ABSTRACT

This study was set out with the aim of investigating the errors of IELTS candidates in writing and speaking modules in order to know the source or the cause of the errors. To this end, sixty IELTS candidates from Pardis Danesh Institute, Tehran, Iran, who took part in a mock IELTS test participated in the present study. To achieve the aforementioned purpose the obtained data were analyzed to identify the type and frequency of the grammatical errors as well as cohesion and coherence errors made by the participants. Moreover, a comparison was made among male and female candidates to find out the differences between the type and the frequency of their errors. In order to discover grammatical errors of the learners, the researchers followed the steps identified by Corder (1981), and in order to analyze the cohesion and coherence errors, they used Halliday and the Prague School of Linguistics' topic structure analysis approach to coherence, and Halliday and Hasan's approach to cohesion. The results indicated that inappropriate choice of noun is the most frequent error which is occurred in participants' performance regarding the grammatical analysis of the data. Furthermore, the analysis of cohesion and coherence errors indicated that candidates have more problems regarding the fluency of their utterances. And finally, data analysis revealed that although there is no great difference among male and female candidates regarding the total number of errors, male candidates made more errors than females on the whole. The findings of the present study can have implications for researchers, teachers, and learners in order to develop understanding of the second language acquisition process. Therefore, they can benefit the results by being aware of the learners' most frequent errors in the process of language learning and focus their attention on the features that may help the learners to have fewer errors in the production of the second language and assist them to become more successful language learners.

KEYWORDS: Error Analysis, Cohesion, Coherence, Grammatical Errors, IELTS Test.

INTRODUCTION

Error analysis in particular is one of the aspects of second language learning processes which has received much attention from researchers. Early researches on error analysis were focused on

collecting and classifying errors. It is unavoidable to make error in language acquisition, and making error is not seen as something negative or destructive, rather they are significant in that they are evidence of how learners acquire language. They occur when the learner is unable to self-correct, and deviates target language system (Brown, 1987).

Error Analysis is valuable and helpful in second language learning because it is a reliable indicator of the problematic areas to learners, teachers, syllabus designers, test developers, and textbook writers. Remedial exercises can be designed to focus more attention on the 'trouble shooting' areas (Keshavarz, 1999). It is a type of linguistic analysis that is concerned with the errors learners make. It involves a comparison between the errors made in the target language and that target language itself (Ellis, 2008). It is an activity to identify, classify and interpret the errors made by someone in speaking or in writing and it is carried out to gain information on common difficulties faced by someone in speaking or in writing English sentences. Early on, researches focused on learners' errors, developing procedures for identifying, explaining, describing, and evaluating them. These studies revealed that learner's errors are systematic and that they reflect the stage of the development that a learner has reached (Corder, 1967; Corder, 1974; Ellis, 2008). An important finding was that learners seem to go beyond the available input, producing errors that show they actively construct rules, which although not target like, guide their performance in the second language.

Error analysis provides teachers and researchers with a priceless source of information. It offers information on learners' errors which in turn helps teachers to correct learners' errors and also enhances the effectiveness and usefulness of their teaching. Michaelides (1990) declares that the systematic analysis of learner's errors can be of countless value to all those involved, i.e., learners, teachers, test developers, and the researchers. For teachers it can offer a clear and reliable picture of her/his learners' knowledge of the second language.

Statement of the Problem

The importance of second language learners' errors has been contended by numerous studies. According to Corder (1974), learners' errors are significant in three ways. First to the teacher, it can reveal how far the learner has progressed and what remains to be learnt. Second, they provide to the researcher evidence of how language is learned or acquired, and what strategies or procedures the learner is employing in his discovery of the language. Thirdly, they are indispensable to the learner himself, because we can regard the making of errors as a device the learner uses in order to learn.

Despite the increase in scholarship devoted to error analysis (Ahmadvand, 2008; Brown, 2006; Chen, 1996; Cotton & Wilson, 2008; Darus, 2009; Jabbari & Fazilatfar, 2012; Nezami, 2012; Ying, 1987), analyzing the candidates' errors in writing and speaking modules of IELTS have received relatively little attention and also researchers did not account for the effect of gender on learners' errors. And also, there has been little research on errors in written English compared with the studies that have concentrated on reading and phonology even within the limited field of error analysis. The study to be done is supposed to shed light on the issue of error analysis, and on the second language learning process.

Purpose of the Study

Based on the literature, the study of error is of paramount importance for researchers, teachers, and learners in order to develop understanding of the second language acquisition process. There is a need for students to recognize the significance of errors which occur in their writing and speaking, to fully grasp and understand the nature of the errors made. The present study will be carried out with the aim of identifying the errors of IELTS candidates in writing and speaking modules in order to know the source or the cause of the error and how the students can learn from their mistakes in order that they will not make some errors repeatedly.

REVIEW OF LITERATURE

Errors comprise a significant portion of a learner's language performance and they provide important insights into the processes of second language acquisition. Explanation of errors will have to be multi-dimensional and include factors beyond the observable characteristics of the errors (Cotton & Wilson, 2008; Darus, 2009; Jabbari & Fazilatfar, 2012; Nezami, 2012). Researchers indicate that errors are caused by competence factors (lack of knowledge of the rules) rather than performance factors (fatigue and inattention). Corder (1967) defines errors as systematic deviations which occur due to the learner's still developing knowledge of the second language rule system; errors are considered as any deviation from a selected norm of language performance. There are different types of errors: global errors, local errors, developmental errors, interlingual errors, ambiguous errors, and grab bag errors (Ellis, 2008; James, 1985; Lee, 1980). Global errors are errors that affect overall sentence organization and they may significantly hinder communication, while local errors affect a single element in a sentence; previous studies revealed that errors which significantly hindered communication were of a certain type (Global errors) and those did not hinder communication were of another type (Local errors). Global errors violate the whole structure of an utterance and for this reason may make it challenging and difficult to process.

Developmental errors are errors similar to those made by children learning target language as their first language. On the other hand, interlingual errors are similar in structure to a semantically equivalent phrase or sentence in the learner's native language. Ambiguous errors are those that can be classified equally well as developmental or interlingual, so they are either developmental or interlingual. And finally, those errors which are neither developmental nor interlingual are called grab bag errors (Darus, 2009; Ellis, 1994; Lee, 1980; Olsson, 1973; Richards, 1985; Wiley, 2010). Furthermore, Corder made a distinction between non-systematic and systematic errors. Nonsystematic errors appear in learners' native language. Corder names these 'mistakes' and asserts that they are not vital to the process of language teaching and learning. He uses the term 'errors' for the systematic ones, which happen in a second language.

Definition of Error Analysis

Error analysis is a type of linguistic analysis that is concerned with the errors learners make. It consists of a comparison between the errors made in the target language and that target language itself (Ellis, 2008). It is an activity to identify, classify and interpret the errors made by someone

in speaking or in writing and it is carried out to obtain information on common difficulties faced by someone in speaking or in writing English sentences.

Carl James, in his *Errors in Language Learning and Use*, describes Error Analysis as “the process of determining the incidence, nature, causes and consequences of unsuccessful language” (James, 1998). He states that error analysis will investigate what people do not know and how they try to cope with them. Corder states that Error Analysis is different from ‘performance analysis’ in that the “performance analysis is the study of the whole performance data from individual learners, whereas the term EA is reserved for the study of erroneous utterances produced by groups of learners” (Corder 1975 cited in James 1998). It is crucial to make a distinction between error and mistake. To recognize errors and mistakes, the consistency of learner’s performance should be checked. Corder, (1967) introduces a criterion that helps to make such a distinction: it is the self-correction criterion. A mistake can be self- corrected, and modified, but an error cannot. Errors are ‘systematic,’ and are occurred repeatedly without being organized by learners. The researchers choose to work on learners’ errors and not their mistakes.

Importance of Error Analysis

At first sight, focusing on learners’ errors rather than their success may seem unusual and odd. However, focusing on errors can be useful in that they are an indicator of learner language, raising the central question of ‘why do learners make errors?’; error analysis is also useful for teachers to know what the problematic areas are in order to give remedial instructions. And finally, making errors may in fact help learners to learn when they monitor and self-correct the errors they make (Ahmadvand, 2008; Brown, 2006; Darus, 2009; Ellis, 1994; Lee, 1980; Olsson, 1973; Richards, 1985; Wiley, 2010).

In second language learning, as Corder observes, the learners’ errors are indicative of the state of the learners’ knowledge, and of the ways in which a second language is learned. Corder (1974) distinguishes three types of error according to their systematicity: Pre-systematic, Systematic, and Post-systematic errors. Other experts like Dulay and Burt (1974) classified the errors into three broad categories: Developmental, Interference, and Unique errors. Ellis (2008) argues that classification of errors helps us in diagnosing learners’ language problems at any stage of their development. Corder (1967) says that the presence of errors indicates that language learning is taking place. He points out that errors can give significant understanding into how a learner learned a language. The reasons and sources behind errors are manifold. Cooper (1977) states that “language deviations are not random but systematic and reflect an implicit hypothesis to the nature of language being learned”.

Procedures of Error Analysis

James (1998) identifies four stages for error analysis. The first stage is error detection which spots the error itself. The second stage is error location in which the informer locates the error. The following stage is error description and the learner’s language system is described. And finally, the last stage is error categorization or classification. Corder (1974, cited in Ellis 1994) suggests a complex way of getting to the problems that analysts face when trying to identify errors. Ellis states that the proposed procedure “[...acknowledges the importance of

‘interpretation’ and distinguishes three types: normal, authoritative, and plausible”. The distinctive types displayed refer to different interpretations of errors made by the analysts. Corder (cited in Ellis, 2008, p. 46) identifies five steps in error analysis which includes: collection of a sample of learner language, identification of errors, description of errors, explanation of errors, and evaluation of errors. After collecting an authentic and reliable sample of learner language, the analyzer must identify the errors. To identify errors, learners’ sentences are compared with what seem to be the normal or correct sentences in the target language which correspond with them. Sometimes this is fairly straightforward. When all the errors have been identified, they can be depicted and described. In this stage errors are described whether they are overt or covert, and then they are classified into different types. There are numerous ways for categorizing errors. One way is to classify errors into grammatical errors. Another way might be to try to identify the general ways in which the learners’ sentences differ from the target-language sentences. Classifying and describing errors are of great help to diagnose and detect learners’ language learning problems at different stages of their development (Ellis, 1997). An overt error is easy to identify because the sentence is not well-formed and there is an obvious deviation in its form, but covert errors appear in sentences which are superficially well-organized and well-formed (Corder, 1971).

The first two steps in error analysis, identification and classification, are preliminaries to the much more demanding task of explaining why errors occur. In this step sources of errors are examined. Learners’ errors can have several sources like transfer of first language knowledge into second language, overgeneralization, omission, and interlingual causes. The final stage in error analysis is error evaluation which is done with the aim of helping learners learn second language. General and local errors are distinguished here; some errors can be considered more crucial and serious (global errors) than others because they are more likely to hinder communication. Teachers, syllabus designers, and test developers will want to focus their attention on these errors.

RESEARCH QUESTIONS

This study is seeking to answer the following questions:

RQ1. What are the most frequent grammatical errors made by IELTS male and female candidates?

RQ2. What are the most frequent cohesive and coherence errors made by IELTS male and female candidates?

RQ3. Are there any significant differences regarding types and frequencies of errors among male and female candidates?

METHODOLOGY

Participants

Sixty IELTS candidates who took part in a mock IELTS test participated in the present study. For the purpose of the current study, the participants’ performances on Task 2 of the writing module along with section 3 of the speaking module of the mock IELTS test were selected. The

participants were from Pardis Danesh Institute in Tehran. Some of the participants took part in the mock IELTS test in October 2013 while the others took part in the aforementioned test in January 2014. Their age range was 20-35. The participants were 30 males and 30 females.

Instrumentation

The data for the present study was the IELTS candidates' performance on Task 2 of the writing module along with section 3 of the speaking module of the mock IELTS test. The writing sections were analyzed by the researchers using error analysis methodology. Moreover, the speaking part was recorded and transcribed by the researchers followed by error analysis to realize and calculate the frequency of the errors made by the participants.

Data Collection Procedure

Data collection procedure started in October 2013 and is ended in February 2014. Sixty IELTS candidates were chosen from Pardis Danesh Institute, Tehran, Iran. First the participants took part in a mock IELTS test. Then the researchers collected their performance on the task 2 of the writing module and section 3 of the speaking module. Afterwards the researchers analyzed the content of the participants' writings. At first, they analyzed the data to discover grammatical errors of the learners by following the steps identified by Corder (1981, cited in Ellis, 2008, p. 46) in order to recognize the errors and frequency with which they were made by the participants. Subsequently in order to analyze the cohesion and coherence of the participants' performance on task 2 of writing module, the researchers uses Halliday and the Prague School of Linguistics' topic structure analysis approach to coherence, and Halliday and Hasan's approach to cohesion. The same procedure was carried out for analysis of the section 3 of the speaking module.

Data Analysis Procedure

For analyzing the collected data, the researcher followed the steps identified by Corder (cited in Ellis, 2008, p. 46) which includes: Collection of a sample of learner language, Identification of errors, Description of errors, Explanation of errors, and Evaluation of errors.

Grammar Analysis

To know the description of the grammar errors in the students' writing and speaking, the researchers identified the grammar errors, and classified them into 6 aspects: Verbs, Nouns, Conjunctions, Articles, Pronouns, and Prepositions. The following table shows the classification of the grammatical errors which have been used in this study:

Category	Subcategories					
Verbs	Missing	Tense	Singular/Plural	Incorrect Positive Form	Incorrect Negative Form	Gerunds, Infinitive, Participles
Nouns	Missing	Singular/Plural	Inappropriate Choice			
Conjunctions	Missing	Misplaced	Inappropriate Choice			
Articles	Missing	Superfluous	Inappropriate Choice			
Pronouns	Missing	Superfluous	Inappropriate Choice			
Prepositions	Missing	Superfluous	Inappropriate Choice			

Cohesion and Coherence Analysis

For analyzing learners' coherence and cohesion errors, the researcher uses Halliday and the Prague School of Linguistics' topic structure analysis approach to coherence, and Halliday and Hasan's approach to cohesion. Topic structure analysis (TSA) is an approach to analyzing coherence. It has been used to identify different categories of thematic progression, the most common being sequential progression where the rheme of one sentence becomes the theme of the next (a-b, b-c, c-d), and parallel progression where the theme of one clause becomes the theme of the next or subsequent clauses (a-b, a-c, a-d). Alternatively, in extended parallel progression, the first and the last topics of a piece of text are the same but are interrupted with some sequential progression (a-b, b-c, ad). Topic-based analysis involves analyzing the ways in which topics evolve and change over a stretch of text (Cotton & Waltson, 2008). Analysis of cohesion must include an approach which identifies the explicit lexical and grammatical items which bind a text together. The most influential approach to cohesion to date was developed by Halliday and Hasan (1976) who identified five distinct categories: reference, substitution, ellipsis, conjunction and lexical cohesion (Cotton & Waltson, 2008).

RESULTS AND DISCUSSION

The results of the present study are reported in three parts. The first part of this section deals with the result of the grammatical analysis of the errors in the students' writing and speaking and calculation of the frequency with which they occur. The second part deals with the frequent cohesive and coherence errors made by IELTS male and female candidates. Finally, the third part consists of the differences regarding types and frequencies of errors among male and female candidates.

RQ1: Grammatical analysis of the errors in the students' writing and speaking performance on a mock IELTS test

The researchers identified the grammar errors, and according to Corder (cited in Ellis, 2008, p. 46), classified them into 6 features: Verbs, Nouns, Conjunctions, Articles, Pronouns, and Prepositions. Each of these categories consists of some subcategories which were analyzed and the frequency of their occurrences in the participants' performance was calculated and reported in the Table 1.

Table 1 represents the observed errors made by participants and the frequency with which they were attended to. The errors in each category are arranged from the most frequent to the least frequent one. On the whole, 948 errors in the writing and speaking performance of the participants were observed in the data. As the table presents, the error category which was most frequently attended to was the *Noun* category in which the subcategory of *Inappropriate Choice* was the most frequent error made by participants that was identified in about 14% of the errors. Making *singular/plural* error in category of Nouns occurred 135 times. *Missing Nouns* and *Missing Conjunctions* were the next two error categories which were identified in students' performance. These four error types were the ones that were presented the most in the data. All in all, most of the errors occurred in the category of *Nouns*. The second category in which the most errors were recognized was *Verbs*. *Prepositions* and *Conjunctions* were also among the errors

that have been observed the most in the analyzed data. The rest of the errors are listed in the table. As it can be seen, *Incorrect Negative Forms* is attended to less than other errors.

Table 1: The observed Grammatical Errors Made by the IELTS Candidates

N	Category	Subcategories	Frequency	Percentage
1.	Nouns	Inappropriate choice <i>E.g.: They can (create) their food.</i>	140	14.7
		Singular/plural <i>E.g.: They care about their (childs).</i>	135	14.2
		Missing <i>E.g.: Get much (more) time than before.</i>	75	7.9
2.	Verbs	Tense <i>E.g.: many years ago there (are) small restaurants.</i>	57	6
		Gerunds, Infinitive, Participles <i>E.g.: The only thing they can do (to resolving) this problem is raising the cost of food.</i>	56	5.9
		Singular/Plural <i>E.g.: The teachers (wasn't) kind.</i>	50	5.2
		Missing <i>E.g.: Fast food (is) usually very delicious</i>	42	4.4
		Incorrect Positive Form <i>E.g.: To teach them how (can they) have a healthy diet.</i>	14	1.5
		Incorrect Negative Form <i>E.g.: She (don't) have to cook.</i>	6	0.6
3.	Prepositions	Inappropriate Choice <i>E.g.: It's better (to) children to rely on themselves.</i>	38	4
		Superfluous <i>E.g.: Characters of children determined (in) before 7 years old.</i>	37	3.9
		Missing <i>E.g.: It's hard to learn all (of) them.</i>	30	3
4.	Conjunctions	Missing <i>E.g.: The reality is (that) the real junk foods are fast foods.</i>	72	7.5
		Inappropriate Choice <i>E.g.: They start their school (and) their age is not good for starting school.</i>	17	1.7
		Misplaced <i>E.g.: If we ask (and) them.</i>	10	1
5.	Articles	Missing <i>E.g.: They have to go to (the) restaurant.</i>	56	5.9
		Inappropriate Choice <i>E.g.: To play (an) musical instrument.</i>	15	1.5
		Superfluous <i>E.g.: (a) small groups of</i>	14	1.4
6.	Pronouns	Missing <i>E.g.: The people must know that (they) must change this condition.</i>	46	4.8
		Inappropriate Choice <i>E.g.: Everyone could publish (their) beliefs.</i>	31	3.2
		Superfluous <i>Education, in Iran's context, (it) is an essential part of people's life.</i>	7	0.7
Total			948	100

RQ2: Analysis of Cohesive and Coherence Errors Made by IELTS Male and Female Candidates

According to topic-based structure analysis method (Watson, 2004), at the first the analyzed texts were broken into 3 units; introduction, body, and conclusion. Then in each unit, the researchers investigated the sentence structures, dependent, independent clauses, incomplete and paralleled structures, and ellipted words and sentences. In the second stage, the key concepts in each text were identified based on topic-based method; words with interactional functions (e.g. I guess) and textual functions (e.g. reasoning) were recognized. In the next stage the relationships between key concepts were detected and linked together based on the degree of the concept relatedness. Finally, the overall cohesion and coherence were measured to find out the comprehensibility and acceptability of the text. In order to analyze the candidates' coherence errors, Halliday's topic structure analysis was utilized and the sequential theme-rheme progression was identified. In the analysis of the performance of the students in the writing and speaking tests, 6 types of cohesion and coherence errors were identified and categorized by the researchers. The extracted errors included:

1. *Fluency*: It is assessed based on the candidates' errors such as mispronunciation, substitution, self-correction, using of hedges and omissions. It also refers to the comprehensiveness and appropriateness of their utterances.
2. *Cohesive devices*: It refers to the linking words or phrases in a sentence which make the text coherent. The examples of cohesive devices are however, in conclusion, hence, at last, eventually, finally, rarely, normally, at first, moreover, and further. Each one of these examples can be used to begin a sentence or to link together the sentences.
3. *Conveying the Message*: It refers to the clarity, being to the point, simplicity and intelligibility of the utterances and sentences.
4. *Logical progression*: It refers to the choice of words and sentences considered to be logical and reasonable according to the condition and situation in which they are performed.
5. *Background knowledge and Experience*: It refers to the personal experiences, bringing examples and what a person already knows about the topic.
6. *Theme-rheme Progression*: It refers to the sequential progression where the rheme of one sentence becomes the theme of the next (a-b, b-c, c-d), and parallel progression where the theme of one clause becomes the theme of the next or subsequent clauses (a-b, a-c, a-d).

Table 2: Cohesive and Coherence Errors Made by IELTS Candidates

Number	Category	Frequency	Percentage
1.	Fluency	93	25
2.	Cohesive devices	79	21.7
3.	Conveying the Message	58	15.9
4.	Theme-Rheme Progression	52	14
5.	Logical Progression	46	12.6
6.	Background Knowledge and Experience	36	9.8
Total		364	100

Table 2 demonstrates the observed cohesion and coherence errors made by IELTS candidates and the frequency with which they were attended to. 6 types of errors were distinguished and categorized by the researchers. The errors are arranged from the most frequent to the least frequent one. In general, 364 errors of cohesion and coherence in the writing and speaking performance of the participants were identified in the data. As it is presented in the table, the error which was most frequently attended to was the *Fluency* which was recognized in 25% of the errors. Making error in usage of *cohesive devices (linking words or phrases)*, occurred 79 times. *Conveying message* and *Logical progression* were the next two error categories which were identified in students' performance. These four error types were the most frequently occurred errors discovered in the participants' performance. The rest of the errors are listed in the table. As it can be seen, the *background Knowledge and Experience* is attended to less than other types of errors.

RQ3: A Comparison of the Observed Errors and Frequencies of Errors among Male and Female Candidates

To answer the third question of the present study regarding the difference concerning the types of errors made by male and female candidates, the researchers compared male and female candidates' errors and the result is presented in table 3.

Table 3: A Comparison of the Observed Errors and Frequencies of Errors among Male and Female Candidates

Gender	Error Category	frequency	percentage
Male	Grammatical	532	40.5
	Cohesion & Coherence	163	12.4
Female	Grammatical	416	31.7
	Cohesion & Coherence	201	15.3
	Total	1312	100

As it is shown in table 3, male candidates made more grammatical errors than females, while female candidates made more cohesion and coherence errors. As it is obvious from the data represented in table 3, on the whole male participants made 695 error types while females made 617 types of errors. Totally, 1312 error types were identified in candidates' performance in which 40% of grammatical errors were male candidates' errors. On the other hand male participants made less cohesion and coherence errors than females and 15% of errors were made by females in the category of cohesion and coherence.

Discussion

As it is stated by Corder (1981), errors made by learners are significant and can provide us with important information in three ways, first of all it is important for teachers regarding the fact that error analysis can disclose how far the learners has progressed and what still remains to be learned. Secondly, the researchers will be provided by evidence of how the language is learned or acquired and what type of strategies and processes used by the language learners in discovery of the language. Finally, they are essential to the learner himself, because we can consider the making of errors as a device the learner uses in order to learn. Moreover, as it is mentioned before, according to Ellis (2008) classification of errors helps us in recognizing and analyzing learners' language problems at any stage of their development.

Besides, studying errors is of supreme significance for teachers, researchers, and learners in order to expand their understanding of the second language acquisition process. This study also aimed at identifying the errors of IELTS candidates in writing and speaking modules in order to be acquainted with the source or the cause of the error and how the students can learn from their mistakes in order that they will not make some errors repeatedly. Furthermore, the current study considered the role of gender in making errors and to see if there exist any difference regarding types and frequencies of errors among male and female candidates.

As it was indicated in the results of the grammatical analysis of the data, the error category which was most frequently attended to was the *Noun* category in which the subcategory of *Inappropriate Choice* was the most recurrent error made by participants. One probable reason for this result can be due to educational system in Iran in which the teachers and administrators yet pursue traditional approaches for grammar teaching, and despite all innovations in this field they still follow the steps and principles of GTM by using deductive approaches for teaching grammatical rules and forget to pay enough attention to pragmatic approaches and the language use which seems to play an important, essential role in learning a second language.

Another reason can be the cultural differences and the effect of first language culture, learners' unfamiliarity with the pragmatic of the target language and L1 interference that lead the learners to use inappropriate nouns in specific situations, which make their utterances unintelligible and unacceptable. Moreover, in the context of Iran's educational system, nouns usually decontextualized and represented to the learners without indication of an appropriate context in which they can be utilized.

This result is not compatible with Murrow's inference (2004), in which the result of the study revealed that errors relating to use of *Verbs* far outweighed any other category. Moreover, it concluded that Confusion between parts of speech, for example adjectives used as adverbs, was the next most common error. In addition, the result revealed that the second category in which the most errors were recognized was *Verbs* in which the subcategory of *Tense* occurred the most in participants' performance. This result is in line with Hourani's deduction (2008), in which he analyzed the common grammatical errors in the English writing and concluded that students find a difficulty when and how to use the tense and the form of the verb more frequently than other types of errors. So far, many studies have been conducted regarding the role of coherence and cohesion in pragmatics (Wolska, 2008; Witte & Faigley, 2008; Dontcheva-Navratilova & Povolná, 2009; Toolan, 2013), there seems that there is a need for inclusion of pragmatic instruction in the classrooms in order to have more comprehensible and coherent utterances.

The second part of data analysis regarding the cohesion and coherence error analysis demonstrated that the error which was most frequently attended to was the *Fluency*. This can be because of the lack of opportunities to practice the language in real context and not having enough exposure to language in use in language classes, this can happen because English in Iran is considered as a foreign language rather than a second language and outside the classrooms students will not be provided by enough chance to practice what they have learned in order to become more fluent. More prominently, as it was stated most of the language institutes still

follow traditional approaches to teaching English which focuses on accuracy rather than fluency and as a result learners may be less fluent than accurate.

Also, the result indicated that students have problems regarding *conveying the message* appropriately and *logical progression* of their utterances. This can be due to students' lack of awareness of pragmatics. This result is well-matched with Povolna (2012), who argued that pragmatic awareness approach to teaching intended to develop a gradual awareness of the difference between the foreign-language-learners' performance and that of capable users of the language, that is to say native speakers of English. Tomlinson (1994, cited in Pavolna 2012), also believed that as a result of pragmatic awareness challenging features of suitable language use can be recognized and their acquisition facilitated.

Eventually, the third part of the result section which is a comparison of the observed errors and frequencies of errors among male and female candidates demonstrated that as a whole male candidates made more errors than females, on the other hand female candidates although have less errors concerning the total number of errors but they have more cohesion and coherence errors than males. This can be because of the fact that females according to Holmes (1995), and McMillan (1977) intended to have more accurate utterances and Women's language is more indirect, less blunt, and has more prestigious forms. Also, as it is stated by Lackoff (1975) and Holmes (1995), Women used more hedges and tag questions than men which may cause this error type. Besides, Since 1970s many scholars such as Deborah Cameron, Penelope Eckert, Janet Holmes, Deborah Tannen, Robin Lakoff, and others began research in language and gender and concluded that men and women use language differently. The result of this section is in line with Saeed, Ramazan, Gujjar & Iqbal's inference (2011), who concluded that women being better language learners than men.

Like all other studies, this study also suffers some shortcomings. The main shortcoming of this study can be the limited number of participants. With larger population and analyzing more learners' performance, other problems and differences among participants can be distinguished which is worth taking into account. Besides, the participants were not homogenized and the researchers did not consider the possible differences in participants' background knowledge, their age, and level of language proficiency which may lead to dissimilar outcomes. Moreover, since the participants took part in a mock IELTS test, they may not represent their best performance because they have considered it just as a preparatory examination not a real one. The analysis of the genuine IELTS examination may supply us with a different result which is worth considering.

CONCLUSION AND IMPLICATIONS

The present study sought to investigate the errors of IELTS candidates in writing and speaking modules in order to know the source or the cause of the error. The study aimed to analyze and identify the frequent grammatical errors made by male and female candidates who took part in a mock IELTS examination. Moreover, the current study attempted to examine the most frequent cohesive and coherence errors made by aforementioned participants. Likewise, this study was

conducted to indicate the possible differences regarding types and frequencies of errors among male and female candidates.

The results of the current study indicated that inappropriate choice of noun is the most frequent error which is occurred in participants' performance regarding the grammatical analysis of the data. Also, the result revealed that students have more problems in producing correct forms of nouns, verbs, prepositions and conjunctions. On the other hand, *Incorrect Negative Forms* is observed less than other errors.

Furthermore, the analysis of cohesion and coherence errors indicated that candidates have more problems regarding the fluency, comprehensiveness and acceptability of their utterances. Moreover, the last part of the data analysis revealed that there is no great difference among male and female candidates regarding the total number of errors although male candidates made more errors than females on the whole. Besides, data analysis showed that females made more cohesion and coherence errors than male candidates.

The findings of the present study can have implications for candidates, teachers, test developers and researchers. Being acquainted with the areas that they may have more difficulties and problems, candidates can concentrate on those areas and try to improve their abilities and knowledge concerning these problematic features. This can raise their awareness concerning the challenges of the language learning process. Teachers can also make use of this information in order to become aware of the second language acquisition process. They will be acquainted with the problems and difficulties that the learners may face in the process of language learning and it make them effective teachers who can equip the learners with a more efficient instruction so that the learners become aware of the significant criteria that a proficient speaker attends to while performing on writing and speaking tests.

In addition, the result of the present study can be utilized by test developers as a guide according to which they can focus on these analyzed areas in which students may have more or less problems and develop their tests according to the learners' needs. Moreover, researchers can also benefit the results of the current study by providing them with information about the learners' most frequent errors in the process of language learning and focus their attention on the features that may help the learners to have less errors in the production of the second language and assist them to become more successful language learners.

Several studies can be performed to further examine the type and frequency of the errors made by candidates. Initially, the same study can be replicated with more participants or with another framework as a base for data analysis. Also, it is worth considering role of other factors such as participants' background knowledge and their level of language proficiency, also the strategies and styles employed by the participants while performing on the tests can be taken into account. Besides, other factors such as participants' personal characteristics, their anxiety and motivation can be considered as significant issues that may affect their performance.

Finally, as it is stated by Corder (1981), learners' errors are significant not only for the teachers and researchers but also they are indispensable to the learners themselves, because it is believed that learners use making of errors as a device in order to learn.

ABSTRACT

The present study aimed to identify the distribution of logical markers according to cross-cultural or cross-linguistic preferences. The corpus of this study consisted of 240 opinion columns of three Persian newspapers (IRAN, Hamshahri and Ettelaat) and two English ones (New York Times and Independent). Different logical markers were highlighted in the texts and classified based on the Dafouz-Milne's (2008) taxonomy of metadiscourse markers. The results showed that logical markers are present in English and Persian newspapers' opinion columns, but there are variations as to the distribution. The results has implications for columnists and gives them ideas on how to logical markers effectively to convince their audience by presenting the propositional material in a way that the audience find more convincing. It can also be useful for Persian students of English who have to pass courses on journalistic texts at university and it is necessary for them to know different kinds of metadiscourse markers.

KEYWORDS: Logical markers; cross-cultural; cross-linguistic

INTRODUCTION

In written genres, writers try to guide and direct readers through the text. Newspapers, especially the opinion columns have a wide audience. So columnists try to persuade their readers to share the writer's views using certain features called discourse markers. Logical markers as a kind of metadiscourse marker helps readers to comprehend the text better. They express semantic and structural relationships between discourse stretches and help readers to interpret pragmatic connections by explicitly signaling additive (and, further more), adversative (but, however), consecutive (so, therefore), and conclusive relationships (finally, in sum).

Although metadiscourse markers have been studied in a number of different contexts, little attention has been given to news discourse, and especially to logical markers which can help to persuade readers in English and Persian opinion columns. Newspaper columns are some of the most adequate examples of persuasive writing (Connor, 1996, as cited in Dafouz-Milne, 2008).

Logical markers are used to help readers decode messages, share the writer's views, and reflect

the particular conventions that are followed in a given culture and play a crucial role in the construction and attainment of persuasion. Textual and interpersonal metadiscourse markers contribute toward the overall persuasiveness of a text (Dafouz-Milne, 2008). There is no study on logical markers in Persian newspapers. The present study provides insights into the use of logical markers by using a large corpus of English and Persian opinion columns.

LITRATURE REVIEW

Newspaper opinion columns

Mass media is a term used to denote a section of the media specifically designed to reach a very large audience such as the population of a nation. Mass media has become one of the principal means through which people gain access to a large part of our information about the world, as well as to much of our entertainment. Newspaper is a kind of mass media. "Newspaper discourse is one of the most persuasive writing in all countries, setting standards for written persuasion" (Connor, 1996, as cited in Dafouz-Milne, 2008, p. 96). Shams (2007) believes that newspapers educate by going beyond basic facts in the in-depth analysis of columns, commentaries and editorials; and they provides a print marketplace for advertisers and prospective customers.

The online and print editions of newspapers share some defining features. First, newspapers are made of diverse content. In addition, they feature editorials, letters to the editor, movie listing, horoscopes, comics, sports, film, interview, recipes, advice column, opinion column, classified advertisement, and a host of other material. Second, newspapers are conventionally packaged. Both the print and online versions are organized according to the content. Third, newspapers are local. Fourth, more than any other medium, newspapers serve as a historical record, and fifth, newspapers are timely (Dominick, 2009).

Newspapers vary in terms of circulation. Circulation is the total number of a newspaper distributed to subscribers and vendors in one day. Some newspapers are nationally published; some are published locally. Some newspapers are published twice a week, once a month, four times a year, or even less often. However, most newspapers are published every day (daily newspapers). Also newspapers differ in focus. General-circulation newspapers print materials of interest to a broad audience, while special-interest papers target a more specific audience (Shams, 2007).

Newspapers offer their readers an opportunity to express their opinions on current events. Columns refer to a series of articles by the same person appearing on a regular basis in a newspaper and present the person's personal opinion on different issues. They are views behind the news written by people who take an interest in explaining behind-the-scene events. Singular voice (they use the personal "I") is used in columns. Columnists are either staff members of the newspaper or syndicated columnists who write for different newspapers. They may talk about their personal interests and personal agenda. They also have their own styles. Some try to be funny; others are very serious and use a very formal style (Shams, 2007).

All news is subjective. Personal columns make this subjectivity overt. Personal columns work when the voice speaks in particularly original tones. They may be witty, controversial, culturally eclectic, conversational, whimsical, ironic, confessional, authoritative, subversive, and irritating. The reader enters into a kind of relationship with the writer. Personal column styles, language, and tones are also appropriate to their newspapers. There are many forms of personal columns. They may be straight opinion or involve a small amount of journalistic research (Keeble, 1998). One of the major columns of newspapers is opinion column. They target a wide audience and are among the most persuasive writing in all countries (Reah, 1998).

When reading an editorial or an opinion column, it is helpful to imagine that the writer is engaged in a debate with his or her readers. The writer is trying to persuade readers or convince them that a certain point of view is the correct one. There are, however, important differences between editorials and opinion columns. An editorial is generally written on behalf of the entire newspaper. It represents the point of view of not just the writer, but of the newspaper at large. In reality, of course, not everyone at the paper will agree with any given editorial. But in principle, an editorial speaks for the newspaper as an institution, not just the person who has written it (Petroce, 2008)

Columnists need to use the propositional material in a way that their audience will find most convincing and attractive; Moreover, writers have to create a credible textual persona or ethos and develop an appropriate attitude towards their readers and the claims they present, if they want to be successful in persuading their readers. Metadiscourse markers play a crucial role in the construction of this textual persona (Dafouz-Milne, 2008, p. 96).

Logical markers

Metadiscourse markers are a kind of cohesive devices that help to establish relationships between different sentences or between different parts of a sentence (Halliday & Hasan, 1976). They shape the writers' arguments to the needs and expectations of their target readers. Metadiscourse helps organize, engage the audience, and signal the writer's attitude. It is the author's overt or covert presence into the discourse to inform and to shape the reader's thoughts (Crismore, 1984, p. 280). Coherence relations that hold together different parts of the discourse are partly responsible for the perceived coherence of a text. Coherence is achieved by different means. According to Taboada (2006) discourse markers guide the text receiver in the recognition of those relations. In order to be successful, the writer needs to operate at two levels: the level of text (discourse) in which the writer supplies information about the subject of the text, and the level of metatext (metadiscourse) in which the writer does not add any propositional material but helps readers organize, classify, interpret, evaluate, and react to such material.

A variety of metadiscourse taxonomies have been proposed (Dafouz-Milne, 2008; Hyland & Tse, 2004; Dafouz, 2003; Hyland, 1998; Vande Kopple, 1997). Most of these taxonomies organize the linguistic units under the functional headings of textual discourse - the organization of discourse - and interpersonal metadiscourse - the writer's stance towards both the content in the text and the potential reader.

Dafouz-Milne (2008) studied both textual and interpersonal metadiscourse markers. She included the following macro-categories: hedges, certainty markers, attributors, attitude markers, and commentaries. She further divided the category of hedges up to three subcategories: epistemic verbs, probability adverbs, and epistemic expressions. The results showed that hedges were the most common category of interpersonal metadiscourse markers in both British and Spanish texts. Dafouz-Milne concluded that the critical factor in producing a successfully persuasive text is to skillfully combine both expressions that weaken the argument (i.e; hedges) and those that strengthen it (i.e; attitudinal markers or certainty markers).

Logical markers as a category of textual metadiscourse markers express semantic and structural relationships between discourse stretches, and help readers interpret pragmatic connections by explicitly signaling additive, adversative, and conclusive relationships in the text. Vande Kopple calls them connectives which function as signposts to guide readers that construct appropriate representations in memory. They help show readers how the parts of texts are related to one another (Vande Kopple, 1997, p. 2).

In academic writing, there are terms or phrases that express the logical relationships between different things. These important *signposts* serve as signals for the meaning of the text and the writer uses them to organize the text in order to make his point clear. These words are called linking words, connectors, discourse markers or signal words. Linking words (also called transitional devices, logical connectors or connecting words) help the reader follow the logical meaning and structure of the text (Vande kopple, 1997).

Hyland and Tse (2004, p. 168) categorize logical markers in terms of transitions and frame markers. Dafouz-Milne (2008, p.97) states that logical markers express semantic and structural relationships between discourse stretches. Characteristically, connectives are not syntactically integrative elements in the clause; they are peripheral to it. Connectives serve to make that relationship obvious so that the reader may interpret it in accordance with the writer's intended meaning (Rahman, 2004, p. 45). Martin and Rose (2003, p. 110) state that "conjunctions serve as logical connections between figures, adding them together, comparing them, sequencing them in time, or explaining their causes, purposes or conditions".

A few studies have been done on logical markers. Dorgeloh (2004) examined the use of sentence-initial *and* in Modern English written language as compared to Early Modern English. He argued that the function of the discourse marker *and* in interactive discourse applies to connecting written sentences as well, and the reluctance with which it is used today in most written registers has not evolved entirely by chance. Results showed that the use of sentence-initial conjunction varies largely across genres. Findings also have relevance for the relation between discourse coherence and discourse type. While *and* potentially supports speaker continuity both at an ideational and at a pragmatic level, a written discourse type defined by a pragmatic function, such as the argumentative or expository type prevailing in modern science, apparently requires connections to be more explicit and semantic in kind. At various stages in the analysis, it has become obvious that quantitative data are not always sufficient to determine the discourse function of a particular linguistic phenomenon.

Yeung (2009) investigated the meaning and use of *besides* by studying expert corpora, dictionary definitions, and examples, as well as comparing and contrasting the experts' use with that of the Hong Kong Chinese learners of English. Yeung believes that the use of connectives has always been a trouble spot for Second Language Learners of English. There may be various reasons for this, one of them is the lack of awareness of how *besides* functions as a discourse marker. The study showed that connectives should be understood not only in terms of their semantic meanings but are better grasped through an appreciation of their pragmatic and stylistic functions in actual contexts of use.

Waring (2009) studied the adverb *also* with the aim to investigate the intricate operation of *also* in actual interaction. The actual interaction dealt with in this article pertains specifically to the institutional contexts of graduate seminar and television forum, where the central activity concerns the exchange of ideas or pursuit of positions. The supplementary data set included seven sessions of roundtable discussions on current affairs. He focused on the semantic features of *also* (i.e. additive and likewise) which are strategically deployed to accomplish different interactional goals in either a disjunctive or a disaffiliative environment. He showed that the additive feature of *also* can be activated to function in a disjunctive environment to achieve the appearance of coherence, and accordingly, to legitimize one's speaking rights. In addition, the semantic meanings of *also* are strategically employed to build coherence and to modulate the force of one's contribution in specific sequential environments. He stated that *Also* functions at the level of discourse.

RESEARCH QUESTIONS

This study attempts to answer the following questions:

1. To what extent are logical markers used in Persian and English opinion columns?
2. Is there any significant difference in using logical markers in Persian and English opinion columns?

METHODOLOGY

In this study, logical markers in opinion columns of English and Persian newspapers are compared in order to explore how these markers are distributed according to cross-cultural or cross-linguistic preferences.

Dataset

The corpus in this study consisted of five newspapers, three Persian newspapers (*Ettelaat*, *Hamshahri*, and *IRAN*) and two English ones (*New York Times* and *Independent*) all of which were chosen according to their status and the political and rhetorical influence they exert in their respective national cultures. The opinion columns of these newspapers which covered social and cultural, economics, and politics topics were investigated. Generally 240 columns were analyzed: One hundred-twenty opinion columns of the Persian newspapers which were published during January and February 2009 and 120 opinion columns of the English newspapers published during January and February 2009 were selected. This quantity was assumed to be adequate to allow the researcher to make valid generalizations.

Instrumentation

A contrastive analysis was made between the opinion columns of Persian and English newspapers in the use of logical markers as pragmatic devices. Dafouz-Milne taxonomy (2008) was used as the theoretical framework for the selection of these two metadiscourse devices which covers the functional division of textual and interpersonal metadiscourse. This division has offered a variety of subcategories covering both the pragmatic functions of metadiscourse markers and the linguistic devices used to carry out such functions. Opinion columns are a subgenre of persuasive texts (Van Dijk, 1988, as cited in Dafouz-Milne, 2008) and their final aim is to convince the audience by means of textual and interpersonal metadiscourse markers.

Procedure

A sample of 240 opinion columns from five English and Persian newspapers was selected for the study. The selected Persian newspapers were *Ettelaat*, *IRAN*, and *Hamshahri* and the English press was *New York Times* and *Independent*. To reduce the impact of time and possible changes in the writing styles, the English and Persian columns (120) published between January and February 2009 were selected. From each English newspaper, 60 texts were selected during two months. But, for the Persian counterparts, because there were three newspapers, the first twenty issues of each newspaper during two months were selected for the analysis.

The electronic version of the English newspapers and the hard copy of the Persian newspapers were used. Initially, the opinion columns, either obtained directly from the electronic versions of the relevant newspapers or manually, were scanned and converted into Rich Text format. Then, word count was run on the corpus to have a rough estimate of the quantity of the data. Since the columns in Persian could not be converted into Rich Text, they were counted twice manually. Next, the texts were carefully read three or four times in order to identify the linguistic signals in focus and key signals that characterize logical markers. To analyze the data quantitatively, the frequency of the two categories across each dataset was calculated. About 20 percent of the data was analyzed for the inter-rater reliability and agreement was reached accordingly. Also, for the sake of intra-rater reliability, the data was analyzed two times within about one month interval. Having analyzed the data and presenting the frequencies, in order to see if the possible differences are statistically significant, *chi-square* analysis was administrated.

RESULTS AND DISCUSSION

The quantitative analysis reveals that the texts written in Persian used a higher number of logical markers than did the texts in English (Persian, $n=7087$, English, $n=4879$). While Persian and English both relied more on logical markers for coherence, Persian managed to overtake English in the use of logical markers. On the whole, the statistical analysis showed that the differences between the two languages were statistically significant (Table 1). The fact is that the difference between the two languages may show that Persian tends to go greater lengths establishing coherence in the text, hence providing more guidance for the readers to comprehend the purpose of the text.

Table 1: Logical markers in English and Persian Newspapers

Total textual markers	Word count	Logical markers (%)
English	92,214	4879 (2.5)
Persian	81,152	7087 (3.9)
Chi-square		407.426

Critical value= 3.8415

A closer investigation of the two languages is possible if the *subcategories* of the respective metadiscoursal elements are also taken into account. As Table 2 shows, the two languages differ in the way they prioritize the respective subcategories. English capitalizes maximally on the 'additive' (61.74%) and minimally on the 'conclusive markers' (0.66%). Persian also uses 'additive' (82.4%) as the first priority, which is more frequent than its English counterpart. In fact, Persian texts abound in the use of additive markers (n=5842) to link ideas.

Table 2: Logical markers in English and Persian Newspapers

Total logical devices markers	Word count	Additive (%)	Adversative (%)	Consecutive (%)	Conclusive (%)
English	92,214	2989 (61.74)	1412 (29.16)	408 (8.42)	70 (0.66)
Persian	81,152	5842 (82.4)	742 (10.46)	471 (6.6432)	32 (0.45)
Chi-square		3447.754	208.403	4.515	14.157
Differences		p<0.05	p=0	p<0.05	p=0

Critical value= 3.8415

As a general rule, it seems that both languages find 'additives' central to text's persuasiveness. Also, Persian texts use conclusive markers as the last priority which is slightly less frequent than its English counterpart. English texts almost make greater use of conclusive elements. Furthermore, it is revealed (Table 2) that English and Persian assume the second place for adversatives. But English writers use these markers more frequently than Persian ones, so the English texts prefer the use of adversatives (n=1412) to construct arguments. Also, both corpora used consecutive markers as the third priority, and Persian texts used more consecutive markers than English ones. The analysis, generally speaking, shows that the differences between the Persian and the English writers involve the use of all logical markers with greater distinction in the use of additives and adversatives. The *chi-square* analysis revealed that the difference was significant for the respective markers. On a general level, the quantitative analysis reveals that the texts written in *Ettelaat* used a high number of logical markers than the texts in *Hamshahri* and *IRAN* (*Ettelaat*, n=3828, *IRAN*, n=1876, *Hamshahri*, n=1383).

Table 3: Logical markers in Persian Newspapers

Total Textual Markers	Word Count	Logical markers (%)
Hamshahri	18,316	1383 (7.5)
IRAN	25,403	1876 (7.38)
Ettelaat	37,433	3828 (15.22)
Chi-square		1415.462

Critical value= 3.8415

Within the English corpus, again, variations were observed in using logical markers in *New York Times* and *Independent*, and this variation was statistically significant. Table 4 exhibits the related figures.

Table 4: Logical markers in English Newspapers

Total Textual Markers	Word Count	Logical markers (%)
New York times	40,958	2256 (5.5)
Independent	51,256	2623 (5.11)
Chi-square		27.606

Critical value= 3.841

The quantitative analysis reveals that on a global level, both English and Persian texts in this corpus include a great number of logical markers. The presence of logical markers is natural since these items function as connectors providing cohesion to the texts because without these connective devices, texts would be unreadable. Comparing the total number of logical markers by both sets of writers, the study found that Persian texts use more logical markers than English ones. The fact that the difference between the two languages is more salient in the use of logical markers may show that Persian texts tend to establish more coherence in the texts, so they provides more guidance for the reader to comprehend texts better.

In spite of this quantitative difference, there is nevertheless an interesting difference in the distribution of logical subcategories included in this study. Statistically speaking, the difference in the use of the first two subcategories (i.e., additive and adversative markers) is considerable. The analysis showed that the Persian texts had a significantly greater number of additive discourse markers than the English texts. The results for the Persian writers may show Persian rhetorical conventions, which seem to favor a progressive argumentation strategy, building up evidence of the same type, clause by clause, and hence, the need for many additive markers.

Note the following examples – from the Persian and the English data – and notice the argumentation involved in the English sample.

(1) Persian:

Banabarin vazifeyearab va keshvarhaye mosalman ast ke a faghat be khatere anche dar ghaze rokh dadeh, balke be khatere hefze amniyat, movzee motefavet **va** behtar az gozashte etekhaz konnand **va** in vahdate kamel tamamiye javame arbi **va** eslami ra dar yak didgahe moshtarak mitalabad; melati ke bayad dar moghabele in dardha **va** khatarat beistad **va** dar asase esteratezhee khod tajdide nazar konad ta chashm andazi jedi ra baraye moghabele ba tajavozate ehtemali tarsim konad **va** bedanad ke amniyate eslami dar khatar ast.

(2) English:

Who owns this hotel? The struggle for hegemony over the modern Arab world is as old as Nasser's Egypt. But what is new today is that non-Arab Iran is now making a bid for primacy — challenging Egypt **and** Saudi Arabia. Iran has deftly used military aid to **both** Hamas **and** Hezbollah to create a rocket-armed force on Israel's northern **and** western borders. This enables Tehran to stop **and** start the Israeli-Palestinian conflict at will **and** to paint itself as the true protector of the Palestinians, as opposed to the weak Arab regimes.

English writers seem to favor a progressive argumentation strategy, building up evidence of the same type, word by word, and hence, the need for many additive markers. But comparing the use of additive and adversative markers in the two corpora, it was found that both text types rely on more additive markers than adversative markers to link ideas (e.g. *and/va*, *moreover/alave bar in*, *furthermore/alave bar in ...*). Persian texts use the additive connector *va* more than other additives, and English texts use the additive connector *and* more than other additives. A grammatical explanation of the high presence of additive markers in the Persian and English corpora could be the average length of sentences; English and Persian writers prefer to produce longer sentences conjoined by additive markers. The two examples below extracted from the data exhibit how English and Persian writers use the additive markers in order to make long sentences. The English writer uses the additive marker *and* to join the phrases in a progressive argumentation.

(3) English:

Obama shot back at a Virginia meeting of House Democrats — the very lawmakers who had saddled the package with party favors **and** shipped it off to the hostile Senate. He accused the Republicans of having “false theories of the past” **and** “phony arguments,” of playing “petty politics” **and** “gamesmanship” **and** just plain “nit-picking.” He seemed hostile **and** snaky. It wasn’t a good look for a man who promised to change the tone in Washington.

The Persian author constructs his rationale listing a set of reasons that head in the same direction by means of additive markers: *and/va*, *in addition to/alave bar in*, *also/ hamchenin*. Comparing the second subcategory (adversative markers), English texts included more adversative markers than their Persian counterparts.

(4) Persian:

(...) *in siyaset mitavanad chand tasir bar eghtesad keshvar begozarad, hazineh tamamshodeh kalaha dar keshvar ra kahesh midahad ke be kaheshesh nerhke tavarom khahad shod va_sababe afzayesh taghaza baraye niroye kar va afzayesh forsathaye shoghli jadid dar keshvar mishavad ke be kaheshesh nerkhe bikari komak khahad nemod. Alave bar inha in siyaset mitavanad afzayesh dastmozdha ra ba afzayeshesh bahrevari motanaseb konad ke yek siyasete zede tavaromi mahsub migardad.*

Regarding consecutive markers, Persian writers build more on consecutive devices than the English ones, but the difference was not significant. The frequent consecutive marker which was used by English writers was *so* which was followed by *therefore* and the more frequent one which was used by Persian writers was *banabarin*. The example below extracted from the data shows how the English author builds his argument on the Obama's response to the economic crisis using a contrastive approach and consequently employing the adversative marker *but*.

(5) English:

(...) So far the Obama administration's response to the economic crisis is all too reminiscent of Japan in the 1990s: a fiscal expansion large enough to avert the worst, **but** not enough to kick-start recovery; support for the banking system, **but** a reluctance to force banks to face up to their losses. It's early days yet, **but** we're falling behind the curve.

Regarding conclusive devices, the English texts make use of conclusive markers twice more than the Persian texts. This shows that English writers reach a conclusion when they start an argument

but Iranian writers only consider the connection of ideas. The examples below mark the differences between the two languages. The English author uses the conclusive marker *all in all* and *after all* and *in any case* to conclude the discussion.

(6) English:

All in all, the centrists' insistence on comforting the comfortable while afflicting the afflicted will, if reflected in the final bill, lead to substantially lower employment and substantially more suffering. But how did this happen? I blame President Obama's belief that he can transcend the partisan divide — a belief that warped his economic strategy. **After all**, many people expected Mr. Obama to come out with a really strong stimulus plan, reflecting both the economy's dire straits and his own electoral mandate.

(7) English:

The teens — ranging from sixth graders to high school seniors — come to the center for a variety of reasons. Some do so because they live in overcrowded apartments, others because they need a quiet place to study or want help with their homework, and still others because they want to hang out with their friends. With its open door policy, it may seem that anyone — even a teen who might be a bad influence — might frequent the center, but Reyes said center staffers discourage that by acting in an unwelcoming manner toward a teen who is using bad language or engaging in unacceptable behavior. "We don't tolerate it, and they go out," Reyes said. In some cases, she might try to get the teen help, by hooking them up with a drug and alcohol program or by just talking to their parents. **In any case**, her main goal is to make the center a positive option for teens.

In the above example, the author explains teens' reasons to come to center and the services that the center staffers present to them; then he concludes center manager's aim by using the conclusive marker *in any case*.

(8) Persian:

In gone tadabir mitavanad chehre karihe esraeel ra bar jahaniyan ashkar konad; chehreye yak eshgalgare ghatel ke kodakan ra hadaf gerefte va ba be atash keshidane amakene maskoni be vasileye bombhaye fosfori, jang ra edame dad east. Hameye inha ba hamkariye kasani anjam shod east ke dar kenare in rejim istadeand va dam bar nemiavarand. Banabarin vazifeye arab va keshvarhaye mosalman ast ken a faghat be khatere anche dar ghaze rokh dade, balke be khatere hefze amniyate mosalmanan, movzee motafavet va behtar az gozashte ettekhez konnand **va** in vahdat kamele tamamiye javame arabi va eslami ra dar yek didgah moshtarak mitalabad; melati ke bayad dar mogabele in dardha va khatarat beistad va bar asase esteratezhiye khod tajdide nazar konad ta chashm andazi jedi ra baraye moghabele ba tajavozate ehtemali tarsim konad va bedanad ke amniyate eslami dar khatar ast, aya chenin kari anjam midahand?

In the above example, the Persian author could use the conclusive marker *behar hal* (in any case) instead of *va* (and). This shows that the Persian authors interested in additive markers, even sometimes, use this marker in a wrong place.

CONCLUSION

This study has presented quantitative and qualitative data on the presence of logical markers in a corpus of Persian and English opinion columns. Regarding similarities, the study reveals that logical markers are present in both English and Persian texts, although there are variations regarding their distribution. As Dafouz-Milne (2008) states that these similarities can be

attributed to the newspaper-genre characteristics of opinion columns that seem to contribute to the national culture and exhibit certain uniformity across languages. Concerning differences, this study suggests that there is some variation across languages in the construction of opinion columns. The findings showed that Persian writers used more additive markers than English ones and concerning the second subcategory of logical markers, i.e. adversative markers, English writers used more of these markers than Persian ones. As Dafouz (2003) proposed differences in the use of additive and adversative markers may be due to the way cultures construct argumentative texts. Persian authors add justification to the original idea via additive markers. In contrast, the English authors make a higher use of adversative markers in order to contrast the pros and cons of an argument which is stated in an opinion column.

In this study, logical markers in opinion columns of international and Persian newspapers have been studied. The results gained from the present study are useful for columnists. Opinion column is a kind of persuasive writing, so the columnists should be able to convince their readers that her or his opinions are correct. In order to convince their audience, they should present the propositional material in a way that the audience find more convincing. Metadiscourse markers, especially logical markers can be useful in this way.

There are some important limitations in this study: a) the number of English and Persian newspapers was not equal, initially, three English newspapers (Independent, New York Times, and Washington Post) and three Persian newspapers (Iran. Hamshahri, and Ettelaat) were chosen, but because of the president elections, the link of Washington Post was cut, and two English newspapers with three Persian ones were compared.

There are various textual reasons that were not analyzed in this study (the topic, the type of newspaper, the number of newspaper, and the columnist). Thus, further studies by using a larger corpus could offer more insights into the use of logical markers. Logical markers can also be studies focusing on different disciplines and genres and this may involve other subjects.

ABSTRACT

The present study investigated the effect of self directed learning (SDL) strategies on introvert and extrovert Iranian English as a foreign language (EFL) learners' reading comprehension. To this end, 20 extrovert and 20 introvert students were selected from among a total population of 75 intermediate EFL students based on Eysenck Personality Questionnaire (EPQ) (1964). Twenty students were also put into the third group as the control group. While in the control group we focused on Teacher Directed Learning (TDL), in the experimental groups we focused on explicit teaching of SDL strategies, in the course of teaching reading. The IELTS Reading Test was administered as the pretest and posttest before and after the study, which took 16 sessions in six weeks. The results of the study showed that the experimental groups outperformed the control group. It was also shown that SDL strategies had a more significant impact on introvert – rather than extrovert - students' reading comprehension. We hope that language teachers try to consider the personality types of their students in the course of pursuing their teaching objectives.

KEYWORDS: Self directed learning strategies, reading comprehension, extrovert, introvert

INTRODUCTION

In today world classes learners are different and so have different goals and learn in different ways (Brown, 1987). Therefore, teachers may not have the sufficient knowledge to handle all these differences. Handling such classes exacts techniques and strategies. One way to solve this problem could be allowing the learners to accept the responsibility of their own learning which, according to Hiemstra (1994), could lead to autonomy. It is in such a context that language-learning strategies (LLSs) have emerged as a means of achieving learner autonomy in the process of language learning (Benson & Voller, 1997; Oxford, 1990). A number of researches have shown the significant contribution of language learning strategies to effective language learning (Cohen & Weaver, 1998; Oxford, 1996). The belief is that learners need to act independently in order to improve their informational needs. Recently, the significance of self-directed learning (SDL) strategies, which are part of (language) learning strategies, is coming to vogue.

Merriam and Caffarella (1999) confirm that SDL has been a major focus of adult education since last decades.

Over the last few decades, we have witnessed an influential shift within the field of education, in general, and language teaching and language learning, in particular resulting in greater stress on learners and learning process in lieu of on teachers and teaching products. Furthermore, today, as Richard and Rodger (2001) also confirm, teaching method is not considered as the most important factor in determining the success or failure of language teaching and learning. The belief is that language teachers should try to make their students less dependent on the teachers and reach a level of autonomy (Tamada, 1996; Wenden, 1991). Therefore, it is suggested that teachers take advantage of the differences in today students' learning styles and personality types for contributing to more successful learning. Emerging developments in the field of L2 teaching and learning such as distance learning, andragogy and SDL emphasize the role of the independent learner in the language learning process.

SDL has its roots in adult learning. By distinguishing learning by adults from learning by children, Knowles (1968) made a great contribution to the concept of SDL. Based on the concept of andragogy, SDL has been described as a process in which individuals take responsibility for their own learning, try to realize their own learning needs, and set goals. In such process, as Knowles (1975) put it, learners should also make decisions on resources and learning strategies and assessing the value of the learning outcomes. In their study, Costa and Kallick (2003) described self-directed learners as those who are self-managing, self-monitoring and self-modifying.

From among the factors which cause individual differences, personality types are the most important one. According to Kirby (1984) the term personality type was started to use when researchers tried to find the ways to match teaching methods and instructional materials to the need of each learner. Numerous studies (Pintrich, Roser, & Degroot, 1994; Wigzell & Al-Ansari; 1993) have found that personality types influence academic achievements. Personality is generally conceived of as composed of a series of traits such as extroversion/introversion, neuroticism/stability, and it is typically measured by means of some kind of self-report questionnaire (Ely, 1986; Eysenck & Eysenck, 1964). Studies have revealed that the most eye-catching personality dimension attracting researchers' focus in the L2 field has always been extroversion/introversion (Dorneye, 2005). According to Heaven (1989) as opposed to extroverts, introverts seek ideas from internal sources such as brain storming, personal reflection and theoretical exploration. Before starting any kind of activities, introverts prefer to think about it, to work alone and enjoy solitary studying. Eysenck (1965) believes that while extroverts hate reading or studying by them, introverts are enthusiastic about books rather than people, and they enjoy planning ahead.

This study investigated the relationship between SDL strategies and introvert-extrovert Iranian EFL learners' reading comprehension. We believe that by knowing students' personality types, teachers are able to guess students' needs in English and can decide to select some specific activities and avoid some other unnecessary activities. The rationale behind the study was that

the personality of learners constitutes a major factor contributing to success or failure in language learning. To cite an example, Naiman, et al. (1978) investigated learners' personality factors and found out that in "good language learners," extroversion is helpful in learning the language. However, as Ellis (2008) put it, it is somewhat surprising to find that the research that has investigated personality factors and L2 learning is quite scanty and, in many ways, unsatisfactory.

BACKGROUND TO THE STUDY

No one can deny the significant contribution of reading ability to academic, career, and life success in today world context of information. As Akyol (2006:29) put it, reading is a complex dynamic process that makes nonverbal communication between writer and reader possible. According to Rivers (1968), reading is an important skill for English language learners as it contributes effectively to language learning, especially in countries where language learners do not have the opportunity to communicate with native speakers in person but have access to the written form of that language. On the other hand, the major purpose of most of those who are involved in the field of language teaching/learning, whether they are working on reading or any other skills, is to facilitate the process of teaching/learning. It is in such a context that, nowadays, the focus of researchers has been shifted towards the importance of learners' personal differences and their possible influence on the learning process and accordingly, on learning results.

One of the main objectives in foreign language learning area is to enhance awareness about students' personal differences. As noted and as Brown (2000) also confirms, this is because the success of second language learning is due not only to cognitive factors but also to affective and personality factors of the learners, among which personality is of greater importance. It is in such a context that the paramount importance of personality factors such as introversion and extroversion has come to light in recent years (Dornyei, 2005). They play an important role in the overall performance of language learning in general and in reading comprehension performance in particular.

Findings of researchers show that considering personality factors in planning and presenting education can improve learning processes. However, besides to personality factors, the instructional options of teachers also play a crucial role in developing language learning in general and reading comprehension in particular. One of the most significant of such options is the explicit teaching of SDL strategies, chief among which are metacognitive strategies. This study addresses this area.

REVIEW OF THE RELATED LITERATURE

As Grabe (2004, p19) believes "reading comprehension implies processing efficiency, language knowledge, extensive practice in reading, cognitive resources in working memory to allow critical reflection, appropriate purposes for reading, and strategic awareness". Language learning strategies are special activities taken by the learner to make learning easier, faster, more

enjoyable, more self-directed, more effective, and more transferable to new situations (Oxford, 1990). Most of language learning strategies assist learners to take responsibility in their learning process and learn independently. It is in lieu of such importance attributed to learning strategies that SDL strategies have recently received much attention of researchers. Exploration of these strategies has helped learners use processes to improve their skills in a L2 or FL. According to Oxford (1997), these strategies can be affected by variables like motivation, attitude, gender, learning styles, and personality type like extroversion and introversion. As it will be described, utilization of SDL strategies has been found to contribute effectively to learners' performance in language learning.

Busch (1982) explored the relationship between introversion-extroversion and English language proficiency of 105 adult school and 80 junior college learners in Japan. A Japanese version of EPI and a nationally standardized English test, consisting grammar / vocabulary, reading, aural comprehension, and dictation, were used to collect the data. In general, no significant relationship was found between extroversion and language measures. Only, pronunciation, a subcomponent of the oral test, was significantly and negatively correlated with extroversion.

Lightbown and Spada (2006) state that many classroom teachers believe that in second or foreign language learning, extroverts are more successful than introverts, particularly in their communicative ability. In a study, Dewaele and Furnham (2000) found that extroversion is inextricably linked with fluency in second language (L2) production. Also, based on the findings of several studies, extroverts were found to be superior to introverts in short-term memory. Among them is the finding of Eysenck (1981) that to retrieve information from long-term memory introverts need more time than extroverts do. Eysenck believes that this difference could be driven from the overarousal of the introverts. He concluded that introverts would not get the advantage in conducting the tasks that involve processing of several items of information.

Ehrman and Oxford (1995) did a study investigating the relationship between personality type and language learning strategies with a larger sample. This study also showed that extroverts are different from introverts because of using more social strategies. Furthermore, Ehrman and Oxford (1990) found an important relationship between extroversion/introversion and learner strategies of 20 adults learning Turkish as a foreign language. They found that extroverts preferred social strategies such as asking for clarification, and functional practice strategies such as seeking practice opportunities outside of class while introverts preferred to learn alone and avoid social contacts and spontaneous situations. Ehrman and Oxford mentioned that "users of social strategies tend to be open about their thoughts and feelings and... they are realistic and down-to-earth in their learning" (p.375).

Wakamoto (2000) studied the relationship between extroversion/introversion and language learning strategies of 222 Japanese EFL learners. He found that functional practice strategies and socio-affective strategies significantly correlated with extrovert learners. He also found that with introverts, he could see no preferred language learning strategies. He concluded that extrovert learners will ask for clarification more readily than introverts, so they improve their

chances for input needed for developing an interlanguage. The results of analyses of Gan's (2008) study showed that communication strategies correlated with extroversion although this correlation did not reach the significance level. In this study Gan tried to investigate the impact of extroversion on pronunciation, communication strategies, vocabulary and language patterns of L2 learners in Hong Kong. He concluded that extroverts seemed to employ communication strategies more than introverts.

Wakamoto (2007) examined the impact of extroversion/introversion and associated learner strategies on English language comprehension. He found that extrovert Japanese EFL learners used socio-affective strategies more frequently than introvert ones. Millot and Cranney (1973) in a study on relationship between personality type and learning style in reading comprehension found a significant link between personality types of introversion, intuition and perceiving and learning style. In another study, Kiany (1997) investigated the relationship between extroversion and English proficiency of 237 Iranian postgraduate students studying in English-speaking Countries. He used Persian version of EPQ; and TOEFL, IELTS, MCHE, and cloze tests. The results of his study showed a negative and a significant relationship between extroversion and TOEFL subcomponent of reading comprehension. That is, he found that more extroverted learners tended to have lower scores on the reading comprehension. This study also showed that introverts performed better than extroverts at least in receptive proficiency tests and general academic achievement.

