ignored in language pedagogy. However, the inability of students to handle

different situations on the one hand, and the emergence of Communicative Competence Models (Canale & Swain, 1980; Canale, 1983; Bachman, 1990; and Bachman & Palmer, 1996) in which pragmatic competence was considered as an essential part of language competence on the other hand, gave a new prominence to the subject of pragmatics in language pedagogy. In Bachman (1990), pragmatic competence was considered as one the two main component of language competence along with organizational competence.

For Bachman, Organizational competence comprises those abilities involved in controlling the formal structure of language while pragmatic competence is concerned with the relationship between users of those structures and the context of communication (pp. 87-89). As Kasper (2001) also believes, pragmatic competence is not a piece of additional knowledge to the learners' existing knowledge, but it is an organic part of the learners' communicative competence.

In SL contexts, it is expectable that learners gradually acquire such rules through their frequent exposure with the new language. However, in FL context where learners barely have any interaction in the new language out of the class, the need to teach pragmatics is the most apparent. However, Bardovi-Harlig (2001), claims that even ESL learners who have access to good amounts of pragmatic input differ significantly in their performance compared to native speakers.

At the same time, researchers found that pragmatic competence could not be expected to be developed along with the grammatical competence and it was apparent when they came across many learners who were linguistically highly competent but who lagged behind in their pragmatic ability (Lee, 2007; Eslami-Rasekh et.al, 2004; Vasquez & Sharpless, 2009; Bardovi-harli & Dorney, 1997). The same point is mentioned by Bardovi-Harlig & Mahan-Taylor (2003), "learners at the higher levels of grammatical proficiency often show a wide range of pragmatic competence. Thus, we find that even advanced nonnative speakers are neither uniformly successful, nor uniformly unsuccessful, but the range is quite wide".

The importance attributed to pragmatic competence and the apparent difference between pragmatic competence of native speakers and language learners, even those who are highly proficient with regard to linguistic knowledge, highlights the importance and necessity of teaching pragmatics. The study of nonnative speakers' use and acquisition of these pragmatic rules relates to the domain of Interlanguage Pragmatics.

Speech Act Theory

Speech act theory was first proposed by the British language philosopher, John Austin. According to Austin (1955, as cited in Barron 2002), a speaker produces three types of act:

- The *locutionary act*, i.e., the act of uttering (phonemes, morphemes, sentences) and also referring to and saying something about the world.
- The *illocutionary act*, i.e., the speaker's intention realized in producing an utterance. E.g., request, compliment.

- The perlocutionary act, i.e., the intended effect of an utterance on the hearer, e.g., to make hearer do something, to make hearer happy. (p. 12)

This classification reveals that in producing an utterance, not only we say something, but also we mean something from what we say, and we seek to have an influence on our interlocutor. According to Barron (2002), the illocutionary act is the principal focus of speech act theory and it is, indeed, itself, standardly referred to as the "speech act".

However, the perlocutionary act is of concern for the study of CR because sometimes the actual effect of a compliment on the compliment receiver can be very different from what the speaker has in mind. This specially happens when the compliment giver is not properly familiar with the social and cultural conventions of the compliment receiver or when she/he does not take into account the social status of his/her interlocutor. For example, in some cultures it is common for a man to compliment another man while in others it can be totally misinterpreted. According to Golato (2005), what really makes a compliment a compliment is the context within which it is uttered. She demonstrates that the same utterance can be compliment, interruption, reproach, sarcasm or tease in different situations.

Searle (1980; as cited in Barron, 2002) believes that the central assumption of speech act theory is as follows:

.... the minimal unit of communication is not a sentence or other expressions, but rather the performance of certain kinds of acts, such as making statements, asking questions, giving orders, describing,, etc.

For Cohen (2007), "speech acts are often, but not always, the patterned, routinized language that natives and pragmatically competent nonnative speakers and writers in a given speech community use to perform functions such as thanking, complimenting, requesting, refusing, apologizing, and complaining" (p.3).

Many studies have been conducted with a focus on different speech acts such as requests (Fukuya & Clark, 2001), compliments (Rose & Ng, 2001), apologies (Olshtain & Cohen, 1990), etc. Indeed, speech acts are an aspect of pragmatics which has attracted the highest degree of attention in recent years. According to Cohen (2007), "speech acts constitute an engaging aspect of pragmatics because of the possible misfit between what you say or write in a language in the given speech act and what is meant by it" (p.3).

Compliment Response (CR)

Compliment responses have often been studied in a contrastive fashion to illuminate cultural differences in CR behavior between two speech communities. The studies presented in this section contrast how users of two different languages respond in distinct manners to compliments. One contrastive study of American and Thai's compliment responses (Gajaseni, 1994), for example, found that Americans were not only more likely to accept compliments, but that they tended to give more lengthy responses. The author also found that both groups tended to

accept compliments more from an interlocutor of a higher social status and to reject those more often from someone of a lower status. This finding might show that these groups see compliment acceptances more polite than rejections.

Chiang and Pochtraeger (1993) compared compliment responses of Chinese-born and American-born English speakers and found the American-born speakers were more likely to positively elaborate on responses, while the Chinese-born participants were more likely to deny or negatively elaborate on a compliment. These authors state that “for Americans, the least preferred type of compliment response is rejection or denial” (p.2). Fong (1998) studied the perceptions of compliment behavior of Americans by Chinese immigrants and found that the Chinese natives often thought that Americans gave compliments too freely. The Chinese speakers in this study questioned the sincerity of the compliments.

Yoko (1995) compared Japanese CRs to American norms and found that in the Japanese speakers’ responses, rejection of the CR was the ideal and acceptance of it could be problematic. The author notes that the standard American CR is “thank you” which accepts the compliment without necessarily agreeing with it and avoiding appearing conceited. Yoko also writes that compliments put the recipient in a conflict to neither reject a compliment but to also show solidarity and rapport. Yoko writes “in contrast, it is generally accepted in Japanese society that people should not accept compliments referring directly to themselves or their possessions” (53). Nelson, Al-Batal, and Echols (1998) compared Arabic and English CRs and found that both groups, unlike the previously mentioned studies, were more likely to accept compliments than to reject them. The authors noted that Americans used “appreciation tokens” (“thanks”) while the Arabic-speaking Syrians often used formulaic forms not seen in the American data.

Yu (2004) studied the CRs of two groups of Chinese learners of English, one group lived in the United States and the other in Taiwan. Similar to the present study, these participants responded to compliments in different situations with interlocutors whose status and gender varied. Yu found that the responses from the learners in the United States were more likely to be acceptances than compliments, and the responses from the learners in Taiwan were more likely to be rejections.

Not all studies of interest to this study are concerned with cross-cultural variation. Parisi and Wogan (2005) studied the effect of gender on complimenting behavior of American college students and found great variance in the performance of CRs depending on gender. They explain “males gave females a higher proportion of compliments on appearance than skill and females did the opposite, giving males a higher proportion of compliments on skill than appearance” (21). Hobbs (2003), however, had different results when she examined politeness strategies used in voice mail messages. She notes “male speakers’ use of politeness markers was roughly equal to that of women’s” (243).

Heidari, et al., (2009)’s study focused on compliment response strategies used by Iranian male/female teenage students. In that study, they compare such strategies with regard to four situational setting: appearance, character, ability, and possession. They collected their data using

DCTs and analyzed it through Holmes micro/macro strategies framework. The result of their study indicated a consistent tendency across the macro, micro levels for the female participants to use fewer Accept strategies, and more Evade and Reject strategies, than their male counterparts; that is, the females express appreciation for a compliment less and denigrate themselves more.

RESEARCH QUESTIONS

In the present study, the following research questions are addressed:

- 1- Is there any difference between CR strategies of female Iranian university students when the compliment giver is of the same/opposite gender?
- 2- Is there any difference between CR strategies of male Iranian university students when the compliment giver is of the same/opposite gender?

METHODOLOGY

Participants

A total of forty students of English in Allame Tabataba'ee University, Iran, including 17 males and 23 females, were selected as the participants of the study. Students were between 18 and 29 years old and had studied English for an average of 6 years, so all had a high-intermediate proficiency in English. To ensure their homogeneity with regard to English proficiency, all the participants were selected from those enrolled in the third year of English studies.

Instrument

A DCT was utilized to elicit data from the participants. The reason for using DCT was that they can provide us with sound data in a relatively short period of time. The DCT was consisted of two situations. In each situation the participants were presented with a compliment on appearance or possession, however, once the compliment was given by a classmate of the opposite sex and in the second situation by a close friend of the same sex. Participants were asked to identify their gender, age, and number of years studying English before giving their answers to the compliments (See appendix).

Data Analysis

Different CR patterns used by the participants were analyzed using Holmes' (1988) frame work of CR strategies which is consisted of three macro strategies, Accept, Evade, and Reject, each of which divided into a number of micro strategies as shown in table 1.

Table 1: Holmes' CR Strategies

Macro level CRs	Micro level CRs	Examples
Accept	Appreciation Token	"Thanks"; "Thank you"; "Cheers"; "Yes"; "Good"
	Agreeing Utterance	"I know"; "I am glad you think so"; "I did realize I did that well"; "Yeah, I really like it"
	Downgrading Qualifying Utterance	"It's nothing"; "It was no problem"; "I enjoyed doing it"; "I hope it was OK"; "I still only use it to call people"; "It's not bad."
	Return Compliment	"You're not too bad yourself"; "Your child was an angel"; "I'm sure you will be great"; "Yours was good too."
Reject	Disagreeing Utterance	"Nah, I don't think so"; "I thought I did badly"; "Nah, it's nothing special"; "It's not"; "Don't say so."
	Question Accuracy	"Why?"; "It's right"; "really?"
	Challenging Sincerity	"Stop lying"; "Don't lie"; "Don't joke about it"; "You must be kidding"; "Don't, come on."
Evade	Shift Credit	"That's what friends are for"; "You're polite"; "No worries"; "My pleasure."
	Informative Comment	"It wasn't hard"; "You can get it from (store name); It's really cheap."
	Request Reassurance	"Really?"

However, the data revealed some new CR strategies which were categorized under the label of *Insulting* because the compliment receiver answered the compliment with some sort of insult such as "it's none of your business".

RESULTS AND DISCUSSION

Results

In this section the kind of strategies used by the participants in different situation is explained. It should be mentioned that in some occasions, the students used more than one strategy for each situation.

CR Strategies Used by Females with Females of the Same Age

When encountered with a compliment giver of the same sex and age, female participants tended to follow an *Accept*, *Evade*, and *Reject* trend with regard to macro CR strategies. When focusing on micro CR strategies, *appreciation token* is the first popular one, and *Informative comment* the second one. Other CR strategies are *agreeing utterance*, *shift credit*, *request reassurance*, and *insulting*.

Table 2: Frequency of CR Strategies Used by Females with Females of the Same Age

Accept	Appreciation Token	15	65.2%
	Agreeing Utterance	2	8.6%
	Downgrading Qualifying Utterance	0	0%
	Return Compliment	0	0%
Reject	Disagreeing Utterance	0	0%
	Question Accuracy	0	0%
	Challenging Sincerity	0	0%
Evade	Shift Credit	2	8.6%
	Informative Comment	4	17.3%
	Request Reassurance	2	8.6%

CR Strategies Used by Males with Males of the Same Age

Surprisingly, male participants used only two CR strategies with their male counterparts, Appreciation token and insulting. More surprisingly, Appreciation token consisted about 94% of the responses and Insulting 5%. Other CR strategies were not used in this sample at all.

Table 3: Frequency of CR Strategies Used by Males with Males of the Same Age

Accept	Appreciation Token	16	94.1%
	Agreeing Utterance	0	0%
	Downgrading Qualifying Utterance	0	0%
	Return Compliment	0	0%
Reject	Disagreeing Utterance	0	0%
	Question Accuracy	0	0%
	Challenging Sincerity	0	0%
Evade	Shift Credit	0	0%
	Informative Comment	0	0%
	Request Reassurance	0	0%
Other strategies	Insulting	1	5.8%

CR Strategies used by Females with Males of the Same Age

At the macro level, females followed Accept, Evade, and Reject trend when replying to male compliment givers of the same age. At the micro level, Appreciation token encompassed around 61% of the compliment responses and Insulting 17% of them. Other CR strategies include Return compliment, Disagreeing utterance, Shift credit, Request reassurance.

Table 4: Frequency of CR Strategies used by Females with Males of the Same Age

Accept	Appreciation Token	14	60.8%
	Agreeing Utterance	0	0%
	Downgrading Qualifying Utterance	0	0%
	Return Compliment	1	4.3%
Reject	Disagreeing Utterance	2	8.6%
	Question Accuracy	0	0%
	Challenging Sincerity	0	0%
Evade	Shift Credit	1	4.3%
	Informative Comment	0	0%
	Request Reassurance	2	8.6%
Other strategies	Insulting	4	17.3%

CR Strategies Used by Males with Females of the Same Age

Male participants used the same Accept, Evade, and Reject trend respectively with their female counterparts. Again, Appreciation token has the most popularity, and Agreeing utterance the next

one. Other strategies included Request reassurance and Insulting. Reject strategies were not used at all.

Table 5: Frequency of CR Strategies Used by Males with Females of the Same Age

Accept	Appreciation Token	11	64.7%
	Agreeing Utterance	3	17.6%
	Downgrading Qualifying Utterance	0	0%
	Return Compliment	0	0%
Reject	Disagreeing Utterance	0	0%
	Question Accuracy	0	0%
	Challenging Sincerity	0	0%
Evade	Shift Credit	0	0%
	Informative Comment	0	0%
	Request Reassurance	2	11.7%
Other strategies	Insulting	2	11.7%

Discussion

Based on the results obtained, the research questions of the study are discussed one by one:

What are the CR strategies of female Iranian university students when the compliment giver is of the same gender and similar age?

In this situation, the two dominant CR strategies at macro level were *Accept* and *Evade* and at micro level, *Appreciation Token* (65.2%) and *Informative Comment* (17.3%). Other strategies were *Agreeing Utterance*, *Shift Credit*, and *Request Reassurance*. This pattern may be the result of intimacy between two females of the same age. Such an intimacy gives the participants the freedom to use more *Informative Comment* in which they find the opportunity to elaborate more on the subject of compliment.

What are the CR strategies of male Iranian university students when the compliment giver is of the same gender and similar age?

The results were surprising when male participants responded to male interlocutors of the same age. The majority of CR strategies were *Appreciation Token* (94.1%) which may be the sign of confidence that such participant could feel when encountered with a compliment giver of the same gender and age. However, a new category of CR strategies emerged in this situation which we called *Insulting* (5.8%). This might be the result of misunderstanding from the compliment receiver side who misinterprets the compliment as a negative act rather than a positive one. In other words, the compliment receiver might had interpreted the compliment as a sign of envy, tease, sarcasm, or things alike rather than a true compliment and this had led him to respond with a kind of *Insulting*.

What are the CR strategies of female Iranian university students when the compliment giver is of the opposite gender and similar age?

When the interlocutor was a male of the same age, female participants tended to use CR macro strategies in *Accept*, *Evade*, and *Reject* order. At the micro level, *Appreciation Token* (60.8%) was the dominant CR strategy. Other frequently used strategies were *Insulting* (17.3%), *Disagreeing Utterance* (8.6%), and *Request Reassurance* (8.6%). Almost all the time, the *Insulting* strategy was used when the compliment was on appearance. This trend can have many cultural implications and shows the tendency of female participants to interpret such compliments from male interlocutors as having sexual intentions rather than being genuine. Disagreeing

utterance and Request reassurance strategies can be a sign of confidence lack and modesty among female students.

What are the CR strategies of male Iranian university students when the compliment giver is of the opposite gender and similar age?

In this situation, macro strategies were followed again in *Accept*, *Evade*, and *Reject* order. The two dominant micro strategies were *Appreciation Token* (64.7%) and *Agreeing Utterance* (17.6%). Other CR strategies were *Request Reassurance* (11.7%) and *Insulting* (11.7%). Using more *Accept* strategies can be a sign of higher confidence among male students when receiving a compliment from a female student. However, similar to females, male participants tended to use occasionally other strategies which may reveal their uncertainty and misunderstanding.

CONCLUSION

The present study was an attempt to investigate the differences in compliment response between Iranian male and female university students. Another factor which was of interest was the effect of compliment giver's gender on the compliment receiver's response.

Results of this study showed that males and females follow different strategies when responding to compliments from interlocutors of the same or opposite sex. Female students, for example, tended to be more modest in responding to compliments than their male counterparts. This modesty was observed either when the compliment giver was a male or a female. On the other hand, when responding to a female friend, female students used another strategy, informative comment, asking for more details of the compliment. In contrast, other strategies used with male classmates were insulting or disagreeing.

Male students, in general, showed more modesty to their female compliment givers than their male friends. At the same time, they used more agreeing strategies when their compliment giver was of the same gender. Part of this difference can be attributed to socio-cultural norms which dominate a society. Such norms in a society like Iran expect females to be more modest and conservative when encountered with a male speaker. However, males often do not have this restriction and tend to express themselves more freely.

Results of this study can be illuminating for both fields of language teaching and cultural studies. They familiarize us with the dominant compliment response strategies which learners of English use in their daily interactions and inform language teachers about students' strengths and weaknesses. In addition, such results can present valuable insight into the cultural norms which dominate any society. However, the present study was limited both in the size of the participants, and in their variation regarding social factors and age range. Further research can be conducted at a larger scale and with a variety of participants from different educational and social backgrounds, and different age groups. Also, the tool of data collection can be enhanced by incorporating more situations.

APPENDIX

Discourse completion Task (DCT)

Age:

Sex: (Circle One): M F

Year studying English:

Please write what you would say in response to the utterances in the following situations.

Write your response, exactly as you would say it to the person with whom you are speaking.

There is no right or wrong answer so please answer as honestly as possible.

1. A student of the opposite sex compliments your haircut. What would you say to him/her?
2. Your close friend (of the same sex as you) compliments you on your new car. What would you say to him/her?

THE RELATIONSHIPS AMONG WILLINGNESS TO COMMUNICATE, TOPIC FAMILIARITY AND IRANIAN INTERMEDIATE EFL LEARNERS' WRITING ABILITY

ABSTRACT

Awakening Willingness to communicate (WTC) in learners of second language is deemed the supreme goal of L2 education. WTC refers to the idea that language learners who are willing to communicate in the second language look for chances to communicate, and actually they do communicate. The present study focused on the relationships among WTC, topic familiarity and Iranian intermediate EFL learners' writing ability to answer the following research questions: 1) Is there any significant relationship between Iranian intermediate EFL learners' WTC and topic familiarity? 2) Is there any significant relationship between Iranian intermediate EFL learners' WTC and writing ability? 3) Is there any significant relationship between Iranian intermediate EFL learners' topic familiarity and writing ability? Seventy five male and female EFL learners participated in the study. The participants took Nelson English Language Test (200C) as the proficiency test and filled out MacIntyre et al. (2001) WTC questionnaire. They were also given a list of topics (Malekzadeh 2011) to choose the familiar and unfamiliar ones for writing tasks. The collected data were analyzed using statistical techniques such as Pearson Product Moment Correlation and paired-samples t-test. The results revealed that there was no relationship between Iranian intermediate EFL learners' WTC and topic familiarity. Also, there was a significant relationship between Iranian intermediate EFL learners' WTC and writing ability. Findings also indicated that there was a significant relationship between Iranian intermediate EFL learners' topic familiarity and writing ability. This study claimed a bond between WTC and writing ability with regard to topic familiarity. The findings of the present study suggest that EFL learners outperform in writing when they are more willing to communicate and familiar with the topics.

KEYWORDS: willingness to communicate (WTC), topic familiarity, writing

INTRODUCTION

Since the late 90s, attempts have been made to conceptualize willingness to communicate to explain an individual's degree of readiness to participate in discourse in an L2 (MacIntyre,

Clement, Dornyei & Noels, 1998). MacIntyre et al. (1998) recognizes the difference between L1 and L2 WTC and mentions it's probably being due to the uncertainty inherent in L2 use that interacts in a more complex manner with the variables influencing L1 WTC, i.e. individual differences. WTC was originally introduced with reference to L1 communication, and it was considered to be a fixed personality trait that is stable across situations, but when WTC was extended to L2 communication situations, it was proposed that it is not necessary to limit WTC to a trait-like variable, since the use of an L2 introduces the potential for significant situational differences based on wide variations in competence and inter-group relations (MacIntyre, Clement, Dornyei, & Noels, 1998).

To improve communicative skills one needs to use language. This is specifically why WTC is potentially of great importance. With an increasing emphasis on authentic communication in L2 learning and instruction, a willingness on the part of students to communicate seems to have multiple advantages such as development of learner autonomy, an increase of exposure and second language communication (McIntyre, Baker, Clement, & Conrad, 2001; Kang, 2005).

Researchers in WTC seem to agree that learners who actively use the language have a greater potential to develop language proficiency; since they have more opportunities to communicate with others. Thus, the more willing to communicate language learners are the more likely they are to attain greater language proficiency (McIntyre, 1994; McIntyre et al., 1998; Yashima, 2002). Therefore, employing strategies to reinforce WTC, encouraging students to involve in verbal behaviors, and fostering risk-taking on the part of learners can undoubtedly meet the goals of language learning instruction.

Designs of some useful and interesting topics for students will stimulate students' talks. Familiarity with the discussion topics will promote the smooth progress in communication activities and increase students' WTC abilities. The study of literature (Peyton & Reed, 1990; Song, 1997; Reid, 1997; Holmes & Moulton, 1997; Peyton, 1984) shows students' satisfaction and lower anxiety when they write about topics of their interest.

Students generally find writing a very demanding skill and feel anxious in the writing tasks. One of the reasons is that the writing task requires more elaboration and clarity compared to other skills. Writing teachers commonly do not look for appropriate methods to facilitate students' writing processes; instead correct their grammatical errors which results in anxiety and students' unwillingness to write (Garlikov, 2000).

Writing is claimed to play an important role in one's intellectual development and career preparation (Gere, 1985). According to Dyson (1995), writing is not merely an individual activity but a process which requires social interaction. As writing skills of students develop, they begin to apply their knowledge to the written expression more and more easily and go beyond what they have learnt (Raimes, 1983).

To sum up, learners usually communicate when they are interested. So, teachers should try to improve learners' writing ability by locating their fields of interest.

RESEARCH QUESTIONS

1. Is there any significant relationship between WTC and topic familiarity in Iranian intermediate EFL learners?
2. Is there any significant relationship between Iranian intermediate EFL learners' WTC and writing ability?
3. Is there any significant relationship between Iranian intermediate EFL learners' topic familiarity and writing ability?

RESEARCH HYPOTHESES

H1. There is no significant relationship between WTC and topic familiarity in Iranian intermediate EFL learners.

H2. There is no significant relationship between Iranian intermediate EFL learners' WTC and writing ability.

H3. There is no significant relationship between Iranian intermediate EFL learners' topic familiarity and writing ability.

METHODOLOGY

Design of the Study

In this study, an ex post facto correlational design was used to find the relationships among WTC, topic familiarity and Iranian intermediate EFL learners' writing ability. The results showed that there were a significant relationship between learners' WTC and writing performance as well as topic familiarity and writing ability.

Participants

The participants in this study were Iranian intermediate EFL learners in Jihad Daneshgahi, Kharazmi University branch. Nonrandom convenience sampling was used for the present study. The reason is that, the samples of this study were willing, available for the study and they could provide useful information for answering questions and hypotheses (Creswell, 2008). Based on the learners' scores of the proficiency test (Nelson English Test), the total participants of the present study were 75 male and female intermediate English learners whose age ranged from 15 to 36 years old.

Instrumentation

The instruments used in this study were:

Nelson English Language Test

The first instrument used in this study was a 50-item placement test, with the purpose of finding the proficiency level of the participants. Based on the defined band scores, participants who scored 60 were defined as intermediate learners.

MacIntyre et al. (2001) WTC Questionnaire

In this study, the Willingness to Communicate (WTC) questionnaire developed by MacIntyre et al. (2001) was used in order to collect the necessary data. This questionnaire is designed in two parts 27 items which tests communication inside the classroom and outside the classroom context. Since in EFL Contexts learners have little, if any contact with language outside classrooms, the researcher decided to use the first part_ WTC inside the classroom. It is a 5- point Likert scale questionnaire consisting of four skill areas of speaking (8 items), reading (6 items), writing (8 items) and listening comprehension (5 items).

A list of topics for writing (Malekzadeh 2011)

All learners were given a paper with a list of strange and unusual topics used by Malekzadeh (2011). Then, they were required to check those topics they had no idea about. The purpose was to choose topics for which the learners did not have any background knowledge. Out of these topics, two familiar (*Traveling to a foreign country* and *You have three more days to live*) and two unfamiliar topics (*Your plane encounters turbulence and drops* and *Going to Mars*) were chosen.

Procedure

As mentioned earlier, convenient sampling technique was used to select samples of this study from Jihad Daneshgahi, Kharazmi University branch. In order to find the proficiency level of the participants, Nelson English Language Test 200C was used. The maximum time allocated for the test was 45 minutes. The students answered the multiple choice questions of the test by simply ticking the correct option in the test and they were asked to answer all the questions. The participants were also informed that no negative points were granted for their wrong responses.

In the second phase of the study, MacIntyre et al. WTC questionnaire was given to the students to check their willingness to communicate while they choose 1 = Almost never willing, 2 = Sometimes willing, 3 = Willing half of the time, 4 = Usually willing, 5 = Almost always willing for each item. On the same session, the students were also given a list of topics for writing. The students ticked topics that were familiar and put (X) for topics that were unfamiliar to them. The students completed the survey in 20 minutes. After examining the papers, the topics that students chose as familiar and unfamiliar were chosen. At the next phase, one of familiar topics along with an unfamiliar one were given to the students and they were asked to write three paragraphs about each. In the last phase, the students were asked to write about the second familiar and unfamiliar topics.

RESULTS AND DISCUSSION

All the participants were supposed to write four writings in this study, two writings for familiar and two for unfamiliar topics. Familiarity and unfamiliarity with the topics were determined by the participants themselves. Then each of these writings were rated by three raters. In order to indicate the inter-rater reliability among the raters, the Pearson Product correlation moment was calculated. The results are shown in the following tables.

Unfamiliar Writing Task 1

Table 1: Intraclass Correlation Coefficient, Unfamiliar Writing 1

	Intraclass Correlation	95% Confidence Interval		F Test with True Value 0			
		Lower Bound	Upper Bound	Value	df1	df2	Sig
Single Measures	.805	.730	.865	13.363	74	148	.000
Average Measures	.925	.890	.950	13.363	74	148	.000

If a single rater had rated the subjects several times, the intra-rater reliability would have been ($\alpha = .80$, $P < .05$) statistically significant.

Unfamiliar Writing Task 2

The second unfamiliar writing task done by participants was about "Your Plane Encounters Turbulence and Drops". Fifty seven out of seventy five participants chose this as the most unusual and the strangest topic. After being rated by three raters, Pearson Product correlation moment was run to determine inter-rater reliability among the raters.

The results of the Cronbach's alpha ($\alpha = .77$, $P < .05$) (Table 2) indicated that there were significant agreement among the three raters who rated the EFL learners' writings on the second unfamiliar topic.

Table 2: Intraclass Correlation Coefficient, Unfamiliar Writing 2

	Intraclass Correlation	95% Confidence Interval		F Test with True Value 0			
		Lower Bound	Upper Bound	Value	df1	df2	Sig
Single Measures	.537	.407	.658	4.485	74	148	.000
Average Measures	.777	.673	.852	4.485	74	148	.000

If a single rater had rated the subjects several times, the intra-rater reliability would have been ($\alpha = .53$, $P < .05$) statistically significant.

Familiar Writing Task 1

Fifty four out of seventy five participants believed they were familiar with the writing task "You Have Three More Days to Live". So, as the first familiar writing task they wrote about this topic. Like the other tasks, this task was rated by three raters and in order to determine the inter-rater reliability, Pearson Product correlation moment was run.

The results of the Cronbach's alpha ($\alpha = .84$, $P < .05$) (Table 3) indicated that there were significant agreement among the three raters who rated the EFL learners' writings on the first familiar topic.

Table 3: Intraclass Correlation Coefficient, familiar Writing 1

	Intraclass Correlation	95% Confidence Interval		F Test with True Value 0			
		Lower Bound	Upper Bound	Value	df1	df2	Sig
Single Measures	.647	.533	.746	6.498	74	148	.000
Average Measures	.846	.774	.898	6.498	74	148	.000

If a single rater had rated the subjects several times, the intra-rater reliability would have been ($\alpha = .64$, $P < .05$) statistically significant.

Familiar Writing Task 2

The last task of this study due to sixty six out of seventy five participants was about the familiar topic "Travelling to a Foreign Country". The three raters rated the last task too and Pearson Product correlation moment was run to determine the inter-rater reliability.

The results of the Cronbach's alpha ($\alpha = .87$, $P < .05$) (Table 4) indicated that there were significant agreement among the three raters who rated the EFL learners' writings on the second familiar topic.

Table 4: Intraclass Correlation Coefficient, Familiar Writing 2

	Intraclass Correlation	95% Confidence Interval		F Test with True Value 0			
		Lower Bound	Upper Bound	Value	df1	df2	Sig
Single Measures	.702	.600	.788	8.078	74	148	.000
Average Measures	.876	.818	.918	8.078	74	148	.000

If a single rater had rated the subjects several times, the intra-rater reliability would have been ($\alpha = .70$, $P < .05$) statistically significant.

The First Null Hypothesis

There is no significant relationship between Iranian intermediate EFL learners' WTC and topic familiarity.

A Pearson Product moment correlation coefficient was calculated to specify the relationship between EFL learners' WTC and topic familiarity. The results of the Pearson correlation ($R(73) = .16$, $P > .05$, representing a weak effect size) indicated that there was not any significant relationship between Iranian intermediate EFL learners' WTC and topic familiarity. Thus the first null-hypothesis could not be rejected.

Table 5: Pearson Correlation, WTC with Topic Familiarity

		WTC
Familiarity	Pearson Correlation	.167
	Sig. (2-tailed)	.153
	N	75

In literature, according to Kang (2005), providing interesting topics for which learners have background knowledge and experience raises their interest and fosters their willingness to communicate. Also, familiarity with the discussion topics will promote the smooth progress in communication activities and increase students' WTC abilities. The study of literature (Peyton & Reed, 1990; Song, 1997; Reid, 1997; Holmes & Moulton, 1997; Peyton, 1984) shows students' satisfaction and lower anxiety when they write about topics of their interest. Similarly, Cao and Philp (2006) found that the degree of students' WTC is determined by factors such as group size, familiarity with the interlocutor, the degree of interlocutor(s)' participation in the discussion, and familiarity with the discussed topic. While Schmidt-Rinehart (1994) indicated that the subjects scored considerably higher on the familiar topic than on the new one the opposite result found here.

The Second Null Hypothesis

There is no significant relationship between Iranian intermediate EFL learners' WTC and writing ability.

To determine the relationship between EFL learners' WTC and writing performances, Pearson Product moment correlation coefficient was run. The results of the Pearson correlation ($R(73) = .24$, $P < .05$, representing an almost moderate effect size) indicated that there was an almost moderate and significant relationship between EFL learners' WTC and writing ability. Thus the second null-hypothesis was rejected.

Table 6: Pearson Correlation, WTC with Writing Ability

		Writing
Familiarity	Pearson Correlation	.245*
	Sig. (2-tailed)	.034
	N	75

*. Correlation is significant at the 0.05 level (2-tailed).

There is no other piece of research in the literature investigating the relationship between learners' WTC and writing ability, but Freiermuth and Jarrell (2006) investigated the effect of online chat on willingness to communicate. They gathered their data from questionnaires and from the analysis of the discourse produced by the students. They concluded that in the context of their study online chatting, in comparison to face-to-face interaction, put students more at ease and hence enhanced their willingness to communicate. Milani (2008) attempted to investigate the role of task type (oral and written), proficiency level, and gender on 190 Iranian adult language learners' WTC. The results indicated that task type did not itself determine WTC, and there was no significant difference between oral and written task in prompting a higher WTC. Willingness to communicate in the written form increased in higher levels, while the oral WTC, more or less, remained the same.

The Third Null Hypothesis

There is no significant relationship between Iranian intermediate EFL learners' topic familiarity and writing ability.

A paired-samples t-test was run to compare the EFL learners' means on topic familiar and unfamiliar writing tasks. As displayed in Table 7 the subjects showed a higher mean on topic familiar writing tasks ($M = 7.38$, $SD = 1.39$) than unfamiliar topics ($M = 6.10$, $SD = 1.60$).

Table 7: Descriptive Statistics, Topic Familiarity

	Mean	N	Std. Deviation	Std. Error Mean
Familiarity	7.38	75	1.391	.161
Unfamiliarity	6.10	75	1.602	.185

The results of the paired-samples t-test ($t(74) = 8.96$, $P < .05$, $r = .72$) representing a large effect size indicated that there was a significant difference between the subjects' means on topic

familiar and unfamiliar writing tasks. Thus the third null-hypothesis was rejected. The EFL learners showed a significantly higher mean on familiar topics.

Table 8: Paired-Samples t-test, Topic Familiarity

Paired Differences					t	df	Sig. (2-tailed)
Mean	Std. Deviation	Std. Mean	Error95% Interval of the Difference	Lower	Upper		
1.284	1.241	.143	.999	1.570	8.965	74	.000

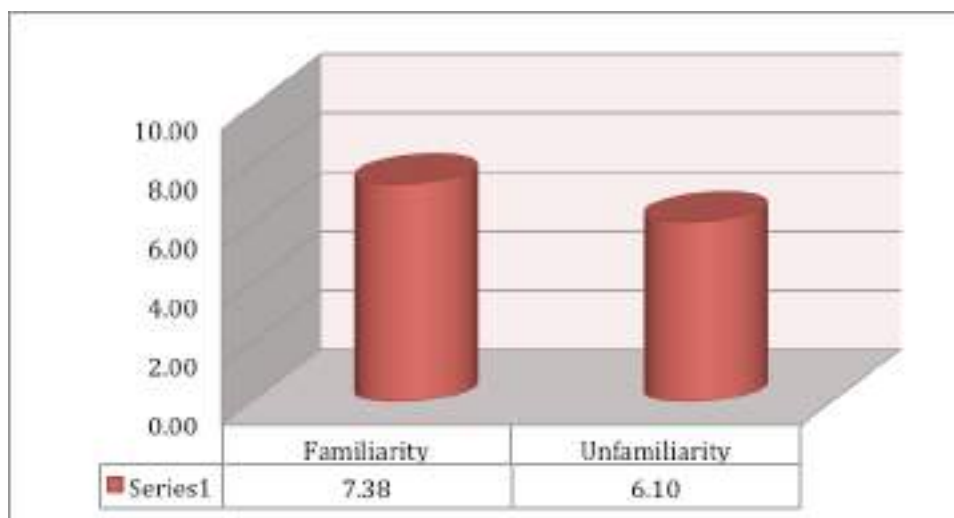

Figure 1: Mean Scores, Topic Familiarity

Based on the above figure, it can be seen that the participants had significantly different performances on the familiar and unfamiliar writing tasks. Comparing the mean scores of the writing tasks makes it clear that the participants performed better on familiar writing tasks compared against the unfamiliar ones. Therefore, the third null hypothesis can be rejected and it can be said that there is a significant relationship between topic familiarity and writing ability of Iranian intermediate EFL learners.

Not much has yet been done on measuring the effect of topic familiarity on writing performance in EFL setting. Most of the researches have been done on oral production, but a few studies have been done on L2 learners' written performance. Lynch (1996) emphasizes that in many cases it is our unfamiliarity with the appropriate background knowledge that prevents us from understanding something, rather than our inadequate knowledge of the language. Pulido (2007) also found that familiarity of the learners with the topics of the reading tasks leads to their better comprehension of the texts.

Chang (2006) revealed that while reading comprehension monitoring efforts were motivated by both topic familiarity and linguistic difficulty, inferencing events were primarily facilitated by topic familiarity.

In sum, most of the EFL learners, even the graduate ones have some difficulties in English writing. Furthermore, when the L2 learners are exposed with tasks having familiar topics or when they have prior information about the topics of the tasks to be performed, in fact, they automatically focus-on-meaning rather than form (Long, 1990; Schmidt-Rinehart, 1994; Markham and Latham, 1987). The findings of the present study suggest that EFL learners outperform in writing when they are more willing to communicate and familiar with the topics.

CONCLUSION

The main trust of this study was to investigate whether writing performance in learners of English as a foreign language (EFL) is related to their willingness to communicate (WTC) and topic familiarity. Three questions motivated the researcher to conduct such a study. The first question was related to the relationship between Iranian intermediate EFL learners' WTC and topic familiarity. In order to answer the first question of the study, Pearson Product moment correlation coefficient was conducted to see if there existed any relationship between Iranian intermediate EFL learners' WTC and topic familiarity. The results showed that there was no relationship between the two variables.

The second question focused on the relationship between Iranian intermediate EFL learners' WTC and writing ability. A Pearson Product moment correlation coefficient was run to answer the second question of the study to examine the relationship between Iranian intermediate EFL learners' WTC and writing ability. It revealed that there was a significant relationship between Iranian intermediate EFL learners' WTC and writing ability.

Finally, the third question examined the relationship between Iranian intermediate EFL learners' topic familiarity and writing ability. A paired-samples t-test was run to investigate if there existed any relationship between Iranian intermediate EFL learners' topic familiarity and writing ability. The results indicated that there existed a significant relationship between Iranian intermediate EFL learners' topic familiarity and writing ability.

The findings of the study can be quite advantageous for language teachers and course book designers. In any classroom context, teachers should consider the fact that not all the learners are equally willing to communicate with others and participate in classroom activities. Keeping the personality differences among the learners in mind, teachers should try to understand all learners, both willing and unwilling to communicate, and be realistic in setting the learning objectives. In order to encourage learners to communicate more in class, the teacher can pick up materials about which learners have background knowledge and experience.

Also, by the current zeal towards task-based language teaching, it seems that teachers' familiarity with learners' individual differences with respect to patterns of WTC in the foreign language can definitely help him design better tasks and assign more logical roles to students.

The results of this study can help language course book designers, too. It is not only the language teacher that must select appropriate tasks for learners, course book designers also have an important role in designing appropriate materials, so that such material can serve the needs of all kinds of learners. It is definitely a wise decision to design some activities about which learners have background information.

Similar to any other research, the outcomes of the current paper are influenced by a number of limitations and delimitations and should make the reader cautious about generalizing the findings to other situations. The researcher could not control the age and education background of the participants. Furthermore, the study was intended to make use of male and female learners to the same degree, but since the participants of this study were selected from one language institute, the researcher had problems in finding as many participants as she wished. The participants were intermediate; so, the findings cannot be generalized to populations at higher proficiency levels. Moreover, the researcher focused on writing proficiency of the participants; therefore, other language skills could not be addressed.

THE IMPACT OF IDEOLOGY ON TRANSLATION: A CASE IN IRAN

Zahra Ehteshami

Payame Noor University, Tehran, Iran
zahra.ehteshami@gmail.com

ABSTRACT

Of the many factors, which are important in the field of translation, ideology has received considerable attention. The effect of ideology on translation practice has been an issue of great concern to researchers in the past years. To this end, two professional translators with different opposing ideologies were selected following purposeful sampling technique to satisfy the objective of the study. In this investigation, each translator was required to work on three news articles on current issues. The analysis of the translated texts revealed that the translators' ideologies did affect their translation. The study might have implication both theoretically and pedagogically. The results might be useful for curriculum developers in translation studies and practitioners.

KEYWORDS: Ideological impact; Ideological manipulations; Leftist; Rightist; Translators.

INTRODUCTION

A translation can be considered as a piece of social work, which serves others. It means that the value of translation can only be realized and the effect of translation embodied when it is transmitted and accepted by others. Translation is not just a process that goes on in the translator's head. It can play an important part in the struggle between rival ideologies (Bassnet & Lefevere, 1990).

Many factors may affect translation, but there has been considerable attention to its ideological aspect from the researchers' point of view. According to Fawcett (1998), "throughout the centuries, individuals and institutions applied their particular beliefs to the production of certain effect in translation" (p. 107). Research on this field began in the early history of translation profession. From the researchers' perspective, ideological approach to translation can be seen even in some of the earliest famous translated texts. Since the 1980s, Western researchers have shown great interest in the relationships among power, ideology and various cultural products and some (Calzada Perez, 2003; Schaffner, 2003) even claim that "all language use is ideological", "any translation is ideological" (as cited in Ping, 2004).

The deficiency of old linguistics-based approaches – which 'are mainly descriptive studies focusing on textual forms' (Calzada-Pérez, 2003) – in accounting for social values in translation and other aspects of language use resulted in developing a new trend of research called critical discourse analysis (CDA) 'whose primary aim is to expose the ideological forces that underlie communicative exchanges [like translating]' (Calzada-Pérez, 2003, p.2). According to CDA

advocates, all language use, including translation, is ideological and this means that translation is always a site for ideological encounters. Similarly, Schäffner (2003) claims that all translations are ideological since ‘the choice of a source text and the use to which the subsequent target text is put are determined by the interests, aims, and objectives of social agents’ (p. 23, as cited in Karoubi, 2005). Schäffner (2003) explains, “ ideological aspects can be more or less obvious in texts, depending on the topic of a text, its genre and communicative purposes, and ideological aspects can also be examined in the process of text production (translating) and the role of the translator as a target text producer as well as a source text interpreter”(as cited in Karoubi, 2005).

Karoubi (2005) has also explained that translators can use translation as a tool for conveying an idea that like or dislike. This process that may happen unconsciously, in most cases, it is unavoidable. Translators interpret texts by setting them against their backdrop of known words and phrases, present statements, familiar conventions, previous texts, or, in other words, their general knowledge, which is ideological. This knowledge is what has been called the basis of their interpretation of the text.

Vision is another representation of ideological impacts. Information can be presented from an ideological perspective: a system of norms is values pertaining to social relations. This explains why two newspapers reporting on the same event can produce different reports (Renkema, 2004, p.127).

Definition of Ideology

The term ideology has been always related to politics and economy as it is evident in its dictionary definition as “ideas that form the basis of an economic and political theory or that is held by a particular group or person” (*Oxford Advanced Learners’ Dictionary*).

Ideology has been defined in different ways; but most of its definitions are directly related to personal and political beliefs. Ideologies are opinions, assumptions, attitudes, and values that indicate the unequal status of individuals and groups in society. They are not always conscious. Ideologies could be unconsciously internalized through one’s social practices and historical experiences. Ideologies do not always have a preventive and misleading function. While ideologies cause inequalities seem natural and acceptable, they can also illuminate them to facilitate social change.

Scholars in the field of language-related, cultural and translation studies, however, often tend to extend the concept of ideology beyond political sphere and define it in a rather politically neutralized sense as “a set of ideas, which organize our lives and help us understand the relation to our environment”(Calzada-Pérez, 2003, p. 5, as cited in Karoubi, 2005). The ideology of a translation, according to Tymoczko (2003), will be a combination of the content of the source text and the various speech acts represented in the source text relevant to the source context, layered together with the representation of the content, its relevance to the receptor audience, and the various speech acts of the translation itself addressing the target context, as well as resonance and discrepancies between these two ‘utterances’.

Responsibility of Translators

Responsibility can appear in any profession, and the translation profession is no exception. Translators should be aware of the ethical issues that can come up so that they know how to avoid them as well. Researchers of this field believe that the translators are autonomous individuals who are responsible for the result of their translational act consequences. They focus on translator, giving him/her more freedom. While they consider translators as mediators and manipulators, they expect them to be responsible for their behavior. There are myriad and varied responsibilities for a translation professional; some of which are visibility, accuracy, attention to details and punctuality, etc. However, one of the basic responsibilities, is communicating the meaning of a text, or making sure that the text has been communicated properly. One the one hand, the translator must strive to approximate the translation product to the original text in terms of message, meaning and communicative and informative intents. On the other, the translator must approximate the translation product to the norms, conventions and standards of the target language. In the presence of uncertainty, these constraints become stronger and more salient forcing the translator to adopt translation strategies that often fail to produce optimal approximations (Darwish 2009). Nowadays, greater importance is given to the ideology: The effect of translator's point of view on the process and product of translation. These days the concept of translators' ideology is much discussed. As it was mentioned earlier, this impact is unavoidable, but some translators try to reduce it as much as possible. They prefer not to be engaged in social and political challenges of their country. In spite of being unavoidable, the impact of this factor needs to be controlled. Although it is against the translators' ethics, sometimes a translator's ideology may change the whole meaning of the original text, which is completely against the ethics of translation profession. It will be apparent from this review that one aspect of translation is rooted in ideology. While much excellent work has been done over the past decades on the different aspects of translation, we are still a long way from its ideal form.

Studies on Translation and Ideology

According to Darwish (2010), translation is an occupation that is easily subjected to ideological manipulations and it plays a selective role in the transfer of science, literature and art into receptor languages and cultures. He believes that it also, more seriously fulfils a reconstituting function in managing knowledge transfer and social and cultural change. Although it is almost unavoidable to keep your perspectives apart from your behavior, in this case translation, other scholars in the field of translation believe that the best and the most reasonable translation is the one, which is away from your attitude. They claim that simple translation is the easiest form of translation profession. Lander (2001) believes that a translator should not allow ideology to color anything s/he translates. He claims that if ideology influences translation, the profession suffers. Nevertheless, Epstein (2008) has commented that this point of view refers to the ideal translation. In this ideal world, ideology would not color our translation. Epstein believes that in reality, in most cases, it is impossible to avoid this impact (Epstein, 2008). In a study related to ideology and translation, Karoubi (2005) has demonstrated that translators' knowledge that is their ideology influences their behaviors. Translators can use translation as a tool for conveying an idea that they like or dislike. Translators interpret texts by setting them against their backdrop of known words and phrases, present statements, familiar conventions, previous texts, or, in other words,

their general knowledge, which is ideological. This knowledge is what has been called the basis of their interpretation of the text.

Translation activities in Iran appear to have largely been ideologically influenced. In fact, it is not specific to Iran but is evident throughout world translation history. Fawcett (2001) provides an eloquent illustration of how “throughout the centuries, individuals and institutions have applied their particular beliefs to the production of certain effects in translation”. Depending on whether they find themselves in agreement with the dominant ideology of their time or not, translators choose translations with the same ideology to support it or a different one to reform it (as cited in Ping, 2004). This point may be found in translation of a text by two opposite ideologies. Hence, the purpose of this study is to investigate whether there is a difference between the acts of translators with different ideologies, and if there is any, how different ideologies influence the product of translations of a text. There seems to be a contrast between the professional behaviors of two translators with different ideologies; one is leftist, the other one is rightist.

RESEACRH QUESTION

This paper is a tentative probe into the effect of ideology on the translation product. It seeks for appropriate answer(s) for the following question: Is there any difference between the translation products of translators with different ideologies?

METODHOLOGY

The present study followed a descriptive design to examine the profile of two translated texts and to provide a gist of prominent ideological differences between them.

Participants

The sample comprised two translation professionals. One of them worked in a translation office and the other one a self-employed in Tehran, Iran. They were both male and had completed their bachelor's degrees in English translation in Iran. One of them aged 30, and ideologically was rightist; he was also an English teacher in a high school. The other one aged 35 with an opposite perspective, a leftist. Sampling technique was purposive and non-random to meet the requirement of the study.

Materials

In order to carry out the topic of news articles we had in mind, we needed access to a number of different English news cites or newspapers. We chose one of the most recent and challenging topics of news. It was about Syria's civil war especially about using chemical weapons. This was a challenging topic because there were two different views related to this subject matter. One of the articles was chosen from CTV National News; It contains 474 words and was published by Associated Press (AP) on June 13, 2013. There were two more articles from Washington Post. The first one, *Syrian civil war threatens cease-fire with Israel*, by Colum Lynch, contained about 2100 words and was published on Thursday, March 21, 2013. The second article chosen from Washington Post contained 757 words and was written by Abigail Hauslohner, published on

Saturday, April 27, 2013: *Hezbollah's role in Syrian civil war drives sectarian tension in Lebanon.*

The use of the news articles as the instrument for gathering the data in present study has several advantages:

- It was supposed to be quite challenging to indicate different ideologies.
- It was rich and sensitive to individuals' political perspectives, which formed the main part of their ideologies.
- It might allow comparison with other studies.

Procedures

Each translator was given a copy of the so-called articles to translate into Farsi in the second week of May 2013. None of them was informed about the purpose of this study; that is to say, none of them had received any information about the research and its process. They received both articles at the same time. Translating the texts lasted for approximately one week. They were allowed to use dictionaries to translate the articles.

RESULTS AND DISCUSSION

In the first news article, which contained 2100 words, 8 main words, the second news that contained 474 words, 6 keywords, and in the third one with 757 words, and 5 major words, were translated considerably different. It might be claimed that these differences are rooted in the translators' ideology. Some targeted key sentences, phrases, and words were translated completely different. However, the focus of attention of this study is on key words. Table 1 below displays some examples:

Table 1: Examples of differences between translations of some keywords

Original word/phrase	Leftist's translation	Rightist's translation
Rebels	مخالفين	شورشيان
Israel	اسرائيل	رژيم صهيونيستي
Terrorist organization like Hezbollah	سازمان تروريستي حزب الله	سازمان حزب الله
Israeli invaders	مهاجمين اسرانيلى	متجاوزين اسرانيلى
Opposition	حزب مخالف	شورشيان

Figure 1 also shows the differences in the so-called articles:

CONCLUSION

After analyzing the translation products of these two translators, it was found that there were considerable differences among them. It may be argued that translation is an independent profession, but indeed, it is a profession that strongly depends on ideology. The foregoing discussion has sought to highlight how ideology has impact on translation products. Translation is and will remain one of the most important and worthy occupations; however, it is an occupation that is easily subject to ideological manipulations.

Ideological impact on translation is a noticeable factor that is unavoidable but it is more close to the ideal world if we can reduce this impact. When the translators' ideology influences the translation's product strongly, the whole profession may suffer. Sometimes the main idea of the original text may be manipulated and changed by this impact; therefore, it is better to reduce it as much as it is possible.

However, some researchers in this field believe that this manipulation cannot affect the source text strongly. The translator can in some few strongly communicative translation situations, i.e. less formal, encouraging self-expression, "rewrite" the source text in the light of his/her personal ideology/axiology. This can be viewed as a manipulation – happily this is called *axiology* nowadays – but this is not however the manipulation preached by the School of Manipulation (see Snell-Hornby, 1998) since this does not affect the explicit semantic content and function of the source text (as cited in Petrescu, 2009).

The present paper, as other researches in language studies, has some limitations. The subjects were few, then the generalizability of results is low. Also, a limited genre was studied, and selection of other genres might bring up different results.

ABSTRACT

This study aimed to compare the American English and Farsi physics lectures to identify the frequency of use and various types of discourse makers used by means of a corpus linguistics analysis. Moreover, it intended to compare them in terms of their occurrences to see to what extent the physics lectures spoken by Iranian lecturers resemble to or differ from the ones spoken by American lecturers. To this end, a corpus of ten spoken physics lectures was selected. Half of these lectures (five American physics lectures) were extracted from Stanford University website, and the other half (five Farsi physics lectures) were downloaded from Iranian Sharif University of Technology website. For analysis, the DMs classification model proposed by Belles-Fortuno (2006) was employed. The variables for the analysis were frequency rate and occurrences of each pre-established markers in the corpora. The frequency and percentage of each DM was calculated, and then Chi-squares were applied to show whether the differences in the different corpora were significant. The results revealed significant differences between the frequencies of different DMs in the two corpora. It was observed that American physics lecturers used DMs more than the Iranian ones. An overall view on individual categories illustrated that micro-markers had the highest rate in contrast with macro-markers and operators across both corpora.

KEYWORDS: Corpus, Physics lectures, Farsi, American English, Discourse marker

INTRODUCTION

A discourse marker is a word or phrase that is relatively syntax-independent, does not change the meaning of the sentence, and has a somewhat empty meaning, e.g. the particles oh, well, now, then, you know, and I mean, and the connectives so, because, and, but, and or perform important functions in spoken and written discourse (Schiffrin, 1986). The difference between spoken and written discourse can affect the use and function of discourse markers (henceforth DMs). Speakers have access to a richer context in spoken discourse; in other words, “they have prosody and phonology as well as nonverbal communication or interaction with external physical objects” (Belles-Fortuno, 2006, p. 112). A lecture, as a spoken discourse, intends to present information or to teach people about a particular subject. Teachers are involved with different instructional

materials, such as seminars, tutorials, videos, and writing assignments, among others; but lecture remains the central instructional activity (Flowerdew, 1994) which plays an important role in academic settings. Benson (1994) defines lecture as “the central ritual of the culture of learning” (p.425). There is a wide literature on the study of lecture genre in order to be able to differ from various lecturing styles, linguistic features affecting lecture delivery, etc. However, we also have to take into consideration the assumption about lecture culture and how these may differ significantly (Belles-Fortuno, 2006, p. 82).

All over the world, lecturing is considered as an effective practice in higher education, focusing especially on spoken academic discourse (Dunkel & Davy, 1989). Understanding and comprehending lecture content seems to be necessary for students’ university success; furthermore, students should be able to not only read English publications, but also participate and deliver papers at conferences, even do research and give lecture in academic contexts. Many researchers have suggested that an understanding of the role of DMs and the relationships between different parts of the text is fundamental for the comprehension of lectures (Coulthard & Montgomery, 1981; Chaudron & Richards, 1986; Morrison, 1974).

In Iran, lecturers are not trained in how to give lecture nor are there specific trainings in regard to the use and functions of DMs which are fundamental for lecture comprehension. This study is an effort to analyze the content of lectures, specifically physics lectures, as an academic genre within a corpus linguistic approach. The aim is analyzing some linguistic features (DMs) that are useful in the understanding and retention of physics lectures. The objective is to describe the use and functions of DMs and the similarities and differences that may exist between American physics lectures and Iranian ones.

Significance in language learning

The results of the study have implications for the lecturers of physics science to be aware of different conventions governing this discipline. Discourse markers are used in dissimilar ways in different languages and disciplines; this makes it important for teachers and ESP course designers to recognize this for instruction. The results of the study can also make lecturers of the physics disciplines aware of the conventions of their discipline and help them to be careful in using different DMs to deliver their speeches in a more natural way. Still another contribution of this study is that it contributes to the improvement of the ability to understand the language of spoken academic discourse.

Statement of the Problem

In Iran, lecturers are not trained in how to give lecture nor are there specific trainings in regard to the use and functions of DMs which are fundamental for lecture comprehension. The study presented here is an effort to analyze the content of lectures, specifically physics lectures as an academic genre within a corpus linguistic approach. The choice of physics was not made arbitrarily. Physics has been traditionally viewed as a difficult subject to study, particularly at the university level. Language problem in physics lectures maybe acute due to the complexity and abstractness inherent in science such as physics. To the best of our knowledge, very few studies have been conducted to scrutinize DMs within monologic lectures in discourse of physics science

in general, and to compare DMs between Farsi and American English physics lectures in particular. The main purpose of this study is to analyze spoken academic discourse, and more concretely the genre of physics lecture as it is presented to undergraduate university students by means of a contrastive analysis between Farsi and American physics lectures.

LITERATURE REVIEW

Researchers have recently become interested in academic genres (seminar, conference presentations, etc.), especially the genre of lecture. DMs are essential for the understanding of written texts, and they play a significant role in creating a meaningful and coherent message in the communication process of oral discourse. The studies presented here have used spoken corpora as the method of study and they have focused on the use of a single or various DMs. In addition, these researchers provided a wide and broad classification of DMs. For instance, Del Saz (2003, 2005) focused on the notion of reformulation and the lexical units that explicitly convey reformulation. She called them Discourse Markers of Reformulation (DMs of RF). She claimed that what has been called reformulator can be considered a DM. She analyzed naturally occurring instances of language collected in the British National Corpus (BNC) and considered reformulators as DMs because, according to Fraser (1999), they have connectivity and non-truth conditionality which are features of a DM.

The DMs of RF is based on Fraser's canonical form for a DMSEQUENCE, namely, S1-DM+S2. In her investigation, Del Saz (2003) attempted to fit DMs of RF into Fraser' (1999) classification. Swales and Malczewski (2001) worked on spoken academic discourse and emphasized on what they called "a cluster of features that constellate around discourse management across a wide range of university speech events" (2001, p. 146). They described speech events as 'activity types' (Levinson, 1979) in which language is used to get things done. They pointed out a difference between academic speech that is monologic (often lectures, conference presentations, etc) and dialogic talk (telephone workshops, interviews, etc). They examined MICASE (Michigan Corpus of Academic Spoken English) (Simpson, Briggs, Ovens, & Swales, 2002) and studied the use of footing changes they called New Episode Flags (NEFs). They focused on the linguistic resources (or NEFs) which participants used in different university events to move from lecture format to discussion (or the reverse) or change the direction of the lecture or discussion. They analyzed linguistic resources such as group vocatives (folks, gang, friends, guys), directive or vocative verbs (say, listen, look) and exhortative or jussive imperative let, all these not with a large number of occurrences. They also analyzed more frequent NEFs in the MICASE such as okay, so and now (DMs). Another study dealing with academic discourse is one by Rendle-Short (2003), who analyses the use of the DM so in seminar talk within the computer science discipline. Based on Schiffrin (1987), she explains how so can function in two distinct ways.

Semantically, so ties adjoining clauses together conveying causal relations. First, it can mark the overall structure by indicating its relationship to a whole stretch of discourse and another part of discourse. Secondly so marks structure locally, by referring to the immediately preceding clauses, in this ca, by referring to the immediately preceding clauses, in this case so is marking lower-

levels of structure. Moreover, so can also function pragmatically; in this case so marks the potential speaker discourse transitions functioning as such as a topic-shifter. Rendle-Short (2003) takes these three functions of so and analyses them in a corpus composed of six first video-taped and then transcribed computer science seminar talks. She found that the DM so is commonly used seminar talk with different functions depending on its position in the talk. She particularly attracted by the way in which DMs are used together with intonation, pitch, volume, gesture and tools considering all these resources for the speaker. Also, she has shown that monologic talk is not continuous but divided into smaller parts or sections which follow a finely organized and well-structured discourse pattern. The question is whether this finely organized discourse pattern can be universally applied or, on the contrary, spoken discourse patterns mainly depend on the genre under analysis as well as on the speaker's performance.

RESEARCH QUESTIONS

This study aims to answer the following questions:

Which types of DMs do American lecturers use in the monologic lectures of Physics?

Which types of DMs do Farsi lecturers use in the monologic lectures of Physics?

Is there any significant difference in the use of DMs between American and Iranian monologic lectures of Physics?

METHODOLOGY

Corpora

In this contrastive study, a corpus of 10 spoken physics lectures was compiled. Five American lectures were collected from the Stanford University website (www.stanford.edu) and five Iranian lectures from the Sharif University of Technology website (www.maktabkhooneh.org). All the lectures were delivered by native speakers of respective languages and they also had the same topics. Only monologic lectures were selected where one speaker monopolizes the floor, sometimes followed by question and answer periods. The titles of the lectures used in this study were in the domain of quantum mechanics, Einstein's theory of relativity, thermodynamic, cosmology and electronic. The duration of the lectures in both corpora was so close to each other; the long ones were approximately one hour and fourthly six minutes and the shorter ones were roughly one hour and twenty five minutes.

Instruments

The DMs classification model proposed by Belles-Fortuno (2006) was employed for analyzing the corpora (See Figure 1). This taxonomy was used to determine and compare both corpora in terms of the occurrences and frequency rate of each DM.

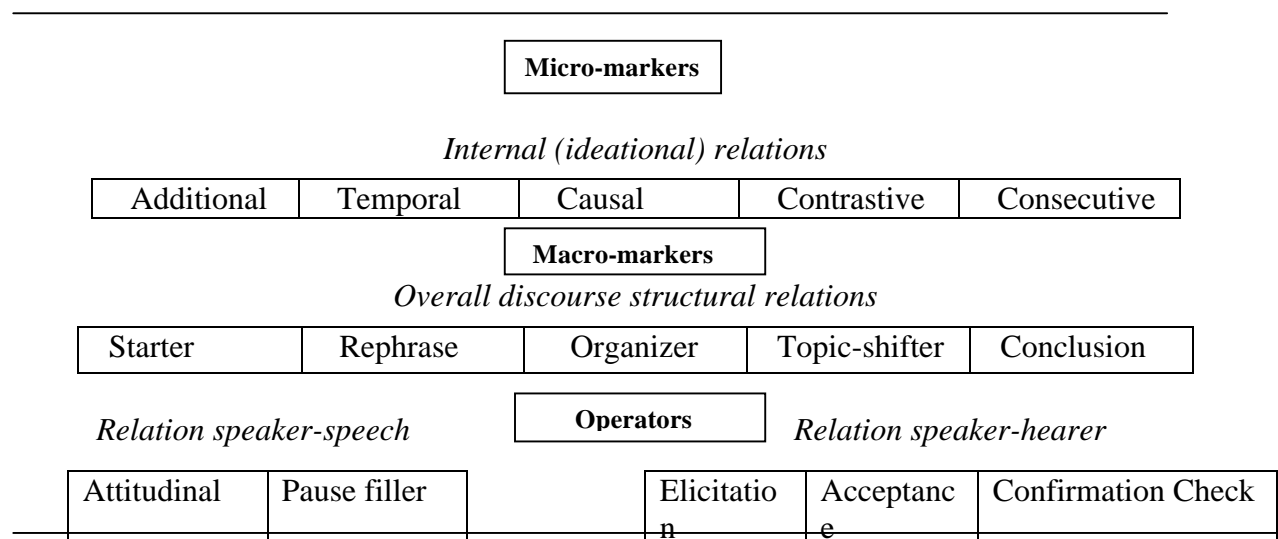

Figure 1: DMs classification model by Belles-Fortuno (2006)

Belles-Fortuno's (2006) taxonomy is based on the Hallidayan's (1994) functional meanings, namely, ideational, interpersonal and textual, and the relations they can convey along the discourse utterances. His model consists of three categories: micro-markers, macro-markers, and operators. "Micro-markers express logico-semantic relations in the discourse. According to this model, these markers have lexical or descriptive meaning (Belles-Fortuno, 2006, p. 95). Therefore, categories such as causal, contrastive, consecutive or additional DMs would be placed under this part. "Macro-markers convey an overall structure of the ongoing discourse and aim at segmenting and structuring utterances. They enhance retention and recall in post-lecture tests" (14, p. 43). They play an essential role in activating content schemata and helping listeners to successfully follow the lecture. Operators are those DMs which rhetorically signal the speakers' intentions and affect the illocutionary force. These markers are more specifically related to conversational, spoken discourse rather than written discourse. Belles-Fortuno (2006) narrowed the scope of his study by choosing a maximum of three DMs for each category. In the current study, Belles-Fortuno's classification was used for contrasting the DMs application in both North-American and Farsi physics lectures.

Procedure

After downloading and transcribing the selected lectures, we commenced the main phase of the study which is the process of analyzing the lectures' discourse markers. The variables used for the analysis of DMs were the number of occurrences and the frequency rate of each pre-established marker in the two sub-corpora. For analyzing the corpora of this study, the DMs classification model proposed by Belles-Fortuno (2006) was employed. After analyzing the North-American physics lectures, the Farsi ones were analyzed. Hence, a contrastive study between North-American English and Farsi physics lectures was carried out and the results for this study were provided. Prior to conducting the analyses, we analyzed the one Farsi and one English physics lecture as the pilot study to help minimize the likelihood of endangering the

reliability of the analyses and the findings. After we were through with the analyses, Phi correlation was applied to calculate the inter-rater reliability of the analyses. As can be observed from the obtained correlation coefficient between the two ratings (inter-rater reliability, = 0.86), there was a high reliability of the researchers' judgment in analyzing the lectures.

RESULTS AND DISCUSSION

A general overview of the analysis of DMs in both the NAC and IC gives the following results: DMs seem to be more often used in the NAC than in the IC as the resulting rates show. According to the occurrences rate, a total of 2852 DMs for the five American physics lectures were found in the NAC, whereas in the IC the rate was lower, 1496 DMs for the five Iranian physics lectures. Without distinguishing and comparing both corpora, the total rate for each individual category of DMs, that is, micro-marker, macro-markers, and operators, is as follows: micro-markers were the most frequently used type of DMs, followed by operators and macro-markers.

Table 1: Micro-Markers Frequencies in the NAC and the IC

Micro-markers	in the NAC	in the IC
Additional	706 (40%)	493 (54%)
Temporal	148 (8.5%)	115 (12.5%)
Causal	151 (9%)	98 (10%)
Contrastive	191 (11.5%)	109 (11.5%)
Consecutive	539 (31%)	114 (12%)
Total	1735 (61%)	904 (60.5%)
Chi-square (0.0)		

As shown in table 1, the overall results of analyzing micro-markers indicated that the North-American physics lectures used micro-markers as 61 percent of DMs in their speeches and the Iranian physics lectures used them as 61.5 percent. Thus, in the NAC micro-markers were used similarly to the IC. Also the results of analyzing micro-markers in the NAC represented that the two categories with the highest frequency rates were *additional* (40%) and *consecutive* (31%), while the categories with lower frequency rates were *contrastive* (11.5%), *causal* (9%) and *temporal* (8.5%). In the IC, the most frequent category was *additional* (54%); the other three categories showed close frequency rates and comprised *temporal* which were used more, (12.5%) then *consecutive* (12%), followed by *contrastive*, (11.5%). As the results displayed, *consecutive* was the second category in the NAC, whereas in the IC, this category represented a minor difference with *temporal*, and came in the third place. Categories showing the lowest frequency rates were *temporal* and *causal* in the NAC; however, in the IC, *contrastive* and *causal* had the least frequency rates. It should be noted that, at the end of each table in this section DMs are compared with each other through Chi-square. In all the comparisons, the probability (α) level is set at 0.05 (see table 1). According to the above table, Chi-square (0.0) indicates significant differences in the frequency rates of micro-markers between the NAC and IC. It means that the American and Iranian physics lecturers used micro-markers in differently their speeches.

On the other hand, the findings reveal that the total percentage of macro-markers in the IC was slightly higher than the total percentage in the NAC. The most frequent category in both corpora

was *topic-shifter*. The next categories in order of frequency rate were *organizer* and *rephraser* in both corpora. The least frequently used categories were *conclusion* and *starter* in the NAC and the IC. Table 2 shows the frequencies of macro-markers in both sub-corpora. As you can see, the significance value of Chi-square (0.821), illustrates no significant differences between the two corpora. In other words, there was not any remarkable difference in the use of macro-markers between the two corpora.

Table 2: Macro-markers Frequencies in the NAC and the IC

Macro-markers	in the NAC	in the IC
Starter	46 (9%)	27 (8%)
Rephraser	75 (14.5%)	46 (15%)
Organizer	118 (23%)	65 (21%)
Topic-shifter	269 (52%)	161 (55%)
Conclusion	7 (1.5%)	7 (1%)
Total	515(18%)	306 (20%)
Chi-square (0.821)		

Concerning *operators*, they revealed a slightly higher frequency rate in the NAC in contrast with the IC. In the analysis of *operators* in the NAC, the three most recurrent categories were *pause-filler*, *acceptance* and *confirmation-check* although this order was different in the IC, and it was as: *pause-filler*, *conformation-check* and *acceptance*. On the other hand, the categories showing the lowest frequency rates were similar in both corpora, which were *attitudinal* and *elicitation*. The least frequent category was *elicitation* in both corpora as illustrated in table 3.

Table 3: Operators Frequencies in the NAC and the IC

Macro-markers	in the NAC	in the IC
Attitudinal	31 (6%)	26 (9%)
Pause-filler	257 (42%)	115 (37%)
Elicitation	5 (1%)	4 (1%)
Acceptance	210 (34.5%)	68 (23%)
Conformation-check	99 (16.5%)	88 (30%)
Total	602 (21%)	290 (19.5%)
Chi-square (0.0)		

As table 3 depicts, the significance value of Chi-square (0.0), which is way below 0.05, demonstrates significant differences between the two corpora. In means there were significant differences in the ways North-American physics lecturers and Iranian physics lecturers use operators. At the end of this section it is worth mentioning the Chi-square of the overall results of both the NAC and the IC in table below:

Table 4: Chi-square of overall comparison of the NAC and the IC

The Overall Results of DMs
Chi-square (0.0)

Table 4 shows the Chi-square of the overall results in both corpora. As one can observe, the Chi-square value is (0.0) which means that there were significant differences in the use of DMs between the North-American physics lectures and the Iranian physics lectures.

Discussion

The findings in the result section compared the use of discourse markers in terms of their frequencies and occurrences in the two corpora. However, the quantitative analysis is needed to be complemented and supported by qualitative analyses. Attempts are made to handle this in what follows to discuss the findings in detail. Thus, the research questions are brought up again here, and the main findings are expounded on thoroughly based on the results obtained.

Is there any significant difference in the use of discourse markers between American and Iranian monologic lectures of physics?

The total number of DMs was different across the two corpora. The North-American physics lecturers and the Iranian physics lecturers employed DMs with different frequencies since the nature and history of each language is distinctive in many aspects. One might interpret this in light of North-American lecturers' tendency to segment and use DMs more often than Iranian lecturers. A closer look at the three types of DMs (micro-markers, macro-markers and operators) revealed that, in general, micro-markers are the type of DMs most widely used in both corpora over the other two types. This may be due to the type of the genre under study, monologic physics lectures. The fact that micro-markers are more often used than macro-markers and operators could be due to the peculiarities of the genre, that is, academic lectures specifically physics science. Taking into account that micro-markers express logico-semantic relations in the discourse, it could be said that in the North-American and Iranian physics lecture discourses, there is a need to convey lexical and descriptive meaning along the discourse of lectures as opposed to macro-markers, which convey an overall structure of the ongoing discourse and aim at segmenting and structuring utterances although both micro and macro-markers affect and reinforce *part-of-discourse/part-of discourse relations* (Belles-Fortuno, 2006). It is worth pointing out that those instances of micro-markers tend to be more fixed and less variable linguistic units, different from macro-markers, which tend to be longer chunks of language, more unsteady and sensitive to changes and prone to form language expressions, which may vary from one language to another, not having clear corresponding counterparts (Swales, 2004). According to the present findings, operators are second in use in the North-American corpus and third in use in the Iranian corpus.

This is not surprising taking into consideration the specificities of a corpus like ours. We have analyzed a spoken academic corpus and not a written one; the characteristics of an oral corpus differ from those of a written corpus. In spoken discourse, *speaker-speech* or, even more so, *speaker-hearer* relations are important in the discourse community which has to share a common communicative purpose and use similar rhetorical devices in the communication process (Swales 1990). Operators are those DMs which rhetorically signal the speakers' intentions and affect the illocutionary force. Probably, the study of a written corpus would have given operators a minor and less significant position; however, the results obtained from our spoken academic discourse corpus give operators a quite important position. This fact could be linked to the trend towards a

more ‘open’ lecture style (Swales, 2002) which tends to be more participatory as has been already been mentioned in this dissertation. Relations *speaker-speech* or *speaker-hearer* gain importance resulting in a relevant use of operators in both the NAC and the IC.

On the other hand, macro-markers were one of the least frequently used DMs. Although expressing relations *part-of discourse/part-of discourse* (as micro-markers do), these markers are characterized by conveying global discourse structural meanings and aim at segmenting and structuring utterances affecting discourse relations at a more segmental level of analysis. The fact that macro-markers are one of the least frequently used markers makes us think of macro-markers as having less relevance in the spoken academic discourse of North-American and Iranian physics lectures. As said above, it may happen that the specificities and peculiarities of spoken academic discourse do not aid and promote the use of macro-markers which would possibly be more relevant in the study of written discourse. The relation *part-of-discourse/part-of-discourse* seems to be primarily expressed by means of micro-markers rather than macro-markers in our NAC and IC. Previous studies regarding DMs in lecture discourse have pointed out the importance of macro-markers, which are said to be “more conducive to successfully recall of the lecture than micro-markers” (Chaudron & Richards, 1986, p. 122). This idea is also supported by DeCarrico and Nattinger (1988) who postulated that macro-markers are beneficial for activating content schemata and more recently followed by Jung (2003). Although these authors have highlighted the importance of macro-markers rather than that of micro-markers, the findings from this study have proven that micro-markers have a prominent place in lectures; at least micro-markers have proven to be more often used and preferred by the North-American and Iranian lecturers in the field of physics sciences.

Which types of discourse markers do American lecturers use in the monologic lectures of physics?

Results showed that American lecturers use micro-markers more than the two other DMs categories. In the NAC, the three most frequently occurring micro-markers were in order: *additional*, *consecutive* and *contrastive*. As already said in the previous chapter, the Americans used *additional* and *consecutive* more than the other micro-markers in their physics lectures. As a discipline, physics is concerned with describing the world by constructing models, the end product of this modeling process often being a mathematical representation, which in physics is colloquially referred to as an equation. Because of their importance in the representation of physics knowledge, physics equations affect discourse of physics lectures. Equations are connected to each other with the use of *additional* and *consecutive* DMs. The final results of micro-markers in this study also revealed that physics lecturers used *additional* and *consecutive* markers more than the other DMs.

If one observes the sub-categories in micro-markers, the most relevant markers in the NAC are *and*, *so* and *then*. The *additional* micro-marker *and* has proven to be the most frequently used marker in the NAC, functioning in the majority of its uses as *additional* marker. As a DM, *and* can also work as an operator conveying relations *speaker-speech* where it is used as a hesitator or pause-filler rather than having a strict semantic meaning. Other micro-markers with high

frequency rates in NAC were *so* and *but*. As a whole, we observe that *consecutives* were followed by *additional*s with a high rate of frequency in the NAC physics lectures.

Within the *consecutive* category, there is a micro-marker that outnumbered the rest, *so*. It has largely been studied as being one of the most ambiguous DMs as well as one of the most commonly used ones together with *and*. From the NAC analysis, we have observed that *so* can have more than one function among discourse utterances and can convey different meanings. We have considered here *so* as a semantic DM that affects ideational internal relations functioning as a micro-marker within the *consecutive* category and marking fact-based, knowledge-based or action-based consecutive relations, mostly exchangeable by *therefore*. These instances of *so* generally occur at the end of a section of speech. At this point, we understand a section of speech as characterized with louder more prominent speech at the beginning of the section and quieter, faster speech at the end of it. The beginning of each section introduces a new topic or idea, thus resembling the paragraph-initial indentation of the written paragraph (Brown & Yule, 1983; Chafe, 1979; Hinds, 1979).

A closer look at individual categories reveals that in the NAC the *topic-shifter* category owes its high frequency to the macro-marker *so*; however, as noted previously in this chapter, *so* is one of those polysemous markers that can have different meanings (we have already seen *so* as a consecutive marker in the micro-marker classification). *So* as a macro-marker affects the overall discourse structural relations, in this case it normally occurs at the beginning of a section of talk, generally after a long pause, and its function is to introduce a new topic, in contrast to *so* as a micro-marker with a consecutive meaning. This function of *so* as a *topic-shifter* is similar to the notion of *so* as a ‘flag’ mentioned by Swales and Malczewski (2001), or the ‘global’ function of *so* that indicates relationships to a whole stretch of discourse pointed out by Schiffrin (1987).

Within *organizer*, there was a macro-marker with a high frequency rate which has been used in the NAC, worth mentioning here. This was *let’s*, the contracted form or *let us* in the full form with the first person plural object pronoun. These macro-marker appeared in the NAC followed by verbs such as *go back*, *run through*, *focus*, *look*, etc.

On the other hand, less important in the NAC were the categories of *starter* and *conclusion* with very few occurrences. The lack of *starter* and *conclusion* macro-markers could be linked to the fact that a lecture time session is not necessarily and strictly related to a lecture lesson time; that is to say, one content lesson or syllabus unit may need more than one session (lecture) to be fully and completely explained. Therefore, there are no clear beginning or concluding linguistic signals within a single lecture, but a need to use *organizers* or *topic-shifters* to create an ongoing discourse structure.

In addition, operators were the second frequent category which the American lecturers used in their speeches. Furthermore, the three most frequent categories were: *pause-filler*, *acceptance* and *confirmation-check*. Taking into account the two kinds of relations conveyed by operators (relations speaker-speech and/or speaker-hearer), we observe that the most relevant category for the NAC *pause-filler* conveys relations speaker-speech, whereas the two other relevant

categories, *acceptance* and *confirmation-check*, convey relations speaker/hearer. Presumably and according to authors such as Benson (1994) and Mason (1994) among others, the North-American lectures tend to move toward a more participatory and interactive lecturing style. If this is so, a larger number of confirmation-checks would have been expected in the NAC, but the results show the opposite and there is a large number of *pause-fillers*. The question here is that why the North-American lecturers use fewer *confirmation-checks* than *pause-filler*. One possible interpretation is that North-American University students are more used to participating in classes, thus providing feedback to the lecturers in ways that do not occur in Iranian lectures. As said previously, the second most relevant category in the NAC was *acceptance*. In this sense, a more interactional type of lecture can also be given by the use of *acceptance* operators.

If we take a general view of the results obtained in the use of operators in the NAC, the most recurrent operator is *Okay* as it can have different functions as an operator, either as a *pause-filler*, an *acceptance* operator, or a *confirmation-check*. The operator *Okay* is quite broad since it can function in many different ways as a response to questions when prompting or agreeing with the main speaker, what other authors have called *back-channel* instances of *Okay* (Swales and Malczewski, 2001) and what Belles-Fortuno (2006) have categorized as *acceptance Okay* can also be used as a kind of question tag, that is, *Okay?*, in which case it is a *confirmation-check* (both cases marking speaker-hearer relations). However, and contrary to what could be expected from a direct question, most instances of *Okay* as a *confirmation-check* in the NAC are not intended to elicit a direct verbal response (Belles-Fortuno, 2006). The third function of *Okay* is as a *pause-filler* operator to maintain the floor in which case it is hard to interpret, barely holding a semantic meaning.

The two least frequently used categories in the NAC were *elicitation* and *attitudinal*. In the case of *elicitation*, we are not surprised, since the corpus under study is composed of monologic lectures where one speaker monopolizes the floor with scarce or little interventions. A wide use of *elicitation* operators was not expected in any of the two sub-corpora although one could be less monologic than the other that is the American one. As for the *attitudinal* category, we have to point out the case of the operator *I think / we think*. *I think* has proven to be the most recurrent *attitudinal* operator in the North-American lectures in the discourse of physics sciences.

Which types of discourse markers do Farsi lecturers use in the monologic lectures of physics?

Concerning the Farsi lecturers' use of DMs in the monologic lectures of physics science, it should be mentioned that Farsi lecturers use DMs slightly different from the American ones. The frequency and occurrences of DMs in the IC were less than the NAC. Furthermore, the DMs categories were used in the IC with the following order: micro-markers, macro-markers, and operators. An overall view in the IC showed that micro-markers have the highest rate in contrast with macro-markers and operators, the same as the NAC. This represented that lecturers in both corpora tended to express logico-semantic relations in their lectures. As a result, it could be said that in the discourse of physics lectures, there was a need to convey lexical and descriptive meaning by using micro-markers. Within micro-markers, there were three categories with the highest frequency rates that are: *additional*, *temporal*, and *consecutive*. Comparing the use of micro-markers in the IC and NAC, the highest category in ranking *additional* is similar to the

NAC due to markers *and* and its counterpart in the IC *va*. The use of *va* (*and*) within the *additional* category is the most relevant for the final number of micro-markers used in the IC. As an additive marker, *and* normally occurs after or before a short or long pause in order to add something new to the ongoing topic joining two clauses together.

The other main difference between the NAC and the IC is found in the *temporal* category. This category is very relevant in the Iranian lecture corpus, whereas it is one of the least frequently used categories in the NAC. We could say that temporal internal relations in the Iranian lectures seem to be rather important; the lecturer is prone to place students and discourse in time much more than the North-American lecturers who make a more extensive use of additional and contrastive micro-markers. By way of contrast, *consecutive* was one of the important categories in both corpora. In the IC ranked third. One can say that the use of *consecutive* markers in the physics lectures can be due to the nature of this physics science. As I said elsewhere in this chapter, the existence of mathematical equations as an unrepeated part of physics intensifies the use of *consecutive* markers in both corpora. *Consecutive* markers can link mathematical equations to each other as observed in the physics lectures in both the NAC and IC.

The second type of markers was macro-markers which had the next place in frequency after micro-markers in the IC. It is worth mentioning that macro-markers express relations *part-of discourse/part-of discourse* (as micro-markers do). These markers are characterized by conveying global discourse structural meanings and aim at segmenting and structuring utterances affecting discourse relations at a more segmental level of analysis. Thus, macro-markers are used more in the IC than the NAC; it means that the American lecturers convey discourse structural meaning more by the use of micro-markers, but in the IC, macro-markers are also important for conveying this discourse structural meaning. The relation *part-of-discourse/part-of-discourse* seems to be primarily expressed by means of micro-markers rather than macro-markers in the NAC. Previous studies regarding DMs in lecture discourse have pointed out the importance of macro-markers, which are said to be “more conducive to successfully recall of the lecture than micro-markers” (Chaudron & Richards 1986, p. 122). This idea is also supported by DeCarrico and Nattinger (1988), who postulated that macro-markers are beneficial for activating content schemata and more recently followed by Jung (2003).

Macro-markers which were employed more in the IC were *topic-shifter*, *organizer* and *rephraser*, the same as the NAC. According to the findings, the Iranian lectures in the discourse of the physics Science tend to generally change the topic the same as the North-American lectures. Both *conclusion* and *starter* accounted for the lowest percentage in the ranking due to DMs like *barae paian dadan be* (*to end up*) and *barae shoro* (*to begin*). It is obvious that the lecturers in both the NAC and IC just use these markers at the beginning of their speeches or at the end of their speeches; sometimes they even do not make use of this kind of markers in their speeches and finish them directly. Comparing the IC with NAC, one can understand the North-American lecturers use this kind of markers slightly more than the Iranian ones, and it can be due to the nature of Farsi language and the culture of Iranian people.

The last category in the IC was *operators*. As the results described, the three most frequent categories in the IC were: *pause-filler*, *confirmation-check*, and *acceptance*. Taking into account the two kinds of relations conveyed by operators (relations speaker-speech and/ or speaker-hearer), we observe that the most relevant category for the IC (*pause-filler*) conveys relations *speaker-speech*. However, the second frequent used operators were *confirmation-check* which conveyed speaker-heater relations. Comparing these results with the NAC in which the second place belongs to *acceptance*, we can say that there were differences in the use of *operators* in both corpora. *Confirmation-checks* were more numerous in the IC than the NAC. This could be due to the fact that the Iranian lecturers need to continuously check that the audience has understood what they are explaining, either because the lecturer has the feeling the students are not having an effective lecture learning, because the topic under discussion is of a difficult nature, or due to the age of the audience (junior or senior), a junior student might feel shy to interrupt the lecturer. Therefore, he or she does not participate as much as a senior tertiary student, which would explain why *confirmation-checks* were used more in the IC than NAC.

CONCLUSION

The purpose of this study was to explore and compare the frequencies and occurrences of discourse markers between North-American and Iranian physics lectures to find out whether or not there were any significant differences in their use. In addition, it aimed to juxtapose American and Iranian lecturers of physics science in terms of the similarities and differences between the ways they use these discourse markers. The results of the study indicated that there were differences in the use of discourse markers. In other words, American lecturers' use of discourse markers differs from Iranian lecturers' in terms of their frequencies. Regarding different frequencies, results revealed that that discourse markers were utilized more frequently by the American lectures than the Iranian ones in the field of physics science. To put it simply, there were differences among the two corpora in terms of their most and least frequent DMs. Another conclusion to draw is that DMs are the same in both corpora respecting their occurrences. By this, it can be said that the American and Iranian lectures use similar discourse markers in their physics speeches.

Limitations of the study

There were definitely some limitations to this study. Firstly, we faced some problems during data collection. The data were selected from prestigious universities websites, and we had to find physics lectures which had the same topics in both the American and Iranian ones. These factors made the process of data collection more time-consuming than we expected and limited our corpus to only five lectures in each corpus. Furthermore, the full transcripts of the lectures were not generally available on the websites, and hence we had to transcribe all the lectures by ourselves; this was a painstaking undertaking.

RELIABILITY AND VALIDITY OF GENESEE AND UPSHUR'S SELF EVALUATION RATING SCALE

Reza Nejati

Shahid Rajaei Teacher Training University

Nejatireza2@gmail.com

ABSTRACT

Tests are the most widely used assessment tools in the classroom and outside of the classroom. They are used for placement, admission to a program, achievement, research and other purposes. In some circumstances, due to practical and or other concerns, instead of tests, self-assessment scales are used. In both cases, however, it is important to consider the appropriateness, i.e., the reliability and validity of the measure. Reliability measures the consistency of the test; validity is the extent to which the test measures what it claims to measure. This study reports and discusses the results of administering a self reporting test, namely, Genesee and Upshur's self evaluation rating scale (GUSRS). Over 1000 Iranian students took the test. The results, analyzed through confirmatory factor analysis and Cronbach's alpha, revealed that, the GUSRS is a valid and reliable instrument. The instrument may be useful especially as a complimentary measure along with other test forms. Before using this rating scale, however, the examinees should be given training on how to interpret the test items.

KEYWORDS: Reliability, Validity, Self-evaluation, Rating scale

INTRODUCTION

Interest in self-assessment methodologies in foreign/second language education has emerged in 1980s. Work has been undertaken in many parts of the world and several reports on the theoretical and practical implications of using self-assessment techniques have come out (Oscarsson, 1997).

Attention to self-assessment developed out of interest in the area of autonomous learning or learner independence. Conversely, it has been viewed as one of the more challenging areas of self-directed learning. It is admitted that learners might not be experienced enough to make judgments of this sort (Blue, 1994).

Many teachers express doubt about the value and accuracy of student self-evaluation. The doubts may relate to the point that students may have fictitious perceptions of their accomplishments and that they may be motivated by self-interest. Frequently heard is the claim that the "good students" under-estimate their achievement while students who do not know what successful performance requires, over-estimate their attainments. These concerns suggest, from a measurement perspective, that self-assessment introduces construct-irrelevant variance that threatens the validity of assessment (Ross, 2006).

Despite these criticisms, there are a number of reasons why self-assessment should be encouraged in language classes. Oscarsson (1998) gives six different reasons why self-assessment can be beneficial to language learning. First, he stresses that self-assessment promotes learning. It gives learners training in evaluation, which results in benefits to the learning process. Secondly, it gives both students and teachers an awareness of perceived levels of abilities. Training in self-assessment, even in its simplest form, like asking “What have I been learning?” encourages learners to look at course content in a more discerning way. Thirdly, it is highly motivating in terms of goal-orientation. Fourth, through the use of self-assessment methodologies, the range of assessment techniques is expanded in the classroom. Because of using self-assessment, the learner broadens his/her range of experience within the realm of assessment. Fifth, by practicing self-assessment, the students participate in their own evaluation (Dickinson, 1987). They, in effect, share the assessment burden with the teacher. Finally, by successfully involving students in their own assessment, beneficial post-course effects will happen.

In spite of the criticisms leveled against self-assessment in terms of validity and reliability, educators have successfully used writing conferences, reflection logs, weekly self-evaluations, self-assessment checklists, teacher-student interviews and inventories. A popular technique in the area of self-assessment has been the use of rating scales, checklists and questionnaires. These three techniques have been used as a means where learners could rate their perceived general language proficiency or ability level. A lot of developmental work has been done in this area using “ability statements” such as “I can read and understand newspaper articles intended for native speakers of the language” (Coombe, 1992; Oscarsson, 1984).

Learner diaries and dialog journals have been proposed as one way of systematizing self-assessment for students (Oscarsson, 1984; Dickinson, 1987). Learners should be encouraged to write about what they learned over the course and what they plan to do with their acquired skills.

To summarize, there are a number of benefits to using self-assessment in the classroom. It allows students to weigh up their knowledge of the language at various points within a course and/or semester. It also assists students in the development of critical faculties. Self-assessment also enables students to look at language in more concrete terms. Using the techniques mentioned here, self-assessment motivates students to look at their strengths and weaknesses and become more autonomous learners that is a fundamental part of the learning process.

The purpose of the study

Self-assessment can take many forms, including writing conferences, reflection logs, weekly self-evaluations, self-assessment checklists and inventories, teacher-student interviews, etc. These types of self-assessment have one thing in common: they ask students to look at their work to find out what they have learned and what have not learned. Although each method differs slightly, all should include enough time for students to consider reflectively and evaluate their progress. When students understand the criteria for good work before they begin an activity, they are more likely to meet those criteria. The key to this understanding is to make the criteria clear. Students' reflections can provide effective feedback for improving your instructional plan. As

your students answer questions about their learning and the strategies they use, think about their responses to find out what they are really learning and to see if they are learning what you are teaching them.

Whereas formal or standardized tests have already established construct, predictive, and concurrent validity and reliability indices, the question of the validity and reliability of learners' self-estimates still remains controversial. Many language constructs, such as proficiency and communicative competence, are hard to define and must be clearly operationalized to ensure the validation of assessment among learners. The criterion by which learners are to assess themselves may be unclear and thus add an added risk to validity.

Language learners in EFL contexts may find self-assessment very difficult if no comparisons to a native speaker are available to them. Since reliability, like validity, depends on systematic analysis, the question is whether self-assessments are consistent. They most likely are not. Learners need to be encouraged to assess their performance on a regular basis. The present study, then, attempts to examine one self-assessment checklist. It further intends to determine the psychometric characteristic of a frequently used self-assessment instrument, namely, Genesee and Upshur's self-evaluation rating scale (GUSRS).

RESEARCH QUESTIONS

The study addresses the following questions.

1. Are the constructs of GUSRS psychologically real in an EFL setting?
2. Is GUSRS reliable in an EFL context?

METHODOLOGY

This section describes the means and methods utilized to answer the research questions put forward in this study. It describes the participants, the instruments, the data collection procedure, the scoring method and the analyses performed.

Participants

Over twelve hundred undergraduate English and non-English major students were asked to take the rating scale. Nevertheless, some students did not return the forms. Some others did not provide the information requested. Hence, these forms were discarded. All in all, the researcher could obtain 1016 forms.

Instrumentation

To achieve the purpose of this study Genesee and Upshur's (1996) self-evaluation rating scale was used. According to the instructions of the questionnaire, the students should rate themselves with terms such as *never*, *rarely*, *half of the time*, *often*, *always*. Since these terms are categorical, they may result in subjective judgment thereby decrease the reliability of the outcomes. To avoid this pitfall, the rating was modified. The subjects were required to choose 0-20, 21-40, 41-60, 61-80, 81-100 depending on how competent they saw themselves in each skill. The items are illustrated under Table 1 below. To make sure that the subjects clearly understand the items, they

were translated into students' native language, Persian. To avoid drawbacks of probable mistakes in the translation of the scale, it was back-translated.

Data Analysis

The two issues often cited in reference to more serious research studies are the reliability and construct validity of inventories or surveys when administered to specific samples. Assessing reliability is a relatively straightforward statistical technique. Cronbach's Alpha is the statistical procedure that is usually used. The higher the value of alpha, the more accurate the survey or inventory is estimated to be. One frequent way of establishing indicators of construct validity is to use confirmatory factor analysis of all the items and scales on a survey to see if the conceptualization of the theory/ model is confirmed. Should the index meet the cut-off point set by the psychometrics then some piece of evidence has been produced upon which a case for construct validity can be established. To establish the reliability and the construct validity of the rating scale, the techniques mentioned above were used.

RESULTS AND DISCUSSION

The first research question was:

Are the constructs of GUSRS psychologically real in an EFL setting?

It must be stated that this question does not lead to a null hypothesis for the question essentially deals with a latent construct not (in) dependent variables. Hence, construct validity is usually examined through factor analysis which purports to 'discover simple patterns in the pattern of relationships among the variables' (Darlington, 2004). The construct validity of the GUSRS was examined through the use of confirmatory factor analysis. To do so, a structural equation model was developed. The structural model is displayed in Table 1 below.

Table 1: Structural Model for the GUSRS

Scale	Items
Speaking	s1 s2 s3
Writing	s4 s5
Listening	s6 s7 s8
Reading	s9 s10 s11

The model was developed in accordance with the original authors' conceptualization of language proficiency. They believe that proficiency can be manifested in the following manner.

Items 1, 2, and 3 constitute speaking ability. They are written out below.

- I can describe where I live and people I know.
- I can describe my life experiences and events.
- I can present clear, detailed descriptions of complex subjects.

Items 4 and 5 comprise writing ability. They are inscribed here.

- I can fill in forms with personal details, for example entering my name, nationality, and address on a hotel registration form.
- I can write short essays.

Listening comprehension is mirrored in items 6, 7, and 8. The items are noted down below.

- I can understand native speakers when they talk about daily affairs.
- I can understand academic lectures.
- I can understand movies without too much effort.

Items 9, 10 and 11 speak for reading comprehension. They read as follows.

- I can read and understand the information in simple everyday material such as advertisements, menus, and timetables.
- I can read articles and reports on social or political issues.
- I can read articles and reports related to my field of study.

The parameter estimation for the model used maximum likelihood. Goodness of fit information is displayed in the following table.

Table 2: Goodness-of-Fit Information for the GUSRS

Degrees of Freedom = 40
Minimum Fit Function Chi-Square = 187.98 P = 0.0
Estimated Non-centrality Parameter (NCP) = 147.98
Minimum Fit Function Value = 0.19
Population Discrepancy Function Value (F0) = 0.15
Root Mean Square Error of Approximation (RMSEA) = 0.060
Expected Cross-Validation Index (ECVI) = 0.24
ECVI for saturated Model = 0.13
ECVI for Independence Model = 10.10
Chi-Square for Independence Model with 55 Degrees of Freedom = 10231.33
Independence AIC = 10253.33
Model AIC = 239.98
Saturated AIC = 132.00
Independence CAIC = 10318.49
Model CAIC = 393.99
Saturated CAIC = 522.96
Root Mean Square Residual (RMR) = 0.20
Standardized RMR = 0.094
Goodness of Fit Index (GFI) = 0.99
Adjusted Goodness of Fit Index (AGFI) = 0.99
Parsimony Goodness of Fit Index (PGFI) = 0.60
Normed Fit Index (NFI) = 0.98
Non-Normed Fit Index (NNFI) = 0.98
Parsimony Normed Fit Index (PNFI) = 0.71
Comparative Fit Index (CFI) = 0.99
Incremental Fit Index (IFI) = 0.99
Relative Fit Index (RFI) = 0.97
Critical N (CN) = 344.91

Root Mean Square Error of Approximation (RMSEA) of the model in question was found to be 0.06, which typically indicates close fit. Hence, the researcher could retain the self-evaluation model used in this study.

The RMSEA measures the amount of discrepancy between model and data in the population, taking model complexity (i.e., number of estimated parameters) into account. The following are rules of thumb for the interpretation of the RMSEA:

Practical experience has made us feel that a value of RMSEA of about .05 or less would indicate a close fit of the model in relation to the degrees of freedom. This figure is based on subjective judgment. It cannot be regarded as infallible or correct, but it is more reasonable than the requirement of exact fit with the $RMSEA = 0.0$. We are also of the opinion that a value of about 0.08 or less for the RMSEA would indicate a reasonable error of approximation and would not want to employ a model with a RMSEA greater than 0.1 (Browne and Cudeck (1993).

The Comparative Fit Index (CFI) here was calculated to be 0.99. According to one rule of thumb, the CFI value should be above .90 for a model to be acceptable. The Non-Normed Fit Index (NNFI) was 0.98 indicating that the model fits the present sample. T-values obtained between measured variables (items) and latent variables (constructs) in all cases were statistically meaningful signifying coherent relation between the indicators and the constructs they represented. Moreover, these T-values showed that all indicator variables were effectively measuring the same construct, i.e., the model enjoyed convergent validity (Anderson, and Gerbing, 1988).

Further, T-values observed between factors, namely *speaking, writing, listening and reading* and the latent construct of proficiency represented as SELF (short for Self-assessment) turned out to be significant implying that these factors could legitimately be viewed as good measures of language proficiency.

Assuming that construct validity evidence would subsume other types of validity, namely, content, criterion, face and consequential, it would be safe to claim that the GUSQ is a valid instrument to be used for the assessment of proficiency in Iran. However, the utility of a self-rating instrument must not be exaggerated because, as readers may agree with the writer, there is a possibility of measurement inaccuracy with such instruments. Some teachers and researchers rightly question the methodology of self-assessment on the ground that some students may overestimate themselves, especially if the consequence of the test is dire for them or they may underestimate themselves due to their personality. Another factor that may cause overestimation/underestimation of one's ability is the fact that the students may misinterpret the items of the rating scale. This is particularly true of perfectionist student. A perfectionist student may have trouble with concepts such as 'clear', 'detailed' and 'complex subjects' as stated in the following statement taken from the GUSRS.

I can present clear, detailed descriptions of complex subjects.

The above-mentioned statement is but one example. Other statements are also open to personal interpretation.

The reliability of the GUSRS is addressed in the next section. The second research question was: *Is GUSRS reliable in an EFL context?*

As stated before, reliability questions do not render themselves to null hypotheses for they do not deal with the so-called (in) dependent variables. Again, the researcher has to resort to the acceptability norms in the field of Social Science research.

Before attempting to answer this question, it must be added that the rating scale had four scales, namely speaking, writing, listening and reading. Hence, the reliability of all subscales and that of the whole questionnaire is reported here. The reliability index for the whole questionnaire turned out to be. 0.92.

Table 3: Reliability Statistics of GUSRS

Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items
0.919	0.920	11

The analyses were run to examine the internal consistency of items in each scale (Table 4). All four scales, namely speaking, writing, listening and reading yielded acceptable reliability estimates ranging from 0.68 to 0.89.

Table 4: Reliability Statistics of the GUSRS Factors

Scale	Cronbach's Alpha Based on Standardized Items	N of Items
Speaking	0.89	3
Listening Comprehension	0.79	3
Reading Comprehension	0.85	3
Writing	0.68	2

The item- total correlations were examined for the items in all scales. Correlations for all items were within acceptable ranges (0.46 to 0.71).

Based on the results displayed in the tables above, one can easily see that the rating scale of interest in the present study is highly reliable. That is to say, Iranian researchers can use this rating scale with certainty. Needless to add, however, in using any instrument, the findings based merely on measurement model will not be 100 percent useful. Practitioners and researchers are advised to take contextual factors into consideration. For example, before using the GUSRS rating scale, the users should see if the rating scale items reflect the way language teaching/ assessment is echoed in the curriculum and whether a self-assessment instrument is appreciated by the stake holders in education, namely, officials, principals, teachers, parents and students.

CONCLUSION

Having answered the research questions, the researcher found that the GUSRS is an appropriate questionnaire on account of construct validity, reliability and practicality. If the present sample represents the population of Iranian University students, instructors and or researchers can use this rating scale for proficiency assessment. Nevertheless, assuming that statistical analysis is not the final arbiter for it investigates the input given to it not more, the researcher, based on the review of the literature, suggests that some new descriptors be added to the GUSRS if one wishes to develop a more comprehensive measure of self- assessment.

The present study did not deal with the following issues which, if investigated, might be of great use for the clarification of other factors in self-assessment studies.

1. Age factor was not controlled. This would shed light on the issue of underestimation or overestimation of one's abilities through an inside in measures.
2. The socio-economic status of the subjects was not taken into account. The main charge here is that the socio-economic and the cultural context of students' lives may influence their approach to self-assessment. Learners are not all alike; they live in particular socio-economic settings where age, gender, race and class all interact to influence their attitudes to tests.
3. Data gathering was limited to the implementation of a questionnaire on one sample of subjects. However, Gay and Airasian suggest that determining construct validity involves gathering numerous test results from the instrument on similar populations (Airasian, (2000). This would also provide more information on the reliability of the measure. Moreover, the literature of Social and Psychological Research contends that research in this field should be approached through different elicitation instruments – the so-called triangulation approach. It remains to be seen whether students' self-ratings correlate with outside criteria (criterion-referenced testing). The study could have been carried out, using parallel tests of proficiency, say, TOEFL, in a tighter design such as 'within group' and or 'between groups' design. This would bring concurrent evidence of both content and construct validity of the instrument used.

Limitations of the study

The study has some limitations. First, the instrument used for this study is a self- report measure. Second, the instrument items are subject to personal interpretation. Such instruments are prone to overestimation and or underestimation thereby the results obtained might be conflated with error. Therefore, the findings should be interpreted with care. Third, personal variables such as age, gender, educational background and socio-economic status of the participants were not controlled. As a consequence the generalizability of the findings may be somewhat limited.

ABSTRACT

Recently much attention has been paid to assessment in language pedagogy literature. Portfolio Assessment as an assessment technique was not an exception as well. One of the benefits of using portfolios for assessment is that they tend to promote a richer and more sophisticated understanding of writing (Birjandi, et.al. 2008). Unfortunately, to date little research has been done on the use of portfolios as an assessment technique at the university level in Iran and the effects it might have on writing skill. Hence the researchers tried to find the impact of using portfolio assessment on the improvement of Iranian medical students' English writing performance. The study used a sample population of 64 male and female students in Hormozgan University of Medical Sciences in Bandarabbas, Iran. They were selected out of 182 students based on the results of an essay writing test. The participants were randomly divided into two groups of 32, the control and experimental groups all of whom attended a session of "getting started with portfolios" held by the researchers in which the portfolio model of Moya & O'Malley (1994) was explained. All of the participants attended the same English course held in 15 sessions. The experimental group members were treated with the portfolio method (i.e. given the portfolio properties, they were asked to prepare and present their writing tasks as a structured portfolio) while at the end of the class both groups were given an essay posttest. The results of this study showed a rather significant advantage in the scores of experimental group providing confirmation of the positive effect that the portfolio compilation by the students had on their writing performance. This would provide further proof that the mostly avoided portfolio approach is in fact beneficial in the learning process of writing as a productive skill and is worthy of considering by teachers and curriculum planners.

KEYWORDS: Portfolio, Portfolio Assessment, Performance Assessment

INTRODUCTION

Assessment is a powerful pedagogical tool for promoting effective learning. By googling the net using the key words "learning portfolio" and "portfolio assessment" the popularity of these concepts are seen in academic circles (Apple, 2004; Fenwick, 2000; Jennings, 2008; Shimo,

2003; Yeo Kee Jiar, 2006). If done in the right ways, assessment can provide a basis for planning the next instructional steps in response to students' needs. It gives feedback to be drawn on into teaching strategies and practices at all levels. Tutors should use assessment as part of teaching and learning to raise their students' achievement.

Teachers and researchers are greatly interested in implementing a portfolio assessment in their classrooms (Paulson, et.al. 1992). These interests stem from the different aims that teachers and researchers would like to achieve. They suggested three reasons for using portfolios in writing instruction: as teaching tools, for professional development, and for assessment purposes.

The traditional role that assessment plays for the purposes of grading and reporting should be revisited to promote learning. In this regard, an effective way of assessing students through assessment is by means of authentic assessment to review their portfolios. Portfolios are open-ended and versatile. The content of the portfolios depend on determined educational goals and purposes and can include a variety of students' tasks.

Portfolio development is introduced in many studies as a viable replacement for standardized testing. The feasibility of altering or supplementing standardized testing with portfolio assessment for the purpose of determining student achievement and competencies is currently being explored everywhere.

Proponents of portfolio-based assessment are of the idea that portfolios are better predictors of students' performance in any authentic situation and they can also improve students' higher-order thinking skills (Tillema, 1998). Research concerning portfolio use at the college and university level, however, is limited at this time. Portfolios are becoming more popular in a variety of postsecondary programs like English composition and writing as well (Clayton, 1998). To date, little research has been done on the use of portfolios as an EFL program at the university level in Iran.

The Portfolio Assessment Process

According to Damiani (2004), the use of the portfolio as an assessment tool is a process with multiple steps. The process takes time, and all of the component parts must be in place before the assessment can be utilized effectively. She goes on to mention these steps as follows.

Decide on a purpose or theme

General assessment alone is not a sufficient goal for a portfolio. It must be decided specifically what is to be assessed. Portfolios are most useful for addressing the student's ability to apply what has been learned. Therefore, a useful question to consider is, what skills or techniques do I want the students to learn to apply? The answer to this question can often be found in the school curriculum.

Consider what samples

Consider what samples of student work might best illustrate the application of the standard or educational goal in question. Written work samples, of course, come to mind. However,

videotapes, pictures of products or activities, and testimonials are only a few of the many different ways to document achievement.

Determine how samples will be selected

A range of procedures can be utilized here. Students, maybe in conjunction with parents and teachers, might select work to be included, or a specific type of sample might be required by the teacher, the school, or the school system.

Assess the process and the product or the product only?

Assessing the process would require some documentation regarding how the learner developed the product. For example, did the student use the process for planning a short story or utilizing the experimental method that was taught in class? Was it used correctly? Evaluation of the process will require a procedure for accurately documenting the process used. The documentation could include a log or video of the steps or an interview with the student. Usually, if both the process and the product are to be evaluated, a separate scoring system will have to be developed for each.

Develop an appropriate scoring system

Usually this is best done through the use of a rubric, a point scale with descriptors that explain how the work will be evaluated. Points are allotted with the highest quality work getting the most points. If the descriptors are clear and specific, they become goals for which the student can aim. There should be a separate scale for each standard being evaluated. For example, if one standard being assessed is the use of grammatically correct sentence structure, five points might be allotted if all sentences are grammatically correct. Then, a specific number of errors would be identified for all other points with zero points given if there are more than a certain number of errors. It is important that the standards for evaluation be carefully explained. If we evaluate for clarity of writing, then an operational description of what is meant by clarity should be provided. Points available should be small enough to be practical and meaningful; an allotment of 20 points for clarity is not workable because an evaluator cannot really distinguish between a 17- and an 18-point product with regard to clarity.

Share the scoring system with the students

Qualitative descriptors of how the student will be evaluated, known in advance, can guide learning and performance.

Engage the learner in a discussion of the product

Through the process of discussion the teacher and the learner can explore the material in more depth, exchange feelings and attitudes with regard to the product and the learning process, and reap the greatest advantage of effective portfolio implementation.

Significance and Objectives of the Study

The concepts of traditional testing or the more recent assessment approaches – including portfolio creating or portfolio assessment – are not new in many developed language pedagogical approaches around the world. For some teachers though, the portfolio approach is unknown. As

Rea (2001) asserts, they find a gap between what they believe could be a helpful pedagogical approach and what their students are actually doing.

Our instructors and students in Iran are less familiar with the concept of Portfolio Assessment, thus are not ready to use it in current EFL programs in the universities. Those who are familiar with it would choose not to use it for several reasons one of which might be the time-consuming nature of portfolios. The researchers find it necessary to make it more clear for them and also show its possible merits for teachers and students.

BACKGROUND

Portfolio development is increasingly cited as a viable alternative to standardized testing (Shepard, 1989; Valencia, 1990a). The feasibility of replacing or supplementing standardized testing with portfolio assessment for purposes of determining student achievement and competencies is being explored everywhere.

Recently, portfolios have been proposed and adopted as student assessment management tools in addition to or simultaneously with standardized achievement tests (Baron, 1992b; Brewer, 1990). More recently, there has been a growing interest mainly in mainstream educators in performance assessment and specially portfolio assessment thanks to concerns that multiple-choice tests fail to assess higher order skills and other skills essential for functioning in school or work settings (O'Neil, 1992; Rothman, 1991). Multiple-choice tests are not authentic because they do not represent the activities that students typically engage in. In addition, multiple-choice tests do not reflect current theories of learning and cognition and are not based on abilities students actually need for future success (Hancock, 1994).

Whereas standardized tests serve a purpose in education, they are neither infallible nor sufficient. Many educators acknowledge that any "single score, whether it is a course grade or a percentile score from a norm referenced test, almost always fails to accurately report student overall progress" (Flood & Lapp, 1989, p. 509). A single measure is incapable of estimating the diversity of skills, knowledge, processes, and strategies that combine to determine student progress. Another concern is that standardized tests cannot be used to closely screen student's progress in the school curriculum throughout the year since they are only administered once or twice per semester, thus portfolio development is increasingly drawn on as a viable alternative to standardized testing.

RESEARCH QUESTION AND HYPOTHESIS

Based on the presented subject of portfolio assessment and its effects on the students proficiencies during EFL programs the researchers propose the following question to be addressed in the study:

1. Does portfolio assessment have any impact on the writing proficiency of university EFL learners?

To address this question the researchers try to logically and statistically reject the following null hypothesis:

1. Portfolio Assessment does not affect the writing performance of intermediate EFL learners.

If the researchers can reject this null hypothesis then an alternative hypothesis will be accepted.

METHODOLOGY

For the purpose of this study, an experimental design was used with an experimental group and a control group to investigate the effectiveness of portfolio compilation on the experimental group's writing performance in comparison with that of the control group participants. In this section, the sampling method, instruments and the procedure used in the study are elaborated on.

Participants

Based on the portfolio model presented early in the study, the current study was conducted on a group of 64 intermediate students in Hormozgan University of Medical Sciences in Bandarabbas, Iran, studying in a Medical Doctorate program. They were selected out of 182 students based on the results of an essay test.

Instruments

The materials used in this study are an essay writing as pretest and another essay writing as posttest with equal word counts and scoring procedures and similar topics related to the field of medicine (i.e. patient history, prescriptions, etc.). The submitted writings were marked by two raters as well as both researchers with the same scoring criteria applied in all to minimize the subjectivity. The Pearson's inter-rater reliability index was calculated at ($r=0.81$).

Procedure

After selecting the 64 participants, the researchers gave them a choice on their preferred testing method. This test included two writing topics related to the science of medicine and for each topic the students were asked to write an essay of at least 100 words. Then they attended several sessions of Getting Started with Portfolios in which the researchers elaborated on the portfolio model of the study. Having mastered the knowledge necessary for preparing a portfolio and the grading based on this approach instead of the traditional methods of testing, the researchers asked them to voluntarily select between these two approaches (keeping in mind that if the students have an option to choose between the portfolio approach and the traditional method the final results would be more reliable).

These 64 students were randomly divided into two groups of 32, one as the experiment group and the other as the control group. All of the participants attended the same writing class receiving the same input. The experiment group members were treated with the portfolio method of assessment (i.e. given the portfolio properties, they were asked to prepare and present their writing tasks as a structured portfolio) while both groups were assessed with an essay test parallel to that of the pretest.

The results of pretest and posttest which were rated by two skilled writing raters plus the researchers according to the same scoring criteria are presented and discussed in the next chapter. It should be noted that the age and gender of the participants were not controlled in the study.

RESULTS AND DISCUSSION

Descriptive Statistics of Both Groups

The results of the pretests and posttest were rated by three skilled writing raters. Using SPSS v.20, the following analyses were made on subjects' scores. First you can see in table 1 the descriptive statistics of the control group:

Table 1: descriptive statistics of control group

	Control Group Pretest Average	Control Group Posttest Average
N Valid	32	32
Missing	0	0
Mean	14.9921	15.5546
Median	15.1700	15.1000
Mode	14.17 ^a	15.02 ^a
Std. Deviation	1.5731	1.2679
Variance	2.408	1.562
Skewness	-.315	-.159
Std. Error of Skewness	.343	.343
Range	9.50	8.75
Minimum	10.50	11.25
Maximum	20.00	20.00
Sum	479.25	482

a. Multiple modes exist. The smallest value is shown

As it's been illustrated in table 1, the average score achieved by control group in the posttest (15.5546) has by a small amount exceeded the average of control group pretest (14.9921). This increase is scientifically insignificant and can even be ignored.

But let's take a look at the descriptive statistics of the experimental group of the study in table 2.

Table 2: Descriptive statistics of experimental group

	Experimental Group Pretest Average	Experimental Group Posttest Average
N Valid	32	32
Missing	0	0
Mean	14.9453	17.0078
Median	15.9800	18.3100

a. Multiple modes exist. The smallest value is shown

Table 2 illustrates the same descriptive statistics regarding the experimental group's pretest and posttest. We can observe a rather noticeable increase between the average of pretest (15.2734) and the average of posttest (17. 9296). This increase is statistically interpreted in later tables.

Discussion

A researcher can reject the null hypothesis in social sciences when the significance is below 0.05 and then the alternative hypothesis will be accepted. As is shown in this study, the paired samples statistics of experimental group indicate that the t-test with 44 degrees of freedom was significant which means that the null hypothesis can be rejected.

This also means that the difference observed among Experimental group averages of pretest and posttest is a significant reliable difference. The average mean observed for the experimental

group's posttest far exceeds the same observation for the control group which suggests that the method used for the experimental group is more effective than that of control group.

CONCLUSION

This study set out to determine the effects of portfolio compilation as an assessment approach on the writing performance of Iranian language learners. The writing skill, generally, is the weakest of the four skills among Iranian learners of English and for the participants, the medical students, this skill is of utmost importance. Hence, attempting to improve their writing performance, the authors implemented the portfolio approach and tested it against a simple essay approach. Finally, based on these results the researchers can claim that the portfolio assessment method used in this study has positive effects on writing competence of Iranian EFL learners.

There were however some limitations such as considering only the writing skill and not the combination of all skills. The authors also liked to investigate other Iranian students in different university programs which was simply not feasible for a single piece of study.

REPLACEMENT OPERATION IN SELF-INITIATED REPAIR PRACTICES IN ORAL REPRODUCTION OF SHORT STORIES

ABSTRACT

This paper investigated replacement operation, one of the self-initiated repair operations, practiced by Iranian students of English as a foreign language (EFL) in reproduction of short stories. In addition, the present study examined learners' priorities in employing repair methods. Two repair methods were analyzed, explicit repair and tacit repair. To this end, two groups of thirty EFL students in two oral reproduction courses at Sheikh-Bahaei university (Iran) were required to reproduce two short stories as their final exam. This study purposefully used two groups of learners in two different academic years, sophomores and juniors, to inspect whether the academic level of studies has an impact on the frequency of use of repair practices. To collect data, two short stories were selected from Oral Reproduction of Stories by Abbas Ali Rezai, and participants were voice recorded. After transcribing the data and applying the Chi-square test (Yates correction factor), the results revealed that both sophomore and junior Iranian EFL learners produced explicit repair practices more frequently. Furthermore, students in the sophomore group practiced more instances of replacement repair operation. The findings of the present research may have implications for syllabus designers and teachers as well as students.

KEYWORDS: self-initiated repair, repair operation, repair method, explicit repair, tacit repair

INTRODUCTION

As it is evident, students in educational EFL settings frequently encounter conversational challenges when they are to interact with other interlocutors such as other students or teachers i.e. they mostly experience moments of conversational breakdowns for various reasons. In fact, they struggle to transmit a comprehensible message to their interlocutors, and they sometimes fail to do so. Therefore, Leonard (1983) suggests that competent communicators learn to regulate and modify messages within a conversation. Speech modification may entail planning to select appropriate words, reducing the complexity of utterances, or elaborating on a statement for clarification. When individuals do not properly regulate or modify messages, a communication breakdown may occur. Interactants, thus, try to make repairs to their utterances in order to maintain communication.

Hence, Language repair, first defined by Schegloff, Jefferson and Sacks (1977) as the set of practices whereby a co-interactant interrupts the ongoing course of action to attend to possible trouble in speaking, hearing or understanding the talk, is used as an important communication

strategy to maintain the conversation and avoid breakdowns. ‘Trouble’ includes such things as “misarticulation, malapropisms, use of a ‘wrong’ word, unavailability of a word when needed, failure to hear or to be heard, trouble on the part of the recipient in understanding, incorrect understandings by recipients” (Schegloff, 1987a : 210), among others. Repair is used to ensure “that the interaction does not freeze in its place when trouble arises, that inter-subjectivity is maintained or restored, and that the turn and sequence and activity can progress to possible completion” (Schegloff, 2007b : xiv).

A key distinction has been provided by conversation analysts between *initiating* repair and actually making the repair by giving the repair solution. In fact, this is an important distinction because repair can be initiated by one party and completed by another. Most often, repair is initiated by the speaker of the *trouble-source* or *repairable* (these terms are used interchangeably in the literature), and this is referred to as *self* - initiated repair. Generally the speaker who self - initiates repair also completes the repair by producing a repair solution (Kitzinger & Lerner, 2010).

In self - initiated self - repair, then, a current speaker stops what s/he is saying to deal with something which is being treated as a problem in what s/he has said, or started to say, or may be about to say — for example, cutting off the talk to replace a word uttered in error with the correct word. By contrast, in *other* - initiated repair someone other than the speaker of the trouble -source initiates repair. Hence, it is the recipient of a turn - at - talk (rather than its speaker) who initiates repair on it (Schegloff, et al., 1977).

Self-initiated repair operations identified by Schegloff (2007) are: replacing, inserting, deleting, searching, parenthesizing, aborting, sequence jumping, recycling, reformatting and reordering. Replacing, which is probably the most common operation in English and also in some other languages (Fox, et al., 2010) is the focus of the present study. It involves “ a speaker’ s substituting for a wholly or partially articulated element of a turn - in - progress another, different element, while retaining the sense that this is the same utterance ” (Schegloff, 2008).

Replacement repairs come in various forms such as antonyms or synonyms, alternative formulations of the trouble - source term. Also, they can substitute a full - form for an indexical reference, or a new full - form reference for the trouble - source reference, either for the same referent or for a different one. Replacing can extract an individual from a collectivity or conversely can aggregate an individual to a collectivity by replacing (e.g. “ I ” with “ we ”) (Lerner & Kitzinger, 2007a). Speakers can also use replacement to change the tense of a verb (e.g. from past to present).

Cut-offs are a common way of halting progressivity in English (and in many other languages). So, too, are various other hitches in speaking — including sound stretches and other delaying productions (e.g. “um”, or “ uh ”). Such hitches do not initiate repair by themselves, but rather alert recipients to the possibility of a repair of trouble (if it was trouble) only becoming evident from an inspection of what happens next. Nevertheless, Repairs can also be initiated tacitly, without any explicit advance indication that progressivity is being suspended; in such instances it

is only apparent on production of the repair solution that a repair is being affected, and that the onward progressivity of the turn has been suspended for the purposes of that repair (Lerner & Kitzinger, 2010). There is no one - to - one relationship between the method of repair initiation and the repair operation: repair initiated with a cut - off can turn out to be replacing, inserting, deleting, or any other of the full range of repair operations.

On the basis of such assumptions, the present research aims to investigate whether two methods of repair: explicit (using cut-offs and hitches) and tacit (using no indicators) in replacement repairs are used in the oral production of Iranian EFL learners. The study also aims to identify how repair methods in replacement operation practices are used by both groups in order to regulate and maintain conversation, pass comprehensible messages to their interlocutors and achieve their communicative goals. The findings will hopefully provide insights into how important these practices are in real life communication; in addition, EFL syllabus designers may gear the courses to the linguistic and communicative ability of their students.

Indeed, a couple of prior studies have been carried out on language repair. For example, Nagano (1997: 81) in his study on the self-repair of Japanese learners of English concludes that "... the self-repair of Japanese speakers of English is not very different in some ways from that of the L1 speakers in Levelt's study".

Research has also shown that repair, which is a language phenomenon, is necessary for keeping communication smooth and accurate, and it has been evident in the literature that language learners are able to employ many repair strategies in second language interaction (Schegloff et al., 1977; Schegloff, 2000, 2007; Watterson, 2008). Additionally, It is evident in language repair research that both native and non-native speakers of English use repair practices while negotiating meaning in order to understand or make themselves understood (Firth & Wagner, 1997).

Drew (1997) suggests that "self-repair is also a mechanism of remedying mistakes in conversation". 'Mistakes' may also relate to acceptability problems, such as saying something wrong in a broad sense, that is untrue, inappropriate or irrelevant (Schegloff, 2007).

According to Schegloff et al. (1977), self-initiated self-repair (self-repair) takes the form of initiation with a non-lexical initiator, followed by the repairing segment (p. 376). These non-lexical initiators include cut-offs, lengthening of sounds, and quasi-lexical fillers such as *uh* and *um*. In order to repair their errors in problematic talk, language users repeat words and use fillers to gain time and achieve their communicative goal. Schegloff et al. (1977) state that self-initiated and self-completed repair (self-initiated self-repair) occurs when the interlocutor who is responsible for the trouble source both initiates and completes the repair.

The problematic talk 'trouble source' can be defined as an utterance or a part of an utterance that is perceived as problematic by at least one of the interlocutors. The speaker may feel that the utterance did not correspond to what he/she wanted to say, while the hearer may be unable to

decode the intended meaning of the utterance. The speaker may also assume that the recipient did not understand the utterance in the right way (Faerch & Kasper, 1982:79).

Self-initiation, self-completed repair is the most common repair strategy used (Schegloff et al., 1977). The speaker makes an error, detects it, cuts off what he/she was saying, and repairs the error. Repairs are signaled through the use of strategies, such as interruption, editing expressions (*er, em*) and backtracking. Similarly, Berg(1986: 212) admits that the repair process begins with an error. An error means "all kinds of inadvertent behaviors". Errors are usually detected during the articulation of the problematic word, which is usually signaled by the interruption of the flow of speech by the speaker himself.

Research on the repair of second language learners (e.g., Kranke & Christison, 1983; Schegloff, 2000) shows preference for self-initiated repair, although variations can be seen in the amount of initiation depending on the learner's language level (cf. Krahne and Christison, 1983). Krahne and Christison (1983) remark that "...language learners have demonstrated ability to utilize non-language-specific techniques of interaction maintenance which also facilitate their comprehension, and we can assume, their acquisition of the new language" (p. 234).

When EFL learners come across situations in which they make conversational mistakes, repair comes to help to smooth the way to return the conversation to normalcy. However, lack of linguistic knowledge may impede them from using repair practices or lengthen the time before repair is produced. According to Faerch and Kasper (1983), during the planning and execution phases, L2 speakers encounter problems due to their lack of linguistic resources; therefore, they modify their plan and use their existing knowledge, usually consciously, with the intention of sending a comprehensible message and achieving their communicative goal.

As a matter of fact repair operations take various forms as Schegloff (2007) suggests such as replacement, insertion, deletion, etc., yet repair is produced either explicitly by using hitches(hesitation markers and indicators) or tacitly with no hitches as in the following examples (taken from the data of the present research):

(1)

- 1 S: Buh the men we:re the men **are were** surprise'd
2 T: [nod]

(2)

- 1 S: The man **said told** his son he should'n heve done id
2 T: Ok

(3)

- 1 S: She jus' uh:'(0.4) met her mum at the street' 'er, (0.2) **on** de street
2 T:

(4)

- 1 S: You know and thet house wes really **bi:-small**
2 T: Aha...

As it is evident from these replacement examples, students in examples (1) and (2) did not use any advance indications to let the interlocutor become aware of the suspension of the turn; however, in examples (3) and (4), students explicitly alerted the cut-off by using delaying hitches and sound stretches respectively.

Replacement is a common repair practice whose role in communication could be one of the "most effective strategies for promoting comprehension that a speaker can use" (Hoekje, 1984: 10). However, research literature on replacement operation in Iranian EFL learners is not rich enough. Hence, the need for more research on repair practices, especially repair operations, is felt as teachers and syllabus designers can benefit from the findings of this type of research to have a better grasp.

Fotovatnia and Dorri's study (2013) concentrated on repair strategies used by Iranian learners in accordance with gender's effect on their use; nevertheless, repair operations were not the focus of the study.

RESEARCH QUESTIONS

The focus of the present study is to investigate replacement operation in oral reproduction of stories. It compares explicit and tacit repair practices produced by Iranian EFL learners. More specifically, the aim of the present research is to answer the following questions:

1. Is replacement, as the most frequent repair operation, practiced by Iranian EFL students in retelling short stories?
2. Which repair method, explicit or tacit, is more frequently practiced?
3. Is there a relationship between the participants' academic level of studies and the frequency of replacement repair practices?

METHODOLOGY

Participants

The participants of this study were sixty male and female third-year and second-year EFL students enrolled in the oral reproduction courses at Sheikh-Bahaei university. In December 2014, these participants, in two groups of 30, ranging from age 20 to 24 performed a story-retelling task as their final exam. The first group included fifteen males and fifteen females, and

they were all selected from the oral reproduction of short stories course offered to sophomores. Also, the second group included fifteen males and fifteen females, but they were selected from the same course offered to juniors. Students were not informed that they were selected for this study to keep the natural state of their performance. However, the researcher let them know the fact after the exam.

Instruments and materials

To control the effect of prior English studies, all students who had enrolled in these two classes took an Oxford Placement Test (Allan, 2004). Prior to the study, the OPT was used to assess the participants' homogeneity in terms of proficiency. The test had 100 multiple choice items. Along with Allen's (2004) scoring guidelines, 60 of the participants who scored higher than 68 out of 100 were selected as upper-intermediate learners for the main phase of the study. Two short stories were selected from Oral Reproduction of Stories book (Rezai, 2013): *The Six Rows of Pompons* and *All Summer in a Day*, which were thought to be interesting, and within the proficiency level of the students, after consultations with three university professors.

Procedure

All participants were assigned to read the stories and prepare for oral reproduction as their final exam. The participants were individually audio-recorded in the researcher's office while retelling the stories to the researcher. The researcher used gestures, such as nodding, to show that he was following, and interested, and to encourage the participants to continue their retelling. Since real-life conversations require more interaction between speakers, the researcher also tried to interrupt the participants, using words and expressions, such as *then, aha, OK, oh my God!, Did he do that? Oh Really!*, and *What happened then?* This had a positive impact on the participants' performance, and their motivation to complete the task. The participants' production was carefully transcribed. All pauses and sound elongations were included in the transcription. In the transcription, every pause was shown in seconds, which was measured with the use of a stop watch. Markee (2000) suggests that the entire speech event should be transcribed to "provide an exhaustive account of the data potentially available for analysis" (p. 105).

The researcher was interested in analyzing the oral production of the participants because the interlocutor, who was the researcher of the present study himself, did not produce much discourse. Regarding the markers of repair, the researcher detected repair methods in replacement operation in the transcription of the spoken discourse of Iranian learners of English, and then classified them into two categories: explicit and tacit repair. Markee (2000) identified markers of repair stating that "repairs are likely to be signaled by various markers of incipient repair (pauses, silences, sound stretches, cut-offs and phrases like 'you know' and 'I mean'" (p. 86). Next, frequencies and percentages of explicit repair and tacit repair in replacement operation practices were calculated. Furthermore, to find out any statistical differences in the use of repair methods between the two groups of EFL learners, a Chi-square test was used.

It should be noted that in order to maximize the reliability of the researcher's classification, it was passed to three intra-raters, who are professors of Applied Linguistics at the University of Isfahan. In order to make the raters' task easier, the methods were highlighted and classified in

context. That is, the whole utterance in which repair was practiced was transcribed. The raters were asked to verify whether that the researcher's classification was accurate based on the definition of each method. Their comments were taken into consideration and after necessary rectifications, the final categories and frequencies were ready.

Also, the researcher selected two groups of students from two different years of studies to find out whether offering this course to both sophomores and juniors was an appropriate decision taken by syllabus designers.

RESULTS AND DISCUSSION

Table 1: Frequencies and Percentages of Repair Methods Practices of the First Group (sophomores)

Repair Method	Frequency	Percentages
Explicit	136	83.4
Tacit	27	16.6
Total	163	100%

As can be seen in Table 1, the participants in the first group recorded 163 instances of replacement repair practices while retelling the two stories. It was observed that they tried their best to report as many events as they could; even very specific details were reported. This was evident in the average number of words used in their oral production which by means of MS Office word count, was found to be 600 words per story on average. It was also observed that all the participants in the first group used some instances of repair practices, either explicit or tacit. They practiced the two methods under investigation at the rate of 136 and 27 instances, respectively.

Table 2: Frequencies and Percentages of Repair Methods Practices of the Second Group (Juniors)

Repair Method	Frequency	Percentages
Explicit	63	56.25
Tacit	49	43.75
Total	112	100%

Table 2 above shows that the juniors used fewer repair practices than the sophomores; they employed a total number of 112 instances of replacement repair practices, representing both methods. Contrary to the first group participants, it was noted that the third-year participants described only the key events; very specific details were not reported. This was manifested in the average number of words they produced, which was 450. Again, participants of the second group produced explicit repairs more frequently (63 cases).

In order to find out whether these differences were significant or not, a Chi-square test (*Yates correction factor*) was applied. The results of this statistical analysis procedure are discussed. The data show that the sophomores used 163 cases of replacement repair practices, while the juniors practiced 112 instances, indicating that the sophomores used more cases of replacement repair. The result of the Chi-square test ($\chi^2=23.19$) reveals significant differences between the sophomores and juniors in practicing replacement repair operation at $\alpha = .01$. The critical value

of χ^2 with 1d.f is 6.63. Thus, it can be concluded there is a relationship between the academic years of studies and practicing replacement operation. That is, the participants in the second year of their studies produced more instances of replacement repair operation.

Discussion

Above all, the results of the present study confirm that replacement operation is frequently used by Iranian EFL learners too. Also, the use of two methods of repair practices by Iranian EFL learners reveal that the findings are in line with the results of previous research on language repair (Lerner & Kitzinger, 2010). However, it was found that there were significant differences between the two groups in terms of the frequency of repair practices.

The statistical analysis presented in Tables 1&2 revealed that the learners in the first group significantly produced more explicit repair practices and fewer tacit repair instances of replacement operation in the story retelling task, when compared to those in the second group. This may have been due to a number of reasons. As stated previously, the number of words uttered by sophomores exceeded the number of words produced by juniors, which might be attributed to their lack of communicative abilities since linguistic background was controlled by homogenizing the participants through using an OPT.

Replacement operation as a self-initiated repair practice was used by both groups as an attempt made by the speaker to plan for a new utterance or to gain time to recall the next lexical item, when s/he felt that s/he made an error. Another point is that the juniors produced fewer repair instances, which could be attributed to the fact that they were more concise in story-retelling, i.e. they reported only the major events in both stories. It was possible that the juniors, due to the fact that they were more experienced, had designed a plan before attending the short stories retelling session. The answer to this question can be found by applying further research.

Also, Self-initiated repair was used when the speakers encountered problems with retrieving different items of the stories such as names of characters, story events, and main ideas. Additionally, it was noticed that replacement repair was not always successful; that is, the speakers tried to correct what they thought to be a mistake, but they did not do that successfully. This finding is thus a verification of the view that self-initiated repair is a well-organized, orderly, and rule-governed phenomenon and not a chaotic aspect of spoken discourse (Schegloff et al., 1977). Furthermore, it was found that participants in both groups were keen on taking risks to transmit comprehensible messages to their interlocutor, who was the researcher in the present study. They practiced repairs to retrieve ideas and lexical items and maintain conversation, and to produce correct forms or ideas. The participants' use of such repairs made their oral production comprehensible, despite the presence of hesitations and pauses.

CONCLUSION

This study sought to investigate if replacement operation is practiced by Iranian EFL learners in oral reproduction of short stories and how learners prioritize their repair methods in their utterances. Additionally, this research examined if academic level of studies might have an

impact on the frequency of repair practices produced by the learners. Not surprisingly, the findings may raise the need for EFL syllabus designers and researchers to be aware of differences in producing repair practices among learners. In fact, courses offered to students must have been geared towards specific communicative abilities of the target learners, for example, when students can benefit more from their courses as they become more communicatively competent. In addition, teachers will be able to respond to the communication problems of students more effectively when they understand students' ways of resolving the conversation problems and the factors that affect them. In fact, teachers may help their students by giving awareness of appropriate strategies to overcome conversational difficulties.

Another implication is what can be used by students as learners' strategies i.e. learners get a better grasp of their own oral productions and find necessary strategies to deal with their own conversational breakdowns and in case of retelling short stories, students may find pre-planned strategies which can help them to perform the task more successfully.

The present study suffered from several limitations such as time and small samples. Also, this research included only students with an upper-intermediate level of proficiency; therefore, generalizations cannot be made to all levels of proficiency.

ABSTRACT

Teaching how to speak English is one of the important factors between educational practitioners and thus finding efficient techniques to improve this ability have long been under research. The most important element for speaking and communication is learning vocabulary. Since learning vocabulary is not easy, utilizing new techniques can help students in facilitate learning and create motivation for them. As the native speakers are the genuine source of vocabulary, this research was conducted to investigate the effectiveness of chatting with native speakers on learning vocabulary. To fulfill the purpose of this study, 56 students in Danesh Ara institution of Iran in Mashhad city were selected, who took a placement test. Subsequently, 40 intermediate students were selected, 20 as experimental group and 20 as control group. They all took a pre-test on vocabulary and then were advised to chat with the native speakers. Some students, who did not know how to chat with the native speakers, were instructed how to do so. The control group didn't have the chance to speak with the native speakers and they learned the vocabulary with traditional methods (e.g. reading the new words, repeating after the teacher and then memorizing them for the next session). After 20 sessions, the pre-test was administered as post-test, The data was entered in SPSS and the independent sample test is calculated, the results showed significant improvement on learning vocabulary in the experimental group. So chatting with the native speakers could be one of the interesting technique in facilitate learning vocabulary.

KEYWORDS: Chatting, Vocabulary, Intermediate, Native speakers.

INTRODUCTION

Most studies that were reviewed focused on the effects of using computer on language learning, and the effects of online units designed to teach L2 vocabulary on the students' achievement, attitude towards English language and satisfaction with the online unit. The examiners noticed

that there are very few online materials designed to help L2 learners learn vocabulary, and very few scales designed to measure premedical students' attitude towards English and their satisfaction with these units. This adds to the significance of the current study. The researchers made use of the communicative method of teaching English that focuses on enhancing vocabulary in designing the learning material of the current study.

As Michelin (1997) states that "The use of the Internet in English language classes exposes the students to a wider range of English than they usually encounter in their daily lives. Furthermore, the World Wide Web is an invaluable source of information both for teachers and students. With respect to other advantages of implementing the internet, it can be stated that real time technology can help to solve the problem of insufficient exposure to vocabulary practice, specifically by chatting with the native speakers.

From reviewing the literature relevant to the current research, the following are concluded:

The current study is similar to Ushida's (2003) study since both studies used online units to develop students' acquisition of vocabulary and both measured the effects of these units on the students' attitude toward English language and satisfaction with these units. Kaya's (2006) study is the most similar study to the current study in the design of the online units and using WEBCT to deliver the units to improve the students' vocabulary acquisition.

Kaya's (2006) online unit contained text, images, movie, and audio in order to facilitate the vocabulary learning process like the online unit used in the current study. As Warschauer and Healey (1998) states that through chatting, learners of a language can communicate inexpensively and quickly with other native speakers all over the world. This communication can be either synchronous with all users logged on and chatting at the same time.

RESEARCH QUESTION

Is there any significant difference between the performance of Iranian intermediate EFL learners in learning vocabulary when instructed by chatting and those who receive instruction in traditional way?

METHODOLOGY

Participants

56 participants took part in a placement test in Danesh Ara Institute in Mashhad, Iran. So, the explorers could determine their language level. Upon inclusion in the program, this sample was selected from intermediate students. Their proficiency level had been determined via the placement test administered at the institute.

Placement test has been designed for choosing the intermediate students and placing students into the six levels of the series and the other option for getting to this level was passing previous levels of English courses in institute. It could be inferred that the participants had the same, or very similar general English proficiency. After administration of the test, only 40 participants

could get score of 52-61 for placement test and thus they were selected to be the sample of this study. This clarified that participants were at level 4 (intermediate) and indicated that the great majority of subjects were homogenous. The proficiency level of the participants was also determined by passing the previous levels of English courses in the institute. The Iranian EFL learners were divided randomly into experimental group and control group.

20 participants were assigned to be the experimental group and were called group A. 20 participants were assigned to be the control group and were called group B. Both groups had the pre-test to examine their initial lexical knowledge. Then group "A" received treatment based on chatting with the native speakers. But group B did not receive this treatment. Finally both groups had the post-test after 20 sessions. Both pre-test and post-test were the same for both groups. The pretest study was different because it measured three dependent variables and provided support for the learners.

Materials and instruments

In the data gathering procedure, the first step consisted of placement test. Placement test helps the investigators to select intermediate students and collect required data. The instruments used for data collection were placement test, pre-test, post-test, online chat, computer, social network (Yahoo messenger).

The Placement test was utilized to determine the level of the participants. It is written by the Colchester English Study Centre (Appendix 1). It was administered in different occasions and the reliability is proved and it help to select intermediate students and to homogenize their proficiency level. The students who can answer 52-61 correct questions from 80 questions are selected as intermediate level. The pre-test was used to measure the learner's initial vocabulary knowledge. And the post-test was utilized to determine the efficiency of online chatting with native speakers on vocabulary knowledge. All participants were encouraged to register in free online websites and make their own ID in order to know each other and contact with native speakers of English.

The experimental group had access to the Internet and used yahoo messenger for online chatting with the native speakers. We considered and assessed the students' computer skills, typing abilities and familiarity with communication technology. Then we selected EFL learners who had similar level of skills in these regards

Design and procedures

The study started in November 2013 and ran for 20 sessions. 3 tests were used. The procedure included different stages of application such as selection of the subjects, instruments and materials.

At the first session, the intermediate students were selected via placement test. Those who obtained scores between 52 and 61 indicated that they were at the intermediate level and thus homogenous. In fact, the placement test acted as a criterion for selecting the students who were approximately at the same level of vocabulary knowledge. In order to have an effective

comparison between the level of lexical knowledge of treatment and control groups, a pre-test was administered to check their knowledge of vocabulary and proficiency level as a reference for their improvement after treatment. So after 20 sessions both groups attended the post-test. After administration of pre-test, the control group received no treatment. However the experimental group received treatment based on online chatting with the native speakers and we rechecked their ability at surfing the net, typing, and online communication and chose those who had the same and equal ability.

For the experimental group, the teacher specified the duration of online chatting for 6-8 hours per day. During this time, the teacher was also online, in order to supervise and assist the EFL learners. EFL learners used yahoo messenger software for online chatting with the native speakers and they used it as a tool to type the messages in chat box and communicate with the native speakers about any topic. Furthermore the institute administered 8 random sessions to assess the students' progress during online chatting with the native speakers. These 8 sessions helped them to understand the situation and the process of improvement of lexical knowledge. It should be noted that the control group was taught by using traditional methods (such as reading the words, repeating them and saying the meaning of each word). This group did not have the chance to chat with the native speakers. To maximize the validity of the study, we controlled some variables such as age, gender, environment, time of chatting, knowledge of vocabulary, typing ability, familiarity with online communication and checking the students simultaneously. Farhady, Jafarpour, Birjandi ,1994 state that , " one of the best ways of testing knowledge of vocabulary is via close passage test". Thus we also used close passage test in the last week to make our results more valid.

Data analysis

The data was analyzed through SPSS and One-way analysis of variance was run to analyze the average scores of the two groups. Placement test shows the homogeneity of the groups and also participants' background information. The pre-test was administered to show the knowledge of vocabulary and level of proficiency. We used the independent samples T-test to compare the results of the post-test of two groups and we also used the paired samples T-test to compare the result of pre- test with post- test for each group.

RESULTS AND DISSCUSION

To start with, the researchers had to analyze the data obtained from the administration of the Pretest/Posttest. The group statistics of the scores of the 40 students who took the Pretest/Posttest in both the experimental group and control group are presented in Table 1.

Table 1: Descriptive analysis of both groups in T1 and T2 - Group Statistics

Students		N	Mean	Std. Deviation	Std. Error Mean
Pretest	Experimental Group	20	14.65	3.977	.889
	Control Group	20	14.15	3.360	.751
Posttest	Experimental Group	20	15.80	3.037	.679
	Control Group	20	14.30	3.147	.704

The next step in data analysis was computing the reliability among pre-test and post-test in experimental and control group. As the pre-test and post-test are the same, if the test is reliable, the alpha should be up to 0/75. Table 2 shows the alpha of pre-test and post-test of the experimental group is 0/944 and Table 3 shows the alpha of pre-test/post-test of the control group is 0/898. It means that the pre-test/post-test is highly reliable. Because we have two groups, experimental and control group, naturally the scores are different. The test reliability of the 2 groups which is shown in the table below is different.

Table 2: Reliability Statistics

Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items
.944	.962	2

Table 3: Reliability Statistics

Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	N of Items
.898	.899	2

The next step was to run an independent t-test to compare the mean scores of the two groups on the pre-test (Table 1). The results, as indicated in Table 4, demonstrated that the variances fulfilled the condition of the homogeneity at 0.05 level of significant. ($F=2.402$, $p=0.130>0.05$)

Since the homogeneity of the variances of the two groups was proved, the results of the t-test was claimed to be dependable. Considering the results of the t-test ($t=0.309$, $df=38$, $p=0.759>0.05$), it was concluded that there was significant difference between the experimental group and the control group.

Table 4: Independent Samples Test

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Pretest	Equal variances assumed	.776	.384	.429	38	.670	.500	1.164	-1.857	2.857
	Equal variances not assumed			.429	36.969	.670	.500	1.164	-1.859	2.859
Posttest	Equal variances assumed	.014	.906	1.534	38	.133	1.500	.978	-.480	3.480
	Equal variances not assumed			1.534	37.951	.133	1.500	.978	-.480	3.480

An independent t-test was run to compare the mean scores of the control and experimental groups on the post-test. As displayed in Table 1, the mean score for the experimental group is 14.65, with a standard deviation of 3.977 in pre-test and 14.30 in post-test, with a standard deviation of 3.147. The mean score and the standard deviation for pre-test of the control group are 15.80 and 3.037, and the mean score and the standard deviation for post-test of the control group are 14.15 and 3.360, respectively. These statistical analysis shows the differences between the control and experimental groups' mean scores on the post-test. And as shown in Table 4, Sig. (2-tailed) is more than 0.05, it indicates the effect of chatting on improving learning vocabulary.

CONCLUSION

The purpose of this study was to examine whether chatting of the Iranian intermediate EFL learners with native speakers had any significant effect on learning vocabulary. At the outset of this study the participants were homogenized through the placement test. The results of this study indicated that online chatting with the native speakers, had a significant effect on learning vocabulary on the EFL learners. Also it is clearly observed that the learners in the experimental group were actively involved in expressing themselves freely in the chat rooms with using new vocabulary without anxiety and fear of making mistakes. This sense of security also motivated them to accomplish more as they went along during the course. Using Internet chat rooms for improving students' knowledge of vocabulary is also of great importance due to the opportunity that a chat room naturally gives to its users by combining speaking and writing (more specifically typing) so that all of them can express themselves and type their ideas at the same time without any interference with and interruptions of others' speech and also give reply from the native speakers that are the genuine source of the EFL and learn the new vocabulary from them. This is not possible in real classes. A very prominent advantage of chat room worth mentioning is that whatever is typed there can be saved on disks and further be used by the students to improve their learning and by the teacher to evaluate students and their progress and design better activities and tasks for their improvement of vocabulary.

Internet and chatting with different people all over the world are very important revolutions in the history of human communication. In the third millennium, few people would contest that English is an essential world language today and that the Internet has become a part of modern life. The investigators hope that the results obtained from this study would be beneficial for all those involved in language learning/teaching and help EFL learners improve a much coveted goal, i.e. learning vocabulary that is the key to learning every language.

All in all, according to this research, chatting of Iranian intermediate EFL learners with native speakers has a positive effect on learning vocabulary in experimental group when compared with the control group that shows the level of scores after the treatment is higher than the scores before the treatment).

Limitation of the Study

The limitation of this study is problem with Internet disconnection when the students and the researcher should attend for chatting. Other limitation is that some of the students couldn't attend

on time because they have other works to do and they attend late. Then explore the real native speaker was other limitation in this study. Some people give wrong information about their nationality, at first the researcher should chat with them and when she assure that the addressee was native speaker, introduce to the students and it wasted a lot of time.

Appendix 1: Placement test

ENGLISH LANGUAGE PLACEMENT TEST
(Written by the Colchester English Study Centre)

Choose the answer that you think is correct and circle the appropriate letter:

1.	This man has dark a) heads b) head c) hairs d) hair
2.	and a a) beard b) barber c) moustaches d) facehair
3.	He is a jacket a) wearing b) carrying c) having d) holding

4.	and he is a piece of paper. a) wearing b) holding c) having d) getting
5.	He is sitting at his a) chair b) desk c) office d) room
6.	- perhaps he is a) work b) at work c) business d) on job
7.	You arrive at a party at 8 p.m. What do you say? a) Goodnight b) Good-bye c) Good evening d) Good afternoon
8.	Someone offers you a drink. You don't want it. What do you say? a) Thank you b) Please c) No, thank you d) No, please
9.	Henderson going to work. a) likes not b) don't like c) doesn't like d) not like
10. early in the morning? a) Does he get up b) Gets he up c) Do he get up d) Get he up
11.	He to drive a car. a) am learning b) learning c) is learning d) are learning
12.	A train is a bus. a) more quickly b) quickly c) quicker than d) more quick
13.	He swim very well. a) not can b) cannot c) doesn't can d) don't can
14. the bus to work. a) Always Roberts catches b) Roberts always catches c) Roberts catches always d) Roberts does always catches
15.	Peter works in London. a) He goes there by train b) He there goes by train c) He goes by train there d) There goes he by train
16. TV last night. a) Did he watch b) Watched he c) Did he watched d) Does he watch
17.	I spoke slowly, but he understand me. a) canned not b) didn't can c) didn't could d) could not
18.	He made last year. a) many money b) much money c) a lot of money d) lots money
19.	I asked him a) to not go away b) to go not away c) not to go away d) go not away
20.	He used to live London. a) on b) in c) to d) at
21.	James to him on the phone. a) spoked b) speaked c) spoke d) spoken
22.	" Quiet, please – I" a) am doing a test! b) do a test! c) doing a test! d) does a test!
23.	I won't go to Cambridge if it tomorrow. a) rain b) would rain c) rains d) raining
24.	While he to London he saw an accident. a) was driving b) drives c) drove d) had driven
25.	Millions of cigarettes every year. a) is smoke b) are smoking c) are smoked d) are smoke
26.	He has a experience in marketing in Europe. a) grand b) wide c) large d) great
27.	I remember him in London. a) of meeting b) to meet c) to meeting d) meeting
28.	But I saw him in Frankfurt a) 3 years ago b) for 3 years c) before 3 years d) since 3 years

29.	Could you look the blackboard and read what is on it? a) to b) on c) for d) at
30.	Smith went abroad last year. abroad before. a) He had never been b) He had been never c) He never went d) He went never
31.	The last Olympic Games in Athens. a) were held b) was held c) were held d) were hold
32.	He took cheese. a) all of b) all c) the all d) all of the
33.	The committee held a last week. a) meeting b) gathering c) session d) sitting
34.	I the Prime Minister's speech very carefully. a) heard to b) heard c) listened to d) overheard
35.	He would have known that, if he the meeting. a) had attended b) would have attended c) has attended d) would attend
36.	Would you mind the door? a) open b) to open c) opening d) to opening
37.	In August he for us for 25 years. a) will have worked b) will work c) is going to work d) will be working
38. since I came back to the office? a) Did Robinson telephone b) Was Robinson telephoning c) telephoned Robinson d) Has Robinson telephoned
39.	He speaks English very well he's only 12. a) whereas b) despite c) in spite of d) although
40.	"Don't do that," I said. I him not to do that. a) talked b) told c) spoke d) said
41.	He never takes risks. He's a very man. a) mindful b) anxious c) attentive d) cautious
42.	I'd like to put a suggestion, if I may. a) forward b) over c) across d) through
43.	I this test for at least half an hour now. a) do b) am doing c) have done d) have been doing
44.	I'll speak to him when he a) will arrive b) is arriving c) arrives d) would arrive
45.	"Can you come tomorrow?" He asked tomorrow. a) if I come b) that i come c) if I could come d) that I can come
46.	He hasn't come again today. If he doesn't come, what to do tomorrow. a) he wouldn't know b) he didn't know c) he will not have known d) he won't know
47.	CONVERSATION (questions 47 – 64): Mr and Mrs Wallace want to buy a house, so they go to the office of an estate agent. Agent: Good morning. Mr and Mrs Wallace? Mrs Wallace: Mr Hogan? Agent: How do you do. Mrs Wallace: I spoke to you on the phone. is my husband. a) This b) It c) He d) That Mr Wallace: How do you do.
48.	Agent: How do you do. sit down. a) You b) Please c) Now d) Let (They all sit down at a desk.)
49.	Agent: I understand from our telephone conversation that you're a) intending b) interesting c) intended d) interested
50.	in buying a property for about £85,000, is that ?

	a) true b) possible c) not d) right
51.	Mrs Wallace: No. Well the price is right, but – er – well, we a problem. a) make b) have c) are d) seem We've been living abroad for the last ten years -
52.	Mr Wallace: Longer that. a) than b) that c) as d) to
53.	Mrs Wallace: Yes, I suppose it is – and we want to settle back here a) because b) and c) but d) so
54.	we have very different ideas of the of place we'd like to live in. a) kind b) piece c) shape d) area
55.	Mr Wallace: Yes, you see prefer to live in town, in a centrally located flat. a) I b) I'd c) we d) we'd
56.	Mrs Wallace: And I am really keen to live in country. a) the b) a c) some d) -
57.	I want a big garden. I want a new view. I want to be to go for walks. a) able b) possible c) can d) allow I want to go back to work – that is, to get back into teaching.
58.	Mr Wallace: Well, I'm sure you teach in London, in town, just as easily. a) would b) might c) should d) could
59.	Mrs Wallace: Yes, I think the chances of a) and b) but c) so d) then
60.	getting a job probably much greater in a village school a) is b) are c) will d) would
61.	and I like to be part of the community again, darling. a) would b) do c) will d) shall
62.	Mr Wallace: And I want to live in a flat maintenance included. a) for b) with c) and d) by
63.	You know – you pay for all the I mean, I'm not a do-it-yourself man. a) services b) servants c) assistance d) assistants
64.	I don't like to mend leaky , and that sort of thing. a) walls b) floors c) roofs d) ceilings
65.	AT A HOTEL (question 65 – 80) Mr Graham has just checked into a hotel, but he is not happy with his room. He goes down to the reception desk. Mr Graham: I'm there's been a mistake. My room doesn't have a bath. a) sorry b) afraid c) anxious d) regret
66.	Hotel Clerk: Well, I think your room is correct, sir. Room 118 ? a) don't you b) isn't it c) doesn't it d) can you
67.	Mr Graham:, could I have a bath, please? a) Thus b) Well c) In spite d) Thank you
68.	Hotel Clerk: Er – I'm afraid we don't a room with a bath and – a) reserve b) get c) have d) retain
69.	Mr Graham: Look, I'm very tired. I don't want to but my firm always book a room with a bath. a) shout b) denounce c) anger d) argue
70.	Hotel Clerk: Er – I'll check the a) correspondence b) mailing c) communicate d) lettering
71.	but I don't think you were into a room with a bath. a) reserved b) checked c) booked d) registered There we are, it is Mr Graham, isn't it? Mr Graham: It is, yes. The clerk shows Mr Graham a letter.

72.	Hotel Clerk: Yes, one room. a) alone b) single c) bathless d) only
73.	Mr Graham: I'll see them when I get back. Well, I that it's our mistake, a) appreciate b) deprecate c) respect d) expect
74.	but are you sure there's with a bath? a) not b) something c) anything d) nothing Hotel Clerk: Well,
75.	Mr Graham: I've just flown a very long and I'm very tired and all I want is a bath and a sleep. a) distance b) airline c) period d) timing
76.	Hotel Clerk: Well, as I've said, sir, there's nothing for tonight. a) extremely b) perfectly c) absolutely d) especially But let's see. You're here for five days, aren't you? Mr Graham: Oh dear!
77.	Hotel Clerk: I'll just have a with the manager. a) word b) sentence c) phrase d) dialogue
78.	Mr Graham: I would it. a) value b) appreciate c) thank d) reward
79.	I'm to have a long hot bath! a) despaired b) worried c) desperate d) overwhelmed
80.	Hotel Clerk: Don't worry, sir! it with me. a) Let b) Leave c) Give d) Stop

TEFL TEACHERS' REACTIVE FOCUS ON FORM: THE CASE OF IRANIAN PRE-INTERMEDIATE AND INTERMEDIATE LANGUAGE LEARNERS AND THEIR SPOKEN LINGUISTICS ERROR TYPES

Ahmad R. Beigi Rizi¹

ABSTRACT

The role of corrective feedback (CF) is debated in second language acquisition (SLA). The possible relationship among L2 teachers' spoken corrective feedback types, the learners' proficiency levels, and their error types have not been unequivocally shown, in particular, not in the case of foreign language teachers' reactive focus on form among pre-intermediate and intermediate levels. This study includes the transcripts of 120 hours of naturalistic classroom interactions recorded from ten classes of five teachers (two classes for each teacher, one pre-intermediate and one intermediate), totaling 1608 reactive focus on form episodes, known as corrective feedback. Chi-square analysis was used to analyze association between variables of this study in pairs (proficiency level and error types, proficiency level and corrective feedback types, error types and corrective feedback types). Statistically significant associations were revealed from the results of the analysis and also recasts were found to be the most widely employed corrective feedback types at both proficiency levels. Overall, the present study has shown that there is a diversity of corrective feedback reactions by the EFL teachers.

KEYWORDS: Corrective feedback, Focus on form, Reactive focus on form episode, Recast, Marked recast, Unmarked recast

INTRODUCTION

During interaction in foreign language classes, participants in the conversation may negotiate for meaning due to a lack of understanding. As part of this negotiation, foreign learners receive feedback on their language production, potentially helping to draw attention to different language problems and leading them to notice gaps between features of their interlanguage and the target language. By providing learners with information regarding their linguistic and communicative accomplishments or failures, this interactional feedback creates a favorable environment for L2 development. Through negotiation of meaning, input can be uniquely tailored to individuals'

strengths, weaknesses, and communicative needs providing language that suits their distinct development levels.

The discussions on how corrective feedback (CF) should be viewed, have developed in SLA and language pedagogy and the controversies address (1) whether CF contributes to L2 acquisition, (2) which errors should be corrected, (3) who should do the correcting (the teacher or the learner him/herself), (4) which type of CF is the most effective, and (5) what is the best timing for CF (immediate or delayed) (Ellis & Jiang, 2009). According to Lyster (1993) and Swain (1995), a communicative oriented environment is not the only necessary condition for Second Language (SL) acquisition. According to them, a way to significantly improve learners' performance is to focus on form in communicative settings, referring to formal instruction while communicative activities are performed, i.e., teachers drawing learners' attention to specific linguistic forms when a task-based syllabus is followed. For Ellis (1994), there are two ways to **focus on form**. The first is through the activities that require both communication and attention to form, and the second through corrective feedback during performance in communication activities. The latter will be the focus of this article.

Focus on form

Focus on form overtly draws students' attention to linguistic elements as they arise incidentally in lessons whose overriding focus is on meaning or communication (Long, 1991, as cited in Doughty, 2001). Focus on form involves an occasional shift in attention to linguistic code features — by the teacher and/or one or more students — triggered by perceived problems with comprehension or production (Long & Robinsin, 1998).

Focus on form Instruction

FFI occurs during interlanguage construction and attempts to draw learners' attention to and providing opportunities for them to practice specific language features (Ellis, Basturkman&Loewen, 2001).

For example, a student might say, “*Everybody love flowers.*” The teacher would respond, “*love!*”. You need to use the third person singular “*loves*”.” The student would then state, “*Everybody loves flowers.*” A distinction exists between ***reactive and pre-emptive focus-on-form***. **Reactive focus-on-form** refers to error correction, corrective feedback, or negative evidence/feedback. Error correction occurs when, during the context of focus-on-meaning activities, learners' attention is drawn to errors in their production. Thus, the error triggers discourse aimed at a specific linguistic item. Contrarily, **pre-emptive focus-on-form** is defined as occurring when either the teacher or a learner initiates attention to form even though no actual problem in production has arisen (Farrokhi & Gholami, 2007).

According to Ellis, Loewen and Erlam (2006) corrective feedback (CF) takes the form of responses to learner utterances that contain error. The responses can consist of (a) an indication that an error has been committed, (b) provision of the correct target language form, or (c) metalinguistic information about the nature of the error, or any combination of these (p. 340).

Lyster & Ranta (1997) identified six different corrective feedback strategies: explicit correction, recasts, clarification requests, metalinguistic information, elicitation, and repetition. All of these techniques are placed in an explicit-implicit continuum. Farrokhi (2005a) also proposed a more comprehensible and applicable classification of feedback types: unmarked recasts, marked recasts, explicit correction, and negotiated feedback.

L2 proficiency and CF

This article also explores the relationship between the learners' proficiency level (pre-intermediate and intermediate levels) and the teachers' employed CF types. Proficiency in an L2 requires that learners acquire a rich repertoire of formulaic expressions, which caters to fluency, and a rule-based competence consisting of knowledge of specific grammatical rules, which caters to complexity and accuracy (Skehan 1998). Evidence that proficiency level may affect teachers' choice of corrective feedback can be found in Lyster and Ranta's (1997) study. They reported that the teacher of the most advanced class tended to recast learner errors to a lesser degree than the other three teachers did.

Types of errors

When foreign language teachers are correcting learners' errors, it is important to identify the type of error the learners make because it is not always the case teachers want or need to correct everything. In setting up taxonomy of errors, many researchers have established their own category of errors. In this study the researchers have used the Lyster's taxonomy of errors which distinguishes four main error types: (1. grammatical, 2. lexical, 3. phonological, and 4. unsolicited use of L1) Lyster (1998).

REVIEW OF THE RELATED STUDIES

One of the most popular questions among researchers and teachers is how to treat foreign language learners' errors. Correcting learners' errors is a vital classroom activity which is open to systematic investigations since as Guenette (2007) observes, the problem of how to handle learners' errors lies in the paucity of research which deals with corrective feedback systematically and at the same time controls many a variable involved in the process of giving corrective feedback to learners. To give or not to give feedback is no longer the question, because, thus, the majority of studies on feedback (Ashwell, 2000; Amirghassemi, Azabdaftari, & Saeidi, 2013; Bitchener, 2008; Chandler, 2000; Fathman & Whalley, 1990; Ferris, 1995a, 1995b, 1995c, 1997, 1999, 2006; Ferris & Hedgcock, 1998; Ferris & Helt, 2000; Ferris, Chaney, Komura, Roberts, & McKee, 2000) reveal the importance of responding to learners' output either in oral or written form; Ellis (2009) states that research on feedback can be studied from two perspectives: "the teachers' provision of feedback and students' responses to this feedback" (p. 98). He categorizes the former into: Direct CF (Corrective Feedback), Indirect CF, Metalinguistic CF, Focused and unfocused CF, Electronic feedback, and reformulation; the latter deals with whether students are required to revise or not; however, the question of what and how to respond to second or foreign language learners' speech or written essays remains unresolved; some doubt the type of feedback given to learners, some are skeptical of focus of feedback, and where these two reach a consensus, the third party opposes by questioning both on methodological grounds.

Ajideh and FareedAghdam (2012) investigated the possible relationship among L2 teachers' spoken corrective feedback types, the learners' proficiency levels (intermediate and advanced levels), and their error types. They concluded that there might be no one single way of treating learners' errors. The study provided support for the incorporation of focus on form into the context of meaning-focused instruction. This study suggested that learners of intermediate and advanced levels committed different types of errors and all the teachers employed different types of corrective feedback for learners of different proficiencies and the interaction between error types and CF types were statistically significant, confirming that learners' error types affected teachers' choice of CF types.

Lyster and Ranta (1997) investigated the relationship between types of corrective feedback and learner uptake in a primary French immersion classroom. Four teachers provided corrective feedback on learner errors in speech production in 14 subject-matter lessons and 13 French language art lessons. Feedbacks were classified into six types: explicit correction, recasts, clarification requests, metalinguistic feedback, elicitation, and repetition. Learner uptake, a student utterance following the teacher's feedback, was also categorized into two types: repair and need-repair, or in other words, successful and unsuccessful responses. The results revealed that the most frequent type of feedback was the recast. Moreover, the recast never led to student-generated repair; the learner merely repeated what the teacher had said. In contrast, elicitation and metalinguistic feedback were less frequent and were found to be effective in that they encouraged learners to generate repair.

Lyster (1998) also investigated the relationship among error types and corrective feedback in relation to immediate learner repair. The results of this study showed that the interaction between error type and feedback type was meaningful; it also confirmed that error type affected choice of feedback. To the best of our knowledge, there is not any comprehensive descriptive study investigating types of spoken errors and their frequencies across pre-intermediate and intermediate levels. So, there is a need to investigate these issues which probably have a relationship with selecting specific feedback types by teachers. This work attempted to explore different types of teachers' corrective feedback relative to different types of learners' errors across two proficiency levels (pre-intermediate and intermediate). To meet these objectives, the following research questions were formulated.

RESEARCH QUESTIONS

- 1) Which types of L2 learners' spoken linguistic error types are corrected most frequently by their teachers across pre-intermediate and intermediate levels?
- 2) Do L2 teachers use different types of spoken corrective feedback for learners of pre-intermediate and intermediate levels?
- 3) What types of learners' errors lead to what types of teachers' corrective feedback?

METHODOLOGY

Participants

For this study pre-intermediate and intermediate students of five teachers from Payampersa English language teaching institute in Zarrinshahr city in Isfahan province of Iran were chosen. The teachers were one male and four females. One pre-intermediate and one intermediate class per teacher were invited and the interactions of 8 sessions from each class (80 session, 120 totally) were recorded, transcribed, coded and analyzed. The total number of the students in this study were 100, aged between 13 to 35, including 48 males and 52 females. The classes ranged in size from 7 to 20 students. The teachers were unaware of the purpose of the study. They were just invited to take part in the study.

Instruments

Quick Placement Test

Besides considering these proficiency levels based on the institute' criteria, a proficiency test of Nelson test (2001) including 30 questions and a reliability of 0.873 was administrated to screen the subjects and homogenize them based on their levels of proficiency.

Course book

The course book used in the conventionally instructed group was "American Headway 2" for pre-intermediate and "American Headway 3" for intermediate level by Soars and Sayer (2010). These course books were used because they were being taught by the institute and the teachers were familiar with them.

The recording Software Program

The sessions of the classes were recorded with ZavioCamGraba IP System 3.5.57.

Analysis and data coding system

The researchers listened to the recordings, identified and then transcribed episodes containing reactive focus on form (RFF) in this study only because the teachers perceive the learners' utterance as inaccurate or inappropriate and draw their attention to the problematic feature through negative feedback.

When RFF episodes were coded, they were classified as two main parts. In the first part the linguistic errors committed by the students were included, and in the second part the teachers' responses to the errors in the form of corrective feedback were included.

- 1) The linguistic errors committed by the students were classified into four main types according to Lyster and Ranta's (1997) classification.
 - a. **Grammatical errors:** determiners, prepositions, pronouns, word order, tense, auxiliaries, subject verb agreement, noun-adjective agreement, plurals, negation, question formation
 - b. **Lexical errors:** inaccurate choices and non-target derivations of lexical items in open classes namely, nouns, verbs, adverbs, and adjectives, and incorrect use of prefixes and suffixes.

- c. **Phonological errors**: Suprasegmental and segmental aspects of the phonological system
 - d. **Unsolicited uses of LI**: students' use of Persian when English would have been more appropriate and expected
- 2) The teachers' responses to the errors in the form of corrective feedback were classified into six types based on a combination of Farrokhi (2005a) and Lyster&Ranta's (1997) classifications.
- a. **Unmarked recasts**: (teacher's implicit corrective reformulation of student's non-target like form)
 - b. **Marked recasts**: (teacher's corrective reformulation and highlighting or marking the reformulation)
 - c. **Explicit correction**: (Teacher's direct treatment of students' non-target-like form by explanation, definition, examples, etc.)
 - d. **Negotiated feedback**: (teacher provides students with signals to facilitate peer- and self-correction).
 - e. **Clarification request**: (carries questions indicating that the utterance has been ill-formed or misunderstood and that a reformulation or a repetition is required).
 - f. **Elicitation**: (a correction technique that prompts the learner to self-correct through request for reformulations of an ill-formed utterance, the use of open questions, or use of strategic pauses to allow a learner to complete an utterance).

The researchers used the raw frequencies and percentages of RFF episodes and then Pearson's chi-square analysis was performed on the raw frequencies. In order to determine inter-rater reliability of RFF episodes identification, a second rater coded a sample of 10% of the data independently. Analysis of the coding presented 83% agreement.

RESULTS AND DISCUSSION

The results are presented in three parts using different figures and tables as follows:

The learners' proficiency levels and their error types

Table 1 shows the frequency distribution of error types in the entire database. A total of 1608 error turns were identified in 120 hours of meaning-focused lessons, 924 (57.5%) and 684 (42.5%) at pre-intermediate and intermediate levels respectively. It means that each RFF episode occurred at a rate of every 4.4 minutes which means that the teachers were attentive to corrective feedback, one reason could be because they were being recorded and they cared about the meaning and form and the other reason could be that the learners were eager to communicate without being worried if they were corrected by the teachers.

Table1: Frequency and percentage of error types across proficiency levels (all teachers)

Error Types	Level			
	Pre-intermediate		Intermediate	
	Raw Frequency	Percentage	Raw Frequency	Percentage
L1	126	13.6%	77	11.3%
Phonological	331	35.8%	129	18.9%
Lexical	225	24.4%	187	27.3%
Grammatical	242	26.2%	291	42.5%
Raw Total	924	100%	684	100%

The percentages of error types committed by Pre-intermediate learners are as follows: 13.6% were L1, 35.8% were phonological errors, 24.4% were lexical errors, and 26.2% were grammatical. So, phonological errors were the most frequent error type at this level. The percentages of error types at intermediate level show a different pattern, comparing with those at Pre-intermediate level. Grammatical errors accounting for 42.5% were mostly occurred at intermediate level. And lexical errors, with 15.2% discrepancy, had the second highest percentage (27.3%). Figure 1 displays an even more obvious picture of the percentage of errors.

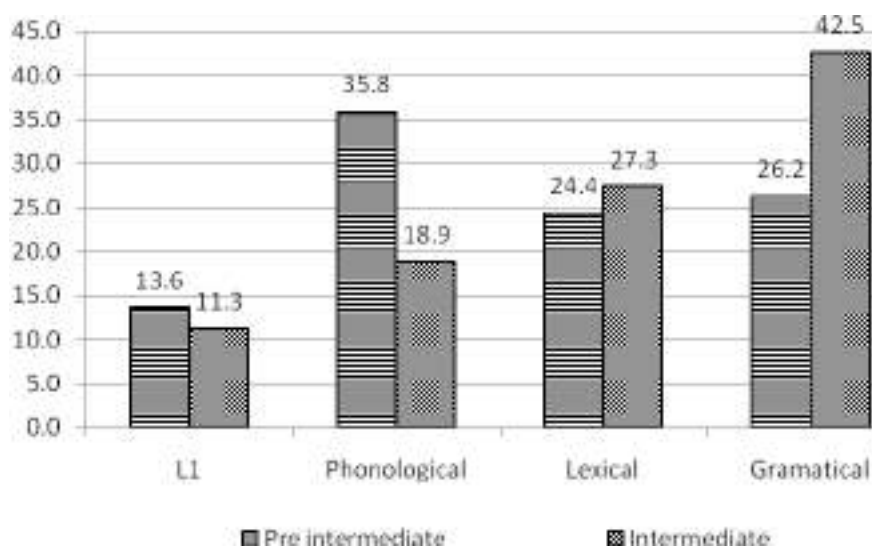

Figure 1: Percentage of error types across proficiency levels (All Teachers)

In order to find out whether there was a statistically significant association between learners' proficiency level and their error types, the chi-square test was used. The results ($\chi^2 = 0.744$, $df = 3$, $p < .05$) revealed that the association between the variables was statistically significant. This suggests that learners of different proficiencies committed different types of errors.

The learners' proficiency levels and the teachers' corrective feedback types

In Table 2 we can observe the distribution of different feedback moves employed by teachers at both proficiencies, and figure 2 shows the percentages graphically. In general 924 (57.46%) instances of RFFE's occurred at pre-intermediate classes, while there were 684 (42.54%) instances at intermediate classes. As can be seen in the table 2 and figure 2, marked recasts accounting for almost (42.3%) of all CF moves were the most widely used CF for pre-intermediate learners. And unmarked recasts (35.7%) were favored to be employed more than other corrective feedback types for intermediate learners. This might lie in the implicit nature of unmarked recasts. As the definition clarifies, unmarked recasts, in comparison with marked ones, do not highlight the learner's non-target-like form. So, unmarked recasts risk being ambiguously perceived by pre-intermediate learners as alternative forms fulfilling discourse functions other than corrective ones.

Table 2: Frequency and percentage of feedback types across proficiency levels (all teachers)

Corrective Feedback Types	Level			
	Pre-intermediate		Intermediate	
	Raw Frequency	Percentage	Raw Frequency	Percentage
Marked	391	42.3%	63	9.2%
Unmarked	248	26.8%	244	35.7%
Explicit	106	11.5%	44	6.4%
Negotiated	68	7.4%	167	24.4%
Clarification	46	5.0%	57	8.3%
Elicitation	65	7.0%	109	15.9%
Raw Total	924	100%	684	100%

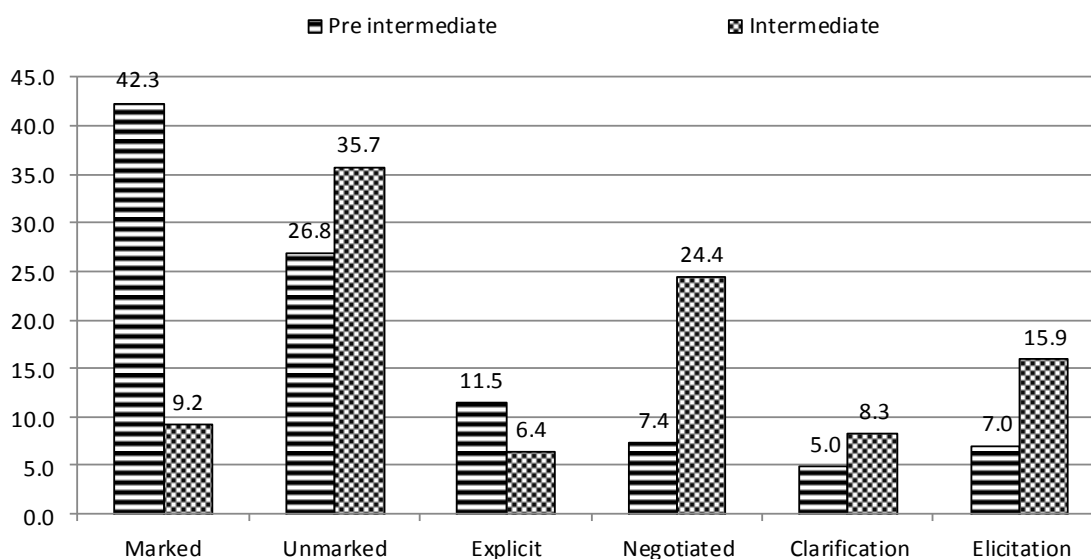

Figure 2: Percentage of feedback types across proficiency levels (All Teachers)

The results ($\chi^2=2.87$, $df = 5$, $p< .05$) indicated a statistically significant association. It means that all the teachers employed different types of corrective feedback for learners of different proficiencies.

The relationship between the learners' error types and the teachers' corrective feedback types

Table 3 presents a comparison of the distribution of CF types across different error types. Unsolicited uses of L1 invited mostly marked recasts (56.65%). Other types of corrective feedback following L1 errors accounted only for 43.35% of all CF turns. Similarly, phonological errors were mostly followed by marked recasts (48.04%). The second CF type following phonological errors was unmarked recast, accounting for 19.35%. Other four types of CF have very low percentages. Lexical errors were corrected mostly using unmarked recasts which accounted for almost half (47.57%) of the total number of CF. They were secondly followed by negotiated feedback (14.56%). The third and fourth CF types used to treat lexical errors were explicit correction (12.14%) and elicitation (11.41%) respectively. Clarification request and marked recasts following lexical errors totally account for 14.32% of all FC types. And finally, grammatical errors mostly favored unmarked recasts (35.65%). Negotiated feedbacks, accounting for 23.83% and marked recasts, accounting for 16.32%, were the second and third type of corrective feedback following grammatical errors. Other three CF types totally accounts for 24.2% of the total number of CFs.

Table 3: Relationship between error types & feedback types

Corrective Feedback Types	Raw Frequency & Percentage of Error Types							
	L1		Phonological		Lexical		Grammatical	
Marked	115	56.65%	221	48.04%	31	7.52%	87	16.32%
Unmarked	17	8.37%	89	19.35%	196	47.57%	190	35.65%
Explicit	20	9.85%	40	8.70%	50	12.14%	40	7.50%
Negotiated	19	9.36%	29	6.30%	60	14.56%	127	23.83%
Clarification	18	8.87%	34	7.39%	28	6.80%	23	4.32%
Elicitation	14	6.90%	47	10.22%	47	11.41%	66	12.38%
Total	203	100%	460	100%	412	100%	533	100%

Figure 3 illustrates a clearer picture of the relationship between learners' error types and teachers' CF types. As the findings suggest, the five teachers provided corrective feedback consistently. It means that the teachers' correction of learners' errors showed some degree of systematicity in that they tended to select feedback types in accordance with error types: namely, marked recasts after unsolicited uses of L1 and phonological errors and unmarked recasts after lexical and grammatical errors.

According to the results of chi-square test ($\chi^2=3.79$, $df = 15$, $p< .05$), the interaction between error types and CF types were statistically significant, confirming that learners' error types affected teachers' choice of CF types.

CONCLUSION

The focus of this study which was based on just teachers' reactive focus on form and only on four types of learners' linguistic errors among just two levels of proficiencies showed that although the same books and the same language teaching methodology were applied in each class the EFL learners of different proficiencies (pre-intermediate and intermediate levels) committed different types of errors and the EFL teachers being affected by learners' error types, employed different types of corrective feedback for learners of different proficiencies which means that the learners' error types affected teachers' choice of CF types.

This study also shows that we probably can never expect the students of the same class commit the same mistakes because the students think differently and produce different topics to support their beliefs and comments and they use their own specific acquired language competence, culture, knowledge and feelings to create their own personal output. According to Ellis and Jiang (2009) "different perspectives on corrective feedback are offered by interactionist/cognitive theories and sociocultural theory". This study not only shows the diversity of errors among the students of different proficiency levels but also supports the fact that there is a diversity of corrective feedback reactions by the EFL teachers.

ABSTRACT

The present study was an attempt to investigate the difference between extrovert and introvert English as a foreign language (EFL) learners' cooperative writing. Initially 150 intermediate learners were asked to participate in the study. They sat in a Preliminary English Test PET and 90 homogenous learners, in term of language proficiency, were selected to fill Persian translation of Eysenck Personality Inventory questionnaire. Based on the results, 30 introvert and 30 extrovert learners were randomly assigned to two experimental groups. Both groups received a model of cooperative learning (CL), i.e. Cooperative Integrated Reading and Composition (CIRC) as their treatment. After the treatment was done, they were asked to cooperatively write two essays in descriptive voice on two different topics. Their writings were scored based on Jacobs, Zingraf, Wormuth, Hartfiel, and Hughery (1981) scoring profile by two raters, and the mean of each student's scores were considered as their cooperative writing score. Then the performance of extrovert and introvert learners on the test was compared using independent samples t-test. The results indicated that introvert learners significantly outperformed extrovert learners. The results indicated that despite the fact that Iranian learners are mostly individualistic, some cooperative learning methods could be helpful and accepted by them. Also teacher training centers need familiarize teachers with CL techniques and syllabus designers use more exercises and tasks include CL models like CIRC.

KEYWORDS: *cooperative writing, extrovert, introvert.*

INTRODUCTION

Many EFL teachers complain and wonder why their students do not show considerable improvement in their writings every time they check the students' writings. This shortcoming on the part of a student's maybe partly due to personality traits and partly due to atmosphere of the class which is more competitive and teacher-centered rather than cooperative and learner-centered. almost all researchers working on CL have consensus on that the learners performance improves through cooperative learning (Johnson & Johnson, 2008; Kagan, 1990; Slavin, 1995; Sharan, 2010, as cited in shideh, 2011). There is also conflicting suggestions about the differences

between learning achievements of extroverted and introverted learners (e.g. Berry, 2007; Van Dael, 2005). Furthermore, only a few researches have been done in order to compare EFL learners' personality trait of extroversion/introversion and their performance in cooperative writing tasks, e.g., in Iran, Shideh (2011) has investigated this relationship in speaking tasks.

Cooperative writing is the instructional use of small groups so that students work together to maximize their own and each other's learning. In this way students will interact with each other and the teacher during the instructional session. As Johnson and Johnson (2008) stated within cooperative situations, individuals seek outcomes that are beneficial to themselves and beneficial to all other group members. According to Sharan, Y. (2010) the benefits of cooperative learning are a better mutual relationship, respect, and higher communication. It also has advantages in thinking strategies. Competitive learners have difficulty in obtaining a balance between being competitive and interacting with others. Their emotional interaction and trust are two other concerns. "The basic elements are Positive interdependence, Promotive interaction, Interpersonal and small group skills, Group processing, and individual and group accountability which are essential for effective group learning, achievement, and higher-order social, personal and cognitive skills (e.g., problem solving, reasoning, decision-making, planning, organizing, and reflecting)." (Johnson, D.W & Johnson R.T. 2005, pp.285-360).

An Overlook on Cooperative Learning

Co-operative learning has been championed by many advocates. One reason for its popularity lies in the flexibility of the term 'co-operative learning' and, consequently, in the possibility of applying it to different theories and educational contexts. At first sight this flexibility strikes one as positive, and no doubt it is. However, the term is potentially misleading if the conditions it denotes are not seen as being embedded in a particular theory, a specific domain of knowledge or a certain curricular context; for example, a common curriculum. In co-operative learning contexts students do not learn in what may be called a compositional vacuum; they are members of a class and a small group. New researches defend the claim that it is especially such compositional contexts that have consequences for learning opportunities in co-operative learning environments (Resh, 1999; Terwel *et al.* 2001; Terwel & Van den Eeden, 1994; Webb, 1982).

Co-operative learning was designed and implemented to develop social strategies and acceptable social attitudes in students, and to improve social relations within and between groups. In addition, there is a large cluster of co-operative learning models aimed at cognitive development. Sometimes co-operative learning is directed at both the social and the cognitive side of human development. There is yet a third, more comprehensive perspective, one that is not necessarily in contrast to the social and the cognitive aims of co-operative learning. It is called curriculum perspective on cooperative learning. Furthermore College and university students are increasingly being asked by faculty to work co-operatively and learn collaboratively. This increased emphasis on group learning is partly a reaction to societal changes including a new emphasis on team work in the business sector (Millis & Cottell, 1998) coupled with a realization that in a rapidly changing information society (Hansen & Stephens, 2000) communication skills are increasingly important. At the tertiary level of education, the reasons include an increasingly diverse student population who need to develop ways of learning together in order to achieve (Millis & Cottell,

1998), the increased use of teaching and learning that emphasize learner-driven approaches such as peer learning (Hansen & Stephens, 2000), the growth of online courses (Carlson, 2000) that may include a computer-mediated conferencing component requiring online dialogue, and student projects that often require a team approach because of their scope, depth and type (Puntambekar 1999).

Researchers have shown that group learning leads to academic and cognitive benefits. Group learning promotes student learning and achievement (Cockrell *et al.*, 2000; Hiltz, 1998; Johnson *et al.* 2000; Slavin, 1992), increase the development of critical thinking skills (Brandon and Hollingshead, 1999; Cockrell *et al.*, 2000), and promote greater transfer of learning (Brandon and Hollingshead 1999). Group learning also aids in the development of social skills such as communication, presentation, problem solving, leadership, delegation and organization (Cheng & Warren, 2000).

Kagan (1995) states: cooperative learning was developed originally for educating people of different ages, experience and levels of mastery of the craft of interdependence. He sees education as a reacculturation process through constructive conversation. Students learn about the culture of the society they wish to join by developing the appropriate vocabulary of that society and by exploring that society's culture and norms. Cooperative learning may be used in different situations. For example students work in pairs together in a Think-Pair-Share procedure, where students consider a question individually, discuss their ideas with another student to form a consensus answer, and then share their results with the entire class. The use of pairs can be introduced at any time during a class to address questions or solve problems or to create variety in a class presentation. The Jig Saw method (Aronson 1978) is a good example. Students become "experts" on a concept and are responsible for teaching it to the other group members. Groups subdivide a topic and members work together with those from other groups who have the same topic. They then return to their original groups and explain their topic.

Johnson, Johnson and Smith (1991) have summarized some principles in their definition of cooperative learning: "First, knowledge is constructed, discovered, and transformed by students. Faculty create the conditions within which students can construct meaning from the material studied by processing it through existing cognitive structures and then retaining it in long-term memory where it remains open to further processing and possible reconstruction. Second, students actively construct their own knowledge. Learning is conceived of as something a learner does, not something that is done to the learner. Students do not passively accept knowledge from the teacher or curriculum. Students activate their existing cognitive structures or construct new ones to subsume the new input. Third, faculty effort is aimed at developing students' competencies and talents. Fourth, education is a personal transaction among students and between the faculty and students as they work together. Fifth, all of the above can only take place within a cooperative context. Sixth, teaching is assumed to be a complex application of theory and research that requires considerable teacher training and continuous refinement of skills and procedures" (p1:6)

There are different models of cooperative learning: Slavin developed the STAD method (Student Teams-Achievement-Divisions) where the teacher presents a lesson, and then the students meet in teams of four or five members to complete a set of worksheets on the lesson. Each student then takes a quiz on the material and the scores the students contribute to their teams are based upon the degree to which they have improved their individual past averages. The highest scoring teams are recognized in a weekly class newsletter. In another method developed by Slavin- TGT (Teams-Games-Tournaments) instead of taking quizzes the students play academic games as representatives of their teams. They compete with students having similar achievement levels and coach each other prior to the games to insure all group members are competent in the subject matter. Other structures include: CIRC- Cooperative Integrated Reading and Comparison (Madden, Slavin, and Stevens), Learning Together (Johnson & Johnson), Jigsaw II (Slavin).

Who Gains What From Cooperative Learning

For all its demonstrated benefits, students are often apprehensive about group learning, especially those who have had previous experience with learning in groups. Students fear that other team members will not pull their weight or that they will waste their time explaining the material to be learned to slower team mates (Felder & Brent, 1996; Salomon & Globerson, 1989). Students are also resistant to student-centred approaches to learning because of its novelty; they are accustomed to teacher-centred, direct instruction where students are provided with the content they need to know (Felder & Brent, 1996). Another major reason for apprehension is that college and university students often do not know how to work together and are not given any help in making their groups functional (Phipps *et al.* 2001).

Equally important is the impact of group learning on faculty. Faculty face myriad instructional and institutional challenges when implementing group learning into their classrooms. These include the changing role of the instructor from lecturer to facilitator or coach, the shift in authority from the individual instructor to shared authority with the group of learners, careful planning of the instructional setting such as timing and efficiency concerns, and assessment issues such as group versus individual grades.

Traditionally, the instructor has been the source of knowledge in the classroom (Hansen & Stephens, 2000). As a result of the nature of this role, instructors adopted what they considered to be the most efficient instructional method for imparting information – lecturing. While lecturing is still the most common teaching method in higher education (Gamson, 1994), it simply does not occupy a very major role in the collaborative learning context. As the onus for knowledge construction, information researching and product creation rests increasingly with student groups, the role of the teacher changes from ‘the sage on the stage’ to ‘the guide on the side’. In this way, faculty become individuals who facilitate students in the learning process. They assist with knowledge discovery and investigation, subtly steer learning activities and group processes, and coach students along in the educational experience. In group learning, the relationships between students and teachers are different from more traditional educational contexts. Both learners and instructors share the responsibility for the learning experience. Students become participants who use social skills to create knowledge, and undertake and complete tasks (Matthews *et al.* 1995). For the teacher-as-lecturer to become the teacher-as-facilitator, a shift in authority within the

classroom must occur. This can be disconcerting for many teachers. However, with careful planning, flexibility, self-confidence and practice, a shift in the role of the teacher from the traditional lecturer to a facilitator/mentor can be accomplished successfully (Hanson 1995).

Group learning imposes a steep learning curve on everyone involved (Felder & Brent, 1996). The key to making group learning successful is to understand the process and to take precautionary steps to ensure success (Felder & Brent, 1996).

RESEARCH QUESTION

To investigate the difference between extrovert/introvert EFL learners' cooperative writing the following question was proposed: Is there any significant difference between extrovert/introvert EFL learners' cooperative writing?

METHODOLOGY

The purpose of the study is to investigate the difference between extrovert and introvert EFL learners' cooperative writing. Accordingly, 150 male EFL students were tested and 60 of them were selected to serve as the subjects of the study. These 60 learners were assigned to four different groups—two groups included extroverts and two groups included introverts. Afterwards, they will be taken a course of writing based on a model of cooperative learning, namely Cooperative Integrative Reading and Composition (CIRC). At the end of the program they were asked to sit in two writing tests and the obtained results went through the statistical analysis.

Participants

The participants of this study were 60 intermediate EFL learners studying English at three branches of Iranmehr Language Institute, namely Haft-e Tir, Dolat, and Shahrak-e Gharb, Tehran, Iran. The Participants were ranging between 20 and 30 in age. Initially 90 learners were selected from a larger group of 150 students based on their results on PET. Then, 60 students were selected based on the results of the performance on the administered short scale of Eysenck Personality Questionnaire- Revised. Half of the selected students were proved, based on the results of the questionnaire, to be extrovert and the other half to be introvert.

Instrumentation

Personality Questionnaire

The EPI (Eysenck, Eysenck, & Barrett, 1985) is a validated 57 Yes/No item questionnaire to assess the personality traits of a person. The test provides the testees with three different scores: the E score which is related to how much extrovert a person is, the N score measuring the neuroticism, and the Lie score which tries to measure how socially desirable a person has wanted to prove to be. The E score is computed out of 24 since it consists of 24 items, the N score is out of 24, and the Lie score is out of nine. The researchers used the Farsi version provided and validated by Seena Institute of Behavioral Sciences Research in Tehran in order for the respondents to answer the questionnaire more accurately. the reliability of the administration of the EPI questionnaire was calculated to be 0.72.

Preliminary English Test (PET)

To begin with, the researcher used a sample PET to choose a homogenous sample of participants based on their level of proficiency prior to the study. PET consists of the four parts of reading and writing (paper 1), listening (paper 2), and speaking (paper 3).

The first paper (reading and writing) takes one hour and 30 minutes. The reading part consists of five parts (35 questions) which test different reading skills with a variety of texts. The writing part comprises three parts which test a range of writing skills. The test's focus here is the assessment of candidates' ability to produce straightforward written English. Paper 2 (listening) takes 30 minutes. This part consists of four parts ranging from short exchanges to longer dialogues and monologues which will be heard by students two times. The test focus in this section is assessment of candidates' ability to understand dialogues and monologues in both informal and neutral settings on a range of everyday topics. The last paper which is speaking lasts for 10-12 minutes per pair of candidates. The test focus of the speaking part is assessment of candidates' ability to express themselves in order to carry out functions as threshold level. As this research was focused on the writing ability of the learners, the listening, reading, and writing papers of the PET was administered. The reliability of the test scores gained by the participants on the pilot PET – using Cronbach Alpha was 0.72. The inter-rater reliability of the two raters scoring the writing papers proved significant ($r = 0.832$, $p = 0.003 < 0.01$). Hence, the researcher was rest assured that the two raters could proceed with scoring all the subsequent writing papers in this study.

Essay Writing Test

Two essay writing test were used to fulfill the purpose of this study. The students will be asked to cooperatively write two essays on two different predetermined topics in a descriptive voice. Their performances on these tests were scored by two raters and the mean of each learner's score were served as the data for final data analyses.

Writing Rating Scales

The analytic writing scale which was used to rating participants performance on the both essay writing tests is based on analytic scoring profile of Jacobs, Zingraf, Wormuth, Hartfiel, and Hughey (1981, as cited in Weigle, 2002, p.116). In this rubrics, essays are rated on five different rating dimensions of writing quality in different parts: content (30 points), organization (20 points), vocabulary (20 points), language use (25 points), and mechanics (5 points). Also, there are several sample answers to the Writing Part 3, with marks and examiner comments, in order to help teachers to assess the standards required in PET. In the present study, marks for Part 3 of PET were given according to the Cambridge Mark Scheme ranging from 0-5. The inter-rater reliability of the scores, calculated based on the first 10 papers scored by them, was proved significant ($r = 0.791$, $p = 0.007 < 0.01$)

RESULTS AND DATA ANALYSIS

Participant Selection

The first step in the process of participants' selection was to pilot PET. Since the purpose of this study was to measure the writing ability of the participants, the speaking section of PET was excluded from PET. Following the piloting of the PET, the descriptive statistics of this administration were calculated with the mean and standard deviation standing at 48.83 and 7.79, respectively. after piloting the test, item analysis was done. Item facility measures fell between .33 and .75 and item discrimination amounts ranged from .14 to .54. Therefore, there was no mal-functioning item; and thus, no need to revision on any of the items. Moreover, the reliability of the test scores gained by the participants on the pilot PET – using Cronbach Alpha was 0.72.

Following the piloting, the PET was administered to 150 students with the aim of selecting 90 of them for the study. The aim of this administration was to homogenize learners in terms of their language proficiency. The descriptive statistics of this process are presented below with the mean and standard deviation being 52.28 and 7.98, respectively.

Table 1: Descriptive Statistics for PET Proficiency Test

Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation	Skewness	
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error
PETadministration	150	32.00	69.50	52.2800	7.98036	-.297	.198
Valid N (listwise)	150						

Figure 1: Histogram of the Scores Obtained on the PET Administration

The next step was to identify extrovert and introvert learners participants were asked to fill in the Persian translation of Eysenck Personality Inventory. In order to save the validity of the questionnaire, the participants were asked to answer to the all items of the questionnaire. Only the E score of them, however, was utilized in identifying the degree of extroversion. Descriptive statistics of the participants' performance in the 24 items of the questionnaire devoted to measure the degree of extroversion (E-score) is provided in table 2.

Table 2: Descriptive Statistics of Participants' E-Score in EPI

Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation	Skewness	
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error
Escore	90	3.00	22.00	11.0667	5.55018	.281	.254
Valid N (listwise)	90						

Figure 2: Histogram of the E Scores of the Participants in EPI

The researcher administered the two cooperative writing tests as posttests in the two experimental groups.

As shown in Table 3 below, the mean and standard deviation of the introvert group were 78.97 and 8.39, respectively. In the extrovert group, however, the mean was 72.63 while the standard deviation stood at 8.93.

Table 3: Descriptive Statistics for the Essay Writing Posttest in Both Groups

Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation	Skewness	
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error
Introvert	30	62.00	94.00	78.9667	8.39328	-.202	.427
extrovert	30	60.00	91.00	72.6333	8.93070	.367	.427
Valid N (listwise)	30						

Figure 3: Histogram of the Writing Posttest Scores Obtained by the Introvert Group

Figure 4: Histogram of the Writing Posttest Scores Obtained by the Extrovert Group

Finally to test the null hypothesis an independent sample *t*-test was run in order to find out if there is any significant difference between the mean scores of the two groups at the final exam.

Table 4: Independent Samples T-Test on the Performance of Both Groups in the Essay Writing Posttest

Independent Samples Test

			Levene's Test for Equality of Variances		t-test for Equality of Means						
			F	Sig.	t	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
										Lower	Upper
Writing Scores	Equal variances assumed		.529	.470	2.830	58	.006	6.33333	2.23759	1.85431	10.81236
	Equal variances not assumed				2.830	57.778	.006	6.33333	2.23759	1.85394	10.81273

CONCLUSION

In implementing cooperative learning contextual factors and personality factors should be taken into account. Although extroverts seemed to benefit more from the activities of CIRC, the introverts outperformed them in the writing. The results were in line with the findings of other researches that reported inverse relationship between the degree of extroversion and writing performance. The reason for this difference could be that introverts “use different pathways in the brain, ” when they do writing. Another reason could be lowering significantly the level of anxiety. When they don't need to retrieve the words immediately, they can better code the words from their long term memory and write it down.

Teacher training centers and institutions need to familiarize teachers with explicit techniques of CIRC which is proved to be more effective in the process of writing.

The results indicate that despite the fact that Iranian learners are mostly individualistic and prefer to work on their own, some cooperative learning methods could be helpful and accepted by them.

The results of this research may have implication for syllabus designers to insert more exercises that include cooperative learning of the materials.

It provides insights for the material developers to use more of CIRC exercises and tasks in their material when they are aimed to improve the writing of the students.

It is recommended that more CIRC tasks and exercises be applied in a lesson in the form of well-designed tasks to enhance students' learning. This will allow teachers to teach less and students to learn more through constructing their own knowledge over learning.

Limitations of the study

Since the educational culture in Iran is individualistic, it is difficult to convince learners to work in groups. The majority of the students depend on the teacher providing them with the correct answers. Therefore, persuading students to work in groups requires a lot of effort. Since CIRC,

by definition, is developed for the upper elementary grades (Stevens et al., 1987, as cited in Slavin, 2011, p 14), the participants of this study were limited to upper elementary learners.

ABSTRACT

Recently, the interest of both teachers and researchers in the field of foreign language learning and teaching has increasingly focused on the learner, including the strategies which an individual uses in learning and communicating. The problem under investigation was to see whether there is any significant relationship among the field independence-dependence, attitudes and performing on grammatical structure by students from high schools of Sanandaj. It also examines separately the relationships of FD/I cognitive styles and the students' grammatical performance and also the relationships of attitudes and students' grammatical performance toward learning English. So 60 students of Farzanegan high school were selected. To measure the students' FD/I level the Group Embedded Figures Test (GEFT) was administered. The means of the students' scores were used to represent their grammar tests performance. The results of Pearson Product-Moment Correlation revealed a significant correlation between the FD/I cognitive styles and the grammar scores. But again according to those results there isn't any significant correlation between attitudes and grammar scores. One of the most important implications of this study may be in that teachers can classify their students based on their FD/I cognitive styles to teach structure (Grammar) skills more efficiently and systematically. In fact, the Iranian EFL teachers should take this into account that the learners' 'cognitive styles (FD/I) are considered to be determining factors in the process of teaching and learning structure skills.

KEYWORDS: Field-dependent/independent learner's, Attitude, Performance grammar tests.

INTRODUCTION

The concept of attitudes has since long been one of the most generally applied concepts by psychologists and sociologists (Allport, 1935; Ajzen, 2001). Although many theoretical approaches in social psychology have given their own specific meaning to the concept (Van der Pligt & De Vries, 1995; Eagly & Chaiken, 1993), some general notion of attitude is common to all interpretations. Generally accepted is the conception that attitudes have an intermediary role in the psychological process between stimuli from some object (person, situation, and instance) and behavioral responses.

In most approaches attitude is referring to some evaluative condition or process which explains the consistency of individual behavior with respect to some object. Cognitive as well as affective elements (positive or negative) are generally considered as intrinsically related to attitudes. Although behavioral elements are related to attitudes, it is accepted rather broadly that they are not parts of attitudes: attitudes are the evaluative responses that explain (in some degree) the behavioral acts (Ajzen & Fishbein, 1980).

Field dependence (FD) refers to a cognitive style in which an individual tends to look at the whole of a learning task which contains many items. The FD individual has difficulty in studying a particular item when it occurs within a field of other items. The "field" may be perceptual or it may be abstract, such as a set of ideas, thoughts, or feelings. Field independence (FI), on the contrary, refers to a cognitive style in which an individual is able to identify or focus on particular items and is not discredited by other items in the background or context (Brown, 2000; Gollnick and Chein, 1994). It appears possible that language tests of today may favor learners with certain cognitive styles. The present study is an attempt at finding the possible relationships of field independence-dependence, with EFL learner's attitudes towards the English language and their performance on grammar tests: A Case of High-School Students.

REVIEW OF THE LITERATURE

A number of studies have noted that the distinction between Field-Dependent and Field-Independent individuals is similar to that of differentiating Holists and Serialists (e.g., Jonassen & Grabowski, 1993; Riding & Cheema, 1991). Field-Dependent individuals typically see the global picture, ignore the details, and approach a task more holistically. Field-Independent individuals tend to discern figures as being discrete from their background, to focus on details, and to be more surrealistic in their approach to learning.

What Affects Field Dependence-Independence?

Thus far the discussion has focused on things that are affected by field dependence-independence. There are a few factors, however, that affect the degree to which we are each field dependent or independent.

Child Rearing Practices

Witkin (1973) believed that field dependence-independence tendencies result from child rearing practices that emphasize gaining independence from parental controls (Korchin, 1986). The early

studies of child rearing done by Witkin (1973) showed that when there is strong emphasis on obedience to parental authority and external control of impulses, the child will likely become relatively field dependent. When there is encouragements within the family for the child to develop separate, autonomous functioning, the child will become relatively field independent.

Gender

There is mixed evidence on the effect of gender on field dependence-independence. Studies of children have not found any differences at all. However, in studies of adults when differences between sexes and field dependence-independence are found, males always achieve scores that are indicative of greater field independence. The effect of gender on field dependence-independence is so small that this factor is practically insignificant.

Age

There appears to be some effect of age on field dependence-independence. Children are generally fielded dependent, but their field independence increases as they become adults. Adults (especially adult learners) are more field independent (Gurley, 1984). After that time, field independence gradually decreases throughout the remainder of life, with older people tending to be more field dependent than younger people (Witkin, et al., 1973).

The present study, investigates the relationship between the learning styles (dependent and independent styles) of the students in English language achievement by considering age and gender of the learners.

Research in the Realm of Field Dependency and Field Independence in Iran

In his study, Salmani-Nodoushan (2007) titled "Is Field Dependence or Independence a predictor of EFL reading performance" investigated the Field Dependency or Independency on systematic variance into Iranian EFL students' overall and task-specific performance on task-based reading comprehension tests. Having selected a large number of freshman, sophomore, junior, and senior students, all majoring in English at different Iranian universities, he administered the Group Embedded Figures Test (GEFT) to the participants. His study demonstrated that individuals 'cognitive styles made a significant difference in their test performance in the proficient, semi proficient, and fairly proficient groups, but this was not the case in the low- proficient group. In addition his study revealed that cognitive style resulted in a significant difference in participants' performance on specific tasks such as true-false, sentence completion, outlining, scanning, and elicitation in all proficiency groups.

Yarahmadi (2011) did a study on Field Independence/Dependence and ownership writing differences found that for both male and female students there was a relationship between Field Dependency and ownership in writing. She concluded that the use of first person singular pronouns and /or possessive adjectives was more characteristic of Field Dependent students. She argued that students are able to improve their writing ability by being aware of style areas in which they feel less comfortable, and this provide avenues to enrich their nonintellectual growth. In the same vein, teachers can identify learning style patterns in writing classes and make the best

use of such information by devising lesson plans which takes into account individual learning style preferences.

Ahmady and Yamini (1992) conducted a study on the relationship between Field Dependency/Independency and listening comprehension strategy use by female Iranian English language learners. Selecting 138 students at the intermediate level, chosen out of 208, they were given the Strategy Inventory for Listening Comprehension to determine the type of strategies they used. Correlation coefficients illustrated that metacognitive, memory, cognitive and social strategies were significantly related to the cognitive style, whereas affective and compensatory strategies did not demonstrate a significant correlation. They concluded that FI students used metacognitive, memory, and cognitive strategies more frequently than the FD counterparts, but FD students used social strategies more than FI ones.

Nilforooshan and Afghar (2007) did a study on the impact of Field Dependence-Independence in EFL learners' writing performance. They found that there is a significant difference between Field Dependent/ Independent groups in writing skill in general and narrative writing in particular with Field Independent learners outperforming the Field Dependents.

RESEARCH QUESTIONS

The present study aims at answering four research questions:

1. Is there any relationship of field independence-dependence and performance grammar tests among high school students in Sanandaj?
2. Is there any relationship of attitude towards English language and performance grammar tests among high school students of Sanandaj?
3. Can GEFT significantly predict attitude toward learning English?
4. Can GEFT significantly predict grammar tests towards learning English?

NULL HYPOTHESES

In line with the above questions, the following three hypotheses are formulated:

1. There is no relationship between field independency-dependency and learning grammatical structure among high school students in Sanandaj.
2. There is no relationship between attitudes toward English and learning grammatical structure among high school students in Sanandaj.
3. GEFT cannot significantly predict attitude toward learning English.
4. GEFT cannot significantly predict grammatical structure toward learning English.

METODOLOGY

Participants

The participants of the study were initially 60 students who studied at grade two in Farzanegan high school of Sanandaj. The age of the participants ranged from 16 to 17. There were no boy students in this study.

Instruments

For collecting information from participant two questionnaires and one grammar test from lessons 1-5 of high school student's book were employed. The measurements of each of these variables are discussed in the following sections:

Group Embedded Figure Test

The Group Embedded Figure Test (GEFT) was used to categorize students as field dependent, field independent, or bimodal for the purposes of providing their attitudes toward English and learning structure. The GEFT is a group administered test that requires the subject to outline a simple geometric shape within a complex design. The subject must locate or separate the relevant information from the contextual field and restructure it to design the correct shape. In theory, this task discriminates the extent to which the person perceives analytically and is able to identify the relevant information within the organized field. The estimate of reliability of the GEFT is reported at .82 (Witkin, Oltman, Raskin, & Karp, (1971).

The GEFT test was presented in a booklet form. During the GEFT test, participants were required to finish all 25 items within 12 minutes. Within each complex figure was embedded one of eight simple figures, participants were asked to trace the simple figure with a pencil. In the first two minutes, participants worked on seven practice items, which were not scored. In the following ten minutes, participants completed the 18 items that comprised the actual test. The completed tests were individually scored by the researcher. The total possible score ranged from 0 to 18. Omitted items were scored as incorrect (Witkin et al., 1971).

Participants in this study were classified as field dependent (FD) and field independent (FI) based on their scores on the GEFT test. Participants who scored greater than one-half standard deviation above the mean were considered field independent, while participants who scored less than one-half standard deviation below the mean were considered field dependent (Dwyer & Moore, 1991-1992).

Attitude/Motivation Test Battery (ATMB)

Another test that was used for this study is Attitude/Motivation Test Battery (AMTB). This test was performed to measure the student's attitudes. This test consisted of 104 items that they can answer the items independently. Since I selected this test for high school students, I have translated the questionnaire from English to Persian.

Grammar test

And the last questionnaire was grammar test, in which I selected 40 questions from khat Sefid book of high school students for investigating the score of their grammars. And since this book was designed by some experts of language teaching so this book is valid and it is used in all English classes of schools.

Procedures

At the beginning of each session, the researcher read a detailed explanation outlining the research process. Participants were asked to complete the GEFT test first. They were given two minutes to

work on the 7 practice items, and then 10 minutes to take the actual test. Standard oral directions from the manual for the Group Embedded Figures Test were given during the test to ensure that all participants received the same message.

The tests of this study were accomplished in 3 days and also in two classes of high school in Sanandaj. At first day, the participants finished the GEFT test which took an average time of 10 minutes, at the second day, they were asked to answer the grammar test which took an average time of 20 minutes independently. There was no interaction between participants during the session.

And in third day, they were asked to answer the Attitude/Motivation Test Battery (AMTB) which took an average time of 25 minutes to complete. This test consisted of 104 questions that students answered them according to their attitudes and feelings toward English language.

Data collection and analysis

Data were collected through questionnaire. First, Attitude/Motivation Test Battery (AMTB) was performed in order to find their own feelings based on everything they know and have heard. There is no right or wrong answer. Second, Group Embedded Figure Test (GEFT) was performed to illustrate the field dependent and independent students. Third, the grammar test was performed in order to examine the student's score in grammar. And at last to examine the relationships among these three variables, correlation analysis was performed.

A descriptive analysis was first conducted to generate detailed information, including means, standard deviation, and frequency data, to describe and infer characteristics of the participants.

RESULTS AND DISCUSSIONS

1. Is there any relationship between field independence-dependence and performance on grammar tests among high school students in Sanandaj?

A point-biserial correlation was run to probe any significant relationships of field independence-dependence and performance on grammar tests among high school students of Sanandaj.

Table 1: Point-Biserial Correlation Matrix to Learning Structure with Types of Personality Traits

		Personality Traits
Grammar Test	Pearson Correlation	.609
	Sig. (2-tailed)	.000
	N	40

The results ($R_{pbs}(40) = .609, P < .05$) indicated that there was a significant relationships between field independence-dependence and performance grammar tests among high school students of Sanandaj. Thus the first null-hypothesis **was rejected**.

2. Is there any relationship of attitudes toward English language and performance on grammar tests among high school students of Sanandaj?

A Pearson correlation was run to probe any significant relationships of attitudes toward English and performance on grammar tests among high school students of Sanandaj.

Table 2: Pearson Correlation for correlation of Learning Structure with Attitude toward Language Learning

		Attitude
Grammar Test	Pearson Correlation	.262
	Sig. (2-tailed)	.102
	N	40

The results ($R(40) = .26$, $P > .05$) indicated that there was not any significant relationship between attitudes toward English language learning and performance on grammar tests among high school students of Sanandaj. Thus the second null-hypothesis **was supported**.

KR-21 Reliability

Table 3 : Descriptive Statistics

	N	Mean	Variance	KR-21
Attitude	60	400.717	2345.800	.90
Grammar Test	60	14.892	5.043	.54
GEFT	60	11.900	16.227	.74

According to the table 3, for attitude reliability as the number of students is 60, the mean is 400.717, the variance is 2345.800, and the KR-21 is .90 so this test is acceptable amount. For grammar tests reliability as the number of students is 60, the mean is 14.892, the variance is 5.043, and the KR-21 is .54 so this test is acceptable amount. And for the reliability of last tests GEFT as the number of students is 60, the mean is 11.900, the variance is 16.227, and the KR-21 is .74 so this test is acceptable amount.

Construct Validity

A factor analysis was run to probe the underlying constructs of the attitude, grammatical structure and GEFT tests. The SPSS extracted one factor which accounted for 53.05 percent of the total variance.

Factor analysis to probe the underlying constructs of the attitude, structure and GEFT tests

Table 4: Total Variance Explained for the extracted factor

Component	Initial Eigenvalues			Extraction Sums of Squared Loadings		
	Total	% of Variance	Cumulative %	Total	% of Variance	Cumulative %
1	1.592	53.052	53.052	1.592	53.052	53.052
2	.963	32.093	85.145			
3	.446	14.855	100.000			

As displayed in Table 5 the attitude, grammar tests and GEFT tests loaded on the only extracted factor.

Table 5: Components Matrix for the extracted factor

	Component
	1
GEFT	.873
Grammar Test	.847
Attitude	.335

As displayed in Table 5 the attitude, grammar tests and GEFT tests loaded on the only extracted factor. Based on these results it can be concluded that for the present sample, these three tests tap on the same underlying construct although the Attitude seems to have the least contribution to this trait (factor).

3. Can GEFT predict students' attitude toward learning English?

A regression analysis was run to predict students' attitude by using GEFT as seen in Table 6.

Table 6: Model Summary Attitude on GEFT

Model	R	R Square	Adjusted Square	R Std. Error of the Estimate
1	.159 ^a	.025	.009	48.2243

a. Predictors: (Constant), GEFT

b. Dependent Variable: Attitude

Based on the above Table, GEFT can predict only 2.5 percent of students' attitude ($R = .15$, $R^2 = .025$). This small amount could be attributed to the fact that FI/D is a cognitive factor while attitude is an affective factor which may not be so correlated.

Figure 1: Normal P-P Plot 2 regression model for normal distribution

The Normal P-P Plot 1 indicated that the regression model enjoyed normal distribution because majority of the dots fell along the diagonal.

Normal P-P Plot: Attitude on GEFT

4. Can GEFT predict students' performance on grammar tests?

A regression analysis was run to predict students' structure by using GEFT as it is observed in Table 7.

Table 7: Model Summary Structure on GEFT

Model	R	R Square	Adjusted Square	R Std. Error of the Estimate
1	.547 ^a	.299	.287	1.8964

a. Predictors: (Constant), GEFT

b. Dependent Variable: Structure

Based on the results indicated in Table 7 GEFT can predict 29.9 percent of students' structure ($R = .54$, $R^2 = .199$). This higher amount of correlation could be attributed to the fact that performance on grammar tests and GEFT are both cognitive factors.

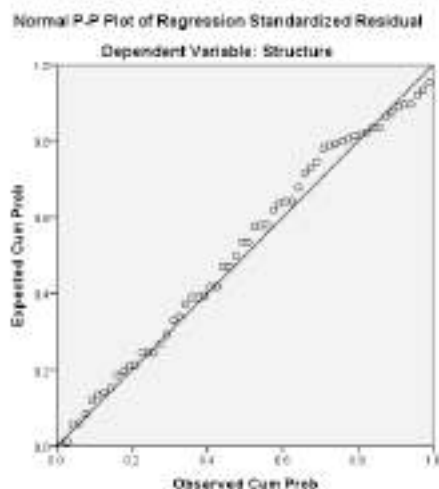

Figure 2: Normal P-P Plot 2 regression model for normal distribution

The Normal P-P Plot 2 indicated that the regression model enjoyed normal distribution because majority of the dots fell along the diagonal.

Normal P-P Plot: Structure on GEFT

The results obtained in this study show that field dependence- independence are related to the performance grammar tests of high school students. But there isn't any significant relationship between attitude and performance grammar tests of high school students.

As field dependence has been associated with naturalistic second language acquisition and field independence with classroom learning (See Ellis, 1985; Brown, 2000; Carter, 1988), it seems natural for FI students to use more meta-cognitive strategies to enhance their grammatical learning. Similarly, FI students make more use of cognitive strategies including translation,

repetition, transfer, rehearsal, etc. This can also be attributed to conscious learning and the activities that can be found in formal classroom situations.

In regards to the students' attitudes towards the English language the results revealed that besides supporting the idea that English should be the medium of instruction in the secondary schools and at least some subjects like Physics and Chemistry should be taught in English, they were of the view that the teaching of English should start as early as the first grade in the schools. For their attitudes toward the Western culture, the students' findings revealed that more than half of them showed their interest in the culture of the English speaking World as represented by English-language films. A possible interpretation of these findings might be the result of social tendencies affected by globalization. On the other hand, most of the students, in the present study, had negative attitudes toward the importance of using the English language in schools. Concerning the students' English language attitudes, on the other hand, interesting findings were obtained. With regard to their attitudes towards the social value of English, the findings reveal that whilst most of the students responded positively to the idea that "*the development of our country is possible mainly by educated people who know English well*", the majority of them responded negatively to "*the use of English in government and business offices helps in getting things done easily*".

CONCLUSION

The main objectives of this study were to explore the relationships of field independence-dependence, with EFL learner's attitudes towards the English language and their performance on grammar Tests and to determine whether this field independence-dependence and attitude were related to the performance grammar tests of high school students. The results showed that there was significant relationship between field independence-dependence and performance grammar tests among high school students in Sanandaj. So the first null hypothesis was rejected. No significant relationship was also found between attitude toward English and performance grammar tests among high school students in Sanandaj. Therefore the last two null hypotheses were supported.

And according to the last two questions because GEFT can predict 29.9 percent of students' structure, so performance on grammar tests and GEFT are both cognitive factors. And at last because GEFT can predict only 2.5 percent of students' attitude, so this small amount could be attributed to the fact that FI/D is a cognitive factor while attitude is an affective factor which may not be so correlated.

Limitations of the study

This study, like many other studies, has a number of limitations. The number of the participants was relatively small (N= 60). This limitation may be due to the lack of time of students in the school. Factors like this might limit the generalizability of the results of this study to other populations. The other problem lies in the fact that this sample was a convenient sample, not any randomly selected. This may also limit the generalizability of the results of the study to other contexts. Another limitation is that in this study just one high school is selected.

EVALUATION AND CONTENT ANALYSIS OF “ENGLISH FOR AVIATION FOR PILOTS AND AIR TRAFFIC CONTROLLERS” TEXTBOOK AS AN ESP BOOK

Ali Zolfagharian

Imam Khomeini International University

Javad Khalilpour

Allame Tabataba'i University

ABSTRACT

Books in language learning and teaching have an undeniable significant role. Since English language teaching is essential for air traffic controllers and pilots all around the world, the aim of this study is to clarify the role of a coursebook used in educating and training air traffic controllers and pilots. This study conducted an analysis and evaluation of an ESP book in aviation industry named “English for Aviation for Pilots and Air Traffic Controllers” by Oxford University Press. The analysis of this book is done by responding to the five questions about skills, content, sequencing, sociolinguistic factor of variety of language and format. To do this, a series of checklists from “teaching English to Speakers of Other Languages: Substance and Techniques” by Betty W. Robinett(1978), “Choosing your Coursebook” by Alan Cunningsworth(1995), and “Language Curriculum Design” by Nation(2010) were used. “English for Aviation for Pilots and Air Traffic Controllers” is analyzed and evaluated as suitable book for both purposes of classroom book and self-study. Notwithstanding some weaknesses, the book can satisfy the needs and interests of students whom are pilots and air traffic controllers to do their job with the first goal of safety.

KEYWORDS: communication, English language, aviation, ICAO, skills, activity, content.

INTRODUCTION

Some catastrophic accidents happened from the very beginning of aviation industry that were caused by language problems such as language misusing, misinterpretation of language used, malfunctioning in means of communication, different regional or social dialects and accents, lack in language knowledge or language use. English language is the unique language of aviation all around the world which is used not only in routine flights, but also in an emergency situation. Having the English language knowledge is vital for the safe conduct of flights and passengers lives. For instance, if an emergency occurred the pilot must be able to utter as simple and fluent as possible the nature of the situation and on the other hand the controller has to understand it completely without any missing part and then must take the proper action in order to resolve the emergency or assist the pilot of aircraft. Hence since 2008 ICAO (International Civil Aviation Organization) published and regulated the ICAO language proficiency requirement for

operational level (level 4) to unify the globally use of English language in aviation industry by ATCs and pilots.

Sometimes the pilot or air traffic controller says a phrase that cannot be interpreted by the officer on the other side of the communication and then caused an accident or incident. For instance in Tenerife North Airport disaster the crash killed 583 people, making it the deadliest accident in aviation history in which the KLM co-pilot read back *WE ARE AT TAKEOFF* then the tower controller, who could not see the runway due to the dense fog, initially responded with "OK" (nonstandard phraseology), which reinforced the KLM captain's misinterpretation that they had takeoff clearance. The controller misinterpreted that they were in takeoff position and ready to begin the roll when takeoff clearance was received, but not in the process of taking off. The controller then immediately added "stand by for takeoff, I will call you," indicating that he had not intended the clearance to be interpreted as a takeoff clearance. Therefore one of the reasons in this crash was the use of ambiguous non-standard phrases by the KLM co-pilot ("We're at take off") and the Tenerife control tower ("OK").

Consider that in face to face interaction apart from listening and speaking skills, we have body language, facial expressions, etc in order to pass our intention to the hearer, but in aviation there is no other mean than listening skill and ability in radiotelephony communication which is more difficult, challenging and requires higher degree of language proficiency than face to face communication. In addition the sound quality may be poor; and there exists garbled voice, and background noises. Therefore a proficient aviator must be able to use his/her language in any unpredictable situation effectively.

Hymes (1972) claims that in order to achieve communicative goal, second language learners must learn to speak not only grammatically, but also "appropriately". Here in aviation English, this "appropriateness" is the matter that authors try their bests to achieve it by providing authentic, comprehensible, meaningful, contextualized instructional materials.

The goal of language learning is communicative competence. Therefore the aim of all language learning books is to teach learners communication. Apparently Aviation English communication is pilot-ATC, pilot-pilot and ATC-ATC communications.

The language proficiency requirements for Aviation English (AE) by ICAO apply to listening and speaking skills only and do not address the reading and writing. It is also worth to consider that nowadays the number of international flights, which fly over several different countries with variety of languages and accents, are increasing. Therefore the need for an international language like English and also its acquisition or learning is increasing too.

Table 1: ICAO language proficiency rating scale for pilots and air traffic controllers (ICAO Annex 1)

Level	Pronunciation	Structure	Vocabulary
Operational 4	Pronunciation, stress, rhythm, and intonation are influenced by the L1 but only sometimes interfere with ease of understanding.	Basic grammatical structures and sentence patterns are used creatively and are usually well controlled. Errors may occur, particularly in unusual or unexpected circumstances, but rarely interfere with meaning	Vocabulary range and accuracy are usually sufficient to communicate effectively on common, concrete, and work-related topics. Can often paraphrase successfully when lacking vocabulary in unusual or unexpected circumstances
Pre-operational 3	Pronunciation, stress, rhythm, and intonation are influenced by the L1 and frequently interfere with ease of understanding	Basic grammatical structures and sentence patterns associated with predictable situations are not always well controlled, errors frequently interfere with meaning	Vocabulary range and accuracy are usually sufficient to communicate effectively on common, concrete, and work-related topics, but range is limited and the word choice often inappropriate. It often unable to paraphrase successfully when lacking vocabulary
Elementary 2	Pronunciation, stress, rhythm, and intonation, are heavily influenced by the L1 and usually interfere with ease of understanding.	Shows only limited control of a few simple memorized grammatical structures and Sentence patterns.	Limited vocabulary range consisting only of isolated words and memorize phrases.
Pre-elementary 1	Perform at a level below the Elementary level	Perform at a level below the Elementary level	Perform at a level below the Elementary level
Level	Fluency	Comprehension	Interaction
Operational 4	Produces stretches of language at an appropriate tempo. There may be occasional loss of fluency on transition from rehearsed or formulaic speech to spontaneous interaction, but this does not prevent effective communication. Can make limited use of discourse markers or connectors. Fillers are not distracting.	Comprehension is mostly accurate on common, concrete, and work related topics when the accent or variety used is sufficiently intelligible for an international community of users. When the speaker is confronted with a linguistic or situational complication or an unexpected turn of events, comprehension may be slower or require clarification strategies.	Responses are usually immediate, appropriate and informative. Initiates and maintains exchanges even when dealing with an unexpected turn of events. Deals adequately with apparent misunderstandings by checking, confirming or clarifying.
Pre-operational 3	Produces stretches of language, but phrasing and pausing are often inappropriate. Hesitations or slowness in language processing may prevent effective communication.	Comprehension is often accurate in on common, concrete, and work related topics when the accent or variety used is sufficiently intelligible for an international community of	Responses are sometimes immediate, appropriate, and informative. Can initiate and maintain exchanges with reasonable ease on familiar

	Fillers are sometimes distracting.	users. May fail to understand a linguistic or situational complication or an unexpected turn of events.	topics and in predictable situations. Generally inadequate when dealing with an unexpected turn of events.
Elementary 2	Can produce very short, isolated, memorized utterances with frequent pausing and a distracting use of fillers to search for expressions and to articulate less familiar words.	Comprehension is limited to isolated, memorized phrases when they are carefully and slowly articulated.	Response time is slow and often inappropriate. Interaction is limited to simple routine exchanges.
Pre-elementary 1	Performs at a level below the Elementary level.	Performs at a level below the Elementary level.	Performs at a level below the Elementary level.

At the same time books are important resources for teachers in order to help students to learn the instructional material and they are basic and main sources of data for the users.

Oxford University Press published English for aviation for Pilots and Air Traffic Controllers after IACO regulated its operational level 4 rating scale and its deadline in 2008. the goal of the book is to train and educate not only the students of air traffic services and pilots, but also the current pilots and ATCS who are at work. Taking into account the ICAO rating scale, the researchers attempt to see this ESP book deals with six subskills of pronunciation, structures, vocabulary, fluency, comprehension and interaction. The book suggests that it can be used either as a coursebook in a class or a self-study book.

Objectives of the study

Because of the essential and unique role of language proficiency in aviation industry as a means of communication, the researchers try to analyze the defined areas of ICAO language proficiency rating scale. The present study believes that having a broader and deeper knowledge of content materials can assist teacher, designers, trainers, ESP material developers, ATCs and pilots, and aviation authorities to discover new approaches to improve the quality of coursebooks and consequently the quality of teaching and learning and also to provide a newly established ways of teaching.

RESEARCH QUESTIONS

To conduct, the current research provides methods in analysis of the book: Language skills, general content, sequencing, sociolinguistics factors, format (impression) evaluation and seeks to respond to following questions:

1. Does the book integrate the “four skills”? is there a balanced approach toward the skills?(language skills)
2. Does the book reflect what is now known about language and language learning?(general content)
 - a. Authenticity of language
 - b. Appropriateness and currency of topics ,situations, and contexts
 - c. Proficiency level-is it pitched for the right level?
3. How is the book sequenced?(sequencing)
4. Does the sociolinguistics factors are mentioned in the book? E.g. variety of language-American, British, standard.
5. Is the book attractive, durable and usable?(format)

METHODOLOGY

Materials

The ESP coursebook “*English for Aviation for Pilots and Air Traffic Controllers*” by Sue Ellis and Terence Gerighty is the main material of this study in which there are 8 units arranging from Preflight and ground movements to landing phase and on the ground again. The main purpose of the book is to develop communicative competence of pilots and air traffic controllers and their language production while they are on duty of control center or tower and in command of aircraft.

Instruments

To manage the analysis, series of checklists from the three mentioned books in introduction are used. “Teaching by Principles” by Brown(2001) and “Approaches and Methods in Language Teaching” by Richards and Rodgers(2001). and other books are implemented to assist the evaluation.

RESULTS AND DISCUSSION

Language Skills

According to content-based instruction, English language skills must be integral in drills and activities. “It is important to integrate all the skills, as well as vocabulary and grammar in an authentic context”, Larsen-Freeman (2011). Therefore beside integrity of skills, authenticity is salient too. An authentic activity makes the learner feel in real situation or real life condition. So it helps the learning process in the learners mind.

Activities should be in a way to make learning meaningful in a real context. Stoller (1997) believes that language activities should be in service of language skills improvement. This study conduct an evaluation on each of the ICAO rating scale skills in details based on different types of activities and their frequencies in the book.

Six ICAO language skills are: vocabulary, pronunciation, structure, fluency, comprehension, and interaction.

Vocabulary

As shown in ICAO rating scale in Table 1, pilots and ATCs must be able to communicate effectively on common, concrete, and work-related topics and often paraphrase successfully when lacking vocabulary in unusual or unexpected situations. Table 2 illustrates the different types of drills and tasks which are presented in the book and their frequencies.

Table 2: Vocabulary Activities

Activities	frequency	Activities	frequency
Pair-work	4	Matching	5
Listen and Choose	2	Using pictures and maps	8
Listen and check	1	Listen and write	1
Sentence completion	6	Listen and talk	1
Question answering	3	Experience telling	2
paraphrase	1		

According to Larsen-Freeman, Teaching should build on students' previous experiences, therefore the book has two experience-telling which wants the students to talk about their real experiences in work.

As indicated in ICAO scale students can paraphrase the sentences when they lack in vocabulary knowledge. Only the last unit of the book has a paraphrasing activity. Paraphrasing is so important for pilots and air traffic controllers while they are working and they do not know the exact word or the other person does not understand a specific vocabulary, he/she must paraphrase the meaning of that word. In vocabulary activities of the book beside other types of activities, there are five listening activities that indicate the integrity of skills, likewise writing and speaking activities. According to Content-Based Instruction skills must be integrated in an authentic context. "Instructional materials should have authenticity and comprehensibility" Jack C. Richards. The most frequent activity is using map and pictures which are eight. These use visual memory of the learners in order to internalize target vocabularies.

In question answering activities also we can see integration of skills because they have writing and talking too. Activities have discussion and pair-work tasks which are in accordance with CBI. It is worth to mention that units 5 and 6 do not have vocabulary activities.

Pronunciation

Pronunciation is fundamental for comprehension, fluency and interaction. If the speaker cannot pronounce the sounds correctly, the hearer cannot understand and react properly. And also if there is no correct pronunciation there will be no fluency.

Table 3: pronunciation activities

Activity	frequency
Recognition	10
Listen & Repeat	2
Pair work	2

One of the activities that students are suggested to improve is recognition which has the most frequency through the book. When a person realizes or recognizes the missed item (here is pronunciation), before it, he/she must have comprehended the meaning. Therefore recognition indicates the comprehension of the students. In almost all of the pronunciation activities in the book, first there is a recognition task, then provided by an audio track in the CD to check and monitor the students recognized input. The teacher in the classroom can correct the learners' mistakes or in case of self-study, the student can self-monitor him/herself.

Unit one is merely dedicated to ICAO numbers and alphabet pronunciation. Unit one is the only unit which has listen and repeat exercises (two activities) and there is no trace of repetition in other units. So repetition which is in support of behaviorism in second language acquisition is neglected among the book with the exception of unit 1 and follows the functional, interactional and cognitive method of teaching pronunciation, for instance, recognition and pair-work drills.

In teaching of pronunciation, the book seems to have a sequence and order. Unit one has numbers and alphabet. Unit two works on 2-syllable words stress pattern. Unit three dedicated to stress pattern in sentences, e.g. interrogative and declarative sentences. Unit four discusses how to pronounce /s/, /ʃ/, /t/ phonemes and also stressed words in sentences. Unit five tries to teach vowels and some diphthongs. Unit six talks about how to read a broadcast in a correct phonetic form and a pairwork. The broadcast context is aviation that provides comprehensibility and authenticity to the activity. Unit seven has activities about 3-syllable words stress pattern and even 4-syllable words. Unit eight provides three ways of pronouncing regular past tense [ed] verbs and consonant clusters in words. Therefore the book has an easy-to-difficult order of activities and pronunciation content material.

Structure

Pilots and air traffic controllers must know and use the correct and proper forms (structures) of English while they are communicating. Not having the knowledge of structure and even more important, not having the knowledge of how to use it in aviation communication may cause problems, incidents or even accidents. The purpose of the book is to train pilots and air traffic controllers to reach operational level 4 in which error may occur but rarely interfere with meaning.

Table 4: frequency table of structural activities

Activity	frequency	Activity	frequency
Gap filling (completion)	5	Writing activity	1
Rearranging scrambled sentences	1	Underlining the correct form	1
Pairwork	3	Listen and complete	1
Matching	3	Retelling the story	1
Listen and choose	2	talk	2

Gap filling (completion) is the most frequent type of activity in structure parts, then matching and pair-work

Again pair-work is detected as somehow an important activity in this area through the book to be compatible with communicative competence and CBI. The book tries to practice and work on all aspects of communicative competence. Canale defined the four aspects of communicative competence as: grammatical, discourse, sociolinguistic, strategic competence. For instance by pairwork activity the book works on sociolinguistic and strategic competence while here in structure section the main focus is on grammatical competence too.

In teaching structure, the authors provide other skills like speaking, writing, listening and interaction. Therefore here the book has integrity of skills too.

In each structure activity, after having enough exercised the tasks by learners, the book provides a small box in order to show the structural patterns of what the learner exercised. As it is known, this way of teaching grammar is called "induction". So the book follows inductive teaching of structures. Functions are important in structure. Grammatical structures are fit to that specific function of the exercise.

In unit four, there is a structure box with no activity before and after it.

Fluency

ICAO: students must be able to provide sentences at an appropriate tempo and can make limited use of discourse markers and connectors. Fillers are not distracting.

The book seeks to teach the students the above goal.

Table 5: fluency activities and their frequencies

Activity	frequency	Activity	frequency
matching	4	Multiple choice test	1
Pair-work	7	underlining	1
Listen and question answering	4	Sentence completion	1
Question answering and talk	7	Picture matching	1
Experience telling	2	reading	10

Pair-work, question answering and talk are thereof the most frequent activities in this area which are all communicative in nature. There are ten reading exercises in which students will learn their fluencies. Fluency in reading is different from fluency in speaking. The book mostly tries to improve reading fluency ability of the students and tries less in speaking fluency. This amount of frequency shows the weakness of the book that the most frequent activity in fluency section is reading. As mentioned only fluency in speaking is significant in aviation and there is no use of reading in aviation. Although fluency in reading can effect on fluency in speaking, there is not a

straight and complete relationship between these two types of fluencies. Two experience telling activities provide authenticity and contextualization.

Experience telling makes the environment contentful. By contentful, we mean there will be a relationship between language and work related real personal memories. Other students can add some points and comment on the told experience to have peer interaction.

On page 41, the book has a multiple choice test. Unit four has only reading fluency activity. Six listening activities depict the importance of this skill in obtaining fluency.

It is clear that in fluency section, the book has integrity of skills. For instance reading, writing and speaking as well (table 5 shows this fact).

Interaction

Pilots and ATCs can speak in an interactive manner; otherwise they will encounter a problem in their work. The learners should reach the level to check, confirm or clarify the misunderstandings. Responses are usually immediate, appropriate and informative. They can initiate and maintain exchanges even in unpredictable situations. Therefore students should learn interaction and its techniques and skills through 13 pair-work communicative activities in the book. Pair work is the most frequent activity in the book in this area. It is reasonable and logic because when the learner starts interaction there must be another learner or participant to interact. Therefore pair-work is relevant and appropriate to be the most frequent one.

Table 6: interaction activities and their frequencies

Activity	frequency
Pair-work	13
Listen and check	1
explanation	1
Group-work	1
Listen and answer	1

Beside pair work activities, there are only four other activities among the whole book. This is another sign that interactive pair work activities are playing the major role in this area. The book demonstrates a good image of interaction for learners with its 13 pair work communicative exercises. It is clear from the table that first students are asked to listen to the audio, then check, answer or explain the heard voice. Listening is a comprehensive skill and speaking is a productive skill. Both are needed in interaction. So we have comprehension and production with each other. It is worth to mention here the significance of the role of interaction in aviation that if there is no capability to interact, ATCs and pilots will not work at all.

Comprehension

Comprehension is the most vital language skill for pilots and ATCs. If a pilot or an ATC cannot understand the meaning of the message correctly, the consequences will probably be dangerous and when they misunderstand the meaning, the situation will be even more dangerous.

Table 7: comprehension activities and their frequencies

Activity	Frequency	Activity	Frequency
Listen & Answer the questions	14	Listen & Match	5
Listen & Find the difficult area	2	Matching	2
Discussion	3	Picture Matching	1
Listen & Choose	5	Experience Telling	2
Listen & Check	3	Reading	2
Listen& Complete	9	Comprehension	

Here in this book, comprehension skill is the same as listening to some extent. Six activities out of 11 types of activities throughout the book are dedicated to listening skill. It shows the significance of listening comprehension in aviation and the role of it in AE.

Again in this area the book has two experience telling activities show the authenticity of the book as an ESP book. Interestingly the book has two reading comprehension parts in which students attempt to improve their comprehension ability in reading skill too. The need for reading comprehension is much less than listening comprehension.

It is worth to mention that having the knowledge of different accents is necessary for pilots and ATCs, because pilots may fly over different regions and countries around the world and ATCs have variety of international over flight, arrival and departure flight in their area of responsibility with different accents and dialects. At least being familiar with the American and British English is necessary and needed. This book attempts to show some of the differences between them.

38 activities are in listening and 3 are in matching. This contrast shows that comprehension ability or skill must be learnt by listening tasks. If there is no comprehension, there will not be production and performance. Hence comprehension is the base of performance. By performance, it is meant interaction, speaking and writing of which this study discusses the interaction and speaking. In this area there are interaction, reading, listening, discussion and experience telling. Hence, as CBI method suggests, integrity of skills is clear.

Content

Willis and Willis have provided six questions that can help us to evaluate the curriculum in respect of belonging to task-based language teaching or not. Fives are appropriate in evaluation of the books. The answers of these questions are as follows:

1. The book engages the learner's interests via interesting, work related and situational audio tracks and readings, etc.
2. Of course the focus of the book is on meaning.
3. The outcome of the book is getting ICAO operational level 4 examination.
4. To some extent completion is the priority of the activities of the book.
5. Activities are in authentic and real contexts.

Thus we can conclude that the content is task-based.

The students of this book are ATCs and pilots, so they have background knowledge of Aviation and English language. Therefore the proficiency level of the book is suitable for the level of the learners. In Krashen's (1985) term it is $i+1$ in order to be effective in the acquisition process.

The learners are seeking to reach ICAO level 4 of language proficiency and the book's goal is exactly the same. Therefore the content suits the needs of learners. As mentioned before the content suits the interests of them too. Ideas can help the learning of language and are useful to the learners. The idea content of this book is a specific academic subject (aviation English). As this book is an ESP course book, this idea content suits the interests and needs of the learners.

The content is aviation and the learners are adult pilots and air traffic controllers. So the age and content are appropriate.

Sequencing

The book consists of eight units. The first unit of the book is "Introduction to Air Communications". As the name suggests, it is an introductory unit. It starts with the basics and teaches basic information in aviation and aviation English e.g. pronunciation standards.

The order of the book is chronological which starts from "Pre-flight", then "Ground Movements" to "Landing" and "On the Ground" again.

Unit two begins with preflight checks and unit eight ends in Taxiing and getting to the gate. In the topics under the title of each unit, there are some non-routine situations that provide some emergency or unusual conditions in the field of aviation in order to prepare pilots and ATCs to be ready for them. Non-routine and emergency situations are inevitable and inseparable events in aviation industry.

Each unit has a Starter section which is accompanied by pictures and is followed by a kind of warm-up exercise that includes discussion, checking, matching, completion or reasoning and talking in pairs communicatively. At the end of the book, there are appendixes. The first is "Test Yourself!" which is crossword puzzle for evaluating and testing vocabulary knowledge of the students' lexicon (Chomsky's term (1957)).

Then, there are the "Partner Files" which are used in pair work interaction tasks. After them, there is "Answer Key" which is the answers of the activities through the book. The book is used for self-study as well as a coursebook in a class. In former, the learner may need some of the responses which can be obtained from this part.

Finally, there is "Transcripts" which are used for CD audio tracks. At the end of each unit a section exists which is called "Output". It is a kind of reading comprehension. Another part is "Over to You" that is an activity of discussion, thinking and giving opinions, telling experiences and real past stories. Responds to this part is not obligatory in classroom by the teacher. The book follows the linear approach to sequencing because has an easy-to-difficult order of providing the items and skills. This kind of sequencing (linear) is appropriate for the development of

vocabulary, structural items, fluency, pronunciation, comprehension and. Therefore once an item has been presented in a class, it has been learned and does not need focused revision (Nation, 2010, Language Curriculum Design). As the instructed materials will not be exercised again during the course, if a student cannot obtain that material completely or the matter of absenteeism is the disadvantage of linear approach. So each unit designed on the basis of previous knowledge of the students and knowledge provided in previous unit. Therefore the book helps learners make the most effective use of previous knowledge (learning burden). It is worth to mention again here that the integrity of skills through the whole book has a positive effect on each other for learning and so that interference effects are avoided. (Interference)

According to the fluency of the exercises in each of the skill areas, the book provides the best possible coverage language through inclusion of items. The book progressively covers useful language items and skills (keep moving forward). Teachers of this coursebook should be aware of aviation knowledge and is recommended to be an ATC or a pilot, and he/she can account of when the learners are most ready to learn the skill. So far the study covered these areas of content: 1.learning burden 2.interference 3.teacherability.

Sociolinguistic Factor (variety of language)

Variety of language is significant in aviation English because it is an international language which the participants are from different countries with different mother tongue and its own linguistic rules. They must learn, speak and understand the standard English being used in aviation. Books should provide materials in order to teach the learners this issue.

Throughout the book variety of English language is mentioned in different sections and in variety of forms. For instance, there is a part in the book that indicates the different pronunciations such as British and American. In other part there is a box which shows the different kinds of dictation of English, for example aerodrome/airport or aeroplane/airplane. There is standard phraseology in many situations in aviation radio telephony communications which there is no trace of it in the book.

Format

As the book is an ESP book, it is apparently a meaning-focused book. It focuses also to the skills of language proficiency of AE (ICAO), so it is language focused too, including the fluency in AE. Therefore it meets the four strands principle which is meaning focused input, language-focused learning, meaning focused output and fluency.

As mentioned above the input is based on meanings, because meanings are vital and essential in the aviation industry. So the book has comprehensible input. Activities aimed at increasing the fluency through the book in order to make learners use their knowledge receptively and productively. But honestly speaking it is the weakness of the book that the majority of these field activities are in reading.

In the 21st century, technology, beauty, colors and design are essential elements for the books to affect the reader (learner). Therefore publishers must focus on these issues to be influential and

successful. The book includes CD ROM and audio CD with attractive relevant effective radio telephony extracts. CD ROM has an alphabetical word list and interactive exercises in different colors.

The cover of the book is blue with a very attractive design. The three images make the front cover attractive. Each unit starts with pictures and their relevant exercises. All units are started with different real images with the exception of unit 3 and 8. These units are started by sign pictures. Each page of the book includes one color at least other than the color of the heading of exercises and their stems. So the book is multicolored. Different kinds of pictures are shown in the following table.

Table 8: frequency table of pictures

Picture	Frequ ency
Real Image	57
Cartoon	89
Picture	
Aeronautical	1
Chart	
Box	31
TOTAL	147

147 pictures in only 95 pages indicate that each page of this book has at least one picture. Real photos consist of peoples' faces, aircraft in variety of angles, flights in different phases. Different incidental or accident situations like burst tire, ground crash, wild animal or fire onboard and also meteorological phenomena like volcanic ash and etc. Therefore the design of the book is attractive and pleasant for the readers. They will not be bored while they are studying this book. As the book itself suggests, students can use this book as either a coursebook in class or self-study book. For this purpose, the book has the Audio CD, CD ROM and Answer Keys and a section in all units named Over to You.

The major content of boxes in the book is variety of language, structural clues and useful language tips.

If the teacher of the course with this instructional material intends to teach aviation English and general English via topics, he/she will not be able to use this book. Because the book does not have situational-topical unit titles, the units cannot be taught randomly, and the learners lose the other provided materials. The other reason for not being able to use the book randomly is the linear order of the book. The third reason is that the book follows easy-to-difficult way of material presentation.

Based on the purpose of the book which is to train and teach pilots and ATCs for higher and better proficiency according to ICAO operational level 4, the book is durable, but the design, pictures and images may need to be changed in future to include more recent images of that era. This book fits to the needs of pilots and ATCs in instructional issues. Instructional issues are those six language skills of ICAO, but not the needs of teachers completely, because the chronological order of units and easy-to-difficult way of providing materials.

The book could satisfy the interests of learners to some extent and not completely, because most learners are interested in situational unit titles (based on a research on Iranian air traffic controllers). Some situational topics in aviation industry is: sick passenger, runway incursion, excursion, shortage of fuel, fire, dangerous goods, pressurization, landing problems, strikes, communication failure and etc. therefore the problem is time sequential order of units.

CONCLUSION

The aim of this study is to analyze and evaluate an ESP book in aviation industry named “English for Aviation for pilots and ATCs”. In this analysis some questions in the domain of the skills, contents, sequencing, sociolinguistic feature of variety of language and format were responded. In order to answer these questions a series of checklists from “*Teaching English to speakers of other languages: substance and techniques*” by Betty W. Robinett (1978), “*choosing your coursebook*” by Alan Cunningsworth(1995), and “*Language Curriculum Design*” by Nation were used.

It is vital for ATCs and pilots to recall ICAO operational level of English to avoid catastrophic accident resulted from lack of English knowledge. This knowledge consists of comprehension and production. In vocabulary sections throughout the book, according to frequency table of vocabulary activities, using picture and maps is the most frequent one. These use visual memory of the learners to internalize target vocabulary. Only the last unit of the book has paraphrasing. A pilot or an ATC should be able to paraphrase in conditions when the intended word cannot be comprehended or cannot be recalled to say. An effective and influential book should work on paraphrasing because it is essential in the field of aviation, especially in abnormal and unusual situations while safety is the first issue at work. Totally, vocabulary activities are evaluated as compatible with modern methods in language learning and teaching, but with some lacks and weak points. Having natural pronunciation is necessary in aviation for the sake of safety. The major activity in pronunciation sections of the book is recognition which works on both comprehension and production.

There is an easy-to-difficult order of activities in pronunciation. Providing structural patterns in the book has an inductive way. Gap filling, pairwork and matching are the most frequent activities in the book. The book has integrity of skills through combination of different language skills like speaking, writing, listening and interaction in order to practice on structures. Fluency is the weakest point of the book, because the most frequent activity is reading which is irrelevant to the nature of aviation. Experience telling and pairwork provide authenticity and contextualization. As the nature of interaction is to have two participants to exercise, pairwork is the most frequent activity. The authors provided a god deal of interaction exercises in the book to learn interaction to the learners. Despite interaction in these practices the book has listening activity too. In the comprehension area, 38 activities in listening and 3 in matching were used. It shows that comprehension skill must be learnt by listening tasks. In a number of pages, the book tries to teach and present some tips in language variations between American and British English. Knowledge in variety of language helps the pilots and ATCs to work with persons that have different mother tongues.

The book follows linear approach to sequencing because has an easy-to-difficult order of providing items and skills. As evaluated in the discussion section, it has its own benefits and disadvantages. Finally in the domain of format and presentation, the book meets the few strands principle which in meaning-focused input, language-focused input, language- focused learning, meaning-focused output and fluency.

THE EFFECT OF PEER FEEDBACK ON COHESION IMPROVEMENT IN WRITING SKILL AMONG EFL LEARNERS

Ahmad Yaghoubi (Corresponding author)

ABSTRACT

The purpose of the present study was to investigate the effect of peer feedback on cohesion improvement in writing skill among English as foreign language (EFL) learners. This study focused on using peer feedback as a teaching tool in order to improve cohesion in writing among upper intermediate EFL learners at Shokuh institute in Kashmar, Iran. The participants of the study were 87 upper intermediate EFL learners who were selected from the institute. The boys' and girls' groups studied separately; there were 20 students in male control group; 21 students in the male experimental group, and 23 students in each of the female experimental and control groups. The quasi-experimental design was used to examine the hypotheses of the study. The same process of managing classes was applied to all groups, but the students in the experimental groups received feedback from their classmates. Finally, after considering the statistical analysis, the results revealed that peer feedback can significantly improve the cohesion in writing among upper intermediate EFL learners. In addition, there was a statistically significant difference between the males and females in benefiting from peer feedback. The results of the study suggest that the teachers can use peer feedback as a teaching tool to improve cohesion in the students' writing and improve their participation in their classes, but since the male students were less likely to benefit from the peer feedback process in comparison to the females, teachers must have more concentration on the male learners in order to improve their performance in the process of peer feedback.

KEYWORDS: Cohesion, Cohesive Writing, Peer Feedback

INTRODUCTION

Cohesion refers to the ways in which texts are 'stuck together', the ways in which sentences are linked or connected by various linguistic and semantic ties (Kennedy, 1998). According to Halliday and Hassan (1976), "the concept of cohesion is related to semantic; it means that there is a relationship between the meaning that exist in text and that define it as a text" (p. 48). Many researchers have highlighted the importance of text cohesion claiming that a

text stands as a text by means of cohesion. Without cohesion, sentences would be disjointed and would result in a number of unrelated sentences (Hinkel, 2001).

According to Bijami (2013), as writing process approach has changed the way of teaching writing from students' final products to the process of writing, peer feedback has come to take an important part in writing instruction. Moreover, based on this process oriented approach, there are many teachers of English who even believe that teaching writing skill to EFL learners is more complex than teaching other communicative skills (Mazdayasna & Tahririan, 2001). Traditionally, the teacher is the only one who has high knowledge to provide feedback to students' writing. But nowadays, peer feedback has been known as a critical technique for improving students' writing. EFL learners often feel stressful and anxious when writing in a foreign language and make a variety of errors or mistakes when writing. As a result, researchers and teachers have made an attempt to know how they can help students to minimize their mistakes in their writing. However, they also admit that it is impossible for them or any teacher to read and correct all the students' compositions on writing compositions because correcting written work is time-consuming, especially for large classes.

While the teacher feedback tends to generate more comments at the grammatical level, peer feedback can generate more comments on the content, organization, and vocabulary (Paulus, 1999). As well as beneficial effects on the quality of writing, peer feedback has advantages such as developing critical thinking, learner autonomy and social interaction among students (Yang, Badger & Yu, 2006). The practice of peer feedback allows students to receive more individual comments as well as giving reviewers the opportunity to practice and develop different language skills (Lundstrom & Baker, 2009).

Peer feedback with its advantages can be a good way to persuade learners to read and provide comments and suggestions for making improvement in their peers' writings before the last versions of their works are submitted to their teachers. Peer feedback works as an important tool in the process oriented approach to writing instruction because in addition to learners' demands for enhancement of writing ability, it helps them understand their learning level.

Moreover, peer feedback can be a very good technique to make learners improve critical thinking and critical reading more than teacher feedback. To put it in another way, peer feedback helps students make good use of their own efforts to make their writings valuable and efficient (Macpherson, 1999). Nevertheless, despite of its role and impact on the process of writing, it seems that peer feedback has not been paid much attention in Iran.

The present study tried to discover if peer feedback could be used as a teaching tool in order to improve cohesion in the student's writing skill. The study also focused on finding the effect of gender on students' cohesion improvement in writing owing to the implementation of peer feedback. The participants' performances in the pre-and post writing exams as well as their experiences in peer feedback give helpful insights to writing instructors. Findings of the present study could contribute to enhance the effectiveness of using peer feedback in writing classes.

RESEARCH QUESTIONS AND RELATED HYPOTHESES

The present study aims at answering the following questions:

1. Does peer feedback have any significant effect on improving cohesion in writing among upper intermediate EFL learners?
2. Is there any significant difference between the male and female upper intermediate learners' cohesion in writing improvement owing to the implementation of peer feedback?

The following null hypotheses were proposed on the basis of the aforementioned research questions:

1. Peer feedback does not have any significant effect on improving cohesion in writing among upper intermediate EFL learners.
2. There is no significant difference between the male and female upper intermediate EFL learners' cohesion in writing improvement owing to the implementation of peer feedback.

METHODOLOGY

Participants

Eighty seven upper intermediate Persian EFL learners from English classes in one of the institutes in Kashmar (the researcher's hometown), named Shokuh, were the participants of this study who were selected by convenience sampling. To ensure that the participants were at the same level of proficiency, a Preliminary English Test was administered to them. Forty one male learners and 46 female learners were selected in each group. Their age ranged from 17 to 22. There were 20 students in male control group; 21 students in the male experimental group, and 23 students in each of the female experimental and control groups.

Instrumentation

Instruments that were used in the study are as follows:

The Preliminary English Test (PET): PET is a Language Proficiency Test designed for people who study English at an intermediate level. It was used for homogenizing the participants of the study. The test is divided into 4 sections: Reading and Writing, Listening and Speaking. Reading and Writing sections were administered in this study. The allocated time for this test was around 35 minutes for Reading Skill including 35 items, and 30 minutes for Writing Skill including 8 items. In order to investigate the reliability of the PET, the Test Retest method was used. Therefore, the test was piloted in a time interval of two weeks with a group of 35 learners who had the similar characteristics with the participants of the study. The results showed that the correlation coefficient of the scores was (0.921), which was an acceptable reliability for the measurement instrument.

The Pretest: Students in both control and experimental groups took part in a pretest that was designed to assess the knowledge of cohesion among participants. Since there was not any standard test available for this purpose, this pretest was designed and standardized by the researcher. In order to determine the reliability of the Cohesion Test, in a pilot study, 17 questions have been completed by a group of 30 students other than the main sample. According

to Cronbach's alpha index, the reliability of the test was 0.85, which indicated a high level of reliability for the test.

The Posttest: The posttest which administered at the end of the semester was the same multiple choice cohesion test that implemented as the pretest at the beginning of the semester

Procedure

In order to answer the questions of the research, the research was started by choosing 87 upper intermediate students from an institute in Kashmar. They were qualified enough in writing to be a part of this study. When all the students gave their consent to be part of the research, they attended a 30 minute English class, twice a week for a whole semester (18 sessions). These 30 minutes were a part of their routine class time in the institute. Students were selected from a group of 92 students in four classes of two female and two male ones. These students were selected through convenience sampling.

The students in each session asked to write about a topic that was provided from previous years standard TOEFL tests. Next, the students in the experimental male and female groups were asked to read their classmates' compositions and to give them some written feedbacks. The control group went through the same process except that they did not receive any feedback from their classmates.

Both control and experimental groups had teacher feedback, but the peer feedback was merely presented in the experimental groups. Therefore, this assured the researcher that the change in the students' performance was the result of the treatment in the experimental group. At the beginning of the semester students in both control and experimental groups took part in a cohesion multiple choice test, and at the end of the semester the students performed the same test as the posttest to see if the process of giving peer feedback to each other had any effect on improving their cohesive writing.

RESULTS AND DISCUSSION

As there were two experimental and two control groups, and the first research question was "Does peer feedback have any significant effect on improving cohesion in writing among upper intermediate EFL learners?", t test and analysis of covariance (ANCOVA) were used in order to find the answer to this question.

The second question "Is there any significant difference between the male and female upper intermediate EFL learners' cohesion in writing improvement owing to the implementation of peer feedback?" answered through using analysis of covariance too. The following data have been provided to answer these research questions.

Analysis of the Pretest

Table 1 demonstrates the mean scores of pretest in the control and experimental groups. There were 44 students in the experimental groups and 43 students in the control groups. According to

the table, an independent samples t-test was conducted to compare the pretest mean scores in experimental and control groups. There was no significant difference in the scores of the experimental ($M=11.93$, $SD=1.17$) and control ($M=12.21$, $SD=1.28$) groups; $t=1.491$, $p = 0.136$. These results suggest that there was no significant difference between the experimental and control groups' pretest scores.

Table 1: The Comparison of Pretest Mean Scores in the Control and Experimental Group

	N	Mean	SD	Levene's Test		T Test	
				F value	Sig.	T value	Sig.
Experimental	44	11.93	1.17	1.204	0.271	1.491	0.136
Control	43	12.21	1.28				

Table 2 demonstrates the mean scores of the pretest in the girls' and boys' groups. Forty one students in the boys' group and 46 students in the girls' group have been examined.

Based on this table, an independent samples t-test was conducted to compare the pretest mean scores in boys' and girls' groups. There was not a significant difference in the scores of boys' ($M= 12.21$ $SD=1.20$) and girls' ($M=11.96$, $SD=1.20$) groups; $t = 1.372$, $p = 0.170$.

Table 2: Comparing the Mean Scores of the Pretest in Both Girls' and Boys' Groups

	N	Mean	SD	Levene's Test		T Test	
				F value	Sig.	T value	Sig.
Girls	46	11.96	1.20	1.008	0.487	1.372	0.170
Boys	41	12.21	1.20				

Testing the First Hypotheses

Table 3 demonstrates the mean scores of posttest in the control and experimental groups. According to the table, an independent samples t-test was conducted to compare the posttest mean scores in experimental and control group. There was a significant difference in the scores of experimental ($M=14.09$ $SD=1.12$) and control ($M=12.42$, $SD=1.20$) groups; $t = -9.092$, $p = 0$. These results suggest that the peer feedback really had an effect on improving cohesion in writing. Specifically, our results suggest that improving in the experimental group's cohesion in writing was greater than the control group.