In another study by Phongnapharuk's (2007), 25 students, who registered in the first semester of an English reading and writing course, were selected. The study involved the use of applied metacognitive strategies via CALL to enhance English reading and writing abilities. Phongnapharuk found a significant correlation between metacognition, as one of the important elements of SDL strategies, and students' English reading abilities. Later, Wichadee (2007, 2011) attempted to investigate this issue by (1) providing a learning contract which required learners to take the responsibility of their own learning, and (2) developing a SDL instructional model in order to improve reading ability of undergraduate students. He reported that the learning contract and his SDL model helped the students significantly improve their reading ability. In the two latter studies students were embroiled in planning, monitoring, and evaluating their own learning. These studies, then, suggest that there is a direct relationship between SDL and reading comprehension. Needless to say that a number of other researches in the related literature show positive relationships between SDL and reading comprehension (Khodabandehlou et al., 2011; Kim, 2010; Zarei & Gahremani, 2010; Meshkat & Hassanzade, 2014).

But research on the relationship between SDL strategies and reading comprehension with respect to personality type is not sufficient. In the present study we addressed this gap in the related literature in a hope to put our findings into teaching practice of second language in order to facilitate the development of second language reading comprehension teaching. The present research, as such, investigated the effect of explicit teaching of SDL strategies on introvert vs. extrovert Iranian EFL learners' reading comprehension.

RESEARCH QUESTIONS

In order to identify the effect of self-directed learning strategies on introvert vs. extrovert Iranian EFL learners' reading comprehension, the following research questions were raised:

Q1: Do Self-directed learning strategies have any effect on Iranian EFL learners' reading comprehension?

Q2: Do Self-Directed learning strategies have any effect on introvert Iranian EFL learners' reading comprehension?

Q3: Do Self-directed learning strategies have any effect on extrovert Iranian EFL learners' reading comprehension?

Q4: Do Self-directed learning strategies have more effect on introvert than extrovert Iranian EFL learners' reading comprehension?

Based on the above questions, the related null hypotheses were formulated as well.

METHODOLOGY

Design

In the present study while SDL is the independent variable, reading comprehension is the dependent variable. Introvert and extrovert personality traits are also as moderator variables. Due to the fact that two groups receive treatment while the other group (control group) does not receive such treatment and that we have pretest and posttest before and after the study, the design of this study is a pretest posttest control group design, which is a scientifically sophisticated method. It provides a method of investigation to derive basic relationships among phenomena under controlled condition or, more simply, to identify the conditions underlying the occurrence of a given phenomenon.

Participants

Sixty male and female intermediate EFL learners studying English in Parsian Language Institute in Lamerd, Fars, in Iran participated in this study. All the participants were native speakers of Persian and their age ranged between 15-20 years. These participants were selected through conducting the IELTS Reading Test from among a total population of 75 learners in the same language school. It should be noted that the number of the females was more than the male students (34 female students and 26 male students). Then, they were randomly divided into three groups: one control (n=20) and two experimental (group 1, 20 introverts; group 2, 20 extroverts).

Instrumentation

To accomplish the objectives of this study, two tests (pre and posttests) and a questionnaire regarding personality type were administered.

Testing Materials

The IELTS Reading Comprehension Test

Seventy five students were assessed through an IELTS reading comprehension test before the study in order to have 3 homogenized groups of 20 participants each, based on their scores in the

pretest. The same IELTS test was given after the study, after a-16-session practice, to see the impact of TDL and SDL strategies on the control and experimental groups. The test was similar both in format of the questions and their level for the three groups. The test consisted of 3 parts with a total of 13 questions:

Part A: included 4 items that participants were supposed to choose the most suitable heading for each section/paragraph from the list of headings.

Part B: included 5 multiple-choice questions for the participants to answer.

Part C: included 4 items for the participants to identify True/False/Not Given alternatives.

Learners had 25 minutes to answer the questions. It should be mentioned that this test was used for two reasons: Firstly because it is internationally valid, reliable and easy to administer. Second, because there are raters who can reliably and validly score students' reading skill, since experienced teachers who specifically teach IELTS preparation courses develop an ability to "guess" students mark with an acceptable degree of precision. Each subject was rated by three different raters, prior to and after the treatment sessions.

Eysenck Personality Inventory (EPI), (1964)

Eysenck personality inventory questionnaire was used in the present study. This measure is an internationally reliable instrument which has been translated and validated in Iran (Kiany, 1997). The EPQ is an established and popular personality test with a world-wide usage. The test consists of 90 Yes/No questions, which measure psychological factors of Extroversion (E), Neuroticism (N), and Psychoticism (P). It also has a Lie (L) scale which aims at identifying possible faking on the part of the subject. Twenty one items are related to Extroversion. However, the whole questionnaire was taken by the subjects to avoid violation of the reliability and validity. The Yes/No answers were supposed to be given based on the usual way of acting or thinking of an individual. The researcher used the Farsi version in order for the respondents to answer the questionnaire more accurately. The answer key and the standard rating scales and procedures were also provided in the battery.

Instructional Materials

Interchange3, 3rd edition

The main text book used in this research was interchange 3 by Jack C. Richards with Jonathan Hall and Susan Proctor. This textbook was used in Iran Parsian institute in Lamerd for intermediate learners and it consists of 16 units which are divided into four terms. The main purpose of this book is to integrate reading, grammar, pronunciation, vocabulary, listening, speaking, and writing. Every unit of this book also contains a reading comprehension text.

Selected Reading Books

These books contain reading pages of different genres and are graded from elementary to upper-intermediate level, using the syllabus devised by Linda Lee and Eric Gundersen. Since the level of students in this study is intermediate, intermediate level was chosen. The main texts used in this research included various reading texts suitable for intermediate learners. They consisted of 15 reading texts which were taught during 16 sessions in one semester. The main

content of these texts was learning reading texts and the purpose was to learn and practice texts with various topics such as foods, communication, friendship etc. The content of the passages was the same for three groups. In experimental groups, these texts were taught to the learners by resorting to various SDL strategies.

Procedure

In the first step, the IELTS reading comprehension test was piloted with 20 students with similar characteristics to that of the main participants of the study in order to confirm its reliability. Then the test was implemented for the purpose of homogenizing the sample of the study and to make sure that the study enjoys homogeneous participants with respect to their English language reading comprehension. That is, sixty participants whose scores fell one Standard Deviation (1SD) below and above the mean were selected, out of 75, as the main participants of the study. After selecting the main participants, an attempt was made to figure out their personality type. The Eysenck Personality Questionnaire was administered and the results were analyzed. The EPQ distinguished the extrovert and introvert participants resulting 36 extroverts and 24 introverts. The participants, then, were randomly assigned into two experimental groups (20 extroverts and 20 introverts) and a control group (n=20).

While the control group underwent instruction on TDL over 16 sessions, the students in the experimental groups underwent instruction on SDL. The classes met three times in a week, each session lasting for 90 minutes. The groups were under the supervision of the same instructor. In the treatment period, SDL strategies, taken from Abdullah (2001), were used, as in the following:

The teacher assisted the participants in realizing their learning needs, setting their learning goals, applying appropriate strategies, and evaluating their learning outcomes. Throughout the course, the teacher tried to highlight the students' awareness of their responsibilities in the course of learning. During the course of experimentation the participants in the experimental groups were encouraged to participate in making decisions about what is to be learned, when and how it should be learned, and how it should be evaluated. The teacher avoided correcting the students' local errors in order to encourage SDL among them. This strategy led them to feel secure during learning. Afterwards, the teacher tried to encourage students to monitor their own learning. She made it possible by requiring them to reflect on what they did. The teacher also tried to help them to think about their needs and abilities. They were also encouraged to choose appropriate skills and strategies for their learning. The students were said to alter their learning strategy if the strategy at hand had failed.

The fact is that when we assisted students to expand awareness about their own thinking and learning processes, we were helping them think about the effectiveness of the strategies they use in reaching the goals they have set. This way, we were contributing to their metacognitive strategies. Block (2004) believes that, the use of a long-term metacognitive strategy of planning what is to be done, monitoring our progress, and evaluating the results is an effectual way of helping students take more control of their own thought and feeling processes. In order to encourage SDL in our reading classes (experimental groups), we asked learners to read and

underline unknown words without looking up the meaning in dictionary; use contextual clues to guess the general meaning; skip unnecessary unknown words; and break them up into root, prefix and suffix. We also showed them how good readers interpret their reading and what they do when they do not comprehend. We explained that good readers do not move directly through a text without stopping to consider whether the text makes sense based on their own background knowledge, or whether their knowledge can be used to help them understand confusing or challenging materials. They draw on prior knowledge and experience to help them understand what they are reading and are thus able to use that knowledge to make connections. By teaching students how to connect to text they were able to better understand what they were reading. Accessing prior knowledge and experiences is a good starting place when teaching SDL strategies, because every student has experiences, knowledge, opinions, and emotions that they can draw upon.

Finally, in order to measure the participants' reading comprehension ability after the treatment, all of the participants were given the same IELTS Reading test as the posttest.

RESULTS AND DISCUSSION

First we wanted to see if TDL has influenced the reading comprehension of the participants in the control group.

Table 1 (a): Paired Samples Statistics

		Mean	N	Std. Deviation	Std. Error Mean
Pair 1	E1	15.4500	20	2.62528	.58703
	E2	15.9000	20	2.61373	.58445

Table 1 (b): Paired Samples Correlations

		N	Correlation	Sig.
Pair 1	E1&E2	20	.881	.000

Table 1 ©: Paired Samples Test

		Paired Differences					t	df	Sig. (2-tailed)
		Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
					Lower	Upper			
Pair 1	E1-E2	-.45000	1.27630	.28539	-1.04733	.14733	-1.577	19	.131

E1: The reading comprehension of the participants in the control group before the study.

E2: The reading comprehension of the participants in the control group after the study.

As p-value (0.131) in Paired Samples Test is more than 0.05, the assumption of the equality of the average of the reading comprehension of the students in the control group before and after the study is not rejected. This means that the reading comprehension of the students in the control group do not have significant difference before and after the study. As it is shown in Table 1, there is no significant difference in the average of the reading comprehension of the participants in the control group before and after the study.

At this stage we wanted to see if SDL strategies have influenced the reading comprehension of the introvert participants in the first experimental group.

Table 2 (a): Paired Samples Statistics

		Mean	N	Std. Deviation	Std. Error Mean
Pair 1	F1	13.0000	20	3.24443	.72548
	F2	16.2500	20	1.83174	.40959

Table 2 (b): Paired Samples Correlations

		N	Correlation	Sig.
Pair 1	F1&F2	20	.753	.000

Table 2 ©: Paired Samples Test

		Paired Differences					t	df	Sig. (2-tailed)
		Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
					Lower	Upper			
Pair 1	F1–F2	-3.25000	2.22131	.49670	-4.28960	-2.21040	-6.543	19	.000

F1: The reading comprehension of the introverts in the experimental group before the experiment.

F2: The reading comprehension of the introverts in the experimental group after the experiment.

As p-value (0.000) in Paired Samples Test is less than 0.05, the assumption of the equality of the average of the reading comprehension of introvert students in the two groups before and after the study is rejected. This means that the reading comprehension of the introverts in the two groups have a significant difference before and after the study. Also with regard to the fact that the difference between the average of reading comprehension of the introverts in the two groups before and after the study is negative so it could be concluded that the average of the reading comprehension of the introverts after the experiment has been more than that of before the experiment (Table 2). To put it another way, SDL strategies have had positive impact on the reading comprehension of the introvert students.

Finally, we wanted to see if SDL strategies have influenced the reading comprehension of the extrovert participants in the second experimental group.

Table 3 (a): Paired Samples Statistics

		Mean	N	Std. Deviation	Std. Error Mean
Pair 1	T1	14.4500	20	2.43818	.54519
	T2	15.7000	20	1.62546	.36346

Table 3 (b): Paired Samples Correlations

		N	Correlation	Sig.
Pair 1	T1&T2	20	.647	.002

Table 3 ©: Paired Samples Test

		Paired Differences					t	df	Sig. (2-tailed)
		Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
					Lower	Upper			
Pair 1	T1-T2	-1.25000	1.86025	.41596	-2.12062	-.37938	-3.005	19	.007

T1: The reading comprehension of the extroverts, in the second experimental group, before the experiment.

T2: The reading comprehension of the extroverts, in the second experimental group, after the experiment.

As p-value (0.0007) in Paired Samples Test is less than 0.05, the assumption of the equality of the average of the reading comprehension of extrovert students in the two groups before and after the study is rejected. This means that the reading comprehension of the extroverts in the two groups have significant difference before and after the study. Also with regard to the fact that the difference between the average of reading comprehension of the extroverts in the two groups before and after the study is negative so it could be concluded that the average of the reading comprehension of the extroverts after the experiment has been more than that of before the experiment (Table 3). To put it another way, SDL strategies have had positive impact on the reading comprehension of the extrovert students.

But as we consider the data more closely, it becomes evident that the difference in the average of the reading comprehension of extrovert students is less than the difference in the average of the reading comprehension of introverts, in the two groups before and after the experiment. This means that SDL strategies have had more positive impacts on introverts rather than extroverts. That is to say introverts have gained more benefits out of explicit teaching of SDL strategies in their reading course.

Discussion

The results of the present study are in contrast with the findings of researchers like Nikoopour and Amini Farsani (2010) which showed that learners with extrovert and introvert personality types did not show any significant difference regarding the use of language learning strategies. But

our findings are in congruent with the findings of a number of other researchers (Wigzell & Al-Ansari; 1993; Pintrich, Roser, & Degroot, 1994; Kiany, 1997; Dwyer, 1998). However, besides to personality factors, the instructional option (i.e., explicit teaching of SDL strategies) we focused upon in this study played a crucial role in developing reading comprehension of the participants. This is also in parallel with the findings of a number of other researches in the related literature that showed positive relationships between SDL and reading comprehension (Kim, 2010; Zarei & Gahremani, 2010; Khodabandehlou et al., 2011; Meshkat & Hassanzade, 2014).

In our study, we noticed that the more self-directed the reader, the more successful s/he has been. That is to say, introverts were generally better readers than extroverts. While extroverts seemed to hate reading or studying by them and preferred social strategies such as asking for clarification, and were more willing to be involved in discussion based and general activities, introverts preferred activities which required careful attention for comprehension. They preferred to think about the texts at hand, and enjoy solitary studying by learning alone and by avoiding social contacts. They liked planning ahead, monitoring their progress, and evaluating the results. In sum, they were in the habit of taking more control of their own learning.

CONCLUSION

The present study investigated the effect of self directed learning (SDL) strategies on introvert and extrovert Iranian EFL learners' reading comprehension. It was found that:

SDL strategies have significant effect on Iranian EFL learners' reading comprehension.
SDL strategies have significant effect on introvert Iranian EFL learners' reading comprehension.
SDL strategies have significant effect on extrovert Iranian EFL learners' reading comprehension.
SDL strategies have more significant effect on introvert rather than extrovert Iranian EFL learners' reading comprehension.

The results of this research show that considering personality types like extroversion / introversion in planning and presenting education can improve learning processes and consequently reading comprehension achievement meaningfully. Furthermore, the results show that introverts seemed to have taken full advantage of SDL strategies in their reading comprehension course. It seemed that they were willing to be more self directed.

We believe that by knowing students' personality types, teachers are able to guess students' needs in English and can decide to do some useful activities and avoid some other useless activities. We suggest teachers to pay more attention to the significance of explicit teaching of particularly SDL strategies in the course of teaching reading comprehension. We would also like to suggest researchers to investigate the effectiveness of SDL strategies with regard to other skills and subskills.

Finally, it should be mentioned that as with any other study, this inquiry too had few research limitations. First, this study was conducted at Parsian institute in Lamerd, in Iran. Second, the

sample were narrowed down to merely one institute' students. Thus, more researches are needed in similar situations to support the findings and to find more about self-directed learning strategies impacts on the students' performances. Third, our time was limited; maybe more time was needed to have more accurate and comprehensive results. Forth, our sample was limited to 60 EFL Learners only. Fifth, self-directed learning strategies could be applied to different language skills and subskills, whereas it was limited to merely EFL learners' reading comprehension in this study.

ABSTRACT

This research was conducted to investigate the relationship between English as a foreign language (EFL) teachers' critical thinking and their spiritual intelligence among 70 Iranian EFL teachers with respect to gender. The objective was to find out whether critical thinking ability has any significant relationship with teachers' spiritual intelligence. The 70 EFL teacher (35 females, 35 males) aged between 23 and 40 years old with a range of between 1 and 17 years of teaching experience from private language institutes or public schools in Shiraz, Iran, were administered SISI-24, the Spiritual Intelligence Self-Report Inventory developed by D. King (2008) and Honey's Critical Thinking Questionnaire developed by Honey's (2004). The results obtained through using Pearson Product-Moment Correlation showed that there were significant positive correlations between teachers' spiritual intelligence and critical thinking. The results of multiple regressions showed that SI, CSE and CET can predict CT. Furthermore using T-Test, it was found that with respect to gender, teachers were significantly different on their scores on SI and female teachers' SI levels were higher than males', however there were no significant differences among male and female participants' CT. Besides demonstrating the benefits of utilizing critical thinking and spiritual intelligence to create a safe environment for student learning, this study also highlights the roles of these variables in language teaching.

KEYWORDS: Spiritual Intelligence (SI), Critical Thinking (CT), EFL Teachers

INTRODUCTION

Undoubtedly teachers are influential factors in educational contexts which can effectively motivate learners, produce interesting and pleasurable learning activity and moreover increase the students' academic achievement, as Campbell (2000) indicated one of the influential key factors in the process of language teaching and learning is teacher. In line with the importance of teachers, individuals who think critically can ask appropriate questions, gather relevant information efficiently and creatively, sort through this information, reason logically from this information, and come to reliable and trustworthy conclusions about the world that enable him to live and act successfully in it (Center for Critical Thinking, 1996a).

Furthermore with the development of technical society, educational system needs more effective and creative teachers who can think critically, since critical thinking poses essential questions about the nature of knowledge and reasoning. As Freeley and Steinberg (2000) stated critical thinking is "the ability to analyze, criticize, and advocate ideas; to reason inductively and deductively; and to reach factual or judgmental conclusions based on sound inferences drawn from unambiguous statements of knowledge or belief" .

Robert Ennis (Norris & Ennis, 1989) defines critical thinking as "rational reflective thinking concerned with what to do or believe". According to this definition we can conclude that the capacity to bring reason is deeply interconnected with our beliefs and actions. However critical thinking doesn't lead to success unless it covers virtually any situation and to figure out the logic of whatever is happening in that situation.

In current literature, issues related to human's interior or underlying potentials of mind and consciousness are partially neglected in educational contexts. Following the exciting results of studied about Multiple Intelligences (MI) and Emotional Intelligence (EI), Spiritual intelligence (SI) is emitting new demands in educational contexts. Zohar and Marshal (2000) entitled "*SQ: the ultimate intelligence*" defined SQ as the intelligence with which we ask fundamental questions and with which we reframe our answers. Emmons (2000) illustrated SQ as the adaptive use of spiritual information to facilitate everyday problem solving and goal attainment. Spiritual intelligence can be described as a set of adaptive mental capacities that based on non-material and transcendent aspects of reality, specifically those which are related to the nature of one's existence, personal meaning, transcendence, and heightened states of consciousness (King, 2008). On the other hand, there are many investigations that confirm the effectiveness of critical thinking on different aspects of second or foreign language learning, however these research mostly focus on learners performances such as their language proficiency or skill development. Moreover the previous studies on teacher's critical thinking reveal that there is a significant positive relationship between Iranian EFL teachers' critical thinking ability and their pedagogical success. According to these studies high levels of critical thinking are related to high levels of teacher success as evaluated by EFL learners. It means that more successful EFL teachers are the ones who have benefited from critical thinking abilities. The more critical thinking the EFL teacher is the more successful he/she in his/her teaching career. (Birjandi, 2010; Ghaemi, 2011).

However the available literature in Iran is admittedly low on empirical research on the relationship between EFL teachers' critical thinking and spiritual intelligence. As such, the scarcity of research in this area necessitates undertaking a precise study in this area.

LITERATURE REVIEW

Critical Thinking

Our actions to a large extent are affected by the quality of our thought. Critical thinking is a way of thinking about different issues or situations which analyzes or assesses thinking by questioning and clarifying the problems. Paul (1985) defines critical thinking as "learning how to ask and answer questions of analysis, synthesis and evaluation". Dr. Steven Brookfield (1987) stated that

critical thinking involves two interrelated processes: “identifying and challenging assumptions, and imagining and exploring others.” He also added that “Critical Thinking involves recognizing and researching assumptions that undergird thoughts and actions.”

Although Siegel (1988) defines critical thinking as “the educational cognate of rationality”, and a critical thinker as one who is “appropriately moved by reasons”, he explains about a concept of critical thinking which involves a critical spirit. According to him, critical thinking indicates dispositions, personality inclinations, habits of the mind, and traits of character (Siegel, 1988, 2003).

Facione (1990) defines critical thinking as “purposeful, self regulatory judgment which results in the interpretation, analysis, evaluation, and inference as well as the explanation of the evidential, conceptual, methodological, criteriological, or contextual considerations upon which judgment is based”.

Critical thinking can be considered from different perspectives. If we want to look at critical thinking as a cognitive process we can refer to Diane Halpern (1996) definition:

“Critical thinking is the use of those cognitive skills or strategies that increase the probability of a desirable outcome. It is used to describe thinking that is purposeful, reasoned, and goal directed .the kind of thinking involved in solving problems, formulating inferences, calculating likelihood, and making decisions when the thinker is using skills that are thoughtful and effective for the particular context and type of thinking task.”

CT also has been viewed as more than cognitive perspective, Pithers and Soden (2000) assert that critical thinking encompasses a number of abilities such as identifying a problem and the assumptions on which it is based, focusing the problem, analyzing, understanding and making use of inferences, inductive and deductive logic, and judging the validity and reliability of assumptions and sources of data.

Rudd, Baker, and Hoover (2000) expanded these definitions and asserted that critical thinking is a “reasoned, purposive, and introspective approach to solving problems or addressing questions with incomplete evidence and information for which an incontrovertible solution is unlikely”. Scriven and Paul (2004) defined critical thinking as, “that mode of thinking - about any subject, content, or problem - in which the thinker improves the quality of his or her thinking by skillfully taking charge of the structures inherent in thinking and imposing intellectual standards upon them.”

Ricketts and Rudd (2004) describe three dimensions of critical thinking disposition:

- Cognitive Maturity: students’ predisposition to looking for opportunities to use reasoning; anticipating situations that require reasoning; and confidence in reasoning ability.
- Engagement: students’ predisposition to be intellectually curious and desire to know the truth.
- Innovativeness: students’ predisposition to being aware of the complexity of the problems; being open to other points of view; and being aware of their own and others biases and predispositions.

Radhakrishnan (2009) stated the characteristics of a critical thinking teacher as below:

- He asks pertinent questions to see whether his students have learned or not.
- He assesses statements and arguments.
- He is able to admit a lack of understanding or information.
- He has a sense of curiosity.
- He is interested in finding new solutions for becoming teaching problems.
- He is able to clearly define a set of criteria for analyzing ideas.
- He is willing to examine beliefs, assumptions, and opinions and weigh them against facts.
- He listens carefully to others and is able to give feedback.
- He sees that critical thinking is a lifelong process of self assessment.
- He suspends judgment until all facts have been gathered and considered.
- He looks for evidence to support assumption and beliefs.
- He is able to adjust opinions when new facts are found.
- He looks for proof.
- He examines problems closely.
- He is able to reject information that is incorrect or irrelevant.

Previous research reveals that students' perceptions and interpretations of the academic environment have a certain disposition towards their approaches to learning, and this in turn affects their learning outcomes (Entwistle & Tait, 1990). Young (1980) also believed that if teachers use appropriate instructional methods and curriculum materials, students will improve their critical thinking skills.

Ruminski and Hanks (1995) put emphasize on teachers' ability to think and teach critically. They asserted that teachers should have a clear concept of critical thinking before they become involved in the process of teaching and evaluation.

Spiritual Intelligence

Psychologist Robert A. Emmons in 1999 studied SI. He, who had been studying personality traits and examining virtues applied Gardner's criteria of identifying intelligences and organized neurological, developmental, evolutionary and psychological evidence. He reviewed the empirical literature in the psychology of religion and concluded that SI is a distinct intelligence. Emmons listed five core characteristics of SI:

1. The capacity to transcend the physical and material.
2. The ability to experience heightened states of consciousness.
3. The ability to sanctify everyday experiences.
4. The ability to utilize spiritual resources to solve problems.
5. The capacity to be virtuous.

He emphasized the relevance of spirituality and its importance for mental health and subjective well-being. In a research done on emotional intelligence Goleman (1995) stated that one's success is related to high emotional and spiritual intelligence. As Danah Zohar (2000) said in the book *Connecting with our Spiritual Intelligence*, "It provides a context for our actions, as well as the way we assess whether one course of action or one life-path is more meaningful than another.

SQ is the necessary foundation for the effective functioning of both IQ and EQ. It is our ultimate intelligence.”

Spiritual intelligent or spiritual quotient is a set of abilities people use to apply, manifest, and embody spiritual resources, values, and qualities to enhance daily functioning and wellbeing (Amram, 2007).

There has been done some research on this issue which addresses students’ actions towards their surroundings. According to Nafis (2007) with a good and pure soul, students will be able to keep good attitudes and able to practice a lingual well as this will enable them to control themselves from doing things that are wrong in term of values and norms which could influence a well behaved norm. Saidy et al, (2009) claims that Spiritual Intelligence is seen as a factor that influences students’ language skills and the awareness of the needs to enhance secondary students’ language skills through emotional and spiritual balance should be given emphasis in the current educational system. Hassan (2009) asserted that students with high levels of SQ are more confident in taking an action and more sensitive towards their surroundings.

On the other hand, some researchers believe that spirituality should be part of language teaching. Palmer (1999, 2003) suggested that spirituality should be part of a classroom teacher’s training and practice. McGreevy and Copley (1999) presented a number of guidelines for doing so, including a focus on the arts, making the classrooms and school a place of beauty, taking time to ponder profound issues and questions that students want to address, and involving students in service learning projects. Kessler (2000) introduces seven gateways to the soul that teachers can use as part of their classroom practice. Each of the pathways Kessler identified received attention from other researchers.

According to King’s (2008) model of spiritual intelligence, SI is as a set of mental capacities which contribute to the awareness, integration, and adaptive application of the nonmaterial and transcendent aspects of one’s existence, leading to such outcomes as deep existential reflection, enhancement of meaning, recognition of a transcendent self, and mastery of spiritual states and it has four main components: (1) critical existential thinking, (2) personal meaning production, (3) transcendental awareness, and (4) conscious state expansion.

Critical Existential Thinking (CET) is the ability to ponder critically on different meanings, purposes, and other existential or metaphysical issues. And existential thinking is commonplace in definitions of both spirituality and spiritual intelligence (Zohar & Marshall, 2000). Personal Meaning Production (PMP) is the capacity to engender personal meaning and purpose in physical and mental experiences. Transcendental Awareness (TA) is the ability to go beyond personal limitations, and be aware of transcendent dimensions of the self, of others, and of the physical world. Conscious state expansion (CSE) is the capacity to expand the state of consciousness and to reach pure consciousness.

With regard to above mentioned issues and the growing interest and prominence of both CT and spiritual intelligence and the scarcity of research in this area the present study was undertaken to

see whether Iranian EFL teachers' critical thinking is related to their spiritual intelligence. To this end, the present study aims to; first, investigate the relationship between SI and CT, second, to investigate whether there are any differences in teachers on SI and CT scores with respect to gender.

RESEACRH QUESTIONS

In order to achieve the purpose of the study the following research question was poised:

Q: Is there any significant relationship between EFL teachers' critical thinking and their spiritual intelligence?

Based on the above-mentioned research question, the following null hypothesis was raised:

H0: There is no significant relationship between EFL teachers' critical thinking and their spiritual intelligence.

METHODOLOGY

Participants

The participant in this study consisted of 70 EFL teacher (35females, 35 males) aged between 23 and 40 years old with a range of between 1 and 17 years of teaching experience. The participants were selected from private language institutes or public schools in Shiraz, Iran. The institutes were chosen based on accessibility.

Instruments

SISI-24

SISI-24, the Spiritual Intelligence Self-Report Inventory, is a 24 item questionnaire developed by D.King (2008) that contains 4 factors / Subscales: Critical Existential Thinking (CET), Personal Meaning Production (PMP), Transcendental Awareness (TA) and Conscious State Expansion (CSE). Responses are provided on a 5-point continuous likert scale anchored by 0 (Not at all true of me) and 4 (Completely true of me). In order to eradicate possible misunderstandings or confusion on the side of the subjects, the translated version of the SISI-24, the Spiritual Intelligence Self-Report Inventory was used to collect information on students' spiritual intelligence. The questionnaire's reliability and validity were satisfactory according to a research conducted by Raghibi (2010), the questionnaire's reliability coefficient was 67% and its Cronbach's alpha coefficient was 89%. The overall reliability for SISI for this study using Cronbach's Alpha turned out to be 0.82.

Critical Thinking Questionnaire

Alongside the spiritual intelligence questionnaire, the translated version of Honey's (2004) critical thinking questionnaire was administered to the participants to evaluate the skills of analysis, inference, evaluation, inductive reasoning and deductive reasoning. The questionnaire included 30 multiple choice items followed by five alternatives consisting of never, rarely, sometimes, often, and always. The reliability of the questionnaire according to Naieni (2005) was .86 by. The overall reliability for Critical Thinking Questionnaire for this study using Cronbach's Alpha was 0.84.

Procedure

To gather the required data, the following steps were taken. The participants were EFL teachers who were working in Shiraz public schools or language institutions. Firstly all the teachers were provided with an oral description of the objectives of the test and the two questionnaires. To avoid any misunderstandings, the researcher used the translated versions of the two questionnaires. Then they were given the Honey's Critical Thinking Questionnaire, to evaluate teachers' critical thinking ability, along with the Spiritual Intelligence Self-Report Inventory, to measure teacher's spiritual intelligence. The teachers were requested to select the most appropriate answers to the questions. The questionnaire administration took approximately 15 minutes. Teachers were asked to fill out the questionnaires at home in their free time and submit it to the researcher within a week. Having collected the two completed questionnaires, the researcher analyzed the data and extracted the results.

RESULTS AND DISCUSSION

Descriptive statistics

In this section, the results of the study are presented and discussed. The descriptive analysis of the participants' SISI-24 and Honey's critical thinking questionnaire are presented in Table1. As the table indicates, the participants were 70 English teachers. The minimum and the maximum scores on SISI are 53 and 93 respectively. The overall mean and SD of the participants on SISI are 75.71 and 11.00 respectively. The participants' scores ranged from 56 to 110 on Critical Thinking Questionnaire. The overall mean and SD of the participants on Critical Thinking Questionnaire are 86.81 and 11.91.

Table 1: Descriptive statistics for SQ, CT and reading comprehension scores

	N	Range	Minimum	Maximum	Mean	Std. Deviation	Variance
SI	70	40.00	53.00	93.00	75.7143	11.00085	121.019
CT	70	54.00	56.00	110.00	86.8143	11.91308	141.922

Based on the results illustrated in Table 2, the mean scores for SI subscales utilized by participants are 22.21 (TA), 21.27 (CET), PMP (16.20), CSE (15.72).

Table 2: Descriptive Statistics of the Participant's Performance on Spiritual Intelligence Self-Report Inventory

	N	Mean	Std. Deviation
Transcendental Awareness	70	22.2143	3.98873
Critical Existential Thinking	70	21.2714	5.67456
Personal Meaning Production	70	16.2000	3.06736
Conscious State Expansion	70	15.7286	3.12967

SI and CT

In order to test the relationships between teachers SI and CT, a series of Pearson Product-Moment Correlations was run (table 3). The results indicated that there were significant positive correlations between CT and SI ($r = .92$, $p < 0.01$) and CT and SI subscales: CT and TA

($r = .277$, $p < 0.05$), and CT and CSE ($r = .542$, $p < 0.01$) and CT and CET ($r = .923$, $p < 0.01$) and CT and PMP ($r = .675$, $p < 0.01$).

Table 3: Correlations

	CT	SI	TA	CSE	CET	PMP
CT Pearson Correlation	1	.92**	.277*	.542**	.923**	.675**
Sig. (2-tailed)		.000	.020	.000	.000	.000
N	70	70	70	70	70	70

*. Correlation is significant at the 0.05 level (2-tailed).

**. Correlation is significant at the 0.01 level (2-tailed).

To analyze the data further, Regression Analysis was conducted (table 4). The results indicate that teachers' total score of SI ($\beta = .855$, $t = 4.556$, $p < .01$), CSE ($\beta = -.167$, $t = -2.378$, $p < .05$), and CET ($\beta = .360$, $t = 3.318$, $p < .01$) are positive predictors of the dependent variable (CT).

Table 4: Regressions Coefficients(a)

Model	Unstandardized Coefficients		Standardized Coefficients	t	Sig.
	B	Std. Error	Beta		
1 (Constant)	26.089	3.765		6.929	.000
SI	.926	.203	.855	4.556	.000
TA	-.347	.223	-.116	-1.557	.124
CSE	-.636	.267	-.167	-2.378	.020
PMP	-.480	.271	-.124	-1.775	.081
CET	.757	.228	.360	3.318	.001

a. Dependent Variable: CT

The results revealed that the model containing scores of CT test can predict 86 percent of the teachers' spiritual intelligence. In this part of research $R^2 = 0.86$, indicating that 86% of the variance in CT is explained by the independent variable SI (table 5). The R value is 0.84 which indicates the correlation coefficient between teachers' CT and spiritual intelligence.

Table 5: Regression Analysis Model Summary for SI Predicting CT

Model	R	R Square
1	.92	.86

a. Predictors: (constant), SI

b. Dependent Variable: CI

Teacher Differences on SI and CT with Respect to Gender

To explore whether there were significant SI and CT differences among teachers with respect to gender, a series of independent t-test analyses was conducted (table 6). The results indicated that, with respect to gender, teachers were significantly different on their scores on SI (t

=11.761 , $df = 61.3$, $p < .05$), however there are no significant differences among male and female participants' CT ($t = 11.610$, $p > .05$).

Table 6: Comparison of Means, Standard Deviations and T-Values of Teachers on Their SI and CT Subscales Scores by Gender (N=70)

Gender	Male (N = 35)		Female (N = 35)		t	sig
	Mean	SD	Mean	SD		
SI	66.7714	5.20794	84.6571	7.33622	11.761	.004
CT	77.1714	7.12694	96.4571	6.76645	11.610	.46

Discussion

Critical thinking has been one of the prevailing concepts in language teaching. According to Halpern (2003) Critical thinking is one of the cognitive abilities that "increase[s] the probability of a desirable outcome... the kind of thinking involved in solving problems, formulating inferences, calculating likelihoods, and making decisions". Today the importance of critical thinking is acknowledged in different educational fields, According to Schaefersman (1991) all education must involve not only 'what to think', but also 'how to think'.

Asking questions, inventing new ways of teaching, creating effective techniques and adapting your knowledge in new situations and circumstances in teaching context require a critical teacher. According to Nunan and Lamb (1999) Critical thinking teachers are ones who are capable of monitoring, critiquing and defending their actions in planning, implementing and evaluating language programs. On the other hand spirituality is an integral part of our life which affects human development in numerous fields. We expect teachers to create a safe environment for students' learning.

For the relationship between CT and SI the results showed that spiritual intelligence had a significant relationship with CT and the variation in teachers' spiritual intelligence can be explained by taking their CT into account. Therefore, the researcher was able to reject the null hypothesis of the study which stated that there is no significant relationship between EFL teachers' critical thinking and their spiritual intelligence. Teachers' total score of SI, CSE and CET were positive predictors of CT. More specifically, the multiple regression analysis demonstrated that two of the four components of spiritual intelligence as defined by King (2008), namely 'Critical Existential Thinking' and 'Conscious State Expansion' are significantly positively correlated with CT scores. The size of this correlation indicates that generally high levels of critical thinking are related to high levels of spiritual intelligence as evaluated by EFL learners. Or the more critical thinking the EFL teacher is the more spiritual intelligent in his career. This is hardly surprising since both teachers' critical thinking and spiritual intelligence addresses numerous questions of 'how's', 'what's' and 'why's'. The questioning ability of teachers helps them improve their teaching effectiveness (Richards, 1990). All the findings from the previous studies have revealed that critical thinking plays an important role in teachers' success. A study done by Ghaemi (2011) revealed that there is a significant relationship between EFL teachers' critical thinking and their teaching success.

According to Scriven and Paul (2004) critical thinking is “that mode of thinking - about any subject, content, or problem - in which the thinker improves the quality of his or her thinking by skillfully taking charge of the structures inherent in thinking and imposing intellectual standards upon them.” According to this definition critical thinking refers to one's internal world as an individual, i.e., people's internal or spiritual values.

On the other hand both critical thinking and spiritual intelligence address human ability in solving problems. According to Rudd, Baker, and Hoover (2000) critical thinking is a “reasoned, purposive, and introspective approach to solving problems or addressing questions with incomplete evidence and information for which an incontrovertible solution is unlikely”. Emmons in 1999 defines spiritual intelligence as the ability to utilize spiritual resources to solve problems. With respect to gender, teachers were significantly different on SI, with females reporting higher SI levels, however there were no significant differences among male and female participants' CT.

CONCLUSION

The findings of the present study confirm the important role of critical thinking and spiritual intelligence in language teaching. It is concluded that those EFL teachers that have higher levels of SI are more critical thinkers. The current study revealed that almost 86 percent of those teachers who benefited from CT abilities have higher spiritual intelligence. The present study also investigated the role of gender on teachers' spiritual intelligence and critical thinking ability. It was found that female teachers' SI levels were higher than males', however there were no significant differences among male and female participants' CT.

The relationship between CT and spiritual intelligence suggests that teachers' ability to analyze, creative and deduce, and solve problems is related with how deeply they think. Spiritual experience enables a teacher to cope with demanding situations in teaching and choose creative new solutions.

The study underlines the importance of critical thinking and spiritual intelligence in English language teaching. The results also imply that more work needs to be done towards measuring the relationship between both SI and CT in ELT. Future research should focus on measuring a larger and more representative and diverse sample of the EFL teacher population, among middle, and high school level teachers. This may find differences in spiritual intelligence and critical thinking among different teaching levels. Concerning the importance of spiritual intelligence in all aspects of life, it is necessary for teachers to increase their information about spiritual intelligence and ways to develop it particularly among students in ELT context.

Although the researcher has made a lot of attempts to minimize the pitfalls of this study, there are some limitations: the population of this study was limited to one city, only Shiraz. Hence, it might not be the true example of EFL teachers and thus the results cannot be generalized thoroughly. The other limitation was that the population of the research was small, only 70 EFL teachers so it was not appropriate to generalize the researches' results to other groups.

ABSTRACT

This study addressed critically the question: why is it that a method like silent way hasn't become so popular among language teachers? To find answer to this question, Silent Way has been evaluated on the basis of KARDS (knowing, analyzing, recognizing, doing, seeing) model modules and parameters. KARDS model has been proposed by Kumaravadivelu (2012) as an exclusive alternative modular framework which seeks an education plan for a global society and calls for restructuring of language teacher education to incorporate process-based multidirectional cyclical modules aimed at preparing teachers to be 'strategic thinkers, exploratory researchers and transformative intellectuals. To achieve the goal of the study, we have reviewed Silent Way in details in order to see whether the modules and parameters of KARDS model are satisfied by using this method in education plan or not. At the end, we have come to the conclusion that most of the parameters are not satisfied or are partially satisfied. The findings of the studies led us to some worthwhile insights in teaching language. The most striking one is that clearly we have shown in what respects silent way cannot fulfill the requirements of teaching language for a global society. Another insight coming from the study can be the consideration of this study as a model for language teachers to evaluate the way they teach language in their particular context. Finally, the positive aspects of silent way that were in compliance with KARDS model were also mentioned; therefore, teacher can take them into consideration and use them if they are appropriate for their own situation.

KEYWORDS: KARDS Model, Silent Way, Critical Evaluation, Globalization.

INTRODUCTION

"Why should I speak when my student can?"

"Tell me and I forget, Teach me and I remember, Involve me and I learn"

The above mottos remind us a method of language teaching introduced by Caleb Gattegno in the early 1970s. This method is called "**Silent Way**" which is well known for the use of colored

sticks called cuisenaire rods and for the approach to the teaching of initial reading in which sounds are taught by colors.

This method, however, was not used for a long time; moreover, was not even widely used at its own time. The question that arises here is why is it that the methods like silent way appear and then disappear within a short period of time. To put it in another way, what rationale lies behind the fact that some methods do not receive lots of appeal and attention among language practitioners? To seek the answer a critical view at the principles and assumptions of the method is called upon. To have a critical view at any method, a kind of sophisticated theoretical framework or scientific theory and model is undoubtedly necessary. The kind of framework that, according to Zeicher(2005), must consider not only issues such as teachers' knowledge, skills, dispositions, cognition, and beliefs but also factors such as educational, cultural and ideological movement as well as major swings in the political pendulum.

The need for having a comprehensive framework is also emphasized by Kumaravadivelu (2012). He states, “if there is a need for comprehensive framework for teacher preparation in the field of general education, which has witnessed substantial exploration and expansion in the last fifty years, then, clearly, the need for such a framework in the relatively nascent field of second and foreign teacher education is even greater” (p. 2).

Now that we live in a post method era, there is a plausible need to choose an up to date framework satisfying the accounts mentioned above and accounting well for the evaluation of the method in question. For this reason, Kumaravadivelu's (2012) KARDS model, which will be elaborated in details later in this study, is adopted.

After the specification of the model, now for the evaluation of the method in question with a critical view, it is required that we review silent way in details. In what follows, some of the aspects of Silent Way (SW) drawn from different teaching books are mentioned.

SILENT WAY

Basic premises for SW

First of all, as its name implies, the method is based on the premise that teacher should be silent as much as possible and the learners should be encouraged to produce language as much as possible. This is because it is believed that silence makes students to concentrate on what is to be learned. Furthermore, The SW assumes that learners work with resources and nothing else, as they are solely responsible for what they learn. On the top of all that, teaching here should be subordinated to learning.

Learning hypotheses

Some hypotheses about how learning can be best taken place are in favor of SW. One of which is that learning is facilitated if the learner discovers or creates rather than remembers and repeats what is to be learned. Another hypothesis is that learning is facilitated by accompanying

(mediating) physical objects. And finally, learning is facilitated by problem solving involving the material to be learned.

Goals of the Silent Way teacher

The goals which this method sets for teachers to achieve are: 1. at the end the Students are able to use the language for self-expression. 2. The students develop independence from the teacher; develop their own criteria for correctness. Or to put it in another way, they become independent by relying on themselves. Thus, to achieve this end, the teacher should give them only what they absolutely need to promote their learning.

Characteristics of the teaching process

The teacher sets up situations that focus on the structures of the language. These structures are introduced through a language-specific sound-color chart. And they are also constantly reviewed and recycled. Another characteristics associated with SW is that pronunciation is seen as fundamental.

Nature of student-teacher interaction

Although the teacher is silent, He is still very active by setting up situations to force awareness, listening carefully to students' speech, and silently working with them on their production through the use of nonverbal gestures and the tools he has at his disposal. Besides, Student-student verbal interaction is desirable (students can learn from one another) and is therefore encouraged.

How to deal with feeling of students?

When their feelings interfere, the teacher tries to find ways for the students to overcome them. Through feedback sessions at the end of the lessons, students have an opportunity to express how they feel. It is hoped that a relaxed, enjoyable learning environment will be created.

How to accomplish evaluation?

Although the teacher may never give a formal test, he assesses student learning all the time. Since "teaching is subordinated to learning," the teacher must be responsive to immediate learning needs. The teacher's silence frees him to attend to his students and to be aware of these needs.

The syllabus

The syllabus that SW proponents follow is Structural syllabus in which Language items, the imperative, numeration, and prepositions of location are of great importance.

Instructional materials

Using special objects and materials is a special feature of Silent Way. Color-coded pronunciation charts (Fidel charts) are one of the materials that is specific to this method. The Fidel is a set of charts presenting all the possible spellings of each sound of the language which was originally created for teaching native speakers to read with Words in Color. Color-coded vocabulary wall charts, Colored rods, a pointer, Reading/writing exercises are among other instructional materials

used in this method. Further, the method makes use of color association to help teach pronunciation; there is a sound-color chart which is used to teach the language sounds.

Types of learning & teaching activities

The teacher models a word, phrase, or sentence and then elicits learner responses. Learners then go on to create their own utterances by putting together old and new information. Charts, rods, and other aids may be used to elicit learner responses. Teacher modeling is minimal, although much of the activity may be teacher directed.

Principles

Silence in SW is considered as a tool to help students to foster autonomy, or the exercise of initiative and to learn how to accept responsibility for their own learning. The teacher's silence encourages group cooperation as well. The teacher should give only what help is necessary in order for the students to rely on each other and themselves and develop their own inner criteria for correctness as a result. The teacher who is responsible for creating an environment that encourages student risk taking and facilitates learning, also works with the students while the students work on the language. In addition, Teacher provides non-repetitive and motivating practice. He also provides meaning through direct perception, not through translation. He is yet a neutral observer, neither pleased by correct performance nor discouraged by error.

Since errors show the teacher where things are unclear, they are important and necessary to learning. At the beginning and early stages of learning, making errors seems natural; therefore, the teacher needs to look for progress, not perfection. The teacher can gain valuable information from student feedback. Learning takes place in time and at different rates by students. The elements of the language are introduced logically, expanding upon what students already know. Some learning takes place naturally as we sleep. Students will naturally work on the day's lesson then. The skills of speaking, reading, and writing reinforce one another. The teacher creates a relaxed atmosphere of mutual cooperation and has to take into account students' individual needs and varying levels of competence.

Additionally, a successful learning involves commitment of the self to language acquisition through the use of silent awareness and then active trial. Besides, In Silent Way learners are expected to acquire "inner criteria" and become independent, autonomous and responsible.

Finally, language and culture in silent way are perceived as inseparable; therefore, in teaching the item of target language, the culture associated with that target language should be considered and taught.

The Silent Way respects

The silent way respects the learners and their learning processes before anything. This is because students have already mastered professional in their native language and are treated as sophisticated language learners. Another thing the method respects is the impacts of teaching upon learning. That is to say, the Silent Way techniques are designed to allow teachers to intervene without interfering with the learning processes. The other thing respected by the

method is the language being learned - The materials and techniques are designed to bring students into contact the totality and complexity of the new language. Yet, they have to be used in specific way that provides opportunities for working analytically on every pinpointed issue.

KUMARAVADIVELU'S KARDS MODEL

In his book named as Language Teacher Education for a Global Society, Kumaravadivelu calls for a move as restructuring of language teacher education to incorporate process-based multidirectional cyclical modules aimed at preparing teachers to be 'strategic thinkers, exploratory researchers and transformative intellectuals'. The rationale for such a move, according to him, is globalization which embodies economic, cultural, and educational dimensions.

In line with this move, in the report titled as *Transforming teacher education* (Alliance, 2008), it is mentioned that notwithstanding their origins, commonalities and differences, all systems of teacher preparation must rethink their core assumptions and processes in the new global context.

To understand the fast-evolving global context and consequently develop language teacher education plan for a global society, five interconnected globalizing perspectives, and the shifting assumptions that these five perspective demand have to be taken into account. These perspectives are: Post-national, Post-modern, Post-colonial, Post-transmission, and Post-method perspective. The first three are related to historical, political and sociocultural developments; the last two to language teacher education. In what follows, each perspective is discussed very briefly.

From the post-national perspective, the Nationalism is being severely challenged by economic and cultural globalization, creating a global cultural consciousness and resulting in the Shifting assumption that educational issues also can be touched globally.

Postmodernism acknowledges complexity and diversity. In other words, instead of looking for one unifying truth, it recognizes a multiplicity of narratives. Individuals are then entitled to construct their own self, and we have here something we call identity formation. The Shifting assumption that emerges from this perspective is questioning ideology, power, knowledge, class, and things like that.

What Post-colonial perspective emphasizes is that Languages like English, French, and Spanish which are of global and colonial nature tended and were considered to be world's lingua franca formerly. Therefore, there was the threat of linguistic and cultural imperialism. The shifting assumption of this perspective is that many countries have built programs for foreign language education devoid of their cultures, to preserve their own linguistic and culture heritage.

Post-transmission perspective criticizes transmission models as information-oriented, and not enquiry-oriented; hence, designed to transfer a pre-determined, pre-selected and pre-sequenced body of knowledge. The shifting assumption this perspective calls upon is that we should enable

teachers to construct their own versions/visions of teaching, and produce self-directing, self-determining individuals.

Finally, post-method perspective attacks the concept of method. To this perspective, this concept is limited in a way that it makes teachers enslaved by the rigidity of methods guidelines and methodological paradigms. Nowadays, therefore, we don't have to look for alternative method, but we have look for an alternative to method. The Shifting assumption on the basis of this perspective is that the goal of teacher education is to transform classroom practitioners into strategic thinkers, teachers and researchers.

The five global perspectives mentioned above are related to a set of operating principles that can govern the processes and practices of L2 teacher education. They are: Particularity, Practicality, and Possibility.

The principle of particularity is based on the hermeneutic philosophy of *situational understanding*, which claims that a meaningful pedagogy must be constructed on a holistic interpretation of particular situations, and that it can be improved only by improving those particular situations. . All pedagogy, like politics is local. "Language teacher and teacher education plan must be sensitive to a particular group of teachers, teaching a particular group of learners, pursuing a particular set of goals, within a particular institutional context, embedded in a particular socio-cultural milieu" (Kumaravadivelu, 2001, p. 538).

The relationship between theory and practice is focused broadly by the principle of practicality, and the teachers' skill in monitoring their own teaching effectiveness is addressed narrowly by this principle. The harmful dichotomy between theory and practice gives rise to the misconception that theorists produce knowledge, teachers consume knowledge. By contrast, teachers must be enabled to develop the knowledge, skill, attitude& autonomy necessary to construct their own context-sensitive theory of practice.

The principle of possibility is drawn from critical pedagogy and opposes language teacher education programs that merely transmit a dead body of content knowledge; instead, it favors those that raise sociopolitical consciousness among all the participants so that they can form and transform their personal and social identity.

KARDS model proposed by Kumar seems an excellent and plausible response to those language teacher education plans which cannot meet the challenges of globalization, and as an answer to the need of restructurings language teacher education. This model is modular in nature and consists of five modules: Knowing, Analyzing, Recognizing, Doing, and Seeing. Each modular is discussed as follows.

Module 1: Knowing

The term Knowing is employed here instead of knowledge to exert considerable emphasis on the ways of knowing indicating that knowing is a process; knowledge is a product.

Knowing, implying teacher's knowledge consists of a three-fold frame of reference: teacher's Professional knowledge, teacher's Procedural knowledge and teacher's Personal knowledge.

Teacher's Professional knowledge

With respect to teacher's Professional knowledge, the teacher must know fundamental concepts of language, language learning, and language teaching.

Knowledge about language itself entails knowledge of language as a system (phonological, semantic, syntactic system of language), language as discourse (deals with the cohesive nature of connected texts), and language as ideology (deals with a critical analysis of language; its social, political, cultural and ideological meanings; and seeing how it is exploited in the service of power).

Knowledge about learning deals with knowing about psycholinguistic grounds like **Input** (oral/written corpus of target language, by 1. Native speakers, 2. Simplified language by teachers, textbooks, NNSs, 3. peers). **Intake** (collecting and analyzing spoken and written interlanguage produced by learners). **Intake factors** (facilitate L2 development and consist of: 1. Individual factors like age and motivation, 2. Strategic factors like learning strategies, 3. Educational factors likelanguagepolicies and planning). **Intake processes** (language learning mental operations). **Output**(corpus of learners' well-formed as well as deviant utterances).

Finally, knowledge about language teaching mostly concerns with knowledge about methods of language teaching. The established methods primarily adhere to two basic approaches to language teaching: Use through usage and usage through use. The former heavily focuses on language as a system, and the syllabus and curriculum designer adherent to this approach carefully select a set of grammatical structures and vocabulary items, and sequence them according to their perceived difficulty level. The assumption here is that grammatical competence ultimately leads to communicative competence, and language learning is more intentional than incidental. The later, on the other hand, considers language learning as more incidental than intentional; therefore, communication and meaningful interaction are primary.

Teacher's procedural knowledge

Procedural knowledge relates to management skills and strategies for planning, implementing, monitoring and evaluating classroom events and activities. There are several aspects to the management of classroom language learning, the most important of which are topic management and talk management. The first mainly involves managing the structure of information exchange, which in turn involves the type of questions asked and responses expected. The information structure in most language classes follows what is called the IRF sequence, that is, the teacher initiates (I), the learner responds(R), and the teacher provides appropriate feedback(F). In most traditional classes talk sequence predominates. To move away from this rigid formula, teachers are advised to ask referential questions which seek new information and permit open-ended responses from students, rather just display questions which allow learners only to display a closed set of language used. Teachers can closely link their talk management with topic management.

Topic management relates to the content of classroom talk. Normally, teachers confine themselves to discussing the topics included in the prescribed textbook. However, going beyond them and encourage students to initiate topics of their interests is likely to increase their motivation to participate in classroom interaction.

Personal knowledge

Teacher's individual observations, experiences, reflections, and interpretations gathered over a period of time. Unexplained and unexplainable understanding and awareness of what constitutes good teaching that is accumulated by teachers, which has been termed differently by different scholars. For example, Van Manen (1997) names this cumulative awareness as teachers' *sense-making*, teachers' *sense of plausibility* is utilized by (prabhu, 1990), and Hargreaves (1994) calls it *ethic of practicality*.

Therefore, teachers are expected to have the ability to critically recognize, reflect, review, and reinvent their own identities, beliefs and values.

Module 2: Analyzing

L2 teachers must develop the knowledge and skills necessary to analyze and understand learner Needs, motivation, and autonomy.

Learner Needs

A needs analysis should be done to discover: What language learners have to learn (their needs), what learners like to learn (their wants), and what they have not yet learned (their lacks). It can be done through questionnaires, interviews, observations, placement tests .

Learner motivation

Because of expanding global cultural consciousness, L2 learners are no longer integratively motivated. Non-English speaking world learns and uses English for communicational purposes because English is now seen more as a communicational tool, than as a cultural career. Based on Self- Determination Theory in cognitive psychology, intrinsic motivation functions as an important energizer of behavior. So, motivation is now being conceptualized & theorized to address changing realities.

Learner Autonomy

Learner autonomy is the ability to take charge of one's own learning. Learners can play an active role in topic / talk selection. Learners should develop critical awareness of the cultural constructions, ideologies and social positioning to effectively exercise their agency and develop their own voice.

Module 3: Recognizing

Success in teaching depends also on teacher's recognizing his/her Teaching Self. The teaching self is the inner self teachers bring with them to the practice of everyday teaching. It is accomplished through recognizing: Teacher Identities, Beliefs, and Values.

Teacher identities

Identity is the degree of individual's agency in determining a sense of self.

Teacher identity shapes teacher's perceptions about what constitutes teaching, and learning. Teacher education must help teachers become aware of the possibilities & strategies for personal/ and professional identity transformation.

Teacher beliefs

Teacher knowledge is filtered through teacher beliefs. Teacher education must help teachers to analyze their beliefs, and to critically reflect on them. Beliefs can be analyzed through teacher narratives, autobiographical reflections. Language teacher beliefs: Concepts such as "best method" and "good teaching" should be abandoned in favor of the recognition of diversity in teachers and the idea that "best teaching" is "the individually best".

Teacher Values

Values are beliefs with a moral and ethical slant. A teacher is a moral agent. Teachers face dilemmas and conflicts in dealing with agendas pursued by political and religious entities, or by administrators and students. Interrogating the teaching self: Self-observation, self-analysis and self-reflection can help teachers construct their self- image of who they are as persons and who they are as professionals.

Module 4: Doing

Teacher education program must prepare teachers who are successful in Teaching, Theorizing, and Dialogizing.

Teaching

Teaching with two goals: Maximizing learning opportunities and Mentoring personal information. Things should "get learned", rather than "get taught". Language teaching is more than teaching language. Teachers should be sensitive to linguistic, cultural and educational demands of the global society.

Theorizing

Pedagogic knowledge must emerge from the practice of everyday teaching. Teachers should keep their eyes and ears open, and notice what works and what doesn't, with what groups of learners, for what reason, and think about what actionable changes are necessary and possible. The thinking teacher is no longer perceived as someone who applies theories, but as someone who theorizes practice. Tools: action research, case study, classroom .interaction analysis

Dialogizing

Teacher development is a dialogic construction of meaning. A community of teachers is a community of inquiry, which is a community of knowledge builders. The interlocutors in this community practice and work collaboratively to enhance their knowledge and enrich their experience. Different points of view are respected and treated as a resource of reciprocal critique and learning.

Module 5: Seeing

Despite the great importance of that people simply see the things as they are conventionally there and that is also this module in teaching, little attention and consideration it has received in the field of education and TEOSL. The traditional view of seeing that is prevalent in educational circles is something which everybody else can see. Moreover, they trust what they see. This way of seeing is mostly based on familiarity, experience, and commonsense. It is embedded in human propensity. It therefore requires extraordinary capacity to stop seeing the things that are conventionally there to be seen. The task of teacher regarding seeing is to have critical engagement in relation to what happens “There”, e.g., in the classroom. Kvernbeck (200, p. 361) distinguishes two other kinds of seeing apart from traditional view of seeing, which is termed as seeing in. In what follows three kinds of seeing ordered based on the level of perception are defined:

Seeing-in: Superficially looking at things as they appear.

Seeing-as: Making sense of the experience of current observation.

Seeing-that: Demanding a critical interpretation of what we see.

To see what happens in the classroom we have to consider: Learner perspective, Teacher perspective, and Observer perspective.

Learner perspective

Learners have a role in evaluating teaching acts. Learners are stake-holders of the classroom enterprise. Learners can provide valuable feedback, on an on-going basis. The more teachers gather learner feedback, the better and more productive their intervention will be.

Teacher perspective

Teacher can be considered as manager, acculturator, as professional. Teacher helps STs become accustomed to cultural beliefs and practices of the target language community. Teacher’s view of what constitute a good language class, which refers mostly to class cohesiveness, that is, class functioning effectively as a group.

Observer perspective

Observers may be teacher educators, master teachers, cooperating teachers, supervisors, peers. Observation ensures collaboration among colleagues. Its nature should be meaningful, rewarding, non-threatening feedback aimed at professional development. Teachers see their work in new and critical ways, and engage in self-reflection. No one is marginalized, no one is privileged.

EVALUATION OF SILENT WAY BASED ON KARDS MODEL

Knowing

Professional Knowledge

Professional knowledge relates to the fundamental concepts of language, language teaching, and language learning. Knowledge about language in turn entails knowledge of language as a system, as discourse, and as ideology. In terms of language as a system, silent way has a considerable

emphasis. It has a structural syllabus; focuses on patterns of sounds, vocabulary teaching, and syntactic system of language. What is more, teachers in silent way should have a good knowledge of systems and subsystems of language.

However, this method does not go beyond structure; and therefore, language as a discourse does not receive considerable attention. The teacher focuses on prepositional meaning, rather than communicative value. The students discover how to produce grammatical sentences no matter whether or not they are appropriate in a context. Teachers here do not necessarily need to know about the functional grammar, speech act, coherent relationship and other discoursal features of language.

This method, as mentioned earlier, considers language and culture inseparable. The teachers are not free to take into consideration their cultural, political, and ideological meanings. Hence, what the teachers have to know about and present is just the culture of the language they are supposed to teach. With regard to knowledge about language learning it was said that in this method the students receive body of language through various sources (e.g. oral and written corpus), then they are expected to work on input through discovery learning or problem solving and internalize them (intake & intake factors). In the end, they are supposed to produce language (output). Finally, a silent way teacher is supposed to have a great knowledge of cognitive psychology, information processing and second language acquisition.

Regarding knowledge about language teaching, the approach to language teaching used in silent way is “use through usage”. A set of grammatical structures and vocabularies items are selected and sequenced based on the perceived difficulty level. Therefore, the teachers are trained to teach the learners in accordance with this approach, and the knowledge about how to teach using the alternative approach, namely, ‘usage through use’ is not necessary.

Procedural knowledge

Procedural knowledge is about knowing how to manage classroom learning and teaching. This knowledge plays a crucial role in silent way. The teacher has to set up a classroom environment in which learners become autonomous, independent, and responsible. Moreover, students’ verbal interaction is encouraged and at the same time, listening carefully to students’ speech, and silently working with them on their production through the use of nonverbal gestures and the tools he has at his disposal should be done as well. Taking all these into account and controlling the class simultaneously require the teachers to have a great deal of information so as to manage classroom language learning effectively.

Personal knowledge

All the teachers using silent way are trained to follow the same route (the principles and procedures of silent way, structural syllabus, and etc.) and reach the same destination (the goal of silent way). In this respect no room remains for the personal knowledge of the teachers. However, personally, I think, here the teachers can use their personal knowledge to implement the principles of silent way more effectively. In addition, they also have idiosyncratic procedural personal knowledge in creating the effective environment for learning.

Analyzing

Learner needs

In silent way, the teacher should give the learners only what they absolutely need to promote their learning. Therefore, the teacher should be able to do a need analysis to find out how far the learner has progressed toward the goals of silent way and what remains for him to learn. That is why in this method the teacher has to assess students' learning all the time although through informal test. Here the teacher has to know that the students have varying needs; varying needs in the sense that they are different in how well or how fast they learn. Hence, the necessities and the lacks are considered here, but the students' wants are disregarded. This failure to be sensitive to learners' wants, according to Kumar (2012) has lead to a phenomenon in Asian countries, where a vast number of learners from poorly-staffed, badly-equipped government-run state schools flock to private language centers that have mushroomed in cities so that they can gain much needed English communicative abilities.

Learner motivation

Learners of silent way are said to be highly motivated in the sense that mastery of linguistic skills are seen in the light of an emotional inner peace resulting from the sense of power and control brought about by new levels of awareness. Silent Way learning claims to "consolidate the human dimensions of being, which include variety and individuality as essential factors for an acceptance of others as contributors to one's own life" and even moves us "towards better and more lasting solutions of present-day conflicts". Discovery learning is considered as the shift from extrinsic to intrinsic rewards.

Learner Autonomy

Here learners are considered autonomous in the sense that they have free will to choose among any set of linguistic choices, the ability to choose intelligently and carefully is said to be the evidence of autonomy and responsibility. However, the autonomy that is defined by kumar, as we have seen above, is not fully satisfied in this method. The students are not allowed to make decision about what to teach and how to teach. The syllabus is already pre-established and must be structural syllabus; therefore, the students have no control over what they learn and are not encouraged to develop their own agency.

Recognizing

The constituent elements of Recognizing are teacher identities, teacher beliefs, and teacher values. All these three elements are actually disregarded in silent way because the role of the teacher as a technician or facilitator is pre-established. Be silent as much as you can .some of these pre-determined principles of silent way might be in conflict with teachers values and beliefs but they have no choice.

Doing

Teaching

Teaching as a subcategory of doing in the language classroom chiefly entails maximizing learning opportunities and mentoring personal transformation. Regarding maximizing learning opportunities, a silent way teacher should be able to create a situation in which Student-student

verbal interaction is desirable (students can learn from one another). The teacher's silence encourages group cooperation. The elements of the language are introduced logically, expanding upon what students already know. However, the utilization of learning opportunities is limited by pre-determined syllabus, textbooks, and things like that.

With regard to mentoring personal transformation, this method advocates commitment of the self to language acquisition through the use of silent awareness and then active trial. It also views learning as a problem-solving, creative process, and discovering activity in which the learner is a principal actor rather than a bench-bound listener. However, here there is problem solving expected to be done by students but not problem posing. That is to say, it is always the teacher who proposes a problem, and the students have to solve. The reverse is not happened and the students are not supposed to pose a problem. Moreover, the learners' commitment is used in learning units of language as system not political, social, etc. Therefore, there is no critical pedagogy.

Theorizing

Teachers here are consumers of the scholars' theories. Theory of language and theory of learning of this method are already established and the teachers have to follow.

Dialogizing

Students in silent way can have a verbal exchange to express their self, their feeling and experiences. But this cannot be regarded as a dialogic exchange in which there is an interaction between meanings, between belief systems, between voices, etc.

Seeing

Learner perspective

Learners are considered as problem solvers which are cognitively active in shaping what they learn.

Teacher perspective

Stevick defines the Silent Way teacher's tasks as (a) to teach, (b) to test, and (c) to get out of the way. Here teacher has no voice about what to teach and he has to stick to structural syllabus.

Observer perspective

No room is assigned for a critical observer in silent way. Teachers try to follow what they have learnt as a good way of implementing silent way principles, and the observers when assessing the teachers just tick the items on a check list that satisfy the principles and guidelines of the method at best.

DISCUSSION AND CONCLUSION

If now we come back to our question why is it that a method like silent way does not receive lots of attention, we can find our answer through considering the results obtaining from our critical analysis of this method. We have seen that most of the grounds of silent way are not compatible

with the modules and sub-modules of KARDS model. In other words, most of the parameters of the KARDS model that we have elaborated are not satisfied or are partially satisfied when adopting silent way as an educational plan. To illustrate the point, Assume that an education plan sets out to train the teachers based on silent way principles, assume further that the trained teachers implement what the method wants from them (not possible in all contexts though) and the goals the method pursue are being achieved. Yet, many requirements that a plan needs to tackle the challenge of globalization remain unfulfilled.

In addition to what have been mentioned before, what the silent way suffers more from concerns with the application of operating principles presented by Kumar that can govern the processes and practices of L2 teacher education. These Principles are: Particularity, Practicality, and Possibility. It is not clear whether it can be use for beginner or advanced adult or children, large number of students or a few students. In some situations it is not possible to provide the tools.

Therefore, this method cannot count for particular group of teachers, teaching a particular group of learners, pursuing a particular set of goals, within a particular institutional context, embedded in a particular socio-cultural milieu.

The evaluation that we have done is expected to bring about some precious insights for language teaching. First of all, we have shown in what grounds silent way cannot satisfy the modules and parameters of KARDS model and consequently the needs of globalization. Another insight coming from the study can be the consideration of this study as a model for language teachers to evaluate the way they teach language in their particular context. Finally, the positive aspects of silent way that were in compliance with KARDS model were also mentioned; therefore, teacher can take them into consideration and use them if they are appropriate for their own situation.