Table 3: The Mean Scores of the Posttest in the Control and Experimental Groups

	N	Mean	SD	Levene's Test		T Test	
				F value	Sig.	T value	Sig.
Experimental	44	14.09	1.12	1.154	0.319	-9.092	0.000
Control	43	12.42	1.20				

In a second attempt, in order to better see the differences between the experimental and control groups with controlling the effect of their pretest scores, an analysis of covariance was implemented. According to table 4, there was a significant effect of grouping on the students' posttest scores, after controlling for their pretest scores ($F(1, 84) = 213.248$ $P=0.000<0.05$). Considering the eta coefficient in this model, there was a significant effect of being in the experimental or control group on improving cohesion in the students' writing after controlling for their scores. As a result, the effect of putting students in two control and experimental groups was statistically significant and it can be concluded that Peer feedback improves cohesion in writing among upper intermediate EFL learners.

Table 4: Analysis of Covariance Related to the Effect of Peer Feedback on Cohesion in Writing

Source	The Sum of Squares	Degree of freedom	Squares Mean	F	Sig.	Eta Coefficient	Power
Model	293.280	2	146.640	107.956	0.000	0.720	1.000
Constant	175.430	1	175.430	129.151	0.000	0.606	1.000
Pretest	0.002	1	0.002	0.001	0.970	0.000	0.050
Group	289.661	1	289.661	213.248	0.000	0.717	1.000
Error	114.099	84	1.358				
Total	18138.000	87					

Figure 1, compares the obtained scores in the Experimental and Control groups. In this graph, we can observe that the frequency of the higher scores in the EG is greater than CG. Therefore the significant difference between the two groups was concluded which was the effect of the treatment.

Figure 1: The Effect of Peer Feedback on Improving Cohesion in Writing among Learners

Testing the Second Hypotheses

In Table 5, the posttest mean scores of both boys' and girls' groups are demonstrated. According to this table, an independent samples t-test was conducted to compare the posttest mean scores among boys and girls. There was a significant difference in the scores of girls' group ($M=13.54$, $SD=2.48$) and boys' group ($M=12.98$, $SD=1.75$); $t(85) = -1.743$, $p = 0.081$. These results suggest that the gender really has an effect on improving cohesion in writing through using peer feedback. Specifically, our results suggest that improvement in the female students' writing cohesion is greater than the male students.

Table 5: Comparing the Posttest Mean Scores in Boys' and Girls' Groups

	N	Mean	SD	Levene's Test		T Test	
				F value	Sig.	T value	Sig.
Girls	46	13.54	2.48	2.005	0.011	-1.743	0.081
Boys	41	12.98	1.75				

In a second effort to better see the differences between the girls' and boys' groups with controlling the effect of their pretest scores, an analysis of covariance was implemented. According to Table 6, there was a significant effect of gender on the students' posttest scores after controlling for their pretest scores ($F(1.84) = 6.822$, $P = 0.011 < 0.05$). This model was statistically significant and regarding eta coefficient in this model, there was a significant effect of gender in benefiting from the peer feedback process. As a result, it can be concluded that: Female upper intermediate EFL learners had better outputs "regarding improving cohesion in their writing" than male learners owing to implementation of peer feedback. Also Figure 2 compares the obtained scores in the girls' and boys' groups. In this graph, we can observe that the frequency of the higher scores in the girls' group is greater than boys' group; therefore, the significant difference between the two groups was concluded which was the effect of the treatment.

Table 6: Covariance Analysis Related to the Effect of Peer Feedback on Improving Cohesion in Writing among Males and Females

Source	The Sum of Squares	Degree of freedom	Squares Mean	F	Sig.	Eta Coefficient	Power
Model	301.946	3	100.649	79.233	0.000	0.741	1.000
Constant	148.120	1	148.120	116.604	0.000	0.584	1.000
Pretest	0.530	1	0.530	0.417	0.520	0.005	0.098
Group	293.185	1	293.185	230.803	0.000	0.736	1.000
Gender	8.66	1	8.666	6.822	0.011	0.076	0.733
Error	105.433	83	1.270	1.			
Total	18138.000	87					

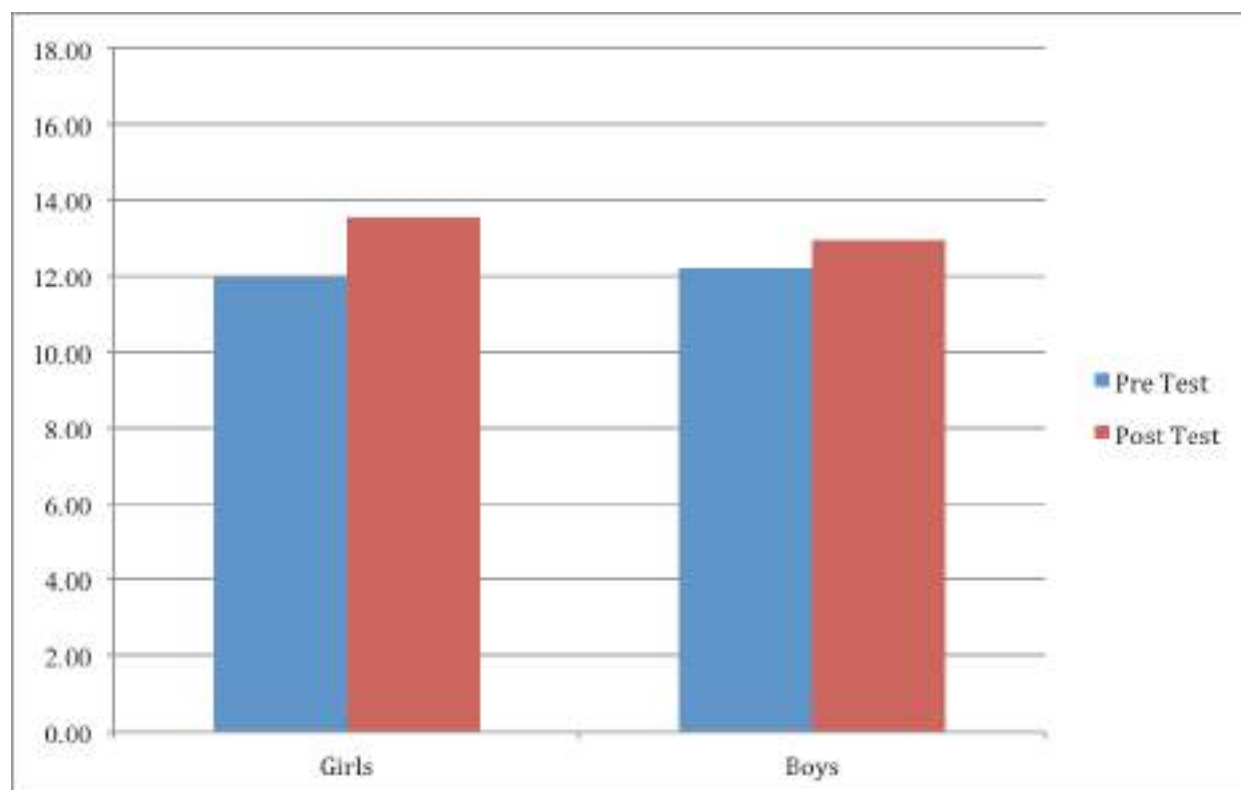

Figure 2: The Impact of Gender on Improving Cohesion in Writing Owing to the Implementation of Peer Feedback

Discussion

The findings of the present study, which indicates that using peer feedback as a teaching tool improves the cohesion in the students' writing, are somewhat inline with the findings of wakabayashi (2013) who accomplished a study with 25 Japanese university students. The study revealed significant increase in the mean scores of those who were benefited from peer feedback. Therefore, it was concluded that peer feedback improved the EFL students' writing skill.

Furthermore, in another study in line the findings of this research, Maarof, Yamat and Li Li (2011) showed that engaging learners in critical evaluation and presenting peer feedback for the purpose of exchanging help for revision can enhance more successful and effective writing. According to the findings of the study it was also concluded that peer feedback could affect the cohesion in writing among EFL learners. Moreover, they concluded that peer feedback encouraged students to participate in the classroom activity and made them less passively teacher dependent.

Findings of the first research question also support the findings of Hyland (2003) who state that peer feedback is one of the effective ways to improve students' writing, and it facilitates further writing development. Hyland and Hyland (2006), also propose that feedback is perceived as an essential element to help writers make better subsequent drafts, which is somehow inline with the findings of the present study.

Moreover, the findings of this study, which revealed that the female learners had more improvement in their writing owing to the implementation of peer feedback, were not in line with the findings of Aljamal (2006) who carried out a research to find out if there were any statistically significant differences between the achievement of the males and females on peer response in the learners writing skill, and he found no notable differences between the male group and the female group in their peer responses.

CONCLUSION

The main purpose of the present study was to investigate the effect of peer feedback on cohesion improvement in writing skill among EFL learners. The first research question inquired whether peer feedback had any significant effect on improving cohesion in writing among upper intermediate EFL learners. The results of the study indicated that the null hypothesis related to the first research question was rejected, and it was concluded that Peer feedback improved cohesion in writing among upper intermediate EFL learners.

In addition, the second research hypothesis which reiterated that there was no statistical significant difference between the male and female upper intermediate learners' cohesion in writing improvement owing to the implementation of peer feedback" was rejected due to the obtained results. Therefore, it was concluded that gender was an effective factor regarding the improvement in writing cohesion due to the implementation of peer feedback. As the result, the effect of gender was statistically significant and female upper intermediate learners had better outputs regarding improving cohesion in their writing than male learners owing to implementation of Peer feedback.

Like other studies, this research faced a number of limitations and delimitations which have to be considered while attempting to generalize its findings. First, the implemented sampling procedure was convenience sampling from upper intermediate EFL learners in an institute in Kashmar. Convenience sampling can limit the generalizability of the study's findings (Creswell, 2003). Moreover, since there were two classes for each group, it was difficult to make the two classes conditions exactly like each other. Finally, concerning the delimitation which was set by the researcher, the present study was exclusively done on Iranian upper intermediate English learners, who were considered as EFL students.

INVESTIGATING POLITENESS STRATEGIES FOR USING DISAGREEMENT BY IRANIAN EFL LEARNERS AT DIFFERENT PROFICIENCY LEVELS

Maryam Norouzi

(MA, Faculty of Foreign Language/Department of English language and Literature Islamic Azad
University, Maraghe, Iran)

Corresponding author's email: norouzi.maryam27@gmail.com

ABSTRACT

This study investigated the influence of politeness strategies in different disagreement situations by Iranian learners of English as a foreign language. The sample involved 50 Iranian students Institute. They were divided equally into intermediate and advance group. A Discourse completion Test (DCT), consisting of five situations in which learners' disagreement strategies was explored. The taxonomy from Muntigl and Turnbull (1995) was employed for counting and analyzing the utterances of disagreement from the responses. The findings of the study revealed that disagreement strategies are related to skills of language, EFL learners acquire pragmatic and linguistic knowledge. To help students realize maximum pragmatic success, teachers need to make their students fully aware of the specific speech act sets and the accompanying linguistic features to produce appropriate and acceptable complaint and other important speech acts. The major findings of this research that, intermediate and advance learners use the same type of strategies, however, they differ in the type and frequency of use of these strategies.

KEYTERMS: disagreement, politeness strategies, speech acts

INTRODUCTION

Defining different speech acts has been established since 1960 (Meijers, 2007), recently there has been a shift towards empirical studies which focus on perception and production of various speech acts by EFL or ESL learners. Flor and Juan (2006) regarded pragmatics as a "linguistic concept related to language use which involves speaker's intentions while communicating utterances as a reaction to Chomsky's abstract construct of language in which grammar played a predominant role" (p. 5). The present study was carried out to achieve the objectives, to identify politeness strategies used by Iranian EFL learners across different proficiency levels in showing disagreement and to find out the similarities and differences between at two different levels of proficiency (intermediate and advance learners). The findings will help Iranian English language teachers and syllabus designers to explain situations in which students may fail pragmatically and to develop material to handle these problems. The findings may provide the interactant, with knowledge and courage to handle disagreement without impolite or unpleasant conducts, this help the social interactants to developed richer and healthier relationship. It is hoped that the findings of this study will provide some worthwhile knowledge into the teaching and training of communication skills in EFL courses. According to Brown and Levinson (1987), disagreement

by its nature is a face-threatening act which threatens the solidarity between the speaker and the addressee. Disagreement by its nature restricts the action environment of the addressee by the way of what he can say or do because it creates a slot in which an answer to the content of the disagreement is expected (Locher, 2001). Due to the complexity of pragmatic instruction and assessment, as well as widespread pragmatic variation, pragmatic instruction is still largely ignored in foreign language classrooms since classrooms attention, focuses mostly on linguistic features of the target forms, rather than the social and cultural aspects so essential to their use (Felix-Bardfer, 2004).

Therefore, based on the result of the other studies, there is a need for further research on the pragmatic competence of Iranian EFL students in all aspects.

REVIEW OF RELATED LITERATURE

Theoretical background

This part includes both theoretical and empirical structures. In the theoretical studies section, politeness and speech act theories are highlighted. The other section reviews empirical studies on the speech act of disagreement with the aim of providing a framework for the current investigation.

Pragmatic

The word "pragmatics" refers to "social speech" but in the field of disabilities it has taken on a wider meaning encompassing all skills that involve social interaction. In order to have meaningful interactions with people, one must have a desire to interactions with people, one must have a desire to interact, recognize people as separate beings from one's self, have the capacity for joint attention, physical perspective taking, mental perspective taking, tolerance for differences on the most basic level, understanding of giving and receiving nonverbal cues, and the ability to rapidly interpret and integrate all of this information. All living creatures both emit and interact with each other and survive. When two people communicate, they generally use both verbal and non-verbal language to give and receive signals (pragmatic language). Interpreting and understanding these signals and using inference enable us predict what the other person is feeling or trying to say (Theory of Mind). By understanding this information, conversations happen, relationships build, and social relationships can flourish (social interaction), (leech, 1983).

Politeness

The academic study of politeness was a new field when leech published his first paper on the subject-language and Tact- in 1977, shortly before Brown and Levinson's more extensive and influential study appeared in 1987: 'Universals of language usage: Politeness phenomena.' Since then, the field has grown enormously: Watts (2003) says that he has "a bibliography [on politeness] that contains roughly 1,200 titles and it is growing steadily week by week"(p. 83). There is now an international journal dedicated to this field: the Journal of politeness research, founded in the current year (2005).

Brown and Levinson's seminal treatment of politeness (1987), reissued as a monograph in 1987 has remained the most frequently cited publication on language and politeness. Indeed, since its publication, in spite of heavy criticism, it has held its ground as the model that other writers turn to as the starting-point of their own research perspective. Leech (1983) own treatment of politeness in principles of pragmatics has also often been bracketed with Brown and Levinson (1987) as a pioneering, essentially Gricean treatment of politeness, and has been criticized in a similar way.

Speech act Theory

The speech act theory is largely attributed to the British Philosopher Austin (1962) who claims that many utterances, termed performatives, do not only communicate information, but are equivalent to actions. That is to say, through the use of these utterances, people do things for them; they apologize, promise, request, refuse, complain, etc. utterances that used to realize the above functions are known as speech acts. Just as linguistics have tried to understand how speakers might be able to produce an infinite number of sentences given a very finite set of rules for sentences, philosophers have tried to understand how an infinite number of sentences might reflect a very finite set of functions, the philosophers reasoned that the number of things we do with words is limited, we ought to be able to assign functions to utterances.

The problem with assigning functions to sentences is that speaker's intent and sentence's meanings are not always the same. Speaker intent may be more or less, or actually the opposite, of sentence meaning or function. Nevertheless, philosophers such as Austin (1962) and Searle (1969) have shown that it is possible to classify utterances into a very small set of functions. Austin's original insight was that stating or describing is only one function of language. In fact, he argued, statements do not even have any privileged position.

Empirical Background of the Study

Kotthoff (1993) looked upon disagreement and concession in German and Anglo-American disputes. The findings suggested that the preference structure can change once a dissent-turn-sequence is displayed. Concessions occur when interlocutors are unable to defend their position. This finding showed that "giving up a position that has already been argued for can also be face-threatening because it could be interpreted as submissiveness" (p. 213). It is obvious that interactants are after solidarity which keeps their face.

Nancy Bell (1998) in the paper "politeness in the speech act of Korean ESL learners" examined the production of three face threatening speech acts (disagreement, request, and giving advice suggestion) by a group of high beginning Korean ESL students. This study was conducted in the context of vocabulary grammar elective class which consisted of 11 students. The data which consisted of 29 speech acts including five requests, six suggestions, and eighteen disagreements was collected through audio or video taping of each class meeting. The main framework for data analysis was Brown and Levinson's (1987) politeness strategies (five of 10 negative politeness strategies and two of 75 positive politeness strategies were used). By comparing the ESL Korean learners' strategies they use when requesting and giving suggestion, different results obtained. The learners in this study used direct, bald on-record strategies in performing the speech act of

disagreement, but they revealed a high linguistic level and the ability to increase the politeness of the act when making request and giving suggestion. It was argued that sensitivity to status, which in the Korean context includes a great emphasis on age differences, is a major factor for these differences.

Vera (2010) explored the negotiation of (im) politeness carried out by Argentine speakers of English in the discourse of disagreement in simulated business meeting. For this purpose, a corpus consisting of 20 videotaped dyadic business simulations was collected. The participants' whose ages ranged between 20 to 50 years old were all business people with decision-making positions in international companies and with an excellent level of proficiency in English. The data was analyzed from a socio-pragmatic perspective combining Watt's discursive model of relational work with the notion of Graduation and Engagement from Appraisal Theory (Martin & White, 2005). The analysis revealed that the speakers draw on a range of different discursive strategies to voice disagreement in business negotiations. These have been summarized into four sub functions, namely Contradictions, Challenges, Counterclaims, and Counterproposals. In the first phase of the negotiation, where participants take a stand and introduce their proposals, very few contracting and challenging acts were detected.

Shrif and Noor (2011) in their article "Disagreement Politeness among Adolescents" examined, some adolescents were deemed guilty of poor L2 spoken politeness due to their low proficiency level. Thus, to identify the extent of this factor, a contrastive study of disagreement politeness between L1 and L2 was carried out where a discourse completion test method [1] was adapted for data induction and taxonomy of disagreement [2] was adopted for data elicitation. Two variables, i.e. social distance and power difference were analyzed. Findings suggested both variables did significantly influence adolescents' spoken disagreement politeness. The research concluded that a polite adolescent might not be bound to a language in adhering to politeness despite the variables.

Regardless of language, place formality, and topic of disagreement, an intuitively polite adolescent may adhere to disagreement politeness strategy. S/he may portray a better disagreement politeness when addressing a friend (-Power) at a formal situation (+Distance) while arguing a formal topic, as opposed to a friend (-Power) at an informal place (-Distance) on an informal topic. This may be due to the greater application of self-denigration in a situation with greater social distance. In a disagreement with someone of higher level of superiority like an educator, adolescents may use less tact depending on the severity of the face threatening situation. The adolescents have been placed under pressure to defend their positive face wants despite the positive power difference (+Power) and social distance (+Distance) (lecturer-student). In general, the students would show a greater disagreement politeness in formal situations (+Distance)/ (+Power). In an informal situation (-Distance) with lower level of superiority (-Power), the students would adhere the least to politeness strategies during disagreement handling.

RESEARCH QUESTION AND HYPOTHESES

The present study investigated the interface of politeness in the realization of disagreement in language data. Politeness is important phenomena in face-to-face interaction. Disagreement is an arena in which this key concept is likely to be observed. In so doing, the aim was to find answers for the following research questions:

1. What are the different disagreement strategies uses by Iranian EFL learners in two different levels of proficiency? (Intermediate and advance).
2. Are there any differences between intermediate and advance Iranian EFL learners in expressing disagreement strategies?
3. What types of politeness strategies are employed by two groups?
4. Are there any differences between intermediate and advance Iranian EFL learners in using politeness strategies?

METHODOLOGY

Participants

The participants of this study consisted of 50 Iranian learning English at Shoukoh Institute in Iran, Astara. A community sample of 50 EFL learners participated in this study, comprising 25 males and 25 females, their age-range vary between 21to 25. They were all EFL learners studying in language institutes in Astara.

Instruments

Two instruments were employed to obtain the research data. The English Language Proficiency Test (TOEFL Actual Tests 2004), (see appendix I) and Discourse Completion Test (DCT), (see appendix II). The English Language Proficiency Test was used to assure the homogeneity of the Iranian group in terms of their L2 proficiency. This test included fifty listening comprehensions, fifty structures, fifty written expression, and five reading comprehension texts consisting of fifty multiple choice items (see appendix I). Each item was assigned one point, and the overall scores were one hundred and fifty.

Procedure

The approach used in this study was survey based. In order to investigate politeness in the realization of disagreement, the participants in two groups were given DCT which consisted of five scenarios (see appendix II). The questionnaire used here presented a brief description of certain situations, which specified the setting, the social distance between interlocutors and their status relative to each other. When identifying the utterances of disagreement from the responses, the taxonomy from Muntigl and Turnbull (1995) were applied.

In this taxonomy, five types of disagreement: irrelevancy claim, challenge, contradiction, and counterclaim are recognized. Finally, the responses of the learners were compared with Brown and Levinson's (1987) politeness theory.

RESULTS AND DISCUSSION

In order to analyze the collected data and find an answer for the imposed research questions, the research used SPSS program and frequency of each data at each proficiency level was determined. In this step, the actual disagreement realizations were analyzed. First, the occurrences of the features in question were counted for the intermediate and advance learners. Second, possible relationships between proficiency level and disagreement realizations were analyzed, Muntigl and Turnbull (1995) have identified four types of disagreement: Irrelevancy claims (IC), challenges (CH), contradiction (CT), and Counterclaims (CC). The strategies of avoiding explicit disagreement such as using positive marks, partial agreement and so on can indicate indirectness and being polite in the speech act of disagreement. Muntigl and Turnbull (1998) propose that there exist a fifth type in which disagreement type is the combination of contradictions followed by counterclaims.

Intermediate group expressed their disagreement implicitly (indirect level or off-record strategies) by use of mitigating devices and positive markers. It showed that even the intermediate learners were able to select a polite, conventionally indirect strategy in the L2 and they were careful about face wants of their interlocutors. This study was designed to address the important issue of pragmatic development of disagreement strategies in Iranian EFL learners. The findings of this study provide some evidence of relationship between the learners' level of language proficiency level and type of disagreement strategies. The findings indicated that remarkable components that used in both group were contradictions and counterclaims. In Brown and Levinson's (1987) term disagreement inherently threatens either the hearer's or the speaker's face-wants, and that politeness is involved in redressing those face threatening acts. This is in line with the findings of Pearson (1986) and Beebe and Takahashi (1989) that native speaker's strategies for expressing disagreement are generally characterized by mitigation, that is, by reducing the directness of the disagreement and with it the strength of FTA. Inappropriate performance of learners in different disagreement situations might be resulted from their linguistic limitations. This result is in accordance with the findings of Umar (2006) by Sudanese learners on the speech act of complaint and Jalilifar (2009) by Iranian subjects on request strategies. They found that lower proficiency learners may, to some extents, have pragmatic competence, but they lack sufficient linguistic competence to perform appropriately in a foreign language. The higher the proficiency level, the more appropriately they will utter their disagreements.

The results of this study indicated that disagreement is more severe when it personally threatens the interlocutors' feelings. If primary aims are politeness and maintenance of social harmony, then it would be predicated that fewer politeness markers would be used for less severe disagreement, and more politeness would be used for less severe disagreement. We can find that Iranian learners indirectly disagree with their interlocutors, and learners use more politeness in front of their professor, boss, and his/her friends. In the present study in some instances, this was the case, but not in all.

Table 1: Disagreement to the Supervisor

Types of disagreement	Levels	Frequencies
Irrelevancy claims	Intermediate Advance	4% 0%
challenges	Intermediate Advance	44% 44%
contradictions	Intermediate Advance	36% 24%
counterclaims	Intermediate Advance	12% 28%
contradictions Followed by counterclaim	Intermediate Advance	4% 4%

Table 1 above shows that in the advance level, participants used challenges with the frequency of (44%), counterclaim with the frequency of (28%), contradiction with the frequency of (24%), and contradictions followed by counterclaim with the frequency of (4%). The remarkable components in the intermediate level were challenges with frequency of (44%), contradiction with frequency of (36%), counterclaim (12%), Irrelevancy claim (4%), and contradictions followed by counterclaims (4%).

Figure 1: Disagreement to the Supervisor

Table 2: Disagreement to Boss

Types of disagreement	Levels	Frequencies
Irrelevancy claims	Intermediate Advance	4% 0%
challenges	Intermediate Advance	0% 0%
contradictions	Intermediate Advance	84% 92%
counterclaims	Intermediate Advance	0% 4%
contradictions Followed by counterclaims	Intermediate Advance	12% 4%

Table 2 shows that in the intermediate level, participants used contradiction (84%), contradictions followed by counterclaims (12%), and Irrelevancy claim (4%). In the advance level, they used contradiction (92%), counterclaim (4%), and contradiction followed by counterclaim (4%).

In the intermediate level, participants used contradictions followed by counterclaims (28%), Irrelevancy claims (24%), contradiction (20%), counterclaim (16%), and challenges (12%). The advance learners used counterclaim (36%), Irrelevancy claim (28%), contradiction followed by counterclaim (16%), and contradiction (12%), and challenge (8%).

Table 3: Disagreement to Friend

Types of disagreement	Levels	Frequencies
Irrelevancy claims	Intermediate	8%
	Advance	8%
challenges	Intermediate	32%
	Advance	4%
contradictions	Intermediate	8%
	Advance	16%
counterclaims	Intermediate	40%
	Advance	56%
contradictions Followed by counterclaim	Intermediate	12%
	Advance	16%

In this situations intermediate level used counterclaim (40%), challenge (32%), contradiction followed by counterclaim (12%), Irrelevancy claim (8%), and contradiction (8%). In the advance level, they used counterclaims (56%), contradiction (16%), contradiction followed by counterclaim (16%), and Irrelevancy claim (8%), and challenge (4%).

Table 4: Disagreement to Classmate

Types of disagreement	Levels	Frequencies
Irrelevancy claims	Intermediate	24%
	Advance	28%
challenges	Intermediate	12%
	Advance	8%
contradictions	Intermediate	20%
	Advance	12%
counterclaims	Intermediate	16%
	Advance	36%
Contradictions Followed by counterclaim	Intermediate	28%
	Advance	16%

Figure 3: Disagreement to Classmate

Table 5: Disagreement to the Younger sister

Types of disagreement	Levels	Frequencies
Irrelevancy claims	Intermediate	12%
	Advance	12%
challenges	Intermediate	4%
	Advance	8%
contradictions	Intermediate	0%
	Advance	16%
counterclaims	Intermediate	80%
	Advance	48%
contradictions Followed by counterclaim	Intermediate	4%
	Advance	16%

In the intermediate level, participants used counterclaim (80%), Irrelevancy claim (12%), contradiction followed by counterclaims (4%), and challenges (4%). In the advance level, participants used counterclaim (48%), contradictions followed by counterclaims (16%), Irrelevancy claim (12%), contradiction (16%), and challenges (8%).

CONCLUSION, LIMITATIONS AND DELIMITATIONS OF THE STUDY

Finding of the study revealed that disagreement strategies are related to skills of language. That is, as learning progress, EFL learners acquire pragmatic and linguistic knowledge.

It was revealed that learners are more sensitive to the use of more politeness strategies in disagreeing to the boss, professor, and also their friends. It was found that EFL learners may have access to the range of speech acts and they may have enough pragmatic competence, but they may use just limited number of these strategies due to the lack of linguistic competence.

The use of counterclaims is the first most frequently used strategies, by Iranian EFL learners. It was revealed that with the use of counterclaims, speakers propose an alternative claim that does not directly contradict or challenge other's claim. The strategies of avoiding explicit disagreement can indicate indirectness and being polite in the speech act of disagreement. More importantly, even in the high proficiency levels (advance), EFL learners fail to act out different function of speech appropriately. So, EFL learners must be aware of foreign language pragmatic rules and socio-cultural constraints on speech acts as well as grammatical rules in order to have successful communication. Schmidt (1993) suggested that, if an English language learner is to acquire pragmatics; he/she needs to take into account linguistic functions and the context.

Teacher can develop pragmatic competence in L2 with different speech act set in the materials in their curriculum. Bardovi-Harlig (2003) states that "teaching pragmatics by increasing the pragmatic knowledge of the learners enables them to use and interpret socially appropriate language in particular situation. This in turn will help them to develop a higher level of confidence in their communication abilities"(p. 87).

We need to help our students develop pragmatic of English language norms in both EFL and ESL context.

Certain limitations were imposed on this study. First, the number of participants in this study was 50; the result of the study would be meaningful if we could have access to a large number of participants in different situations and places which might increase the acceptability of the results. Second in order to have clear idea about the issues of politeness strategies focusing disagreement, a comparative study of two different cultures, at different levels may be very beneficial, but this research was conducted only Iranian EFL context. Third if the production questionnaire were in a dialogue form instead, we had the chance of more intact disagreement forms and the results could be different. Results would have been much more reliable if an interview was conducted.

The delimitations of the study are as follow: first, the findings of the study cannot be generalized to the wider population due to the relatively restricted number of respondents. Second, due to using DCT as a form of written open ended questionnaire with limited number of situations, the data for the present study was limited to this type of methods were used. If the production questionnaire was in a dialogue form instead, the research had the chance of more intact disagreement forms and the result could be different. The delimitations of this study were the number of context; more contexts would probably have allowed a more manageable data collection and more exhaustive data analysis and results.

Discourse Completion Test

Five scenarios are described below in which you are expected to disagree with the speaker on different occasions. How would you respond? Please write out what you are to SAY in real life scenarios.

1. Your supervisor questions the originality of the term paper you submit. S/he says to you, "I'm sorry, but I don't think these ideas are yours." However, they are yours. In response, you will say,

"....."

2. You work in a company. Your boss presents you with a plan for reorganization of the department that you are certain will not work. Your boss says isn't it a great plan? In response, you will say,

"....."

3. Your friend makes the following comment on your thesis, "I think you should supply more data to support your arguments. You know, your conclusion is a little bit weak." However, you think that there has been enough evidence and the problem is how to give a better explanation of the data. In response, you will say,

"....."

4. In a seminar class on the effect of modern technology, one of your classmates says, "The so-called modern technology is endangering the environment. It causes too much pollution". However, you believe such problems are only temporary and can be solved gradually. In response, you will say"

"....."

5. You are watching the movie Titanic with your younger sister at home. When the ship is about to sink and the first mate calls out, "Women and children first" to get on the lifeboat, your sister suddenly blurts out, "It's really unfair and prejudiced to women: we're no weaker than men. Why should women instead of men go first with the children?" In your opinion, women are, physically speaking, not as strong as men. Your response will be:

"....."

THE EFFECTS OF DYNAMIC ASSESSMENT ON IMPROVING WRITING ABILITY OF INTERMEDIATE EFL LEARNERS

Parissa Pedram Parsi

MA graduate from Islamic Azad University, Roudehen Branch, Tehran, Iran

Dr. Reza Vahdani Sanavi

Assistant Professor at Islamic Azad University, Roudehen Branch, Tehran, Iran

ABSTRACT

The present study was intended to investigate the impact of teaching two techniques on the writing proficiency of Iranian English as Foreign learners (EFL) in Tehran, Iran. To achieve this goal, the researcher selected 45 female intermediate learners of Royan Institute in Tehran based on their performance on the preliminary English test from 70 intermediate level learners. The participants were divided into three groups, two experimental groups and one control group. One experimental group was exposed to Form-Focused Instruction and the other experimental group received Conference Writing and the third group was randomly chosen as the control group. All of groups were tested prior to and after the training of the experimental groups. One way Anova was run to detect any possible differences among the means of the three groups. The statistical procedure indicated that, those students who received the Conference writing treatment outperformed the other groups. Some pedagogical implications were finally inferred in the end. Accordingly, teaching Conference Writing in the English class has a positive impact on the writing proficiency of intermediate EFL learners. It also helps the teachers to incorporate DA into the classes and identify the weaknesses of their learners and provide mediation when and where needed.

KEYWORDS: Dynamic Assessment, Interactionist, Conference Writing, Form-Focused Instruction

INTRODUCTION

Background knowledge

Dynamic Assessment (DA) is based on the theory of development proposed by Vygotsky (1986). When he was studying the development of children's mental abilities, he found out that what a child can do independently only showed a part of the child's full ability and assistance. He further claimed that mediation offered by a teacher can help a child to do more than it was expected of him/her. Based on Vygotsky's theory, what the child can do independently showed a view of the child's post development, but what a child can do after mediation represents the child's future development.

Vygotsky named this difference between what a child can do independently and what the same child can fulfill with assistance, ZPD (Zone of Proximal Development). Interaction in the field of the ZPD is a guidance for promoting that development. "According to DA theory, a good

instruction involves assessment and good assessment involves instruction” (Lantlof&Poehner, 2004, p. 2).

Vygotsky (1986) suggested a whole range of possible interactive interventions to be used during ZPD assessment, such as asking leading questions, modeling, starting to solve the tasks and asking students to continue and so on, but he produced no standardized procedure for the ZPD assessment. Vygotsky also made no particular distinction between ZPD assessment and static assessment in content-based learning area (Kozulin & Garb, 2002). The fully operationalized programs for DA of general cognitive functions were developed by Budoff in the USA and Feuerstein in Israel (see Lidz, 1987). Budoff (as cited in Kozulin & Garb, 2002) suggested DA as a better tool for classification of students and prediction of their future achievements, but Feuerstein claimed that the goal of DA is to discover and actualize the students' propensity toward cognitive change. Currently a wide variety of dynamic cognitive assessment procedures is available. What is united in all of these procedures is based on test-teach-test program. And what distinguishes them is the nature of "teaching" that occurs between pre and post-tests (Campione, 1996; Haywood & Tzuriel, 1992; Lidz & Elliot, 2000)

In the Iranian EFL context, despite new methods and approaches which have been successful in other EFL contexts all over the world, most of techniques used to teach writing skill nowadays are still traditional, i.e. the teacher focuses on the end product and does not lead the students through the process of writing (Birjandi & Malmir, 2009).

One of the ways to improve learners' writing skill is the systematic feedback that learners may receive from teachers as it signifies the importance of learning as a process. To have such a formative feedback, through prompts and recasts and conference writing as means of DA, the learners can take the opportunity to actively involve in the process of learning as well as diagnosing the problems and reflecting upon them by means of systematic and effective feedback.

It should be mentioned that, DA is new to applied linguistics and not many practical investigations have been done in the area of language teaching and testing (Birjandi&Sarem, 2012). However, there have been some studies that have explored the applications of these procedures to L2 instructional contexts (Ableeva, 2008; Anton, 2003; Birjandi&Ebadi, 2010; Birjandi,Estaji & Deyhim, 2013; Kozulin & Garb, 2002; Lantlof, 2009; Pishgadam,Barabadi & Kamrood, 2011; Poehner, 2008).

Researchers have been especially interested in how assessment influences students' learning strategies and leaning processes and since students want to proceed and succeed in their studies, they care to know what aspects of their performance are assessed and how. Not only do most assessment results arrive far too late to influence learning but also they are not in a form which can be used by learners to aid their development.

Assessment informs students about their strengths and weaknesses and indicates the following steps to take in the learning process. Through appropriate assessment, students can also make an

active contribution to their knowledge construction, which is beneficial to the learning outcomes. In this research, the researcher used CW as one DA technique and FFI as conventional technique for differentiated instruction, constructivist pedagogy and principles of DA in second language acquisition to address the writing needs of second language learners.

The aim of this study was to investigate the impact of DA technique versus conventional technique on English language acquisition and differentiated instruction for intermediate level of foreign language female Iranian students in an Institute.

REVIEW OF THE RELATED LITERATURE

DA is an interactive approach to psychological or psycho-educational assessment that embedded intervention within the assessment procedure. Most typically, there is pre-test followed by an intervention and a posttest. This allows the assessor to determine the client or the students' response to the intervention. There are a number of different DA procedures that have a wide variety of content domains. One purpose of DA is to determine if a student had the potential to learn a new skill. DA posits a qualitatively different way of thinking about assessment from how it is traditionally understood by classroom teachers and researchers.

As the researcher mentioned above, DA proceeds from an ontological perspective on human abilities, and it developed more than 80 years ago by Vygotsky. Poehner (2008) pointed out:

Vygotsky's research into the development of cognitive functions revealed that this process is not a matter of innate abilities growing into a mature state, but that it is the emergence of new ways of thinking, acting, and being that result from an individual's engagement in activities, where he or she is supported by cultural artificial and by interactions with others. In this way, the social environment is not merely the stage on which development plays out; it is in fact the driving force of development (p.1).

An important consequence of this view of mental abilities is that observing individual's independent performance reveals, at best, the results of past development.

The Vygotskian approach to education offered that teaching and learning had a leading role in development. This statement was not similar to many leading theories of education including that proposed by Piaget. Vygotsky (1978) suggested that instruction should not wait for developmental readiness, but rather, development happens when learners take part in activities that are beyond their current level of ability and the total combination of assessment and instruction can only be achieved when learner development becomes the aim of educational activities which is the major aim of DA.

If one wishes to understand the processes of development, to intervene, to help individuals overcome difficulties, and to support their ongoing development, then more observation of solo performance is insufficient. Instead, active collaboration with individuals simultaneously reveals the full range of their abilities and promotes their development. "In educational contexts, this

means that assessment (understanding learner's abilities) and instruction (supporting learner's development) are dialectically integrated activities. This pedagogical approach has come to be known as DA" (Poehner, 2008, p.2).

Based on the critical review of DA, Sternberg and his colleague Grigorenko proposed that DA procedures were not only necessary to integrate assessment and instruction but also crucial for insights into the depth of individual's ability. They focused on the poor performance and the specific ways of supporting development. They argued that DA broadened the view of learners' knowledge and abilities and that enabled them to use the result of assessments more effectively and DA principles created a new generation of tests (Sternberg & Grigorenko, 2002).

Models of DA

Lantlof and Poehner (2004), proposed the terms interventionist and interactionist to describe the two kinds of mediation that DA researchers offered to educators. However, mediation can entail a wide array of support, ranging from standardized hints to dialogic intervention.

Interventionist DA

The first characteristic of interventionist approaches to DA is that the mediation which is given to educators is standardized. The instructors must follow a highly disciplined approach to mediation in which all prompts, hints and leading questions have been prepared in a hierarchical manner, from implicit to explicit, and are usually assigned a numerical value.

The followers of interventionist approach emphasized the incorporation of using psychometric terms which lead to maximizing the assessment objectivity. In this approach learners' performance is measured in a quantified form as scores (Poehner, 2008).

Interactionist DA

Feuerstein's Mediated Learning Experience: Feuerstein and his colleagues (as cited in Poehner, 2008) conducted the work on the basis that human beings are not closed systems, they are open systems. They showed that with intervention one could develop the human cognitive abilities. Feuerstein's theory called "Structural Cognitive Modifiability" (SCM) suggested that cognitive abilities of human beings are not the same as their biological specifications such as height and color of eyes, but rather they can promote in a variety of ways depending on the quality of interaction and instruction Feuerstein (as cited in Poehner, 2008) It was the same as Vygotskian theory that uniquely human forms of consciousness was rooted in participation in social activities. Feuerstein and his colleagues believed that in educational testing assessment, the ability of individuals begin to change and one can develop their abilities which are very different from their previous ability that they have shown. So this approach is far from the unstated belief that mental abilities were static (Poehner, 2008).

Feuerstein and his colleagues discussed that most education systems predicted the future functioning of learners based on their present performance, "ignoring the possibility that the predicted destiny may not materialize if powerful intervention take place" (Feuerstein et al., 1988, p.83).

In interactionist DA, the important thing is learner development. The flexible and dialogic nature of interactionist DA is used by instructors in classrooms.

Interactionist DA in the Educational Setting

Newman et al. (1989) investigated the development in the classroom setting within the framework of ZPD. They made an important difference between “assessment by teaching”, and “assessment while teaching”. They believed that in a traditional classroom, learning of students has hierarchies that constitute “a sequence of increasingly difficult tasks”. Deciding about how successful the learners are in the class is often measured by achievement tests at a particular stage in the teaching sequence. In assessment while - teaching environments, instruction is not prepared according to ‘a neat sequence of levels to be mastered in an invariant sequence with a single correct route to mastery’. Task and knowledge are chosen based on the teacher's assumptions about how they can be taught from simplicity to complexity, but when teachers and learners involve in instructional activities many unanticipated direction and invariable rates may happen (see Coughlan and Duff, 1994). Teachers always must be prepared for a suitable type of mediation and know how they can use it when learners started to mediate themselves.

Theory in Use: ZPD

Vygotsky (1986) developed the concept of ZPD. It is a way for the teachers to assist their students to have logical thinking and have a schema of scientific concepts which he refers to as a fabric of concepts.

The ZPD shows skills and concepts that a student can successfully obtain if the teacher provides with him/her the assisted performance. It is an important theoretical basis for differentiated instruction. The teacher can provide the students the classrooms with different ability levels, not only in terms of what they can do independently but also in what they can do under conditions of assisted performance.

To conclude, Vygotsky's ZPD shows us a new model of learning. Teacher gives various forms of mediation, and then by giving assistance, the ability of student may mature until it internalizes. There are two important factors in this process: first, teachers can accurately estimate the student's ZPD, the best measure of ZPD will be actual real- time student performance when the teacher has given her/him proper mediation (i.e., teacher observation and reflection). However, the teachers cannot deny the validity of assessment that measures independent performance. Second, the teacher should have given a proper reflection that acts upon this information to choose the right and proper instruction that is truly suitable for the student's ZPD, at least some part of the day must be dedicated to focusing on true learners' needs instead of performing regularly curriculum.

In this research, the researcher used two techniques of TBI(Task Based Instruction) in two classes: FFI & CW.

Form – Focused Instruction

The concept of FFI is related to TBI as a technique of developing grammatical competence within the frame of a communication language approach developed. FFI is not one method, but it

is a combination of methods grading from explicit and planned to implicit and reactive. Long and Robinson (1998) described FFI as a method that shifts our attention from meaning to grammar, similar to what happened in real life when a communication broke down.

Conference Writing Instruction

The researcher in this research tested a new line of inquiry and that is using the writer's conference as a jigsaw task, a two way information-gap task. It is a new way in which the researcher used the writing process as a tool for second language acquisition. As mentioned before, Lightbown (1998) saw one aspect of TBI as a teacher -student dialogue where by the student would self-correct oral grammar through incisive teacher questions. A conference between the teacher (the native or native -like English speaker) and the student (the English language learner) to go over a rough draft through the steps of the writing process for incorporating TBI into classroom considering the writing process.

Vygotsky likened written language to a conversation with a blank piece of paper, lacking both the expressive qualities of oral speech and a live interlocutor, he saw it a highly abstract form of communication that did not repeat the development of speech. Vygotsky (1986) stated that:

Written speech is monologues, it is a conversation with a blank sheet of paper. Thus, writing requires a double abstraction, abstraction from the sound of speech and abstraction from the interlocutor Our studies show that the child has little motivation to learn writing when we begin to teach it. He feels no need for it and has only a vague idea of its usefulness (p.181).

How can the researchers use this theory in the field of second language acquisition and how can they make it possible for second language learners to improve their writing ability by using these principles? What role does grammar instruction have within the classroom? One proposed answer to these questions raised in the above paragraph is Task Based Instruction (TBI). It represents the middle ground between naturalistic forms of communicative language teaching focused on comprehensible input and traditional language teaching focused almost exclusively on grammar (Ellis, 2003).

In this method TBI through CW students produce discourse about writing. This discourse includes many elements such as content, language, text structure, purpose, reader, writer's intentions, graphic dimensions, etc. In addition to assisting in writing the text, the writing conference also helps the students to produce discourse about writing. This discourse strongly depends on the interaction with the teacher, being linked to the communicative situation in which it occurs, where the student, the teacher, and the text are co-presented. A CW technique can help students in mobilizing the concepts and the words that are needed to provide the written texts that they have produced.

In this research, the researcher uses TBI as a new method for improving the learners' writing ability. There are two techniques which the researcher wants to examine in this research:

- 1) One manifestation of TBI/FFI as a teacher-student dialogue whereby the student would self-correct oral grammar mistakes through teacher questions.
- 2) A one-on-one conference between the teacher (the native or native like speaker) and student (the English language learner) to move a rough draft through the stages of the writing process that could be vehicle for incorporating DA into the classroom.

An Overview of Related Research Studies

A number of research studies have been done on Dynamic Assessment and language improving skills. In their paper titled "A comparative study of the impact of DA models on the writing ability and attitude of Iranian EFL learners" Hassaskhah and Haghparast (2012) revealed the results of their research "DA is considered superior to traditional assessment approaches in that it takes into account the individual differences between the learners, additionally it is development - referenced."

Shrestha and coffin (2011) published their study of DA and academic writing development. They found DA is an assessment approach that blends instruction and assessment. "It consisted interaction between tutor-researcher and two business students across various drafts in line with DA approach, the analyses of such interaction suggested that DA can help to identify and respond to the areas that students need the most support. They concluded that a learning theory- driven approach such as DA helps undergraduate students to develop their academic writing by responding to their individual needs.

In a quantitative study on the using of DA approach for promoting speaking skill of Iranian EFL learners, Shokuohi (2011) tested 80 adult English language learners. She divided the participants into three groups: the control group and the two experimental groups. One experimental group was taught conventional approach and the other was taught DA approach. The findings revealed that the experimental group that using DA approach outperformed the conventional one.

Garb and Kozulin (2002) designed and tested a Dynamic EFL Assessment in a population of at – risk students in Israelian which they concluded that the instructional value of DA lies in the fact that its results can be used for the development of individual learning plans for students with different learning needs. They confirmed that the paradigm of DA is useful not only in the field of general cognitive performance but also in other curricular domain as EFL learning.

In another research Pishghadam, Barabadi and Kamrood (2011) studied the impact of teaching DA and using prompts via developing software on Iranian MA students' reading skill and reported that the participants, when had had opportunity to become familiarized with these techniques and procedures, gained better scores in comparison with the time when they did not use these techniques. This study confirmed that DA in general was useful and helpful for the students.

It is concluded that these studies show outstanding results by teaching DA techniques on improving language skills.

RESEARCH QUESTION

The research question posed in this study is: Do types of instruction have any significant effect on the improvement of the writing ability of the Iranian EFL learners?

METHODOLOGY

This section provides a thorough description of what was done to take us to the answer of the question posed in this study.

Participants

To investigate the efficacy of each commentary technique of conference writing and form focused writing five female classes including seventy participants in intermediate level were selected. They were students at Royan Institute located in Tehran, Iran. The students in the five classes were studying English “Interchange III” book. In addition, the entire participants had prior training in writing, as it was part of the skills taught by their text- books. A Nelson Quick Test was administered to make sure that the students are at the same level in general language proficiency. The researcher calculated the mean and variability for determining the statistical significance of difference among the five groups. After the scoring process, she compared the means of them by using one way ANOVA. She found out there were outliers, so they were crossed out from the research groups. And 45 participants were selected and divided into three groups: Group A and B as experimental ones and group C as the control group.

The treatment took place after the Institute class hours for group A, 25-30 minutes twice a week for two months and a half. But in group B they wrote their compositions as homework and then brought them to researcher, while group C did not receive any special feedback about writing.

Instrument

The Nelson quick test was used for homogenizing the participants of the study and the preliminary English test (PET) from Cambridge ESOL exams (writing section) was adopted in order to prove that three groups enjoyed the same level writing proficiency prior to the main study. For measuring the reliability of the Nelson test , the researcher used the KR-21 measurement and it was 0.88. (The result has shown in Table1 and Table 2). The researcher used the same PET writing test as the writing post-test at the end of the semester. The classes were held in twenty 105 minutes sessions within two- month and a half period.

Procedure

The study involved three groups of female Iranian adult intermediate learners, with two groups as experimental groups and one group as the control group. They were attending 20 sessions of general English training, and CW group after each session had mini conferences for 25-30 minutes to receive feedback about their compositions. In FFI group students wrote their compositions as homework and then brought them to the researcher to receive feedback and in the control group, they did not receive any special feedback in their writing task. The students’ level for writing proficiency was assessed before and after the training sessions to determine any changes made as a result of the treatments that they received. In order to avoid any threats to the

reliability of the scores, the pretest and posttest were scored by the researcher and a second scorer. The mean of the two scorers' score for each participant was calculated and reported as the participant test score.

Design

The present study employed a quasi-experimental design in its quantitative approach to study the effects of performing FFI and CW techniques on the writing proficiency of two groups of female Iranian adult intermediate English learners.

RESULTS AND DISCUSSION

Using quantitative approach of this study the researcher sought to find the answer to the following question: Do types of instruction have any significant effect on the improvement of the writing ability of the Iranian EFL learners?

The data were collected through a quasi-experimental design and analyzed. The SPSS (statistical package for the social sciences) software was employed to analyze the data collected from the control group and experimental groups.

Nelson Test of General Language Proficiency

The Nelson test of general language proficiency was administered to 70 students. Based on the mean of 37.93 and standard deviation of 8.27 (Table 4.3), 45 subjects were selected and divided into three equal groups for the main study. The KR-21 reliability for the test was 0.88.

Table 1: Descriptive Statistics; NELSON

	N	Mean	Std. Deviation	Variance	KR-21
Proficiency	70	37.93	8.278	68.531	0.88
Valid N (listwise)	70				

A one-way ANOVA was run to compare the means of the Conference Writing, Form Focused and Control group on the Nelson test in order to prove that they enjoyed the same level of general language proficiency prior to the main study. Before discussing the one-way ANOVA results, it is worth mentioning that the three groups enjoyed homogenous variances on the Nelson-test, i.e. their scores did not show markedly different distributions. As displayed in Table 2 the Levene's F-value of .036 was not significant ($P > 0.05$).

Table 2: Test of Homogeneity of Variances

Levene Statistic	df1	df2	Sig.
0.036	2	42	0.965

Based on the results displayed in Table 3 ($F(2, 42) = .0089$, $P > 0.05$; $\omega^2 = 0.042$ representing a weak effect size) it can be concluded that there were not any significant differences between means of the participants in Conference Writing, Form Focused and Control groups on the Nelson test. Thus, it can be claimed that they enjoyed the same level of general language proficiency prior to the main study.

Table 3: One-Way ANOVA; NELSON by Groups

	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	1.244	2	0.622	0.089	0.915
Within Groups	293.200	42	6.981		
Total	294.444	44			

As displayed in table 4 means of the learners in CW , FFI, and the control group on the Nelson test are 38.67, 38.93 and 39.07 respectively.

Table 4: Descriptive Statistics; NELSON by Groups

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean	
					Lower Bound	Upper Bound
Conference Writing	15	38.67	2.690	0.695	37.18	40.16
Form Focused	15	38.93	2.658	0.686	37.46	40.41
Control	15	39.07	2.576	0.665	37.64	40.49
Total	45	38.89	2.587	0.386	38.11	39.67

Another one-way ANOVA was run to compare the means of the students in the two experimental groups and the Control group on the pretest of writing in order to prove that they enjoyed the same level of general language proficiency prior to the main study. As displayed in Table 5 means of the CW, FFI and Control group on the pretest of writing test are 12.86, 12.66 and 12.26 respectively.

Table 5: Descriptive Statistics; Pretest of Writing by Groups

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean	
					Lower Bound	Upper Bound
Conference Writing	15	12.867	2.2318	0.5762	11.631	14.103
Form Focused	15	12.667	2.0931	0.5404	11.508	13.826
Control	15	12.267	2.3135	0.5973	10.985	13.548
Total	45	12.600	2.1784	0.3247	11.946	13.254

The same writing test (PET) was given to the participants after the experiment was carried out. Based on the results displayed in Table 6, it can be concluded that there were significant differences between means of CW, FFI and control group on gained score of writing.

Table 6: Descriptive Statistics; Posttest of Writing by Groups

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean	
					Lower Bound	Upper Bound
Conference Writing	15	17.467	1.7674	0.4563	16.488	18.445
Form Focused	15	16.067	1.3870	0.3581	15.299	16.835
Control	15	13.133	1.4075	0.3634	12.354	13.913
Total	45	15.556	2.3602	0.3518	14.846	16.265

Thus it can be claimed that the null hypothesis of instruction that the types of instruction did not have any significant effect on the improvement of writing ability of the Iranian EFL learners was rejected, and as displayed in Table 6 the CW group showed a higher gained score on the writing test.

CONCLUSIONS AND IMPLICATIONS

Findings and Conclusion

The first finding of this study indicated a rejection of the null hypothesis, as displayed in Table 4 the CW shows a higher mean score on the posttest writing in comparison with the other groups. Thus, there were statistically significant different among the experimental groups and the control group.

However, the results showed that in the field of Task-Based instruction there is slight difference between two techniques and using DA technique is a new way for assessing the students and it has completed the conventional method of testing.

The overall results of this study showed that using CW as means of dynamic assessment has a major influence on writing ability of the Iranian female adult EFL learners. The findings in this study supported that, what Haywood and Tzuriel (2002) had extracted from several conclusions of DA studies in the educational settings. Test performance improves after teaching or mediation. Almost always mediation leads to greater performance gains. e.g. Burns; 1991; Kester & Pena; 2001, Missiuna & Samuels, 1989 in apply DA in second language contexts.

The findings of this study revealed that DA is not a replacement for static assessment, but a procedure which complements traditional methods of assessing students.

The finding is similar to findings of Birjandi et al. (2013) showed that DA methods are in accordance with conventional methods and there is a slight difference between them. In addition, the findings of this study were different from Van Lier's views (2006, as cited in Hassaskhah & Haghparast, 2012) that saw DA as a threat for dominating testing techniques or because it is too different from the static assessment (Sternberg & Grigrenko, 2002).

On the whole, the privilege of CW found in this study might have been due to the difference in the degree and nature of feedback and depth of metacognition of the learners in the process of assessment resulting in obtaining a deeper view of the criteria for assessment and thus a struggle for achieving those criteria.

As we saw in this research, the nature of collaborative CW between the teachers and students and the co-construction of the entire assessment scheme in the Conference writing group may have played a crucial role in developing the learners' writing ability.

The results of this research indicated that only through interaction and assisted performance can new concepts and ways of thinking can be successfully assimilated into student's existing knowledge base (Bevridge, 1997; Delisi & Golbeck, 1999; Vygotsky, 1978, 1986).

Also this study presented another evidence for the effectiveness of getting the learner's involve in the process of assessment. However, what the findings of this study aligned with the literature was that from the two types of procedures, CW technique was significantly more effective in improving students' learning. This might have been due to the fact that CW, based on the feedback that the researcher provided the learner with, learners felt that they can improve their writing competence and build up their writing confidence in the following chain of reflection. Besides, students who used DA, liked activities more than before and stated that internalizing the rules and techniques got easier. Interacting with the teacher revealed students' improvement to themselves clearly and completely, thus their confidence in writing better in the future was built up, and the probability of transferring these experiences in the writing task to a future similar one or more complicated one was definitely reasonable unlike other assessments that set their aims on evaluating the students or providing feedback for their study, the ultimate goal of DA is promoting development.

The researcher hopes this study and similar studies help English teachers to perform better in their classes and help the students to write more accurately and promote their writing ability.

Limitations of the study

Second language acquisition is a complex process that typically spans over many years, but the study took place over a period of only two and a half months; therefore, it was difficult to extrapolate second language acquisition from such a short time frame. Furthermore, one of the major limitations of this study was the small number of participants which limits the conclusions drawn from the results of this study in terms of its generalizability.

Pedagogical Implications

The present study provided empirical evidence on the effect of DA approach on the complexity of Iranian EFL learners' written production and could provide some pedagogical implications in the EFL contexts. Since the study came to a significant result, the researcher aimed to provide some suggestions or ways in order to introduce or improve DA approach in Iranian education context.

The findings supported the theory that dynamic assessment of writing ability is a valid method of improving writing skill. It complements static assessment by providing more elaborate information regarding the students' writing profile (Birjandi et al., 2013).

DA technique may introduce some benefits to the field of writing in second language learning. Therefore, the findings of this investigation may be important for different groups of people within the field. That is to say, their application has to be investigated from the perspective of these beneficiaries of the research.

Foreign Language Learners

EFL learners will profit most from DA, because their writing ability can be more accurately assessed which can in turn lead to higher level of writing performance (Birjandi et al., 2013). If learners' awareness about the benefits of DA technique is raised, it can result in higher degrees of motivation in conducting conference writing and thus improvement of their writing proficiency.

Language Teachers or Testers

Language teachers can also benefit from the results of this study. It provides language teachers with rationale to carry out writing group work activities in class to improve students' writing skill with the focus both on meeting the objectives of the task and assessing the extent to which those objectives are met. It also helps the teachers to incorporate DA into the classes and identify the weaknesses of their learners and provide mediation when and where needed. Moreover, this study by providing practical guidelines in this method gives teachers more confidence to implement DA in to their classes (Hassasskhah & Haghparast, 2012).

Syllabus designers and material developers

This study may be helpful to syllabus designers who need to emphasize more flexibility. In DA, learners are the most important side of the educational program. If the syllabus is not in line with the needs of learners, teacher may take the syllabus designer's role. Therefore, there should be enough flexibility in the syllabi to satisfy the needs of the students. This study may inspire the material developers to develop materials for writing course or workshops focusing on learners' needs, give the possibility of diagnosing the problematic areas to the teachers, and make language courses more relevant to students' needs (Birjandi et al, 2013).

ESP Teachers

In addition, the result of this study may be a great benefit and value to ESP teachers involved in teaching English for specific purposes in which they aim at improving the writing proficiency for a specific purpose. Since in ESP classes, the students' needs are the focus of attention, through interaction of both parties, the learners and the teacher can pave the path to meet the learners' needs. For such teachers it might be necessary to involve the learners in the process of assessment through conference writing to make themselves as well as the learners more sensitive about the needs and interests of the learners and thus, benefit more from the courses.

ABSTRACT

The aim of current research was to determine the relationship between sense of belonging to school and educational joy with academic self-efficacy. The research is of correlation and predicting type. Statistical population included male high school students of Ahvaz, Iran from whom 180 people were selected using multi stage randomized sampling method. Data were collected using Sakiz's Sense of Belonging to School (2007), Educational Joy Subscale of Pekrun's Progress Emotions Questionnaire (2002) and Patrrick, Hix, and Ryan's (1997) Self-Efficacy Questionnaire, and were analyzed by coefficient correlation and regression analysis methods. The results showed that there is a significant positive relationship between sense of belonging to school and educational joy with academic self-efficacy. Also, the results obtained from regression analysis in simultaneously entry showed that predicting variables could explain 37% of academic self-efficacy. Furthermore, all of predicting variables play a significant role in predicting academic self-efficacy. Given low level of some students' interest and motivation to course and school and also the high prevalence of learning disabilities and school leaving, the findings of this research could be used by mental health professionals and counsellors in therapeutic institutions and counselling centers.

KEYWORDS: sense of belonging to school, educational joy, academic self-efficacy

INTRODUCTION

Self-efficacy is a motivational factor which plays a critical role in academic involvement and academic achievements of students (Linenbrink & Pintrich, 2003). Academic self-efficacy is a construct referring to the role of individuals' self-effectiveness beliefs in their abilities, and that more they believe in their abilities, the better their abilities in learning activities is (Boroumand & Sheykhi Fini, 2011). Students with same knowledge, skills, and strategies show notable

differences in occupation, academic performance, and progression in academic tasks. A key motivation for these differences is self-efficacy beliefs. By obtaining some useful information, individuals develop opinions about their abilities for learning. Over time, these opinions become solidified and lead children to perceive themselves as able or less able individuals (Paris & Newman, 1990). Self-efficacy beliefs positively impact on students' use of self-regulate learning strategies, select and occupy career, resistance in difficult situations of task, academic motivation, and academic achievement (Sakiz, 2007). Beliefs, abilities and learning, previous experiences, attitudes, attributions, education style, and social background can affect on students' perceived self-efficacy (Schunk, 1990). Self-efficacy beliefs impact on behavioral (strength, effort, adaptive help seeking), cognitive (use of strategy), metacognitive (awareness of one own cognitions), and motivational engagement in academic tasks (Linenbrink & Pintrich, 2003). When an engagement is done, learning and success that increase self-efficacy and, in turn, engagement, is followed. The results of previous researches show that individuals' beliefs affect on their learning abilities in their approach to new challenges. The students with high self-efficacy specify challenging goals for themselves and become firmly committed to those goals (Bandura, 1997). Perceived self-efficacy has effect on goal set behavior, effort and strength (Zimmerman, Bandura, Martinez-Pons, 1993), stimulate the use of learning strategies (Zimmerman, 2000b), determines the possibility of taking advantage of master opportunities, and impacts on selecting the learning environments (Zimmerman, 1989). Self-efficacy beliefs adjust learning behavior and affect on future expectations and academic achievement (Zimmerman, 2000a).

Sense of belonging to school is one of the factors relating to academic self-efficacy. Sense of belonging to school is a psychological need that leads to positive psychological outcomes (Anderman, 2003). In other words, sense of belonging to school refers to the extent which students feel integration with other peers in school (Gueto, Guerrero, Sugimaru, & Zevallos, 2010). Researches showed that children with low sense of belonging to school led to feeling of estrangement, weak achievement and finally dropout. In contrast, high sense of belongingness leads to high motivation and scores (Juvonen, 2006). Academic emotion is one other constructs that seem to be related to academic self-efficacy. Academic emotions, as other more generic emotions, can be defined as temporal events in certain situation and specified time (Pekrun, 2006). The joy following learning, exhaustion due to class trainings and failures and angers due to difficult tasks are examples of academic emotions. Studies have shown that emotions such as joy, hope, pride, relief, anger, anxiety, shame, frustration, and boredom are significantly related to motivation, use of cognitive resources, learning strategies, self-regulation and academic achievement (Pekrun, Goetz, Titz, & Perry, 2002). Pekrun (2006) examined the role of variable "teacher" in students' academic emotions and showed that positive reinforcement of teachers has a positive relationship with academic joy and negative relationship with academic anxiety, but academic pressure from teachers has reverse consequence. The relationship between emotions and teacher supporting of competence was significant. The relationship between academic joy and teacher's characteristics (close relationships) is confirmed. Students who perceived their math teachers as supportive, experienced higher academic joy; so, the relationship between teacher affective support with academic joy was positive and significant and with academic frustration was negative and significant (Sakiz, 2007). In several related studies, Goodenow examined the relationship between adolescents' sense of belonging and expectations, values, motivation, effort

and progress. In her first study, Goodenow (1993A) examined the relationship between the sense of membership to the school, the expectation of success, worth. The results showed that the sense of membership to the school was positively, significantly related to expectations of future achievements and academic value but was not statistically significantly related to academic effort or behavior. Goodenow mentioned that the relationship between academic effort and academic achievement may be mediated by motivation. In other research, Goodenow (1993b) examined the relationship between sense of belonging-support, academic motivation, academic effort and achievement in adolescents. Students responded to Motivation environments Inventory Questionnaire of their particular area (expectation of success and educational value), sense of belonging, and personal support in four domains (math, social studies, English and Science), that sense of belonging and class support appeared as the most powerful and highest predictor of adolescents' educational values and expectations of success. Students' perceptions of teachers in terms of teachers' interest, support and respect for student, was the strongest factor associated with the efforts and progress of the students. Other research, Lang, Wong, Fraser (2005) found that teacher's friendly and perceived behaviors, such as listening with interest, being considerate, and sympathy, caused to increase the academic joy of chemistry students. These studies show that, regardless of cultural, developmental, educational, or gender differences, there is a positive relationship between teachers' affective attitudes and students' academic enjoy.

RESEARCH QUESTIONS

1. is there a significant relationship between sense of belonging to school and academic self-efficacy?
2. is there a significant relationship between academic effort and academic self-efficacy?
3. is there a significant multiple relationship between sense of belonging to school and academic efforts with academic self-efficacy?

RESEARCH HYPOTHESES

In this study, we sought to examine the following hypotheses:

1. There is a significant relationship between sense of belonging to school and academic self-efficacy.
2. There is a significant relationship between academic effort and academic self-efficacy.
3. There is a significant multiple relationship between sense of belonging to school and academic efforts with academic self-efficacy.

METHODOLOGY

The statistical sample and population

Current study is correlational and predicting. The statistical population of this research consisted of all first high school year male students of high schools of Ahvaz, Iran in academic year of 2014-15. The sampling method of current research was multistage random sampling method; in which, initially two areas among all schools of Ahvaz were selected, from each of which, two schools chose (totally 4 schools); and, then, in next stage, sample groups were randomly simple

selected in proportion to all existing first high school year students of that school; all of students of selected classrooms were used in the sample. Totally, 180 students of high schools of Ahvaz were sampled. In this study, research ethics were completely followed so that participants were ensured about confidentiality of information and they filled questionnaires with full consent and anonymously in a quiet environment.

Research tools

In this research, following questionnaires were used to collecting information:

sense of belonging to school scale

In present research, Sakiz's (2007) perceived sense of belongingness scale was used to measure students' perceived sense of belongingness. This scale is a self-report scale which its items are of likert type (1 = fully disagree, 2 = disagree, 3 = no opinion, 4 = agree, 5 = fully agree) and has made based on existing different tools. The sense of belonging to school scale consisted of 8 items (e.g. I am treated as respectful as others in English class) and the evidences of its reliability and validity are reviewed and confirmed. Sakiz (2007), using Cronbach' alpha, obtained .88 for reliability coefficient of sense of belongingness subscale from sense of belongingness scale. Also, he examined the validity of this subscale using confirmatory factorial analysis and the obtained results showed that the structure of this subscale has an acceptable fitness with data. Furthermore, Cronbach's alpha for this research was 71%.

Pekrun's Academic joy Scale

In present research, Sakiz's (2007) academic enjoy scale was used to measure students' academic joy. This scale is a self-report scale which its items are of likert type (1 = fully disagree, 2 = disagree, 3 = no opinion, 4 = agree, 5 = fully agree) and has made based on existing different tools. The academic enjoy scale consisted of 6 items (e.g. I enjoy of taking part in English class) and the evidences of its reliability and validity are reviewed and confirmed. Sakiz (2007), using Cronbach' alpha, obtained .83 for reliability coefficient of academic enjoy subscale from academic enjoy scale. Also, he examined the validity of this subscale using confirmatory factorial analysis and the obtained results showed that the structure of this subscale has an acceptable fitness with data. Furthermore, Cronbach's alpha for this research was 88% .

Patrick's Academic Self-Efficacy

This scale is designed by Patrick, Hix, & Ryan (1997); it included 5 items reflecting students' perceptions about their competency in performing class tasks. This scale is a self-report scale which its items are of likert type (1 = fully disagree, 2 = disagree, 3 = no opinion, 4 = agree, 5 = fully agree) and has made based on existing different tools. Migley et.al. (2000) reported .78 for the reliability of this scale using Cronbach's alpha. Hashemi Sheykh Shobani (2001), using Cronbach's alpha and Spearman-Brown split-half methods, reported .65 and .59, respectively, for reliability. Validity of this construct has been proven in many studies. In another study by Haji Yakhchali (2012), Cronbach's alpha and split-half method were used to examine the reliability of this scale. Cronbach's alpha coefficient and split-half for academic self-efficacy scale obtained .73 and .66, respectively, that indicates desirable and acceptable reliability of this test. Also, confirmatory factorial analysis was used to examine the validity of this subscale and the obtained results showed that all of items of academic self-efficacy scale have acceptable factorial loads

bigger than .30 and have positive and significant load on their related factor in level of $p < .0001$. Furthermore, Cronbach's alpha for this research was 73%.

Methods of data analysis

The descriptive and inferential statistical methods were used to analyze the obtained data. Mean, standard deviation, the largest and smallest scores were used in level of descriptive statistics, and correlation coefficient and regression analysis in simultaneously entry way have been used in level of inferential statistics.

RESULTS AND DISCUSSION

Table (1) shows the descriptive indices related to the participants' achieved scores in research variable:

Table 1: Mean, standard deviation, smallest and largest scores achieved by participants in research

Index Variable	Mean	Std. Dv.	Largest score	Smallest score
Sense of belonging to school	7.30	1.81	10	2
Academic joy	6.23	2.16	10	2
Academic self-efficacy	7.67	1.70	10	2

Simple correlation coefficients between sense of belonging to school and academic joy are presented table 2.

Table 2: Simple correlation coefficients of research variables

Predicting variable	Criterion variable		
	R	P	N
Sense of belonging to school	.52	.001	180
Academic joy	.43	.001	180

As it can be seen in table (2), there is a positive significant correlation between sense of belonging to school and academic self-efficacy ($p = .001$; $r = .52$). Also, there is a positive significant correlation between academic joy and academic self-efficacy ($p = .001$; $r = .43$).

In order to exploratory analyses, regression analysis in simultaneously entry way was used, in which academic self-efficacy as criterion variable, and sense of belonging to school and academic joy as predicting variables entered into the formula. The results of regression analysis is shown in table 3.

Table 3: The results regression analysis of sense of belonging and academic joy with academic self-efficacy (Enter method)

Predicting variables	Multiple relationship (MR)	The coefficient of determination (RS)	F ratio P possibility	Regression coefficient (β) and (B)		
				1	2	3
1- sense of belonging	.531	.29	F = 39.22 P < .001	B = .411 B = .385 t = 6.26 P < .001	-	-
2-academic joy	.615	.371	F = 21.73 P < .001	B = .315 B = .295 t = 4.07 P < .001	B = .194 B = .153 t = 2.50 P < .001	-

As it can be seen in table (3), based on results of multiple regression analysis and with simultaneously entry, multiple correlation coefficient for the linear combination of sense of belonging and academic joy with academic self-efficacy was $RM = .61$ and coefficient of determination was $SR = .371$ that are significant at level of $p < .001$. With regard to the results of table 3 and obtained coefficient of correlation, it is cleared that about 38 percent of variance of the variable of students' academic self-efficacy could be explained by the variables of sense of belonging to school and academic joy. Therefore, Given the importance and impact of academic joy and feeling of belonging to school on students' self-efficacy, it is recommended that ministry of education improves the background of students' sense of self-efficacy and attachment to school with regard to their interests and longings, revision of some certain theoretical and boring lessons, turning into motivational strategies through inclusion of functional and practical lessons, enrichment of educational settings and applying appropriate patterns of education.

CONCLUSION

The main aim of this research was to examine the relationship of sense of belonging to school and academic joy with self-efficacy beliefs. In general, the results of correlation analysis shows that there is a positive and significant relationship between sense of belongingness and academic self-efficacy, and also between academic joy and academic self-efficacy. The results obtained of testing this hypothesis are consistent with the results of Sakiz (2007), Zimmerman, Bandura, and Martin-Pons (1992). Students who enjoy the feeling of belonging to the school and had more education, higher education in the classroom demonstrated efficacy. is a high-risk behaviors among students. In line with our expectations in a positive sense with fun educational, academic self-efficacy was directly related. Sense of belonging is more conducive to experience positive emotions while its failure to experience negative emotions were derived from research findings Bamysr and Leary (1995) were aligned. That is, students having higher sense of belonging to school and academic joy, expressed higher academic self-efficacy in class. Bond et. al. (2007) in their research named "social belongingness and belonging to school as predictors of academic performance and mental health," concluded that belonging to school is a supportive factor in positive academic outputs and reducing high risk behaviors among students. According to many researches have been done in this area, increasing the sense of belonging to school have positive relationship between and effects on students' motivation and self-efficacy, thereby, leads to their

academic achievements. Consistent with our expectations, sense of belongingness was positively, significantly related to academic joy, and directly with academic self-efficacy. Students who expressed higher sense of belongingness in class, experienced more academic joy, less frustration, and more academic self-efficacy in classes. Higher sense of belongingness would lead to experiencing positive emotions, while its nonexistence would lead to experiencing negative emotions, that these findings were consistent with Baumister and Leary's (1995) researches.

Academic joy is an active positive emotion that is experienced when engaging in a joyful, pleasant, satisfying task (Pekrun, 1992). Positive academic emotions may have positive effects on students' academic achievement by increased mediating of motivation and flexible learning actions (Pekrun et. al., 2002). For example, experiencing hope, joy, or proud can lead to increased academic self-efficacy, motivation and more engagement in tasks, while experiencing anxiety, sadness, frustration, shame, or anger can lead to worse motivation that could, in turn, lead to less engagement and more avoidance (Pekrun, 1992). In learning settings, lack of joy and interest to tasks would lead to feeling of boredom along with feeling of despair and separation of activities (Hamilton, 1983).

Limitations of the study

Among the limitations of the present study was that the study was conducted on male high school students. Therefore, generalization to female students or lower levels is not possible. In this study, questionnaires were exclusively used. Because of this reason, there may be a bias in obtained information. The findings of this study cannot be generalized to other cities and cultures.

ABSTRACT

The social language forms of English as foreign language (EFL) teachers help them dominate their students through the application of lesson plans in a classroom context. The present review paper attempts to examine the classroom lesson plan, language and power in teaching English in a foreign language classroom by reviewing the application of a lesson plan in an EFL class, language, power and lesson plan and presenting some evidence for techniques of power in pedagogical interaction. It studies language and power across the application of a lesson plan in the EFL classroom context, the paper concludes that how the lesson plan of a foreign language teacher shapes the classroom discourse and power and how language teachers in turn have the capacity to create and impose discourses. The article concludes that the lesson plan and teacher's talk play a crucial role in the exercise of power through the language of classroom teacher and both language teachers and mentors can benefit from the role of the lesson plan in the classroom context and finally recommends the future generation of digital classroom lesson plans.

KEYWORDS: Critical Discourse Analysis, Lesson plan, language and power, TEFL, mentoring software

INTRODUCTION

Within the different cultural contexts of modern society the concept of power and its manipulation and persuasive form is omnipresent. Power has also been studied in the educational context by many authors who have evidenced its importance not only within a particular community but also in any place in which interaction occurs (Ramos, 2004). Power from a Critical Discourse Analysis (CDA) perspective is a principal condition of educational context; it is not static but dynamic and is generated as a natural effect of human beings' interactions and circulates among participants (Orellana, 1996; Wodak & Meyer, 2001; Fairclough, 2003; Ramos, 2004)

¹ Correspondence: Ahmad Reza Beigi Rizi, Email: arbeigi@fgn.ui.ac.ir

According to Fairclough (1989) “different approaches to the study of language have been developed such as linguistics, sociolinguistics, pragmatics, cognitive psychology and artificial intelligence, conversation analysis and discourse analysis” (p. 6). He claims that that “these approaches have failed to give appropriate consideration to the social aspects of language” (Fairclough 1989, p. 13); therefore, he proposes critical language study (CLS) as an alternative orientation to language study. While making some use of all of the aforementioned approaches, the proposed approach attempts to go beyond them and provides a synthesis of necessary theoretical concepts and analytical framework for doing critical analyses (Fairclough 1989, p. 14). This approach focuses on social interactions analyzing linguistic elements to show the hidden agendas and effects they bring about (Fairclough 1989, p. 40). Critical discourse analysts focus on “relations between discourse, power, dominance and social inequality” (van Dijk, 1993, p.249) and how discourse (re)produces and maintains these relations of dominance and inequality. Because of their concern with the analysis of the “often opaque relationships” between discourse practices and wider social and cultural structures, CDA practitioners take an “explicit socio-political stance” (van Dijk, 1993, p.252). In this respect, CDA is different from the other main, and more descriptive, approach to institutional discourse, conversation analysis (CA).

What is the role of language in CDA in relation to power? One way to answer this question is to show how the power is exercised in the society. According to Fairclough (1989) power in any society is exercised by means of two instruments: coercion and consent (p. 33). He contends that *ideology* is the primary means of manufacturing consent which is presented through the channel of language (Fairclough 1989, p. 17).

In an EFL classroom, language is a means of interaction for teaching, learning, classroom management, creating motivation and etc. According to Schiffirin (1994) such complicated interactions are signaled, constructed, and delineated not only by one’s linguistic structure and communicative style but also by subtle and elaborate features of social identity, affect, and implied meanings that reflect both broad social features like role relationships and more narrow social meanings like interpersonal significance (Cited in Ball 2005, p. 64). These features of language, teachers application of lesson plans, classroom discourse and the teachers and students perceptions grow together to form the phenomenon of interactional power in the EFL classroom environment.

APPLICATION OF A LESSON PLAN IN AN EFL CLASS

Many researchers such as James (1992) and Knop (1982) have offered the importance of lesson plans for planning foreign language lessons. On the other hand many foreign language programs of language institutes, colleges and universities are designed to help students achieve certain goals. Typically, these goals include listening comprehension (and, sometimes viewing the comprehension in listening), speaking and writing ability, understanding the culture(s), the perspectives of different cultures, the history or literary traditions of the people who speak the language (Rifkin, 2003, p.169).

Any language program has definite features, for example according to Swaffar, Arens, and Byrnes (1991) as typical teaching strategies, students should be provided with opportunities to use the language to express personalized meanings and to listen, view, and read authentic texts; the students are also required to study grammar outside of class so that communicative activities could be emphasized during the class time (Rifkin, 2003, p.169).

American Council on the Teaching of Foreign Languages has recommend ACTFL (American Council on the Teaching of Foreign Languages), Proficiency Guidelines National Standards in Foreign Language Education Project (2006), (refer to Appendix A) for all levels of instructions because they offer an appropriate framework for the organization of the foreign language curriculum. The language teaching field needs the ACTFL Proficiency Guidelines as a series of descriptors identifying degrees of success in communication in each of the four language skills such as listening, reading, writing, and speaking.

There is plenty of evidence from foreign language curricula, lesson plans, students' textbooks and the literature Pasternak and Bailey (2004), Nakata (2010). This shows that teaching English language proficiency is planned and organized to suggest that English language proficiency is an important aspect of EFL teaching plans and teacher proficiency. Pasternak and Bailey offer a convincing look at "language teacher proficiency". They believe There are varying degrees of language teacher proficiency and whether or not a teacher is proficient depends on how we define the multifaceted construct of proficiency (Pasternak & Bailey, 2004, p. 163). According to Omaggio-Hadley (2000) teachers need to spend a lot of attention to both the development of students' receptive and productive skills. For the productive skills of speaking and writing, Omaggio-Hadley also has suggested the teachers to provide instruction that balances the development of students' speaking or writing fluency and the development of accuracy of not only grammar, but also syntax, pronunciation and intonation, lexicon, etc. (Rifkin, 2003, p.170). While planning and organizing a lesson plan, foreign language teachers should focus on both accuracy-focused activities and fluency-focused activities Richards (2002, p. 13). According to Oxford (1999) "if only accuracy-focused activities are practiced some students may drive away from language studies and if too many fluency-focused activities are applied students may fail to develop an understanding of the grammar and syntax of the target language and the lack of mastery of syntax and grammar may eventually slow down their desire to reach higher levels of language proficiency and some students develop this type of anxiety into permanent anxiety" (pp. 58-67). Therefor a lesson plan needs to shape a balance of accuracy-and fluency-focused activities. National Standards in Foreign Language Education Project (2006) which provide standards for foreign language learning in this century recommend some proficiency guidelines that offer foreign language teachers a framework of functions or task hierarchies that can be used to construct a curriculum, leading learners from task to task as they improve their skills at using the target language to communicate. The Standards for Foreign Language Learning in the 21st Century (National Standards, 2006) provide teachers with direction as to what the content of courses might be. (See Appendix A)

According to Fox and Diaz-Greenberg (2006) the national standards represented an important modification in the understanding of the teaching and learning dynamic this is reflected in the

adaptation of the national standards, which have shifted from an emphasis on teaching to a focus on learning. This way, students become more important actors—as primary clients, consumers, and learners.

As Conrad (2011) explained the most important factor in what a student learns is what the student does, not what the teacher does. Therefore, [his] approach to teaching is to give primary attention to the activities the students can engage in that will best help them achieve the course goals and outcomes, rather than what [he] as the teacher will do. [His] focus is on choosing what reading, what homework assignments, and what projects will present them with opportunities to learn. (p.1)

The national standards present five broad areas known as “Five Cs” for foreign language learning: communication, cultures, connections, comparisons, and communities. Each “C” which is supposed to be a standard area has a few sub goals that are content-oriented (see Appendix A). The standards provide foreign language teachers approximately at many levels of instruction with direction as to the types of content they can use to fill their curricula. For example, according to the standards for foreign language learning available on line at: (http://www.actfl.org/sites/default/files/pdfs/public/StandardsforFLLexecsumm_rev.pdf) for the first “C” or communication the first standard is that: Students engage in conversations, provide and obtain information, express feelings and emotions, and exchange opinions.

This standard focuses on interpersonal communication, that is, direct oral or written communication between individuals who are in personal contact. In most modern languages, students can quite quickly learn a number of phrases that will permit them to interact with each other. In the course of their study, they will grow in their ability to converse in a culturally appropriate manner. So for example with this standard at:

Grade 4: Students ask and answer questions about such things as family, school events, and celebrations in person or via letters, e-mail, or audio and video tapes.

Grade 8: Students exchange information about personal events, memorable experiences, and other school subjects with peers and/or members of the target cultures.

Grade 12: Students exchange, support, and discuss their opinions and individual perspectives with peers and / or speakers of the target language on a variety of topics dealing with contemporary and historical issues.

Guidelines for language teaching create conditions for successful language teaching and learning that is why creating a lesson plan help language teachers to visualize the different steps of language teaching.

LANGUAGE, POWER AND LESSON PLAN

Teaching according to Haynes (2010) is considered to be a three-step activity. The first step consists of planning and preparation activities – required before teaching a class; the second activities consist of classroom management, teaching and learning in the classroom; and the third

activities consist of assessment, with associated activities such as recording and reporting, and evaluation that take place after the lesson (p.1). The metaphor of teaching as a three-step activity does, however, have some disadvantages. It encourages one to think that the third step – assessment, evaluation and review – is the end of the process and it discourages us to think about the growing critical awareness of language (Haynes 2010, p.1).

According to Fairclough (1989) the following reasons can help us to infer that it is essential to focus on critical language study (CLS) in the development of a lesson plan in an EFL class:

1. Fairclough (1989) cares about how CLS might contribute to the emancipation of those who are dominated and oppressed in our society. (p.233)
 - In developing a lesson plan teachers need to know how CLS might contribute to the emancipation of students who are dominated and oppressed in an EFL classroom.
2. He argued that *critical language awareness*, based upon CLS, should be a significant objective of language education, and there are *some suggestions about methods for developing it*. The main reason for this choice of focus is its current relevance, given the major changes in educational policy and practice which are being implemented or planned. (p.233)
 - Language awareness, based upon critical language study (CLS), should be a one of the objective of lesson planning, and we need to research the suggestions about methods for developing it. The main reason for this choice of focus is its current relevance, given the major changes in educational policy and practice which are being implemented or planned.
3. He also said that one of his purposes in writing ... was to help increase consciousness of how language contributes to the domination of some people by others, because consciousness is the first step towards emancipation. (p.233)
 - This article helps increase consciousness of how language contributes to the domination of students by teachers, because consciousness is the first step towards emancipation.
4. He supports the fact that from the perspective of CLS, there is nothing to object to in the idea that the development of children's language capabilities requires that they and their teachers have some 'model' of language, but the view of language and discourse is radically different from the instrumental conception (task-oriented language teaching). And since CLS ascribes richer and weightier social significance to language, it has a correspondingly wider view of language education. (p.237)
 - Since the development of children's language capabilities requires that they and their teachers have some 'model' of language, from the perspective of CLS the development of the lesson plans should be focused on.
5. Fairclough (1989) has recommended the following terms of references for a 'model' of language
 - 1) A model of the English language, whether spoken or written which would (i) serve as the basis of how teachers are trained to understand how the English language works; (ii) inform professional discussion of all aspects of English teaching. (p.237)

- 2) The principles which should guide teachers on how far and in what ways the model should be made explicit to pupils, to make them conscious of how language is used in a range of contexts. (p.237)
 - 3) What, in general terms, pupils need to know about how the English language works and in consequence what they should have been taught and be expected to understand on this score at age 7, 11 and 16. (p.238)
6. He also agreed that education, by contrast, is not just passing things on (though it is partly that); it is developing the child's critical consciousness of her environment and her critical self-consciousness, and her capacity to contribute to the shaping and reshaping of her social world. (p.238, 239)
7. He also concludes that 'language awareness' should be an element in the school, curriculum though the content of existing language awareness programmes is generally by no means critical! (p.239)
8. He recommends us how children should be taught about language and suggests a four-part cycle: (p.242)
 - (i) Reflection on experience: children are asked to reflect upon their own discourse and their experience of social constraints upon it, and to share their reflections with the class.
 - (ii) Systematizing experience: the teacher shows the children how to express these reflections in a systematic form, giving them the status of 'knowledge'.
 - (iii) Explanation: this knowledge becomes an object of further collective reflection and analysis by the class, and social explanations are sought (level 2 of language awareness above).
 - (iv) Developing practice: the awareness resulting from (i)-(iii) is used to develop the child's capacity for purposeful discourse. (p.242)
9. An example by Fairclough (1989) is that:

“One focus might be children's experience of writing, with the aim of extending their capacity to use written language into domains which the majority of people are conventionally excluded from, such as the writing of history. There is nothing novel about this exercise; it is the sort of thing that many English teachers do. But what they do not generally do is systematically tie it to the development of critical awareness in the way I am suggesting.” (p.243)
10. In terms of the cycle, Fairclough (1989) believes that the teacher might proceed with the exercise as follows: (p.243)
 - (i) Reflection on experience: ask the children to think about and describe the purposes for which they use writing as opposed to speech, what they think writing 'is for', purposes for which writing is used by others but not by them, and their perceptions of which uses of writing have most social prestige (Fairclough, 1989, p.243).
 - (ii) Systematizing experience: present a systematic account of differences of function between speech and writing, the social prestige of various uses of writing, and the distribution of access to prestigious uses (Fairclough, 1989, p.243).
 - (iii) Explanation: use (i) and (ii) as the basis for class reflection on the social reasons to access to prestigious uses of writing being restricted; focusing upon history, and social

constraints on who writes history, as well as its subject matter, the language in which it is written, and so forth (Fairclough, 1989, p.243).

(iv) Developing practice: set up a history-writing project for the children, in which they are encouraged to stretch or break conventions for history writing by: (a) writing a history of a grouping, such as women or children in their local community, whose history is not normally written; (b) wanting in a language, such as one of the minority languages or a non-standard variety of English, which is not normally used for such purposes; (c) being serious historians themselves, by writing for a real purpose rather than just as an exercise - they might be encouraged, for example, to place copies of their histories in a local library (Fairclough, 1989, p.243).

Finally To sum up, Fairclough (1989) has suggested on the basis of his two guiding principles the development of children's language capabilities should proceed through bringing together their existing abilities and experiences, their growing critical awareness of language, and their growing capacity to engage in purposeful discourse. (Fairclough, 1989, p.244)

EVIDENCE FOR TECHNIQUES OF POWER IN PEDAGOGICAL INTERACTION

In classroom communication the teachers control the students through the discourse they construct. One can simply examine language and power in a TEFL setting, showing how classroom communication is shaped by discourse and how teachers in turn have the capacity to create and impose discourse. In this section an example of teacher-student talk is examined through the teacher's lesson plan to show some forms that "discourse as social control" takes within the context of the classroom. Table 1 is a lesson plan of the fifth session of a twenty - session advanced foreign language class of an EFL teacher, each session lasts for one hour and thirty minutes.

Table 1: The lesson plan of the fifth session of Advanced Part One Class

Advanced Part One

The lesson plan (**Table 1**) shows the tendency of the *teacher* or *the mentors of the institution* in teaching and controlling the language teaching in the EFL class. The items of exercises are chosen and written in the order the teacher or the institution has preferred.

The following selected observed discourse is based on the recorded film and the present lesson plan of the teacher in table 1.

Table 2: An extracted classroom interaction between the teacher and the students

... after the two-minute warm up

- (1) **Teacher:** the previous session we practiced how to talk about “things we have in common” & “things we have which are different. Any questions? O.K, Let review and practice on some sample sentences. Please repeat after me: “Juan’s been to Brazil, and so have I.”
- (2) All Students repeat.
- (3) **Teacher:** He tried snowboarding, but I haven’t.
- (4) All Students repeat. ...
- (5) **Teacher:** ... Now. We’re going to er review the previous session exercises we were doing last session on “things we have in common” & “things we have which are different”. Ok let’s have a dialogue with our partners by using the expressions on page nine exercise 3 and talk about things we have in common & things we have which are different from each other.
- (6) **Sina:** Which one should we talk about first “things in common” or “things different”?
- (7) **Teacher:** It really doesn’t matter which one. ... Yes, Saddi can I help you?
- (8) **Saddi:** Can we first practice the sentences on “Synonyms in context” in exercise 2, and then review your exercise 1.
- (9) **Teacher:** It is a wonderful idea, but this exercise is very important and should be practiced first because it is part of the lesson plan.
- (10) **Saddi:** Yes, thank you. (*Saddi agrees with the teacher*)
- (11) **Teacher:** Ok. Let’s start.
(... Students start pair work ... and the teacher walks among the students and gives feedback to the students.)

Note: (Retrieved with permission from the recorded film from Payampersa Language Institute, Zarinshahr, Isfahan, Iran, www.payampersa.ir, Date: February 3, 2015, Time: 20:00 to 21:30)

DISCUSSION

The lesson plan (**Table 1**) shows the tendency of the teacher or the mentors of the institution in teaching and controlling the language teaching in the EFL class. The items of exercises are chosen and written in the order the teacher or the institution has preferred. The teacher has the lesson plan before the class starts and the students of the class are not aware of the teacher’s lesson plan which is a constraint on the students. By these features the teacher practices power and teaches English as foreign language in the classroom. In this sample lesson plan the time spent on warm up or warm down have been considered to be short which is a controlling feature. According to Thomas et al. (2004) “Language has a key role in transforming power into right and obedience into duty. Some scholars would go further and say that language is the arena where the concepts of right (both in the sense of entitlement and in the sense of what is morally acceptable) and duty are created, and thus language actually creates power, as well as being a site where power is performed.” (p.10). In this lesson plan the time allowed to be spent on warm up or warm down is short to control the classroom talk so that more time is spent on the application of

language for other items in teaching English as foreign language. The lesson plan controls the amount of classroom interaction between the EFL teacher and the students. So the *time, the order and the kind of lesson plan items* are all the controlling features of the classroom interactions and of course the connection between language use and unequal relations of power particularly in EFL classroom. A lesson plan shows how the conventions for teaching and learning among the institutions, teachers and the students represent common sense assumptions which treat authority and hierarchy as natural. The teacher knows about teaching and learning but the students don't. The teacher is in a position to determine how a learning and teaching should be dealt with but the students aren't. It is right and natural that the institutions and the teachers should make the educational decisions and control the course of teaching and learning and the students should obey and cooperate. A well-organized lesson plan can make teaching English more powerful and control the forms of language that are used. The proponents of learner-centered pedagogy believe that teachers and learners should share power and that learners should have more control over their educational process (Nunan, 1988). The proponents of other pedagogies may have other beliefs, whatever they are the lesson plan plays an important role in the use of language in the classroom and control of power.

In this discourse sequence (**Table 2**) which is based on the present lesson plan of the teacher in table 1, the teacher's or the mentor's tendency in operating the class has been presented. The teacher tries to attempt to establish some continuity between the last session's work and the task he wishes the students to engage in, (turn (1)). Prior to engaging the students in the task, the teacher checks their understanding and their ability in producing the correct structures of the task by eliciting from them what he thinks are the main features they should bear in mind, by providing feedback (turns (2), (4), (9)). In turn (9) the teacher refrains from providing direct answer himself, because in this way he can both check the students' knowledge and help present this knowledge as something owned by the students as well as himself. By the way, learners should get involved with new knowledge if they want to consolidate their own understanding. And this is achieved through trying to use this knowledge on their own. According to Mercer (1995), "in order to be successful in the process of creating knowledge in classrooms, themes must emerge and continue, teachers should offer, accept and revisit explanations and understanding must be consolidated" (p. 68). In sequence 1, the teacher tries to make students focus, review and produce structures such as "and so have I", "but I haven't", "neither do I", "nor am I".

One reason is that according to Richards (2002) it is now accepted that models for oral interaction cannot be based simply on the intuitions or applied linguists and textbook writers should be informed by the findings of conversation analysis and corpus analysis of real speech and the frequency of fixed utterances or conversational routines in spoken language has been revealed to be important. (p.17)

In his lesson plan (Table 1), the teacher tries to control the students by asking them to focus, review and produce the intended structures by classroom pair work. Moreover, there are some features that, not only show the teacher's control over the students, but also enact this very control. For example, in turns (8), (9) the teacher controls the student very politely and does not

let the student change the direction of teaching and the teacher's tendency by saying "It is a wonderful idea, but this exercise is very important and should be practiced first because it is part of the lesson plan." This way the teacher places constraints on what the student should do. Here the exercise of power is polite, direct and intentional. The student is persuaded and accepts the constraint because he was encouraged by the sentence "It is a wonderful idea" and then the student is persuaded by "but this exercise is very important and should be practiced first" and the teacher probably stops the student(s) from changing the direction of language teaching by saying "because it is part of the lesson plan" and the students follow the teacher's tendency and the lesson plan. In this sequence a technique of power is applied in which language is given a central role. According to Foucault (1983) these "techniques of power" are pervasive in the classroom. This sentence according to Fairclough (1989) is a kind of "discourse which involves the more or less self-conscious application of social scientific knowledge for purposes of bureaucratic control" (p.213).

CONCLUSION

This article has outlined why the topics of the lesson plans, language and power might be worth studying in the context of EFL classroom and why we are assuming that the three topics are related. This review article has tried to show that at some ways the lesson plans, language and power are related. The study of language in the context of EFL classroom is worthwhile because it is such an important part of all our language teaching. The classroom discourse which is created by teachers by planning and applying the lesson plans in the classroom helps teachers to dominate students scientifically, educationally and more socially accepted.

Lesson plan and *teacher's talk* seem to play a crucial role in the exercise of power through the language of classroom teacher. Thus classroom discourse of the teacher which has risen from the application of preplanned lesson plan may directly and coercively enact power, through the teacher's directive discourse, and through the applicable laws and regulations of lesson plans, or the pre planned instructions by the teacher or the mentor of the institution via language teachers. Power may also be manifested more indirectly in discourse, as representation in the form of an expression, description, or legitimation of powerful actors or their actions and ideologies. Power may also be manifested more indirectly in the teacher's discourse and the application of the lesson plan because the *time*, the *order* and the *kind of lesson plan items* are all the controlling features of the classroom interactions and of course the connection between language use and unequal relations of power particularly in EFL classroom. The time, the order and the kind of lesson plan items forces the language teacher to produce special expressions or descriptions in the classroom. The presence of the lesson plan also legitimates the teacher's activity and discourse in the classroom. The teacher's knowledge, lesson plan and his authority seems to have made the teacher, the powerful actor of his classroom actions and ideologies or the mentor's ideologies and the mentor's expected classroom actions and discourse via the classroom teacher.

Another implication is that language teachers and the EFL mentors can learn a great deal about how EFL classroom discourse is structured, how it functions, and what the most widespread, but

sometimes invisible, assumptions about different lesson plans, groups of students and teachers in the classrooms are.

Language teachers can also find this knowledge valuable because it contributes to their understanding of themselves and their relationships with students, their lesson plans and the institution. Knowledge about the lesson plans, language and power may enable language teachers to make choices in their language use which make them feel better about themselves. Language teachers can also find knowledge about the areas discussed in this article valuable because it can be used to challenge what they perceive as unfairness in the classroom.

The next implication is that the mentors and language trainers can show and teach the importance of the socially accepted language forms of EFL language teachers through the application of lesson plans in a classroom context by using the critical discourse analysis of language that the lesson plans can give to pre service, in service and advanced teachers. For example if the language teachers are younger than the language learners or as old the learners the correct and socially accepted domination of the learners by the teachers would be useful to control and teach the students.

Language teachers in universities, schools, language institutes and other educational institutions use their lesson plans and language with a variety of aims and goals especially for the educational ones. A typical example of one of these goals is to lead the students' learning tasks and activities along guidelines specified by a curriculum or a teacher's or the institution lesson plan, and to construct a version of educational knowledge, i.e., a metalanguage, which is believed to be important for the negotiation of each of the educational topics and subjects taught in the classroom context.

For further research, it is recommended to create a mentoring computer software and place the digital lesson plans and the controlling educational materials on the monitors and show and apply the lesson plans in the classroom context and research the manipulation of power through the application of more tangible lesson plans for the language learners. In this case the mentors can develop the lesson plans and more advanced and detailed new plans can be prepared and applied in the classroom and new directive discourse can be taught to the language teachers by closely looking at the digital lesson plans, language and power in EFL classrooms.

APPENDIX A

The “Five Cs” of the National Standards for Foreign Language Learning*

Goal 1: Communication

Standard 1.1- Interpersonal Communication: Students engage in conversation, provide and obtain information, express feeling and emotion, and exchange opinions.

Standard 1.2 – Interpretive Communication: Students understand and interpret written and spoken language on a variety of topics.

Standard 1.3 – Presentational Communication: Students present information, concepts and ideas to an audience of listeners or readers on a variety of topics.

Goal 2: Cultures

Standard 2.1 – Practices and Perspective: Students demonstrate an understanding of the relationship between the practices and perspectives of the culture studied.

Standard 2.2 – Products and Perspectives: Students demonstrate an understanding of the relationship between the products and perspectives of the culture studied.

Goal 3: Connections

Standard 3.1 – Knowledge of Other Disciplines: Students reinforce and further their knowledge of other disciplines through the foreign language.

Standard 3.2 – Distinctive Viewpoints: Students acquire information and recognize the distinctive viewpoints that are only available through the foreign language and its cultures.

Goal 4: Comparisons

Standard 4.1 – Nature of Language: Students demonstrate understanding of the nature of language through comparisons of the language studied and their own.

Standard 4.2 – Culture: Students demonstrate understanding of the concept of culture through comparisons of the cultures studied and their own.

Goal 5: Community

Standard 5.1 – Beyond the School Setting: Students use the language both within and beyond the school setting.

Standard 5.2 – Life-long Learners: Students show evidence of becoming life-long learners by using the language for personal enjoyment and enrichment.

ABSTRACT

The receptor language and culture entail obligatory features that shape the possible interpretations of the translation, as well as extending the meaning of the translation in directions other than those inherent in the source text. Adopting Critical Discourse Analysis (CDA) with particular emphasis on the framework of Fairclough (1989), the present investigation was an attempt to shed light on the relationship between language and ideology involved in translation in general, and more specifically, to uncover the underlying ideological assumptions invisible in texts, both source text (ST) and (TT), and consequently ascertain whether or not translators' ideologies are imposed in their translations. The corpus consisted of the full text of the source text and two different Persian translations of the book: An Introduction to Sociology: Feminist Perspectives by Abbott and Pamela. In this investigation, a detailed contrastive, comparative study at the micro-level included explanation of lexical items and grammatical choices conducted to examine, describe and subsequently interpret the patterns at the macro level in English source text and its Persian translated versions. From the finding of the study we realize just how important it is to be conscious of the ideology that underlies a translation. It is essential to know what the translator has added, what he has left out, the words he has chosen, and how he has placed them. Because behind every one of his selections there is a voluntary act that reveals his history and socio-political milieu that surrounds him, in other words, his own culture.

KEYWORDS: CDA, Ideology, Translation Studies, Feminism, cultural turn, Discourse

INTRODUCTION

“Translation study is classified as the new academic discipline related to the study of the theory in addition to phenomena of translation. By its nature it was multilingual and also interdisciplinary, surrounding languages, linguistics, communication studies, philosophy and numerous types of cultural studies.” (Munday , 2001,p.1). “How must we know when a translation can be good? This straightforward question lied in the middle of all concerns along with translation criticism. But not only this, in wanting to assess the grade of a translation one additionally addresses the heart of virtually any theory of translation, I. e., the question with the nature of translation or maybe, more specially, the nature with the relationship concerning a supply text and its translation text.” (House , 2001,p. 243).

“The study of translation in charged political contexts illustrated the relationship between discourse and power, and showed that, as a site where discourses meet and compete, translation negotiates power relations. But the working of power is not simply “top down” a matter of inexorable repression and constraint: instead, translation, like other cultural activities, can be mobilized for counter discourses and subversion, or for any number of mediating positions in between.” (Gentzler&Tymoczko, 2002, p.xiv) Thus, the main aim of CDA within TS is to disclose the underlying and often implicit ideological and power relations in spoken and written discourse. Fairclough and Wodak (1997,p.258) described the aim of CDA as to make the “ideological loading of particular ways of using language and the relations of power which underlie them” more visible. Within CDA, this was often done on such basis as discourse in one language and one culture. With regards to translation, however, “textual functions, ideological contexts, and root relations involving power employ both for the source text message and culture also to the target text and also culture” (Schäffner, 2004, p.16).

In TS, certain aspects of CDA have been applied to analyze the ideological motivations behind translators’ text linguistic choices in the TT and the translator’s role in the interpretation process of the intended meaning of the ST and the production of a new TT. The main purpose of this research was to employ Norman Fairclough’s model (1989) as a framework for CDA in the analysis of TTs in translation of one single sociology book titled “*An Introduction to Sociology: Feminist Perspectives*” written by Pamela Abbott& Claire Wallace in English. Finally, the present research mainly attempted to learn the main ideological assumptions veiled inside the text messaging, equally source text (ST) and target text (TT), therefore to make sure whether the translators’ ideologies were added to their particular translations; in other words, to recognize where translators according to their own ideological concepts used various techniques from what the author used inside the text.

“Critical Discourse Analysis (CDA) and Political Discourse Analysis (PDA) also mediated among linguistic structures as evident in text and the social, political, and historical contexts of text production and reception.” (Schäffner, 2004, p.22). This research studied the textual or discursive manifestations of power structures and ideologies and their specific linguistic realizations at lexical and grammatical levels on the basis of Fairclough’s model. This research tried to answer the following questions:

LITERATURE REVIEW

The field of critical discourse analysis

“Critical discourse analysis provided theories and methods for the empirical study of the relations between discourse and social and cultural developments in different social domains.” (Jørgensen & Phillips, 2002, P.71). critical discourse analysis was viewed as integrating (a) analysis of text, (b) analysis of processes of text production, consumption and distribution, and (c) sociocultural analysis of the discursive event (be it an interview, a scientific paper, or a conversation) (Fairclough, 1995, P.23).

Critical discourse analysis by Norman Fairclough

Fairclough (1995a, p.135) applied the concept of discourse in three different ways. “1) discourse described language use as social practice. 2) discourse was understood as the kind of language used within a specific field, such as political or scientific discourse. 3) discourse was used as a count noun (a discourse, the discourse, the discourses, discourses) referring to a way of speaking which gives meaning to experiences from a particular perspective. For example, a feminist discourse, a neoliberal discourse, a Marxist discourse, a consumer discourse.” (As cited in Jørgensen & Phillips, 2002, PP.77-78). His model was based on the assumption that language was an irreducible part of social life. The dialectic relation between language and social reality was realized through social events (texts), social practices (orders of discourse) and social structures (languages) (Fairclough, 2003, P.24).

In his research, Fairclough attempted to uncover ideological and power patterns in texts. Fairclough provided a tripartite framework for the analysis of text and discourse: 1) the linguistic description of the formal properties of the text; 2) the interpretation of the relationship between the discursive processes/interaction and the text, where text was the end product of a process of text production and as a resource in the process of text interpretation and lastly, 3) the explanation of the relationship between discourse and social and cultural reality.

Description, interpretation, explanation

“Description was the first stage of the CDA, which included the analysis of the texture of texts” (Fairclough, 2003, P.158). “Formal textual elements related to the social world according to three types of value: experiential, relational and expressive. The experiential value was concerned with the text producer’s experience of the natural or social world (content, knowledge and beliefs). Relational value reflected the social relationships, which were enacted via text in discourse. Expressive value showed the producer’s evaluation of the reality (attitude towards subjects and social identities)”. (Fairclough, 1989, p. 112). Interpretation deals with the understanding of meaning embedded in texts. The level of interpretation was concerned with participant’s text production and text interpretation (understanding). According to Gee (1999, p.17) “was the knowledge of language plus action, interaction, values, beliefs, symbols, objects, tools and places of events that are recognizable to people as a particular type of identity that may engage in a particular type of activity. The explanation stage in CDA saw discourse as a part of processes of social struggle and power relations. It showed how discourses were determined by social structures and what reproductive effects discourses have on those structures.

Political discourse analysis: topics and methods

Political discourse analysis was concerned with the analysis of political discourse. Political discourse has been described as “a complex form of human activity” (Chilton & Schäffner, 1997, p.207). Political situations and processes can be linked to discourse types and levels of discourse organization by way of four strategic functions as an intermediate level. She proposed the following four functions: “(i) coercion; (ii) resistance, opposition and protest; (iii) dissimulation; (iv) legitimization and delegitimization.” (Schäffner, 2004, p.3).

Translation and CDA

Main characteristics of the field

The first business of the translator was to translate. A text may therefore be pulled in five different directions, as followed: “(1) the individual style or idiolect of the SL author. When should it be (a) preserved, (b) normalised (2) the conventional grammatical and lexical usage for this type of text, depending on the topic and the situation. (3) Content items referring specifically to the SL, or third language (i.e. not SL or TL) cultures. (4) The typical format of a text in a book, periodical, newspaper, etc., as influenced by tradition at the time. (5) The views and prejudices of the translator, which may be personal and subjective, or may be social and cultural, involving the translator's 'group loyalty factor', which may reflect the national, political, ethnic, religious, social class, sex, etc. assumptions of the translator” (Newmark, 1998, p.5).

Translation, ideology and power

Ideology, for Fairclough, was ‘meaning in the service of power’ (Fairclough, 1995b, p.14). More precisely, he understood ideologies as constructions of meaning that contribute to the production, reproduction and transformation of relations of domination (Fairclough, 1992b, p.87). “In the 1950s and 1960s, practicing translators began consciously to calibrate their translation techniques to achieve effects they wished to produce in their audiences, whether those effects were religious faith, consumption of products, or literary success. In short translators began to realize how translated texts could manipulate readers to achieve desired.” (Gentzler & Tymoczko, 2002).

RESEARCH QUESTIONS

- 1) To what extent do the translators change the ideological position of Abbott and Wallace in the translations of the book: “*An Introduction to Sociology: Feminist Perspectives*” with recourse to Fairclough’s model for CDA?
- 2) Which translation strategies produce which results and which effects?
- 3) Which particular sociocultural and ideological constraints influence the translation policy in general and the target text production in particular?

METHODOLOGY

Corpus of the study

Identifying regularities in the behavior of several translators at the same time in the same culture can help to establish which particular general concept of translation prevailed in a particular community at a particular time. An empirical and historical perspective also allows to study the

dominant ideology in the translations of the book "*An Introduction to Sociology: Feminist Perspectives*" in two different period of time. one of them in 1997 (in the Second decade of Islamic Republic) and the other in 2001 (in the Third decade of Islamic Republic) with considering the knowledge of people about the feminist perspectives.

The data for this research are the translations of the book "*An Introduction to Sociology: Feminist Perspectives*" and also 'pretexts', e.g. translator's prefaces, footnotes, the whole discourse on translation. This research has thus paved the way to developing a history of translation and a sociology of translation in the second and third decades of Islamic Republic. The researcher believed that the selected book provides for the analysis and comparison of an original and its translation on three different levels: the ideology of translators, the ideology of authors of the book and "translation equivalence". "Equivalence" is the fundamental criterion of translation quality.

In seeking the above-mentioned objectives, an illustrative corpus of the two full-text Persian translations of one single politically sensitive book titled "*An Introduction to Sociology: Feminist Perspectives*" written by Pamela Abbott and Claire Wallacel in English had been determined. Thus, the material employed in this kind of research had been separated into three groups:

- 1) Source Text: Abbott, P & Wallacel, C. (1997). *An Introduction to Sociology: Feminist Perspectives*. LONDAN, Routledge.
- 2) Trget text translator: KHorasani, M & Ahmadi, H. (در امدی بر جامعه شناسی نگرشهای) (1376). Tehran: Donyayeh Madar Publication.
- 3) Trget text translator: Najm Aragi, M (جامعه شناسی زنان) (1380): Tehran: Ney Publication.

Theoretical framework

This research in Fairclough's (1989) model framework is concerned with the dominant ideology in translation with trying to find out what happens in the mind of translators. The CDA framework described in this thesis was based on three stages of analysis defined by Norman Fairclough (1989), i.e. description (text-linguistic analysis), interpretation (assigning pragmatic values to textual features) and explanation (the social and situational context in terms of power and ideological struggle).

Procedure

The researcher read some chapters of the selected book randomly and compared it with the available translations in the second and third decades of the Islamic Republic of Iran to see how the ideologically loaded lexemes were rendered in Persian language considering the socio-cultural and ideological nuances of the time. The researcher use Fairclough's model as the basis for the analyzing the ideological effects of the translators in the two translations of the book "*An Introduction to Sociology: Feminist Perspectives*". The analytical model involves 97 sentences for analyzing the vocabulary and 50 sentences for analyzing the grammar that surveyed at the micro and macro levels.

Collecting the data

Data collection of the present research starts by presenting examples of authentic translations of the book *"An Introduction to Sociology: Feminist Perspectives."* In the second and third decades of Islamic Republic, commenting on them from the point of view of TS. These examples political effects caused by specific translation solutions; the processes by which information is transferred via translation to another culture; and the structure and function of equally valid texts in their respective cultures. After a brief survey of the discipline of Translation Studies, chosen parts in the first and the second translation has been critically studied to determine the frequency of translation strategies, The translators may have used strategies to make the text correspond to the genre conventions that apply in the target culture, or to compensate for different background knowledge or sensibilities of the new addressees.

Be that as it may, the more or less subtle differences between the English and the Persian language text reflect different ideological phenomena, both texts thus serving as windows onto ideologies in the two political cultures. These differences based on CDA rules, however, was presented in tables.

RESULTS AND DISCUSSION

In this research in interpreting the translator's intention and procedures, the researcher was here not criticising them but attempting to understand why he had used these procedures. In considering the ideology of translated texts, the researcher did not take the points successively; He grouped them selectively under general heads: on the basis of Fairclough; s(1989) at the micro level he studied experiential, relational and expressive values and at the macro level surveyed interpretation and explanation.

Micro level analysis

Description: text analysis

Fairclough (1989) explained three values with regard to studying vocabulary and grammar at the micro level. The three values of analysis were experiential, relational and expressive. This part of the paper starts by presenting examples of authentic translations of selected book, commenting on them from the point of view of TS. These examples show the method of researcher in data analysis. Table 1 below shows the frequency and percentage of each discursive strategy in Experiential values of vocabulary analysis. Fairclough's (1989) gives four major cases for experiential values of vocabulary analysis: synonymy, hyponymy, antonymy and overwording.

As Table 1 shows that in TT2 Najm Aragi in the third decades of Islamic translated all 97 items of the ST into overwording (23 items); hyponymy (31 items); synonymy (31 items) and antonymy (3 items), and in comparison with TT1 in the second decades of Islamic Republic as it has been shown in table 1 KHorasani and Ahmadi translated all 97 items of the ST into overwording(26 items); synonymy (70 items) the frequency of the data revealed that in the third decades of Islamic Republic changing of writer's ideology of the selected book are far more than second decade. In fact, unlike the other approaches the researcher had examined, in the third decade of Islamic Republic feminism was an overtly political approach and can attack other

approaches for their false assumptions about women. It also seems, on the whole, ideologies of femininity and women's assigned role in the society all play key roles in translation of feminist works in the first decades of Islamic Republic.

Table 1: Experiential values of vocabulary analysis

NO	Translation strategy	TT1		TT2	
		frequency	percentage	frequency	percentage
1	Overwording	26	26/80	23	23/71
2	Hyponymy	-----	-----	31	31/95
3	Synonymy	70	72/16	31	31/95
4	Antonymy	-----	-----	3	3/09

Table 2: Experiential values of grammar analysis

NO	Translation strategy	TT1		TT2	
		frequency	percentage	frequency	percentage
1	Positive sentence	30	60	34	68
2	Negative sentence	20	40	16	32
3	Passive sentence	5	10	15	30
4	Active sentence	45	90	35	70

Tables 3 and 4 below show the frequency and percentage of each discursive strategy in relational values of vocabulary and grammar analysis; Relational values of vocabulary analysis included Three items: formality, informality and euphemistic expression. and Relational values of vocabulary included three modes: Declarative, Imperative, Question.

Table 3: Relational values of vocabulary analysis

NO	Translation strategy	TT1		TT2	
		frequency	percentage	frequency	percentage
1	Formality	58	57/79	57	58/76
2	Informality	21	21/64	13	13/40
3	Euphemistic	18	18/55	25	25/77

Table 4: Relational values of grammar analysis

NO	Translation strategy	TT1		TT2	
		frequency	percentage	frequency	percentage
1	Declarative Mode	46	92	42	84
2	Imperative Mode	4	8	8	16
3	Question Mode	-----	-----	-----	-----

Macro level analysis

Translator judgments

At this level of investigation, the researcher concentrates on other research that deals with cultural difference and with the interface between the source culture and the foreign. linking ideology dominant discourse to translation strategies.

At the beginning of the book that had been rendered by Najm Aragi there was the preface of the translator about the book of "An Introduction to Sociology: Feminist Perspectives" and its authors. the analyses of this preface show that the Iranian feminist translators are very open about flaunting their manipulation of texts. Najm Aragi as the translator of the selected book of this research in the third decades of Islamic Republic is also explicit in stating that the aim of her book on feminism and translation is to cast the widest net around issues of feminism in translation and, through feminism, to move translation studies closer to a cultural studies framework. Najm Aragi in particular highlights the power relations in the translation of the colonized peoples and takes translation studies to task for its Western philosophical and ideological bias before the revolution.

The other translation of the same original book "An Introduction to Sociology: Feminist Perspectives" was translated by Khorasani and Ahmadi in the second decade of Islamic Republic when Islamic revolutionary movement was dominant in translating the works especially the feminism books. The strategies that had been used in the translation show that among of this

translations some of the words often accompanied by justificatory footnotes. All of these footnotes in this study, looks at the language of the TT and sees cultural implications in the choices made, in this case, the researcher has examined a footnotes that has been translated in the second decades of Islamic Republic. It is also clear from this brief analysis of these footnotes that a whole range of interacting factors are at work. These include the perhaps inevitable dislocation of the source culture, the translation of the feminist works in Iran and the location of the patronage of feminism within Iran in the second decade.

Translators strategies

At macro level, the following examples were presented by researcher to show his method in analysis of translator's strategies.

Table7: Translator's strategies in the stage of Description

	Source Text	Target Text1	Target Text2
Translation strategies	-----	synonymy	antonymy
Description	The working class is made up of service personnel and manual workers e.g. waitresses , cooks, car mechanics, bricklayers, dustmen and so on.	طبقه کارگزار کارکنان خدماتی و کارگران یدی تشکیل می شود. پیشخدمت های زن، آشپزها، تعمیر کاران اتومبیل، بنا ها و رفتگران از آن جمله اند.	طبقه گارگر از کارکنان خدمات و کارگران یدی مثلاً " پیشخدمت ، آشپز، مکانیک اتومبیل، بنا، رفتگرو غیره تشکیل می شود

On the basis of the table 7, the word "waitress" in the ST is translated as "پیش خدمت زن" in TT1 and "پیش خدمت" in TT2. The word "waitress" means a woman whose job is to bring the food to customers at their tables in a restaurant. All societies have a division of labour based on sex work that is seen as women's work and work that is seen as men's work; labour is gendered. However, the nature of the work that is done by men or women varies from society to society and has changed historically in Iran. The word "پیش خدمت زن" deleted in TT2 and had been replaced by the word "پیش خدمت". The analysis of the table 7 showed that the word "پیش خدمت" in the third decade of the Islamic Republic is incompatible with the meaning of the word waitress. Antonymous translation of the word "waitress" in TT2 showed that the property of this word conform to the social system in which it exists. In Iran working in restaurant are frequently undertaken by men either alone or alongside their wives. thus, Najm Aragi by using the dominant social system of that period as the yardstick which working in restaurant are frequently undertaken by men so, she translated the word "waitress" in the TT2 AS "پیش خدمت". It was also clear that such fluidity of meaning was on the base of cultural model, that gender conferred certain essential feminine and masculine traits is constructivist feminism, which asked women (and men) to consider what it meant to be a woman to consider how much of what society had often deemed to be inherently female traits are in fact culturally and socially constructed.

Table 8: Translator's strategies in the stage of explanation

Source text1	Target text1	Target text2
Women often find it difficult to participate in after-meeting drink sessions at the pub , where important business is discussed.	زنان غالبا شرکت در نشست های پس از جلسات را، که با پذیرایی همراه اند و در آن ها مسائل مهم مورد بحث قرار می گیرند، دشوار می یابند.	شرکت در گپ های دوستانه پس از خاتمه ی این جلسات که به بحث و جدل درباره ی مسائل مهم و جدی می گذرد نیز برای زنان اسان نیست.

As stated in table no 8, the word "pub" in the ST refers to a public house, informally known as a "pub", is an establishment licensed to serve alcoholic drinks for consumption on the premises in countries and regions of British influence. this word that is unlawful and religiously prohibited in Islam the translators deleted the meaning of the word in TT1(in the second decade of Islamic Republic)and TT2(in the third decade of Islamic republic).The deletion of the meaning of the word "pub" showed that First: this word was ethical corruption and violated the criteria of press law for publication.Second: One of the pillars of the revolution was to resist against the cultural imperialism of the West and ensure cultural independence through "construction of an indigenous and authentic Islamic model of modernity and progress in Iran.thus TT1 and TT2 was translated on the base of Islamic model by the translators of the second and third decades of the Islamic Republic. Third, however, both translators in TT1 andTT2 operate in contexts which are shaped by social aims and ideologies, which is particularly obvious in the field of politics.

CONCLUSION

This research showed that Persian translators seek to emphasize their identity and ideological stance in the translation project. One of these, Najm Aragi, a translator of feminist works, is openly assertive about the manipulation this involves: The feminist translator, affirming her critical difference, her delight in interminable re-reading and re-writing, and shows the signs of her manipulation of the ST in her translation. The more or less subtle differences between the English and the Persian text reflect different ideological phenomena, both texts thus serving as windows on to ideologies in the two political cultures.

This research showed that CDA is a helpful tool in the translation process of political texts. The CDA integration in translation was a very new field within TS and had not been researched extensively.In the production of the TT; the translators in some sentences adopt a neutral stance and reproduce the text with no ideological implications in the TL. And also in some sentences as discussed in table 8, the translators embed their ideological stance in the choice of certain linguistic and grammatical patterns, which then created a different meaning in the TL and which created the target reader's assumptions of the TT, not allowing the target reader to access the original ST meaning.

In this research the CDA framework applied to TS in three ways: a) as an auxiliary tool for critical analysis of the ST prior to the translation process, b) for the analysis of the translator's

role in the creation of power and ideological struggle in the TT and c) for the analysis of the translator's choices in the recreation of the power and ideological struggle in the TT.

The results of the TT analysis showed that The views and prejudices of the both translators, were personal , subjective, social , cultural, involving the translator's group loyalty factor, which reflected the national, political, ethnic, religious, social class, sex, etc. assumptions of the translator in the second and third decade of Islamic Republic. Admittedly, the examples that the researcher discussed in the present research were extreme cases. Not all translations show differences to their source text in such a drastic way, but the researcher chose them deliberately to raise our awareness to the variety of factors that are involved in translation.

Limitations of the study

A limitation that the researcher confronted was that there were just two translations of the same book by two different translators, one by Manizheh Najm Araghi and the other by Maryam KHorasani and Hamid Ahmadi .

ABSTRACT

The present study was an attempt to investigate the effectiveness of Student Teams- Achievement Divisions (STAD) as a cooperative learning (CL) technique in enhancing Iranian EFL (English as a foreign language) learners' knowledge of collocations. Sixty-four intermediate learners in two intact groups were selected as the participants of this study. They were proved homogeneous after administering the Preliminary English Test (PET) and then were assigned as an experimental and a control group. Each group took a researcher-made, validated pretest of collocations at the outset of the study whose reliability was estimated as 0.83 through Cronbach alpha. The experimental group received collocation instruction according to STAD procedures while the control group was exposed to an individualistic instruction. The content of the instruction was in accordance with the content of learners' course book, followed by a set of researcher-made collocation tasks performed by both study groups after receiving the instruction. At the end of the eight-session treatment, the same researcher-made pretest was administered as the post-test and the students' performance was analyzed through an independent samples t-test. The results of data analysis showed that STAD is a significantly effective cooperative technique in bringing about improved collocation performance. In fact, the finding of this study is hoped to help language teachers to find an appropriate way through which CL can be implemented in one of its most effective techniques, namely STAD.

KEYWORDS: STAD, Cooperative language learning, English collocations, Intermediate learners

INTRODUCTION

The issue of learner-centered activities in the classroom has been regarded as an indispensable matter of concern for quite a while for those responsible for guaranteeing the best for instructive frameworks. Cooperative learning techniques, developed on the basis of learner-centered methodology, give learners chances to take more active parts in their own particular learning. In

this learning method, small groups of students work together to achieve a common goal. In fact, cooperative learning is a successful teaching technique in which small teams, encompassing students with different levels of ability, use a variety of learning activities to jointly improve their understanding of a subject (Johnson & Johnson, 1999).

There are different ways through which group work or cooperative learning can be applied by classroom teachers. Student teams-achievement divisions (STAD) is one of the techniques developed by Slavin (1987) in which students are assigned to four- or five-member learning teams that are heterogeneous in terms of proficiency level, sex, and ethnicity. This technique is based on fostering students' motivation for learning by focusing on cooperation between the members of different teams. In other words, it is focused on team cooperation and does not include individual competition (Slavin, 1987). However, most research on STAD is limited to fields other than language and a limited number of studies have dealt with language macroskills. In fact, very few studies have focused on the effectiveness of STAD for teaching language components, such as grammar, vocabulary, and collocation in particular.

Collocation is perceived as a significant component of language use and communication and can be discriminators of native speakers from non-native speakers (Koya, 2006; Nation, 2001; Wouden, 1997). Studies have shown that L2 learners are not confident in the use of collocations (Burgschmidt & Perkins, 1985, as cited in Howarth, 1998) and that the collocation challenge is more critical than general vocabulary problems (Bahns & Eldaw, 1993). In order to help learners cope with challenges in learning difficult aspects of language, including collocations, researchers have turned attention to the effect of learner-learner interaction since 1980s.

Research results have revealed that cooperative tasks are more likely to create better language learning opportunities and specifically more vocabulary learning opportunities compared to individual tasks (Storch, 2005; Wigglesworth & Storch, 2009). Similarly, the existing studies show that interaction, either between learners (Adams, 2007) or between a learner and a teacher (Ellis, Tanaka, & Yamazaki, 1994; Gass & Alvarez Torres, 2005) has the potential to enhance vocabulary learning. Accordingly, learners should be provided with numerous opportunities to engage in interactive activities rather than passive learning. STAD is believed to pave the way towards reaching this objective.

Seeking for an appropriate learner-centered and cooperative methodology at one hand and considering the complexity of collocation learning, on the other hand, were assumed as the major problems based on which the present study was conducted. In a nutshell, this study is believed to get a more critical look to the viability of STAD, a cooperative teaching technique, or the conventional individualized methodology in improving Iranian EFL learners' collocation learning.

RESEARCH QUESTION

To achieve the purpose of this study the following research questions were proposed:

Does STAD have any significant effect on promoting Iranian learners' knowledge of English collocations?

RESEARCH HYPOTHESIS

The above research questions led to the statement of the following null hypothesis:

STAD does not have any significant effect on promoting Iranian learners' knowledge of English collocations.

METHODOLOGY

Participants

Participants of this study were sixty-four Iranian intermediate EFL learners studying in Simin Language Institute in Iran. They were in two separate classes, encompassing both male and female learners, ranging in age from sixteen to twenty one. One class was assigned as control group, and the other one as experimental group, each including thirty-two subjects. The students in the experimental group were further divided into eight STAD groups based on their performance on a general language proficiency test, namely PET (Preliminary English Test). Accordingly, each STAD group consisted of four members: (a) one learner with a high PET score, (b) another with a low PET score, and (c) the two others with average PET scores. The test was also used to confirm the homogeneity of experimental and control groups.

Instrumentation

The instruments used in different stages of the current research were: (a) a language proficiency test (PET), (b) a researcher-made pre/post-test, and (c) seventy collocations to be used in treatment followed by researcher-made collocation tasks.

The Preliminary English Test (PET)

The Preliminary English Test (PET) is a test of language proficiency by University of Cambridge ESOL Examination which covers all four language skills of listening, speaking, reading, and writing. The speaking section which contained four parts was excluded in the present study for practicality purposes, namely the ease of administration and ease of scoring.

The Pre/Post-test

The pre-test and post-test were the same in the present study and developed by the researcher based on the collocations students learned during the treatment. The test had four parts, including 40 items on the whole measuring the students' knowledge of both lexical and grammatical collocations. For obtaining the content validity of the test, the researcher got the help of an experienced EFL teacher majored in TEFL and two professors with ten years experience in TEFL. The reliability of the test was also determined as 0.83 through Cronbach Alpha in a pilot study. The learners in both study groups took the pretest before receiving the treatment. After eight sessions of learning collocations they took the posttest, and the results underwent data analysis to find out whether STAD had any significant effect on learners' collocation learning or not.

Collocation Tasks

A total number of seventy English collocations were used for the instruction. Some of them were selected from the learners' textbook, New Interchange Two, and some others from Oxford Collocations Dictionary. All seventy collocations were taught to both control and experimental groups in eight sessions. Each collocation was proposed with an example, and the examples were mostly taken from Longman Dictionary of Contemporary English, Longman Exams Coach, Oxford Collocations Dictionary, Oxford Advanced Dictionary, and Oxford Students Dictionary.

A researcher-made task was also used to evaluate students' collocation learning at the end of each session. Accordingly, eight tasks were used for the purpose of this study. The content of each task was based on the collocations students learned in each session, and each task was made up of three parts, namely part A (review), part B (reception and production), and part C (production) to be used in eight sessions. The reliability of each task was computed through KR-21 formula in a pilot study. The tasks were given to both control and experimental groups at the end of each session to evaluate their achievement.

Procedure of the Study

STAD is one of the techniques of cooperative learning in which students are divided into groups of 4-5 members. Based on this technique, the teacher presents the lesson and then gives the students in each group a test based on the content of the instruction. The average of the students' score in each group is the score of STAD group. Accordingly, the STAD groups will be classified to Good Team, Great Team, and Super Team with respect to their scores achieved at the end of each session (Slavin, 1994). This way of grouping is believed to motivate the members of each group to get high scores in order to be introduced as the Super Team. In other words, students can be encouraged to participate more actively and to be responsible for their own learning through helping their teammates (Johnson & Johnson, 1994). To apply this technique in the present study, the following steps were taken:

A test of language proficiency (PET) was administered at the outset of the study to find out if the participants were homogeneous or not. The analysis of the data revealed that the control and experimental groups were homogeneous in terms of their language proficiency.

The students took a researcher-made pre-test of English collocations in the second session. The test was aimed at determining the participants' knowledge of English collocations before receiving the treatment. The experimental group was divided into eight groups/ teams of four members based on their performance on the PET so that each group encompassed one student with a high PET score, one with a low PET score, and two students with average scores in PET test. After grouping the participants the researcher explained the procedures of STAD to the students in the experimental group.

Eight to nine collocations were taught to both control and experimental groups in each treatment session; therefore, seventy collocations were taught on the whole. After teaching the collocations, students in both groups were assigned to do the related tasks. Tasks were given to students at the end of each session to evaluate their achievement. They were performed collaboratively in

experimental group so that each team member was involved in a joint activity whose result was attributed to individual members' activities. This was believed to motivate each student to try his/her best to perform the task (Johnson, Johnson, & Holubec, 1998). The teacher collected the completed tasks and corrected them for the following session. Accordingly, at the beginning of the following session, the teacher announced the rank-ordered STAD teams based on their scores on the task as Good, Great, and Super Teams.

Each participant in the control group did the task individually. In other words, each student was responsible for his/her own learning, and there was no team cooperation in control group. After eight sessions of treatment, the post-test was given to both study groups. The students took the post-test individually in both control and experimental groups. The results of the test underwent data analysis to determine if there would be any significant difference between the control and experimental groups in terms of collocation learning.

RESULTS AND DISCUSSION

To prove the homogeneity of study groups in terms of their knowledge of English collocations, a pretest was administered at the outset of the study. The descriptive statistics of participants' scores in the two experimental and control groups on the pretest were computed and presented in Table 1. The table shows that the mean and standard deviation of the experimental ($M = 26.78$, $SD = 2.48$) and control ($M = 26.63$, $SD = 2.75$) groups are not far from each other on the pretest.

Table 1: Descriptive Statistics of Two Group's Scores on the Pre-test

Source	Group	N	Mean	Std. Deviation
Pre-test	Experimental	32	26.78	2.48
Pre-test	Control	32	26.63	2.75

The results of independent samples t-test for comparing the two groups' mean scores on the pretest are provided in Table 2 below. The table shows that the equality of variances was proved because p value of Levene's Test (.42) was more than .05.

Table 2: Independent Samples t-Test to Compare Two Groups' Scores on the Pre-test of Collocation

Levene's Test for Variances			T-test for Means			
	F	$Sig.$	t	Df	$Sig. (2-tailed)$	Mean Diff.
Equal variance assumed	.646	.425	.238	62	.813	.156

In other words, test results as appeared in Table 4.6 failed to find any statistically significant difference in means between the two groups on the pre-test ($t_{(62)} = .238$, $p = .81$, $p > .05$) since the t -observed (.238) was lower than the t critical (2.00), and p value (.81) was larger than the selected significant level for this study, .05. Therefore, the two groups were proved homogeneous in terms of knowledge of English collocations at the beginning of the study and before receiving any instruction.

Investigating the Research Question

To answer the research question of this study that asks whether or not STAD has any significant effect on promoting Iranian learners' knowledge of English collocations, the descriptive statistics of participants' scores in the two experimental and control groups on the post-test were computed and presented in Table 3. As the results reveal, the students in the experimental group ($M = 37.03$, $SD = 2.08$) outperformed those in the control group ($M = 34.16$, $SD = 2.98$) on the post-test.

Table 3: Descriptive Statistics of Two Group's Scores on the Post-test

Source	Group	N	Mean	Std. Deviation
Post-test	Experimental	32	37.03	2.08
Post-test	Control	32	34.16	2.98

Further, independent samples t-test was used to compare the two groups' mean scores on the posttest. The results are provided in Table 4. As the table shows, the p value (.002) in Levene's Test was less than .05, indicating that the variances were not equal. Therefore, the data in Row "Equal variance not assumed" was analyzed to test the hypothesis.

Table 4: Independent Samples t-Test to Compare Two Groups' Scores on the Post-test of Collocation

Levene's Test for Variances			T-test for Means			
F	$Sig.$		t	df	$Sig. (2-tailed)$	Mean Diff.
Equal variance assumed	10.107	.002	4.466	62	.000	2.87
Equal variance not assumed			4.466	55.45	.000	2.87

Table 4 shows that independent samples t-test detected a statistically significant difference in mean scores between the two experimental and control groups ($t_{(55.48)} = 4.46$, $p = .000$, $p < .05$). This means that the t value (4.46) was greater than the t critical (2.00), and the p value (.000) was higher than the selected significant level for this study (.05); consequently, the first null hypothesis as "STAD has no significant effect on promoting Iranian learners' knowledge of English collocations" was rejected, and it could be claimed that STAD affects Iranian learners' knowledge of English collocations.

The results of quantitative data analyses showed that STAD had a serious impact on the collocation performance of the participants when their pretest and posttest scores were compared. In other words, the experimental group participants' collocation achievement was improved after receiving the treatment. The obtained results are consistent with the results obtained from other

studies investigating the effectiveness of the cooperative teaching techniques including STAD (Alijanian, 2012; Durukan, 2011; Mohseny & Jamour, 2012; Nazir Khan & Inamullah, 2011; Razavi, Nakhle, & Naghavi, 2012). All of the above researchers have found that the cooperative teaching techniques in relation to the language learning of the learners were more effective than the traditional, individualized techniques.

Such a result can be accounted by the positive interdependence and the individual accountability principles of the cooperative teaching. The fact is that the group members worked collaboratively to enhance the performance of their own and others. They achieved intersubjectivity because they agreed on the way to accomplish the task at hand and cooperated with each other to meet the purpose. This success can be also attributed to the group autonomy achieved by the cooperation of the members, as well. The idea is that in the experimental group, members of each group were encouraged to complete the tasks autonomously which means that learners in CL were active learners who were learning on their own (Pritchard, 2009).

CONCLUSION

The results of statistical analyses indicated that STAD participants are more successful in comparison with the control group participants in improving their collocation performance. Perhaps one major justification for coming to this conclusion is the fact that learners in cooperative groups including STAD get peer motivation and assistance from their more skilled friends. They may see that their commitments are expected and appreciated for the whole group. Their peers are accessible to help them when they need a specific response to an inquiry or answer for a problem. When a partner produces an inappropriate response, the more capable learners in the group can clarify the reasons why that answer is not satisfactory, and this clarification can lead to cooperation among group partners which can advance deeper learning of materials through clarification, elaboration, or mental interpretation which takes place throughout this collaboration.

The contrast between STAD and individualistic instruction in the present study is identified with the fact that STAD was focused around cooperative learning with the positive communication among peers in the group while the control group was focused around conventional learning with the absence of communication among peers which may explain the distinction in the significance of these two pedagogical techniques. Group rewards as one of the focal ideas of STAD cooperative learning technique can have a powerful impact on learners' achievements, especially collocation performance which is a challenging task. Consequently, the advantage of STAD can likewise be seen from a behavioral learning theory perspective which is based on the assumption that learners would persevere with tasks that give a prize, and learners would neglect working on those assignments that have no reward or retribution (Johnson, Johnson, & Smith, 1998).

Perhaps another conceivable reason that learners in the STAD group were more successful than those in the control group is that individual learning and practice in conventional teaching lacks interpersonal feedback in the practice. Besides, the learning circumstances might cooperatively

empower learners to process data more profoundly than the individuals who are learning the information on their own.

Implications of the study

The undertaking of the present study was an effort to localize the suggested practice of CL techniques on the Iranian EFL learners to seek scientifically the superiority of the STAD strategy in their collocation performance. The obtained results can be considered as illuminating guidelines first and for most for language teachers, the main decision makers in the classroom. In fact, the findings help teachers to select the best ways the techniques of CL can be implemented for the learners.

Furthermore, this study suggests that teachers need to carefully monitor levels of learners and patterns of interaction within the groups in their classrooms and make sure that all students have an equal chance of sharing their ideas and views in the group. The STAD technique minimizes listening time, and makes students responsible for their own learning. Given that each group needs its members to perform well in order for the whole group to succeed, this technique maximizes interaction and establishes an atmosphere of cooperation and respect for other students. Taking these into consideration, teachers need to let the students think through and discover the effective ways of cooperating and delivering the task content to the peers.

Moreover, what is of significant importance in this process is for materials developers to take into account the cooperative principles according to which learners can interact with each other much freely. In other words, materials developers should consider the importance of having interactive and cooperative techniques when designing materials for foreign language students.

Suggestions for further study

The present research focused on general analyses of the effectiveness of STAD with regard to Iranian EFL learners' collocation learning. Future studies can focus on the investigation of a number of teaching methods alongside the cooperative methods. Also, future researchers can examine other types of cooperative teaching methods in addition to STAD such as Teams-Games-Tournaments (TGT), Group Investigation (GI), and Jigsaw Procedure. Moreover, the present research focused on the collocation learning via STAD technique. Further studies can be done to investigate the contribution of STAD to teaching other strings of words, such as idioms, or proverbs.

THE PERSPECTIVE TOWARD INTERPRETING OF TABARSI'S MAJMA-OL-BAIAN

Soheila Safdari

Researcher in Arabic Language Teaching, Tabriz, Iran

Email: Dr.Sana.Taherzadeh77@gmail.com

ABSTRACT

Interpreting the Quran was started from the starting years after the death of Prophet Mohammed and until now different interpreters have been writing and interpreting. One of these interpreters is "Majm-Ol-Baian" interpreter which Sheikh Tabarsi wrote it in 6th AH. Tabarsi utilized the seven sciences of Quran's sciences for writing "Majma-Ol-Baian". Tabarsi utilized the poem evidences for explaining the concepts of phrases and meaning of words, mentioning the reasons of different readings, spelling the words and phrases, describing the rhetoric points and proving the perspectives and theories in different last fields. The methodology which was used through the present article is to interpret the Sheikh in Majma-Ol-Baian is "Conceptual and literal". The result of the administered studying indicated Sheikh Tabarsi states from Quran's sciences in seven techniques in the starting points of interpretation and then enters the interpretation discussion of each chapter. The research's conclusion stated that different reasons, vowels of words and sentences and theories were used in different fields by using the poem evidences for writing "Mama-Ol-Baian."

KEYTERMS: Quran, Interpretation, Tabarsi, Majma-Ol-Baian, Poem Evidences

INTRODUCTION

One of the important Islamic sciences which is complete than the other sciences is interpreting science of Quran and God's statement, and different complete attempts have been done for discussing about comprehending it and is counted as the example of higher education (Eslami, 1995). But interpreting books are the writings of Islamic scientists are more than expected and worthwhile interpretation "Majma-Ol-Baian" is the masterpiece and the selected work of Abu Ali Fazl Ebne Hasan Tabarsi one of the ten selected works of Quran's interpretations. Undoubtedly, Quran was descended in Arabic language in Saudi Arabia Island the environment where there were different and famous theologians and preachers and poets. Therefore, the phrases and statements which are come in Quran have been reflected in the poems of informed and Islamic poets, so for people who want to understand Quran and know what the words and phrase mean, they can understand the meaning of them by referring to poems of those poets; therefore, Sheikh Tabarsi mentioned the poems of some poets for making familiar the words and phrases and this work closes the reader to understand the different dimensions of understanding the meaning of words, and on the other hand it shows us that how Tabarsi understood the Arabic literature (Eftekhari, 1999).

Amin Ol Eslam or Amin Oddin Abu Ali Fazl Ebn Tabarsi was born in 469 of Ghadr in Mashhad. He set off Najaf for continuing his studying and in the last period of his life came back to

Sabzvar and he passed away in 548 of Ghadr in 80th. The important and famous quotation is that he passed away in Sabzvar and then his body was taken to Mashhad and entombed around the shrine of Imam Reza, but some others believe that he has been entombed in Sabzvar (Afandi, 1994).

REVIEW OF THE RELATED LITERATURE

The importance of poem evidences near the interpreters

Academic authors use hedges to reduce and minimize the potential threat new claims make on other researchers by soliciting acceptance and challenging their own work (Aboulalaei, 2013).

Hedges can show not only a speaker's uncertainty but a variety of social meanings. It has been detected that hedge never state uncertainty, impression, warmth, or any other social function in the abstract. They do so, only as they become mobilized in the concrete arenas of everyday talk, as forms of situated practice (Dixon & Foster, 1996).

According to Holmes (1984 and 1990 as cited in Aboulalaei, 2013), boosters are seem to play a crucial role in producing and creating conversational solidarity. Hedges and boosters draw attention to the fact that expressions do not just commitment ideas, but also the author's attitude to them and to readers (Halliday, 1978 as cited in Aboulalaei, 2013).

According to Aboulalaei (2013), range of studies have shown the pragmatic importance of hedging as a resource for stating uncertainty, skepticism and deference in academic contexts and texts, but researcher still known little about how it functions in specific academic domains. And boosters emphasize the power and force of propositions and show commitment to expressions, so asserting the author's conviction and restricting the negotiating space available with colleagues, effecting interpersonal solidarity and membership of a disciplinary in-group. Boosters allow authors to negotiate the status of their information, aiding to establish its perceived truth by presenting it as consensually given (Aboulalaei, 2013).

As Hyland found (1998a), hedges and boosters are response to the potential negotiability of claims and an indication of the author's acknowledgement of disciplinary norm of special argument. They work to stabilize and balance objective information, subjective evaluation and interpersonal negotiation, and this can be an important and powerful persuasive factor in gaining acceptance for claims.

Hedges are used by academic authors to show and express underlying attitudes and strength of commitment or claim which means that hedges can be used to avoid opposition to a proposition (Hyland, 1998b, 1996 as cited in Aboulalaei, 2013).

One of the important functions of hedges is to contribute to a relationship by altering and changing readers to the author's perspective and view towards both propositional information and to the readers themselves (Hyland, 1998 as cited in Isabel, 2001).

As Isabel mentioned (2001), the important reason for paying attention to text linguistic cues or devices is that use of a meta-language in the analysis of the language itself may facilitate access to the propositional content and construct meaning. Finally, Science students tend to prefer an approach to textual analysis that draws upon concrete points taught, if possible in an explicit, rational and objective way. And hedging devices are a common strategy for mitigating and modulating academic discourse.

According to Isabel (2001), hedges can be used to state the writer's attitude(s) to both proposition (i.e. content) and readers (i.e. peers). The term "hedge" is utilized by Hyland (2000:87-88): "Hedge?...?like possible, might and perhaps?...? represent explicit qualification of the writer's commitment. This may be to show uncertainty, and indicate that information is presented as an opinion rather than accredited fact, or it may be to convey deference, modesty or respect for colleagues' views"

According to Moreno and Suárez (2008), the following example is a positive critical act which the single italicized and underlined text contains evaluative material on the meta-discourseal plane: "Reader of ELT *may* be especially *interested* in the long chapter centered on the Ruskin-Whistler controversy". In above example the modal verb *may* is used to soften slightly the power and force of proposition stated and expressed by the author by adding the extra meaning of tentativeness. The meaning of the expression becomes something like: "it is possible but not guaranteed that reader of ELT will be interested in the aspect of the book commented upon." But the important factor here is that without this modal item, a hedging plane or devices, the prediction would have been expressed in very categorical terms [Readers of ELT will be especially interested in...], showing the author's strong belief in it. In above example the model item *may* can also be put or situated on the meta-discourseal plan since the epistemic meaning added by it affects, or modifies, the meaning of the entire proposition without adding or annexing any new propositional content to the text (Aboulalaei, 2013).

context, hedges and boosters

Holmes (1990) has examined a number of linguistic forms widely recognized as potential 'hedges' in Lakoff's sense (i.e. attenuators or mitigations of the strength of a speech act) and the conclusion has been consistent: linguistic forms are complex and the functions they state cannot be specified in a social and textual vacuum.

As Hyland (1998b) states, hedges and boosters can be found together in stretches of discourse where authors look for creating different rhetorical effects. Authors must socially mediate their arguments, discussions, shaping their evidence, observations, data, and flashes of insight into their community. In so doing, they are contemporary negotiating a harmonious relationship with their readers, framing their arguments in conformity with disciplinary expectations concerning appropriate author involvement and interpersonal conduct. Hedges are one of the most studied parts of their audience-oriented aspect of claim design.

According to Hyland (1998b), the special ways that authors conceptualize problems, generate inquiry, approach their objects of study, and persuade their colleagues are likely to influence the ways they employ hedges and boosters in their discourse.

Hyland (1998b) concluded that, the results show and suggest a general division between Philosophy, Marketing, Linguistics and Sociology on one hand, and Physics and Engineering on the other, with Biology occupying the middle ground, and this distinction is illustrated by the fact that over 70% of all hedges occurred in the humanities social science papers and they were over twice as frequent in Philosophy, Marketing and Linguistics, as in Physics and Engineering. And the most frequent hedges are **may**, **would** and **possible** and the most frequent boosters are **will**, **show** and **the fact that**. Of course epistemic verbs such as **suggest**, **indicate**, **assume** and **seem** are also heavily used as hedges.

According to Nash (1990 as cited in Hyland, 1998a), authors present their work and articles in various ways partly because they have different sorts of work to present, but also since they are presenting it to people with various ways of seeing and explaining the world. In other words, since academic or article writing is a form of knowledge-making, differences in the types of problems studied and ways of addressing them should aid account for disciplinary variation.

Isabel believed that(2001),in recent years research has also been concerned with the study of the use and utilizing of hedges and boosters in different academic genres, disciplines such as research articles (Hyland, 1999, 1998; Aboulalaei, 2013); scientific letters (Hyland, 2000, chap.6: 1999) and book reviews (Hyland,2000, chap. 3).

According to Isabel (2001), the results obtained indicate that hedging plans in English articles are almost double those in Portuguese articles. The structure of discourse of English articles may partly dictate the utilizing of hedges. English tends to use and utilize more hedge than Portuguese. Moreover, although the article genres need a relative uniformity, it appears that language conventions can change between writers with different cultural background.

As Hyland explained (2000 as cited in Isabel, 2001), in academic English, hedging devices mark the author's attitude to both proposition (i.e. content) and audience and are therefore an important and pervasive part in academic discourse. However, L2 learners seem to have some difficulty assessing qualification and certainty in the author's commitments to a claim and sometimes fail to notice hedges. So it is expected that by becoming familiar and getting acquainted with hedging, as a relevant discourse convention in academic writing, reading of academic texts and articles might be facilitated.

Orta, Miiñ, Sanz and Duenas (2006) concluded that, disciplinary affiliation appears to be an important determinant in the use of interpersonal meta-discourse strategies, in Research Articles from the four examined disciplines; Business, Applied Linguistics, Urology and Food Technology. Finally, the exploration and description of meta-discourse from the point of view of genres in contrast seems to hint in the following direction: the similar meta-discourse features may have conventional and institutionalized uses that change from genre to genre; that is, there

are important differences, in terms of frequency and function, in the way competent members of a certain disciplinary community use metadiscoursal plans and devices. Such fundamental differences both distinguish the genres and help to explain and describe the differences in meta-discourse use.

It was manifested that hedges and boosters were almost equally used in the Introduction and Conclusion parts of the research articles sampled, and most of the scholars have explored frequency and functions of hedging according to genre and various rhetorical sections of scientific papers (Maurie, 2008).

According to Maurie (2008), Psychology writers appear to be detached while mass communication authors seem more committed. The important problem here is that the topics of Research Articles apparently influenced the commitment and detachment of the authors. Research Articles are direct for researchers to propose new ideas which are likely to support or contradict findings of other scholars; so, authors employ cautious language as the acceptance of their research contributions depend largely on how these are presented to the academic community. Utilizing cautious language means mitigating the strength of a proposal by developing and increasing or decreasing its illocutionary power via hedging and boosting devices (Vassileva, 2001 as cited in Mojica, 2005 in Maurie, 2008) which serve three main rhetorical functions: 1) threat reducing strategies... to point distance and to avoid absolute expressions; 2) strategies to accurately reflect the certainty of knowledge ; and 3) politeness strategies... between authors and readers (salvager-Mayer, 1997, p.106 as cited in Maurie,2008).

According to Flowerdrew (2001 quoted in MagaliPaquetd, 2008), there are three areas of difficulty in learner academic writing, (i.e. collocational patterning, pragmatic appropriacy and discourse features). Collocational patterning has to do with academic learners and university students' lack of familiarity with the typical lexico-grammatical environment of words “(e.g. **we have performed a survey. A questionnaire has been conveyed to the public**).” Pragmatic appropriacy concerns the author's attitude and view to his/her message, as realized via modal verbs, modal adjuncts, boosters, hedges, etc. Discourse features or parts are lexical and structural items in context.

As Vázquez and Giner (2008) discussed, there has been a growing interest lately in hedging and the motivation for its use and employing in academic/scientific writing. The interest is concentrated on that hedges are really employed in scientific discourse, which is thought to be above all rational and neutral. This is connected with the fact that scientific discourse obeys the some mechanisms as ordinary everyday communications do, although it wants to hide this, more or less successfully, by employing a code of its own.

Various disciplines accept and deal with different data and hence, show different amounts of boosters in their discourse (Vázquez & Giner, 2009). In writing academic articles, there are two important factors that affect the writing; that is, to write article writers should attend them, since these factors help them to express their meaning with certainty or doubt. Sometimes it is easy for

readers to analyze and explain the grant writers' referential behavior, since the genre and genre system help readers to find writers' attitudes and beliefs (Feng, 2009).

According to Isabel (2009), becoming familiar with hedging as a writing convention of academic English may facilitate reading or writing academic texts. The most commonly used and utilized hedges in academic discourse are modal verbs (**may/might, can/could, would, should**), lexical verbs (**suggest, indicate, appear, believe**) and adverbs (**possibly, probably, likely**) (Ewa, 2010).

According to Amiryousefi and EslamiRasekh (2010), one of the important factors, which affect the use and distribution of meta-discourse marker, is genre. And texts can be grouped into one genre or another based on their key linguistic or rhetorical dimensions. Meta-discourse is one such part. Texts can be analyzed and grouped based on various kinds of interactions they produce with their readers, and various kinds of persuasion sought by authors or speakers. Genre is defined as communicative events or phenomena specified by a series of communicative purposes and feature recognized by the members of community (Swale, 1990 as cited in Amiryousefi & Eslami Rasekh, 2010).

According to Maurie (2008), commitment and detachment in one's claims are linguistically revealed in the use of hedging and boosting plans and devices. The authors' tendency to utilize strong language to show commitment imply the need for the inclusion of lessons on hedging and boosting in research writing topics and subjects as well as the need for students to be more exposed to the conventions of research writing.

According to Aboulalaei (2013), academic writing is created by paying special attention to the specific constraints or conventions of different disciplines. These constraints condition the resources used by academic writers in their different disciplines. Scholar's work is reflected in academic discourse through a selection of linguistic elements; and this selection is made by following the conventions or rules of a particular discourse community. These conventions might ensure academic writers that their work will actually be recognized by readers and accepted by their colleagues in that discourse community. As Vartalla (2001; 248) states, "different disciplines may not be altogether uniform when it comes to frequency, forms, and variety of hedges". In this way, hedges and boosters in Medicine may not present the same occurrence as in Linguistics or Chemistry.

Quran was descended in Saudi Arabia when the able poets and eloquent had been grown up. Using the strange and unfamiliar statements was common among them. Even though they discussed and disputed with each other, and it was possible that some referees were executed for analyzing the poems. Using these statements and words and strange interpretation was strange. Undoubtedly, whatever the poet closed to the urban ethic, using the strange and unfamiliar interpretation was less in his poems, but since the Arabs liked the poem, the way was not closed for desert poets and they went with full-haversack of poems to Okaz Bazaar and sold their reserve. In this situation and through the period of time Quran shined its bright lights on the island of Saudi Arabia.

People who like the great and pretty speeches were attracted by these speeches, and on the other hand while Quran was descended in Arabic, but there are some words and phrases which are non-Ghoreish. In Quran, we can see that there are some words which are not common Ghoreishian words (Like: ZAMHARIR, and.. which was taken from TEI Tribe) (Tabatabaei, 1992), and this caused that the great difference was happened among the tribes in understanding a verse, and each one had the different interpretation about the used word and because of this the interpretations' styles which were divided to two parts were created; the first one was Mecca Interpretation style with leading of Abdollah Ebn Abbas and the other one was Iraq and Basra Interpretation with leading of Abdollah Ebn Masud (Kariman, 1996) .

The interpretation work was being increased because of Muslims' interesting to Quran. It was natural that by passing the time from Prophet Mohammed's message and companions and followers, these differences were increased. Therefore, the interpreters attended to Arabic poems for claiming the correctness of their interpretation and put it as their firm rope to prove their claim and interpretations like Alkeshaf Zomokhsery and Majma Ol Baian Tabarsi and Jame ol Javame are counted like them.

As we saw, mentioning the poem evidences are so important for people to access the correctness of verses, and this issue was not limited to Quran just. By passing the time, the Arabic scholars entered this to Arabic Grammar which Seibuieh started it by writing the valuable book in the names of Alketab, and then stating the grammar without considering the poem evidence was abolished, and the Arabic Grammar was changed to poem, which Alfihe Ebn Malel is the great evidence for this. People like Ebn Aghil and Jamal eddin Ebn Hesham Ansari and Siuti and others who were the professor of Arabic Grammar wrote books in explaining poems and knew it suitable and because of that people who surrounded the Arabic poems and recorded them in their mind impacted more on Arabic Literature (Kariman, 1996).

Reason of Compilation

In introduction of Majma-Ol-Baian Fi Tafsir Al Quran (corrected and suspension by Seied Hashem Rasuli Mahallati), the story of heart attack of Sheikh Tabarsi was mentioned by Mohsem Hoseini Ameli in Mostadarak Ol Vasael and Mostanbet Ol Masael written by Haj Mirza Hosein Noori Tabarsi died in 1320 Nuclear Calendar. (Haj Mirza Hoseini quoted the story from interpretation book of Kabir Monhej Al Sadeghin fi Elza Al Mokhalefin compiled by Molla Fath Allah Kashani). The story is that: Sheikh Tabarsi fainted and after washing out him and entombed him, suddenly among the grave his heart started to palpitate and understood that he was alive, in that time he avow that if he would be alive he would write the interpretation of the great book, in that time a robber stole the shroud of Sheikh. The Sheikh got him and told him: "bring me a cloth and take this shroud." After that, the Sheikh started to write the interpretation (Kariman, 1966).

METHODOLOGY

The interpreting methods of Sheikh Tabarsi in Majma Ol Baian

Sheikh Tabarsi states from Quran's sciences in seven techniques in the starting points of interpretation and then enters the interpretation discussion of each chapter, and the titles of seven-title techniques are as follow:

First technique: the number of Quran chapters and profits of knowing it, their narrators in cities

Second technique: the names of famous readers and their narrators in cities

Third technique: stating the meaning of interpretation and gloss

Forth technique: stating the names of Quran and their meanings

Fifth technique: stating the summary of Quran's sciences

Sixth technique: news in Quran's wisdom and its fans

Seventh technique: in stating what is totem for Quran's reader

Style and method of interpreting of Sheikh in Majma-Ol-Baian is "Conceptual and literal."

The order of studying

- Discussing about each chapter's Mecca and Medina
- The number of verses of chapters and the existed differences
- The names of chapters and their appellations
- Stating the chapters' scholarship which was mentioned by Obaia Ebn Kaeb from Prophet Mohammed
- Stating the reading differences by mentioning the reason of accepting the famous quotation
- Discussing the words and substances of verses and their derivation mean and flections
- Justifying the vowels of words and sentences and their compounds
- Stating the reasons and reasons of descending
- Writing the meaning, verdicts and verses' gloss

All these discussions have been come in the name of Algharaea, Alhojat, Allogat, Alearab and Almaena, and sometimes for interpreting the verse of Quran from other verse was used and the corroborant states its perspective. About verses of verdicts which are about 500 verses, Sheilh states the statements of other Islamic religious, and then he states the Shi's idea and in that time he states his perspective as the judgment. His perspectives show his skillful in jurisprudence.

The characteristics of works and scientific personality of Tabarsi

A: Free thinking and looking up

The Sheikh is free thinking and looking up, and the situation helped him to access the scientists and huge awareness. These people try to get any information and analyze the pros and cons.

B: Research sincerity, fairness in writing

Sincerity in research, fairness in research, mindedness in quotes sayings and designing the others' ideas by attention to different perspectives are the other summit in scientific and research life of Tabarsi.

CONCLUSION

According to findings of Tabarsi, it can be added that Tabari has also given the above interpretation and that according to Tabari the verse is intended for the group of Jews and Christians who are living at the time of the Mahdi. The author then mentions a tradition in favor of this view and says that Ali ibn Ibrahim reports in his tafsir from Shahr ibn Hushab who reports from Hajjaj ibn Yusuf 1 who said: "This verse surprises me. When I order the death of Jews and Christians and when their throats are being slit, I wait for them to say something but I never hear anything from them on this subject before their death. Their lips do not even move." I said: "May God guide the Amir, the meaning of the verse is not this." He asked: "What is the meaning then?" I said: "Isa ibn Maryam will descend to the earth before the Day of Judgment and will pray behind the Mahdi." 2 He said: "From which source do you state that?" I said: "Imam Baqir related this to me". Some asked to Shahr: "What was your purpose in saying this to him?" He said: "I wanted to irritate him". Tabarsi used the seven sciences of Quran in writing "Majma-Ol-Baian". Tabarsi used the different reasons, vowels of words and sentences and theories in different fields by using the poem evidences for writing "Mama-Ol-Baian."

ABSTRACT

Recent studies about achievement motivation mostly focus on individuals' goals in academic situations which might affect educational behaviors and students' academic achievement outcomes. The purpose of this study was to investigate the relationship between motivational goal orientations and academic achievement of high school students of Shiraz, Iran. In total, 835 high school students of Shiraz participated in this study. The participants filled in the Inventory of School Motivation. The Grade Point Average (GPA), mathematics and English final exam scores of the students were gathered. The data were analyzed through Pearson correlation coefficient. The analysis of the data indicated that the GPA had a positive meaningful relationship with competition, effort and social concern goals and it had a negative meaningful relationship with social power and token goals. The score of mathematics and English had a positive meaningful relationship with effort goal and it had a negative meaningful relationship with social power and token goals. Different motivational goals orientation can have significant effects on students' academic achievement outcomes. The implication of this study is that it helps the officials of the education systems and families to be more cognizant of the students' goal orientations in their schooling and to pave the way for students to achieve their goal and improve their educational performance.

KEYWORDS: Motivational goals orientation, Academic achievement, Student's motivation

INTRODUCTION

Trainers, teachers and parents consider motivation as the key to successful educational performance (Watkins, McInerney & Lee, 2002). One of the most important areas of research in educational researches is the effect of students' motivation on educational outcomes. Motivation can be conceptualized as the student's energy and drive to get involved in learning (Criss, 2011),

and it also plays a big role in the interest of students in school, education and enjoyment of it (Martin, 2003; Ali & McInerney, 2006). Motivation is also one of the psychological bases of students' achievement (Ali & McInerney, 2006; Nolson, O'Mara, McInerney & Dowson, 2006) and it leads students' goals orientation (McInerney, McInerney & Dowson, 2005; King, Ganotice & Watkins, 2011; Maehr & Zushu, 2009). Recent theories in achievement motivation mostly focus on individuals' goals in academic situations which might affect educational behaviors, cognitive processes and achievement (McInerney, Maehr & Dowson, 2004; McInerney, 2004; McInerney & Dowson 2003; King, Ganotice & Watkins, 2011). One of these theories is Maehr's Personal Investment Theory. From its inception, personal investment theory was developed to be a cross-culturally relevant model of students' achievement goals. In this model, four types of goals are proposed to be important in understanding student motivation in school: mastery goals, social goals, performance goals, and extrinsic goals. Each of these goals, in turn, is comprised of two facets (King, Ganotice & Watkins, 2011) (See Table 1). Different motivational goals can have significant effects on students' achievement outcomes (Elliot & Church, 1999; McInerney, 2008; Pintrich, 2000; King, Gatonic & Watkins, 2011).

Table 1: Four types of achievement goals in personal investment theory

Achievement goal	Facet	Definition	Sample items
1.Mastery goals	Task involvement	interest in the task	"The more interesting the schoolwork the harder I try."
	Effort	willingness to expend effort for schoolwork	"I always try hard to understand something new in my schoolwork."
2.Performance goals	Competition	competitiveness in learning	"I like to compete with others in school"
	Social power	seeking status through group leadership	"I like being in charge of a group."
3.Social goals	Affiliation		
	Concern	belonging to a group when doing schoolwork	"I can do my best work at school when I work with others."
4.Extrinsic goals	Token	concern for other students	"I like helping other students with their School work."
	Praise	seeking tangible rewards for schoolwork	"Getting a reward for my good schoolwork is important to me."
		seeking social recognition for schoolwork	"I work best when I am praised in school."

Studies showed that achievement goals are related to outcomes such as self-esteem, general well-being, socio-emotional functioning, learning strategies (Wolters, 2004), self-regulated learning (Pintrich, 2000), grades (Elliot & Murayama, 2008), emotions in school (Pekrun et al. 2006, 2009), self-related beliefs (Pajares, Brinter & Valinte, 2000), and other valued educational outcomes (Elliot, 2005).

Ali and McInerney (2003) found that a positive relationship exists between effort goals, GPA and achievement in English but there is a negative relationship between task, effort and GPA.

Similarly, social power goal is a strong negative predictor of English and mathematics scores. Also receiving rewards was a strong positive predictor of GPA in some groups.

Sulimon and McInerney (2003), found that for Lebanese students and non-Lebanese students living in Australia, task and effort goal is a strong predictor of science and English achievement but social power, competition, social concern, praise and token goals in both groups are not predictors of students' academic achievement.

Most of the recent studies in western countries about motivation are concerned with motivational goals but a few studies have been carried out in Iran about this subject. Regarding the role of students' motivational goal orientations in academic achievement and considering the fact that one of the most significant problems of Iranian students is lack of motivation (Sobhaninejad & Abedi, 2006), the investigation of the relationship between motivational goals and academic achievement in Iran seems necessary.

RESEARCH QUESTION

Is there any meaningful relationship between students' goal orientations and academic achievement?

METHODOLOGY

Participants

In total, 835 students of Shiraz high schools participated in this study consisting of 420 males and 415 females. Among them, 260 students (31.2%) were in the first grade, 274 students (32.8%) were in the second grade, and 301 students (36%) were in the third grade of high school.

Instruments

The Inventory of School Motivation (McInerney & Sinclair, 1991, 1992; McInerney et al., 1997; McInerney, Yeung, & McInerney, 2001) was devised as an exploratory instrument through which a range of motivation salient constructs drawn from Maehr's Personal Investment (Maehr, 1984; Maehr & Braskamp, 1986) model could be identified in educational settings across a large number of different groups. There is a lot of empirical evidence drawn from both exploratory and confirmatory factor analytic studies for the validity and reliability of scales drawn from the ISM (see, for example, McInerney et al., 1997, 2003). Inventory questions are related to the perceived behavioral goals, with each having two elements:

Task (Mastery): Task involvement (e.g., "I like to see that I am improving in my schoolwork") and Effort (e.g., "When I am improving in my schoolwork I try even harder").

Ego (Performance): Competition (e.g., "I like to compete with others at school") and Social Power (e.g., "I work hard at school to be put in charge of a group").

Social solidarity: Affiliation (e.g., "I prefer to work with other people at school rather than

work alone”) and Social concern (e.g., “I like to help other students do well at school”).

Extrinsic: Praise (e.g., “I want to be praised for my good schoolwork”) and Token rewards (e.g., “I work best in class when I get some kind of rewards”).

The students responded to each item on a 5-point Likert scale (1 = strongly disagree to 5 = strongly agree). The Persian version of the Inventory of School Motivation was used in this study. Azadikhah, (2012), calculated the Cronbach’s Alpha as follows: Task = 0.70, Effort = 0.72, Competition = 0.82, social power = 0.85, social concern = 0.78, praise = 0.84, token rewards = 0.85, the reliability of the ISM was $\alpha = 0.93$. In order to examine the academic achievement variable, we gathered the GPA, English and mathematics final exam scores of the students.

RESULTS AND DISCUSSION

99.76 percent of the students (848 students) answered the questionnaire. The average age of the students was 17, and most of the students were between 16 and 18 years old. As it can be seen in Table 1, in all scales the mean is higher than the median. The range of the mean is between 3.29 (Social power) and 4.42 (Task). The range of the standard deviation is between 0.60 and 0.96. Also the range of the correlations of the instrument subscales is between 0.23 and 0.61.

Table 2: Mean, standard deviation and Pearson correlation between the ISM scales

Variable	Mean	SD	1	2	3	4	5	6	7
1. Task	4/42	0/60	1	0/47	0/36	0/23	0/34	0/38	0/28
2. Effort	3/90	0/79		1	0/42	0/27	0/49	0/28	0/26
3. Competition	4/04	0/82			1	0/31	0/35	0/38	0/33
4. Social power	3/29	0/96				1	0/30	0/50	0/45
5. Social concern	3/82	0/81					1	0/34	0/27
6. Praise	3/97	0/86						1	0/61
7. Token	3/51	0/94							1

All correlations are meaningful at $p < 0.05$ level

The findings indicated that a meaningful difference existed between girls and boys in “Social concern” ($p < 0.01$, $t = -3.69$), “Praise” ($p < 0.01$, $t = -4.97$), “Task” ($p < 0.01$, $t = -6.34$) and “Effort” ($p < 0.05$, $t = -3.09$) scales. The average of these scores was higher in girls than boys, while there was no significant difference between boys and girls in “Competition”, “Social power” and “Token” scales.

Pearson correlation between the Inventory scales, the students’ GPA and their final exam scores in mathematics and English was calculated to investigate the relationship between motivational goals orientation and academic achievement. The results showed that there was a positive meaningful relationship between the students’ GPA, effort ($r = 0.20$, $p < 0.05$), social concern ($r = 0.08$, $p < 0.01$), and competition goals ($r = 0.13$, $p < 0.01$) and there was a negative meaningful relationship between the students’ GPA, social power ($r = 0.09$, $p < 0.01$), and token goals ($r = 0.09$, $p < 0.01$). Other results indicate that mathematics score has a positive relationship with effort goal

($r=0.16$, $p<0.05$) and there is a negative meaningful relationship between mathematics score and social power goal ($r=0.12$, $p<0.05$). Also this study showed that English score has a positive meaningful relationship with effort goal ($r=0.13$, $p<0.05$), and it has a negative meaningful relationship with social power ($r=0.12$, $p<0.05$) and token goals ($r=0.11$, $p<0.05$) (Table 2).

Table 3: Pearson correlation between motivational goals and academic achievement

Variable	M	SD	1	2	3	4	5	6	7	8	9	10
1.Task	4/42	0/60	1									
2 . Effort	3/90	0/79	0/52**	1								
3.Social Concerns	3/82	0/81	0/36**	0/50**	1							
4 . Competition	4/04	0/82	0/40**	0/45**	0/36**	1						
5.Praise	3/97	0/86	0/40**	0/30**	0/35**	0/41**	1					
6 . Social Power	3/29	0/96	0/24**	0/29**	0/28**	0/32**	0/49**	1				
7.Token	3/51	0/94	0/28**	0/27**	0/25**	0/33**	0/60**	0/45**	1			
8 . English Language	15/00	4/09	0/00	0/13**	0/00	0/05	0/06	0/09**	0/11**	1		
9 . Mathematics	15/19	4/22	0/01	0/16**	0/04	0/05	0/03	0/12**	0/10**	0/66**	1	
10 .GPA	16/41	2/55	0/06	0/20**	0/08*	0/13**	0/03	0/09*	0/09*	0/73**	0/78**	1

** $P<0/01$ * $p<0/05$

CONCLUSION

Given the importance of students' motivational goals in academic achievement, this study was conducted to bridge the existing gap in the discovery of possible relationships between students' motivational goals and academic achievement criteria. The students of first, second and third grades of Shiraz high schools completed the Inventory of School Motivation. The academic achievement criteria, the students' English language and mathematics final exam grades and also their GPA were taken into consideration. The total score of the students on ISM indicated that they were relatively motivated (McInerney, 2008; McInerney, Yeung & McInerney, 2001). Task goal was the highest valued motivational variable which was in line with the result of the study conducted by Ali and McInerney (2005) and McInerney (2008). The results of this study indicated that the students' GPA had a positive meaningful relationship with effort, competition and social concern goals, but it had a negative meaningful relationship with social power and token goals. The results of this study were consistent with those of Yousefi, Ghasemi and Firouznia (2009) and with those of Amrai, Elahi Motlagh, Azizi Zolani and Parhoun (2011). Also mathematics score had a positive meaningful relationship with effort goal while it had a negative meaningful relationship with social power and token goals. Other findings of this study indicate that there is a positive meaningful relationship between English score and effort goal but there is a negative meaningful relationship between English score, social power and token goals. This finding was consistent with that of Ali and McInerney (2005), Ali and McInerney (2006) and Sulimon and McInerney (2003), McInerney, Yeung & McInerney, 2001. In interpreting these results, we can say that one of the characteristics of motivated students is that they make a lot of efforts to do their tasks, learn new subject matters, and solve difficult problems. It is obvious that their efforts will finally lead to getting a good grade from their teachers and therefore the GPA

can be considered a yardstick for students' efforts in school. Findings of this study indicated that effort as a criterion for motivation has positive relationship with students' GPA. Although this relationship is weak, it is theoretically in line with the relationship between effort and GPA. The positive relationship between social concern and GPA was as predicted theoretically. Motivated students are not only worried about their achievement but they also feel satisfied when their friends are successful in doing their tasks. The findings showed that this motivation feature has positive relationship with the students' GPA. Being ranked the first in class and having a sense of superiority over others is among the features of the competition dimension of motivation. It is assumed that those who have a high score in this dimension, their GPA is an indicator of their achievement. In this respect, the findings were in line with the theoretical orientation of this study. A possible explanation of why the relationship between these two dimensions and the GPA is weak is that the GPA is not a solid criterion for assessing students' effort. In some courses, some scoring standards might not be met on the part of the teacher and the students might get good grades without making any effort. Since the GPA is determined based on teacher-made tests, non-standardness of these tests and the difference between scoring criteria in different courses (e.g. English and mathematics) might be a reason for the weakness of these relationships. Anyhow, these relationships were in line with those of the studies done by Ali and McInerney (2005), Ali and McInerney (2006), and Suliman and McInerney (2003). Since there was a high correlation between competition and the students' GPA, we can say that if competition is in line with students' literacy, they should be encouraged but if they are indulged in one-dimensional aspect and surpass other students by gaining better grades, it is an alarm for education authorities and other sections of the society. We can also say that students who spend their time on side issues are weaker than others because they would like to assume leadership and superiority to others which should be replaced by cooperation and friendliness. The comparison between two groups of male and female students indicated that girls have more motivation than boys in "Effort", "Social concern" and "Task" subscales. The possible reason for this issue is the greater accountability of girls and their future responsibility like maternal duties. The limitation of this study was that the students' final exam scores were used as academic achievement criteria. These tests are not standardized and therefore their validity and reliability might not be appropriate. Also these tests are highly dependent on the test evaluator's opinion and the scores might reflect the evaluator's emotional aspect of scoring. Since this study was limited to students of high school, generalization about other grades should be made with caution. According to the mentioned limitation, we suggest that researchers use the scores of the standardized tests in their future studies as academic achievement criteria.

ABSTRACT

This study sought to investigate the relationship between the use of technology and reflective teaching within the Iranian English as a foreign language (EFL) context. Use of educational technology in this research was defined as employing means such as email, the Internet, blog, electronic databases, electronic journal, Learning Management System, and podcast to do class activities. An analytic survey method was used and the data were gathered through a questionnaire. A total sample of 100 participants including 50 EFL instructors teaching English at English departments in Azad University branches in Shiraz, Iran and some surrounding towns as well as 50 teachers teaching English in advanced levels in Iran Language Institute were selected through purposive sampling. Pearson correlation coefficient and t-test techniques were used for data analysis. The findings showed that there was a significant relationship between use of educational technology and reflection on teaching among English instructors in both educational contexts. This means that according to what they have reported, the more they used educational technology in teaching, the more reflection on teaching would be the results. Furthermore, the findings revealed that gender did not significantly influence use of educational technology and reflective teaching. The results of the present study indicated that reflection and educational technology are two complementary factors to facilitate teacher's practices and increase their professional progression as well.

KEYWORDS: reflection, reflective teaching, educational technology, gender difference

INTRODUCTION

Within the field of education over the last few decades, a gradual but marked shift has taken place, resulting in less emphasis on traditional teaching and greater stress on reflection and reflective teaching. In a word, language teaching has progressively moved towards reflective teaching (Kumaravadivelu, 2001; Prabhu, 1990). According to the definition given by Longman Dictionary of Language Teaching and Applied Linguistics, "reflective teaching is an approach to teaching and to teacher education which is based on the assumptions that teachers can improve

their understanding of teaching and the quality of their own teaching by reflecting critically on their own practices. In teacher education programs, activities which seek to develop a reflective approach to teaching aim to develop the skills of considering the teaching process thoughtfully, analytically and objectively, as a way of improving classroom practices” (p. 451). In the same vein, reflective teaching involves teachers’ learning how to subject their beliefs to critical analysis and taking responsibility for their actions. That is why providing teachers with opportunities to use conscious reflection is crucial (Farrell, 2001).

Reflective teaching is a series of actions of cautious attentions in education which assist teachers to resolve the problems of teaching that they encounter in the class. In addition, with receptive view point in teaching, instructors will enhance their teaching abilities as well as self-efficacy (Dewey, 1933). With a reflective approach, teachers and instructors of English as a second or foreign language are given opportunities to think about what they are doing, ponder on their past experience and current experience they are involved in their classroom practice to make connections between theory and practice, decide about necessary changes to improve attitudes, beliefs and teaching practices in order to bring about a match between teaching procedures, activities, and techniques and their student’s learning styles and needs. In a nutshell, teachers can play the role core educational decision-makers (Pacheco, 2005). Using reflection as an integral part of teacher's practice is one method of professional development in education (Calderhead & Gates, 1993). According to Dewey (1964) reflection is a vital tool for teaching because it allows us understand where our status are when we perform as a teacher. It changes actions that are only appetitive, blind, and impulsive into intelligent action. Reflective practice on teaching assists practitioners to enhance professional progression (Killon & Todman, 1991).

On the other hand, technology has been an increasingly attractive concept within the field of education for the past decades. Instructional technology is supposed to support and promote the teaching-learning environment or even bring about some ground for promotional modifications in educational practices (Dwad, 1992; Pop & Golub, 2002; Sells, 2011). Moreover, technological tools such as computer mediated communication (CMC) enhancing thinking critically, developing collaboration and reflective practice in learning and teaching context as well (Arnold & Ducate, 2006; Kessler & Bikowski, 2010; Miceli, Murray & Kennedy, 2010; Tang & Lam, 2014; Waltonen-Moore, Stuart, Newton, Oswald, & Varonis, 2006). Thus, the development of instructional technologies contributing to richer options facilitates reflective teaching and learning (Bosch & Cardinale, 1993). In spite of the bulk of research findings revealing the merits of teachers and instructors’ wide-spread use of technology, it has not become deeply integrated into typical curriculums yet.

While reflection on teaching is an absolute precondition for instructors to enhance effectiveness of his or her teaching (Dewey, 1916) it is of high significance for them when deciding to infuse technology into their teaching. Instructors should consider technology as an indispensable part of instructional delivery. Thus, is it so crucial for instructors to know how effectively integrate technology in relation to teaching and learning context, i.e. they should be able to evaluate the appropriateness of any technological tools to understand whether they are compatible with their lesson plan and learning results, and allowing them to promote the evaluation of instruction, aims

of lessons, reflection on teaching to support effective teaching practices (Bosch & Cardinale, 1993).

RELATED LITERATURE

The basic idea of reflective teaching originated from John Dewey (1933) who made a difference between 'routine action' and 'reflective action'. Dewey argued that routine action is focused on convention, custom, and authority and circumstances, while reflective action involves pliability, self-valuation analysis and social awareness. He asserted that: "...quality educators and education cannot be derived from the imitation of techniques that have worked in the past, but rather teachers should be trained in analyzing and defining principles behind the techniques. In short, it is theorized that the more teacher reflectivity, the better the quality of teaching" (p. 89).

Furthermore, Shon (1987) claimed that reflective teaching involves looking at what you perform in the classroom, deliberating on why you do it, and pondering about whether it is effective, i.e., self-appraisal and self-monitoring process. Wood and Stevens (1988) have emphasized that through selecting a systematic and critical approach, reflective teaching involves teacher in examining, analyzing, assessing, modifying and enhancing their practice. In light of this, Zeichner and Liston (1996) claimed that reflective teaching causes teachers to pay attention to the educational and cultural conditions of their teaching as well as school modifications and be responsible for their professional growth. Additionally, it engaged teachers in analyzing, planning, trying to resolve the difficulty of classroom, schools, and questioning regarding beliefs and values in their teaching context.

Reflective teachers build possible connections between the requirements and learners' particular actions. Teachers undertake a rational reflection's process, examination and explanation to enhance their teaching, which in turns, in several ways indicated the learning processes which was anticipated from students. A reflective instructor converts perceptions into active change, and considered what s/he performs from diverse aspects to the extent possible as well as finding new solutions through self-appraisal as outlined by Jonassen (1999). Richards (1990) sees reflection as a key component of teacher development. He indicated that self-inquiry and critical thinking can help teachers move from a level where they may be guided largely by impulse, intuition, or routine, to a level where their actions are guided by reflection and critical thinking.

In recent years, educational technology has gained a noticeable place in the revolution of education, offering more choices for both learners and teachers and also cause pliability in the context of teaching and learning. Tomei (2002) defined educational technology as "the application of behavioral and physical sciences concepts and other knowledge to the solution of problems". Through applying technology pedagogical, educational occasions enhanced which cause to empower instructor to have sufficient time for arrangement, planning of teaching and so meet the requirements of the students. Moreover he stated that teacher's use of technology in the context of the teaching leads to involvement of learner's utilization of technology and also it assists students to attend to the relationship between what the instructor is teaching and the technology being employed. So, the perception of learners regarding learning is increased, which

in turn, result in making them ready for technology based- society (Majed, 1996). In a study, Yang (2009) investigated the application of blogs as a reflective device in the instruction processes of English as Foreign Language (EFL) student teachers, who wanted to learn to teach English for future development in Taiwan. The findings of the study revealed that participants regarded technology a beneficial tool for reflecting and contacting, talking with each other. The study also pointed out positive remarks regarding the application of blogs as a means to offer and enhance critical reflection of EFL teachers.

In another study, Insuasty and Zambrano castillo (2010) sought to explore how student teachers' using journal keeping and blog group discussions could enable them to become more reflective practitioners. The findings of the study indicated that student teachers increased their understanding regarding what reflective teaching said implicitly and most of their journal entries mainly emphasized on assessing teaching, identifying and solving difficulties, demonstrated reflective origins as well. In another research by Sardegna and Dugartysreenova (2014) the researchers sought to determine pre-service foreign language teachers' (N=425) attitudes about the importance and helpfulness of utilizing technology-increased activities (discussion forums, blogs, wikis, e-portfolios, videotape recordings) in a method course, and their comprehension regarding how these activities improved their learning. Participants had an idea that the technology-oriented activities offered enhanced occasions to have a more rich and different. Interactions, peer feedback, reflection and promoted a deeper understanding as well as greater realization of the value of technology-enhanced practices.

Hajizaedeh (2011) examined the effect of blog on reflective practice of male and female Iranian college students. Forty students kept voluntary blogs in their free time throughout a semester participated in the study. The students usually wrote about everyday activities, but they also used their blogs to write their reflections about their language learning. The findings suggest that blogs could be one tool for teachers to use in order to encourage students to reflect on their learning.

STATEMENT OF THE PROBLEM

Reflective teaching and technology are two important issues in educational environments in general and EFL contexts in particular. Reflection in general and "Reflective Pedagogy" in particular are the missing elements of Iranian academic realm. Iranian academic realm entails both university and institute contexts. Both contexts assist learners to develop English professionally as a foreign language. There have been few research on these issues in a variety of EFL contexts, and also have received little attention in two Iranian sub context. Furthermore, most studies conducted on technology in language teaching in Iran, have concentrated on the use of instructional technology to enhance learning quality and strengthening related variables as well as student's reflective thinking and reflective learning. Given the above options, it seemed necessary to conduct such as study in Iran which assists instructors how to applying reflective teaching and using educational technology to enhance efficiency of their teaching practices and promote reflection on teaching as well.

RESEARCH QUESTIONS

- 1) Could instructors' reflective teaching be related to their educational technology use in Iranian EFL sub-contexts?
- 2) Is gender related to instructors' reflective teaching and technology use?

METHODOLOGY

Participants

The participants of in this study consisted of 100 male and female EFL instructors including 50 EFL instructors teaching English at the department of English in Azad University branches in Shiraz and some surrounding towns and 50 EFL teachers teaching English in advanced levels in Iran Language Institute. The instructors were arranged based on their rank in the university, namely professor, associated professor, assistant professor and lecturer. Purposive sampling was used in this survey.

Instruments

The necessary data for this study gathered by means of questionnaire on reflective teaching and use of educational technology. The questionnaire was designed by the researcher with respect to the requirements of answering the stated research question. As it was mentioned before, the researcher worked on data to be collected with questionnaire among instructors at the variety of Azad University branches and teachers at the Iran Language Institute. The questionnaire considered of 44 questions and consisted of two parts. The first one is related to personal attitudes, and the second is allocated to questions centering upon the application of reflective teaching, educational technology, and considering both issues. A five-point Likert type scale has been designed. The five options "never", "seldom", "sometimes", "frequently" and "quite frequently" was designed to scale the participants' responses in a multiple-choice test format. Each response has its point ranging from 1= never to 5= quite frequently (see the questionnaire in the appendix).

Procedures

data collection procedures

100 EFL instructors including 50 EFL instructors teaching English at the department of English in Azad University branches in Shiraz and some surrounding towns and 50 EFL teachers teaching English in advanced levels in Iran Language Institute took part in this survey during the academic year of 2013 within 4 months. Participation was voluntary and no remuneration was suggested. The data were collected from the questionnaire and utilized for SPSS. Before, the above mentioned questionnaire was given to each teacher, they were asked to fill out the questionnaires in all honesty and meticulously since their careful completion would definitely contribute to obtaining real data which is crucial for more accurate findings and the information would be kept confidential. Respondents answered the questions in two parts: In part A they filled up their demographic details such as gender, current level of study, program of study. In part B respondents indicated their reflective teaching and use of technology.

Data analysis procedures

To analyze the data the statistical package for the social science (SPSS) Version 16 were utilized. Also, researcher used descriptive and inferential statistics. In the descriptive part frequency, percentage, mean and standard deviation were utilized to indicate the demographic details. In the inferential statistics to determine the differences between use of technology and reflective teaching based on gender in these two sub context an independent sample t-test was run. To determine the correlation between instructors reflective teaching and use of technology the Pearson correlation coefficient was employed.

RESULTS AND DISCUSSION

Following the main objective of the study, the first research question was set out to explore whether there was any relationship between instructors' use of technology and their reflective teaching in the two Iranian teaching sub contexts on the whole, and in each context separately. The Pearson Correlation Coefficient was used to examine this relationship. The results are tabulated in tables below.

Table 1: Pearson Correlation Coefficient between reflective teaching and technology in the two Iranian teaching sub contexts on the whole

Independent Dependent		Technology
Reflective teaching	Correlation	0.906
	sig	0.000

As indicated by the results presented in table 1, the correlation coefficient was calculated to be 0.906, which is highly significant. The findings show that there are positive and direct significant relationships between technology and reflective teaching. Therefore, in both teaching sub context as a whole, the more the EFL instructors used technology, the more reflective teaching will be and vice versa.

Table 2: Pearson Correlation Coefficient between reflective teaching and technology in institute context

Independent Dependent		Technology
Reflective teaching	Correlation	0.878
	sig	0.000

Given the data in the table 2, the results of Person Correlation Coefficient is also positively and highly significant as well. Results indicate that technology is significantly and positively correlated to reflective teaching, i.e. considering institute context, increasing in using technology contributing to enhancing reflective teaching and reversely.

Table 3: Pearson Correlation Coefficient between reflective teaching and technology in university context

Independent Dependent		Technology
Reflective teaching	Correlation	0.928
	sig	0.000

Table 3 indicates that the relationship between technology and reflective teaching was again positive and highly significant. This revealed that in the context of the university, EFL instructors who used more technology achieved higher level of reflective teaching and vice versa.

The second research question was referred to investigate whether gender had any effect on technology and reflective teaching use respectively. First in the context of the university and in that of institute on the whole, and then individually in per of them. Using an independent sample t-test intended to determine whether the two variables are influenced by gender. The findings are depicted in the following tables.

Table 4: Difference of educational technology use by EFL university professors and institute teachers based on the gender in the two Iranian teaching sub contexts on the whole

Gender	N	Mean	Std. Deviation	T	Sig
Male	57	3.45	0.54	0.95	0.343
Female	43	3.34	0.52		

The results displayed in the above table indicate that on the whole, in spite of the fact that the mean scores of male group were slightly more than the female ones. This showed a relatively more technology use by male group. However, analysis of an independent t-test revealed that these results were not statically significant (as shown in table 4).

Table 5: Difference of educational technology use by EFL university professors and institute teachers based on the gender in institute context

Gender	N	Mean	Std. Deviation	T	Sig
Male	21	3.27	0.65	-0.64	0.522
Female	29	3.37	0.39		

Regarding the findings given in table 5, although the mean score of the male group, compared to that of female, was found more, i.e., the use of technology by male group was partly more than the female ones in institute context. Yet, this partial difference was insignificance as well.

Table 6: Difference of educational technology use by EFL university professors and institute teachers based on the gender in university context

Gender	N	Mean	Std. Deviation	T	Sig
Male	36	3.55	0.43	1.53	0.132
Female	14	3.29	0.73		

The data presented in table 6, considering the mean scores of both female and male groups, despite that of male group were higher than that of female, That is, in compassion by female the males' application of technology was slightly higher. However, Findings reveal no significant difference between male and female groups regarding using technology in the context of university.

Table 7: Difference of reflective teaching use by EFL university professors and institute teachers based on the gender in the two Iranian teaching sub contexts on the whole

Gender	N	Mean	Std. Deviation	T	Sig
Male	57	3.55	0.51	1.28	0.203
Female	43	3.41	0.59		

Despite the fact that the mean score of the male group was relatively more in compassion with female one, the independent samples t-test results in Table 7 illustrates no significant difference between the two groups of instructors regarding the use of reflective teaching in their class management.

Table 8: Difference of reflective teaching use by EFL university professors and institute teachers based on the gender in institute context

Gender	N	Mean	Std. Deviation	T	Sig
Male	21	3.46	0.59	0.56	0.572
Female	29	3.37	0.44		

Table 8 shows that even though the mean score of the female group was little more than the female one, there are non-statistically significance differences between the mean scores of the both groups as regards using reflective teaching in institute context.

Table 9: Difference of reflective teaching use by EFL university professors and institute teachers based on the gender in university context

Gender	N	Mean	Std. Deviation	T	Sig
Male	36	3.60	0.45	0.67	0.505
Female	14	3.48	0.82		

As above table demonstrates, comparing the mean scores of the male group with that of the female one showed that male instructors had more tendencies towards reflective teaching. However, the observed difference between the gender groups was not significant.

Discussion

The present study aimed at broadening our understanding of the implication of reflection and reflective teaching practices and the efficiency of educational technology and addresses the question of whether the Iranian EFL instructor's use of educational technology tools could lead to enhance and facilitate reflective teaching practices. Reflection and reflective teaching considered as important and significant factors in teaching context in both public and private university. Educational technology can also significantly affect teaching and teacher's effective practice

inside classroom. Based on the findings of the present research on one hand reflective teaching assist instructors to make connection between theory and practice and also enhancing the efficiency of teaching practices, on the other hand applying educational technology also boost the effectiveness of teaching practices. In addition through applying educational technology teachers can reflect on their teaching and if necessary make any modification on the instruction or strategies of teaching. The present findings are in line with the previous research which showed that university teachers considered technology- increased such as activates useful for binding theory and practice, improving thinking critically, and enhancing professional development activities and for promoting reflective practice as well (Sardegna and Dugartysreenova, 2014; Yang, 2009). Broadly speaking, since education moves progressively towards the promotion of efficacy of teaching, use of educational technology was a necessity in the context of teaching in general and reflective teaching in particular. Iranian EFL instructors appreciate the status of technology along with other aspects of teaching. Reflection is also crucial in teaching therefore this new methods of teaching is developed increasingly as well in Iranian academic realm.

CONCLUSION

The purpose of this study was to investigate the relationship between Iranian EFL instructors' use of educational technology and reflective teaching. The results indicated that there is a high and positive correlation between these two variables. It is self-evident that technology played an important role in teaching and reflective teaching as well. The application of educational technology assist teacher to increase the productiveness of teaching practices and instructional strategies. While technology is of high significance in the context of teaching, the need for reflection is also have significant role to promote the effectiveness of teaching. In light of this technology can significantly benefit teachers to reflect on their teaching and analyze, examine their instruction, methods, lesson plan, and students to make rational decision and also make any necessary changes in the context of teaching.

Limitations of the study

The present research has some limitations preventing it to propose completely developed as goes with other similar studies.

1. The researcher could not check if the reflective participants pursue the reflection principles knowingly or just by their insights, because the reflectivity status of the teacher was showed by a questionnaire .In other words the researcher could not conduct interviews for data collection triangulation purposes due to non-availability of the participants.
2. As the teachers did not cooperate in collecting research data through questionnaire, the researcher spent much more time for about four months in gathering research data.

ABSTRACT

This study was an attempt to seek the impact of scaffolding on reading comprehension ability of intermediate EFL learners. To fulfill this purpose, 60 language learners studying English at Parto institute, in Tehran, Iran were considered as the participants. Participants including males and females between 20 to 50 years old were divided into four classes and each two classes formed one of the experimental groups. After assuring of the homogeneity of students through a pre-piloted Preliminary English Test (PET) in terms of their English proficiency in general and reading comprehension in particular, scaffolding strategy (question answering) was applied for one group and scaffolding strategy (question generating) was used for the other group. After running the classes, a pre-piloted reading section of another PET test was administered to both experimental groups as the posttest. The data analysis showed there was not any significant difference between the effect of the two scaffolding strategies (question generating and question answering) on reading comprehension of EFL learners. Results of this study have implications for language learners, helps the learners' autonomy and independence in learning and keeps students on task, and for language teachers, guide students to have more collaboration, discussion, group work, get learners engaged in learning by both initiating & sustaining their interest.

KEYWORDS: Scaffolding, Reading, Reading Comprehension, Question Answering, Question Generating

INTRODUCTION

According to Farhady (2005), "Reading is one of the most useful and necessary skills for daily life. People usually read because they want to obtain information about a specific subject" (p. 1). Farhady further maintains that there are various purposes for reading such as getting facts, exchanging ideas, enjoying leisure time, or expressing feelings. Therefore, most people obtain

new information or ideas through the process of reading. " Given the importance of reading in our daily lives, there is little wonder why assisting English language learners in understanding reading comprehension texts has always been a major preoccupation for reading researchers and teachers" (Baleghizadeh, 2011, p.1669).

According to Alexandar (1996), instruction can be effective in providing learners with a repertoire of strategies that promote comprehension monitoring and foster comprehension. For students to become motivated strategic strategy users, they need "systematically orchestrated instruction or training". (Alexander, 1996; Kasper, 2000; Singhal, 2001; Van Wyk, 2001) believe that in order to meet the reading needs of students within the 21st century, educators are pressed to develop effective instructional means for teaching reading comprehension and reading strategy use. Rosenshine and Meister (1992 cited in Larkin, 2002) state that A very useful strategy to optimize student learning is scaffolding which provides a supportive environment while facilitating student independence. Scaffolding is a process in which students are given support until they can apply new skills and strategies independently.

Thus, this study aimed to investigate the comparative effect of two scaffolding strategies, question answering and question generating on EFL learners' reading comprehension.

Due to the shift in the nature of teaching methodologies towards student's self centeredness in learning situations, the professionals are constantly seeking for implementing teaching methods to shift the responsibility of learning task to learners. Among many strategies, in this regard scaffolding is one of the principles of effective instruction which enables teachers to accommodate individual needs. Scaffolding is a metaphor to describe the type of help offered by an expert (such as a tutor or parent) to support a student to carry out the task that the student is initially unable to accomplish independently (Wood, Bruner, & Ross 1976).

The researcher as an EFL teacher and learner, has noticed EFL learners' struggle to cope with comprehending a written passage, and has been on the look for a way or technique to facilitate the task. Having this objective in mind the researcher decided to apply scaffolding strategies to help the learners to improve the reading comprehension abilities. But, in spite of the existence of numerous scaffolding strategies in this field, no research has been done to the best of the researcher's knowledge to investigate the comparative effectiveness of question answering and question generating to reveal the privilege of one strategy over another in improving reading comprehension of EFL learners. Therefore, the present study was an attempt to investigate which one of the scaffolding strategies would improve the learners' reading comprehension more.

Scaffolding

Benson, (1997 as cited in Lipscomb, Swanson, West, 2004) stated that, scaffolding was developed to describe the type of assistance offered by a teacher or peer to support learning. In the process of scaffolding, the teacher assists the student master a task that the student is initially unable to do it independently. The teacher helps with only those skills that are beyond the student's capability. Allowing the student to complete as much of the task as possible is an important point of scaffolding. Teacher only helps the student with tasks that are just beyond his current capability. Student errors are expected, but, with teacher feedback, the student is able to

achieve the task. When the student takes responsibility for the task, the teacher begins the gradual removal of the scaffolding, which allows the student to work independently. He continues that Scaffolding is actually a bridge used to build upon what students already know to arrive at something they do not know.

Reading comprehension

Reading comprehension is the act of understanding what you are reading. "Reading comprehension is an intentional, active, interactive process that occurs before, during and after a person reads a particular piece of writing"(Brummitt-Yale, 2008 p.2). Papalia (2006) also believes that "Reading comprehension entails more than knowledge of vocabulary and syntax. It also requires ability to perceive the exact nature of the passage being communicated-a deeper form of understanding sometimes called 'reading between the lines'. "Students must learn to detect mood and intentions as well as factual detail" (p.74).

According to Snow (2002), "reading is a process of extracting and constructing meaning through interaction and involvement with written language". (p.11)

Reading

Similarly Hughes (2007) says that reading is a complex interaction between the text, the reader, and the purposes for reading, which are shaped by the reader's prior knowledge and experiences, the reader's knowledge about reading and writing language and the reader's language community which is culturally and socially situated

Question generating (QG)

It is the purposeful posing and answering of questions about what is read especially to make inferences or uncover details (why, what, where, when, etc) and specific information needed to deeply analyze the body of knowledge process (Researchprécis, 2004). According to the "Generating Question"(2007), the generating questions strategy involves requiring students to read a specific text to create questions and elicit important information from the passage, and answer their questions.

Asking students to create their own questions about a reading passage encourages them to read more actively and helps them to focus their attention on key ideas.

Question answering (QA)

According to Raphael (1986), it is a reading comprehension strategy that was developed to "clarify how students approach the tasks of reading texts and answering questions"(p.206-221).It encourages students to be active, strategic readers of texts (Raphael, 1986)

Raphael (1986) continues that,Question Answer Relationship (QAR) is a useful tool in providing a basis for three comprehensionstrategies: locating information, determining text structures and how theyconvey information, and determining when an inference would be required. It initially helps children understand that information from both texts andtheir knowledge base. It helps students search for key words and phrases tolocate the appropriate information for answering

questions. Finally, QARshelp students recognize whether or not information is present in the text and, if not, that it is necessary to read between or beyond the lines to answer the question. Raphael, T.E., & Au, K.H (2005 cited in "The Reading Teacher", 2005) described that how Question Answer Relationships can provide a framework for comprehension instruction with the potential of closing the literacy achievement gap. According to the site "Reading Rockets", there are some steps in order to help students make use of QAR:

➤ *Right There Questions, Think and Search Questions, Author and You, On My Own*

RESEARC QUESTION AND HYPOTHESIS

Question: Is there any significant difference between the impact of question answering and question generating on EFL learners' reading comprehension?

Hypothesis: There is no significant difference between the impact of ' question answering and question generating on EFL learners' reading comprehension.

METHODOLOGY

Participants

Sixty Iranian intermediate students of Parto Institute, in Tehran were non-randomly selected to participate in this study. The participants formed intact groups including males and females between 20 to 50 years old were divided into four classes and each two classes formed one of the experimental groups.

Instrumentation

To accomplish the purpose of the study, the following instruments were utilized:

PET Test

Preliminary English Test was administered to assess the language ability of the participants. In this study, the sample of the test which was used included three sections of reading, writing, and listening. The reading section of this language proficiency test had 35 items. For the writing section, there were three parts including five sentence transformation items in the first part and in the other two parts, students were required to write one essay for each part; in other words, in the second part students were required to write a short communicative message about 35-45 words, and for the third part, they were required to write a longer piece of continuous writing about 100 words. The allotted time for the PET reading and writing parts was one hour and 30 minutes.

In the listening section, students were required to answer 13 three-option multiple-choice items and six filling-the-gap items and six true/false items. The allotted time for the PET listening part was 30 minutes. It is necessary to mention that with the aim of saving time, the researcher used only reading, writing, and listening parts of the PET. Moreover, the main focus of the study was reading comprehension, thus the speaking section was not administered in this study.

Therefore, the Reading section had 35 marks, listening section had 25 marks

The writing section had 25 marks. The total mark was out of 85. Before the main administration, the test was piloted on 30 students at intermediate level with the same characteristics of the target sample. The item characteristics including IF and ID were calculated. Items with item facility beyond 0.67 and below 0.33 and items with discrimination value below 0.4 were eliminated. Reliability estimated 0.82. There were 3 malfunctioning items and were excluded, two questions in reading and one in listening. After removing malfunctioning items the reliability was estimated as 0.84. The allotted time for answering the remaining 62 items and the two tasks of writing was two hours.

The first section of the writing was rated according to the writing scales of PET test. The writing sections 2 and 3 of the test were rated by two different raters, the researcher and another trained instructor and to make sure of the consistency between the two raters the inter-rater reliability was estimated ($r=.466$, $p=.009<.05$ for writing part 2 and $r=.654$, $p=.000<.05$ for writing part 3). Therefore, the mean of the two raters' scores for each individual was estimated for further analyses.

Pre-treatment test

The revised PET test was administered and the PET reading scores of the two groups of learners were compared to make sure that they were the same with respect to their reading comprehension ability before the start of the study.

Post-test

In order to check the improvement of reading comprehension of the participants after receiving scaffolding strategies instructions in reading, the learners were given another version of PET reading comprehension test. But prior to the administration of the post test, it was piloted on 30 learners who were similar to the main sample, and item characteristics were probed and reliability was 0.72, as the result four malfunctioning items were deleted from the test and the reliability turned out to be 0.75.

Procedure

This study was composed of a pilot study and a main study. In the pilot study the PET test was administered on 30 EFL learners with similar characteristics to the main sample. The purpose of the pilot study was to determine item characteristics as well as the reliability and gain some insight about the problems that the participants might encounter in the test administration. Also, another version of a PET reading test was piloted on a similar group of learners.

In the main study there were five stages. In the first stage the PET test was administered to ensure the homogeneity and assess the language proficiency of the participants in both classes. Then the reading scores of two groups were calculated and compared by Mann-Whitney U test, to make sure that the two intact groups were homogeneous regarding their general English proficiency in general and their reading comprehension proficiency in particular.

In the third stage, the treatment stage, the participants in the two groups received different treatments within 10 sessions; therefore, in one group question answering, and in another group,

question generating techniques were practiced every session. In the fourth stage, after 10 sessions of treatment there was a reading post –test, in order to reveal any possible improvement in reading comprehension abilities of the learners after receiving instruction in both groups. Thus the learners took a reading test which was piloted before. In the fifth stage, to determine whether there was any significant difference in reading ability of the learners, hence comparing the effect of the two treatments on the reading achievement of the learners, a t- test was conducted to reveal the significance of the difference between the two groups' mean scores.

The Treatments

Treatment in Question answering group

There were 30 intermediate male and female students in the first group. The condition of both groups regarding the time of the class (90 minutes) and the course book of the Institute (Four Corners 3) were the same. Four Corners 3 included 12 units with four integrated skills in which three units were being taught during 15 sessions of the class .Therefore, three reading sections of the units (1 to 3) followed by questions were being taught during the term as one of the practical sources. The teacher also taught some texts from Interchange2 (2005) which contained 16 units with four integrated skills but teacher just taught units (8, 9, 13) followed by some questions. She selected three short stories (p. 6, 8, 18, 22) with exercises from 'Steps t Steps to Understanding' to work on as the practical source during 10 sessions of treatment. All these sources were appropriate for intermediate level. In order to work on a Question answering strategy the research taught texts through the following steps:

For the first step in the first session, the teacher allocated 60 minutes

For introducing the Question Answering strategy explained that questions could be part of the reading lesson and previewing questions could help students focus on reading, then in order to show the relationship of questions to answers she hung a large chart in the class and introduced it to the students. She modeled how each level of QAR could be identified and answered. She said Questions on the chart were divided into four categories as follow and explained the definition for each category:

Right There: the answer is found in the text, usually as a phrase contained within one sentence.

Think and Search: while the answer is in the text, the student is required to combine separate sections or pieces of text to answer the question.

Author and You: as the answer is not directly stated in the text, the student draws on prior knowledge as well as what the author has written to answer the question.

On Your Own: requires students to think about what is already known from their reading and experience (prior knowledge) to formulate an answer (Rafael, 1982)

As the second step the teacher gave each student one copy of the text from the Interchange 2 and modeled the sample for the class. First she read the text aloud for students, then she read question aloud for the class and underlined the keywords of the questions .Finally, she read the text again in order to find the answers. She taught how to answer the questions according to Question Answering strategy depicted in the chart, explained each question and each answer in details according to the chart, categorized the questions and justified why each question related to

In the second and third sessions of the class teacher reviewed the strategy and asked students to work on another text in small groups to write different questions within the group, then they read aloud their answers for the class. The teacher corrected their answers and explained the category of the QAR for each question, gave them some feedbacks, examples or any explanations needed. For the other 7 sessions, students were exposed to different texts from Interchange 2 by Richards (2005), Four corners 3 by Richards and Bohlke (2012) and some texts that she selected from 'Steps For Understanding' by Hill (2005) as the practical source and were supposed to do the task independently by adopting Question Answering strategy on different samples as mentioned before and if necessary the teacher gave more explanations and clarifications of the answers.

Question generating

There were 30 intermediate male and female students in the first group. The condition of both groups regarding the time of the class (90 minutes) and the course book of the Institute (Four Corners 3) were the same. The Four Corners 3(2012) included 12 units with four integrated skills in which three units were being taught during 15 sessions of the class. Therefore, three reading sections of the units (1 to 3) followed by questions were being taught during the term as one of the practical sources. The teacher also taught some texts from Interchange2 (2005) which contained 16 units with four integrated skills but teacher just taught units (p. 8 , 9,13) followed by some questions. She selected three short stories (p. 6, 8, 18, 22) with exercises from 'Steps to Understanding' to work on as the practical source during 10 sessions of treatment.

For the first step of the first session in the second group, the researcher introduced the Question Generating strategy in 60 minutes.

She gave a text from Interchange 2 to each student, she modeled the text as she wrote the title of the passage on the whiteboard and asked students to think about the title that left them with unanswered questions, and sometimes she suggested a question such as what does the title show? What does it refer to? She then encouraged students to raise more questions about the title. On the second step, the teachers explained that for a better understanding of the events or story's characters and improve comprehension; the reader should ask questions as s/he reads (during reading). Then she directed them to a text and read the text aloud and modeled questioning process as she was reading it sentence by sentence, she made different questions and wrote them on the board and asked the students to add any questions of their own, during which she made comments on those parts of the story that contained the answers to the questions. While making questions students might have some difficulties, teacher helped them to make correct forms. On the next step the teacher had students share the text they read in small groups and encouraged them to discuss some of the unanswered questions they made in their mind such as why a particular character made that decision or what would have happened to the character if the story had continued. They could also finish the story or text as they liked or guessed. As she finished all the steps and students understood the strategy, she asked them to remember this strategy for the next sessions.

In the second and third sessions of the class teacher reviewed the strategy and asked students to work on another text in small groups to write different questions within the group, then they read aloud their answers for the class. The teacher corrected their questions, gave them some feedbacks, examples or any explanations needed.

For the other 7 sessions, students were exposed to different texts from Interchange 2 by Richards (2005), Four corners 3 by Richards and Bohlke (2012) and some texts that she selected from 'Steps For Understanding' by Hill (2005) as the practical source and were supposed to do the task independently by adopting Question Generating strategy on different samples as mentioned before and if necessary the teacher gave more explanations and clarifications of the answers.

RESULTS AND DISCUSSION

This study was an attempt to explore the comparative effect of scaffolding strategies on EFL intermediate learners' reading comprehension.

The reliability after removing three malfunctioning items turned out to be as high as .84

Table 1: Inter-rater reliability for PET writing scores
(Pearson Correlation)*

	Writing1 (Rater1)	Writing1 (Rater2)
Writing1 (Rater1)	1.00	.466**
Writing1 (Rater2)	.466**	1.00

*N=30

** . Correlation is significant at the 0.01 level (2-tailed).

	Writing2 (Rater1)	Writing2 (Rater2)
Writing2 (Rater1)	1.00	.654**
Writing2 (Rater2)	.654**	1.00

*N=30

** . Correlation is significant at the 0.01 level (2-tailed).

As shown in Table 1, the correlation between the two raters' writing scores part 2 turned out to be significant ($r=.466$, $p<.01$).

The correlation between the two raters' writing scores part 3 turned out to be significant ($r=.65$, $p<.01$).

Table 2: Descriptive Statistics of the pretest reading scores

	N	Mean	Std. Deviation	Skewness		Skewness ratios
	Statistic	Statistic	Statistic	Statistic	Std. Error	
QApretest	30	26.83	1.931	.099	.427	.23
QGpretest	30	27.33	2.23	-1.246	.427	2.9

As shown in Table 2, the skewness ratio for the QG exceeds the normality range of ± 1.96 , hence the normality condition was violated, and the non-parametric Mann-Whitney U test was run instead. The following graphs show the distribution of the pretest scores:

Figure 1: Histogram representing the QA pretest scores distribution

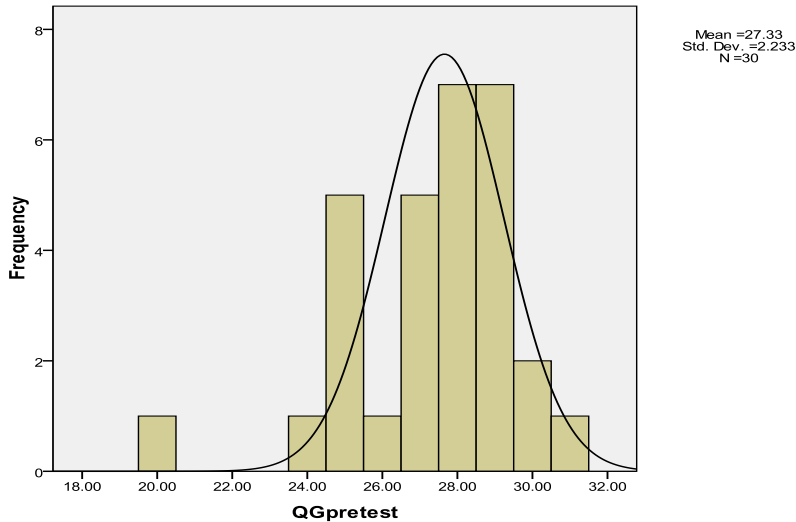

Figure 2: Histogram representing the QG pretest scores distribution

The following tables were generated to compare the pre-test scores through Mann-Whitney U test:

Table 3: Ranks of the pretest scores

	grouping	N	Mean Rank	Sum of Ranks
reading pretest	QA	30	27.78	833.50
	QG	30	33.22	996.50
	total	60		

As Table 3 shows, QG group gained a higher mean rank compared with the QA group. The following table shows the significance of this difference:

Table 4: Mann-Whitney test on the pretest scores

	Reading pretest
Mann-Whitney U	368.500
Wilcoxon W	833.500
Z	-1.220
Asymp. Sig. (2-tailed)	.223

a. Grouping Variable: grouping

As Table 4 shows, the difference between the two groups' reading abilities turned out to be non-significant at the outset ($M=368.5$, $p=.223>.05$). Therefore, the homogeneity of the learners with respect to their reading comprehension prior to the treatment was ensured.

Before administering the posttest, another version of the PET reading test was piloted on 30 subjects with similar characteristics of the main sample. Then item characteristics were calculated and items with facility index beyond 0.67 and below 0.33 and items with discrimination value below 0.4 were eliminated, as a result 4 items were found to be malfunctioning and were removed from the test Reliability of the test turned out to be 0.72,, and then the reliability was estimated at 0.75 shown in the following table:

Table 5: Reliability Estimates of the post test before and after Removing Malfunctioning Items

	Number of Participants	Number of Items	CronbachAlpha
Before Removing Malfunctioning Items	30	35	.72
After Removing Malfunctioning Items	30	31	.75

To test the null hypothesis, a t test had to be run between the two groups' posttest mean scores. But, firstly the normality condition had to be checked:

Table 6: Descriptive Statistics of the posttest scores

	N	Mean	Std. Deviation	Skewness	Skewness ratios	
	Statistic	Statistic	Statistic	Statistic	Std. Error	
QA posttest	30	26.9333	1.98152	.355	.427	.83
QG posttest	30	27.6333	1.69143	-.155	.427	.36

As shown in Table 6, both sets of scores were normally distributed as the skewness ratios were both within the normality range of ± 1.96 . Therefore, a t test was legitimate to run. The following tables show the result thereof:

Table 7: Group Statistics of the posttest scores

	grouping	N	Mean	Std. Deviation	Std. Error Mean
reading posttest	QA	30	26.93	1.98	.36
	QG	30	27.63	1.69	.31

As Table 7 depicts, Question Generating gained a higher mean score compare with Question Answering .The following table shows if this difference was significant:

Table 8: Independent Samples Test on the posttest scores

		F	Sig.	t	df	Sig. (2- tailed)	Mean Differences	Std. Error Differences	95% Confidence Interval of the Difference	
									Lower	Upper
Reading posttest	Equal	1.37	0.24	-1.47	58	0.147	-0.07	0.48	-1.65	0.25
	Equal variance not assumed			-1.47	56.605	0.147	-0.07	0.48	-1.65	0.25

As displayed in Table 8 the variances of the two sets of scores turned out to be homogeneous ($F=1.36$, $p=.24>.05$). Therefore, with this assumption met, the first row of the table was referred to in order to see the result of the t test. As the sig value under t test turned out to be .147, larger than .05, it is concluded that the two groups were not significantly different in their posttest performance. Hence, the null hypothesis failed to be rejected.

The following bar graph visually shows the mean scores of the two groups on the posttest:

Figure 3: Bar graph representing the post test means scores of the two groups

The application of statistical analyses revealed that the learners did not improve from these two strategies and there was no significant difference between the effectiveness of question answering and question generating in promoting learners' reading comprehension. The results are in line with findings of (Fadakar, 2013) who investigated the impact of scaffolding on reading comprehension ability of intermediate EFL learners and found that scaffolding had no significant effect on the reading comprehension of intermediate EFL learners. However, These results are in contrast with a number of researchers' findings who confirmed that scaffolding strategies enhance reading comprehension of the learners (Martin & Rose, 2007; Dorkchandra, 2013; Hui-Chin Yeh & Pei-Yi Lai, 2012; in Humphries, 2011-2013; Hui-Chin Yeh & Pei-Yi Lai, 2012; Johnson, 2014; Wagoner, Smith, 2014). Also, here is another research by Hemmati and Bemani (2013) who worked on Comparing Effect of 'Summarizing', 'Question-Answer Relationship', and 'Syntactic Structure Identification' on the Reading Comprehension of Iranian EFL students and revealed that QAR strategy led to better comprehension of reading texts which is in contrast with the researcher findings.

On the whole, this study revealed that scaffolding in its general sense did not affect students' reading comprehension which runs counter to the research conducted by Martin and Rose (2007) in which they applied scaffolding strategies for teaching reading and writing and achieved spectacular improvements in student outcomes.

It is needless to say that although comprehension is accepted as a process which is time-consuming and difficult to master, readers are not reading unless they comprehend (Haji Maibodi, 2008) which in turn calls for motivation. Therefore, one can ponder over issues such as what kind of texts teachers use in the classroom, how they create reading purposes for those texts, and in what ways they encourage students to read those texts.

The researcher agreed with what Yen-Chi Fan (2010) mentioned in his research that although implementing comprehension strategy instruction for one semester may help learners adopt some

degree of strategic reading behaviors, but it takes long-term efforts and practices for EFL learners to fully develop their strategic reading abilities. Walqui (2006) added in "Scaffolding Instruction for English Language Learners" that for our English learners we need to use scaffolding strategies more extensively, continuously building scaffolds as the need arises, and we need to communicate their purpose and uses to students. While for the native speaker two tasks may be sufficient to understand and practice a concept, the English Language Learner may need four or five different tasks to achieve similar competence. It will take teachers of English Language Learners longer to teach their units, and they may not be able to teach as much in terms of detailed content.

The researcher found these two strategies useful and motivating for learners but she came to the conclusion that as (Haji Maibodi, 2008) mentioned, it is very time-consuming and difficult to master them especially in classes in which teachers have time limitations, but she believes scaffolding improves learners comprehension if teachers make use of these strategies more than 10 sessions to master its techniques, sure more signification will turn out.

Based on the procedure adopted in this study, the researcher speculates that even more than 10 sessions of instruction may have been needed to improve the learners' reading comprehension significantly and/or to reveal a difference between the impact of the two strategies of scaffolding.

CONCLUSION

This study tried to investigate the effect of two scaffolding strategies on intermediate EFL learners' reading comprehension. In order to do this, 60 students who were in four intact classes were assigned into two experimental groups.

After the instructional period through which one experimental group received scaffolding question answering reading strategy and another experimental group received question generating strategy, both groups took a reading posttest. The comparison of their mean scores revealed that there was not any significant difference between students' Question Answering strategy and Question Generating strategy on Reading comprehension of EFL learners'.

RR

Limitations

Certain limitations were imposed on this study. First, the age and gender of the participants were a source of difference because students were not exactly at the same age or the same gender since the institute where the study was carried out had a co-educational system. Therefore, generalization of this study to other age ranges in communities of EFL learners would not be appropriate without further research.

Second, there were limited numbers of students in each class in the institute; therefore, teacher should have at least four classes in order to have enough sample size for this study. This division which was imposed on the researcher might have had an influence on the outcome of the study as the classes were not held at the same hour.

ABSTRACT

This study explored the effect of employing smart board in enhancement of English as Foreign Language (EFL) learners' speaking and listening skills. Forty lower-intermediate EFL students were selected from Kashmar, Iran. They were assigned to control and experimental groups. Participants in experimental group were provided with a smart board as a teaching tool while those in the control group were taught using a traditional white board. Smart board was found as an effective tool in educational contexts which can significantly influence learners' academic performance and autonomy. These results provide pedagogical implications for utilizing smart board as an effective educational tool in EFL contexts where technology will replace traditional teaching techniques and even teachers; as a result autonomous EFL students will learn independently from their teaches.

KEYWORDS: autonomy, test battery, smart board, digital pen.

INTRODUCTION

Background

Speaking and listening are categorized as oral communicative skills which are considered of great importance in the contexts of English as a foreign language (EFL). Since the main purpose of learning a foreign language is communication, searching for new techniques which help learners enhance their oral skills, listening and speaking is important (Khosravani, Khosravani & Ganji Khoosf, 2014). Several techniques and tools have been introduced and employed in EFL settings in order to enhance students' speaking and listening skills. With the advent of technology

EFL contexts have experienced significant changes. Technology has changed every aspect of human life in general and his/her foreign language learning (FLL) process, in specific. According to Haider and Chowdhury (2012), the emergence of Computer Assisted Language Learning (CALL) has resulted in significant changes in the arena of language teaching and learning starting from the use of innovative learning materials to the widening of interaction patterns among a huge and diverse community of learners. There have been arguments with respect to the advantages and disadvantages of CALL, though the trend of employing computer assisted tools in language teaching is increasing throughout the world (ibid). CALL has played a key role in personalizing education (Ghalami Nobar & Ahangari, 2012). Only when learners are able to take benefit from each learning opportunity rather than simply responding to different stimuli from the teacher can they be skilful manipulators of language in their language learning process (Ying, n.d.). The situation demands the urgent need of enhancing learners' initiatives and learner autonomy (ibid). Schmenk, (2005) states that: 'The popularity of learner autonomy may be at least partially related to the rise of computer technology and the growing importance of computers in language learning environments worldwide' (P.107).

Hence due to the popularity of computer use in EFL contexts the present study aims at exploring the effect of CALL on Iranian intermediate EFL learners' task-based listening speaking and autonomy.

REVIEW OF LITERATURE

Haider and Chowdhury (2012) conducted a study based on a survey of the Communicative English Language Certificate (CELC) course run by the Foreign Language Training Center (FLTC), a project under the Ministry of Education, Bangladesh. Their study was done on 425 learners who had completed the CELC course at the selected four centers of FLTC. According to the findings obtained by these two authors it can be concluded that the FLTC project is doing a creditable task by offering quality English language teaching employing Computer Assisted Language Learning (CALL) facilities to the learners of Bangladesh. This study also manifests some weaknesses of the program delivery, teaching approaches and learning support. Some of these problems are not surprising because the program was still evolving and experiencing the changing practices during the study. These led to some of the instructors' difficulty in getting themselves at ease with the computer based materials and technological instruments quickly (ibid).

Park and Son (2009) investigated factors influencing EFL teachers' employment of computers in their classrooms in order to find out EFL teachers' attitudes toward CALL and ways to improve CALL practice in schools. The results of their study indicated teachers' positive and favorable attitudes toward the employment of the computers. They regarded computer technology as a helpful teaching tool which can improve ways of teaching through providing students with different language inputs and increasing students' learning experiences in real and authentic contexts. It was also reported that external factors including lack of time, insufficient computer facilities, rigid school curricula, textbooks and lack of administrative support put negative effects on the implementation of CALL in the classroom. Internal factors like teachers' limited computer

skills, knowledge about computers, beliefs and perceptions of CALL also appear to significantly influence teachers' decisions on the employment of CALL (ibid).

Barani (2011) investigated the relationship between CALL and listening skill of Iranian EFL learners. His results suggested that there was a statistically significant difference between CALL users and nonusers in favor of the experimental group ($p < .05$).

Ghalami and Ahangari (2012) explored the impact of CALL on enhancing Iranian EFL learners' task-based listening as a motivating device to improve formation of positive attitudes. Their findings indicated that there was a meaningful difference between the experimental and control groups; that is to say, the participants in experimental group performed better than those in control group and obtained a higher average. The motivation of the experimental group participants was also higher compared to those in control group.

Nachoua (2012) in a study entitled "Computer-Assisted Language Learning for Improving Students' Listening Skill" found that CALL is a motivating method and computers are valuable instruments in second/foreign language classes to improve students' listening skill. Also, participants in experimental group (CALL) outperformed those in control group. Students' performance was improved in grammar, vocabulary, writing and listening. Furthermore, many parameters indicated that significant progress was attained in the group receiving a CALL teaching.

Edalati Shams (2013) investigated the effects of hybrid learning on Iranian EFL learners' autonomy in vocabulary learning. Hybrid Learning (HL), according to Bärenfänger (2005, as cited in Edalati Shams, 2013), is a learning approach including traditional classroom learning, computer-assisted language learning (CALL), and self-directed learning (SDL). According to Edalati Shams' findings a few of the learners manifested a considerable level of autonomy in learning from the outset. They were used to watching movies, reading books, listening to music, surfing the net, and gaming in English and outnumbered others in posts and comments they published on the weblog. The quantitative analysis proved that these already autonomous learners obtained the most significant gains throughout this HL course regarding both vocabulary knowledge and level of autonomy. Learners, mostly, had positive views on employing modern technology for the purpose of learning. The need for learner training and the significance of computer literacy were both expressed by the learners and witnessed by the researcher throughout the course. CALL and traditional classroom learning played complementary roles and each supplemented the disadvantages of another. Drawback to the use of weblogs observed in this course was regarding the asynchronicity of communication in a weblog. Regarding the learners' responses to the autonomy questionnaire at the beginning and end of the course, a statistically significant difference was found between the mean scores of the two sets of scores the learners got at the questionnaire which means that there was an improvement in the learners' level of autonomy after participating in the HL course (ibid). To sum up, the results of Edalati Shams (2013) indicated that learners' autonomy level and vocabulary knowledge increased at the end of HL course.

RESEARCH QUESTIONS

The following research questions were posed by the researcher:

Q1: Does the employment of smart board have any significant effect on lower-intermediate EFL learners' speaking and listening?

Q2: Does the employment of smart board have any significant effect on lower-intermediate EFL learners' autonomy?

RESEARCH NULL-HYPOTHESES

The following research null-hypotheses were formulated by the researcher:

HO1: The employment of smart board does not have any significant effect on lower-intermediate EFL learners' speaking and listening.

HO2: The employment of smart board does not have any significant effect on lower-intermediate EFL learners' autonomy.

METHODOLOGY

Participants

A sample including 48 lower-intermediate EFL students learning English in Khorasan Institute Of Foreign Languages in Kashmar, Iran was selected. Their age ranged from 19 to 25. Only females took part in this study. None of these participants have traveled to an English speaking country. The participants' homogeneity was confirmed using Quick Placement Test.

Instrumentations

Quick Placement Test (QPT)

To make sure that the participants were at the same level of language proficiency this kind of test developed by Oxford University Press and University of Cambridge Local Examinations Syndicate (60 multiple-choice items; grammar, vocabulary, cloze test) was administered to a population consisting of 94 EFL learners. Those students who scored 24 to 30 out of 40 were selected as the subjects of the present study (lower-intermediate).

Listening Speaking test battery

Participants' speaking ability was assessed via an interview between the researcher and the respondents. Also, an audio-CD was employed to assess the participants' listening comprehension. These assessments were done at the start and at the end of the study, but the materials employed as the assessment instruments were different. The test battery was adopted from Top Notch Fundamental A and B (Saslow & Asher, 2013). These two books are taught at some Iranian language institutes.

Learner autonomy questionnaire

In order to assess EFL students' autonomy in learning a Learner Autonomy Questionnaire developed by Zhang and Li (2004) was administered to see how autonomous the participants were in learning English as a foreign language. The content validity and reliability of the questionnaire have been already confirmed. The questionnaire has two parts: Part 1 includes 11 multiple-choice items on a 5- point Likert scale. The choices range from 1 (never) to 5 (always).

Part 2 includes 10 multiple-choice self-reporting items and students had to choose one option from the five alternatives.

Procedure

Forty-eight lower-intermediate EFL learners selected as the participants of the study, based on QPT, were randomly assigned to control (N=24) and experimental (N=24) groups. Listening-speaking materials adopted from interchange were taught to both groups by the same teacher. Smart board was employed in experimental class. Smart board works with a computer, projector, digital pens, and software called Notebook. The computer screen is projected to the smart board. Also using digital pen the teacher and the student alike can annotate. The quality of displaying materials on the screen was very high allowing the students to watch and hear effectively. On the contrary, participants in control group were not provided with a smart board and traditional white board was employed in order to teach new materials. Finally students in both groups sat for the posttest. Also participants in the experimental group were asked to complete the learner autonomy questionnaire before and after the treatment so that the effects of using smart boards on enhancement of EFL learners' autonomy were explored.

RESULTS AND DISCUSSION

This section summarizes the data obtained from the instruments given to the participants; also the null-hypotheses already proposed are tested.

Results of the pretest

Table 1 shows data related to the participants' performance in the pretest (listening and speaking).

Table 1: Results of pretest

Group	N	M	SD	df	t	sig
Control	24	14.96	4.58	46	1.36	.17
experimental	24	16.75	4.51			

As Table 1 shows there is no statistically meaningful difference between mean of control group (M=14.96; SD=4.58) and that of experimental group (M=16.75; SD=4.51) because p-value is greater than .05 (sig=.17; t=1.36). Therefore, the homogeneity of the participants was confirmed at the beginning of the course.

Results of the posttest

Data in Table 2 show the results obtained from the participants' performance in the posttest.

Table 2: Results of posttest

Group	N	M	SD	df	t	sig
Control	24	17.29	3.11	46	2.40	.02
experimental	24	20.21	5.06			

Data in Table 2 show the effects of the treatment (employment of smart board) on EFL learners' speaking and listening. Based on these data, participants in experimental group (M=20.21;

SD=5.06) had significantly better performance than those in control group M=17.29; SD=311) in the posttest. Accordingly, the significant effect of employing smart board is confirmed ($p=.02<.05$).

Results of learner autonomy

To explore the effect of employing smart board on EFL learner's autonomy paired-samples t-test was employed since the questionnaire was given to the participants in experimental group as pre and posttest (Table 3).

Table 3: Results of learner autonomy

Group	N	M	SD	df	t	sig
Pair 1	24	64.67	13.95	23	12.10	.000
Pair 2	24	70.42	15.54			

Table 3 shows that the mean of experimental group in the pretest is 64.67 and its mean in the posttest is 70.42. Since p-value (.000) is less than .05 it can be concluded that using smart board in EFL speaking and listening classrooms can improve learners' autonomy. The present study aimed at exploring the effects of smart board on enhancing lower-intermediate EFL learners' speaking and listening skills and their autonomy. Findings confirmed the significant effects of employing smart board as an effective learning tool in order to enhance EFL learners' speaking and listening skills. This finding was in agreement with Ghalami and Ahangari's (2012) who explored the impact of CALL on enhancing Iranian EFL learners' task-based listening. Also these findings supported the effectiveness of smart board in improving EFL learners' autonomy. As Wheeler (2001) claims, through computer technology students are provided with power to access, manipulate, modify, store, and retrieve information thus enhancing their autonomy in the classroom. In addition, according to Elaziz (2008), utilizing smart boards can create a more enjoyable, creative, and interesting context of teaching and learning. As Bacon (2011) believes smart whiteboards influence learning through increasing the learners' engagement in a classroom, motivating the learners and promoting enthusiasm for learning. Smart whiteboards, as argued by Chapelle (2003), can support learning and can be used in a variety of learning contexts.

CONCLUSION

The purpose of the present study was to explore the effects of CALL on Iranian lower-intermediate EFL students' speaking and listening as well as their autonomy. Having employed SPSS, the researchers tested the two research null-hypotheses formulated for the study. Results of t-test indicated positive effects of utilizing smart-boards in EFL speaking and listening classrooms, apparently due to the experimental participants' increased engagement in class activities and tasks. Also, the students' enhancement may be as a result of an increased level of motivation to learn. The findings offer pedagogical implications for utilizing smart-board and other technological tools in EFL contexts which need to be motivating and enjoyable.

Limitations of the study

The limitations of the present study were as following:

- The present study explored the effect of CALL on listening and speaking. Other skills such as writing and reading were not taken into consideration.
- Among psychological traits, only autonomy was examined and other traits such as confidence, motivation, self-regulation, etc. were excluded.
- Concerning technological tools, only smart board was implemented and other devices were not employed in the treatment group.
- Only lower-intermediate EFL students participated in this study and other EFL populations did not take part in the present study. Also, all of them were female.

ABSTRACT

Dynamic assessment has opened new horizons for teaching and assessment of writing performance. The present study was undertaken to explore the impact of dynamic and non-dynamic assessment on improving writing performance of Iranian English as a foreign language (EFL) students, and also to explore whether dynamic assessment has any immediate and delayed effects on writing performance of Iranian intermediate EFL students. The design of this study was quasi-experimental. Fifty Iranian students out of 120 were non randomly selected as participants of this study based on their scores on pet test. To determine the prior writing skill, a pre-test including two writing topics were administered to the participants in both experimental and control group. Then, the teacher worked on writing skill of experimental group with dynamic assessment technique, whereas she worked on control groups' writing through traditional method. At the end of the experiment, to check whether participants' writing performance had been improved through dynamic assessment, a post-test was administered to the participants of both groups. The result of this post-test was also the immediate effect of dynamic assessment. Thus, it can be concluded that dynamic assessment is an effective teaching tool for improving writing performance of students, and it has immediate effects. To explore the delayed effect of dynamic assessment, five weeks after the first post-test, the participants were called for the second post-test. Thus, the results showed that experimental group performed better than control group. Therefore, it can be concluded that, dynamic assessment has also delayed impact on writing skill of EFL Iranian students.

KEYWORDS: *Dynamic assessment, Non-dynamic assessment, Immediate effect, Delayed effect, Writing performance*

INTRODUCTION

Dynamic assessment (DA) in language learning, which derives from Vygotsky's (1978) idea on how child's cognition develops and applies Vygotsky's sociocultural theory into assessment, can offer new insights into assessment in the language classroom by revealing invaluable secrets about the ability of individual students and their abilities while answering each test item. The

reason can be the process-oriented nature of dynamic assessment. While the results of traditional Non-Dynamic assessment (NDA) can only show the already existent abilities of the student, the analysis of Zone of Proximal Development (ZPD) makes it possible to evaluate the ability of the student to learn from the interaction with a teacher or a more competent peer and predict their possible future development. Because Vygotsky's (1978) zone of proximal development suggests that different people can have the same baseline score on a static test but may differ in the extent to which they can profit from instruction. Unaided performance on static measures tells us what has already been learned or accomplished, whereas the breadth of the zone of proximal development is thought to provide prospective indications of what can be learned (Ajideh & Nourdad, 2012).

Nowadays, in most of the countries, especially in Iran, product oriented testing and teaching are the most widely used testing methods in today's educational environments, including the field of second and foreign language learning. Many language teachers around the world including Iranian teachers, use final assessment tests in their curricula to see how much the students have progressed on the subject they are being taught. On the other hand, it is not a rare case to hear a teacher saying that s/he does not understand why some students perform very well in the class but cannot get high grades from the tests. At this point, dynamic assessment in language learning, which applies Vygotsky's sociocultural theory into assessment, might offer new insights to assessment in the language classroom. Vygotsky's theory basically suggests that if we want to understand learning and development, we have to focus on process instead of product. Lantolf and Thorne (2006), Vygotsky argued that "the only appropriate way of understanding and explaining forms of human mental functioning is by studying the process, and not the outcome of development" (p.28). This is the critical point which distinguishes dynamic assessment from other forms of assessment. In this approach, development process is seen as a predictor of the individual's or group's future performance.

Dynamic assessment according to Vygotsky's sociocultural theory suggests that instruction and assessment should be inseparable from one another. In other words, if teachers want to see how their students really progress in their classes, their assessment should not focus on testing the students' performance with a final achievement test per se. The real focus should be on what students can achieve with the help of the teacher or peers during the class activities because what is achieved with the help of others shows the potential progress for achievement without any help. That is, if students are able to achieve a task with others today, this shows that they will be able to achieve it by themselves in near future because being able to achieve it with others proves that the internalization process has already begun. On the other hand, what teachers generally do in language courses is to assess students' actual development after some time of instruction, and to decide on the potential development by looking at the results. However, Lantolf & Thorne (2006) Vygotsky, this process should be the other way around because "the potential development varies independently of actual development, meaning that the latter, in and of itself, cannot be used to predict the former" (p.328).

On the other hand, dynamic assessment is a procedure which takes the results of an intervention into consideration. Dynamic assessment is basically grounded in Vygotsky's innovative insight

that in the zone of proximal development instruction leads development. Vygotsky (1978) argued that a person's potential developmental level is as important as the actual developmental level and responsiveness to assistance is an indispensable feature for understanding cognitive ability because it provides an insight into the person's future (potential) development.

Dynamic assessment is known as an effective teaching tool in EFL learning. In fact, dynamic assessment in language learning can offer new insights into assessment in the language classroom by revealing invaluable secrets about the ability of individual students and their abilities while answering each test item. The reason can be the process-oriented nature of dynamic assessment. While the results of traditional non-dynamic assessment can only show the already existent abilities of the student, dynamic assessment adjusted to the needs of particular learners makes it possible to evaluate the ability of the student to learn from the interaction with a teacher or a more competent peer and predict their possible future development. Regarding the advantages and effectiveness of dynamic assessment in learning and developing a foreign language, little attention has been paid to its place in the academic curriculums of many countries especially, Iran. Likewise, little research have been conducted on this issue.

As discussed above, unfortunately, in Iran, little attention has been paid to the effectiveness of dynamic assessment and therefore, this study investigated the effect of dynamic and non-dynamic assessment on writing performance of Iranian EFL learners. The central purpose of this research is determining the existence of any relationship between dynamic assessment and the writing performance of language students. In this study we investigated the scores of students in writing performance test to determine whether or not it is influenced by the intervention they received. In other words, the present research attempted to investigate the effect of dynamic assessment on the writing performance of students. Also, this study attempted to examine the immediate and delayed effect of dynamic and non- dynamic assessment on intermediate Iranian EFL students. There is no similar example of an experimental study in writing which examines the dynamic assessment and its immediate and delayed impact on the writing performance.

Furthermore review of literature on the use of dynamic assessment in EFL classrooms reveals that despite the rich and strong background of dynamic assessment, a few research has been conducted on the effectiveness and practicability of dynamic assessment in different learning environments in Iran, therefore, the present study attempted to investigate the effect of dynamic assessment on improving writing performance of intermediate Iranian EFL students.

LITREATURE REVIEW

Theoretical Research on Dynamic Assessment

Although theoretical framework of dynamic assessment was proposed by Vygotsky, he did not present any methodological guidelines for its application in real educational settings. There is a robust research literature on dynamic assessment in general education and psychology, however, the approach is relatively unknown or at least new in second/foreign language studies. In fact dynamic assessment has generated an impressive body of research in the study of general intelligence and of basic learning abilities among individuals with special needs (Tzuriel, 2000;

Lidz, 2002; Baek & Kim, 2003; Hasson & Joffe, 2007; Wang, 2010;), but studies of dynamic assessment's implications for problems particular to the development of L2 abilities are only beginning by a limited number of scholars in this field. Most of these discussions have been made at the theoretical level of dynamic assessment in language education and the number of studies focusing on practical and empirical dimensions to provide guidelines of methodological applications is very limited. For example Yildirim (2008) takes an in depth look at the issue of dynamic assessment from the standpoint of Vygotsky's sociocultural theory. He draws the theoretical framework and also discusses the methodological applications of the theory but his study doesn't include practical and empirical dimension in detail.

In fact, the literature on the use of dynamic assessment in the classroom whether as a teaching or assessment tool is controversial. Although most of the researchers advocate the effectiveness of dynamic assessment in learning and teaching and believe that dynamic assessment is an effective and useful teaching and assessment tool (e.g., Anton, 2003; Poehner 2008; Ajideh & Nourdad, 2012), some others criticize the reliability of dynamic assessment and see it as an inappropriate teaching and testing tool in classroom (e.g. Frisby & Braden, 1992).

And although most of the researchers advocate the effectiveness of dynamic assessment in learning and teaching, they assert also that some degree of subjectivity is an essential feature of dynamic assessment (Tzuriel, 2000). Aastrup (2010) thinks that the theoretical basis for dynamic assessment is well known but not always practiced in assessments or teaching. So far experience indicates that dynamic assessment is a good tool to investigate a pupil's mathematical thinking in order to plan and carry out adapted teaching. However, using the dynamic assessment material does not guarantee that the assessment will be carried out dynamically. It is only meant to be a good tool in order to practice the dialogue in an appropriate way, discovering how to help the pupil reach a new functional level. Therefore, applying the philosophy of socio-cultural learning theory and training in order to establish good dialogues is important for the assessment leader. Many pupils who find the assessment situation positive, their knowledge is more appreciated than they are used to, and they experience successes and a good atmosphere.

The dynamic way of meeting a pupil also influences the techniques teachers use in the classroom. Teachers seem to be more open to alternative ways of solving problems. In many cases the focus of the lessons moves from product to process, inspiring pupils to talk about their own strategies and jointly reflect on different strategies.

Considering this ambiguity on the effectiveness and practicability of dynamic assessment, the present study attempted to explore its effect on writing performance of EFL Iranian students.

Empirical Studies on Dynamic Assessment

In a recent study Sadeghi and Khanahmadi (2011) assessed the viability of dynamic assessment used as an instructional adjunct in the development of Iranian EFL learners' grammar. The study was conducted on 60 intermediate EFL learners and each session during the treatment the two groups of experimental and control took a grammar test in which the experimental group received

mediation on test items. The results of their study proved that dynamic assessment oriented instruction significantly improved the learning of L2 grammar.

In another study, Pishghadam, Barabadi, and Kamrood (2011) applied a computerized dynamic assessment on 104 university students with moderate proficiency level. The software could calculate the non-dynamic assessment score of the participants, that is their score before any intervention of each item, as well as a dynamic assessment score, which is the score after providing mediation for unsuccessful answers. Using a t-test the researchers compared the dynamic and non-dynamic score of the participants and found a significant difference implying the usefulness of dynamic assessment in increasing the reading comprehension score of the participants.

Immediate and Delayed Effect of Dynamic Assessment

According to Ajideh and Nourdad (2012) measuring student's ability in transferring the developed abilities into new items after some time is delayed effect. It refers to the degree of maintenance of the positive or negative effects of treatment on the writing performance students in a longer period of time. That is, delayed effect refers to the effects of a treatment that remain until some other time. In the present research, we use this sense of delayed effect.

According to the web definition immediate effect refers to the degree of the positive or negative effects of treatment soon after the treatment is over. Immediate effects are those that occur within minutes of the exposure. In the present research, also, immediate effect refers to the effects of a treatment on writing performance of Iranian EFL students right after the treatment, i.e., teaching through dynamic assessment is over.

According to Ajideh and Nurdad (2012) there is great difference between assessing reading comprehension ability of EFL learners dynamically and non-dynamically, and that dynamic assessment leads in increased reading comprehension ability and this improvement is not short-term and can remain after some time interval because learners take advantage of the mediation on their ZPDs.

Empirical Studies on Immediate and Delayed Effect of Dynamic Assessment

In a study Ajideh and Nourdad (2012), investigating the difference between applying dynamic assessment and non-dynamic assessment for reading comprehension ability of EFL learners and also the immediate and delayed effect of dynamic assessment. The results of the study revealed a significant difference between dynamic and non-dynamic assessment with a statistically significant increase in the reading comprehension scores of the group being assessed dynamically. The findings of the study also presented the existence of not only immediate but also delayed effect of dynamic assessment on reading ability of the participants.

In another study Ajideh and Nourdad (2012), aimed at investigating the immediate and delayed effect of dynamic assessment on reading comprehension ability of EFL learners at three proficiency levels. The results of the study revealed that while applying dynamic assessment had both immediate and delayed effect on improving the reading comprehension of the EFL learners,

no significant difference was observed among different proficiency levels. In other words there is no significant difference in the immediate and delayed effect of dynamic assessment of EFL learners' reading comprehension ability in low-, mid-, and high-proficiency levels. That is to say dynamic assessment can be beneficial for EFL readers and its effect remains overtime. And learners of low-, mid-, and high-proficiency levels improve their reading comprehension ability almost equally and the proficiency level doesn't affect the amount of taking the advantage of dynamic assessment.

According to Ajideh and Nourdad (2012) measuring student's ability in transferring the developed abilities into new items after some time is delayed effect. It refers to the degree of maintenance of the positive or negative effects of treatment on the writing performance students in a longer period of time. That is, delayed effect refers to the effects of a treatment that remain until some other time. In the present research, we use this sense of delayed effect.

According to the web definition immediate effect refers to the degree of the positive or negative effects of treatment soon after the treatment is over. Immediate effects are those that occur within minutes of the exposure. In the present research, also, immediate effect refers to the effects of a treatment on writing performance of Iranian EFL students right after the treatment, i.e., teaching through dynamic assessment is over.

According to Ajideh and Nurdad (2012) there is great difference between assessing reading comprehension ability of EFL learners dynamically and non-dynamically, and that dynamic assessment leads in increased reading comprehension ability and this improvement is not short-term and can remain after some time interval because learners take advantage of the mediation on their ZPDs.

RESEARCH QUESTIONS AND HYPOTHESIS

Q1: Is there any difference between dynamic and non-dynamic assessment of EFL writing performance?

Q2: What is the immediate effect of applying dynamic assessment on EFL writing performance?

Q3: What is the delayed effect of applying dynamic assessment on writing performance?

H1: There is a difference between dynamic and non-dynamic assessment of EFL writing performance.

H2: Applying dynamic assessment has immediate effect on EFL writing performance.

H3: Applying dynamic assessment has no delayed effect on EFL writing performance.

METHODOLOGY

Participants

The participants in this study were 50 female intermediate Iranian EFL language learners. After assuring the homogeneity of all of the students, one of the intact classes were randomly considered as experimental group and another one as control group. Because of the limitations

of the language institution schedule, it was not possible to randomize the participants, and therefore the two classes remained intact.

Instrumentation

The following instruments were utilized in the present study. A proficiency test (PET) was administered to the participants in order to homogenize participants in terms of language proficiency. PET stands for Preliminary English Test which is suitable for testing language proficiency of intermediate students. It included four sections of speaking, listening, reading and writing, and there were 8 questions and topics at writing section. The estimated time for the test was two hours.

Then, a pre-test was administered to both experimental group and control to determine the participants' writing performance abilities before the experiment. The pre-test included two writing topics. The pre-test conducted in a non-dynamic way, i.e. in the traditional or usual way, with which all of the participants were familiar.

After the pre-test, the treatment began and last for five sessions. In each session, the researcher as a teacher introduced a topic for writing, and received feedback. After 5 sessions of treatment, the teacher administered a post-test to the participants. Like the pre-test, the post-test included two writing topics, and its reliability and validity was insured in advance. After five weeks, another post-test was administered to the participants of both groups to determine the delayed effect of dynamic assessment on writing performance of EFL learners.

Research Procedures

To conduct the present research, the researcher considered two classes of a language center which totally included 50 female students—25 in one class and 25 in another class. To assure the homogeneity of the two classes in terms of language proficiency, the researcher administered a Preliminary English test (PET) to the students. After determining the homogeneity of the students, the researcher considered one of the intact classes as experimental group and the other class as control group. Then, the researcher administered a pre-test to the participants to determine their writing skill before the treatment. The pre-test included two writing topics chosen from "Interchange series, volume 2, third edition", and its reliability and validity was determined beforehand. The pre-test included two writing topics. The pre-test conducted in a non-dynamic way, i.e. in the traditional or usual way, with which all of the participants were familiar.

In order to have a normal test Kolmogorov-Smirnov Test was administered to tests. After the pre-test on writing performance, the treatment began and last for five sessions. In each session, the teacher introduced a topic for writing, and received learners' feedback. The teacher worked on the writing skill of experimental group in a dynamic assessment way. In other words, the teacher first gave a general topic, and then tried to narrow down it, and simplify the topic through word mapping and clustering, and question-and answer techniques, which are three common techniques for narrowing down a topic in a dynamic way. The teacher was also supporting learner development actively by understanding learner abilities. While, the teacher worked on writing skill of the control group through traditional or usual way, i.e., through non-dynamic

assessment way. It is worth saying that due to quantitative research it was not possible to apply the interactionist model of dynamic assessment. The selected model was, therefore, interventionist approach.

At the end of the treatment, the researcher administered the first post-test to determine whether learners' writing performance had been improved through employing dynamic assessment technique. Like the pre-test, the post-test included two writing topics, and its reliability and validity was insured in advance. To observe the effect of dynamic assessment and to make the scores as reliable as possible the researcher avoided any help in that test session and the test takers of experimental group had to resort to their previous experience of taking dynamic test and get help of the key points of those sessions and show how much they had learned from those dynamic sessions. Students in control group took the test as usual because they were already familiar with and used to non dynamic tests. The comparison of the pre-test and post-test's mean scores used to answer to the first research question. The mean score of this post- test was also taken as immediate effect of dynamic assessment on writing of EFL students.

But the study was not limited to this point, and another new step was taken. For finding out about the delayed effect of dynamic tests, test takers were called for the second post-test after 5 weeks to conduct second post test, and the same testing procedure and statistical analyses were repeated with different writing tests and comparisons were made between control and experimental groups to realize any probable delayed effect of dynamic assessment.

RESULTS AND DISCUSSION

The study was conducted through pretest-posttest non-randomized quasi-experimental design to compare the writing performance of students in control groups with the writing performance of students in experimental groups.

Statistical Analysis for Hypotheses

Hypothesis 1: There is a difference between dynamic and non-dynamic assessment of EFL writing performance.

In order to answer the research questions and test the hypotheses, first of all, the researcher determined the homogeneity of the participants in terms of their language proficiency through the Preliminary English Test (PET), and then in order to answer the first research question, the researcher administered a pre-test and a post-test. Accordingly, two Independent Sample t-tests were conducted-- before and after the treatment-- to compute and compare the mean scores and to check the participants' writing performance after the treatment. In order to answer to the second research question, five weeks after the first post-test, another post-test was administered to the participants of both groups to determine the delayed effect of dynamic assessment on writing performance of EFL learners.

Table 1 below shows the descriptive data for proficiency scores of the participants, and Table 2 shows the Independent Samples T-test results for the proficiency scores.

Table1: Descriptive statistics for proficiency scores

Group Statistics					
	CLASS	N	Mean	Std. Deviation	Std. Error Mean
SCORE	Experimental group	25	62.5223	17.72064	4.82345
	Control group	25	64.1664	15.46584	3.64436

Table 2: Independent samples t-test results for the proficiency scores

Independent Samples Test									
	Levene's Test for Equality of Variances		t-test for Equality of Means						
								95% Confidence Interval of the Difference	
	F	Sig.	t	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Lower	Upper
Equal variances assumed	3.240	0.123	-.565	38	.654	-3.14000	6.0326	-1.54634	.73540
Equal variances not assumed		.00000	-.565	35.754	.655	-3.14000	6.0326	-1.55130	.74530

It shows that there was no significant difference between the two groups considering their language proficiency ($t(38) = 0.565$, $p = 0.654$). Therefore, it can be concluded that the experimental group and control group are homogeneous.

Kolmogorov-Smirnov Test for pre-test two Groups

One of the requirements of this test is the normality of the score distribution. Thus, it was necessary to conduct a One-Sample Kolmogorov-Smirnov test.

Table 3: One-Sample Kolmogorov-Smirnov Test of Normality

Groups	Kolmogorov-Smirnov			Shapiro-Wilk		
	Statistic	df	Sig.	Statistic	df	Sig.
Pretest experimental	.178	20	.097	.888	20	.226
Control	.189	20	.059	.950	20	.368

The results of kolmogorov-smirnov test for pre-test of control and experimental groups is $p > .05$, so the distribution of data is normal and the normal distribution assumption seems to hold.

A Pre-test on writing performance

After administering the proficiency test (PET) and assuring the homogeneity of the participants in experimental and control groups, the researcher administered a pre-test to both groups to determine the participants' writing performance abilities before the experiment. Students' pre-test compositions were evaluated by two experienced teachers. Students in control group were required to write about a topic without the mediation of the teacher, because they were taught through traditional method, while the experimental group were asked to write about the same topic but with mediation of the teacher, because they were taught through dynamic assessment. As it will be explained in the following section, post testing procedures were exactly the same as pretesting. Students writing were scored analytically. In this scale for measuring written proficiency, different parts of writing (grammar, vocabulary, mechanics, fluency and organization/form) are scored from 1 to 6. Furthermore, they must be added up to gain the score of written performance. Thus, a perfect writing scored 30 in this kind of scoring.

In order to calculate and compare the mean scores of the participants on pre- test, the researcher conducted another t-test. Table 4 and Table5 below present the descriptive data of the means of the pre-test and the results of the t-test.

Table 4: Descriptive statistics of the Means of the pre-test

Group Statistics					
	CLASS	N	Mean	Std. Deviation	Std. Error Mean
SCORE	Experimental group	25	17.6534	3.67465	.69543
	Control group	25	18.0234	2.97343	.612345

Table 5: Result of the T-test for Pre-test Scores

Independent Samples Test									
	Levene's Test for Equality of Variances		t-test for Equality of Means					95% Confidence Interval of the Difference	
	F	Sig.	T	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Lower	Upper
Equal variances assumed	.322	.570	-.652	38	.516	-.54000	.86641	-1.19534E0	2.20734
Equal variances not assumed			-.652	37.452	.516	-.54000	.86641	-1.19605E0	2.27805

As it obvious, Table 5 shows that there is no significant difference between control group ($M=18.02$, $SD=2.973$) and experimental group ($M=17.65$, $SD=3.67$). Moreover, as it can be observed in Table 4.4., the magnitude of the differences in the means of the two groups (mean difference = .54) is very small, and the p-value is bigger than 0.05 ($t(38) = 0.652$, $p = .516$). Therefore, it can be concluded that the participants are homogeneous considering their prior performance on writing skill.

Hypothesis 2: Applying dynamic assessment has immediate effect on EFL writing performance. In order to test this hypothesis, it was necessary to compare the mean scores of the pre-test and the first post-test.

The First post-test for immediate effect

After the pre-test and determining the participants' proficiency on writing skill, the research treatment began and last for 5 sessions because of time schedule of the institute. After 5 sessions of treatment, a post-test was administered to the participants. Like the pre-test, the post-test included a writing topic which was taken from Interchange 2, and its reliability and validity was insured in advance. The estimated time for writing was 30 minutes, and all these tests—the pre-test and post-tests-- were conducted in non-dynamic way as Iranian students were familiar with. The purpose of the first post-test is to illustrate the immediate effect of dynamic assessment. 5 weeks after the first post-test, students invited to sit for the second post-test.

T-Test

Table 6: Descriptive statistics of the Post-test

Group Statistics					
	CLASS	N	Mean	Std. Deviation	Std. Error Mean
SCORE	Experimental group	25	22.97434	3.65340	.45423
	Control group	25	18.9724	2.02532	.36979

Table 7: Results of the T-test for the Post-test

Independent Samples Test									
	Levene's Test for Equality of Variances		t-test for Equality of Means						
								95% Confidence Interval of the Difference	
	F	Sig.	T	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Lower	Upper
Equal variances assumed	.065	.821	-4.679	38	.000	-4,40000	.98762	-6.18545	-2.53911
Equal variances not assumed			-4.679	37.764	.000	-4,40000	.98762	-6.19545	-2.52014

As it is shown in Table 6, the mean score of experimental group ($M = 22.97$) is higher than the mean score of the control group (18.97). Therefore, we can assume that the experimental group performs better than the control group. However, to see whether the mean differences are statistically significant, the results obtained from the Independent Samples T-test need to be analyzed.

Moreover, as it is displayed in the Table 7, the p-value is less than 0.05 ($t(38) = 4.679$, $P = .000$). Therefore, we can conclude that there is a significant difference between the mean scores of the experimental and control group. This is the answer to the first question of this research. That is, dynamic assessment had an immediate impact on improving writing performance of EFL students, thus the first and second hypotheses are proved.

Hypothesis3: Applying dynamic assessment has no delayed effect on EFL writing performance. As it was mentioned before, 5 weeks after the first post-test, students were invited to sit for the second post-test to check the delayed effect of dynamic assessment on EFL writing performance.

The Second Post-test for Exploring Delayed effect

The purpose of the first post-test was to illustrate the immediate effect of dynamic assessment. 5 weeks after the first post-test, students invited to sit for the second post-test.

For finding out about the delayed effect of dynamic tests, participants were called for the second post-test five weeks after the first post-test, to measure their ability in transferring the developed abilities into new items after some time, and the same testing procedure and statistical analyses were repeated with different writing tests and comparisons were made between control and experimental groups to realize any probable delayed effect of dynamic assessment.