ABSTRACT

This study explored the effect of different demands of output tasks on English as a foreign language (EFL) learners' use of listening strategies, listening comprehension, and noticing of language form. The purpose of this study was to investigate how different demands of output tasks including: listening for memorization, listening for summarization, and listening for visualization have different impacts on learners' listening strategies while listening, listening comprehending, and grammar noticing. In this case, 60 students, in Abidar English Center, located in Sanandaj- Iran, who were all studying 'Interchange 2', were selected to participate in the study. The participants were randomly divided into three groups. Before performing the tasks, the results of a listening comprehension test and a grammar test, as pre-tests, revealed no significant difference among three groups. By performing the different output tasks on three groups, two other tests including: a listening comprehension test and a grammar test were used as post-tests, and a questionnaire was used for assessing the different strategies used at the time of listening. The results showed a significant difference between memorization group with other two groups based on their accuracy in grammar. No difference was appeared in listening comprehension among three groups. Moreover, through working on a questionnaire which demonstrated the strength of a five-factor model underlying Metacognitive Awareness Listening Questionnaire (MALQ): (1) problem-solving, (2) planning and evaluation, (3) mental translation, (4) person knowledge, and (5) directed attention, the different groups employed different listening strategies while listening.

KEYWORDS: Listening strategy, Listening comprehension, Noticing, Language form, Inter-language, Output task, Task demands.

INTRODUCTION

In the past 10 years, much attention in second language learning research has been devoted to composing hypotheses and theories explaining crucial factors that may develop foreign language (FL) listening comprehension (Nagle & Sanders, 1986; Buck, 1991). Researchers have argued that listening comprehension ability can be taught and trained by using appropriate strategies (Chien & Wei, 1997; Chien & Kao, 2004). Research shows that learners do have their own listening strategies, and there are some differences in what they do in order to comprehend the listening text (Oxford, 1993). To be more successful listeners, listeners should employ a greater number and range of listening strategies; listeners should be flexible in changing strategies to meet the task and be motivated to understand the oral message (Bacon, 1992a). Having a significant and crucial role, the importance of this phenomenon will be enhanced and improved through pre-determined strategies used by learners and may result in a higher level of listening comprehension.

Listening comprehension is a complex activity; coordinating sounds, vocabulary, grammatical structures, and background knowledge involve a great deal of mental processes on the part of the listener (Vandergrift, 1999). O'Malley, Chamot & Kupper (1989) demonstrated that effective EFL listeners use both top-down and bottom-up strategies to construct meaning, while ineffective listeners just determine the meanings of individual words. A study done by Shang (2005) also demonstrated that EFL listeners with lower-proficiency focus on memorizing the picayune linguistic details instead of concentrating on the whole comprehension.

Meaning-focused instruction which ignores the form is not efficient enough in producing successful L2 learners (Ellis & Sheen, 2006). However, the fact that teachers accept every inter-language form produced by the learner without correction will result in fossilized errors (Seedhouse, 1997). Noticing to meaning causes developing competence when other aspects of language such as syntax, semantics, word choice, and discourse structure are considered, too. Skehan (1998) states that "after the critical period, language learning is constrained by similar structures and processes to other learning, and that for learners, meaning takes priority and language form has secondary importance."

For getting the best results at the time of listening, listeners are requested to focus on form in spite of meaning. Long (1991) stated that focus on form overtly draws students' attention to linguistic elements as they arise incidentally in lessons whose overriding focus is on meaning or communication. Therefore, in the process of listening, attention also should be directed to language form for obtaining competency. Swain (1998) argues for the facilitative role of learner production in learning. Swain (1995) also proposes that learners need to attend to form in order to achieve high levels of linguistic competence. According to Ellis (2001a) form refers to not only grammar, but also any aspect of linguistic form, and focus on form can be directed at phonology, vocabulary, grammar, discourse, and even spelling.

Mackey (2000) fulfilled a research based on the development of morphosyntactic and lexical forms to examine the effects of learners' noticing the gap through interactional feedback in the classroom. The results of his study show that learners, who had more noticing in employing the

forms in spite of attending to meaning, developed more. However, attention is limited, that is, learners cannot attend to meaning and form at the same time. (VanPatten, 1990).

Research findings have indicated that output tasks influence language processing and language learning (Swain, 1985, 1995; Swain & Lapkin, 1995; Izumi, 1999; Izumi, 2002). So, planning before a task or a pre-planned task results in the improvement of task performance particularly in the field of listening. Schmidt (2001) states that "task requirements, task instruction, and input enhancements techniques affect what is attended to and noticed in on-line processing" (p. 10). Thus, the way language is processed and directs learners' attention toward language form, comes true by planning pre-planned tasks in a way that it provides learners some opportunities, and facilitates the way for more learning in further steps.

It is believed that learners' sensitivity to the way they encode their intended meaning in the target language is enhanced through the act of producing the target language (Swain, 1998). Since, the progression of this matter will be facilitated by planning output tasks in the process of learning.

Output is not the last stage of language learning, that is, it feeds back to previous stages of learning which consequently results in inter-language development (Swain, 1998 & Gass, 1997). Therefore, the present study implies to the pre-planned output tasks in the field of listening. In other words, the study dealt with investigating the effect of different output tasks on the process of listening to make the students raise their meta-cognitive awareness and focus on meaning and form in an integrated way.

RESEARCH QUESTIONS

1. Do different demands of output tasks lead to differences in listening strategies employed by the participants?
2. Do different demands of output tasks lead to differences in listening comprehension of the participants?
3. Do different demands of output tasks lead to differences in noticing of language form by the participants?

METHODOLOGY

Participants

The participants consisted of 75 students (both male and female) in Abidar English Center, located in Sanandaj. All participants have been studying English as a foreign language for two years. The researcher administered a test named "Standardized English Language Knowledge Test" designed by Wei-Tsung Hsu (2008) in order to ensure the homogeneity of the participants regarding their language proficiency level. Based on the obtained scores fallen on standard deviation below or above the mean, 60 learners out of 75 were selected as the participants of the study and 15 participants were discarded.

Instruments

In the present study, four types of instruments were administered:

Standardized English Language Knowledge Test

The participants' English Knowledge Test was composed of 29 test items for the grammatical subtest and 27 test items for the vocabulary subtest which was designed by Hsu (2008). This test was used by the researcher in order to be sure about the homogeneity of students' proficiency level. The reliability index of the test, as reported by Hsu (2008), is .915, measured at Cronbach alpha.

Participants were divided into three groups of Memorization, Summarization, and visualization. The researcher worked on three groups by different output tasks for each. In this case, the memorization group was asked to reproduce a listening part exactly, summarization group was asked to retell it, and visualization group was asked to draw a picture based on what they have got in advance.

Multiple choice listening comprehension test (Pre-test)

While dividing groups into three, and before performing the tasks, a listening comprehension test was used by researcher from "Listening Advantage" book, level 2, written by "Tom Kenny & Tamami Wada" to assess the participants' listening comprehension. The researcher tried to show if learners paid attention to meaning and to what extent. Total score of each participant was calculated based on the number of correct answers.

Grammar test (pre-test)

The format of the grammar test was designed by TOEFL IBT KAPLAN which was assumed to indicate participants' language form noticing before working on different output tasks. The aim of this part was that to what extent learners notice to language form. Total score of each participant was calculated based on the number of correct answers.

Multiple choice listening comprehension test (post-test)

A listening comprehension test was used by researcher from "Listening Advantage" book, level 2, written by "Tom Kenny & Tamami Wada" to assess the participants' listening comprehension after employing different output tasks for a term.

Grammar test (post-test)

The format of the grammar test was designed by TOEFL IBT KAPLAN which was assumed to indicate participants' language form noticing after a term of doing different output tasks.

Reliability of Grammar and listening comprehension tests

To estimate the reliability of the grammar and listening comprehension tests (pre-post tests), KR-21 method of estimating reliability was used. In so doing, the mean, the variance and the number of items ($M=11.74$, $V=79$, $K=10$) were used to calculate reliability manually. The reliability of grammar test (pre-test) was 0.72, that of grammar test (post-test) was 0.74, that of

listening comprehension test (pre-test) was 0.78, and that of listening comprehension test (post-test) was 0.78.

Metacognitive Awareness Listening Questionnaire (MALQ)

The format of Metacognitive Awareness Listening Questionnaire (MALQ) was designed by Vandergrift (2005a) following guidelines outlined by Brown (2001), Dörnyei (2003), and Gilham (2000). The Internal reliability ranges from .68 to .78. The aim of this questionnaire was to assess listeners' metacognitive awareness and perceived use of strategies while listening to oral texts. The questionnaire demonstrated the strength of a five-factor model underlying the MALQ: (1) problem-solving, (2) planning and evaluation, (3) mental translation, (4) person knowledge, and (5) directed attention. The Likert scale in 6 points, ranging from "strongly agree" to "strongly disagree", was used. The researcher asked learners to respond each question carefully. This questionnaire also intended to appraise learners' awareness of the listening process and reflect on their strategy use while listening.

Procedure

The English Language Knowledge Test was administered to measure the proficiency of the participants. Total score of the test was 56. In so doing, sixty students who got the enough score were participated in the study and 15 were discarded from the study.

First, the students were divided into 3 groups randomly and they were asked to participate in the listening comprehension and grammar pre-tests to see if there is any significant difference between them before mediation. These two tests were considered as pre-tests.

Then, after several treatment sessions (about one term), participants in group (1) were asked to listen to a short listening part and reproduce it exactly (memorization), Participants in group (2) were asked to listen to the oral text and retell the content of the text (summarization), and participants in group (3) were asked to listen to the oral text and draw a picture based on the content (visualization). Ten minutes were enough for each participant in order to be prepared for producing output as memorizing, summarizing, and visualizing.

In the third step, the participants were asked to describe what they had done during the listening phase. They were asked to check each of the 21 statements in the Metacognitive Awareness Listening Questionnaire (MALQ), and circle the number which best described their use of listening strategies through a Likert scale ranging from 1 (I strongly disagree), 2 (I disagree), 3 (I partly disagree), 4 (I partly agree), 5 (I agree), and 6 (I strongly agree). The learners were advised that they must work at their own pace. Due to participants' limited command of getting the aim of the questionnaire, MALQ was translated into Farsi.

Fourth, during the final session, the participants were asked to perform two different kinds of tests: (1) for evaluating the participants' knowledge of listening comprehension, the listening comprehension test papers were distributed among learners. The participants were requested to listen to each oral text and circle around the correct choices. The researcher, in this way, showed the extent the participants notice to the meaning. (2) Grammar test was another test for focusing

on the form; the participants were asked to fill the blanks with correct parts of speech. These two tests were considered as post- tests.

Data Analysis

The data of the present study was obtained through listening comprehension test results, grammar test results, and self-reports of participants' listening strategies.

The data set was analyzed in the following steps: (1) The self-reports were analyzed to investigate whether different demands of output tasks would cause different listening strategies during the listening phase. The quantitative test was used to compare group differences of the listed listening strategies. (2) The comprehension check test answers were scored and correct answers were totaled for each participant. Then group differences were analyzed through using one-way between-groups ANOVA to examine the significant difference between the three groups, as measured by the Listening Comprehension post-test. The researcher wanted to understand whether different output tasks would effect on learners' listening comprehension or not. (3) The grammar test answers were scored and correct answers were totaled for each participant to show that whether different demands of output tasks would effect on noticing to the form. The one-way between groups ANOVA was used to investigate the group differences.

RESULTS AND DISCUSSION

The purpose of this part was to testify the truth or falsity of the research hypotheses. The results of the study presented in three steps provided answers for each of the four research hypotheses. In the first step, the results from One-way between groups ANOVA examined the relationship between learners' demands of output tasks including memorization, summarization and visualization and their performance on listening comprehension test. In the second step, using one-way ANOVA, the study demonstrated the relationship between learners' demands of output tasks including memorization, summarization and visualization and their performance on grammar test. In the third step, the study demonstrated the relationship between learners' demands of output tasks and Meta-cognitive Awareness Listening Strategies including planning-evaluation, directed attention, person knowledge, mental translation and problem-solving.

Homogeneity of the participants

In order to make our sampling fairly homogenous in terms of the level of learners' proficiency, the researcher just included those students whose scores on language proficiency test (named "Standardized English Language Knowledge Test") used in this study fell on standard deviation below or above the mean and ignored the rest. The total number of score obtained by a test taker on this test was calculated out of 56, one score for each question item. In so doing, 15 participants were discarded from the study since their scores on this test did not fall between the mean and on standard deviation above or below the mean.

Table 1: Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
Scores on Proficiency test	75	12	54	29.05	11.304
Valid N (listwise)	75				

As displayed by Table 1, the mean was 29 and standard deviation was 11. Therefore, given on standard deviation above and below the mean, participants whose scores were between 18 and 40 were included in the study (since $29 - 11 = 18$ and $29 + 11 = 40$). Altogether, the researcher was left with 60 students who were roughly at the same level of proficiency. By doing so, participants selected would be at the same level of intermediate language proficiency.

The students' performance on listening comprehension pre-test
Pre-test between three groups:

Table 2: Mean and standard deviation of the three groups on listening pre-test

group	N	Mean	Std. Deviation	Std. Error Mean
pre-test Memorization	20	25.00	3.53	.79
Summarization	20	23.35	3.89	.87
Visualization	20	24.00	3.00	.67

Table 2 represents the mean and standard deviation for the three groups which are approximately the same. The mean score of memorization group is 25.00, that of summarization group is 23.35, that of the visualization group is 24.00. The table also gives the number of people in each group which is 20.

Table 3: One-way ANOVA for scores on listening pre-test

ANOVA

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	27.64	2	13.81	1.12	.331
Within Groups	698.55	57	12.25		
Total	726.18	59			

A one-way between-groups analysis of variance was conducted to examine the significant difference between the three groups, as measured by the Listening Comprehension Pre-test. Subjects were divided into three groups according to their demands of output tasks. There was *not* a statistically significant difference at the $p < .05$ level in students' scores for the three groups [$F(2, 57) = 1.12, p = .01$] (See Table 3).

The students' performance on grammar pre-test
Pre-test between three groups:

Table 4: Mean and standard deviation of the three groups on grammar pre-test

group	N	Mean	Std. Deviation	Std. Error Mean
pre-test Memorization	20	27.30	4.26	.95
Summarization	20	29.15	5.92	1.32
Visualization	20	28.65	4.92	1.10

Table 4 represents the mean and standard deviation for the three groups which are approximately the same. The mean score of memorization group is 27.30, that of summarization group is 29.15, that of the visualization group is 28.65. The table also gives the number of people in each group which is 20.

Table 5: One-way ANOVA for scores on grammar pre-test

ANOVA

scores on grammar pre-test

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	36.633	2	18.317	.709	.497
Within Groups	1473.300	57	25.847		
Total	1509.933	59			

There was *not* a statistically significant difference at the $p < .05$ level in students' scores for the three age groups [$F(2, 57) = .70, p = .01$] (See Table 5).

The students' performance on listening comprehension post-test

Table 6: Mean and standard deviation of the three groups on listening post-test

group	N	Mean	Std. Deviation	Std. Error Mean
post-test Memorization	20	25.60	5.96	1.33
Summarization	20	26.95	6.45	1.44
Visualization	20	28.15	6.88	1.53

Table 6 shows the mean and standard deviation for the three groups which are approximately the same. The mean score of memorization group is 25.60, that of summarization group is 26.95, that of the visualization group is 28.15. The table also gives the number of people in each group which is 20.

Table 7: One-way ANOVA for scores on listening comprehension post-test

ANOVA

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	65.10	2	32.55	.783	.462
Within Groups	2368.30	57	41.54		
Total	2433.40	59			

Using the statistical formula of one-way between-groups ANOVA, the researcher examined the significant difference between the three groups, as measured by the listening comprehension Post-test. Subjects were divided into three groups according to their demands of output tasks. There was *not a* statistically significant difference at the $p < .05$ level in students' scores for the three age groups [$F(2, 57) = .783, p = .01$] (See Table 7). Therefore, the second research hypothesis was not rejected.

By preparing three different output tasks, the researcher couldn't influence the differences between groups based on their listening comprehension. Maybe designing more output tasks could help finding this distinction. It seems that retelling output tasks may trigger the learners' critical thinking to ask themselves questions about the text and evaluate their perceptions.

The students' performance on grammar post-test

Table 8: Mean and standard deviation of the three groups on grammar post-test

	group	N	Mean	Std. Deviation	Std. Error Mean
Post -test	Memorization	20	34.05	3.17	.79
	Summarization	20	30.70	5.02	1.12
	Visualization	20	29.80	4.42	.98

As displayed by Table 8, the mean and standard deviation for the three groups in which the first group mean score is much more than that of other groups.

Table 9: One-way ANOVA for scores on grammar post-test

ANOVA

scores on grammar post test

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	200.62	2	100.31	5.48	.007
Within Groups	1042.35	57	18.28		
Total	1242.98	59			

Using the statistical formula of one-way between-groups ANOVA, the researcher examined the significant difference between the three groups, as measured by the Grammar Post-test. Subjects were divided into three groups according to their demands of output tasks. There was *a* statistically significant difference at the $p < .05$ level in students' scores for the three groups [$F(2, 57) = 5.48, p = .01$] (See Table 9). Therefore, the third research hypothesis was rejected.

Table 10: Post-hoc test for listening post-test scores

Multiple Comparisons
Scores on grammar post test
Tukey HSD

(I) levels		(J) levels	Mean Differenc e (I-J)	Std. Error	Sig.	95% Confidence Interval	
						Lower Bound	Upper Bound
dimen sion2	memorization	dimensio n3	3.35*	1.35	.04	.10	6.60
		visualization	4.25*	1.35	.00	1.00	7.50
	summarization	dimensio n3	-3.35*	1.35	.04	-6.60	-.10
		visualization	.90	1.35	.78	-2.35	4.15
	visualization	dimensio n3	-4.25*	1.35	.00	-7.50	-1.00
		summarization	-.90	1.35	.78	-4.15	2.35

*. The mean difference is significant at the 0.05 level.

As displayed by Table 10, Post-hoc comparisons using the Tukey HSD test indicated that the mean score for memorization was significantly different from summarization and visualization. Summarization did not differ significantly from visualization. By performing different demands of output tasks, there was a significant difference between memorization group with summarization and visualization groups based on their noticing to form. So, the researcher does agree with the ideas of Lightbown & Spada et al. (1990) that a higher level of grammatical accuracy in oral production is expected in combination of form-focused and meaning-focused teaching.

Calculating the effect size for listening post-test

Although SPSS does not generate it for this analysis, it is possible to determine the effect size for this result. The information needed to calculate eta squared, one of the most common effect size statistics, is provided in the ANOVA table. The formula is:

$$\text{Eta squared} = \text{Sum of squares between-groups} / \text{Total sum of squares}$$

In this study, the researcher divided the Sum of squares for between groups (200.62) by the Total sum of squares (1242.98). The resulting eta squared value is .16, which in Cohen's (1988) terms would be considered a *great* effect size. It means that the effect size between the three groups is great.

Cohen classifies .01 as a small effect, .06 as a medium effect and .14 as a large effect.

Metacognitive Awareness Listening Questionnaire (MALQ)

Reliability of the translated questionnaire

Due to the lack of enough knowledge of students in comprehending the aim of the questionnaire, the researcher translated it into Farsi in order to clarify the aim of strategies used by learners while listening. Since the researcher, first, estimated its reliability. To

examine the internal consistency of the translated questionnaire, Cronbach Alpha was used, and Cronbach's Alpha estimated the reliability of the whole items as 0.78.

Memorization group

Table 11: MALQ for memorization group

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid Planning evaluation	63	14.1	14.1	15.0
Directed attention	110	24.7	24.7	41.2
Person knowledge	55	12.3	12.3	54.3
Mental translation	118	26.5	26.5	82.4
Problem solving	74	16.6	16.6	100.0
Total	420	100.0	100.0	

The results from the SPSS Software for Windows version 21:00 yielded interesting frequency concerning the MALQ for memorization group. The most commonly-identified strategy was concerned with *mental translation*.

Summarization group

Table 12: MALQ for summarization group

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid Planning -evaluation	135	32.1	32.1	21.9
Directed attention	88	21.0	21.0	53.1
Person knowledge	48	11.4	11.4	64.5
Mental translation	65	15.5	15.5	80.0
Problem solving	84	20.0	20.0	100.0
Total	420	100.0	100.0	

The most commonly-identified strategy was concerned with *planning-evaluation*.

Visualization group

Table 13: MALQ for visualization group

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid Planning-evaluation	92	21.9	21.9	21.9
Directed attention	142	31.8	31.8	55.7
Person knowledge	64	15.2	15.2	71.0
Mental translation	52	12.4	12.4	83.3
Problem solving	70	16.7	16.7	100.0
Total	420	100.0	100.0	

The most commonly-identified strategy was concerned with *directed attention*.

CONCLUSION

Findings of this study referred that being more aware of the meta-cognitive listening strategies helps learners raise their consciousness and tend toward the variety of suitable strategies while performing the different demands of output tasks for listening.

By gathering the information of the questionnaire, the researcher found that when we listen to something in our real life, we clearly do it with some purpose, if we want to replicate it in our classes as real as outside, it is better to give classroom's listening some purpose, too, and make learners extremely motivated; in this way, their strong motivation leads to succeed. The researcher was looking for some ways which could increase the attention of learners toward language form and help learners shift from content to form to convey their meaning through which. The spoken sentences by English learners should be perfectly grammatical. Because of the complexities observed in English form and particularly in grammar, the successful ways of teaching help more effectively. By prescribing a variety of beneficial output tasks, the EFL learners can promote the gap of inter-language.

Overcoming the performance of tasks correctly needs a variety of skills and experiences obtained by teachers and learners. Getting these results won't be feasible unless by training based on educational skills which are in the favor of both teachers and learners.

Teachers need to think realistically about the task ahead. There are loads of merits and demerits in fulfilling the different tasks. So, distinguishing those with highly positive points and mitigating those with negative points doesn't come true unless by experienced and knowledgeable teachers. The new way of devising syllabi cannot be examined under the old syllabus. All doing in these fields need overall changing and modifying by up to date and modern ways of teaching.

Applicants must hold a recognized teaching qualification. Everyone who has got a degree of teaching is not merely a good and responsible teacher. New teachers should do times teaching practice as part of the course, until they find enough confidence to run their classes to meet the learners' needs. For performing different tasks, it is better to make subjects introduced to classes interesting and fun; there is certainly no lack of interest in some subjects which cannot motivate learners to participate in performing output tasks. Some scholars' idea is that although language forms are necessary in language learning, but are not considered in CLT and Interactive tasks, which are supposed to focus on the comprehensibility of the language, give priority to fluency over accuracy. By doing this research, the researcher found loads of reasons which can promote the communication and interaction between learners based on learning English forms and applying them in their speaking. So, getting accuracy in the first step is not considered as a barrier on the way of interacting, but also strives to facilitate this journey faster.

The researcher faced the following limitations in her research study:

First, the researcher teaches in a private English center with limited number of learners in each class, thus the sample size was not large enough, so, the effect of output tasks needs to be examined on more participants. Second, since the researcher could consider just three different output tasks in this study because of the lack of enough time, other types of output tasks need

to be investigated in future studies. Third, long-term effects of output tasks have better results on learners based on their strategies employed while listening, their listening comprehension and their accuracy toward form, but the present study examines just the short-term effects of output tasks. Fourth, according to Ellis et al. (2002) form refers to not only grammar, but also any aspect of linguistic form. Ellis et al. (2001a) argues focus on form can be directed at phonology, vocabulary, grammar, discourse, and even spelling; the researcher could consider just grammar as a part of noticing to form. So, in further studies, preparing some tasks which could cover the different elements of form would be suggested. Fifth, among four skills intervene in learning English, listening was a skill which was considered by the researcher; so, other skills will be recommended.

ABSTRACT

This descriptive qualitative study was conducted to find out what speech acts and language functions are found in the conversation models of Prospect 1 (An English Textbook for Iranian Junior High School Students Year XII authorized by Textbook Curriculum Development of the Ministry of Education of the Islamic Republic of Iran). This English textbook was designed for use in Iran's junior high school grade XII and is of particular interest because it was based on a communicative approach and was student-centered, whereas past traditional textbooks had followed the traditional methods. The task involved the analysis of the utterances of the conversation models based on Searle's (1976) speech acts taxonomy and van Ek's (1998) list of macro and micro-language functions. A hand count of speech acts revealed speech acts in 123 utterances. The most frequent speech acts were those of Representative, while no Declarative speech acts were observed. Also it was found that Imparting and seeking factual information accounted for 54.28 percent of language functions and only 0.71 percent referred to Structuring Discourse ones. The results indicated that these pragmatic factors were distributed unequally throughout the conversation models. Finally, some implications were offered for the textbook authors in considering and including all types of the speech acts and language functions in English textbooks.

KEYWORDS: Speech acts, Language functions, Prospect 1

INTRODUCTION

Knowing a language does not just mean acquiring the syntax or semantics (linguistic competence), but to develop and use the knowledge of pragmatics (pragmatic competence). Pragmatic competence in foreign language contexts is defined as the knowledge of communicative action or speech acts, how to perform it, and the ability to utilize the language in proper ways based on the context or contextual factors (Kasper, 1997; Kasper & Roever, 2005). Pragmatic competence helps learners to come up with the problems of miscommunication indifferent cultures, and for effective communication in target language. Therefore, language pedagogy should promote language learners' pragmatic competence in the target language, especially in terms of emphasis on one of the significant pragmatic features, speech acts, through

adequate pedagogical practices. And also, we, as teachers, have the responsibility to help language learners develop their pragmatic competence by providing them authentic and appropriate pragmatic input and making them familiar with different speech acts and making them enable to produce those speech acts in different contexts.

But, as a fact, in EFL contexts, it is difficult to equip learners with authentic pragmatic input. Because in EFL settings, like Iran, English is taught as a foreign language and most often, the students do not use English in their daily lives. Their exposure to English language is limited to their English classes with non-native teachers and to the textbooks authorized by the Ministry of Education. Therefore, as Razmjoo (2007) believes, textbooks are necessary resource for foreign language learning that has the main role in teaching and learning a foreign language. However, as Gholami, RimaniNikou, and Soultanpour (2012) claims no textbook can be perfect; hence, textbook evaluation is very important to clarify the suitability of the sources and find the best one. Because of this fact it is necessary to evaluate the textbooks constantly to see if they are appropriate and modify them if necessary. This process enables us to make informed decisions through which student achievement will increase and educational programs will be more successful.

This study tries to analyze the conversation models of *Prospect 1* based on Searle's (1976) speech act taxonomy and van Ek's (1998) list of macro and micro-language functions in order to find the different types and frequencies of speech acts and language functions applied in the conversation models of this textbook.

RELATED STUDIES

Speech Acts/ Functions

According to Yule (1996), speech acts are actions performed via utterances. In English, they are labeled as apology, offer, compliment, invitation, promise, or request. These labels for different kinds of speech acts apply to the speaker's communicative intention in producing an utterance. The speaker normally expects that the hearer comprehends his or her communicative intention.

Searle (1976) classified speech acts into five major categories:

1. Representatives: These speech acts commit the speaker to the truth of the expressed proposition, e.g. asserting and concluding.
2. Directives: These are the speech acts which get the listener to do something, e.g. requesting and questioning.
3. Commissives: These speech acts commit the speaker to some future course of action, e.g. promising and threatening.
4. Expressives: These speech acts express a psychological state, such as thanking, apologizing, and welcoming.
5. Declaratives: These are speech acts which make immediate changes in the state of affairs and tend to rely on elaborate extra-linguistic institutions, such as declaring war or marriage.

Functions describe the social actions that people intend to perform through language and are expressed in terms like *expressing agreement with a statement* or *showing that one is following a person's discourse*. van Ek (1998) listed 6 macro-functions of language:

1. Imparting and seeking factual information
2. Expressing and eliciting attitudes
3. Getting things done (suasion)
4. Socializing
5. Structuring discourse
6. Communication repair

and 132 micro-functions, e.g., asking, instructing, commanding, suggesting, and requesting .

Foreign Research on Textbook Evaluation

Kanik (2002) did a study to show effectiveness of ESP reading materials at both macro and micro level including nine criteria for English for Law courses at Bashkent University in Turkey.

Morgan (2003) studied IELTS preparation materials and showed that there is a need for more materials that are beyond test-taking practice and aim at developing the language competencies that the candidates need for their work or study destinations. Vellenga (2004) made a comparison between EFL and ESL textbooks. She stated that textbooks rarely provide enough information for learners to successfully acquire pragmatic competence.

Yuka (2008) investigated closing sections in “Oral Communications I” textbooks, which are used in Japanese high school English classes, to see how and how much closing sections are presented.

Batjargal (2010) conducted a doctoral study to look at speech acts in an English language textbook series (English 1-6 series designed for Mongolian secondary schools), including a Student's book, an Activity book, and the Teacher's book.

Finally, the most recent study in textbook evaluation has been performed by Maesaroh (2013) on speech acts and gambits found in the conversation models of *Look Ahead 2* (an English text book for senior high school grade XI).

Iranian Research on Textbook Evaluation

A number of studies have also been done in Iran on the book evaluation. Tavakoli (1995) studied the language functions in the dialogues in the English textbooks of Iranian senior high schools. Razmjoo (2007) investigated the CLT principles in the Iranian high school and private institute textbooks.

Riazi and Mosalanejad (2010) investigated the types of learning objectives represented in Iranian senior high school and pre-university English textbooks using Bloom's taxonomy of learning objectives.

Iraji (2007), as cited in Koosha and Dastjerdi, (2012) studied the extent to which the principles of CLT and TBLT approaches have been taken into consideration in New Interchange series.

Soozandehfar and Sahragard (2011) analyzed the conversation sections of Top Notch Fundamental textbooks from the pragmatic dimension of language functions and speech acts. Talebinejad and Namdar(2011) investigated the reading comprehension sections of Iranian high school English textbooks (IHSETs) to find out the extent of using discourse markers and their types.

The work reported by Koosha and Dastjerdi (2012) studied the use of request forms in Richard's Interchange Series, Books I, II, and III.

Moradi, Karbalaeei, and Afraz (2013) aimed at the evaluation of Speech Acts and Language Functions in High School English Textbooks (I, II And III) and Interchange Series, Books I, II, And III.

Soleimani and ShafieKhah (2014) attempted to examine the ESP book taught at Payame Noor University for BA Students of Accounting to see whether the book satisfied students according to their objectives, needs, and wants. Regarding the foreign and Iranian studies on textbook evaluation, no study has been done on *Prospect 1* textbook, which has recently come into the realm of FLT, with regard to the pragmatic dimension applying Searle's (1976) speech act classification and van Ek's (1998) list of macro and micro-functions of language.

RESEARCH QUESTIONS

Based on the objectives of the current study the following questions will be answered in this research:

- 1- Which speech acts and language functions are found in the conversation models?
- 2- How are these speech acts and language functions distributed in the conversation models?

METHODOLOGY

Material

Prospect 1 (an English textbook for junior high school students year XII authorized by Textbook Curriculum Development of the Ministry of Education of the Islamic Republic of Iran) composed of 8 lessons. Each lesson is divided into three sections, *Conversation*, *Sounds and Letters*, and *Listening and Reading*. Two conversation models are presented in each lesson, one in *Conversation* section and one in *Sounds and Letters* section. Altogether, there are 16 conversation models in this textbook.

Data Collection Procedure

In this study, all the 16 conversation models given in the *Prospect 1* were chosen as the object of the study. The aim was to find out what speech acts and language functions are found in them.

Following steps were applied in collecting the data.

1. All the conversations given in the *Prospect 1* were read to comprehend the information of the texts.
2. The conversations were respectively numbered 1 to 16.
3. The clauses containing speech acts were identified and classified according to Searle's (1976) 5 different speech acts classes: *Representatives*, *Directives*, *Commissives*, *Expressives*, and *Declaratives*.
4. The clauses in each class were analyzed and sub-classified according to van Ek's (1998) 6 main functions (*Imparting and seeking factual information*, *Expressing and finding out attitudes*, *Expressing and finding out moral attitudes*, *Deciding on courses of actions*, *Socializing*, *Structuring discourse*, and *Communication repair*) and 132 micro-functions: (e.g. *Correcting*, *Expressing gratitude*, *Offering assistance*, *Greeting*, *Asking someone to spell something*, and *etc.*)

Data Analysis Procedure

As mentioned before, *Prospect 1* (an English textbook for junior high school students year XII authorized by Textbook Curriculum Development of the Ministry of Education of the Islamic Republic of Iran) is communicatively oriented, therefore, it is conversation-based. The speech acts and language functions analyzed in this research are the ones used in conversations which are included in the *Conversation* and *Sounds and Letters* sections.

As the study is basically qualitative, the only quantitative analysis performed in this study was counting the frequencies of the occurrence of each class of Searle's (1976) speech act taxonomy and van Ek's (1998) language functions categories, as well as their percentages illustrated in Table 1 and 2. Also, the chi-square test was applied in order to better illustrate the distribution levels of these pragmatic variables. The results are shown in Table 3 and Table 4.

RESULTS AND DISCUSSION

Results

Tables 1 and 2 display the frequencies and percentages of speech acts and language functions, respectively:

Table 1: Frequencies and Percentages of Speech Acts

No.	Speech Acts	Frequency	Percentage (%)
1	Declarative	0	0
2	Commissive	3	2.43
3	Directive	50	40.65
4	Expressive	19	15.44
5	Representative	51	41.46
	Total	123	100

As the results in Table 1 reveals the percentages of speech acts show that 41.46% refers to *Representatives*, 40.65% to *Directives*, 15.44% to *Expressives*, 2.43% to *Commissives*, and 0% to *Declaratives*. Therefore, it can be concluded that the overall minimum frequency refers to *Declarative* speech acts ($f=0$), and the overall maximum belongs to *Representative* speech acts ($f=51$).

Table 2: Chi-Square Results

Chi-Square	51.111
df	4
Asymp. Sig.	.000

Based on this table, the difference between the frequencies of these speech acts is significant and meaningful. In other words, the speech acts in the conversations of *Prospect 1* are not distributed equally and not at the same or close levels of frequency, i.e. Sig. = .000 ($p < .05$).

Table 3: Frequencies and Percentages of Language Functions

No.	Functions	Frequency	Percentage (%)
1	Imparting and seeking factual information	76	54.28
2	Expressing and finding out attitudes	15	10.71
3	Deciding on courses of actions (Suasion)	18	12.85
4	Socializing	18	12.85
5	Structuring discourse	1	0.71
6	Communication repair	12	8.57
	Total	140	100

Based on Table 3, *Imparting and seeking factual information* comprises 54.28 percent, *Expressing and finding out attitudes* 10.71 percent, *Deciding on courses of actions (Suasion)* 12.85 percent, *Socializing* 12.85 percent, *Structuring discourse* 0.71 percent, and *Communication repair* 8.57 percent of language functions in the book. As a result, *Imparting and seeking factual information* ($f=76$) is the most frequent class of language functions, and the least one is *Structuring discourse* ($f=1$).

Table 4: Chi-Square Results

Chi-Square	36.113
df	5
Asymp. Sig.	.000

According to this table, the difference between the frequencies of these language functions is significant and meaningful. In other words, the language functions in the conversations of *Prospect 1* are not distributed equally and not at the same or close levels of frequency, i.e. Sig. = .000 ($p < .05$).

Discussion

As the results from Table 1 illustrates, out of the five speech act classes in Searle's (1976) classification, one speech act, i.e. *Declarative*, was absent among other speech acts. In other words, four classes of Searle's (1976) speech act classification, including *Representative*, *Expressive*, *Directive*, and *Commissive* speech acts, were present in the conversation models of the textbook (See Appendix A). Therefore, the lack of the *Declarative* speech acts in all of the conversation models of this textbook may be regarded as a weakness for this textbook. As Cutting (2002) states, declarative speech acts are used frequently in everyday communication. They are words and expressions that change the world by their every utterance, such as "I bet," "I declare," "I resign," "I announce," "I pronounce," and many other utterances which are used in different contexts. Also Searle (1976) explains that all types of speech acts are frequently used in every day communication, and believes that different kinds of situations or contexts enable us to use different types of speech acts in order to maintain the basic relationships in our social lives. Therefore, to become pragmatically competent and functional in almost all the contexts of communication, learners need to gain the knowledge of all types of speech acts so as to be able to apply pragmatically appropriate speech acts in different communicative contexts. In this respect, the conversation models of *Prospect 1* do not contain all types of Searle's (1976) speech acts, on the one hand, and according to the results of the chi-square test in Table 3, the existing speech acts are not equally distributed throughout these conversations.

The results from Table 2 indicate that *Prospect 1* textbook covers all the six macro-functions of language. Also a total number of 30 language micro-functions are included in the conversation models of this textbook (See Appendix B). *Imparting and seeking factual information* comprises 54.28 percent of language functions in the book including *identifying*, *reporting*, *correcting*, *asking*, and *answering question*. Then, *expressing and finding out attitudes* comprises 10.71 percent of language functions including *expressing agreement*, *expressing wants*, *expressing liking*, *expressing interest*, *expressing gratitude*, and *offering an apology*. The third, *deciding on courses of actions (Suasion)*, comprises 12.85 percent of language functions including *suggesting a course of action*, *requesting*, *instructing or directing*, *offering assistance*, *inviting someone to do something*, *accepting an offer*, and *declining an offer*. *Socializing* also comprises 12.85 percent of the language functions including *attracting attention*, *greeting people*, *meeting a friend*, *replying to greeting*, *introducing someone*, *being introduced to someone*, and *taking leave*. Then, *structuring discourse* comprises 0.71 percent of language functions including *giving signals that you are hearing and understanding*. Finally, *communication repair* comprises 8.57 percent of language functions including *asking for repetition*, *asking someone to spell something*, *appealing for assistance*, and *spelling out a word or expression*. Looking at the frequencies and percentages of these language functions in Table 2, one can find out the fluctuations among these pragmatic variables in the conversation models. Moreover, as the result of the chi-square test shows in Table 4, there is a significant difference in the distribution of the language functions in the conversation models.

CONCLUSION

The present study aimed at identifying and categorising the speech acts and language functions in the conversation models of Iranian seventh grade of junior high school English textbook, *Prospect 1* based on Searle's (1976) speech acts taxonomy and van Ek's (1998) list of macro and micro-language functions. The results revealed that the most frequent speech acts in *Prospect 1* are *Representatives* whereas *Declaratives* are not included.

According to Cutting (2002) a good conversation consists of all of the language functions with an equal distribution throughout the textbook. In other words, real conversations in real-life situation contain all of the language functions. So, a good and suitable textbook must include conversations containing all types of these language functions distributed equally throughout the conversations of the book in order to make learners pragmatically competent in their speaking performance. As a result, it is better for the conversation models in *Prospect 1* to include all types of these language functions equally. Therefore, it is necessary for the textbook authors to take this pragmatic pitfall of the conversation models of *Prospect 1* into consideration in developing later *Prospect Series* textbooks. Furthermore, according to the results, the existing speech acts and language functions are not equally distributed throughout the conversation models of the textbook, then; this study recommends the authors to use all types of speech acts and language functions at the same frequency or percentage among all of the conversation models.

In relation to these findings, it is worth mentioning that this textbook, like other language textbooks which have been taught in Iran schools, suffers from lack of explicit instruction of pragmatic features, e.g., speech acts. Many Iranian and international studies have examined the effect of explicit instruction on the development of pragmatic knowledge, e.g., Silva (2003); Alcon-Soler & Guzman-Pitarch (2010); Salemi, Rabiee, & Ketabi (2012); Salehi (2013); Rafieyan, Sharifi-Nejad, & Siew Eng (2014). And most of them found that explicit teaching of pragmatic aspects can be very effective and beneficial for students in order to develop their pragmatic competence in target language. It is recommended, therefore, that the textbook authors try to incorporate explicit instruction of pragmatics into the communicative design of the next *Prospect* textbooks.

Regarding the findings of this study, further studies can be conducted to investigate the presence or absence of different types of speech acts and language functions in later *Prospect* textbooks.

THE RELATIONSHIP BETWEEN IRANIAN EFL TEACHERS' PERSONALITY TRAITS EMOTIONAL INTELLIGENCE AND THEIR JOB SATISFACTION

Sharareh Ebrahimi

Safir English Language Institute, Tehran, Iran

Email: eb_sharareh@yahoo.com

ABSTRACT

The present study was designed to investigate the relationship between personality traits, emotional intelligence, and English teachers' job satisfaction in Iranian English as a Foreign Language (EFL) teachers. In so doing, a sample of 80 EFL teachers, who were teaching English in English language institutes in Tehran, Iran was selected. The participants' views towards their job satisfaction, emotional intelligence, and personality traits were investigated using three Likert-type questionnaires. The results of descriptive statistics revealed that Iranian EFL teachers were not satisfied with school-based and system-based factors of their career. Their satisfaction restricted to the intrinsic factors of their job. The results of multiple regression analyses showed that the personality traits are stronger predictors of teachers' job satisfaction. the present study added the potential influence of the personality and emotions in promoting teachers' job satisfaction and a sense of belonging and belief in positive outcomes.

KEYWORDS: EFL Teachers, Emotional Intelligence, Job Satisfaction, Personality Traits

INTRODUCTION

Nowadays, academic work in every field of study is extensively linked to real world professional experience and teaching is not considered as an exception in this case. Thus, if we want to have well-prepared EFL teachers, we should provide real life training program for them. Concentrating on the issue of learning, a teacher is always influenced by many factors throughout his or her learning. It does not matter how old the learner is. The teacher learns or boosts his or her learning through the environment.

The studies on individual and personality differences are a central theme in psychology as well as the other areas of social and behavior sciences (Saklofske & Eysneck, 1998). According to Pervin and John (1995), personality is defined as a unique expression of individual differences in behavior and experience which must out of necessity, be reflected in personal attributes. In other words, psychologically, it is a truism that people are different in many fundamental ways and individuals are characterized by a unique pattern of traits. It could also be defined as "the relatively enduring style of thinking, feeling, and acting that characterizes an individual" (Costa, McCrae & Kay, 1995, p. 124). Moreover, McMartin (1995) also defined personality as "the developing system of distinctive emotional, cognitive and spiritual attributes that manifest themselves in the individual's characteristic behavior at any point in the life course" (p. 5). There

are many different views regarding the issue of the definition of personality and personality traits like any other abstract concepts, as what is meant by personality or personality traits are not usually tangible or measurable directly, however, the main theme is identical.

It is believed that personality factors are important in learning development in general and the improvement of linguistic abilities specifically (Ellis, 1985). Horwitz (1999) pointed out “language learners are individuals approaching language learning in their own unique way” (p.558). Therefore, for many language teachers, personality of the learners is one of the major factors that contributes to their success or failure (Ellis, 1996). In addition, it could also be concluded that individuals who are characterized as particular psychological types, adopt the same way of learning, face almost the same problems in that process, and approach those problems in quite the same way (Fazeli, 2012). Consequently, every one involves in the process of teaching and learning must be aware of the relationship between learners’ personality traits and their academic performance as personality and personality factors play an important and undeniable role in the area of teaching and learning (Eysenck, 1967; Cattell & Butcher, 1968).

Individual variables such as motivation, cognitive styles, abilities, and learning strategies play an important role in the process of learning and nowadays; many researchers have focused on them in their studies. Mokhtari (2007) asserted that some individuals’ differences such as attitudes, sex, nationality, major, and so forth can affect the frequency and variety of language learning strategy use. One of these learners’ variables which we can mention is intelligence.

In 1990s, the emotional intelligence was introduced for the first time and it was used in many fields including education. This concept was formally developed out of growing emphasis on research on the interaction of emotion and thought in the field of psychology. Goleman (1995) defined emotional intelligence as abilities such as being able to motivate oneself and persist in the face of frustration, to control impulses and delay gratification; to regulate one’s moods and keep distress from swamping the ability to think; to emphasize and to hope, which include self-control, zeal and persistence, and the ability to motivate oneself. Later, Goleman reformulated his first definition of emotional intelligence and broke down emotional intelligence into twenty-five different emotional competencies, like political awareness, service orientation, self-confidence, consciousness and achievement drive (Goleman, 1998). Furthermore, Mayer and Salovey (1990) defined the Emotional Intelligence as the ability to monitor one’s own and others’ feelings and emotions, to discriminate among them and to use this information to guide one’s thinking and actions.

In recent decades, a lot of researchers had investigated these aspects such as logical reasoning, spatial skills, math skills, understanding analogies, verbal skills, etc. for example, Terman (1921, cited in Rouhani, 2008) states that an individual is intelligent in proportion as he is able to carry on abstract thinking. Although Intelligence Quotient (IQ) could predict, to some academic degree, professional and personal success, but there were some people with high IQ scores who were poorly doing in their life and losing their chances of success.

In order to take advantages of social life and interact in an effective and confident environment, it is important to learn a complex set of social skills such as personality traits. The body of literature reveals a lack of empirical research on personality traits and language learning. Educators must be aware of the impact of individual differences among learners and the personality traits on their learning process. Educators must be aware of the research on personality, since one of the goals of education is the personal and social development of learners. Despite the significant role of personality features in differentiating individual learners, and the potential effect it can have on teaching, to date, very scarce number of studies have been conducted to explore the relationship between emotional intelligence, personality traits, and teachers' job satisfaction. This issue is highlighted when it is considered in Iranian EFL context.

RESEARCH QUESTIONS

The following research questions were posed in order to meet the objectives of the study:

1. Are Iranian EFL teachers' personality traits and emotional intelligence significant predictors of their job satisfaction?
2. Which aspect of Iranian EFL teachers' personality traits is a significant predictor of their job satisfaction?

METHODOLOGY

Participants

The participants in this study included 80 EFL teachers who were teaching in English language institutes of Tehran. They were both male and female. Their English teaching experience varied from 10 to 15 years. The present study adopted a convenience sampling method in which a certain group of people are chosen for the study. This sampling method was chosen in order to maximize the number of EFL teachers as close to the researcher's residence as possible in this survey. The researcher invited these EFL teachers working in the high schools to respond to the questionnaires.

Instruments

The instruments of the study consisted of three questionnaires: a) Personality Traits Questionnaire, introduced by Townend (1991), was used to identify the students' thoughts, ideas, and emotions to compare them with those of others. It includes four sub-scales of assertive, aggressive, submissive, and passive characteristics. Each of these sub-scales consisted of 20 questions that were randomly placed in the questionnaire. After reading each item, the testee needed to examine the particular questioned behavior introspectively; if the questioned attribute was present in his behavior with a high degree of frequency then the affirmative echoic was used; otherwise he should choose "no". Actually the answer sheet displays a binary choice; b) Emotional Quotient inventory (EQ-i) developed by Bar-On (1997) model of EI was used in this study. This scale assesses EI based on self-reported responses to 133 items tapping the evaluation and expression of emotion in oneself and others, and using emotions to solve the problems. The Persian version of this instrument was employed to avoid cross-cultural differences and probable misunderstandings regarding the content of the questionnaire. The original Emotional Quotient

inventory (EQ-i) had demonstrated high internal consistency (Cronbach's Alpha ranging from .87 to .90), and good two- week test-retest reliability ($r = .78$) (across a wide variety of cultures) (Bar-On et al., 1997); c) Teachers' Job Satisfaction Questionnaire developed by Karavas (2010), consists of four main parts: Part 1 elicits the biographical information about teachers (age, sex, years of teaching experience, types of the schools/institutions, and geographical region of schools/institutions in which they have taught). Part 2 consists of a series of 15 Likert-type statements related to teachers' level of satisfaction with various aspects of their job extrinsic to the task of teaching such as their recognition by students, peers, parents and the wider community, the image of teachers, their status in society, their salary, working hours, benefits, etc. The scores on this part were measured by a 5 point scale ranging from 1= highly satisfying to 5= highly dissatisfying. Part 3 consists of a series of 20 Likert type statements focusing on the second research question of the study. More specifically, this part of the questionnaire elicited respondents' attitudes towards various school based factors, their work and their relationship with students. The answers on this part were measured on a 5 point Likert scale ranging from 1= strongly agree to 5= strongly disagree. Finally, Part 4 investigates the reasons which teachers express for choosing teaching as a career.

RESULTS AND DISCUSSION

In order to prove the normality of the scores of the emotional intelligence, job satisfaction, and personality, a one sample Kolmogorov-Smirnov test was performed. The results are presented in Table 1.

Table 1: One-Sample Kolmogorov-Smirnov test of emotional intelligence, job satisfaction and personality

		Emotional Intelligence	Job Satisfaction	Personality
N		80	80	80
Normal Parameters ^{a,b}	Mean	487.2500	87.8000	13.79
	Std. Deviation	49.89343	4.89743	2.271
Most Extreme Differences	Absolute	.109	.148	.128
	Positive	.058	.069	.090
	Negative	-.109	-.148	-.128
Kolmogorov-Smirnov Z		.975	1.320	1.148
Asymp. Sig. (2-tailed)		.298	.061	.144
a. Test distribution is Normal.				
b. Calculated from data.				

As the Table 1 shows, the most extreme difference between the scores is not significant. The measured significance levels for emotional intelligence, job satisfaction and personality scores were 0.29, .06 and 0.14; they were higher than the assumed level of significance (i.e., 0.05), therefore, it can be concluded that there was no significant difference between the observed distribution of the scores of emotional intelligence, job satisfaction, and personality and they are normally distributed. In order to investigate the first research question of the study in finding whether Iranian EFL teachers' personality traits and emotional intelligence are significant predictors of their job satisfaction, a standard multiple regression was performed. Table 2

provides the extent to which variability in the dependent variable (job satisfaction) is accounted for by the independent variables (personality traits and emotional intelligence).

Table 2: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.758 ^a	.575	.562	.3976
Predictors: (Constant), Emotional Intelligence, Personality				

With regard to Table 2, the coefficient of multiple correlations is presented in the "R" column. R is the measure of the prediction of the dependent variable; in this case, job satisfaction. A value of 0.75 indicates a good level of prediction. The "R Square" or R^2 value is the proportion of variance in the job satisfaction that can be explained by the independent variables (i.e., emotional Intelligence and personality traits). It indicates that emotional Intelligence and personality traits explain 57% of the variability of job satisfaction.

In order to determine whether the provided model (emotional Intelligence and personality traits as independent and job satisfaction as dependent variable) is a good fit for the data, a one-way ANOVA was performed. The results are shown in Table 3.

Table 3: ANOVA of regression model

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	5.078	2	2.539	47.56	.000 ^b
	Residual	144.289	117	5.344		
	Total	149.367	119			
Dependent Variable: Job Satisfaction						
Predictors: (Constant), Emotional Intelligence, Personality						

The F value in the Table 3 verifies the fitness of overall regression model for the data. The result shows that ($F = 47.56$, $p = 0$) p value is lower than assumed level of significance (i.e., 0.05), therefore, EFL learners' emotional intelligence and personality traits can significantly predict their job satisfaction (i.e., the regression model is a suitable method for analyzing the data) and the first research question of the study was verified.

In order to investigate the second research question of the study in finding which aspect of Iranian EFL teachers' personality traits is a significant predictor of their job satisfaction, another multiple regression was conducted. Table 4 provides the extent to which variability in the dependent variable (job satisfaction) is accounted for by the independent variables (aspects of personality traits).

Table 4: Model Summary

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.309 ^a	.096	.047	4.77977
a. Predictors: (Constant), Passiveness, Assertiveness, Aggressiveness, Submissiveness				

R is the measure of the prediction of the dependent variable; in this case, job satisfaction. A value of 0.30 indicates a good level of prediction. The " R Square" or R^2 value is the proportion of variance in the job satisfaction that can be explained by the independent variables (i.e., aspects of personality traits). It indicates that aspects of personality traits explain 9% of the variability of job satisfaction.

In order to determine whether the provided model (aspects of personality traits as independent and job satisfaction as dependent variable) is a good fit for the data, a one-way ANOVA was performed. The results are shown in Table 5.

Table 5: ANOVA of the regression model

ANOVA ^a						
Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	181.335	4	45.334	21.984	.006 ^b
	Residual	1713.465	75	22.846		
	Total	1894.800	79			
a. Dependent Variable: Job Satisfaction						
b. Predictors: (Constant), Passiveness, Assertiveness, Aggressiveness, Submissiveness						

The F value in the Table 5 verifies the fitness of overall regression model for the data. The result shows that ($F = 21.98$, $p < .05$) p value is lower than assumed level of significance (i.e., 0.05), therefore, different aspects of personality traits can significantly predict their job satisfaction (i.e., the regression model is a suitable method for analyzing the data). Table 6 shows the information about the model coefficients. The general form of the model is to predict EFL learners' job satisfaction from their personality traits.

Table 6: Coefficients of the model

Coefficients ^a						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	90.706	2.999		30.249	.000
	Aggressiveness	-.042	.163	-.032	-.255	.799
	Assertiveness	-.365	.163	-.278	-2.238	.028
	Submissiveness	-.193	.224	-.123	-.862	.392
	Passiveness	.212	.154	.178	1.375	.173
a. Dependent Variable: Job Satisfaction						

As can be seen in the above table, assertiveness ($b = .27$, $p < .05$) is a significant predictor of EFL teachers' job satisfaction which would indicate that larger assertiveness is related to higher job satisfaction. In other words, assertiveness aspect of personality traits is a significant predictor of Iranian EFL teachers' job satisfaction. Therefore, the second research question of the study was verified.

The results of multiple regression analyses showed that the personality traits is a stronger predictor of teachers' job satisfaction. This finding supported those of Day (2002), Day et al., (2006) and Shann (1998) who found that teachers are satisfied with the intrinsic elements of their

work such as interaction with students, professional autonomy, and self-growth and express dissatisfaction with issues related to school-based factors. This result also confirms the findings from the study of Karavas (2010) who showed that Greek EFL teachers' satisfaction of their job has a significant relationship with students' achievements. The results of multiple regression showed that the assertiveness aspect of personality traits is a significant predictor of Iranian EFL teachers' job satisfaction. This result confirmed those of Vandenberghe and Huberman (1999) who found that teacher student relationship enhanced teacher satisfaction and the direct consequences for it when emotional exhaustion, a sense of futility, and reduced personal accomplishment creep into teachers' working lives. The results of this study were in line with those of Zembylas and Papanastasiou (2004) who found that teachers' reliance on student responsiveness was significantly related to the teachers' personal satisfaction.

CONCLUSION

The present study was designed to investigate the impact of personality traits and emotional intelligence on Iranian EFL teachers' job satisfaction in Iranian EFL teachers. Teachers' dissatisfaction with their jobs may be mainly due to the insufficient salary, and/or due to the fact that the educational system does not give appropriate values to different teaching qualities. In other words, teachers believe that for the existing educational system an experienced and skillful teacher is equal to an inexperienced and less skillful teacher. Whatever the reason, this problem - the teachers' dissatisfaction with their job - may deeply affect the teaching methodology on the part of teachers and consequently language learning on the part of learners, as well. These problems may lead to less friendly relationships between teachers and their students, and less time spent on students' problems with learning English as examples which lend themselves well to support the importance of teachers' dissatisfaction with their job.

The present study provides implications for English language teachers to pay attention to the concept of emotional intelligence and try to follow strategies and use techniques in order to promote their emotional intelligence. They can share their feelings with colleagues to help them be familiar with each other, enhance their interpersonal communications, develop cognitive abilities, and reduce stress and anxiety.

The implementation of this study in its present suggested form can be justified in terms of some limitations. The participants were selected according to available sampling. The study can be duplicated using procedures that allow a higher degree of randomization and eventually more generalizability.

THE IMPACT OF TEACHING ENGLISH PRONUNCIATION VIA MUSICAL RHYTHM UPON PRONUNCIATION IMPROVEMENT OF IRANIAN KURDISH EFL LEARNERS

Farid Ghaemi (Assistant Professor)

Department of Literature and Foreign Languages, Karaj Azad University

Faraz Pourjam (PhD candidate)

Karaj Islamic Azad University

ABSTRACT

This investigation intends to seek into investigating the impact of teaching pronunciation through a fun activity of Rhythm upon the learners' pronunciation improvement. This study is to discover whether students in this group will gain a significant improvement in pronunciation compared to the other group. To ensure the homogeneity of the two groups, the Nelson Proficiency Test will be administered among 120 Iranian English as a foreign language (EFL) learners. 82 students whose scores fell within the range of one standard deviation above and below the mean (scores from 26 to 38) were chosen as homogeneous subjects for this study. Next, Pearson test of English is handed to students as the oral pre-test. Then, Levene's test for equality of variances is employed to demonstrate that four sets of scores have equal variances and therefore are homogeneous at pretest. Two-way AVOVA is employed after that to show statistically significant effect for gender and pronunciation improvement. Levene's test for equality of variances is also employed to demonstrate that four sets of scores (control & experimental, male and female) have equal variances and therefore are homogeneous at post-test. Finally, Two-way ANOVA is utilized to testify the veracity of null hypotheses. ANOVA detected a statistically significant effect for group, i.e. teaching music and rhyme. Accordingly, the first null hypothesis was rejected. Thus with high degree of confidence it can be claimed that Teaching music and rhyme affects Pronunciation of young Iranian EFL learners. Additionally, ANOVA results revealed no statistically significant effect for gender. Accordingly, the second null hypothesis was not rejected. With high degree of confidence it was claimed that teaching music and rhyme affects pronunciation of young Iranian EFL learners and using this method for teaching pronunciation in Iranian context will bring about fruitful educational implications.

KEYWORDS: Teaching Pronunciation, Musical Rhythm, Pronunciation Improvement, EFL Learners, Kurdish Dialect

INTRODUCTION

Rhythm of English is conceived of as one of the hugest difficulties for many foreign learners of English. It is more vital for EFL learners who have a very diverse structure in their L1 (e.g. Kurdish). These learners are not generally provoked for pronunciation exercise. Consequently, this research will investigate the impact of musical rhythm, upon pronunciation improvement.

Rhythm, in fact, is timing patterns amid syllables. Nevertheless, the timing patterns are not similar in all languages. There are, principally, two contrary sorts of rhythm in languages: stress-timed and syllable-timed. In keeping with Mackay (1985), stress-timed rhythm is decided by stressed syllables that happen at standard gaps of time, with an irregular and varying number of unstressed syllables among them; syllable-timed rhythm is founded on the whole number of syllables as each syllable receives roughly identical quantity of time. English, with a fluctuation of stressed and unstressed syllables, is apparently stress-timed.”(Chen, C. et al 1996).

Statement of the problem

Kurdish, with almost the same weight and time in all syllables, is syllable-timed. The syllables in Kurdish have approximately very similar length and weight. Many Kurd learners are not conscious about this distinction. They employ the rhythm of Kurdish (syllable _timed rhythm) when they speak English. So these pronunciation difficulties might cause speech to become incomprehensible. It possibly will also be tedious for the learners to perform pronunciation and word stress in traditional language teaching method. Numerous students are fed up with the conventional methods which teach word stress. L1 interference is a major distress for EFL learners’ performance. A language like Kurdish which has a radically dissimilar stress system with English can inflict the fact that the learners put stress in any syllables in a word or a sentence. So as to aid students understand that English rhythm is dissimilar with Kurdish, we are capable of using these two illustrations:

Kurdish: syllable timed rhythm English: stressed timed rhythm

English rhythm consists of higher bouncing balls (stressed syllables) and lower bouncing balls (unstressed syllables), which indicates English as a language with different length and weight syllables. On the other hand, Kurdish comprises of identical bounces that represent Kurdish as the language with similar weight and length syllable language.

LITERATURE REVIEW

All over the centuries, specialists in diverse fields - philosophers, scientists, teachers and therapists have distinguished the role of music for remedial and developmental functions. During the last two decades, researches have had major progresses in the theory of foreign language learning. Several researchers find the educational conjoining of language and music unpredictably persuasive since there are frequent historical and developmental evidences of music's connection with language learning. Language and music are the two approaches which human beings employ to be in touch and communicate themselves via sound. Many ESL students who have achieved advanced high levels are still having problem in communicating, owing to low clearness. Word and sentence stress are constituents that donate to a great extent to intelligibility. The schoolwork consists of detailed methodology that can be functional in many ESL classrooms. Envisage you are a highly developed adolescent English language learner (ELL). This is your last year of high school, and you have completed the overwhelming confronts of passing all necessary standardized tests and gaining adequate credits to graduate from school. Your highly developed understanding of the English language has brought your admission at many highly regarded universities. Your awareness of English grammar very much surpasses that

of the normal graduating high school students. You are able to discriminate between a gerund and an infinitive. Your knowledge of past perfect is perfect, and you can reel off comparatives and superlatives. You have perfectly learned the intricate syntax, grammar, and vocabulary of English. In reality, there appears no hurdle to your social and academic achievement, except for one setback. Your meager pronunciation hinders your capability to interact in words. Youngster language learners are not probable to automatically “lift” the pronunciation models of a new language, while native speakers of English instinctively obtain the abilities to make the rhythmic impulses of our language very untimely in life. It is merely the time when another speaker falls short to produce satisfactory stress, intonation, and rhythm. We expect that we become attentive of these aspects at all.

Historical processes in pedagogy of pronunciation

Pronunciation teaching has been connected to the most accepted recent method utilized (Celce-Murcia, Brinton, & Goodwin, 1996). Pronunciation was rarely taught throughout the supremacy of the grammar-translation method. From the 1940s through the 1960s, pronunciation was given prominence in the Audio-lingual Method. Over this period, instruction concentrated on imitation and memorization, with recurrent use of error correction. Learners were for long hours in language labs listening to and repeating sounds and phrases. Ideal pronunciation was the chief objective. This trend to highlight pronunciation weakened for the next two decades. Some ESL specialists questioned if pronunciation might even be practically taught. The formerly admired drills exercised were believed to be futile. Accordingly, pronunciation instruction was nearly overlooked. Conversely, in the 1970s, some professionals started to reassess the significance of pronunciation, but with a new focus on communicative practice and learner participation (Morley, 1975).

Since the 1980s, attention to pronunciation has rematerialized, for the most part for use in academic and work-related frameworks. The newest focal point of pronunciation instruction is to allow ELLs to become efficient and competent speakers. As more holistic, interactive approaches have become progressively more well-liked, pronunciation instruction is now being taken in hand within the context of authentic communication (Celce-Murcia, Brinton, & Goodwin 1996; Morley, 1991). Now that pronunciation instruction is deriving from its normally-marginalized role in ESL instruction, professionals are finding out that ideal grammar is not adequate. The ebbs and flows of a language are attained via a natural-like accent. Acculturation is the capacity of the beginner to get a feel for and survive within the leading culture, without abandoning their first culture. The influence of music on today’s community is unfeasible to fail to notice. Tuning into most television or radio channels will give rise to a flood of music-based songs and advertisements. Without a doubt, music has become a main part of mainstream culture. Success in acculturation can enhance successful language acquisition (Schumann, 1986).

Working with children

Children are attracted to nursery rhymes, rhythmic activities, and songs as key texts in building concepts of reality. Though, it sounds that only innovative teachers go after the methods recommended in an institutional framework. Surely, the enhancement of language teaching might be viewed as the aim; in itself a main reason to probe and create.

Songs endorse the application of hand gestures, rhythmic movement, and the format permits public presentation. All of these promote abilities which are not mentioned in more conventional language teaching contexts. In effect, this is at variance significantly with the recent teaching practices employed in most situations that maintain language is best taught via teaching in vocabulary and the regulations to merge them. The effectiveness of such teaching, nevertheless well regarded by most teachers as it is textbook-related and moderately easy to manage, is not very high. The musical method concentrates on establishing fun with the language and allowing words come in a more normal way, and per se has more in common with interactive language learning method, that uses social interaction, small groups, and peer conversation. Music might be incorporated into a more authentic way of learning language. It helps out learners not only with learning of vocabulary, but also acquisition of language-related data. Advantages of applying music in the early on childhood language class are the upshots of the natural sympathy of music with language. Universal music activities that comprise singing and rhythm help promote the growth of aural discriminating skills, with incorporation of letter sounds, syllabification, and words pronunciation. Children pay special attention to delicate differences in tone and timing, which allows them to master their accent perfectly.

Working with adults

Several young adults/adults that pursue the EFL lessons are not total beginners, which mean that they already have some previous command of the language; either they have mastered it via usual school education or by individual experience. Typically, adults start the course either to get ready for tests in their school/university or for occupation headway, occasionally just for personal means. Much of the difficulties that students face in the study of English are a result of the extent to which their mother language varies from English, leading them to frequently make errors of syntax and pronunciation or to allot grammatical models of their own language to English, articulate some sounds wrongly or with problem and to confound items of vocabulary famous as false friends. In addition, cultural distinctions in interaction styles and likings are noteworthy. As expected, students who do not do extremely well with customary delivery methods are required to be dealt with in a different way, but the appropriate nature of that teaching, either musical, rational, or some other means might rely more on the teacher's personal capacities than student needs.

A review of the researches done in the field

Accent and clearness, the ability to be comprehended, make up for a major assistance to interpersonal interactions. The major constituents of accent are *segmental* features: spoken sounds and mixtures of sounds, and the *suprasegmental* facets: stress (length and loudness used for syllables), intonation (speech music or rising and falling of voice pitch), and liaisons or rhythm (word connections during flows of speech). Suprasegmental features of language go beyond the segmental production of vowels and consonants. They enlarge athwart the register of unique sounds and are typically automatically produced by native speakers. Many specialists assert that learning suprasegmentals might help general clearness even more than acquisition of the segmental features usually stressed in the classroom (Grant & Levis, 2003).

Following is an outline of momentous findings, or requirement thereof, pertaining to these issues explained. As rhythm is worldwide, (Martinec, 2000), it looks a reasonable supply to put into practice in the schooling of students who come from varied cultural and linguistic environments. Some investigation has demonstrated that overt instruction of English models may bring about major enhancement of production, even after L1 rhythmic models have been deeply acquired (Adams, 1979). The significance of position rhythm has in pronunciation has directed the focus of this research.

RESEARCH QUESTIONS

Align with the research purposes; the following research questions are formed:

1. Does teaching English through musical rhythm have any significant effect on the development of young Iranian EFL learners' pronunciation improvement?
2. Does gender of young Iranian EFL learners' affect their pronunciation improvement through teaching musical rhythm?

METHODOLOGY

Participants

120 Iranian EFL elementary learners in an English language institute aged from 7-9 years old will participate in this study. To ensure the homogeneity of the two groups, the Nelson Proficiency Test will be administered among 120 Iranian EFL learners. 82 students whose scores fell within the range of one standard deviation above and below the mean (scores from 26 to 38) were chosen as homogeneous participants for this study.

Instruments

The following instruments are employed in order to conduct the study:

1. First, to ascertain the homogeneity of the participants of the study in terms of language proficiency, a general language proficiency test named Nelson Proficiency Test will be utilized.
2. An oral pre- post tests using some observation cards to determine the differences in each group before and after the instruction will be employed.

Procedure

To ensure the homogeneity of the two groups, the Nelson Proficiency Test is administered to 120 EFL learners. Afterwards, reliability of Nelson proficiency test is calculated through K-R 21 Method. 82 students whose scores fell within the range of one standard deviation above and below the mean (scores from 26 to 38) were chosen as homogeneous participants for this study. In control group and experimental one 42 and 40 students are assigned with 45 male participants and 37 female ones respectively. After that Pearson test of English is handed to students as the oral pre-test. Next, reliability of pre-test is computed through Cronbach's Alpha formula. Then, Levene's test for equality of variances is employed to demonstrate that four sets of scores (control & experimental, male and female) have equal variances and therefore are homogeneous at pretest. Two-way AVOVA is employed after that to show statistically significant effect for

gender and pronunciation improvement. In experimental group teacher uses musical rhythm to teach as the treatment of the study while in the other one she does not. At the end of the term a posttest is given to both experimental group and control one to check any significant difference between their performances. Later, Reliability of post-test is computed through Cronbach's Alpha. Levene's test for equality of variances is also employed to demonstrate that four sets of scores (control & experimental, male and female) have equal variances and therefore are homogeneous at post-test. Finally, Two-way ANOVA is utilized to testify the veracity of null hypotheses.

RESULTS AND DISCUSSIONS

This section presents the results of the study which was an attempt to investigate the effect of teaching rhyme and music on young Iranian EFL learners' pronunciation improvement. To obtain the goal, the researcher tested the null hypotheses stated on the basis of the research questions. The first step to answer the research questions was to calculate the descriptive statistics for the related conditions, and the second step was to submit the data to repeated measures ANOVAs to determine whether there are significant differences between the conditions specified for each null hypothesis. The following represents the steps of screening the data against each null hypothesis.

Homogeneity process through nelson Proficiency Test

To ensure the homogeneity of the two groups, the Nelson Proficiency Test was administered among 120 EFL learners. Those students (N = 82) whose scores fell within the range of one standard deviation above and below the mean (scores from 26 to 38) were chosen as homogeneous participants for this study. Descriptive statistics for this homogeneity test is represented in Table 1.

Table 1: Descriptive Statistics of Nelson Proficiency Test

N	Range	Min.	Max.	Mean	Median	Mode	Std. Error	Std. Deviation
120	26	20	46	32.27	32.00	30	.558	6.109
120								

The mean score of participants was 32.27 with standard deviation of 6.109. The min of students was 20 and the median of the group was 32.00.

Figure 1: Nelson Proficiency Test Scores

Table 2: Reliability of Nelson Proficiency Test

Reliability of Nelson Proficiency Test	Valid	Number of Students	%	Number of Items	K-R 21 Method
	Excluded	30	0		
	Total	30	100.0		

Table 3: Between-Subjects Factors

		Value Label	N
Group	1	Control	42
	2	Experimental	40
Gender	1	Male	45
	2	Female	37

Table 4: Reliability of pre-test

Reliability of Pretest	Valid	Number of Students	%	Number of Items	Cronbach's Alpha
	Excluded ^a	0	0		
	Total	18	100.0		

The mean score of participants in control group for men was 19.61 with standard deviation of 5.639 and mean for female was 19.47 with standard deviation of 6.177, for experimental group

the mean score of male participants was 18.45 with standard deviation of 5.096 and for female the mean was 19.28 with standard deviation of 5.410.

Table 5: Dependent Variable: Pronunciation at Pretest

Group	Gender	Mean	Std. Deviation	N
Control	Male	19.61	5.639	23
	Female	19.47	6.177	19
	Total	19.55	5.815	42
Experimental	Male	18.45	5.096	22
	Female	19.28	5.410	18
	Total	18.83	5.188	40
Total	Male	19.04	5.351	45
	Female	19.38	5.737	37
	Total	19.20	5.496	82

Figure 2: Dependent Variable: Pronunciation at Pretest

Levene's Test of Equality of Error Variances

F	df1	df2	Sig.
.057	3	78	.962

Levene's Test for Equality of Variances demonstrates that the hypothesis of equal of variances was supported because Sig. was .96 at pretest, which is greater than the .05 significance level for

this study ($p > \alpha$). Therefore it was concluded that four sets of scores (control & experimental, male and female) have equal variances and therefore are homogeneous at pretest.

Corrected Total	2446.878	81				

ANOVA failed to detect a statistically significant effect for group, ($F = .29$ $p = .58$, $p > .05$, Effect size = .004). Moreover, ANOVA results found no statistically significant effect for gender ($F = .07$ $p = .78$, $p > .05$, Effect size = .001). Accordingly, there was no significant difference between the pronunciation improvement of participants in control and experimental groups, and also between male and female participants before facing any treatment. Also, the interaction effect of Group * Gender was not significant ($F = .15$, $p = .70$, $p > .05$, Effect size = .002)

Levene's Test of Equality of Error Variances

Dependent Variable: Pronunciation at Posttest

F	df1	df2	Sig.
.345	3	78	.793

Levene's Test for Equality of Variances manifests that the hypothesis of equal of variances was proved since Sig. was .79 at posttest, which is greater than the .05 significance level for this study ($p > \alpha$). As a result it was concluded that four sets of scores (control & experimental, male and female) have equal variances and therefore are homogeneous at posttest.

Table 10: Two-way ANOVA

Null Hypothesis One

ANOVA detected a statistically significant effect for group, i.e. Teaching music and rhyme ($F = 9.26$, $p = .003$, $p < .05$, Effect size = .10). Accordingly, the first null hypothesis which predicted that Teaching music and rhyme does not affect Pronunciation of young Iranian EFL learners was rejected. Thus with high degree of confidence it can be claimed that Teaching music and rhyme affects Pronunciation of young Iranian EFL learners

Null Hypothesis two

Additionally, ANOVA results revealed no statistically significant effect for gender ($F = .13$, $p = .71$, $p > .05$, Effect size = .002). Accordingly, the second null hypothesis which predicted that gender of Iranian students does not affect their pronunciation was not rejected. Also, the interaction of Group * Gender was not significant ($F = .38$, $p = .53$, $p > .05$, Effect size = .005). The findings of the study clearly stated that teaching pronunciation through having fun and music bear direct influence upon students. As with the case of children, the findings imply that they will be much more affected by music as their biological features allow them to be so. Concerning adults, more intensive line of research needs to be conducted as to accurately determine which age range is how much affected by music in terms of the pronunciation improvement.

CONCLUSION

Due to the complexity and intricacy of the nature of the issue, finding a logical and appropriate answer to the questions raised in this paper can be beneficial in many ways and many aspects. This study is designed to investigate the effect of teaching the pronunciation through a fun activity of musical rhythm on the EFL young learners' pronunciation improvement. "The Angle of the North, a statue by Anthony Gormley in the north West of England, gives us a satisfying metaphor to deal confront with the biggest difficulty teachers' see regarding motivation." (Rogers 1996:61). Teaching word stress is one of those angles of North. So it is very essential for the teachers to overcome this problem." (Hammer, J. 2009: 57).

English is a very rhythmical language, so that a learner who can maintain the rhythm of the language is more likely to sound both natural and fluent. The two components of the system which have the greatest influence on rhythm are sentence stress and the various features of connected speech, i.e. what happens to words when we put them in an utterance." (Darn, 2007:7). Perception of rhythm of English is a very essential stage for learning a language. It may be a phase for pronunciation improvement. Sound pronunciation is an indispensable factor in having an intelligible and comprehensible speech. Musical rhythm can be viewed as a new and efficient one.

Limitations

Even after perception practicing word stress is a big problem for many EFL learners and teachers in Iran particularly for the young learners. Using the rhythmic technique, I have tried to find a solution to overcome this problem. It is obvious that the human child from the times she/he sits on her/his parents' lap starts clapping and learning while she is having fun. This method seems to be very effective in teaching rhythm of English through a fun way to practice rhythm of English unconsciously. The participants of this research will only be Iranian EFL young learners. Boukan will be the geographical area in which the research will be conducted. All participants will be Iranian EFL students who live in Boukan and they can speak Kurdish and Persian and no other nationalities will take part in this research. All the participants are in elementary level of English.

ABSTRACT

This study examined the relationship between teacher autonomy and learner autonomy among teachers and English as a foreign language (EFL) university students in Bandar Abbas, Iran, in two samples: a) 25 professors of Islamic Azad and Payam Noor universities of Bandar Abbas, b) 77 MA students of those universities majoring in English Teaching and English Translation. Professors were asked to complete Teacher Autonomy Scale (TAS) and students were asked to fill Learner Autonomy Questionnaire (LAQ). The independent t-test and the one-sample t-test were applied to examine the relationship between Teacher autonomy and learner autonomy and to clarify autonomy level of students. The results of the study indicated that there was no significant relationship between teacher autonomy and learner autonomy and also, the autonomy level of students was high. The finding of the study can be applied not only to language learning contexts, but to all kinds of learning. Autonomy equips students with the power to deal with everyday situations and find solutions to the problems they encounter.

KEYWORDS: autonomy, teacher autonomy, learner autonomy

INTRODUCTION

In the field of second and foreign language teaching and learning, as the theory and practice of language teaching enters a new century, the importance of helping students become more autonomous in their learning has become one of its more prominent themes (Benson, 2001, p. 1) and a number of justifications for advocating learner autonomy in language learning have been proposed (Finch, 2000). Nanuli Chitashvili (2007) stated that autonomy is a complex socio-cognitive system, manifested in different degrees of independence and control of one's own learning process, involving capacities, abilities, attitudes, willingness, decision making, choices, planning, actions, and assessment either as a language learner or as a communicator inside or outside the classroom. The second language learning will proceed most effectively if learners are allowed to develop and exercise their autonomy. Benson (2008) argued autonomy is directly related to learning so the role of the learner and his/her contribution in the process of second

language learning is very important. Teachers and learners are working on and with each other in the process of learning autonomy. The teacher autonomy and learner autonomy are interacting with each other. According to Smith (2001), “Teachers also need to constantly reflect on their own role in the classroom, monitoring the extent to which they constrain or scaffold students’ thinking and behavior, so as to engage students in autonomous and effective learning”. If students want to learn to take control of their learning, the teacher may need to learn to let learners learn by themselves while providing necessary help. But learner autonomy cannot be simplified only as freedom from the control of the teacher, freedom from the constraints of the curriculum, even freedom to choose not to learn. In fact, Berofsky (1997) considered that the most important freedom that autonomy implies is “the learner's freedom from self, by which we mean his or her capacity to transcend the limitations of personal heritage”. Burkert and Schwienhorst (2008) took the view that teachers who themselves are autonomous learners may have a positive influence on the development of autonomy in their students. Learner autonomy has been considered as an essential part of learning in the last ten years based on the learners themselves, their needs, interests and reasons to learn a subject (Guevara de Leon, 2010). Learners are the makers of their own fortune and valued members of a learning community that is their class. It is up to learners if they want to learn. Many experts in the field of educational reform reported that empowering teachers is an appropriate place to begin in solving the problems of today’s schools (Melenyzer, 1990). If we are to empower teachers and exalt them as professionals, then, like other professionals, teachers must have the freedom to prescribe the best treatment for their students as doctors or lawyers do for their clients. This freedom is teacher autonomy and is not restricted to the classroom but also must include decisions that impact the classrooms such as school structure and organization (Pearson & Hall, 1993).

The present study aimed to explore the relationship between teacher autonomy and learner autonomy among the professors and the EFL university students majoring in English language translation and English language teaching in Bandar Abbas.

LITERATURE REVIEW

In the field of second and foreign language teaching and learning, as the theory and practice of language teaching enters a new century, the importance of helping students become more autonomous in their learning has become one of its more prominent themes (Benson, 2001, p. 1). According to Nunan (1997) the concept of autonomy in language learning is linked to the communicative approach. The second language learning will proceed most effectively if learners are allowed to develop and exercise their autonomy. The connection between autonomy in language learning and the communicative approach is, therefore, relatively well-developed at a theoretical level. The definition of teacher autonomy becomes more ambiguous as one reviews the literature on the subject. What seems like autonomy to one teacher may seem like isolation to another. One teacher may view autonomy as a means to gain substantial freedom from interference or supervision; another may view it as the freedom to develop collegial relationships and accomplish tasks that extend beyond the classroom. Some teachers thrive on autonomy, while others perceive it as a means for principals to avoid their duties (Fraser & Sorenson, 1992).

Thavenius (1999) argued that teacher autonomy refers to the teacher's ability and willingness to help learners take responsibility for their own learning (p.160). The teachers' role in an autonomous language classroom is to help learners learn by exposing them to the language and providing opportunities for them to practice the new language in class as well as at home (Lowes & Target, 1999). A teacher aiming to foster learner autonomy in his classroom also has to be aware of the importance of differentiation. Differentiating instruction is the idea of accommodating different ways learners learn; to design the lessons according to learners' needs and differences in the classroom. In a differentiated classroom it should be taken into consideration that learners have different abilities, skills and backgrounds. All of this affects the way they learn (Tomlinson, 2003). The learner autonomy teacher is one who helps learners become more aware of themselves as language learners (e.g. styles, needs, difficulties) and encourages greater independence in learning 'while recognizing that as learner expertise increases, teacher involvement inevitably decreases' (Hurd, 1998, p. 70). A number of definitions of learner autonomy exist in the field. Little (1991) conceptualized autonomy as "a capacity for detachment, critical reflection, decision-making, and independent action" (p. 4). He believes that the capacity for autonomy will be demonstrated in the way learners learn and in the way they transfer what they have learned to wider contexts. Benson (2001) defined autonomy as "the capacity to take control over one's own learning" (p. 2). It is not a method of learning; rather it is an attribute of the learner's approach to the learning process. According to him, control over learning may take different forms at different levels of the learning process. Other researchers such as Wenden (1991), Littlewood (1996) and Scharle and Szabo (2000) defined learner autonomy in different dimensions such as learning and acquiring strategies and attitudes - learners' ability and willingness and the freedom and responsibility.

It is of vital importance to understand the dynamic relationship between teacher autonomy and learner autonomy. They are interrelated and interactive. Smith (2001) explained explicitly their relationship, "Teachers also need to constantly reflect on their own role in the classroom, monitoring the extent to which they constrain or scaffold students' thinking and behavior, so as to engage students in autonomous and effective learning". As a result, teachers are required to get fully prepared for teacher autonomy. To promote LA, Yang (1998) suggested that teachers embark on new roles as helpers, facilitators, advisors, and guides. Teachers also provide information and help change learners' misconceptions through lectures, discussions or reading materials. Knowing and understanding the principles of learner autonomy is important before refusing or supporting it. New roles for teachers and learners are emerging and teaching has to be adapted to them. Autonomy requires a fundamental change in educational practices, and teachers and learners need to generate new developmental plans, according to continuous learning and reflection on their learning needs and purposes. Autonomous learning should be occurred through negotiation and cooperation between teachers and learners (Riasati & Mollaei, 2014).

RESEARCH QUESTIONS

To this end, the following research questions were addressed in this study:

1. Is there any significant relationship between teacher autonomy and their Students to become autonomous in the learning foreign language?

2. What level of autonomy is present among EFL students?

METHODOLOGY

Participants

The Participants of this study consisted of two groups of professors and students taking part in Azad University and Payam Noor University of Hormozgan province, Iran. In first group, there were 25 professors in teaching and translation of English (both male and female). In another group there were 77 M.A students of those universities. They were majoring Teaching English as a Foreign Language (TEFL) and Translation at the Department of Foreign Languages. They were studying in first and second semester. The participants were selected randomly as the sample of this study.

Instruments

To determine whether teacher autonomy has any correlation with learner autonomy, two instruments were used in this study. First, a Teacher Autonomy Scale (TAS) and second, a Learner Autonomy Questionnaire.

Teacher autonomy scale (TAS)

The TAS was developed by Pearson and Hall (1993). The 18 items on the scale were originally designed to elicit the degree to which teachers perceive they have autonomy in the following areas: (a) selection of activities and materials, (b) classroom standards of conduct, (c) instructional planning and sequencing, and (d) personal on-the-job decision making. In the study of Pearson & Moomaw (2005) of the TAS which utilized a stable factor structure with improved internal consistency reliability .83, that was computed based on Cronbach's alpha.

Learner autonomy questionnaire (LAQ)

It is designed by Zhang and Li (2004). It has two parts including 21 items after they were revised and predicted on the basis of the learning strategies classified by Oxford (1990), Wenden (1998) and O'Malley & Chamot (1990). The first part had 11 questions and each had five-point Likert scale (1= never, 2=rarely, 3=sometimes, 4=often, 5=always). In the second part there were 10 questions. They should be answered based on five multiple-choice items.

Procedure

The participants were given the questionnaires and were requested to complete the survey, so that their autonomy level was obtained. The teacher's questionnaire was taken 15 minutes to answer it and student's questionnaire was taken 20 minutes to be completed. The data were collected in one month.

Data analysis

After collecting the data, the TAS and LAQ were scored based on the Likert-scale, the scores are respectively 1,2,3,4 and 5. In order to investigate whether there was a match or mismatch between teacher autonomy and learners autonomy, the independent t-test was used to calculate the correlation between the autonomy means in two groups.

RESULTS AND DISCUSSIONS

Descriptive statistics

Table1: Statistics for teachers' and learners' autonomy

Statistics Groups	N	Mean	Std. Deviation	Minimum	Maximum
Teachers	25	46.07	6.195	33.33	66.67
Learners	77	57.18	10.957	33.33	83.33

The autonomy in both groups was scaled to be between 0 and 100. The teachers' autonomy had mean 46.07 with standard deviation 6.195 and between 33.33 and 66.67. The learners' autonomy had mean 57.18 with standard deviation 10.957 and between 33.33 and 83.33.

Inferential statistics

Table 2: Kolmogorov-Smirnov test of normality for teachers' and learners' autonomy

Statistics Groups	Z	Sig.
Teachers	1.045	0.225
Learners	0.887	0.411

The above table shows results for Kolmogorov-Smirnov Test. Since sig. values were greater than 0.05 (Sig.>0.05) for two groups, the statistics were not significant which means that the distributions were normal.

Investigation of the research questions

To answer the first question, the autonomy means in two groups were compared by the independent t-test as follows.

Table 3: The independent t-test for comparison of autonomy between teachers and their students

Statistics group	N	Mean	Std. Deviation	Std. Error Mean	Mean Difference	T	df	Sig. (2-tailed)
Teacher	25	46.07	6.195	1.239	-11.11	-4.81	100	0.001
Learner	77	57.18	10.957	1.248				

The result of independent t-test as presented in table 3 shows that there was a significant difference between two groups at the level of 0.01 ($\text{Sig.}=0.001<0.01$). This indicated that teacher autonomy significantly different from their students to be autonomous. Thus we infer that there is no relationship between teacher autonomy and their students to become autonomous in the learning foreign language.

The second research question concerned the autonomy level of students. The learners' scores obtained from questionnaires were compared with the expected value of 50. According to table 11, the mean of the learners' scores ($M=57.18$) was greater than 50. The statistically significance of the difference was tested by the one-sample t-test as presented in the following table.

Table 4: The one-sample t-test for the learners' autonomy

Statistics Variable	N	Mean	Std. Deviation	Std. Error Mean	Test value = 50			
					Mean Difference	T	df	Sig. (2-tailed)
Overall effect	77	57.18	10.957	1.248	7.18	5.757	76	0.001

As shown in table 4, the t-test was significant at the level of 0.01 ($\text{Sig.}=0.001<0.01$). Thus the difference between the learners' autonomy mean and the expected value (50) was significant. In other words, the level of autonomy among Iranian EFL students is higher than the average.

Discussion

In order to answer the relationship between TAS and LAQ, it was done by comparing the autonomy means of two groups with the independent t-test. It was revealed that teacher autonomy significantly different from their students to be autonomous. Thus, we infer that there is no relationship between teacher autonomy and their students to become autonomous in the learning foreign language. However, the relationship and interaction between teacher autonomy and learner autonomy were emphasized in many researches in this era. According to Camilleri (1999), a learner autonomous classroom is a place where learners and teachers have constructive interaction with each other and learn from each other. The teacher is responsible for helping learners become aware of alternative strategies and learning styles. LA does not mean learning without a teacher. As, little (1991) said that it is one misconception about LA. The learners need to work collaboratively with their peers and with the help of teachers. As shown in table 4, the difference between the learners' autonomy mean and the expected value (50) was significant. In other words, the level of autonomy among Iranian EFL students is higher than the average.

CONCLUSION

Based on the findings of the present study, it can be concluded that there is no significance relationship between teacher autonomy and learner autonomy among EFL students in Bandar Abbas, whereas the existence of relationship between these two components was mentioned in

many other researches. The result of the study revealed that autonomy level of student is higher than expected average of autonomy level.

Limitations of the study

The subjects of this study were English-major learners. A different research project with participants in a large sample size from other backgrounds that have dissimilar types of motivation would be interesting. This study employed quantitative research design, further study can be designed and employed qualitative research design and in order to get a complete picture of students' views, the questionnaire can be accompanied with other instruments such as observation and interview to achieve more reliable results.

ABSTRACT

This study was conducted to investigate the relationship between Field Independence, Reflectivity/Impulsivity, and Reading Comprehension ability of Iranian English as a Foreign Language (EFL) Learners. To reach this aim, 125 EFL freshman and sophomore undergraduate university students at Iran's Islamic Azad University Central Tehran Branch were randomly selected. They were asked to fill out two questionnaires on cognitive styles of Field Independence (Group Embedded Figure Test), and Reflectivity/Impulsivity (Impulsivity sub-scale of Eysenck's Impulsiveness Questionnaire, I7, IVE) and one Reading Comprehension test (First Certificate in English). Subsequently, the collected data were analyzed through Pearson Correlation formula the results of which revealed that there was a statistically significant relationship between Field Independence and Reading Comprehension, and there was also a statistically significant relationship between Reflectivity and Reading Comprehension. Furthermore, it was found out that both Field Independence and Reflectivity could significantly predict the Reading Comprehension ability of the EFL learners. The implication of this research is for test developers in order to prepare accurate and fair tests. It can also be useful for language teachers, for they can help learners by addressing their needs using appropriate teaching strategies and for language learners as well because they will be able to see the cause of their problems in comprehending and passing language reading tests.

KEYWORDS: Cognitive styles, Field Independence, Reflectivity/Impulsivity, and Reading Comprehension

INTRODUCTION

Success in second language learning generally and factors that affect learning process and performance in language tests particularly, have been investigated by many researchers in order to provide guidelines for teachers and learners in second language settings. The enormous complexity and variety of the variables involved in the development of second/foreign language learning and test performance have been discussed by many researchers and scholars (Brown,

1987; Stern, 1983; Chastain, 1988; Dunkel, 1991; Bachman, 1995, etc). Chastain (1988) distinguishes four sets of variables as learner variables that are involved in the language learning: Affective variables (self-concept, perseverance, etc) Cognitive variables (cognitive style, learning skills, etc) Social variables (social context, language and culture shock) and Biological variables (gender and age). Moreover, in communicative language ability, factors such as test method facets, personal attributes, and random factors are considered as potential source of error in measurement that decrease both the reliability of scores and the validity of their interpretations. Among the mentioned factors, attributes of the test takers that are not related to the ability we are interested in, such as cognitive styles should be considered by language teachers and test developers for they are reported to influence and to interfere with the students' Reading Comprehension process and performance on different tests as well (Brown, 2000; Bachman, 1995).

Abraham (1985) explains that cognitive style is part of the learners' characteristics which apparently is related to second language learning for they depict individuals' differences in a learning context and test performance. The term cognitive style was defined by Brown (1994) as the link between personality and cognition that influences how we learn things in general, and the particular approach we adopt when dealing with problems. Among the numerous cognitive styles that exist, only a few of them have received attention in second language researches in recent years. Field Independence and Reflectivity/Impulsivity as two of the most important cognitive styles which have been considered by researchers to see if they are related to learning, learners' performance in tests and even to test results in case of showing the real knowledge of test takers were selected in this study (e.g. Jamieson, 1992; Skehan, 1989; Abraham, 1985; Kogan, 1981; Doran, 1973, etc).

According to Salmani-Nodoushan (2007) among the cognitive styles identified so far, the FI/D dimension has been the most extensively studied and has had the widest application to educational issues and specifically to second language learning. One of the subjects that attracted researchers is to see if there is any relationship between FI/D construct and Reading Comprehension (Davey, 1990; Jamali, 2001; Salmani-Nodoushan, 2007; Behnam and Fathi, 2009; Khalili Sabet and Mohammadi, 2013). In their study, Behnam and Fathi (2009) considered the cognitive style of FI/D of 60 intermediate EFL learners and its relationship with reading performance. The results indicated that Field Independent participants have an advantage over Field Dependent ones. Khalili Sabet and Mohammadi (2013) intended to investigate the relationship between FI/D styles and Reading Comprehension abilities of 90 university students as well as to explore EFL readers' attitude toward reading in a foreign language with respect to their cognitive style and the results revealed that there is a relationship between Field Dependency/Independence and Reading Comprehension. The present study is an extension of their works on the possible relationship between Field Independence cognitive style and Reading Comprehension Ability of EFL learners with a larger sample and a different context.

The other cognitive style which was assumed to be in relation with language learning process and performance in language skills was Reflectivity/Impulsivity. Most of the research studies concerning the relationship between R/I cognitive style and language skills have focused on the

impact of children or adults' cognitive styles on the receptive skills of reading or listening whether in their first, second, or foreign language (Messer, 1976; Pirouznia, 1994; Salimi, 2001; Ghapanchi and Dashti, 2011). Salimi (2001) studied the relationship between Impulsivity and performance of Iranian Ph. D candidates in TMU (Tarbiat Modarres University) general English proficiency test. Overall results of the research indicated that Low Impulsive subjects outperformed High and Medium Impulsives in all sections, and that there is a significant difference between Low and High Impulsives in Total and Reading Comprehension section. Ghapanchi and Dashti (2011) attempted to study the relationship between cognitive style of Impulsivity and performance of the 100 sophomore EFL university students on display, referential and inferential Reading Comprehension questions. The results revealed that there was no significant difference between Low, Medium and High Impulsives with respect to their performance in Display, Referential, and Inferential Reading Comprehension questions. As it was mentioned, in this study, it was tried to extend the previous findings and find the possible relationship between Reflectivity/Impulsivity and Reading Comprehension Ability of EFL learners in a new context. It should be mentioned that the main reason to choose these two cognitive styles was to see if there is any difference between predictability of Field Independence and Reflectivity/Impulsivity about Reading Comprehension ability of Iranian EFL learners.

During the past decades, the emphasis on communicative language ability in teaching, learning and testing pinned importance on Reading Comprehension as a very influential skill in learning second/foreign languages and also on the factors that influence the learners' Reading Comprehension ability and learners' performance on Reading Comprehension tests (Widdowson, 1984; Chastain, 1988). For most EFL learners, developing Reading Comprehension skill is considered as the most important component of learning among other skills. In many EFL learning contexts, learners have very little or no accessibility to native speakers or enough listening input and only have access to books, journals, periodicals and other reading materials to gain the information they need. Regarding the importance of Reading Comprehension in language classes, Chastain (1988) mentions that all types of authentic comprehensible text can be used in order to help learners to develop a sufficient language base from which they can create messages they want to share with others. Furthermore, Widdowson (1984) refers to reading as communication activity and believes that the communication happens between the writer who encodes some messages and the reader who decodes the messages through top down or bottom up models for comprehending the message. Due to the importance of Reading Comprehension Ability of the learners in learning, teaching, and testing in EFL settings, some studies have been done but for the lack of sufficient research on the possible relationship between these two variables and Iranian university students' general performance in Reading Comprehension tests in EFL settings, in this research, two cognitive styles of Field Independence and Reflectivity/Impulsivity were considered in case of being possibly related to EFL learners performance in Reading Comprehension tests, and also in case of being a predictive factor on the Reading Comprehension test result.

The other factor that made this study significant was about the result of this research that can be useful for test developers in order to prepare accurate and fair tests that show real language knowledge of test takers independent of the test takers cognitive styles. It can also be useful for

language teachers, for they can help learners by addressing their needs using appropriate teaching strategies to help them to have a better understanding and comprehension. Moreover, it can be helpful for language learners because if they know their cognitive style they will be able to see the cause of their problems in comprehending and passing language reading tests. Thus they can use the learning strategies suitable to their cognitive styles and get better results or manipulate style levels in their encounter with the language.

Field Independence

Field Dependence (FD) is a cognitive style in which an individual tends to look at the whole of a learning task that contains many items and has difficulty in studying a particular item when it occurs within a field of other items. The field may be perceptual, or it may be abstract such as a set of ideas, thoughts, or feelings. Field Independence (FI), on the contrary, refers to a cognitive style in which an individual is able to identify or focus on particular items and is not distracted by other items in the background or the context (Brown, 2000; Gollnick & Chein, 1994).

Reflectivity/Impulsivity

The other cognitive style that gained attention is Reflectivity/Impulsivity or as Kagan (1966) puts it: “conceptual tempo”. This cognitive dimension refers to “either fast, spontaneous and unplanned, or slow, cautious and planned performance in cognitive tasks” (Malle & Neubauer, 1991, p. 865). “The ‘Impulsives’ reach decision and report them very quickly with little concern for accuracy” (Kagan, 1966, as cited in Jamieson, 1992, p. 492). On the other hand, ‘Reflectives’ are slow and accurate learners and they take longer to respond and consequently make fewer errors (Razmjoo & Mirzaei, 2009).

Reading Comprehension

Defining Reading Comprehension and describing a single comprehensive definition is a difficult task for it is a very complicated matter. According to Chastain (1988) reading is a process which requires active mental processing of the learner and activation of previously acquired knowledge and skills while focusing on the reading materials in order to recreate and comprehend what someone else has written. Perfetti (1984, p. 40-41) defines reading as “thinking guided by print” (as cited in Chastain, 1988. P. 216).

REASEAECH HYPOTHESE

In order to reach the aims of this research, the following null hypotheses were stated:

1. There is no significant relationship between Field Independence and Reading Comprehension ability of Iranian EFL Learners.
2. There is no significant relationship between Reflectivity/Impulsivity and Reading Comprehension ability of Iranian EFL Learners.
3. There is no difference between predictability of Field Independence and Reflectivity/Impulsivity about Reading Comprehension ability of Iranian EFL learners.

METHODOLOGY

Participants

The participants of this study were 125 university students who were selected randomly from among students in BA English majors at Islamic Azad University Tehran Central Branch, Iran. The age range of participants was 19 -25 years old and among them there were 98 female and 27 male. In addition to them, another 30 university students, with similar characteristics to the main sample took part in this study for piloting the Reading Comprehension section of the FCE test.

Instrumentation

In order to accomplish the purpose of this study, the following three instruments were utilized: Eysenck (1990) Impulsiveness Questionnaire (I7. IVE) which contains 54 items, assesses Impulsiveness (19 items), Ventureness (16 items), and Empathy (19 items). A Persian version of this questionnaire was prepared and validated by Salimi (2001). The reliability of the Persian Impulsive sub-scale was tested using Cronbach's alpha which was found to be 0.86 and Spearman-Brown's unusual-length split-half reliability which was found to be 0.86, both of which are acceptable indicators of reliability. This questionnaire consisted of 19 five-multiple choice items. Those whose grades fell among (19 to 57) were regarded as high Impulsive and those with grades of (58 to 95) were considered as Reflective.

The second questionnaire was Group Embedded Figures Test (GEFT) which is a figure test that assesses Field Independence and has been first developed by Witkin, Oltman, Raskin, and Karp (1971). They reported a Spearman-Brown reliability coefficient of 0.82 for their instrument. Comparing the parallel test to the Embedded Figures Test established the validity of the GEFT (Blanton, 2004). In addition, internal consistency and construct validity of the GEFT are satisfactory. The GEFT is a 25-item test which requires participants to locate and trace simple geometric figures embedded within progressively more complex ones. Based on the number of correct answers given by subjects, the scores on GEFT range from 0 (the most FD) to 18 (the most FI). In this study, participants were classified with GEFT scores of 11 and less than 11 into the FD group and those with GEFT scores above 11 out of 18 into the FI group. The Cambridge First Certificate in English (FCE) is an upper-Intermediate level examination which is the third level of the Cambridge ESOL Main Suite examinations and is at Level B2 of the Council of Europe Common European Framework was also used. The FCE consists of 5 tests – Reading, Writing, Listening, Use of English and Speaking. The reading section has three parts and takes 60 minutes: Part 1 consists of a text with 8 multiple choice questions, Part 2 consists of a text with 7 sentences missing (gapped text), and Part 3 includes multiple matching with 15 questions. In part one and two each question scores 2 points, and in part three each question scores 1 point. Thus totally the reading section mark is counted out of 45.

Procedure

To achieve the purpose of this study, at the first step, thirty university students with similar characteristics to the main sample who were selected randomly took part in piloting the reading section of the FCE. They were among BA students majoring in English and they did not participate in the main investigation. The Reading section of the FCE exam consisted of 30 questions and it took approximately 60 minutes. After gathering the information, based on

analysis on items five malfunctioning items were eliminated from the test. Following this, the main study was carried out with 125 EFL students. The Persian version of Eysenck's Impulsiveness Questionnaire and the GEFT questionnaire were administered to participants for obtaining information about their cognitive styles. Based on their performance in these questionnaires, they were classified as Reflective/ Impulsive, and Field Independent/ Dependent. The researcher was present while participants were responding to questionnaires to provide further explanations if required. Then the revised version of the reading section of the FCE was administered to participants to gather information on their level of ability in Reading Comprehension in the same session. At the final step, the statistical procedures were conducted by the researcher to test the hypotheses of this study.

RESULTS AND DISCUSSION

Before starting the main study, the reading section of the FCE test was once piloted. The analysis of the FCE piloting with 30 items revealed that the reliability of the test was lower than acceptable (Cronbach's Alpha = .593). In order to increase the reliability of the test, after some analysis such as Item Analysis, Item Facility, Item Difficulty, and Choice Distribution, 5 Items (4-5-8-10-13) were deleted from the test, so the number of items remaining became 25. To make sure that the reliability of the remaining 25 items was acceptable, Cronbach's Alpha analysis was used again and the result showed an acceptable reliability (Cronbach's Alpha = .640). On the next step, in order to test the null hypotheses of this study through the Parametric Pearson correlation formula, the assumptions of Normality of distribution of each set of scores and Linearity relation between each pair of variables were checked. First, *Normality condition* was verified through the following data:

Table 1: Descriptive Statistics of the three variables

	N	Minimum	Maximum	Mean	Std. Deviation	Skewness		Skewness ratios
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error	
FI	125	2.00	18.00	11.1520	3.87518	-.365	.217	-1.68
Reflectivity	125	41.00	77.00	59.3520	7.41430	-.034	.217	.15
Reading	125	10.00	33.00	22.4000	4.73320	-.382	.217	-1.76
Valid N (listwise)	125							

As the table 1 showed, the ratio of skewness statistic of FI questionnaire, R/I questionnaire, and Reading Comprehension test were within the ranges of (± 1.96) which means that their distribution did not show a significant deviation from normality. Thus, the normality condition was met. To check the second assumption which was *Linearity of relations*, the researcher visually inspected the data through following scatter plots.

Figure 1: Scatter plot representing the relationship between Reading and FI (The FI was written FD in this figure)

As the figure 1 visually illustrated, the dots cluster around a straight line stretching from the bottom left to the top right, implying a positive relationship between the learners' Reading Comprehension and their Field Independence.

Figure 2: Scatter plot representing the relationship between Reading and Reflectivity

As the figure 2 visually illustrated, the coordinate values form a cigar shape stretching from the bottom left to the top right, hence the linearity of the relationship is also revealed. When the above assumptions were met, correlational analysis was conducted by the researcher for testing the hypotheses of the study.

To test the first hypothesis a correlation between Reading Comprehension and FI was conducted. The following table shows the result:

Table 2: Correlation between Reading and FI

		FI	Reading
FI	Pearson Correlation	1	.296**
	Sig. (2-tailed)		.001
	N	125	125
Reading	Pearson Correlation	.296**	1
	Sig. (2-tailed)	.001	
	N	125	125

** . Correlation is significant at the 0.01 level (2-tailed).

As displayed in table 2, the correlation between Reading Comprehension and FI of the EFL learners turned out to be positive and significant ($r = .296$, $p = .001 < .05$). Therefore, the first null hypothesis was rejected. The strength of the relationship however, turned out to be small ($.296^2 = .08$). Expressed in percentage, only 8 percent of variance in Reading Comprehension could be explained by variance in FI. This low relationship power of course affects the generalizability of the finding to the population.

To test the second hypothesis, a correlational analysis was conducted between Reading Comprehension and Reflectivity. The following table shows the result:

Table 3: Correlation between Reading and Reflectivity

		Reading	Reflectivity
Reading	Pearson Correlation	1	.321**
	Sig. (2-tailed)		.000
	N	125	125
Reflectivity	Pearson Correlation	.321**	1
	Sig. (2-tailed)	.000	
	N	125	125

** . Correlation is significant at the 0.01 level (2-tailed).

As the table 3 showed, the relationship between Reading Comprehension and Reflectivity of the learners also turned out to be positive and significant ($r = .321$, $p = .000 < .05$) which leads to the rejection of the second null hypothesis. The strength of the relationship also turned out to be as small as .10 ($.321^2$), which limits the generalizability of the finding as well.

And finally to test the third null hypothesis multiple regression was needed to compare the predictability of FI and Reflectivity about Reading Comprehension of the learners. Firstly however, the conditions for multiple regressions were checked: The normality condition, the multicollinearity condition, the presence of outliers, and the homoscedasticity condition.

The normality condition was visually verified as below:

Figure 3: Normality plot of the residuals about the dependent variable

As the values form a straight line and there is no major deviation from the line, it is concluded that normality condition was met. The second condition was multicollinearity which is the relationship between the Independent variables.

Table 5: Correlations

		Reflectivity	FI
Reflectivity	Pearson Correlation	1	.107
	Sig. (2-tailed)		.235
	N	125	125
FI	Pearson Correlation	.107	1
	Sig. (2-tailed)	.235	
	N	125	125

As it was shown in table 5, the relationship between Independent variables turned out to be small ($r = .107$), which does not violate the condition. Thus the second conditioned was met. The presence of outliers was also checked through the standardized residual in the following table.

Table 6: Residuals Statistics^a

	Minimum	Maximum	Mean	Std. Deviation	N
Predicted Value	16.8417	26.9454	22.4000	1.96608	125
Std. Predicted Value	-2.827	2.312	.000	1.000	125
Standard Error of Predicted Value	.389	1.172	.651	.168	125
Adjusted Predicted Value	17.0652	27.0038	22.3920	1.96966	125
Residual	-12.99859	9.36853	.00000	4.30555	125
Std. Residual	-2.995	2.158	.000	.992	125
Stud. Residual	-3.035	2.185	.001	1.004	125
Deleted Residual	-13.34766	9.60466	.00803	4.40947	125
Stud. Deleted Residual	-3.143	2.220	-.001	1.012	125
Mahal. Distance	.003	8.051	1.984	1.536	125
Cook's Distance	.000	.082	.008	.013	125
Centered Leverage Value	.000	.065	.016	.012	125

a. Dependent Variable: Reading

As depicted there the values do not exceed 3.3, which imply the absence of affecting outliers. Mahal. Distance values were also inspected to check the outliers. As the maximum value does not exceed 13.82 (with two Independent variables) (Pallant, 2007), it is concluded that there were no outliers. Hence, the third condition was met.

Homoscedasticity of the residuals about the dependent variable was checked finally.

Figure 4: Homoscedasticity of the residuals about the dependent variable

As displayed in the above scatter plot the dots form a rectangular shape with most of the values clustered at the centre. Therefore, homoscedasticity condition was also met. As the above mentioned conditions were met, the researcher was able to conduct a multiple regression. The following tables show the result of the multiple regressions:

Table 7: Model Summary^b

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.415 ^a	.173	.159	4.34070

a. Predictors: (Constant), Reflectivity, FI

b. Dependent Variable: Reading

As the above table showed, the R square value was .173. This means that 17.3 variance in the dependent variable (Reading Comprehension) could be explained by the model. The following table shows the significance of this model:

Table 8: ANOVA^b

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	479.316	2	239.658	12.720	.000 ^a
	Residual	2298.684	122	18.842		
	Total	2778.000	124			

As illustrated in table 8 the model turned out to be significant ($F = 12.72$, $p = .000 < .05$), implying that the predictability of the Independent variables (FI and R) about the dependent variable was significant. The contribution of each Independent variable is shown in the following table.

Table 9: Coefficients^a

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.	95.0% Confidence Interval for B		Correlations			Collinearity Statistics	
		B	Std. Error	Beta			Lower Bound	Upper Bound	Zero-order	Partial	Part	Tolerance	VIF
1	(Constant)	7.692	3.243		2.372	.019	1.272	14.111					
	FD	.323	.101	.265	3.196	.002	.123	.524	.296	.278	.263	.989	1.012
	Reflectivity	.187	.053	.293	3.538	.001	.082	.292	.321	.305	.291	.989	1.012

a. Dependent Variable: Reading

As shown above, the p values for both independent variables under beta values turned out to be smaller than .05, implying that both of them had a significant contribution to the predictability about the dependent variable. Therefore, the third null hypothesis fails to be rejected.

According to the analysis of the data, the first null hypothesis was rejected and a positive and significant relationship was found between Field Independence and Reading Comprehension ability ($r=.296$, $p=.001<.05$). This relationship confirmed that individuals with high Field Independence have a better performance on Reading Comprehension tests for they used strategies to generate solutions to problems. The findings of this study also lead to the rejection of the second null hypotheses and suggested a positive and significant relationship between Reflectivity and Reading Comprehension ability of the learners ($r=.321$, $p=.000<.05$). This result confirmed that Reflective learners are considered as thoughtful people who like to consider all the possible angles and implications and also to observe all different conclusions for as long as possible before acting so they outperform Impulsive learners.

The other important result of this study was about the predictability of the Independent variables about the dependent variable which was significant and it showed that both of the Independent variables (FI and R) had a significant contribution to the predictability about the dependent variable (Reading Comprehension).

CONCLUSION

In this study the researcher focused on cognitive styles of Field Independence and Reflectivity/Impulsivity as determining factors in learning process and outcome and tried to explore any significant relationship between them and Reading Comprehension ability of Iranian EFL learners. Based on the data analyses the results have shown that there is a positive and significant relationship between Field Independence and Reading Comprehension ability and there is also a positive and significant relationship between Reflectivity and Reading Comprehension ability of the EFL learners.

As the results revealed, since a statistically significant relationship between Field Independence and Reading Comprehension ability has been found it can be concluded that the higher the Field Independency of the learners is, the more successful they tend to be in Reading Comprehension tests. Furthermore, the a positive and significant relationship between Reflectivity and Reading Comprehension ability of the learners confirmed that the more Reflective the learners are, the better their performances are on Reading Comprehension tests.

In addition, it was shown in this study that the learners' Field Independence and Reflectivity as Independent variables had a significant contribution to the predictability about the dependent variable which is Reading Comprehension ability of the EFL learners. Considering this fact, it can be said that Field Independence and Reflectivity can be considered as two sources of variation in language learning process and outcome, particularly in Reading Comprehension test scores. Thus the result of this study could be of benefit to all language teachers and learners, test developers and syllabus designers.

Limitations of the study

1. The results of this study may not be generalized to all Iranian EFL students with different Reading Comprehension ability, for the size of the sample was small.

2. Participants were chosen from among undergraduate students, freshmen and sophomores, as the researcher had only access to them.
3. The age range of the participants was between 19 - 25 and findings may not be applied to younger or older learners.

ABSTRACT

The aim of this study was to explore the functions and the roles of being bilingual on learning new imperative English verbs among male Iranian high school students. The main attempt was investigating whether Arabic-Persian bilingual students take advantage/es of their bilingualism in learning new imperative verbs of third language (English) or not. For this purpose, 60 male students from Susangerd, Bostan and Hamidie (the bilingual Arab/Persian cities in Khuzestan province in Iran) were asked to take part in this experiment. The sample of this research were junior high school students between 13 - 16 years old. These students were selected randomly from 6 state and English schools. The data were collected, and analyzed by use of t- test and the outcome results demonstrated that bilingualism had significance advantages in learning new imperative English verbs among khouzestanian Iranian EFL junior high school male students. The finding also shown that bilingualism could employe as a teaching technique in EFL classes where all of learners share the same L1.

KEYWORDS: bilingualism, grammar, imperative verbs, Arabic, Persian ,EFL learners.

INTRODUCTION

The impact of bilingualism on English grammar learning (imperative verbs) will study in this research. There has already been a great interest among linguists and psychologists to study bilingualism and its effects on individuals or the EFL learners in many cases . When teachers teach grammar, actually there are two purposes: enhancing fluency and accuracy in all of language skills. As you know fluency is ability to speak fluently, whereas accuracy is ability to speak with correct grammar structures, such as correct use of imperative verb forms. In many countries that English regarded as foreign language, the teachers begin their teaching plans by grammar forms, especially imperative verbs (such as open the books, stand up, sit down)to make the classes excited. Moreover, the learners usually learn and do the imperative verbs faster than other subjects. For many of teachers who working in teaching and methodology , the imperative English verbs has been the most exciting area of EFL classes. EFL teachers constantly should

explain English grammar forms to help the learners speak and write correctly. As you know Iranian community is dominantly a bilingual community, and the Persian as an official language used as linguistic and cultural homogenization, while minority languages are not used in education system. In Iran, for a long time bilingualism and its effect was considered as negative factor that threatening the learning of students. So in present study, we aim to find that is there any advantage in bilingualism (on bilingual Iranian learners) in learning new imperative English or not?

Bilingualism

Ellis (1994) defines bilingualism as the use of two languages by an individual or speech community. His statement was rather confusing because there is no mention of the degree to which the people or speech community is able to use their languages. Moreover, there isn't any mention to the degree or manner in which they achieved their bilingualism from birth in a bilingual setting growing up there, or acquired as a second language later in life. It is necessary to say that there is no universally accepted definition of bilingualism concept.

Some like Grosjean (1982) refer to the use of both languages simultaneously, whereas others like Weinreich (1953) refer to alternating between the two and using only one language at any time. All in all, there are multiple definitions of bilingualism and childhood bilingualism, but in particular, this study focuses on Iranian bilingual male children.

Imperative verbs in English

Imperative verbs were known as Bossy verbs, because they tell us what to do. We put imperative verbs at the beginning of sentences, which automatically changes them into instructions or actions that should be done. The commands are usually very short sentences and acted immediately. When we read or hear instructions, we want them to be quick and snappy, so we can act upon them straight away. Imperative verbs do not leave space for questions or discussion even if the sentence has a polite tone. We usually use the root form of the verb to create the imperative verbs. For example :

Open your books boys, Write your names, Push the table, Listen to me students.

LITERATURE REVIEW

The short background of bilingualism research

Before the 1960s research on bilingual people was varied but with an unit pattern of result and conclusions, for instance, being bilingual was detrimental to a child's linguistic and cognitive development and put the people at a disadvantage compared to monolingual ones. The main opinions were that bilinguals would have smaller vocabularies and cognitive abilities. Those studies reported that bilinguals performed worse in IQ tests, vocabularies tests, and suffered in most aspects of language development.

But new researchers believe that, these studies suffered from several methodological problems and conclusion. Peal and Lambert (1969) published a study which brought to light the importance

of controlling for such factors as age, sex, as well as standardized measure when selecting a sample of bilinguals to be studied. They carefully matched their bilingual to their monolingual participants and they found that the bilinguals showed significant advantages over the monolinguals in both verbal and non-verbal tests, especially in non-verbal tests that required more mental flexibility.

Bilingualism studies in Iran

Keshavarz and Astaneh (2004) conducted a research in which they studied the impact of bilingualism on third language vocabulary learning of three groups of bi/monolingual female students (Turkish-Persian bilinguals, Armenian-Persian bilinguals and Persian monolinguals) in two regions of the Iran. Finally, they concluded that bilingualism has a positive effect on third language vocabulary learning.

Kassaiian and Esmaeli (2011) conducted a research to investigate the effect of bilingualism on third language breadth of vocabulary knowledge and word reading skill on Armenian bilinguals learners which mostly live in Isfahan province in Iran. The Nation's vocabulary levels test and Burt word reading test were used to measure subjects' knowledge of vocabulary and their word reading skill. After computations, the results indicated that bilingualism is highly correlated with breadth of vocabulary knowledge and reading skill.

Although studies conducted in national context centering on the effect of bilingualism on L3 vocabulary learning have mostly reported the positive and facilitating role of bilingualism, but not in all areas of L3. There are studies investigating the effect of bilingualism on other sub skills of language which have achieved paradoxical findings, for instance, while Merrikhi (2012) states that bilinguals definitely outperform monolinguals on the English grammar, Maghsoudi (2010) notes that monolingual and bilingual learners do not differ in acquiring syntactic structure. He even maintains that monolingual participants surpass bilingual participant ts in general English proficiency.

RESEARCH QUESTIONS

With respect to the topic of the current study, two research questions are set to be investigated which are as follow:

1. Does home speaking in first language (L1) have any effect on learning new English imperative verbs among bilingual junior high school EFL learners ?
2. Dose bilingualism have any positive or negative effects on learning new English imperative verbs?

METHODOLOGY

This study was conducted in khouzeestan province in Iran. The aim of this part of study was to note down the methods in which material has be gathered, formulated and evaluated in order to test and verify the questions made at the beginning of this study.

Participants

The participants were two groups of junior high school male learners with ages between 13-16 years. The participants were selected from state and private schools, and then divided into two groups.

30 male studentsPersian/ monolingual

30 male studentsPersian_ Arabic/ bilingual

Instruments

The field of research was conducted in order to gather the required information for the analysis of the topic of study. This research draws its material from different sources as follow:

Questionnaires

The questionnaire include twenty four multiple choice items and used to collect specific items, and provides information about age, sex, parents ,school,occupation,level of education and etc. This questionnaires designed and used by Sipra, M. A. (2007).

The Oxford Placement Test (Dave Allen 1992)

A test of grammar was administered as a measure of learners' linguistic competence. The administration of this test was important in order to select a specific level of learners with respect to the topic of this investigation. To this purpose, the Oxford Placement Test (OPT) was used in order to select the level of learners. This OPT test contained 100 multiple choice grammar items.

The Oxford Placement is a valid and reliable measure of language ability.

Tests on imperative verbs (pre/post tests)

One type of test was constructed in order to assess the students' performance with regard to the topic of this study. This multiple choice tests, which evaluates the retention of imperative verbs among learners, comprises twenty items. The test is a valid and reliable measure of language ability. The source of the tests is englishforeveryone.org.

Procedure

In order to accomplish the aim of this study, a step-by-step procedure was followed: First of all, the aim of the researcher was to choose a homogenous group of the subjects. For this purpose, placement test the Oxford Placement Test (OPT) was given to 160 male students. The evaluation of the subjects' performances on that test was perfectly objective because it was a multiple-choice test and every item had only one correct answer. Finally 75 students (42 bilinguals/33 monolinguals) were passed ,but we select only 60 according to the rank of best scores and then divided them in two groups, 30 of them bilingual and the next participants monolingual. Secondly, pre-test administered to both groups. This pre-test included 20 multiple-choice items and participants had to select the correct choice. After pre test we had treatment ,the treatment lasted for 8 sessions and the timing of each session was 75 minutes. Both groups attended in treatment sessions at the same language center but on different days which are:

Bilingual Group on even days from 5 to 6:15 P.M

Monolingual Group on odd days from 5 to 6:15 P.M

Thirdly, the treatment (teaching intermediate level) were given to them in a systematic ways, two days a week. The material for teaching were Touchstone books. Fortunately none of the students were absent during the treatment in two groups. And this factor would increase the reliability of the conclusions. Finally, at the end of sessions, the subjects were given 4 free days to study for the final exam (post-test). The allocated time for 20 imperative verb questions was 40 minutes. It is necessary to say that the post test with 20 items was completely similar to pre-test one in style and framework but its content was different and it was a level ahead of the pre-test.

RESULTS AND DISCUSSION

Data analysis

In this part of study the researcher has tried to present the data collected concerning the research topic. The data has been collected through questionnaires, OPT test, pre and post test. Moreover, the researcher has represented his research through the presentation of tables and statistical annexations.

Results of the Pretest

The results of the t-test analysis for the comparison of the MG and BG are presented below:

Table 1: Descriptive Statistics for Comparing the MG and BG pretest Scores

	group	N	Mean	Std. Deviation	Std. Error Mean
pre test	MG	30	15.3333	2.80803	.51267
	BG	30	15.5667	2.29968	.41986

Such descriptive statistics as mean and standard deviation are shown for both groups in Table 1. As you see the mean score of the BG (M= 15.5) is greater than the mean score of the MG (M=15.3) but this difference does not seem to be significant.

Results of the First Research Question

After the treatment sessions, the posttest was given to the participants. Remember, the research question of the study asked : Does home speaking in first language (L1) have any effect on learning new English imperative verbs among bilingual junior high school EFL learners ?

A paired-samples t-test was run to capture any possible difference between the performances of the learners in the BG on the pretest and posttest.

Table 2: Descriptive Statistics for Comparing pretest and posttest Scores of the MG

	Mean	N	Std. Deviation	Std. Error Mean
MG Pretest	15.3333	30	2.80803	.51267
MG posttest	16.1667	30	1.78274	.32548

In the MG, the mean score on the pretest ($M = 15.33$) is substantially less than the mean score on the posttest ($M = 16.16$). However, to check the statistical (in-) significance of this difference, one needs to consult the Sig. (2-tailed) column in the t-test table which follows.

Table 3: Results of the Paired Samples T-Test for Comparing Pretest and Post test Scores of the MG

Table 5: Results of the Paired Samples t Test for Comparing Pretest and Posttest Scores of the MCS									
	Paired Differences				95% Confidence Interval of the Difference		t	Df	Sig. (2-tailed)
	Mean	Std. Deviation	Std. Error	Lower	Upper				
						Mean			
Pretest-Posttest	-83333	4.26763	77916	-42689	76022	-.070	29	.294	

Because the Sig. (2-tailed) value is greater than the alpha level ($.000 < .05$), it could be argued that there was a statistically no significant difference between the pretest scores of the learners in the MG ($M = 15.33$, $SD = 2.80$) and their posttest scores ($M = 16.16$, $SD = 41.78$), $t(29) = -.070$. The magnitude of this difference. The conclusion could be that learning new English imperative verbs among MG don't significantly improves the knowledge of the learners. The table 3 shows that the performance of the learners in the MG on the posttest is different from their performance on the pretest but not very much.

Results of the Second Research Question

The second research question of the current study was formulated to investigate that: Dose bilingualism have any positive or negative effects on learning new English imperative verbs? Like the analysis performed for the first research question, a paired samples t-test was conducted. Table 4 displays the descriptive statistics for this analysis.

Table 4: Descriptive Statistics for Comparing Pretest and Posttest Scores of the BG

	N	Mean	Std. Deviation	Std. Error Mean
BG Pretest	30	15.56	2.29968	.41986
BG Posttest	30	17.50	1.67641	.30607

It can be seen that in the BG on the posttest, the mean score of the learners (M= 17.50) is enormously greater than that of pretest (M= 15.56). To make certain that the difference is indeed statistically significant, the following t-test table should be consulted.

Table 5: Results of the Paired Samples T-Test for Comparing Pretest and Posttest Scores of the BG

	Paired Differences				95% Confidence Interval of the Difference		T	df	Sig. (2-tailed)
	Mean	Std. Deviation	Std. Mean Error	Lower	Upper				
Pretest-Posttest	-1.93333	3.94735	.72069	-3.40730	-.45937	-2.683	29	.012	

Given the fact that the p value is less than the specified level of significance ($.000 < .05$), it could be concluded that there was a significant difference between the posttest scores of the learners in the BG (M = 15.56, SD = 2.29) and their posttest scores (M= 17.50, SD = 1.67), $t = -2.683$. The magnitude of the difference between the pretest and posttest scores of the BG, calculated through Eta Squared formula was which is a large effect size. This table also signifies the great difference between the pretest and posttest scores of the bilingual learners. The conclusion up to this part is that the bilingual learners understand and did the imperative verbs more better than monolingual learners. So we find that, our training during 4 week was affective and bilingualism had a significant positive effect on learning new English imperative verbs.

CONCLUSION

This study was an attempt to investigate the possible effect of bilingualism on learning new imperative English verbs. The result of study shown that bilingualism has a small but important role and effect to play in learning new imperative English verbs. Moreover, this study shown that bilingualism competence that help in learning new imperative verbs may not be found advisable in English methodology and the use of two languages in the class is generally facilitating the language learning experience. The teachers participating in the research indicated that the translation of many words and verbs in two languages or even the whole sentences is a good way to learn the imperative verbs. More over the study also shown that in the EFL classes, bilingualism has played a supportive and facilitating role. As with any other class technique, the using of the mother tongue was only a means to the end of improving foreign language proficiency. We agree with the majority of the student participants that no more than 25% of class time should be spent using L1. In my experience, this percentage can decrease as the students' English proficiency increases.

Sugesstion for further research

The present study indicated that bilingualism can be considered as supportive factor that helping male EFL learners on learning new imperative English verbs. As it is true for every research, it is not possible to claim that all the findings of this study are generalizable to similar cases. Finally, there are some suggestions for further investigations listed as below:

The same study can be conducted in advanced-level situation to see is there any difference between the findings of this study and other findings?

The same study can be conducted to investigate the effect of bilingualism on younger or older ages of participants of the present study, since this study focused on participants between 14-16 years. This study was conducted on male learners, the following studies can be conducted to investigate the effect of bilingualism on both gender.

Kasmankola@yahoo.com

ABSTRACT

"Humor is an essential part of everyday communication and an important component of innumerable literary works and of art in general. It is rooted in a specific cultural and linguistic context, but it is also an indispensable part of intercultural communication. Wordplay and humor add so much to a text and sometimes can be truly essential to the story or document, but they are incredibly difficult to translate well" (Vandaele, 2002, p. 153). The present study was an attempt to look into what strategies translators apply while translating humor in children's literature between ages 8 to 12. The corpus consisted of four English books with their Farsi translations: Dan Guttman's "Mr. Docker is off his rocker", "Miss Daisy is crazy", "Mrs. Cooney is loony" and "Miss Small is off the wall" (by Mahboubeh Najafkhani). The humors according to the definition of humor mentioned in this study were identified and a detailed comparison was made between the humors in the original books and their Persian equivalents. What became evident through conducting this study was the fact that for the purpose of translating humor in the selected books, not all the strategies introduced by Attardo which was regarded as the theoretical framework of this study are used in Persian translations of the texts and also there are some strategies that work better than any others. By examining the collected data and investigating the table of the percentage of the usage of these strategies, it was concluded that Reproducing and Substitution are the most useful strategies and Domestication, Omission and Compensation are the least applicable strategy for the purpose of translating humor. When a translator who is aware of this matter can focus on the strategies that are more useful, h/she will reach a better result.

KEYWORDS: Translation, Children's Literature, Humor, Wordplay

INTRODUCTION

"Translation process has always been challenging and debatable. Poets, philosophers and literary

men had difficulties about translations. This idea generally came from their own experiences” (Mollanazar, 2003, P.8). There have been debates over the concept of translation for many years. Linguists and experts like Nida (1982) believe that translation is something beyond finding equivalents of source language in the target language.

Translating may be defined as rereading and rewriting for target –language audiences, which make translations uniquely different from their originals; every text which is translated, takes on new language; a new culture, a new reader, and a new point of view (Wells, 1948). “One of the most important factors in translation is the culture of the target language. Cultural knowledge and cultural difference have always been a major focus of translator training and translation theory for as long as either has been in existence. The main concern has traditionally been with words and phrases that are so heavily and exclusively grounded in one culture that they are almost impossible to be translated into the terms of another.” (Robinson, 2007, p.186). Translation of children's literature is very similar to that of other literary texts. The more widely children read, the more open-minded they are likely to grow up. Literature in translation can enrich a child's world by providing glimpses into the lives and actions of young people in other parts of the world and fostering his understanding of cultural diversity. Despite the progress that has been made in understanding children's texts from other countries through the medium of translation and their importance, the need for research into and dissemination of the diversity of children's literatures is still acute. Yet translating children's literature has its own special feature; children's books have a dual audience, children and adults (O'Dell, 1948). Research shows that appropriate content is an element everyone who selects, reads, tells, translates, edits, publishes, sells or promotes literature for children is interested in, for it is widely accepted that literature is a major carrier of content and powerful medium for understanding the world (Xeni, 2007). For children it is easier to assimilate new information when this is presented within the structure of a story or a poem, whereas research activities that followed earlier attempts revealed that literature for children can meet essential need of the audience / readership in question and what is more give answers to life time matters (Xeni, 2006). “Humor is an essential part of everyday communication and an important component of innumerable literary works and of art in general. Humor is a significant children's need met in literature. Throughout this particular paper in children's anxieties, worries and fears, making literature a beneficiary activity for a child's wellbeing. Humor is used in everyday parlance to refer simultaneously to an effect and its (con) textual causes, an occurrence so normal (ised) that we don't even notice it. This is a trivial issue for ordinary understanding, but an annoying and confusing one in the scholarly debate on humor” (Vandaele, 2002, p. 153).

It will be argued that despite various other lifetime matters, children of all three age groups (Xeni, 2000) suffer from anxieties, worries and fears including separation anxiety, which is closely related to loneliness and isolation, super mental phenomena and animals, noise and situations with noise, the school life (i.e. school directors and teachers, authority punishment /restriction, homework, test, school failure, etc.), super mental events and beings, bodily injury, etc. (ibid). These will be presented and analyzed underlying children's literature that humor cannot be humor for humor's sake alone, but it serves a hyper purpose: to meet essential childhood need (Xeni, 2000). Wordplay, combining "formal similarity" and "semantic dissimilarity" (Delabastita, 1993, as cited in De Geest, 1996), is a good example of humor being

culture-specific. It is culturally bound in that culture defines what kind of wordplay is appropriate and that recognizing and appreciating it requires background knowledge (Leppihalme, 1996). When translating wordplay from the SL to the TL, a translator has basically three options available: wordplay, some other rhetorical device or no wordplay (Leppihalme, 1996). The choice between the options at hand is not simple. Quite the contrary, it includes both textual and extra textual concerns. SL wordplay may contain, for example, elements that are unacceptable, or even taboo, according to TL norms and that may have to be played down for TL purposes. One could say that the translator necessarily rewrites humor for the TL audience following, at least to some extent, the norms accepted in the target culture.

“One might ask if translating humor is fundamentally different from any other forms of translation; after all, it is often agreed that successful translation involves recreating in the TL text those features of the SL text that are relevant for the text to function for a certain purpose” (see Kussmaul, 1995:90). With a humorous text, the purpose is, for all practical purposes, always the same: to elicit laughter. In a way the translator has less latitude with a humorous text, in that the translation should be able to function for the TL audience in a maximally similar way as the original text did for the SL audience, even if this were achieved by substantially altering it. Balancing between SL restrictions and TL demands, the translator is engaged in what could be compared to an exercise in tightrope walking, in that the immediacy of effect can easily be lost.

In this study, the researcher has tried to investigate the common strategies adopted by an Iranian translator to translate humorous words in children's books from English to Persian. The model of translation strategies which is presented by Attardo (1994) is taken into consideration as a framework for investigating the humor translation strategies.

REVIEW LITERATURE

Characteristics of children's literature

From discussion concerning the definition, content, and theory of CHL, various characteristic feature of CHL can be derived. When listing some of the main characteristics that can be easily traced from statements and arguments through the years, it becomes clear that the aspects of language and content are what matter the most. Therefore, drawing from Nodelman (1996, 2008) Oittinen (2000), Xein (2007) and Panaou and Tsilimeni (2011), the following list of characteristics can be drafted: ‘simplicistic’, ‘comprehensive’, ‘cautious with readability and speak ability’, ‘repetitive’, ‘didactic, and at the same time, ‘optimistic’, ‘straightforward’, ‘child appropriate’, ‘expressing a child's point of view’, or ‘about childhood’, and ‘with illustration’, ‘fantasy’, and ‘happy ending’.

An attempt to provide an overview of the characteristics of CHL over the centuries reveals that the concepts established in any given period of time were not self-governing. They were dependent to a high degree on social, ideological, and spiritual factors influencing the writer. Prevalent views with regarded to childhood the child's role in the family and societal contexts also played their part in establishing CHL characteristics (Lathey, 2006). In the past, CHL was expected to involve didacticism and to thus consist of ethical/religious element (Shavit, 1986).

Books for children were more seen as a way to acquire happiness and satisfaction (Nodleman, 1996, 2008). It is interesting to note the entirely secondary function of entertainment until very recently.

As soon as didactic narratives lost their appeal somewhat, the value of CHL as a mean for happiness, satisfaction, enjoyment, and enhancement was promoted (Nodleman, 2008). According to the well-known Greek translator of CHL, Petrovits-Androutsopoulou (1990), excellent CHL can perhaps eventually provide some teaching in its own way, offering some knowledge, but this is not what a writer aims for. What is important is that CHL cultivates children's inner world, widens their horizons, transfers life experiences, provides children with an opportunity to experience life and art, and given them pleasure. In a modernized world, writers for children began paying attention to the aesthetic value of their texts and the pleasure they bring to readers in addition to knowledge (Kontoleon, 1988; Lathey, 2006; Nodleman, 2008). To them literature was primarily an aesthesis of life expressed by feelings with cognitive and intellectual aspects as secondary. With the coming of modernity, writers tended to avoid naïve narratives with didactic elements and attempted to adopt a more sincere and authentic attitude towards readers, trying to mirror reality in Their work (Kontoleon, 2008) Using cultivated language, humor, pictures and realism, they worked towards offering enjoyment to the child-readers, helping them handle or overcome their problems, and mature and advance their spirit, inner-world, and personality, preparing them to integrate smoothly in society, and become creative the aesthetic pleasure, the greater the benefit for the child-reader, and at the same time, the greater the impact on the status of CHL in literary studies (Pinsent, 2006; Nodleman, 2008). It is noteworthy here that a child's development was felt to be achieved via enjoyment and aesthetic means.