T-Test

Table 8: Descriptive statistics of the second Post-test

Group Statistics					
	CLASS	N	Mean	Std. Deviation	Std. Error Mean
SCORE	Experimental group	25	22.01434	2.45527	.46412
	Control group	25	17.9724	2.5353	.36549

Table 9: Results of the T-test for the second Post-test

Independent Samples Test									
	Levene's Test for Equality of Variances		t-test for Equality of Means						
								95% Confidence Interval of the	
	F	Sig.	Difference	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Lower	Upper
Equal variances assumed	.068	.820	-4.861	38	.000	-4.30000	.97689	-6.17933	-2.42871
Equal variances not assumed			-4.861	37.623	.000	-4.30000	.97689	-6.18325	-2.41022

As it is displayed in Table 8 the mean score of experimental group ($M = 22.01$) is bigger than the mean score of the control group (17.97). Thus, it can be assumed that the experimental group, again, outperformed the control group.

Furthermore, as it is displayed in the Table 9, the p-value is less than 0.05 ($t(38) = 4.861$, $P = .000$).

Discussion

The present study aimed at investigating the effect of dynamic assessment on EFL learners' writing performance in intermediate level, and also attempted to explore its immediate and delayed effect. In other words, the present study aimed at investigating the difference between applying dynamic assessment and non-dynamic assessment for writing performance of intermediate EFL learners and also the immediate and delayed effect of dynamic assessment.

The results of the research revealed a significant difference between dynamic and non-dynamic assessment with a statistically significant increase in the writing scores of the group being assessed dynamically. That is, the findings of the present study showed that EFL learners could gain that kind of development in writing ability because after going through dynamic assessment session and being given the appropriate mediation they were able to take the advantage of the mediations in their later independent performance in immediate post-test.

The findings were in line with the findings of some similar previous studies such as Sadeghi and Khanahmadi (2011). All these studies, like the results of the present study, revealed that dynamic assessment improved participants' writing skill or other skills. The findings of the present study also revealed the existence of not only immediate but also delayed effect of dynamic assessment on participant's writing ability.

The findings of this study support Sadeghi and Khanahmadi (2011)'s idea that dynamic assessment can improve learners' foreign language skills, they assessed the viability of dynamic assessment used as an instructional adjunct in the development of Iranian EFL learners' grammar. The results of their study proved that dynamic assessment oriented instruction significantly improved the learning of L2 grammar.

The results of the present study also support Pishghadam, Barabadi, and Kamrood (2011) research. They applied a computerized dynamic assessment on 104 university students with moderate proficiency level. The software could calculate the non-dynamic assessment score of the participants, that is their score before any intervention of each item, as well as a dynamic assessment score, which is the score after providing mediation for unsuccessful answers. Using a t-test the researchers compared the dynamic and non-dynamic score of the participants and found a significant difference implying the usefulness of dynamic assessment in increasing the reading comprehension score of the participants.

However, the findings of this study rejects Ajideh and Nourdad (2012) idea that dynamic assessment has no delayed effect. He investigated the impact of dynamic assessment on improving reading ability of EFL Iranian learners and found that dynamic assessment improved learners' reading ability which although this idea is consistent with the findings of the present study, he also found that dynamic assessment has no delayed effect which this idea is inconsistent with our findings.

The outcomes of this study also reject the study conducted by Frisby and Braden (1992). They studied the reliability of dynamic assessment used in the classroom, and found that dynamic

assessment reliability is questionable and it is not an appropriate testing tool. As it is clear, this idea rejects the findings of the present research.

CONCLUSION

Dynamic assessment integrates assessment and instruction into a seamless, unified activity aimed at promoting learner development through appropriate forms of mediation that are sensitive to the individual's (or in some cases a group's) current abilities. In essence, dynamic assessment is a procedure for simultaneously assessing and promoting development that takes account of the individual's or group's (ZPD). Dynamic assessment focuses 'on modifiability and on producing suggestions for interventions that appear successful in facilitating improved learner performance' (Lidz, 1991)

Considering the dynamic assessment as an effective teaching technique in the classroom, this study mainly attempted to investigate the effect of dynamic and non-dynamic assessment on writing performance of Iranian EFL learners. In other words, the central purpose of this research is determining the existence of any relationship between dynamic assessment and the writing performance of language students. This research also investigated the impact of immediate and delayed effects of dynamic assessment on writing performance of EFL learners.

To determine the prior writing skill, a pre-test including two writing topics were administered to the participants in both experimental and control group, and the mean score was calculated. Then, the teacher worked on writing skill of experimental group with dynamic assessment technique, whereas she worked on control groups' writing through traditional method. At the end of the experiment, to check whether participants' writing performance had been improved through dynamic assessment, a post-test was administered to the participants of both groups. Comparison of the mean scores of the pre-test and post-test revealed that experimental group outperformed the control group. The result of this post-test was also the immediate effect of dynamic assessment. Thus, it can be concluded that dynamic assessment is an effective teaching tool for improving writing performance of intermediate students, and it has immediate effects. To explore the delayed effect of dynamic assessment, five weeks after the first post-test, the participants were called for the second post-test. The second post-test, like the previous test, was two writing topics. Thus, the results showed that experimental group performed better than control group. Therefore, it can be concluded that, dynamic assessment has also delayed impact on writing skill of EFL Iranian students. The results of this study can be useful and informative for both teachers and learners in providing them with new horizons of instructing students through a step by step procedure.

Pedagogical implication

The findings of this study can have several pedagogical implications for language teachers, language learners, and curriculum designers. First, considering the positive impact of teacher mediation during teaching, language teachers can easily use dynamic assessment as a new effective technique in the classroom for teaching different aspects of English language. Second, applying dynamic assessment, language teachers can develop a learning environment which is

stress-free, and hence leads into positive washback effect during exams because dynamic assessment provides a learning environment in which testing and teaching aims and procedures are in line with each other and interwoven. Third, through mediations, teachers can develop learners' autonomy in the classroom and also make them autonomous in doing similar tasks later on.

Dynamic assessment helps students to take the advantage of mediation provided by the assessor and become autonomous in the classroom and in doing similar tasks later on. Likewise, applying dynamic assessment provides learners with mediation which results in reduced stress. In other words, dynamic assessment provides a stress-free learning environment for learners, and because of this, it presents a true picture of learners' abilities and learning potential (i.e. their current status and hidden potential in the zone of proximal development), which is the first and most important purpose of assessment. Accordingly, learners can be aware of their potential abilities.

Finally, based on the finding of this study which shows that dynamic assessment is helpful in improving writing performance, language learners can benefit from syllabuses which use dynamic assessment technique. Curriculum designers can develop syllabuses which employ dynamic assessment as a teaching technique, because exploiting dynamic assessment results in better learning outcomes and also, as mentioned above, results in learners autonomy and positive washback. Currently, both of the issues of learner autonomy and washback effect are of great importance and under investigation in EFL. Likewise, because dynamic assessment provides a stress-free learning environment for learners, it presents a true picture of learners' abilities and learning potential (i.e. their current status and hidden potential in the zone of proximal development), which is the first and most important purpose of assessment.

Suggestions for further research

This study is an effort to empirically examine the impact of dynamic assessment on improving EFL learners' writing skill and also explore its immediate and delayed effect on improving their writing performance. Further research is needed in these areas to have a thorough understanding of these issues. The following recommendations are stated as suggestions for further research:

It is recommended that this study be replicated with a larger number of participants with the same background. It would also be interesting to conduct the same research across levels of proficiency i.e., for learners with different levels of language proficiency. Moreover, the research may include both male and female learners. In the present research all of the participants were female college-level (intermediate) university students.

Another research can be designed to investigate the impact of dynamic assessment on another aspect of language learning like vocabulary learning or improving another skill, such as speaking, reading, listening. It is hoped that the outcome of this study will be of some use to future research studies. The present research used interventionist approach of dynamic assessment to examine its impact on writing skill of intermediate students, therefore, another research can be designed to investigate the impact of dynamic assessment through interactionist approach.

ABSTRACT

Teacher talk which constitutes a preliminary attribute of much education, plays a significant role in English as foreign language (EFL) contexts marked by the restriction of L2 exposure to the language classroom. The present study explores the effect of appropriate teacher talk in terms of the provision of opportunities for learner interaction, language achievement and the fostering of positive attitudes. To this end, 50 learners and 2 experienced language institute teachers took part in the study. One class received appropriate teachers talk with the encouragement of language interaction while the other class did not present learners with opportunities for self-expression. Data were collected through questionnaire, test and observation. Results clearly showed the positive effect of appropriate teacher talk on learners' engagement and attitudes. Findings highlighted how the pedagogical discourse and language learning is mutually shaped by teachers and learners in their language learning practices. The study yields crucial implications which can be directly applied by teachers and teacher educators to the actual classroom practice.

KEYWORDS: teacher talk, interaction, language performance, attitude, education programs

INTRODUCTION

In recent years, scholars have argued that the classroom should be considered as a context in its own right or as interdependent contexts that is jointly shaped and defined by the participants: the teachers and learners (Johnson, 1995; Seedhouse, 1996; van Lier, 1988). According to this perspective, the analysis of teacher and learner interaction needs to begin with the belief that verbal behavior is goal-oriented and dominated by specific rules which is also true for participants in interactions of other contexts such as a restaurant (Walsh, 2002). Therefore, similar to other discourse contexts, interactants in the language classroom are kept within bounds

of the prevailing features of the context. Some of these features are outlined by Walsh (2002, p. 4):

1. Teachers largely control the topic of discussion;
2. Teachers often control both content and procedure;
3. Teachers usually control who may participate and when;
4. Students take their cues from teachers;
5. Role relationships between teachers and learners are unequal;
6. Teachers are responsible for managing the interaction which occurs;
7. Teachers talk most of the time;
8. Teachers modify their talk to learners;
9. Learners rarely modify their talk to teachers;
10. Teachers ask questions (to which they know the answers) most of the time.

If the social nature of the EFL classroom in its own right is recognized which has the value of research by itself without any comparison to other contexts, then the focus on the comprehension of classroom discourse should attend to teacher quality instead of quantity. This goal is attained by considering the essential relationship between language use and instructional purpose.

A considerable body of research exists on the interrelation of interaction, input, output and the importance of the negotiation of meaning (e.g., Long, 1983, 1996; Swain, 1985, 1995; Pica, 1994; Foster, 1998). Although the current perspectives on the nature of the relation between negotiation of meaning and language learning is still dismal, its very identification is certainly a strong benchmark of the necessity of giving more attention to the connection of teacher talk and learners' language learning.

Research on teacher talk

In the past few decades, there has been an increasing interest in teacher's linguistic input during instruction (Cazden, 2001) and during classroom routines (Dickerson, 2005; Glazer & Burke, 1994; Maloney & Larrivee, 2002; Moguel, 2004; Short, Kaufman, Kaser, Kahn, & Crawford, 1999; Patrick, Anderman, Ryan, Edelin, & Midgley, 2001; Steele, 1998). In the other word, studies of teacher talk are related to two language types. One is the investigation of language that teachers use in their language classrooms, and the other is the investigation of language that they use in subject matter lessons. In recent years there has been several studies reporting on the specificities of teacher talk and the role of it regarding EFL learners' language acquisition (Incecay, 2010). Kim and Suh (2004), for example, studied teacher talk in Korean English classroom. They analyzed recorded data from six middle school teachers in Busan. The results showed that teachers' talk accounted for about 60% of classroom discourse and teachers talked about 17 times a minute, which is 4.5 times more than the students' talk. The findings also indicated that teacher talk in the teacher-fronted class was more than that in the student-centered classes.

In another similar research, Lin (2005) investigated whether there were differences between the teachers' talk in monolingual and bilingual classrooms. The results of the study showed that there were significant differences between teachers' talk in both classes, such that teacher talk in

monolingual class was more focused on content-area vocabulary and its function. The teacher also used all the participant organization types including teacher to student, teacher to class, choral repetition and self-repetition strategies. In addition, the teacher used limited and broad references in the class time. On the other hand, in the bilingual class, the teacher talk focused more on form rather than content and teacher talk contained more phonological cues for teaching vocabulary items. The teacher used more visual support and repetition and the range of reference was narrow and focused on routine exchanges. Moreover, the teacher used more instruction and procedural directives in the classroom.

Xiao-Yan (2006) examined the amount of teacher talk in total class time and investigated its impact on foreign language learning of 80 Chinese students. The results of the study revealed that most of the class time was allocated to teacher talk- 76% of the total class time. According to the learners of this study, this amount of teacher talk could change the atmosphere of the class because "most of the students like to listen to teachers' instruction and view it as a good learning strategy. But they do not like teachers to explain everything to them" (p. 36). Nevertheless, most of the learners believed that teacher talk is the most useful source of learning inside the classroom and it has direct and positive effect on their learning.

In another research, Rezaee and Farahian (2012) asked 12 intermediate learners to participate in their study to examine the amount of teacher talk in the classroom and investigated the role of teachers' questions on students' learning. The results of the study showed that in each class session, 62% to 73% of the class time was devoted to teacher talk and almost 20% to 25% was allocated to student talk with the rest of the class time devoted to other tasks such as the groups works to related questions or issues raised by the teacher to the whole class.

Incecay (2010) investigated the role of teacher talk in young learners' language learning. The results of the study revealed that some of the features of teacher talk could facilitate learners' language process while other features restricted the learning process. More specifically, 'direct error correction', 'prompting', 'extended wait time' and 'repairing' facilitated students' learning process and 'turn competition', 'teacher echo' and 'extended use of turn taking' obstructed learners' acquisition.

The effect of teachers' talk on incidental vocabulary learning of 20 high-intermediate and advanced ESL students in an institute in Montreal was explored by Horst, Collins, White, and Cardoso (2010). The results of the study showed that teachers rarely used new vocabulary items in the class time and their talks were short and limited. Moreover, the results of the study revealed that although the teachers' discourse exchanges were short, they were comprehensive and complete. The findings of this study support the idea that teacher talk improves incidental vocabulary learning of the students.

Slavit and Mason (2011) examined the oral academic language used by teachers during content area instruction. The results of the study revealed that students did not have much opportunity to hear the specialized language of the content areas from their teachers because teachers used more than 88% of non-academic language during content area instruction. These opaque terms or non-

academic language included homophones, idiomatic expressions, heteronyms, deictic pronouns and demonstratives which caused some problems for the students.

RESEARCH QUESTIONS

With respect to the socially-constructed nature of the language use in EFL classrooms which is comparable to the language in naturally occurring contexts, the present study intended to focus on the teacher's speech which constitutes a large amount of classroom discourse. This research aims at answering the following questions:

1. Does positive teacher talk have effect on student's language learning?
2. Does positive teacher talk increase student's interaction during the classes?
3. Does positive teacher talk promote students' attitudes towards the teacher?

METHODOLOGY

Participants

Learners

50 female language learners in a language institute in Hamedan, Iran were selected as the participants of this study. Their age ranged from 12 to 19 years and had the same language and educational background. Their level of proficiency was lower-intermediate which was determined according to Oxford placement test administered at the beginning of the study. As a result of the proficiency test, 25 learners were randomly assigned to a class where positive teacher talk was practiced and the other 25 learners were assigned to a class without positive talk.

Teachers

Two experienced teachers of EFL (five or more years of teaching experience) were invited to participate in this research. Both teachers had post-graduate degrees.

Instruments

The instruments of this study were questionnaire, tests and observation. Following is the description of each.

Questionnaire: in order to get better insights about the learners' attitudes towards their teacher's language use and interaction in the classroom, the Learner Perception of a Good Teacher questionnaire (2005) which was developed by the Character Education Partnership was adopted (see appendix). This questionnaire was used to collect information on language learners' evaluation of their English classes and their teachers' speech on the basis of their usually and normally practiced classroom activities. This questionnaire is divided into two parts and is composed of 36 items. The questionnaire is a 5-point Likert type scale with the items ranging from '1 = rarely', '2 = once in a while', '3 = sometimes', '4 = most of the time', and '5 = almost always'. The participants were asked to read each statement and indicate their reaction by choosing a number in the questionnaire. The reliability of the questionnaire was computed using the Cronbach Alpha method. The Cronbach-alpha coefficient value for the reliability analysis of the questionnaire was found as .85.

Preliminary English Test (PET): PET was used as the post-test to determine control and experimental participants' overall language performance after the treatment. PET includes 35 reading questions, 7 writing questions, 25 listening questions and 4 parts of speaking skill. The overall score obtained from the test was considered as the criterion for the comparison of the control and experimental groups.

Observation: Classroom observation was also carried out for the reason that the observation focuses on naturally occurring data and includes a fine-grained analysis. Thus, this approach is highly empirical, highlighting naturally occurring data without any effort to match the data to pre-conceived categories. The proof that such categories are employed by the participants was shown by reference to and instances from the data. In sum, observation leads the researcher to attend solely to the interactional patterns appearing from the data, rather than focusing entirely on any pre-identified ideas which language teachers might try to implement to the data.

Procedure

After assuring the learners' language homogeneity, they were assigned two different classrooms and received different treatments for equal time of seven weeks. In class one, the participants received positive teacher talk treatment which included 'teacher questions', 'feedback', 'wait time', 'pausing', 'paraphrasing', 'probing for specificity', 'putting ideas on the table', 'paying attention to self and other', 'presuming positive intentions' and 'balancing advocacy and inquiry'. The teacher attempted to provide adequate input to the learners in teacher-fronted activities by encouraging learners in the classroom interaction, encouraging conversational adjustments between teacher and learners, advocating opportunities for self-expression, facilitating and motivating clarification by learners, repeating and rephrasing utterances, and scheduling several activities during the class time. Quite the reverse, teacher talk in the control class included exchanges through display questions, speech modification in response to non-understanding, students' rare modification of their speech, teachers' rare request for learners' speech modification, control of the topic of conversation, and rare asking of questions for which they did not have answers.

After the completion of classes, the PET test and the questionnaire were administered to the learners. In addition, the results of observation were analyzed.

RESULTS AND DISCUSSION

In order to analyze the data to test the research questions, the statistical procedures have been carried out using statistical package for the social sciences (SPSS) version 21 (2012). First, the scores of dependent variable were analyzed to ensure the assumptions of normality. The results of the histograms, Kolmogorov-Smirnov tests, and the box plots are presented below.

Table 1: Kolmogorov-Smirnov Test Results

Null hypothesis	Test	Sig.	Decision
The distribution of performance is normal with mean 87.68 and standard deviation 11.60.	One-Sample Kolmogorov-Smirnov Test	.42	Retain the null hypothesis.
The distribution of interaction is normal with mean 10.94 and standard deviation 4.6	One-Sample Kolmogorov-Smirnov Test	.49	Retain the null hypothesis.
The distribution of attitude is normal with mean 25.38 and standard deviation 2.66.	One-Sample Kolmogorov-Smirnov Test	.36	Retain the null hypothesis.
The results of Kolmogorov-Smirnov test show that the scores of all dependent variables are normally distributed ($p > 0.05$).			

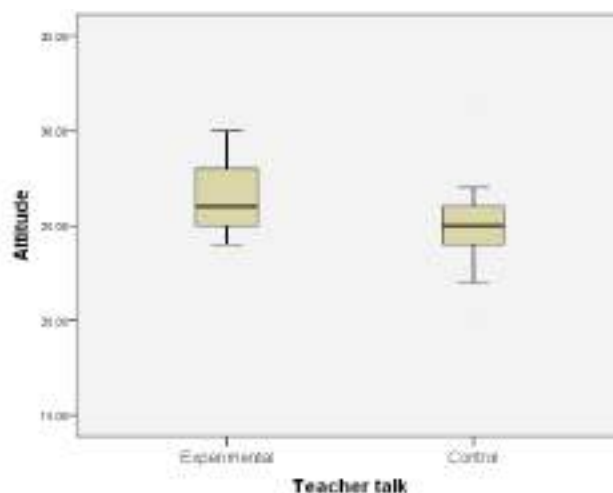

Figure 1: Box plot results for attitude

Figure 2: Box plot results for performance

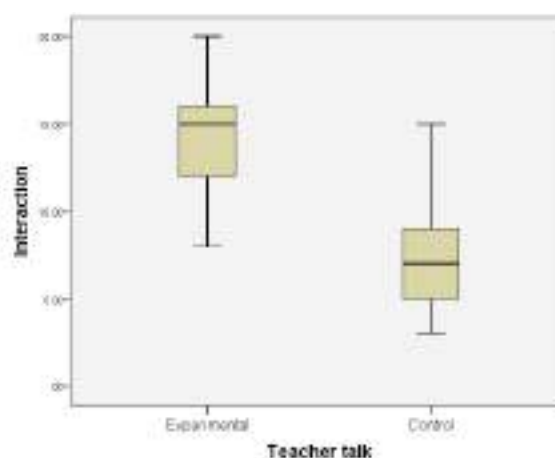

Figure 3: Box plot results interaction

Having ascertained the assumptions of independent samples *t*-test as a parametric test (i.e., the normality of data), the next step was to conduct the *t*-tests.

In order to investigate the first research null hypothesis on the role of teacher talk on learners' language performance, an independent samples *t*-test was carried out. First, the results of descriptive statistics are presented in table 2.

Table 2: Descriptive Statistics of Experimental and Control Groups

	Teacher talk	N	Mean	Std. Deviation	Std. Error Mean
Performance	Experimental	25	94.5200	5.99389	1.19878
	Control	25	80.8400	11.90476	2.38095

As the mean and standard deviation scores in table 4.2 show, there are differences between the experimental ($M = 94.25$, $SD = 5.99$) and control ($M = 80.84$, $SD = 11.90$) group learners' performance in the test. However, in order to get more accurate and reliable results, an independent samples *t*-test was run, the results of which are displayed in table 4.3.

Table 3: T-test Results of Group Differences in Language Performance

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
Performance	Equal variances assumed	11.39	.001	5.13	48	.000	13.68	2.66	8.32	19.03
	Equal variances not assumed			5.13	35.43	.000	13.68	2.66	8.27	19.08

The results show that the significance level of Levene's test is $p = 0.001$, which means that the variances for the two groups (experimental and control) are not same. The results of independent samples *t*-test show statistically significant difference ($t(35.43) = 5.13$, $p < 0.05$) between the experimental and control groups in the performance test. The descriptive statistics, too, point to the same finding showing that learners in the experimental group ($M = 94.25$, $SD = 5.99$) who were exposed to positive teacher talk outperformed those in the control group ($M = 80.84$, $SD = 11.90$). Therefore, the first null hypothesis of the present study is rejected.

In order to examine the second research hypothesis which is concerned with the role of teacher talk on learners' language interaction, an independent samples *t*-test was run. First, the results of descriptive statistics are shown.

Table 4: Descriptive Statistics of Interaction across Groups

	Teacher talk	N	Mean	Std. Deviation	Std. Error Mean
Interaction	Experimental	25	14.5200	3.24191	.64838
	Control	25	7.3600	2.69072	.53814

As table 4.4 shows, there are significant mean differences between the experimental ($M = 14.52$, $SD = 3.24$) and control ($M = 7.36$, $SD = 2.69$) participants' interaction scores. The results of t -test are indicated in table 5.

Table 5: T-test Results of Group Differences in Interaction

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Interaction	Equal variances assumed	.50	.48	8.49	48	.000	7.16	.84	5.46	8.85
	Equal variances not assumed			8.49	46.42	.000	7.16	.84	5.46	8.85

The results show that the significance level of Levene's test is $p = 0.48$, which means that the variances for the two groups (experimental and control) are the same. The results of independent samples t -test show statistically significant difference ($t(48) = 8.49$, $p < 0.05$) between the experimental and control group learners in the interaction scores. The descriptive statistics, too, point to the same finding showing that the experimental ($M = 14.52$, $SD = 3.24$) learners who received positive teacher talk gained higher scores in terms of language interaction compared to control group peers ($M = 7.36$, $SD = 2.69$). Thus, the second null hypothesis of the present study is rejected. For the investigation of the last research hypothesis of the present study, too, an independent samples t -test was run. First, the results of descriptive statistics are reported.

Table 6: Descriptive Statistics of Attitude across Groups

	Teacher talk	N	Mean	Std. Deviation	Std. Error Mean
Attitude	Experimental	25	26.4800	1.91746	.38349
	Control	25	24.2800	2.87981	.57596

As table 6 shows, there are significant mean differences between the experimental ($M = 26.48$, $SD = 1.91$) and control ($M = 24.28$, $SD = 2.87$) participants' attitude scores. The results of t -test are indicated in table 7.

Table 7: T-test Results of Group Differences in Attitude

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Attitude	Equal variances assumed	.07	.78	3.17	48	.003	2.20	.69	.80	3.59
	Equal variances not assumed			3.17	41.78	.003	2.20	.69	.80	3.59

The results show that the significance level of Levene's test is $p = 0.78$, which means that the variances for the two groups (experimental and control) are the same. The results of independent samples t -test show statistically significant difference ($t(48) = 3.17$, $p < 0.05$) between the experimental and control group learners in the attitude scores. The descriptive statistics, too, point to the same finding showing that the experimental ($M = 26.48$, $SD = 1.91$) learners who received positive teacher talk held a more satisfying attitude towards the classroom compared to control group peers ($M = 24.28$, $SD = 2.87$). Thus, the third null hypothesis of the present study is rejected.

The findings of the present study clearly shed light on the significance of teachers' speech in EFL classroom. The results of statistical analyses showed that experimental learners' attitudes, language performance, and interaction were enhanced at the end of the treatment period compared to their control peers. The results of the study are therefore in line with those of previous studies (e.g., Love, 1991; Musumeci, 1996; Pica, 1994; Walsh, 2002). The results of these studies, too, pinpoint the advantages of teacher talk in creating opportunities for learner involvement due to the fact that the teachers' use of language and pedagogic aim are at one. In other words, the teacher facilitates high learner involvement by developing a context in which learners are actively involved. Walsh (2002) argues that "the teacher, by controlled use of language and by matching pedagogic and linguistic goals, facilitates and promotes reformulation and clarification, leading to greater involvement and precision of language on the part of the learners" (p. 9).

CONCLUSION

There is in fact a vicious circle in the language use of teachers and the students' achievement. As the teachers use language which is appropriately tailored to the students' comprehension, goals, level, needs and wants, students' perceptions of success develops and extends which itself strengthens the self-efficacy of teachers in language use. Learners' success affects teachers' instruction type, choice of tasks, perseverance in achieving goals, and persistent effort. This behavior on the part of teachers can lead to the learners' development of long term goals about English learning who can form positive and constructive orientations toward English. Therefore, positive attitudes can help them set longer term goals and expectations of success, leading in turn

to higher self-efficacy beliefs. And, learners' level of achievement or language performance could lead to lower or higher self-efficiency beliefs in teachers' interactional discourse.

The findings of this study, therefore, have significant implications for teacher education and research. Teachers should be conscious of the significance of effective language use in the EFL classroom. By recognizing the connection between instructional purpose and language use, teachers can be more conscious of the essence of appropriate language use according to the teaching goal. Teachers also need to quit the idea of filling in the gaps in the language of the EFL learners. By using these strategies, teachers diminish the chance for conversational adjustments and learning opportunities.

Teachers should pay attention to the fact that students, especially those at the beginning stages cannot easily understand them; thus, they should teach at a slow to normal pace. This argument is in line with Krashen's $i+1$ (as cited in McLaughlin, 1987) and Pienmann's Teachability hypothesis (as cited in R. Ellis, 2008). Both of these lines of argument advocate the level of instruction that is slightly above the learners' current level of development. They can break thoughts into manageable phrases, but not into individual words, as this will interrupt the rhythm of speech. As with importance of holistic learning, teachers can use visual clues so learners can associate words with objects. It is helpful to label as many items in the classroom as possible.

As one of the data collection tools in the present study was classroom observation, teachers can be more aware about their language use in the classroom by recording their classes. By so doing, they can get better insight about their verbal behavior in the class. Listening to the audio or video records and also analyzing the transcripts can increase teachers' awareness about efficient and useful language use.

With regard to the educational programs, it should be noted that they can spend more time and attention to the appropriate teacher talk in the classroom. This point is significantly important since the current pre- and in-service education programs do not pay due attention to the importance of useful communication and the significance of measuring the use of language in teaching. Current models of teacher education are commonly focused on two issues: the methodology issue and the language awareness issue. It is suggested that the third issue of teacher talk, interaction and learning be also included in education programs.

There should also be a more comprehensive understanding of the quality language use in the classroom in order to reach a series of guidelines which bring about effective teaching in the classroom. With adequate attention given to the teachers' differences in terms of their teaching style and with the avoidance of being too much prescriptive about pedagogical practices, much can be done to boost teachers' comprehension of the relation between teachers talk, interaction and language acquisition. This can lead to a more thoughtful and controlled use of language in the classroom.

The study has some limitations that should be taken into consideration. First, the cross-sectional nature of the study in which the variables have been tested at once, exerts restrictions on the

generalizability of results which can be neutralized by the conduction of longitudinal research. Second, questionnaires can be subject to responses silhouetted with social desirability. Results of the study, therefore, need to be interpreted with due consideration.

Appendix

(Learner Perception of a Good Teacher)

Name of Institute:

Name of student:

Gender : Male

Female

Age :

Date:

Direction: this questionnaire is just a part of my research about (Teacher talk) -how you can learn best in English classroom- please answer carefully and objectively .your responses to this questionnaire will help instructors confirm quality teaching and improve teaching skills and methods. Helps from you will be highly appreciated. Thank you very much.

PART 1:

ITEMS		<div> <div>Extremely Important</div> <div>→</div> <div>Not important</div> </div>				
		1	2	3	4	5
1	The teacher explains important concepts/ideas in ways that I can understand	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
2	The teacher stimulates my interest in the subject	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
3	The teacher demonstrates enthusiasm in teaching the unit	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
4	Appropriate teaching techniques are used by the teacher to enhance my learning	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

5	The teacher is helpful if I encounter difficulties with the lecture/unit	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
6	The teacher is available for consultation (e. g., email, online, face-to-face or telephone).	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>
7	I receive feedback in time to help me improve.	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>

PART 2: The number rating stands for the following:

1 = rarely 2 = once in a while 3 = sometimes 4 = most of the time 5 = almost always

Circle the answer that fits with your experience of this teacher for each item.

<p>EXPLICIT CURRICULUM: How well does the teacher teach the core subject?</p>						
1	Teacher is prepared for class.	1	2	3	4	5
2	Teacher knows his/her subject.	1	2	3	4	5
3	Teacher is organized and neat.	1	2	3	4	5
4	Teacher plans class time and assignments that help students to problem solve and think critically. Teacher provides activities that make subject matter meaningful.	1	2	3	4	5
5	Teacher is flexible in accommodating for individual student needs.	1	2	3	4	5
6	Teacher is clear in giving directions and on explaining what is expected on assignments and tests.	1	2	3	4	5
7	Teacher allows you to be active in the classroom learning environment.	1	2	3	4	5
8	Teacher manages the time well.	1	2	3	4	5
9	Teacher returns homework in a timely manner.	1	2	3	4	5
10	Teacher has clear classroom procedures so students don't waste time	1	2	3	4	5
11	Teacher grades fairly.	1	2	3	4	5
12	I have learned a lot from this teacher about this subject	1	2	3	4	5
13	Teacher gives me good feedback on homework and projects so that I can improve.	1	2	3	4	5
14	Teacher is creative in developing activities and lessons	1	2	3	4	5
15	Teacher encourages students to speak up and be active in the class.	1	2	3	4	5

ISBN: 2269-2787 & ISBN: 2269-8218 www.wjilatwib.org

IMPLICIT CURRICULUM: How well does the teacher model the core values through how he/she behaves with students and with other staff persons?						
16	Teacher follows through on what he/she says. You can count on the teacher's word.	1	2	3	4	5
17	Teacher listens and understands students' point of view; he/she may not agree, but students feel understood.	1	2	3	4	5
18	Teacher respects the opinions and decisions of students.	1	2	3	4	5
19	Teacher is willing to accept responsibility for his/her own mistakes.	1	2	3	4	5
20	Teacher is willing to learn from students.	1	2	3	4	5
21	Teacher is sensitive to the needs of students.	1	2	3	4	5
22	Teacher's words and actions match.	1	2	3	4	5
23	Teacher is fun to be with.	1	2	3	4	5
24	Teacher likes and respects students.	1	2	3	4	5
25	Teacher helps you when you ask for help.	1	2	3	4	5
26	Teacher is consistent and fair in discipline.	1	2	3	4	5
27	I trust this teacher.	1	2	3	4	5
28	Teacher tries to model what teacher expects of students.	1	2	3	4	5
29	Teacher is fair and firm in discipline without being too strict.	1	2	3	4	5

Any other comments or suggestions:

Thank you for taking the time to think through the items carefully and thank you for completing this questionnaire honestly.

THE EFFECTS OF AWARENESS-RAISING OF SPOKEN TEXT CHARACTERISTICS ON EFL LEARNERS' ORAL PERFORMANCE ACROSS GENDER

Mortaza Aslrasouli

Department of English language, Islamic Azad University, Maragheh Branch, Maragheh, Iran

Elham Khodayari

Department of English language, Islamic Azad University, Maragheh Branch, Maragheh, Iran

ABSTRACT

Over the past decade or so, an effort has been made to draw learners' attention on various linguistic features through different language activities. Among these, raising learners' awareness on the linguistic aspects is considered to play an effective role on their improved performance. Hence, the present study sought to examine the effects of awareness – raising of spoken text characteristics (i.e., time-creating, facilitation, and compensation devices) on Iranian English as a foreign language (EFL) learners' oral production in a speaking task across gender. A total of 28 upper-intermediate students from Voice of Tabriz institute, Iran, participated in the study. The participants were randomly divided into two groups of experimental and control groups. The experimental group received instruction on the spoken features; however, the control group underwent the same course of instruction in a traditional method without any treatment. Following an administration of a posttest, it was found that the experimental group outperformed the control group with respect to the spoken features. However, the statistical analyses did not reveal any significant differences across the gender role, with male and female participants performing relatively identical degree of oral performance. The findings lend support to the idea that the students' awareness should be raised with respect to the features of speaking skills during the class activities. The findings suggest implications for educators, materials developers, and EFL learners in particular.

KEYWORDS: Awareness-raising, Time-creating devices, Facilitation devices, Compensation devices, Gender, Spoken text features, Oral performance,

INTRODUCTION

Following language awareness movement in 1980s, the role of consciousness in second language acquisition (SLA) received considerable attention by theoreticians, researchers, and practitioners in the field. It is argued that the key role of consciousness should be specifically regarded if we are to make progress in understanding how language acquisition occurs (e.g., Leow, 2000). By understanding the functions and effects of the concept of consciousness in SLA, students will be able to use language consciously and appropriately. Evidence from research findings and their relevance to the issues of consciousness lend support to the fact that conscious learning can contribute to successful second language (L2) acquisition (Robinson, 2003).

Conscious awareness of the target language system, as Schmidt (1990, 1995) contends, is vital if learners are to create more correct forms and utilize them less erroneously. Schmidt (2001) has also argued that SLA is driven by what learners pay consciously attention to and notice in the target language input and what they understand the significance of the noticed input to be. Four concepts of consciousness are currently discussed in the literature: attention, awareness, intentionality, and control. Since the focal point in this study is on awareness-raising, the concept of awareness is explicated for a better understanding below.

Awareness

Awareness is an individual's subjective experience of a stimulus or cognitive content. Ellis (1993a), in his discussion of implicit and explicit knowledge, stated that explicit knowledge is a conscious representation which is not the same as articulated knowledge. The significant issue, then, is whether awareness is stimulated by oral or written language, by reference or not, by timing, by different social arrangements, by formal or functional activities involving a focus on L2 input or reflection on input (Long, 1991). In line with Ellis (1993a), three conditions, according to Allport (1988), are conceived as essential for a person to be aware of a given experience. First, the person must indicate a behavioral or cognitive change as a result of experience. Second, the person must show that he / she was aware of the experience at the time it happened. Finally, the person must be capable of describing the experience.

A point of distinction between two types of knowledge seems essential to better understand the role of awareness in learning. Paradis (1994) makes a distinction between implicit and explicit knowledge where the former is acquired without awareness, unavailable to conscious memory even after competence and put to use spontaneously without conscious control. The latter, however, is knowledge that the learner is aware of and can access on demand. Schmidt (1990) argues that learners have to pay some kind of attention to language forms in order for the acquisition of accuracy.

It is, hence, safe to argue that teachers should make learners aware of the processes involved in language learning and to help them find environments that suit their needs best. Kohonen (1991) argues that raising the awareness of one's own learning and gaining an understanding of the processes involved is a core factor for the development of autonomous learning. Therefore a balance must be found between providing opportunities for the learners to take control over their learning while at the same time supporting those learners who are not ready or who feel unprepared to take on this responsibility for themselves.

Speaking Proficiency and awareness

The concept of consciousness-raising, particularly awareness-raising activities, are hotly debated in the field to come up with more practical employment devices of those activities with respect to various areas of L2 acquisition. One such area has been the command of speaking skills in English which is a priority for many L2 or foreign-language learners (Richards, 2008). Learners often evaluate their success in language learning and the effectiveness of their English course on the basis of how much they feel they have improved in their spoken language proficiency. They only feel satisfied of their development when they realize they can speak and utter English words

easily, or that the effort they have to make in order to speak decreases as they acquire new information through their material with the assistance of their instructor. Allison and Martyn (1993) believed that materials developers have to devote some parts in the course books to introduce the unique characteristics of spoken language.

Characteristics of spoken texts

Many learners of English encounter more difficulties in listening and speaking than in reading and writing. One of the contributing factors is that much emphasis is laid on the written text in the teaching syllabus. The effect is that young learners start learning the written form of the language with little regard to its aural-oral aspect. When listening to natural, unscripted speech, students are exposed to loose, flowing texts. On the other hand, when reading, they are exposed to dense, structured texts. Many teachers fail to highlight this difference to the students and subsequently the teaching and learning of listening and speaking skills can only achieve minimal results.

Foreign language teachers, thus, are strongly suggested to equip the learners with ways to alert learners to these characteristics in order that they can cope with real-world listening input and real-life communication more effectively. Classroom listening, however, is not real-life listening. So it is very important to provide students with training in listening comprehension that will prepare them for effective functioning outside the classroom. Activities should give learners practice in coping with at least some of the features of real-life-situations. They will be more motivating and interesting to do than contrived textbook comprehension exercises. EFL learners should take the following factors into account if they want to make communication easy and deal with its issues in a better way (Lam, 2002):

Utilization of time-creating devices

The speaker uses the time creating devices to simplify the speech production as well as to generate time to produce what to tell next in unplanned speech. One example is the utilization of pause feature even if pause filler doesn't have any lexical or syntactic function such as "um" , "urh" , "eh" that is invented to offer great help for speaker to gain enough time to communicate his words .

Utilization of facilitation devices

Bygate (1987) argues that speakers employ facilitation devices when they are under time pressure in real-life communication to make their speech production less demanding. If learners are not equipped for these devices in listening and fail to recover the full meaning of these constructions, they will experience difficulties in real-life communication. Utilization of fixed and conventional phrases, speech formulas, and Stock phrases such as "I see what you mean," "I'm sure you're right but..." "You know," "I mean," "kind of," are some of the devices to facilitate speech production. (Lam, 2002). The use of these ready-made phrases reduces the burden of speaker's task, thereby increasing speed and fluency. As effective listeners, students need to be instructed about them understand their function.

Utilization of compensation devices

Since listening data are processed very swiftly, the rate of natural speech is highly difficult so that spoken discourse cannot be retrieved during normal interaction. Redundancy in natural speech, however, provides the speakers with some processing time to overcome the deficiency. The three common ways of repetition, reformulation, and rephrasing can be employed to create redundancy and relieve memory load. Speakers always find themselves correcting or improving what they have already said. They may repeat part of speech at the request of listener or express their ideas in different ways. According to Lam (1997), repetition, reformulation, and rephrasing are used by speaker to build redundancy and effective listeners need to be familiar with these elements of redundancy to be able to guess meanings from the help of compensation devices.

REVIEW OF RELATED LITERATURE

Recent years have witnessed a bulk of research considering the role of awareness-raising activities on learners' ultimate comprehension and production elements of language enterprise. Quite a number of studies (e.g., Elbro & Petersen, 2004; Nakatani, 2005; Saito, 2007; Shu-Chin, 2012; Svalberg, 2007), have acknowledged a general positive impact of awareness giving on learners' subsequent performances. Altman (1997), from her personal language learning case study, found that, "a key to the success of the language learner seems to be the extensive employment of awareness—the focusing of attention on all aspects of the language to be learned" (p. 93).

Nakatani (2005) explored the influence of awareness giving on young Japanese adults' use of oral communication strategies such as maintenance of fluency and negotiation of meaning. The findings revealed that the learners in the experimental group who received awareness produced longer sentences and used more achievement strategies, and did not leave the message as often as the learners in the comparison group.

Following this line of enquiry, Shu-Chin (2012) found positive effect of the use of rhetorical consciousness-raising instructional materials in writing research papers. In line with the results found by Nakatani (2005), Jones (2001) found positive impact of explicit training in conversational story telling. Similarly, Elbro and Petersen (2004) came to this conclusion that phonological awareness-raising of kindergarten children of dyslexic parents was influential. The children received awareness-raising for 17 weeks and it was revealed that the awareness training had long-term effects as late as grade 7.

Sze (2008) researched the effect of awareness-raising in teaching of phonetics. He addressed the question of how teachers should approach phonics teaching in L2 contexts. His main purpose in his paper was to argue for an awareness raising approach to teaching phonics to school children who learn English as a second language. He then explains and concludes that the approach of awareness-raising is more advantageous and it applying it to the classroom and the process of teaching leads to a more successful teaching outcome in phonetics.

It has been claimed that explicit learning within language awareness framework is facilitative in a variety of linguistic fields (Svalberg, 2007). Despite the core role of awareness raising in the process of L2 acquisition and learning of different skills (e.g., Ghorbani, 2011; Robinson, 1995; Schmidt, 1994, 2001), there are some arguments against the significance of language awareness. For example, Alderson, Clapham, and Steel (1997) in their study conclude that whilst knowledge about language may be worthwhile in its own right, there is no evidence to justify the teaching of metalinguistic knowledge as a means of improving students' linguistic proficiency. Al-Hejin (2004) also takes a more cautious stance, but concludes that both attention and awareness facilitate learning. The debate includes Norris and Ortega's (2000) synthesis and analysis of 49 published studies, which concluded that on the available evidence explicit instruction, is more effective than implicit instruction.

Speaking skill is a very important and crucial part of learning any language. Its importance and specific characteristics have been pointed out constantly by experts involved in the field. It has also been emphasized that teachers must be aware of such characteristics in order to better instruct their pupils. Unlike the sole focus on the mere skill and teachers familiarity with it, the matter that whether learners' awareness of the existence of such factors has any effect on their acquisition, have not been taken under close scrutiny to see whether knowing these characteristics prior the material learning can guide language learners through a better learning path or not. Also the fact that whether this knowledge is gender relevant has not been considered much in the studies. This study tackles the issue that whether familiarizing the learners with characteristics of spoken text and raising their awareness of such characteristics increases their language intake and also the issue that whether learners' gender plays a role in this process. The aforementioned studies imply that awareness-raising is not just limited to the forms of language but it can be expanded to different skills of language. Although so many studies have been done in this field, but few researches have reported the effect of awareness-raising features on speaking skill. As it has been stated before, this study is an endeavour on the base of Lam's theory the effect of awareness-raising about features on spoken text in order to improve EFL learners' speaking skill.

RESEARCH QUESTIONS

This study will be an attempt to find scientific answers for the following research questions:

1. What is the effect of raising awareness about characteristics of spoken text on the upper-intermediate Iranian EFL learners' speaking skill?
2. Is there any significant difference between male and female upper-intermediate Iranian EFL learners' use of speaking features?

RESEARCH HYPOTHESES

In order to fulfil the objective of the study, the following null hypotheses have been proposed:

Ho. (1): Awareness-raising of the characteristics of spoken text has no effect on the speaking proficiency of the upper-intermediate Iranian EFL learners.

Ho. (2): There is no significant difference between male and female upper-intermediate Iranian EFL learners' use of speaking features.

METHODOLOGY

Participants

A total of 28 students participated in this study. An equal number of 14 students, namely, 7 male and 7 female, took part in the experimental and control groups. The study participants attended in English conversation courses at Voice of Tabriz institute (Foreign Languages Center). The English conversation course lasted for 2 months and was held twice a week for 105 minutes per session in the evening (Holidays were excluded). For the homogeneity of the subjects, prior to research, the proficiency test PET (Cambridge Preliminary English Test, 2004) was administered to 56 students. From this pool 28 students participated in the study and were assigned randomly into the experimental and control groups.

Instrumentation and materials

This study was conducted with 28 EFL students chosen from among 56 students based on their proficiency scores. The proficiency test PET (Cambridge Preliminary English Test) was administered to make sure as to the homogeneity of the two groups in terms of their level of proficiency. The test included two parts, namely, a reading-writing part and a listening part.

In addition to the proficiency test, a pretest was administered to measure as well as to homogenize the participants' speaking skill in both groups of the study. The pretest included an argumentative topic selected from Top Notch series. The test required the participants to express their opinion on a predetermined topic which was not already discussed in the course. Their oral performance was recorded by the tape recorder and later was rated via three different raters.

Following this, the study included treatment sessions twice a week for two months in which a 6-minute English B.B.C podcast was used. The program involved different real-situation conversations in dialogue and monologue forms of authentic speech. The experimental group received discussion activities after each listening activity; however, the participants of the control group did not receive any discussions.

In order to measure and compare the participants' oral performance in both groups and the effects of awareness-raising on students' speaking performance in the experimental group, a similar posttest was administered to the groups. The scoring criteria for the conducted tests will be discussed later in this chapter.

Procedure

The study was conducted through the following stages: First, Cambridge Preliminary English Test (PET) was administered to homogenize the participants in terms of their English language proficiency. From among 56 participants who took this test, 28 students whose scores were one standard deviation above and below the mean were selected as the participants of the experiment. Second, the participants were randomly assigned into two groups: an experimental and a control

group, each including 14 participants. Next, a speaking assessment pretest was administered. For this purpose, we asked the very same topic with allotted 2 minutes to each and every individual of participants and the results were evaluated by three. The raters were already instructed about the rating criteria and necessary guidelines were offered in a one-hour session.

The next step of the experiment was the treatment stage that lasted for 9 weeks (2 months). In each session, the participants in the experimental group were exposed to authentic listening tasks to get familiar with the real-life speaking features and become aware of the communication devices employed by native speakers. After highlighting the spoken features in listening task, a discussion over these features was formed. More than 20 minutes was allotted to this activity in each session.

The participants in the control group were exposed to the same listening tasks in each session. They didn't receive any treatment of discussion, or awareness - raising activities about the features of spoken language which were the use of time-creating, facilitation, and compensations devices before, during, and after listening to the materials. But the difficult vocabulary or ideas were presented to them as a pre-listening activity. On the other hand, the experimental group received discussion, or awareness - raising about the features of spoken language in terms of the use of time-creating, facilitation, and compensations devices before, during, and after listening to the materials. Every session, the researcher at the beginning of the class talked about the different kinds of real conversation features and during the listening task he explained those features. At the end of the class, he asked students to distinguish those features in the listening task and discuss about them.

Finally, a posttest was given to the participants of both groups at the end of the course of instruction to compare their oral performance and to see whether awareness-raising of features of real speech has any impact on their speaking performance. After collecting the data, the participants' oral performance was transcribed to measure their oral production.

Measurement of Speaking Performance

Following the collection of the audio-taped data, three criteria of time-creating, facilitation, and compensations devices were developed to evaluate the quality of the participants' oral production. The three measurement criteria were intended to assess the fluency dimension of participants' oral performances. That is, the aim was to better understand whether employing any of the devices explained below leads to more fluent speech in learners. Each rater was instructed about the related strategies and their scores were averaged for later data analysis and rating basis. The criteria were operationalized as follows:

1. *Time-creating devices*: application of pause feature even if pause filler doesn't have any lexical or syntactic function such as "um" , "urh" , "eh" that is invented to offer great help for speaker to earn enough time to convey his words .

2. *Facilitation devices*: employment of ready-made phrases to simplify speaker's task, thereby increasing speed and fluency. Such phrases as "you know," "I mean," and "well" may serve as pause fillers as well.

3. *Compensation devices*: The three common ways are use of repetition, reformulation, and rephrasing strategies to create redundancy and relieve memory load. Speakers always find themselves correcting or improving what they have already said.

RESULTS AND DISCUSSION

After collecting the data, the experimental and control groups' oral performance was transcribed. Their oral production was measured based on the established criteria with respect to speaking features. To answer the research questions, the data were then submitted to statistical analyses which included several Independent Samples t-tests and descriptive analyses. That is, four different Independent Samples t-tests were used in order to measure and compare the homogeneity and amount of progress in speaking features for both groups in pre-test and posttest. In all analysis the alpha was set at .05.

A statistical analysis was run to calculate the distribution of data in the pre-test and posttest. Table 1 indicates the descriptive statistics for data distribution for speaking variable in pretest and posttest. The mean score in pretest and posttest were **29.54** and **34.93** respectively and the minimum and maximum scores were **20** and **40** for the pre-test and for the posttest were **21** and **48** respectively.

Table 1: Descriptive Statistics for Data Distribution – Pre/Posttest

	N	Mean	Std.	Skewness	Kurtosis	Minimum	Maximum
Pre-test	28	29.54	5.922	.180	-.196	20	40
Posttest	28	34.93	7.195	.177	.111	21	48

In order to investigate the distribution normality of variables score, kolmogorov-samimov test was used. The *p* value in pretest was **0.863** and in posttest was **0.985**. With regard to acquired significance level, it is concluded that speaking variable in both pretest and posttest has normal distribution. Table 2 shows the statistics for the normality distribution.

Table 2: One-Sample Kolmogorov-Smirnov Test for Pre/Posttest

	Mean	N	Std.	Sig.
Speaking Pre-test	29.54 34.93	28	5.922 7.195	.863
Speaking posttest		28		.985

An Independent Samples t-test was used to compare the homogeneity of the two groups of the study in pre-test. Table 3 indicates the results of independent samples t-test for pre-test.

Table 3: Descriptive Statistics and Independent Samples t-test for the Pre-test Speaking

	Mean	N	Std.	t	df.	Sig.
Speaking Pre-test						
Control group	29.86 29.21	14	5.600 6.423	.282	26	.780
Experimental group		14				

As Table 3 indicates the mean score for speaking pretest in control group was **29.86** and in experimental group was **29.21** and the p level was **0.78**. That is, the participants in two groups of the study performed rather equally with respect to the three features of spoken devices (time-creating, facilitation, and compensation devices). As a result, the control and experimental groups do not statistically differ with respect to speaking pretest. So the homogeneity of control and experimental group is verified.

In order to study the homogeneity of male and female, speaking pretest scores were compared in either group. Another independent samples t-test was used for this comparison.

Table 4: Descriptive Statistics and Independent Samples t-test for the Male and Female- Pre-test Speaking

	Mean	N	Std.	t	df.	Sig.
Speaking Pre-test						
Male	29.07 30.00	14	5.690 6.325	.408	26	.686
Female		14				

As Table 4 illustrates, the mean score of speaking pretest in male's group was **29.07** and in female's group was **30** and the significance level was **0.686**. Table 4 shows the results of Independent Samples t-test for both male and female groups. Regarding the significance level ($p=0.68$) in t-test, the null hypothesis was not rejected. In terms of gender, no group outperformed another one with respect to the three dimensions of spoken features. As a result,

there is no significant difference in the speaking pretest scores in both groups of male and female. So the male and female groups are homogeneous.

First hypothesis: Awareness-raising of spoken text characteristic has no effect on EFL learner speaking skill.

Table 5: Descriptive Statistics and Independent Samples t-test for the Posttest Speaking

	Mean	N	Std.	t	df.	Sig.
Speaking Posttest						
Control group	32.07	14	6.318	2.254	26	.033
Experimental group	37.79	14	7.073			

An Independent Samples t-test was used to answer this hypothesis. As Table 5 indicates, the mean score of speaking posttest in control group was **32.07** and in experimental group **37.79**. The latter group outperformed the former in speaking posttest. With regard to the significance level of t-test ($p=0.033$), the null hypothesis is rejected. As a result, the experimental groups' speaking fluency improved in terms of the three dimensions of features of spoken text in the posttest which means that the awareness-raising of spoken text characteristics tends to have a significant effect on EFL learners' speaking skill.

Second hypothesis: There is no significant difference between male and female in applying the speech techniques.

Table 6: Descriptive Statistics and Independent Samples t-test for the Male and Female- Posttest Speaking

	Mean	N	Std.	t	df.	Sig.
Speaking Pre-test						
Male	34.79	14	7.628	.103	26	.919
Female	35.07	14	7.022			

Finally, another Independent Samples t-test was used to answer the second hypothesis. As Table 6 indicates the mean score of speaking posttest in male's group is **34.79** and in female's group is **35.07**. The female group outperformed the male one in the posttest. With regard to p value ($p=0.919$), the null hypothesis is not rejected. As a result, there is no statistically significant difference between the female and male groups in speaking posttest. So there is no significant difference between male and female in applying the spoken features in terms of time-creation, facilitation, and compensation devices which lead to ultimate fluency.

Discussion

The present study was designed to shed light on our understanding of spoken text features when the awareness-raising is employed in language activities. The rationale underlying this study is that when learners are aware of the kinds of characteristics used in the spoken texts and they receive instruction on these features, their oral performance, and hence, their oral production is improved. Since learners often judge their success in language learning and the effectiveness of their English course on the basis of how much they feel they have improved in their spoken language proficiency, instructing them about the spoken text features and consequently raising their awareness on these characteristics will equip them with necessary skills and strategies to succeed in their final oral productions. Compared to other studies, it has taken the view that learners' oral performance in EFL contexts extremely suffers due to the scarcity of exposure to the target language and the ignorance of focusing attention (the absence of learners' awareness) on different spoken text features which are embedded in language activities. Therefore, the present study has focused on the awareness-raising of spoken text characteristics and then on the influence of this awareness EFL learners speaking skill and their subsequent oral production.

Using a range of measures, the participants' oral performances in both groups of the study were measured and compared. First, the speaking variable in both pretest and posttest had normal distribution. Second, the researchers found some evidence that raising learners' awareness of characteristics of spoken language resulted in improvements in their oral performance. This finding is supported by the idea that adding specific texts or instructions regarding speaking skill's characteristics to the English learning materials appear to be a necessity. If EFL learners recognize the features of spoken language, their future difficulties will be removed in the final stage of language production.

The findings of the study are also supported by Allison and Martyn's belief (1993) that materials developers have to be required to develop and incorporate some parts in the course books to introduce the unique characteristics of spoken language.

The results of the study are also in line with the suggestions made by Lam (1997) and Wu (1993) who stated that students need to recognize the features of spoken language and be aware of such techniques as the use of time-creating, facilitation and compensations devices in order that they can handle real-life listening input and real-world communication. Wu (1993) further pointed out that in order to formulate and create what to say and facilitate his/her speech production; a speaker is suggested to use time-creating devices to gain the necessary time in final stage of oral production. Consequently, Bygate (1987) suggests that time pressure in real-world communication makes it necessary for the speaker to apply facilitation devices to facilitate the production of speech. Again, the finding of the present study is in line with the idea proposed by Bygate (1987).

However, with respect to gender and its impact on the learners' application of speaking techniques, no positive effect was found in this study. The results of the study did not indicate any statistically significant differences in terms of gender and its role in speaking activities

between the two genders of the study. The reason for the absence of significance between the two genders leaves another question for further investigation in later attempts.

The first research question addressed the effects of raising awareness about the characteristics of spoken text. The results of the study indicate that EFL learners' awareness is significantly raised by instructing them about the features of spoken texts and equipping them with such techniques as the time-creating, facilitation and compensations devices, which gives more support to the insights and theories of Allison and Martyn (1993), Lam (1997), Wu (1993), and Bygate (1987).

Therefore, it is safe to argue that raising learners' awareness about the characteristics of spoken text and providing them with the necessary speaking devices give them the opportunity to recognize the skills and strategies that should be included in the completion of an oral production activity. In doing so, learners' oral performance quality is likely to improve to a great extent. Therefore, the findings of the study are in line with the previous studies regarding raising learners' awareness.

The second research question addressed the effects of gender on EFL learners' use of speaking features. The findings in this study did not indicate a statistically significant effect on L2 production as a result of gender differences between male and female learners. Although the participants' awareness was raised with respect to the speaking features and was instructed equally on the communication techniques, when they came to produce L2 under the real time communication, gender differences were not capable of improving learners' oral performance. Therefore, the results revealed that no gender outperformed the other in terms of the quality of their oral production.

CONCLUSION

This study made an attempt to investigate the effects of awareness – raising of spoken text characteristics on Iranian learners' oral production in a speaking task. The research was conducted with 28 students taking an English conversation course at Voice of Tabriz institute at upper-intermediate level. Doing the same speaking task, the participants' oral performance in both experimental and control groups was recorded and measured based on the established criteria. The effect of awareness-raising on the established aspects of language production was determined by comparing the participants' performance among participants with and without exposure and instruction to/about communication strategies.

Previous research findings (e.g. Ghorbani, 2011; Jones, 2001; Nakatani, 2005; Shu-Chin, 2012, and Sze, 2008) provide evidence supporting the effectiveness of awareness - raising in enhancing and improving EFL learners' oral performance. The findings of the present study provided support for the close link between awareness-raising as a metacognitive strategy and high quality of oral performance.

The findings of this research supported claim which proposed that the communicational skills can be learnt consciously and that the communicational skills are important to enable learners to have a conversation and it is a great part of their language development.

In brief, it can be concluded that in EFL contexts teaching features of spoken texts by raising learners' consciousness about different communication devices and techniques is an effective way to improve their oral performances. Accordingly, it can be an effective replacement for the traditional way of practicing and testing speaking skill in EFL classes.

Pedagogical implications of the study

The present study supports the findings of previous research regarding awareness - raising. The most important contribution of this study is that it provides L2 and L2 educators with a clear explanation of how awareness - raising affected the L2 learners' (a) cognitive strategic processes, (b) their application of social strategies, and (c) the affective aspect of their speech. The present study has implications for pedagogy. In terms of pedagogical practice, the findings of this study suggest that awareness-raising can promote an optimal balance between conscious attention/awareness and characteristics of spoken texts. In addition, the findings suggest that learners' awareness of those features can balance the learners' quality of speech.

Lastly, there are certain implications taken from this study for language teachers and material development experts. Teachers can include consciousness-raising activities in their daily teaching programs to enable learners to improve their quality of speech. In teacher education courses, the findings can be beneficial for training language teachers who are to teach English as a foreign language in EFL contexts.

Suggestions for further research

First, the present study did not take into account different levels of proficiency. Only upper-intermediate learners participated in the study. To examine the effects of raising awareness on the learners' oral performance, different levels of proficiency should be included in the study. Second, from the different types of language learning skills and sub skills, only speaking skill was used to be performed and measured after doing consciousness raising task in the classroom setting. Different results might be observed with different levels of proficiency and various skills and sub skills of English language in an EFL setting. Third, the number of students participating in the study was limited to 14 in each group. A larger sample of participants should be selected and examined to ensure the effectiveness of awareness-raising on the learners' oral performance. It seems that a large sample might produce more reliable and different results.

ABSTRACT

This study investigated the effect of teaching grammatical linkers (GLs) on Iranian pre-intermediate L2 learners who read to comprehend the written academic discourse. Reading comprehension of written academic discourse may be enhanced if university students are familiar with GLs as cohesive devices (e.g., however, and, so, etc.). In doing this study, 80 university students took part in the investigation. Through the administration of a homogeneity test, 52 pre-intermediate students who enrolled in the second year of English translation at Abadan Azad University were chosen. Then they were randomly divided into two groups of control (n=26) and experimental (n=26). They took a reading comprehension pre-test to assess their knowledge of GLs at the beginning of the research. To evaluate the frequency of GLs used by participants, they also took a pre-test of writing one-paragraph essays. During eight sessions, both groups worked on reading passages. The experimental group received explicit instruction including explanation on the form and function of GLs, while the control group received conventional instruction including examples in an implicit method. At the end of the treatment, a post-test on reading comprehension were administered to evaluate the effect of GLs instructions and a one-paragraph essays to assess the participants' uses of GLs. The results obtained from the Independent and Paired Samples t-tests revealed that there was a significant difference between the performances of two groups. In the post-test, the experimental group outperformed the control group in comprehending written academic discourse. The results of analyzing GLs frequency showed a significant difference between the pre and post-tests. This study suggests that teaching cohesive devices such as GLs may help teachers to teach reading comprehension effectively.

KEYWORDS: Grammatical linkers (GLs), Reading comprehension, Written academic discourse

INTRODUCTION

Discourse is described as a piece of writing or speech that is longer than a sentence or an utterance. In academic writing, it is indispensable for the writers to guide the readers through the discourse signaling what is important and how each sentence links to others (Schiffrin, 1987). Accordingly, grammatical linkers (i.e., addition, contrast and comparison, conclusion, etc.) are the discourse signaling cues and use between sentences and between paragraphs. They connect

the related ideas, so they help readers to see connections that they might miss or misunderstand (Risselada & Spooren, 1998).

Grammatical linkers (GLs) are the main elements of linguistic production and the crucial factors in successful language learning. These linkers (e.g., but, however, and, or, etc.) are partly familiar to the authors and readers who often participate in academic discourse. The loss of such words and phrases might show the lack of cohesion in a particular discourse. There is no doubt that as writers mature; they rely increasingly on GLs as cohesive devices and that the lesser use of them is considered as a characteristic of the novice writers (Fraser, 1999). Students of English as a foreign language (EFL) may be unfamiliar with GLs as well as their functions in written academic discourse, and therefore may have the problems in comprehending these kinds of texts. In addition, as Fung (2011) states, nowadays a few teachers are prepared to teach students how to make use of grammatical linkers to build comprehension, though it is a widely accepted fact that knowledge of GLs is important for reading.

Students can benefit from explicit instruction that focuses on the identification of these linkers and their functions. Furthermore, they can get cues for signaling information and discourse organization, which are used to control the amount of information presented in the text as well as the ways in which the new information is introduced, and which in turn help reading comprehension, especially with more difficult texts (Hyland, 2005). There are many different GLs and, perhaps even more importantly, some of them are used more in speech than in writing, or vice versa or some of them are more informally used than formally and so on. Some researchers (e.g., Halliday & Hasan, 1976) have provided the lists of GLs, classified them, assigned different names to each category and defined special features for each of them.

According to Parker (1982), GLs include Addition, Comparison, Contrast, Emphasis, Example, Exception, Place, Proof, Purpose, Result, Sequence, Summary, Time (Appendix E). Among these categories, just four groups have been selected and taught in this study. They are as follows:

Table 1: GLs' Classification (extracted from Parker, 1982)

Contrast	but, in contrast, on the contrary, although, however, whereas, while, though, even though
Addition	And, in addition, furthermore, moreover, besides, also, additionally, further, not only-but also, as well as
Time	After, before, then, once, next, finally, at last, first, second, etc., at first, soon, meanwhile, at the same time, for a minute, hour, day, etc., during the morning, day, week, etc., immediately, as soon as, when, until, as
Summary	Therefore, so, consequently, thus, in short, in conclusion, in brief, as a result

GLs rank among the key cohesive devices in formal written discourses. What is more, the knowledge of these linkers helps to understand and create text with greater ease. Many Iranian pre-intermediate L2 learners have problems in comprehending written academic discourse and their teachers often complain from the weaknesses of the students and the low level of EFL classes. It seems the training that these students receive does not enable them to attain full

competence in comprehending written academic discourse (Parvaresh & Nemati, 2008). These learners may be unfamiliar with GLs and their functions in the written texts. The present study intends to investigate teaching these linkers into pre-intermediate L2 learners who have many problems in comprehending written academic discourse.

REVIEW OF LITERATURE

GLs are words and expressions taken into consideration within the text in order to join one sentence to another sentence or one paragraph to another paragraph. A writer utilizes these linkers between sentences to show relationships between ideas in adjoining major sections of academic discourses. S/he presents an idea and then other ideas to deepen the first idea by adding for example: and, besides, further. Here, it should be clarified what is meant by the term 'GLs' in this study.

One of the ways that writers help readers through discourse is by "marking" how the coming sentence or clause relates back to previous discourse. Thus if the author wants to show a continuation of a previous line of thought, s/he will begin the coming sentence with a linker such as *in addition* or *moreover*. This automatically helps the reader to approach the coming sentence with the knowledge of how it relates to the theme the author is constructing. If, on the other hand, the author wants to signal a change in direction of the discourse, s/he will utilize a linker such as *on the other hand* or *conversely*. Groups of researchers have worked on GLs.

According to Huddleston and Pullum (2002), there are many ways of relating one clause to another besides the use of a connective adjunct. Coordinators are one such device; syntactically, these have distinctive properties that lead us to analyze them differently from connective adjuncts. Nevertheless, the division between coordinators and connective adjuncts is not entirely clear-cut, and items such as *yet* and *so* have some uses where they are clearly connective adjuncts, others where they are very similar to coordinators. According to Hyland (2005), GLs are conjunctions and adverbial phrases that help readers interpret pragmatic connections between steps in an argument by making comparison, contrast, and consequence in the discourse. In comparison, writers show the way two or more ideas are the same (e.g., similarity, likeness, equally). In contrast, writers show the way two or more ideas are different (e.g., in contrast, however, but). Consequences relations tell readers that either a conclusion is being drawn or justified (e.g., therefore, consequently) or an argument is being counted (e.g., nevertheless, anyway).

Celce-Murcia and Larsen-Freeman (1999) introduced conjunctions in this way: "Coordinating conjunctions (a) conjoin syntactically equivalent constituents and (b) lead the listener/ reader to certain interpretations of the way that clauses relate to each other meaningfully. Adverbial subordinators and conjunctive adverbials are often called logical connectors. Like some coordinating conjunctions, logical connectors are typically said to be types of cohesive devices, lexical expressions that may add little or no prepositional content by themselves but that serve to specify the relationships among sentences in oral or written discourse, thereby leading the listener/reader to the feeling that the sentences "hang together" or make sense" (p. 519).

According to Parrot (2002), conjunctions are divided into three categories: coordinating conjunctions, subordinating conjunctions and discourse markers. "Coordinating conjunctions include only three words: and, but, and or. They can serve to (a) link together parts of constituents and are therefore contained within the constituent and (b) to form a link between clauses" (p. 262). "Subordinating conjunctions serve to link two clauses of unequal importance. They consist of (a) one word, such as after, although and if, (b) two or more words: as if, as soon as and as long as if, (b) two or more words: as if, as soon as and as long as" (p. 335). And, those connective elements between sentences indicating logical relationships and sequence are called DMs.

Discourse analysis forms the discipline that studies and analyses the actual language in use. It involves both language form and language function. Moreover, it includes the study of both spoken interaction and written texts. A discourse analysis of written texts might include a study of topic development and cohesion across the sentences. Cohesion and coherence are two main aspects of discourse. When a writer is planning to write a well-organized text, cohesion and coherence are important considerations. Here, these two aspects will be explained. Cohesion is a particular feature of the spoken and written human speech. In general, cohesion is the network of lexical, grammatical, and other relations which connect different parts of a text. These relations organize and create a text by needing the reader to interpret words and expressions with reference to other words and expressions in the surrounding sentences and paragraphs and hence, according to Halliday and Hassan (1976), make the text 'cohere' (Carrell, 1982).

Coherence is another feature that comes usually to be related to the feature of cohesion. Some researchers apply the term cohesion to the surface structure of the text and the term coherence to the concepts and relations underlying its meaning (Jin, 1998). Cohesion has sometimes been applied to smaller units of language in the text, and coherence, to some general overall interrelatedness in the text. Other researchers have defined cohesion as "continuity in word and sentence structure", and coherence as "continuity in meaning and context" (Louwerse & Graesser, 2005). According to Halliday and Hasan (1976), there are two kinds of cohesion that help the coherence, one being lexical cohesion and the other being grammatical cohesion.

Written Academic Discourse

Discourse is a term becoming more and more usual in a wide range of academic and non-academic contexts, in written and spoken form. Some linguists use it in reference to texts, while others claim it means speech. One definition of discourse is that "discourse is a continuous stretch of language larger than a sentence, often constituting a coherent unit such as a sermon, argument, joke, or narrative" (Crystal, 1992, p. 25). Somewhere else, the terms 'text' and 'discourse' are nearly utilized interchangeably implying that the first term refers to the linguistic product, whereas the second one denotes the entire dynamics of the processes.

The term 'discourse' has been also defined in a various ways: for example, as language use above the level of the sentence, as language use in context, and as real language use. The tasks and preoccupations of discourse analysts may change while studying spoken or written language. Whereas "conversational analysis" is a term used for analysis of spoken discourse, some linguists

for the study of written discourse use the term “text linguistics”. Written academic discourse is different from other discourses in any aspect of linguistic behavior, in the study of particular patterns of pronunciation, in the word choice, sentence structure, semantic representation, and the pragmatic analysis. The crucial function of the written academic discourse is referential, which involves the following aspects: it conveys information, presents arguments and explains facts and the different relations between them. To fulfill this function successfully, the written academic discourse needs a high level of explicitness, clear logical organization and an avoidance of ambiguity. In order to achieve all these criteria, this kind of discourse uses the appropriate terminology, formal language, complete sentences, relative clauses, and other devices among which GLs are certainly worth emphasizing.

Why Teaching GLs?

In contrast to the early years of the communicative approach that was felt the knowledge of grammar may not be necessary for one to communicate in a language, in recent years there has been a re-thinking about grammar teaching. In these days, it is being more accepted that language learning is essentially learning how grammar functions in the achievement of meaning (Widdowson, 1983). Nowadays, learners are first exposed to a new language in a comprehensible context, so that they are able to understand its function and meaning. Only then is their attention turned to examining the grammatical forms that have been used to convey that meaning. Organization of discourse is often indicated by GLs. They are viewed as effective means of cohesion in English, no matter whether it is written or spoken, formal or informal.

Over the past 20 years or so, the description of linguistic items related to GLs has been a research focus in many studies related to language learning and teaching. Schiffrin (1987) began writing about the significance of GLs in the 80s. Research studies on GLs can be generally divided into two categories. The first category describes research on GLs through the descriptive analysis of them in a particular language as spoken by native speakers (NS) of the language. The second category describes research on GLs which relate and examine the acquisition of GLs of the target language by non-native speakers (NNS), mostly that of teachers and language learners. Fung and Carter (2007) state that the second category of research on GLs has been studied much less. Yunus and Haris (2014) believe that GLs are not only important in joining words, sentences or paragraphs, but also indispensable for the coherent of the whole essay. These researchers studied the use of GLs in ESL students' essay writing. When they analyzed the secondary school students' essays, they identified something about the use of GLs such as the misused, the overused and the advanced used of them. These researchers also interviewed the teachers to get extra information about their opinion regarding GLs based on their teaching experience. When the researchers analyzed the answers, most of the interviewees seemed clueless and had no idea what GLs are all about. In this way, there was not enough exposure to GLs to make the students had a better understanding on how to incorporate the use of them in their essay.

In a study, Kalajahi and Abdullah (2012) attempted to examine Iranian English language teachers' perception towards the use of GLs in the English as a Foreign Language (EFL) classroom. This research extended on Fung's (2011) study and further included the listening and speaking skills together with the role of GLs in teaching the reading and writing skills. Three

research questions were posed in this study. They were: (1) What is the perception of Iranian English teachers toward the use of GLs?; (2) How do Iranian English teachers perceive GLs?; and (3) Do Iranian English teachers exhibit high, moderate, or low attitudes toward the use of grammatical linkers? The descriptive method to the data analysis in this study provided better understanding of teacher's perception towards the use of GLs. Forty five Iranian English teachers participated in the study via a questionnaire survey. Results from the analysis of data showed that Iranian English teachers seem to have a moderate attitude toward GLs. Findings also suggested that teachers tend to believe in the pragmatic and practical value of GLs.

THE RESEARCH QUESTION

The current study aims to answer the following question:

Does teaching GLs have any effect on EFL learners' comprehension of written academic discourse?

METHODOLOGY

Participants

This study was conducted with the help of 80 male and female participants majoring in English Translation. These students were studying in the third and fourth semesters at Abadan Azad University, Iran. These students' age were ranging from 20 to 35 years old. To achieve the objectives of the present study and to evaluate the homogeneity level of the participants, all of them were given a homogeneity test (Richards, Lesley, Hansen, Sandy & Zukowski, 2008). Upon the administration of this test, 52 participants whose test scores were one standard deviation below or above the mean score were assigned to the group of study. Then they were randomly divided into two groups of control (n=26) and experimental (n=26). The control group received implicit instruction on GLs and the experimental group received explicit instruction on contextual learning of GLs.

Instrumentation

To run this study, several instruments were utilized. At first, 80 EFL learners took a homogeneity test based on "Interchange passages placement and evaluation package" (Richards et al., 2008). This test was consisted of 50 items on grammar and structure in multiple-choice format performed for making the participants homogeneous at the pre-intermediate level. The total score of this test was 50 and its reliability was computed through KR-21 formula as ($r=.751$). The second instrument was composed of two separate pre-tests. One of the pre-tests was on reading comprehension (Appendix B) included two parts and 40 items. Each part was consisted of 20 items in the multiple-choice format. The items of the first part were based on "Top Notch, level 1 A & B" (Saslow & Ascher, 2007), and the items of the second part were based on the students' textbook; "Expanding Reading Skills" (Markstein & Hirasawa, 2005). Both parts aimed to determine the learners' knowledge on GLs before the treatment. The pre-test was piloted on the learners with the same proficiency level to arrive at the reliability of the pre-test. The total score of this test was 40 and its reliability was calculated through Cronbach Alpha formula as ($\alpha=.801$). The pre-test on GLs frequency was also assessed through writing one-paragraph essays on

a topic selected by the learners among three topics. The frequency of GLs was numbered by two raters. The inter-rater reliability of the test was calculated through Pearson Correlation Coefficient as ($r=.811$). The last instrument was two separate post-tests. The first post-test was modified based on the pre-test to determine the effect of teaching GLs on further comprehension of written academic discourse after the treatment. The reliability of this test was also calculated through Cronbach Alpha formula as ($\alpha=.761$) and another post-test on writing one-paragraph essays was administered to evaluate the frequency of GLs used by two groups after the instruction. The inter-rater reliability of the essay post-test was estimated through Pearson Correlation Coefficient as ($r=.793$).

Materials

In this study, the materials prepared for two groups were consisted of "Expanding Reading Skills" extracted from Markstein and Hirasawa (2005) and Top Notch, level 1 A & B extracted from Saslow and Ascher (2007). The first book included 12 reading passages. Among these passages, just eight of them were taught during the course. In order to check learners' understanding on each passage, each one had some reading comprehension exercises. These exercises were directed to three areas of reading skills development: (1) vocabulary development; (2) structural analysis; (3) relational and inferential analysis. The second book was introduced to both groups for extensive reading activities.

Procedure

At first the researcher asked the students of third and fourth semesters who were studying at Abadan Azad University to take part in a study. They were 80 students, both male and female, majoring in English translation. In order to determine the homogeneity of these subjects at the pre-intermediate level, a homogeneity test based on the *Interchange passages placement and evaluation package* extracted from (Richards et al, 2008) was administered. Next, among them 52 students whose scores were one standard deviation above or below the mean score were selected and randomly divided into two groups: control ($n=26$) and experimental ($n=26$). Both groups were under the instruction in 10 sessions, during five weeks, twice a week and 30 minutes per day.

In order to examine the effect of teaching GLs on improvement of written academic discourse comprehension, in the first session of the course a pre-test on reading comprehension was administered and both groups answered some multiple-choice questions in terms of their knowledge on GLs. This test lasted for 45 minutes. Then both groups were involved in the learning activities and their progress was carefully controlled during the eight sessions. In this course, teaching some reading passages was the main work of the instructor. The focus of each passage was on GLs to enhance students' reading comprehension. These passages were chosen from students' textbook, "Expanding Reading Skills" (Markstein & Hirasawa, 2005). In each session, one reading passage and one category of GLs were taught to both groups. Since among different categories of GLs, the focus of this study was on four clusters (contrast, addition, time, and summary), only these four groups were taught throughout the course. During these eight sessions, experimental group received explicit instruction on the form and function of GLs. Through explicit instruction, all the information about GLs' structures was expressed precisely

and clearly. These students underlined GLs in their reading passages and received full explanation on the usage of the members of each category. In contrast to this group, the control group received implicit instruction on the form and function of GLs. Through implicit instruction, information regarding GLs' structures was implied but indirectly expressed. Instead of underlining GLs, control group worked on the usual format of the reading texts. The instructor prepared for this group of participants separate examples on the usage of each category. Control group dealt with these examples without getting any explanation from the instructor. They unconsciously learnt the structures of GLs. At the end of each session, both groups answered some reading comprehension exercises. Besides working on these reading passages, reading strategies such as scanning and skimming as well as intensive reading were emphasized in both groups. Both of them also practiced finding lexical relations such as synonyms, antonyms and hyponyms as well as the structures of standard written English. In the tenth session and at the end of the treatment, a posttest on reading comprehension that was a modified form of the pre-test was administered to show the students' comprehension of written academic discourse in terms of their knowledge of GLs. This test also lasted for 45 minutes. To calculate the effectiveness of treatment on the experimental group comparing with the control group, Independent and Paired Samples t-tests as well as chi-square will be used.

RESULTS AND DISCUSSION

Based on the goal of this study which was the investigation of teaching GLs into pre-intermediate EFL learners for further comprehension of written academic discourse, the participants of this study passed a pre-test as well as a post-test on reading comprehension. After the analysis of these tests, the following results obtained:

Table 2: Descriptive Statistics (Pre-test)

Groups	N	Mean	Std. Deviation	Std. Error Mean
Experimental	26	23.5909	5.34219	1.13896
Control	26	20.0000	8.71780	1.59164

The above table shows the descriptive statistics of the participants' performance on reading comprehension in the pre-test. The mean score of the experimental group is 23.59 and the mean score of the control group is 20.00. In order to see if there is any significant difference between two groups in the pre-test and they have been homogeneous before the treatment or not, an Independent Samples t-test was administered. Table 3 shows the results.

Table 3: Independent Samples t-Test (Pre-test)

		Levene's Test for Equality of Variances		t-test for Equality of Means						
									95% Interval Difference	Confidence of the Difference
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Lower	Upper
Equal variances assumed	variances	7.233	.010	1.709	50	.094	3.59	2.10	-.63	7.810
Equal variances not assumed	not assumed			1.835	48.67	.073	3.59	1.95	-.34	7.52

Table 3 shows the observed t (1.709) is less than the critical t (2.000). This means that the difference between two groups is not significant. Thus, the two groups have been homogeneous.

Table 4: Descriptive Statistics (Post-test)

Groups	N	Mean	Std. Deviation	Std. Error Mean
Experimental	26	28.13	8.51	1.81
Control	26	21.33	11.23	2.05

Table 4 indicates the descriptive statistics of the participants' performance on reading comprehension in the post-test. The mean score of the experimental group is 28.13 and the mean score of the control group is 21.33. To find out if there is any significant difference between the two groups in the post-test, an Independent Samples t-test was administered. Table 5 shows the results.

Table 5: Independent Samples t-Test (Post-test)

		Levene's Test for Equality of Variances		t-test for Equality of Means					
								95% Interval Difference	Confidence of the Difference
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	
Equal variances assumed		2.001	.163	2.380	50	.021	6.80	2.85	
Equal variances not assumed				2.483	49.9	.016	6.80	2.73	

The above table shows the observed t (2.380) is greater than the critical t (2.000). It means that the difference between two groups is significant.

Table 6: Descriptive Statistics (Pre and post-tests)

Groups		Mean	N	Std. Deviation	Std. Error Mean
Pair 1	Pre-test Experimental	23.59	26	5.34	1.138
	Post-test Experimental	28.13	26	8.51	1.81
Pair 2	Pre-test Control	20.00	26	8.71	1.59
	Post-test Control	21.33	26	11.23	2.05

Table 6 shows the descriptive statistics of pre and post-tests on reading comprehension for each group. According to this table, the mean score of the experimental group in the post-test is 28.13 while this amount for the pre-test of the same group is 23.59. This table also shows that the mean score of the control group in the post-test is 21.33 whereas this amount for the pre-test of the same group is 20.00. In order to discover if there is any significant difference between the pre and post-tests of each group, a Paired Samples t -test was administered. Table 7 indicates the results.

Table 7: Paired Samples t -Test (Pre and post-tests)

Paired Differences				t	df	Sig. (2-tailed)
Pairs		95% Confidence Interval of the Difference				
		Mean	Std. Deviation	Std. Error Mean	Lower	Upper
Pair 1	Pre-and post-test Experimental	4.54	7.34	1.56	7.80	1.28
Pair 2	Pre-and post-test Control	1.33	15.18	2.77	7.00	4.33

The above table indicates that the observed t (2.902) of the pair 1 (Experimental group) is greater than the critical t (2.080). So the difference between the pre-test and post-test of the experimental group is significant. In contrast, observed t (.481) of the pair 2 (Control group) is less than the critical t (2.045). Therefore, the difference between the pre-test and post-test of the control group is not significant.

Discussion

In order to answer the first research question, the researcher compared the two groups of participants in the pre and post-tests. The pre-test was compared to the post-test to show any difference between the participants' performance on developing reading comprehension concerned with using GLs. After analyzing data through the software "SPSS", version 17, the results obtained from the descriptive statistics of the pre-test showed an increase in the mean score of the experimental group in the pre-test. Then based on the administration of an Independent Samples t -test, it was revealed that the observed t was less than the critical t , so it was clear that there was not any significance difference between two groups in the pre-test. As a result, the two groups were homogeneous.

The results obtained from the descriptive statistics of the post-test also indicated an increase in the mean score of the experimental group in contrast to the mean score of the control group in the

post-test. Through the administration of another Independent Samples t-test, it was revealed that the observed t was greater than the critical t . It means that there was a significant difference between two groups of the participants in the post-test and consequently, experimental group had a better performance.

The results obtained from the descriptive statistics of the pre and post-tests showed another increase in the mean scores of both groups in the post-test in contrast to their pre-test. This time, through the administration of the Paired Samples t-test and the comparison between the observed t and critical t of each group revealed that the observed t of the experimental group was greater than its critical t . This means that there was a significant difference between the performances of the experimental group in the pre and post-tests in contrast to the control group. Since through the data analysis had been proved both groups were homogeneous before the treatment, the recent results showed that the experimental group performed more successfully than the other group after the treatment.

The reason of this progress can be interpreted in terms of the explanation the experimental group received on the forms and functions of GLs in analyzing the reading texts during the course. However, in this regard the control group received implicit instruction, mainly examples. By explicit instructions, the instructor clearly outlines what the learning goals are for the students, and offers unambiguous explanations of the skills and information structures the learners need. By implicit instruction, we refer to teaching where the instructor just gives examples and may explain the subject orally as what is currently used in conventional classrooms. The teachers teach the subject to the students and allow them to make their own conclusions and create their own conceptual structures and assimilate the information in the way that makes the most sense to them (Ellis, 1994).

If learners become familiar with the writing structures, they can comprehend the reading passages more easily. GLs are one of these structures which control group could not master it through implicit instruction and cognitive learning; hence, they showed a low performance after the treatment. On the contrary, the experimental group received a kind of instruction on GLs during the course that was compatible with their level of learning.

CONCLUSION

This study was conducted with the assumption that the teaching of the various GLs might cause a relative improvement to EFL learners' comprehension of written academic discourse. As very little was done and known in this context, this study was based on empirical research on teaching GLs and a series of activities and exercises and home works done in class or at home to consolidate the teaching sessions. The field work brought a number of results in that the experimental group showed a higher mean of comprehension whereas the control group got a much lower one. The direct explanation to these results is that after 10 sessions of instruction, the experimental group not only answered almost all the items of the pos-test and obtained higher scores than the control group, but also got high scores in the most difficult part of this test (long reading text). On the contrary, the control group failed in solving a good number of items, even

the easiest ones (mini-texts). Besides, in the essay writing the experimental group also appeared more successful than the other group in the proper use of wide range of GLs. The explanation to this fact is due to the implicit instruction that control group got on GLs during these sessions.

Through implicit instruction, control group did not become aware of this fact that based on meaningful connection some linkers are used at the beginning of the sentences, some of them in the middle and some in other places. They also were not aware of this fact that GLs receive different punctuations in different positions. For example, in the sentence "Mary had a bad headache; *however*, she went to work", they did not know that based on the presence of semicolon and comma, among several contrastive linkers, just the linker "*however*" is used. Moreover, control group did not get enough knowledge of this fact that some linkers are used in combination with particular prepositions.

This study evaluated the effect of GLs on reading comprehension and its data was collected through the tests. Further studies could evaluate the effect of these linkers on other language skills such as listening or speaking and collect data through other ways such as the interview, voice recording or classroom observation. Because of low number of English major students at Abadan Azad University, this study was done on a small sample population. Any replication should attempt to use a larger sample population, which may have affected the reliability of the results. This study was conducted on Iranian learners that English is their foreign language (EFL); it is possible to do it on the learners of other countries that English is their second language (ESL). This study was done on language learners at pre-intermediate level. Interested researchers can study the relation between recognition of GLs and reading comprehension on other levels of language ability such as intermediate or advanced. Considering the fact that this study was conducted on both male and female learners, it is suggested that similar studies could be done with the participants including only male or female ones. This study was done on students that English was their major. Other investigations could be conducted on the students of other majors.

Like all studies, this study had limitations and could not include all the issues related to the topic. Since the subject of GLs was wide, this study was only limited to this aspect of cohesive devices. It is clear that there exists another important category of cohesive devices that is the lexical one, within the same context of cohesion. This study would gain much objectivity if this aspect had been dealt with, too. In this study, adaptation of the reading texts to the students' level of proficiency which respond to all requirements of the study was another constraint; as the researcher could not find a reading text including different GLs from different categories.

ABSTRACT

The purpose of the present study was to investigate the most effective and frequently used listening micro-skills in English as foreign language (EFL) classes in bilingual context at lower levels. Moreover, this study was also to probe empirically the effect of awareness-raising about these micro-skills and the most effective cognitive strategies on developing EFL listening comprehension skills. For studying the effect of awareness-raising, first 30 teachers and M.A students took part in identifying the most frequently used micro-skills in Khuzestan Province as a bilingual context. After gathering data, 7 listening micro-skills were identified as being the most frequently used skills for performing tasks in EFL classes. 40 bilingual learners took the Nelson proficiency test and they were divided into two groups, one experimental and one control group. The experimental group underwent awareness-raising activities on micro-skills in listening comprehension as well as elaboration and prediction strategies based on Chamot and O'Malley (1994) model. The control group did not receive any strategy-based treatment and was taught listening activities through a conventional method. Finally, a post-test from "Tactics for Listening" (Richards, 2011), was given to both groups after nine weeks instruction. Using the Independent Samples t-test, the findings revealed that (a) micro skill and strategy awareness-raising had positive effect on listening comprehension of Iranian EFL learners in a bilingual context and (b) instruction of micro skill and strategy had no differential effect on listening comprehension of female and male learners. Implications of the present study contribute to the teachers who teach listening comprehension and help them to raise learners' awareness in learning listening tasks effectively.

KEYWORDS: Listening micro-skills, bilingual context, lower level students

INTRODUCTION

With the growing tendency toward developing communicative competence, speaking and listening have gained lots of attention from both teachers' and learners' side. According to Rivers (1984), "adults spend 40-50% of communication time listening, 25-30% speaking, 11-16% reading, and about 9% writing" (p. 331). Therefore, composing large part of communication, it is necessary to investigate the different aspects of speaking and listening. Communicative competence framework, the abilities underlying language proficiency, according to Canal and Swain (1980) are: grammatical competence, discourse competence, sociolinguistic competence

and strategic competence. Regarding these, speaking and listening skills can be assumed as multidimensional constructs, succeeding at which requires exploring their effective components and improving those parts. Listening is a critical skill that underlies all verbal communication inside and outside a classroom. Individuals use listening all the time, in and out, at home, at work, for social, entertainment or for academic settings. In everyday life, listening is used more than any other language skill.

Some researchers (e.g., Krashen & Terrell, 1983) have stressed the key role that listening as comprehensible input plays in acquiring the target language. Listening is a fundamental skill in first language acquisition and is important in English as Foreign Language learning (Bozorgian & Pillay, 2013). Peterson (2001) stated "it is the primary channel for language input and acquisition" (p. 87).

Despite the importance of listening and the rewards listening can bring to the second or foreign language learning process, it has, instructionally, been neglected or overlooked until the last few decades. Compared with other skills in TEFL/TESL, listening has neglected in many language learning situations (Buck, 2001). It was assumed that listening comprehension is naturally acquired and improved by students as they are listening to the teacher all day. Wolvin and Coakley (1996) noted that "how utterly amazing is the general assumption that the ability to listen well is a natural gift for which no training is required" (p. 26). Listening has recently started to receive attention and to be recognized as a skill that needs to be developed just like any other language skill (Brown, 1990). Perhaps the most important reason for such recognition stems from the great problems listening cause for large numbers of English language students.

Listening comprehension is a complex process and a number of theorists have tried to describe it in terms of taxonomies of micro-skills. One of the first taxonomies is the division of listening into a two-stage process: the first step is the extraction of the basic linguistic information and the second step is the utilization of that information for the communicative purpose. Other attempts were aimed at describing listening skills in communicative terms. These taxonomies go beyond linguistic processing and consider a wide variety of skills necessary for relating the basic linguistic processing to the wider communicative situation. Weir's (1993) taxonomy is one of communicative taxonomies. The most detailed communicative taxonomies were built and suggested that different lists of 'micro-skills' are required for various listening purposes (Richards, 1983). Besides the assumption that there are identifiable listening skills, there seems to be agreement in the language testing literature that these skills can be arranged in a hierarchy from lower order (e.g. understanding utterances at the literal level) to higher order (e.g. making inference and critical evaluation) (Weir, 1993). This skills- approach and the existence of such skills treated with caution. Buck (2001) declares that although there is no evidence that these lists of micro skills constitute a complete unified description of the listening process, there is no doubt that many of the components are of crucial importance in listening.

A more fruitful way of approaching listening difficulties reflects current practice in the teaching of reading which regards efficient reading as dependent on a set of micro skills (Grellet, 1981). Field (1998) pointed out breaking listening into micro skills offers two possibilities. "It can

support the kind of diagnostic approach already outlined, providing a checklist against which many breakdowns of understanding can be matched: is the breakdown due, for example, to failure to identify unstressed words, to failure to select the most important points of information, or to problems caused by assimilation?" (pp. 111-112). Some researchers stress the necessities of explicit teaching of listening strategies (Mendelsohn, 1994). Field (2001) emphasizes that listening should be broken into separate micro skills and strategies should be modeled in relation to a task rather than taught separately. This is in line with an interest which has offered thought-provoking ideas about what good language learners do to succeed. Applied research on language learning investigates the feasibility of helping students become more effective language learners by teaching them some of characteristics of the "good language learner" (Rubin, 1975).

Unfortunately, teachers, especially in EFL contexts, often are not aware about the process of listening; as a result, the common practice in the class is that teachers and educators focus on the outcome of the listening rather than listening itself (i.e. the process of listening). Field (1998) believes that most published courses continue to practice listening rather than teach the skill, raising the concern that the material tests not teaches.

Students are the heart of the learning process that can actually do the learning. In a community where English is learned as a foreign language, learners are less exposed to listening input. Consequently, most of the EFL learners at low levels have problems in listening comprehension and listening seems the most demanding skill. In this context most educators test listening not teach it and consider it as a product without regarding the processes and skills through which listening takes place (Sheerin, 1987). As a result, there is a need to do more research on listening in such contexts and present appropriate methodology, skills and tactics to make up for the gap. One possible way to teach the process of listening is to give learners awareness about listening micro-skills and strategies.

Learner-centered approaches require the teachers to assess their students' differences and strategies and micro skills they utilize in process of learning a foreign language in different context. Furthermore, research results in the field of language learning have indicated that learners' cultural backgrounds and gender do affect their learning process. Learners from two different sex and linguistic and cultural backgrounds may employ different listening micro skills and strategies when approaching a new language. Limitations in raising the existing literature highlight the need for the study of this topic in lower intermediate level EFL contexts in Iran.

REVIEW OF LITERATURE

Listening is a process that enables the brain to construct meaning from the sounds heard. It is, however, known that listening is an internal process, which cannot be observed directly. This means, "It is difficult to assess whether the listener has effectively used the skills at a particular occasion, what listening strategies are employed, which source of information is dominantly used, and what problems the listener experiences" (Anderson & Lynch, 1988). This feature of listening might lead to the view that listening is a passive skill in which the listener simply receives a spoken message. Thus, listening remains the least understood and studied in the

language teaching/learning area (Rost, 1990). Although it has been difficult to define listening, a sort of agreement seems to have recently been reached on what listening comprehension entails.

Listening, nowadays, is perceived as an active process that involves four interrelated processes: receiving, attending to, assigning meaning and responding to an aural stimulus based on on-going complex and multidimensional cognitive processes (Buck, 2001). Based on the above mentioned statements, listening comprehension is a cognitive skill. It may develop through acquisition of learning skills and strategies. Explicit instruction of listening skills and strategies is necessary and useful for EFL learners.

A number of researchers have attempted to investigate the effect of some aspects of listening ability instruction on listeners' comprehension performances. Their aim is to identify the effect of different contexts and variables on skill and strategy instruction. Bacon (1992) investigated the learning strategies used by 50 learners of Spanish at an American university when listening to and comprehending authentic text. The study revealed that females and males reported using different strategies to deal with passage difficulty. Females reported using a significantly higher proportion of metacognitive strategies than did males. Males appeared to use cognitive strategies more than females. Paulauskas (1994) in an attempt to assess the effect of strategy training on the listening achievement of high beginning and low intermediate adult learners examined the reciprocal strategy methodology and direct methodology. The two strategy groups received training in four comprehension-fostering strategies: predicting text content, summarizing main information, questioning for comprehension of main ideas and clarifying comprehension difficulties. As predicted in the first hypothesis of this study, it was found that the two strategy groups performed significantly better than the control group on the two listening test measures. No significant differences were found between the two strategy groups. Nakatani (2005) studied the influence of awareness giving on young Japanese adults' use of oral communication strategies such as maintenance of fluency and negotiation of meaning. The researcher found that the learners in the experimental group who received awareness produced longer sentences and used more achievement strategies, and did not leave the message as often as the learners in the comparison group. Recently, Bozorgian and Pillay (2013) investigate the effect of training five listening strategies delivered in L1 (guessing, making inferences, identifying topics, repetition, and note-taking) on listening comprehension and the results indicated that listening strategies delivered in L1 led to a statistically significant improvement in their discrete listening scores compared with the control group.

Having reviewed the related research literature, it appears that further study of listening proficiency improvement through explicit listening micro skill and strategy instruction may be useful. Hence, this current study seeks to document the impact of using listening micro skills awareness on the development of L2 listening proficiency.

RESEARCH QUESTIONS

1. What are the most effective listening micro-skills used in the performing listening comprehension among bilingual learners in Iranian context?

2. Do awareness- raising activities about listening micro skills have any effect on the listening comprehension among the bilingual learners?
3. Does listening micro skills awareness have any differential effect on listening comprehension of Iranian female and male learners?

METHODOLOGY

Participants

The population among which participants of the present study were selected included 74 pre-intermediate bilingual Iranian EFL learners studying English at Safereh Andisheh Institute, Shoush, Iran. To select and ensure the homogeneity of the participants included in the final stage of the study, the Nelson Homogeneity Test was administered to the whole population. The students who scored one standard deviation above and one standard deviation below the mean were selected as the most homogenous students. Among them, 40 learners 20 male and 20 female were randomly selected and assigned in two groups one was experimental group with 10 male and 10 female and the other was control group with 10 male and 10 female to participate in the study.

Instrumentation

The instruments used for data collection in this study included:

A Questionnaire was developed based on Weir's (1993) taxonomy of micro-skills and Nunan (2001) taxonomy of Most Effective Listening Micro Skills. It was developed in an attempt to determine the effective micro skills used in the bilingual context.

Nelson Homogeneity Test developed by Fowler and Coe (1976). The reliability of the test was estimated ($r=.78$) through a pilot test based on KR-21 method.

c) A pre-test contained the actual test items, in order to determine how well the subjects know the contents before treatment. Its reliability which was estimated (.71) based on KR-21 method.

d) The tasks used in the classroom extracted from American New Interchange (Richards, 2005) and Tactics for Listening (Richards, 2011). The rationale for this selection is that this writer's books are the most popular in the field of listening and speaking. These are the books most commonly used in Iran for listening classes for lower intermediate learners and the listening tasks used are authentic and compatible with EFL contexts.

e) A post-test used to reveal the effect of the treatment of the effective listening micro skills and on listening comprehension. Its reliability which was estimated (.88) based on KR-21 method.

Research Procedure

Since it was not possible to raise awareness about all the listening micro-skills in the current study, an attempt was made to determine the most effective and frequently used listening micro-skills which are used in the bilingual EFL context as a base line study. For this purpose and in order to select the effective and most frequently used skills for the study, 30 bilingual EFL teachers and MA bilingual students were asked to response each skill. In effect, they were provided with the list of different skills and were asked to response to each micro skill ranging from 1 least useful to 5 most useful in bilingual EFL classes.

For selecting homogenous subjects, first Nelson Homogeneity Test was administered to a group of EFL learners who were learning English in the institute. The subjects were 74 pre-intermediate bilingual Iranian EFL learners. In order to select homogenous subjects, those who scored one standard deviation above and one standard deviation below the mean were selected as the most homogenous learners. After selecting the homogenous subjects, 40 participants included 20 male and 20 female who were assigned to the control and experimental groups randomly so that every male or female participant had the equal chance of being in the control or experimental group. For the purpose of randomization, every participant was assigned a number and then the odd numbers were selected as the control group and the even numbers were selected as the experimental group. Thus, there were 20 learners 10 male and 10 female in the experimental group and 20 learners 10 male and 10 female in the control group. Before any instruction, pre-test was given to both experimental and control groups to determine how well the subjects know the contents before treatment.

The experimental and comparison groups went through different procedures during the study. While the comparison group did not receive any treatment, the experimental group received the treatment. They were given awareness about the most useful listening micro-skills involved in the listening process in bilingual EFL context. All the classes meet twice a week at different times of the day, covering the same content and material for all the groups and in order to enhance the reliability and validity of the study, the same material was used by the same teacher. The course of treatment lasted seven weeks in which students becoming trained in and practicing one micro skill or in every two sessions. The control group received the traditional and common practice in English classes that is the teacher plays the listening text in the class two or three times and after that focuses on the incoming listening comprehension questions. They are given handouts containing comprehension questions on each listening segment. Following the Instructions they just answer the same tasks done by the pure exposure group and hand them to the teacher to be marked. No group discussion was done by control group students. This typical method goes on in listening classes without teaching listening skills, while students in the experimental group were taught different listening skills. These training sessions heavily relied on the instructions and suggestions given by O'Malley and Chamot (1990) emphasize explicit teaching of the different learning strategies. The instruction model is the following the preparation, presentation, modeling, practice, evaluating phases.

When the training sessions and exercise giving sessions were over for the experimental and control groups respectively, another version of listening comprehension test for post-test was administered to both groups to test their listening comprehension enhancement. The scores in both experimental and control groups were calculated and separated for the data analysis using independent samples t-test test with SPSS package, version 17.

RESULTS AND DISCUSSION

As mentioned before, this study attempted to investigate the effect of the most effective micro skills awareness giving on listening comprehension skills in bilingual context. So the first research question is:

An answer to the first research question is used as the baseline for the main study. The data obtained from the questionnaire and the mean scores of its items provided us with the most effective and less effective micro skills used by all the subjects. The findings reported by subjects in the questionnaire are as follows:

Table 1: Questionnaire Analysis of Listening Micro skills

Listening sub skill	Mean	%
Listening for the gist of oral material	4.2	84
Listening for the main ideas; and distinguishing that from supporting details and examples	4.1	82
Listening for specific information, including recall of the important details	3.7	74
Listening for determining the speaker's attitude	2.53	50
Making inferences, deductions and understanding of the speaker's purpose	4.3	86
Relating utterances to speakers' social and situational context	3.26	65
Recognizing the communicative function of utterances	3.4	68
Ability to guess the meanings of unfamiliar lexical items in the context	4.5	90
Ability to understand reduced forms of words in spoken language	3.76	75
Understanding grammatical notions such as comparison, cause and effect, result, etc	3.46	69
Understanding discourse markers	3.43	68
Understanding the main syntactic structure of clauses, phrases and sentences	3.33	66
Understanding cohesive devices especially reference	4.3	86
Understanding lexical bundles and collocations	3.3	66
Understanding lexis of the oral materials	3.06	61
Ability to extract the salient points to summarize oral material	3.36	67
Ability to select relevant key words	3.26	65
Listening for phonemic distinctions	2.4	48
Listening for stress recognition	2.66	53
Listening for tone/pitch to identify speaker's attitude in speech	2.53	50
Total mean	3.22	64

Table 1 presents the mean of responses for each item in questionnaire. The average of individual micro skill items ranged from a low of 2.4 (item 18) to a high of 4.5 (item8), while the overall mean of this sample was 3.224, indicating that these micro skills had medium of effectiveness in EFL (English as a foreign language) bilingual context. [In examining micro skills use on the five-point scale, three types of usage were identified as suggested by Oxford (1990): high (mean>3.5), medium (2.5<mean<3.5), and low (mean<2.5)].

A close examination of the individual micro skills suggests that the most effective micro skill is ability to guess the meaning of unfamiliar lexical items from context [M=4.5] and less effective one is listening for phonemic distinctions. The results of questionnaire revealed that seven of micro skills identified as the most effective micro skills divided into groups in an inventory of effective listening micro skills.

First to ensure that the experimental and the control group have the same level of language proficiency and that the any difference of the groups after the treatment was not due to different language backgrounds, an analysis of the experimental and the control group's pre-tests was made. Table 1 provides the descriptive statistics of students' listening pre-tests in terms of the number of participants (N), means, standard deviations (SD), and (SEM) standard errors of mean.

Table 2: Descriptive Statistics (Experimental vs. Control groups, Pre-test)

Groups	N	Mean	Std. Deviation	Std. Error Mean
Experimental	20	42.7500	2.67296	.59769
Control	20	43.7500	2.73140	.61076

The above table indicates the mean score of the experimental group was 42.75 with standard deviation of 2.6729 and the mean score for the control group was 43.75 with SD=2.7314. However, to see whether this difference between the experimental group and the control group was statistically significant or not, a *t*-test was used the results presented in Table 3.

Table 3: Independent Samples *t*-Test (Experimental vs. Control groups, Pre-test)

		Levene's Test for Equality of Variances		t-test for Equality of Means				95% Confidence Interval of the Difference		
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Lower	Upper
Equal variances assumed		.182	.672	-1.170	38	.249	-1.00	.85	-2.72	.72
Equal variances not assumed				-1.170	37.9	.249	-1.000	.85	-2.72	.72

The results of the independent samples *t*-test for the experimental and control groups pre-test revealed that there is no significant difference between mean scores of experimental (M=43.75) and control (M=42.75) groups in pretest exam. The critical *t* is greater than *t* observed in the pre-test and *P* value equals 0.249 by degree of freedom 38 is greater than critical *P* value ($p > 0.05$) which means there is no statistically significant difference between the performances of experimental groups comparing it to the control group.

To test this question and in order to investigate the difference between control and experimental groups after the treatment, the gathered listening comprehension scores obtained in listening post test by both groups subjected to statistical analysis of independent samples *t*-test to verify whether the performances of both groups were the same or different. The data for question two is presented in Table 4 below.

Table 4: Descriptive Statistics (Experimental vs. Control groups, Post-test)

Groups	N	Mean	Std. Deviation	Std. Error Mean
Experimental	20	69.8000	5.52125	1.23459
Control	20	52.8000	2.35305	.52616

Although the above table shows that the mean score of the experimental group (69.8) with standard deviation of 5.5212 was greater than the mean score for the control group (52.80) with standard deviation of 2.3530, an Independent Samples *t*-test was applied in order to ensure that this large difference was statistically significant. Table 5 shows this clearly.

Table 5: Independent Samples *t*-Test (Experimental vs. Control groups, Post-test)

		Levene's Test for Equality of Variances		t-test for Equality of Means					95% Confidence Interval of the Difference	
		F	Sig.	T	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Lower	Upper
Equal variances assumed		16.769	.000	12.667	38	.000	17.00	1.34	14.28	19.71
Equal variances not assumed										

Table 5 shows, the observed-value in the above table reached 12.667 by degree of freedom 38 and significant level of (sig = 0.000). Since it is greater than the critical *t*-value and *p* value is less than critical *p*-value, it can be concluded that the *t*-test value was significant at the level of 0.05 ($p < .05$). The result was in favor of the experimental group. This is proof that the experimental group outdid the control group with a statistically significant difference. Hence, it can be said that the skill and strategy approach had a strong positive effect on the students' listening skills. Thus, the null hypothesis, which stated that:

"Listening micro skills awareness-raising do not affect bilinguals' listening comprehension skills" was not supported because results showed a significant difference between the experimental group and the control one. Finally, to answer the third research question and to investigate the effect of treatment on gender an analysis of male and female experimental group's pre-tests and post-test was conducted to ensure that the male and the female in experimental group have the same level of language proficiency before the treatment and to examine the difference after the treatment. The results are presented in Table 8.

Table 8: Descriptive Statistics (Experimental Groups, Pre-test vs. Post-test)

Gender	N	Mean	Std. Deviation	Std. Error Mean
Male (Pre-test)	10	42.4000	2.83627	.89691
Female(Pre-test)	10	43.1000	2.60128	.82260
Male(Post-test)	10	71.2000	6.21468	1.96525
Female(Post-test)	10	68.4000	4.62361	1.46211

Table 8 indicates that the mean score of male in experimental group' pre-test (M=42.4, SD=2.8362) and the mean score of female in experimental group' pre-test (M=43.1, SD 2.6012) and the mean score of male in experimental group' post-test (71.2, SD=6.2146) and the mean score of female in experimental group' post-test (M=68.4, SD=4.6236). To determine whether there is significant difference between male and female performance in experimental group' pretest and posttest, an independent samples t-test was applied. The results are shown in Table 9.

Table 9. Independent Samples t- Test(Experimental Groups, Pre-test vs. Post-test)

		Levene's Test for Equality of Variances		t-test for Equality of Means								95% Confidence Interval of the Difference	
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference				Lower	Upper
Pre-test (Male vs. Female)	Equal variances assumed	.338	.568	-.575	18	.572	-.70	1.21				-3.25	1.85
	Equal variances not assumed												
Post-test (Male vs. Female)	Equal variances assumed	2.21	.154	1.143	18	.268	2.80	2.44				-2.34	7.94
	Equal variances not assumed												

Table 9 shows the homogeneity of male and female in experimental group before the treatment. The observed p-value (Sig. = .572) is more than the level of significance (.05). Therefore, there is no difference on listening comprehension performances of female and male learners of experimental group in pre-test. The results of this table also show that there is no significant difference between females and males in the listening comprehension post-test.

Discussion

English teachers and M.A students responded to items of researcher-made questionnaire which provided them with answering to the Likert scale. The results indicated that among 20 items

(micro skill), the subjects reported 7 as the most effective and frequently used in bilingual context. The means of this 7 micro skills range from 3.7 to 4.5 that indicate high use or effectiveness of them in listening comprehension. They are as follow: 1. listening for gist of the oral passage, 2. listening for main ideas or important information; and distinguishing that from supporting details, examples, 3. listening for specific information, including recall of important details, 4. making inferences and deductions and understanding the speaker's purpose, 5. ability to guess the meaning of unfamiliar lexical items from context, 6. understanding cohesive devices especially reference, 7. ability to understand reduced forms of words in spoken language.

The high level of effectiveness of these micro skills used among Iranian bilingual may be attributed to several factors. One of the most important of them is the fact that Iran is a context in which English is considered to be a foreign language. Since learners find little opportunity to use English outside the formal setting of the classroom, they learn and practice English in the classroom with listening materials and comprehension questions clearly train and test these micro skills more than others. The second factor which seems to be influential in the high use of this is due to the easiness of systematic training of these listening micro skills. They are also easy to teach and learners learn and employ them easily. They usually try to make gist or elicit specific information to help them reach to answers for items when they feel that a linguistic item or structure is beyond their heads. Also, if they encounter a difficult word they may guess the meaning of unfamiliar word from context. In fact they routinely do these in their educational career.

The results of the study and the data analysis also revealed that bilingual learners use a wide range of cognitive micro skills. They used seven as high level and 12 as medium level of effectiveness among 20 cognitive micro skills. This may be due to the assumption that bilinguals possess the two competences which elevate their cognitive skills since they have a previous language learning experience. Nation and McLaughlin's (1986) statement support the results of this study that bilinguals are superior to monolinguals when it comes to cognitive skills. This also is consistent with Sanborn's (2005) research findings that bilingual learners have advantages of meta-linguistic awareness, cognitive flexibility, creativity and divergent thinking, elasticity in thinking and slightly speedier cognitive development.

The selection of distinguishing phonemic distinctions as low level of effectiveness in learning listening can be explained due to uselessness of this skill in information process and that bilingual learners do not care this skill when they are exposed to listening materials. The second reason is that the bilingual learners approach learning listening skill in the top-down process more than the bottom-up process. This is consistent with Jiménez, Garcia, and Pearson (1996) research findings that successful bilingual learners used more top-down approaches than did the monolingual groups.

The main findings of the analysis indicated a positive answer to the second research question of the study. It was found that the raising awareness about effective listening micro skills had a positive effect on the students' listening skills. This was proved through the higher mean score (69.8) that the experimental group obtained in the post-test in comparison to mean score (52.8) of

control group. Specifically, the experimental group's performance was more differentiated than that of the control group in the post-test. Furthermore, the pre-test results for both groups did not reveal any statistically significant difference between the two groups. This means that before the application of the experiment they both had nearly similar listening levels. That is to say, they had the same language background.

The big difference between the experimental group and the control group could be attributed to many reasons. Firstly, the effective listening micro skills that were taught in the experimental group are the foremost reason for the improvement of this group listening comprehension. During the seven weeks of the experiment, the experimental group used to be aware and practice important micro skills and such listening training can be said to have enhanced the experimental group's listening abilities in an effective way. On the other hand, the control group did not have that opportunity to deal with listening micro skills. They just listen to same materials and answer comprehension questions without any training in listening process. In fact their listening is just tested. The second reason for the outperformance of the experimental group is that the students who are trained strategically as well as they practice the more effective mental activities for comprehending the listening are likely to gain the metacognitive knowledge about listening tasks. This knowledge is perhaps the most important factor in effective listening strategy training. This goes in line with Chamot and O'Malley (1994) who believe that "explicit metacognitive knowledge about task characteristics and appropriate strategies for task solution is a major determiner of language learning effectiveness" (p. 372). The second reason is that the learners in experimental group start to feel self-confidence and remove anxiety because they equipped with the appropriate knowledge (metacognitive knowledge) and tools (micro skills). This confidence further enhanced student strategies to deal with listening tasks (cognitive strategies) and regulate their listening (metacognitive strategies) as well as assist learners to overcome the difficulties they confronted with. This seems to be corresponding with Nyikos (1996) who states that "strategy instruction helps students overcome fear or anxiety" (p. 112). This also leads them feel independent as they had cope with and overcome their difficulties.

In sum, the interaction between all the factors discussed above was the interpretation for the positive results obtained for second research question. These factors result in reducing learners' anxiety, as well as increasing their confidence that in turn lead to a better listening performance. The results are also regarded as confirmation of numerous previous studies suggested that skills and strategies can be taught and that such teaching increase performance in the second and foreign language process.

Research has shown evidence of gender differences in the use of language learning strategies, with the majority of studies reporting higher use of strategies by females than males (Bacon, 1992). Despite the assumption that females outperform males in learning and using language learning skills and strategies, the findings of this study indicated that gender did not have any significant effect on the learning listening micro skills. Furthermore, considering the mean differences between pre and post-test scores it can be found that male improved more than female in learning listening micro skills.

The main reason that can encounter for these findings is that the males have more tendency to achieve survival learning where males would be more motivated than females for survival needs (e.g., supporting their family). The second reason may be due to cultural context of study that is traditional male-oriented culture. The males are more motivated for getting proficiency in English because this may help them to get a better job. Other reason for this contradictory evidence of gender differences is the mental acts which are not the same among male and female bilinguals. As Wharton (2000) suggested that socialization and life experience as a result of previous language learning experience may be more effective than gender on types of learning strategy use.

CONCLUSION

This study is primarily beneficial to EFL learners who intend to make improvements in their listening skill. As this study indicated the skill and strategy approach is absolutely conducive by providing learners with activities that can help learners overcome or cope with listening difficulties so that they can have better control over their listening comprehension. This is an important tenet of skill and strategy instruction that students are more active when they are in charge of their own learning. Learners trained in micro skills and strategies can manage, monitor, and evaluate their learning process and check their progress in language learning frequently and this does not only improve listening performance but also leads to a degree of autonomy. Most importantly skill and strategy instruction leads learners to revise and modify their beliefs that they are capable of taking responsibility for their own learning and sharing the burden with their teachers and look at learning differently and to be in the belief that what causes success is not luck or mere innate ability but rather having and using appropriate strategies and the ability to take risks.

The findings of this research have important implications for task designers. According to the findings, it is suggested that listening tasks should be designed in accord with listening micro skills and strategies. Task designers are well counseled to design their listening comprehension activities in such a way that necessitates the employment of listening micro skills and strategies. Also, they must bear in mind that micro skills and strategies should be presented in a right time and at suitable levels that conforms to the listeners' actual potential in cognition, in order for them to comprehend the listening passages better. In the sense that before designing tasks for the EFL listening courses, task designers should consider the most frequently used listening micro-skills and strategies that learners use in performing the listening tasks. Most of the books available are not based on the different listening micro-skills and strategies; therefore, it is recommended for the material and task designer to design materials and tasks based on the listening micro-skills and strategies that are used more frequently in the EFL context. This needs teachers and task designers enhance their own awareness of these skills and strategies which aid them modify the materials and tasks in accord with these micro-skills and strategies.

The present research faced some limitations including the small size of the research sample since they are available at that time. The main limitation was to determine who is a pure bilingual and the criteria of bilingualism. In Khuzestan province, Iran, Arab communities use Arabic mostly for

conversation rather than writing and reading skills, they may not be pure bilinguals. However, they use Arabic in their family and social interactions and Farsi is just their official language. Therefore, we call them bilingual in that sense.

ABSTRACT

This study compared and analyzed the use of transition markers (TMs) in research articles (RAs) on the three disciplines of physics, computer engineering, and applied linguistics written in English. It aimed to find the possible similarities and differences in using TMs by native English writers of physics, computer and applied linguistics articles. It also compared the use of TMs in applied linguistics written by native English and non-native Iranian authors. To achieve this goal, 180 RAs from international and national journals were selected between 2005 and 2012. RAs included 25 on physics, 56 on computer engineering and 54 on applied linguistics written by English writers and 45 applied linguistic ones written by Iranian authors. A classification of transition markers was formulated by Halliday and Hassan (1976) to form the model for analyzing the data. After determining the frequency and percentage of each transition marker, Chi-square analysis was used to see if the differences between these disciplines were significant. Findings revealed that computer engineering writers used transition markers more than physics writers. The intra-discipline analysis showed that Persian writers of applied linguistics used less TMs than their English counterparts. The results of this study could be useful for English for Specific Purposes (ESP) developers, English for Academic Purposes (EAP) developers, translators, teachers and ESP writers in Iran and all who are interested in learning more about English.

KEYWORDS: Metadiscourse markers, Transitions, Scientific writing, Articles

INTRODUCTION

Researchers should be objective and unbiased in reporting their findings in academic writing; this belief of academic writing has been criticized by several researchers (e.g., Hyland, 2001). Researchers (e.g., Hyland, 2005) claim that interaction in written text can be managed in the same way as the spoken text, though with different effects due to the different medium. Hyland (2004) describe academic writing as social engagement, comprising interaction between writers

and readers. Hence, intellectual and proficient writers are not supposed to write texts to signify an external reality, rather to use language to express themselves and their work, and to acknowledge and negotiate social relations with readers.

Academic writing is created by different disciplines which includes features represent a particular community. In order to represent these features of an underlying community in research articles, the writers should engage and influence the readers. One way to do this is through the use of metadiscourse markers. Metadiscourse refers to ‘the cover term for self-reflective expressions used to negotiate interactional meanings in a text, assisting the writer(or speaker) to express a viewpoint and engage with readers as members of a particular community’(Hyland 2005).It is believed that metadiscourse is a central part in academic writing which makes a mutual understanding between writers and readers. It involves linguistic devices which writers use to shape their arguments to the needs and expectations of their target language.

One of the metadiscourse features through which the writer helps reader to understand the text is transition markers. On the other hand, transition markers make the written text easy to understand at first time. According to Hyland (2005), transition markers are mainly conjunctions and adverbial phrases which help readers interpret pragmatic connections between steps in an argument by making additive, contrastive, and causative steps in the discourse. Addition adds elements to the argument (e.g., *and, furthermore, moreover*). Comparison marks arguments as either similar (e.g., *similarity, likeness, equally*) or different (e.g., *in contrast, however, but*). Consequences relations tell readers that either a conclusion is being drawn or justified (e.g., *therefore, consequently*) or an argument is being counted (e.g., *nevertheless, anyway*).

Despite the crucial role of transition markers in academic writing, not many studies have been conducted concerning the frequency and use of transition markers in discussion and conclusion sections of research articles. Therefore, this study aims to compare and contrast the frequency of transition markers in discussion and conclusion sections of English native and non-native research articles.

Metadiscourse is increasingly important to research in reading, writing and text structure. Despite their importance, studies of metadiscourse outside of European or U.S contexts have not received the attention they deserve (Crismore & Abdollahzade, 2010). In addition, the lack of comparative research on the use of transition markers has created some sort of unawareness as to which disciplines are more TMs compared with other discipline. There is no perfect answer to questions like these due to the small number of researches carried out in this regard.

Although some researchers (Vassileva, 2001) compared TMs in research articles in English and Persian research articles, analysis of discussion and conclusion sections of research articles in terms of the type and frequency of TMs has received little attention. Thus, comparative studies on frequency and type of the use of TMs have been rare and this requires more studies to be conducted comparing native and non-native researchers in the use of TMs.

Thus, this study focuses on the type and frequency of transition markers in the discussion and conclusion sections of research articles in hard science and soft science written by English writers and Iranian writers of English. The research articles under the present study were selected from three disciplines including applied linguistics from soft applied science as well as computer engineering from hard applied and physics from hard pure science.

The purpose of the study is to investigate the occurrence of TMs in the articles written by Iranian writers as non-native writers and English writers as native writers in computer engineering, physics and applied linguistics fields of study. It is hoped that the results of this study will shed some light on academic writing problems for Iranian researchers and may provide English practitioners with better idea on writing scientific papers through using TMs appropriately and adequately. It is also hoped that the results of the present research will be useful for English for Specific Purposes (ESP) developers, English for Academic Purposes (EAP) developers, translators, teachers and ESP writers in Iran.

REVIEW OF LITERATURE

Metadiscourse markers

For first time, the term metadiscourse was defined by Harris in 1959. Later, a number of researchers such as William (1981) elaborated it more. Harris (1959) defined metadiscourse as “non topical linguistics material”(p. 464). “Metadiscourse embodies the idea that communication is more than just the exchange of information, goods or communicating”(Hyland, 2005, p. 3). Metadiscourse is discourse about discourse, intended to direct rather than inform readers (William, 1981). Metadiscourse is "discourse about discourse" and refers to the authors or speakers linguistic manifestation in his text to interact with his receivers. Metadiscourse includes linguistic elements which do not refer to aspects of external reality (as propositional or referential elements do). But to the organization of the discourse itself and to aspects of the relationship that develops between the author and the reader (Crismore, 1989).

Crismore, Markkanen and Steffensen (1993), define metadiscourse as: "linguistic material in texts, written or spoken, which does not add anything to the propositional content but that is intended to help the listener or reader organize, interpret and evaluate the information given"(p.40). Similarly Hyland (1999) stresses non-propositionality of metadiscourse as follows: One important means by which texts depict the characteristics of an underlying community is through the writer's use of metadiscourse. All academic disciplines have conventions of rhetorical personality which influence the way writers intrude into their texts to organize their arguments and represent themselves, their readers, their attitudes. This is largely accomplished through non propositional material or metadiscourse.

Arguing the importance of metadiscourse devices, Camiciottoli (2003) states that metadiscourse markers produce a desire effect, depending on writer's underlying purposes and perceptions of the reader's expectations. They help writers to presents information in a clear, convincing and interesting to promote acceptance and understanding, as well as reader- writer solidarity. They act

as persuasive devices to affect and influence the reader's reactions to texts according to the values and established rules and conventions of a discourse community.

Hyland (1999) states that "metadiscourse marker relates to the level of personality or the tenor of the discourse and influence such matters as author's intimacy and remoteness expression of attitude, commitment to proposition and the degree of the reader's involvement" (p. 8). Focusing on the importance of context in interpreting metadiscourse, Hyland (1999) further adds that:

To study metadiscourse without appeal to its associated rhetorical environment is to ignore the content which conditions its use and gives it meaning. Focusing only on the surface realizations give the impression that metadiscourse is purely writer-centered phenomenon and either neglect its relationship to a particular audience or unconsciously calls up contexts in an unsystematic way. In other words, the meaning metadiscourse only becomes operative within the particular context, both invoking and reinforcing that context with regard to audience, purpose and situation. Its use, therefore, reflects differences in the various forms of organized cultural communication reorganized and employed by distinct academic discipline for particular purposes (p. 6).

Adel (2006) believes that "metadiscourse is a functional category that can be realized in a great variety of ways" (p.22). She believes that an item which is metadiscursive in some point due to its relation with its co-text may not be met as a discursive feature in another. Vande Kopple (1985) introduced the first model of metadiscourse, divides into two category of textual and interpersonal. In this model, textual metadiscourse includes text connectives, code glosses and narrators markers, and interpersonal metadiscourse consists of validity markers, attitude markers and commentaries. Crismore, Markkanen, and Steffensen (1993) presented the revised model. In addition, they introduced textual and interpersonal as two main categories of metadiscourse, but they classified textual metadiscourse into two types, textual and interpretive. Textual markers include features which can help the discourse to be organized, and interpretive markers facilitate readers' interpretation and understanding of the writer's intention and writing strategies (Crismore *et al.*, 1993).

Dahl (2004) proposes a taxonomy consisting of two categories of metatextual elements. The first, called *locational metatext*, comprises linguistic elements which refer to the text itself or to parts of it. Dahl's (2004) second category has been termed *rhetorical metatext*. It includes meta elements which assist the reader in the processing of the text by making explicit the rhetorical acts performed by the writer in the argumentation process.

Hyland and Tse (2004, p. 169) propose a model of metadiscourse which distinguishes interactive and interaction dimensions. Interactive Resources are those devices which are used explicitly by writers in an argument. They are used to organize the discourse, help and guide the reader through the text. Readers can get the intended meaning and interpretations of all the text through explicit use of these devices which can be recovered from the text. Interactional resources engage

the readers in the discussion by alerting them to the writer's attitudes and propositional information and readers themselves.

Hyland (1999) studied the use of metadiscourse in texts books and research articles in three disciplines: Biology, Applied linguistics and Marketing. The result of this study showed that applied linguistics use more evidences and relational markers, the writers of biology prefer to use hedges and marketing text books use fewer evidences and endophorics. Hyland stated that the greatest diversity in most types of metadiscourse both across genres and disciplines is found in biology.

Camiciottoli (2003) investigated the effect of metadiscourse on reading comprehension of a group of Italian university of students. In this study, students were divided into two groups, and then they read selected texts from two versions of the same texts which differed in the quantity and type of the texts. Finally each group took a reading comprehension test and their mean scores were compared. The results showed that matadiscourse features have a positive effect on the students' comprehension. She concluded that "the greater presence of some types of metadiscourse (e.g., frame markers, person markers, and hedges) could be linked to the better performance. In some of the comprehension questions (Camiciottoli, 2003).

Mauranen (1993) studied the relationship between matadiscourse and first language and culture written in English by Finnish and Anglo-American native and non- native students. The findings of this study revealed that Anglo-American students used more metadiscourse than Finnish students. In the other hand, Mauranen found that Finnish students tend to guide the readers thorough the text. She concluded that "Anglo-Americans tried to be as explicitness possible in their writing in order to give the reader the feelings of comfort and easiness, while in Finnish culture," saying too obvious things is, as we know, patronizing" (Mauranen, 1993, p. 17).

Zarei and Mansoori (2007) looked at the metdiscursive pattern in research articles written in English and Persian in two fields: Computer engineering and applied linguistics. The findings revealed that both English and Persian texts emphasized text coherence but in Persian texts much of the meaning left to be uncovered by the reader.

Another study was conducted by Zarei and Mansoori (2011), focus on the use of metadiscourse in two disciplines: Applied linguistics versus computer engineering within two languages: Persian and English. The analysis of the data showed that the metadiscourse resources are different in two languages and Humanities focused on the textuality to the detriment of the reader involvement.

Shokohi and Talati Baghsiahi (2009) studied the functions of metadiscourse in sociology research artiles in Persian and English. The results showed that there are a higher number of metadiscourse elements in the English texts. Also, It is found that textual metadiscourse is used more than the interpersonal metadiscourse in both languages. Finally, they conclude that the Persian writers are less interested in explicitly organizing the texts and engaging the readers.