Beyond the years of didacticism and aesthetic enjoyment, new ways of seeing things emerged. Influenced by postmodernism, CHL presented new tendencies in terms of its characteristics and the role of child-reader. The latter, having an active role to play and being now responsible for the meaning-making of the literary text as a critical literate individual, experiences an era where a piece of literary work is open to various readings, interpretations, critical engagement, approaches, and dimensions (Nikoljeva, 1998; Economidou, 2000; Stein, 2000; Mallouri, 2006; Sinfield & Hawkins, 2006).

In traditional CHL the main characteristics of writing for child-reader are different to those of ADL. Some characteristics derive from attempts to define CHL, where scholars, instead of listing characteristics, tend to report features that – from their point of view – signify that the particular literary work is addressed to children. In this framework, Petrovits- Androutsopoulou (1990) suggests that simplicity of language, the avoidance of taboo language, like insults and curse words, as well as sarcasm, and short sentences, describing characters, settings and the plot, are some of the main characteristics that authors and translators should incorporate in their books. Similarly, McDowel (1991) asserts that CHL texts are shorter in length, written in simple language, and have an 'easy to follow' structure, mainly consisting of dialogue, and with less description. Crouch (1962) stresses that CHL should be comprehensible, and Sakellariou (1987) and Nodelmaan (1992) both underline that CHL should consist of uncomplicated language

characterized by innocence, optimism, didacticism, and happy endings. This links to Tucker's (1976) earlier idea that a forced limitation of literature in certain areas of experience and vocabulary was necessary. The use of 'simple language's is a recurring characteristic where CHL is concerned (Oittinen, 2000; Lathey, 2006; Camara Aguilera, 2008).

Translating children's literature

This section covers certain behavior pattern of translating children's literature. It may seem that writing and translating for children is much easier than performing these jobs for adult. Children have their own language. If an Adult is to write or to translate for them, she should learn this language. Other Wise her work won't be successful because the addresses don't understand her works .consider you are talking to child; you cannot use all work that you prefer. On the other but they are not common among adults. When translating for children, the translator should consider all these in mind and then start her job.

Shavit (1986) considers translating for children a semiotic concept as opposed to a traditional normative sense: "translation understood as part of a transfer Mechanism that is, the process by which textual models of one system are transferred to another" (p.11) the translated text in the target language then relates to the source text in different ways. Therefore the target text is the result of the relationship between two different systems; the source and the target systems. When translation viewed as part of the transfer process, the significant issue to regard is that it is not just translation of a text from one Language to another but also translation of a text from one system to another; for example, from adult system in to children's.

The translation should be understandable for children. If there is a word or expression which is not known in their world, it should be replaced by something else or omitted because it causes confusion, ambiguity and sometimes misunderstanding. Lopez (2006) confirms this idea and believes that Translator can, and should; leave out things that are beyond children's comprehension .it is not difficult to understand the importance of translating.

Word children's and adult's literature are broadly the same (Chambers, 1980).On the whole, translating for children is complex and just like translating for adults, it needs a good knowledge of the specific age group for which the TT is destined. This does not mean that only parents or people involved with children should translate for the younger ones but maybe "when translating for children, we should listen to the child, the child in the neighborhood and the child within ourselves" (Oittinen.1993.p.15).

The concept of humor

Glottology (Attardo, 1994; popa, 2005) also known as humorology, is the study of humor and is regarded as "one of the least understood, though studied, phenomena" (Popa, 2005, p. 48). In the context of this study, humor translation (HT), therefore, is seen as a branch of the study of humor and a field that is also heavily under-researched. What is believed about humor in the research world, where it is often seen as a culture- bound element, is well articulated by Alexander (1977): "Humor does not travel well across national boundaries [and [does not always survive translation across languages "(p.159). Or as Vandaele (2002) puts it, "... the sheer difficulty of humor as a

concept may discourage translation researchers..."(p. 150) a statement that explains the limited research in the field in many language combinations.

HT is a key area explored in this thesis, along with CHLT, translation process research, translator's strategies and approaches. This is a vital step as TS and humor studies are disciplines that have been long established but their intersections have seldom been explored (Chiaro, 2010), especially in such a way as this thesis proposes.

Using translation strategies while translating humor

It is impossible to translate a text from a source language in to a Target language without using translation strategies:

Andrew Chesterman claims that the most simple translation strategy is change something of course this is a rather simple view on translation strategies applied, because there needs to be a reason on changing something.

"Strategies of translation involve the basic task of to translate it. Both of these tasks are determined by various factors: cultural, economic and political" (Baker, 1998.p.240). Attardo (2002) suggests five main strategies:

1) Reproducing

"Reproducing is employed when the format of a joke that exists in the source culture (SC) cannot be found in the target culture (TC).In this case; the translator reproduces the joke" (Attardo, 2002, p. 186).

2) Domestication

Domestication is applied so as to make a certain joke from the ST amusing for the target recipient? The aim of this strategy is to produce a TT as similar to the non-translated text as possible.

3) Substitution

Substitution is the strategy employed when replacing a joke from the SL with a different one that will be comprehensible and amusing for the target recipient in the TL. This strategy is similar to reproducing, as it is applied due to cultural differences. According to Attardo (2002), substitution is, in other words, a free translation. As he puts it, while substitution is not a translation at the semantic level, it can be successful as long as it "elicits the laughter that the speaker was seeking" (Attardo, 2002, p. 189).

4) Omission

Omission is used in the most intricate cases, when a translator cannot possibly manage to render a joke into the TL.

5) Compensation

Compensation, which is linked to omission, is employed when the translator compensates for the loss of a non-translated joke by introducing another joke, which does not exist in the SL, in a different part of a text. According to Bruzdziak (2009), omission and compensation can be seen as 'gain and loss' in the process of translation. "A non-translated joke in the TT is conceived as a loss in translation, whereas a joke introduced in another part of the TT serves to compensate for the previous loss" (Gottlieb, 1997, p.222).

RESEARCH QUESTIONS

1. What strategies has the Persian translator applied to transfer humor from English to Persian for ages 8 to 12?
2. Which strategies have been more frequently used by the translator?

METHODOLOGY

Corpus of the study

To accomplish the objective of the study two criteria were designated for choosing the corpus of this research; the first one were the books in which humor plays a large role than in any other books and the writer who was well known for using humor in her works, and the second one was availability of the Persian translation of the books. Several books were given a close look, four of which carrying humor were extracted and worked on. In these books, humor plays a large role than in any other books and included various humors. This writer's creativity in using humor engaged the researcher to see if Persian translators were successful in transferring this beauty in Persian translation.

Also, the researcher intended to find out which strategies the translator used to transfer the same beauty into the target language. So, the corpus consisted of four original texts along with their translations as listed below:

Table 1: The English Corpus Used in this Research

Text No	Title	Author
1	Mr. Docker is off his rocker	Dan Guttman
2	Miss Daisy is Crazy	Dan Guttman
3	Mrs. Cooney is Loony	Dan Guttman
4	Miss Small is off the wall	Dan Guttman

In table 4, the information regarding the Persian elements was provided. The data was sorted according to the title of the books in Persian, the name of the translators, the date and the name of publication in Iran. It should be mentioned that no random selection has been done and all wordplays have been gathered.

Table 2: The Persian Corpus Used in this Research

شماره متن	عنوان	مترجم	تاریخ انتشار در ایران	ناشر
1	آقای میچل، دانشمند خل و چل	محبوبه نجف خانی	1390	نشر افق
2	خانم بریج، معلم گیج	محبوبه نجف خانی	1390	نشر افق
3	خانم براشت، مربی بهداشت	محبوبه نجف خانی	1390	نشر افق
4	خانم لیزار، ما را گذاشته سرکار	محبوبه نجف خانی	1390	نشر افق

Theoretical framework

In this study, the researcher used Attardo's model for the translation of humor in order to analyze the collected data and classify and categorize them. Attardo (2002) suggests five main strategies: Reproducing, Domestication, Substitution, Omission and Compensation

Procedure

After searching in the market and the internet in order to find the books containing humor together with their Persian translations, Dan Guttman's "Mr. Docker is off his rocker", "Miss. Daisy is Crazy", "Mrs. Cooney is loony" and Miss. Small is off the wall" with their Farsi translations were selected because of their popularity in containing humor. After accessing the original texts and their corresponding Farsi translations, the main books were read sentence by sentence and word by word and finally a number of items carrying humor according to the definition of humor were identified. He wanted to understand how effective the translation strategies were. They were listed in a piece of papers to be examined in the next step and so a list of word plays and translation strategies was provided. In pursuit of this step, the researcher examined the listed items to see whether they were translated through applying a translation strategy. In the next stage, according to different types of strategies proposed by Attardo in translating humor, the types of the strategies used by translators in translation of each humorous item were identified and determined. It is pressing to note that the table of specification presented for each translated book which depicted the humorous section, their Persian translations and the types of strategy used according to Attardo, respectively. Finally, the results were put into numerical modes and were shown in a table in chapter 4 and their percentages were elicited and the most and the least frequently used strategies were represented.

Data Collection

Data was gathered from the parallel corpora, consisting of twenty five children's books, translated from English into Persian. Attardo's (2002) model in translation of humor in children's literature was used.

After deciding on the corpus of the study, the researcher carried out the data collection procedure. In the first stage, the main books were read sentence by sentence and word by word and finally a

number of items carrying humor according to the definition of humor were identified. They were listed in a piece of papers to be examined in the next step and so a list of word plays and translation strategies was provided. In pursuit of this step, the researcher examined the listed items to see whether they were translated through applying a translation strategy. In the next stage, according to different types of strategies proposed by Attardo (2002) in translating humor, the types of the strategies used by translators in translation of each humorous item were identified and determined. It is pressing to note that the table of specification presented for each translated book which depicted the humorous section, their Persian translations and the types of strategy used according to Attardo, respectively. Finally, the results were put into numerical modes and were shown in a table and their percentages were elicited and the most and the least frequently used strategy were represented.

Samples of strategies used in translating wordplays

1. Reproducing:

"Pleeeeeeeeeee": "تو را به خداااا بگویند چیه"

2. Substitution:

"Nah-nah-nah boo boo": "دماغ سوخته می خریم"

3. Reproducing:

"Cluck like a chicken": "مثل مرغ قدقد کنم"

4. Substitution:

"Real potato freak": "کشته و مرده سیب زمینی"

5. Reproducing:

"You're blinded by love ": "عشق چشمهایت را کور کرده "

6. Reproducing:

"Football players are really dump": "بازیکنان آمریکایی همه شان خنگ اند "

Design

To answer the research question, the present study applied descriptive approach, as Farhady (2005, p. 144) represents, through descriptive method, "the researcher attempts to describe and interpret the current status of phenomena." So, the present study was concerned with clarifying and describing the strategies applied by an Iranian translator while translating humor. In this study, comparisons were done between the main texts and their corresponding translations in order to find techniques used by translators in translating humor and between the found techniques in order to determine the most frequent ones.

RESULTS AND DISCUSSION

In the process of tracking down the samples, the collected data was first sorted and organized in tables. These data included wordplays instances of each book. For this purpose, the researcher designed tables, consisting of the original and translated proper names and the type of strategy applied in translating that wordplay. In summarizing the results of the analysis of instances, the number of applied strategies was counted in all books. Then, the frequency and the percentage of the different strategies used in translating that name was measured and were shown in tables.

Finally, tables were analyzed and their results were discussed. In the next phase, the frequency and the percentage of the most frequent strategies were measured in each book.

Table 3: The frequency and percentage of strategies among all data.

	Strategy	Fr.	%
1	Reproducing	31	83
2	Substitution	6	17
3	Domestication	0	0
4	Omission	0	0
5	Compensation	0	0

The above table represents strategies used in translating proper names from the most commonly used strategies to less commonly used one. As the distribution of strategies shows, out of 37 data collected by the researcher from four original English books, 31 instances refer to reproducing strategy, 6 instances refer to substitution and the other strategies are not used.

The difficulty in reading Dan Guttman's works is understanding humor which depends on meaning, so in order to improve this ability during translation, some strategies must be introduced for translating different genders. The model applied in this study which was put forward by Attardo (2002), was taken as the framework of this study for the translation of humor and contained five strategies, namely: reproducing, domestication, substitution, omission and compensation. The items considered in this model were regarded as the strategies to be used in translation of humors found in the chosen books. The humors were selected and extracted according to the definition of humor mentioned in key terms definition in section one of the present study. The translator (Mahboubeh Najafkhani) tried to translate humor in a way to be more and more understandable for children and accordingly applied reproducing and substitution in order to make the humorous stories understandable and at the same time as funny as the original texts.

Having sorted four translated versions of the original texts and found the wordplays and strategies applied by the translator, the researcher found the following interesting findings regarding the type and frequency of each wordplay and strategy. As the summary of the statistical findings in the above table presents, it can be concluded that among wordplays, Onomatopoeia and Hyperbole are the most frequently used in books of the research. But among strategies, Reproducing and Substitution are the most frequently used in four books and this can be due to the nature of such strategies, according to which the meaning or the function of the source sentences or texts is preserved.

CONCLUSION

To that end, Dan Guttman's stories " Mr. Docker is off his rocker", "Miss Daisy is Crazy", "Mrs. Cooney is loony" and "Miss Small is off the wall" and their translations were compared, the data were analyzed on the basis of Attardo's classification of strategies.

What is understood from "Mr. Docker is off his rocker", "Miss Daisy is Crazy", "Mrs. Cooney is loony" and "Miss Small is off the wall" is one of the most difficult challenges and barriers. There are several factors that often confuse the reader, the humorous conversations that depend on the meaning, usage and pronunciation of words and the ambiguity of them and this make confusion to the translator which meaning of his word is the main idea. The findings showed that when a word or a sentence is funny in English culture and makes children laugh, it is funny in Iranian culture and makes children laugh according to the types of wordplays.

The collected data which were the result of examining the books and their translations mentioned before in this study showed that for the purpose of translating humor in "Mr. Docker is off his rocker", "Miss Daisy is Crazy", "Mrs. Cooney is loony" and "Miss Small is off the wall", not all the strategies introduced by Attardo are used in the corresponding Persian translations of the texts and also there are some strategies that work better than the others. These strategies are as follows: Reproducing, Substitution, Domestication, Omission and Compensation.

By investigating the tables of the percentage of the usage of these wordplays and strategies, among the wordplays, Onomatopoeia and Hyperbole are the most frequently used wordplays and Alliteration and Personification are the least useful ones. On the other hand, among strategies, Reproducing and substitution are the most frequently applied strategies and the other strategies are the least frequently used ones for the purpose of translating humor in this study.

Limitation of the study

The main limitation of the study was concerned to the fact that although there were many Persian sources in Iran that were translated versions of the English books, the researcher couldn't find the original English books in Iran.

ABSTRACT

Writing is viewed as an individual activity and normally teachers are expected to feedback students' writings. Although there has been a growing body of research on using collaborative activities in English as a second language (ESL) and/or English as a foreign language (EFL) classes to enhance speaking, on writing, there are only a few-documented researches. The present study examined collaborative dialogue of 12 EFL low-intermediate male teenagers in one intact class. The researcher analyzed the participants' collaborative dialogue in terms of the occurrence of lexis, form (grammar and cohesion), and mechanics (punctuation and spelling) in their language-related episode writings; additional data was collected through interviews with the participants, class observations, group discussions, field-notes, and written materials in order to find out how the collaborative dialogue led to the improvement of the participants writing ability in English. The present research may be of great value for teachers and practitioners since it devises a proper way to motivate students to enhance their writings ability through collaboration. The researcher determined writing quality by an analytic rating procedure that included cohesion, grammar, vocabulary, spelling, and punctuation (Weir, 1998 as cited in Weigle, 2008). Analysis of data showed that there has been a gradual improvement in terms of writing ability when comparing sessions from the first phase to the last phase. Results also indicated that all the students except for one perceived collaborative dialogue positively and consider it useful in enhancing writing ability. The best conclusion was that collaborative dialogue strategy assisted the participants to perform their pieces of writing better than those in non-collaborative dialogue class. Here, the researchers could conclude that if our students get acquainted with the technique of collaborative dialogue and the writing skill is taught to the students by means of this strategy, they are more successful at accomplishing the task than when they do it individually.

KEYWORDS: collaborative dialogue, lexis, form, mechanics

INTRODUCTION

The significance of the writing ability has long been the focal point for much discussion in learning English as a foreign and/or second language. There is no doubt that writing skill is the thorniest skill for learners to learn. The problem exists not only in producing and arranging ideas, but also in changing these ideas into written materials. Considering that there are a wide variety of theories and implementation factors, teaching the writing skill is a daunting task. Writing is really seen as a process of discovery as the writers try to find their way while they are struggling to think, compose and put their ideas together. In that way, it is not considered as a static process but as a cognitive, social and dynamic one (Kellogg, 2008 as cited in Javed, Juan, & Nazli, 2013). Duenans believes that writing, nowadays, is considered as an important expertise in supporting other learning experiences, and reformulating knowledge. In fact, the new trends have begun to see writing as an active communication, social process involving discussions, interaction with others, group work, and peer work. When writing becomes a social act, the teacher can make use of some technique called collaborative dialogue to facilitate the learning of this skill. In recent years, the idea that collaborative dialogue may also mediate learning, has been developed (Duenans, 2004; Tudge & Wells, 1998 as cited in Swain, Brooks and Tocalli- Beller, 2002). According to Swain (2000, as cited in Lantolf, 2009) collaborative dialogue originates in the perspective sociocultural theory of mind which claims that cognition and knowledge are dialogically formed. Collaborative dialogue is linguistic knowledge and makes performance to great competence. It is where language use and language learning can take place at exactly the same time. It is language use facilitating language learning. It is cognitive activity and social activity. It is a type of dialogue in which students become engaged in problem-solving and knowledge-building.

Statement of the Problem

One of the salient hardship for English as a second language students (ESLS) and/or English as a foreign language students (EFLS) is the learning of writing skill, and the reason is that our students do not have access to experienced and trained teachers, and most of our teachers are not really aware of what techniques may be useful for teaching this skill. Although a growing number of studies (Baradaran & Mo'ezzy, 2011; Meihami & Varmaghani, 2013) have been carried out pertaining to the relation of other teaching techniques with writing, to the best of the researcher's knowledge, not enough research has been conducted into how collaborative dialogue, as a more recent teaching strategy, can assist students in their writing quality. In other words, there are only a few documented researches to explore how collaborative dialogue lead to improvement on writing proficiency of English as a foreign language students in Iran. In the present study, the researchers made an effort to teach the writing skill by the help of collaborative dialogue technique to the students. In fact, this is aimed at investigating how the present technique led to the improvement of the EFL students' writing proficiency in Iran.

LITERATURE REVIEW

Collaborative Dialogue

A theoretical claim is that language is a source of the second and/or foreign language learning. The idea of languaging that comes from Vygotsky showed the crucial role that language plays in

mediating cognitive processes. Language and thought are different; in fact, Vygotsky proposed that language completes thought. We can think of language as an activity i.e., a process of making meaning and constructing knowledge and experience through language, in the exact sense of word, language is an episode of the process of learning. The word languaging compels us to understand language as a process rather than an object. When we have to deal with a complicated problem, we may speak with another person in order to find a solution to it (collaborative dialogue) or may whisper to ourselves (private speech). These are two types of languaging. In both of them, the purpose is to solve a complex problem (Swain, 2010 as cited in Watanabe & Swain, 2013). Collaborative dialogue is dialogue in which students have interaction with each other to find a solution to their linguistic problems. It is dialogue that forms linguistic knowledge, that mediate joint problem solving and knowledge building. It is where language use and language learning can take place simultaneously. It is language use mediating language learning. In brief, what is taking place in collaborative dialogue their “saying” and reacting to “what is said” is language learning i.e., knowledge building mediated by language i.e., a semiotic tool (Swain, 2000 as cited in Lantolf, 2002).

Language-Related Episode

Language-related episodes are instances of collaborative dialogue in which the students talk about the language they are generating, question their language use or self-correct their language production. Language-related episodes provide opportunities for language learning. In such episodes, the participants talk about linguistic form as an object (Swain & Lapkin, 1998 as cited in Swain, Brooks, & Tocalli-Beller, 2002). Swain and Lapkin (2002) believe that three types of language-related episodes are found as the students collaboratively write a text. Form-oriented (F-O) LREs, lexis-oriented (L-O) LREs, and mechanics-oriented (M-O) LREs. Any segment in the collaborative discourse of the students dealing with grammatical accuracy is organized as form-oriented LREs. These episodes are about the tense of verb, articles, prepositions, linking devices, pronoun reference, and word-order. The segments in the collaborative dialogue which are dealing with word’ meaning, word choice or procedures of expressing an idea is classified as lexis-oriented LREs, and language-related episodes dealing with spelling and punctuation are categorized as mechanics-oriented LREs.

Collaborative Dialogue as a Source of Learning

Collaborative dialogue involves two characteristics. The performance of collaborative dialogue among students promotes “noticing”. Noticing occurs in different forms. Noticing something in target language for it is frequent. Noticing that the target language forms is completely different from the students’ own inter language. From time to time, the students notice that they cannot express exactly the meaning that they wish to convey at the very moment of attempting to produce it. Another characteristics in which producing language may serve the language learning process is through “hypothesis testing”. When there are errors in students’ written production, the students give hypothesis to each other in order to solve the errors. To better understand a hypothesis, the students have to do something, and one procedure of doing this is to write something. This process of modification done by students in order to find a satisfactory solution to their linguistic problems represents the second and/or foreign language learning. Collaborative

dialogue forcefully persuade the students to process language with more mental effort. Thus, it seems to have a significant role in learning (Kowal & Swain, 1997 as cited in Lantolf, 2009).

Scaffolding

Scaffolding is one of the mediational means used during collaborative dialogue (Watanabe & Swain, 2013). The term of scaffolding derives from SCT which its central idea is that cognition must be investigated within the social context. SCT considers learning, concluding language learning, as dialogically based so that Artigal (1992 as cited in Ellis, 2012) claims that ‘language acquisition device’ is found in the interaction that occurs between interactants or conversationalists rather than in the learners’ heads. Scaffolding is a process in which one student (an expert or a novice) helps another student (a novice) to accomplish a skill that they cannot do independently (Ellis, 2012). Cook (2008) defined scaffolding as the process that assists the learner to reach the next point in development and, in sociocultural theory, it involves social assistance by others rather than physical resources such as dictionary. As per Pool and Patthey-chavez (1994), the tenet of scaffolding has also been described through another phrase namely “assisted performance”. The phrase assisted performance involves both “assistance” afforded and the consequences of that assistance in facilitating “performance”. And finally, the effects of assistance will be obvious in the performance of the one assisted.

Use of First Language (L1)

There has been a lot of disagreement or argument over the use of first language (L1) in second language (L2) classroom as a mediational means throughout collaborative dialogue (Watanabe & Swain, 2013). Swain and Lapkin (2000 as cited in Yang, 2014) believe that judicious use of L1 can advocate L2 learning and use. Banning the use of L1 in performing L2 tasks is to prevent L2 students from an important cognitive tool. Anton and DiCamilla (1998) examined the sociocognitive functions of L1 use in the collaborative dialogue of adults learning the Spanish language as an L2. Qualitative analysis of five groups working collaboratively on writing tasks showed how the L1 facilitated expression of private speech. In their investigation of collaborative dialogue between university ESL students as they participated in peer revision of their L2 writing, they found that the learners make use of their L1 to understand the text, solve language-related problems, produce ideas, take over the task, and keep dialogue. In sum, after their study, they underlined the importance of the L1 as a vital cognitive tool for the students’ collaborative problem solving.

Repetition

In accordance with Watanabe and Swain (2013), repetition is another mediational means which can be used over collaborative dialogue. Dicamilla and Anton (1997) investigated the use of repetition to mediate solutions to language- related problems in the second and/or foreign language learning. The subjects in their study consisted of adult L2 Spanish learners took part in collaborative writing tasks. They came to the conclusion that, in peer-peer collaborative dialogue, repetition played a vital role in creating and maintaining students’ shared perspective of the task and mediated the co-construction of linguistic knowledge.

Empirical Review

According to Swain and Lapkin (1998), a number of studies have investigated language learning clearly and easily seen in collaborative dialogue. Donato (1994) investigated the transcripts of scaffolding, defined as a situation where a participant who knows more can create, by means of speech, supportive conditions in which those who have lack of knowledge can take part and increase current skills and knowledge to higher levels of competence. Donato found that per student owned some relevant information but not all. The participants together solved their problems successfully. They combined the scaffolded information and reached the correct construction. Students have generated language and reflect on it, showing how they are simultaneously novices as individuals yet experts collectively. Together they have performed beyond their individual competencies. Altogether, 32 cases of scaffolded help were discovered in the hour-long planning session. The question is that if this collective scaffolding provided opportunities for linguistic development in the individual learner. To determine this question, evidence for independent second language performance was sought in the actual oral activity performed the following week. Of the 32 cases of collective scaffolding seen in the planning session, the participants used 75% of language structures included in the scaffolding correctly the following week. Thus, through collaborative dialogue, the participants increased both their own second language knowledge and their peer's second language. The participants afforded the necessary support and opportunities for each other so that they could outperform their competence.

The results of Donato's research are consonant with Vygotsky's theory which claims that the individual knowledge is socially and dialogically derived and its origin can be observed directly in the interactions among students over problem-solving tasks. It is important to note here that the unit of analysis used in Donato's study was the dialogue, in this case, through dialogue how students provided a collective scaffold. In the La Pierre study (1994) to be described, dialogue was also the unit of analysis. She isolated language-related episodes- episodes in which language was the focus of discussion. The La Pierre study (1994) involved grade 8 early French immersion students. In La Pierre's study (1994) it was hypothesized that when second language learners engage in a task in which they have to talk about the language they are generating (metatalk) for completing the task, that metatalk may be a source of second language learning. The task the students engaged in was dictogloss. Language-related episodes were separated from the transcripts of the students' talk as they tried to find an answer to linguistic problems that they encountered while, with a partner, reconstructing the passage. As per these episodes, items were constructed to test the language discussed. Thus, any pair of the students had to respond to a set of test items which the students had discussed them in reconstructing the passage. These tests were given almost one week after the students had accomplished the task. The results of La Pierre's 1994 study indicate that when the students solved a linguistic problem together, the solution exactly was the same as their responses one week later. For example, if the students, through collaborative dialogue, attained a correct solution jointly, approximately 80% of the relevant posttest items were correct. Moreover, if they reached an incorrect solution, approximately 70% of the responses on the posttest items were false. In other words, the students tried to keep the same knowledge that they had constructed collaboratively the previous week. These results suggest these language-related episodes were the opportunities for second language

learning. Another study was conducted by Kowal and Swain (1997) as cited in Lantolf (2009) in doing a task that needed students to recreate a text they had just heard, Rachel and Sophie (pseudonyms) two grade 8 French immersion students working together, wrote the sentence: Meme les solutions ecologiques causent quelquefois des nouvelle menaces (even ecological solutions sometimes cause new threats). In their written text, des was dropped out and replaced with de. This replacement by them, shows the students' current hypothesis about the form that a partitive should take in front of an adjective. This process of modification (the change from des to de) proves second language acquisition, yet, our grasp of what Rachel and Sophie produced is greatly improved when we share in their dialogue as they construct the phrase des nouvellesmenaces. The phrase that they had heard was actually de nouveaux problem, but, they rephrased the text and wrote menace. They made the activity more challenging by stretching their inter-language. In turn 1, Rachel has utilized the noun menaces as a synonym for problems, and Sophie, in turn 2, congratulate her on this. But the phrase des nouveaux menaces is not well-formed. To be well-formed, the partitive des needs to be changed to de because it precede an adjective, and nouveaux should be nouvelles, because menace is a feminine noun. Producing the phrase des nouveaux menaces gives them an opportunity to notice gaps in their linguistic knowledge. In turn3, she expresses the possibilities to see what looks best, and then explicitly formulates her question: Is it des nouveaux or de nouveaux? She keeps on to test out her hypothesis in turn 5. This question is raised in Sophie's mind whether the new word that her friend has introduced is masculine or feminine. Knowing this is important since if menaces is masculine, then the form of the adjective should be nouveaux and if it is feminine, then the form of the adjective should be nouvelles. In turn 6, as we can see, Sophie test alternatives to reach the correct choice. Finally, they refer to a dictionary (artefact) and discover that menace is feminine. In turn 8, Sophie affords the correct form of the adjective, and in turn 9, Rachel confirms Sophie's choice. In brief, we have seen, in this example, when Sophie and Rachel were trying to produce a phrase, they recognized what they did not know. They formed hypotheses, test them out, and finally they referred to a tool (a dictionary) that would provide them with a definite response. What occurred in their collaborative dialogue-their "saying" and responding to "what is said" is language learning (knowledge building) mediated by language (as a semiotic tool). Rachel and Sophie's dialogue is both social and cognitive activity. It is a linguistic-problem solving through social interaction.

RESEARCH QUESTIONS

Taking the importance of learning writing skill in the one hand, and the role of collaborative dialogue in language teaching on the other hand, the following general question and specific questions were caused to fulfill the objective of the present study:

RQ1: How does collaborative dialogue lead to improvement on Iranian low-intermediate EFL students' writing proficiency? (General question).

RQ2: How does collaborative dialogue assist Iranian low-intermediate EFL students with their writing cohesion? (Specific question).

RQ3: How does collaborative dialogue assist Iranian low-intermediate EFL students' writing grammar? (Specific question).

RQ4: How does collaborative dialogue help Iranian low-intermediate EFL students with their writing vocabulary? (Specific question).

RQ5: How does collaborative dialogue assist Iranian low-intermediate EFL students' writing punctuation? (Specific question).

RQ6: How does collaborative dialogue help Iranian low-intermediate EFL students' writing spelling? (Specific question).

METHODOLOGY

Participants

The participants, in the present research, were an intact class of 12 high school students (teenagers) of English as a foreign language. All of these students were Iranian, and English was taught in an EFL context. They shared the same first language (L1) background, Farsi, and their overall proficiency in the English language was low-intermediate level. They ranged in age from 13 to 19 years old. No female was included, and every single student attended 19 sessions. They had a common language knowledge in two respects: (a) They were recruited to participate voluntarily in an English class in Bisotoon Institute, and (b) Prior to being enrolled in Bisotoon Institute, they had studied EFL in their schools.

Instrumentations

To fulfill the objectives of the present study, the researchers employed the following instruments:

Oxford Placement Test (OPT):

Firstly, an English language proficiency test called "Oxford Placement Test" was administered to verify whether the participants enjoyed the same level of language proficiency or not. OPT was chosen since it is a reliable and efficient means of grading and placing students into classes at the start of a course. Enormous researches were carried out across the world, funded by Education Testing Services Co., to establish validity and reliability of the test. The present test is periodically updated to ensure quality and accuracy. This test has been pretested and validated by thousands of students in more than sixty countries ensuring accurate and reliable results. It has a strong theoretical basis (Retrieved from www.lang.ox.ac.uk/courses.test).

Use of One-on-One Interview

Secondly, the researchers conducted one-on-one interviews to find out what was in the minds of the students about writing ability in English. For reliability or the consistency of response, the researchers should have restated a query in a slightly different form at a later time in the interview, or, more precisely, they should have repeated the interview at another time, yet, because of short research span, this feasibility was impossible. Validity is greater if the interview is based upon a carefully designed structure, and it elicits the significant information which is

vital. For the interview to be more valid, it was judged by a panel of experts in the field of inquiry since they were fully aware of selecting the essential questions (Best & Kahn, 2006).

Use of Dictoglass Task

Thirdly, for the purpose of the treatment i.e., “collaborative dialogue”, a number of dictoglass tasks or passage construction tasks the same in length were employed by the researcher. According to Smith (2012), any passage is suitable as long as it is comprehensible to the students when read at normal speed. As a general rule, the text should be at or below the students’ current proficiency level, although they may include new vocabularies.

Use of Investigator Triangulation

Over the course, the researcher used investigator triangulation, that is, using multiple observers (Mackey & Gass, 2005). John (1992, as cited in Mackey & Gass, 2005) noted that the importance of triangulation is that it decreases observer bias and increases the validity and reliability of the information. Therefore, three other teachers were invited, by the researchers, to observe the class. They accompanied the researchers from the outset of tenth session to the end of the eighteenth session. Best and Kahn (2006) believe that observation as a research instrument must always be systematic, directed by particular aim, carefully concentrated. Like other research instruments, it must be checked for reliability and validity. To achieve a satisfactory degree of content validity, the researcher identified and sampled the significant incidents of behaviors. In doing so, the panel of experts assisted him in selecting a limited number of incidents. In the present study, the reliability of observations was established with a high percentage of agreement among the teachers.

Use of Rating Scale

Afterwards, the rating scale which was utilized for reporting was TEEP by Cyril Weir (1998 as cited in Weigle, 2008). The reasons for the use of Weir’s scheme by the researcher were that it provides more detailed information with respect to the students’ performance on the different aspects of form, lexis, and mechanics, and also its reliability and validity were confirmed by a large number of writing specialists. Weir’s scheme is composed of seven scales including content, organization, cohesion, vocabulary, grammar, punctuation, and spelling. As per the present study, the researchers used five indicators of Weir’s scheme concluding cohesion, vocabulary, grammar, punctuation, and spelling.

Use of a Questionnaire and a Focus-Group Interview

And finally, having passed a five-week period in which the students received the treatment, a questionnaire and a focus-group interview were constructed and carried out consecutively in a series, without an interruption by the researchers. In the recent study, depending on the students’ overall writing proficiency, the researchers preferred questionnaires which were made up of closed-ended items, and the participants did not need generating any free writing; Instead, they were to choose one of the given options (irrespective of whether their answer is among them). Therefore, he selected the most famous type of closed-ended items called “likert scale”. In the present study, content and face validity of the questionnaire were established by the help of the panel of experts. In order for the questionnaire to be reliable, the researcher should have

administered the same questionnaire to the same sample on another occasion and compared the responses with those of the first (Best & Kahn, 2006). However, due to the short research span, this was not feasible. Immediately, after conducting the closed-ended questionnaires, the participants were called for a focus-group interview in order to elicit the participants' views of collaborative dialogue experience. The researchers solicited a small number of general questions and got responses from all the individuals in the group. For the focus-group interview to be valid, it was judged by the experts in the field of inquiry because they were fully aware of selecting the essential questions (Best & Kahn, 2006). In order to avoid the idiosyncratic results that take place due to some unexpected internal or external factors that influence the dynamic of a group, the researcher should have run the focus-group interview twice (Dornyei, 2011), yet, because the present study must be completed within a specific time span, this was not possible.

Procedure

In order to run the present study, it was necessary for the researchers to employ some instruments and use a number of phases over the course. Firstly, Oxford Placement Test was administered to verify whether the participants enjoyed the same level of language proficiency or not. The result of the test showed that the proficiency level of the students in English were found to be low-intermediate. Secondly, the researchers conducted one-on-one interviews with all the students one at a time to find out what was in the minds of the students about writing ability in English. From the outset of the second session until the end of ninth session, any special treatment was not submitted to the students except that they were asked to do writing individually in the same traditional method. Then, prior to the beginning of the tenth session, the researchers/ tutors solicited the students to get into groups of three. They, in order to have more accurate information, demanded three other teachers to cooperate with them on the present research. Any of the teachers was intended for a group of three students. Observer A was specifically for Group A, Observer B was intended for Group B, Observer C was asked to observe Group C, and the researchers were responsible for Group D. they were supposed to check the students' dialogue and take notes of their produced LREs and then they should submit their collected LREs to the researchers for later analysis. In the next step, from the tenth session on, the treatment i.e., collaborative dialogue was submitted to the participants. When there were errors in each other's scripts, they were giving hypothesis together to solve the hardship, therefore, they were in continuous modification of each other's scripts in order to make them acceptable. At the end of every session, the researchers had ongoing assessment with respect to students' writing assignment. The researchers furnished the students with a variety of texts (Dictoglass) in order to check their ability in writing. The passages were about the content of the materials included in their textbook. The researcher collected a set of observations, checklists, and performance assessment. In the next stage, the use of the rating scale was strictly necessary for the researchers to score, therefore, they made use of Weir's analytic scale (TEEP). Considering the students' proficiency in English, the researchers took into account five scales of Weir's scheme for the purpose of the present study including cohesion, grammar, vocabulary, punctuation, and spelling. TEEP scoring scheme gives an equal weight to cohesion, vocabulary, grammar, punctuation, and spelling of EFL students. Each component is separately evaluated and a score ranging from zero, for the lowest (*poor*), 1 for *average* performance, 2 for *good* performance to three, for the highest

(*excellent* performance) is given. The score of these components cannot be summed up, and they should be reported separately. It should be noted that the use of the word "excellent", by Weir, does not mean the absence of the mistakes among the students' texts. Thus the researcher took it into account in this study. And finally after the treatment on session 19, a closed-ended questionnaire called Likert scale and a focus-group interview were designed and followed one after the other without any interruption by the researchers. As per the current scale, each response was assigned a number for scoring purposes (e. g., Agree=3 Neither agree nor disagree=2 Disagree=1) and the scores of all the items were summed up or averaged. Therefore, the researchers assigned a scale value to each of the three responses, and it was assumed that a higher total score expresses support and approval of the target attitude. In order to conduct a focus-group interview, the researcher divided the students into four groups of three, and then asked them open-ended questions in Farsi so that the students could best voice their experiences for collaborative dialogue without any barrier

Treatment Procedures

To practice collaborative dialogue with the help of Dictoglass in this class of EFL students, the researchers did the following steps: The first step was preparation: The researchers introduced a topic, and the key vocabularies were addressed. The second step was dictation: The researchers read a text at normal speed, twice or three times. The first time, the students just listened to and the second time, they jotted down some words that could help them recall the text. The third stage was reconstruction: The students together pooled their ideas or resources to reconstruct the text from their joint notes and write a final version. It was during this reconstruction phase that participants produced language-related episodes as they were searching for correct words or forms they needed to convey their intended meaning, and the final stage involving analysis and correction, the students analyzed and compared their text with the reconstruction of their group. The participants discussed the differences, the texts and then compared their text with the original ones and notes or made necessary corrections (Wajnyrb, 1990 as cited in Smith 2012).

Data Collection and Data Analysis

The researchers adopted a qualitative multiple case study. In the current study, qualitative data were collected via a one-on-one and a focus-group interview, direct observation of classroom activities, introspective methods (verbal reporting or protocol analysis), investigator triangulation, and questionnaires within a period of five weeks. Data collection took place in nine sessions and lasted five weeks. From session10 to session 18, the students wrote their pieces of writings through collaborative dialogue .Group talk data, from the outset of the tenth session, was transcribed for each group. The reason behind having an equal number of collaborative session for all the groups was to accurately reflect the linguistic features of the participants' collaborative discourse within the equal number of sessions. The verbal interactions taking place among the peers in each group, were jotted down by the researcher and the observers for later analysis. The researchers scrutinized the responses to the closed-ended questionnaires, his collected LREs and the observers' collected LREs. In addition, field-note observation was used through the study for a comprehensive investigation of the research questions. Where relevant, frequency technique was used through the study for the students' feedback. In doing so, the researchers coded the students' verbal protocol in terms of LREs, selected them and used quantification for the analysis

of the data. The researchers and the observers elicited LREs from the students' talk or interaction by taking notes when the students attempted to solve linguistic problems they encountered while jointly reconstructing the passage. The researchers traced language-related episodes related to the different aspects of writing through each stage of the activity in an effort to realize what was learnt and why. The scripts written collaboratively by each group of the students were rated and reported just by the researcher according to Weir' scheme (1998 as cited in Weigle, 2008). The researchers rated and reported the passage on a 4 point-scale with 0 representing *poor* performance, 1 representing *average*, 2 representing *good* performance, and 3 representing *excellent* performance.

RESULTS AND DISSCUSSION

In order to answer the research questions stipulated in the present study, the researchers investigated the dialogue of all the Groups (A, B, C, and D,) in terms of Form-oriented (F-O) LREs (grammar and cohesion), of Lexical-oriented (L-O) LREs (vocabulary) and of Mechanics-oriented (M-O) LREs (punctuation and spelling) in an attempt to realize their conversation as a foreign language writing learning. The first research question asked, "How does collaborative dialogue lead to improvement in Iranian low-intermediate EFL students' writing proficiency?" .The researchers looked into the generated LREs of each scale separately in all the Groups and showed them in the following tables. These tables show that the participants' writing proficiency improved as they went along further.

Table 1: The number of LREs for all the Groups from sessions10-12

Type Frequency	Form-Based LREs	Score	Descriptor
Group A	15	0	Poor
Group B	14	0	Poor
Group C	13	0	Poor
Group D	12	0	Poor

Concerning the scale of form, it was observed that cohesion in the scripts of the students in all the Groups was almost absent, and they used almost all grammatical patterns inaccurately.

Table 2: The number of LREs for all the Groups from sessions 13-15

Type Frequency	Form-Based LREs	Score	Descriptor
Group A	12	0	Poor
Group B	13	0	Poor
Group C	6	1	Average
Group D	6	1	Average

On the second phase, the form of Group A and B's texts had the same previous condition, however, that of Group C, and D enriched somewhat. Although there was unsatisfactory cohesion in their texts, there was frequent grammatical inaccuracies in their texts.

Table 3: The number of LREs for all the Groups from sessions 16-18

Type Frequency	Form-Based LREs	Score	Descriptor
Group A	5	3	Average
Group B	6	3	Average
Group C	2	3	Excellent
Group D	2	3	Excellent

On the last phase, the Groups C and D's writing form improved to a great extent compared with the last two phases. For all the parts of their writing, there was satisfactory use of cohesion resulting in effective communication and almost no grammatical inaccuracies were observed in their writing form. Group A and B's writing form enriched slightly although there was frequent grammatical inaccuracies and unsatisfactory cohesion so that there was little confusion in comprehension of most of the intended communication.

Table 4: The number of LREs for all the Groups from sessions 10-12

Type Frequency	Lexis-Based LREs	Score	Descriptor
Group A	3	2	Good
Group B	3	2	Good
Group C	3	2	Good
Group D	3	2	Good

With respect to the scale of lexis, there were some inadequacies in the choice of correct vocabulary in all the Groups' scripts.

Table 5: The number of LREs for all the Groups from sessions 13-15

Type Frequency	Lexis-Based LREs	Score	Descriptor
Group A	2	3	Excellent
Group B	2	3	Excellent
Group C	2	3	Excellent
Group D	2	3	Excellent

On the second phase, only rare inappropriate language-related episodes were found in all the Group's texts.

Table 6: The number of LREs for all the Groups from sessions 16-18

Type Frequency	Lexis-Based LREs	Score	Descriptor
Group A	2	3	Excellent
Group B	2	3	Excellent
Group C	1	3	Excellent
Group D	1	3	Excellent

On the last phase, again only rare inappropriacies were observed in the scripts of the students in all the Groups.

Table 7: The number of LREs for all the Groups from sessions 10-12

Type Frequency	Mechanic-based LREs	Score	Descriptor
Group A	12	0	Poor
Group B	13	0	Poor
Group C	6	1	Average
Group D	5	1	Average

Regarding mechanical accuracy, the students in Group A and Group B ignored the conventions of punctuation completely and almost all spellings were inaccurate, however, in Group C and D, low standard of accuracy in punctuation and spelling were observed.

Table 8: The number of LREs for all the groups from sessions 13-15

Type Frequency	Mechanic-based LREs	Score	Descriptor
Group A	7	2	Good
Group B	7	2	Good
Group C	3	3	Excellent
Group D	2	3	Excellent

On the second phase, Group A and B enriched slightly so that there were some inaccuracies in spelling and punctuation. In respect to Group C and D, almost no inaccuracies were observed in the scripts of the students.

Table 9: The number of LREs for all the groups from sessions 16-18

Type Frequency	Mechanic-based LREs	Score	Descriptor
Group A	4	3	Excellent
Group B	4	3	Excellent
Group C	1	3	Excellent
Group D	1	3	Excellent

On the last phase, Group A and B advanced to a great extent. In this stage, like Group C and D, they nearly have no inaccuracies in spelling and punctuation.

In sum up, the less the number of LREs, the more enhancement in writing proficiency will be. As the Tables 1 to 9 show, as the students move from the beginning stages of the introduction of collaborative dialogue at 10-12 sessions which the researchers called phase I towards the last phase which is collaborative dialogue they did in sessions 16-18, there has been a gradual development in terms of the students' writing.

The less the number of the LREs, the higher the writing scores of the students. To understand how these produced LREs exert a strong influence on other aspects of writing skill, this is the query to be answered in the following research questions. Similarly, the other research questions were answered. That is, the researchers looked into the dialogue of all the Groups in terms of form (research question 2&3), of lexis (research question 4) and of mechanics (research question 5&6). In addition to a set of LREs which were used to respond to the research questions stipulated in the recent study, the researchers invited three EFL teachers (Observers) to the class to observe collaborative dialogue technique from session 10 to session 18. The observers were all willing to cooperate. Each observer had devoted half hour of time to observing the class every session.

The Questionnaire's Findings

The closed-ended questionnaires were given to the students on the last week of the course, week ten. There was a 10-item closed-ended questionnaire. They involved statements expressing either a positive/favorable or a negative/unfavorable attitude towards collaborative dialogue. The researchers asked the participants to indicate the extent to which they agree or disagree with these items by marking. They assigned a scale value to each of the responses (3 for Agree, 2 for Neither Agree Nor Disagree, and 1 for Disagree) (Best & Kahn, 2006). Overall, the students in our present study had a very positive attitude towards collaborative dialogue. When asked whether they found collaborative dialogue helpful in the class for foreign language writing, almost all of them put an x in the Agree box.

10*3=30 Most favourable response possible
10*2=20 A neutral attitude

The score for any student would fall between 10 and 30. Above 20 if opinions tended to be favourable to the given point of view and below 20 if opinions tended to be unfavourable.

Interview's findings

Generally, the interviewed participants considered collaborative dialogue helpful in nature. Mainly, they asserted that collaborative dialogue helped them to generate ideas and improved their grammar, cohesion, vocabulary, punctuation and spelling. Moreover, it made the students take part in discussion after they finished writing, therefore, they found that their writing advanced when they were discussing with the peers concerning the individual drafts. Interestingly, they revealed that the teacher review could be embarrassing, and they shied away from discussing their writing with their teacher. On the other hand, they felt more comfortable with sharing their writing with their peers. In total, the participants' responses to the focus-group interviews showed that most of students were quite supportive of the activity and found it useful.

CONCLUSION

The data presented in the current study are exactly in consistent with Swain and Lapkin' data (1998), claiming the data affords proof for cognitive process in the dialogue of the students because they repeatedly produce alternatives, assess the alternatives, and apply the resulting information to solve their linguistic problems. They also use their native language as a mediational tool in order to control their own behavior, to concentrate on specific second and/or foreign language structures, and to produce and assess alternatives. The interaction occurs amongst the participants advocates the vital role of collaborative activity in the classroom. The best conclusion is that the devised treatment i.e., collaborative dialogue assists the participants to perform better than those in non-collaborative class. Here, we can conclude that if our students get acquainted with the technique of collaborative dialogue and carry out one task collaboratively, they are more successful at accomplishing the task than when they do it individually.

Implications

From a research perspective, the current study similar to the one conducted by Watanabe and Swain (2007), proves the importance of viewing peer-peer collaborative dialogue as a mediator of second and/or foreign writing learning, and the gradual development in the students' writing over the course emphasizes how writing learning happens in interaction, not as a result of interaction. Also, in the same way as Watanabe and Swain's research (2007), the present study advocates the claim that collaborative dialogue is a useful unit of analysis to explore the process and the product of second language and/or foreign language writing learning. When the students are doing collaborative dialogue in order to solve their writing problems, this collaboration can outstrip their competence so that it allows them to extend their present capabilities and knowledge to the higher level of competence.

Suggestions for Further Research

In terms of methodology, we think it would be valuable in future work to combine an analysis of students' collaborative dialogue with the follow-up interviews in order to derive a more fine-grained understanding of the mental process (Swain & Lapkin, 1998). Another suggestion would be to investigate the effects of collaborative dialogue discussions on the speaking skill of the students, the reading expertise of the students, and the listening skill of the students. The results of the present study indicate that collaborative dialogue enrich the writing skill of the participants. Yet, to what extent, it improves speaking skill, reading expertise, or listening skill, if it does, is not clear up to now. In other words, further research explaining other skills in accordance with the use of collaborative dialogue would be a useful follow-up to the current study (Meihami, Meihami, & Varmaghani, 2013). The participants' knowledge of how to collaborate effectively with peers was too limited. One study (Berg, 1999) has showed that the effectiveness of the student collaboration relies on the students' capability to work and solve language-related problems collaboratively. He found that if the students are trained how to do joint activities with peers prior to collaborative activities, it will have a significant effect on promoting scaffolding and learning (Berg, 1999 as cited in Nassaji & Tian, 2010).

Limitations of the Study

The limitations which have been posed in the present research are as follows: The first limitation was related to participants. The researchers liked to have more participants in order to have more reliable results. More samples from different institutions would definitely yield more generalizable results. There was also age limit for the participants and the researchers were forced to conduct the experiment on teenagers. The second limitation was connected with the inability of the researchers in controlling the gender variable. They were limited to one sex i.e., male students. Also, the researchers wanted to give the students more writing assignments in order to get stronger results for the study, but, they did not manage because the research was done during the students' school days, and they always complained about the shortage of the time. Despite the researcher's cognizance of the use of closed-ended questions in quantitative research, they found it right and pertinent to make use of such a questionnaire owing to the students' proficiency in writing. For the questionnaire and focus-group interview to be reliable the researchers should have run them twice, however, owing to time span, this was not feasible.

ABSTRACT

*This study explored and compared the effectiveness of focus-on-form (FonF) task instruction (i.e., input vs. collaborative output tasks) on Iranian English as a foreign language (EFL) learners' willingness to communicate (WTC). To achieve the objective, 50 Iranian pre-intermediate EFL students took part in this study. The FonF tasks were presented in the form of input FonF tasks (i.e., textual enhancement, processing instruction, and discourse tasks) and collaborative output FonF tasks (i.e., dictogloss, jigsaw, and text reconstruction tasks) to 2 classes of 50 pre-intermediate Iranian EFL students. Participants answered the pretest-posttest questions of the WTC questionnaire. The analysis of the paired samples *t* test in the input and collaborative output FonF tasks group showed that these types of FonF tasks did not improve the participants' WTC significantly. However, the participants in the collaborative output FonF tasks group outperformed those in the input FonF tasks groups. The results of the study imply that monitoring students' WTC in second/foreign language (L2) and improving it should be considered as one of the goals of L2 teachers and syllabus designers through implementation of collaborative FonF tasks.*

KEYWORDS: Focus on Form; Task Instruction; WTC

INTRODUCTION

Form-focused instruction, as the recent development in grammar pedagogy, is effective when it is used in meaningful communicative contexts (Ellis, 2001; Long, 1991). Consequently, it leads learners to higher level of accuracy in L2. In fact, the goal of L2 teaching is to help the learners communicate both accurately and fluently. According to Nassaji and Fotos (2011), communicative language teaching (CLT) and the previous structure-based methods paid little

attention to these aspects, which lead to the advent of a new approach known as focus-on-form (FonF).

FonF refers to an instructional option, which integrates grammar and communication in L2 teaching (Nassaji & Fotos, 2011). Besides, it refers to “how focal attentional resources are allocated to linguistic forms” (Long & Robinson 1998, p. 27). According to Norris and Ortega (2001), L2 instruction that focuses on form leads to substantial gain in L2 structures and the gains are sustained over time. Moreover, according to Lightbown and Spada (1993), FonF instruction within the context of communicative programs is more effective in developing L2 learning than in the programs which are limited to exclusive, separate emphasis on accuracy or fluency. Also, Loewen (2003) maintains that FonF makes L2 learners notice linguistic items rather than merely focused-on meaning lessons.

According to Long (2000), FonF provides an effective and impressive condition for L2 learning. It is learner-centered and represents L2 learners’ internal syllabus. Moreover, it happens when the L2 learner is attending to the meaning and has a communication problem. He, also, believes that L2 learners can learn most of the L2 grammar accidentally, while their attention is on the meaning. Not only are linguistic structures in the communication approach emphasized, but the attention to grammatical forms is, also, considered as an important factor in task-based instruction. According to Savignon (2005, p. 645), “the CTL [communicative language teaching] does not exclude a focus on metalinguistic awareness or knowledge of rules of syntax.” As Skehan (1996, p. 18) argues, “learners do not simply acquire the language to which they are exposed, however carefully that exposure may be orchestrated by the teacher.”

On the other hand, willingness to communicate (WTC) is considered as an important and effective factor in an L2. It is defined as “a readiness to enter into discourse at a particular time with a specific person, or persons, using a L2” (McIntyre, Clement, Dornyei, & Noels, 1998, p. 547). The importance of communication and L2 learners’ enthusiasm to communicate effectively leads L2 teachers/researchers to design curricula and improve L2 instruction communicatively. In fact, the importance of communication makes L2 learners engage in a communicative context to improve their communicative competence (Savignon, 2005).

McCroskey and Richmond (1987), initially, referred to WTC as the native verbal communication and individual’s general tendency to talk. Then, it was introduced into communication contexts and L2 instruction by McIntyre et al. (1998). They, also, introduced the WTC model as the one in which social, affective, cognitive, and situational variables are involved and can, in turn, predict one’s actual use of that language. In addition, the WTC model is composed of psychological, linguistic, and communicative variables in order to explain L2 communication (McIntyre et al.).

According to Swain and Lapkin (2002), language would be learned effectively in interactive and meaningful contexts in a pragmatic setting, so it is very important to find the variables which help to improve communication and which encourages L2 learners to communicate effectively. Besides, McIntyre et al. (1998) believe that the significant and ultimate aim of L2 learning is to “engender in language students the willingness to seek out communication opportunities and the

willingness actually to communicate in them” (p. 547). In fact, the primary goal of L2 pedagogy is to teach individuals to communicate willingly. Considering this statement, the creation of WTC in L2 classes becomes important.

Consequently, one of the important aspects to consider is the L2 learners’ WTC in the EFL classroom. In fact, WTC is expected to facilitate L2 learning because higher WTC among L2 learners leads to increase opportunity for authentic L2 use (MacIntyre, Baker, Clément, & Conrod, 2001), which is a necessary condition for their language development (MacIntyre & Legatto, 2011). As MacIntyre (2007) has argued, WTC represents the psychological preparedness to use L2 when the opportunity arises. It is believed that the degree of WTC is an important factor in learning an L2 and the ability to communicate in that language. In fact, there is a direct relationship between L2 learners’ WTC and their successes in L2 learning, as the higher WTC a speaker has, the more likely he or she is to succeed in L2 acquisition. As Richmond and Roach (1992) state, high WTC is associated with increased frequency and amount of communication.

As mentioned by MacIntyre and MacKinnon (2007), the choice to speak or to remain silent seems to be a factor in the success of EFL learners. When the opportunity to use English arises, it is usual to have the two options of speaking or refraining from it. According to MacIntyre (2007), both individual factors (e.g., anxiety, motivation, attitude, interpersonal attraction, etc.) and social contextual factors (e.g., ethno-linguistic vitality, language contact, etc.) can influence WTC. One of these factors is the learner’s motivation. However, Dörnyei and Skehan (2003) view L2 WTC as an extension of the motivation construct. Therefore, the relationship between the two concepts becomes an important issue. As Cao and Philp (2006) state, situational WTC could change in the classroom across the three interactional contexts, under the influence of situational variables (i.e., group size and familiarity with interlocutors), the familiarity and interest of tasks under discussion, and the confidence of the L2 learners in relation to the performing tasks. Consequently, performing tasks may influence the L2 learners’ WTC, which is the subject of this study. However, the types of tasks and the processes of performances are the important issues, which should be taken into consideration.

This study was, therefore, designed to contemplate on two possibilities regarding the type of FonF tasks. At the same time, WTC as an important factor in L2 communication enhancement was checked. With great emphasis on communication and training individual to communicate effectively inside as well as outside the classroom, many researchers (e.g., MacIntyre et al., 1998) argue that the main goal of L2 education should be the development of WTC in language instruction and learning. L2 Learners’ attitude to classroom activities is, also, emphasized by researchers working from a sociocultural theoretical perspective. As Lantolf and Thorne (2006) point out, L2 learners are viewed as active agents who assign significance to things and events in their life. This process of L2 learners as the active agents in their learning is appropriate when investigating adult classroom contexts. Such L2 learners display a wide range of learning goals, expectations, and abilities (Lantolf & Thorne, 2006). Furthermore, although L2 learners’ attitudes to the tasks have been evaluated as an important consideration in explaining their willingness to actively contribute to the task, there has been relatively little classroom-based research on their

willingness toward such tasks. Hence, this study was designed to examine the effect of input-based and collaborative output tasks on English as a foreign language (EFL) learners' WTC.

Research on the efficacy of the types of tasks in improving L2 learners' WTC is inconclusive. In addition, there seems to be little research studies which has investigated and compared the effect of FonF instruction tasks (i.e., input vs. collaborative output tasks) on L2 learners' WTC—the concepts which have been recently discussed more theoretically than being tested. As the main consideration, this study focused on the effect of FonF tasks on L2 learners' WTC and it investigated whether the kinds of FonF tasks (i.e. input vs. output-based tasks) improve their WTC effectively.

LITERATURE REVIEW

Input and collaborative output tasks as the type of FonF instruction have received a considerable attention during recent years. Input tasks of processing instruction approach is based on Lee and VanPatten's (2003) model of input processing, according to which exposure to explicit instruction and input-processing activities helps L2 learners create a connection between form and meaning and this leads to the process of learning grammar from meaning. VanPatten (2002) has argued that "since the aim of this approach is to assist the learner in making form-meaning connections during input processing; it is more appropriate to view it as a type of focus on form" (p. 764). Also, according to Nassaji and Fotos (2011), by understanding how L2 learners process input, affective and comprehensive instructional devices can be made and leads to the input processing acquisition.

As Sharwood-Smith (1991) argues, textual enhancement is a kind of external forms of input enhancement as highlighting the correct form of input. It is, also, an implicit form of input enhancement as it makes L2 learners to pay attention to form, while the main focus is on meaning. In fact, input enhancement is divided into two different dimensions: explicitness and elaboration. The former relates to the degree of how attention is attracted to the forms, and the later refers to the intensity with which enhancement procedures take place. Also, Sharwood-Smith (1991) points to the achievement of input enhancement internally or externally. Internal enhancement happens when L2 learners pay attention to the form by learning strategies. External enhancement happens when the teacher or external operations notice the forms. Consequently, textual enhancement is a kind of external and implicit forms of input enhancement.

Discourse-based pedagogy, as the other input-based FonF task instruction, focuses on the communicative use of grammar, as it refers to the ability to use grammar in communicative discourse. Thus, L2 learners must recognize the communication purpose of the sentence regardless of the obvious meaning of its syntax (Nassaji & Fotos, 2011). FonF through discourse is considered as an effective factor in L2 grammar instruction, as it pays attention to meaning and forms as well as utilization of these forms within larger discourse context. In fact, as Levy (1997) argues, L2 learners need to learn chunks of speech, formulaic utterances, and collocations by using communication and merely discourse-level input can provide authentic example of specific grammatical structures.

Collaborative output FonF tasks of dictogloss, reconstruction cloze tasks, and jigsaw tasks, also, were the focus of many studies. Vasiljevic (2010) believes that the dictogloss procedure can improve the development of L2 learners' communicative competence, as L2 learners' communication is much more natural and authentic than in traditional classes. Also, time limitation to reconstruct the text makes L2 learners to use time effectively. Moreover, speaking time is longer in comparison to traditional teacher-centered classroom. Dictogloss, also, promotes L2 learners autonomy, as they are expected to help each other instead of expecting teacher to provide the information. Moreover, text reconstruction task as a task that generates a high number of grammatical language-related episodes is influential. The task is, also, considered to be effective, as it leads L2 learners' conscious attention to grammatical accuracy (García Mayo, 2002; Kowal & Swain, 1997; Storch, 1998). In this task, L2 learners are considered to create and reconstruct a text by inserting and using all the grammatical words to create meaningful and grammatical paragraph.

In addition, another area, which is the subject of the present study, is WTC. It is considered as an important and effective factor in SLA. WTC is defined as "the predisposition toward or away from communicating, given the choice" (MacIntyre, Baker, Clement, & Donovan, 2003, p. 538). It is assumed that the degree of WTC is a factor in learning an L2 and the ability to communicate in that language. Consequently, the importance of communication leads L2 teachers to improve L2 instruction communicably. In fact, the higher WTC a speaker has, the more likely he or she is to succeed in L2 learning. High WTC is associated with increased frequency and amount of communication (Richmond & Roach, 1992).

WTC in L1 was considered as the degree of being introverted or extroverted. McCroskey and Richmond (1991), also, believe that the antecedents of WTC are communicative competence, introversion, self-esteem, and cultural diversity. According to McCroskey and Richmond (1991), WTC in L1 is considered as a trait-like situation and many situational variables such as people's feelings, recent communications, other persons, and what is gained or lost through that communication strongly influence communicative manners. In line with studies on L1 WTC, MacIntyre et al. (1998) adapted WTC to L2 situation and discovered individual differences and their relations to communication behaviors in an L2. They believe that the use of an L2 is associated with the situational differences of competence and intergroup relations. Therefore, it would not be essential to constrain WTC to the trait-like variable.

Theoretical exploration and pedagogical application throughout the current decade have, primarily, promoted the important role of using language to communicate in L2 learning and teaching. Moreover, MacIntyre et al. (1998) argued that the ultimate goal of L2 learning should be to "engender in language students the willingness to seek out communication opportunities and the willingness actually to communicate in them" (p. 547). Based on this argument, MacIntyre et al. (1998) propose that creating WTC should be a proper objective for L2 education.

Regarding this statement, the creation of WTC in L2 classes becomes important. Also, MacIntyre et al. (1998) proposed a heuristic model of the WTC construct with an account of linguistic, communicative, and social psychological variables that might affect one's WTC in a second

language communication context. The trait-like conceptualization of WTC advanced by McCroskey and Richmond (1987) in L1 communication was then extended as a situational variable with both transient and enduring influences in an L2 setting in MacIntyre et al.'s (1998) study.

According to MacIntyre et al. (2009) the psychological, linguistic, educational, and communicative aspects of language are not by any means separated; in fact, they are incorporated as the characteristics of L2 learner's experiences. They believe that emotional and cognitive processes impact L2 learning and use significantly and conflictingly. Consequently, sometimes L2 learners have a strong desire for communication, and other times L2 learners are unwilling to communicate. MacIntyre et al. (1998) provide a pyramid model of variables affecting WTC as shown in Figure 1. The model is explained in the following:

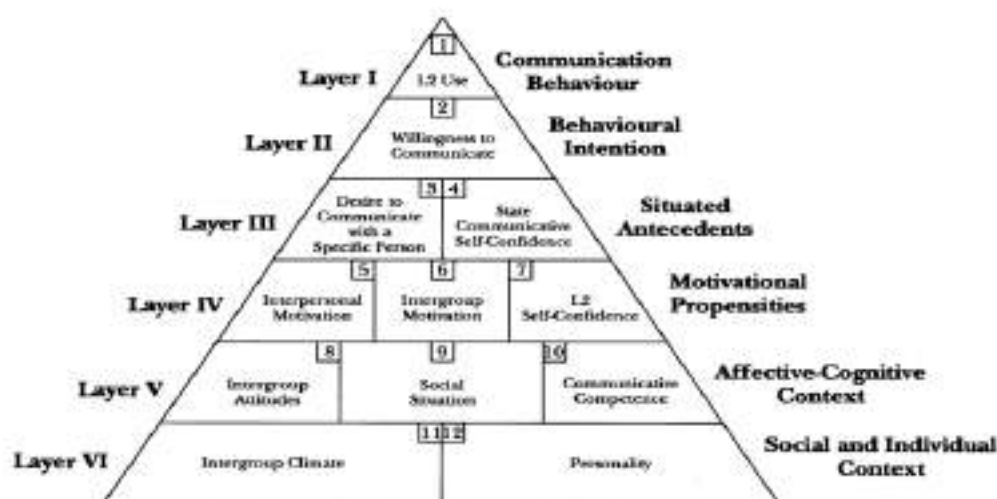

Figure 1: MacIntyre et al.'s (1998) WTC model.

MacIntyre et al. (1998) consider WTC in L2 as a layered pyramid model in which different variables influence L2 learners' eventual L2 use (see Figure 1). WTC is influenced by both situational influences (Layers I, II, III) and enduring influences (Layers IV, V, VI). In fact, the L2 learners have more control over the act of communicating in L2 as they move up the pyramid.

In this pyramid model, they made a distinction between immediate situational factors and enduring influences that underlie L2 WTC. At the top of the hierarchy, the frequency of L2 communication is mentioned. WTC is underneath of L2 use and is influenced by the situational factors of desire to communicate and L2 users' state self-confidence. At the bottom of the layers of the pyramid, social psychological factors, such as personality and intergroup motivation are integrated into the model. The strength of the model lies in the conceptualization of L2 WTC as a situational variable and incorporating both trait and situational predictors of WTC into this model.

According to McIntyer et al. (1998), WTC contains a model which consists of six layers or variables. These layers differ from each other in the kind of their situational or enduring influences on WTC. Situational influences refer to the context that a person functions, in contrast with, enduring influence that is described as the individuals' properties, which can apply to any situation (Riasati & Noordin, 2011). The first three layers are communication behavior, behavior intention, and situated antecedents, which pose situational influence on L2 communication. The last three layers are motivation properties, effective-cognitive context, as well as social and individual context, which make enduring influences on L2 communication (McIntyre et al., 1998).

Over the last two decades, SLA researchers (e.g., Kang, 2005; MacIntyre, 2007; MacIntyre et al., 1998; MacIntyre & Legatto, 2011; Yashima, 2002) have all emphasized the importance of WTC as a crucial component of modern language instruction. Communicative competence, alone, may not result in actual L2 communication inside or outside the classroom (Dörnyei, 2005). Kang states that "L2 learners with a high level of WTC are more likely to use L2 in authentic communication and facilitate language learning" (p. 278). Therefore, recent researches in WTC investigated its effects on L2 learning.