METHODOLOGY

Data

The data used in the present study consist of 180 research articles from three English native disciplines including physics, computer engineering, applied linguistics and the non-native discipline of applied linguistics in English published internationally in prestigious journals. 135 research articles written by native researchers of English and 45 of them written by Iranian researchers as NNRs of English. There are some reasons for this selection. First of all, there is a standard typology for the classification of academic knowledge distinguishing between 'pure' or 'applied' and 'hard' or 'soft' disciplines (Becher & Trowler, 2001). According to this classification of academic discourse, the researcher decided to work on physics as a hard-pure, computer engineering as a hard-applied, and applied linguistics as a soft-applied academic discourse. The reason for which the researcher used applied linguistics is our familiarity with and good command of that.

Moreover, the researcher compiled a non-native data of applied linguistics in English which included RAs written by Iranian writers to see if there is any difference between native and non-native authors in the same discipline of applied linguistics with regard to the transition markers.

Procedure and Data Analysis

The first step involved the collection of 180 research articles across three native disciplines including computer engineering, physics and applied linguistics and a non-native discipline of applied linguistics in order to examine the occurrence of TMs in their discussion and conclusion sections and the difference between native and non-native researchers in the use of TMs in applied linguistics articles. In the next step, all research articles were saved on the computer to form data-based and then, the two sections of the research articles consisting of 253719 words were chosen for the analysis.

The taxonomy of Halliday and Hassan (1976) was extracted for the analysis of the selected sections of RAs regarding the use of TMs. In the next phase, the articles were examined to determine the frequency of TMs. According to Adel (2006), metadiscourse expressions can be multifunctional and context dependent, therefore, determining the frequency of TMs was conducted manually throughout each data. Moreover, this job was done twice for the purpose of accuracy. So, the researcher calculated the inter-rater reliability through the calculation of correlation between the raters based on Spearman formula to make sure whether the analysis was done in the right way.

After the data were obtained, they were summarized by the use of descriptive statistics and presented through frequency table. The frequency and percentage of each TM in each discipline were calculated separately and then computer engineering and physics articles were compared with each other and native applied linguistics with group non-native applied linguistics. Then, Chi-square was used to determine if there was a significant difference between the research articles in the use of TMs.

RESULTS AND DISCUSSION

Quantitative Analysis

A total of 1746 transition markers were identified in all research articles. In computer engineering RAs 517 TMs were used (76985 words), 161 were used in physics RAs (24794 words), 735 were identified in native applied linguistics RAs (97719 words), and 333 in non-native applied linguistics RAs (53821 words).

Frequency and percentage of TMs in RAs

The four groups of RAs investigated in this study were analyzed concerning the frequency of occurrence of transition markers in each of the 5 categories of the taxonomy used in this study. Table 1 shows the statistics which were obtained after the analysis of the articles; rows numbered 1-5 represent the taxonomy applied here in this study. The frequency and percentage of all transition markers in each discipline under the present study are shown in columns under each discipline as well. Total number of TMs is also given.

Table 1: Frequency and percentage of transition markers in RAs

Types of TMs	Computer engineering		Physics		Applied linguistics native		Applied linguistics non-native		Total TMs in all the discipline	Percentage of the category
	Freq.	Percent	Freq.	Percent.	Freq.	Percent	Freq.	Percent		
Causal	87	16.82	46	28.57	129	17.55	85	25.52	347	19.87%
Adversative	160	30.94	48	29.81	208	28.29	87	26.12	503	28.80%
Sequential	59	11.41	17	10.55	99	13.46	35	10.51	210	12.02%
Conditional	0	0	0	0	0	0	3	0.90	3	0.17%
Additional	211	40.81	50	31.05	299	40.68	123	36.93	683	39.11%
Total TMs in the discipline	517	0.67	161	0.64	735	0.75	333	0.61	1746	
Total words in the discipline	76985		24794		97719		53821			

Frequency of occurrence of transition markers in RAs

In the following the five categories of the taxonomy of TMs presented are introduced:

1. Causal

The first category in the classification used here represented the causal connectors. Different causal connectors were found which were mostly situated in texts on applied linguistics by non-native writers. However, the least number of this category was found in physics articles. The sum of the occurrence of this category in the five groups equaled 347 cases (19.87% of all the TMs) among which causal connectors “*thus*” had the highest frequency while “*hence*” had the lowest.

2. Adversative

The frequent adversative connectors were found in applied linguistics articles written by native researchers. While the least number of this category was found in physics articles, this category had the frequency of 503 cases in all the five groups (28.80% of all the TMs) among which adversative connectors “however” had the highest frequency while “even so” had the least.

3. Sequential

This category occurred 210 times in the four groups (12.02% of all the TMs). The most frequent type of this category was found in texts on applied linguistics by native writers, while the least number of this category was found in physics articles among which the transition markers “finally” had the highest frequency while “at present” had the least. (For observing the details.

4. Conditional

This category was found to be repeated three times (0.17%) in applied linguistics by non-native writers while the least number of this category was found in computer engineering, physics and native applied linguistics.

5. Additional

The fifth category of transition markers in the classification of TMs in the present study deals with the additional connectors. The overall number occurrence of this category was 683 cases equal to 39.11% of the TMs highlighted in this study. The most frequent type of this category was found in texts on applied linguistics by native writers, while the least amount of this category was found in physics articles.

Cross-disciplinary variation of transition markers in RA_s

The analysis was done using Chi-square analysis to find the difference between physics and computer engineering articles in terms of using TMs. The results of the analysis are shown in the following table, where X^2 stands for the Chi-square amount and P shows the level of significance:

Table 2: Chi-Square analysis

Categories of TMs	Causal	Adversative	Sequential	Conditional	Additional	df	X^2	p
Disciplines								
Physics articles	46	48	17	0	50	4	12.8	0.012
Computer engineering	87	160	59	0	211			

The difference between physics and computer engineering articles was found to be significant at ($p < 0.05$) since the Observed X^2 (12.8) is greater than the Critical X^2 (9.4) with $df=4$.

Inter-disciplinary variation of transition markers in RA_s

The analysis was done using Chi-square analysis to find the difference between applied linguistics articles written by native writers and those of written by non-native writers in terms of

using TMs. The results of the analysis are shown in the following table, where X^2 stands for the Chi-square and P shows the level of significance:

Table 4: Chi-Square analysis

Categories of		Causal	Adversative	Sequential	Conditional	Additional	df	X^2	p
TMs	Disciplines								
	Applied native articles	129	208	99	0	299	4	16.7	0.002
	Applied non-native articles	85	87	35	3	123			

The difference between applied linguistics articles written by native writers and those of written by non-native writers was found to be significant at ($p < 0.05$) since the Observed X^2 (16.7) is greater than the Critical X^2 (9.4) with $df=4$. Results obtained from analyzing the types and frequencies of transition markers in computer engineering articles and physics articles showed significant differences in using TMs in the two groups. In other words, there were no significant differences in the types and frequencies between these two disciplines was rejected and so were articles written on applied linguistics by English and Iranian researchers.

Discussion

The results of this study showed that there are differences and similarities between computer engineering and physics As. In both set of articles, the most frequent types of transition markers were additional connectors, and the least ones were conditional and sequential connectors. Such differences in various disciplines can be explained by regarding the nature of fields of knowledge. For example, the field of physics can be accounted as "hard" sciences in which methods, materials, and procedures can be measured precisely and experiment context is more controlled, whereas Economics as a "soft" science is characterized as having a theoretical foundation with tentative essence. Similarly, Hyland (1998) argues that the control of variables in the soft-knowledge fields is looser and research findings are not streamlined. Thus, the soft disciplines more likely need more strategies and devices such as interactive metadiscourse elements to persuade audiences.

The possible reason for higher occurrence of TMs in computer engineering is that although computer engineering generally represents technological information, it gives information about some issues which are not absolutely technological. So it has some characteristics of "soft" science which is characterized as having a theoretical foundation with tentative nature.

In general, the natural sciences and mathematics are classed as hard-pure; the science-based professions such as engineering are classed as hard-applied. So physics and computer engineering can be considered as hard science; therefore, they are expected to have some common characteristics. This can justify similarity between these two disciplines in terms of using same categories of TMs in both disciplines adversative connectors were of the greatest frequency and also both disciplines used conditional connectors equally.

In the view of the second research question, the analysis of the data showed that there were disciplinary similarities and differences in the use of transition markers in applied linguistics RAs written by English and Iranian authors. In both set of articles, the most frequent were additional connectors. Adversative and causal connectors occur in the second and third position respectively. In applied linguistics articles written by native authors there were 735 TMs out of 97719 words whereas in the Iranian ones 333 TMs out of 53821 words. In other words, there was a significant difference between these two disciplines. The results of the study are also to some extent similar to the results of the study conducted by Farrokhi and Ashrafi (2009) which concluded that there is a significant difference in the distribution of textual metadiscourse markers between the writings of native English writers and non-native Persian writers of English. The results of this study confirm Dahl's (2004) claim that language and national writing traditions seem to be the most influential factors in using interactive metadiscourse markers in linguistics texts.

One of the reasons in meaningful differences between the uses of TMs in articles written by native and Iranian non-native writers can be the lack of the non-native writers' mastery of conventions and linguistic rules of academic writing genre. According to Hyland (2009), academic writing, much like any other kind of writing, is only effective when writers use conventions that other members of their community find recognizable and convincing. Moreover, not only the non-native writers needs to master in linguistics rules and conventions of academic texts, but also they require understand higher levels of discourse. Hyland (2004) mention that metadiscourse resources are of great value at higher levels of writing in an academic and at the same time meaningful and appropriate way to a particular disciplinary community.

The other reason can be the influence of linguistic background and culture traditions of non-native writers on the use of metadiscourse markers in the second language. According to Hyland (2004) the writers' cultural and rhetorical preferences can affect the use of metadiscourse markers and the style of discourse organization. So, it can be said that non-native writers must be familiar with the cultural conventions of the use of metadiscourse markers in the target language in order to produce successful texts in a foreign language.

CONCLUSION

This study aimed to examine the use of transition markers in discussion and conclusion sections of published articles in the fields of physics, computer, and applied linguistics among English native and Iranian non-native researchers. The results of this study showed the writers of physics articles used more TMs than the writers of computer engineering articles which showed the different nature between these two disciplines. On the other hand, the nature of discipline can influence the frequency of transitional markers in the written text. Another result of this study revealed that Iranian researchers of linguistics slightly use less connector than English native researchers. This underuse problem may be related to the impact of first language and culture of non-native writers on the use of TMs in the second language. Also, these two groups of writers from these two disciplines showed that various preferences in employing TMs types based on their propositional content, argumentation and readers.

Finally, it can be said that even when the non-native writers have a good knowledge of TMs, they will be influenced by their first language and culture. Contrastive studies on the use of metadiscourse markers in different disciplines with different languages help the writers to familiar with the differences between their cultures and the culture of discourse to which they write the text. Also, it shows us that some languages and disciplines are specific and this awareness is important for the development of writers.

Difficulties for those non-native writers and students who want to be considered as member of the academic discourse may be because of the lack of familiarity with the conventions of disciplinary culture and these resources of academic discourse. According to Mauranen (1993), cultural differences in metadiscourse use may result in unintentionally inefficient writing on the part of L2 writers. Therefore, EFL writers need to increase understanding of these resources and rhetorical conventions of their disciplinary community in order to join that community.

The results of this study may be useful for the teachers of English for academic purposes and English for specific purposes in making their learners aware of the ways in which metadiscourse resources including TMs occur in the text in order to achieve the communicative purpose of specific genre. So, it is necessary to pay attention to these resources and teaching them to the foreign language learners of English in ESP, EAP course.

Also, these findings of this study can be used by teachers of EFL learners to aware them the differences which occur in the conventions of metadiscourse use between native and non- native writers.

This study has examined some important questions about the types and frequencies of TMs in English and Persian in the disciplines of applied linguistics, physics, and computer engineering. Further research may be carried onto comparatively studying TMs in other disciplines in English articles written by English and Iranian writers to find if these devices are used differently. It is possible to compare research articles written by authors with other language background; for example, between German writers and English writers. It is also possible to compare other metadiscourse markers such as frame markers in research articles. In this study, the checklist used was based on Halliday and Hassan (1976). In other studies other checklists or combination of different checklists can be used. The present study dealt with discussion and conclusion sections in RAs while other sections in RAs could be studied in terms of TMs and other metadiscourse markers.

ABSTRACT

The present study aimed to examine the effect of oral corrective feedback provided by the means of indirect focus on form through corrective recast in comparison with direct focus on form through metalinguistic feedback on linguistic accuracy of pre-university students' oral production was studying at Mehr School in Khoramshar, Iran. To fulfill the purpose of the study, 40 students were chosen through a Nelson Proficiency Test (series 300D) used to homogenize the participants regarding their language proficiency level. Based on the results of this test, two matched experimental groups, 20 participants as the Indirect Corrective Recast (ICR) and 20 participants as Direct Metalinguistic Feedback (DMF), were formed. After ten sessions of treatment, the two groups were post-tested through another structured interview. The analysis of the data was done through Paired and Independent Samples t-test. While both groups made statistically significant improvement in terms of the average accuracy gains, concerning the general effectiveness of the two feedback techniques to focus on form, the data analysis indicated that there was no significant difference between the two groups, though the ICR Group performed slightly better on the post-test than the DMF Group. In sum, this study confirmed that the planned focus on form can be an effective tool for the development of oral accuracy in the EFL situations. It can also be concluded that intensive recasts which are repeatedly focused on a particular structure are not different from direct types of feedback in teaching linguistic accuracy.

KEYWORDS: Corrective recast, Metalinguistic feedback, Accuracy, Oral Production

INTRODUCTION

As indicated by Corder (1967), errors play an essential role in the process of language learning because they show the extent to which the learners have learned the target language as well as the areas in which they still require help. This study aimed at examining the ways through which teachers orally correct learners' errors and the impact of such corrections on learners' English language production. As Shaffer (2008) stated, one of the questions confronting every EFL

(English as a Foreign Language) teacher is how to correct oral errors and how much to correct. Researchers' attitude varies widely on this: from no correction to extensive correction, from immediate to delayed correction, and from indirect to direct correction. Language learners also have their own ideas on how and whether they want to have their oral errors corrected by their teacher in the classroom context.

Corrective feedback as one of the efficient techniques of focus on form and meaning has long been used in second language classrooms. Learning entails feedback. Otherwise, the students have no means of evaluating the extent and appropriateness of their learning. Within the field of second language research, a numerous number of studies are centering on corrective feedback. Feedback is an essential part of language pedagogy because through teacher's feedback learners can be aware of how far they have progressed and how they are doing. All of these techniques are put into a direct-indirect continuum. Metalinguistic and recasts have been recognized as two useful feedback treatments that arise in the course of interaction to deal with communication problems.

While a great many studies have been done to investigate the efficacy of corrective feedback in EFL, there is still debate over what kinds of corrective feedback is more effective. The present study aimed at investigating whether there is any statistically significant difference between groups of Iranian pre-university students receiving indirect feedback on form through corrective recast in comparison with another group receiving direct focus on form through metalinguistic feedback on linguistic accuracy of oral production at the same level of language proficiency. Nassaji and Swain (2000) maintained the primary issue that exists in the area of corrective feedback is that most of second language teachers are not familiar with the impacts of different types of feedbacks, which feedback is more suitable for which level? They are not aware that whether corrective recasts or metalinguistic feedback has more beneficial effect on students' accuracy.

The purpose of this study was to see whether pre-university school students in Iran benefit more from indirect focus on form through corrective recast or direct focus on form through metalinguistic feedback. This study aimed to provide data for English teachers and researchers with better understanding of corrective feedback and which type can be more useful for students' oral accuracy and retention. One of the concerns of teachers, particularly in communicative-focused classes, is that they wonder if students' oral productions should be corrected in terms of indirect or direct corrective feedback. As teachers obtain a better perception of which kind of corrective feedback benefit students, students receive more quality instruction and receive feedback that best contributes to L2 acquisition.

REVIEW OF LITERATURE

Reactive and proactive focus on form has both advantages and disadvantages. An advantage of reactive focus on form is that the natural flow of communication is not interrupted as a teacher should only correct learners' repetitive errors using more indirect techniques such as recast. In addition, "the teacher does not have to pre-select a target form before a class" (Doughty & William, 1998, p. 206). On the other hand, Doughty and Williams (1998) suggest that reactive

focus on form is not practical when the learners are of “different L1s, of different abilities, or of such high ability that errors go unnoticed by the teacher or other learners, since the message is successfully delivered” (p. 206).

Doughty and Williams (1998) respond to these conditions of reactive focus on form by asserting that teachers should “notice and be prepared to handle various learning difficulties as they arise” (p. 206). The proactive focus on form was introduced in order to overcome deficiencies of the reactive stance and can be successfully used to either a large class-size or learners at different levels of ability. In proactive focus on form a teacher must choose a target structure before starting class and design a schedule on the basis of “considerations of individual learner differences, developmental language learning sequences, input quality, formal or functional complexity, and L1 influences on SLA process” (p. 198).

Loschky and Bley-Vromen (1993, cited in Doughty & Williams, 1998) introduced concept of task essentialness regarding the difficulties in proactive focus on form. Thus, Swain (1998) proposed dictogloss which could fulfill the condition of task essentialness to a large extent. In dictogloss for focus on form purpose, the teacher read a text involving the targeted structure to students at normal speed, while the students need to take notes and then reconstruct the text together. Afterwards, at the time of reconstruction and reproduction, the teacher can focus on that specific form.

Direct feedback to focus on form includes explicitly attracting the focus of the learner to the error with or without rule explanation. The two kinds of direct corrective feedback that fall toward the more explicit end of the continuum are determined by Lyster and Ranta (1997) as: (a) ‘direct correction’ when it is overtly stated that an error has been made and the correct form is provided; and (b) ‘metalinguistic feedback’ when a metalinguistic explanation of the underlying grammatical rule is given. Therefore, if a language learner says, “He go to school every day,” the corrective feedback can be supplied directly, for example, “no, not go, you should say goes,.” and may or may not contain metalinguistic information, for instance, “Don’t forget to make the verb agree with the subject” (Lightbown & Spada, 1999, pp. 171-172). Metalinguistic feedback is divided into three subcategories: metalinguistic comments, metalinguistic information and metalinguistic questions (Lyster & Ranta, 1997).

Metalinguistic comments, the most minimally informative of the three, simply demonstrate the occurrence of an error. The second subcategory of metalinguistic feedback is metalinguistic information which goes beyond simply indicating the occurrence or location of the error and “generally supplies some metalanguage that refers to the nature of the error” (Lyster & Ranta, 1997, p. 47). The third subcategory of metalinguistic feedback is metalinguistic questions that refer to the nature of the error but try to extract the information from the student.

Richards, Platt and Platt (1992, p. 141) stated that fluency is mainly used in contrast with accuracy which is “the ability to produce grammatically correct sentences but may not include the ability to speak or write fluently”. Harmer (2001) asserted that non-communicative activities are expected to improve the accuracy of learners. On the other hand, communicative activities are

to enhance the fluency of learners. The common idea is that during accuracy work, the teacher is supposed to point out and correct the errors made by learners. In addition, during communicative activities teachers should not interrupt the flow of the speech of learners to shed light on the grammatical, lexical, or pronunciation errors, for the reason that this act interrupts communication.

Ellis, Loewen, and Erlam (2006) in an experimental study investigated the effects of direct and indirect corrective feedback on the acquisition of past tense -ed among low-intermediate learners. The indirect feedback in this study was recast and the direct feedback was metalinguistic feedback. The results of this study indicated that direct feedback containing metalinguistic information was more effective than indirect feedback containing recasts.

Nassaji (2009) investigated the impact of recasts with more direct types of corrective feedback which is called prompt on a series of linguistic features. Despite the fact that these target features were not new to learners in his study either, he came to a reassuring point that the degree of learners' latent knowledge of the target forms may affect the efficacy of recasts and feedback which is called prompt on a series of linguistic features. Despite the fact that these target features were not new to learners in his study either, he came to a reassuring point that the degree of learners' latent knowledge of the target forms may affect the efficacy of recasts and more heavily on learners' latent knowledge of the target form than recasts. He further supposed that recasts could be "more beneficial for learning new forms" than prompts (2009, p.441).

Sheen (2007) investigated the impact of focused corrective feedback on the improvement of 91 adult ESL learners' accuracy in the use of two kinds of articles ('the' and 'a'). This study involved a direct only group (the researcher pointed to errors and provided correct forms), a direct-metalinguistic group (the researcher pointed to errors, provided correct forms, and supplied metalinguistic explanations), and a control group. The efficacy of the corrective feedback was measured on post-tests. Sheen found that both direct corrective feedback groups outperformed the control group. This study also revealed that direct corrective feedback helped upgrade ESL learners' accuracy, particularly when metalinguistic feedback was supplied. She described this result by pointing out that the feedback supplied to the students with the correct form was limited to two linguistic forms (i.e., articles 'the' and 'a'), which made the processing load manageable for them.

Saito and Lyster (2012) compared the impacts of instruction with and without recasts targeting pronunciation errors in the use of English /ɪ/ by Japanese students of English. All students participated in four hours of form-focused tasks designed to improve their argumentative skills in English while attracting their attention to the target forms through typographically enhanced input and providing opportunities for production practice. During these tasks, one group received recasts following their mispronunciation or unclear pronunciation of /ɪ/ while no corrective feedback was provided to the other. The students receiving recasts made considerably more improvement than those not receiving recasts, again revealing that practice in tandem with feedback supplies more support for the restructuring of interlanguage forms than practice alone.

Sometimes with previous studies regarding the effectiveness of indirect and direct feedback, little to no difference occurs between recasts and metalinguistic error correction. A research done by Kim and Mathes (2001) utilized a target structure of dative verbs with 20 Korean adult ESL learners. Their study examined two groups: Group A received metalinguistic feedback and Group B received recasts. Both were presented in two sessions one week apart from each other. Although learners told that they preferred direct feedback, the achievements between the two production tasks were not significant.

Another study done by Sanz (2003) examined 28 first-year university learners of Spanish studying pronouns between the object and verb and placed them into two groups. Group one received metalinguistic feedback and group two received implicit feedback. Sentence completion and written video retelling revealed that both groups significantly enhanced ability to provide the target structure with no difference between the groups.

RESEARCH QUESTIONS

The research questions formulated for the purpose of this study were as follows:

1. Is there any statistically significant difference between the pre-test and post-test linguistic accuracy of participants' oral production, receiving-indirect focus on form through corrective recast?
2. Is there any statistically significant difference between the pre-test and post-test linguistic accuracy of participants' oral production, receiving direct focus on form through metalinguistic feedback?
3. Is there any statistically significant difference between post-test linguistic accuracy of participants' oral production, receiving-Indirect focus on form through corrective recast and those participants receiving direct focus on form through metalinguistic Feedback?

METHODOLOGY

Design

This study was conducted based on pre-test and post-test design which composed of two independent variables (two techniques of focus on form, i.e., indirect focus on form through corrective recast, and direct focus on form through metalinguistic feedback), and a dependent variable (linguistic accuracy). Drawing upon Mackey and Gass (2005), the present study had a between-groups design. More specifically, since the two groups of the study received different treatments, and there was no control group, the design took the form of comparison groups design, one of between-groups design types.

The design of the study included:

Language proficiency test: Nelson English Language Test (series 300D) developed by Fowler and Coe (1976) was used as a means to homogenize the experimental groups' participants.

Pre-test: It was done through a structured interview to measure the accuracy scores of participants on the basis of three mentioned grammatical structures before treatments.

Treatment 1: It was in the form of indirect focus on form through corrective recast.

Treatment 2: It was in the form of direct focus on form through metalinguistic feedback.

Post-test: It was done through another structured interview to measure the accuracy scores of participants on the basis of three mentioned grammatical structures after treatments.

Participants

Participants of the study were selected through the random sampling among pre-university students studying at Mehr School in Khoramshar, Iran. Upon administering Nelson Proficiency Test, 40 students whose scores were within one standard deviation above or below the mean score of the whole sample were recognized as eligible participants and included in the study. They were selected out of 52 pre-university students who took this test (i.e. Nelson test). Subsequently, these participants were evenly assigned to one of two experimental groups, one as the Indirect Corrective Recast (ICR) group and the other as the Direct Metalinguistic Feedback (DMF) group, respectively. Each group included 20 participants. Regarding the participants' demographic information, they were all male students and their age ranged between 17 and 19 years old.

Instrumentation

In order to accomplish the objectives of this study, the following instruments were employed: To run the study, first, a Nelson English Language Test was used as a means to homogenize the participants with regard to their language proficiency level. While the Nelson test is standardized and highly reliable, this test was also piloted with a similar group of eight students from the same population to verify its consistency with respect to the context of the present study. Hence, the general English proficiency test was found to be appropriate for the participants performing level. It is worth noting here that the reliability of general English proficiency test estimated by KR-21 method appeared to be ($r=.76$). This test consisted of four parts: cloze tests, structure, vocabulary, and pronunciation. All parts were in the form of Multiple-Choice questions. There were, in all, 50 items and the time allotted was 60 minutes.

The second instruments used in this study were two structured interviews including three grammatical structures namely second-conditional sentences, should have + past participle, and the use of four types of conjunction including so, such, too and enough in adverbial clauses in order to elicit the required structure from the participants, in pre-test and post-test. It is important to note that since there was no valid and reliable ready-made test in the market fulfilling the purpose of this research, the pre-test was designed and developed by the researcher based on the grammatical exercises related to these three aimed structures which are commonly used in Pre-University Students' English Workbooks. This test was in the form of structured interview included 20 items and before final administration it was piloted with a smaller group of pre-university students who were similar in English proficiency level to the main participants of the study. An item analysis was done to calculate the level of difficulty of all items. Then, based on the results of this analysis, some items were modified or replaced by some new ones. The reliability of this test which was calculated by KR-21 method and it came out to be satisfactory with an index of .77. Another similar test of 20 items like pre-test was used as the post-test to measure the effectiveness of the instructional approaches. The reliability index for this test was 0.78. It should be noted that in all the interviews, the interviewer read the situation to the

interviewee. Then the interviewee was supposed to start his answers orally with the provided incomplete sentences, with the required structure. Accuracy ratios were computed to score the interviews (by two raters) through dividing the correct uses by the sum of the total number of incorrect and zero uses (White, 1998).

For treatment, three passages for dictogloss purpose were developed for each structure, which were the same for both the ICR and the DMF Group. As noted in Chapter Two, dictogloss (Swain, 1998) was used to meet the condition of task essentialness, that is to say, to provide enough opportunities for the teacher to offer focus on the aimed form (Loschky & Bley-Vromen, 1993, cited in Doughty & Williams, 1998). These passages for dictogloss were selected based on reading comprehension activities of their English Workbooks that students had worked on them during the class activities. Then the researcher included many instances of the specified structure for each passage to fulfill the objective of the study in order to attract the participants' attention to focus on the aimed form.

Procedure

Based on the administration of Nelson Proficiency Test, 40 participants whose test scores were one standard deviation below or above the mean score were included as the eligible participants of the study. Based on the results of this test, two matched experimental groups, 20 participants as the ICR Group and 20 participants as the DMF Group were formed. Further, to make sure the participants, in the two groups, did not possess statistically significantly different abilities in terms of linguistic accuracy, a pre-test was given, requiring the participants in both groups to answer orally the questions of structured interview in order to obtain the accuracy rate of the participants before treatment. It should be noted that the questions of structured interview in pre-test were about three grammatical structures namely second-conditional sentences, should + have + past participle, and the use of four types of conjunction including so, such, too, and enough in adverbial clauses. It is worth mentioning that the participants in this study had a little familiarity with these three grammatical structures based on what they had studied in their English course books.

It should be noted that the ratings of the interviews in the pre-test and post-test were carried out by two raters. The inter-rater reliability was calculated through Person Correlation analysis for the pre-test of accuracy is ($r=.94$) and for post-test of accuracy is ($r=.97$) which shows that there is a high positive relationship between the scores rated by Rater 1 and Rater 2 in both pre-test and post-test for both experimental groups.

Regarding the treatment, this study required the teachers to provide the participants with a kind of task that pushed the participants to use the aimed structures in a way that the completion and fulfillment of the task was not possible without using them. This matter, called task essentialness (Loschky & Bley-Vromen, 1993, cited in Doughty & Williams, 1998), was solved by using dictogloss (Swain, 1998). Three passages were developed for each structure to be presented to participants for dictogloss purpose, in ten sessions that each session lasted for about 45 minutes.

Furthermore, during the dictogloss, the participants took notes about the text which was read aloud by the teacher at normal speed, which also involved many instances of the aimed structures. Then, the participants were to reconstruct the text and supply an oral production of the summary of the text, once in pairs or small groups of three, and once more to the class.

In the ICR Group, the participants were provided with corrective recast, once during the pair or group work by their trained teacher by walking around the class and eavesdropping on them, and once more at the time of the oral production to the class. It should be pointed out that in order to attain the maximum benefit from recasts, the participants were made familiar with the nature of recasts; that is to say, the learners were instructed that the use of recasts by the teacher was not confirmations of meaning but rather reactions to erroneous forms (Nicholas, Lightbown & Spada, 2001).

For the post-test, which was about 30 days after the pre-test, the participants took the post-test through another structured interview, which was again double-rated. It should be pointed out that the scores used for data analysis were resulted from getting the average of two scores given by the two raters, if the scores were ever different at all.

Data Analysis

Taking account of the research questions and the null hypotheses and regarding the fact that all the assumptions for parametric tests were met, to determine the existence of any statistically significant difference between the language proficiency levels of the two groups before the experiment began, an Independent-Samples *t*-test was run on the language proficiency level mean scores of the two groups. Moreover, another Independent-Samples *t*-test was used to examine the existence of any statistically significant difference between the two groups' mean scores on the pre-test before starting the treatment. Next, to investigate the first and second null hypotheses, two separate Paired-Samples *t*-tests were run, one determined the pre-test and post-test mean scores differences of the ICR Group and the other determining the pre-test and post-test mean scores differences of the DMF Group. Finally, to either confirm or reject the third null hypothesis, an-Independent-Samples *t*-test was used to investigate the existence of any statistically significant difference between the two groups' mean scores on the post-test.

RESULTS AND DISCUSSION

In order to measure the accuracy scores of two groups on the basis of three aimed grammatical structures before the treatment, a pre-test was administered to the participants. The participants' overall scores on the pre-test were collected through structured interview and are shown in Table 1.

Table 1: ICR and DMF Group's Pre-test Descriptive Statistics (Pre-test)

	N	Mean	Std. Deviation	Std. Error Mean
ICR Group	20	27.66	18.66	4.17
DMF Group	20	29.78	16.61	3.71

The mean was 27.66 and the standard deviation was 18.66 for the ICR Group. In the case of the DMF Group, the mean and standard deviation were 29.78 and 16.61 respectively. As it is noticed, the means and standard deviations of the two groups were approximately similar on the pre-test. The data were put into Independent Samples *t*-test analysis to show any possible difference between the ICR and DMF Groups on the pre-test. Table 2 shows the results.

Table 2: Independent Samples T-test on Pre-test Mean Scores

		Levene's Test for Equality of Variances		t-test for Equality of Means		95% Confidence Interval of the Difference			
	F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Lower	Upper
Equal variances assumed	.530	.471	.37	38	.70	2.12	5.58	13.43	9.19
Equal variances not assumed			.37	37.49	.70	2.12	5.58	13.43	9.19

As shown in Table 2 the two groups were not significantly different with respect to their variances. ($F=.530$, $p=.471$). T_{observed} value, by degrees of freedom 38, was 0.37. As it can be seen the value of the Sig. (2- tailed) is .70 which was more than 0.05, hence; it can be inferred that both the ICR and the DMF Group performed significantly similar on the pre-test, that is, the participants' oral accuracy concerning the knowledge of three aimed grammatical before treatment was considerably equal.

Further, to investigate the first and second hypotheses, two separate paired-samples *t*-tests were run, one determining the pre-test and post-test mean scores differences of the ICR Group, and the other determining the pre-test and post-test mean scores differences of the DMF Group. To determine whether this difference was statistically significant, nevertheless, a paired-samples *t*-test was utilized.

Table 3: ICR Group's Pre-test and Post-test Descriptive Statistics

		Mean	N	Std. Deviation	Std. Error Mean
Pair	Pre-test ICR	27.66	20	18.66	4.17
	Post-test ICR	60.81	20	21.90	4.89

Table 4: Paired Samples T-test on ICR Group, Pre-test and Post-test

		Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference		t	df	Sig. (2-tailed)
					Lower	Upper			
Pair	Pre ICR –Post ICR	33.15	10.14	2.26	-37.89	28.40	14.6	19	.000

As Table 4 indicates the T_{observed} absolute value, by degree of freedom of 19, -was 14.61. Since the Sig. (2-tailed) was less than 0.05, this statistical test confirmed that the difference in mean scores of the pre-test and post-test was statistically significant. This finding was not in conformity with the claim of Null Hypothesis 1. This hypothesis was, consequently, statistically rejected. Therefore, the Paired Samples t -test analysis revealed that the participants in the ICR Group receiving corrective feedback improved significantly in their post-test for their performance on the accuracy of oral production ($p=.000 < 0.05$). The results proved the hypothesis that indirect error correction through corrective recast during oral activities by the means of dictogloss to focus on the aimed form seemed to have a significant overall effect on students' oral accuracy. To determine the existence of any statistically significant difference between the results of the DMF Group's pre-test and post-test, a similar approach was adopted. The relating descriptive statistics are presented in Table 5.

Table 5: DMF Group's Pre-test and Post-test Descriptive Statistics

		Mean	N	Std. Deviation	Std. Error Mean
Pair	Pre-test DMF	29.78	20	16.61	3.71
	Post-test DMF	56.79	20	20.59	4.60

As it is evident in Table 5, the pre-test-mean score of the DMF Group was 29.78, while that of the post-test was 56.79. Although this difference between the two mean scores seemed to be less than the mean scores difference of the ICR Groups' pre-test and post-test, a paired-samples t -test was run to see if this difference in the DMF Group was statistically significant (Table 6).

Table 6: Paired Samples *t*-test on DMF Group, Pre-test and Post-test

		Paired Differences				95% Interval of the Difference		t	df	Sig. (2- tailed)
		Mean	Std. Deviation	Std. Mean	Error	Lower	Upper			
Pair	Pre DMF–Post DMF	27.01	8.19	1.83		-30.84	-23.17	14.74	19	.000

Regarding the T_{observed} absolute value, by degree of freedom of 19, which was computed to be 14.74, and taking the value of the Sig. (2- tailed) into account, 0.00, it was proved that the difference between the two mean scores was statistically significant. This meant that the participants in the DMF Group had performed significantly better on the post-test; hence, the Null Hypothesis 2 was rejected. On the whole, the paired-samples *t*-test analysis indicated that the learners in the DMF Group receiving metalinguistic feedback also made considerable progress for development of their oral accuracy. That is to say, both types of corrective feedback in this study were effective in facilitating participants' oral linguistic accuracy. An independent-samples *t*-test was used to analyze the existence of any statistically significant difference between the two groups' mean scores on the post-test.

Table 7: ICR and DMF Groups' Post-test Descriptive Statistics

	N	Mean	Std. Deviation	Std. Error Mean
ICR Group	20	60.81	21.90	4.89
DMF Group	20	56.79	20.59	4.60

With respect to the pre-test and post-test mean scores, whereas the ICR participants gained a pre-test mean score of 27.66, which was lower than the pre-test mean score of the DMF participants (29.78), they performed better on the post-test and obtained a mean score of 60.81, as compared to that of the DMF participants (56.79). In other words, the mean gain of the ICR Group was computed to be 33.15, while that of the DMF Group was calculated to be 27.01. In order to analyze the existence of any statistically significant difference between the two groups' mean scores on the post-test, an independent samples *t*-test was run.

Table 8: Independent Samples *t*-test on Post-test Mean Scores

		Levene's Test for Equality of Variances		t-test for Equality of Means				95% Confidence Interval of the Difference	
		F	Sig.	t	df	Sig. (2- tailed)	Mean Difference	Std. Difference	Error Lower Upper
Equal assumed	variances	.087	.769	.59	38	.55	4.02	6.72	9.59 17.63
Equal	variances not assumed			.59	37.85	.55	4.02	6.72	9.59 17.63

As Table 8 indicates, the Sig. value of the Levene's Test for Equality of Variances was more than 0.05, it was concluded that the variability in the two conditions was the same. The T_{observed} value was, therefore, 0.59, by degree of freedom of 38. Moreover, since the Sig. (2-tailed) was more than 0.05, this statistical test confirmed that there was not a statistically significant difference between the oral production's linguistic accuracy performance of the ICR and DMF Groups on the post-test based on the three aimed grammatical structures. The third Null Hypothesis was, therefore, verified.

Discussion

Results of paired-samples *t*-test analysis showed that, in spite of the low performance of the participants in the pre-test, there were significant differences at 0.05 levels between the pre-and-post mean ranks of the ICR group based on three aimed grammatical structures in the form of structured interview, in favor of the post-test. Thus, the first null hypothesis stating that "There are not significant differences at 0.05 levels between the pre-and-post-test mean ranks of the ICR group on the three aimed grammatical structures" was rejected. This improvement may be due to the fact that the recasts used in the present study were corrective in nature. This kind of recasts composed of two steps: 1) repetition (generally with rising intonation) to draw the participants' attention accompanied by 2) recasts to supply, contrastively, the necessary target exemplar. This made recasts more salient and easier to notice.

The third reasonable interpretation is that the participants of the ICR Group were already taught grammar explicitly in the context based on what they had studied in their English course book. This enabled them to respond to and benefit from recasts effectively. This supports the conclusions about the positive relationship between explicit knowledge and noticing. These conclusions revealed that learners who tended to respond to recasts had learned grammar rules explicitly. For example, Rhee (2012) concluded that contexts and explicit knowledge interdependently created the cognitive ability that increased the effectiveness of recasts on second/foreign language processing, which then arguably determined subsequent language development.

Results of another paired-samples *t*-test analysis showed that there were significant differences at 0.05 levels between the pre-and-post mean ranks of the DMF Group based on three aimed grammatical structures in the form of structured interview, in favor of the post-test. This indicates that metalinguistic feedback like corrective recast led to significant improvement in the participants' oral grammatical accuracy. It mainly provided the participants with negative evidence explicitly.

The findings of the present study indicated that in spite of the differences between the two experimental groups' means during the ten sessions of oral production and treatment, the results of independent sample *t*-test showed that there were not statistically significant differences at 0.05 levels between the post-test mean ranks of the ICR Group and the DMF Group based on three aimed grammatical structures in the form of structured interview. Indeed, the two feedback types were equally effective in the development of the oral accuracy. Considering these findings, it can be suggested that the intensive recasts focused on a specific forms are not different from direct types of feedback. However, the findings of the current study revealed that recasts seemed to be an effective type of corrective feedback with low level language learners as they were short, one change and accompanied by clues and gestures which empowered the participants to pinpoint their errors and hence bridge the gap between their erroneous utterances and the target utterances (e.g., Sheen, 2004)

CONCLUSION

The present study attempted to examine the potential impact of the two feedback techniques to focus on form through corrective recast and metalinguistic feedback on linguistic accuracy of Iranian pre-university students in the terms of three aimed grammatical structures. Both theory and research proposed that directing learners' attention to linguistic forms during meaning focused activities can help learners to improve accuracy as well as fluency. This study found that focus on form instruction contributes to the learners' accuracy gains. Results are encouraging as far as the two types of feedback in grammatical accuracy are concerned. They revealed that the two feedback techniques (corrective recasts and metalinguistic feedback) were effective in enhancing the participants' grammatical accuracy in oral production. The findings indicated that in spite of the difference between the two experimental groups' means in the favors of the ICR Group, this means difference were not statistically significant on the post-test. In fact, the two types of feedback were almost equally effective in the development of the oral grammatical accuracy.

This study investigated the two techniques of focus on form, demonstrating higher gains after the application of indirect focus on form through corrective recast and direct focus on form through metalinguistic feedback on linguistic accuracy of oral production of Iranian pre-university students based on three aimed grammatical structures. Since corrective recast led to higher score on post-test, albeit by a relatively small margin, in comparison with metalinguistic feedback, it may be beneficial for a teacher to use indirect error correction when possible. Moreover, this study indicates some support for the use of focus on form rather than the use of traditional focus on formS. Hence, teachers need to be familiarized with the techniques of focus on form,

especially the indirect ones which keep the communicative nature of the language classes. So, it would be logical to allot some time to the training of teachers in this respect.

Since this study was confined in terms of its participants, structures in focus, techniques of focus on form, etc., it appears to be necessary to point out some further research to be done in this regard. Considering the fact that this study was limited to only two techniques of focus on form, it is suggested that similar studies be conducted with other techniques of focus on form whether indirect ones or direct ones, such as clarification request, elicitation, etc. Moreover, more comprehensive studies could be done to investigate the effect of more than two techniques at a time on language acquisition. Since the present study focused on only three structures in English, similar studies could examine the accuracy gains in terms of other structures in English. Similar research could be done regarding written recognition and production of other English structures.

ABSTRACT

The present study attempted to investigate the male and female teachers' attitudes towards computer assisted language learning (CALL) in developing English language teaching in Iranian context. This study was also to examine the MA and PhD teachers' computer literacy and its effects on using CALL facilities in English classrooms. The participants of this study were 35 university teachers who were selected based on non-random convenient sampling method at the universities of Shahid Chamran and Islamic Azad Universities in Ahvaz, Iran. The research instrument was a three-section questionnaire extracted from Shin and Son (2007) which is in multiple-choice, Likert type and open ended items. The data were collected and analyzed through K-S test of normality and Independent Samples t-test. The results of the study showed that the facilities and equipments are poor and universities need to reassess CALL facilities, in the case of computer literacy and skills, teachers were enough competent and they used CALL facilities if they have access to such equipments. Findings showed that there was lack of technological equipments for CALL implementations which may affect English as foreign language (EFL) teachers' motivation in using CALL technology in their teaching career. The implications of study suggest that teachers should keep in mind that they need to be competent both in computer use and language teaching methodologies. Thus they may find new teaching CALL techniques in teaching EFL tasks in their classrooms.

KEYWORDS: Male, female, teachers' attitudes, Computer assisted language learning (CALL)

INTRODUCTION

Computer-assisted language learning (CALL) provides an effective environment in which students can practice in an interactive manner using multi-media contents, either with the supervision of teachers or on their own pace in a self study mode. The advancement of speech and language technologies has opened new perspectives on CALL systems. The influence of these powerful technological tools has pervaded all aspects of the educational, business, and economic sectors of our world (Singhal, 2004). There is no doubt that the computer has established itself firmly in the world of business and communication technology; it has also successes in acquiring a fundamental role in the educational process (Albirini, 2006a,

2006b). This role is becoming more powerful as computers become cheaper, smaller in size, more adaptable and easier to handle. Computers are becoming more appealing to teachers because of their huge capabilities and extensive effectiveness (Dhaif, 2004).

Computer and new technologies help students to obtain individual instruction which are designed to meet their specific needs; therefore, teachers should catch up with the new technologies to enhance students' learning. Teachers' tasks are different from the traditional teaching. Recently, teachers are not only instructors but also assistants to students' learning. Teachers should give the students chance of creative and critical thinking, the role of teachers in this modern environment of CALL has become active, creative, and innovative. Since students see a computer as a trendy and useful tool, which enables them to be close to the world, new technologies and web sites are very motivating, offering a wide range of authentic material and promoting development of new learning strategies. English as a foreign language (EFL) learners need to use CALL for sending e-mails, using chat rooms, article, class – conferencing, etc. inside and outside the classroom. All these allow the learner to participate in the target language culture. Besides these positive effects, negative ones such as technical and financial problems, lack of training, inappropriate material, and the huge quantity of information requiring skills and judgment on CALL should be also mentioned. The crucial problem is how teachers use these resources. According to Moras (2001), the use of computers does not constitute a method, but rather, it is a medium in which variety of methods, approaches and pedagogical philosophies may be implemented. Warschaur and Whittaker (1997), suggest that in order to make effective use of new technologies, teachers must take a step back and focus on some pedagogical requirements. Teachers should have self-defined goals in order to use it successfully in the classroom. Some of the reasons could also be that CALL creates perfect conditions for writing because it provides authentic materials, or raises students' motivation and can help to achieve computer literacy which is essential for future work and success.

This study was conducted based on the advantages of CALL which have mentioned in the literature of this research. The motivation behind this study was to uncover teachers' attitudes using CALL in Khuzestan setting, teachers' computer literacy in teaching English, and teachers' knowledge of computer facilities of universities. The present study also intended to investigate and evaluate CALL facilities at Khuzestan universities and also investigated English teachers' CALL knowledge in these universities.

REVIEW OF LITERATURE

Computer-Assisted Language Learning means search for and study of applications of the computer in language teaching and study of applications of the computer in language teaching and learning (Levy, 1997). CALL means learners learning language in any context with, through, and around computer technologies. According to these definitions, computer and new technologies are considered as an essential medium for language teaching and learning. Television, mobiles, iphones, ipads and other technologies could be considered as very modern inventions and become ordinary and essential in daily life. Similarly, computers become ordinary in the life of millions of people around the world (Mahdi, 2013), because of advances in

computer technology teachers are motivated to reassess the computer and consider it a valuable part of daily foreign language learning. Software programs, compact disk technologies, and computer networks are providing teachers with new methods of incorporating culture, grammar, and real language use in the classroom while students gain access to audio, visual, and textual information about the language and the culture of its speakers.

CALL facilities can affect developing EFL in different aspects, they can create authentic learning environment for the learners and give learners constant access to plenty of materials such as newspapers and magazine articles, offer learners the opportunity to take part in activities in the target language, exchange messages with native speakers and interact with them, as part of cultural and social exchange and the outcome being improvement in different skills (Dina & Ciornei, 2013).

With regard to CALL facilities, a few technical issues should be taken into account. It is obvious that availability of a computer room on a regular class is the first thing that teachers need for CALL to be successful. The experiences of many teachers (e.g. Hashemi & Aziznezhad, 2011) have revealed that three students per computer is the maximum for the teaching experience to be effective. Moreover, navigation on the web implies other specific requirements, such as, access to a reliable network environment, use of modern equipment and browser. This may need many newer sites which are designed through the latest Internet technology in order to anticipate potential problems.

According to Liao and Pope (2008), computer literacy is the knowledge and ability a person has to use computers and technology efficiently. Computer literacy can also refer to the comfort level someone has with using computer programs and other applications that are associated with computers. Another valuable component of computer literacy involves the knowledge of how computers work and operate.

Technological tools such as PCs, laptops, or mobiles are used very effectively and frequently in the classroom for instructional purposes. Drills, tutorials, and computer-based tasks are used in the classrooms in order to promote learning of English skills (Beatty & Nunan, 2004). According to Bangs and Cantos (2004), integrating computer technologies efficiently into language teaching require a combined knowledge of foreign language pedagogy, teaching experience and some computer literacy. Language technologies have been sorting through novel technologies evaluating various instructional potentials, researching current educational uses, and sharing findings with educators to help design instructional technology that enhances language learning. New technologies are interested for preparing teaching materials and activities to be used in teaching skills such as pronunciation, grammar, vocabulary, listening and speaking, communication, reading, and writing (Rahimi & Yadollahi, 2011).

The computer as a tool is used in order to facilitate learning of language. It is powerless and has no inborn wisdom; no initiative and inherent ability to learn or to teach and it is totally the servant of the user, and it is dependent on the teacher in many cases. For example, it is impossible to create educational materials without the help of the teacher. All the teaching, linguistic materials and instructions must be specified by the teacher. It is the teacher decides

what degree of control the computer will have in his/her classes (Chapelle, 2005). Being a relatively new and interdisciplinary field of study, CALL draws on quite an amount of diverse disciplines, theories and fields that can be grouped into five categories: psychology, artificial intelligence, computational linguistics, instructional technology and design, and human-computer interaction studies (Levy, 1997).

CALL instruction was a theory of instruction centered on the teaching process; however, with the noticeable shift from a focus on teaching to a focus on learning, second language acquisition (SLA) was of paramount importance. Unfortunately, SLA's reflections on CALL have been far from transparent as there is 'no generally accepted theory of SLA to embrace with confidence' (Fox, 1993, p. 101) and there are at least forty theories, models, perspectives, metaphors, hypotheses, and theoretical claims in the SLA literature (Beretta, 1991). The Internet has also given way to computer-mediated communication in language teaching and learning. According to the definition provided by Herring (1996), Computer Mediated Communication (CMC) is "communication that takes place between human beings via the instrumentality of computers" (p.1). CMC may be categorized as either synchronous or asynchronous. Synchronous CMC requires all participants to be online at the same time where an active exchange of information takes place as the participants read or listen to messages and respond immediately. Synchronous CMC includes, instant messaging and chatting through MSN or Skype programs, classroom discussions, and MOOs (Multi-user domain Object Oriented). In asynchronous CMC, participants can log onto the computer and respond to message whenever it is convenient for them. Asynchronous CMC includes mailing lists, bulletin boards, blogs, and e-mail.

RESEARCH QUESTIONS

This study aimed to find out the answers to the following research questions:

RQ₁. Do teachers' educational levels affect the use of CALL in the teaching EFL processes?

RQ₂. Do university colleges prepare adequate CALL facilities for EFL teachers?

RQ₃. Do male and female teachers use CALL facilities similarly in their EFL classrooms?

METHODOLOGY

Participants

This study was conducted in both governmental and non-governmental universities of Khuzestan where English is taught by university teachers. The EFL university teachers who participated in filling in the questionnaires were selected based on non-random convenient sampling method from Shahid Chamran, Payam-e-noor, Jahad Daneshgahi as governmental universities in Ahvaz, Iran and Islamic Azad Universities of Ahvaz, Abadan, Masjid Suleiman, and Khuzestan Science and Research Branch in Khuzestan province in Iran as non-governmental universities. They taught EFL at the levels of BA, MA, and PhD courses. The numbers of the participants were 20 males and 15 females. Also 19 of the participants hold MA degree and 16 of them hold PhD degree. The age range of the participants was from 26 to 60 with a mean age of 35. The results are presented in Table 1.

Table 1: Participants of the Study

Gender		Age				Degree			
Male	Female	Male		Female		Male		Female	
20 (57%)	15 (43%)	Under 50	Above 50	Under50	Above 50	MA	PhD	MA	PhD
		19(95%)	1(5%)	14(95%)	1(5%)	10(50%)	10 (50%)	9 (60%)	6(40%)

Instrumentation

In this study a three-section questionnaire was extracted from Shin and Son (2007) and administrated in order to collect data among EFL university teachers. It was used to collect male and female teachers' perceptions and perspectives on the use of CALL as a new tool for better implementation of EFL teaching. The questionnaire consisted of three sections; the first section includes 16 personal and educational items aimed to collect the profile of the participants' background such as their age, gender, degree, teaching experience, using CALL at home and classroom, and reasons for using it, and their level of familiarity with CALL.

The second section includes 15 items of four-point Likert scale including the choices of Strongly Disagree (1), Disagree (2), Agree (3), and Strongly Agree (4), intended to explore teachers' perceptions and perspectives on the use of CALL, the first five items related to CALL and its characteristics in providing appropriate teaching and learning materials, the second five items relate to students and their attitudes toward CALL and motivation in learning English via CALL, and the third five items relate to the teachers attitude and ability in utilizing CALL as a teaching tool.

The third section of the questionnaire includes three open-ended questions the advantages, disadvantages of CALL, and teachers' comments in using CALL for teaching purposes. These items investigated EFL university teachers' general opinions and comments on the use of the CALL for teaching purposes in the classroom.

The questionnaire was used as an instrument to analyze the features and the numbers in a scale and to differentiate the levels of participants' answers. The items are grouped according to the concepts of responses as a whole. The reliability of the questionnaire was estimated through Pearson correlation analysis on the two occurrences of piloting the questionnaire among a group of 8 MA and PhD university teachers in two occasions of a two-week interval. The participants in the pilot test were supposed to have the same level of knowledge of the research sample. The questionnaire was revised and modified after the pilot test and its reliability coefficient was analyzed through Pearson Correlation analysis as ($r=.762$).

Procedure

The questionnaire was extracted from Shin and Son (2007) with some modifications. Their questionnaire was designed to assess the use of the Internet in the classrooms; however, we modified it to be adjusted in the research of the effect of CALL on teaching EFL. Then it was

distributed to EFL teachers of governmental and non-governmental universities in Khuzestan (where English is taught at BA and MA levels) in the first semester of 2013-2014 academic year and they returned it within two weeks.

The questionnaire used in this study consisted of 16 items of personal data and 15 items of four-point Likert rated from 1 to 4 and 3 open-ended questions about teachers' attitudes toward the use of CALL in teaching EFL. The data collected through the questionnaire were analyzed through descriptive and inferential statistics. Descriptive studies aimed to describe and to interpret the mean, standard deviation (SD) and the variance of each group. Accordingly descriptive statistics was concerned with conditions or relationships that exist, practices that prevail; beliefs, points of views or attitudes that were held; processes that were being felt; or trends that were developing. In sum descriptive statistics in the present research was concerned with how and what existed among the respondents.

The rationale behind the use of descriptive statistics in this study was to obtain complete and detailed perceptions of teachers in regard to computer-assisted language learning. In descriptive statistics, summary statistics are used to summarize a set of observations in order to communicate the largest amount as simply as possible.

In section one items 1 to 4 of the questionnaire asked the participants' gender (i.e., male and female), education degree (i.e., MA and PhD), age (i.e., under 50 and above 50), teaching experiences (i.e., under 15 and above 15) and their access to CALL (Table 1). The items 5, 6, 10, 14, and 16 were yes /no questions on the use of CALL in the classroom. Items 8 and 9 asked the type of CALL and reasons of using it in teaching EFL. Items 7 and 11 asked the time allocating to use CALL for teaching and items 12, 13, and 15 asked the main reasons for searching webs. Items 11, 12, 13 and 15 were in multiple-choice formats.

The second section included 15 four-point Likert scale items. The main theme of the items was the role of CALL used for teaching EFL. The necessity of CALL was also mentioned in these items. The items were scored based on 1 to 4.

RESULTS AND DISCUSSION

The collected data were analyzed through K-S test of normality and Independent Samples t-test analyses to find any different between MA and PhD teachers' perspectives in general and male and female teachers, in particular. The effects of teachers' experiences were also assessed to find any significant difference among the participants.

Table 2: Descriptive Statistics of Females' Attitudes toward CALL

Female group	N	Minimum	Maximum	Mean	Std. Deviation
Strongly Disagree	15	.00	3.00	.2000	.77460
Disagree	15	.00	7.00	1.9333	2.01660
Agree	15	4.00	10.00	7.1333	1.59762
Strongly Agree	15	3.00	8.00	5.6000	1.59463

Table 2 shows mean and Std. Deviations of each item in female's group. The mean of each item showed that disagree had the least and agree had the most attention, therefore, the results of this part showed that female group had positive view toward the use of CALL but not same to the male group. Results are illustrated in Table 3.

Table 3: Kolmogorov-Smirnov Test (Items)

		Strongly Disagree	Disagree	Agree	Strongly Agree
Number		15	15	15	15
Normal Parameters	Mean	.2000	1.9333	7.1333	5.6000
	Std. Deviation				
Most Extreme Differences	Absolute	.77460	2.01660	1.59762	1.59463
	Positive				
	Negative	.535	.278	.200	.175
Kolmogorov-Smirnov Z					
Asymp. Sig. (2-tailed)		.535	.278	.160	.175
		-.398	-.169	-.200	-.143
		2.073	1.078	.775	.680
		.000	.196	.585	.745

Test distribution is normal.

Table 3 is the K-S test of the female group which is used to determine that whether the test is normal and according to K-S test it was normal; therefore, Independent Samples *t*-test can be used to calculate the data. Results are shown in Table 4.

Table 4: Descriptive Statistics of Teachers' attitudes toward CALL (Males vs. Females)

Groups	Number	Mean	Std. Deviation	Std. Error Mean
Males	15	61.9333	9.09840	2.34920
Females	15	47.0667	3.86313	.99764

Table 4 compares two male and female groups and the result showed that mean of the male group is greater than the females. It means that male group had more positive view toward the use of CALL and since descriptive statistics cannot show the significant difference therefore, Independent Samples *t*-test is used to show the significant difference of the test. It is shown as the following. Results are shown in Table 5.

Table 5: Independent Samples *t*-test of Using CALL (Males vs. Females)

<i>t</i> – test for Equality of Means								
							95% Confidence interval of the difference	
	<i>t</i>	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference		Lower	Upper
Equal variances assumed	5.82	28	.000	14.86	2.55		9.63	20.09
Equal variances not assumed	5.82	18.88	.000	14.86	2.55		9.52	20.21

Table 5 shows that the critical $t=2.04$ is less than the observed $t=5.82$, thus the difference between the groups is significant at ($p<0.05$). Males and females' attitudes toward using CALL are analyzed through the Independent Samples *t*-test to calculate the difference between male and female teachers' perceptions.

Table 6: Descriptive Statistics of Participants' Gender and Using CALL

Groups	Number	Mean	Std. Deviation	Std. Error Mean
Male	20	50.3500	8.05426	1.80099
Female	15	41.6000	13.31916	3.43899

Table 6 showed that the mean of the male group is higher than the females which means that males more positive view toward the use of CALL. Both groups had positive attitude towards computer integration and technology use but males due to some factors including more effects of computer in their daily routines, since they are using more computerized facilities and Internet cafés in the society.

Table 7: Independent Samples *t*-test of Participants' Gender and Using CALL

<i>t</i> – test for Equality of Means								
							95% Confidence interval of the difference	
	<i>t</i>	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference		Lower	Upper
Male Equal variances assumed	2.41	33	.021	8.75	3.62		1.37	16.12
Female Equal variances not assumed	2.25	21.53	.035	8.75	3.88		.68	16.81

Table 7 shows that the critical $t=2.04$ is less than the observed $t=2.41$, thus the difference between the groups is significant at ($p<0.05$).

Discussion

This section concerns with discussing the results of the study through referring the research questions were raised earlier. Results of the study showed that using technology is known as one the recent techniques to enhance desirable learning and studies showed that both learners and teachers are interested in technology especially, new ones including CALL. In line with the progress of the society and technology teachers should start to adapt these new instructional tasks in order to motivate their learners for better learning. Since the young generation is so adapted to CALL technology and it is an inseparable part of their lives; therefore, teachers should start using this positive attitude of learners toward using CALL for language teaching. It may be stated that teachers who are interested in CALL agree on the effectiveness of CALL in teaching EFL. With regard to the first question, it should be stated that EFL teachers' educational levels do not affect on the use of CALL in teaching EFL. Both male and female university EFL teachers tend to use CALL during their teaching processes. In other words, both MA and PhD teachers face the problems including lack of CALL equipments, financial problems, slow Internet, etc. This may affect their computer literacy in using appropriate programs in teaching EFL. Results also showed that CALL literacy is common among male teachers rather than female teachers. This may be due to the availability of such facilities in the society which are used by males rather than females. These facilities are internet cafes, game nets, computer games, etc.

According to the results of this study, CALL may improve language learning which may motivate teachers to teach EFL effectively. Computer and new technologies including CALL facilities which are common among young teachers since this new generation could be called digital natives. In most of the previous studies in CALL, several factors were mentioned as the barriers to the implementation of CALL (e.g. Park & Son, 2009) including external factors such as insufficient computer facilities, lack of administrative support, lack of time, etc. Therefore, it seems that these factors are common problems in most contexts like the setting of Iran. However, it is necessary to use CALL in higher educational settings for teaching EFL. Moreover, language learning centers need to be equipped with these facilities for teaching foreign languages. The participants of this study agreed that CALL facilities at their university are poor and they do not access to new technology in the classroom due to the factors which were mentioned in the previous section. It is also shown that one of the main reasons CALL manipulations is that these facilities are rare due to their expenses. Therefore, as it is agreed by the majority of teachers, these facilities are not used due to EFL classrooms which run in traditional methods such as using blackboards and pen and paper methods.

It is also clear that the teachers' attitudes toward CALL are dramatically affecting learners' judgment of using technology. The teachers need to be competent in using computers and enthusiastic about using them. They should have positive attitudes on using computerized equipment if they want their students to work with CALL (Hubbard, 2010). Teachers' attitudes towards computers define their attitude towards CALL. The teachers who consider themselves to be proficient and integrated with computers have positive attitudes towards CALL. The study proved providing computer literacy classes for teachers who have problems with computer and new technologies. Computer literacy in classes may be highly beneficial. When the teachers are confident enough to work with computers, they have positive attitude towards using computers in

order to teach a foreign language and then their students are likely to have higher motivation and eventually higher achievement. CALL has much to offer when it is integrated into the curriculum with a well-organized fashion. Students have positive attitudes towards it. As Gardner (1985) suggests, when students have positive attitudes they will be more motivated and they more likely to perform better and achieve higher levels of acquisition.

Teachers should keep in mind that students in higher education would need to be proficient both in computers and language. They need to research, write reports, present them, and communicate in English via computers. Therefore, it is not only the question of technology for learning English, but also the urge to assist them in developing CALL.

CONCLUSION

The present study attempted to investigate the teachers' attitudes toward using CALL in developing EFL among MA and PhD and also male and female teachers. The participants of this study were two male and female groups with respectively 20 and 15 EFL university teachers. A questionnaire on the use of CALL was given to the participants; the questionnaire consisted of three parts which asked the participants' views toward using the CALL. The results of the study showed that the facilities and equipments at the universities are so poor and they need to reassess their CALL facilities (Zamani, 2010). In the case of computer literacy and skills, teachers were enough competent and they almost used computer and new technologies to search for teaching materials. Since one of the research questions was about the role of gender in CALL use, the findings of the study showed that male teachers were more interested in computer use than the females and younger teachers were more integrated in technology use than the traditional ones. Although the survey showed positive views on the use of CALL in teaching EFL, the integration of CALL into classroom was very limited and this problem was due to large numbers of students in the classrooms, limited time to finish the textbooks, lack of technical and pedagogical training of using CALL, lack of computer facilities, and slow Internet. According to Machtmes (2005), the use of CALL technology in the classroom needs substantial investments of time, financial support, equipment, personal commitment and courage in order to explore teaching innovation in the EFL classrooms.

There are some implications for language teachers, learners, and college administrators. It is highly recommended these implications as new ideas for further studies about CALL. The findings of the study showed that EFL teachers have positive view toward technology use and its effect on learners' language proficiency and motivation in language learning (Cooper & Self, 1990). According to the participants' view, using the CALL and technology help to access to the new and up to date materials which lead to better education.

The study also revealed those students' language skills, especially listening, speaking, and writing will be improved through using technology. The students are also interested in using CALL when teachers can use these facilities in the classroom. Thus providing students with web sites or CALL approaches is believed to be highly constructive (Inan & Lowther, 2010). The results of this study implied that male teachers are more proficient in using CALL tasks.

Technology will not weaken the teachers' role, since it is revealed that there will be necessary to offer technology and computer literacy courses to both teachers. University colleges are advised to prepare and develop CALL facilities for better language learning and teaching. Most teachers in this study believed that CALL approaches can be an effective tool for teaching a foreign or second language because they can find authentic, up to date, and various materials, as students are motivated in learning with computers. However, there seems to be some obstacles in using CALL and technology in EFL classrooms including limited computer facilities, limited technical support, slow Internet, and even no access to Internet in classes, etc (Alkahtani, 2007). Therefore, universities need to pay more attention to this issue of language learning and teaching.

ABSTRACT

This study aimed at investigating the effectiveness of three various types of clustering (i.e., semantic, thematic, and haphazard clustering) in the vocabulary acquisition and recall of English as a foreign language (EFL) students as well as the putative role of gender in this regard. To achieve these aims, 50 Iranian native speakers of Persian, including 25 males and 25 females, whose linguistic homogeneity had been confirmed through the Oxford Placement Test were selected as the participants of this study. To make sure that the participants had no prior knowledge of the targeted words, the Vocabulary Knowledge Scale (Paribakht & Wesche, 1993) was also administrated. Three separate lists of vocabulary based on their clustering type were then prepared and employed each of which included eight new English words along with their Persian equivalents. These lists were given to the participants in three steps separately. In each step, the participants were required to read the new words along with their Persian equivalents for a specific amount of time and then be immediately tested on them. Each correctly guessed answer received one point. The obtained data were then subjected to an analysis of variance and an independent samples t-test to see if the observed differences were meaningful. A Post hoc Scheffe test was later run to shed more light on these differences. The results demonstrated a statistically significant difference in the immediate posttest in favor of thematic clustering over haphazard and semantic clustering. That is, the performance of participants (both males and females) was improved when vocabulary was presented in thematic cluster. The present study could have implications for language teachers, materials developers, and educators in general: thematic clustering of lexical items ought to be prioritized over semantic or haphazard clustering of the vocabulary items chosen to be taught to L2 learners.

KEYWORDS: Thematic clustering, Semantic clustering, Haphazard clustering, Vocabulary acquisition

INTRODUCTION

Learning vocabulary, as the most unmanageable component in the process of language learning and particularly in the process of second language learning, is really a demanding task which according to Montrul (2001) “involves much more than learning sound-meaning pairings; it also involves learning how lexical information is morphologically expressed and syntactically constrained” (p. 145). Therefore, language learners should experience various tasks such as extensive reading as well as explicit instruction (Schmitt, 2008) in order to enhance their vocabulary knowledge. Through explicit instruction, teachers provide students with lists of words or pictures that are most related to particular situations or topics. Introducing words in groups is among the strategies or techniques used by teachers for direct vocabulary instruction and it seems to enhance vocabulary learning. In this method, which is called clustering, words are grouped in various ways. Words within a cluster share a common super-ordinate concept and can be grouped or related to each other semantically or thematically.

Most English textbooks in use in the context of Iran introduce lexical items in semantic clusters and curriculum writers attempt to select, for each lesson, a set of semantically clustered words that fit specific situations and tasks or that express different notions. It seems that curriculum writers along with EFL program designers assume that this way of organizing and presenting new vocabulary items will benefit learners as it will help them to build semantic networks and relationships and consequently will facilitate and accelerate learning including both acquisition and recall. Whether words can be learned better, stored deeper, and remembered easier when presented semantically, thematically, or even unrelated is the concern of many researchers and remain still controversial.

The present study was an attempt to compare the effects of two different methods of teaching vocabulary items including semantically-related or thematically-related vocabulary presentation on lexical acquisition and recall of Iranian EFL learners to find out which one facilitates vocabulary learning more. Additionally, this study investigated to what extent short-term memory and long-term memory can reserve the words of different sets. Since gender appears to have an effect on the retention and recall of the learned words, the study also aimed to investigate its role in this regard, that is, to see whether these ways of presenting lexical items have a statistically significant relationship with gender's retention of vocabulary items.

REVIEW OF THE LITERATURE

Vocabulary learning has a key role in second language acquisition (SLA). It is quite necessary for second language (SL) learners to acquire at least hundreds of words in order to be able to communicate in the target language at the most basic level. Second language learners should be able to communicate more effectively and comprehend a broader range of input from the target language through learning a good range of new vocabulary. Bogaards (2001) reminds that for many learners, language learning is the same as knowing a large number of words by heart. So it should not be denied that words constitute a major part of a language. With this in mind, it is necessary to help learners to effectively store and retrieve words in the target language (Sokmen, 1997), and this compels the use of effective pedagogical methods in teaching vocabulary.

Semantic clustering as a vocabulary learning strategy

Semantic field theory is based on the assumption that vocabulary is cognitively organized by interrelationships and networks between words. In a sense that the mind classifies vocabulary by making connections in meaning; these connections in meaning are called semantic fields (Channell, 1981). He interprets this to mean that words that are close in meaning are literally located closer to each other in the mental lexicon. Based on this theory since vocabulary is organized in the mind into groups of words that are linked in meaning, it should be presented to students in groups of semantically related words to facilitate learning (Channell, 1981). Jullian's (2000) article supports this notion as an effective method of classroom presentation for second learners. Semantic categories are linguistically based and thematic clusters are cognitively based. Although these two types of clusters will not be mutually exclusive, the slight difference between them is still apparent. Variable word class can be considered as one other defining characteristic of a thematic cluster.

Tinkham (1994) claims that authors and planners of ESL programs who are following a more learner-centered approach select vocabulary items based on the communicative needs of the learners, and then organize their programs into units to reflect situations in which students have to use English. In this approach, the vocabulary items needed to express notions, functions and to fit tasks tend to be presented as they are in the structure-centered approach that is they are grouped into semantic clusters.

Channell (1981) suggests using semantic field theory (Lehrer, 1974) and componential analysis (Nida, 1975) in order to facilitate vocabulary acquisition. Semantic field theory describes the vocabulary of language as existing in interrelating networks and relationships that is semantic fields as opposed to long lists of random words. She suggests that since the mind seems to categorize vocabulary based on semantic similarity, categorizing vocabulary into semantic fields will help the learner acquire it more easily. While semantic clusters fall into categories like nouns and verbs, thematic clusters contain a mixture of verbs, adjectives, adverbs and nouns.

Thematic clustering as a vocabulary learning strategy

Based on psychological union, thematic clustering is intended to make an association between a set of related words and a shared thematic concept. Both the interference theory and the distinctiveness hypothesis fail to predict the impact of thematic clustering. Despite the fact that researchers are interested in similar words in a number of studies in relation to interference, there are some conflicting issues. For example, a cluster of words like frog, green, swim, and slipper has not been their interest when they probe for evidence for interference. On the other hand, clusters of words like car, raceway, team, champion, and drive which are not similar have not attracted the researchers, favoring the distinctiveness hypothesis.

Al-Jabri (2005) expressed that "lexical semanticists, when investigating the way speakers organize words in their mental lexicons, propose that speakers subconsciously organize words in frames or schemas with reference to the speaker's background knowledge rather than in semantic fields" (p.48). On the basis of associative strength, clustering of this kind are cognitively rather than linguistically derived, and therefore would seem fit most easily into learning centered

second language acquisition programs which are most interested in learning process than with linguistic analysis. Within frame semantics as labeled by Fillmore (1985), “speakers can be said to know the meaning of the word only by first understanding the background frames that motivate the concept that the word encodes. Within such an approach, words or word senses are not related to each other directly, word to word, but only by way of their links to common background frames and indications of the manner in which their meanings highlight particular elements of such frames” (cited in Fillmore & Atkins, 1992, p. 77).

According to Brewer and Nakamura (1984), schema theory explains how old information possessed by the learner influences the learning of new information. It aims to explain the way different types of knowledge are learned and people’s interpretation of the world from a psychological. This theory is among the most intellectually exciting areas in cognitive psychology. Brewer and Nakamura (1984) remark that the idea that schemas are unconscious was rejected by psychologists and philosophers who claim that psychology data are restricted only to conscious rather than unconscious phenomena. Behaviorists also rejected the same idea. They claim that the data of psychology are restricted to observations of overt behaviors. But after much discussion, the idea has now been universally accepted.

Generally speaking, schemas help us by organizing our knowledge, assisting with recall, and guiding our behavior. They help us make sense of current experiences and interpret situations. Much research has been done studying the schema theory to show that information which is schema-related is recalled better than schema-unrelated information.

Since there are still contradicting conclusions with regards to the best type of clustering, the current study was set up as an attempt to uncover the superiority of three different clustering techniques (i.e. semantic, thematic, and haphazard), and to examine the role of gender in this regard.

RESEARCH QUESTIONS

This study, hence, was set up to answer the following research questions:

1. Does semantic clustering of vocabulary items affect lexical acquisition and recall of Iranian EFL learners?
2. Does thematic clustering of vocabulary items affect lexical acquisition and recall of Iranian EFL learners?
3. Is there any difference between semantic and thematic clustering of English vocabulary in their effectiveness on lexical acquisition and recall of Iranian EFL learners?
4. Is there any difference between males and females with respect to the type of vocabulary clustering?

METHODOLOGY

The present study was conducted as an experimental and quantitative hypothesis testing study to investigate the effectiveness of thematic versus semantic clustering of L2 vocabulary on lexical

acquisition and recall of Iranian EFL learners. Additionally, this study investigated to what extent males and females behaved differently regarding understanding and retrieving of semantically-oriented or thematically-oriented vocabulary items. That is, it compared the performance of male and female language learners in terms of these different ways of clustering of words.

Participants

The participants of this experiment were 50 native speakers of Persian, including 25 males and 25 females, aged 18 to 30. Based on the central limit theorem (CLT), contemplating this number of participants led into obtaining normal distribution; therefore, it was possible to conduct different types of parametric tests with 25 participants in each group. The participants were selected from among the students who were studying English as a foreign language at Jahad Daneshgahi English Language Center based on the results of the Oxford Placement Test (OPT). The OPT (2007) was employed as a homogenizing tool for the sake of the linguistic homogeneity of the participants.

Materials and instrumentation

Since the aim of this study was to investigate the effectiveness of three types of vocabulary clustering techniques in vocabulary acquisition and recall of EFL learners, three lists of words as the materials of the study were prepared each of which represented a particular clustering. The selected words for the first list were semantically related and included eight coordinate English words under the headword 'occupations' and shared a common semantic relationship. Given the nature of semantic classes, the words in the semantic set shared the same word class, with all eight terms being noun. They were also accompanied by the Persian equivalents.

The second list contained eight semantically unrelated words in English accompanied by the Persian equivalents. The word class of these words was not held constant. The third list was arranged based on eight English words related thematically and accompanied by their Persian equivalents. These words were categorized under the theme of marriage-related terms and included words of various syntactic classes.

The study also adopted three instruments for data collection. The first one was the Oxford Placement Test (2007) to check the homogeneity of the participants in terms of their language proficiency. The widely used placement test, the reliability of which has been reported in a colossal number of studies, contained 50 items in multiple choice formats assessing students' knowledge of vocabulary, grammar, and reading comprehension. It also included an optimal writing task estimating students' ability regarding productive skills. The whole test was designed to be administered in 65 minutes. The Vocabulary Knowledge Scale (VKS) developed by Paribakht and Wesche (1993) as the second instrument in this study was administrated as the pretest to make sure that the participants had no prior knowledge of the targeted words. The internal consistency measure of the reliability of the test was calculated to be .84. Three short gap filling exercises as the last instrument were also taken from Intermediate Vocabulary by Thomas (1986) and employed as the posttest in this study.

Procedure

To achieve the aims of the study, some steps were taken. To have a homogeneous group, the OPT was firstly administrated at Jahad Daneshgahi English Language Center and 50 native speakers of Persian, including 25 males and 25 females whose linguistic homogeneity was confirmed on the basis of the test result, were selected from among the intermediate students who were studying English as a foreign Language there. Following the guidelines in the test booklet, those learners whose score was above 47 were confirmed as intermediate learners and were selected for the purpose of the study.

The second step was administrating the Vocabulary Knowledge Scale Test (VKS) as a subsidiary assessment tool. This test, containing eighty vocabulary words, was employed as the pretest and presented to the participants to find out which vocabulary items the learners did not know. The scores obtained from this test were not included in the study since they did not affect its process. Each participant was then given six pages having the list of semantically-related, thematically-related, and haphazard English words accompanied by their Persian equivalents and the short gap filling exercises. This step was undertaken in two phases including studying phase and recall phase. In the first phase, the participants were required to study the first page consisting of the list of eight semantically-related English words accompanied by their Persian equivalents for a total of four minutes, that is, 30 seconds per item. They were advised to study carefully using every possible strategy to learn new lexical items in the list. The participants were also informed that they would be having an immediate recall test on the same vocabulary items. After four minutes, the students had to stop studying and then, the immediate recall phase began in which each participant was required to turn to the following page that included a short gap filling exercise.

In this stage, the participants were required to fill in the gaps of the short reading by applying the appropriate words from the previous page they had studied some minutes ago. In order to eliminate any chance of memorizing the list as a whole rather than learning them, the participants were informed that the required words in the short reading had been arranged in a different sequence. Exactly the same was done for thematic and haphazard English clusters. The researchers afterwards identified, scored, and calculated all the answers given by the students to the short gap filling exercises in a sense that each correct answer of a lexical item was considered as one point. Since there were eight lexical items in each type of clustering list, the total score in every list was 8 points. The data gathered through this procedure were later subjected to the statistical procedure.

RESULTS AND DISCUSSION

Results of the first research question

The first addressed research question in this study was:

1. Does semantic clustering of vocabulary items affect lexical acquisition and recall of Iranian EFL learners?

To find an acceptable answer for this question, the researcher identified, calculated, and scored all the correct answers given by the students in the short gap filling exercises prepared for estimating the participants' knowledge of semantically related words. These exercises were

selected from the Intermediate Vocabulary by Thomas (1986). Each given correct answer was considered as one point so the total score in each list was 8.

Table 1: Descriptive Statistics: The Immediate Posttest Results Relating to the Semantically-Clustered Words

N	Valid	50
	Missing	0
Mean		3.10
Std. Error of Mean		.132
Mode		3
Std. Deviation		.931
Variance		.867
Range		3
Minimum		2
Maximum		5

As it is shown in the above table, the mean of the scores for the short gap filling exercises on semantically clustered words was 3.10. That is, most of the participants provided just less than half of the required words. The participants guessed at maximum 5 words correctly and at minimum 2 words. This indicated that they were not able to work as successfully as expected in this part. The following table provides some extra information in this regard.

Table 2: Frequency Table: The Immediate Posttest Results Relating to the Semantically-Clustered Words

		Valid		Cumulative
		Frequency	Percent	Percent
Valid	2	14	28.0	28.0
	3	22	44.0	72.0
	4	9	18.0	90.0
	5	5	10.0	100.0
	Total	50	100.0	100.0

According to the above table, out of 50, 14 participants had two correct answers, 22 participants had three correct answers, nine participants had four correct answers, and five participants had five correct answers.

Results of the second research question

The second research question that was posed in the study was:

2. Does thematic clustering of vocabulary items affect lexical acquisition and recall of Iranian EFL learners?

To obtain an answer to this question, the frequency of correct answers in the short gap filling exercises was calculated for each student separately. For every correct answer that the students provided, one point was given to them. The points were then added and the final score was given. The average of all scores was thereafter determined. The required words were thematically oriented.

Table 3: Descriptive Statistics: *The Immediate Posttest Results Relating to the Thematically-Clustered Words*

N	Valid	50
	Missing	0
Mean		4.90
Std. Error of Mean		.186
Mode		4 ^a
Std. Deviation		1.313
Variance		1.724
Range		5
Minimum		3
Maximum		8

a. Multiple modes exist. The smallest value is shown.

Based on the above table, the participants approximately provided 5 correct answers for the 8 existing blanks in the exercises organized thematically. To be specific, the mean of all provided correct answers was equal to 4.90 which was above the mean score obtained in the semantically related set of words. Here, the maximum and the minimum number of given correct answers were 8 and 3 respectively, that is, there were some exercises which were filled in by the students completely correct. It seems that the students acquired and recalled more words when the lexical items were presented to them in thematic cluster and therefore worked more successfully.

Table 4: Frequency Table: *The Immediate Posttest Results Relating to the Thematically-Clustered Words*

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	3	8	16.0	16.0	16.0
	4	14	28.0	28.0	44.0
	5	9	18.0	18.0	62.0
	6	14	28.0	28.0	90.0
	7	4	8.0	8.0	98.0
	8	1	2.0	2.0	100.0
Total		50	100.0	100.0	

The next tables pertain to what the participants did in the haphazard list of words.

Table 5: Descriptive Statistics: The Immediate Posttest Results Relating to the Unrelated-Clustered Words

N	Valid	50
	Missing	0
Mean		3.12
Std. Error of Mean		.142
Mode		3
Std. Deviation		1.003
Variance		1.006
Range		4
Minimum		1
Maximum		5

Regarding the unrelated set of lexical items, as shown above, the participants at most filled in four intended blanks and at least one blank correctly. The mean score was 3.12 which was slightly above that in the semantically related group and still below that in the thematically related group.

Table 6: Frequency Table: the Immediate Posttest Results Relating to the Unrelated-Clustered Words

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	1	2	4.0	4.0	4.0
	2	11	22.0	22.0	26.0
	3	21	42.0	42.0	68.0
	4	11	22.0	22.0	90.0
	5	5	10.0	10.0	100.0
	Total	50	100.0	100.0	

Regarding the above table which has a detailed look on the distribution of unrelated words guesses by the participants correctly, one correct answer goes to two students and five correct answers go to five answers. The same number of students ($n = 11$) recalled 2 and 4 answers respectively and the rest ($n = 21$) remembered three correct answers.

Results of the third research question

The next research question that the researchers addressed in this study was:

3. Is there any difference between semantic and thematic clustering of English vocabulary in their effectiveness on lexical acquisition and recall of Iranian EFL learners?

For this question, the means of scores that were achieved by the participants in the three groups of semantic, thematic, and haphazard texts were compared to see if there was any statistically significant difference among them.

Table 7: One-Sample Statistics: The Means in the Three Types of Cluster

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean		Minimum	Maximum
					Lower Bound	Upper Bound		
Semantic	50	3.10	.931	.132	2.83	3.41	1	5
Thematic	50	4.90	1.313	.186	4.53	5.27	3	8
Unrelated	50	3.12	1.003	.142	2.83	3.41	1	5
Total	150	3.71	1.392	.114	3.49	3.94	1	8

After comparing the means, it was found that the participants had different reactions towards the three types of clustering of vocabulary. According to the table, the largest deviation and mean refers to the time when the participants were examined on the thematically oriented words. That is, the participants had the best achievement and recalled more words when lexical items were thematically organized and presented. When examined semantically, the participants had the lowest recall and achievement. That is, the semantically related group seemed to be the least effective technique.

The variation was clear among the participants when they were tested on the effect of the three types of clustering and this could be assessed for more accurate results by another inferential test. That is, in order to determine whether there was a statistically significant difference among the three groups or to explore the impact of type of clustering on the vocabulary acquisition and recall of Iranian EFL learners, a one-way analysis of variance (ANOVA) was run based on which the existing differences among the three groups were revealed to be statistically significant.

Table 8: ANOVA: Results of the Immediate Posttest

	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	105.613	2	52.807	42.405	.000
Within Groups	183.060	147	1.245		
Total	288.673	149			

To be specific, there was a statistically main effect for the clustering types (semantic, thematic, or unrelated) that had been used for estimating the acquisition and recall of new lexical items. In other words, the observed differences were meaningful at 0.05 level of significance and one can be 95% sure that these differences were not obtained accidentally. In order to test which type of clustering had the most important effect on the acquisition and recall scores, post-hoc comparisons were employed to identify the detailed difference among the three types. The following table revealed the main location causing this effect.

Table 9: Multiple Comparisons: Dependent Variable: Results of the Immediate Posttests

		Mean Difference (I-J)		Std. Error	Sig.
(I) groups	(J) groups				
Turkey HSD	semantic	thematic	-1.800*	.219	.000
		unrelated	-.020	.219	.995
	thematic	semantic	1.800*	.219	.000
		unrelated	1.780*	.219	.000
	unrelated	semantic	.020	.219	.995
		thematic	-1.780*	.219	.000

The findings of the post-hoc test indicated, in multiple paired comparisons, that the differences were at the highest level when comparing the participants' scores in the thematic and the semantic lists and in the thematic and the haphazard lists. In other words, there was a statistically significant difference between the gained scores in the thematic and the semantic lists as well as in the thematic and the haphazard lists. This led to the conclusion that the thematic clustering was the most effective strategy for vocabulary presentation to the EFL learners.

Results of the fourth research question

The last investigated research question in this study was:

4. Is there any difference between males and females with respect to the type of vocabulary clustering?

To detect the relationship between the gender and the type of vocabulary clustering, the performance of both males and females in the exercises examining the learners' knowledge of words that had been presented to them in semantic, thematic, and haphazard clusters were separately considered.

Table 10: Descriptive Statistics: Female Performance on Tests

		Semantic	Thematic	Unrelated words
N	Valid	25	25	25
	Missing	0	0	0
Mean		3.32	5.56	3.08
Std. Error of Mean		.206	.201	.223
Median		3.00	6.00	3.00
Mode		3	6	3
Std. Deviation		1.030	1.003	1.115
Variance		1.060	1.007	1.243
Minimum		2	4	1
Maximum		5	7	5

a. Gender = female

As shown in the above table, the females ($n = 25$) acquired and recalled the most when words had been presented to them in thematic cluster. The score means of females in semantic, thematic, and haphazard sets of lexical items were 3.32, 5.56, and 3.08 respectively. The most number of words were acquired and recalled when presented thematically, less when presented semantically, and the least when presented in a haphazard manner. The females at least remembered one word (in unrelated set of words) and at most 7 words (in thematic set of lexical items). None of them could fill in all the blanks correctly.

Table 11: Descriptive Statistics: Male Performance on Tests

		Semantic	Thematic	Unrelated words
N	Valid	25	25	25
	Missing	0	0	0
Mean		2.88	4.24	3.16
Std. Error of Mean		.156	.254	.180
Median		3.00	4.00	3.00
Mode		3	4	3
Std. Deviation		.781	1.268	.898
Variance		.610	1.607	.807
Minimum		2	3	2
Maximum		4	8	5

a. Gender = male

Considering males, they had the best performance in the exercises organized thematically and the worst in the exercises organized semantically. Both males and females worked successfully in the thematically-oriented set of lexical items. They at least guessed and remembered two correct answers and there was a case in which males even completed the text completely correctly. The score means obtained for the semantic, thematic, and haphazard sets of words were 2.88, 4.24, and 3.16 respectively. The results revealed that males and females performed quite reverse in the exercises including the semantic and haphazard sets of lexical items. The females' knowledge of the words organized semantically was more than the males' and on the other hand, the males' knowledge of the words organized haphazardly was more than the males'. After investigating the males' and females' performance separately, their score means from the three different groups of exercises needed to be compared to detect whether the males differ from the females in this regard and whether this difference (if any) was statistically significant.

Table 12: Group Statistics: Males' and Females' Mean Scores

	Gender	N	Mean	Std. Deviation	Std. Error Mean
Semantic	female	25	3.32	1.030	.206
	male	25	2.88	.781	.156
Thematic	female	25	5.56	1.003	.201
	male	25	4.24	1.268	.254
Unrelated words	Female	25	3.08	1.115	.223
	Male	25	3.16	.898	.180

Considering semantic clustering of vocabulary, the data included in the table indicated that the female participants acquired and recalled more words than the male participants and their mean scores therefore differed from each other. In terms of another type of vocabulary clustering, that is, thematic clustering, there was again difference in the performance of both genders. In this case, females worked more successfully and their final achieved points were therefore higher than those of males. The last group of clustering relates to the haphazard lexical items and the findings in this case were quite reverse and indicated that the achieved scores by the females were lower than the males. The mean scores of males and females were here 3.16 and 3.08 respectively. To see the meaningfulness of these differences, an independent t-test was conducted.

Table 13: Independent Sample Test: Males' and Females' Mean Scores

		t-test for Equality of Means						
		T	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Interval of the Difference	Confidence of the Difference
							Lower	Upper
Semantic	Equal variances assumed	1.702	48	.095	.440	.258	-.080	.960
Thematic		4.083	48	.000	1.320	.323	.670	1.970
Unrelated		-.279	48	.781	-.080	.286	-.656	.496

As the above table shows, although there was a difference between males and females in terms of their mean scores from both the exercises with required semantically-oriented words and unrelated words, this difference did not reach statistical significance. In other words, the females and males did approximately have the same memory of words thought to them beforehand. Considering thematically-oriented words, this difference did however reach statistical significance.

In the remaining part of the current section, the obtained results are discussed and compared with the results of previous studies. The results obtained for the first research question revealed that the means of the semantically related words was 3.10. To be specific most of the participants provided just less than half of the required words. Consequently, the first hypothesis which was semantic clustering of vocabulary items does not affect lexical acquisition and recall of Iranian EFL learners was supported in this study.

Based on the result achieved for the second research question concerning with thematically related words, the mean was equal to 4.90, which was above the mean score obtained in the semantically related set of words. Besides, there were also some exercises which were filled in by the students completely correct. Therefore, the results showed thematic clustering of vocabulary items affected lexical acquisition and recall of Iranian EFL learners. Considering the result achieved in the analysis of haphazard set of lexical items, the mean score was 3.12, which was slightly above that in the semantically related group and still below that in the thematically related

group. To be more specific, the participants at most filled in four intended blanks and at least one blank correctly.

The results obtained from the third research question indicated that among the means of scores achieved by the participants in the three groups of semantic, thematic, and haphazard texts, the largest deviation and mean refer to the time when the participants were examined on the thematically oriented words, that is, the participants had the best achievement and recalled more words when lexical items were thematically organized and presented. When examined semantically, the participants had the lowest recall and achievement in a sense that the semantically related group seemed to be the least effective. Based on a one-way ANOVA, the observed differences among the three groups were meaningful at 0.05 level of significance and one can be 95% sure that these differences were not obtained accidentally. The results of this study generally proved that those exposed to thematically related sets of words outperformed those exposed to semantically related words which is in line with Tinkham's (1993, 1997) point of view when he claimed that providing learners' vocabulary with thematic clusters was a more effective method of instruction than semantically clustered sets. Learners can learn words that belong to the particular topic or theme better than those vocabularies that are semantically clustered.

The findings of this research determined that learning new words in semantic clusters required more time to be learned completely and it also needed more learning trials which is in total agreement with many researchers (Finkbeiner & Nicol, 2003; Higa, 1963; Laufer, 1989; Nation, 2000; Tinkham, 1993, 1997; Waring, 1997) who argue that learning similar words which share numerous common elements and a super-ordinate concept are difficult because these words will interfere with each other and have a negative impact on their retention.

There are different reasons why words presented in unrelated clusters were retained more efficiently than those presented in semantically related sets. According to Aitchison (1996), McCarthy (1990), and Meara (1983), although vocabulary items appear to be organized in the mental lexicon around semantic bonds, learning of new vocabulary items might pursue a different path of mental processing. McLaughlin (1990) also claims that semantic fields are the final outcomes of the learning process while they represent aspects and features of what is already known. Additionally, the findings of the study confirm the empirical studies by Iranian researchers such as Marashi and Azarmi (2012) who showed that presenting words in semantically unrelated clusters and in an intentional learning method were more effective for students' vocabulary achievement compared to the other methods and Mirjalili et al. (2012) who indicated that the students generally recalled the highest number of words from the unrelated clusters.

Moreover, the results of the present study are in line with two psychological theories including theory of interference and the distinctive hypothesis discussed earlier (Finkbeiner & Nicol, 2003; Tinkham, 1993, 1997; Waring, 1997). It can be argued that presenting L2 learners with vocabulary items grouped in semantic clusters actually impedes vocabulary learning.

The most surprising result gained from the data in this study showed that gender can be considered as an effective variable in this respect as there was difference between two groups of males and females in the retention and recall of vocabulary items. The score means of females in semantic, thematic, and haphazard sets of lexical items were 3.32, 5.56, and 3.08 and of males were 2.88, 4.24, and 3.16 respectively, that is, they both had the best performance on the thematically-clustered words tests.

Considering semantic and unrelated clustering of vocabulary, although there was a difference between males and females in terms of their score means, this difference did not reach statistical significance. In terms of thematic clustering of vocabulary, the results revealed that there was significant difference between the males' and females' scores. In the end, the researchers came to this conclusion that in the process of different types of vocabulary learning clustering, female students excelled male students and the last hypothesis which stated that there was a statistically significant relationship between gender and the type of vocabulary clustering was consequently supported in this study. In theory, this finding of present study is in line with that of Zhuanglin (1989) and of Larsen-Freeman (2000) and in practice, with conclusions by some researchers such as Wu Yi'an, Liu Runqing, (1996) who believed that female students obviously acted better than male students in terms of language learning.

CONCLUSION

Since any language emerges first as words, using various effectual strategies and techniques for better and more rapid acquisition and recall of new lexical items are then of crucial importance. Presenting vocabulary in groups and clusters has been proved to be among the factors or strategies that lead to better acquisition of words.

The results and the statistical analysis of the data in the immediate posttests of this study indicated that there were statistically significant differences among the three types of vocabulary clustering techniques and this led to the assumption that vocabulary clustering in presentation of new words had an effect on vocabulary acquisition and immediate recall of foreign language learners of English. To be specific, the findings revealed that all the three vocabulary instruction techniques which were used in this study were effective in the learners' vocabulary acquisition and recall, but since thematic clustering for presenting new words to the learners of foreign/second language had the most positive effect compared to semantic clustering and haphazard grouping of the words, it can be concluded that it was the most effective method for Persian-speaking EFL learners' (both males and females) vocabulary knowledge. Semantic clustering of the lexical items was shown to be on the other hand the least effective.

As the classroom has been the most important context, or sometimes the only one, for foreign language learners to acquire a new language where a large portion of input is expected to be available, providing enough comprehensible input providing learners with thematically clustered words can be of great importance. Reading and listening to appropriate texts can serve as the supportive techniques in this regard and can give great insight to the language learners.

What could perhaps impose limitations on the results obtained in this study include the limited number of words in each word list (i.e. eight words), the limited number of participants in each group, and the idiosyncratic learning styles of the learners which could not be under the control of the researchers. Yet, the results might be applied (though by caution) in many language learning settings in Iran.

POLITENESS USE IN SELOKO CUSTOM WEDDING CEREMONY “ULUR ANTAR SERAH TERIMA PENGANTIN” IN THE BOOK *JAMBINESSE TRADITIONAL CEREMONY 4TH* VOLUME

Wennyta

Lecturer, Batanghari University, Jambi, Indonesia
wennytaadjis@gmail.com

ABSTRACT

This research is intended to give the description about politeness in the text Jambinese Seloko custom in “Ulur Antar Serah Terima Pengantin” in the book Jambinese Traditional Ceremony 4th Volume. The research method is qualitative which is written descriptively. The data in this research is consisted of primary and secondary data. Population and sample in this research are texts of Jambinese Seloko custom that is published by Traditional Institutions Jambi Province Indonesia. The technique of data analysis that is used is content analysis. From the result and discussion, it could be concluded that there are six uses of politeness maxims in Jambinese Seloko custom texts (wedding ceremony) especially back and forth handover the bride in the book Jambinese Traditional Ceremony 4th Volume; they are the use (1) tact maxim, (2) generosity maxim, (3) approbation maxim, (4) modesty maxim, (5) agreement maxim, and (6) sympathy maxim.

KEYWORDS: politeness, seloko custom, *ulur antar serah terima pengantin*, Jambinese

INTRODUCTION

Indonesians should be proud because they have various language and literature inheritance from their ancestors that are invaluable. This variety of languages creates hundreds of regional literature. This various literature colors and enriches the literary work of Indonesia. Literature is a creative art of human that involves all aspects of human life. “Literature is used in communication situation which controlled by a particular culture environment” (Luxemburt, in Nurgiyantoro, 2008:16). Generally, Indonesians in the pre-modern period did not have written tradition. Although some have had written tradition, it is still rarely used to create literary work. Literary during that pre-modern period is usually given orally and also passed orally. For some regional literature, that tradition is still developing beside the effort for recording and writing.

Seloko is a traditional poem in the same group as mantra, verse, aphorism in two lines, proverb, etc. “*Seloko* is a traditional Indonesian poem which aphorism or proverb which contains advising aphorism or views and guidance for good life. Almost in all regions of Jambi province, there is seloko tradition (Syam, 2001:7).”

Jambi province as one of the provinces in Indonesia has many regional literature, one of them is seloko custom. Seloko custom, as other regional literature, contains positive values from the society as its proponent. It was said like that because seloko custom of Jambi is the outcome of the act of expressing the humanity essence of Malay society in Jambi. Because of that, the effort to reveal those values is required as a form of preservation of those noble values in the culture of Jambinese Malay society.

The opinion of Saphir (in Wahab, 1995) tells that there is some truth in the expression that says language determines behavior of human custom. People that use good choice of words, sentence structures, and idioms when speaking shows that the personality of that person is indeed good. On the contrary, if someone did not have good behavior, even though they have tried to communicate correctly and well-mannered in front of other people, there will come a time in which they are not able to cover their inherent bad behavior which then shows in their bad choice of words, sentence structures, idioms and impoliteness. Politeness is an aspect of language behavior that could increase the emotional intelligence of its speaker because in communication, speaker and hearer are required not only to deliver truth, but also to maintain commitment and harmony of the relation. The harmony of the relation between speaker and hearer would be maintained if both sides keep refrain on embarrassing each other.

Ethics in language behavior is what is called as politeness. If this is connected with seloko custom as a form literature which is delivered using language as its media, there must be a lot of politeness values contained in its every saying. Therefore, the study about how the realization of politeness behavior in Traditional Ceremony of Handover the Bride “*Ulur Antar Serah Terima Pengantin*” which is contained in the book Jambinese Traditional Ceremony 4th Volume is necessary.

RESEARCH QUESTION

From the explanation that are mentioned before, this study is meant to answer how the form of tact maxim, generosity maxim, approbation maxim, modesty maxim, agreement maxim, and sympathy maxim in Jambinese Seloko wedding custom “*Ulur Antar Serah Terima Pengantin*” in the Book Jambinese Traditional Ceremony 4th Volume.

METHODOLOGY

The method that is used in this research is qualitative. The data are taken from seloko custom of Jambinese Malay which has been documented by Traditional Institution Jambi Province Indonesia in Jambinese Custom History book year 2001. The technique of collecting data that is used in this research is library study.

JAMBIANESE CULTURE

Language is a tool to transmit culture from a generation to the next one. Extinction, decline, and weakening of the function of one particular language implied the decline or extinction of one

cultural wealth. The everlasting of language, especially the regional language will strengthen the longevity of regional culture which contains oral literature and oral tradition. Using the potential of regional culture like oral literature and oral tradition as the source of character education is a revitalization of youth personality which is made by culture-based education.

One of the forms of the language own by Jambi province is a form of literature which is known as seloko culture of Jambi. Karim (2007:14) said that “Seloko in Indonesian language often called Seloka or proverb or with other words also often called as cultural advice”. Seloko word comes from Sanskrit word *Seloka* which means a form of classical Malay poem which contains idioms in which there are jokes, limericks, dreams, imaginations, teases, or insults. In Jambinese Malay language, seloko is a poem that consists of four lines which each line consisting of 8-11 words. The verse rhythm a-a-a-a, Karim (2007:14) gives an example of seloko as follows:

Ada seekor burung pelatuk
Cari makan di kayu buruk
Tuan umpama ayam pungguk
Ayam mencakar, rajin mematuk

In some areas in Indonesia, some seloko rules are unused. In Jambi region, the number of lines in seloko is inconsistent. The verses are also irregular, but the rhythm is easy-listened which contains rules or norms of customs that apply in Jambinese culture (Karim, 20017:15).

SELOKO AS A FORM OF TRADITIONAL POEM

Jambinese seloko custom is an idiom that contains messages or advices that have ethics and moral values, also used as a tool to enforce and supervise society norms to make sure it is always abided. The content of Jambinese seloko are the behavior rules in everyday life of the society and principles of law and norms which always be abided by the society because it has sanction. One of the examples of Jambinese seloko is about how decisions are made in a government, jambinese seoloko said that “*Berjenjang naik betanggo turun, turun dari takak nan di atas, naik dari takak nan di bawah*”, which means that during decision making there are levels of decision making. The highest level of decision making is for example: the highest level decision making which is Alam Nan Barajo, up until the lowest level of decision making which is Anak nan Berbapak, Kemenakan nan Bermamak.

ULUR ANTAR PENGANTIN (HANDOVER OF THE BRIDE)

The ceremony of back and forth handover the bride is conducted after the groom has arrived in the yard of the home of the bride. Usually, the groom is accompanied by uncles and elders and also children escort to the house of the bride. The ceremony of back and forth handover the bride could only be completed and accepted by both party after the discussion is decided by the mediator. After that, the bride and groom are met and sat down on their place, and then chieftain gives them advices. This ceremony is called Labuh Lek ceremony. It could be said that this ceremony is obligatory that has to be conducted during wedding ceremony of Handover the Bride

“*Ulur Antar Serah Terima Pengantin*” in the book Jambinese Traditional Ceremony 4th Volume published by Traditional Institution Jambi Province Indonesia.

SOCIOPRAGMATICS

Sociopragmatics is a study that highlights the use of language in a society culture within particular social situation like what Leech 1983 said sociopragmatics is one of two sides of pragmatics which the other part is pragmalinguistic. Sociopragmatic study involves two theory which are speech act theory and politeness theory. Austin (in Levinson,1985:236). Austin stated, “In uttering sentence, one is also doing something.” A speech act is created when a speaker or a writer makes an utterance to a hearer or a reader in a context. In other words, speech act is an action performed by the use of an utterance to communicate. Speech act theory is related to three acts in pragmatic which is locutionary act, illocutionary, and perlocutionary act. While politeness in language behavior like what is said by Lakoff that there are three things that should be considered to maintain politeness as follows:

MAXIMS OF POLITENESS

According to Leech (1983), “the politeness principles are divided into six maxims”. Maxim is the principle of language in lingual interaction; principles that control the act, language use, and its interpretation to actions and utterances of the opposite. Besides that, maxim also called as a form of pragmatic based on mutual principle and politeness principle. The examples of politeness maxim can be seen as follows:

Tact Maxim

Leech (1983: 132) “Minimize the benefit to self” and “Maximize cost to self”. If every person conducts the core of generosity maxim in their everyday utterances and daily interactions, envy, jealousy and heartache between people would be avoided.

Generosity Maxim

Generosity maxim involves minimizing the benefit to self and maximizing the cost to self (Leech, 1983: 132). Within generosity maxim, it is explained that people would be considered as polite if they are always trying to give award to other people in their utterances. With this maxim, it is hoped that participants of utterances would not insult, scorn, or humiliate each other.

Approbation Maxim

This maxim involves minimizing dispraise and maximizing praise for others (Leech, 1983:132). In approbation maxim, the speaker and hearer are expected to act humble by reducing compliment to their ownself. People would be said as arrogant and haughty if they are always praise and give credit to their ownself during utterances. In Indonesian culture and language society, modesty and courtesy are often used as a parameter to determine the politeness of people.

Modesty Maxim

This maxim requires the speaker to minimize praise of self and maximize dispraise of self. In this maxim, it is expected that the speaker shows modesty by minimizing praise upon own self.

Agreement Maxim

This maxim involves minimizing disagreement and maximizing agreement between self and other. There is a tendency to increase an agreement and to minimize a disagreement by declaring a regret or partial agreement when someone speaks with other.

Sympathy Maxim

This maxim is divided into two sub maxims they are “minimize antipathy between self and other” and “maximize sympathy between self and other” (Leech, 1983:132). In sympathy maxim, the speaker and hearer are expected to maximize sympathy between each other. Having no sympathy to one utterance participant would be considered as impolite. Indonesians hold sympathy to other people in daily communication in high-esteem.

RESULTS AND DISCUSSION

The use of Tact Maxim

Seloko	Meaning
Yang datang Barangkali kami iko kok bejalan lah sampai ke batas, berlayar lah sampai polo ke pulau. Kalau bejalan lah sampai ke batas kok berlayar lah sampai polo ke pulau, ia boleh kami ko berkato agak sepatah berunding agak sebaris, sebab bak pantun nak mudo”	People who come “Maybe if we were walking we have arrived to the borders of sailing, we have arrived to the island, if we were walking we have arrived to the borders of sailing, we have arrived to the island. Let us speak a little discuss a few lines like a youth poem.
Yang menerima Ooo.....macam itu maksudnyo, maeko datuk kato-kato petuah orang tuo-tuo kito, idak elok, becakap di tengah laman, ko berunding sepanjang jalan, apo bunyi petuah orang-orang tuo-tuo kito yang sebagaimano dalam pantun seloko. Batang belimbing di tengah laman Uratnyo menyuruk ke bawah rumah Idak elok kito berunding di tengah laman Elok kito naik ke atas rumah <i>Hendak duo pantun seiring</i> <i>Batang cempedak di tengah laman</i> <i>Uratnyo susun betindih</i> <i>Idak elok kito tegak di tengah laman</i> <i>Elok kito naik makan sirih</i> <i>Tanggolah kami tegakkan, kok lawang lah kami bukak</i> <i>Tikarlah kami bentangkan pulak, silohkan datuk-datuk segalonyo naik kerumah!</i>	“Ooo..... That is the intention, like what elders and our ancestors said, it’s not good, to speak in the middle of the yard to discuss along the road, like the advices given by our elders like what is mentioned in seloko poem. <i>Star fruit tree in the middle of the yard</i> <i>The root hides under the house</i> <i>It’s not good to discuss in the middle of the yard</i> <i>It’s better to go up into the house</i> It’s better for two poems to go along Jackfruit tree in the middle of the yard The roots are overlapping each other It’s not good to stand in the middle of the yard It’s better if we go up and eat betel leaf. We have put up ladders, we have opened the door, we have spread the mat, and we invite elders to get in to the house.

Seloko examples above shows the use of tact maxim which are conducted by the host. The host clearly tries to act wise by asking the guests to immediately come into the house because it is not

good to be seen discussing in the house yard by other people. That seloko shows that the house asks the guests to come inside the house to discuss; this is the part that shows that there is a tact maxim in that part of seloko.

The Use of Modesty Maxim

Seloko	Meaning
Yang dating Macam iko datuk, kami nan sebanyak iko takut kalau cepat kaki salah langkah, cepat tangan salah limbac, cepat mulut salah kato, elok jago kami betanyo, kalau naik kerumah datuk-datuk ado idak larang kedengan pantangnyo.	People who come “It’s like this elders all of us are afraid if we walks too fast and missteps, hands too fast and took the wrong thing, speaks too fast and misspeak. It’s better for us to ask whether there are some taboos in walking into fellow elders’ house.

That seloko mentioned by the guests show the use of modesty maxim. That utterance displays the courtesy of the guests, before they are being allowed to come in, they asked humbly about things they need to do, whether there are some taboos they have to abide.

The Use of Generosity Maxim

Seloko	Meaning
Yang menerima Baiklah kalau macam itu kato Datuk-datuk, sesat di ujung tali balik ke pangkal tali, sesat di ujung jalan balik ke pangkal jalan. Tidak keruh yang tidak jernih dan idak kusut yang tidak selesai, silang yang tidak patut. Jadi macam mano kito serahkan kepada Datuk-datuk penengah sajo, kok keruh mintak dijernihkan, silang mintak di patut	People who accept All right then if that’s what fellow elders say, lost the tip of a rope get back to the beginning of the road, lost in the end of the road back to the beginning of the road. There is no cloudy that is not clear and there is no tangle that is not finished, crossed there are not appropriate. So what if we just give this to the mediator elders, if couled we asked to be cleared, if crossed we asked to be appropriated.

The seloko above exhibits the use of generosity maxim that is said by the host in the utterance **Datuk-datuk penengah sajo, kok keruh mintak dijernihkan, silang mintak di patut**. In that utterance, they asked with their generosity that if there are some conflicts later, the conflicts are to be returned to the mediator elders.

The Use of Agreement Maxim

Seloko	Meaning
Yang menerima Datuk-datuk nenek mamak yang kami muliokan. Sesuai dengan adat yang tereco tepakai, kok betanyo lepas litak kalu nak berunding tentu lepas makan, kareno kami iko tadi ado membawak sirih nan sekapur, rokok nan sebatang, elok jago kito makan sirih sekapur mengisap rokok nan sebatang bak pantun anak mudo	People who accept “Venerable elders and uncles. In accordance to the customs that is good to use, if we were to ask it’s after stopped being hungry, if we were to discuss of course after we finished eating, because we did bring betel and lime, a cigarette, it is better for us to eat betel while puffing a cigarette, like a youth poem.

The seloko above contains agreement maxim, in the utterance **Sesuai dengan adat yang tereco tepakai, kok betanyo lepas litak kalu nak berunding tentu lepas makan, kareno kami iko tadi ado membawak sirih nan sekapur, rokok nan sebatang, elok jago kito makan sirih sekapur mengisap rokok nan sebatang bak pantun anak mudo**. That utterance shows that the host

clearly states the condition to begin the ceremony. Because the guest has brought betel and cigarettes, the host asks the guests to eat betel and smoke cigarettes before starting the ceremony, this would be an agreement from both sides.

The Use of Sympathy Maxim

Seloko	Meaning
<i>Kalau macam itu kato Datu-datur, itu namonyo serah patah arang</i> atau serah patah umbut-umbut, atau serah kumbang putus tali, kami bukan mengelak, segan keno ba-sengecek segan jatuh.	If that's what elders said, it is called surrender broken charcoal, surrender broken shoot, or surrender broken thread beetle, we are not avoiding unwilling because afraid of falling when we are talking.

The sympathy maxim is showed by the words of the host that say that they support the intention of the guests because they don't want any misunderstanding. It can be seen from ***Kalau macam itu kato Datu-datur, itu namonyo serah patah arang***. Therefore agreement is made for that.

The Use of Aprobation Maxim

Seloko	Meaning
<i>Yang dating</i> Datur-datur, Nenek-Mamak, Tuo-Tuo Tenggana Alim Ulama, Cerdik Pandai, <i>yang gedang begelar, yang kecil benamo kok gedang idak diimbau gelarnya, nan kecil idak polo disebut namonyo.</i>	<i>People who come</i> Elders and uncles, clergy and cunning ones, the great ones have titles the small ones have names, the great ones are not called by their titles, the small ones also called by their names. Women with jingling bracelets, with shining rings on their fingers, clothed with sarong, pandanus fold hair bun. We are nothing, we arrange our fingers which are ten, we bow our heads which is one. Asking for forgiveness from the elders, requesting apology from the many.

The utterance ***yang kecil benamo kok gedang idak diimbau gelarnya, nan kecil idak polo disebut namonyo*** shows approbation maxim. That utterance displays appreciation that is given to everyone (with their age irrelevant) because everyone has the same position in the customs that apply.

CONCLUSION

This research investigates the indication of maxims proposed by Leech in Jambinese seloko wedding custom *ulur antar serah terima pengantin* in the book Jambinese Traditional Ceremony 4th Volume. Based on the result and discussion, it is found out that there are five types of maxims used in that book. They are tact maxim, modesty maxim, agreement maxim, sympathy maxim, and approbation maxim. It is concluded that the types of maxim mostly used in Jambinese seloko wedding custom *ulur antar serah terima pengantin* in the book Jambinese Traditional Ceremony 4th Volume is tact maxim which is occurred for four times. Moreover, modesty maxim is used for two times while agreement maxim, sympathy maxim, and approbation maxim are only used for one time.

Limitations of the study

This research is limited to the use of Maxims which are proposed by Leech (1993). Those maxims are tact maxim, generosity maxim, approbation maxim, modesty maxim, agreement maxim, and sympathy maxim. Furthermore, the aspects of politeness and context are needed in supporting data analysis.

TEACHERS' ATTITUDE TOWARD THE ROLE OF LITERATURE IN EFL CLASSES

Safoora Kheirabadi

Department of English language, Sanandaj Branch,
Islamic Azad University, Sanandaj, Iran
S.kheirabadi1988@gmail.com

Vahid Gholami, Ph.D

Department of English language, Sanandaj Branch,
Islamic Azad University, Sanandaj, Iran

ABSTRACT

The purpose of this qualitative study was to obtain qualitative results from a sample of 20 Iranian English as a foreign language EFL teachers regarding their attitude towards the role of literature in EFL classes, and consequently follow up with some interviews to probe or explore how well they practically employ this issue in their classrooms. The participants were twenty male and female Iranian EFL teachers, teaching in different private language centers in Sanandaj, Iran. Generally, the participants were from two main categories; literature-graduated and TEFL-graduated teachers. The results of participants' interviews indicated that teachers should be encouraged to make adequate use of literature genres in classrooms, also, the participants considered short stories useful in language classes. Most of the participants considered literary materials as an important source for learning English. For some teachers literature could only be presented in order to improve reading skill and sub skills such as vocabulary and grammar. On the other hand some others said it is a "narrow usage" and they claimed that literature can go further and it can be connected to the learners' lives.

KEYWORDS: EFL teachers; Literature; Attitude, Literary genres

INTRODUCTION

Attitudes toward the role of English literature and its potential influence on the expanded area of teaching and methodology, which seek learning at the long turn, are extremely complex and vary from teacher to teacher. The past three decades have witnessed a national and still an international debate over this matter, particularly in developing countries such as Iran. "It has only been since the 1980s that this area has attracted more interest among EFL teachers" (Clanfield, 2011). The debate is still of great enthusiasm and a sea of differences is to be met and it is generally because of voices supporting and those criticizing literature along with teaching process. Literature-based instruction in EFL/ESL classes had been abandoned for justified and still questionable reasons in various methodologies.

However, with the presence of so many literary critics and controversies, literature could honorably climb the teaching pedestal in the recent years. One of the most common complaints is that teachers and curriculum supervisors find literary texts difficult, hard to understand and not relevant to the students' lives. Literature which once was the main teaching material in language teaching approaches became less popular when language teaching and learning started to put its pivotal emphasis on the functional use of language and its audio/oral role in teaching classes. However, the role of literature in the ELT classroom has been regained and nowadays many teachers view literature and literary materials as providing rich linguistic input, and a considerably affluent source of learner motivation. This change in approaches might be better referred to as what Marckwardt (1972) considered "changing winds and shifting sands" (as cited in Brown, 2002, p. 17) and the cyclical nature of teaching methodology patterns.

REVIEW OF THE LITERATURE

Literacy was and still is the ability to read and write one's own name and further for knowledge and interest, write coherently, and think critically about the written word. In the previous centuries and even ages before that such ability was found in the ability of literary texts comprehension and in its new term literature competence; thus literature was once a core unit of English language classrooms. When Grammar Translation Method was in its heydays during the previous century, using literary texts in the language classes was abundant due to the rudimentary definition of literacy. On those days literature was an end in itself.

Role of Literature in Language Learning

The teacher in classroom plays a significant role in making students understand the value of literature and literary texts. Empirical studies consider various reasons for the teachers to use literary texts in their classes. Keshavarzi (2012) suggests as English teachers, specifically, are always concerned with the various kind of material they are going to present to their students, literature can solve their problems. He believes as language learning requires acquiring the language four skills of reading comprehension, writing, listening and speaking. Literary sources provide materials that can meet some of these abilities thus literature has proved a good source that fulfills these four skills. He goes further than just the language skills fulfillment and claims as: "language learning deals with culture, and hence with social understanding. It is this feature of language that demands materials dealing with culture.

Related Empirical Studies

There is a plethora of research that has been carried out internationally to investigate learners' motivation and attitudes towards the English language. In Malaysia, for example, Vijchulata and Lee (1985) reported on a study that investigated the students' motivation for learning English in University Putra Malaysia (UPM). Based on Gardner and Lambert's research (1972), the researchers developed a questionnaire to elicit the data required. The questionnaire was administered on approximately a thousand students from all the different faculties in UPM. The findings revealed that UPM students are both integratively and instrumentally oriented towards learning the English language.

Another study by Sarjit (1993) attempted to explore the language needs of consultants at a company. The name of the organization was not mentioned as the consultants did not allow the researcher to expose their identities. Learners' motivation was of concern in the study. The research sample consisted of 26 consultants, 4 directors and one instructor. In her study, Sarjit (1993) employed different techniques to gather information, such as questionnaire, interviews and field observation. For the subjects' motivation, the study found that instrumental motivation was the main reason for learning the language followed by personal motivation.

RESEARCH QUESTIONS

In this study the researcher tries to find answers to following questions:

1. How do English language teachers perceive the effectiveness of English literature in their English classes?
2. What literary genre is assumed to be the most useful and practical one in language teaching classes based on teachers' perceptions?

METHODOLOGY

Participants

The participants of the study were English teachers who had teaching experience from one to ten years. This sample was composed of 20 English teachers, both males and females, who worked during summer 2013 semester in private language institutes in Sanandaj. Generally, the participants were from two main categories; literature-graduated and TEFL-graduated teachers. It was strictly desired that these participants would be among those teachers who were teaching English in different levels of English classrooms as a part of their regular daily schedule. A more insightful description of each participant is presented in table 1

Table 1: participants' characteristics

Participant's number	Age	Gender	Degree	major	Experience (years)	Levels taught	Willing to teach
1	24	M	M.A.	Literature	2	Elementary	Yes
2	27	M	B.A.	Teaching	4	Intermediate	Yes
3	22	F	B.A.	Teaching	1	Elementary	Yes
4	29	F	B.A.	Literature	6	Elementary Intermediate	Yes
5	30	F	B.A.	Literature	7	Elementary Intermediate	Yes
6	27	M	M.A.	Teaching	7	Elementary Intermediate	Yes
7	26	F	M.A.	Literature	5	Elementary	Yes
8	26	M	B.A.	Teaching	5	Elementary Intermediate Upper-inter	Yes
9	25	M	B.A.	Literature	4	Intermediate Upper-inter Advanced	Yes
10	30	F	M.A.	Teaching	8	Intermediate Upper-inter Advanced Elementary	Yes

Instrumentation

The instruments for data collection in this study were a form of demography and semi-structural interviews conducted by the researcher. The form and its content do not affect the results of the study. It is just used to collect information about the qualifications and background of the participants. The main instrument to collect data for the study was face-to-face interview. Each of these instruments is described below:

Demographic Forms

A demographic form was given to each participant to be filled in before the interview. This form gives participants information about the study and how it is conducted and asks for their names, major, years of experience in teaching and the level of teaching. It also asks them if they are willing to take part in the study. The information in this form is not analyzed to gain a result for the study. That is, the researcher does not differentiate and discern attitudes of participants based on the information provided in this form. It can just help us categorize the participants and make sure that all of them are graduated teachers with real identities to get more insights into the study.

Semi-structured Interviews

One of the most famous data gathering instruments in research methodology area is semi-structured interview (Keats, 2001). According to Keats (2001) recording the interview helps improve the reliability. Such interviews have an exploratory nature since the interviewer provides orientation for interviewee. The interviews were conducted one by one in a relaxed atmosphere. Interviews used in this study consisted of eight questions and were constructed in order to gather information for this study. The interview questions were all developed by the researcher shared and edited by two judges to ensure their relevance, feasibility and validation. The judges were two experienced university professors holding Ph.D. degree in TEFL with five and six years of experience. Each interview lasted for about 15 minutes and was recorded and transcribed later for further analysis. Since the participants of the study are English teachers the interviews have been done in English.

Procedure

As mentioned earlier this research was conducted in a qualitative approach. According to Nunan (1997) qualitative information gained through interviews is crucial and of great importance since it can provide reliable outcomes. For this reason, qualitative data was collected through face-to-face semi-structured interviews. Semi-structured interviews were used to identify the participants' perceptions of literature role in English classes. Accomplishing a qualitative study necessitates a precise procedure fulfillment. So, a clear definition of these terms and the procedures helps us manage the study correctly.

Data Collection Procedure

A random list of 20 participants was gathered from teachers from different English language institutes, and with different trends in teaching and different university majors, literature and TEFL. This was done through cluster sampling by written confirmation and demographic forms which were given to participants before the interviews. Through these forms they were asked about their willingness to participate in the study. Then the interviews were held and questions

were directed to each participant in a face-to-face interview in a relaxed environment to collect information on their attitudes. They were asked to answer a set of eight free-response questions on the topic of literature inclusion.

Data Analysis of Qualitative Approach

Each learner was interviewed individually. They answered the questions about their knowledge and feeling about literature and their attitudes toward it. In an interview study the term reliability refers to the degree of consistency that the interview has for the respondents. The content analysis approach is based on Keats (2001). According to Keats (2001) recording the interview helps improve the reliability. Teachers' oral performances were recorded to measure the reliability of the measuring instruments.

The data was analyzed using a version of the grounded theory approach in which the researcher tried to look for multiple themes. In order to do the content analysis, the researcher decided to deal with sentence units of analysis in interviews. The participants' sentences were selected due to perceiving and finding a general and basic perspective regarding the implied ideas for the persecuted issue. The explicit sentences and explanations of participants to the questions were considered as the scale of judgment in our analysis.

As an example, the sentence "it's a little bit time-consuming to cover all the literary texts in the classes." simply declares its meaning and implication. So, there is no need to analyze and interpret its words and sub-sections.

RESULTS AND DISCUSSIONS

The present study was interested in probing whether English teachers are aware of literature competence or not, besides; how the 20 participants, who were all English teachers, perceive literature role in their classroom methodologies for learning English in English private schools of Sanandaj in Iran. In this chapter qualitative data analysis is presented. The unit of analysis consists of participants' utterances which contain material related to the research questions.

The main research questions for this qualitative study were:

1. How do English teachers in Sanandaj define the effectiveness of English literature in their classes? And what are their views toward instructional value of English literature in EFL classes?
2. What literary genre is assumed to be the most useful and practical one in language teaching classes based on teachers' perceptions?

The analysis of the data was based on the grounded theory approach in which the researcher tried to look for multiple themes while scrutinizing each uttered sentence. The researcher highlighted three important patterns to be investigated during the analysis of interviews. A) The effectiveness and usage of literature; B) Importance of literature and C) The important literature genres.

Patterns A and B are included in answers to the first research question and are elicited from interview questions 3, 4, 5 and 6. Pattern C is dealt with while answering the second research

question and is elicited from interview questions 7 and 8. Most of the stated sentences from participants are quoted directly in order to let easier analysis.

Qualitative Data Analysis for Question Number 1

(Q 1) How do English teachers in Sanandaj understand the effectiveness of English literature in their classes? And what are the most valuable literary sources according to teachers' views in English literature in EFL classes?

PATTERN A: Literature effectiveness and usage

Based on the conducted interviews the researcher searched for sentences in which she could possibly see a relationship with the justifications of literature effectiveness according to the teachers' ideas emerged in the interviews conducted by the researcher. Regarding the effectiveness of literature, the teachers presented the effectiveness of literature the same ideas. Most of the participants considered literary materials as an important source for learning English. In order to see whether it was effective the participants were asked in third question of interview: Do you consider English literature as an important teaching resource? In other word, does literature foster learning a language? If your answer is possibly positive or even negative please elaborate. The teachers participated in this research claimed two views for application of literature usage in their classes. Firstly, for some teachers literature could only be presented in order to improve reading skill and sub skills such as vocabulary and grammar. Secondly, on the other hand some others said it is a "narrow usage" and they claimed literature can go more and it can be connected to the learners' lives. For instance participant number 10 said:

"Ok for sure! Actually my answer to this question is yes! I do consider it as an important resource. Because, you know, English literature is an authentic source, and whatever you find in a literary text is something authentic. So I consider it for sure a positive resource".

Participant number 4 even went further and said:

"Yes I consider it important and it has to be taught even here in the institutes in addition to universities. Because you know even if the teachers are really familiarized with teaching methods they have to be able to know about literature world and it is somehow possible. It is really essential to have literature and literary materials in classes".

This was while Participant number 4 said:

"You know literature is the life itself and it is the mirror to life and I always tell my students about it. So it is really a complete source and it includes whatever you call it instructional materials because you can find different dimensions of life and the learners can have those experiences by reading literature. Then my students can have the same experience by presenting them some literary genres. They will learn indirectly how to live not only just learn the language.

Participant number 6 said: "the most important one (usage) that I can say now, is changing perspectives and thoughts of humans towards life. It is very important that the students can chase the mind of characters and learn how other people think about different matters in life."

Furthermore, regarding the effectiveness of literature participant number 6 said:

"Definitely yes because my BA was in literature I pushed myself very interested in it. Although my MA was English teaching I am still interested in literature. When I want to teach, in most of my classes stories are one of the most important resources. I think that teaching through literature helps you have an open mind and think in new ways. So, I definitely use literature. It is important in my classes".

This was, however, neglected by some others like participant number 2 who said:

"Ok, my role in the class is just facilitating communicative processes. Ok? My students just want to learn how to speak and how to understand English, so they don't need to learn something about English literature, so I think it is not something necessary. Yeah! So in my classes, only communication is so important for them not literature".

Additionally, participant number 3 said:

"How and when you use literature depends on the situation and the classes. Sometimes we use but the most important point of this answer is to use literature indirectly, not directly in our teaching.

Participant number 5 claimed:

"Since I am not an expert (in literature) I think it can only help improve vocabulary in a narrow view and for the broad view it can give the learners some philosophy of life. Normally we never teach literature and some literary material like poems in original forms. But as I said some teachers use story books but I never use them directly in my classes, students read them and they are supposed to understand the meanings or paraphrase the sentences and the structures or something like that. Since my learners are teenagers I think it is hard for them to understand some points of philosophy and social norms, in such cases it even causes paradoxical situations for them and it could be baffling for them".

PATTERN B: Importance of literature

The teachers were also asked to see if they personally thought it was important for the learners to get familiar with English literature or not. Again two different views were found. On the one side for some of the participants the learners had to be familiarized with the world of literatures and for some others only literature was considered as a tool for learning more and thus they would not have taught literature with a meticulous attention. Participant number 1 said:

"Of course yes, they should be familiar (with literature) because literature contains culture and the learners must know something about the culture of the target language they are learning. They also should be exposed to authentic reading materials and sources. Of course I should say for us communication is important, and because of that they may never need pure literary texts".

Participant number 10 said:

".....some of my learners knew nothing about literature, when they first came to my classes, they got familiar with what literature is. And somehow it was from my classes or from my colleagues' classes that they learn more about it or they got a desire and are encouraged to continue their study in the field".

Participant number 3 suggested"

"It is based on our idea about literature that is, how we perceive the literature. For example as I said in my classes most of the students come to learn speaking, Listening and sometimes writing, but we do not pay attention to different literary materials in special in a broad sense, and so we may never need to tell them in details about the literature....."