With regard to the study at Australian National University carried out by Wang (2004), 20 university students learning Modern Chinese from a second-year class at the Australian National University were selected to look at the relationship between students' L2 written performance and their WTC in class. The participants were given a survey about their WTC in class and a language written test. The questionnaires covered the situational settings in language class context, such as willingness to ask the teacher for clarification, willingness to initiate the conversation, and willingness to try new words and phrases. The written test contained grammar items and a short essay writing. The study revealed that there was a relationship between the students' L2 written performance and their WTC in class. In fact, the more willing the students were to communicate in class, the better they did in their L2 written performance.

Also, Freiermuth and Jarrell (2006) investigated the relationship between WTC and online chat. They compared face to face spoken language with using online chat in performing solving tasks. Nine groups, consisting of four participants, took part in the study. Both the questionnaire and the subjects' discourse analysis were investigated and led to the conclusion that online chat provided a comfortable environment and improved L2 participants' WTC.

Another study by Wang and Erlam (2011), investigated the relationship between task-based lessons and L2 learners' WTC. In this study, the L2 learners performed the tasks and the L2 teacher recorded their WTC during the tasks and in variety of contexts. Four students were the main consideration of this inquiry. The tasks helped the learners to reduce their communication anxiety and increase perceived communication competence. The learners' attitudes toward these tasks were positive, and they found these tasks as the fun games that led to their WTC. In fact, all the L2 learners used the L2 when they were doing tasks.

Weaver (2004) examined situational variables underlying WTC in L2 classrooms in relation to task types. His study investigated 1104 Japanese learners' WTC within an L2 classroom at tertiary level. Unlike previous studies that exclusively adopted the WTC scale developed by McCroskey and Richmond (1991), this study used a questionnaire developed by the researcher himself to investigate whether or not the learner's L2 WTC would vary across 17 speaking situations and tasks potentially arising in this social context of a L2 classroom. The findings revealed that the students' WTC varied significantly across the different speaking situations and tasks and suggested that task as a variable, likely, to contribute to changes in WTC in L2 classrooms.

In a subsequent study, Weaver (2005) followed an experimental design to investigate the effect of English instruction and pretask planning on students' level of WTC to do different speaking tasks within an oral communication class. Weaver's study employed a WTC survey ($n = 490$), specifically designed for an L2 classroom. The results showed post-instruction gains in terms of WTC, suggesting that the pretask planning had a positive effect on WTC.

In summary, the review of the related literature shows that more investigation is required to examine the effect of input and collaborative output FonF tasks and WTC. Failure of research in comparing the effect of input vs. collaborative output tasks on different grammatical structures made the present researchers investigate their effect on L2 learners' WTC. Firstly, the importance of communication can never be neglected. Secondly, more attention needs to make this aspect more effective. As a result, WTC, as one of important factors in communication, was examined in the present research.

RESEARCH QUESTIONS

In light of the above issues, this study sought to address the following research questions:

1. Do Form-focused tasks significantly improve Iranian EFL learners' WTC?
2. Do collaborative output tasks increase Iranian EFL learners' WTC more significantly than input-based tasks?

METHODOLOGY

Participants

To collect the data, a total of 50 pre-intermediate EFL students were involved in the main study. All the participants were native speakers of Persian who learnt English as a foreign language in Zabansara language Institute in Isfahan, Iran and had no prior experience of being in English-speaking countries. Their age ranged from 16 to 22. After the Oxford Placement Test (OPT), 50 out of the 80 students were selected and divided into two 25 member groups. The study was conducted during an academic term in two pre-intermediate adult classrooms in 2013. The undergraduate participants were attending the class approximately for three days a week and were receiving their education mainly in English as the medium of instruction.

Instruments

In this study, two instruments were employed: OPT and the WTC questionnaire. At first, in order to investigate the homogeneity of the participants in both classes, the OPT was used. It included 100 multiple-choice items. The level required for the research was pre-intermediate, and the scores needed for this level were 60 to 67 out of 100. According to Allen (2004), OPT has both features of highly economical and easy to administer test and these leads to consistently meaningful scores from level 1 (beginner) upwards. Also, the OPT has been calibrated against the proficiency levels based on the Common European Framework of Reference for Languages (CEFR), the Cambridge ESOL Examinations, and other major international examinations. Meanwhile, the reliability of the test as measured by Cronbach's alpha in the current study was found to be 0.85.

The WTC questionnaire was used in order to check the effect of input vs. collaborative output tasks on the participants' WTC. The participants were supposed to indicate the frequency of time they chose to speak in English in each classroom situation. Further, this questionnaire contained two main parts of inside classroom and outside classroom questions. Each part included 27 items and checked the participants' WTC in both situations. This study estimated the internal consistency of the WTC questionnaire using Cronbach's alpha. The results indicated that the Cronbach's alpha for the questionnaire was .84.

Procedures

This study had a quasi-experimental design. Fifty EFL learners participated in the main study. They were divided randomly into two groups (i.e., input-based and collaborative output FonF groups). At the beginning of the course, the OPT was used in order to check the homogeneity of both experimental groups (i.e., input-based vs. collaborative output groups). The WTC questionnaire was given to the participants at the beginning and at the end of the course.

The study took place over one term. Several grammatical structures were chosen to be instructed based on two different kinds of tasks. In one group, the input-based FonF tasks (i.e., textual enhancement, processing instruction, and discourse tasks) were used, and, in the other, the collaborative output FonF tasks (i.e., dictogloss, jigsaw, and text reconstruction tasks) were performed. The grammatical structures were the same in both classes; only the kinds of tasks and activities differed.

In the input FonF group, the three input-based tasks of textual enhancement, processing instruction, and discourse tasks were instructed. Processing instruction is divided into two main activities: referential and affective. A referential activity is an activity with a right or wrong answer. An affective activity is concerned with the participants' expression of their opinions. Textual enhancement draws the L2 participants' attention toward linguistic forms by making them more salient using bolding, italicizing, and underlining. Discourse pedagogy focuses on grammar forms and meanings, as well as, use of those forms within larger discourse context.

In the collaborative group, collaborative output FonF tasks were performed. According to Wajnryb (1990), dictogloss contains a warm-up discussion of the topic. Afterwards, instructors

read the text twice, and the students use their notes to reconstruct the text in a small group. Consequently, the learners' text is analyzed and corrected by the teacher and learners. Reconstruction cloze tasks lead L2 learners to produce specific target structures and involve two versions of the text: the original and a cloze version. The original text is read by the teacher at a normal pace. L2 learners listen carefully and take notes of the related content. Afterwards, they receive the cloze version of the text. They fill in the blanks with words and phrases related to the original text; finally, they compare their texts with the original ones and discuss the differences. A jigsaw task is a two-way information gap task in which L2 learners hold different information of a task and are supposed to exchange the different pieces of information to perform the task. The instruction lasted for about 26 sessions, 3 days a week. At the end of the course, the WTC questionnaire was used to check the participants' WTC improvement.

RESULTS AND DISCUSSION

Table 1 reports the descriptive statistics of the pretest and posttest of WTC scores in both the input and collaborative output groups prior and after the treatments were carried out.

Table 1: Descriptive Statistics of the WTC Scores in the Input and Output Groups

Group	Variable	N	Min	Max	M	Std. Dev
Input	Pretest WTC	25	17.35	34.51	28.20	3.96
	Posttest WTC	25	18.66	38.51	28.33	4.06
Output	Pretest WTC	25	21.32	37.67	28.18	3.44
	Posttest WTC	25	24.33	39.83	31.00	4.19

As Table 1 indicates, the mean pretest scores of WTC in the input group and output group were 28.20 and 28.18, respectively. That is, the mean score in the input group was higher. The posttest demonstrated that the scores in the input group and output group were 28.33 and 31.00, respectively. Besides, both groups showed an increase in the scores from the pretests to the posttests.

The first research question inquired if using input-based and collaborative output FonF tasks could significantly improve EFL learners' WTC. To address the first research questions of the study, *paired samples t test* was conducted. Table 2 reports the sample statistics of WTC scores. Also, Table 3 shows the result of the *t test*.

Table 2: Sample Statistics of the Pretest and Posttest WTC

Variable	N	M	Std. Dev	Std. Error Mean
Pretest WTC	50	28.19	3.67	.51
Posttest WTC	50	29.66	4.30	.60

Table 3 :Paired Samples *t* Test Between the Pretest and Posttest of WTC Scores

		Paired Differences				<i>t</i>	<i>df</i>	Sig.
Variable	<i>M</i>	Std. Dev	Std. Mean	Error	95% Confidence			
					Lower	Upper		
Pretest WTC	-1.47	5.20	.73		-2.95	.003	-2.00	.051
Posttest WTC								

According to Table 3, the results show $t = -2.00$ and the significance level is more than 0.05. It can be concluded that there was a not significant difference between the two scores. Thus, the participants' responses to the WTC questions after performing the input and collaborative output tasks were not significantly different. The mean decrease was -1.47, with a 95 % confidence interval stretching from a lower bound of -2.95 to an upper bound of .003.

Moreover, in order to check the effect of the WTC test in the input and output groups, two *t* tests were performed. As Tables 4 and 5 show, the WTC scores did not improve significantly in the input group from the pretest to the posttest, but the WTC scores improved significantly in the output group from the pretest to the posttest.

Table 4: Paired Samples *t* Test of WTC in the Input Group

		Paired Differences				<i>t</i>	<i>df</i>	Sig.
	<i>M</i>	Std. Dev	Std. Mean	Error	95% Confidence			
					Lower	Upper		
WTC Pretest - WTC Posttest	-.12	4.95	.99		-2.16	1.91	-.127	.900

Table 5: Paired Samples Test of WTC in the Output Group

		Paired Differences				<i>t</i>	<i>df</i>	Sig.
	<i>M</i>	Std. Dev	Std. Mean	Error	95% Confidence			
					Lower	Upper		
WTC Pretest - WTC Posttest	-2.82	5.19	1.03		-4.96	-.68	-2.71	.012

The second research question asked if the collaborative output tasks were more effective than the input-based tasks in improving the participants' WTC. To address this research question, covariate analyses were conducted. However, it was so important, first, to make sure that the WTC scores had similar variances across both groups. Thus, Levene's test of equality of variance was done (see Table 6):

Table 6: Tests of Equality of Variance WTC Pretest

Test	Variable	F	df1	df2	Sig.
Levene	Pretest WTC	1.34	12	32	.24

Levene tests the null hypothesis that the error variance of the dependent variable is equal across groups. As Table 6 depicts, Levene's statistics was larger than .05. Thus, the variance was equal, and there was no significant difference between the variance of the groups. Also, sample Kolmogorov-Smirnov test was run. The significance value of Kolmogorov-Smirnov showed the normality of the sets of scores. As Table 7 presents, Kolmogorov-Smirnov value means was not significant, and in each group was more than (.05), which manifests the normality of the distribution of the scores. This further supports the homogeneity of the groups before the treatment was carried out. Also, the reliability assumption was met because the internal consistency of the pretest WTC scores was found to be (.84) through running Cronbach's alpha.

Table 7: Tests of Normality

Test	Variable	F	df	Sig.
Input	Pretest WTC	.139	25	.200
Output	Pretest WTC	1.47	25	.173

The other assumption is the influence of treatment on covariate measurement. This assumption was, also, checked because the covariate (pretests) was measured prior to the treatment of the study (manipulation). The results are reported in Table 8. As Table 8 displays, the treatment for the pretest scores was not significant, $F = 3.110$, $p = .054$. There was not an interaction between the treatment and the pretest scores. This indicates that there was not a very significant difference between the two groups in terms of their WTC scores before the treatment was conducted.

Table 8: Analysis of Covariance on the WTC Scores for the Interaction Effect

Source	Sum of Squares	df	Mean Square	F	Sig.	Partial Eta Squared
Corrected Model	106.234	2	53.117	3.11	.056	.117
Intercept	480.887	1	480.887	28.15	.000	.375
Group* WTC Pretest	106.234	2	53.117	3.11	.054	.054
Error	802.646	47	17.078			
Total Corrected	44922.545	50				
Total	908.880	49				

To address this research question of the study, a one-way covariate test was conducted. The posttest scores from the WTC test were considered as the dependent variable and the pretest scores as the covariate variable. The groups were considered as the independent variables. The error was originally set at .05 when comparing the groups on the grammar variable. The results of analysis of variance for the treatment effect are reported in Table 9.

Table 9: Analysis of Covariance for the Treatment Effect on the WTC Posttest Scores

Source	Sum of Squares	df	Mean Square	F	Sig.	Partial Squared	Eta
Corrected Model	111.81	2	55.90	3.29	.046	.123	
Intercept	488.18	1	488.18	28.78	.000	.380	
WTC Pretest	22.81	1	22.81	1.34	.252	.028	
Group	89.36	1	89.36	5.27	.026	.101	
Error	797.06	47	16.95				
Total	44922.54	50					
Corrected Total	908.88	49					

According to the Table 9, after removing the effect of the pretest, there was a significant difference between the two input and collaborative output groups, $F = 5.27$, $*p < .05$. Therefore, it is approved that there was significant difference in the posttests after the treatments. In fact, the two groups of input and collaborative output showed a significant difference after the instruction.

Discussion

This study investigated the effect of input and collaborative output FonF tasks on Iranian EFL learners' WTC. The result showed that input and collaborative output tasks influenced the participants' WTC, but the improvement was not significant. Thus, the first null hypothesis is not rejected. In this study, the input and collaborative output tasks increased the participants' WTC. Based on the result, these tasks and the importance of L2 learners' attitudes towards classroom tasks and activities are considered important factors in L2 learning motivation. The study by Dornyei and Kormos (2000), in British and Hungarian classes found that the students' engagement in classroom oral activities and tasks correlated significantly with their attitudes towards the language tasks they were asked to perform. In this study, both tasks increased the participants' motivation and, consequently, led to their WTC improvement.

L2 learners' attitude to classroom activities is, also, emphasized by researchers working from a sociocultural theoretical perspective. In the study, the input and collaborative output FonF tasks provided the participants with positive attitude and made them active agents to perform the tasks and receive feedback. As Lantolf and Thorne (2006) argue, L2 learners are viewed as active agents who assign significance to things and events in their life. This process of L2 learners as the active agents in their learning is appropriate when investigating adult classroom contexts. Such L2 learners display a wide range of learning goals, expectations, and abilities.

In this study, both the input and collaborative output tasks provided the participants with the perceived communication competence and low levels of anxiety; however, it was not very effective. According to MacIntyre's (1994) WTC model, WTC was predicted by two variables of perceived communication competence and communication anxiety. That is, the model predicted that high levels of perceived competence combined with low levels of anxiety would lead to greater WTC, and, in turn, more frequent communication in an L2. Although L2 learners' attitudes to the tasks are evaluated as an important consideration in explaining their willingness to

actively contribute to the task, there has been relatively little classroom-based research on their attitude and willingness towards such tasks.

The influence of the input and collaborative output tasks on the participants' WTC was not significant. There are several reasons to support this finding. First, more sufficient time was perhaps required to improve their WTC effectively, and tasks usage over time could lead to the improvement of their WTC. More research is required in order to investigate the effect of different types of tasks overtime and their influence on L2 learners' WTC. Second, as MacIntyre and MacKinnon (2007) mention, the choice to speak or to remain silent seems to be a factor here. According to MacIntyre (2007), both individual factors (i.e., anxiety, motivation, attitudes, interpersonal attraction, etc.) and social contextual factors (i.e., ethno-linguistic vitality, language contact, etc.) either enhance or reduce WTC. Consequently, the influences of these factors on L2 learners' WTC should be considered. Finally, the type of tasks could be a variable affecting the result.

The second research question considered if collaborative output tasks were more effective than input-based tasks in improving the participants' WTC. It was approved that there was a significant difference in the posttest of WTC in the input vs. collaborative output groups. In fact, the two groups of input and collaborative output showed a significant difference after instruction; collaborative output tasks appeared to influence the participants' WTC more. Thus, the last null hypothesis is rejected.

There are several reasons why collaborative output tasks were more effective than input tasks in improving the participants' WTC. The first reason is that collaborative output activities (i.e., jigsaw, text reconstruction, & dictogloss) push L2 learners to develop their interlanguage by drawing their attention to form while they are creating meaning. Consequently, the interactive nature of the collaborative output tasks influenced the participants' WTC and made them more willing to communicate in the classroom. They were in line with sociocultural approach. Some researchers (Lantolf & Appel, 1994) consider sociocultural approach as the knowledge which is constructed through social interaction and between individuals and is then internalized (Vygotsky, 1978). This view has led to the effect of, and interest in, collaborative tasks, where language use and language learning take place simultaneously (Swain & Lapkin, 2002).

In the current study, the collaborative output tasks of reconstruction cloze task, dictogloss, and jigsaw tasks were used. Reconstruction cloze task is claimed to be an effective form-focused task, as L2 learners work collaboratively and peer feedback is available (García Mayo, 2002; Kowal & Swain, 1997; Storch, 1998). In this study, during the reconstruction task, the texts were devoid of function words and the participants had to come up with an accurate product. Consequently, they exchanged their grammatical information and received peer and L2 instructor feedback. Also, dictogloss encouraged them to reflect on their own output (Wajnryb, 2001). As Swain (1998) argues, dictogloss could make L2 learners process syntactically, pay attention to the gaps in their interlanguage, and consider the mismatch between their own language use and L2 (Doughty & Williams, 1998), or notice metatalk on the connections between form and meaning and in relation to the writing process (Kowal & Swain, 2001). Finally, jigsaw task, as an information gap

activity, could lead L2 learners exchange the part of the necessary information and perform the task. According to Swain and Lapkin (2001), jigsaw task is a type of task where opportunities for negotiation of meaning are likely to be generated. WTC in an L2 is defined as the individual's "readiness to enter into discourse at a particular time with a specific person or persons, using a L2" (MacIntyre, et al., 1998, p. 547). As far as the readiness is concerned, language competence is the first thing to have. Good language proficiency will result in good communication. According to this study and concerning the mentioned features of collaborative output tasks, using these tasks may influence L2 learners' language proficiency and, in turn, affect their WTC.

The second reason may be that the collaborative output tasks engaged the participants and attracted their attentions to task orientation. According to Peng and Woodrow (2010), there are three influential factors of teacher support, student cohesiveness, and task orientation in language classrooms. Dorman, Fisher, and Waldrup (2006) define teacher support as the extent to which the teacher helps, supports, trusts, befriends, and is interested in the students. Student cohesiveness refers to the extent to which students know, help, and support each other (Dorman et al., 2006). At last, task orientation refers to the extent to which it is important to complete the activities and solve the problems (Dorman et al., 2006).

It is possible that collaborative output tasks, as the attractive and useful tasks, led to the participants' engagement. In this study, collaborative output tasks were considered to be more effective than input tasks in improving their WTC. In fact, collaborative output tasks may decrease L2 learners' anxiety. In Peng and Woodrow's (2010) study, a negative correlation was found between communication anxiety with L2 WTC, perceived communicative competence, teacher support, student cohesiveness, and task orientation. Also, a positive correlation was found between L2 WTC with perceived communicative competence, teacher support, student cohesiveness, and task orientation.

The last reason is that the collaborative output tasks provided the participants with repeated exposure to grammatical structures. MacIntyre et al. (1998) mention the L2 WTC heuristic model and consider the frequency of L2 use along with the situated approach. At the top of the model, the frequency of L2 communication is mentioned. WTC is placed directly underneath the use of L2. Also, WTC is influenced by the situational factors of L2 learners' desire for communication and self-confidence. Hence, collaborative output tasks could expose L2 learners to grammatical structures repeatedly, and this fulfills WTC heuristic model's requirement of the frequent use of L2. The above finding is inconsistent with the findings made by Barjesteh, Vaseghi, and Neissi (2012) who demonstrated that the Iranian learners were highly WTC in two context-types (i.e., group discussion and meeting) and one receiver-type (i.e., friend). As the majority of Iranian learners have the opportunity of speaking English only in the language classroom, both input and collaborative output tasks, particularly collaborative ones, can provide the chance of group discussion, meeting, and friendly chat.

CONCLUSION

In this study, the influence of input and collaborative output FonF tasks instructions on L2 learners' WTC was examined. The results showed that there was no significant difference between the pretest and posttest of the participants' WTC. Also, the analyses revealed that the collaborative output tasks were more effective than the input tasks in improving the participants' WTC. According to this study, collaborative output tasks provide L2 learners with communication opportunities in L2 classes. The only opportunity for EFL learners to use their ability to communicate is in the classroom. Communication is a process in which people influence each other. Communicating in class by performing different types of tasks can make the learning atmosphere more relaxing, which hopefully can lead to better L2 performance with the teacher's better understanding of the students' WTC. Perhaps, the learners' readiness to use those opportunities which arise in the classroom can lead to their success in learning an L2. Monitoring students' WTC and improving their learning skill should, thus, be seen as one of the goals of L2 teachers.

There are still reasons to be cautious about the findings of this study. One limitation could be the sample size of this study. This study aimed to address a specific group of 50 Iranian EFL students. Despite the fact that the number of participants was sufficient for the purpose of the study, a larger sample size would have yielded more robust results so to make stronger generalization. Moreover, the current study did not examine communication orientations of the participants. Another limitation concerns the WTC instrument employed in the current study. Although the validity and reliability of the instrument were checked to satisfy the requirements of data collection, the depth of the information that the self-report tests could collect was limited due to the nature of questionnaire instruments; to obtain more comprehensive information about WTC in L2, qualitative methods such as interview and observation could be employed to complement the data.

ABSTRACT

Nowadays, technical terminology translation plays an important role in human life. Specific groups of people all over the world refer to learn these terminologies in order to be familiar with a subject and improve their knowledge in that domain. On the other hand, saving the technical translation equivalent is a particularly salient challenge for technical translators. The present study was conducted to investigate the difference between the translation of banking terminology in the dictionaries and that used by banking experts. To fulfill the purpose of the study, 40 Banking experts, consisting of male and female in different ages, were randomly selected from six banks. They were given a questionnaire including 197 sentences consisting of 214 underlined banking terminologies. The obtained data was analyzed and the results of the present study indicated that there is no activity by Persian Language and Literature Academy in making equivalents for economic terminology. Moreover, the results demonstrated the insufficiency of dictionaries in offering the equivalents for some economic terminologies. Besides, banking experts mostly suggested their own equivalents for the terminologies, but in some cases the offered translation by experts, were not unified or sometimes entirely opposite and in some cases, they offered descriptive definition for the terminologies. Thus, the results were interpreted to have implications for the educational system of translation studies to enhance its syllabus in training the technical translators. The significance of this research lies in the fact that the Persian Language and Literature Academy, which is responsible for creating economic terminology equivalents, develop a unified procedure for this purpose.

KEYWORDS: Technical Terminology, Technical Translation, Banking Terminology, Banking Terminology Translation

INTRODUCTION

Around the world, translation plays an important role in human life. When thinking about it, everything in life is a translation. Nowadays, technical text is one of those texts that play an important role in human life, because these texts help readers solve problems. Markel (2003)

quotes "technical communication is not meant to express a writer's creativity or to entertain readers; it is intended to help readers learn or do something" (p: 8). Reading these texts is generally not an end in itself. People normally read technical documents because they want to be able to do something else, for instance learn how to use software or find out about the design details of a particular device. As Dobrin (1983) explains, "technical writing adapts technology to the user" (p: 247).

Technical translation involves translation of documents produced by technical writers or more specifically, texts that relate to technological subject areas or texts which deal with technological information and the practical application of science. The presence of specialized terminology is a feature of technical texts. Specialized terminology by itself is not sufficient for classifying a text as "technical", since numerous disciplines and subjects which are not "technical" possess what can be regarded as specialized terminology (Byrne, 2006).

Moreover, many non-technical documents are aimed at specific groups, but technical documents are more special, regarding the audience they are aimed at, than most documents (Byrne 2006, p: 47). It means that these special groups of people refer to these texts, in order to be familiar with a subject and increase their knowledge in that area.

Additionally, he also adds that with the increasing level of globalization of world markets and the ever-shrinking nature of the world because of modern communications, transport and multinational companies, there have been quite significant changes in the way international markets and communications work. An increasing number of companies are using English as a working language, so these technical texts should be transferred between companies and countries with different languages (Pinchuck, 1977).

The aim of technical translation is to present new technical information to the wide new audiences, not to reproduce the source text, or reflect its style or language. Technical translation is a communicative service provided in response to a very definite demand for technical information, which is easily accessible so these texts should be comprehensible, clear, and fast in delivery (Byrne, 2006).

Technical translation as technical text has different kinds; "It is commonly supposed that technical translation includes not only the translation of text in medicine and engineering but also such disciplines as economic, psychology, sociology, geography and law texts" (Javier, 2004,p:92). One kind of technical texts as Javier mentions is economic text, which is practical and consists of financial, banking etc. Stolez (2003) also defines that "economic text is not just a "source text," it has to be conceived as a text from the word of economics"(p: 188).

As Stolez (2003) believes: Economic texts have long been a central field of translation activity and hence of study and analysis. The core of economic specialized language is found in academic articles or business reports, financial accounts, forms, purchase or license contracts, etc. About the characteristics of economic texts there are some ideas such as" the discourse is often mathematical, with lots of formulas and proofs. Second, writing styles vary widely. Authors are

very dry and technical; a few are rather eloquent "(Neugeboren & Jacobson, 2001, p: 9). They also believe that economic writers do not have to be a great "writers" to produce good economics writings. This is because economics writing is different from many other types of writing. It is essentially technical writing, where the goal is not to turn a clever phrase, hold the reader in suspense, or create multi-layered nuance, but rather to achieve clarity. Elegant prose is nice, but clarity is the only style that is relevant for this purposes .

Others such as Byrne (2006) believes that technical translators needs to impersonate the original author who is generally, though not always, an expert in a particular field and they need to write with the same authority as an expert in the target language. Therefore, in this case, the challenge for the technical translator is to be able to research subjects and to have expert knowledge of the way experts in a particular field write texts. Byrne summarizes the essential areas of expertise for technical translators as subject knowledge, writing skills, research skills, knowledge of genres and text types and pedagogical skills. In other words nonliterary translation according to Galinski and Budin (1993, p: 209) is :

The non-literary translator must also be in possession of considerable subject matter knowledge (emphasis added)". Although technical translators have different concerns, such as transferring the information accurately, correctly and effectively, their challenge is to ensure that all of the relevant information is conveyed in such a way that the readers can use the information easily, properly and effectively. Their aim is precisely the same as that of technical writing, but on the whole when considering all the above mentioned characteristics, two factors are prominent; one is the translators' subject knowledge and the other is their translation ability or even their writing skill in translation (Byrne, 2006). Fluck (1992) defines these two factors in another way "the ideal non-literary translator is often defined as a sort of a combination of the subject matter expert and the trained translator".

Technical translation covers the translation of many kinds of specialized texts in science and technology, and in other disciplines such as economics and medicine (Williams & Chesterman, 2002). Especially compared with literary translation, Aixelá (2004) argues against the view that scientific prose can be perfectly or more easily translated: "The contrary is true: the extremely high requirements set for scientific and technical translation mark it out clearly from other genres, making it into an independent research field in its own right." One kind of technical texts as Javier (2004), mentions is economic text, which is practical and consists of financial, banking etc. Stolez (2003) also defines that economic text is not just a source text; it has to be conceived as a text from the word of economics .

Economy is a branch in social studies, which aims to study the production, distribution, and consumption of wealth. Knowledge in economy helps in understanding economic condition of a person or a country or understanding how the various economic agents behave or interact with each other and how the economic activities take place. Therefore, studies in economy are crucial in many aspects. In every society, laws sound to be the result of its economic conditions and development. The relationship between law and economics has increased nowadays according to

economic activity and expansion so that a new discipline called as Economic Law has been emerged .

As economic translation is a kind of technical translation, also because the bankers do economic translation for the economic documents and journals of their own organizations, as well as giving banking services to their customers it is the economy translator who should choose the exact word from the equivalents by his/her economic appreciation. But based on the website of the Academy of Persian Language and Literature, and phone talking with Mr. Mahrami, the public relations manager of the academy, there is no activity in the selection of equivalents for banking terminologies by the academy. Since different equivalents offered for economic terminology by different dictionaries, besides the lack of existence of equivalents for economic terminology in some dictionaries, there is no, based on the researcher's experience as a banker, uniform procedure in the selection of the equivalents for banking terminologies by translators. Therefore, at present research, two factors such as subject knowledge and rate of banking experts' acceptability, which may influence the quality of selected equivalents and their suggestions for banking terminologies, will be discussed.

LITERATURE REVIEW

As a field, technical translation has been recognized, studied, and developed since the 1960s. Thompson (1967), Daniel (1967) and Finch (1969) argue that Stemming from the field of translation studies, the field of technical translation traditionally emphasized much importance on the source language from which a text is translated. However, over the years, there has been a different movement from this traditional approach to focus on the purpose of the translation, and on the intended audience. In this regard, Kingscott, (2002) maintains that perhaps this is because only 5-10% of items in a technical document are terminology, while the other 90-95% of the text is language, most likely in a natural style of the source language .

Newmark (1988) believes that technical translation is only one subset of the different types of professional translation. It is the largest subset as far as output is concerned. Currently, more than 90% of all professionally translated work is done by technical translators, highlighting the importance and significance of the field (Kingscott, 2002).

What Is Translation?

The definition of translation as mentioned in the Cambridge Advanced Learner's Dictionary (2003), as to change words into a different language or change something into a new form, especially to turn a plan in to reality. Nonetheless, translation has been variously defined. The following represent some chronological definitions, which have been uttered by eminent features of translation field:

Bassnett (1980, p.11) says that "What is generally regarded as translation involves the rendering of a source language (SL) text into the target language (TL) so as to ensure that the surface meaning of the SL will be presented as closely as possible but not so closely that the TL structures will be seriously distorted ."

Seleskovitch (1977) believes that translation is a separate activity from interpretation. He defines translation in this way: "Translation is often a code-switching operation implying that a sequence of symbols from one language is substituted for a sequence of symbols in another language." It seems that the definition above focuses on the structure of translation rather than the meaning transference.

Translation Competence

A translator is a person who expresses in a language (generally in his/her mother tongue and writing) what is written in another language. It is obvious that translation is much more than just knowing two languages. There is something that distinguishes a bilingual person from a professional translator: translation competence. The competence needed to translate has also evolved due to different factors, mainly technological factors .

First of all, the term competence and then more specifically the term translation competence will be defined. Competence is the combination of skills, attitudes, and behavior that leads to an individual being able to perform a certain task to a given level. Translation competence is "a complex concept that has been addressed by a number of researchers in the field of Translation Studies" Ezpeleta (2005: 136).

Translation Equivalence

An equivalent term should thus primarily represent the referred concept by its informative content and be usable from the perspective of its user. Secondly, but still important, comes the demand for coherence with the practice of the field and linguistic and terminological acceptability. In this study, translation equivalence refers to a specific kind of technical equivalence, which is used in banks as banking terminologies.

In this regard, Karimi (2006) argues that the process of finding equivalents in two languages is that the translator should first decode the source text (ST). That is, to figure out the meaning message/intention of the original speaker or writer, and then ask himself or herself how the same decoded meaning/message/intention is encoded in the target text (TT). Kade (1968) also suggested four equivalent types: (a) Total (one-to-one correspondence), (b) Facultative (one-to-many correspondence), (c) Approximation (one-to-part-of-one correspondence), (d) Null (no correspondence).

Technical Translation

Technical translation covers the translation of many kinds of specialized texts in science and technology, and in other disciplines such as economics and medicine (Williams and Chesterman, 2002). As translations send technical information throughout the world, a wide range of people can use it. The aim of technical translation is to transmit technical information, as Pinchuck (1977) believes, and this would be just half of the story. Although, he states that technical texts are utilitarian and are intended to serve a relatively finite purpose, namely to clearly present information to the target language readers, there is more to technical translation than just simply transmitting information.

Technical Competence

Technical competence is the ability to perform the activities within a defined standard, consistently and over time. In addition, knowledge of skills in the exercises of, practices required for successful accomplishment of a business, job, and task.

Economics

There is a variety of modern definitions of economics. Some of the differences may reflect evolving views of the subject itself or different views among economists Backhouse, Roger E, and Steven Medema (2008). Antoine de Montchrestien (1615) believes that the earlier term for 'economics' was political economy. It is adapted from the French Mercantilist usage of *économie politique*, which extended economy from the ancient Greek term for household management to the national realm as public administration of the affairs of state. James Steuart (1767) wrote the first book in English with 'political economy' in the title, explaining that just as:

Economy, in general, is the art of providing for all the wants of a family, so the science of political economy seeks to secure a certain fund of subsistence for all the inhabitants, to obviate every circumstance which may render it precarious; to provide every things necessary for supplying the wants of the society, and to employ the inhabitants in such manner as naturally to create reciprocal relations and dependencies between them, so as to supply one another with reciprocal wants.

Translation of Economic Texts

Economics is a broad and complex subject field with several sub-fields like macro- economics, micro economics and economics of a particular state and like that. For perfect economic translation, the economic translator must have in-depth knowledge on the particular part of economics that he or she is going to translate. For non-academic economic document translation, knowledge on the specific field is required. By the way, proficiency in both source and target languages is necessary for accurate economic translation. Robbins (1932) believes that economic translation is the translation of documents related to economics as an academic discipline and non-academic documents like bank articles, sales reports, and more. In this regard, based on Newmark's (1988) definition, economic texts are technical texts and consequently their translation is a part of technical translation. Newmark (1988) believes that technical translation is a kind of specialized translation, institutional translation, the area of politics, commerce, finance, government etc.

Terminology

Terminology is regarded as the systematic designation of defined concepts within a specific field, requiring specialized knowledge and the authorization to exercise a specific profession connected to this specialized knowledge. Terminology is also defined socially: people with specific qualifications for exercising a given profession also connect it to language use in specific professional situations .One might say that since in the realm of science and technology, a set of standard terminology with predefined equivalents exist, there is no terminological level problem in translating technical texts. However, International standardized terminology is very rare (Stolze, 2009). The reason is that new technical concepts are made every day. Many dictionaries

suggested meanings for technical concepts are not equivalent to the original because of different cultural implications and backgrounds.

Banking Terminology

Banking terminology refers to terminologies that are used in banking process in journals, especially in the International Affair Department, Business Affair Department, Money Laundering Department, and the Letter of Credit Department of selected branches that are dealing with foreign countries. These affairs include export, import, and opening of letter of credit.

RESEARCH QUESTION

What is the difference between translation of banking terminology in dictionaries and that used by banking experts?

METHODOLOGY

Participants

The participants of this research were banking experts. To this regard, 40 banking experts participated in this study. They were male and female, between 35 to 45 years old. They had years of experience in the fields of English translation, English teaching, English literature, General Linguistics, Applied linguistics, Economics, Management, and political law. They were employees of the International Affair Department, Business Affair Department, Money Laundering Department, and Selected Branches of six Iranian Banks, Melli, Eghtesad Novin, Tejarat, Refah, Sepah, and Keshavarzi.

Material

In order to fulfill the purpose of the present study, three different dictionaries and eight books were chosen as material. The chosen materials were as follows.

- Aria Banking and Economic Specialized Dictionary (2011)
 - Aryanpour Dictionary (1988)
 - Farhang Moaser Money, Banking and International Finance Dictionary (2011)
 - Uniform Rules for Collections (1996)
 - Force Majeure and Hardship Clause (2003)
 - Uniform Customs and Practice for Documentary Credits
 - Uniform Rules for Demand Guarantees
 - Uniform Rules for Bank Payment Obligations
 - United Nations convention on Contracts for the International Carriage of Goods Wholly or Partly by Sea
 - Incoterms 2010 International Chamber of Commerce (ICC) Rules for the Use of Domestic and International of Trade Terms
 - Case Study on Documentary Credits (Problems, Queries, Answers)
- (ICC) International Chamber of Commerce, The World Business Organization, publishes these books.

Instrumentation

In order to capture all possible results of the research question, the instrumentation was cautiously presented in one section, which has been arranged in one questionnaire package. The questionnaire package was a banking terminology equivalents. The test used in this research was economic terminology translation test, consisting of one hundred and ninety seven sentences which included two hundred and fourteen banking terminologies. In every sentence, there was at least one underlined banking terminology that was extracted from sources that are used in banks. These sources were prepared from ICC (International chamber of commerce) and its equivalents in Persian language from three dictionaries, i.e. Aria Banking and Economic Specialized Dictionary, Aryanpour Dictionary, and Farhang Moaser Money, Banking and International Finance Dictionary.

Theoretical Framework

The theoretical framework of this study was based on the Katamba and Tajvidi's model . (Katamba, 2006), in productivity of word-formation, explains three kinds of productivity:

Procedure

After preparing banking sources such as articles, books, and journals, all banking terminologies, which were two hundred and fifteen (excluding the repeated ones), were extracted and written down. From those sources, a questionnaire that consisted of four choices A, B, C, and D was prepared. Then, the researcher found Persian equivalents for those banking terminologies from three different dictionaries and wrote them in the choices A, B, and C. In the next step the researcher requested forty banking experts to select the best equivalent from one of the choices of A, B, and C. If none of the choices were equivalent for the underlined banking terminology, they were requested to write their own equivalents in choice D, based on their own banking experience. In the last step, the selected answers by banking experts were compared and analyzed on (Katamba, 2006) and (Tajvidi's, 2000) framework model to select the best equivalent for banking terminologies.

Collecting the data

The present study reports the data analysis in a chronological order, discusses the description of banking terminologies equivalents in Persian language at first, and then illustrates the inferential analysis performed on the research question.

RESULTS AND DISCUSSION

According to the results tabulated in the table 1, most of the banking experts provided their own equivalents for underlined banking terminologies. The total descriptive result of the questionnaire investigation is as follows:

Table 1: Results Summary of the Questionnaire

Choice	A	B	C	D	N	Total
Frequency	5	7	7	15	6	40
Percentage	%11.90	%17.48	%18.74	%36.37	%15.51	%100

As can be seen in the above table, 5 out of 40 banking experts equal to 11.90 percent, have chosen banking terminology equivalents from choice A, which its equivalents in Persian language were extracted from Aria Banking and Economic Specialized Dictionary. 7 out of 40 banking experts equal to 17.48 percent, chose B, which its equivalents were extracted from Aryanpur Dictionary, and 7 out of 40 banking experts equal to 18.74 percent, choice C, which its equivalents were extracted from Farhang Moaser Money, Banking and International Finance Dictionary.

In addition, banking experts were asked to write their own equivalents in choice D if none of choices A, B, or C were equivalents for underlined banking terminologies in the questionnaire. In this regard, 15 out of 40 banking experts equal to 36.37 percent, produced their own equivalents for underlined banking terminologies in choice D. Moreover, banking experts were requested to select choice N if they had no comments on the underlined banking terminologies. In this regard, 6 out of 40 banking experts equal to 15.51 percent, had no comment. The total indicates that 100 percent of the choices were chosen by 40 banking experts.

As mentioned before, 15 out of 40 banking experts equal to 36.37 percent, made their own equivalents for underlined banking terminologies. Compound banking terminologies were part of them and the overall frequency and percentage were illustrated in the table below:

Table 2: Percentage of suggested equivalents of samples for compound words

Items (Compound words)	Equivalents in Persian Language	Percentage	Frequency	Total Percentage	Total Frequency
Remitting Bank	بانک و اگذارنده، بانک فرستنده، بانک ارسال کننده، بانک و اگذارنده در کشور فروشنده، بانک پرداخت کننده، بانک ظرف صادر کننده، بانک واریز کننده،	%0.14	0.06	%36.37	40
Performing Party	انجام دهنده، طرف مجری، شرکت انجام دهنده حمل و نقل، شرکت عامل، عامل حمل، طرف تهیه کننده کننده کالا، شخص عملیاتی، اجرا قرارداد	%0.33	0.13	%36.37	40

The examples above were samples of compound words for banking terminologies in this study, whose equivalents were produced by banking experts in Persian language. Apparently, whether based on the subject knowledge of banking experts or not, approximately most of banking experts tend to create their own equivalents for a number of compound words of banking terminologies.

Phrases

There are a number of phrases among banking terminologies, but in the compassion of compound words, banking experts offered their own less equivalents for those phrases.

Table 3: Percentage of suggested equivalents for banking terminology phrases

Items (phrases)	Equivalents in Persian Language (Offered By Banking Experts)	Percentage	Frequency	Total Percentage	Total Frequency
Bill of Exchange	No comment	0	0	%36.37	40
Bill of Lading	بارنامه، بارنامه کشتی	%27.5		%36.37	40

The Influence of Education on the Equivalent Selection

Moreover, while analyzing the data, the researcher came to an finding that in the offering of the equivalents for banking terminologies, that were offered by banking experts, who had Ph.D educational degree, were different from other equivalents which were offered by other banking experts. The samples of this category were tabulated in table 4:

Table 4: Samples of PHD degree banking expert equivalents for banking terminologies

Items (Banking terminologies)	Equivalent(s) offered by Ph.D Degree Experts	Other Experts Equivalents
Facsimile	نگار دور	فکس، رونوشت برابر اصل، کپی برابر اصل،

Apparently, based on data analysis of the samples of Ph.D degree banking expert equivalents, there is a significant difference between Ph.D degree banking expert equivalents and those offered by other experts. In the following sentence, "Details of the drawee, including full name, postal address, or the domicile at which presentation is to be made as well as applicable telex, telephone and facsimile numbers", It is entirely clear that as "facsimile" is not a document and "دورنگار" is a proper equivalent, which is offered by a Ph.D degree banking expert, rather than the equivalent "رونوشت برابر اصل، کپی برابر اصل" which was suggested by other experts that talks about a document or "فکس" that is foreignized. Moreover, foreignization is one of the problems in finding equivalents for a number of banking terminologies. After analysis, the results were revealed and are indicated in the following table.

Table 5: Samples of foreignization equivalents for banking terminologies

Items (Banking Terminologies)	Choice A	Choice B	Choice C	Choice D (Experts Suggestion)
Perforate	##	سوراخ کردن	##	Perforate

According to table 5, there are no equivalents for these samples of banking terminologies in Persian language and that experts used the exact English words while translating, as well as while

talking to bank customers. The problem is that the customers who deal with banking affairs, especially with the International Foreign Affairs Department, do not understand the exact meaning of these terminologies. In this regard, since all of the banking terminologies are international expressions, there were no choices and alternative options for banking experts. Thus, they use the English words as an equivalent for banking terminologies.

Significant Differences and oppositions to the Selected Equivalents

According to the results of this study, the researcher found that there are significant differences among the presented equivalents for banking terminologies by banking experts. After identifying the opposite equivalents, their classification is as follows:

Table 6: Samples of Significant differences and oppositions in the selected equivalents

Items (Banking Terminologies)	Choice D (Banking Experts' Comments)	Percentage	Frequency	Total Percentage	Total Frequency
Free Out	هزینه تخلیه از کشتی، تخلیه کامل، مسیر دریایی درست، آزادسازی، تخلیه کامل کشتی در پایان قرارداد، بدون هزینه تخلیه	%0.13	0.05	%36.37	40
Relent	با مشتری مدارا کردن، چشم پوشی کردن، تخفیف دادن، قبول نکردن، زیربارن رفتن، قبول کردن، نرم شدن	%0.17	0.07	%36.37	40
Attestation de verification	گواهی تطبیق، تأیید قبولی، تصدیق گواهی، صحه، احراز، اصالت، سرویس تأیید گواهی، انگلیسی نیست	%0.20	0.08	%36.37	40

As can be seen, in the data analysis of banking terminologies, the researcher found significant differences among the samples of the presented equivalents in choice D. In this regard, a number of banking experts produced their own equivalents as they were dealing with a general text, and use general equivalents for an economic expression. In the terminologies "free out" and "relent", respectively 0.05 and 0.07 out of 40 banking experts equal to 0.13 and 0.17 percent, offered their own equivalents. Apparently, in both cases, banking experts have an opposite idea about them. Moreover, in the expression "attestation de verification" a number of banking experts believed that the mentioned word is not an English word and had no idea about it, but other experts offered their own equivalents.

Descriptive Explanation and Collocation of Banking Terminology Equivalents

When words appear next to banking terms and within a banking context, their meanings may differ from their general or common meanings. Collocation is a problem known as a translator's trap. For instance, based on Aria Banking and Economic Specialized Dictionary, and Farhang Moaser Money, Banking and International Finance Dictionary, the equivalent for the compound word "advising bank" is "بانک ابلاغ کننده". But most banking experts believe that since the word "ابلاغیه" has judicial meaning, hence there is no collocation between "بانک" and "ابلاغیه", and in this regard the violence of collocation range in Persian language occurs according to most

banking experts as the proper equivalent for “advising bank “is” بانک اطلاع دهنده”. Apparently, deciding upon collocations and their meaning are important issue in banking terminology equivalents.

Table 7: Samples of collocation of equivalents

Item (banking terminology)	Choice D (Banking Experts' Comments)	Percentage	Frequency	Total Percentage	Total Frequency
Advising Bank	بانک اطلاع دهنده	%0.31	0.12	%36.37	40

According to table 7, 0.12 out of 40 banking experts equal to 0.31 percent, offered “ بانک اطلاع دهنده” as an equivalent for “advising bank”.

Moreover, Based on Newmark (1988), “usually descriptive terms which suddenly become technical terms, their meaning sometimes hides innocently behind a more general or figurative meaning”. Due to the results, a number of banking terminologies are categorized in the following table.

Table 8: Samples of Descriptive explanation of banking terminology equivalents

Items(Banking Terminologies)	Choice D Banking experts' explanation	Percentage	Frequency	Total Percentage	Total Frequency
Negotiation	پرداخت وجه اسناد پس از معامله توسط بانک گشایش کننده	%0.06	0.02	%36.37	40

As table 8, shows, based on the principle of economy, it is not possible to consider equivalents for a number of banking terminologies, thus the experts have to describe the term and use it as an equivalent.

Failure of Banking Experts in Giving Banking Terminology Equivalents

After analyzing the results of this study, the researcher found that banking experts could not offer their own equivalents for a number of banking terminologies, even for some simple ones. The following table shows the results.

Table 9: Samples of Failure of Banking Experts in Giving Banking Terminology Equivalents

Item (banking terminology)	Choice N No Comment	Percentage	Frequency	Total Percentage	Total Frequency
Intended	###	%0.11	0.04	%15.51	40

According to table 9, the results show that a number of banking experts were unable to offer a number of terminology equivalents. For the item "Intended", it was predicted that most of the

banking experts knew the terminology equivalent in Persian language, but 0.04 out of 40 banking experts equal to 0.11 percent of them were unable to offer it.

All Agreement of Banking Experts in Compound Words Equivalents of Banking Terminologies

By analyzing the results of this study, the researcher came to an interesting result. For a number of banking terminologies especially compound words the equivalents of banking terminologies were approximately chosen by common consent of banking experts. The results are shown below:

Table 10: Samples of all agreement of banking experts compound words equivalents of banking terminologies

Item (banking terminologies)	Choice D	Percentage	Frequency	Common Consent percentage	Common Consent Frequency	Total Percentage	Total Frequency
Foreign Debt	بدهی خارجی	%0.40	0.16	%0.34	0.13	%36.37	40

As was previously mentioned, banking experts tend to offer their own equivalents for compound words. As seen among the samples, a number of compound word equivalents, offered by banking experts, are the same suggested equivalents. For example, for the term “foreign debt” 0.16 out of 40 banking experts equal to 0.40 percent, offered their own equivalents, in which 0.34 percent of offered equivalents for the term is "بدهی خارجی".

Shortage of Banking and Economic Specialized Dictionaries in Offering Banking Terminology Equivalents

After analyzing the prepared questionnaire of banking terminologies, which were answered by banking experts, the researcher found that there were no equivalents for a number of banking terms in Banking and Economic Specialized Dictionaries. A number of banking experts selected the equivalents from Aryanpour General Dictionary, in which the offered equivalents were not related to banking and economics. Table 11, indicates the results.

Table 11: Samples of shortage of banking and economic specialized dictionaries in offering the banking terminology equivalents

Item (banking terminology)	Choice A	Choice C	Percentage Choices A and C	Frequency Choices A and C	Total Percentage choice A	Total Frequency choice A	Total Percentage choice C	Total Frequency choice C
Courier	0	0	0	0	%11.90	5	%18.74	7
Initiative	0	0	0	0	%11.90	5	%18.74	7

According to table 11, it is clear that there are no equivalents for the underlined term in the choices A and C that respectively were extracted from Aria Banking and Economic Specialized Dictionary, and Farhang Moaser Money, Banking and International Finance Dictionary.

In the investigation of banking expert's skills or their tendencies to suggest their own equivalents for banking terminologies, which were described throughout this study. Therefore, what was conspicuous here was that in comparison of the translation of banking terminology in the dictionaries and that used by banking experts, the researcher found that banking experts, to a large extent, reflected their own equivalents for most of the banking terminologies. As there is no activity by the Persian Language and Literature Academy in developing equivalents for economic, financial, and banking terminologies in Persian language, the researcher had to compare banking terminology equivalents in and among dictionaries and banking experts. It was concluded that through this study that more investigation and work is needed in financial translation field from both sides, the banking experts and, especially, the Academy, which is responsible in these areas. It is necessary for the Academy to make a reliable reference of equivalents for economic, financial, and banking terminologies.

CONCLUSION

According to the results of this study, the researcher came up with the conclusion that there is no effort by the Persian Language and Literature Academy to make equivalents for economic terminologies. Moreover, the results demonstrated that there were no equivalents for a number of economic terms in dictionaries, even in specialized ones. Besides, banking experts mostly suggested their own equivalents for them. But among them, there were significant differences or entirely opposite and descriptive definitions for a number of the equivalents .

The outcome of this study was that by scrutinizing various aspects of banking terminology equivalents, and by examining the ways they have been translated, the researcher concluded that there are no equivalents for a number of economic terms in dictionaries, even in specialized ones. Besides, the banking experts' current information is not enough in suggesting economic equivalents, and thus more investigation and work is needed in the economic translation field by banking experts. Moreover, there is a need for an academy to create a teamwork effort in the field of economic terminology translation, in the sense of being more specific, in order to develop a reliable reference for presenting proper equivalents in economic translations.

Limitations of the study

As the limitations of this research, it is necessary to mention that: the gender and age of the experts is not considered in this research. Also, despite the variety of economic texts that contains banking terminology, there are not enough proficient translators for these texts. In fact, many economic texts are not translated yet. Since in this research it is necessary to compare the dictionary equivalents of banking terminology and those suggested by banking experts, therefore, despite the many books in this regard, only seven books which are most commonly used in banks are selected as the materials of this research.

On the other hand, as the researcher is a banker, thus he prefers to work on economic translation. But, it is out of reach of this study to analyze the equivalent of all types of economical terminology. Therefore, only banking terminology is chosen as the main focus of this research.

THE COMPARATIVE STUDY OF THREE DIFFERENT GENRES ON THE BASIS OF HOLLIDAY'S SYSTEMIC FUNCTIONAL GRAMMAR FRAMEWORK

Pezhman Bagheri

Department of Foreign Language, Isfahan (Khorasgan) Branch, Islamic Azad University, Isfahan, Iran

Bahram Hadian

Department of Foreign Language, Isfahan (Khorasgan) Branch, Islamic Azad University, Isfahan, Iran

ABSTRACT

This genre-based study aimed to investigate three different genres on the basis of Holliday's ideational met function. To this end, three genres, drawn from high school and university books of Iran, have been selected for the investigation. The purpose was to see whether we can consider some unique characteristics for each genre in terms of used processes or not. The three genres used in this study were economy, biology, and theology. In order to determine the frequency of different processes of ideational met function, the verbs indicating the processes have been counted. After data analysis, it was found that in three mentioned genres, the relational and martial processes have been used with more frequently as compared with other processes, and relational process have been used in theology genre with less frequently as compared with the other two genres. Furthermore, the economy genre was similar to biology genre in terms of the frequently of existing processes. But, both economy and biology genres were quite different from theology genre. The overall conclusion is that the aim of biology and economy genres is to demonstrate the relationship between the phenomena which are of concrete nature, and the theology genre pays much more attention to man and his behavior. Finally, the findings of this study can provide worthwhile implications and insights in light with educational and scientific objectives, which are useful for textbook designers, teachers and other practitioners. The insights resulting from this study can also be influential for educational objectives and methods.

KEYWORDS: Genres, Metafunction, Process, Context, Content Analysis.

INTRODUCTION

According to Swales (1990, p.58), a genre “comprises a class of communicative events, the members of which share some set of communicative purposes. These purposes are recognized by the expert members of the parent discourse community and thereby constitute the rationale for the genre. This rationale shapes the schematic structure of the discourse and influences and constrains choice of content and style”. This definition has prompted lots of researchers to carry out different studies with the aim of analyzing different texts; to the extent that lots of structural components of different text types along with their distribution patterns have been identified.

Many textbooks all over the world have been designed and developed based on these genre-based analyses. Generally speaking, genre is associated with the applied specific situation as well as the specific communication goals. It should be noted that "a genre consists of three basic parts: the context of the situation, role and relations between the two parts, the first feature-language" (Baber & Conrad, 2009). In other words, a genre is first described based on its salient grammatical and lexical characteristics; in addition, its situation context is described. For example, whether a text is written or oral, or whether it is interactive or not, and what is the communication goal? On the other hand, the relationship between the linguistic features and properties of context (e. g, the purpose of the association) should be determined. That is because genre is basically a functional approach. Hence, there is an intertwined interaction between genre- based studies and linguistic doctrines, and many studies have used linguistic doctrines in analyzing written genres. One of the functional linguistic doctrines that have been widely used in analyzing spoken and written genres is Holliday's systemic functional grammar. This theory is a functional theory of language. In other words, it explores the language in terms of its functioning in human lives (Tavernier, 2004). Systemic-functional linguistics (SFL), as its name suggests, considers function and semantics as the basis of human language and communicative activity (Martin, Mathieson & Painter, 1997). The term 'systemic' refers to the view of language as "a network of systems, or interrelated sets of options for making meaning" (Halliday, 1994, p.15).

One of the basic concepts in Holliday's systemic functional grammar is language metafunctions. Halliday (1985) identified three metafunctions, namely ideational, interpersonal and textual. The ideational met function of language deals with language as representation: it focuses on the role of language in representing and shaping reality. Language is able to fulfill this function by subdividing reality into processes that take place, entities that can take part in these processes (living beings; concrete and abstract things), and qualities that we can use to describe these entities (Tavernier's, 2004). As Holliday and Mathieson note (1997, p.14), "the ideational meatfunction is concerned with 'ideation' that is grammatical resources for construing our experience of the world around us and inside us. One of its major grammatical systems is TRANSITIVITY, the resource for construing our experience the flux of 'goings-on', as structural configurations; each consisting of a process, the participants involved in the process, and circumstances attendant on it." As different types of processes are used in the analysis, so the concentration is being made on describing the different types of processes and their associated configurations of particular roles. This study is based on ideational functional language which consists of six types of processes one of the functions of a clause is to represent experience: to describe the events and states of the real (and unreal) world. In the SFL model, a representation of experience consists of: 1.Processes Processes: what kind of event/state is being described. 2. Participants, Participants: the entities involved in the process, e.g., Actor, Sayers, Sensor, etc. 3.Circumstances Circumstances: specifying the when, where, why and how of the process.

Register is also an important notion in Holliday's systemic functional grammar, which is based on the selection among different varieties of the language. This selection is not actually accidental and is restricted based on the given register. Halliday (1990) interprets this notion as "a semantic concept" which "can be defined as a configuration of meanings that are typically associated with a particular situational configuration of field, mode, and tenor."(p.38).The linguistic features

(specific expressions, lexicon-grammatical and phonological features) and the particular values of the three dimensions of field, mode and tenor determine the functional variety of a language (Halliday, 1994, p.22). These three parameters can be used to specify the context of situation in which language is used. Field of discourse is defined as “the total event, in which the text is functioning, together with the purposive activity of the speaker or writer; it thus includes the subject-matter as one element in it” (p. 22). The field describes activities and processes that are happening at the time of speech. The analysis of this parameter focuses on the entire situation, e.g. when a mother talks to her child. The mode of discourse refers to “the function of the text in the event, including therefore both the channel taken by the language – spoken or written, extempore or prepared – and its [genre], or rhetorical mode, as narrative, didactic, persuasive, ‘phatic communion’ and so on” (ibid). This variable determines the role and function of language in a particular situation. When analyzing the mode of a text, the main question is ‘What is achieved by the use of language in this context?’ For example, a fairy tale (in written form) may have a narrative or entertaining function. A spoken conversation can be argumentative (in a discussion) or phatic (e.g. to contact someone or to keep in touch with someone). Tenor of discourse (sometimes also referred to as style) describes the people that take part in an event as well as their relationships and statuses. “The tenor refers to the type of role interaction, the set of relevant social relations, permanent and temporary, among the participants involved” (Halliday 1994, p.22). There might be a specific hierarchy between the interlocutors, e.g. when the head of a business talks to an employee, or they may have only a temporary relationship, e.g. when a person asks an unknown pedestrian for the time. All three variables (field, mode, tenor) taken together enable people to characterize the situational context specifically, and, thus, to recreate part of the language that is being used (Halliday, 1994).

On the account given above, different processes may be used in different genres. As an example, in instructions it is believed that substantial processes are used more common as compared with other processes. On the other hand, in news and reporting genres, verbal processes are used more often. Therefore, based on the kind of genre, the frequency of processes are different, and since the change of the processes play an essential role in determining the meaning of the texts, it seems important to find out what processes are used more in different text types. Hence, this study is conducted to finding out how the processes of ideational metafunction are distributed in three different genres, namely biology, theology and economics aiming to find out how the kind of genre can influence the frequency of processes. Resolving this issue can bring about some worthwhile insights in designing textbooks for students at schools and universities.

PERVIOUS STUDIES

Many studies, using Linguistics doctrines, have analyzed literary genres. For example, Hassan (1989) has analyzed the text from the point of view of functionalism. He believes that this approach can enhance the quality of education, and it also can resolve the social problems. That is because this way the instructors can teach better and learners can better understand and learn the language.

At the end of her dissertation titled as examining discourse texts in Sport in Persian, Sudabeh Zarei (1999) reported that like any language, the language of sport has its own vocabulary treasures and processes. In this context, the speaker sometimes uses specific terms and sometimes borrows words from a foreign language and sometimes uses fixed processes in the language. On the other hand, because of the similarities between sports and combat phenomenon, some words in this specified operational field has come into sport genres.

In a genre-based article conducted by Aghagolzade, Kord Zafaranlu and Razavian (2011), four Persian short stories from Jalal Ahmad and Sadegh Hedayat have been analyzed based on transient state within Halliday's functional grammar. The frequency of occurrence of the metafunctional ideational processes, after reviewing all the verbs in the stories, has been considered as a style index. The goal of the authors was to determine the attitude of Al Ahmad and Hedayat through the verb used that show the met functional ideational processes in the works of these authors. So to achieve this goal, They first extract all the verbs and used six ideational processes. In each of the short stories Setar and Vasvas from Al Ahmed and David koozhposht and Madeleine by Hedayat, the extracted processes were grouped based on Halliday's theory. After that the percentage and frequency of types of processes have been specified. In the end, they concluded that because Al-Ahmad in his stories has used more substantail process, so he has the more realistic view. According to what we have in the definition of substantail process, since substantial process are more tangible and concrete concepts , it can be said that their conclusion seems fairly reasonable.

RESEARCH QUESTION

The question that this study is going to answer is:

1. How do the different processes of ideational language metafiction differ in terms of frequency in economy, biology and theology?

METHODOLOGY

Since this study tries to compare the frequency of ideational processes in three different genres, it can be considered as a genre-based study in which three different genres on the basis of Halliday's ideational metafunction, especially their processes are compared. The processes to be compared are mental, verbal, relational, substantial, existential, and behavioral processes.

Materials

In line with the research objectives, three different genres were compared. Each of the three selected genres consists of 30 pages. The number of sentences in all three of genres is the same. Three selected genre are: a religious text (theology), an economic text and a biology text. The reason for the selection of these three genres is that each of the selected genres has its own structure, specialized words, and style .The texts to be analyzed have been drawn from high school and college text books in Iran.

Data collection and analysis

To gather data, this study tried to count all the paragraphs used in the texts and classify them based on the type of processes. They type of processes was determined through the kind of verbs they used. Furthermore, that a diagram for each text according to frequency of processes has been shown. Furthermore, for each genre the percentage of processes have been estimated and displayed in a separate table. After determining the frequency of the processes, (x2) chi-square has been find out whether there is a significant difference among the occurrence of processes in different genres

RESULTS AND DISCUSSION

Result of economic text

176 processes have been economic texts. A sample of analyzing economic text is presented in appendix A. Table 1 illustrates the frequency of each process.

Table1: The number and percentage of in the context of economic processes

types of process	relational	substantial	existential	behavioral	verbal	mental
frequency of process	74	56	16	14	11	0
	%42	%32	%9	%8	%6	%3

As Table 1 shows the most economic process in economic text is relational. Figure (4-1) also demonstrates this point clearly:

Figure 1: Distribution of economic genre processes

Result of biology text

As table 2 shows, like the economic genre of the most frequent process here is also relational. After relational process, substantial process is more common than other processes. A sample of analyzing biology text is presented in appendix B.

Table 2: The number and percentage of in the context of biology processes

types of process	relational	substantial	existential	behavioral	verbal	mental
frequency of process	93	49	29	10	19	3
	%46	%24	%14	%5	%9	%2

In addition, the frequency of processes is also illustrated through following graph.

Figure 2: Distribution of processes in biology genre

Result of theology text

The analysis showed that the total of number processes is 242. A sample of analyzing theology text is presented in appendix C. The table below shows the number and type of each process used in this genre.

Table 3: The number and percentage of in the context of theology processes

types of process	relational	substantial	existential	behavioral	verbal	mental
frequency of process	67	83	32	19	27	14
	%28	%35	%13	%10	%8	%6

As the table 3 shows the most frequent process in this genre is substantial. After this process, the relational process is used more often. The following graphs also confirm this point:

Figure 3: Distribution of processes in theology genre

In what follows, the distribution of processes for three genres and how they are distributed differently are indicated clearly:

Figure 4: Distribution of processes in three genres

Additionally, the Chi-square results showed that there are significant differences in terms of using processes in three different genres.

Table 4: Chi-square values for the selected text processes

	Value	d f	Sig
Chi- square in theology & economic	5.608	1	.032
Chi-square in economic & theology	6.196	1	.041
Chi-square in economic & biology	4.809	1	.07
P<0.05	Critical Value= 3.84		

As the values showed there is a statistically significant among the distribution of processes in different selected genres. In what follows, we try to justify these differences.

Discussion

Now it's time to answer the question of the research based on the result of the study. As was mention before: How is the frequency of the ideational processes in economy, biology and theology? as was seen in the economic text, a total of 176 processes, and the highest process that has been used in this context, was the relational process the reason is that this process deal with economic phenomena using linking verbs after relational process, the substantial process had the highest frequency, which indicate the important of material issues in this genre. On the other hand the mental process was the least abundant. In other words, this process is rarely used in Economic texts. Thus, the interpretation of this genre with regards to not having mental concepts should not be difficult (a part from technical words). All in all, it can be said that economic text is virtually made up of relational and substantial processes. The abundant of these two processes indicate that in economic, the purposes of material action are accompanied with economic phenomena (Clark, Feldman, & Gentler, 2000).

Relational process was also the most frequent process in biology text, and mental process was the least frequent, and it may be because biology deals with concrete stuff rather than mental entities (Lucy, 2000). Finally, in theology text substantial process was use more often. It seems that theology uses substantial processes to focus on what human being does in the word.

The result also show that economy text had less processes compared with the other three genres and that is because this genre uses less clauses and less verbs as a result.

CONCLUSION

The purpose of the study was to find out how different processes of ideational metafunction language are distributed in three different genres. The results of the study showed that each genre regarding its communicative goal has its own distribution of processes. The overall conclusion is that the aim of biology and economy genres is to demonstrate the relationship between the phenomena which are of concrete nature, and the theology genre pays much more attention to man and his behavior. The findings of this study have some valuable implication for textbook

designers and teachers in increasing their awareness of how different genres have used different processes to convey meaning. There are some limitations with this study which should be considered. The first limitation concerns with the number of texts used in the study. Furthermore, finding relevant literature regarding the application of Holliday's theory for Persian text types was difficult.

APPENDIXESA: SAMPLE OF ANALYZING ECONOMIC TEXT

فعالان صحنه‌ی اقتصاد، تولیدکنندگان، توزیع‌کنندگان و مصرف‌کنندگان هستند. تولیدکنندگان کالای تولیدی خود را در قبال پول می‌فروشند، توزیع‌کنندگان به ازای خدمتی که ارائه می‌دهند پول دریافت می‌کنند و مصرف‌کنندگان با پرداخت پول، چیزی را که به آن نیاز است، می‌خرند. بدون حضور پول هر یک از مجموعه‌های ذکر شده با مشکل روبه‌رو می‌شود. پول با اجرای نقش حساس خود، زمینه‌ی فعالیت‌های اقتصادی خود را و گسترش آن را برای دست‌اندرکاران صحنه‌ی اقتصاد فراهم می‌آورد. شاید این نکته به ذهن شما خطور کند که از طریق معاوضه نیز می‌توان داد و ستد را انجام داد و به این ترتیب، به حضور پول در صحنه‌ی اقتصاد نیازی نیست اما همانطور که پیش از این گفتیم، مبادله‌ی پایاپای با مشکلاتی همراه بود که برای رفع آن‌ها پول بعنوان وسیله‌ی مبادله تبدیل شد. همانطور که در پیکره بالا دیده می‌شود فرایند رابطه‌ی بافعالی مانند شدن، بودن، و هستن، و فرایند مادی با افعالی مانند فروختن، خریدن و دریافت کردن بیشتر از فرایندهای دیگر یافت می‌شوند. در مقابل فقط یک نمونه از فرایند ذهنی که در عبارت به ذهن خطور کردن نمایان می‌شود یک نمونه فرایند کلامی که از طریق فعل گفتن استفاده شده، در این متن وجود دارد.