Participant number 2 said:

"I think it is not necessary to have literature in our syllabus! So yeah I think it is enjoyable for me but it is not necessary since our students do not need to learn so much about literature they come here to learn how to communicate in English. So they only come here for leaning some conversations to be helpful for them when they go abroad so that they are able to interact with foreigners. That is their main reason for joining my classes. But I don't mean it is not useful..... Only in some of my classes I teach short stories. I want them to memorize some idioms and vocabularies. By the stories they can learn lots of things".

Participant number 11 suggested

".....as I said we use literature in our classes indirectly, for example we do not ask our students what literature is, because the aim of our classes is to teach them how to connect and how to communicate to the other students and other people in other countries. It is the first aim that we want to follow in our class".

Qualitative Data Analysis for Question Number 2

In another section of the interview session the participants were asked to state which kind of literary material was their favorite in order to use it in their classes. This was done through question number 8 of the interview. Unanimously all of the participants considered short stories useful in language classes, but not the full text ones. The samples are brought in what follows.

PATTERN C: the best literary Materials

In order to answer second question of the research, participants presented following responses:

Participant number 3 said:

"All genres are useful but they have to be presented in an abridged form. All of them are good. The novels are really suitable for classes but poems are a little difficult and boring".

Participant number 5, however, said:

"I believe the story books will be the best sources. Because they are rich in vocabulary and it is good for reading comprehension. That will result in fluency in reading and story books should be graded for them"

Participant number 11 suggested:

"Well I think for me the most important genre is story books not the poets or the plays".

Participant number 2 said "I think story is good. Using stories, learners can improve their grammar and vocabulary too".

Participant number 1 also said:

"Well I think for me the most important genre is story books not the poets or the plays".

Almost all of the participants believed in the story books as the best literary material among the existing genres.

CONCLUSION

The results of the study make us conclude that most of the participants considered literary materials as an important source for learning English. For some teachers literature could only be presented in order to improve reading skill and sub skills such as vocabulary and grammar. And for others it is a "narrow usage" and they claimed literature can go more and it can be connected to the learners' lives. On the one side for some of the participants the learners had to be familiarized with the world of literatures and for some others only literature was considered as a tool for learning more and thus they would not have taught literature with a meticulous attention. Also, all of the participants considered short stories useful in language teaching.

As Obediat (1997) claims, literature helps students acquire a native-like competence in English, express their ideas in good English, learn how the English linguistic system is used for communication, see how idiomatic expressions are used, speak clearly, precisely, and concisely, and become more proficient in English, as well as become creative, critical, and analytical learners. The participants of this study generally agreed that literature can help learning English. They were aware about the merits of literary materials in English classes. In fact they believed that literature can be effective in different ways. Firstly, it can help learners to foster their vocabulary competence. This might be due to the fact that there are a plenty of vocabularies in literary texts. The text can give this chance to learners to be exposed to a large number of efficient words. Secondly, they said that grammar could be taught through the literature.

Apart from grammar and vocabulary improvement and according to the result of interviews another perception of the study was that literature could provide learners with a lot of experiences and world views all could be found in literary materials. Some teachers interpret literature as a mirror in which the learners could see many realities consistent with their lives. Furthermore, Custodial and Sutton (1998 p, 20) explain that literature can open horizons of possibility, allowing students to question, interpret, connect, and explore lives realities. Elliot (1990, p, 198) suggests when students can gain access to this material by developing literary competence, then they can effectively internalize the language at a high level. Finally, participants considered literature as a tool which equips students with rich source of authentic material. Literature is the genuine representative of any language. It can be claimed that the literature is the language soul itself.

Limitations of the Study

Any study has some limitations that make generalization of its findings to other contexts a little difficult. The important limitation in this study was that the researcher only focused on Iranian teachers. So, the results may be different in any other context with teachers from socio-cultural backgrounds different from the one of participants in this study. Then, there are limitations of the

beliefs of different gender and age on the study. Taking the context and the participants of the study into consideration, any further generalization from this study should be done with caution. Furthermore, self-reported data collected through interviews has its limitations, since it presents the teachers' perception of the issue rather than the observable facts. Moreover, teachers' L1 background (Persian, Kurdish) are not considered as variables in this study.

Last, although this study had a qualitative design, the number of participants in this study was limited to 20 teachers. Thus, the findings of this study might be generalized to other societies with caution.

ABSTRACT

The present study intended to assess the effect of semantic mapping on pre-university students' reading comprehension. For this purpose, a pretest-posttest intact groups study was developed. Sixty Iranian high school girls took part in the study. At the outset of the study, a reading comprehension test, composed of six reading comprehension, was administered to the participants to make sure that the two groups were homogeneous. The students were recruited in two groups, namely, semantic mapping and pre-reading questioning. Eight passages of the students' textbook were used as the treatment material. The semantic group was taught how to make semantic maps for each text and the other group was taught how to make questions about the texts. After the treatment, a posttest was administered to both groups. The results, analyzed through an independent samples t-test revealed that the semantic group did better than the other group, $t(58) = 2.54, p < .01, d = .10, 95\% CI [.52, 4.41]$. The results from the present study can be used by teachers to improve the learners' reading comprehension.

KEYWORDS: reading comprehension, semantic mapping, pre-reading questioning, schemata

INTRODUCTION

Reading is perhaps the major language skill that most EFL learners need. Reading is central to life. There are many reasons for this; such as reading for pleasure or reading textbooks, scientific books and articles. Reading skills become more important as students advance through the educational system. Teachers normally ask students to read different materials to locate information relevant to their course in schools.

Reading is believed to be a very complex activity. Too many processes are involved in reading for meaning. It involves the rapid coordination of visual, phonological, semantic, and linguistic processes (Plaut, 2005). Furthermore, it is necessary to remember and manipulate information, to know what individual words mean and to be motivated to work on the text to understand its content (Clarke, Truelove, Hulme & Snowling, 2014). Hence, readers may spend a lot of time to read and comprehend a text. However, good readers try to find ways that help them not only understand a text but also enjoy reading.

Understanding a text usually involves activating background knowledge or otherwise known as knowledge of the world. This knowledge is stored in the mind in the form of schemata. People associate an entity or concept with a set of interrelated features. These set of features are called schemata (Field, 2003). According to schema theory, in order to help readers comprehend a text at a normal speed, they should be guided to activate their prior knowledge before they start reading and therefore, one of the teachers' responsibilities in reading classrooms is to design activities that help students activate their background knowledge.

Pre-reading strategies can help teachers activate students' schematic knowledge thereby promote their reading comprehension ability. Semantic mapping, also known as 'mind mapping' (Zadina, Smilkstein, Daiek & Anter, 2014), question and answer, brainstorming, free discussion, predicting, skimming, attending to pictures, graphics and headers are some pre-reading techniques that teachers can use for the purpose of activating background knowledge (Grabe & Stoller, 2011; Long & Doughty, 2009).

According to Pearson (2000) semantic mapping was effective with junior high school students in the context of regular classroom instruction. Asking student to formulate questions about a text, inter alia, is an effective strategy of reading comprehension (Long & Doughty, 2009).

The present study attempts to put semantic mapping and pre-reading questioning strategies into action and see which one can better improve the learners' reading comprehension ability. The expectation is that the results from the present study can be used by teachers to improve the students' reading comprehension.

LITERATURE REVIEW

Reading Comprehension and its Importance

Reading comprehension may be defined as a continuous activity that should be done by the reader so that he or she could comprehend a text in a normal speed and it is not necessary for the reader to vocalize what he or she is reading (Rivers, 1968). A writer tries to create meaning by activating his or her background and linguistic knowledge and the reader should use the same knowledge in order to understand the writer's meaning (Chastain, 1988). Anderson (1999) asserts that readers are constantly busy with building meaning while reading a text because reading is an active and fluent process. He believes it is not right to think that meaning of reading passages should be just searched in the mind of the reader or in the printed page. It resides in both the mind of the reader and in the text itself. Mcknight (2000) believes that through the complex and dynamic process of reading comprehension, readers try to decode the printed words and use their past experiences and knowledge to recreate the intended meaning of the writer. Pearson et al. (2002) describe good readers while they are reading in this way:

- Good readers are *active* readers.
- Good readers typically *look over* the text before they read, noting such things as the *structure* of the text and text sections that might be most relevant to their reading goals.
- As they read, good readers frequently *make predictions* about what is to come.
- Good readers *construct, revise, and question* the meanings they make as they read.

- Good readers try to determine the meaning of *unfamiliar words and concepts* in the text, and they deal with inconsistencies or gaps as needed.
- They draw from, compare, and *integrate their prior knowledge* with material in the text.
- They *monitor their understanding* of the text, making adjustments in their reading as necessary.
- They *evaluate the text's quality and value*, and react to the text in a range of ways, both intellectually and emotionally
- Comprehension is a consuming, continuous, and complex activity, but one that, for good readers, is both *satisfying and productive* (p.1).

Models of Reading Process

Three kinds of reading processing models have generally been distinguished; namely, bottom-up model, top-down model and interactive model.

In the bottom-up model, the reader begins with the smallest unit of language, the letter, and develops the largest unit, the overall meaning. Reutzel and Cooter (2013) define bottom-up model as:

Bottom-up theories hypothesize that learning to read progresses from children learning the parts of language (letters) to understanding whole text (meaning). Much like solving a jigsaw puzzle, bottom-up models of the reading process say that the reading puzzle is solved by beginning with an examination of each piece of the puzzle and then putting pieces together to make a picture (p.1).

In the top- down model, the reader begins with the overall meaning and then relates the content of what s/he reads to her/his own experiences to construct meaning. Chastain (1988) defines top-down processing as "it operates from a knowledge base to work on specific pieces of information"(p.36). During top-down processing, readers try to predict the meaning of the text by activating their background knowledge. Sometimes this expectation is justified and sometimes it is rejected as the reader is progressing reading the text.

It is suggested that both reading processes, top-down and bottom-up, happen at the same time and efficient readers comprehend texts by paying attention to linguistic information of the reading texts and also using their background knowledge, simultaneously (Rumelhart, 1977, 1980). The interactive approaches to reading comprehension involve using different kinds of knowledge so that the reader can extract the meaning from a text. The reader sometimes focuses on the linguistic variables of the text and sometimes relies on his or her own mental knowledge in order to interact with the text and comprehend it at a reasonable rate (Grabe, 1991).

Schema Theory and the Activation of Schemas in L2 Readers

Schemata play a key role in comprehension. Readers regularly use their schema to make sense of what they read According to schema theory, readers use the linguistic information of the reading text and their past experiences and information that are stored in their mind so as to build a meaningful understanding of the content of a text. In other words, both bottom-up and top-down processing are employed during reading comprehension activity. In the process of reading,

"*comprehension* of a message entails drawing information from both the message and the internal schemata until sets are reconciled as a single schema or message" (Hudson, 1982:182).

Goodman (1967) believes that skilled readers try to find the most meaningful elements of a text to comprehend it instead of going through all the details (cited in Chastain, 1988). Grellet (1981; cited in Chastain, 1988) concludes that proficient readers use a top-down processing in reading comprehension; that is, they start understanding the whole and then working toward comprehension of detailed aspects of the reading. Wixson and Peters (1984) proposed efficient readers use their background knowledge, the written text itself and the context by which the topic has been described in order to produce the intended meaning of the writer.

Grabe (2009) defined reading comprehension "Reading is also an interaction between the reader and the text" (p. 15). Efficient reading is achieved when previous knowledge interacts with new information. Reading different texts, readers are required to adjust their own schemata with the content of the text and build pieces of information that are compatible with their own experiences. The readers comprehend so much beyond the basic meaning of the text. A writer cannot control the readers' prediction of a text. The reader's different attitudes towards texts can have a stronger effect on him or her than the writer's real intention.

Ajideh (2006) believes that:

In most cases a common problem students experience in reading classes is the feeling that they know absolutely nothing about the subject they are reading about. However, this feeling may be more complex than generally thought. The problem may not be the lack of background knowledge, but rather the failure to activate that knowledge (p.1).

It is believed that schema theory is a process through which readers combine their own background knowledge with the information in a text to understand it better. The closer the match between the reader's schema and the text, the more comprehension occurs (Wallace, 1992; Brown, 2001). The goal of pre-reading activities is to activate schemata (background knowledge) and they are very important for EFL/ESL readers (Ajideh, 2003).

Several studies (Taglieber et al., 1988; Ajideh, 2006; Pan & Pan, 2009; Thongyon and Thanyapa, 2011; Mihara, 2012) have been conducted to investigate the effects of pre-reading strategies as a means of providing and triggering off background information prior to the reading task. These studies suggest that pre-reading strategies have a facilitative effect in text comprehension, and that teachers can use them to provide and/or activate necessary background knowledge relevant to understanding the new text. Pre-reading strategies are intended to activate appropriate knowledge structures or provide the knowledge that the reader lacks. Pre-reading strategies "prepare native speakers for the concepts that follow, make the reading task easier, connect the new content more meaningfully to prior knowledge, and make reading more enjoyable" (Taglieber et al., 1988, p. 456).

Reading Comprehension Strategies

In order to become efficient readers, reading comprehension strategies are the ways by which teachers can help students monitor their comprehension of texts. These strategies are divided into two major categories: cognitive and metacognitive reading strategies. Williams and Burden (1997) state that cognitive strategies are seen as "mental processes directly concerned with the processing of information in order to learn, that is for obtaining, storage, retrieval or use of information" (p. 148). They include repetition, organizing new language, summarizing, guessing meaning from context, using imagery for memorization, etc. On the other hand, metacognitive strategies include thinking, planning and monitoring of learning process, comprehension and production during language learning. They involve self-evaluation after the language activity is completed. There are three skill techniques in metacognitive strategies: planning, monitoring and evaluation (Cross & Paris, 1988; cited in Senay Sen, 2009).

Semantic Mapping

Johnson and Pearson (1978), developers of semantic mapping technique, believe semantic mapping is a graphic arrangement of words and it shows how new words and ideas related to each other within text. Students should be helped to build semantic maps. Using their prior knowledge, they deepen their understanding of the topics and as a result they construct graphic representations of the relationships and associations of meanings or concepts to the target word (Schwartz & Raphael, 1985).

Semantic mapping is one of the examples of cognitive strategies (Buchard, 2005). Semantic mapping has three applications: general vocabulary development, pre and post reading strategy and a study skill technique (Heimlich & Pittelman, 1986). To clarify the meaning of semantic maps, Heimlich and Pittleman (1986) described them as "semantic maps are diagrams that help students see how words are related to one another"(p.3). Grabe (2009) states that "semantic mapping typically emerges from a reading text and a topic"(p.277). Asking students to fill in a semantic map or create one, the teacher measures their comprehension of a text. Semantic maps can be an aid for students to understand the outlines and details of complex reading materials. It helps students "generate a range of associated words that can then be grouped in relation to the information actually presented in the text" (Grabe, 2009, p.277). Building semantic maps can be done by students individually or in groups and it depends on the complexity of the passages.

Some practical researches (Margosein et al. 1982, Chang et al. 2002, Canas et al. 2004, Onachukwu et al. 2007, Keshavarz et al. 2007 and Thuy 2013) have been done on the effect of different kinds of mapping on reading comprehension, vocabulary learning, etc. The researchers concluded that semantic mapping enhances reading comprehension, it can be used for complex learning tasks, students' retention of word meanings has been increased and they gained positive attitudes toward semantic mapping.

Pre-reading Questioning

One of the examples of metacognitive strategies is pre-reading questioning. Pearson et al. (2002) state that asking questions has an important effect on students' comprehension, but the teacher should help students to generate their own questions about the text. By helping students increase

their responsibility to generate questions, Raphael and her colleagues improved students' reading comprehension; taught them how to ask questions about their reading and where to find the answers to them; helped them to think about the text they are reading and beyond it; and finally inspired them to think creatively and work cooperatively while challenging them to use higher-level thinking skills (Raphael 1982, 1984, 1986; cited in Chien, 2013).

Therefore, re-reading questioning is one of the useful metacognitive strategies that teachers should introduce to students. Some researches (Peng et al. 2007, Kinniburgh et al. 2010, Thongyon & Thanyapa 2011, Yeh et al. 2012 & Supandeni et al. 2013) have been conducted on the effect of pre-reading questioning on reading comprehension. The research results indicated that the pre-reading questioning strategy, if implemented effectively, can increase comprehension of students and provide a strong foundation for reading comprehension.

RESEARCH QUESTIONS

Research question: Is there any statistically significant difference between the effect of semantic mapping and pre-reading questioning on reading comprehension while controlling for the pre-test scores?

In line with the above research question, the following null hypothesis was formulated:

Null Hypothesis: There is no statistically significant difference between semantic mapping and pre-reading questioning on reading comprehension while controlling for the pre-test scores.

METHODOLOGY

Participants

The participants of this study were sixty female high school students studying in Gharchak, Tehran. They were in grade four. The average age of the participants was 17.5 years. The participants were homogenized by the pretest based on their language proficiency. These participants, then, were assigned to two groups, semantic mapping and pre-reading questioning. Thirty participants were in each group.

Instruments

In this study, an instrument was used: University Entrance Exam and the students' textbook, Learning to Read, English for Pre-University Students (Birjandi, et al., 2013) was used as the treatment material.

University Entrance Exam. In order to homogenize the participants and examine the effect of two pre-reading strategies, semantic mapping and pre-reading questioning, on their reading comprehension; the researcher used two parallel tests of reading comprehension, one as the pretest and one as the posttest. Each test included six texts selected from the University Entrance Exams. To choose the appropriate texts, the readability of the texts used for the treatment was estimated through SMOG index. The readability of the textbook passages were 7 to 12.

Therefore, the texts whose readability were 7 to 10 were selected for the pretest and posttest. Each test consisted of 30 multiple choice items, 5 items for each passage. The time allocated for the test was 30 minutes. One point was awarded to each item. The whole score was 30.

Students' Textbook. The researcher used students' textbook (Learning to Read, English for Pre-University Students) as instructional material. This book includes 8 reading comprehension passages. The passages were taught through the two pre-reading strategies, semantic mapping and pre-reading questioning, in two fourth grade classes by the researcher, semantic mapping for one class and pre-reading questioning for the other. Meanwhile, eight blank semantic maps were prepared by the researcher for the first class. The maps were checked by the thesis advisor. The pre-reading questioning class, guided by the researcher, prepared a list including two columns of the things and questions related to the topic for each lesson and used them to comprehend the text.

Procedure

Pre-test. One week before the start of the study, the piloted University Entrance test was administered to 70 students in the fourth grade of high school in Gharchak in order to check the homogeneity of the sample. After scoring the test papers, sixty of the participants were selected as target participants of the research. The results of the pre-test, analyzed through independent samples t-test, showed that there was no statistically significant difference between the two groups. In order to provide an indication of the magnitude of the differences between two groups, the effect size was calculated through eta squared formula. Its magnitude was .1. The guidelines proposed by Cohen (1988; cited in Pallent, 2007) show that .1 is very small. It is safe to claim that the two groups are homogeneous. Then, the participants were divided into two groups, 30 participants in each group.

Treatment. In the semantic mapping class, the researcher began teaching the text by introducing the content words that had been made bold in their textbook. This was done by using the semantic map and guided discussion. The researcher drew the word map on the blackboard so that it was visible to the students. She wrote the topic or main concept in the center of the map. Then she distributed the blank semantic maps among the students and began the pre-reading discussion that focused on the content words. As the students responded to the concept-related questions, the researcher wrote the words, students' responses on the map and directed the students to complete the blank maps in the same way. A sample figure is provided below. When students failed to respond to the concept-related questions, the researcher offered a contextual definition of the word that facilitated understanding of the text. The probable contextualized definitions could be prepared by the teacher in advance. Then the maps were completed and the students were ready to read the passage. While reading, they used their semantic word maps to add to the meaning of words.

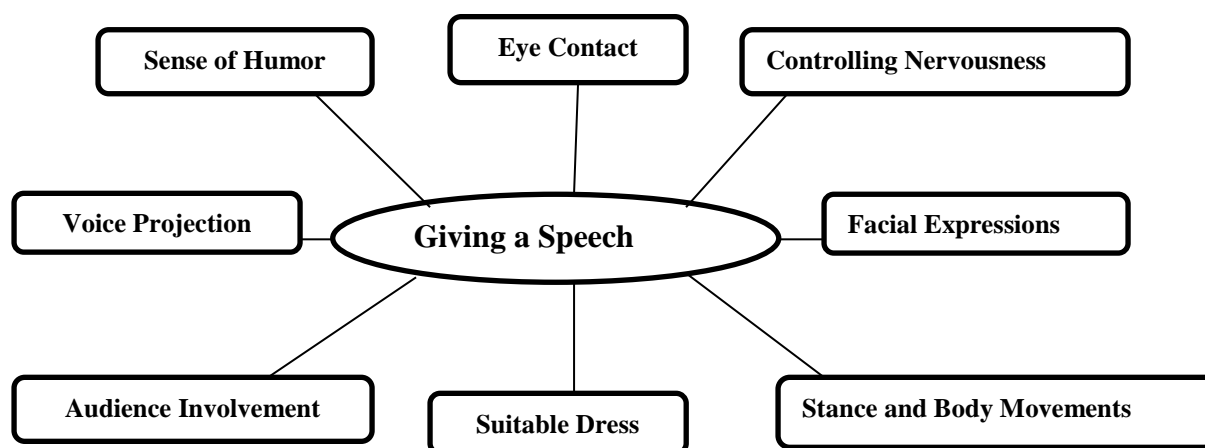

Figure 1: A Sample of Semantic Mapping

In the pre-reading questioning class, the researcher began teaching by introducing the topic of the passage that students were going to read. Once the topic was presented, the students were asked to work in groups and prepare a list of two columns. The first column was supposed to be the list of things about the topic that they were sure of, and the second lists the things that they were not sure/didn't know. Afterwards, the researcher asked one student from each group to write one or two items from their lists on the blackboard, so that interesting items which other groups might not have thought of could be included. Then students were ready to read the passage.

Posttest. A piloted posttest, University Entrance Exam, was used. The University Entrance test was administered after the treatment sessions finished. In order to pilot the posttest, the researcher administered the test to a sample of 30 students who shared the same characteristics as the main participants in the research. The reliability of the University Entrance Exam was .86 which seems to be acceptable. Then, the University Entrance Exam was administered to both groups after the treatment sessions.

RESULTS AND DISCUSSION

To achieve the purpose of the study, a pretest-posttest intact groups study was developed. Based on the results of pre-test (Table 1 below), there was no significant difference between the two groups, $t(58) = 1.32, p > .18$. In other words, the groups are homogeneous in terms of reading ability at the start of the research experiment. Therefore, the results of the post-test can safely be attributed to the treatment effect.

Table 1: Independent Samples Test for the pre-test

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
pretest	Equal variances assumed	.334	.565	1.328	58	.189	1.16667	.87872	-.59228	2.92561
	Equal variances not assumed			1.328	57.776	.190	1.16667	.87872	-.59242	2.92576

One week after the end of the treatment, the posttest was administered to the participants. Since the content and form of the pre-test and post-test were identical, the reliability of the test was checked through test-retest method. To do so, the correlation between the two administrations was estimated. The results, presented in Table 2, indicate that test is highly reliable, $r(60) = .94$.

Table 2: Correlations between pre-test and post-test

		pretest	Posttest
test		1	.941
			.000
		60	60

To examine the effect of the treatment, the results of the post-test were subjected to an independent samples t-test. The results, displayed in Table 3, help reject the null hypothesis, $t(58) = 2.54$, $p < .01$. The mean difference is in favor of the semantic mapping group. Therefore, the researcher can claim that semantic mapping technique has been more effective than question pre-reading questioning.

Table 3: Independent Samples Test for the post-test

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Posttest	Equal variances assumed	.253	.617	2.541	58	.014	2.46667	.97092	.52316	4.41017
	Equal variances not assumed			2.541	57.590	.014	2.46667	.97092	.52287	4.41047

The aim of this section is to explain the effects of two pre-reading strategies, semantic mapping and pre-reading questioning, on fourth graders' reading comprehension. The results indicated that the semantic mapping strategy improved the participants' reading comprehension better than the pre-reading questioning strategy. In addition to the finding mentioned above, other important findings from the study are summarized below.

First, good readers try to make connections between what they read and what they already know. When teachers help students make those connections before, during and after reading, they are teaching them one of the most important strategies that proficient readers use unconsciously. The pre-reading strategy, semantic mapping, used in this study guided students to activate their prior knowledge or schemata to better comprehend the texts. Moreover, students who took part in this study as the semantic mapping group had to build semantic maps. They had to identify the main idea first, and then they had to analyze the content and find the second categories, the supporting details and finally they had to organize the map. This proves that reading is an interactive process during which readers try to use their background knowledge in order to interact with the text (Carrel, 1988; Pearson et al., 2002). Sheorey et al. (2001) emphasize the role of metacognitive awareness in reading comprehension. They believe "the consensus view is that strategic awareness and monitoring of the comprehension process are critically important aspects of skilled reading"(p.432). This kind of awareness and monitoring (metacognition) is "the knowledge of the readers' cognition relative to the reading process and the self-control mechanisms they use to monitor and enhance comprehension"(p.432). Therefore, semantic mapping is a metacognitive strategy (Buchard, 2005) which can help students control and improve their learning before, while and after reading a text.

Second, on the importance of reading comprehension strategies, Grabe (2009) believes that "when reading new information, challenging information, or information for complex and difficult tasks, strategic awareness comes strongly into play" (p.225). This study helped students learn and practice the pre-reading strategy, semantic mapping, that made them achieve independent readers in using strategies. Building semantic maps about a text helps students organize a visual framework of what they know and what they do not know about a topic. Therefore, they may try to think and fill the gaps.

Third, students were made to form groups in order to do the activities. Hence, the results should be interpreted within the framework of cooperative learning. When students are appropriately arranged in groups (both good and weak students are in the groups and their roles are made clear) by the teacher, they know that they should support one another. They should use their personal knowledge and experiences in order to communicate meaningfully in groups. As the teacher has to supervise all the groups and guide them, his or her controlling role is decreased. Therefore, students are left to depend on one another in order to learn the new lesson. They face different people's opinions, reflections, experiences and feedback in group work. Each of these can help the group create a product that reflects a wide range of different views and is thus more complete and comprehensive. In this way, students understand that the responsibility of learning rests on

them. When students interact with people who are close to their own level of understanding, they feel more relaxed. It is the duty of each group member to help others to solve their learning problems and answer the probable questions. As a result, they feel a kind of belonging to the group and are motivated to help their teammates as much as they can. Shy students are encouraged to speak in the presence of their classmates and a kind of warm and close atmosphere is created that help more learning (Richards & Renandya, 2002).

Fourth, one of the characteristics of Communicative Language Teaching is that students use the language for meaningful purposes and "teachers to be in general control" (Richards & Renandya, 2002, p. 48). In Communicative Language Teaching, classroom activities are guided in a way that students participate in a learner-centered, meaningful and real communication. The participants of this study expressed that they experienced a learning situation in which learning was under their control not the teacher's; their background knowledge and experiences helped them interact meaningfully; and they did not repeat teacher's words but said their own words.

Fifth, when students are arranged in groups and are asked to do group activities, they assume some responsibilities and have to obey some rules. This helps good classroom management which is a priority for teachers. The researcher of this study observed a calm, controlled and positive climate in classrooms where group work was running. Students were busy with their responsibilities and in fact they did not have time to disturb others.

CONCLUSION

The research question of this study focuses on the effects of the two pre-reading strategies on students' reading comprehension. Namely, is there any statistically significant difference between the effect of semantic mapping and pre-reading questioning on reading comprehension while controlling for the pre-test scores? The result of the comparison between the mean scores of two groups through the posttest revealed the semantic mapping group developed their reading comprehension skill more than the pre-reading questioning group. It should be mentioned that the results would hold for a special range of age and a particular social/economical class. Whether the participants of this study had used other strategies to comprehend the texts was out of the control of the researcher.

ABSTRACT

This paper aims at providing an overview of some researchers' viewpoints about the Second Language Acquisition (SLA) research and language teaching. Research into language learning and teaching can provide useful input for L2 teaching. SLA research has made relevant contributions to language pedagogy (Long 1990). Lightbown (2000) argues that SLA research is not the only source of information teachers should draw on and offers teachers' guidance. To this end, this review attempted to highlight the supportive link of SLA to language teaching practice with regard to the researchers' viewpoints about its application in English as a foreign language (EFL) pedagogy.

KEYWORDS: Second Language Acquisition; Language Teaching Profession; Researchers' ideas.

INTRODUCTION

SLA research provides a thorough and in-depth basis for language teaching practice and practitioners. Over the past decades a number of groundbreaking theories have been formed to explain how language learning takes place, discover the variables which contribute to second language acquisition and to provide assistance to second language teachers. These theories of SLA which account for language acquisition from different standpoints, have revolutionized our views of teaching and learning. This review introduces some of the most significant theories of second language acquisition which have contributed to classroom pedagogy.

ROUTE AND RATE OF ACQUISITION

The basic findings of SLA research during the past few decades indicate two main results that firstly second language acquisition is highly systematic, and secondly second language acquisition is highly variable.

Although these two major findings might seem to be conflicting, they are more complementary. The first one primarily refers to the route of development (the nature of the stages all learners go through when acquiring the second language - L2). This route remains largely independent of both the learner's mother tongue (L1) and the context of learning (e.g. whether instructed in a

classroom or acquired naturally by exposure). The second statement usually refers to either the rate of the learning process (the speed at which learners are learning the L2), or the outcome of the learning process (how proficient learners become), or both. We all know that both speed of learning and range of outcomes are highly variable from learner to learner: some do much better much more quickly than others. Such findings had invaluable pedagogical implications for language teaching profession in the sense that if we understand what makes learners learn faster and progress ahead, then we can be better teachers or learners. However, these two research lines are supportive and complementary to our insight of how learners learn. In fact, understanding the route learners follow, and the rate they have, give us a clear expectations of what learners can achieve at given points on the developmental scale; a point which is important for both learners and teachers during the learning and teaching process. In addition, such findings lead us, for example, to a better understanding of the significance of errors in the learning process. Producing them need not be seen as necessarily problematic, but can be regarded to as indication of progress.

Many researchers in the discipline have conducted numerous exploratory and confirmatory research studies to draw the above mentioned conclusions. These two findings have been the basis of many teaching methodologies and teaching practices in the profession.

INTERLANGUAGE DEVELOPMENT AND LANGUAGE TRANSFER

The term interlanguage (IL) was introduced by Selinker (1969). It refers to the linguistic system an adult second language learner uses to express meanings in the target language. It refers to a dynamic linguistic system that has been made and utilized by a language learner who is not fully proficient but is approximating the target language by maintaining some features of their first language or overgeneralizing target language forms in their language productions.

The interlanguage is viewed as a separate linguistic system which is different from both the learner's mother tongue and the target language. One main feature of any interlanguage is that it stops to develop at some point. Thus, the adult second-language learner never achieves a level of capacity in the use of the target comparable to that achievable by any child acquiring the target as a native language.

Another basic feature of the interlanguage system is transfer. Odlin (1989, p. 27) defines transfer as the influence of similarities and differences between the target language and the first language. Language transfer has been a central issue in applied linguistics, second language acquisition and language learning (Odlin, 1989). IL was the origin of a change in second language acquisition, the theory of language transfer was challenged and reconsidered several times. In 1950s, transfer was considered the most important factor that related to errors. In the 1960s, the study of transfer diminished with Chomsky's criticism of behaviorist learning theory which justified that learners' errors were not indication of language transfer but the creative construction process.

UNIVERSAL GRAMMAR THEORIES

Universal Grammar (UG) theories are based on Chomsky's idea that there are certain principles that are foundations of language development. These principles are biologically determined and specialized for language learning (Chomsky, 1969, 1980, 1986). Originally, UG theory did not involve itself with second language learning. It was basically a theory concerning the first language learner. Its principles were later utilized by second language researchers and were applied in the field of second language acquisition. UG was used in order to justify the existence of developmental sequences in interlanguage and to support the view of interlanguage as a natural language which is subject to the constraints of the Universal Grammar (Hilles, 1986:45). The use of UG for language transfer, fossilization and L2 pedagogy was also discussed. Evidence was provided that adults have some sort of access to knowledge of UG, and this knowledge is used in the development of foreign language competence (Bley-Vroman, Felix, & Ioup, 1988).

Generally speaking, UG theories of second language acquisition were generated in order to provide justifications for empirical evidence. UG was basically concerned with the internal mechanisms that lead to the acquisition of the formal aspects of the target language and the similarities and differences between acquiring a particular language as a first or a second language. Although researchers have used UG to generate a number of interesting hypotheses about second language acquisition, and generative theorists regard UG as the best theory of grammar because of its descriptive and explanatory adequacy (Ellis, 1994:429), empirical evidence has been restricted to the acquisition of a small set of syntactic phenomena. A general theory of second language acquisition needs to cover a wider range of phenomena (McLaughlin, 1987:108).

COGNITIVE THEORIES

Psychologists and psycholinguists considered second language learning as the acquisition of a complex cognitive skill. Some of the sub-skills involved in the language learning process are the application of grammatical rules, proper vocabulary selection, and the pragmatic conventions which govern the use of a specific language (McLaughlin, 1987:134). These sub-skills become automatic with practice (Posner & Snyder, 1975). During this process of automatization, the learner organizes and restructures new information that is acquired. Through this process of restructuring the learner links new information to old information and achieves increasing degrees of mastery in the second language (McLaughlin, 1987, 1990a).

From the cognitivist's point of view language acquisition is dependent "in both content and developmental sequencing on prior cognitive abilities" and language is viewed as a function of "more general nonlinguistic abilities" (Berman, 1987:4).

The language acquisition theories based on a cognitive view of language development view language acquisition as the gradual automatization of skills through stages of restructuring and linking new information to old knowledge. However, the differences between the various

cognitive models makes it impossible to construct a comprehensive cognitive theory of second language acquisition and furthermore, as Schimdt (1992) believes:

“there is little theoretical support from psychology on the common belief that the development of fluency in a second language is almost exclusively a matter of the increasingly skillful application of rules” (Schmidt, 1992:377).

MULTIDIMENSIONAL MODEL

In the Multidimensional Model, the learner's stage of acquisition of the target language is determined firstly by the learner's developmental stage and secondly the learner's social-psychological direction.

The Multidimensional Model has both explanatory and predictive power in that it not only identifies stages of linguistic development but it also explains why learners experience these developmental stages and it predicts when other grammatical structures will be acquired (Ellis, 1994:384). Although the Multidimensional Model has made important contributions to second language acquisition research, there are some problems with the “falsifiability” of its predictive framework, such as explaining how it is that learners learn whatever they manage to produce despite the processing constraints (see also Larsen-Freeman & Long, 1991:285; McLaughlin, 1987:114-115). Furthermore, the Multidimensional Model does not explain the process through which learners obtain intake from input and how they use this intake to reconstruct internal grammars (Ellis, 1994:388). In this respect the Multidimensional Model is limited.

ACCULTURATION THEORY

Schumann (1978) maintains that:

“second language acquisition is just one aspect of acculturation and the degree to which a learner acculturates to the target-language group will control the degree to which he acquires the second language.”

Based on Schuman's standpoint, second language acquisition is greatly affected by the degree of social and psychological distance between the learner and the target-language culture. Social distance refers to the learner belonging to a certain social group that is in contact with another social group with a different language. Psychological distance results from a number of different affective factors that involve the learner as an individual, such as language shock, culture shock, culture stress, etc. If the social and psychological distance is great then acculturation is ceased and the learner does not progress beyond the early stages of language acquisition. As a result his target language will stay pidginized. Pidginization is characterized by simplifications and reductions occurring in the learner's interlanguage which lead to fossilization when the learner's interlanguage system does not progress in the direction of the target language (for a review see McLaughlin, 1987:110-112).

Schumann's theory received limited empirical support. Among some of the criticisms that the acculturation theory received was that social factors are assumed to have a direct impact on second language acquisition while they are more likely to have an indirect one (Ellis, 1994:233). Also, pidginization is a group phenomenon, while language acquisition is an individual phenomenon. Finally, the acculturation model fails to explain how the social factors influence the quality of contact the learners experience (Ellis, 1994:234).

OUTPUT HYPOTHESIS

The extent to which learners learn by processing linguistic input or by actually producing (i.e. speaking or writing) the language is an issue of debate in SLA research. Opposed to Krashen's claim that acquisition is completely based on comprehensible input, most researchers now acknowledge that learner output also plays a role. Skehan (1998) based on Swain (1995) enlists the contributions of output as follow:

First, the learner production serves to generate better input through the feedback that learners' efforts at production elicit. Second, it forces syntactic processing and forces learners to pay attention to grammar. Third, it allows learners to testify hypotheses about the target language grammar through the feedback they obtain when they make errors. Forth, it helps to automatize existing knowledge. Fifth, it provides opportunities for learners to develop discourse skills. And sixth, it is important for helping learners to develop a 'personal voice' by directing conversation on to topics they are interested in.

The importance of creating opportunities for output, including what Swain (1985) has called pushed output (i.e. output where the learner is stretched to express messages clearly and explicitly), constitutes one of the main reasons for incorporating tasks into a language program. Exercises result in output that is limited in terms of length and complexity. It does not afford students opportunities for the kind of sustained output that theorists argue is necessary for interlanguage development. Research (e.g. Allen, Swain, Harley, & Cummins, 1990) has shown that extended talk of a clause or more in a classroom context is more likely to occur when students initiate interactions in the classroom and when they have to find their own words. This is best achieved by asking learners to perform tasks that require both oral and written language.

LEARNING AND INDIVIDUAL DIFFERENCES

Although there are particular universal aspects of L2 acquisition, there is also considerable variability in the rate of learning and in the ultimate level of achievement. Learning will be more successful when the instruction is matched to students' particular aptitude for learning, and also when the students are motivated.

It is probably beyond the abilities of most teachers to design lessons involving the kind of matching instruction employed in Wesche's study. However, teachers can cater to variation in the nature of their students' aptitude by adopting a flexible teaching approach involving a variety of learning activities. They can also make use of simple learner-training materials (e.g. Ellis &

Sinclair, 1989) designed to make students more aware of their own approaches to learning and to develop awareness of alternative approaches. The good language learner studies suggest that successful language learning requires a flexible approach to learning.

Thus, increasing the range of learning strategies at learners' disposal is one way in which teachers can help them to learn. Such strategy training needs to foster an understanding that language learning requires both an experiential and an analytical approach and to demonstrate the kinds of strategies related to both approaches.

Teachers need to accept that is their responsibility to ensure that their students are motivated and stay motivated and not complain about the fact that students lack motivation. While it is probably true that teachers can do little to influence students' extrinsic motivation, there is a lot they can do to enhance their intrinsic motivation.

CONCLUSION

This paper has reviewed a number of influential second language acquisition theories with varying emphasis on different aspects of the second language acquisition process. What all these theories have in common is the fact that second language acquisition is an ongoing process. Whether language learners use strategies, cognitive or innate mechanisms, they still have to progress towards the target language going through various stages of development.

SLA theories are all concerned with providing explanations about how languages are acquired. Yet, no single theory can offer a comprehensive explanation about the whole process of second language acquisition. Each theory offers a different insight in the complex process of second language acquisition. However based on these theories of second language acquisition and also their explanations and justifications, invaluable pedagogical uses have been drawn by researchers and applied linguists.

The findings of research studies in SLA has nourished ELT pedagogy and classroom practice in essence. The emergence of each theory in psychology accompanied the appearance of one or more teaching methodologies along with specific techniques which were aimed at enhancing learning.

ABSTRACT

The purpose of this study was to explore the effects of semantic relation strategies (semantic-concept and semantic-pictorial) on Iranian English as foreign language (EFL) learners' vocabulary recall and retention. 90 pre-intermediate level students took part in a homogeneity test to determine their homogeneity level. Then they were randomly divided into three groups, 20 learners each: two experimental groups (i.e., semantic-concept and semantic-pictorial) and a control group. Then, three groups were given a pre-test before treatment to determine how well the participants knew the vocabularies of the materials. During an eleven-session course, the three groups covered eight passages selected by the researcher. The experimental group of semantic-concept received instructions on why, when, and how these strategies were used. The experimental group of semantic-pictorial received instructions to classify the words or concepts under pictorial concept determined by the teacher based on the topic, their background knowledge and experience. The control group received traditional vocabulary instructions of using synonyms and definitions or even translation. After the treatment sessions, the participants sat for an immediate vocabulary post-test for the short-term effect, retention, of the vocabularies. Finally, after an interval of three weeks, the participants took the vocabulary delayed post-test as an indicator of the long-term effect, recall, of the vocabularies. Data were analyzed through One-way ANOVA and findings showed significant difference between the groups. The semantic-pictorial group outperformed the other groups in both vocabulary recall and retention. Implications of the study for teaching vocabulary suggest that using semantic-pictorial strategy could be more effective than other strategies in teaching vocabulary to EFL pre-intermediate learners.

KEYWORDS: Semantic Relation Strategies, EFL Learners, Vocabulary Recall, Retention

INTRODUCTION

The outstanding developments in technology and communications have made learning foreign languages in general and English language in particular essential for every individual. English

language has become an international language and a means of communication among people all over the world. In learning a language, there are four skills that we need to improve for complete communication. They are listening, speaking, reading and writing. Obviously vocabulary size influences the four skills. Indeed vocabularies are the building blocks of every language without which one is quite speechless Mostaan (2013). Ellis (1997) believes that vocabulary knowledge can assist grammar acquisition because knowing the words in a text or conversation aids learners to get the meaning of the discourse, which in turn help them to acquire the grammatical patterns. Zhan-Xiang (2004) believed that vocabularies are just like bricks of a high building; despite quite small pieces, they are vital to the great structure. In fact, vocabulary is the most fundamental component, without which communication is not feasible. Comprehension is also important for second language acquisition. If second language learners cannot isolate words from the oral utterances and cannot use lexical information to predict the meaning of the speech, they will not be able to comprehend the utterances. As a result, comprehension of the input depends on vocabulary depth and knowledge (Alnasir, 2012).

Vocabulary knowledge is not only important for oral comprehension, but also for reading comprehension. For instance, learners cannot understand a reading passage if they do not have an adequate vocabulary and do not have the skills to guess meaning from context. In summary, vocabulary knowledge is an essential component of learning a second language for several reasons. Both native speakers and learners recognize the importance of getting the words right because lexical errors are numerous and disruptive. Thus, it is important for learners to have good lexical skills in order to produce sentences and to understand them correctly.

Akbari (2008) suggested that in Iran the method most frequently used in English classes is to consult a bilingual dictionary or the teacher for the meaning of unfamiliar words. Too much dictionary work makes learners bored and reluctant to read, and decreases their comprehension. Also EFL learners often complain about forgetting words quickly and ask about efficient ways for improving long-term retention of words. Therefore, it seems necessary for teachers to make use of some rather innovative strategies for teaching vocabulary. One of the strategies which can be very effective in improving the knowledge of vocabulary and seems to be neglected in the case of Iranian EFL learners is semantic- relation. Thus, there is an urgent need to study this aspect in order to see if vocabulary recall and retention will be influenced by the use of semantic-relation strategy in Iranian EFL pre-intermediate learners.

REVIEW OF LITERATURE

The main reason behind learning a second language in general and vocabulary in specific is to achieve the ultimate goal, which is to know and understand information similar to that of native speakers of a language. As a consequence, that would lead to the need to know the vocabulary size of native speakers. Nation and Waring (1997, as cited in Schmitt, 2000), in their literature review of vocabulary size studies, concluded that a native speaker's vocabulary size is around 20,000 word families, and it is anticipated that a native speaker will add around 1,000 word families every year to his or her vocabulary size. A person will continue to learn new vocabulary throughout his or her lifetime. Furthermore, Nation (2006) claims that second language learners

need to know around 98% of the written or spoken words in discourse in order to understand it very well. In order to reach this percentage in written texts, learners need to know around 8,000 to 9,000 word families. On the other hand, learners need to know around 5,000 to 7,000 in order to understand a spoken discourse. However, Nation and Waring (1997, as cited in Schmitt, 2000) argued that learners can cope with small vocabulary size of 2,000 to 3,000, but if they want to function in English without any unknown vocabulary, the vocabulary sizes which were stated above are necessary.

The concept of a word is rather difficult to explain and there are several different views concerning what a word really is. Singleton (1999) emphasizes that words have a rather privileged status in the popular understanding of what a language is since they are vital to linguistic communication. Indeed, without vocabulary there is no tool to communicate and everybody realizes it. However, different people see words and vocabulary differently and therefore defining a word has its problems.

Words can also have different forms but the forms are not necessarily seen as different words. Furthermore, words can have similar forms but convey different meanings. In addition, idioms cause more confusion in the definition of a word since they function as separate entities even though they consist of several words (Carter, 1998). Carter (1998) summarizes that orthographic, phonological, grammatical and semantic properties of a word are best captured using the term lexical item since it overcomes some problems which the term word encounters.

Sometimes the term vocabulary item is used instead of lexical item. Lexemes are the basic contrasting units in a language. For example, when looking up words in a dictionary, one is often looking for lexemes instead of words. For instance, different tenses of a verb are actually lexemes; different word forms (Carter, 1998). Cook (2001) emphasizes that a word is more than its meaning. Each word has certain forms of the word; a certain pronunciation and spelling which are linked to the pronunciation and spelling rules of the language.

Semantic relationship (SR) skills include recognizing and using knowledge about the relationships among words based on their meanings (as opposed to their phonological or orthographic forms (Berends & Reitsma, 2006). This is achieved by focusing on semantic features of words, the minimal contrastive elements of meaning. In other words, this teaching draws attention to the most fundamental similarities and differences among word meanings in order to develop and strengthen semantic networks. This type of teaching requires teachers and students to go much deeper into their understanding of words, and talk about multiple meanings and connotations. For example, teachers may use a semantic feature analysis to teach a group of related concepts by creating a matrix. On the left is a list of words that share some features but not others. Across the top are words that are features of the words on the left.

Since 1976 that Novak proposed concept mapping, concept maps have been used widely in different fields. The studies have shown the significant effect of concept mapping on meaningful learning (Novak, 2010). Most of the conducted studies have been on first language. But a few studies have been done on second language which some of them are presented below. Chularut

and DeBacker (2004) studied the effect of concept mapping on academic achievement; self-efficacy and self-regulation of students in English classes as a second language have been investigated. The subjects of the study were college and high school students that enrolled for English classes. The findings of the study showed that a group of students that used concept mapping, achieved higher scores in English achievement, self-efficacy and self-regulation in comparison to control group.

Ojima (2006) in a case study investigated the impact of concept map strategy as a pre-task planning on writing skill of three Japanese students. The results showed that concept mapping improved writing skills of English learners on the basis of its complexity and reflectivity in which English was L2. It should be mentioned that most of the studies in the field of concept map strategy have been done by academic researchers and these studies have been their academic projects. In the present study the concept maps in official classes of teachers have been used.

Concept maps represent the relationships among concepts (Novak, 2010). With the visual representation of key words, students can identify main issues of a text and organize these key issues in a meaningful way. Marashi and Azarmi (2012) compared the effect of presenting words in semantically related and unrelated sets in intentional and incidental learning contexts on Iranian EFL learners' vocabulary learning. 120 female EFL learners were randomly put into four experimental groups. In the first group, vocabulary was taught in semantically related sets and in an incidental learning mode. The second group received them in the same sets but in an intentional learning mode. The third experimental group experienced semantically unrelated sets and in an intentional learning mode, while the fourth group was taught the vocabulary in semantically unrelated sets but in an incidental learning mode. The findings revealed that presenting words in semantically unrelated sets and in an intentional learning mode was more effective on students' vocabulary achievement compared to the other modes. Waring (1997) replicated the study of Tinkham (1997).

RESEARCH QUESTIONS

The main research questions to be pursued in this study are as follows:

RQ1: Do semantic-pictorial and semantic-concept strategies improve pre-intermediate EFL learners' vocabulary short and long retention?

RQ2: Is there any significant difference between the use of semantic-pictorial, semantic-concept strategies and conventional ways of teaching vocabulary to pre-intermediate EFL learners' vocabulary short and long retention?

METHODOLOGY

Participants

In the present study, the population was 90 female students who studied English as a foreign language in Esmatie high school in Ahvaz, Iran. They were all in pre- intermediate level. Non-random sampling method was used for the selection of these participants. They took part in a proficiency test, (Richards, 2007) which was used as a homogeneity test and sixty students whose

scores were one standard deviation above and one standard deviation below the mean were chosen as the participants of the present study. They were randomly divided into three groups, two experimental and one control. Each group included twenty subjects. Two experimental groups received semantic-concept and semantic-pictorial strategies while the traditional group received the placebos. The participants were within the age range of 16 to 17.

Instrumentation

In order to accomplish the objective of the present study, the following instruments were employed:

1. Homogeneity test: Richards, Lesley, Hansen, Sandy and Zukowsk (2008) test was used to determine the homogeneity of subjects in terms of language proficiency level and divide the sample population into three groups. This test featured 50 multiple choice items covering only grammar items. The allotted time was 50 minutes. To estimate the reliability of the test, the Kuder-Richardson formula (KR-21) was used and a value of 0.814 was obtained as reliability which indicated that the test was satisfactorily reliable.

2. Pre-test: A pre-test containing the actual test items was administered i.e., based on the classroom materials to the subjects before treatment in order to determine how well the subjects knew the contents before treatment. The subjects were asked to answer 40 multiple-choice vocabulary questions selected from the course passages in 40 minutes. The reliability of the test was calculated through KR-21 formula. To ensure that students did not give more attention than they should to the words appearing in the pre-test, no mention was made of the subsequent learning lessons and the immediate post-test or delayed post-test. The reliability of the pre-test was 0.728.

3. Immediate post-test: To determine the effect of pictorial-concept and semantic-concept strategy on vocabulary retention, after each session of instruction where students had done the strategies in the experimental group and covered the passage given to them to be read there was a 5 minutes rest and right after that there was a ten-multiple-choice question quiz asking the meaning of the new vocabularies learnt in that session. The reliability of the immediate post-test was 0.899.

4. Delayed Post-test: Following the treatment, three weeks later after the end of the course, the instructor showed up in the class to administer the post-test. The sudden, without notice presence of the instructor in the class was to test the retention of words in a longer period to see the real effect of the treatment. All characteristics of the post-test were the same as those of the pre-test in terms of time and the number of items. The only difference of this test to the pre-test was that the order of questions and alternatives was changed to wipe out the probable recall of pre-test answers. Both the pre-test and the post-test were performed as part of the classroom evaluation activities under the supervision of the instructor. The reliability value of these tests was also calculated through KR-21 formula. It was 0.903.

Materials

The material used in this study, reading passages, were the same for the three groups and had been selected from the following source:

1. Top Notch 2A, Second edition (Saslow & Ascher, 2011): It consists of ten units.

Procedure

To accomplish the purpose of the study, first 90 female were selected from Esmatie high school in Ahvaz in district three, then a homogeneity test was administered to the subjects under study to determine their homogeneity and to divide the sample population into three groups. The three groups, 20 learners each, were selected randomly: two experimental and one control group. They met for two and a half hours, once a week.

In the second session of the course, a pre-test containing the actual test items was administered to the subjects before treatment in order to determine how well the subjects know the contents before treatment. The actual vocabulary instruction began from the third session. In each session, the first hour was allotted to vocabulary instruction and the rest to teaching the course book. The whole research took place in a natural language school classroom circumstance. To motivate and encourage the subjects to pay enough attention and to play more active role in the research program, they were told that the purpose of the extra instruction was to improve their vocabulary knowledge and to enable them to commit the vocabulary to their long-term memory.

The entire research project took place in eleven sessions. Eight reading passages were chosen and a variety of vocabulary that could challenge the students to think about how the words fit together was extracted from the passages. During eight sessions of instruction, 60 minutes each, the extracted words and their related passages were worked on. The experimental groups received semantic relation strategy instructions while the other one received the placebo. In order to teach semantic relation strategies in the experimental classes, the following phases were carried out:

Phase 1: In the first session, semantic relation strategies were presented and described explicitly. Then, they were explained to language learners why, when, and how these strategies were used.

Phase 2: In each session, before reading the passage, the teacher presented the students with the challenging new words extracted from the reading passage printed on a piece of paper. Since the focus of the research was on using semantic-concept and pictorial-semantic to teach vocabulary, the predetermined categories were specified to list of the challenging new words.

Phase 3: The students were gathered in groups of two or three around a table, and after explaining the meaning of difficult words, they were directed to classify the words or concepts under semantic or pictorial concept determined by the teacher, based on the topic, their background knowledge and experience.

Phase 4: The students were given the reading passage to read from which the new words had been extracted.

Phase 5: After each session, there was a five-minute rest and right after that there was a ten-multiple-choice question quiz asking the meaning of the new vocabularies learnt in that session. While the experimental group received semantic relation strategies as treatment, the control group did not receive any particular strategies. The students were seated in groups of two or three

around a table as in the experimental group and were simply given the reading passages and required to read them and asked the teacher in case of facing any problems. Similar to the experimental group, after each session, there was a five-minute rest for the control group and right after that there was a ten-multiple-choice immediate test asking the meaning of the new vocabularies learnt in that session. Of course, it was administered to three groups. Then, in the end, three weeks after the end of the course, in session eleven, the post-test was given to three groups to evaluate the retention of words in a longer period and to see the real effect of the treatment.

Data Analysis

In order to determine whether semantic relation strategies have any effect on vocabulary learning, the collected data were analyzed using different statistical procedures. Descriptive statistics such as mean and standard deviations were estimated to describe and summarize the data. The statistical analysis of One-way ANOVA on the three groups' pre-test scores indicated that the difference among the means was not significant. On the other hand, the amount of observed F (.165) for the three groups was lower than Critical F (3.17) suggesting that the difference between three group's mean was not significant. This showed that the groups were homogenous before the research period at the pre-test level. The data of the delayed post-test were put into one-way ANOVA to find the significance differences between the groups. Then a post-hoc Scheffe test was run to determine the effectiveness of instruction which influenced the groups during the recall period. Moreover, KR-21 formula was used to estimate the reliability of the test. The independent variable in this study was semantic relation strategies and the dependent variable was vocabulary learning.

RESULTS AND DISCUSSION

Results of Three Groups' Pre-test

At the beginning of the study, three groups were given a pre-test which their statistical data is presented in Table 1

Table 1: Descriptive Statistics of Semantic Relation Strategies(Pre-test)

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean	Min.	Max.
Groups					Lower Bound	Upper Bound	
Semantic	20	9.4500	10.898	2.43708	4.3491	14.5509	.00
Pictorial	20	10.4000	2.962	.66253	9.0133	11.7867	6.00
Control	20	10.9000	8.340	1.86505	6.9964	14.8036	1.00

As can be seen in Table 1, the number of the students in three groups is 20. Initially, each student's pre-test score on the proficiency test was obtained. Then descriptive statistics of mean and standard deviation of each groups, were calculated. Results indicated that the average means for every three groups was near and the difference among the three groups' was not significant. Regarding the standard deviation (SD), it was found out that the SD of the semantic group was 10.898, higher than other two groups, and SD of the pictorial group was 2.962 which was the lowest comparing to the other two groups.

In order to find out whether the difference among the performances of the three groups was statistically significant, One- way ANOVA for the three groups was applied, and the results of the test were interpreted from two points: Level of significance and F-ratio. Table 4.2., displays the results of the statistical operations.

Table 2: One-way ANOVA of Semantic Relation Strategies(Pre-test)

	Sum Squares	of df	Mean Square	F	Sig.
Between Groups	21.700	2	10.850	.165	.848
Within Groups	3745.550	57	65.711		
Total	3767.250	59			

Since the critical F ($F_c=3.171$) with $df=2/57$ is greater than the observed F ($F_o=.165$), the difference among the groups is not significant. Therefore, three groups are homogenous. Table 2 indicates the statistical analysis of One-way ANOVA on the three groups' pre-test scores. Results of the pre-test on the subject's scores did not reject the null hypothesis at ($p<.848$) level of significance which indicated that the difference among the means was not significant, because of the fact that the probability level chosen for rejecting the null hypothesis of no difference was $\alpha = .05$, so that the null hypothesis was not rejected if the amount of signification was lower than 0.05. By dividing the between-group variance by the within-group variance and finding the ratio between them, we found the probability that the ratio we obtained would recur if the experiment were repeated an infinite number of times with three sample groups on the same participants or any other experimental groups under the same conditions. The critical F was (3.17) while the observed F was (.165); therefore, the observed ratio was not large enough to convince the researcher that the mean difference was significant. On the other hand, in Table 2., the amount of observed F (.165) for the three groups was lower than Critical F (3.17) suggesting that the difference between three group's mean was not significant. This showed that the groups were homogenous before the research period at the pre-test level.

Results of the Three Groups 'immediate Post-test

The descriptive statistics for the three groups on the immediate post-test are presented in Table 3.

Table 3: Descriptive Statistics of Semantic Relation Strategies(Immediate Post-test)

Groups	N	Mean	95% Confidence Interval for Mean					
			Std.Deviation	Std.Error	Lower Bound	Upper Bound	Minimum	Maximum
Semantic	20	14.8500	9.922	2.2186	10.2063	19.4937	2.00	39.00
Pictorial	20	19.1500	13.192	2.9498	12.9760	25.3240	2.00	39.00
Control	20	10.9500	8.272	1.8497	6.4284	14.1716	.00	26.00

Table 3 shows that the mean in the pictorial group differs significantly from two other groups, and also the mean for semantic group shows difference to some degree from conventional group. The mean for pictorial, semantic, and control groups were 19.15, 14.85, and 10.95 respectively. To describe the statistical significance of the three groups' mean, One-way ANOVA was applied, and the results of the test were interpreted from two points: Level of significance and F-ratio. The results of the statistical operations are analyzed in Table 4.

Table 4: One-way ANOVA of Semantic Relation (immediate Post-test)

Sum of Squares	df	Mean Square	F	Sig	
Between Groups	783.433	2	391.717	3.447	.039
Within Groups	6477.300	57	113.637		
Total	7260.733	59			

Based on Table 4, the results of the immediate post-test on the subject's scores rejected the null hypothesis at the 0.05 level of significance which shows that the differences among the means were significant. The amount of observed F (3.447) for the three groups was higher than Critical F (3.17) suggesting that the difference between the three group's mean was significant. Since the probability level for rejecting the null hypothesis was smaller than $\alpha = 0.05$, therefore the null hypothesis was rejected. To clarify which group outperformed other groups in the immediate post-test, the Post-hoc Scheffe test was conducted to compare the specific mean effectiveness among the three groups. Data are illustrated in Table 5.

Table 5: Post-hoc Scheffe test (Multiple Comparisons of Semantic Relation Strategies(Immediate Post-test)

(I) VAR00002	(J) VAR00002	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
					Lower Bound	Upper Bound
Semantic	Pictorial	-4.30000	3.37101	.448	-12.7730	4.1730
	Control	4.55000	3.37101	.408	-3.9230	13.0230
Pictorial	Semantic	4.30000	3.37101	.448	-4.1730	12.7730
	Control	8.85000*	3.37101	.039	.3770	17.3230
Control	Semantic	-4.55000	3.37101	.408	-13.0230	3.9230
	Pictorial	-8.85000*	3.37101	.039	-17.3230	-.3770

*, The mean difference is significant at the 0.05 level.

It can be inferred from Table 5, that pictorial group is significantly different from control group at the 0.05 level. The semantic group is not significantly different from the control group ($p < 0.408$). The results shows that the pictorial group shows the greatest difference in compare to the control group ($p < 0.039$) and it shows that the pictorial-semantic instruction had the most influence on the results of vocabulary retention on the immediate post-test and learners' scores.

Results of the Three Groups ' Delayed Post-test

Table 6: Descriptive Statistics of Semantic Relation Strategies (Delayed Post-test)

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean		Minimu m	Maximu m
					Lower Bound	Upper Bound		
Semantic	20	12.80	11.35	2.53	7.48	18.11	1.00	33.00
Pictorial	20	18.50	11.61	2.59	13.06	23.93	2.00	35.00
Control	20	9.15	6.62	1.48	6.04	12.25	1.00	23.00
Total	60	13.48	10.68	1.37	10.72	16.24	1.00	35.00

Table 6 shows that the mean in the pictorial group differs significantly from two other groups, and also the mean for semantic group shows difference to some degree from conventional group. The mean for pictorial, semantic, and control groups were 18.50, 12.80, and 9.15 respectively. To describe the statistical significance of the three groups' mean, One- way ANOVA was applied, and the results of the test were interpreted from two points: Level of significance and F-ratio. The results of the statistical operations are analyzed in Table 7.

Table 7: One-way ANOVA of Semantic Relation Strategies(Delayed Post-test)

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	888.23	2	444.11	4.328	.018
Within Groups	5848.75	57	102.61		
Total	6736.98	59			

Based on Table 7, the results of the delayed post-test on the subject's scores rejected the null hypothesis at ($p < .018$) level of significance which shows that the differences among the means were significant. The amount of observed F (4.328) for the three groups was higher than Critical F (3.17) suggesting that the difference between the three group's mean was significant. Since the probability level for rejecting the null hypothesis was smaller than $\alpha = 0.05$, therefore the null hypothesis was rejected. To clarify which group outperformed other groups in the delayed post-test, the Post-hoc Scheffe test was conducted to compare the specific mean effectiveness among the three groups. Data are illustrated in Table 8.

Table 8: Post-hoc Scheffe test (Multiple Comparisons of Semantic Relation Strategies(Delayed Post-test)

(I)	(J)	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
VAR00001	VAR00001				Lower Bound	Upper Bound
Semantic	Pictorial	-5.70000	3.20327	.214	-13.7514	2.3514
Pictorial	Control	3.65000	3.20327	.526	-4.4014	11.7014
	Semantic	5.70000	3.20327	.214	-2.3514	13.7514
Control	Control	9.35000*	3.20327	.019	1.2986	17.4014
	Semantic	-3.65000	3.20327	.526	-11.7014	4.4014
	Pictorial	-9.35000*	3.20327	.019	-17.4014	-1.2986

*. The mean difference is significant at the 0.05 level.

As the data indicate in Table 8, there are significant differences between the Pictorial, Semantic, and the control groups. After three weeks interval pictorial group outperformed semantic and control groups. And pictorial group at the 0.05 level shows a great difference to control group.

Discussion

Picture instruction is another method that can be used in classroom to teach new vocabulary. Pictorial-concept was found to be produced a better performance than the other groups. This superiority is due to the fact that this method allows direct link with the conceptual system; as a result, connecting directly the L2 word with the corresponding concept. For the picture- method participants of the present study, this superiority is obvious in the delayed post-test because they performed better than the other participants. From this study, teachers may gain insights into the role of picture methods in the learners' learning process and ways to integrate this method in their

teaching. Pictures reliably improve the reading-to-learn process—just as had been concluded on the basis of the pictures-in-text research literature through the 1980s (e.g., Levie, 1987)

Fang (1996) suggests that “the contributions of pictures to the overall development of children’s literate behavior seem to be overwhelmingly greater than its potential dangers.” In this regard, Fang (1996) lists six roles that pictures play in storybooks. Pictures may serve to help (a) establish the setting, (b) define/develop the characters, (c) extend/develop the plot, (d) provide a different viewpoint, (e) contribute to the text’s coherence, and (f) reinforce the text. Fang goes on to list several benefits that pictures provide, including such things as motivating the reader, promoting creativity, serving as mental scaffolds, fostering aesthetic appreciation, and promoting children’s language and literacy. Based on the result section, there are significant differences between the three groups. The results of the post-test may show the difference between the three groups in case of the use of semantic strategies. The group of pictorial instruction outperformed the group of semantic-concept instruction. It shows that the use of pictorial-concept might be of more use than the use of semantic-concept concerning vocabulary recall and retention. So the second null hypothesis was rejected. Another possible reason may be due to the fact that although both strategies were explained to the participants; however, learners are more interested with pictorial-concept than concept maps. Furthermore, using pictures is easier, comes naturally, and does not need much instruction; while using concept maps is more complicated and may be confusing for the learners who encounter it for the first time. The results showed that the first group’s scores were 15 to 120 percent higher than the second group’s score which shows the positive effect of contextual instruction on vocabulary acquisition, retention, and use.

The results of the delayed post-test, after two weeks, also showed remarkable difference between the three groups and again better performance of pictorial group than semantic - concept group. The findings of this study concerning semantic-concept strategy did not show a positive effect on vocabulary recall and retention, that is, the results of the study did not indicate the superiority of semantic- concept strategy over traditional ways in terms of improving Iranian EFL learners’ vocabulary recall and retention. The findings of the study also revealed that interval between the immediate and the delayed post-test affects the EFL learners’ vocabulary achievement. This interval may affect the loss of learning. However, it needs further research to study the length of interval and the loss of vocabulary achievement. Concerning the inefficiency of semantic-concept strategy in improving Iranian EFL learner's vocabulary recall and retention, the researcher also found that this strategy was considered new by some of the participants in the study and they were not used to the new strategy. It should be stated that innovative strategies such as semantic-concept strategy, require strong foundations, that is, learners need to build a background concerning current ideas and strategies in teaching vocabulary before the main course of instructions.

CONCLUSION

This study began with the assumption that applying vocabulary learning strategies could enhance the Iranian pre-intermediate EFL learners’ vocabulary recall and retention. The two experimental groups were taught the new vocabulary through two methods of instruction. And the control

group did not receive any instruction. The instructor explored to see if the application of different vocabulary learning strategies have any effect on the Iranian EFL learners or to investigate the effect of each approach.

Having administered the post-test and analyzing the data through specific statistical analysis of One-way ANOVA, the researchers found that results indicated that the instruction of using pictorial-semantic strategies did affect the learners' vocabulary acquisition and retention the most. The results also showed that applying the semantic-concept strategy may improve the learners' vocabulary recall and retention. This study faced several limitations in this study including the small size of the research population. Secondly, students were not really cooperative since they knew they are participating in a research they may not did their best to complete the experiment. Thirdly, the time allocated to the instruction was so limited

ABSTRACT

This research investigated the effect of teaching conversational strategies through video clips on developing speaking skills among senior high school students. In doing so, a homogeneity test was administered among 150 students at the third grade of senior high school. Accordingly, one hundred students whose scores fell above and below the median were selected as the participants of the study. The students whose scores were above the median were selected as high achievers and the students whose scores were below the median were chosen as low achievers. Then, the two groups were randomly divided into two sub-groups, the control and the experimental groups. Thus we had two control groups with high and low and two experimental groups with high and low proficiency. Before starting the research, a pre-test was administered among all the four groups. In the control groups, conversational strategies were taught directly by using the teachers' traditional handouts while the experimental groups received six video clips and participated in observation tasks. After 6 sessions of treatment, a post-test was given to the participants. Data were analyzed by paired and independent samples t-test. The findings showed that the experimental group of high achievers significantly performed better than other groups. The results suggest that the video clips can be used in conversational classes to develop speaking proficiency among high achievers rather than low achievers.

KEYWORDS: Conversational strategies, Video clips, Speaking skills

INTRODUCTION

Conversation skills are crucial for effective socialization, influencing how easily people make friends and excel in the workforce (Dörnyei & Thurrell, 1994). Developing good conversation skills often requires that students break bad habits and come up with conversation topics. Although some dynamic and proactive learners can improve their communicative abilities in their own way (finding chances to talk to English speakers or watching English films or TV programs), finding effective ways to prepare students for spontaneous communication is one of the biggest challenges for all current language teaching methodologies. Hence, instruction in

class is important to provide students with conversational strategies to help them avoid or overcome communication breakdowns. Dörnyei and Thurrell (1994) argued that conversational strategies are particularly helpful for language learners who frequently face difficulties in conversations, because these strategies provide them with a sense of security in the language. Conversational strategies could be divided into nine types in order of significance: message adjustment or avoidance, paraphrase, approximation, appeal for help, asking for repetition, asking for clarification, interpretive summary, checking (for comprehension and confirmation), and use of fillers/hesitation devices (Dörnyei&Thurrell). Based on the teaching context, teachers can teach conversational strategies to students in various ways, for instance, through picture dictation tasks (Kebir, 1994), pair-taping (Washburn & Christianson, 1995), or telephone conversation role-plays (Ting & Lau, 2008).

Speaking is an important skill in learning English as a foreign language (EFL). Since learners need it for communication (Nunan, 2001). Students must regularly practice conversing with others to improve their speaking and also to develop conversation skills. The teacher can pair up students with other students and make them comment on topics of interest to them, such as their favorite bands. Although students learn effective strategies for conversing, they still appear awkward, since they are not accustomed to using these skills. In this case, teachers can help by pairing awkward students with friendlier students to help the former feel at ease. Conversation skills do not only involve knowing what to say, but also paying attention to others and picking up on non-verbal cues (Nunan, 2001). The teacher should first indicate different aspects of nonverbal communication, such as eye contact and voice tone. Then, he/she should have students exercise expressing hidden meaning through non-verbal cues, and make other students try to interpret these cues. An integral part of developing conversational skills is learning proper manners. The teacher should reinforce conversation etiquette, and direct to keep his/her students from violating these rules. For example students should not interrupt others when they are speaking. The teacher can kindly remind students when they deviate from these norms. Students are often unaware of their incorrect pronunciation (Nunan, 2001). However, no conversation will run smoothly when improper pronunciation impedes clear communication, an especially significant problem with non-native speakers. Indicating an improperly pronounced word is crucial for students to begin addressing the problem. Some sounds make the throat vibrate, while other sounds do not. The teacher should guide students to feel their vocal cords to determine whether they are properly vocalizing. Some sounds produce a puff of air, while other sounds do not. The teacher should have students place a hand near their mouths to determine if air is coming out of the mouth when it should. Also, the teacher should tell students the proper mouth position when making certain sounds. For example, when making the “f” sound, she should instruct students to touch the bottom lip to the top teeth (Nunan, 2001).

When native speakers and non-native speakers hold conversations, they must ordinarily work together to avoid and overcome communication breakdowns. The strategies and tactics which they use include selecting salient topics, checking comprehension, requesting clarification, repeating utterances, stressing key words, and switching topics (Ellis, 1985). Research shows that the skills involved in negotiating to avoid and repair breakdowns are important for ESL/EFL learners to have. Pica (1987) states that "To engage in the kind of interaction believed to activate

the acquisition process, classroom activities must be structured to provide a context whereby learners not only talk to their interlocutors, but negotiate meaning with them as well" (p. 40). Ellis points out that a one to one native speaker to non- native speaker linguistic environment is superior to the one to many environment of the classroom in providing opportunities for negotiated interaction. Anybody can talk about the news or express basic opinions, but good talkers can frequently tell you things you did not know and that you'll find fascinating. This is why it's good to have knowledge into fields such as psychology or sociology, and bring such knowledge out at the right moments in a conversation.

In the current study, video clips were applied in teaching conversational strategies, as Hill (1989) claimed carefully handled videos could provide a good base for speaking tasks. For EFL learners in Asia, the teaching of conversational strategies through video clips may also familiarize them with how conversational strategies are used in native English speakers' cultures. The present study intends to investigate the effect of teaching conversation strategies via printed and visual modes on developing speaking performance among high school students.

REVIEW OF LITERATURE

The term conversational strategies indicate those strategies which help speakers to maintain a conversation and to achieve their communicative goal (Nguyet & Mai, 2012). Using conversational strategies has been suggested as one effective way to overcome problems in maintaining conversations. Learning effective conversation skills ranks as one of the most significant social abilities that students need to accomplish. Dörnyei and Thurrell (1994) proposed that, learners are well equipped to handle instances of naturally arising conversations through using these strategies. Conversational strategies are also regarded as a sub-division of communication strategies. Sometimes the two terms conversational strategies and communication strategies are believed to be exchangeable. The term conversational strategies indicate those strategies which help speakers to maintain a conversation and to achieve their communicative goal. In short, conversational strategies are worth attention because they can facilitate interaction and fluency.

Effective Factors in Selecting Film

Nowadays, exposing students to English culture is the best way to study English. Using original films is one of the best approaches because language in movies is rich and dialogues are authentic (Chun-Yi, 2008). In other words, stated clearness, attractiveness, length, and familiarity are four criteria of good films for using in the classes. The students are expected to understand the language of the film. The attractive and appealing film arouses the students' curiosity. Students' proficiency level in four skills should be considered in selecting the films and video clips. In addition, time pressure is another major performance condition affecting speaking. Language teachers should pay attention to the length of the film because they need to fit the time of the class. Teachers can cut the extensive sections from films while learners understand the entire plot.

For mature and advanced learners, teachers have to select films which deliver a clear message to enhance classroom discussion. King (2002) stated that teachers should choose films that deal with different interesting fields such as education, science, history, marriage, justice, etc. A theme-based discussion allows students to discover relevant issues rose from a variety of perspectives, develop critical thinking skills, elicit responses, engage in conversation freely on all aspects of the movie they watch and release them from inhibiting grammatical rule-binding and detailed-oriented learning habits.

Speaking Skill

Speaking is an important skill in learning English as EFL. Language learners and teachers look for effective ways to increase this skill. Chastain (1988) argued that speaking a language includes more than knowing the linguistic components of the message and developing language skills needs more than grammatical comprehension and vocabulary memorization. Speaking is an interactive process of building meaning that involves producing and receiving and processing information (Brown, 1994). Its form and meaning are dependent on the context in which it occurs, including the participants themselves, their collective experiences, the physical environment, and the purposes for speaking. It is often spontaneous, open-ended, and developing. However, speech is not always unpredictable. Language functions (or patterns) that tend to recur in certain discourse situations (e.g., declining an invitation or requesting time off from work), can be recognized and charted (Burns & Joyce, 1997). For example, when a salesperson asks "May I help you?" the expected discourse sequence includes a statement of need, response to the need, offer of appreciation, acknowledgement of the appreciation, and a leave-taking exchange. Speaking requires that learners not only know how to produce special points of language such as grammar, pronunciation, or vocabulary (i.e. linguistic competence), but also that they understand when, why, and in what ways to produce language (i.e. sociolinguistic competence). A speaker's skills and speech habits may have an effect on the success of any exchange (van Duzer, 1997). Speaking has a special and important place in the language learning. Language teachers should keep in mind that speaking is not a skill, which they can improve in isolation. Like other language skills, speaking is a process. Speakers use their background and linguistic knowledge to make a meaningful message to their audience. Converting thought to language, though a subconscious process, is a very demanding task for a second or foreign language learner. Speakers must be able to anticipate and then produce the expected patterns of specific discourse situations (Chastain, 1988). They must also handle discrete elements such as turn-taking, rephrasing, providing feedback, or redirecting (Burns & Joyce, 1997). For example, a learner involved in the exchange with the salesperson described previously must know the usual pattern that such an interaction follows and access that knowledge as the exchange progresses. The learner must also choose the correct vocabulary to describe the item sought, rephrase or emphasize words to clarify the description if the clerk does not understand, and use appropriate facial expressions to indicate satisfaction or dissatisfaction with the service. Other skills and knowledge that instruction might address involve the following: producing the sounds, stress patterns, rhythmic structures, and intonations of the language; using grammar structures accurately; assessing characteristics of the target audience, including shared knowledge or shared points of reference, status and power relations of participants, interest levels, or differences in perspectives; selecting vocabulary that is understandable and appropriate for the audience, the

topic being discussed, and the setting in which the speech act occurs; applying strategies to increase comprehensibility, such as emphasizing key words, rephrasing, or checking for listener comprehension; using gestures or body language; and paying attention to the success of the interaction and adjusting components of speech such as vocabulary, rate of speech, and complexity of grammar structures to maximize listener comprehension and involvement (Brown, 1994). Teachers should monitor learners' speech production to determine what skills and knowledge they already have and what areas require development. Therefore, speaking is a key to communication. By considering what good speakers do, what speaking tasks can be used in class, and what specific needs learners report, teachers can help learners improve their speaking and overall oral competency.

Students often think that the ability to speak a language is the product of language learning, but speaking is also a very important part of the language learning process. Effective instructors teach students speaking strategies, using minimal responses, recognizing scripts, and using language to talk about language that they can use to help themselves expand their knowledge of the language and their confidence in using it. These instructors' help students learn to speak so that the students can use speaking to learn.

In a study, Lee (2010) investigated the effects of using film-based instruction on listening comprehension and speaking skills of Applied English majors. The researcher analyzed students' performances on listening comprehension tests and oral presentations before and after the instruction. In addition, students' learning knowledge before and after the instruction compared. The study lasted for a whole semester, from September 2008 to January 2009. The participants of this study were 22 Applied English Department students in Southern Taiwan University who were enrolled in the elected course "Movie English." Instructional activities were developed out of the three feature films which were selected as the main teaching materials in this research. The top three types of films recommended by students were comedy, dramatic feature and animation. The instrumental tools included pre and post treatment questionnaire surveys, the pre and post of listening comprehension tests and the evaluation sheet of oral presentation. Follow-up interviews were also conducted after the treatment. The collected data were analyzed quantitatively through SPSS program. The students' responses to the questionnaires and interviews were also analyzed qualitatively. Based on the findings of the study, using film-based instruction was enhanced learning interests and motivation. Also, it was provided the chance for learning real-life conversation and it was improved listening comprehension and speaking ability of learners. Moreover, Subjects responded that dictation and listening exercise assist their listening most and oral presentation and group discussion help their speaking most.

Nguyet and Mai (2012) explored the effects of teaching conversational strategies through video clips on learners' speaking performance. It was planned as an experimental study conducted with two groups of English majors. All participants received six weeks of instruction on four conversational strategies. The control group received direct instruction from the teachers' handout while the experimental group viewed six video clips and participated in observation tasks. Data was collected via pre-and post-tests on speaking performance and semi-structured interviews. The results showed that after the treatment with video clips, (a) the frequency of the

use of these strategies increased, (b) the learners' speaking performance was enhanced, (c) there was a low correlation between the frequency of strategy use and the learners' speaking performance, and (d) the learners expressed a positive attitude towards the treatment.

Suttinee and Kanchana (2009) aim to obtain empirical data on the types of communication strategies those low-ability students select which may affect their oral communication abilities. Three hundred Thai university students participated in the initial part of this study, 100 of who were randomly selected to complete the Strategies Used in Speaking Task Inventory, which was developed to elicit responses related to their use of communication strategies. In addition, content analysis was employed to confirm the quantitative analysis. It was found that low-ability students tended to employ risk avoidance techniques, especially time gaining strategies, and needed assistance in developing risk-taking techniques such as social-affective, fluency-oriented, help seeking, and circumlocution strategies.

RESEARCH QUESTION

This paper specifically attempted to reflect on the following research question:

Do teaching conversational strategies through video clips enhance the learners' speaking performance among high achievers?

METHODOLOGY

Participants

The present study was conducted with the help of 100 students who were selected out of 150 students of the third grade of Farzanegan high school and Hajar high school, Ahvaz, Iran. As some students attend English institutes and have higher English education, the first step was to make sure of the students' homogeneity in speaking level. Based on Homogeneity test, the students whose scores fell below and above the median were selected as the participants of the study. Fifty of the students were below the median and another fifty students were above the median. Therefore, two groups were randomly divided into two sub-groups, control and experimental groups. Thus, there were two control and experimental groups with high proficiency and two control and experimental groups with low proficiency, each of them included 25 students. The participants ranged in age from 16 to 17 years old. In the control groups, conversational strategies were taught directly by using the teachers' handout traditionally while the experimental groups received six video clips and participated in observation tasks.

Instrumentation

Several different testing instruments were utilized in the process of the development of the present research. Initially the pre- test and post -test were piloted on five learners of English at a similar level to the participants of the study to find out if any modifications should be made. There were no significant changes after the piloting of the test.

A homogeneity test was used to determine the students' homogeneity level. The test contained 50 multiple-choice items and the students were supposed to answer them in 60 minutes. The reliability of this test was computed through Kuder-Richardson-21 formula as ($r = 0.73$).

A pre-test and a post-test determined the effects of teaching conversational strategies through using video clips on developing speaking skills. Moreover, the post-test included the same dialogues in the pre-test. The inter-reliability values of pre and post tests were calculated through Pearson Correlation Analysis as ($r=.72$) and ($r=.81$) respectively. Furthermore, a checklist (Hughes, 2003) was used in both pre and post tests to measure communicative abilities of participants.

Materials

The textbook used in this curriculum for the two groups was "Fundamental Top Notch A and B" written by Joan Saslow and Allen Asher (2007). Considering six sessions for the research at the high schools, the high achievers studied five units of Fundamental Top Notch B and the low achievers studied five units of Fundamental Top Notch A which were selected as the materials of the study. The units were chosen to be compatible with the proficiency level of students. Six two to four minutes video clips were carefully selected from Fundamental Top Notch A and B, which were in line with the speaking level of the experimental groups. Five of the video clips were compatible with the five units of the aforementioned textbook and the sixth clip served as a review for all the strategies used in the supplementary course. The control groups were provided with the hand out of the same selected unit conversations.

Procedure

This study was conducted at Farzanegan high school and Hajar high school in Behbahan, Iran. The participants were 100 high school students out of 150 students in the third grade of aforementioned schools. Based on their performance on a speaking placement test designed by Richards, Lesley, Hansen, Sandy and Zukowski(2008), the students whose scores fell below and above the median were selected as the participants of the study. Reliability index of homogeneity test was ($r=0.73$). So, we had one group of students with high and another one with low English speaking proficiency. Then, the two groups were randomly divided into two sub-groups, control and experimental groups, each of them had 25 students ranged from 16 to 17years old.

The material was five units which were selected from "Fundamental Top Notch A & B" based on students' level. In the experimental group six video clips were used. Each of them was from 2 to 4 minutes. The five week supplementary course were held on five types of conversational strategies which in high groups they were chosen from Top notch B and in low groups the conversation strategies were chosen from Top notch A to be in line with the level of proficiency of students. The sixth video clip served as a review for all of the strategies used in supplementary course. The selected video clips had to meet some criteria. Existence of some various conversation strategies was the first criterion. The second criterion was their appropriateness based on the students' English level and their speaking proficiency. Thirdly, in selecting the video clips we had to take into account the participants' social and religious norms and values as well as the relatedness of the film to the students' daily life in order to communicate well with

them. The video clips were appropriate and fun for the senior high school students. They also were both pedagogical. So they were suitable for using in classes to discover the effects of teaching conversation strategies on developing speaking skill.

In the control groups, conversational strategies were taught directly by using the teachers' handout. A pre-test was administered to discover the speaking skill proficiency at the beginning of research period. Through the pretest, the researcher asked all the four groups of students to practice the five conversations selected by her from "Fundamental Top Notch A& B" in 30 minutes and choose one of them deliberately to practice with their partners. The students were free to choose the dialogue and also add or remove some utterances to them. In fact they were open ended dialogues. The researcher observed the students' conversations that were done in pair and recorded their voices by mp3 player and transcribed them. A checklist (Hughes, 2003) was used in pre-test and post -test to measure communicative abilities of participants. The recordings were evaluated through inter-rater correlation to arrive at the reliability value which met as ($r=0.72$). The treatment lasted 6 sessions, 30 minutes a session, twice a week.

During the treatment, in each session, the researcher devoted times to showing the video clips, introducing conversation strategies and their uses and also practicing new words and dialogues. Each video clip was presented and repeated to the students for 10 minutes in every session. During each session, four types of techniques including note taking, question and answer, discussion, and description were used to work on the video clips. Most of the students took notes while they watched the clips for reviewing it. After watching the clips, some questions were asked to discover students' comprehension of it and then the students practiced the conversation strategies presented in clips in pair. In addition, the students discussed the videos and gave their opinion about them. The control groups were conducted by the same activities which were done in the experimental groups. The only difference between the control and the experimental groups related to the visual phases. Finally, after the six weeks of treatment period, a post-test of speaking achievement covered all the materials was administered to the four groups. Through the post-test, the researcher chose one topic for conversation from the five units of the book that was taught during the course and asked students to do it pair wise. In this phase students could not choose the dialogues themselves. As the pre-test, the students' conversation recorded and transcribed and evaluated by the Hughes (2003)' checklist. The recordings were evaluated through inter-rater reliability. Finally, the results of the pre-test and post-test were compared to each other to know the effect of teaching conversation strategies through video clips on developing students speaking performance.

Data Analysis

The purpose of this study was to determine the effectiveness of teaching conversational strategies through video clips among senior high school students. Students' speaking exam was conducted at the first and the end of the research as the pretest and post-test of speaking. Participants' interviews were recorded for analyzing in both pre and post- tests. The data were collected and analyzed through Statistical Package for Social Sciences (SPSS) 17 in order to determine whether teaching conversational strategies through video clips has any effect on developing speaking skill. In this study, the data were analyzed by Independent and paired samples t-test to see if there

was any significant difference between the control and experimental groups regarding their speaking performance. The analysis went further to find out whether it influences on students' performance in speaking skill; two t-test analyses were applied in this section, for the two groups' performances on speaking. Then, an independent samples t-test was also performed to determine the rate of mean differences, if any, between two groups and this last t-test was used to show the role of teaching conversational strategies through video clips on speaking skill.

RESULTS AND DISCUSSION

In order to determine the effect of teaching conversational strategies through video clips on developing speaking skills among senior high school students, once the scores of the pre-test and post-test were obtained, the mean and standard deviation of the scores were calculated. Then, analysis of paired and Independent Samples t-test was run in order to find out whether the differences between the two paired and independent groups are statistically significant or not. It is important to note that the researcher employed all the formulas with the level of significance set at 0.05 in all their applications. Table 1 provides the descriptive statistics of students' speaking pre-tests in terms of the number of participants (N), means, standard deviations (SD), and standard errors of mean.

Table 1: Descriptive Statistics (Pre-test Experiment. Vs. Control)

	Groups	N	Mean	Std. Deviation	Std. Mean Error
Experimental (L)	1.00	25	18.16	7.79	1.55
Control (L)	2.00	25	18.00	7.00	1.40
Experimental (H)	1.00	25	16.36	4.54	.908
Control (H)	2.00	25	16.72	5.99	1.19

In Table 1, shows the number of the students in the groups of low and high achievers in pre-test are 25. The standard deviations in the experimental and control groups of low achievers were (7.79) and (7.00), while the standard deviation in the experimental and control groups of high achievers were (4.54) and (5.99) respectively. Furthermore, the mean of the experimental low and control low was 18.16 and 18. In addition, the means of the experimental and control groups of high achievers were 16.36 and 16.72 respectively. Thus, there were close means between the pairs low and high achievers in the pre-test. The differences between each the two groups were not significant.

Table 2: Independent Samples t-test (Experimental vs. Control in High and Low Achievers)

t-test for Equality of Means									
Groups		T	df	Sig. (2- tailed)	Me an Diff erence	Std. Error Differ ence	95% Confidence Interval of the Difference Lower Upper		
Experimental (Low) vs. Control (Low)	Equal variances assumed	.076	48	.939	.160	2.09	-4.05	4.37	
	Equal variances not assumed	.076	47.45	.939	.160	2.09	-4.05	4.37	
Experimental (High) vs. Control (High)	Equal variances assumed	.239	48	.812	.360	1.50	-3.38	2.66	
	Equal variances not assumed	.239	44.73	.812	.360	1.50	-3.39	2.67	

Table 2 shows observed t for experimental and control low achievers is .076 with df=48. This amount of observed t does not exceed the critical t, i.e. 2.00. Thus, both groups are homogeneous. The observed t for experimental and control high achievers is .239 with df=48. Since the observed t does not exceed the critical t, both groups are homogeneous. Consequently, the p values for low and high achievers are .939 and .812 respectively which are more than the .05 level of significance. Therefore, the two groups are homogeneous which shows no significant difference between the two groups. So, it can be claimed that two groups were homogeneous at the beginning of the experiment regarding their prior knowledge. Descriptive statistics of students' speaking post-tests are summarized in the Table 3.

Table 3: Descriptive Statistics of Low and High Achievers in Groups' Post-tests

Groups	N	Mean	Std. Deviation	Std. Error Mean
Experimental (L)	25	22.72	2.92	.58
Control (L)	25	18.80	7.45	1.49
Experimental (H)	25	22.68	7.57	1.51
Control (H)	25	17.32	9.085	1.81

Table 3 shows the number of the students in the groups of low and high achievers in post-test is 25, and in each experimental low and high group is 25 too. The standard deviations in experimental and control low achievers are (2.92) and (7.45) respectively, while the standard deviations in the experimental and control high achievers are (7.57) and (9.08) respectively. In addition, the mean of the experimental and control low achievers are 22.72 and 18.80 respectively, and the mean of the experimental high and control high are 22.68 and 17.32.

Table 4: Independent Samples t-tests of Low and High Achievers in Groups' Post-tests

t-test for Equality of Means								
Groups			t	df	Sig. (2- tailed)	Mean Differ ence	Std. Error Diffe rence	95% Confidence Interval of the Difference Lower Upper
Experimental (L) vs. Control (L)	Equal assumed	variances	2.44	48	.018	3.92	1.60	.69 7.14
	Equal assumed	variances not	2.44	31.20	.020	3.92	1.60	.65 7.18
Experimental (H) vs. Control (H)	Equal assumed	variances	2.26	48	.028	5.36	2.36	.60 10.11
	Equal assumed	variances not	2.26	46.49	.028	5.36	2.36	.59 10.12

Table 4 shows there is a significant difference between the means of the two groups in the post-test. Thus, the difference between the means of the experimental and control groups is significant. The Independent Samples t-test for the post- test between low achievers showed that the observed t for the experimental and control low achievers is 2.44 with 48 degree of freedom, this amount of observed t is greater than the critical t (2.0). Also the Independent Samples t-test between high groups showed that the observed t for experimental high and control high is 2.26 with 48 degree of freedom, this amount of observed t is greater than the critical t (2.000). Furthermore, t-test analysis showed the significance value as .018 in the low groups and .28 in the high groups are much greater than 0.05. This means that there is significant difference between the means of the fourth sets of scores in experimental and control groups. Thus, the treatment made a significant difference between control and experimental groups' post-tests. In other words, teaching conversational strategies through video clips developed the speaking performance of the senior high school students.

Discussion

The purpose of this study was to determine the effectiveness of teaching conversational strategies through video clips in improving speaking skill. Since the experimental groups outperformed the control groups in both high and low achievers, teaching conversational strategies through video clips are supposed to improve speaking skill among senior high school students. One possible explanation of such a result is that the correct use of video clips in the classrooms may help students to enhance using conversational strategies in developing their speaking skill. This explanation is compatible with Katchen (2003) who discovered that films could be used as the major course materials in listening and speaking course for English majors at the university levels. It also showed that students benefited from using films. Combination of sounds and

images in watching films may be one of the reasons that improve speaking. King's (2002) ideas are in line with the results of the present research since he stated that the great value of films lies in its combination of sounds, images and sometimes texts. Another explanation for the greater progress of the experimental groups with comparing to the control groups is that using video clips could better demonstrate how to avoid communication breakdown and enhance learners' conversational fluency. Moreover, it was observed that these video clips could effectively illustrate how the conversational strategies are used with both verbal and non-verbal communication. This enables learners to use vocabularies, speaking expressions, and frequently used grammatical structures in their interactive strategies.

Based on the findings of this research, creating a meaningful environment by use of video clips may encourage students to speak. As Canning-Wilson (2000) supports this idea, the use of visuals, films, cartoons, and some audio-visual materials help learners to clarify the messages and enhance their understanding. Progoosh (1996) states the same results and notes that visual imaging systems have widespread among people and is an inseparable part of people's lives. Thus, video clips provide strong motivation for students to learn English. This is in line with Gorjian and Dorshmal (2013) who found that using films in teaching could be motivated and attractive. Similarly, Istanto (2009) emphasized the use of films in classes and his findings are consistent with the outcome of current study. Istanto also argued that films provide strong motivation for learners to learn the target language and culture because they can learn in more interesting ways compared to traditional class activities. Moreover, Jahangard (2007) took the same position and proposed visual materials increase language learning in classrooms.

Based on the above supports, the video clips may arouse learners' curiosity and can motivate learners to develop their speaking skill through using conversation strategies. The learners show less stress and tension in the class since they were able to cope with the difficulties of speaking through various activities and putting them into the use. The learners feel more comfortable in the classes which are fun for them. The findings of this study also are compatible with the findings of Bahrani and Soltani (2002) who concluded that learners show great interest in watching films and different programs of TV during their research. The participants attended the classes with low anxiety which led to the high motivation.

The results also showed that teaching conversational strategies through video clips could generally lead to improve the speaking skill. This result might be predictable since the use of video clips in teaching conversational strategies may attract learners' attention and the observation tasks could raise the learners' awareness on the strategies used in the video clips. Thus, the frequent use of conversational strategies could enhance the learners' speaking performance since they can see when and how to use the strategies in an appropriate manner.

Comparing the means of the pre-test and post-test of the two experimental high and low achievers showed the speaking score of the two experimental high and low achievers improved and there was significant increase in mean of the experimental high achievers. The results also indicated that the experimental high achievers outperformed the experimental low achievers in the post-test although this difference was not significantly confirmed. This may be due to the

background knowledge of high achievers and their mastery on the vocabularies and expressions used in the video clips. Therefore, it can be claimed that having good knowledge of English grammar and vocabularies and also having good listening ability can be a key factor in developing speaking skills through video clips. Thus, the use of video clips for teaching conversational strategies in developing speaking skills may be beneficial to high rather than low achievers.

CONCLUSION

This study proposed new way of teaching conversational strategies that facilitate interaction and maintain speaking fluency in daily conversations. Video clips, are suggested as an effective tool for carrying out this teaching process (Gorjian & Dorshmal, 2013). In this respect, high school learners can be familiar with how conversational strategies are used in native English speakers' cultures. Finally, it is vital for instructors to choose appropriate conversational strategies, video clips, and observation tasks to suit their learners' needs in specific context. The results of the research indicated that video clips did affect the senior high achievers' speaking skill; however, the difference between the high and low achievers in the experimental groups was not significant. In other words, both high and low achievers of the experimental groups performed in the post-test without any significant difference.

ABSTRACT

The present study was conducted to compare the effect of pre-task and online planning on English as a foreign language (EFL) learners' accuracy and fluency in speaking. To fulfill the purpose of the study, 30 intermediate female learners at the first grade of high school were chosen by means of a sample Preliminary English Test (PET) and randomly divided into two experimental groups of 15 students; the pre-task and online planning groups which were provided with 8 sessions with the last one devoted to the posttest. The students in both classes were given the same tasks (two, three, and five minutes depending on the task complexity) but in one group, the participants carried out the task without any planning beforehand and in the other, they performed pretask planning. After the treatment, the two groups were given a posttest on a narrative task. The results of the T-test indicated that the pretask planning group outperformed the online planning group in terms of speaking accuracy and fluency. This study can have some implications for incorporating task based language teaching in the language classroom.

KEYWORD: pretask planning, online planning, fluency, accuracy

INTRODUCTION

The dissatisfaction with traditional methodologies in language teaching and their failure in bringing about naturalistic language learning in which language is used meaningfully and communicatively resulted in a paradigm shift within language teaching towards the more learner-centered communicative methodologies. One of these developments is known as task-based language teaching, a logical development of communicative language teaching (CLT). Task-

based language teaching draws on the use of different tasks in the classroom context as a tool to make language learning a meaningful experience in which an outcome is desired.

Historically speaking, an interest in tasks as potential building blocks of second language instruction came to the scene when researchers turned to tasks as second language acquisition research tools in mid 1980s (Richards & Rodgers, 2001). Some of the proponents of task-based language teaching (TBLT) (e.g., Willis, 1996) consider this change to be a logical development of CLT since it draws on several principles forming part of the CLT movement from 1980s. In fact, in TBLT, it is suggested that engaging learners in task work provides a better context for the activation of learning processes than form-focused activities. This appears to ultimately provide better opportunities for language learning. As indicated by Samuda and Madden (cited in Crookes & Gass, 1993), task-based learning comes from the belief that language can be learned by doing when attention is focused on meaning. TBLT, therefore, organizes the learning process by tasks to be performed in the target language not by functions, notions, topics, and structures.

One way of accounting for language performance is by examining the complexity, accuracy, and fluency of the language produced. According to Skehan (2009), successful performance in task-based contexts include: complexity, defined as more advanced language, accuracy, in which the performer tries to make as few errors as possible, and fluency, the rate of speech production. Since speaking and writing are seen as complex and multi-faceted phenomenon involving a series of interrelated stages, attention to one aspect of production is likely to be at the expense of the other. Depending on the situation, an L2 learner's attention might be focused on one of the three aspects of performance while jeopardizing the other two. For example, L2 learners who are more concerned with the correctness of what is said might not pay much attention to how something is said or vice versa. Therefore L2 learners, especially those at lower levels of proficiency, find it difficult to attend to meaning and form at the same time. L2 learners' problems in production may be lessened if they are given time to plan before they produce an L2 utterance or composition. When learners are given the opportunity to plan the linguistic and propositional content of an upcoming task, they can make up for the drawbacks in their language production and as a result the quality of the linguistic output is improved. In relation to providing learners with opportunities for planning, a number of studies have investigated the impact of planning on language production over the last past decade (e.g. Ellis, 1987; Mehnert, 1998; Ortega, 1999).

Oral tasks are commonly used in second or foreign language classes, which are at times challenging for language learners. The reason seems to be that unlike writing tasks where learners can review and revise their output, an oral presentation demands online language processing. Therefore, students are often given some time to prepare for their presentation prior to the conduction of the task. Ellis (2005) refers to such a preparation as strategic or pre-task planning. Over the past decade there has been a growing interest in the effect of pre-task planning on the subsequent performance. For example, Ortega (2005) claimed that one of the main benefits of strategic planning was that it enabled the learners "to access the upper limits of their interlanguage systems without time pressure, thus, making a wider linguistic repertoire available for subsequent on-line use" (p. 90). In other words, strategic planning reduces the cognitive pressure of online performance. The main focus of the research has been on various design

features and implementation procedures of the tasks and their effects on different aspects of language use such as the fluency, complexity, and accuracy of task performance. While the previous studies have not provided consistent results, they have recognized the influence of certain variables. Task planning, which is defined as the provision of time before or during performing a task (Mochizuki & Ortega, 2008), is one of the implementation variables producing relatively consistent effects on L2 task performance (Ellis, 2003; Ellis, 2005). Task planning, whether pretask or within-task, has been shown to have predictable effects on certain aspects of language use; however, their influences on these aspects are somewhat different (Foster & Skehan, 1996; Yuan & Ellis, 2003).

With regard to its theoretical rationale, the study of planning is considered within a larger framework, namely information processing. Models of information processing account for how information is stored and retrieved. Information processing models are informed by a number of principles (Ellis, 2005). The first principle of information processing models is a control mechanism that language users need to access when they are performing a new task for which they do not have linguistic knowledge (Baddeley & Hitch, 1974; Baddeley & Logie, 1999). This control mechanism draws on explicit stored knowledge. Therefore, it uses up processing power and thus overloads working memory. In fact, this control mechanism consists of a central executive system and a phonological loop. According to Baddeley and Logie (1999), the central executive system controls the relationship between the working and long-term memory. This system is limited in capacity. Therefore, the extent to which language learners are able to attend to a specific system depends on the extent to which other systems are automatized. Hence, planning, whether pretask or within task, seems to play a role in reducing the burden on short-term memory and thus allows for controlled processing and the linear processing of multiple systems. The phonological loop consists of two components, that is, the phonological store providing a temporary representation of material taken from the input or long-term memory and an articulatory rehearsal mechanism which helps maintain materials in working memory that are subject to vanishing. By using this mechanism, that is, articulatory rehearsal, planning allows learners to attend to one set of material while drawing on another set for modification.

Researchers have distinguished two major types of planning pre-task planning and within-task planning (online planning). These are distinguished based on when the planning takes place either before the task itself or during the performance of the task (Ellis, 2005). Pre-task planning is further divided into rehearsal and strategic planning. According to Ellis (2005):

Rehearsal entails providing learners with an opportunity to perform the task before the ‘main performance’. In other words, it involves task repetition with the first performance of the task viewed as a preparation for a subsequent performance. Strategic planning entails learners preparing to perform the task by considering the content they will need to encode and how to express this content. In pre-task planning, the learners have access to the actual task materials. Within-task planning can be differentiated according to the extent to which the task performance is pressured or unpressured. This can be achieved most easily by manipulating the time made available to the learners for the on-line planning of what to say/write in a task performance. When this is unpressured the participants have the opportunity to conceptualize, formulate and

articulate their messages with some care. Moreover, Yuan and Ellis (2003) define online planning as 'the process by which speakers attend carefully to the formulation stage during speech planning and engage in pre-production and post-production monitoring of their speech acts'. In the case of pre-task planning, learners plan propositional content and isolated chunks of language to encode it. As the name suggests, online planning takes place during performance of a task, whereas pre-task planning examines how planning prior to performance influences production. Task-based language teaching, which requires learners to transact tasks resembling their real life language needs, demands language learners to perform planning at different stages of their learning. Thus, in this study, we aimed at examining the effect of pretask and online planning on accuracy and fluency of oral tasks.

REVIEW OF LITERATURE

A number of studies have investigated the effects of planning on L2 learners' oral performance. Research lends general support to the claim that planning in advance impacts positively on language production, mostly fluency and complexity (Ortega, 1999). Studies by Crookes (1989), Foster and Skehan (1996), Skehan and Foster (1997), Wendel (1997) and Mehnert (1998) report that pre-task planning results in increased fluency. In addition, pre-task planning has a positive effect on complexity, in that more complex language is produced by planners than non-planners (Ellis, 2004). Foster and Skehan (1996) found that detailed planners used significantly more subordination than undetailed planners. Wigglesworth (1997) reports that one-minute of planning time only led to more complex language use in the high proficient learners on the difficult task. Yuan and Ellis (2003) found that pre-task planning had a positive effect on complexity. As thus, it has been found that pre-task planning has a positive effect on fluency and complexity. When it comes to accuracy, however, the effects of strategic planning are less certain.

The body of research has consequently shown that pre-task planning leads to more complex language production (e.g., Ortega, 1999), but the findings for accuracy are somewhat surprising. For example, a study by Foster and Skehan (1996), which investigated the effect of three conditions of individual planning (unplanned, detailed planning, and undetailed planning) on task performance, demonstrated that less detailed planning activity resulted in more accurate language production. Wendel (1997), who also found that pre-planned discourse was not significantly more accurate than unplanned performance, explained that accuracy might depend on online/moment-by-moment processing while learners perform the task and not on the offline/pre-task planning.

As discussed above the findings of research on the positive impact of pre-task planning on complexity have been more conclusive than those on the accuracy. In other words, as mentioned above some studies (e.g., Foster & Skehan, 1996; Wendel, 1997) concluded that planning was not effective on accuracy, nevertheless Wigglesworth (1997), who investigated the effect of planning on the performance of different task types and at different proficiency levels in a language testing context, found that planning led to greater accuracy and complexity only on high-proficiency candidates and generally on the most demanding tasks (e.g., summary of a conversation). However, the results indicated that low proficiency candidates did not benefit from

planning time. Wigglesworth suggested that this may have been due to the fact that the low proficiency learners did not use the planning time effectively or may have focused on the content rather than the language of their performance. However, later investigation by Mochizuki and Ortega (2008) advanced the proposal that guided planning that involves specific grammatical features may be a suitable pedagogical tool to be used with beginning levels in foreign language classrooms since this type of guided planning may lead to a balance between communication and grammar.

Crookes, in line with Wigglesworth (1997) found that planning opportunity resulted in significantly more complex language in terms of longer utterances, higher number of S-nodes per utterance, and more and longer subordinate clauses. Regarding accuracy, however, no support was found for the hypothesized favorable effect of the planning condition. Crookes (1989) concluded that a tension appeared to operate in the L2 production between complexity and accuracy, and that planning opportunity seemed to have a more powerful effect on language complexity than on language accuracy, in that the urge for complexity may undermine or weaken simultaneous efforts in achieving accuracy. This pay-off between complexity and accuracy led Crookes to the conclusion that no differences in accuracy are to be expected when learners are given opportunity to plan.

Kawauchi (2005) used three different proficiency levels to show the effect of the interaction between proficiency and pretask planning on task performance. Sixteen low intermediate, 12 high-intermediate, and 11 advanced L2 Japanese learners participated in this study. The content of pretask planning was also specified through choosing three kinds of planning: writing, rehearsal, and reading. The results of the study showed that while strategic planning improved fluency, complexity, and accuracy, it appears that strategic planning worked to the advantage of high-intermediate L2 learners since they performed at the same level of fluency as the advanced L2 learners. Planning also had a negative effect for advanced L2 learners in terms of repetition as an aspect of fluency. In addition, planning appears to have improved complexity in the high-intermediate learners more than in the advanced intermediate learners. Advanced learners were also at a similar level of accuracy to the high-intermediate learners under both planning and non-planning conditions. The low intermediate learners benefited most from the planned task in terms of accuracy.

In another study on the effects of planning condition, task structure and gender on different aspects of written performance, Jafari (2006) found that there was a significant difference between planned and no-planned groups in terms of performance measures (i.e., strong and positive effects of planning on all aspects of learners' performance were observed). There was also an interaction between task structure and planning condition. That is to say, the effects of planning were greater with the personal (i.e., picture-description tasks) and narrative (i.e., narrating stories from some picture strips) tasks than with the decision-making task. In contrast, no interaction was found among task structure, planning condition and gender. Rahmanian (2004) examined the relationship between pre-task and online planning and fluency, accuracy and complexity. He concluded that pre-task planners outperformed other groups in terms of fluency. However, the difference in accuracy and complexity of different planning groups did not reach

conventional level of significance and the mean difference was not considerable. Regarding the effect of task type, he found that descriptive tasks, being easier than narrative tasks and freeing up more attentional resources, were not only significantly more accurate, but also more complex.

RESEARCH QUESTIONS

This study was designed to answer the following research questions:

1. Is there a significant difference in the accuracy of EFL learners' speaking ability in the pretask and online planning conditions?
2. Is there a significant difference in the fluency of EFL learners' speaking ability in the pretask and online planning conditions?

METHODOLOGY

Participants

The participants of this study were 30 EFL students. They were all Iranian adult females, ranging in age from 14 to 16 who were at the first grade of High School in Torbat-e-Heydariyeh, Khorasan razavi, Iran. The participants were homogenized by a sample Preliminary English Test (PET) at the beginning of the term. As the classes were assigned for the teacher, the sample was selected based on convenient non-random sampling. After homogenizing the participants, they were randomly divided into two experimental groups of 15 students, one served as the pre-task planning group and one as the online planning group.

Preliminary English Test (PET)

At the onset of the study, a sample of Preliminary English Test was used to homogenize 60 students among the 105 first grade students of the mentioned high school. The PET consisted of speaking section and 67 items in the reading, writing, and listening sections. The test had a total score of 75 and the administration of the test took 120 minutes. The mean of the scores was calculated and students who achieved between one standard deviation above and below the mean were chosen as the participants of this study.

Procedure

Every session, a task was given to the participants as part of their regular classroom instruction. The instruction was carried out over 7 sessions and the 8th session was allocated to the posttest. The participants in the pre-task planning group listened to the teachers' description of the task and were told that they would receive some time to plan (two, three, or five minutes depending on the task complexity) during which they could think about what they would say when they carry out the task. The participants in this group worked on the pre-task planning individually. After the planning time, two students were randomly asked to talk about the task.

However, the participants in the online planning group worked on the same task in groups with the same planning time and the same teacher's description of the task but without having time to preplan the task. As the posttest, an oral task the same as one of the task types used during the treatment period was selected by the researchers and was given to the participants in both classes

at the end of the term. The task type was narrative and supported by visual material, but required some degree of organization of material to tell a story effectively. The participants in first class (pretask planning) listened to the teachers' description of the task and had five minutes planning time. The only difference in the posttest of the two groups was that the individual pre-task planning group did the planning in the posttest individually while group pre-task planning group carried out the planning in groups of five. The rationale for different conduction of planning in the posttest was that each group had a different experience during the treatment period and thus, the same context needed to be set for the posttest.

Fluency

Fluency has been defined as the production of language in real time without undue pausing or hesitation (Ellis & Barkhuizen, 2005). It could be defined also as the extent to which the language produced in performing a task manifests pausing, hesitation, or reformulations (Ellis, 2003). Following Foster and Skehan (1996), Skehan and Foster (1999), Elder and Iwashita (2005), fluency was measured by counting the number of repetitions (of the same word or phrase), false starts (utterances abandoned before completion), reformulations (phrases or clauses repeated with some modification to syntax, morphology, or word order) and replacements (substitution of one lexical item for another).

Accuracy

Accuracy is defined as the ability to produce error-free speech (Housen & Kuiken, 2009). Ellis (2005) stated that accuracy can be defined as the ability to avoid errors in performance, possibly reflecting higher levels of control in the language as well as a conservative orientation. In the current study, accuracy was measured by calculating the number of error-free clauses. All errors in syntax, morphology, and lexical choice were counted. High means indicate less number of errors and as a result better performance. The same measure was used in some previous studies (Yuan & Ellis, 2003; Guar -Tavares, 2008).

RESULTS AND DISCUSSION

To test the first research question, independent sample *t-test* was used to measure the statistical differences in means between the groups in the results of the post test. The result is shown in Table 1.

Table 1: Independent sample *t-test* result for accuracy

		Levene's Test for Equality of Variances		T-test for equality of means		
		F	Sig.	T	Df	Sig. (2-tailed)
treatment	Equal variances assumed	2.235	.641	-6.045	28	.002
	Equal variances not assumed			-6.035	28	.002

According to the findings and on the basis of calculation of sample *t-tests*, observed value of 2-tailed statistic for the groups and (.00) was less than the alpha level of .05. So, we concluded that

there was a significant difference between the experimental group and the control group in their performance on the posttest.

To examine the second research question independent sample *t*-test was used to measure the differences in developing students' speaking skill between groups. The result is shown in Table 2.

Table 2: Independent sample result for fluency

		Levene's Test for Equality of Variances		T-test for equality of means		
		F	Sig.	T	Df	Sig. (2-tailed)
treatment	Equal variances assumed	6.256	0.212	-.758	28	.005
	Equal variances not assumed			-.758	28	.006

Table 3 shows the mean score of accuracy group in pre and posttest.

Table 3: Group Statistics for accuracy.

	Mean	N	SD	SEM
Accu pretask	14.56	15	2.35	0.43
online	17.46	15	1.25	0.75

As you can see in the above table, students in this group have improved over their speaking ability in the posttest. The following table will show the result for the fluency group.

Table 4: Group Statistics for fluency

	Mean	N	SD	SEM
Flue pretask	16.26	15	1.35	0.43
online	14.46	15	1.25	0.75

Regarding the first research question posed, examining the effect of pre-task and online planning on accuracy, it was found that the participants in the online planning group outperformed the pre-task planning group in the number of error-free clauses produced. In a way, this finding is consistent with the results that Hulstijn and Hulstijn (1984), Ellis (1987), and Yuan and Ellis (2003) obtained. These three studies suggest that the time learners are given for online planning improves the accuracy of their production. In terms of the second research question the results of the present study indicate that pre-task planning positively affects fluency. In pre-task planning the participants are given time prior to the speaking performance. During this time the participants in most cases try to understand the story illustrated in the pictures, organize the information that needs to be conveyed, establish the setting and describe the characters without feeling any pressure. In line with our findings, a number of studies have confirmed that giving learners the opportunity to plan results in greater fluency (e.g., Foster & Skehan, 1996; Skehan & Foster, 1997; Wigglesworth, 1997; Wendel, 1997; Mehnert, 1998; Ortega, 1999).

CONCLUSION

Many studies have been done on the effect of pre-task planning on students' language performance (e.g., Crookes, 1989; Foster & Skehan, 1996, 1999; Mehnert, 1998; Sangarun, 2005; Wendel, 1997; Wigglesworth, 1997; Yuan & Ellis, 2003). What research evidence has shown so far is that giving learners extended planning time before task performance seems to have beneficial effects for complexity, but the findings have been controversial for accuracy. For example, Yuan and Ellis (2003) found that whereas pre-task planning time promoted higher complexity and lexical variety, it did not have significant effects on accuracy. The purpose of this article was to explore the effects of two types of planning (pretask and online) on oral output. This study, being in line with Ellis and Yuan's (2004) study, suggests that pre-task planning has a positive effect on the fluency and complexity of the Oral output, whereas online planning has an influential impact on the accuracy of the Oral product. This has important implications for Oral pedagogy. Depending on the purpose of Oral tasks teachers assign EFL learners, different aspects of the Oral performance can be emphasized by altering the type of planning conditions.

This study has some limitations. The number of learners participating in this study is small so it limits the generalization of the study. Also, the study has been limited to female students. Moreover, the number of session that students underwent treatment is limited to

ABSTRACT

Universal Grammar-oriented second language acquisition research has primarily been interested in investigating whether second language learners, called L2 learners henceforth, have access to Universal Grammar (UG) principles and parameters in their interlanguage grammars. Recently, the pendulum has swung to the poverty of the stimulus argument. Drawing upon the poverty of the stimulus argument, the present study was intended to examine whether Iranian adult L2 learners of English show knowledge of the principle of structure dependency, and whether their level of L2 proficiency influences their understanding of this principle. To this end, a Grammaticality Judgment Test was administered to 63 Persian learners of English (29 freshmen and 34 senior students) who were classified into two levels of language proficiency (the lower-proficiency level and the higher-proficiency level) based upon their institutional status). The results from an independent-samples t-test revealed that there was a significant difference in the mean scores for the two proficiency levels. Similarly, the results from within-group comparisons indicated that the participants in both groups scored highly on structure dependency violations despite the fact that they do not have syntactic movement for questions in their mother tongue implying that their knowledge for structure dependency must be innate as it comes neither from their L1 nor from the L2 input.

KEYWORDS: UG principles, Structure dependency, Poverty of the stimulus argument, L2 acquisition

INTRODUCTION

Since the early 1980s, UG-oriented SLA studies, inspired by Chomsky's Government and Binding Theory, have proliferated (Ellis, 2008). That is to say, the question of whether SLA is mediated by UG and to what extent has been extensively probed since then.

In the case of L2 acquisition, White (2003a) has emphasized the need to distinguish between two issues: the logical problem of language acquisition, on the one hand, and UG availability (access), on the other hand. These two issues are by no means identical, "although they are often

collapsed” (White, 2003a, p. 22). The former is concerned with whether L2 learners develop unconscious syntactic knowledge or a mental representation that goes beyond the L2 input they encounter (Hawkins, 2001; White, 2003a), and the latter seeks to find out whether or not such knowledge is achieved by means of UG (whether UG is available or accessible to L2 learners) (White, 2003a).

The first decade of UG-based SLA research has principally focused on UG availability to L2 learners drawing upon three sets of hypotheses: no access, partial access (indirect access), or full access (direct access). However, “as hypotheses about UG access developed, interest began to shift from overarching questions like ‘Is UG available?’ or ‘What kind of UG access is there in L2?’ to a closer examination of the nature of the interlanguage grammar, with particular focus on whether interlanguage grammars exhibit properties characteristic of natural language” (White, 2003b, p. 17). As far as the second line of research is concerned, “it is conceivable that there is a logical problem of L2 acquisition” (White, 2003a, p. 22), for there appears to be a mismatch between the input (whether naturalistic input or classroom input) L2 learners are exposed to and the output they represent. Therefore, research which has taken into consideration the issue of the logical problem L2 acquisition or the problem of the poverty of the stimulus has looked for evidence as to whether UG principles constrain interlanguage representations (White, 2003a; Ellis, 2008).

To demonstrate that UG principles constrain interlanguage grammars two conditions must hold:

- i) The phenomenon under investigation must be underdetermined by the L2 input.
- ii) The phenomenon in question must also be underdetermined by the L1 grammar.

“Thus, the strongest case for the operation of principles of UG in interlanguage grammars can be made if learners demonstrate knowledge of subtle and abstract linguistic properties which could neither have been learned from the L2 input alone nor derived from the grammar of the mother tongue” (White, 2003b, p. 22).

A UG principle that since Chomsky has been used as the archetypal example to discuss the innateness hypothesis is the principle of structure dependency (Cook, 2003). Therefore, the present study is an attempt to provide further evidence for the poverty of the stimulus argument through investigating the acquisition of the principle of structure dependency by L2 learners of English from an L1 background without syntactic movement.

Structure dependency

Most SLA researchers focusing on UG availability have narrowed down the scope of their studies to parameter resetting in the L2 and the way it deviates from parameter setting in the learners’ L1s, or the way parameters are related to a particular principle (Cook, 2003). Yet few studies have been dedicated to how principles are acquired in the L2 and how they constrain interlanguage representation.

A specific UG principle is the principle of structure dependency, which since Chomsky (1971) has been utilized to set forth the idea of principles (Cook & Newson, 1996). In essence, the principle of structure dependency provides a test-case for UG-oriented studies of both the L1 and the L2 acquisition (Cook, 2000). In the L1, the existence of the principle of structure dependency provides basic evidence for the innateness of UG, and in the case of L2 acquisition, testing structure dependency is tantamount to demonstrating that L2 learners show knowledge of this principle regardless of whether or not they have syntactic movement in their L1s (Cook, 2003).

The principle of structure dependency assumes that “the knowledge of language relies on the structural relationships in the sentence rather than on the sequence of words” (Cook & Newson, 1996, p. 4). That is to say, the grammatical processes within a language function on the basis of the underlying structures in the sentence rather than the linear order of words within the sentence (Sadeghi, 2007).

Structure dependency is closely related with movement. Movement relates the surface structure to the underlying structure wherein the sentence elements are in positions constrained by the grammar (Cook, 2003). The principle of structure dependency stipulates which element in the structure should be moved “not which word in the sequence or which type of word” (Cook, 2003, p. 203). In other words, “the element to be moved must have a particular structural role in the sentence, not be in a particular place in its linear order” (ibid). For instance, the rules for question formation in English do not rely on the linear order of words rather they are structure-dependent.

According to Cook and Newson (1996), in Chomsky’s writings, the principle of structure dependency has often been introduced through questions like the question in (1) that is related to the statement in (2):

- 1) Is Jack going?
- 2) Jack is going.

In forming yes/no questions in English, it is not the 2nd word that is moved; otherwise, the statement in (3) would become the question in (4):

- 3) On Tuesday, Jack is going.
- 4) * Tuesday on Jack is going?

Rather it is the auxiliary within the structure of the sentence that is moved. However, it is not sufficient to specify the kind of word or phrase (e.g., the auxiliary) that is moved (Cook & Newson, 1996). This could be illustrated by (5), Chomsky’s archetype in the discussion of structure dependency and its related question (6), in which he has combined a question with a relative clause consisting of a copula verb:

- 5) Sam is the cat that is black.
- 6) Is Sam the cat that is black?

It must be noted that only the copula verb in the main clause can be moved not the copula *be* in the subordinate clause; therefore, (7) yields an ungrammatical question in English:

- 7) * Is Sam is the cat that black?

It follows from the discussion above that movement is a matter of moving the right element in the right phrase (Cook & Newson, 1996; Cook, 2003; Sadeghi, 2007), and while structure dependency is closely related to movement, it enters into almost all aspects of language in a way that it affects the interpretation of sentences (see Cook & Newson, 1996, for detailed discussion).

English language shows structure dependency in questions as it forms questions through the syntactic movement of certain elements within the sentence. Persian, on the contrary, forms questions by adding the question particle *aya* to the beginning of the sentence rather than moving elements within the sentence; thus, it does not need structure dependency for the formation of questions. So in case Persian learners of English show knowledge of the principle of structure dependency, it surely does not come from their L1.

LITERATURE REVIEW

“Actual L2 research into structure dependency has been sparse” (Cook, 2003, p. 206). In a study, Naoi (1989), as cited in Cook (2003), found that Japanese learners of English showed knowledge of the principle of structure dependency despite the fact that the principle of structure dependency is not required for question formation in Japanese.

In the same vein, Cook (1994), as cited in Cook and Newson (1996), administered a Multi-parameter Universal Grammar Test (MUG test) to a group of native speakers and L2 learners of English from different language backgrounds. The participants were asked for their grammaticality judgment on sentences involving different principles and parameters. The results from the grammaticality judgment tasks revealed that the native speakers rejected sentences with structure dependency violations. As for the L2 learners, all groups with different L1s showed an understanding of the principle of structure dependency, although they demonstrated some variations in their judgment depending on whether they have syntactic movement in their L1s.

In Iran, Sadeghi (2007), in an empirical study, investigated the acquisition of structure dependency among Persian EFL learners by giving a group of 30 adolescents a recognition test, along with a UG adoption test, after training them on relative clauses for four sessions. The results from both tests revealed that the participants showed knowledge of structure dependency, and the few errors they made did not violate structure-dependency indicating that Persian learners of English have the same access to UG as in their L1.

OBJECTIVES OF THE STUDY

The present study generally seeks to establish that Persian EFL learners’ interlanguage grammars are UG constrained and more specifically to provide further evidence for the presence of an innate knowledge of a UG principle called the principle of structure dependency in the minds of Persian learners of English, who do not have question movement in their L1.

RESEARCH QUESTIONS

The following research questions have been raised for the present study:

- 1) Do Iranian EFL learners from a language background without syntactic movement show knowledge of the principle of structure dependency?
- 2) Do lower-proficiency and higher-proficiency learners show any significant differences in their knowledge of structure dependency? (i.e., does the level of language proficiency have any impact on the knowledge of the principle of structure dependency?).

METHODOLOGY

Participants

The participants for this study were 29 Iranian freshmen (26 females, 3 males) and 34 senior students (26 females, 8 males) studying English as a Foreign Language at an institute of higher education in Shiraz, Iran. The participants, aging from 18 to 40, were selected through convenience sampling.

It must be pointed that in the selection of the participants for the present study, the researchers have chosen to suffice to Persian EFL learners and to dispense with native speaker participants in order to avoid the foul of Bely-Vroman's *comparative fallacy* (cited in White, 2003a; Ellis, 2008), who argued that interlanguage grammars are worth studying in their own right, and what really matters in the study of UG principles and parameters is "whether the interlanguage grammar shows evidence of certain distinctions: does learners' performance on grammatical sentences differ significantly from their performance on ungrammatical sentences?" (White, 2003a, p. 26).

Instrument

For the present study, a Grammaticality Judgment Test (GJT) was administered as GJTs, despite their methodological problems, have been proven to be the conventional method in the UG-related L2 studies, and the results they yield are comparable to those of other research (Cook, 2003).

The grammaticality judgment test included a total of 12 test items (8 grammatical and 4 ungrammatical sentences) adopted from an earlier study conducted by Cook (2000). The sentences, which were modeled on Chomsky's classic examples (Cook, 2003), came in 3 types: relative clauses with copula, questions with relative clauses, and structure dependency violations wherein the wrong copula had been moved. There were 4 cases of each sentence type (see the Appendix).

Data Collection Procedure

Prior to the administration of the GJT, the participants were assigned to two groups of language proficiency based on their institutional status, in a way that the freshmen were classified as the lower-proficiency group, and the senior students fell into the higher-proficiency group. Then, the test was carried out in a paper-and-pencil format. The test required the participants to read and

judge each sentence making one of the three choices: *Ok*, *Not Ok*, and *Not Sure*. It must be noted that the researchers adopted an unspeeded format for this study to allow the participants to have sufficient time to judge the grammaticality of each test item using their explicit knowledge of the acquired grammatical rules (Ellis & Barkhuizen, 2005).

Scoring Procedure

As for the scoring procedure, a binary system (0 and 1) of marking the GJT was adopted in a way that *Not Sure* and blank responses as well as the overtly wrong responses were counted as incorrect while *Ok* and *Not Ok* responses in case correctly assigned to the right sentence type were treated as correct. As a result, the correct answer was *Ok* for relative clauses and questions with relative clauses, and *Not Ok* for the structure-dependency violations.

RESULTS AND DISCUSSION

The researchers in this study have been interested in the interlanguage grammars of individual learners in addition to their group behavior. Hence, as group results may conceal individual variations (White, 2003a), the results of the grammaticality judgment test are going to be presented first for the two groups under scrutiny and then for the individual participants. In addition, two one-way repeated measures ANOVAs and an independent samples *t*-test were conducted to provide opportunities for both within-group and between-group comparisons, the results of which have been tabulated in Tables 1, 2, 3, 4, and 7.

Table 1: Repeated measures results for freshmen (multivariate tests^b)

Effect	Value	F	Hypothesis df	Error df	Sig.	Partial Eta Squared
Type						
Wilks' Lambda	.551	11.010 ^a	2.000	27.000	.000	.449

a. Exact statistics

b. Design: Intercept

Within Subjects Design: Type

Table 2: Pairwise comparisons for freshmen

(I) Type	(J) Type	Mean Difference (I-J)	Std. Error	Sig. ^a	95% Confidence Interval for Difference ^a	
					Lower Bound	Upper Bound
A	B	.655	.282	.083	-.063	1.373
	C	-1.069*	.325	.008	-1.897	-.241
B	A	-.655	.282	.083	-1.373	.063
	C	-1.724*	.361	.000	-2.643	-.805
C	A	1.069*	.325	.008	.241	1.897
	B	1.724*	.361	.000	.805	2.643

Based on estimated marginal means

a. Adjustment for multiple comparisons: Bonferroni.

*. The mean difference is significant at the .05level.

Table 1 suggests statistically significant differences in the mean scores obtained by the freshmen on the three sentence types ($p < .0005$). The partial Eta squared value indicates a moderate effect size (Pallant, 2007, citing from Cohen, 1988). Table 2 demonstrates significant differences between Type A vs. Type C sentences on the one hand, and Type B vs. Type C, on the other hand. However, the differences between Type A and Type B sentences are not statistically significant.