APPENDIXESB: SAMPLE OF ANALYZING BIOLOGYTEXT

اگر هر نوکلئوتید علامت رمز یک آمینواسید باشد، بازهای A ، G ، C و T علامت‌های رمز چهار نوع آمینو اسید می‌شوند. بنابراین فقط چهار نوع آمینو اسید علامت رمز خواهند داشت. بدیهی است که رمز یک حرفی جوابگوی 20 نوع آمینو اسید نخواهد بود. در صورتی که رمز دو حرفی باشد فقط 16 نوع آمینو اسید علامت رمز خواهند داشت. بنابراین رمز دو حرفی نیز جوابگوی 20 نوع آمینو اسید نخواهد بود. در صورتی که رمز سه حرفی باشد، 64 رمز سه حرفی به دست می‌آید که بیشتر از تعداد رمز لازم برای 20 نوع آمینو اسید می‌باشد. در این صورت یک آمینواسید ممکن است بیش از یک رمز داشته باشد. در واقع رمزهای نوکلئیک اسیدها سه حرفی هستند. متن بالا مملو از فرایند رابطه‌ی می‌باشد که با افعال ربطی بیان شده‌اند. این متن به خوبی نشان می‌دهد که فرایند رابطه‌ی نقش بسیار مهمی در تدوین متن‌های زیست-شناسی دارد.

APPENDIXESC: SAMPLE OF ANALYZING THEOLOGY TEXT

خداوند، در قرآن کریم، خودش را نور آسمان‌ها و زمین معرفی می‌کند. نور بودن خدا به چه معناست؟ نور، آن چیزی است که خودش پیدا و آشکار است و سبب پیدایی و آشکار شدن چیزهای دیگر می‌شود. همین نور معمولی را در نظر بگیریم نور یک چراغ در اتاق، هم خودش روشن است و هم سبب روشن و آشکار شدن اشیای داخل اتاق می‌شود. نور بودن خداوند بسیار برتر و بالاتر است. او نور هستی است. یعنی تمام موجوداتی که در هستی وجود دارند وجود خود را از او می‌گیرند، و به سبب او پیدا و آشکار می‌شوند و وجودشان به وجود او وابسته است. به همین جهت هر چیزی در این جهان، بی‌انگ وجود خالق و آیه‌ای از آیات الهی محسوب می‌شود. امیر مؤمنان علی می‌فرماید: سپاس خدای را که موجودات را آفرید و با این کار خود را برای آفریدگان تجلی کرد.

THE RELATIONSHIP BETWEEN REFLECTIVE TEACHING AND EFL TEACHERS' EVALUATION OF STUDENTS' ACHIEVEMENT

ABSTRACT

This study aims to investigate the relationship between reflective teaching and EFL teachers' evaluation of students' achievement. The participants in this study consist of fifty English as foreign language (EFL) teachers of Dourod city in IRAN. The data for this study was collected via three different instruments, namely questionnaires, observation, and document analysis. First, the participants completed three questionnaires, the first one dealt with some personal information about participants and their teaching interest. The second questionnaire dealt with the statements relating to teachers' cognitions on their teaching process, (Adopted from Levin, B. (2001)). This questionnaire consisted of some statements checking different aspects of their teaching process. The third questionnaire prepared by Hilisbourugh Colledge in 1968 is a questionnaire for faculty evaluation of student performance. This questionnaire deals with the evaluation of different aspects of students' achievement. Following the administration of questionnaires, some random observations were carried out. Data management and analysis were conducted with SPSS software. I also used the teachers' evaluation of students' achievement in the form of standardized tests, submitted by the participants to support the findings from the third questionnaires. The analysis revealed that most of the participants' practices were consistent with their stated cognitions in all aspects. The analysis of the data also revealed that many of the teachers in this study are not aware of the outcomes of their stated cognitions on their teaching process, and consequently, on their evaluation of students' achievement. The results of this study revealed that there is a moderate relationship between reflective teaching and teachers' evaluation of students' achievement. The results of this study implicated that the local in-service teacher education and training program should aid teachers in identifying and refining their evaluation of students' achievement, as a means of improving their beliefs Towards teaching and consequently evaluation process.

KEYWORDS: Reflective teaching; Teachers' evaluation; Students' achievement;
In-service Teachers.

INTRODUCTION

Reflective practice has been widely researched, starting with John Dewey in 1933, who introduced the idea of reflective thought, described as an active consideration of any belief in the light of the prior knowledge and future objectives. Before the 1970s, research in the area of teacher cognition was influenced by Behaviorism. Research in the effectiveness of teaching was measured through the correlation of students' performance. During the 1980s and the years after, researchers investigated a number of different aspects and dimensions of teachers' cognitions. The main focus was on studying the way teachers think about their own works, their mental processes in planning and carrying out their teaching process, the kind of decisions made in the course of teaching, and how these beliefs may change over time.

Teacher cognition researchers have been concerned with identifying teachers' cognitions and their practices with respect to specific subject matters, foreign/second language was also among the subject which has received attention in this respect. Comparison of teachers' teaching practices with their stated cognitions has been among the common concerns as it could be inferred from Borg (2009). Researchers have employed different instruments which are classified into four categories, including self-reports, verbal commentaries, observations, and reflective writing. Applying these instruments, the researchers have produced data from pre-service and in-service teachers in different contexts as suggested by Borg (2006).

In language teacher cognition research, however, not all the curricular areas within the field of foreign/second language learning have received adequate attention. Evaluation of students' achievement is among those instances in language teacher cognition research which have been scarcely regarded in studies on teachers' cognition and practice.

Purpose of the study

This study might be helpful for those pre-service teachers who want to prepare themselves for teaching in an unexpected classroom situation. Wright (2010) states that "research and states of practice provide us [teacher educators] with inspiration for our own teacher education practice" (p.289). Integral to the process of evaluating students' achievement is that of self-evaluation by teachers. This is so because a question such as how mentally prepared were students for a given lesson cannot be divorced from the question of the degree to which the teacher tries to focus students' attention on the learning activities. During the evaluation process, the literature also suggests that teachers should include an assessment of their actions in relation to the learning activities presented and students' participation in these activities. That is why, the individual teachers are also to benefit from the results of this study, if they care about teaching as their job.

BACKGROUND OF THE STUDY

Reflective Teaching

This section deals with a brief historical overview of reflective teaching research. In this area of research, different aspects of reflective teaching and teachers' reflection are reviewed.

Background of the reflective teaching

Language teaching research in the 1970s, can originally be seen as some classroom studies, in which there was a "process-product approach toward teaching. That is, the teachers' practical teaching and the learners' achievement were observed to see how much a particular type of teaching would lead to learners' learning". If they were found to be effective, the procedures would be recognized as helpful ones which could be adopted by other teachers (Borg, 2006, pp. 5-6).

The beginning of reflective teaching research, focusing on teachers' thought, however, can be traced back to the publication of the report by National Institute of Education in 1975. "The report, then, urged for considering the relationship between thought and action as far as the teachers are concerned" (quoted in Borg, 2006, p. 7). Therefore, the researchers began to think on and search teachers' thought as one of the factors affecting their teaching behavior.

In the studies that were done in the 1970-80s, however, the subject matter to be taught was neglected. This is what Shulman (1986) refers to as "missing paradigm". Shulman (1986) suggested the term "content knowledge" including subject matter knowledge and pedagogical content knowledge which is to be used in a study of teacher cognition" (as cited in Tsui, 2003, p. 50). They can be defined, respectively, as knowledge of the subject matter (i.e. what is to be taught) and the knowledge of how to teach a particular subject matter. That is why teachers' knowledge of the subject matter to be taught became significant in reflective teaching.

Richards (1990, p. 12) believes that second language teacher education is to "provide opportunities to acquire the skills and competencies of effective teachers." This involves an awareness and understanding of the helpful skills and competencies on the part of the teacher educators. It should be noted that to understand teachers and teaching, and consequently those skills and competencies, as Borg (2009) states, we need to understand "the thoughts, knowledge, and beliefs that influence what teachers do" and also language teacher cognition research "has made a significant contribution to our understandings of the process of becoming, being, and developing professionally as a teacher" (p. 163).

The focus of language teacher cognition research, primarily, was on first language and it was "in the mid-1990s" to quote Borg (2009), that "second and foreign language teacher cognition research emerged" (p. 163). Since then, the research on second/foreign language teacher cognition has been mostly on five major themes: cognitions of novice teachers, in-service language teacher cognitions and stated practices, cognitions and practices of in-service teachers, cognitive change in in-service teachers, and comparison of novice and expert language teachers, as inferred from (Borg, 2006). In the present study, the third theme, i.e., cognitions and practices of in-service teachers, has been mainly focused upon. That is, the aim was to compare teachers' stated cognitions with regard to evaluating students' achievement and what they do inside the classroom.

Reflection-in-action and Reflection-on-action

Reflection-in-action involves teachers in critically thinking on the spot, in 'the thick of things' as discussed by (Schon 1983) about what is being taught and the intended outcome, sometimes having to assess, revise and implement new approaches and activities immediately. Schon (1987) stated that reflection occurs before and after action. This he refers to as reflection-on-action. Therefore, before teaching, teachers reflect and plan their teaching procedure and, after doing it, they consider or think about what occurred.

Areas of research in language teacher cognition

This section provides a review of the studies in language teacher cognition with regard to different curricular areas. Although this study focuses on foreign language teaching, this does not mean that language has been the only subject of studies in language teacher cognition research. Many studies can be found in relation to subjects other than language teaching. Conroy (2009) in teaching mathematics, Kenreich (2004) with geography teachers, and Zembylas (2005) with elementary school teacher.

Among the language skills, reading and writing have received some attention and in the language components, grammar can be claimed to have received the most attention in language teacher cognition research and it seems that evaluating students' achievement has been studied rarely. Communicative language teaching also was studied from this perspective. It should be mentioned that the order in which the groups of studies are presented here is based on the amount of attention that has been given to each area.

Grammar in language teacher cognition research

"Grammar has been one of the areas in language teacher cognition research which has received remarkable attention" (Borg, 2006, p. 109). Review of the related literature shows that studies focusing on grammar have concerned with one of the three dimensions discussed in this section. A group of teacher cognition researchers has focused on teachers' *declarative knowledge*. That is, they investigated teachers' knowledge of what they were teaching (rather than how to teach it). Andrews (1999) realized that non-native teachers did better in their knowledge about language than the native ones. It was noted that this knowledge does not suffice, although it is necessary. Berry (1997) has studied students' knowledge of grammar by using a questionnaire to teachers' estimation of their students' knowledge. Many incongruities were observed between what the students knew and what the teachers thought their students would know. These incongruities were not helpful at all, as they would not lead to a satisfaction of the expectations. It was observed that teachers' views about teaching grammar were based on their own learning experiences rather than formal research (as cited in Borg, 2003).

Beliefs about teaching grammar

In another group of studies, the focus has been on teachers' stated beliefs about teaching grammar. In Iran, this focus has been observed in a few of studies, that two of them reviewed here. Farshchi (2009) studied 117 male and female teachers' beliefs about the role of grammar and teaching grammar by using questionnaire. The results show that teachers' gender and the place they taught were of determined factor. In another study by Moini (2009), the beliefs of 130

Iranian teachers by means of a grammar belief questionnaire have been reviewed. The findings showed that teachers' educational backgrounds and experiences were significantly influential. In addition, their workplace seemed to have a determined role in their beliefs, although the gender difference was not influential.

Teachers' grammar teaching representing their cognitions

These kinds of studies mainly considered teachers' stated cognition with respect to some specific behavior. In one of the recent studies, Borg (2005), following "an exploratory-interpretive view of research," (p. 326) considers teachers' grammar teaching and the cognitions behind these by analyzing two EFL teachers from different countries through interviews, observation, and found that for one of them, his knowledge of grammar was thought to be the influential element in the way he treated grammar in class while this was not the case for the other participant. In another study in Turkey in an 18-month period Borg and Philipps through using interviews and observations found that teachers' beliefs are of two kinds: core and peripheral, claiming that although the teachers may peripherally seem to be incongruent with their beliefs, their practices are in line with their core beliefs.

Reading in language teacher cognition research

Some of the studies on language teacher cognition have focused on Reading. Johnson (1992) studied practices and beliefs of six novice teachers and found that "novice teachers with little experience in teaching apply the most functional and recent theoretical stance whereas more experienced ones apply the least recent beliefs". (p. 528). In an Iranian context, Khonamri and Salimi did a study in 2010, which dealt with high school teachers' beliefs on reading strategies and incongruities between the stated beliefs and the stated practices through questionnaires. Although most of the participants declared that it is necessary to explicitly teach the reading strategies, their reported practices did not indicate their beliefs (Khonamri and Salimi, 2010).

Writing in language teacher cognition research

Another area in language teacher cognition research which has been dealt with very peripherally is writing. Tsui (1996) studied the experience of an EFL teacher with respect to process writing for two years and found that teachers' cognitions and practices change by passing of time. He also sheds some light on the way in which "institutional and curricular factors can restrict teacher's capabilities to carry out actions they feel are desirable" (Borg, 2003, p. 103).

Vocabulary in language teacher cognition research

One of the few studies in teacher cognition research focusing on vocabulary instruction is a Ph.D. dissertation by Zhang (2008). In this study, Zhang examined seven Chinese EFL teachers through interview, observation, and stimulated recalls to understand their knowledge of vocabulary instruction, their practical vocabulary teaching, and the relationship between their cognition and practices. The findings showed that teachers were in appropriate level from the aspect of knowledge of vocabulary instruction. The knowledge was found to contain three different broad categories of knowing a word, i.e., form, meaning, and use. The observed practices were reported to be congruent with their cognitions except for their practices on the pragmatic use of the words

and this mismatch, according to Tsui (2003), was considered being probably due to the teachers' own lack of knowledge.

Teachers' evaluation of students' achievement

In this section, I deal with teachers' evaluation of students' achievement. Before I do so, let me discuss evaluating students' achievement, how it is used and what its characteristics are.

Evaluation of students' achievement

Steinberg (1991) supported the idea that evaluation is an integral part of learning development. Through regular evaluation, the teacher is better able to prepare work on students' learning needs in mind and will be able to address individual problems when they arise. Moreover, the process, if carried out effectively, will eventuate into students' progress and the improvement of teaching procedure.

James (1983), while agreeing with the statement that evaluation should be an on-going process, took the idea further, when she stated that teachers should be deliberate in planning for evaluation. In the process of planning for evaluation, they should determine the purpose and decide on the means of measuring the processes and outcomes and collect information via observation and careful monitoring of activities. This statement highlights the fact that observation and monitoring of activities are critical to the process of evaluating students' achievement. If teachers are to follow James-Reid's idea, there is the need to firmly establish, before teaching process, what to observe. For example, as Moyles (2002) states in a classroom they may look at how often individual students interact with them or, while checking for students' understanding of a particular concept or skills, they may look at the number of those who indicated and those who remained neutral. At the end of the teaching session, observations made during the session should be critically evaluated via the use of questions. The act of questioning is an integral aspect of the evaluation process. Highlighted later in this chapter are the kinds of questions used at the evaluation stage of teaching process. Other characteristics of evaluation highlighted by James included the fact that evaluation does not have to be on a large scale and that, overall, evaluation is concerned with the process and product of teaching, that is, teaching procedure and the outcome or results, which is, student learning.

There seems to be a consensus according to Sparapani (2000) that questions regarding students' response to various learning activities are necessary during evaluation process. However, these questions should not only focus on the achievement of cognitive skills but also on the affective. The following are some practical suggestions of how to assess students during the process of evaluating, according to Ferris and Hedgcock (1998), Foxworth (2004). They suggest the need to ask yourself: How well did students respond to the activities you planned? Were they mentally prepared for the learning activity? Were they actively involved in the learning process most of the time? Did all students learn something from the content taught? Then, try to recognize the cause of problems you encountered. Record what worked and what did not work well. Search to identify students with special weaknesses and to whom special attention must be given.

How teachers evaluate students' achievement

There are many questions which are essentials in evaluating students' achievement, such as forms of evaluation, areas to evaluate, and process of evaluation are critical to an understanding of how teachers evaluate students' achievement.

The forms of evaluating students' achievement

Computer software specifically designed for evaluation has revolutionized the form and process used by teachers to evaluate students' achievement. Bryant (1992) elaborating on the use of computer software in the process of evaluation, states that it enables the conversion of check sheets used for evaluating students' progress into electronic form making them more quantifiable. It enables not only the assessment of students and records their progress on the computer, but it also generates reports that can be used for parent reporting sessions and offer greater flexibility in modifying various aspects of a written report. It also enables teachers to reflect on the abilities that they wish to measure and minimize 'paperwork' because it allows the scanning of actual copies of students' work into the computer and have them easily available for reference.

Evaluating teachers' performance during teaching process

Integral to the process of evaluating students is that of self-evaluation by teachers. This is so because a question such as how mentally prepared were students for a given course of instruction cannot be separated from the question of the degree to which the teacher tried to focus students' attention on the learning activities.

The literature does not exclude teachers looking at their actions during evaluation process. Rather, it encourages critical assessment via the use of questions directed at teachers' actions during teaching process. Ferris (1998) support this idea. During the evaluation process, the literature also suggests that teachers should include an assessment of their actions in relation to the learning activities presented and students' participation in these activities. During this process, Foxworth (2004) suggests a number of useful questions. For example, teachers should ask, "Did I guide the students through problems or examples, checking how well they were doing? Did I assess whether or not the students were ready to go on to independent practice? " (p.65). The other areas that would require teachers' attention during evaluation process are teaching methods and objectives.

Reflective Teaching and evaluation of students' achievement

Having identified potentially how teachers' evaluate students' achievement, I try to examine what actions and thoughts indicate their use of reflective teaching in their evaluating students' achievement. As stated in the foregoing discussion by James (1983), the overall aim of the process of evaluation is to enable teachers to prepare work with students learning needs in mind but, more important, if the process is carried out effectively, it will eventuate into students' progress and the improvement of teaching and the teacher as a teacher. The idea of teacher and students' progress is integral to reflective teaching. According to Cole (1997), Coyle (2002), reflective teachers are involved in analyzing, discussing, evaluating, changing, and developing their practice, which will eventuate into student improvement.

There are a number of other characteristics of reflective teaching which demand that teachers, recall, consider and evaluate their teaching experiences as a means of improving future ones, as inferred from (Farrell, 2001; Coyle, 2002). Elder and Paul (1994) pointed out that teachers need to think critically. This involves the willingness to question, take risks in learning, try out new strategies and ideas, seek alternatives, take control of learning, use higher order thinking skills and be able to reflect upon their own learning processes. According to Cunningham (2001), they discuss and analyze with others problems they encounter in their classroom, to aid their analysis of situations, which can eventuate into improved future classroom encounters. Reiman (1999) suggests that they identify personal meaning and or significance of a classroom or school situation, confront the uncertainty about their teaching philosophies and, indeed, their competence. In addition, they should include self-examination. This involves assessing beliefs and values and engaging in discussions that lead to self-understanding and self-improvement which can eventuate into being a better teacher-learner, thus facilitating necessary changes both in self, others and teaching context, as inferred from (Coyle, 2002; Posner, 1989; Hatton & Smith 1995). Calderhead (1992) stated that reflective teachers also analyze and evaluate their own practice, school, classroom relationships, context, and make use of what they have learnt to inform decision-making, planning and future action, and this can eventuate into school improvement.

RESEARCH ASUMPTIONS

Based on the related literature, it can be assumed that reflective teaching influences their practices as it could be also induced from Foxworth (2004). That is, their cognitions are among the factors in taking responsibility for their actions as mentioned by Farrel (2001). Since, reflective teaching and its relationship with evaluating students' achievement have not been the focus of the recent studies, to a considerable extent, the nature of such a relationship will be investigated in this study.

RESEARCH QUESTION

This study tries to answer the following question.

Is there any relationship between reflective teaching and EFL teachers' evaluation of students' achievement?

RESEARCH HYPOTHESIS

The research hypothesis of this study is as follows:

H1: There is a relationship between reflective teaching and teachers' evaluation of students' achievement.

METHODOLOGY

participants

In order to answer the research question for this study, and understanding the action of reflective teachers, fifty participants who were teachers, teaching in high schools were selected. The participants include both male and female teachers having different teaching experience.

Regarding the sampling procedure in this study, it should be mentioned that it took place purposefully. To do this, different criteria were considered. One of these criteria was the awareness of teachers with the concept of reflective teaching and what reflective teachers do in their classes. If they had enough knowledge about the concept of reflective teaching, they would be selected as a participant in this study and if they had not, they would be acquainted with it. Based on that, the researcher talked to sixty five teachers among whom fifty agreed to participate in this study. The purpose and the data collection procedure of the study were clarified, besides the things they were asked to perform.

Instrumentations

The data for this study was collected through three different sources, as follows:

Questionnaires

The main sources of data collection in this study were three questionnaires. They contain closed and ranked questions and also open-ended questions. In order to collect some biographical information and become familiar with participants' characteristics, their teaching experiences and also their teaching interest, I prepared and distributed the first questionnaire. The second questionnaire deals with some questions relating to teachers' cognitions on their teaching process. This questionnaire consisted of some questions that ask respondents (teachers) if they have checked different aspects of their teaching procedure or not. In this questionnaire, participants are required to see if they have checked some basic elements in their teaching process or not. Those elements are categories such as: Purpose for learning, attention, learner-centered focus, thinking skills, assessment, anticipation of problems and finally evaluation. In the second questionnaire, the teachers are asked to answer the questions about their reflection which deals with evaluating students' achievement. In the third questionnaire, the participants were required to complete three sections. In the first section, respondents were asked to answer to questions that deal with the number of students on first day roster and also number of students who failed to complete the course due to the quality of the work or lack of attendance. In section two, the respondents were asked to check the general education core curriculum statements (minimum of three) that they chose as applicable to this course. Finally, participants must evaluate students' performance as measured against your selected general education and cluster outcomes. In order to reduce the difficulty that some of the respondents had in translating the questionnaires, I provided respondents with Persian equivalent of questionnaires which this also improves validity of the results of this study. The questionnaires of this study have been used in different articles and this could illuminate that they are reliable and valid enough to be adopted for this study, I also calculated their reliability value for them which this also could validate the results of the study. My supervisor and advisor also affirmed this issue. Members of the committee and subcommittee must be thanked to allow me to use their questionnaires.

Observations

As the second source of data, the researcher had some class observations which were all recorded during fall semester. For this reason, at first, I prepared an observation sheet which controlled different aspects of the second questionnaire, and then, compared what I observed in their teaching practices with their stated cognitions on second questionnaire. The researcher made these observations randomly for ten of the participants in order to confirm or reject the data obtained from the second questionnaire answered by participants.

Documentary analysis

The fact that meaning and perception are evident in documents, as inferred from Hodder (2000) affirms the use of documentary analysis. Hence, the analysis of a document could reveal many of the author's perspectives. One way to elicit people's perceptions is to examine their writings. For this study, participants' stated cognitions to questionnaire for faculty evaluation of students' performance and their evaluation of students' achievement in the form of final English language tests are compared and analyzed.

Data Analysis

This section deals with the data analysis procedures that have been followed for this study. As it was mentioned earlier, for analyzing the data, the software, **SPSS 21**, has been used.

Descriptive and statistical analysis

To analyze the data in this study and to answer the research question, descriptive statistics in the form of graphs for describing participants' characteristics and also their answers to different questions in questionnaires was used. In inferential section, to determine the normality of the data, Kolmogorov-Smirnov Test was used, and also to specify whether there is a relationship between the variables in this study Pearson Correlation was used.

In this study, for analyzing the data, at first, descriptive statistics was used to reveal the participants' characteristics such as: age, gender, teaching experience and so on, next description of respondents' responses to different questions in questionnaires was carried out, then, respondents' stated responses to questionnaires were compared with observations. Finally, based on the hypothesis, to specify the accuracy of the data obtained in previous section, related statistical tests were used by using spss21 software. In order to receive a clear picture or a detailed description of some of the participants' responses who comment to some of the questions in questionnaires, the researcher also employed both a within case and a cross case analysis of the respondents' comments to some of the questions in the questionnaires.

Within-case analysis

The within-case analysis involved a detailed description of each participant's stated response to different questions in questionnaires. The purpose as stated by Creswell (1998), was to allow me to become intimately familiar with each participant's response to different questions, which in turn allowed me to identify the unique patterns in each of their views and according to Eisenhardt (1989), performing this process accelerated the cross-case comparison. The fact that there was no set standard formats to carrying out within-case analysis or content analysis, as stated by

Eisenhardt (1989), gave me the freedom to create my own with the help of the writing of Powell and Renner (2003).

Cross-case analysis

A cross-case analysis is valuable to compare the cases systematically to see factors that are present in all the responses, those that are present in some responses and not others, and those that are entirely absent. Day (1999) is of the opinion that researchers give little thought or effort to the involvement or learning of teachers who are their subjects. A cross-case analysis involves examining themes or categories across cases, to find those that were common to all cases. I started this process with the development of categories based on my examination of the responses from the within-case analysis. In cross-case analysis process, I first categorized the answers given to the questionnaires, through a process of moving between these responses, I looked for similarities and differences, as suggested by (Powell & Renner, 2003). I then through a process of further analysis, draw conclusions about differences and similarities in respondents' views, according to the identified category.

RESULTS AND DISCUSSION

In this section, at first, participants' responses to self-reflection questionnaire and questionnaire for faculty evaluation of students' performance will be presented. Next the observations have been made to determine the congruity between responses and their practices with respect to what they have checked in self-reflection questionnaire. Then, teachers' evaluation of students' achievement in the form of final tests have been provided to possibly confirm the findings obtained from the questionnaire for faculty evaluation of student performance. Participants' real names for the ethical matters and with the same aim, presenting some exact personal data is avoided according to Borg (2009) and Duff (2008). Participants' responses to self reflection questionnaire have been classified in Table 1. In this table FY stands for frequency of participants who check the question in their teaching. FN stands for frequency of participants who did not check the question in their teaching. PY stands for percentage of participants who check the question and PN stands for percentage of participants who did not check the question in their teaching process.

Table 1: Participants' stated responses to self-reflection questionnaire

Self-reflection questionnaire	F FY	F FN	PPY	PPN
Did you share your objectives with the students you were teaching? If not? Why not?	42	8	84%	16%
Why are objectives important?	32	18	64%	36%
Did you tell the students why they were learning the information in your lesson?	24	26	48%	52%
If not, did you ask the students to share what they would get out of learning the information?	15	35	30%	70%
If neither you nor the students set a purpose for learning, why not?	9	41	18%	82%
Why is setting a purpose for learning important?	27	23	54%	46%
Did you capture their attention?	41	9	82%	18%
Did you keep their attention?	26	24	52%	48%
If not, what would you do differently?	7	43	14%	86%
Was the lesson appropriate for most of the students at the age level?	42	8	84%	16%
If not, was it too easy or too hard?	13	37	26%	74%
Was the lesson related to the students' interest? How do you know?	30	20	60%	40%
Did you build on the students' knowledge?	35	15	70%	30%
If yes, how do you know? If not, why not?	11	39	22%	78%
Why should you build on prior knowledge?	19	31	38%	62%
Did you discuss meta-cognition with the students? If not, why not?	14	36	28%	72%
Why should the students discuss meta-cognition?	8	42	16%	84%
Did you assess student learning and performance? If not, why not?	28	22	56%	44%
If yes, was your assessment in line with your objectives?	34	16	68%	32%
Was your assessment authentic? If yes, how do you know?	17	33	34%	66%
Did the students achieve your objectives?	27	23	54%	46%
Which ones did they achieve?	14	36	28%	72%
Which ones do you not know whether they achieved?	10	40	20%	80%
Did you teach or assess for transfer? If not, why not?	13	37	26%	74%
Why is transfer important?	10	40	20%	80%
Did you have enough time? did you have plans for what to do with the extra time?	40	10	80%	20%
Were there any problems that you had anticipated? Describe what happened.	32	18	64%	36%
Were there any problems that you had not anticipated? Describe what happened.	19	31	38%	62%
What worked best about your lesson?	33	17	66%	34%

Table 2 reveals that to what extent there is congruity between participants' stated cognitions and their observed practice.

Table 2: Teachers' stated cognitions with respect to observed practice

Observations	Frequency of matched	Frequency of not matched	Percentage of matched	Percentage of not matched
Observation 1	23	8	74%	26%
Observation 2	28	3	90%	10%
Observation 3	30	1	97%	3%
Observation 4	27	4	87%	13%
Observation 5	27	4	87%	13%
Observation 6	28	3	90%	10%
Observation 7	23	8	74%	26%
Observation 8	29	2	94%	6%
Observation 9	30	1	97%	3%
Observation 10	23	8	74%	26%

Table 3: Pearson correlation formulae for hypothesis testing

Correlation value	Results	Error value	Significant value
0.555	correlated	0.05	0.000

Discussion

To provide a discussion of the findings of the study, in this section the research question is restated again, and the answer to this question will be developed as follows: The research question was this: *Is there relationship between reflective teaching and teachers' evaluation of students' achievement?*

According to Borg (2009), it is not a flaw if teachers' stated cognitions are not in line with their practices. Important point is to explore the possible reasons of such incongruities. I checked the categories which they answered in questionnaires and made a comparison between what I observed in their teaching practices which were registered in the observation sheets. The results showed that there is a difference between respondents' stated cognitions and their practices and it could be inferred from table 1&2. It seems that participants' cognitions to self reflection questionnaire, mostly match with what they perform in their classes, although in some cases some incongruity observed in what they have checked in self reflection questionnaire and their practices.

Questionnaire for faculty evaluation of student performance was used to reveal participants' cognitions with respect to evaluating students' achievement. To see to what extent

they are congruent with their stated cognitions, participants' final tests of students' performance were used to determine to what extent they are right with respect to their cognitions. Analyzing participants' final tests revealed that participants are in correspondent with their stated cognitions in most of the cases but some incongruities were also recognized. In order to analyze some of the participants' comments on some questions in questionnaire for faculty evaluation of student performance, within case and cross case analysis of responses were carried out. Analysis of participants' responses revealed the similarities and differences among participants' responses with respect to different categories of questionnaire for faculty evaluation of student performance. It also brought about some of the participants' cognitions on the surface which may not be derived from their responses to questionnaires. Based on what literature revealed with regard to reflective teaching and evaluating student's achievement, especially as Foxworth (2004) suggests that some crucial questions such as: 'Did I guide the students through problems or examples, checking how well they were doing?' 'Did I assess whether or not the students were ready to go on to independent practice?' It seems that there is a kind of relationship between reflective teaching and teachers' evaluation of student achievement. To determine the normality of the data, Kolmogorov-Smirnov Test was used, and also to specify whether there is a relationship between the variables in this study Pearson Correlation was used. Table 3 revealed that since the significance value for two variables which are teachers' cognitions and their evaluation of students' achievement is likely bigger than the value of (.5) ($\text{sig} > 0.05$), consequently, teachers' cognitions and their evaluation of students' achievement could be regarded as normal variables.

Table 3 depicted that correlation value was equal to 0.555, which signifies the existence of the moderate relationship between reflective teaching and teachers' evaluation of students' achievement. Consequently, it seems that researcher's hypothesis was confirmed. Taking into consideration what has been stated with respect to reflective teaching and teachers' evaluation of students' achievement, it seems that there is a moderate relationship between reflective teaching and teachers' evaluation of student achievement and this relationship could modify teachers' evaluation of student achievement if they "reflected on their actions before and after their actions" as suggested by Schon (1987). In order to depict this relationship some graphs were provided as follows

Fig 1: Percentage of correspondence between stated responses to self-reflection questionnaire and observed practice for participant 1

Fig 2: Percentage of correspondence between stated responses to self-reflection questionnaire and observed practice for participant 2

Fig 3: Percentage of correspondence between stated responses to self-reflection questionnaire and observed practice for participant 3 & 4

Fig 4: Percentage of correspondence between stated responses to self-reflection questionnaire and observed practice for participant 5

CONCLUSION

An overview of the results of the study suggests that there exists a moderate relationship between the participants' beliefs, emotions or mood, practical knowledge, teaching context and evaluation of students' achievement. However, the results of the study also strongly suggests that reflection was pertinent to the relationship. It helped participants in coping with, understanding the characteristics of the relationship, and using their understanding to make appropriate decisions and adjustments to teaching and learning. Adjustments were usually conducive to learning and sensitive to context and situation.

Based on the results of the study, reflection also seems to be a tool to safeguard feelings or emotions, preserve self, and job. Above all, it helped respondents to cope with perceived contextual challenges. The results of the study probably point to the fact that schools' contexts exerted influence. Therefore, I am of the opinion that they need to be monitored to reduce the negative effect they may have on teachers and, by extension, on evaluation of students' achievement. What is required in the ever changing, demanding, and sometimes-difficult schools' contexts are teachers who employ a model of teaching which incorporates an understanding of their particular contexts, personal beliefs, practical knowledge and particular content knowledge. This model possibly enables them to survive the many contextual constraints and irritations and allow them to draw on knowledge to solve problems that are unique to their particular teaching

situation. This model likely enables creative and innovative approaches to classroom and school situations and problems, which lead to improved learning opportunities for students. Reflective teaching provides an excellent opportunity to achieve these. So, if after I reflected on a challenge to my beliefs about an aspect of teaching, given the constancy of the conceptual frameworks of the areas being considered, I could decide to end a teaching process with a video instead of the written work, as I had previously intended. Alternatively, I may decide to use one method or activity over another quite successfully, as long as my decisions and subsequent actions are for a purpose, would benefit students, would aid in transmitting information and could be evaluated to ascertain what and how much the students learnt.

From this study, I found the following to be pertinent elements of the teaching and learning process: students' cognitive and affective needs, administratively mandated policy, teachers' belief, practical knowledge (knowing what works), and the use of questions for reflection on action and reflection in action. These were pertinent because the respondents frequently engaged with these elements. Based on these, a useful conceptual framework for the local teacher education and training program should aim to develop teachers who are sensitive not only to the cognitive, but also to the affective needs of students, and be able to adapt administratively mandated policy to their unique context. It also may develop teachers who are able to critically examine their beliefs and practical knowledge, as a means of improving their practices.

ABSTRACT

In recent century, bilingualism notion as a research goal has been studied and analyzed in different areas such as linguistics, psychology, learners education, and sociology (Bhatia & Ritchie 2004). Because bilingualism is an interesting and old topic in education and language learning, the aim of this study presents the results of the effects bilingualism on learning new English vocabularies on female Iranian pre-school children, who can speak Farsi and Arabic (bilinguals). This research attempted to find that whether bilingual female children would learn new vocabularies better than monolingual ones or not. In order to answer this question the study was conducted in Susangerd in Iran, the city with more than 70% bilingual. All of participants of this study were Iranian female primary school learners between 9- 10 years. These participants were selected randomly from four English institutes. In order to find homogenous participants the placement test used, after that participants divided in two groups (bilingual and monolingual) then we used pre test, treatment and post test. The data were collected, and analyzed by use of t-test. Finally, The findings of the study show that bilingualism can play high role in learning and understanding confusion English vocabularies among female primary school learners. Moreover, knowing the meaning of English vocabularies in two languages can facilitate English vocabularies learning.

KEYWORDS: bilingualism, monolingual, vocabulary, primary school, female learners.

INTRODUCTION

Contrasting bilingual with monolingual has attracted by too many studies over the past 100 years. These research tried to answer that whether bi or multilingual kids work as well as monolinguals in each field of their languages acquisition, or not.

In this study the main reason behind selecting the effect of bilingualism was my experiences in learning and teaching English as a foreign language (EFL). These experiences lead me to great interest in the process of language acquisition, exclusively the acquisition of two or third languages simultaneously. So the aim of this study is exploring the effect of being bilingual on female primary-school kids when they want to learn new English vocabularies in institute or language schools. As you know many kids around the world learn and use more than one language, and they do this in different ways. Some kids learn two languages from birth and others start to learn a second language when they go to daycare or preschool. In this study, I focus on female bilingual children who know two languages from birth, or shortly after birth. In other words, I focus on Iranian children who have two first languages (Arabic-Farsi) and they could speak both languages very well.

According to some linguistics learning two languages from birth occurs when family speak different languages and decide to use their different languages to raise their child. In other families, the parents may speak the same language, but it is different from the language used in the community at large, for example, Arabic- or Turkish-speaking parents in the Iran. These parents might decide to use only Arabic or only Turkish at home while the child is exposed to Farsi or English with most children in language school they encounter outside the home. The study aim to find that when children continue to develop their abilities in two languages throughout their primary school years, can they gain and understand a new English words faster than monolingual or not. Some scientists believe that Learners/ Individuals who are bilingual switch between two different language systems. Their brains are very active and flexible (Zelasko & Antunez, 2000). Some other claim bilingual kids benefit academically in many ways. Because they are able to switch between languages, they develop more flexible approaches to thinking through problems. Their ability to read and think in two different languages promotes higher levels of abstract thought, which is critically important in learning (Diaz, 1985).

More than half of the world's population is bilingual and two thirds of the world's children grow up in a bilingual environment (Bhatia & Ritchie, 2004). Mackey (2000) claims that bilingualism is the ability to produce complete meaningful utterances in the other language.

Definitions of the main key expressions

Arabic language

Arabic is the official language in many countries including Egypt, Iraq, Libya, K.S.A and north of Africa. Arabic is also the language of Koran. So Muslim of all nationalities such as Iranian and Arab are familiar with it. There are many Arabic dialects, but there is only one version that is taught in schools and used by the media (Microsoft Encarta Encyclopedia-2009).

Persian Language

Persian Language, also known Farsi, is the most widely spoken member Iranian branch of the Indo-Iranian languages, a subfamily of the Indo-European languages. It is the language of Iran (formerly Persia) and is also widely spoken in Afghanistan and, in an archaic form, in Tajikistan and the Pamirs mountain region. Modern Persia had developed by the 9th century. Persian has absorbed a vast Arabic vocabulary (Microsoft Encarta Encyclopedia-2009).

Bilingualism

Up to now, there is no agreed definition of bilingualism among scientists and researchers. Because they believe that bilingualism is a complex psychological and socio-cultural linguistic behavior and has multi-dimensional features. Mackey (2000) claims that bilingualism is the ability to produce complete meaningful utterances in the other language. Bloomfield (1933) believed bilinguals could be defined as individuals who have native like control of two languages. Briefly, bilingualism is the ability to use two languages. Although, defining bilingualism is complex since people with different bilingual features could be classified as bilingual.

A lot of bilinguals had learned two languages at the same time, most of time in early childhood and as a result of the parents or friends bilingualism. These individuals are called simultaneous bilinguals and bilingual who had learned a language after than the other for example as the result of living in a foreign country or academically learning a second language at a school or university are usually called consecutive bilinguals. Normally, simultaneous bilinguals have a more native like accent in two languages, although older learners may have useful knowledge about language, that could help them in the language learning. Bilingualism can be observed everywhere in the world. It is said that “more than half of the world’s population is bilingual and two thirds of the world’s children grow up in a bilingual environment (Bhatia & Ritchie, 2004).

The Benefits of Being Bilingual on kids

Bing bilingual helping kids in many cases of interaction, such as interaction with family, community and culture. Bilingual kids are also able to make new friends and create great relationships in their second language .Latest research had also found that children who raised in bilingual condition shown better self control and confidence which is an important factor of school success. Some bilingual teachers say bilingual kids are more advanced than monolingual ones in solving problems requiring the inhibition of misleading information.

In the past, some families thought learning more than one language could be bad for a kids, but nothing could be further from the truth. In fact, there are great advantages to knowing more than one language. For example, some of linguists claim that knowing a another language clearly benefits a kid's cognitive development. In recent century, the findings of studies addressed that bilingual kids had function as:

learning other languages (Jessner, 2008)

thinking about language(Castro et al,2011)

focusing, remembering, and making decisions (Bialystok, 2001)

understanding math concepts and solving word problems more easily (Zelasko & Antunez, 2000)

developing strong thinking skills (Kessler & Quinn, 1980)

using logic (Bialystok, 2001)

Moreover, research shows that bilingualism may delay the onset of Alzheimer's disease. Bialystok (2009) notes that superiority of bilingualism can be found in tasks and processes demanding a high level of selective attention as well as inhibitory control.

King and Mackey (2009) have indicated potential benefits of bilingualism. One of the most important benefits of bilingualism was taken for granted, bilingual kids know multiple languages, which is important for employment, travel, speaking with members of one's extended family, maintaining a connection to family culture and history, and making new friends from different backgrounds.

Bilingualism and vocabulary

Generally, vocabulary knowledge, based to unique systems of concepts or notions that are acquired in special condition refers to their varying levels of usage and complexity. Although grammar is the essential component of English language, vocabulary is beyond any doubt regarded the most indispensable elements of any language. Vermeer (2001) notes that, vocabularies are the primary carriers of meaning.

Recent research confirms that bilinguals generally control a smaller vocabulary in each language than monolinguals (Bialystok, 2009). Similarly, some evidence suggesting that bilingualism constrains children's vocabulary development. Bilinguals tend to attain lower scores on receptive vocabulary tests. In a study in which 40 children were tested in the Peabody Vocabulary Test, Bialystok & Feng (2009) further confirmed the above-mentioned results.

Feng (2009) further confirmed the above-mentioned results. The participants were divided into two groups, one bilingual group and one monolingual group, and later compared in terms of vocabulary size. The same pattern of results emerged in this study. Bilinguals share an overall smaller average vocabulary in each language than their monolingual peers (Bialystok, 2009).

However, modern researchers have put these results into question. As opposed to Pearson (1993) argue that bilingual children share the same variety of vocabulary sizes as monolingual children. Pearson (1993) argued that both languages must be taken into account when evaluating the development of vocabulary in bilingual children. They take on a holistic approach to the study of bilingualism and argue that it is inappropriate to evaluate bilingual individuals' linguistic skills based on single-language performances, as a bilingual speaker by no means equals two monolingual speakers in one (Pearson 1993).

Rather than comparing monolingual and bilingual children in terms of vocabulary in each language, Pearson (1993) compared monolingual and bilingual children in both total vocabulary and total conceptual vocabulary and found that the overall bilingual vocabulary was comparable to the monolingual one. Although each individual language included fewer words than what is found in the vocabulary of monolingual children, monolinguals did not outperform bilinguals in terms of total vocabulary size (Pearson 1993).

Taking both total vocabulary and total conceptual vocabulary into account, their research demonstrates that bilingual vocabulary development reflects the monolingual rate of development in children between 8 and 30 months of age (Pearson 1993). It is therefore unfair to judge bilingual children's language abilities based on performance in only one of the two languages. Although bilingual children acquire translation equivalents for most words, the exposure to some words is "circumstance-specific" which makes translation equivalents superfluous.

EFL Background in Iran

Like other Asian countries, Iran regarded as an EFL country. The Iranian communicate with each other by using Persian (an official language).

Sociologists believe that, economic and business factors played important roles in spreading English in Iran. Because Iran plays a leading role in supporting of the world economy through its contribution to international organizations.

Generally, during the last five decades Iran economy has grown rapidly. The economic power of Iran mostly dependent on the oil products. The raised of the economy of Iran after world war II has achieved worldwide attention and interest among other nations. So, Iran became a great economic market for P.R.C, European countries and Japan as well. This considerable factor effect the English learning at schools and language institutes. Moreover, as an active member of the UN, Iran had deep political relationships with too many native and nonnative countries of English as well. For these activities and economic movements, for most of Iranian English language used as universal communicative tool and most of Iranian family send their kids to English schools to learn it before they go school.

LITERATURE REVIEW

Research into bilingualism effect on individuals had been addressed in research literature and worldwide. Studies on the effects of bilingualism on cognitive issues began with the using of IQ tests and most of those studies shown negative effects of bilingualism on children's intellectual development. Adler (2001) notes that an interest in the way bilingual students learn vocabularies and solve mathematical problems has drawn on variety of theoretical frame works. Romanie (1995) claimed most of the studies done before the 1960s indicated that monolingual kids were better than bilingual ones in different skills related to verbal and non-verbal abilities. Kaushanskaya and Marian (2009) suggest that monolinguals' ability to learn new words depends on whether they learn new words silently or out loud. Conversely, bilinguals' performance does not depend on any particular learning strategy, and they can acquire new words efficiently under any learning conditions. Paradis (2009) said, bilingual kids produced more right-headed compounds than monolinguals.

In a 2001 Bialystok showed that bilinguals did indeed show enhanced executive control, a quality that has been linked, among other things, to better academic performance. Grosjean(2008) said,

bilingual person is an integrated/ unique language user, and must not be thought of as a double_ monolingual.

THE QUESTION AND HYPOTHESIS

The present study aims to answer the following research question:

Research Questions:

Are there any benefits in bilingualism on learning new English vocabularies among female Iranian primary school students?

Hypotheses:

H1. Bilingual female students (Farsi-Arabic) learn English vocabularies better than monolinguals?

H0 .There is no difference between bilingual and monolingual female students in learning new English vocabulary.

METHODOLOGY

The present part of this research presents the main methodological principles that build framework of study. This research was conducted in a small city in khouzestan province in southeast of Iran.

Participants

The participants of current study in two groups were homogenous in terms of context (same city) age (9–10 years old), nationality (they were all Iranian), sex (they were all female), and level of instruction (beginners). The participants were selected randomly from state and private schools (Safir, Rahele, Shokoh, Somayie), and then divided into two groups, based on their language background.

14 Female studentsPersian monolingual

14 Female students Persia_ Arabic bilingual

Instruments

In this study, in order to find and reach the main goals of research, two forms of tests were applied during the research. The following instruments were used:

Placement Test for Kids: Contains 35 multiple choice tests .Cited from Dynamic Teaching Corporation 2014 .

Elementary Vocabulary book (Thomas, 1990). Elementary Vocabulary book, is for students who are doing a starter course in English and want to check and improve their basic vocabulary. The book presents fundamental vocabularies that students will need to know at an early stage of their studies.

EFL Vocabulary Tests book (Meara, 2010). This book contains tests that design to be used with learners of EFL/ESL. These tests were graded into 6 levels of difficulty, and there were 20 tests

at each stage. The basic tests are Levels one and two. These tests cover the vocabulary of English that every speaker needs to know if they want to understand what they hear or read.

Subject	TEST NUMBER
Placement Test for Kids	35
Elementary Vocabulary book	40
EFL Vocabulary Tests book	40

Procedure

In order to find the purpose of this study, these research steps were followed:

First of all, the aim of the researcher was to choose a homogenous of participants. As mention before, participants were homogenous in context, sex, age and nationality. The Placement Test was given to 44 bilingual and monolingual females learners. The placement test was objective and each test just had one correct answer. the result shown that only 32 ones (15 monolingual and 17 bilingual) could pass the exam but we only select only 28 learners in both groups based on the best obtained scores. After finishing grouping with names BG and MG the pre test based on Elementary Vocabulary book addressed to participants of both groups. The pre test was objective and contained 40 test, the participants should answer the test at 45 minutes. by finishing pre test we had a treatment , the treatment was on based of EFL Vocabulary Tests book .the treatment sessions were 12 ones at Safir Institute in Susangerd and the timing for each sessions was 40 minutes on different days as below:

MG on even days from 5:30 to 6:10 P.M

BG on odd days from 5:30 to 6:10 P.M

The sessions were three days a week, after finishing treatment the participants were given four free days to study for (post-test). The post test include 40 objective tests and its style was similar to pre test but a bit harder.

RESULTS AND DISCUSSION

In this part of research we tried to present the data that collected concerning the study topic. The data were collected by using different elements such as Placement Test, pre test and post test based on the subjects that introduced before .(Elementary Vocabulary book and EFL Vocabulary Tests book). These result will be show through tables and figures. The purpose of the pretest was to make certain that the MG and BG were homogeneous at the outset of the study. T-test was used to help achieve the purpose of the pretest. The results of the t-test analysis for the comparison of the MG and BG are presented below.

Table 1: Descriptive Statistics for Comparing the monolingual and bilingual pre test Scores

group		N	Mean	Std. Deviation	Std. Error Mean
pre test	monolingual	14	16.8571	1.83375	.49009
	bilingual	14	17.2857	1.72888	.46206

Such descriptive statistics as mean and standard deviation are shown for both groups in Table 1. The mean score of the BG ($M = 17.2$) is greater than the mean score of the MG ($M = 16.8$). This difference does not seem to be significant, but to ascertain whether it is or not, one needs to look down the Sig (2-tailed) column in the t-test table below.

Table 2: Results of the Independent-Samples T-Test for Comparing the monolingual and bilingual pre test Scores

		Levene's Test for Equality of Variances		T-test for Equality of Means						
		F.	Sig.	t	Df	Sig. (2- tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
TG Pretest	Equal Variances Assumed	.003	.956	-.636	26	.530	-.42857	.67356	1.8131 0	.95596
	Equal Variances not Assumed			-.636	25.91 0	.530	-.42857	.67356	1.8133 4	.9561 9

According to Table 2 there is not a statistically significant difference in pretest scores of MG ($M = 16.8$, $SD = 1.8$) and BG ($M = 17.2$, $SD = 1.7$) and the $p = .53$ (two-tailed). This is so because the p value is greater than the specified level of significance (i.e. .05). The conclusion would be that the two groups were heterogeneous prior to the experiment. The results of the pretest are also graphically shown in Figure 1.

Figure 1: The Mean Scores of the monolingual and bilingual on the Pre test

As it can be seen in Figure 1, the difference between the pretest scores of the MG and BG was only infinitesimal.

Result of the Research Question

After the treatment sessions ended, the posttest was given to the participants of the study. The research question of the study asked that: Are there any benefits in bilingualism on learning new English vocabularies among female Iranian primary school students? Table 3 displays the descriptive statistics for this analysis.

Table 3: Descriptive Statistics for Comparing the monolingual and bilingual post test Scores

group		N	Mean	Std. Deviation	Std. Error Mean
post test	monolingual	14	17.0714	1.59153	.42535
	bilingual	14	18.6429	1.33631	.35714

As you can see in Table 3, the mean score of BG learners ($M=18.64$) is greater than the mean of MG ($M = 17.07$). To make certain that the difference is indeed statistically significant; the following t-test table should be consulted.

Table 4: Results of the Independent-Samples T-Test for Comparing the monolingual and bilingual post test Scores

		Levene's Test for Equality of Variances		T-test for Equality of Means						
		F.	Sig.	t	Df	Sig. (2- tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
TG Pretest	Equal Variances Assumed	.134	.718	2.82 9	26	.009	-1.57134	.55541	2.7130 8	-.4297 7
	Equal Variances not Assumed			2.82 9	25.24 4	.009	-1.57134	.55541	2.7130 8	-.4281 1

As you see that the p value is less than the specified level of significance ($.009 < .05$), it could be concluded that there was a significant difference between the posttest scores of the learners in the BG ($M = 18.64$ $SD = 1.33$) and MG scores ($M = 17.07$ $SD = 1.59$). Another bar chart is also drawn for the analyses related scores:

Figure 2: The Mean Scores of the monolingual and bilingual on the post test

This bar chart also signifies the great difference between the posttest scores of the learners in both groups. This result implies that the two groups performed differently on the posttest, indicating that the difference between BG and MG was statistically significant. The paired samples t-test analysis revealed that there was a difference between pretest and posttest scores of the learners in both groups. Likewise, a t-test was conducted and the results showed that learners' performance on the posttest outweighed their performance on the pretest. So we found that, the

training (treatment) along four weeks was affective and bilingualism had a significant positive effect on learning English vocabularies among female primary school learners.

CONCLUSION

Today, bilingualism is a feature not just of people, but also of communities. States, countries, or communities in which two or maybe more languages are used in which can be called bilingual community. For instance Algeria (in north of Africa) regarded a bilingual country because French and Arabic are official languages there. Some cities in Iran are also regarded bilingual cities or communities, because most of the people there can speak Arabic and Farsi very well, although Arabic has no official status. In the analysis part of this study it was indicated that bilingualism has positive effects on English language acquisition. That analysis also addressed that female bilingual kids were more successful than monolinguals in learning new vocabularies of English language. This is due to that, there are too many words that common in three languages. Moreover during treatment sometimes the bilingual teacher used both languages (Arabic and Persian) to describe or definite some confusion English vocabularies, and because of this competence the bilingual group learn those vocabularies faster and better than monolingual ones. For more research, it is suggested that the study can be conducted with larger number of participants from all of Republic, so the study will be more practical and useful to find the differences between bilingual and monolingual kids regarding the level of education ,age and sex. It suggests that in bilingual parts of country the government can design bilingual education programs in schools and university like many European countries.

Limitations

The present study suffered from several numbers of limitations and delimitations which will pose inevitable restrictions on the generalizability of its findings which are as below:

There were limitations in generalizability of the results and findings of this study since the level of proficiency was limited to primary school level and participants were randomly selected from 4 language institutes.

It was a very hard task to find 28 students with the suitable characteristics for this study and to convince them to attend in all treatment sessions.

The above-mentioned limitations and some other limitations such as time limitation, cultural limitation and linguistic background of participants must be taken into consideration before any conclusions and generalization based on the findings and results of this study. So any generalizability of the findings of this study must be treated and interpreted cautiously.

ABSTRACT

Antonyms play a significant role in everyday conversations. According to the Croft's point of view (Craft & Cruse, 2004) of classification of adjectives, their application in conversation can lead to vagueness and hence misconception. This paper is an attempt to provide an analysis for the application of a few lexical presupposition triggers in sentences containing gradable antonyms in order to make presuppositions for assigning the scale to scale-free adjectives and hence, remove vagueness. To this end, the authors clung on their own linguistic intuition as well as administration of a survey followed by a qualitative analysis of the data. The research revealed that Persian speakers, when using comparative structures containing comparative free-scale gradable antonym, whenever scale specification is necessary use two types of lexical presuppositions called 'intensifier' and 'receder'. Their shared characteristics is that they lack any semantic content and even lack any similar grammatical function in other contexts. The implication of utilising these lexical presupposition triggers would be removing vagueness within a course of conversation.

KEYWORDS: Lexical Presupposition Triggers, Vagueness, Gradable Antonyms

INTRODUCTION

Due to the great importance and everyday application of comparisons, and significant function and application of adjectives, specifically speaking antonyms, in conversations and linguistic functions, antonyms and their characteristics (semantics of antonyms) have always been the subject of study since Aristotle. In the recent decade, also, a great number of researchers have paid significant attention to characteristics of gradable antonyms and their classification and have presented some categories. According to the Croft's point of view (Craft & Cruse, 2004) of classification of the adjectives and considering the fact that since in his perspective there is at least one group of adjectives -disjunct equipollent- having the characteristics of system-specific and scale-free, their application in conversation can lead to vagueness and hence misconception, the authors

have studied one of the strategies used by the speakers to make the message scale-specific. This paper is an attempt to provide an analysis for the application of a few lexical presupposition triggers in sentences containing gradable antonyms, or as Craft puts it disjunct equipollents, in order to make presuppositions for assigning the scale to scale-free adjectives.

LITERATURE REVIEW

Vagueness and presupposition triggers in general and lexical presupposition triggers in particular have been scrutinized in different languages. Drave (2001) conducted a corpus-based study into the forms and functions of vague language in intercultural conversations between speakers of English and Cantonese. It was found that, whilst English speakers use more vague language than Cantonese speakers, the range of different types and major collocations were similar for the two groups of speakers. In addition, the results showed that there were important functional differences.

In another study on vagueness, Channell (1994) categorizes vagueness and focuses on linguistic expressions that are, in Sadock's (1977) formulation, "purposely and unabashedly vague" (1994: 20). She provides a comprehensive description of different ways of approximating quantities in English, of various ways of referring vaguely to categories (e.g. with tags such as or something like that), and of totally vague words.

Schmid (2001) studied lexical presupposition triggers, namely abstract nouns. This study showed that depending on the types of nouns that English speakers use, speakers can exploit the *N-be-that*-construction in the service of an array of presuppositions, among them existential and factive semantic ones as well as pragmatic ones.

In their recent work, Chemla and Bott (2013) developed and tested two processing accounts of presupposition projection, the *global-first* model and the *local-first* model. They tested these predictions using a verification task. The results showed that across two experiments, using different materials and instructions, participants were faster to derive the global interpretation than the local interpretation, in contrast to the local-first model.

RESEARCH QUESTIONS

In the present study the following research questions are addressed:
How Persian speakers avoid vagueness while using gradable antonyms?
What role do presupposition triggers play in avoiding vagueness?
What are the lexical presupposition triggers used to avoid vagueness?

METHODOLOGY

In the present study, the authors -all Persian native speakers- exploited their linguistic intuition to provide the study with some data. To this end, first and second named authors came up with the example sentences as the data which were then double checked by the third and fourth named au-

thored in terms of their grammaticality and acceptability as well as the implications they may have. In addition, in order to have more reliable study, we have demonstrated occasional surveys to shed light on the implications of the Persian sentences. It is note worthy to mention that all the participants were Persian native speakers and university students. The data was then subjected to a close qualitative analysis in the light of the objectives of the study.

RESULTS AND DISCUSSION

Gradable antonyms

While discussing lexical semantic relations, the term semantic opposition is used as a general tag for a couple of relations among lexicons. But semantic opposition consists of various kinds with having unique characteristics. Antonyms usually consist of verbs, nouns and adjectives. The present study targets gradable adjectives. According to the research revealed in Kennedy (2007), Kennedy and McNally (2005), Kameon, et al. (2011), adjectives can be categorized by their syntactic-semantic behaviors in two main categories of absolute and relative adjectives. The differences can be summarized as follows:

B. Syntactic criteria: negating either pole of the antonyms can be considered as the proof of the other pole. For example:

(1) The door is open.

means:

(2) The door is not closed.

On the other hand:

(3) The door is big.

does not mean:

(4) The door is not small.

B. Semantic criteria: using any type of adjectives peculiar to structure of the other type is not allowed.

(5a) The door is utterly closed.

(5b) *The door is utterly big.

(6a) * The door is very closed.

(6b) The door is very big.

(7a) * This door is more closed that the other one.

(7b) This door is bigger than the other one.

Hence, it can be concluded that relative adjectives share the same characteristics, which is being gradable. That is, all of them are gradable.

(8) and (9) are not ungrammatical with any substitution for a and b if relative antonyms are used:

X, Y, W, Z

(8) X is more a than Y, or

(9) W is more b than Z

So we can call them gradable antonyms. But Croft and Cruse (2004) believe that the classifica-

tion does not suffice since the words categorized, as antonyms are not all the same and have different characteristics. They categorize relative antonyms into four categories; overlapping antonyms, monoscalar, disjunct equipollent, parallel equipollent. The present research targets comparative structures containing gradable antonyms (relative antonyms) belonging to the category of disjunct equipollent. These antonyms have the following characteristics:

A. Both poles of the axis are scale-specified, i.e. on the axis formed by the two poles of adjectives a and b, for the arguments X and Y:

(10a) If X is more a than Y,
one cannot necessarily conclude that:

(10b) X is a.

And inevitably:

(10c) Y is b.

B. Both poles of the axis are system-specified, i.e. in the mentioned axis all the time and in any condition:

If (11a) is true, it cannot be claimed that (11b) is always true.

(11a) X is more b than Y.

(11b) Y is more a than X.

The interaction of the two characteristics mentioned above makes a neutral point in the middle of the axis (Kennedy, 2007), which is usually stated by a neutral adjective. For example, considering an axis with the antonyms 'hot' and 'cold' being the pole, there is a median point which Persian speakers define as 'velarm', meaning tepid. In fact, for the two maximum standard adjectives 'hot' and 'cold', there is a common minimum standard adjective named 'tepid'.

Vagueness

In comparative sentences containing comparative structure, disjunct equipollent antonyms, due to feature A, are scale-free. Consider the following example:

(12a) Jack is fatter than Tom.

(12a) Can be interpreted differently in different contexts. Consider the following contexts:

(12b) Jack is a middle-aged man who is 56 kg in weight and Tom is his twin brother who is 54 kg in weight.

(12c) Jack is a middle-aged man who is 143 kg in weight and Tom is his twin brother who is 140 kg in weight.

(12d) Jack is middle-aged man who is 90 kg in weight and Tom is a nine-year-old boy who is 18

Therefore, the feature scale-free of the comparative adjective 'fatter' is extended to the whole sentence and has made it scale-free. In this condition, it is only with the help of a context that one can judge, for example, the conditions of (12c) whether:

(13a) Jack is fat.

(13b) Tom is fat.

or unlike the mentioned adjective in the sentence, for the context (12b) judge:

(14a) Jack is thin.

(14b) Tom is thin.

However, context conditions are not always clear. In some occasions, the judgment about the context is not the same, or even the speaker and listener are uninformed about their same judgment about the context. In such a condition, the speaker and listener should employ a strategy to adjust their same judgment on a specific scale. The trend can be named 'Scale Specification'; a prevalent strategy among Persian speakers to use lexical presupposition triggers.

The word 'ham', meaning 'also' and 'even'

The word 'ham' is used in two positions in these sentences:

(15) Jack ham az Tom chaghtar ast.

Jack even than Tom fatter is

Even Jack is fatter than Tom.

(16) Jack az Tom ham chaghtar ast.

Jack is Tom also fatter is

Jack is also fatter than Tom.

The present paper first deals with (16).

Having asked any Persian speaker what assumption (16) holds, we assume that the answer is similar to (17) -16 Persian speakers were surveyed and solely one different answer was observed.

(17) Tom is fat.

Now, the question is that whether (17) is the presupposition, entailment or Grecian inference for (16)? First, we adjust the superficial-logical features of the presupposition for the above-mentioned example. Considering the sentence (2) as p and (17) as q , the logical features of the presupposition (Saeed, 2003) are as follows:

- A. $\text{if } p \equiv T \rightarrow q \equiv T$
B. $\text{if } p \equiv F \rightarrow q \equiv T$

C. $if\ q \equiv T \rightarrow p \equiv (T\ OR\ F)$

The given example fully confirms features A and C, but has a dual function for feature B.

- (18) Jack az Tom ham chaghtar nist.
Jack than Tom even fatter not
Jack isn't even fatter than Tom. (NOT Tom is fat)
- (19) In Jack nist ke az Tom ham chaghtar ast.
This Jack isn't who than Tom also fatter is
It isn't Jack who is also fatter than Tom. (Tom is fat.)

Both two negations are common in references and it is usually expected to keep one presupposition in the two types of negation and remove the implication or entailment. However, such examples have a weird reaction toward the test and the issue demands further study. Now we study the semantic features of presupposition and adjust to the table provided by the references.

Table 1: Comparing the features of presupposition, entailment and implication

	Entailment	Presupposition	Implication
Projection when embedded	No	Yes	No
Cancelable when embedded	---	Yes	---
Cancelable when unembedded	No	No	Yes

Projection Feature

(20) Negation:

In Jack nist ke az Tom ham bolandtar ast.
This Jack isn't that than Tom also taller is
It is not Jack who is also taller than Tom. (i.e. Tom is tall.)

(21) Making an introduction for the condition:

Agar Jack az Tom ham sari'tar bashad, mosabeghe ra mibarad.
If Jack than Tom also faster be , race (object marker) wins
If Jack is also faster than Tom, he will win the race. (i.e. Tom is fast.)

(22) Making question:

Aya Jack az Tom ham khasistar ast?
(Question marker) Jack than Tom also stingier is
Is Jack also (even) stingier than Tom? (i.e. Tom is stingy.)

(23) Possibility:

Ehtemalan Jack az Tom ham shoja'tar ast.
Possibly Jack than Tom also more courageous is
Possibly, Jack is more courageous than Tom. (i.e. Tom is courageous.)

(24) Probability:

In ke Jack az Tom ham chaghtar bashad, momken ast.
This that Jack than Tom also fatter to be , probable is
Probably Jack is also (even) fatter than Tom. (i.e. Tom is fat.)

(25) Belief:

Mike mo'taghad ast Jack az Tom ham naghash behtari ast.
Mike believes Jack than Tom also painter better is
Mike believes that Jack is also (even) a better painter than Tom. (i.e. Tom is a good painter.)

It is clear that the assumption in (17) has the projection feature.

Deletion without substitution

(26) ? Jack az Tom ham chaghtar ast, harchand Tom chagh nist.

Jack than Tom also fatter is , however Tom fat isn't

Jack is also (even) fatter than Tom; however, Tom is not fat.

(27) ? In ketab az an pirahan ham gerantar ast, ama an pirahan geran nist.

This book than that shirt also more expensive is, but that shirt expensive isn't

The book is also (even) more expensive than the shirt, although the shirt is not expensive.

As is implied –at least based on the authors' linguistic intuition- that (26) and (27) are unacceptable. And the unacceptability is merely due to the presence of the word 'ham'. A comparison with the acceptable sentences (28) and (29) confirms the claim.

(28) Jack az Tom chaghtar ast, harchand Tom chagh nist.

Jack than Tom fatter is, however Tom fat isn't

Jack is fatter than Tom; however, Tom is not fat.

(29) In ketab az an pirahan gerantar ast, ama an pirahan geran nist.

This book than that shirt more expensive is, but that shirt expensive isn't

The book is more expensive than the shirt, although the shirt is not expensive.

Deletion with Substitution

(30) Ehtemalan Jack az Tom ham shoja'tar ast, harchand Tom shoja' nist.

Possibly Jack than Tom also more courageous is, however Tom courageous isn't

Possibly, Jack is also more courageous than Tom; however, Tom is not courageous.

(31) Agar Tom chagh bashad, Jack az Tom ham chaghtar ast.

If Tom fat to be , Jack than Tom also fatter is

If Tom is fat, Jack is also fatter than Tom.

(32) Mike mo'taghad ast ahu az yuzpalang ham sari'tar ast, ama yuzpalang sari' nist.

Mike believes deer than panther also (even) faster is, but panther fast isn't

Mike believes that deer is also (even) faster than panther, but panther is not fast.

Considering examples (21) to (23), it can be said that the assumption presented in (8) and the like sentences behave similarly to presuppositions. Most specifically, example (22), which is the most

famous and the commonest remover structure in recourses, vividly illustrates this feature.

The word ‘digar’, meaning ‘else’ or ‘anymore’

The word ‘digar’ is used in two positions in these sentences:

(33) Jack digar az Tom chaghtar ast.
Jack else than Tom fatter is
Jack, else, is fatter than Tom.

(34) Jack az Tom digar chaghtar ast.
Jack than Tom else fatter is
Jack is fatter than Tom, else.

It can be judged about these two sentences that both convey the same descriptive semantic content. However, their emphatic meaning can differ. Hence, at this level of study, these two sentences can be considered as paraphrases. Anyhow, to observe the structural similarity to the previous examples, the sentence (34) has been used as the main subject.

Having asked any Persian speaker what assumption (33) and (34) hold, we assume that the answer is similar to (35) - 16 Persian speakers were surveyed and 16 similar judgments were observed.

(35) Tom is not that much fat.

Once more, the query rises whether (35) is really the presupposition for (34)? Hence, similar to the steps taken to study whether ‘ham’ is a presupposition trigger, ‘digar’ has been studied.

The mentioned example finely adjusts to the features A and B mentioned in part 4; however, it has a dual behaviour toward feature B. This dual behavior is even more complicated that the sentence structure with raising negation doesn’t seem to be acceptable.