Table 3: Repeated measures results for senior students (multivariate tests^b)

Effect	Value	F	Hypothesis df	Error df	Sig.	Partial Eta Squared
Type						
Wilks' Lambda	.541	13.594 ^a	2.000	32.000	.000	.459

a. Exact statistics

b. Design: Intercept

Within Subject Design: Type

Table 4: Pairwise comparisons for senior students

(I) Type	(J) Type	Mean Difference (I-J)	Std. Error	Sig. ^a	95% Confidence Interval for Difference ^a	
					Lower Bound	Upper Bound
A	B	-.176	.209	1.000	-.703	.350
	C	-1.206*	.253	.000	-1.843	-.569
B	A	.176	.209	1.000	-.350	.703
	C	-1.029*	.217	.000	-1.577	-.481
C	A	1.206*	.253	.000	.569	1.843
	B	1.029*	.217	.000	.481	1.577

Based on estimated marginal means

a. Adjustment for multiple comparisons: Bonferroni.

*. The mean difference is significant at the .05 level.

In the same vein, Table 3 indicates a significant difference in the senior students' scores on the three sentence types and a moderate size effect. Table 4 reveals non-significant differences between Type A and Type B sentences, yet significant differences between Type A and Type C or Type B and Type C.

Table 5: Correct responses for each sentence type (group results)

N	Lower-proficiency Level 29	Higher-proficiency Level 34
Maximum Possible Score	116	136
a. Relative Clauses	57 (49.13%)	72 (52.94%)
b. Questions	39 (33.62%)	77 (56.61%)
c. Structure-dependency Violations	86 (52.94%)	110 (80.88%)

As it is illustrated in Table 5, both the freshmen and the senior students scored higher on the sentences with structure dependency violations in comparison with the two other sentence types. Also, the freshmen found questions containing relative clauses more difficult than Type A sentences. This is while the senior participants scored almost similarly on Type A and Type B sentences. The results are in line with Cook's (2003) findings that all groups of participants from seven different language backgrounds "strongly reject violations of structure dependency and accept the other two sentence types less strongly" (p. 210). For the sake of a better visualization of the obtained data, see Figure 1 below:

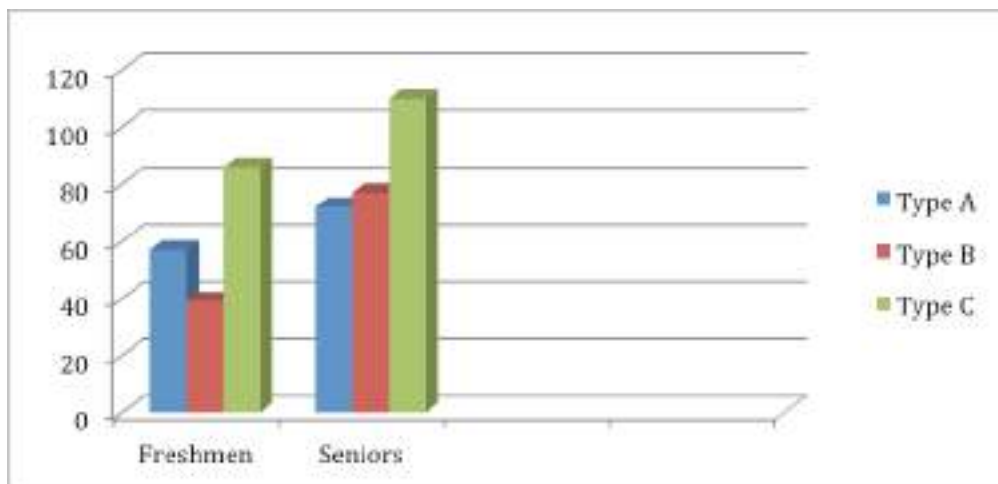

Figure 1: Correct responses for each sentence type (group results)

In order to report the results individually, the scores must be reported in terms of the number of participants scoring at each level from zero to four. Table 6 demonstrates the scores individually for both freshmen and senior students:

Table 6: Scores for L2 individuals for each sentence type

Sentence Types	Scores (Out of 4)				
	0	1	2	3	4
a. Relative Clauses	7	15	20	11	10
b. Questions	13	14	13	15	8
c. Structure-dependency Violations	3	5	6	11	37

Figure 2: Individual scores for each sentence type

As it is illustrated in Figure 2, Type A sentences show a gradual rise from 0 to 2, then fall at 2. Type B questions, however, move rather steadily from 0 to 3 and fall at 3. Finally, Type C sentences show a gradual rise from 0 to 3 and suddenly peak at 4, showing that 37 participants got 4 out of 4 on Type C sentences. This is while Type A sentences became second, and Type B sentences had the fewest number of individuals obtaining 4 out of 4.

Thus, referring back to the research questions posed earlier in this study (1. Do Iranian EFL learners show knowledge of the principle of structure dependency? 2. Does the level of language proficiency have any impact on the knowledge of the principle of structure dependency?), it must be pointed out that Persian EFL learners show a good understanding of the principle of structure dependency as they could detect violations of this principle by 74.13% for the freshmen and 80.88% for the senior students. This has been established by earlier studies on syntax. Sadighi (2008), for instance, quoting from Shapiro (1997), maintains that no one has yet found instances wherein the L2 learners breach principles like structure dependency. Therefore, the first research question could be answered positively. As for the second research question, it is worth mentioning that an independent-samples *t*-test was conducted in order to compare the scores on the GJT obtained by freshmen and senior students. The results revealed that there was a statistically significant difference in the mean scores of the two groups in question at .05 level (see Table 7), indicating that the level of language proficiency had strong impact on the participants' performance on the grammaticality judgment test leading us to conclude that language proficiency does influence this innate endowment. Interestingly, this is in sharp opposition to Jalilifar and Shooshtari's (2009) findings, who concluded that language proficiency has no part in parameter resetting, the case of null subject value.

Table 7: Descriptive statistics and independent samples *t*-test results

		N	Mean	SD	t	df	Sig (2-tailed)
GJT Scores	Freshmen	29	6.17	2.96	-2.187	61	.033
	Senior Students	34	7.65	2.38			

CONCLUSION

This study aimed at investigating whether the principle of structure dependency is known by the Persian L2 learners of English and demonstrating the innateness of this knowledge among L2 learners who do not have syntactic movement for polar interrogatives in their L1.

As it was mentioned before, using the poverty of the stimulus argument to highlight the innateness of a particular aspect of syntax in the L2 learners' interlanguage grammars requires fulfilling the following stages:

- A) providing evidence for the very fact that the L2 learner knows a particular aspect of syntax
- B) demonstrating that this aspect of syntax could not have been acquired from the L2 input
- C) showing that it could neither have been acquired nor transferred from the L1
- D) concluding that it must be innate coming from within the L2 learners' minds.

Hence, if L2 learners show knowledge that does not come from their first language or the L2 input it must then come from their own minds. As for this very study, the participants in both groups showed knowledge of the principle of structure dependency, for they could spot sentences with structure dependency violations, despite the fact that they do not have syntactic movement for question formation in their native language. In addition, the senior students outperformed their lower-proficiency counterparts on the grammaticality judgment test indicating that the level of language proficiency might increase L2 learners' knowledge of UG principles.

Obviously, grammaticality judgment tests do not always yield clear-cut results as L2 learners' intuition tend to be unstable and at times unreliable (Mitchell & Myles, 2004). However, "rejecting the method itself as unsound would undermine most second language acquisition research in the UG paradigm" (Cook, 2000, p. 5).

In the end, it must be pointed out that some scholars including Reali and Christiansen (2005) have challenged the idea that the poverty of the stimulus argument could be applied to auxiliary fronting in interrogatives, which has long been used as a cornerstone in the argument for the innateness hypothesis and have proposed that the basic assumptions of the poverty of the stimulus argument need to be reappraised. Therefore, this study can be considered as a "what if paper", to use Cook's (2003) terminology, in a sense that it is concerned with what consequences will be gained if the poverty of the stimulus argument holds true. Of course, further studies are required to reveal the hidden depths of the poverty of the stimulus argument.

Limitations of the study

The results from the present study might have been limited on several grounds by the methodological problems inherent in the grammaticality judgment test. In essence, the major limitations of this study have arisen from the limitations of the GJT itself. Firstly, the problem of interpreting performance data as evidence of competence might have imposed certain limitations on the findings of the study. Secondly, as Ellis (2008) noted, it is not obvious whether the participants' rejection of particular sentences has been due to the grammatical properties of the sentences or the difficulty they have faced in an attempt to parse the sentences. Finally,

variability in the participants' judgment might have thrown doubt on the reliability of the grammaticality judgment test which has rarely been examined even by eminent UG researchers and has remained unchecked in the present study. The reliability of the GJT for this study could have been examined through a test-retest procedure if the researchers were not pressed for time.

On the whole, had the researchers administered the multiple task technique for the data collection procedure, the findings from the study could have been interpreted with more conviction.

ABSTRACT

This research effort examines the relationship between Iranian English as a foreign language (EFL) teachers' cultural intelligence (CQ) and their self-esteem (SE) and the effect of gender on these two variables (SE & CQ). To this end, 118 Iranian English teachers from different parts of Iran (Based on Krejcie and Morgan's (1970) table), both male (N=53) and female (N=65), participated in this project. Cultural Intelligence Scale developed by Cultural Intelligence Centre in 2005 and self-esteem scale (Rosenberg, 1965) were used in this study. The results indicated a direct significant correlation between Iranian EFL teachers' CQ and their self-esteem ($r=.342$, $sig=.000$). Also it was found that gender does not have any significant effect on EFL teachers' self-esteem (two-tailed $=.189 > .05$) nor does it have any significant effect on their cultural intelligence (two-tailed $= .0933 > .05$). The relationship between cultural intelligence and self-esteem can directly or indirectly lead us to conclude that teachers with higher level of CQ are expected to enjoy higher level of self-esteem, whereas gender has no effect on those variables. These results can have implications for those who are engaged in teacher training programs.

KEYWORDS: Iranian EFL teachers, Self-Esteem, Cultural Intelligence

INTRODUCTION

Recent research shows that teachers have great potential to affect students' educational outcomes (Anderson, 2004). The teacher is an educational leader and decision maker, who directly affects and indirectly influences the students and responsibility of the teachers to guide and inspire students, to enrich his disciples and inculcate values. Research on teacher effectiveness has yielded a wealth of understanding about effective teacher characteristics (Hughes, Abbott-Campbell & Williamson, 2001) on education and learning. These effective teachers have some features that make them different from others.

It is clear that a person who teaches a foreign language and aims at mastering it requires enough information about the culture of the people whose language s/he is trying to teach.

Now, more than ever, cultural intelligence becomes a critical part of preparing youth for their 21st century careers. As the world of work becomes more automated and robotic, cultural intelligence becomes a crucial way to stand apart. As the 21st century presents a deepened global experience through internet resources and more accessible modes of mobility, a greater number of individuals have the opportunity to interact with persons from different cultural backgrounds (Templer et al., 2006). Many ESL students are most comfortable by learning through rote memorization or by mastering grammatical rules that doesn't necessarily mean they won't benefit from other methodologies that you might view as more effective. But teaching with cultural intelligence means you begin with where your students are most comfortable and then find ways to strategically prepare them for alternative strategies. All teachers are aware of the role of English as international language, but only few of the teachers make efforts to teach intercultural activities in language classrooms (Livermore, 2014).

Cultural intelligence (CQ) can be defined as an Individual's capability to function and manage effectively in culturally diverse settings" (Ang & Dyne, 2008, p.3). It also gives insights in how one performs effectively in culturally diverse settings. As a result, teachers need to be culturally intelligent in order to classroom management and teach intercultural activities in language classrooms. A great deal of what's required to work effectively in a cross-cultural context requires creative solutions

Self-esteem can strongly influence thoughts, moods and behaviors. Psychologists notice that deep feelings of worthlessness (loss of self-esteem) are the root of many psychiatric disorders (Shamlou, 1991). Self esteem simply means as an individual's overall evaluation of one's self worth or self image (A. Maslow 1954 and Rogers 1980). Teacher self-esteem may be defined as the evaluation of each characteristic contained in teachers' self-concepts.

According to Maslow's need hierarchy theory of motivation, the esteem needs have two versions, a lower one and a higher one. The lower one is the need for the respect of others, the need for status, fame, glory, recognition, attention, reputation, appreciation, dignity, even dominance. The higher form involves the need for self-respect, including such feelings as confidence, competence, achievement, mastery, independence, and freedom. So having high self-esteem means a person wants to find the courage to do things that previously did not.

LITERATURE REVIEW

Thomas and Inkson (2004) argued that Cultural intelligence (CQ) is a multidimensional competence that is composed of knowledge of other cultures, mindfulness, and a set and of behavioral skills. Cultural intelligence is consists of four dimensions (1) meta-cognition, (2) cognition, (3) motivation, and (4) behavior. Meta-cognition is defined as higher-order mental processes which are concerned with the acquisition, monitoring, and control of cultural knowledge (Dyne, Ang, & Koh, 2009). Cognitive intelligence refers to an individual's knowledge about different cultures, including their norms, traditions, and practices (Ang & Dyne, 2008; Ng et al., 2009). Motivational aspect of CQ involves ones interest in learning and functioning in cross-cultural situations (Ang et al. 2006). Behavioral intelligence includes the

capability to behave appropriately in a cross-cultural setting using different relevant verbal and nonverbal behaviors and practices such as culturally appropriate gestures, facial expressions, and tones (Hall, 1959; Ng 2009, Gudykunst, Ting-Toomey, & Chua, 1988).

McNab and Worthley (2011) examined the relationship between CQ and individual characteristics. Their findings indicated that there is a positive relationship between general self-efficacy and CQ. McNab and Worthly (2011) concluded that general self-efficacy is a salient feature in CQ education and development efforts.

Petrovic (2011) investigated teachers' level of cultural intelligence and the factors that may be regarded as the predictors of CQ. In order to this 107 elementary teachers were participated in this study. These teachers were taught in culturally heterogeneous classes. Contacts with other cultures, communication in a foreign language, reading of foreign literature, watching TV travel shows, the importance of knowing other cultures, experiencing multicultural classes as a challenge, enjoyment of intercultural communication, and openness to cultural learning were selected as the factors for CQ predictors. The result Indicated a high level of CQ in these teachers (mean= 67.79, SD= 9.21).most of teachers showed a high (66.4%) or very high (22.4%) level of CQ.

On other hand, most research has confirmed a positive association between self-esteem and achievement. People who think of themselves favorably should be able to learn and work more efficiently. Someone with a high self-esteem would expect to do well (Kohn,1994). Self-esteem, a relatively old concept in psychology, was coined by William James in 1890. James (1890) in his 'Principles of Psychology' defined self-esteem as being the sum of our successes divided by our pretensions i.e. what we think we ought to achieve. Rosenberg (1965) made an important contribution to defining self-esteem by introducing the concept of 'worthiness'. Worthiness is whether a person judges him or herself as good or bad and is therefore an evaluative attitude towards oneself.

Heyde (1977) conducted a study about the relationship between self-esteem and oral production in ESL performers at the University of Michigan. He reached the conclusion that there is a high correlation between global self esteem and teacher ratings of oral production. Langroudi and Amiri (2014) examined the relationship of academic Self-esteem, academic self-efficacy and academic self-concept to academic achievement among Iranian EFL University Students. The findings of this study revealed that first, there was a significant positive relationship between academic self-efficacy and academic achievement; second, there was a significant positive relationship between academic self-concept and academic achievement; third, there was no relationship between academic self-esteem and academic achievement.

RESEARCH QUESTIONS

The questions that drive our research are:

Is there any relationship between Iranian EFL teachers' self-esteem and their cultural intelligence?

Does gender have any significant effect on self –esteem?

Does gender have any significant effect on cultural intelligence?

METHODOLOGY

Participants

This study was carried out in some cities in Khorasan Razavi, Iran. The study participants consisted of 118 Iranian English language teachers who worked at public school or English language institutes. Both male (N = 53) and female (N = 65) participants were included in the study. The age of the participants ranged from 20 to over 50. They were either BA or MA. Their teaching experience ranged from 1 to over 20 years. The participants were selected randomly.

Instrumentations

Two questionnaires of cultural intelligence scale and the self-esteem scale were used in this study.

Cultural intelligence scale developed by Cultural Intelligence Centre in 2005. It consisted of 4 components. The first one, Metacognitive CQ, included 4 items, the second one which is cognitive CQ was comprised of 6 items, the third one which is motivational CQ consisted of 5 items, and the last component, behavioral CQ, was composed of 5 items. The reliability of each component was reported as follows: metacognitive CQ = 0.72, cognitive CQ = 0.86, motivational CQ = 0.76 and behavioral CQ = 0.83 (Ang et al., 2007). The items of this questionnaire are on the basis of a five point Likert scale, i.e., strongly disagree (1) to strongly agree (5).

Self-esteem scale (Rosenberg, 1965) which comprises 10 statements, 5 positively worded and 5 negatively worded. This 10 item scale assesses an individual's feelings of self-worth when the individual compares himself or herself to other people. The scale is an attempt to achieve a one dimensional measure of global self-esteem. It was designed to represent a continuum of self-worth, with statements that are endorsed by individuals with low self-esteem to statements that are endorsed only by persons with high self-esteem. The scale can also be modified to measure state self-esteem by asking the respondents to reflect on their current feelings. All items are answered using a 4-point Likert scale format ranging from strongly agree to strongly disagree.

The reliability this scale was reported as follows:

A correlation of at least .80 is suggested for at least one type of reliability as evidence; however, standards range from .5 to .9 depending on the intended use and context for the instrument. Internal Consistency: Ranges from .77 to .88. Test-Retest: Ranges from .82 to .85. Aside from the materials which were mentioned earlier, the researcher used no other instrument during the administration of the tests. But for data analysis which is the strong base of this research, some software including SPSS 17.0, Excel 2010, and SAS 9.0 were quite useful or better to say essential to carry out the statistics properly.

Procedure

Participants of this study were 118 Iranian English language teachers of different language institutes and public school from Khorasan Razavi, Iran. They were from both genders and from different ages with different years of experiences. Surveys are usually conducted by using questionnaires. In this study, for collecting the data, different English language teachers answered the questions of questionnaires in the form of emails (using Google drive) or on the paper. Collecting data started on December 2014 and lasted for about 3 weeks. Finally, in order to answer the research question, the responses obtained from the questionnaires were analyzed using SPSS software. Then, the correlation between these two variables was calculated

RESULT AND DISCUSSION

After collecting data obtained from the instruments, data analysis was conducted by using SPSS (16.0).

Participants' Demographic Information

Table 1 shows data related to participants' demographic information.

Table 1: Participants' demographic information

		Frequency	Percent	Valid Percent	Cumulative Percent
Gender	male	53	44.9	44.9	44.9
	female	65	55.1	55.1	100.0
	Total	118	100.0	100.0	
Age	20-29	51	43.2	43.2	43.2
	30-39	50	42.4	42.4	85.6
	40-50	7	5.9	5.9	91.5
	over 50	10	8.5	8.5	100.0
	Total	118	100.0	100.0	
Degree	Teacher Certificate	11	9.3	9.3	9.3
	BA	54	45.8	45.8	55.1
	MA	53	44.9	44.9	100.0
	Total	118	100.0	100.0	
Experience	1-5	59	50.0	50.0	50.0
	6-10	31	26.3	26.3	76.3
	11-15	13	11.0	11.0	87.3
	16-20	5	4.2	4.2	91.5
	Over 20	10	8.5	8.5	100.0
	Total	118	100.0	100.0	

As Table 1 shows a total number of 118 EFL teachers (53 males; 65 females) took part in the study. Participants' age ranged from 20 to over 50 years. The majority of them were 20 to 39 (N=101). Regarding participants' degree, the majority of them (N=107) were either BA (N=54) or MA (N=53). Concerning teaching experience, the majority of them (N=90) were partly novice whose experience was less than 10 years. Only 10 participants had experienced teaching for over 20 years. The rest had the teaching experience between 11 to 20 years.

Correlation between EFL Teachers' Cultural Intelligence & Self-Esteem

In order to see if there is a statistically significant correlation between Iranian EFL teachers' cultural intelligence and their self-esteem Pearson product moment correlation coefficient test was conducted (Table 2).

Table 2: Results of Correlation between EFL Teachers' Cultural Intelligence & Self-Esteem

		Cultural intelligence	Self-esteem
Cultural intelligence	Pearson Correlation	1	.342**
	Sig. (2-tailed)		.000
	N	118	118
Self-esteem	Pearson Correlation	.342**	1
	Sig. (2-tailed)	.000	
	N	118	118

**. Correlation is significant at the 0.01 level (2-tailed).

As Table 2 displays there is a statistically significant correlation ($r=.342$, $\text{sig}=.000$) between EFL teachers' cultural intelligences and their self-esteem. Based on the present finding it can be concluded that a high level of cultural intelligence results in a high level of self-esteem. This may be due to the fact that cultural intelligence may make teachers' aware of similarities and differences between their own culture and the culture of other groups. So this understanding may increase teachers' level of self-esteem. According to Jersild (1955) and toneslon (1981) teachers' self esteem is closely related to students' self esteem. Teacher with high self esteem is able to evaluate themselves more accurate (vukovich & pheiffer, 1980). Teachers who have higher level of self-esteem are more productive (Schultz & Hausafuse, 1982) and also these factors have a positive impact on their healthy and stress.

Role of Gender in EFL Teachers' Cultural Intelligence

In order to compare scores obtained by males in cultural intelligence with females' independent samples t-test was conducted. Results are summarized in Table 3.

Table 3: Results of independent samples t-test for males' & females' cultural intelligence

Gender	N	M	SD	Df	t	Sig(two-tailed)
Male	53	74.96	9.41	116	.085	.933
Female	65	74.80	11.02			

As Table 3 shows there is not any statistically significant [$\text{df}=116$, $t=.085$, $\text{sig}(\text{two-tailed}) = .0933 > .05$] difference between males ($N=53$, $M=74.96$, $SD=9.41$) and females ($N=65$, $M=74.80$, $SD=11.02$) with respect to their cultural intelligence. Therefore, gender is not viewed as a factor affecting EFL teachers' cultural intelligence.

Role of Gender in EFL Teachers' Self-esteem

Once again, independent samples t-test was conducted to investigate the effect of participants' gender on their self-esteem (Table 4).

Table 4: Results of independent samples t-test for males' & females' self-esteem

Gender	N	M	SD	Df	t	Sig(two-tailed)
Male	53	26.09	2.55	116	1.32	.189
Female	65	26.64	1.97			

As Table 4 shows there is not any significant difference [$df=116$, $t=1.32$, sig (two-tailed) $=.189 > .05$] between males ($N=53$, $M=26.09$, $SD=2.55$) and females ($N=65$, $M=26.64$, $SD=1.97$) with respect to their self-esteem. Therefore, based on the present finding it can be concluded that gender does not have any significant effect on EFL teachers' self-esteem.

CONCLUSION

This research project explored the relationship between Iranian EFL teachers' CQ and their self-esteem. Cultural intelligence, in a general sense, is the capability of having successful interactions with people from different cultures. In order to get such conclusion, an EFL teacher should teach intercultural activities in language classrooms and, a teacher with high self-esteem want to find the courage to do things that previously did not.

The findings of this study showed that there is a significant relationship between Iranian EFL teachers' CQ and their self-esteem ($r=.342$, sig $=.000$). Based on this relationship, teachers with high level of cultural intelligence enjoy intercultural communication, openness to cultural learning and contact with people from other cultures, and able to adaptability with different cultures. Thus, because of the significant effect of teachers' self-esteem and cultural intelligence on effective teaching, it seems that teachers with higher self-esteem and cultural intelligence should be employed. The second aim of this paper was to find any relationship between males and female with respect to their cultural intelligence and their self esteem. The results of the analyses revealed gender is not viewed as an affecting factor on EFL teachers' CQ and SE, Therefore, we can conclude that gender does not play a significant role in training and employment of teachers with high self-esteem and cultural intelligence.

This study has some limitations. The result is based on the correlation between cultural awareness and self-esteem and there has been no treatment such as teaching cultural intelligence to the teachers. Also the number of teachers who participated in this study is small. In order to be able to generalize the finding we should search more teachers. Also, the study is limited to EFL teachers in a province in Iran and is not generalizable to other places.

Cultural Intelligence Scale (CQS)

The 20-item, Four Factor Cultural Intelligence Scale (CQS)

Instructions: Select the response that best describes your capabilities.

Select the answer that BEST describes you AS YOU REALLY ARE (1=strongly disagree; 5=strongly agree).

CQ Questionnaire Items

Factor

CQ-Strategy:

MC1	I am conscious of the cultural knowledge I use when interacting with people with different cultural backgrounds.	Strongly disagree	Disagree	Neutral	Agree	Strongly agree
MC2	I adjust my cultural knowledge as I interact with people from a culture that is unfamiliar to me.	Strongly disagree	Disagree	Neutral	Agree	Strongly agree
MC3	I am conscious of the cultural knowledge I apply to cross-cultural interactions.	Strongly disagree	Disagree	Neutral	Agree	Strongly agree
MC4	I check the accuracy of my cultural knowledge as I interact with people from different cultures.	Strongly disagree	Disagree	Neutral	Agree	Strongly agree

CQ-Knowledge:

COG1	I know the legal and economic systems of other cultures.	Strongly disagree	Disagree	Neutral	Agree	Strongly agree
COG2	I know the rules (e.g., vocabulary, grammar) of other languages.	Strongly disagree	Disagree	Neutral	Agree	Strongly agree
COG3	I know the cultural values and religious beliefs of other cultures.	Strongly disagree	Disagree	Neutral	Agree	Strongly agree
COG4	I know the marriage systems of other cultures.	Strongly disagree	Disagree	Neutral	Agree	Strongly agree
COG5	I know the arts and crafts of other cultures.	Strongly disagree	Disagree	Neutral	Agree	Strongly agree
COG6	I know the rules for expressing non-verbal behaviors in other cultures.	Strongly disagree	Disagree	Neutral	Agree	Strongly agree

CQ-Motivation:

MOT1	I enjoy interacting with people from different cultures.	Strongly disagree	Disagree	Neutral	Agree	Strongly agree
MOT2	I am confident that I can socialize with locals in a culture that is unfamiliar to me.	Strongly disagree	Disagree	Neutral	Agree	Strongly agree
MOT3	I am sure I can deal with the stresses of adjusting to a culture that is new to me.	Strongly disagree	Disagree	Neutral	Agree	Strongly agree

	disagree				agree
MOT4	I enjoy living in cultures that are unfamiliar to me.				
	Strongly disagree	Disagree	Neutral	Agree	Strongly agree
MOT5	I am confident that I can get accustomed to the shopping conditions in a different culture.				
	Strongly disagree	Disagree	Neutral	Agree	Strongly agree

CQ-Behavior:

BEH1	I change my verbal behavior (e.g., accent, tone) when a cross-cultural interaction requires it.				
	Strongly disagree	Disagree	Neutral	Agree	Strongly agree
BEH2	I use pause and silence differently to suit different cross-cultural situations.				
	Strongly disagree	Disagree	Neutral	Agree	Strongly agree
BEH3	I vary the rate of my speaking when a cross-cultural situation requires it.				
	Strongly disagree	Disagree	Neutral	Agree	Strongly agree
BEH4	I change my non-verbal behavior when a cross-cultural interaction requires it.				
	Strongly disagree	Disagree	Neutral	Agree	Strongly agree
BEH5	I alter my facial expressions when a cross-cultural interaction requires it.				
	Strongly disagree	Disagree	Neutral	Agree	Strongly agree

Appendix B:

Rosenberg's Self-Esteem Scale

1. I feel that I am a person of worth, at least on an equal plane with others.				
Strongly Agree	Agree	Disagree	Strongly Disagree	
2. I feel that I have a number of good qualities..				
Strongly Agree	Agree	Disagree	Strongly Disagree	
3. All in all, I am inclined to feel that I am a failure.				
Strongly Agree	Agree	Disagree	Strongly Disagree	
4. I am able to do things as well as most other people.				
Strongly Agree	Agree	Disagree	Strongly Disagree	
5. I feel I do not have much to be proud of.				
Strongly Agree	Agree	Disagree	Strongly Disagree	
6. I take a positive attitude toward myself.				
Strongly Agree	Agree	Disagree	Strongly Disagree	
7. On the whole, I am satisfied with myself.				
Strongly Agree	Agree	Disagree	Strongly Disagree	
8. I wish I could have more respect for myself.				
Strongly Agree	Agree	Disagree	Strongly Disagree	

9. I certainly feel useless at times.

Strongly Agree	Agree	Disagree	Strongly Disagree

THE PROCESS OF THE IMPLICIT KNOWLEDGE OF LISTENING SKILL DEPENDING ON THE NOTION OF AUTOMATION IN DEVELOPING INTONATION IN EFL CONTEXT

ABSTRACT

The present study investigated the role of implicit knowledge of listening comprehension on promoting intermediate language learners' intonation. To achieve this purpose, a language proficiency test was administered to 58 female language learners studying English in Pars language institute. Ultimately, 40 intermediate language learners were divided into an Experimental and a control group. The participants in the Experimental group were instructed to practice listening comprehension strategies explicitly and use intonation types and rules implicitly whereas the participants in the control group received some placebo for ten sessions. Statistical analyses were conducted through Paired and Independent Sample t-tests following the post-test administration. The analyses of the post-tests showed that explicit instruction of listening comprehension for language learners proved to be effective in developing the general listening and specifically the intonation which is the purpose of this study. Independent Sample t-test analyses revealed that there was a significant difference between control and experimental groups. The statistical test proved that there was a considerable difference between the post-test of the experimental group and the control group. This study suggests that intonation should be introduced implicitly and then empowered through a lot of practices in the EFL context.

KEYWORDS: Implicit knowledge, Listening skill, Automation, Intonation

INTRODUCTION

The process of listening comprehension thought to be a passive activity but now described as a dynamic interpretive process consisting of a series of complicated interactive processing stages that a listener goes through. As mentioned there exist many interpretations of these processes and different authors make their own distinctions in gradation and the rank order in which some processes occur.

Although intonation has been noticed by linguists in general to be an indispensable component of language and communication in the field of listening, there are few listening specialists who do more than mention its importance and then proceed to ignore it in proportion to other areas of focus (e.g., Mendelsohn, 2001). This may be because of several factors, one being that, perhaps because of the nature of intonation and its obvious connection with sound, it seems to be more often associated with pronunciation and speech production than listening and is usually seen to fall outside the domain of listening comprehension. It is mainly from authors in the field of pronunciation and speech production; however, that advice is to be found recommending a focus on prosodic elements in the sound stream to facilitate listening.

Developing intonation which is considered as a part of productive skill has been discussed for a long time and has been paid attention to through different aspects in language research. This piece of research has tried to observe intonation and its developmental stages differently. Considering the necessity of listening skill in language learning generally, decision is made to look more deeply on the possible effects which listening skill could have on intonation as a part of the receptive process implicitly. Listening has been looked upon and utilized in teaching explicitly and also the results have been implemented in teaching procedures explicitly to measure the listening effects on different skills and sub-skills of the language. In this namely piece of research a considerable job has been done to show the implicit effects of listening through different materials on the intonation to see whether intonation could progress this way or not in EFL context.

In modern language teaching and learning, listening has gained its active and communicative value while, as comes in the literature, it had been neglected for years or less emphasis was laid on this skill. Due to the technology development, these days the teachers and researchers benefit from various listening tools to display tasks in the classroom to hone learners' listening comprehension ability. Yet, students in each level may have problems listening to audio programs.

Listening has remained a difficult skill to teach students since setting listening task is considered time-consuming and boring if the strategy itself is problematic to enhance the students' level of proficiency. Learning a language, students may encounter some affective factors such as motivation, anxiety, self-esteem, inhibition and so forth that let them keep the pace forward or give up and quit the scene unsuccessfully. It seems the primary step overcoming the barriers would be to understand the language spoken in a context. If the recipient do not listen attentively, understanding may be undergone some difficulties interacting in sides.

REVIEW OF LITERATURE

Listening Comprehension

The act of listening plays a vital part in our daily life. Celce-Murcia (1996) states that listening is the most frequently used skill in our daily life compared to the other three skills. 45% corresponds to listening, 30% to speaking, 16% to reading and 9% to writing (Hedge, 2005). Morley (1991) maintains that “we can expect to listen twice as much as we speak, four times

more than we read, and five times more than we write in our daily life” (p. 82). However, Nunan (1988) comments that listening is the “Cinderella Skill” which is overlooked by “its elder sister” speaking in second language learning. Brown (2006) asserts that the number of published books on listening comprehension and its classroom practices in many countries demonstrate that listening is regarded as the least important skill in language teaching. Until 1950s and 1960s, language learning and teaching were limited to grammar, reading and literacy. Later on, primarily the Direct Method and then the Audio Lingual Method highlighted the oral skills which are listening and speaking. From 1970s on, instructional programs expanded their focus on pragmatic skills to include listening and other language skills (Osada, 2004). Researches into listening over the past three decades have emerged that listeners need to integrate phonetic, phonological, prosodic, lexical, syntactic, semantic and pragmatic information to comprehend spoken messages (Celce-Murcia, 1996).

Comparing past approaches, in which listening materials were frequently based on a series of post-listening comprehension questions, in modern language teaching teachers can help students listen more effectively if they spend more time teaching them about the purpose for listening (strategy training). As such, it helps students organize and reflect on their learning (Brown, 2006). Furthermore, since listening is so challenging, teachers need to think carefully about making students' activities successful and the content interesting. They can help students explore a way to lessen the difficulty of listening by training them in different types of listening: systematic presentation of listening for main ideas, listening for details, listening and making inferences (Brown, 2006). When students miss one word or phrase while listening, they might be distracted, stop the task, and lose the link, which seems to be the reason for showing fear and anxiety (Underwood, 1990). Hence, students' motivation (e.g. listening to songs & stories) can play a significant role in learning listening and soothing the problem.

Language learners may encounter some difficulties in understanding the incoming speech. Hedge (2005) divides these difficulties into two types as internal and external problems. Internal problems can be listed as the lack of motivation, high level of anxiety, lack of knowledge of the topic under discussion and unknown vocabulary of what is being heard. On the other hand, external problems are related to listeners' failure in understanding as a result of the speakers' characteristics and environmental noises.

Buck (2001) defines strategies as “the thought of ways in which a learner approaches and manages a task” (p. 104). He classifies strategies as cognitive and metacognitive. For him, “Cognitive Strategies are the mental activities related to the comprehending and storing input in working memory or long-term memory for later retrieval” (Richards, 2008, p. 11). This group consists of three processes as Comprehension Process, Storing and Memory Processes, Using and Retrieval Processes. On the other hand, “Metacognitive Strategies are conscious or unconscious mental activities that perform an executive function in the management of cognitive strategies” (Richards, 2008, p. 11) these are assessing the situation, monitoring, self-evaluating and self-testing.

In English, meaning is not only expressed through lexical choices, but also through intonation, whether that is within through groups, sentence-final intonation, or by paragraphs. Intonation can convey a wealth of information, from syntactic and informational material to attitudinal and emotional viewpoints of the speaker. Intonation can be used to manage conversation topics, negotiate turn-taking, and show awareness of information, all of which may not be apparent by other linguistic means (Swain, 1995). As a logical consequence of rich and multidimensional meaning being conveyed through one linguistic feature, many cross-cultural misunderstandings can be attributed to misinterpretation of intonation features in English (Ellis, 1994).

In English there are many types of intonation patterns, depending on the type of sentence. Under the broad category of 'questions' there are different types of questions, each having its own intonation pattern. They are also several different types of intonation patterns for questions alone: yes-no questions, echo questions, calls for confirmation, alternative questions, rhetorical questions, disbelieving questions, and questions to oneself. Despite the fact that, most questions are accompanied by rising intonation (and L2 learners of English are thus taught this), wh-questions are accompanied by falling intonation, which has been the subject of study in the past.

Research and observation are constantly extending the scope of language awareness with the result that the list of skills to be aware of in learning and teaching are constantly being expanded (Swain, 1995). On the whole, most of the studies carried out in the second language classroom (e.g., Buck, 2001); have noted a general positive impact of awareness giving on learners' subsequent post-exposure performances.

In a study conducted by Zhang, Li, Lo and Meng (2010), perception of English intonation by L1 Chinese speakers was measured by dividing sentential intonation into three categories: declarative statements with intonation signifying continuation or termination, wh-questions and yes-no questions. As stated, Wh-questions carry rising intonation, while yes/no questions and declarative statements are expressed through falling intonation. Participants were to listen to a recording of an L1 English speaker saying statements including these intonation types, then mark whether each sentence contained rising or falling intonation. Students scored high on yes/no questions and declarative sentences, but their scores were equivalent to random guessing on wh-questions, showing they were unaware that Wh-questions are accompanied by falling intonation. Results were the same for continuation statements; participants were unaware of the rising intonation that accompanies these types of sentences. This study suggests that intonation in general is a feature of English that requires a student's attention, whether through explicit instruction or implicit learning. More specifically, this study also suggests that different types of intonation patterns are acquired before others. Not only does a L2 English speaker have to perceive and learn the pitch contrasts between different types of statements, but he or she also has to learn the meaning tied to these contrasts.

Levis (1999) argues that current pedagogical materials on intonation lack communicative purpose and present an inadequate view of the functions of intonation. He further claims that current pedagogical materials and texts have overlooked more recent research. One way current materials rely on “outdated and inaccurate descriptions of intonational forms and function” (p. 37) is in describing English intonation patterns. Current research supports a need for three patterns to describe pitch: rising, falling, and a half-fall or unfinished pattern. All three are needed to fully teach comprehensive intonation of conversation, especially for students to learn accurate response cues. Levis (2002) presents four principles for improving intonational teaching methodology. He encourages teachers to teach intonation in explicit context; this is the most effective way to exemplify dialogic intonation assignment. Secondly, teachers should make learnable and generalizable statements about meaning. Levis offers guidelines for teaching emotional-attitudinal effects on intonation meaning. Thirdly, teaching intonation should be in the context of a communicative purpose, not just the pattern. Otherwise, intonation is treated as subordinate to its communicative value. Lastly, it is important to teach intonation with realistic language. If the primary goal of classroom exercises is communicative proficiency, the unnatural language that has been included in textbooks in the past will no longer be applicable.

Overall, the group that received implicit instruction during the four-week treatment phase scored higher on the perception post-test than those who received no treatment, although the improvement was not found to be statistically significant. A small number of learners with self-reported musical familiarity in the Experimental group did not significantly improve in their perception of intonation patterns compared to their peers. Overall, the difference in scores between the pre- and post-tests is higher for the Experimental group (7.29% vs. 4.55% increase) meaning the group that received implicit instruction during the four-week treatment phase made more gains than those who received no treatment. There were visible patterns or significant gains in one isolated sentence type, Wh-, tag, or declarative. Despite overall improvement, learners with self-reported musical familiarity in the Experimental group significantly got improved in their perception of intonation patterns. These findings suggest that implicit attention to sentence-final intonation supports acquisition for students with reported musical familiarity, though a further area of research could be separating L2 English speakers' perception of intonation pitch and the meaning attached to it for possibly different results. It is possible that musical familiarity is beneficial to the second language learner only after prolonged experience to a form, or sometimes after the new form is introduced.

RESEARCH QUESTIONS OF THE STUDY

The main research questions in this study are as follows:

Does implicit knowledge or automation affect learners' intonation in the experimental and control groups through listening activities in an EFL context?

METHODOLOGY

Participants

The samples of the study were gathered of 58 students in an institute located in Ahvaz. The participants are at the same level, taught by the same instructor. Afterwards, they were randomly assigned into two groups based on the results of a standard test administered (FCE): one control group and the other one experimental group, each containing 20 students, respectively. With regard to the timing of the study, all students participating in the research project received course book treatment. Both groups shared similar social and cultural characteristics and were selected as homogeneous in the intermediate institute level. For selecting homogenous participants, a standard listening comprehension test which is known as 'First Certificate in English' (FCE), was administered to a group of EFL learners who were learning English in a language school called Pars Institute. The participants were 58 intermediate female Iranian EFL learners whose average age range was between 18 and 29. According to the standard structure of the test, each item possesses 1 mark and in order to select homogenous participants, those who had between 10-19 correct answers out of 30 questions were selected for the purpose of the study. After selecting the homogenous participants, they were assigned into two groups namely experimental and control groups according to (+1 -1 SD) one standard deviation above and one below the mean. There were 20 female learners in the experimental group and 20 female learners in the control group.

Instrumentation

Initially, before the final administration, the homogeneity test was piloted with a similar group of 10 students. After piloting the test was found to be appropriate for the participants. A reliability index for this test was calculated through KR-21 ($r=.81$). Then 58 participants took the FCE Homogeneity Test. The test contained thirty multiple-choice and fills in the blanks items and one mark has been specified for each item. Based on the obtained scores two groups were specified according to (-1 +1 SD) above and below the mean. Each group included 20 participants.

A teacher made test was designed and piloted with a similar group of 10 students, then item analysis (item facility and item decimation) was employed through item analysis. Some items were modified or discarded and replaced with new ones. The reliability index for the pre-test was ($r=.76$). After piloting the instructor concluded that only 25 questions could be used in the pre-test level. So a pre-test including 25 items was administered to determine the effectiveness of experimental and control groups regarding implicit listening comprehension to enhance intonation automatically.

For the post-test the instructor administered a test with 25 questions similar to the pre-test to estimate the amount of enhancement caused through the treatment course. It was piloted with a similar group of 10 students. After piloting, the test was found to be appropriate for the participants. The reliability index for the post test was ($r=.78$). It is important to note that both pre and post-tests are teacher-made developed by the instructor.

Another instrument was the course book that was used during the treatment level. 'Listen Here' is a British accent-based book which includes twenty-eight units plus a pronunciation bank at the end. It was written by Clare West (1999).

Procedure

During the study, the Experimental and Control groups went through different procedures. While the Control group did not receive any treatment, the Experimental group received the treatment. Both classes met two times a week at different times of the day, covering the same content and material for all the groups with the Experimental group receiving the treatment and the Control group not receiving any implicit intonation teaching. To enhance the reliability and validity of the study, the same material was used by the same teacher (the researcher). The tasks used for the classroom were selected from the book 'Listen Here' (West, 1999). This writer's book is well known in the field of listening and speaking. This book is most commonly used in Iran for listening classes for intermediate learners and the listening tasks used are authentic and compatible with EFL contexts. The course of treatment lasted 5 weeks. Every week, students in the Experimental group were taught on each listening skill during two sessions. In each week, the teacher tried to implicitly involve the students with the intonation aspects as written or spoken varieties of intonation.

The common practice in such English classes is that firstly the participants were asked to answer the listening tests using the audio CD at home with a lot of repetitions, then checked their answers through their answer key, provided in the book and corrected the wrong answers if any. To analyze the learners' improvement they marked and discussed the wrong answers with the teacher in the class. In this part of the task the teacher presented the learners with some listening comprehension skills and techniques for answering questions related to the listening tasks and also gave them some tips for the following lessons which are supposed to be answered the next session. These techniques included those strategies which deal with different question types and the best ways to answer them. In addition they were familiarized with the 'time hunting' technique for better listening comprehension in which the listener tried to use the short periods of time given during the task to check the previous answered questions and also prepared for the following questions. Then the teacher played the audio again and made the participants look at the audio scripts presented at the end of the book and started performing the intonation practicing tasks implicitly. The skills which are taught to familiarize the learners with the intonation types and kind implicitly were as follows: how to stress individual words and also complete sentences, how to recognize which part of the sentence possesses the highest emphasis, when and where in speech the speaker can use a tonic accent, in which kinds of questions we can use rising or falling intonation and what changes in meaning we can notice if we alter the intonation of tag questions, etc.

Students in the Experimental group were taught some different listening skills explicitly. On the whole, the classes were held for 10 sessions, which emphasize explicit teaching of the different learning strategies of the listening and implicit teaching of intonation. On the other hand the Control group received the same teaching as was mentioned for the Experimental group but with no implicit intonation teaching. When the implicit intonation teaching sessions and exercise-

giving sessions were over for the Experimental and Control groups respectively, a post-test was administered to all the groups to test their listening comprehension enhancement and most importantly as the goal of the present study to test their intonation enhancement. The scores in both Experimental and Control groups were calculated and separated for the data analysis using SPSS package (version 18).

Data Analysis

The data were obtained on FCE then analyzed by using an Independent Samples t-test to insure the homogeneity of Experimental and Control groups regarding listening comprehension before starting the experiment. Furthermore another Independent Samples t-test was also used to see if there was any significant difference between Experimental and Control groups' participants' performance on the listening pre-test before starting the treatment. Next, a Paired Samples t-test was used to see any difference between pre-test and post-test of each group. Finally, an Independent Samples t-test was used to examine the difference between Experimental and Control groups' post-tests.

RESULTS AND DISCUSSION

This section deals with the results obtained throughout the research and analytically scrutinizes the groups' performance in the study.

Tables 1 and 2 indicate the descriptive statistics and Independent Samples t-test for the homogeneity test (First Certificate in English).

Table 1: Descriptive Statistics of Homogeneity Test

	Groups	N	Mean	Std. Deviation	Std. Error Mean
FCE	Experimental	20	15.0000	2.361	98.52815
	Control	20	15.0500	2.625	28.58703

Table 1 indicates that the mean score for Experimental group in First Certificate in English (FCE) homogeneity test was 15.00 and for the Control group was 15.05 and the standard deviations were 2.36 and 2.62 respectively.

Table 2: Independent Samples test for the Homogeneity Test

		t-test for Equality of Means						95% Confidence Interval of the Difference
		T	df	Sig.	Mean	Std. Error		
		Upper		(2 tailed)	Difference	Difference		Lower
Pre-test	Equal variances assumed	.44	38	-.06	-.05	0.78965	-1.64	1.54
	Equal variances not assumed							

This statistical test was used to make sure that there was no difference between two groups before the experiment. Since the sig. (2-tailed) was .06. This confirms that the difference between two groups was not significant. Thus the two groups were homogeneous before the treatment period.

Table 3: Descriptive Statistics of Experimental and Control Groups (Pre-test)

		Groups	N	Mean	Std. Deviation	Std. Error Mean
Pre-test	Experimental		20	31.4000	7.94322	1.77616
	Control		20	32.6500	7.92249	1.77152

As it can be seen in Table 3 the experimental group obtained the mean score of 31.40 and standard deviation of 7.94 and the control group obtained the mean score of 32.65 and standard deviation of 7.92. To see if the mean score of both experimental and control groups are statistically significant an Independent Sample t-test is used.

Table 4: Independent Samples t-test of Mean Scores (Pre-test)

		t-test for Equality of Means						95% Confidence Interval of the Difference
		T	df	Sig.	Mean	Std. Error		
				(2 tailed)	Difference	Difference	Lower	Upper
Pre-test	Equal variances assumed	-.49	38	.621	-1.25000	2.5085	6.32	3.82
	Equal variances not assumed							

Calculation of observed P-value between Experimental and Control groups ($\text{sig}=0.62$) and comparing it with the critical value of $P=0.05$ shows that observed differences is not meaningful and the participants of both experimental and control groups were homogeneous and at the same level of listening knowledge before starting the treatment.

Table 5: Descriptive Statistics of Experimental Group (pre-vs. post-tests)

Experimental	Mean	N	Std. Deviation	Std. Error Mean
Pre-test	31.4000	20	7.94322	1.77616
Post-test	66.0000	20	15.88776	3.55261

As it is evident in Table 5 the pre-test mean score of the experimental group was 31.40 while that of post-test was computed as 66.00. A short look at the table indicates that a considerable difference between two sets of scores could be observed. To see that if this difference was statistically significant, a Paired Samples t-test was run.

Table 6: Paired Samples Test of Experimental Group (pre-vs. post-tests)

Experimental	Paired Differences					T	df	Sig. (2-tailed)
	Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
				Lower	Upper			
Pre-test – Post-test	-34.60	16.91	3.78	-42.51	-26.68	-9.14	19	.000

As it is shown in Table 6 the t-observed value was computed as 9.14 by the degree of freedom of 19. Since the sig. (2-tailed) was less than 0.05 it indicates that there was statistically significant difference between the performances of participants in pre-test and post-test.

Table 7: Descriptive Statistics of Control and Experimental Groups (Post-test)

	Groups	N	Mean	Std. Deviation	Std. Error Mean
Post-test	Experimental	20	66.0000	15.88776	3.55261
	Control	20	46.0500	13.03629	2.91500

As can be seen in the descriptive statistic of Table 7 the mean score of the Experimental group was computed as 66.00 while that of Control group was calculated as 46.05 and nearly corresponding standard deviation between two groups could be observed. To see that the difference between Control and Experimental groups was significant an Independent Samples t-test was used.

Table 8: Independent Samples T-test of Control & Experimental Groups (Post-test)

		t-test for Equality of Means					95% Confidence Interval of the Difference	
		T	df	Sig. (2 tailed)	Mean Difference	Std. Error Difference	Lower	Upper
Pre-test	Equal variances assumed	4.34	38	.000	19.950	4.595461	0.64	9.25
	Equal variances not assumed							

According to Table 8 the t-observed value was 4.34 by the degree of freedom of 38. Moreover, since the sig. (2-tailed) value was less than 0.05. This statistical test proves that a considerable difference between the post-tests of Experimental group and Control group in a favor of Experimental group can be seen.

Discussion

Results of the study indicate that there was statistically significant difference between the performances of participants in pre-test and post-test for the Experimental group. In this case the null hypothesis for question number one is rejected because there is a significant difference between the pre-test and post-test of the Experimental group. Based on the activities which the teacher performed during the treatment period, a significant improvement can be seen in the post-test of the Experimental group which received these treatments. The teacher trained the participants both in the class and out of the class as homework and this had a considerable effect on their listening comprehension and also using intonation in their speaking.

The learners in the Experimental group answered the given questions after listening to the audio CD of the book and this was just as a warm up for the further class activities. Through this kind of homework the teacher used the time of the class for implicit training. The transcriptions were comprehensive enough to teach the basic rules of word stress and sentence intonation implicitly because they included nearly all kinds of word forms such as content or function words and also were rich in various statements and questions to show and emphasize the overall intonation both rising and falling. The improvement of the learners in Experimental group was noticeable after each week and for the teacher to make sure of this improvement, he was asking them to produce some sentences and questions according to what had been said weekly to see if they are practicing and doing their homework correctly.

The findings of this study are in line with the study of (Arjmandi, Ghanimi & Rahimy, 2014) which investigated the effects of audio story practice (task) on EFL learners' listening comprehension. In the Control group the regular method was used to teach English language and in Experimental group audio story task was applied as a supplementary material. A pre-test

on listening comprehension was run to determine the initial level of participants' listening comprehension ability. Then, both groups received a semester treatment sessions (6 weeks). The classes met three sessions each week, each session for 90 minutes. The Experimental group received 30 minutes audio story task treatment at the end of a couple of sessions each week (8 sessions a semester). A post-test measure was run to see whether there is any development in each group' performance after a semester instruction period. The findings of the study showed that there was statistically significant difference between the experimental and the control group. That is, the experimental group outperformed the control group in development of the study.

The results of the study say that there was a significant development in Experimental group's listening comprehension ability using audio story task after the treatment sessions. This development can be defined because of the audio story task as a complementary material to classroom activities. Designing stories to the educational space are considered helpful. However, audio story is strange a bit at the initial step. That is, affecting factors can build obstacle and barriers to improving language learning and teaching procedure, especially listening skill. Yet benefiting from the native speakers' performance (stress, intonation, pitch, and rhythm) is something important in improving intonation. Therefore, the teacher actually tried to somehow consider participants feelings and prepared them for the task. On the other hand, the control group using the regular English class also developed at the end of the project. The development in control group is undeniable because the learners are expected to improve listening comprehension along with the other skills after they receive one semester instruction. However, comparing two groups, the development of the experimental group is statistically more significant than the control group. Therefore, teaching listening can be integrated with audio story task as an effective input to improve learners' listening comprehension ability.

Overall, the group that received implicit instruction during the four-week treatment phase scored higher on the perception post-test than those who received no treatment. Overall, the difference in scores between the pre-test and post-tests is higher for the experimental group, meaning the group that received implicit instruction during the four-week treatment phase made more gains than those who received no treatment. Learners with self-reported musical familiarity in the experimental group did significantly improve in their perception of intonation patterns. These findings suggest that implicit attention to sentence-final intonation may support acquisition for students with reported musical familiarity. It is more likely that the students with musical familiarity could perceive the intonation contrasts more than those without musical experience and therefore answered the questions correctly. Within the group of students with self-reported musical familiarity, there was much variation in the amount and type of musical training. The time studying music ranged from three months to 10 years. Some students were self-taught, others had formal training, and the age at which that training took place varied from student to student. But according to the test-type administered, musicality was a factor that aided students in making intonation gains.

CONCLUSION

Language studies in the domain of language learning strategies, especially listening comprehension in developing, intonation types and skills, are well advised to take the implications presented in this study into thoughtful considerations. This study could be a striking inception of extensive investigations to be launched into discovering the influence of listening comprehension on intonation in EFL context. The listening comprehension skill and the use of proper strategies in promoting listening comprehension should be investigated by teachers as researchers before launching them for better understanding of the task.

Many language teachers in EFL contexts treat the listening comprehension skill in a traditional way. They are considerably careless in teaching this skill, overlooking the insight that they can give language learners by using listening strategies in general and intonation application strategies in particular. Teacher trainers should first introduce the importance of proper listening strategies to language teachers. Then, they must receive some instruction on how and when to utilize these strategies for enhancing better understanding. Subsequent to getting acquainted with these types of listening strategies, they should be highly recommended to employ and teach them at suitable levels of language learning.

In language classrooms, it is suggested that language teachers familiarize their elementary and pre-intermediate language learners with listening comprehension tasks. Since this study manifested that explicit instruction on listening strategies of understanding and answering properly to listening comprehension questions was useful for intermediate learners of English, it is recommended that language teachers explicitly instruct their intermediate language learners in the use of these strategies, and also leave them to use them on their own.

The application of explicit strategies for listening comprehension skill may result in successful learning among female intermediate learners. Language learners who are successful in their listening comprehension skill might draw on this strategy more frequently than do those who are poor in their listening comprehension skill. Learners should try to change their views toward listening and their understanding in that they do not have to expect themselves to understand every piece of the given listening. The modern tactics for listening practitioners suggest a whole understanding of the given listening skill, but they also suggest a detailed attention in case of answering detailed questions. For the listening textbooks to be more effective it is helpful to pay attention more to the pre-listening activities. There should be a part to warm up and negotiate the tasks which are given in each lesson. Material designers should try to apply this part to their listening books to increase the effectiveness of their books. The present study has been carried out at the intermediate level. Succeeding studies had better evaluate the effect of listening comprehension on intonation development at the beginning and advanced levels.

ABSTRACT

Recent studies have suggested that the Computer-Assisted Language Learning (CALL), Moodle programs affect language learning and teaching but there are not any researches on podcasts and reconstruct of them. The present study aimed to investigate the effect of reconstruction podcasts on pre-intermediate English as foreign language (EFL) learners' speaking proficiency. It attempted to examine students' speaking skill among Iranian Islamic Azad University of Ahwaz at BA course level. Sixty participants were non-randomly divided into two groups (the treatment group and the control group) from Richards' (2008) proficiency placement test and the Cambridge oral unlimited placement interview test (2010). Before the period of treatment, the oral sample test was given to eight students who were not in participants' members, but they were at the same level to follow piloting the pre and post-tests. Then, the participants were interviewed a pre-test based on the reconstruction podcast. The present study examined the effect of the podcasts after the reconstruction during treatment on experimental groups. Finally, a post-test was administered to two groups and data were collected. Results showed that the reconstruction podcasts instruction affected the experimental group more than the control group significantly ($p < 0.05$). The present study suggests that the use of the reconstruction podcasts in speaking proficiency could be a beneficial activity which improves both fluency and accuracy of the EFL learners' speaking skill.

KEYWORDS: Reconstruction, Podcast, Speaking proficiency (fluency & accuracy)

INTRODUCTION

By growth of technology and increase of significant of English learning in business, scientific and so on, make learners learn English through CALL, Moodle, and Internet. The life of people, nowadays, is affected by their powerful personal computers and net connection (Mishan, 2005). According to Gulek and Demirtas (2005), they prefer to rely on writing e-mails, chatting on yahoo, sending online cards, reading online News, at all using Computers and Internet for their connections. While, according to the Office of Information Technology of the University of Minnesota in the United States (2006), these days are a shift from e-learning to mobile learning, as podcasting is a time-shifting technology. The scope of English teachers and learners (as second or foreign language) is to speak and write English the same as native speakers. According

to Celce-Murcia (2001), some people believe that speaking is the central aim in language learning and shows interlocutors' abilities of that language and makes accomplished skills in real communication. Richards and Renandya (2002) propose that learning to speak a foreign language needs the knowledge of how native speakers use the language in the context of structural exchange and the knowing its grammatical and semantic rules. They believe that speaking the target language fluently and appropriately is difficult for EFL learners because oral communication proficiency needs the ability to interact in social context. Appropriate interaction involves both verbal communication and paralinguistic elements of speech include pitch, stress and intonation. They argue like the other linguists and philologists such as McCarthy (1991) that the above issues affect paralinguistic elements, non-linguistic elements such as gestures and posture/body language, facial expressions to convey appropriate message during oral communication. They would be occurring by placing the EFL learners in native position among extra listening contents.

According to Son (2008), podcasts have so realistic and authentic contents. Fang (2008) argued that listening and speaking are complementary and listening to the sound before talking is so beneficial for speaking (Celce-Murcia, 2001). For improving fluency and accuracy of speaking, the learner needs the ability to negotiate in social context for appropriate interacting verbal communication and paralinguistic elements (Richards & Renandya, 2002). Iranian EFL learners have also many difficulties in speaking accuracy and fluency (Dolati & Seliman, 2011). The teachers could help learners by giving them opportunity to be in this kind of position. The podcast programs are online learning programs which are so realistic. The EFL learners would practice in real native situations by listening to these podcasts. The purpose of present study based on improving speaking proficiency (fluency and accuracy) through reconstructing of the extra podcast programs.

REVIEW OF LITERATURE

According to Warschauer (1996), CALL has gradually improved over past 30 years; this improvement occurs in three phases, behavioral CALL, communicative CALL, and integrative CALL. Behavioral CALL which has been started from 1950s until improved in 1960s- 1970s, was based on the ten-dominant behaviorist theories of learning. Programs of this phase entailed repetitive language drills and can be referred to as drill and practice. The computer utilizes as a tool or vehicle for delivering instructional materials to the student.

In the late 1970s and 1980s, behavioral CALL was undermined by two important factors. First, behavioral approaches to language learning had been rejected both at theoretical and pedagogical level. Secondly, the introduction of the microcomputer allowed a whole new range of possibilities. The second phase was followed by the communicative approach for teaching which became proponent in the 1970s and 80s. Proponents of this approach felt that the drill and practice programs of the previous decade did not allow enough authentic communication to be of much value. The third phase integrative (multimedia technology and the Internet) of CALL was developed on the integration of skills like listening with reading. Hypermedia makes multimedia powerful and it makes authentic learning environment by listing up through seeing, skills are

easily integrate, students by themselves control their own learning, and facilitates a principle focus on the content, without sacrificing a secondary focus on language form or learning strategies which are important advantages of hypermedia.

The other step of integrative is the Internet. The most use of Internet increase writing and reading skills through online chat speaking and listening. This phase puts all theoretical language teaching principles into practice that is integrating meaningful and authentic communication into all aspects of the language learning curriculum. In addition the combination of internal and external glossaries help learners to significantly recall a greater number of ideas when reading the text than when they only accesses to an external dictionary while reading an online text. Podcast online programs that accessible these days are more authentic and realistic with different topics for huge inference input (Son, 2008). By using different strategies of listening for instance, the reconstructing of the podcasts might improve accuracy and fluency of speakers. In addition, Podcasts are more effective than Moodle system in vocabulary, reading and listening development (Son, 2008).

Harmer (2001) believes that for speaking fluently, interlocutors should correctly pronounce phonemics, use appropriate stress and intonation in the different range of genre and situations, range of conversational and conversational repair strategies. According to Fang (2008), listening and speaking are complementary. Listening comprehension is prior to production in speaking a language. In everyday life, listening is the most frequently used language while Morley (1991) argued, we listen twice as much as we speak, four times as much as we read, and five times as much as we write. According to Richards (1983), a learner can control relatively narrow range of vocabulary at his or her own utterance during expression of an idea in speaking, but when listening to the response he or she no longer deals with the choice of vocabulary (cited in Richards, 2006). Richards (2006) argues that teachers should increase classroom activities in which students need to negotiate meaning, use communication strategies to avoid potential breakdowns in communication. Therefore, an individual must possess a much broader competency in listening comprehension than speaking (Fang, 2008).

Podcast programs are online learning English programs with realistic dialogues and lectures that would be placed learners on real situation. Constantine (2007) believes that for finding new materials in teaching listening, podcasts are so advantage instead of repetition and bad habits of listening materials repeatedly. Podcasts provide new voices and relevant contents. She argued that a teacher must also be committed to teaching good listening techniques such as listening for details. At the end of the day students must be able to do something with what they have heard. As students respond positively to listening tasks, they will be motivated to learn more. The goal of every teacher should be to help students gain confidence in hearing and understanding what is spoken in their new language.

The teacher could bring the appropriate context at EFL learners' home, work and school. The teacher may select best topics of podcasts that correspond with the learners' interest and purpose to lack of native situation for EFL learners could be another reason to use reconstruction podcasts. According to Son (2008), podcasts programs or CALL programs are so beneficial. Nida

(1953) believes that "Learning to speak a language is very largely a task of learning to hear it" (p. 53). Nord (1981) argues that production should occur after reception because reception enables production. According to Derwing (2010), intelligibility (actual understanding) has more significant than comprehensibility (how easy or difficult an individual's pronunciation is to understand) and accent. The teachers may encourage learners to download much of them for more listening inputs (Constantine, 2007).

Son (2008) argues that podcasts are so realistic and authentic and the teacher has opportunity to access many materials and pass them on the learners. Celce-Marcia, Brinton, and Goodwin (1996) argue that listening before talking would be helpful for talking fluently and accurately. Braun (2007) proposes that podcasts were so beneficial for school and librarian EFL learners because of daily listening of appropriate and interested on them by learners. Rezapour, Gorjian and Pazhakh (2012) propose that podcast programs affect vocabulary achievement during English learning as a second language.

There are not several empirical researches conducted on using the reconstruction in language teaching and learning through CALL or listening podcasts, but there are several empirical research on using CALL, Moodle, podcasts program for improving vocabulary, speaking skill, reading comprehension, grammar and so on. In an experiment research, Lomicka (1998) investigated how computer soft ware influenced the level of EFL reading comprehension for students enrolled in a second semester French course. Three conditions were used when students were reading a text on the computer screen: full glossing, limited glossing, or no glossing. The results showed that the students who had access to full glossing improved better than those who had access to either limited glossing or no glossing. Sakar and Ercetin (2004), who went even further and investigated 44 adult intermediate English as foreign language (EFL) learners' preferences for hypermedia annotations, also suggested similar results. The results suggested that students preferred visual annotations to textual and audio annotations. Video and graphic annotations were accessed when students wanted to retrieve background information about the topic and graphic annotations were used to illustrate the meanings of words.

The other similar research by Rezapour, Gorjian, and Pazhakh (2012) were also explored the effect of the podcast and Moodle on improvement vocabulary in language instruction. Ninety EFL learners were selected out of 120 learners from Islamic Azad University of Abadan in pre-intermediate level. The results of that study confirmed that using systematic instruction of Podcast and Moodle approaches could improve vocabulary through acquisition of English language by pre- intermediate learners.

RESEARCH QUESTIONS

The main questions to be investigated in this study are:

RQ1. Do the reconstruction podcasts affect Iranian pre-intermediate EFL learners' accuracy in speaking skill?

RQ2. Do the reconstruction podcasts affect Iranian pre-intermediate EFL learners' fluency in speaking skill?

METHODOLOGY

Participants

The present study was constructed at Islamic Azad University of Ahvaz, Iran. The Interchange Placement Test (Richards, Lesley, Hansen, Sandy & Zukowski, 2008) was used to homogenize the learners. 60 out of 90 Iranian EFL students took the homogeneity test. This test included 50 items and the participants should gain 25 to be placed at the pre-intermediate level. Those pre-intermediate participants whose scores were between one standard deviation above and one standard deviation below the mean were selected as the participants of the study who were revealed homogenous participants. The Cambridge English Unlimited Placement Test (Oral Test, 2010) was interviewed students to estimate their speaking proficiency level. This test was a face to face interview on the reconstruction of the podcasts. These participants were divided by non-random sampling into two groups of control group (n=30) and an experimental group (n=30). The experimental group was taught by the reconstruction podcasts instruction and appropriate listening strategies. The control group was taught through the conventional method of English language teaching "New interchange 1" developed by Richards.

Instrumentation

The Richards (2008) homogeneity test was given to participants to find out their homogeneity level. It was comprised 50 items of multiple-choice on language accuracy. The reliability coefficient of the test in this research was calculated by Kuder-Richardson formula (KR-21). The reliability coefficient for the proficiency test was ($r=0.823$).

The Cambridge English Unlimited Placement Test (Oral Test, 2010) was interviewed students to estimate their level of speaking proficiency. The oral test included placement items concerned with the several selected topics. It was used as a speaking test to homogenize the participants' accuracy and fluency levels.

Interview pre-test (The Reconstruction Podcast Test) was the next instrument that was consisted of listening comprehension and speaking test. This test was downloaded from pre-intermediate podcast programs to determine the participants' proficiency of their listening comprehension and their speaking proficiency before the treatment period. The topic of the pre-test was general due to being relevant to the participants' background knowledge. Before listening to this podcast, the interviewer asked some relevant questions based on the test content related to the participants' real life to familiarize them with the content of the test for more comprehension. The participants were requested one by one to listen to the podcast for 3 to 5 minutes (pre-test) carefully and then they were asked to reconstruct what they were hearing in 2 minutes. Their voice was recorded during their reconstruction. Oral pre-test inter-rater reliability was calculated through Pearson Correlation analysis as ($r=0.791$).

The post-test (The Reconstruction Podcast Test) was also interviewed participants to find out the effect of training by podcasts through reconstruction strategy and to estimate their accuracy and fluency of their speech after period of instruction from both classes. The participants of both classes were taken post-test the same as the pre-test. The topic of the post-test was relevant to the pre-test. The interviewer asked some relevant questions and they reconstructed the podcast. The

participants listened to 3 to 5 minutes of podcast carefully and then they asked to reconstruct what they were hearing (about 2 minutes). Then, their voice was recorded during their reconstruction. The oral post-test inter-rater reliability was calculated through Pearson Correlation analysis as ($r=0.902$).

These podcasts were downloaded from www.zappenglish.com whose topics were consciously selected through participants' interests, purposes and level of their speaking proficiency for pre-, post- test and treatment materials. The Check list was used to score the participants' oral proficiency developed by Hughes (2002) for rating performance of the participants both pre- and post- tests. This checklist comprises six items of fluency and accuracy. The fluency consists of three items to estimate participants' ability of coherence, communication and speed and each of them includes 5 sub-items (15 items), while accuracy includes three items to rate participants' ability of vocabulary, structure and pronunciation again each of them includes 5 sub-items (15 items), at all 30 items utilized for estimating fluency and accuracy in details.

Materials

The main materials were worked on the reconstruction podcasts. The technology revolution among CALL, Moodle and Web- based give positive facilities to teachers and learners for learning and teaching EFL /ESL, in these days. Podcasts are new technology for broadcasting audio programs on the Internet (Selingo, 2006). Podcasting was originally for conveying information and entertainment. But soon educators saw that it has the huge potential for teaching (Adams, 2006). Many writers believe that podcasting can offer language education, especially developing learners' listening and speaking skills (Pun, 2006). Radio and Independent podcasts are two types of podcast programs. Radio podcasts are such as BBC (British Broadcasting Corporation) and RTHK (Radio Television Hong Kong). Independent podcasts are Web-based podcasts produced by individuals and organizations such as Zappenglish. The second type is so beneficial for ELT. We can find these podcast programs from these websites such as <http://www.podcastalley.com/>, <http://epnweb.org/>, <http://recapltld.uk/podcasting/> and <http://zappenglish.com>, <http://iteslj.org/links/ESL/Listening/Podcasts/>, etc. (Man- Man, 2006).

The materials of the study were downloaded from podcasts' online programs, www.zappenglish.com, to be used offline. Therefore, podcasts were utilized as offline for instructing materials in the class and online podcasts were utilized as outside activities (when participants have facilities of net connection). Eighteen contents of podcasts were downloaded from this site and were copied on CDs according to participants' interest, purpose and level of speaking proficiency. It was comprised of the different subjects who follow the same titles. On the other hand, one topic for example "Job and Work" follows by separate contents; listening in vocabulary, listening in formal and listening in colloquial (informal) and each files of the podcasts had its own e- book which includes a transcript, all the colloquial expressions, their definitions and finally some extra written exercises for the instructors' guide. The study looked forward to extra listening in different situations in which improve learners' skills. Then, the CDs consisted of eight topics and five of them followed by listening in vocabulary, listening in formal and listening in colloquial contents and three of them just included listening in formal contents. In addition to these CDs, the instructor guide's CD has transcripts of all contents, too. Ten

contents were taught by instructor in the class during 10 sessions and the rest of them for more listening at home, in car or anywhere that participants liked to listen to. These podcasts have so authentic and realistic contents in different situations for proficiency levels.

Procedure

The whole research project took place in 14 sessions. First session of the present study started by Interchange Placement Test which 90 students of Islamic Azad University taken this test. Sixty students out of 90 were selected as research's participants. Richards et al's (2008) Placement Test was comprised of 50 multiple-choice grammatical items. This test took 45 minutes. Those participants whose scores were between one standard deviation above and one standard deviation below the mean were selected as the participants of this study. Then, the Oral Cambridge Placement test (2010) was interviewed students for estimating their level of speaking proficiency. The participants were at the same level of speaking proficiency and homogenous and then were divided into two groups through non-random convenience sampling method. Thirty of the participants were in the experimental group and 30 ones were in the control group. The aim of this oral (interview) test was to discover the appropriate level of the speaking proficiency of the participants at the beginning of the treatment. Next time, Eight other students which were out of participants were asked to listen to one podcast to inform researcher about learners' interest, background language and time of each podcast spending for each reconstruction in the oral test. This test was beneficial for researcher to get information about the problem of reconstruction and utilizing appropriate strategies during listening and reconstructing the podcasts. It is necessary to say that, those eight students were homogenous and in the same level of speaking proficiency of participants, too.

Then, the pre-test was given to both experimental and control groups which concluded unseen podcast at the level of participants' speaking proficiency with general and relevant topic. This pre- test included an oral (interview) test and a listening comprehension test. The participants of both classes were requested to listen to offline selected podcast and to reconstruct what they were hearing one by one, their voice was recorded by the interviewer. The CDs of offline podcast treatment were available to the experimental group. During the treatment, the experimental group listened to the topics of podcast and reconstructed the content. In this way, the instructor was asking some questions from students and let participants become familiar with the content before listening to it. The instructor asked them to listen twice to each podcast. After listening, participants reconstructed or retold what he or she was hearing about 2 or 3 minutes and the other participants were listened or participated in the retelling activities. Selected podcast programs were downloaded from www.zappenglish.com website which they were corresponded to appropriate participants' level for the experimental group. These podcasts were taught and added to routine conventional course, 30 minutes during 10 sessions of instruction. These podcast programs included 18 podcasts containing so interesting subjects. The podcasts were taught in the class with reconstruction strategy of listening and then speaking procedures. Podcasts are programs that could be daily listened to with different realistic topics. The learners were requested to listen to this podcasts everywhere and try to retell or reconstruct what they were hearing alone and made efforts to record their reconstruction by themselves. Through these podcasts, learners explicitly learn culture, intonation, pitch, stress, and other functions of target

language. Then learners unconsciously use all of them in their speech. The control group was taught routine instruction, the conventional method of teaching English language including working on the text book of New Interchange 1 units dealing with dialogues, discussions, question and answers, etc.

Finally, a post-test was given to the experimental and control groups. It included two- or three-minutes' interview on the selected unseen podcast for both groups. It estimated the reconstruction of the unseen podcast through both groups. Data was recorded and scored by two raters. The inter-rater reliability showed that the scoring consistency. Then the scores were analyzed through SPSS version 17. The descriptive and inferential statistics such as Paired and Independent Samples t-test were done to find any differences between the experimental and control groups.

RESULTS AND DISCUSSION

The Pre- test and Post-test

Descriptive statistics of the pre- and post- tests are presented in Table 1.

Table 1: Descriptive Statistics of the Pre and Post-tests

Pairs	Groups	N	Minimum	Maximum	Mean
Pair 1	Pre-test (Experimental)	30	14.00	26.00	18.6452
	Post-test (Experimental)	30	17.00	27.00	22.0323
Pair 2	Pre-test (Control)	30	7.00	26.00	17.2000
	Post-test (Control)	30	12.00	24.00	17.9667

As shown in Table 1, the number of participants in experimental group is 30 and control group is 30, too. Statistical data in Table 1 provides the descriptive statistics of the two groups, experimental and control, before and after using treatment. Table 1 shows the mean of experimental pre- test group is lower than the mean of the experimental post-test.

In pair (2), the mean of control in the pre-test group is approximately as the same as the post- test of this group. In order to find out whether the differences among the performances of the two groups were statistically significant, the Paired Samples t- test (pre- test versus post-test) was applied, and the results of the tests were interpreted from the two values of t- observed. Since the descriptive statistics cannot show the significant difference between the groups, Paired Samples t-test was run in Table 2.

Table 2: Paired Samples t- Test (Pre-test vs. Post-test/Experimental and Control groups)

Pairs	Groups	Paired Differences			95% Confidence Interval of the Difference		t	df	Sig. (2-tailed)
		Mean	Std. Deviation	Std. Error Mean	Lower	Upper			
Pair 1	Pre-test vs. Post-test (Experimental)	3.38	3.93	.707	4.831	1.942	4.788	29	.000
Pair 2	Pre-test vs. Post-test (Control)	.76	5.28	.965	2.741	1.208	.794	29	.434

Table 2 provides the values of the two pre- versus post- test of experimental and control groups before and after the treatment in terms of the reconstruction podcasts. Table 4.2 indicates the statistical analysis of Paired Samples t- test (experimental and control group). Since observed t (4.788) with df= 29 is greater than the critical t (2.042), the difference between the two tests are significant at ($p < .05$) in the experimental group. According to pair 2, the observed t (.794) with df= 29 is less than the critical t (2.042) in the control group. Thus, the difference between these pre- and post- tests is not significant at ($p < .05$). To calculate the mean difference between pre- and post-tests of the groups, descriptive statistics of the tests is presented in Table 3.

Table 3: Descriptive Statistics of Experimental and Control Groups (Pre-test)

Groups	N	Mean	Std. Deviation	Std. Error Mean
Experimental	30	18.645	3.125	.561
Control	30	17.200	3.507	.640

Table 3 shows that the mean of the pre- test among the experimental group (18.64) is nearly the same as the mean of pre- test among control group which is 17.200. There is no much difference between these two tests. In order to find out whether the similarity among the performances of the two groups was statistically significant, Independent Samples t-test was applied in Table 4.

Table 4: Independent Samples t-Test of Experimental and Control Groups (Pre-test)

		Levene's Test for Equality of Variances		Test for Equality of Means						
		F	Sig.	T	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
Pre-tests									Lower	Upper
Equal variances assumed		.011	.919	1.70	58	.094	1.445	.850	.255	3.14
Equal variances not assumed				1.69	56.7	.095	1.445	.851	.259	3.15

Table 4 provides the means of the two experimental and control groups' pre- test analyzed through Independent Samples t-test before the treatment in terms of reconstruction podcasts and number of participants, means, standard deviations (SD), standard error, lower and upper bounds. As shown in Table 4, since observed t (1.70) with $df= 58$ is less than the critical t (2.00), the difference between the groups is not significant at ($p<.05$). This showed that the groups were homogenous before the research period at the pre-test (Oral Proficiency Test). The podcast scores are analyzed in Table 5 to find any significant difference between the two groups.

Table 5: Descriptive Statistics of Experimental and Control Groups (Post-test)

Groups	N	Mean	Std. Deviation	Std. Error Mean
Experimental	30	22.32	3.134	.562
Control	30	17.96	3.169	.578

Table 5 shows that the mean of experimental post- test is higher than the mean of control one. It reveals that the reconstruction podcasts and the conventional method both performed better in post-test, but the reconstruction podcasts in experimental group outperformed. In order to find out whether the difference among the performances of the two groups in post-test was statistically significant, Independent Samples t-test was applied in Table 6.

Table 6: Independent Samples t-Test of Experimental and Control Groups (Post-test)

Post-tests	Levene's Test for Equality of Variances		t-test for Equality of Means						95% Confidence Interval of the Difference	
	F	Sig.	T	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference		Lower	Upper
Equal variances assumed	.405	.527	4.88	58	.000	4.065	.832		2.399	5.732
Equal variances not assumed			4.87	56.71	.000	4.065	.834		2.395	5.736

As Table 6 indicates, since the observed t (4.88) with $df= 58$ is greater than the Critical t (2.00), the difference between the groups is significant at ($p<.05$).

Discussion

Results of the pre-test and the post-test showed an improvement in overall participants' speaking proficiency skill through instructions and strategies used during this study. However, the most important issue is the usefulness of the reconstruction podcasts activities in order to obtain better

results. Thus, the results will be discussed in this part, was involved with the following research questions. As it was mentioned before, according to data analysis, the experimental group who worked on the reconstruction podcasts instruction has outperformed the control group. It affected both fluently and accuracy in the experimental group rather than the control one.

Based on the results, there are significant differences between the post-tests of groups. The results of the post-test may show the difference between the two groups in case of the Reconstruction podcasts. The group of the reconstruction podcasts instruction outperformed the group of conventional instruction. It shows that the application of pre- and post-listening podcast and reconstruct what they were hearing might be of great help in approving the learners' speaking proficiency. By comparing the both post-test scores of the two groups of experimental and conventional instructions, it can be inferred that the difference may be due to the enormous listening relevant and authentic podcasts and reconstruction.

The ability of fluency is a bit higher the accuracy in the control group is post-test while the ability of accuracy before treatment was a bit higher. It revealed that accuracy was higher than fluency in both groups. This shows that there is a difference between the ability of fluency and accuracy in the experimental group. Fluency and accuracy in the experimental group's post- test were higher than control group. As it was mentioned earlier, it indicates that the accuracy of the learners is higher because of the background knowledge of grammatical competence before treatment during their curriculum at school. The reconstruction podcasts instruction affected more positive improvement on fluency rather than accuracy. This agrees with Rezapour, Gorjian, and Pazhakh's (2012) who argued that listening on these podcasts improve confident and fluency of learners and if participants work forward on this way they past faster their level than ever thought in which prove direct evidence of improving fluency in speaking. By comparing fluency in the experimental pre-test and post-test, fluency is reinforced in the experimental post-test. The experimental group outperformed the control group, but in comparison to accuracy in the experimental group. It reveals that their accuracy scores were higher than the fluency in the tests. It also showed that the background knowledge of both groups may reinforce more by the reconstruction podcasts instruction. The lower scores of the control group may be due to the teacher-centeredness of the instruction or low motivation of participants that may make the students bored.

The results of the descriptive statistics showed that, after the post-test, the mean of the reconstruction podcasts, and conventional instruction groups were different. These results might show that both pre- and post- listening podcasts affected learners' fluency in the treatment sessions. This is supported by Zamari, Adnan, Idris and Yusof (2011) who proved the evidence of improvement learning materials through using online language. Braun (2007) also supported these results that authentic and relevant podcasts have a positive effect on librarian speaking skill and their motivation. Rini (2012) also believed that unconscious listening improves speaking skills of learners. Therefore, based on the results of Descriptive Statistics and the answer to the above second research question, the second null hypothesis was also rejected. Thus, there was significant evidence that the reconstruction podcasts affect pre-intermediate EFL learners' speaking fluency and accuracy which it approximately affect accuracy higher.

CONCLUSION

The present study began with the assumption that applying the reconstruction podcasts instruction could enhance the pre- intermediate EFL learners' speaking proficiency. The experimental and the control groups were taught through two different methods of instruction. The participants of experimental group were taught through reconstruction online and offline podcasts and other group as control group were simultaneously taught the traditional instruction. The instructor explored to see if the application of enormous listening of offline podcasts and reconstruction what they were hearing have any effect on the Iranian pre- intermediate EFL learners' speaking proficiency and to investigate the effect of them, separately, on the ability of accuracy and fluency in speaking.

Having administered the pre-, post- tests and analyzing the data through specific statistical analysis of Descriptive Statistics, Independent Samples t- test and Paired Samples t-Test, the results indicated that the instruction of using the reconstruction podcasts did positive effect on the learners' speaking fluency and accuracy. Based on the present study results, the following conclusions may be made:

1. CALL approaches generally and especially the reconstruction podcasts may influence EFL learners' speaking proficiency.
2. Exposure to language materials through a synchronous approach is an influential factor for EFL learners.
3. The online or enormous offline podcasts reconstructing instruction do have more significant impact on the learners' speaking proficiency (both fluency and accuracy) than conventional instruction.
4. During the offline reconstruction podcasts instruction, the learners listen and reconstruct what they were hearing independently and freely. Therefore, produce and process their utterance better.
5. During the reconstruction podcasts instruction, the familiar questions by teacher and replied by learners can influence learners' listening comprehension ability to reconstruct it better.
6. Online or offline enormous podcasts listening out of the classroom or at class can improve prior knowledge of paralinguistic elements (implicitly master on stress, rhythm and intonation patterns).
7. Online or offline enormous podcasts listening out of the classroom or at class can improve the ability of accuracy and fluency during speaking in which accuracy improves a bit higher than fluency.
8. Conventional instruction based on task- based language teaching can also affect listening comprehension and speaking proficiency but its effect is less than the reconstruction podcasts instructions.

The following suggestions are drawn based on the limitations of the study. They may be applied in future researches. They are as follow:

1. As the study was only conducted at the university, more research is needed in similar situations to support the findings and to find more about the effect of the podcasts constructing instruction on Iranian pre-intermediate EFL learners. It can also be applied at the schools or institutes for different range of ages and levels.

2. This study was conducted to measure the improvement of speaking proficiency ability and in some part listening comprehension ability. Future research can be done regarding the effect of the Reconstruction podcasts on other skills such as writing or reading.
3. The Podcasts instruction associated with some limited pre- and post-listening and speaking activities in this study. In future researches, other useful listening strategies and tasks such as note taking, questionnaires, and multiple- choice questions for better comprehension can be examined or comparing effect of multiple- choice questions with reconstructed for useful speaking.
4. In the present study, the synchronous way of instruction in case of listening was just used. Future research can cover synchronous way of applying podcasts with pictures as the material of speaking.
5. There are different websites containing effective podcast resources. Regarding learners' age and level of proficiency, other websites can be used instead of the "www.Zappenglish.com" website used in this study.
6. Instead of using conversation's content through podcasts, other kinds of literature such as songs, poem, lectures and novels or other kind of podcasts, videos, clips or Mp3 files can be used in future researches.

ABSTRACT

The aim of the present study was to investigate the role of testing, especially a frequent one, as the facilitator of learning among Iranian English as foreign language (EFL) high school students. This study investigated the effect of two quiz formats (selected-response versus constructed-response) was studied among Iranian EFL high school students' writing skills specifically their command of formal grammar on the summative achievement tests. In order to arrive at a logical answer to the research questions, a sample population of 83 female senior high school participants, which was finally reduced to 60 participants, was chosen through a pre-test, namely, Nelson Proficiency Test (Fowler & Coe, 1976). After selection of the participants, they were randomly assigned into three groups (two experimental groups and a control one). Then the experimental groups were provided with the treatment; eight quizzes were given to them frequently. A summative post-test was administered to the groups at the end of the treatment period. One-way ANOVA determined the effect of the variables. The findings of the study revealed statistically significant difference between the experimental groups and control one. The results also showed that constructed-response quizzes with eight times frequency of administration resulted in the development of Iranian high school students' performance on the formal grammar in writing skills ($p < .05$). Therefore, employing appropriate test or quiz formats in the language teaching environment can assist learners to improve their writing through testing. Thus, the frequent administration of quizzes may pave the way for better learning and motivate the students to learn.

KEYWORDS: Frequent selected-response, Frequent constructed-response, Formal grammar

INTRODUCTION

Since English as a foreign language (EFL) has found its place among other subjects in the syllabus of Iranian schools, it seems necessary to pay attention to the techniques that can promote language abilities of Iranian learners. The issue of improving student learning has also been of salient interest in the administrative and academic community, therefore, the importance of

assignments, quizzes, and tests and their relation to student learning is a considerable topic (Smith, Zsidisin & Adams, 2005). This concern for assignments, quizzes, tests, and the role of them in developing students' writing, especially their formal grammar, is the foundation for this study. According to Heaton (2000), teaching and testing are closely related to each other so that it is impossible to work in either field without considering the other. As Harris (1996) points out, "classroom tests are generally prepared, administered, and scored by one teacher. In this situation, test objectives can be based directly on course objectives and test content could be derived from the specific course content" (pp. 1-2). Consequently, tests or quizzes during a given term can make the students better aware of the course objectives. The analysis of the test results reveals the students' areas of difficulty and, accordingly the students will have an opportunity to make up for their weaknesses. Therefore, teacher-made tests: 1) measure students' progress, 2) motivate students, and 3) provide an opportunity for the teacher to diagnose students' weakness. The effect of testing on teaching and learning is called wash back effect, which can be beneficial or harmful to teaching. It is beneficial when the test improves teaching and learning processes (Birjandi, Bagheridoust & Mossallanejad, 2006).

As Baker (1989) states if a test is regarded as important and the stakes are high, preparation for it can come to dominate all teaching and learning activities. Moreover, he believes that wash back can be viewed as part of something more general; the effect of assessment. The effect on educational measurement is not limited to the impact of assessment on learning and teaching, but extends to the way in which assessment affects society as a whole. Bachman (1990) argues that the selected-response items can involve simply selecting the correct answer among several alternatives or the identification of an incorrect alternative as in a sentence with several different words or phrases underlined; only one is incorrect. In the selected-response items, the test taker must select one response among two or more possible alternatives. Farhady, Jafarpur and Birjandi (2003) suggested that in selected or discrete-point items one element should be tested at a time, that only one skill should be gauged at a time, and that only one aspect of a skill should be tested at a time. Constructed-response tests or integrative tests consist of a single sentence or utterance, and can range from two sentences or utterances to virtually free composition, either oral or written form and also are designed to use several skills at one time, or more precisely, to employ different channels, modes or both of the languages simultaneously and in the context of discourse. Advocates of the integrative- sociolinguistic movement would argue that such a test is complex, as actual language use is complex.

Werner (1993) believes that constructed-response questions stimulate the student to construct acceptable answers rather than just recognize ones. The construction may be very brief and short or long. He added that constructed-response items are the key to more authentic assessment and they should be more widely used. As Martin (2011) states, unlike speaking or listening, when one writes he has to think about the correctness of his product. The writer should generate unambiguous ideas and edit them at the same time because his document may entail unchangeable implications for the readers when s/he is not there to clarify misunderstandings or misconceptions. Mirhassani and Ghasemi (2007) state that to put language to use we require two kinds of knowledge, known respectively as schematic knowledge or knowledge of the world and

systematic knowledge or knowledge of the language system; we referred knowledge of the formal grammatical system.

Writing is a central communication skill and is a fundamental process of learning the language. Learning a foreign language, with its four skills, is a very complicated process and different domains should be considered during language learning. One of these important domains is a test item format such as selected-response test versus constructed-response one. Most instructors confine themselves to multiple-choice or selected-response test in their examination for the sake of objectivity (Brown, 2001). The role of frequent administration of constructed-response quizzes in which the student must construct the correct answer, whether in a word, sentence, or essay form is somehow neglected in our high schools during the term quizzes; this will result in a poor writing.

This research clearly suggests that frequent (weekly) quizzes are important in learning writing skills. Therefore, the result of this study can be beneficial and bring to notice by the interested audience, ELT practitioners, and teachers to promote Iranian EFL learners' writing abilities.

REVIEW OF LITERATURE

The field of study wash back effect has not been so welcomed in Iran and the literature is really scant and seems that it is in its infancy (Kheirhak & Ghonsooly, 2014). Gorjian (2011) investigated the impact of different response formats (selected versus constructed) administrations on pre-intermediate Iranian EFL university learners' general writing skill specifically their command of formal organization. The result revealed that constructed-response quiz with ten times frequency of administration resulted in the improvement of Iranian EFL learners' performance in the formal organization in general writing skills. Thus, he found that repeated constructed-response quizzes received the first priority. Therefore, there was a significant difference between, the writing's performance of the group who received ten times constructed-response quizzes and the group who did not receive any quizzes. The findings indicated that constructed-response quizzes can be used for promoting different skills and component of language learning. Bryan (1998) conducted a research on factors contributing to a reduction in race based subgroup differences on a constructed-response paper and pencil test of achievement. Results showed that the constructed-response item format may be a viable alternative to the traditional multiple-choice one in predictors of job performance and simultaneously reduce subgroup differences and subsequent adverse impact on tests of knowledge, skill, ability, and achievement. However, additional research is needed to further demonstrate the appropriateness of the constructed-response format as an alternative to traditional testing methods. Several studies (e.g., Davis, 1999) indicates that students study more efficiently for essay-type examinations than for selection (multiple-choice) tests; students preparing for essay tests focus on broad issues, general concepts, and interrelationships rather than on specific details. Essay tests also give you an opportunity to comment on students' progress, the quality of their thinking, the depth of their understanding, and the difficulties they may be having. However, because essay tests pose only a few questions, their content validity may be low. In addition, the reliability of essay tests is compromised by subjectivity or

inconsistencies in grading. Also short answer tests depending on your objectives, can call for one or two sentences or a long paragraph.

Constructed-response quiz items as Johnson's (2006) findings show are related more strongly to measures of student achievement than did selected-response items. It may be that constructed-response quiz items, which required the actual input of words, engaged students in course content at a deeper level than simply checking selected-response items. However, no significant relationship emerged among the number of constructed-response quizzes and student achievement as measure by conceptual test items. It might be that constructed-response quiz items may not have facilitated the cognitive processing necessary to respond to conceptual measures of learning. He found that students take in quizzes were associated with academic achievement, but the quiz format differentially related to achievement across cognitive domains. On the other hand, Sheaffer and Addo (2013) measured and compared student performance on constructed-response and selected-response questions in a pharmaceuticals course; and collected student feedback on the use of differing question types. Results showed that students correctly answered more selected-response questions than constructed-response questions and felt more confident in doing so.

Gorjian (2011, 2014) stated that weekly, in-class quizzes are based on some testing specialist have been associated with positive learning outcomes including increased student achievement, attendance, and confidence. Their studies show that frequent quiz reportedly maintains student study effort and promote course engagement; for example, Gorjian's study showed that weekly quizzing (constructed-response) was important in learning English writing skills. The results of the study showed that the students who took weekly constructed-response quizzes would show better retention of grammatical patterns than would students who were not engaged in the weekly graded constructed-response quiz. He believes that weekly quizzes and reviews, it is easier for an instructor to know earlier on how well the students understand each lesson or concept and that is best learning when the instructor actively engages or involves students to learn by doing the quizzes. Therefore, the weekly and frequent quiz can have great impact. Results of Greene's (2000) studies indicated that students perceived daily essay quizzes, had an enhancing both learning and class preparations.

Mirhassani and Rahimpour (2003) examined the relationship between quiz, frequency of administrations, and Iranian EFL learners' performance on summative achievement tests. They found that the frequency of quiz administration improved the performance of Iranian EFL learners. Their study showed that completion quizzes with ten times frequency of administration work better with the improvement of Iranian EFL learners' performance on summative achievement tests. They stated that the more students receive quizzes on the content of the book taught, the more they learn the materials taught in depth. If they fail to perform well on one quiz, they try to make up for the other. Moreover, some education research has confirmed that frequent quizzes do yield benefits; for example, Ballard and Johnson (2004) compared tests' results of students who were exposed to quizzes with a control group who no quizzes. They found significantly higher scores of students who experienced quizzing and concluded that frequent quizzes influence learning performance. The mean scores of these students were significantly

higher than for students in the group who experienced no quizzes. However, studies of science students indicated that students' performance was not strongly affected (Drouza & Fleming, 2003). But study of Tuckman (2008) shows that frequent testing provides incentive motivations. Frequently tested students outperform other students on examinations. He mentions that what it might be drove a student to get information into long-term memory are tests. Tests motivate students because they create the opportunity or necessity to achieve success or avoid failure. In that way, tests provide an incentive to learn and they are a source of incentive motivation. The overall results clearly showed that the frequent tests enhanced motivation for students who have typically performed poorly to get content into long-term memory rather than merely targeting for them what to study. Thus, Hughes (1988) reported the benefits for learning that the introduction of a new test can bring about. However, most recent research in this area has found that language tests affect certain aspects of teaching but not others. Thus, language tests seem to be effective in bringing about changes on teaching content, but might have only limited apparent effect on teaching methodologies (Barati, Ghasemi, & Ravand, 2013).

RESEARCH QUESTIONS

The impetus for this study is to find answers to the following questions:

1. Do frequent selected-response quizzes affect the formal grammar in writing skills of Iranian EFL high school students?
2. Do frequent constructed-response quizzes affect the formal grammar in writing skills of Iranian EFL high school students?
3. Is there any significant difference between the effect of frequent selected-response and that of frequent constructed-response quizzes on the formal grammar in writing skills of Iranian EFL high school students?

METHODOLOGY

Participants

The participants of this study were 60 senior high school girls with the age mean of 18 majoring in empirical sciences in Dezful, Iran. They were all Persian native speakers and had learned English chiefly in formal EFL classroom contexts. All participants had a common English background; they had taken English courses for at least six years in high schools and junior high schools. The rationale behind selecting senior high school students was to have more proficient students. The participants were administered a Nelson language proficiency test developed by Fowler and Coe (1976) as a pre-test at the outset of the experiment in order to ascertain their homogeneity in terms of general English proficiency prior to the study. The rationale behind selecting participants suitable for this study was to select homogeneous participants who were in the same range or near each other; regarding their grammar language proficiency. To do so, participants with scores one standard deviation above and one below the mean were selected. To make sure of their homogeneity, One-way ANOVA formula was applied in the pre-test level. Then after selecting the students, they were randomly assigned into three equal groups; the first and third groups (odd-numbered ones) as experimental groups who received treatment and the

second group (even-numbered one) was the control one who received a placebo treatment (N= 20 for all groups).

Instrumentation

The following instruments were used in this study to collect data from the subjects: The first instrument was a general language proficiency test (Fowler & Coe, 1976) as a pre-test in order to find out linguistic abilities of participants. The test consisted of 50 multiple-choice items. To validate this test, it was piloted to a similar group of 20 students to try out items in order to determine their reliability or effectiveness and to determine the reactions of students to the items (Richards, Platt & Platt, 1992). It enjoyed the reliability index of ($r = .72$) obtained through Kuder-Richardson (KR-21) formula.

The second instrument used in the study was a validated summative achievement test, developed by the instructor according to the course objectives and administered as a post-test in order to check out the effects of the research variables. To validate this test, first it was piloted to a similar group of 20 students and the reliability was calculated ($r = .73$). The test had a total score of 40 and it was validated against the standard test of Nelson. It consisted of 40 completion questions (including open-ended and short-answer items). Situations in the two testing instruments comprised the formal grammar in writing skills. The post-test was rated by two raters, who were familiar with the content of the study, in order to control the rater's variable (subjectivity evaluation). To measure the inter-rater reliability, Pearson product moment correlation coefficient formula was used. The inter-rater reliability of the two raters' judgments was estimated as the reliability value ($r = .81$).

Materials

Eight paired quizzes of selected-response and constructed-response items, considered as treatment in this study, were extracted from the book "Reading through Interaction One" written by Farhady and Mirhassani (2008); researcher used it as a supplementary reading book in her classes. Farhady and Mirhassani (2008) claim the book (Reading through Interaction One) seems to be an excellent textbook for improving knowledge of students, in general, and Iranian students in particular. The reasons justifying this position are many, a few of which are mentioned here. First, the book was designed on the basis of reading techniques and meets the scientific principles of the reading skill quite satisfactorily. Second, the reading materials seemed quite authentic and the exercises fairly communicative. Third, the idea of the variety of materials and activities that could be one of the major factors to motivate the readers can be observed in the preparation of the book. Finally, the texts were arranged in a progressively difficult order within the chapters. The researcher found out that the book was a new and interesting textbook to the participants, and also it was suitable for their proficiency level.

The instructor taught one lesson every week, and demanded participants to carefully read it in preparation for a quiz on the next week. The ten items in selected-response quizzes consisted of five multiple-choice, two true or false, and three matching items. The seven items in constructed-response quizzes, consisted of a) two "broken sentence" items in which a series of words are given to the examinees to incorporate them into meaningful sentences b) three short-answer items

which examinee was required either to complete a sentence or to compose one of his own according to the directions provided c) two essay items; a traditional method of testing writing abilities in which students were required to express themselves by composing their own relatively free and extended written responses which is ranged from limited number of words to several sentences to problem set by instructor.

Procedure

At the beginning of the study, a general language proficiency test was given to 83 senior high school students (i.e., all female in Shahid Beheshti High School in Dezful, Iran) who were invited to take this test as a pre-test in this study. This test included 50 multiple-choice items which were adapted by the researcher in accordance with an authentic testing book written by Fowler and Coe (1976). After collecting data, the responses of participants were analyzed. Then sixty students whose performance ranged from one standard deviation above and one below the mean were chosen for this study, and then the selected participants, were randomly divided into three groups: two experimental groups and one control group. Treatment was the second phase of the study. This study focused on developing formal grammar in writing skills. Over a ten week period, a spring semester in 2014, the first experimental group received frequent (weekly) selected-response quizzes, the second experimental group received frequent (weekly) constructed-response quizzes, and the third group served as the control group to validate this study. In the control group learners received no treatment (no particular quiz) and they were not exposed to any evaluation except some oral questions. Rather they engaged in reading comprehension exercises. Over all, two experimental groups received eight quizzes which lasted about 15 minutes, during eight weeks. The first week of the study was spent on the explanation of the procedure and also participants were asked to attend and take a language proficiency test (Fowler & Coe, 1976). From the second week till the end of the term the participants took weekly quizzes. All sessions occurred weekly for eight weeks (on consecutive weeks), at the same time of the day, covered the same content, used the same textbook, and were taught by the same instructor. The researcher believed treatment period was enough to control the time variable. Following each section, students' quizzes were collected and graded by the researcher, and they were informed that the average of their grades on these quizzes on general English book would count toward their final grade as much as one of the major course examinations (to motivate them to participate actively in the experiment). Post-test was the final phase of the investigation. At the end of the experiment (last week), all the experimental and the control groups sat for the summative test so that their performance could be compared. All of the participants were tested regarding their performance on their formal grammar in writing skills. By using the same instructor for all sessions, the author control variation in instruction and materials coverage also account for variation in their abilities.

RESULTS

Some statistical analyses were performed on the data to answer the research questions posed in this study. As the researcher noted before, the major purpose of this study was to investigate the relative effect of two quiz formats on developing writing performance. To address the research questions, the students' variables were measured. In this study, the independent variable was quiz

format at two levels: (1) the selected-response quizzes and (2) the constructed-response quizzes. To test the research hypotheses, as the study deals with comparing more than two means of quizzes formats in frequent administrations, data were submitted to a parametric technique for analyzing the quantitative data. The results of this study were significant for all the hypotheses at the 0.05 level. The Table 1 below shows the descriptive statistics of pre-test and post-test of 20 participants as pilot studies with reliability $r = .72$ and $r = .73$, respectively.

Table 1: Descriptive Statistics of Pilot Tests (Pre-test and Post-test)

Groups	N	Mean	Std. Deviation	Variance	Minimum	Maximum
Pre-test	20	20.15	6.46	41.73	11	34
Post-test	20	19	5.99	35.88	10	35
Total	40	19.57	6.22	38.80	10	34

In order to ensure the homogeneity of the three groups in terms of language proficiency prior to the experiment, the results obtained from pre-test were analyzed. Our null hypothesis would be that there is no meaningful difference among the groups; that they are just three samples of the same population. Table 2 is a report of the results of pre-test which was administered as the homogeneity test and shows the descriptive statistics of the participants' performance in three different groups on pre-test, concerning maximum scores, minimum scores, means, standard deviations (SD), considering their level of proficiency. The mean scores showed that the three groups did not much differ in relation to their background knowledge. The low standard deviation signifies that the students' performance was very close to each other. In other words, their mean scores showed no significant differences.

Table 2: Descriptive Statistics of Pre-test (Nelson Proficiency Test)

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean	Lower Bound	Upper Bound	Min.	Max.
Groups									
Control	20	7.50	1.83	.541	6.35	8.64		4.00	11.00
Selected	20	7.80	1.63	.54	6.25	8.54		5.00	11.00
Constructed	20	7.60	1.63	.36	6.83	8.36		5.00	11.00
Total	60	7.63	1.70	.27	6.94	8.05		4.00	11.00

As shown in the Table 2, the three groups were similar concerning their performance on pre-test and the mean and standard deviations of the groups were approximately similar. But we could not simply look at the mean scores of groups and concluded that they were the same or different and the researcher needed to be certain that they were truly equivalent groups before she began the treatment. Therefore, to determine the difference among the groups, the students' scores on the Nelson test of the three groups was put in One-way ANOVA formula. A simple and common-sense understanding of ANOVA is the comparison of MSW (means within groups) and MSB (means between groups). If the value of the MSB (which includes the treatment effect) is not greater than MSW, then we know that our treatments are all similar. We must recognize the data

as just the samples from the same population. In other words, if the F value is 1 or less, it represents no treatment effect (Hatch & Farhady, 1999).

Table 3: One-way ANOVA(Pre-test)

	Sum of Squares	d.f.	Mean Squares	F	Sig.
Between Groups	.400	2	.200	.041	.960

As Table 3 shows, the observed F value is .041. Since the critical F value corresponding to the degree of freedom of 2 at the probability level of 0.05 is calculated to be 3.171, which is greater than the observed value of F, and the calculated significance equals .960, it can be seen that there is no significant difference between the three groups concerning their performance on the pre-test ($F_{\text{observed}} < F_{\text{critical}}$) and fortunately, the researcher is quite safe in accepting the null hypothesis. Therefore, the results presented in Table 3 showed that the students' homogeneity in terms of their language proficiency.

At the end of the term, a summative achievement test was administered to the students. Each student's score on the summative achievement test was obtained. The results were three subjective measures of the students' performance. That is the summative achievement test of selected, constructed, and control groups. The next step was to analyze the results obtained from the post-test and the descriptive statistics, mean, and standard deviation of each group were calculated. Results showed that the students' performances in the final examination were drastically different. Table 4 shows the post-test results descriptively.

Table 4: Descriptive Statistics(Post-test)

Groups	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean	Interval	Min.	Max.
					Lower Bound	Upper Bound		
Control	20	8.70	2.57	.72	7.18	10.21	4.00	13.00
Selected	20	10.60	2.74	.61	9.31	11.88	6.00	16.00
Constructed	20	15.90	2.28	.50	14.83	16.96	12.00	20.00
Total	60	11.73	4.10	.53	10.67	12.79	4.00	20.00

*Significant at $p < 0.05$

A glance at the Table 4 and comparing the mean of each group with the corresponding mean obtained from pre-test, reveals that the participants' in all groups performed better on post-test and the means of three groups increased. Descriptive statistics provided an indication of the extent of the students' performance of selected-response and constructed-response groups on the post-test. The mean scores have changed signifying; this suggests that the treatment has been

influential. The standard deviation indicated that the dispersion of scores was higher than the scores on the pre-test, which means that the students performed differently on the post-test.

As it is shown in Table 4, the mean score of the group who received constructed-response quizzes indicates that they have performed better than the group who received selected-response quizzes. Whereas the mean of the group who received selected-response quizzes, had not significantly changed, in comparison with their mean score on pre-test. Although the performance of this group enhanced, but not as much as the group who took constructed-response quizzes. This shows that frequent constructed-response quizzes caused an improvement in the students' performance in constructed-response group. Therefore, constructed-response group achieved the highest mean, followed by selected-response group and control group respectively. Regarding the standard deviations of the groups, it was found out that the standard deviations of the selected group were much higher than the constructed and the control group, suggesting that the selected group acted less homogeneous than the other two groups. The low standard deviation in constructed-response group showed that the students' performance was similar to each other than the other groups.

Now the question is whether or not the mean scores are different enough to conclude that the means are indeed different, not due to error variability but to real differences associated with treatment. However, descriptive statistics could not offer the researcher sufficient information on the comparison of the groups to reject or accept the null hypotheses of the research. In order to find out whether the differences among the participants performance on post -test were statistically significant, One-way ANOVA for the groups was applied, and the results of the test were interpreted from two points: Level of significance and F-ratio (Table 5):

Table 5: One-way ANOVA(Post-test of the Three Groups)

	Sum Squares	of df	Mean Square	F	Sig.
Between Groups	556.933	2	278.467	36.173	.000
Within Groups	438.800	57	7.698		
Total	995.733	59			

As shown in Table 5, the null hypotheses can be safely and strongly rejected and the results indicated that the difference among the means was significant and not due to the chance. The results of One-way ANOVA for the constructed group and selected group depicted significant effects of these variables on the writing performance of the sample population. That suggests a strong relationship between frequent constructed-response quizzes and students' writing performance. To find out exactly where the difference lies and which group performed better, a multiple comparisons were performed using the Scheffe's method. The results are shown in Table 6.

Table 6: Post-hoc Scheffe Test (Multiple Comparisons)

I)	(J) VAR00001	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
VAR00001					Lower Bound	Upper Bound
Control	Selected	-1.90	.87	.105	-4.1053	.3053
	Constructed	-7.20*	.87	.000	-9.4053	-4.9947
Selected	Control	1.90	.87	.105	-.3053	4.1053
	Constructed	-5.30*	.87	.000	-7.5053	-3.0947
Constructe d	Control	7.20*	.87	.000	4.9947	9.4053
	Selected	5.30*	.87	.000	3.0947	7.5053

*. The mean difference is significant at the 0.05 level.

The multiple comparisons of the results show differences between the selected group and the control one, but not significant; however such a difference is observed when comparing performance of the participants in other groups, that is, the control and the constructed groups, and the selected and the constructed groups respectively (Sig= .000).

Since the significance level set for the study is 0.05, it can be concluded that participants in constructed-response group performed significantly better on the post-test comparing the participants in the control group. This means that frequent constructed-response quiz was the most effective quiz format in developing formal grammar in writing skills.

Discussion

This section involves discussion of the results and findings presented in chapter four in order to provide answers to the research questions and thereby to reject or accept the null hypotheses which was introduced in chapter one. The results of One-way ANOVA of post-test showed that there was a significance difference among groups, regarding their formal grammar in writing skills. Thus, it can be concluded that the null hypotheses of the research are strongly rejected. These findings clearly suggest that frequent constructed-response quizzes are important in developing formal grammar in English writing skills. Harris (1996) claimed that it is important to reinforce the learning of specific grammatical points or lexical items in writing exercises. Hedge (2005) states the nature of writing is not interesting enough to motivate English learners to practice regularly. Mastering skills entails much practice, writing is no exception. Learning to write is difficult, especially for those writing in a second or a foreign language and effective writing is considered to be a problem for EFL learners. Teachers' experiences also showed that EFL high school students generally have problem and insufficient knowledge of English writing skills. This has encouraged us to emphasize the importance of constructed-response quizzes as one of the most effective instruments to develop writing skills. This is due to the fact that the treatment applied to the constructed group resulted in higher scores and significantly outperformed the selected and control groups. By comparing the mean differences of the groups and levels of significance in Table 4, and examining the complementary results of the Scheffe test, it is concluded that participants in selected group have performed better in post-test than those in the control group. This means that selected group was in the second place concerning the effectiveness in developing formal grammar in writing skills. But this superiority was not totally tangible. The improvement among the writing abilities of participants was significant where they took constructed-response quizzes. Because the participants took a pre-test at the beginning of the

study, it is possible that the students in these three classes were at the same level of background knowledge and the students in the constructed group were better writers.

The results of this study confirmed our prediction that students who took frequent constructed-response quizzes would show better retention of grammatical patterns than would students who were not engaged in the frequent constructed-response quizzes. The preference of constructed-response quizzes (in which students are free to answer questions and the response required may range from one word answer to one or two sentences) might be that they required the productive skills of language in written form and engaged learners in meaning at a deeper level than selected-response quizzes (in which students simply recall or recognize information required to select the appropriate response and no new knowledge is constructed). This increased attention leads to more focus on the comprehension, which in turn causes more retention of the grammatical forms. Besides, since students are familiar with the test, this prior experience or test witness can affect performance on the test task (Bachman, 1995) and they will be able to match what they want to answer with what they had learned as input; therefore, they have less stress for final examination. As a consequence, frequent quizzes, that is, constructed-response items are more probable to help the students remember the materials, especially grammatical points. Thus, the most important point is the effect of the frequent administration of quizzes, which may lead to enhance students' performance on the summative achievement tests. Classroom tests or quizzes, according to many researchers (e.g., Birjandi, et al., 2006; Farhady, et al., 2003; Heaton, 2000) make students better aware of their course objectives and areas of emphasis, as well as their weakness and thus increase their achievement. It may be that students who did not take frequent quizzes may have been characterized by generally disorganized behavior and also quiz is an important motivation for many students. More studies with different population majoring in other fields of study are needed to improve our understanding of how student's performance is influenced by frequent quizzes, for instance, pre-university students or courses in mathematics.

In this study, it was not possible to distinguish the effects of reading practice of writing practice. Did the students' performances improve because frequent quizzes encouraged them to learn to read more carefully, or because they learn to develop and express their written ideas with more clarity, or a combination of the two? Although the writing performances of the three groups were comparable, it might be that the constructed group learned to read more carefully because they were tested by open ended items at every class period. If that is the case, the better performances of the constructed group may be due, at least in part, to more practice reading as well as more frequent writing. The somehow similarity of final examination scores between the selected and control groups and the fact that all three groups were at the same level, the possibility cannot be ruled out in the results on the basis of this study. In general, little research has been conducted in language testing related to the frequent administration of quizzes (Felix, 2005).

CONCLUSION

The results of this study are limited to a sample population of 60 female Iranian senior high school students majoring in empirical sciences. Whether the same findings would be obtained by other high school students studying in other majors (mathematics, or social sciences), or with

other levels (pre-university or even junior high school students), remains unknown. Therefore, a replication of this study with different population is suggested. Another limitation of the study was that due to some limitation it was not possible to assign male participants. Since male and female students' learning styles have been proved to be different, it is suggested that the possible effect of gender be investigated in a study similar to this one. Students vary in their preferences for different test formats, thus using a variety of methods will help students do their best (Davis, 1999). Hence, a replication of this study using other quiz formats or a combination both formats (constructed and selected) is highly recommended so that more consistent information becomes available. The present study investigated the effect of frequent administration of two quiz formats on developing formal grammar in writing skills. Other studies can explore the effect of frequent administration of quiz formats on other language skills such as listening, speaking or reading. Finally, a variety of student strategies are available to syllabus designers, test designers, teachers, and students; the current investigation focused only on the effect of two quiz formats on the formal grammar in writing skills. A deeper understanding of students' patterns of student behavior is required, for example, the influence of various patterns of learning style on achievement.

ABSTRACT

Teachers are believed to play direct roles on the achievement of education goal. This implies that teachers' professionalism matters, as professional teachers make better achievement. As teachers' professionalism becomes an important issue, it is crucial to trace factors underlying professionalism. This paper tries to elaborate a number of factors that affect teachers' professionalism acquisition. The discussion covers current theoretical issues on the affecting factors of teachers' professionalism and the finding of a study on EFL teachers' perceptions towards the affecting factors of professionalism. This study was conducted to 119 EFL teachers of senior and junior high schools. Data were taken through questionnaire designed in Presence-Absence Questions and Rank-Ordering Questions, to reveal respondents' opinion towards the contribution of the variables used in the study on teachers' professionalism acquisition and to disclose respondents' opinion as to the order of importance of each of the variables towards its contribution to teachers' professionalism. Six variables used in this study were General Knowledge Ability, Focus Training, Knowledge of Subject Matter, Teaching Experience, Certification, and Academic Degree. Descriptive statistics were used to analyze the data. The findings of this study suggest that respondents believed that all of the variables have positive contribution to the acquisition of EFL teachers' professionalism. Thus, the writers believed that the six variables have to be considered in developing teachers' professionalism.

KEYWORDS: EFL teachers, professionalism, affecting factors.

INTRODUCTION

Common belief on the role of teachers as one of important contributors towards the achievement of learners is acceptable. It is because teachers are the ones whose job directly affects students' success (Hattie, 2003). According to Hattie, teachers make the second most significant contribution to students' achievement. Hattie argues that the first factor that affects students'

achievement is an internal factor that comes from students themselves which accounts for about 50%, while teacher factor accounts for about 30%, and other factors only account for 20%. Teachers are held responsible for the success of learning. In Indonesia, the issue of teachers' role in education has been widely discussed as the government has officially acknowledged that the job of teaching is a profession. The affirmation of teachers' job as a profession by Indonesian policy makers is mandated by a number of regulatory documents (Law No. 14/2005 on Teachers and Lecturers, Government Regulation No. 74/2008 on Teachers, and National Education Ministry Regulation No. 16/2007 on Teachers' Academic Qualification and Competencies).

The effect of teachers on students' achievement suggests that teachers' professionalism is a crucial factor in education. Thus, there is a need for finding out innovative and systematic approaches to teachers' professional development, including factors that have strong contribution to teachers' professionalism building.

REVIEW OF LITERATURE

The Nature of a Profession

To understand teaching as a profession, one cannot separate teaching profession from the basic characteristics of other professions. The term 'profession' is a broad concept that involves many aspects (Sanusi et al., in Saud 2008; Shulman, in Bransford et al., 2005; Hamied, 2009; Sockett, 2009; Banks et al., 2005, and Kaufman, 2009). Sanusi et al., (in Saud, 2008) elaborate a number of terms related to the concept of profession which include the terms *profession* which means that the job requires expertise, *professional* which refers to the performance of the person carrying out the job as required by a profession, *professionalism* which refers to the commitment of members of the profession to improve their ability, and *professionalization* which refers to the process of professional development to meet professional standards.

Another concept of profession is mentioned by Shulman (in Bransford, et al., 2005). Shulman mentions six characteristics shared by all professions. A profession is a job that entails a service to society, requires a body of scholarly knowledge, demands engagement in practical actions, maintains dynamics, takes into account the importance of experience, and grows as the development of a professional community.

Hamied (2009) also mentions a number of characteristics of a profession. According to Hamied, a profession must maintain a significant social function in communities and its members must have expertise which is gained from accountable education or training. He also adds that members of a profession should uphold high discipline and ethical conduct and should gain income from the profession.

Teaching as a Profession

As a profession, teaching also upholds general principles shared by all professions as mentioned in previous sections. However, there are specific aspects that are attributed to teaching profession. In Indonesian context, as mandated by Law No. 14/2005 on Teachers and Lecturers, and Ministry Regulation No. 16/2007 on Teachers' Academic Qualification and Competencies,

teachers must qualify for four competencies: pedagogical competency, personal competency, social competency, and professional competency, each of which is measured through a number of indicators (Government Regulation No. 74/2008 on Teachers). The regulation provides the competency standards on each subject for different levels of schools. The standards seem to have been based on theories of good language teaching (Brown, 2001).

Good teaching theories have long become dynamic discussions by educators and education researchers. In discussing teaching as a profession, Bransford et al., (2005) mentions three aspects on essential knowledge required for teaching which comprises knowledge of learners and their development in social contexts, knowledge of subject matter, and knowledge of teaching.

Knowledge of Learners

The importance of knowledge of learners for teachers has been discussed by a number of scholars (Banks, et al., 2005; Luke & Elkin, 1988; Clark & Medina, 2000; Nikitina & Fumitaka, 2009; and Gebhard, 1996). According to Banks et al., (2005), one of the aspects that teachers should know about their learners is learner diversity. Diversity is the nature of human being and students are always different from each other. Their differences can include their culture, economic background, cognitive ability, and motivation. Professional teachers should know how to handle culturally diverse students. Teachers need to have a broad set of teaching strategies to deal with students with different cultural backgrounds. Banks et al., (2005) add that the knowledge of culture can include knowing of self and of others. Besides knowing their students' cultural backgrounds, teachers should also know that learners also live in social setting where literacy practices are always changing. This situation demands that teachers need to be familiar with the uncertainty and dynamics of learners' daily life (Luke & Elkins, 1988; Clark & Medina, 2000).

In addition to such external factors as cultural backgrounds, literacy practices, and discourses, internal factors coming from learners are also dominant aspects that construct diverse learners (Nikitina & Fumitaka, 2009; Gebhard, 1996). Nikitina & Fumitaka (2009) and Gebhard (1996) argue that these internal factors are such factors as motivation and cognitive ability. Different learners may have different motivation when learning. Some learners may have high motivation while others may have low motivation. Similarly, different learners may have different cognitive ability. Teachers should be prepared with the knowledge of learners' diversity and the knowledge of how to deal with the diversity.

Banks et al., (2005) emphasize the importance of knowing the diversity on learners' cultural background, Clark & Medina (2000) and Luke & Elkins (1988) point out the importance of understanding diversity on learners' daily life environment, and Nikitina & Fumitaka (2009) and Gebhard (1996) concern with the importance of knowing learners' diversity on cognitive and motivation differences.

Knowledge of Subject Matter

Bransford et al., (2005) mention knowledge of subject matter as another aspect that a teacher should possess. Knowledge of subject matter includes knowledge of subject being taught and

knowledge of how to teach the subject. Knowledge of subject matter is scholarly knowledge that a teacher has gained from schooling as well as from individual knowledge development.

Grossman et al., (2005) and Darling-Hammond & Berry (2006) also mention the importance of knowledge of subject matter for teachers. According to Grossman et al., teachers should possess deep knowledge of the subjects they teach. Similarly, Darling-Hammond & Berry (2006) also acknowledge the importance of knowledge of subject matter. Darling-Hammond and Berry say that a teacher's knowledge of subject matter has a significant role on students' achievement.

Knowledge of Teaching

Knowledge of teaching is also an important aspect that triggers the success of teaching. Theories of knowledge of teaching have been proposed by a number of researchers (Alatis, 2007; Jenkins, in Bransford et al., 2005; Borko et al., 2009; Harmer, 2007; Pennington, in Brown 2001; and Brown, 2001). According to Alatis (2007), in language teaching, good teaching will be met when the teachers meet the following aspects: competency, encouraging personalities, and care. This statement implies that there are prerequisites for successful teaching. First, it must be done by competent teachers; second, it requires non-discouraging teachers; third, the teachers must use accommodative approaches; and fourth, the teachers must care for the students lovingly. These prerequisites imply that good teaching can be understood as a part of nurturing.

There are many variables that apply across teaching situations (Jenkins, cited in Bransford et al., 2005; Borko et al., 2009). These variables can be grouped into four categories: nature of the content, teaching and learning activities, characteristics of the learners, and criterial tasks. These variables affect the effectiveness of teaching. Jenkins (in Bransford et al., 2005) also mentions that teaching practice happens as a collaborative process of four aspects : content, activities, tasks, and learners – each of which has an important role in the achievement of the practice. Thus, it can also be justified that teachers must know knowledge of teaching content, knowledge of teaching activities, knowledge of learners' characteristics, and knowledge of criterial tasks. Knowledge of criterial tasks is the knowledge on the level to the extent students should attain in their learning. These are such levels as to recognize, to recall, or to practice problem solving.

Jenkins (in Bransford et al., 2005) further elaborates her idea that appropriate levels of difficulty should also be taken into account in selecting and designing teaching materials so that the materials can function as a means of attaining goals, that the teaching and learning activities should be made varied that may include lectures, simulations, hands-on (offering active participation), and problem solving, and that the students should develop motivation and attitudes to foster their achievement in attaining knowledge and skills, while the tasks should include recognition, recall, problem solving, and should create effectiveness of new learning.

EFL Teachers' Professionalism and Its Indicators

On the issue of professional characteristics, a number of writers have elaborated the concept of professional teachers. Brown (2001), for example, identifies qualities of professional language teachers by classifying his ideas into four categories: technical knowledge, pedagogical skills, interpersonal skills, and personal qualities. First, foreign language teachers must be

knowledgeable on a number of aspects such as linguistic system, principles of language learning and teaching, knowledge of language skills, knowledge of how language is learnt, knowledge of the connection between language and culture, and knowledge of issues on language through conference and workshop attendance.

Second, professional foreign language teachers must be skillful in two aspects. These are pedagogical skills and interpersonal skills. Language teachers must be well-informed with theories of language teaching and various teaching techniques. This will help teachers make classroom decisions. They should also be able to design and execute lesson plan. Professional language teachers should not be dependent on others. They must be self-subordinated and they should not be under the control of other teachers. They must be under self-control. Professional teachers must be the ones who are ready to give optimal feedback to their students. They must promote student interaction and create teamwork. They also should be creative, effective, and innovative.

Third, professional foreign language teachers must have interpersonal skills. The interpersonal skills include: the awareness of cross-cultural differences and the sensitivity of students' cultural background, ability to respect students' opinion, a sense of patience, ability to promote students' critical thinking, good cooperation with colleagues, and positive habit of knowledge-sharing.

Fourth, professional language teachers must have personal qualities. They must be well-organized, conscious in meeting commitments, and dependable. They must also be flexible when things go awry. Professional language teachers must always curiously try to create new ways of teaching. Next, professional teachers must have short-term and long term goals for their continued professional growth. Last, they must maintain high ethical and moral standards.

In discussing the qualities of EFL teachers, Allen (in Brown, 2001) mentions nine characteristics of good EFL teachers. According to Allen, a professional EFL teachers must hold a degree in TESL/TEFL, love English language, be critical thinkers, be persistent to upgrade oneself, be independent, get ready to go extra mile, be familiar with cultural adaptability, be a professional citizenship, and love the job of teaching English. From these characteristics, we can argue that in order to become a professional EFL teacher, one must hold an academic degree in Teaching English as a Foreign Language, must have positive attitudes of English language, must have positive attitudes on language teaching profession, and should be a critical person.

A professional EFL teacher must hold a degree in Teaching English as a Foreign Language. In Indonesian context, based on Law No. 14/2005, English teachers must hold a four-year college education (undergraduate degree) in English language teaching. This becomes the basis of the licensure for the teachers. This is an important issue since one of the problems of education (in Indonesia) is the fact that there are still many teachers who do not hold this degree. A significant number of them only hold a two-year college or three-year college education. Many of them even do not have degree at all in English education. They are out-of-field teachers. Of 2,783,321 teachers in Indonesia less than 35% of them hold an undergraduate degree in their subject

(Hamied, 2008). Thus, about 65% of teachers have not met the requirement of teaching profession.

Positive attitudes of the English language is also an important factor for EFL teachers (McGroarty, 1996). It becomes the initial and crucial factor for becoming creative EFL teachers. McGroarty also adds that positive attitudes of the English language will raise teacher's and students' awareness to use English. The awareness of using English is an important factor for the success of the teaching process considering that in EFL situations, the opportunity to use English in community is very minimal especially for speaking. Therefore, interaction in the classroom becomes the major opportunity for students and teacher to practice using the language. According to Sockett (2009), positive attitude is part of teaching disposition that becomes one of qualities that a professional teacher must possess along with knowledge and skills. Thus, positive attitude of the English language is part of teaching dispositions for EFL teachers. It is a virtuous aspect that can trigger the teachers to become more creative and to become more motivated in doing their job (Sockett, 2009).

Professional EFL teachers are supposed to be knowledgeable and sensitive to cultural differences that exist between English language and learners' first language (Yeh, 2005; Boyle-Baise, 2005). Language is part of culture. Thus, having positive attitude of the English language includes having positive attitude of the English cultures as teaching language entails teaching cultural aspects of the language. For example, some students feel confident when their errors are corrected directly, while other students like indirect correction (Houten, 1980). Wrong treatment of student's error may hinder interaction.

Professional teachers must promote critical thinking. They are the architects of intellect (Fogarty & McTighe, 1993). Current educational practices move from teacher center to learner center and this requires teacher to give learner more opportunity to express their ideas, argument, and reasoning. Classroom practices should not oppress learners by depositing knowledge to learners (Freire, 1993). Learner center practices require the interaction among learners and learners and interaction between learners and teacher. For this reason, teachers must possess a certain level of cognitive ability since cognitive ability becomes the prerequisite to thinking.

Gebhard (1996) argues that foreign language teachers must create an interactive classroom. Good language teaching should provide opportunities for students to interact. To create an interactive classroom, teachers must understand aspects that can promote students interaction. At the same time, they must also recognize some aspects that may hinder students to interact. Gebhard adds that to do so, teachers must learn from their experience, must realize their role, and must be able to identify the problems that EFL/ESL teachers face in teaching. Knowing the principles of interactive classroom is fundamental for current foreign language teaching as the teaching of foreign language has changed to a new direction, that is shifting from teaching grammar to teaching communicative function.

The previous practices of foreign language teaching had undergone a fashion where teacher-centered model became common traditions (Gebhard, 1996). Besides teacher-centered fashion,