(36) Jack az Tom digar chaghtar nist.
Jack than Tom anymore fatter isn’t
Jack isn’t fatter than Tom anymore. (NOT Tom is not that much fat.)

(37) (*) In Jack nist ke az Tom digar chaghtar ast.
This Jack isn’t who than Tom anymore fatter is
It isn’t Jack who is fatter than Tom anymore. (Tom is not that much fat.)

Again, table (1) is illustrated for an easy comparison of the features as table (2).

Table 2: Comparing the features of presupposition, entailment and implication

	Entailment	Presupposition	Implication
Projection when embedded	No	Yes	No
Cancelable when embedded	---	Yes	---
Cancelable when unembedded	No	No	Yes

Projection Feature

(38) Negation:

In Jack nist ke az Tom dige bolandtar ast.
This Jack isn't that than Tom else taller is
This is not Jack who is else taller than Tom. (i.e. Tom is not that much tall.)

(39) Making an introduction for the condition:

Agar Jack dige az Tom sari'tar bashab, mosabeghe ra mibarad.
If Jack else than Tom faster to be , race (object marker) wins
If Jack is else faster than Tom, he will win the race. (i.e. Tom is not that fast.)

(40) Making question:

Aya Jack az Tom dige khasistar ast?
(Question marker) Jack than Tom else stingier is?
Is Jack else stingier than Tom? (i.e. Tom is not that much stingy.)

(41) Possibility:

Ehtemalan Jack dige az Tom shoja'tar ast.
Possibly Jack else than Tom more courageous is
Possibly, Jack is else more courageous than Tom. (i.e. Tom is not that much courageous.)

(42) Probability:

In ke Jack az Tom dige chaghtar bashad, momken ast.
This that Jack than Tom else fatter to be , probable is
Probably Jack is else fatter than Tom. (i.e. Tom is not that much fat.)

(43) Belief:

Mike mo'taghad ast Jack az Tom dige naghast behtari ast.
Mike believes Jack than Tom else painter better is
Mike believes that Jack is else a better painter than Tom. (i.e. Tom is not that much a good painter.)

It is clear that the assumption in (34) has the projection feature.

Deletion without substitution

(44) ? Jack az Tom ke chaghtar ast, harchand Tom chagh ast.

Jack than Tom else fatter is, however Tom fat is
Jack is else fatter than Tom; however, Tom is fat.

(45) ? In ketab az aan pirahan ke gerantar ast, ama an pirahan geran ast.

This book than that shirt else more expensive is , but that shirt expensive is
The book is else more expensive than the shirt, although the shirt is expensive.

As is implied –at least based on the authors' linguistic intuition- (44) and (45) are unacceptable and weird. And the unacceptability is again merely due to the lack of the word 'digar'. A Com-

parison with the acceptable sentences (46) and (47) confirms the claim.

- (46) Jack az Tom chaghtar ast, harchand Tom chagh nist.
Jack than Tom fatter is, however Tom fat isn't
Jack is fatter than Tom; however, Tom is not fat.
- (47) In ketab az an pirahan gerantar ast, ama an pirahan geran nist.
This book than that shirt more expensive is, but that shirt expensive isn't
The book is more expensive than the shirt, although the shirt is not expensive.

Deletion with substitution

- (48) Ehtemalan Jack az Tom ham shoja'tar ast, harchand Tom shoja' nist.
Possibly Jack than Tom also more courageous is, however Tom courageous isn't
Possibly, Jack is also more courageous than Tom; however, Tom is not courageous.
- (49) Agar Tom ghach bashad, Jack az Tom ham chaghtar ast.
If Tom fat to be, Jack than Tom also fatter is
If Tom is fat, Jack is also fatter than Tom.
- (50) Mike mo'taghad ast aahu az yuzpalang ham sari'tar ast, ama yuzpalang sari' nist.
Mike believes deer than panther also faster is, but panther fast isn't
Mike believes that deer is also faster than panther, but panther is not fast.

Considering examples (48) to (50), it can be said that the assumption presented in (34) and the like sentences behave similarly to presuppositions.

CONCLUSION

According to the studies in this research, it can be concluded that Persian speakers, when using comparative structures containing comparative free-scale gradable antonym, whenever scale specification is necessary can use two types of lexical presupposition triggers in line with determining the position of the mentioned noun in the sentence on axis of the adjective.

The first type of these presupposition triggers can be called 'intensifier' or 'advancer' presupposition trigger. This type, in which the word 'ham' was mentioned as an example and contains the word 'hatta'-meaning 'even'- and the phrase 'hatta....ham'-meaning 'even also'-, advances the internal argument of the adjectival predicate mentioned in the sentence on the axis of the adjective to intensify the external argument of the adjectival phrase in the sentence in having that adjective.

The second type of these presupposition triggers can be named 'receder' or 'extenuator' presupposition triggers. This type, in which the word 'dige' was mentioned as an example and contains the word 'ke'- and the phrase 'ke.....dige', 'recede' the internal argument of the adjectival predicate mentioned in the sentence on the axis of the adjective to extenuate the external argument of the adjectival phrase in the sentence in having that adjective.

The shared characteristics of these two types of lexical presupposition triggers which differenti-

ates them from the other lexical presupposition triggers is that these types lack any semantic content and even lack any similar grammatical function in other contexts, and their only function is to make these presuppositions in order to specify the scale. It is noteworthy to mention that the current study only explicated a few number of the strategies to avoid vagueness, however, attempt can be made to elaborate upon the other strategies exploited by speakers not to sound vague.

ABSTRACT

The acquisition of preposition can be one of the main problems face Second Language Learners. The researchers believe that to learn English Language as a second or a foreign language, one should realize that language is not an abstract construction of the learned, or of dictionary-makers, but is something arising out of the students' work. The authors believe that to predict or to analyze the learners' errors may provide the teachers, researchers and the learners with valuable information in the areas of difficulties that learners may encounter. An empirical study was conducted on 60 Arab Learners of English (ALEs) which lasted about three months. A detailed analysis was made of the errors/mistakes of using the prepositions in 120 written texts produced by ALEs. Written texts were collected from each subject at two stages in the experiment (after the first week, and after the final exam). Quantitative analyses show the impact of error analysis in forms of meta-linguistic feedback and cross linguistic influence on the acquisition of L2 prepositions in the context of ALEs at the Higher College of Technology.

KEYWORDS: Prepositions, SLA, Cross-linguistic influence, meta-linguistic feedback, face-to-face interaction, and overgeneralization

INTRODUCTION

Mourssi (2013d) believes that we can realize the areas of grammar complexity by identifying errors, and by analyzing these errors. The aim behind analyzing the L2 learners' errors/mistakes is to improve second/foreign language learners' writing as well as speaking. It could be

considered that when we want to improve speaking while teaching writing, instructors should follow the same stages in process writing. They can ask students to think, plan, form, think aloud individually, in pairs, or in groups, reform their speaking, and then produce their speaking about the task given. When learners fail to produce target-like form of the target preposition or forget about the usage of the L2 prepositions and used L1 preposition, here is the role of the teacher to interact and analyze the mistakes/errors and give feedback on the production of the learners. In this case, the instructor should know about how to use the preposition in L1. Since he/she has no idea about the usage of L1, this might create a gap between what the teachers teach and what the learners want to learn. Mourssi (2012b) thinks that the process of error analysis might determine how learners process and categorise the input data which they are exposed to. The current study focuses only on the acquisition of the prepositions and how to improve L2 learners' written accuracy, and try to find suitable teaching techniques to be followed with ALEs in the acquisition of L2 prepositions.

This paper is divided into six main sections: section one is the introduction, the literature review is presented in section two, section three describes the methods used in the current study, the analysis and the discussion are presented in section four, the conclusion is presented in section five, and finally, the references are in section six followed by the appendices. The following section presents the literature review.

LITERATURE REVIEW

First of all, it is worth mentioning that a preposition in English Language grammar is often defined as a word which describes the location of one object in relation to another one. Based on our personal experience in teaching English Language for ALEs, we can assume that learning English Language prepositions is confusing for most of them.

This section which deals with literature review is divided into four subsections: in section 2.1, what is generally meant by Error Analysis is presented; this is followed by The Role of Transfer in Interlanguage in section 2.2. Then in 2.3 we will present the Cross-linguistic Influence of Prepositions and Meta-linguistic feedback. Finally, in 2.4 Types of Prepositions in L2 will be presented.

The reader should be reminded that the term of meta-linguistic feedback refers to both Errors/contrastive analysis presented for the L2 learners after their spoken and first written draft based on the target task provided, without providing them with the target-like form, (Mourssi and Al Doori, 2014a). In other word, it refers to explain the nature of the L2 learners' mistakes. Gass and Selinker (2008) believe that although some linguists consider Error Analysis and Contrastive Analysis are out of date, they are still current in the field of SLA.

Definition of Error Analysis

Mourssi (2013d) cited that Brown (1987, p. 17) gave a practical and clear definition of error analysis in which error analysis was defined as a process through which researchers observe, analyze, and classify learner errors in order to elicit some information about the system operating

within the learner. Unlike the contrastive analysis hypothesis which only examines errors attributed to negative transfer from the first language, error analysis investigates all possible sources of error and thus, outperforms contrastive analysis, Mourssi (2013c and 2012b).

Ellis et al. (2008, p. 52) provided a detailed account of, and exemplified a model for, error analysis offered by Corder (1977). Ellis (1997, p. 15-20) and Hubbard et al. (1996, p. 135-141) on the other hand, gave practical advice and provide clear examples of how to identify and analyze learners' errors. Gass and Selinker (2008) defined errors as "red flags" that provide evidence about the knowledge of second language learners. According to Richards (1974), researchers are interested in discovering errors as they are believed to contain valuable information that could be used to develop strategies towards better language acquisition techniques.

It is worth mentioning that Corder (1985, p. 25) distinguished between errors of performance and errors of competence by referring to the former as *mistakes* and the latter as *errors*. Larsen-Freeman and Long (1991, p. 59), James (1998, p. 78) and Ellis (2000, p. 17) described the term 'mistake' as a random slip of a tongue and provided a criterion that might clarify the distinction between errors and mistakes. According to these authors, *a mistake* is a performance fault that the learner is able to correct when his attention is drawn to it, whereas, *an error* is believed to be not self-correctible since a learner cannot correct it when his attention is drawn to it. Errors represent a lack of learner competence, are systematic, and might occur many times unrecognized by the learner, Mourssi (2013c and 2012b). In the current paper, errors and mistakes will be used alternatively.

The Role of Transfer in Interlanguage

Transfer is one of the most important elements which affect interlanguage forms. Investigating it can lead to a better understanding of the source/origin and the development of interlanguage. Researchers were doubtful about the issue of transfer, but some of them have said that it is related to language acquisition and should be discussed. Lado (1957) believed that people rely on their first language when they learn the target language. On the other hand, other researchers such as Dulay and Burt (1974:24) said that transfer has nothing to do with interlanguage. This view was rejected by Mourssi (2013c and 2012b) replying with evidence that most of the interlanguage stages the L2 learners pass through are influenced by cross-linguistic influence of L1 which was termed as Transfer in the 20th century.

In particular, Jarvis and Pavlenko (2008:4) argue that cross-linguistic influence refers to the influence of one language on another in an individual mind. They illuminated several areas of meaning and cross-linguistic influence which had not been carefully looked at before. They presented interesting findings and an analysis of the relationship between language transfer and SLA. Based on Odlin's (1989) claims, and Jarvis and Pavlenko's (2008) findings, the study will investigate the role of L1 in the acquisition of the L2 prepositions in the context of ALEs.

The Cross-linguistic Influence of Prepositions

A preposition is defined as an item which expresses a relationship between entities, it identifies a relationship in space (between one object and another), and/or a relationship in time (between events). It is a matter of fact that in English grammar generally prepositions are considered as very important linguistic items which should be learned efficiently. Pittman (1966) pointed out that learning prepositions earned a reputation for difficulty if not downright unpredictability. Similarly, Takahashi (1969) identified that the target-like form of prepositions can be seen as one of the greatest problem face English language learners.

Grubic (2004) classified prepositions according to their form, function and meaning. Regarding form, prepositions can be either simple (one-word preposition), or complex (also called two-word, three-word, or compound prepositions). Simple prepositions are known as closed class from which we cannot invent new single word prepositions. The second form is complex prepositions which are known as open class due to the new combinations which could be invented. Generally, there are about seventy simple prepositions in English grammar. Among these seventy, we can refer to the most frequently used ones which are: *at, by, for, from, in, of, on, to* and *with*.

Quirk et al. (1993) viewed a prepositional phrase is made of a preposition followed by a prepositional complement which is a noun phrase (e.g. *at the bus stop*) or a WH-clause (e.g. *from what he said*) or V-ing clause (e.g. *by signing a peace treaty*). However, several studies (e.g. Mourssi, 2013c) conducted a study in which explored cross-linguistic influence of L1 in acquiring L2 linguistic items in general. However, some studies investigated the transfer of English prepositions across different languages. Regarding Arabic language, Hamdallah and Tushyeh (1993) and also Hasan and Abdullah (2009) examined the cross-linguistic influence of prepositions across English and Arabic languages. Similarly, Asma (2010) investigated the reality of the phenomenon of simple prepositions transfer from Standard Arabic into English by Algerian EFL learners.

Hashim (1996) conducted a similar study in the Jordanian context in which it was found out that a lot of errors have been found and presented in seven syntactic categories. The first category was verbal preposition. In the same vein, Kharmah, and Hajjaj, (1997) reported that on Arab EFL learners' errors, that the majority of their errors are in English syntax, and in particular, prepositions which can be considered as the most troublesome aspect of syntax. Similar studies reached the same findings in the context of ALEs, such as: Zahid (2006), Mohammed (2005), and Muortaga (2004).

However, we can notice that very few studies investigate the cross-linguistic of L1 in acquiring L2 preposition in other languages e.g. Delshad (1980) conducted a contrastive study of English and Persian prepositions. It was found out that Iranian EFL/ESL learners face difficulty in the use of English prepositions.

Types of prepositions in L2

Fromkin, Rodman, and Hyams (2007) categorized any language under five main different categories. The first category is *phonetics* which refers to the study of individual speech sounds, the second category is *phonology* which refers to the knowledge of how sounds fit together to make words, while the third category is *morphology* which refers to the study of the structure of words, then *syntax* which refers to the study of how words fit together to form phrases, and the last category is *semantics* which refers to the study of the meaning of individual words and how they relate to each other. They added that there are two subcategories for syntax which are: content words and function words. The content words are those words which have meaning or semantic value. The content words include: nouns, verbs, adjectives, and adverbs. The function words are those which are used to explain or create grammatical or structural relationships into which the content words may fit. It is worth mentioning that the function words might have little meaning of their own and they are much fewer in number than content words. Function words include pronouns, articles, and conjunctions. They also added that prepositions are categorized as function words.

Jie (2008) pointed out that the mistakes that students make in relation to prepositions can be varied according to their language backgrounds. Mourssi (2013d) mentioned that realizing the mistakes is useful for learners and teachers as well. The former will know that he/she produced non-target-like form and the later will know the gaps in his/her learner's internalized grammatical system.

Celce-Murcia and Larsen-Freeman (1999) and Cook (2009) mentioned that in SLA, when L1 and L2 are similar, it will be easy for language learner to learn the L2. They added that when L1 and L2 are different, it will be difficult for language learner to learn L2. Mourssi (2012d, and 2013d) pointed out that Arabic Language is different from English Language which resulted in committing many mistake by ALEs whether young or adult learners.

RESEARCH QUESTIONS

The current study seeks to answer the following questions:

To what extent do ALEs commit the prepositional mistakes in writing?

What is the evidence of L1 (Arabic) influence in the acquisition of L2 (English) linguistic items?

What the suitable teaching techniques should be used to help ALEs acquiring L2 prepositions?

This is to provide empirical evidence in relation to test hypotheses emerging from language transfer and thus contribute to the advancement of theory on Second Language Acquisition. In addition, to find a suitable teaching technique, this can be used successfully in the acquisition of L2 prepositions.

METHODOLOGY

This section discusses the subjects of the study, the research questions, the procedures and the methods used in the analysis of the written texts.

The subjects of the study

Two groups represent the subjects of the study. These groups were taught by one of the researchers (Ms. Al Hilali). The target location was at Higher College of Technology HCT in the

Sultanate of Oman. Each group consisted of 30 Arab Learners of English (ALEs), with ages ranging between 20 and 24, Intermediate to Upper-intermediate level in English. The subjects were all Arabic speakers and had been learning English as a foreign language for 12 years attending four to five sessions per week on average. They were all enrolled in a full year as foundation course in English language. The samples were taken from their writing classes during their second academic year. In other words, after they finished the foundation course for one year. The number of the samples is 120 written scripts.

The procedures

The procedure started by getting permission from the HoD. He kindly forwarded our request to the dean of the college. As soon as the HoD got the approval from the dean, he gave us the written permission to take off in the journey of completing the research. We started to assign the methods for the research questions.

Methods assigned to the research question

For the research question presented above, quantitative analyses were followed for all target-like forms and the non-target-like forms of prepositions produced by the samples in 120 written texts. Mourssi (2013c) pointed out that writing is one way to get evidence of the state of a student's internalised grammar system, and suggested that different written texts should be collected from the samples of the study in different timing. We decided that in order to explore interlanguage phenomena and the influence of L1 in acquiring L2 prepositions, a full two writing texts were collected from each sample in the two groups. In addition, worksheets were prepared for the experimental group to get a real chance for meta-linguistic feedback and the face-to-face interaction with ALEs inside the classroom, see Appendix (1).

RESULTS AND DISCUSSION

The analysis of the written texts produced by the ALEs in two groups of writing classes appears to indicate that Arabic Language (L1) has influence in the acquisition of L2 preposition. The analyses indicate that meta-linguistic feedback has its own impact on the acquisition of L2 prepositions. In the following are the details.

Pre-test Analysis

In fact there were many types of mistakes in the writing texts but our aim was to sort out the errors related to the L2 prepositions. The authors think about adding a backup group to the main two groups namely the experimental group and the control group. Sometimes it happens that some groups are cancelled for fewer number of students enrolled in that group. That is why we also analyzed the errors in the backup group but when we reached to the post test, it was taken out because we had already analyzed the target groups.

able (1) below shows that when we calculated the errors related to the prepositions, we found out that experimental group made 47 errors. In the same range, the control group made 49 errors. That is why we continued our research because the two groups were equal or nearly equal in the level of proficiency related to the usage of L2 prepositions. In addition the backup group from which we collected writing texts as well but were not included in the analyses, made 51 errors in the area of using L2 prepositions.

Table 1: Pre-analysis

Group	Number of Non-target-like preposition
Experimental Group	47
Control Group	49
Backup Group	51

The Experimental Group

It was noticed that the ALEs in the experimental group used the prepositions *on* and *in* alternatively in a wrong way. We can see from the table below that they used the preposition *in* instead of the preposition *on* in 21 examples. They used (*in first day*) instead of (*on first day*) 14 times. They also repeated the same error and used (*in a hanger*) instead of (*on a hanger*) 7 times. On the contrary, they used the preposition *in* instead of *on* e.g. (*on open air*) instead of (*on open air*) for 4 times. Sometimes the ALEs omit the preposition because they do not have similar one in their L1 as it shown in example 8 in table 2 below. Also from table 2 below, it is noticed the amount of errors that ALEs in the experimental group made in their pre-test writing.

Table 2: Pre-test Analysis Experimental Group

No	Non-target like form	Target like form	Number of non-target like forms
1	The packaging should help bananas stay fresh to a long time.	The packaging should help bananas stay fresh for a long time.	1
2	The banana on a paper bag...	The banana in a paper bag...	1
3	In first day	On first day	14
4	On open air	In open air	4
5	In a hanger	On a hanger	7
6	I heated each pan in 350 °C	I heated each pan at 350 °C	5
7	I fried the chips on 350 °C	I fried the chips at 350 °C	3
8	I fried the chips 20 min	I fried the chips for 20 min	5
9	I poured olive oil for the first pot.	I poured olive oil in the first pot.	2
10	The effect of the factor in the freshness of bananas.	The effect of the factor on the freshness of bananas.	3
11	I added chips for the third pan.	I added chips to the third pan.	1
12	In the other hand	on the other hand	1
			Total 47

The Control Group

Similar to the experimental group, the control group made nearly the same amount of errors in using the prepositions. Table 3 below shows the amount of errors made by the control group. They used the preposition *in* instead of the preposition *on* in 19 examples. They used (*in day1*)

instead of (*on day1*) 12 times. They also repeated the same error and used (*in a hanger*) instead of (*on a hanger*) 5 times. Besides they repeated the same error 3 times in example 13 in table 3 below. On the contrary, they used the preposition *in* instead of *on* e.g. (*on open air*) instead of (*in open air*) for 4 times in example 4 in table 3 below. It can be seen from the table that most of the errors might be related to L1 or overgeneralization of one preposition on the others. They used the preposition *at* instead of the preposition *for* 5 times in examples 11 and 12 in the table below. Similarly to the experimental group, the ALEs sometimes omit the preposition as it does not have any equaling in their L1 as it is shown in examples 5 and 10 in table 3 above.

Table 3: Pre-test Analysis Control Group

No	Non-target like form	Target like form	Number of non-target like forms
1	I observed the bananas in day 1.	I observed the bananas on day 1.	12

13	At the first day, the bananas were fresh.	On the first day, the bananas were fresh.	3
			Total 49

Post-test Analysis

Regarding research question number 3, the treatment started after analyzing the pre-test directly with the experimental group, while the control group followed the normal method of teaching followed in the college. The experimental group received meta-linguistic feedback and face-to-face interaction. The teacher followed Ex-implicit grammar teaching approach (Mourssi, 2013a). Nagata (1993); Carroll (2001), Rosa and Leow (2004), demonstrate that explicit feedback was more effective than implicit feedback. Similarly, Ellis, Loewen, and Erlam's (2006) study of the effects of recasts and meta-linguistic feedback on the acquisition of English past tense *-ed* also found that explicit feedback is more effective than implicit feedback. On the contrary, Leeman (2003) found out that implicit feedback is more effective than explicit feedback. From the point of view of pre-intermediate and intermediate ALEs, Mourssi (2013a) thinks that it is better to employ both types in the classroom context (Ex-implicit feedback), where explicit feedback can be more effective with low level language learners, while implicit feedback can be more effective with higher level language learners. However, the findings of the current study reveal that meta-linguistic feedback explaining the nature of the learners' errors without giving them the target-like forms seems to be the effective type of corrective feedback with both low and high level second language learners, Mourssi (2013a).

The Experimental Group

Table 4 below shows the errors made by the experimental group after the treatment. Analyzing the information in the table below reveals that the improvement that the ALEs achieved in the experimental group. The authors think that is due to the teaching techniques followed with the ALEs during the experiment.

Table 4: Post-analysis (Final Exam Data) Experimental Group			
No	Non-target -like forms	Number of mistakes	Target -like forms
1	I kept the glasses in 20 °C.	2	I kept the glasses at 20 °C.
2	The material of glasses can affect on ice melting.	5	The material of glasses can affect ice melting.
3	The material of glasses can affect in ice melting.	2	The material of glasses can affect ice melting.
4	Glass material has an effect in the ice melting.	1	Glass material has an effect on the ice melting.
5	I put 1 ice cube for each glass.	1	I put 1 ice cube in each glass.
Total (11)			

From table (4) above, it can be seen that the total amount of errors committed by ALEs in the experimental group is 11. We think that the amount should have been less than that percentage; however, it might be because of the short time of the experiment. It is to remind the reader that the experiment lasted for about three months only.

We think that errors mentioned in the table 4 above reveal that ALEs still think in L1 and write In L2. We mean the Crosslinguistic influence of L1 is very clear in the acquisition of L2 preposition. We think that the main problem is using the two prepositions (*in* and *on*). Mourssi (2012d, 2013c, and 2013d) and Mourssi and Al Doori (2014a) pointed out the issue of crosslinguistic and the importance role of meta-linguistic feedback. However, some ALEs show remarkable improvement by memorizing the usage of the most common preposition. This learning strategy of memorization might be effective and helpful in the process of meta-linguistic feedback and face-to-face interaction.

Using the preposition (*for*) instead of the preposition (*in*) in example 5 in table 4 above shows the literal translation. However, we can see the improvement in the experimental group compared with the control group. This will be presented in the following section.

The Control Group

Analyzing the data derived from table 5 below reveals that ALEs in the control group committed 23 errors compared with 11 errors in the experimental group. One reason might be the teaching techniques followed with the experimental group. Another reason might be the normal feedback that the control group received. It can be seen from the data provided in the table that ALEs used a mixture of (in, on, at, of, for, with, and to) compared with the non-target-like preposition used by ALEs in the experimental group. Similarly, the most common errors were committed by the

ALEs in the control group were the prepositions of (in and on). They used the preposition *in* for five times in a wrong way, and the preposition of *on* four times in a wrong way. We think that if they had received meta-linguistic feedback and there were face-to-face interactions, they would not have committed that number of errors.

It is to remind the reader that the subjects in both groups committed many other types of errors but our main aim is to investigate the errors related to the usage of L2 prepositions in the writing context.

Table 5: Post-analysis (Final Exam Data) Control Group

No	Non-target- like forms	Number of mistakes	Target -like forms
1	The material of the glass affects on the speed at which ice melts.	4	The material of the glass affects the speed at which ice melts.
2	The effect of glass material of ice melting.	1	The effect of glass material on ice melting.
3	I kept the glasses in room temperature.	2	I kept the glasses at room temperature.
4	The ice should be kept solid a long time.	2	The ice should be kept solid for a long time.
5	Effect of the material of glasses in the ice melting.	5	Effect of the material of glasses on the ice melting.
6	The glasses were kept in 20 °C.	2	The glasses were kept at 20 °C.
7	Leave the ice in the glass to 20 min.	2	Leave the ice in the glass for 20 min.
8	Ice was added in each glass.	2	Ice was added to each glass.
9	I kept the glasses with room temperature.	1	I kept the glasses at room temperature.
10	The customers were satisfied of the drinks. (2)	2	The customers were satisfied with the drinks.
		Total (23)	

Summarizing the information provided in tables 4 and 5 and table 6 below shows the post-test analysis for both the experimental group and the control group as well. It can be seen the amount of error in the control group is double the amount of errors committed by the ALEs in the experimental group.

Table 6: Post-analysis for both groups

Group	Number of Non-target-like mistakes
Experimental Group	11
Control Group	23

CONCLUSION

In conclusion, it can be said that based on the different positions of English prepositions in the sentences as it happens in Arabic prepositions, where we can see the English prepositions can follow a nominal, a verbal or an adjectival as well. The ALEs committed this amount of errors. A common characteristic of English prepositions is that most of different prepositions can offer

many different meanings when they are used with the same word. Another issue is that the meaning of the verb itself can be changed totally when it is followed by different prepositions.

The main problem which resulted in negative transfer is that prepositions rarely have a one to one correspondence between English language and Arabic language. In other words, we can find out that an Arabic preposition might be translated into several English prepositions and vice versa we can find out that an English preposition might have several different Arabic translations.

To conclude, we think that there is a very clear impact of L1 on the acquisition of L2 prepositions. The technique of meta-linguistic feedback besides the face-to-face interaction and memorization of common prepositions usage might be the most efficient methods of teaching and learning L2 prepositions.

Limitations of the study

The ALES committed many types of mistakes/errors while writing the first and the second texts. We could not analyze all the types because our target was concentrating only on L2 prepositions. The second limitation was the amount of the samples which was 60 subjects only. We tried to cover all the groups in the study but it was difficult to achieve that due to organizing and administrative reasons.

APPENDICES

Appendix 1: Different tasks given to the experimental group

Task One: Correct the following mistakes. (Group work) based on the non target-like forms

1. Smart phones affect for students badly.
2. Open the website for college.
3. Many students face problem in registration day.
4. They are aware about registration.
5. I poured some water on the glass.

Task Two: Correct the following mistakes.

6. In add and drop day.
7. You may think in creating a timetable.
8. Open the website for HCT.
9. The flowers should be fresh to a long time.
10. The flower on the first glass is fresh.

Task Three: Correct the following mistakes.

11. I added sugar for the first glass.
12. I heated the water for 50 °C.
13. In the other hand
14. In day 1, the flower was fresh.
15. Sugar has an effect for the freshness of flowers.

Task Four: Correct the following mistakes.

16. The effect of water temperature in the growth of plants.
17. How to keep flowers fresh at a long time.
18. The type of water in which flowers are kept affects in their freshness.
19. I poured oil for the first pan.
20. This spray should protect you of mosquitoes.

Task Five: Correct the following mistakes.

21. The growth of plants depend in water temperature.
22. She stopped the child of eating chocolate.
23. If you make so much noise I can't concentrate in my work.
24. Both came in the same time.
25. Customers should be satisfied of the quality of the phones.

EXECUTIVE FUNCTIONS MEDIATE THE FACILITATIVE ROLE OF BILINGUALISM IN THIRD LANGUAGE ACQUISITION

PhD Student of TEFL, Razi University, Kermanshah, Iran

ABSTRACT

Executive functioning refers to a regulatory system of general cognitive abilities that includes processes such as attention and inhibition. These capabilities are responsible for handling cognitive processes such as problem solving, switching between the tasks and ignoring misleading features in a task. The relationship between bilingualism or the use of two languages by an individual and these executive functions has been investigated from different perspectives in the literature on bilingualism. This article aims to review and report the findings on the effects of bilingualism on children's executive functioning and on learning a third language. After introducing executive functioning and bilingualism the literature on the relationship of these two phenomena are reviewed and classified along the categories of inhibitory control, task switching capacities, attention control and working memory. There is then a review of the facilitative role of bilingualism on third language acquisition and the significant role of executive functions in language learning to conclude that the facilitative role of bilingualism reported in the literature is due to its beneficial effects on executive functions. Executive functions mediate the facilitative role of bilingualism in third language acquisition. The results may also explain the observation that a difference in the type of bilingualism leads to a difference in this facilitative role. This may provide a better insight in interpreting the studies done on the relationship between bilingualism and third language acquisition.

KEYWORDS: executive functions, bilingualism, third language acquisition, inhibitory control,

INTRODUCTION

Executive function is an umbrella term that refers to higher cognitive mechanisms that account for the conscious control of thought and action (Zelazo & Muller, 2010). Executive functions, thus, refer to the management of cognitive processes like working memory, task switching, and inhibitory control, among other processes. There is a hypothesized executive system in the mind which is responsible for these cognitive processes. It is thought to be mainly responsible for handling novel situations outside the domain of automatic processes that could be explained by the reproduction of acquired schemas (Field, 2004). Tasks requiring planning, decision-making, error correction, and unrehearsed novel utterances are examples of these novel situations that call for executive functioning. Executive functions might be engaged to inhibit automatic responses

in such situations. Executive function abilities are in a state of change and development due to physical changes in the brain and life experiences. The earliest executive functions that appear are inhibitory control and working memory. These are the basic executive functions that make more complex functions like problem solving possible. Recent research has demonstrated that executive control is not a unitary construct, and can be decomposed into several functions. Miyake et al. (2000) identify three separate, but correlated, executive functions: updating of working memory, inhibition of distractors or responses, and shifting between mental sets. In other words inhibitory control, controlled attention, and task switching can be viewed as the basic components that form our executive functioning (Friedman, Miyake, Corley, Young, DeFries & Hewitt, 2006).

Bilingualism, roughly defined, refers to the ability to use more than one language (Richards & Schmidt, 2002). The definitions of bilingualism can be viewed as sliding along a continuum from 'maximal' definition of the concept that implies equal ability in the two languages to a 'minimal' definition which implies an unbalanced knowledge of the two. The relationship between bilingualism or the use of two languages by an individual and the development of cognitive abilities of children has always been an interesting topic of investigation in the literature (Bialystok, 2011; Hakuta, 1986). Bilingual children are reported to show advantages in executive functions, specifically in inhibitory control and task switching. Speaking two languages requires controlling one's attention and choosing the correct language to use and this may simply mean that bilingualism has advantageous effects on executive functioning. Indeed bilingual children have been reported to be more advantageous in cognitive functions like tests of creativity (Ricciardelli, 1992), spatial problems (Bialystok & Majumder, 1998), and ignoring misleading features (Bialystok & Codd, 1997). It seems that most studies support the advantageous role of bilingualism in a host of intellectual abilities: inhibitory control develops more rapidly in bilingual children and bilingual children are reported to outperform their monolingual peers in controlling their attention which is a key element in executive functioning. There is also a growing literature in the field of second language acquisition on the facilitative role of bilingualism in third language acquisition. The interest in the role of bilingualism in third language acquisition began in 1980s and a host of studies have investigated this relationship. The general conclusion is that, all other things being equal, bilinguals outperform monolinguals in learning an additional language (Cenoz, 2003).

This paper reviews the literature on the effects of bilingualism on children's executive functioning especially inhibitory control, controlled attention and task switching and also the effects of bilingualism on third language acquisition. There is then an argument on the role of executive functions in language learning. The aim is to conclude that the facilitative role of bilingualism in third language acquisition is mediated by executive functions. In other words, bilingualism does not directly facilitate third language acquisition. This facilitative role is due to the advantageous influence of bilingualism on executive functions. The results may also be an explanation for the observation that the kind of bilingualism affects this facilitative role in third language acquisition.

LITERATURE REVIEW

There are different definitions for the term bilingualism in the literature. The definitions can be viewed as sliding along a continuum from a 'maximal' to a 'minimal' degree of bilingualism. Lam (2001) defines bilingualism as 'the phenomenon of competence and communication in two languages'. Thus, a bilingual person is one who can communicate in two languages. Most bilingual children are those who brought up in families with bilingual parents. The two languages may be learned at the same time (simultaneous bilingualism) or the second language may be acquired after the first has been established (sequential bilingualism). From the 1920s on scholars were attracted by bilingualism and studies on this phenomenon started. The earlier studies reported negative effects for bilingualism and it was regarded as a disadvantage (Jespersen, 1922 cited in Herdina & Jessner, 2002). Since the counterclaims of Peal and Lambert (1962) that bilingualism actually is an advantage and bilinguals perform better in certain cognitive tasks studies on bilingualism expanded. They believed that the possibility of switching linguistic codes while performing cognitive tasks gave bilingual children an added flexibility that monolingual children did not enjoy. This hypothesis gave rise to a popular concept regarding bilinguals' cognitive advantages, namely, bilinguals' cognitive flexibility. The interest in the study of the effects of bilingualism on executive functions is a more recent trend in the studies on bilingualism. The main concern here is on the possible advantages of being bilingual on the performance of children on tasks requiring executive functions, that is tasks needing more than automatic routines (Bialystok, 2001). Starting in the 1960s and continuing into the 2000's, dozens of studies were conducted on the relationship between bilingualism and cognitive abilities. In a review by Palij and Homel (1987), they examined bilingualism and its relationship with cognitive development from three perspectives: historical, examination of issues related to methodologies, and the role theory has played in guiding research and what is expected to happen in the future. The authors argued that in the past, bilingualism was viewed as a worry for the parents. It was believed that it caused confusion in children and it impeded their first language learning abilities. However, since that time, a different picture has emerged, an optimistic and supportive view of bilingualism in childhood. The effects of bilingualism on children's executive functioning can be studied from different perspectives.

Bilingualism and inhibitory control

One of the main processes involved in the executive functioning of the cognitive system is the inhibitory control. It plays an important role in making different cognitive processes work together to successfully perform a task. Studies have shown that bilingual children excel in tasks requiring inhibitory control to ignore misleading features. Green (1998) and Bialystok (2001) believe that bilingual children have an advanced degree of inhibitory control. Bilinguals have at their disposal two languages and this means that they have to move or switch between their two languages at any given time and, thus, they need to inhibit or suppress one of their languages in favor of the other one. This constant practice of inhibitory control contribute to the bilingual's advanced ability to ignore distracting or irrelevant input, first in language tasks and then in other general cognitive processes. Investigators suggest that bilingualism promotes inhibitory control mechanisms, and that bilingualism leads to a greater use of inhibitory control, because it is invoked every time language is used (Bialystok et al., 2004). Kovács (2007) argues that there is an advantage for the bilinguals because they constantly engage in selecting and inhibiting

competing responses for language output/motor response. Similarly, Kroll et al. (2008) believe that bilinguals do not avoid cross-language interference but rather they learn to deal with the competition of the two systems and, thus, develop more advanced inhibitory control. Indeed, the first reports on positive effects of bilingualism on inhibitory control rooted from the assumption that the two languages of a bilingual have to be processed on a constant basis. This implies that the speaker faces cross-language interference and, hence, has to promote his/her inhibitory control so as to resist the unintended use of the non-intended language in each situation. This is in line with Bialystok's (2001; 2004) argument that the mere fact of bilingual experience leads to superior inhibitory control. Cross-language interference can only be avoided in normal language processing due to the inhibitory control mechanisms. This claims, however, presupposes the idea that both languages of a bilingual are activated while using one of the languages. This co-activation or parallel activation has well been documented in the literature on multilingualism. Bilingual picture-word is one of the paradigms that have been used in multilingual studies aiming to provide evidence for this co-activation (Costa & Garamazza, 1999; Hermans, 2004). This may be one of the reasons why bilinguals found to have a cognitive advantage over monolinguals; they have excessive practice in inhibitory control.

Bilingualism and controlled attention

We have an ability to tune in to certain inputs and exclude others. It seems that the mind has a hypothetical filter to allow certain pieces of information while blocking others. We are bombarded with auditory and visual information from the environment, but our perceptual system seems to filter out what is not relevant (Styles, 1997).

Attention requires mental effort, with some tasks requiring more than others. The ability to perform two or more tasks simultaneously depends on how much of the capacity of the working memory a task demands. Working memory, however, is said to have limited capacity. Apart from working memory some other factors are also influencing attention. They include issues like motivation, interest and emotional factors (Field, 2005). As well as influencing models of first-language reading and listening, the notion of attention plays a part in theories of second language acquisition. Like inhibitory control the bilinguals' experience of using two languages seems to lead to enhanced controlled-attention than monolinguals. Bilingualism seems to help individuals to pay close attention to relevant information due to the presence of interference (Bialystok & Majumder, 1998). One of the first studies on the relationship between bilingualism and controlled-attention was Ben-Zeev's (1977) study which employed certain metalinguistic tasks like Symbols Substitution accompanied by a context of competition between the usual and unusual semantic reference function. The bilinguals outperformed monolinguals in the tasks and this suggested that bilinguals might have developed certain strategies as a consequence of their dual language acquisition. Bialystok (1992 a) redefines these strategies as 'control of attentional processing', by which she means the child's ability of executive attention to tune to or focus on certain aspects of a stimulus in the presence of distraction or conflict. She proposed the idea that bilingual children show significant advantage compared to monolingual children in tasks calling for advanced controlled-attention. Bialystok (1998) tested this hypothesis by designing a task that required children to make grammaticality judgment ignoring the semantic meaning of the sentence. The bilinguals' higher levels of control processing were supported in a number of the

experiments and replications. It was, thus, concluded that bilingualism facilitates the direction of attention to relevant information in a distraction condition. Working memory, a component of memory responsible for holding short-term information for the purposes of performing the current tasks, is often mentioned in the studies on attention. In Baddeley and Hitch's (1974) model of working memory there is a 'central executive' component that is the same as the 'controlled-attention in Bialystok's (1992 b) words. Attention is responsible for controlling the limited cognitive resources in all forms of information processing. There is, thus, strong correlation between controlled attention and working memory capacity on the conflict resolution task (Kane et al, 2001). In fact bilinguals are reported to show significantly greater working memory capacity than monolinguals on attention-impaired tasks (Yang et al, 2005). Compared to monolinguals, bilinguals can direct their attention to task-relevant information and further maintain their attention in spite of adverse interference.

Bilingualism and task switching

The ability to shift attention between one task and another is an executive function which is referred to as task switching. This ability allows an individual to rapidly adapt to new or different situations. Task switching may cause a slower performance and a decrease in accuracy on a task. This difference in performance and accuracy between tasks in a task-switching situation is known as the switching cost. Task switching is often regarded as a manifestation of cognitive flexibility. Given that bilinguals tend to switch languages rather often, one could readily hypothesize that, to the extent that language switching shares some components with domain-general task-switching, bilingualism should impact task-switching performance. Bilinguals switch between languages so as to select the language that is appropriate in different contexts. This may create or contribute to potential benefits for bilinguals in task switching (Hernandez et al, 2013).

Prior and McWhinney's (2009) study on the effects of bilingualism on task switching is one of the earliest studies in this regard. They investigated the possibility that bilingualism may lead to enhanced efficiency in the ability to shift between mental sets. They compared the performance of monolingual and fluent bilinguals in a task-switching paradigm. Bilinguals proved to incur less switching costs than monolinguals. Based on the reported reduced switch-cost of bilinguals, Hernandez and colleagues explored the way bilingualism affects task-switching mechanisms. Their results qualified previous claims about the effect of bilingualism in reducing non-linguistic switch costs (Hernandez et al, 2013).

Bilingualism and third language acquisition

The interest in the influence of bilingualism on learning an additional language began in the late 1980s (Ringbom, 1987). Different aspects of this influence can be investigated. Bilinguals demonstrate more cognitive flexibility and more metalinguistic awareness in comparison to monolinguals (Cenoz, 2003). The studies show that bilinguals have more capabilities to control and use their linguistic resources (Bialystok, 2001). This privilege can exert positive effects on learning a third language. Moreover, skill transfer can happen much more easily (Cummins, 1991). De Angelis (2007) believes that bilinguals can transfer from both L1 and L2 and this is an advantage in itself.

Several studies have supported the advantages of bilingualism in the development of linguistic and cognitive capabilities (Ringbom, 1987; Bialyok, 1988). Kecskes and Papp (2000) believe that bilingualism facilitates the learning of another language. Other studies in the field have also confirmed that bilingualism assists learning an additional language (Cenoz and Valencia, 1994; Klein, 1995). McLaughlin and Nayak (1989) confirm the positive effect of bilingualism on learning a third language by referring to the fact that bilingual students are able to use a wider variety of learning strategies.

The general conclusion that bilingualism generally facilitates L3 acquisition rate has specially been documented in the area of morphosyntax. Thus, for example, Elaine Klein (1995) observed a general advantage for multilingualism when 15 high-school speakers of L3 English were asked to judge whether the separation of a preposition or a postposition from its noun phrase, or what is known as stranding, was grammatical. They did considerably better than another group of learners of L2 (as opposed to L3) English. This was despite that this phenomenon was absent in their L1s and L2s. The evidence suggests that 'knowledge of two or more languages can accelerate the learning of an additional language. Research on lexical transfer in L3 acquisition has found substantial vocabulary rate advantage for multilinguals' (Ortega, 2009, p.48).

Bialystok's studies (2001) show that bilingual children have higher levels of metalinguistic awareness comparing to monolingual children. Bialystok asserts that there is a positive correlation between the higher levels of bilingualism and the ability to think better about language. A source of evidence for metalinguistic awareness along with mother tongue is other previously learned languages. Cenoz (2011) suggests to the advantages that bilinguals have in learning an additional language. They have more linguistic experiences, more learning strategies, and richer linguistic and cross-cultural repertoire.

One of the earliest studies on the effects of bilingualism on learning a third language was conducted by Ringbom (1987). He compared the monolinguals and Finnish-Swedish bilinguals who were learning English in Finland. The results of these studies showed that the bilingual learners outperformed the monolinguals. The learners were all of the same level of proficiency in English and the same tests were used to measure their achievement. Thomas (1988) noticed that Spanish-English learners of French performed significantly better than their peer monolinguals in learning French in the classroom setting.

Cenoz (1992, cited in Cenoz & Genesee, 1998) compared the monolingual and bilingual learners of English and found that bilinguals outperformed their monolingual peers in language proficiency tests. Moreover, in a series of studies conducted in Spain (Sanz, 1997; Munoz, 2000; Sagasta, 2003) the bilingual children outperformed their monolingual peers in learning English. Gonzalez (1998) studied the Turkish and Moroccan immigrants regarding their progress in learning English. He noticed superiority for bilinguals. In the immersion programs in Canada the studies showed that bilingual students performed better in French tests compared to their monolingual peers (Hurd, 1993). Brohy (2001) showed that Romanian-German bilinguals were more successful in learning French in Switzerland.

Molnar (2010) investigated the differences between second language acquisition and third language acquisition and the effects of bilingualism on learning an additional language. The results were based on the assessment of lexical competence of the Hungarian monolinguals, Hungarian-Romanian bilinguals and Roman monolinguals that were all learners of English. The results demonstrated that the Hungarian-Romanian bilinguals performed better than the Hungarian monolingual group. The results of this study supported this general conclusion that bilingualism has a facilitative effect on learning a third language. Sanz (2000) compared 124 Catalan-Spanish bilinguals with 77 Spanish monolinguals learning English. Their level of proficiency was measured by general proficiency tests of vocabulary and grammar. In this study lots of extraneous variables were controlled. These included the learners' socio-cultural background, motivation, attitudes, and general intelligence. The bilinguals got much better scores than their peer monolinguals.

Cenoz (2003) investigated the effects of two previously known languages on the oral production of the third. The study focused on the cross-linguistic influence by comparing the same group of learners at two different times in their learning process: in grade four and grade six of elementary school. The participants were twenty learners of English as a third language who had received language instruction from the age of four. They were Basque-Spanish bilinguals. The same general conclusion on the facilitative effect of L2 knowledge on L3 acquisition was supported.

Keshavarz and Astaneh (2004) reported that female students at pre-university level in Iran who were speakers of either Armenian and Persian or Turkish and Persian outperformed a comparison group of L1 Persian-L2 English students on an English vocabulary test, even in the absence of any cognates that would be useful for learning English vocabulary. In this study the focus was on the effects of bilingualism on learning English vocabulary and potential variables that would affect the results were controlled. The results clearly show that bilingualism facilitates vocabulary learning in an additional language. Kassaian and Esmae'li (2011) compared the monolingual and bilingual EFL students for their vocabulary acquisition. Thirty Armenian-Persian bilinguals and thirty Persian monolinguals participated in the study. They were all females. Nationality, age, and level of instruction were also controlled. The subjects were all Iranian, aged 17 to 18, and they were all at the lower intermediate level. Nation Vocabulary Test was used to measure their vocabulary knowledge breadth and Burt Word Reading test was used to measure the participants' word reading skills. The results showed that bilingualism displays a high correlation with vocabulary knowledge breadth and reading skill. The bilingual subjects had greater size of vocabulary knowledge breadth and reading skill.

Executive functions and language learning

Executive functions play an important role in language development and use. Most language processing models take into account executive functions such as attention, working memory, task switching, and inhibition in language processing, though it may be under the rubric of the general term of cognitive factors. This means that language processing is not mere a linguistic task (Gomes, Wolfson, and Lalperin, 2007). Executive functions are thought to influence language performance. They 'allow us to organize our behavior over time and override immediate demands in favor of longer-term goals' as Dawson and Guare (2004:1) put it. In other words, in

addition to their general cognitive contributions, the executive functions are vital in language development and language processing. Working memory, for example, has been mentioned as the most important cognitive skill needed for online language processing in both auditory and visual modes (Archibald & Gathercole, 2006). Hungerford and Gonyo (2007) even go further and suggest that language disorders happen because of executive dysfunction. The contribution of working memory, inhibitory control, and shifting abilities to English proficiency has been reported in the studies aimed to investigate the relationship between executive functions and language proficiency. In a study designed by Kaushanskaya, Gross and Buac (2014) to investigate the bilingual advantages in learning further languages they concluded that the bilingual advantages on word-learning tasks may be rooted in bilinguals' ability to rely on domain-general executive function mechanisms in language learning. The role of attention as another component of executive functions in language development has also been investigated to account for the fact that one important mechanism of language is to direct attention to different semantic propositions in an utterance.

DISCUSSION

A comparison of the studies on the positive effects of bilingualism on the development of executive functions and also studies on the facilitative effects of bilingualism on learning a third language can lead to the generation of the idea that bilingualism may not affect L3 acquisition directly. The mere fact that executive functions play a crucial role in language learning in general can lead to the idea that the facilitative role of bilingualism in learning a third language is mediated by executive functions. From a descriptive and structural point of view previous languages seem to make further languages difficult to acquire and this is exactly the prevalent view mentioned earlier on the bilingualism as a disadvantage. Psycholinguistics brought about a totally different view and focused on the positive effects of the previously learnt languages on learning other languages. The review of the studies reveal a timeline from 1980s when the focus was on the facilitative role of bilingualism in third language learning to the 2000s when the focus shifted on the positive effects of bilingualism in better executive functioning. Interpreting these results by the insight provided from the strand of studies that focused on the crucial role of executive functions on language learning contribute to the conclusion that it is these positive effects of bilingualism on executive functions that pave the way for its facilitative role in third language acquisition.

A critical analysis of the studies which have investigated the relationship between bilingualism and third language acquisition can lead to the conclusion that it is not bilingualism per se that has provided the advantage in third language acquisition, but rather the underlying cognitive capabilities which have been reinforced by bilingualism. This may be the reason why Cenoz (2003) noticed that studies on the influences of bilingualism on L3 acquisition give mixed results. The advantage mentioned for bilingualism in these studies may be due to cognitive capability and flexibility that one gets because of learning another language. Further studies need to be done to investigate the role of bilingualism in developing any other skills that rely on executive functioning in order to come to the conclusion that in these studies it is the impact of bilingualism on executive functions that paves the way for a more efficient learning of a third language.

Intelligence may have played a role too. Bilinguals may have shown greater achievement not because they are bilingual, but because they are simply more intelligent. Intelligence is a multidimensional and dynamic predisposition that can be affected by learning experiences. Learning a second language on the part of the bilinguals has, thus, provided a kind of mental gymnastics for the mind and has made it more apt for learning an additional language. Thus the success observed for the bilinguals may be due to this mental aptness. Genesee (1978) found that intelligence can make a difference only for language skills, reading and structural expression, and not for communicative skills in conversation with other speakers. This may be the reason why Magiste (1984) reported a slower oral production rate for multilingual subjects in his study. In the literature on intelligence and aptitude high correlations have been reported between intelligence and vocabulary size (Skehan, 1989). This provides an additional support to claim that the subjects in these studies performed better because of intelligence, a factor which is more psychological than linguistic.

CONCLUSION

The general conclusion of this review is that executive functions mediate the facilitative role of bilingualism in third language learning. Bilingualism has advantageous effects on executive functions. These executive functions in turn are necessary in language learning. Thus, bilingualism contributes to third language learning through its positive impacts on executive functions. In other words, from a linguistic point of view bilingualism may not be beneficial in third language acquisition, but psycholinguistics has provided deeper insights in understanding the nature of language development specially the role of executive functions in this process and it is from this point of view that one can explain the reason of why bilingualism seem to be beneficial in third language acquisition. It should be mentioned here that the facilitative role of bilingualism on third language acquisition may not be merely due to its effects on executive functions but because of some other less observed factors. Bilinguals, for example, may have more motivation for learning another language or they may have more positive attitudes towards other languages due to their knowledge in two languages. In other words, bilingualism may facilitate third language learning not because of cognitive or linguistic reasons, but because of attitudinal factors.

ABSTRACT

The effect of de-motivation in second or foreign language learning and its relevant causes cannot be underestimated. The present study was an attempt to examine the factors of de-motivation affecting English as a foreign language (EFL) learners' performance in speaking English. A questionnaire consisting of teacher-related, student-related and classroom-related de-motivating factors was administered to 100 first grade high school students in one of the institutions of Iran. Tabriz who had been studying English for three years. The data analysis revealed that although all three factors of de-motivation negatively affected the students' performance in speaking English but the classroom related factor was the most effective one among all three factors of de-motivation. The most significant reasons of students in de-motivation were (a) little or no access to the Internet (b) computer equipment shortage, (c) no real-life situation for using English outside the classroom, and (d) no sufficient time for teaching English in classroom by teachers. With respect to the results obtained Instructional materials developers and policymakers can choose the appropriate subject matters, allocate sufficient time amount according to the learner needs. By identifying de-motivating factors, EFL teachers make attempts to decrease or prevent the causes of de-motivation or at least minimize their effect on students' learning. They can use the advantage of de-motivation by identifying the real factors of them and will try to decrease or prevent the causes of de-motivation in order to stop or minimize their effect on students learning.

KEYWORDS: De-motivation, Motivation, De-motivating factors, Learner's attitudes and behaviors.

INTRODUCTION

Motivation is one of the main factors in an individual success in developing a second or foreign language (Dörnyei & Otto, 1998). Dörnyei (2001a, p.6) puts it “the term motivation is a convenient way of talking about a concept which is generally seen as a very important human characteristic but immensely complex”. In sharp contrast to motivation and motivating factors is de-motivating factors which have been completely or at least partly neglected in language teaching and learning studies especially in EFL contexts. Flout and Maruyama (2004) believe

that if motivation pushes learning for life, de-motivation cuts learning short for some reasons. De-motivation is “another side of motivation” (Falout & Marayama, 2004; Kikuchi, 2009). Experiences are showing that learners of a language can't be motivated to learn while having strong reasons for de-motivation against learning and before motivating reluctant learners, the factors and perceptions which cause de-motivation and prevent engagement in learning or willingness must be recognized then removed. There are various factors affecting the language teaching and learning process of language learners. Among these factors motivation plays an important role in the learning process as it has been one of the main factors in an individual success in developing a second or foreign language (Dörnyei & Otto, 1998). There have been de-motivating factors that impede learners learning motivation and hence lead to unsuccessful mastery of English language proficiency. According to Gorham and Christophel (1992), Christophel and Gorham (1995), two thirds of de-motivating factors which diminish communication are related with teacher. Song (2005) also reported that all the factors effect motivated students become motivated but among these teachers related factor played an important role in that process. In language learning process there are a lot of studies which indicate the effect of the motivation on the outcome of learning and results shows that motivation is one of the main determining factors in an individual's success in developing a second (L2) or foreign language (FL). The darker side of motivation or de-motivation has almost been completely ignored in research on FL motivation. Reality shows that de-motivation is a frequent problem in schools, universities and language institutes and a bitter fact is that, the number of de-motivated students is increasing in regular. So in this study we want focus on this important matter in student's learning and try to distinguish the darker side of it and try to shed light on some motivational problems and ganger areas. Therefore, in this study we investigated the main and significant de-motivating factors among Iranian High schools students which impede the learning process and for the result Iranian high school students give up the learning English as foreign language or get cold feet at this process.

RESEARCH QUESTIONS

RQ1: Is there any difference in student-, teacher-, and classroom-related, de-motivating factors that discourage Iranian high school students to speak in English

H1: There is a significant difference among student-, teacher-, and classroom-related, de-motivating factors that discourage Iranian high school students to speak in English

RQ2: Is the teacher related factor is more effective than students related and classroom related factors in de-motivating Iranian high school students to speak in English?

H2: The teacher related factor is more effective than students related and classroom related factors in de-motivating Iranian high school students to speak in English.

METHODOLOGY

Participants

Participants in this study were 100 students from Ashtab, and Emam Sadegh, two different high schools in Tabriz, Iran who were all males and about 14 years old at the first grade. All the

students had taken English classes at school for four years - three years at secondary school and one year at high school. Sampling of the data collecting was randomly done among two different first grade classes at each school.

Instruments

The instrument used to measure de-motivating factors is based on Kikuchi and Sakai (2007) de-motivation questionnaire consists of 43 items in a 5 point Likert-type questions about de-motivation. For the reliability and validity of the questionnaire among the pupils of the study, the de-motivation questionnaires were distributed among a sample group and then after collecting data 30 questions were elicited among those 43 questions which were in relation to de-motivational factors in the students learning to speak in English. The observations and data collection of research were quantitative and by collecting the data through papers given to the participants. In every question five choices were inducted which represent the students positive (True & To some extent true), negative (Not true & Mostly not true) and neutral (Not either true or untrue) for motivational components as suggested by Gardner (1985). For each item, the highest degree of de-motivation receives five points and the lowest one point. The students' scores can range from 30 to 150. Thus, the higher the score, the stronger the de-motivating factor. For the aim of omitting the language understanding problems by the participants, the Farsi version of the scale was given to the participants for data collection in this study so the original questionnaire was translated into the Farsi language. For this, the students could easily read the questions and answer them because of thinking only about the matters which were asked in questions not translating English to Farsi in order to be simple enough to understand.

The questions were classified into nine parts:

1. Teacher's behaviors
2. Inadequate English skills of teachers
3. Threats to self-worth
4. Punishment
5. Language anxiety
6. lack of self-determination
7. Poor classroom management
8. Inadequate facility
9. Test scores

Based on the reviewed studies on de-motivation, the de-motivating factors in language classes can be classified as: 1. Teacher - related factors 2. Student - related factors a)Experience of failure b)Lack of interest 3. Classroom - related factors a) Characteristics of the classroom b) Classroom environment c) Classroom materials

Data Analysis

The present section presents the results of the statistical tests which were used to test the research hypotheses. Before conducting inferential statistics, the normality of the score distributions was checked. As shown in Table 1, the Kolmogorov-Smirnov test was used to check for normality of distribution of data on the questionnaire. It was found that the data was normally distributed ($p > .05$).

Table 1: Test of Normality of Questionnaire Scores

Variable	Factors	Kolmogorov-Smirnov		
		Statistic	Df	Sig.
Questionnaire Scores	Teacher	.06	100	.17*
	Student	.10	100	.07*
	Classroom	.05	100	.12*

* $p \leq .05$

As it was intended to assess whether EFL learners' scores obtained on the de-motivating factors questionnaire would be statistically different with respect to the three factors (the teacher-related factors, student-related factors, and classroom-related factors), pairwise comparisons were made through an inferential statistic called the Tukey Honestly Significant Difference test or Tukey HSD (Wilkinson & the Task Force, 1999).

The Tukey HSD is based on a variation of the *t distribution* that takes into account the number of means being compared. This distribution is called the *studentized range distribution*. Also, because of the fact that the more means that are compared, the more the Type I error rate is inflated, it was decided to set the significance level at 0.01. For this purpose of the study, the means and variances of each group (factor) were, first, computed. They are shown below in Table 2.

Table 2: Results of Mean and Variance Calculation for the Three Factors

Factor	Mean	Variance
Teacher-related	2.96	.80
Student-related	3.03	.63
Classroom-related	3.52	.49

MSE, which is the mean of the variances, was then calculated. It was equal to 0.64. Then, the studentized range statistic (*Q*) was computed through the following formula:

$$Q = \frac{M_i - M_j}{\sqrt{MSE/n}}$$

For each pair of means, where **M_i** is one mean, **M** is the other mean, and **n** is the number of scores in each group. Finally, for each comparison, *p*-value was determined. The degree of freedom was equal to the total number of items minus the number of means. For this study, *df* = 30 - 3 = 27. The tests for these data are shown in Table 3.

Table 3: Three Pair wise Comparisons using Tuckey HSD

Comparison	$M_i - M_j$	Q	p^*
Teacher – Student	0.07	0.40	0.95
Teacher – Classroom	0.56	3.21	0.01
Student – Classroom	0.49	2.60	0.17

* $p \leq .01$

Results (Table 3) show that the mean score of the teacher-related factors was not significantly different ($p < .01$) from that of the student-related factors. In addition, the difference of the mean scores between the student-related factors and the classroom-related factors did not reach statistical significance. However, the only significant comparison was between the teacher-related factors and the classroom-related factors. Considering the results obtained it can be said that the first research hypothesis ($H1$: There is a significant difference among student-, teacher-, and classroom-related, de-motivating factors that discourage Iranian high school students to speak in English) is accepted whereas the second hypothesis ($H2$: The teacher related factor is more effective than students related and classroom related factors in de-motivating Iranian high school students to speak in English) is rejected. All this suggests that classroom-related factors play an important role in comparison with the other factors.

Discussion

The current study intended to investigate the sources of de-motivation among Iranian high school students which discourage them to speak in English. The researcher originally assumed that three de-motivating factors caused those students to lose their motivation to speak in English. The results and findings showed that although the teacher related factors and student related factors are effective on the students de-motivation, the most effective factor is the classroom related factor. Participants at this study strongly declared the shortcomings of schools such as lack of audio and video usage and internet equipment, the classroom crowdedness of students and the idea of having no situation to use English for communication and also its usage out of classroom in real situation were emphasized as de- motivational factors affecting their learning quality which are grouped among the classroom related de-motivational factors.

The findings of this study are in line with the Oxford (1998) study in which she carried out an investigation on 250 American students about their learning experiences. The findings revealed that many shortcomings such as the degree of closure or seriousness of the class and the amount of irrelevant and repetitive subjects in the classroom were the de-motivating factors for the participants of the study. Also this study is in contrast with Gorham and Christophel (1992) studies in which the teacher related factors have played much more important roles in de-motivating the learners of English in comparison with other different factors. Also this study's findings are in contrast with Lantolf and Genung (2002) studies in which they conducted a case study of graduate student learning Chinese as a foreign language in a summer intensive course. They found that the learner became de-motivated because of the teacher's authoritative use of power.

In addition, the research findings revealed the teacher related and student related factors were not dominant factors to de-motivate the Iranian first grade high schools student's learning to speak in English and mostly they suffer from the situation and also the equipments which are used at schools for the learning purposes. Furthermore, the findings pointed out student attitudes about teacher's behavior, student laziness and motives vary one from one student to another.

Student motivation is also affected by various other factors associated with learning English. One of these factors is prior learning experience and also their background English knowledge which seriously affect their current outlook for the learning purpose of that language. By the time students enter to the high school, they have studied English for at least for 3 years at the secondary school and most of them have learned it out at different English institutes. So it is obvious that those more knowledgeable students with vast number of English words and grammar will be more successful and top students at the same classroom in comparing with other less knowledgeable ones at the same class. Another reason which caused the students to lose their motivation and self-confidence was the attitude toward the compulsory nature of language learning at Iranian schools which are designed by policy makers and also taught by the teachers. The students have to take English for the means of passing their current classroom examinations and then trying to succeed university entrance exams which led them have no desire to learn it for communication.

CONCLUSION

It became evident in this study that the classroom related factors play a major role in de-motivating Iranian high school students in speaking English. It seems that classrooms with lack of suitable equipment and interests make the students boring in the classroom and consequently this leads them to lose their eager and willing toward learning English as a language to speak. In order to overcome to this phenomenon, the classrooms should be equipped and updated with the new learning materials like internet and video sets according to the student's needs. And also another possible way to enhance student's motivation is to make the classroom as a friendly environment for their interaction and this will help them to improve their social skills and exert great influence on student's spirit and willingness to work cooperatively. In summary, having a friendly atmosphere in class is worth the effort as it can undoubtedly help students overcome the factors which are de-motivating them from speaking freely in the classroom.

Limitations of the study

Eventually, it must be stated that like many other studies, this study is not without its limitations. The results of this study were based on a sample population of students from two different high schools in Tabriz, Iran. Therefore, the generalization of the findings may be limited to groups of students with similar characteristics only. It may not be applicable for other populations with different countries, educational system and cultural backgrounds.

Regarding the sample, the number of students participating in this study was small. So in order to have more reliable findings, larger groups of students across different cities are needed.

ABSTRACT

Reflection and reflective thinking has come on the scene in the field of language teaching in the recent years. The present study attempted to investigate the familiarity of Iranian EFL teachers with reflective thinking practices in language teaching situation and the main obstacles in way of doing it in the country. Besides, the study attempted to bring to light the effect of reflective thinking in collaborative learning in classroom. Therefore, three instruments including two questionnaires and one interview was put to use by the researchers. The findings of the study showed that Iranian language teachers are not familiar enough with reflective practice and its influence on language learning and teaching and teacher development. Also, the results of the study lit upon the main obstacles in the way of doing reflective teaching in the country. Finally the results of the research brought to light the practical effects of using reflection in fostering collaborative learning in the classroom setting. This study has many implications for EFL teachers, teacher trainers, curriculum developers and sociolinguists.

KEYWORDS: Cooperative Learning, Reflective Thinking, Teacher Development, Teacher Training

INTRODUCTION

It was about one hundred years ago that Dewey (1933) in his classic works gave birth to the term reflective practice in the field of teaching. According to Liston (1987), reflection is a cognitive inquiry and a thoughtful examination of action considering educational knowledge, practices and values in which experiences are analyzed in the context of prior knowledge for the endeavors of finding meaning that will lead to the creation of a new knowledge and to the development of new alternative ways. Dewey, in his classic works, added flesh on teacher education and introduced a reflective approach as an alternative to the existing models of teacher education (1910; 1933). In

his writings, Dewey made a criticism that teacher education is dominated by technical orientation, in which candidate teachers were guided to acquire and master technical skills, and where utmost importance was given on how to teach, without considering principles or philosophy in their practice. It was for the same reason that the term "reflective thinking" became popularized in the literature on teacher education in both pre-service and in-service programs. Reflective thinking skills and its application in teaching plays a vital role in the preparation of many new teachers on one hand and improving the practice of experienced teachers on the other. According to Johnson (2006), entering into constant professional development activities, which is a hallmark of reflective thinking practice, is a key for change to happen because it gives rise to self-directed, collaborative, inquiry based learning that is closely associated with teachers' classroom lives. In addition, reflective thinking provides enough resources for teachers to analyse, and evaluate their own practices, schools, classroom relationships and context of learning based on which teachers can make decisions and plan for future actions in the classroom and this could lead school, students and teacher to improve (Mrglova, 2008). On top of that, according to research findings (Glazer, Abbott & Haris, 2004; Kraft, 2002), reflective practices play a role in collaboration and communication in classroom which is an integral part of any language classroom especially in EFL contexts that is largely dependent on classroom interaction. Also, according to Erginel (2006) reflective practices that involve active self-evaluation, effective communication with equal peers and with colleagues, create a supportive interaction for professional growth which in turn let the teachers know how to bring to use the implications of their reflective practice during tutorial courses in real classroom context. He has also asserted that a reflective practice in classroom entails cooperation and teamwork along with autonomy. In spite of the fact that reflective practices can play a crucial role in, pre-service and in-service teacher education in many countries around the world and its importance as an approach to teaching in general and language teaching in particular, it is not known to what extent Iranian EFL teachers are familiar with reflective thinking concepts, strategies and, on top of that, the way they think of reflective thinking in teaching practice. Furthermore, little is done to explore the ways through which reflective practices can help interaction and cooperation in classroom in EFL context, if at all.

REVIEW OF LITERATURE

This study is an attempt to delve into Iranian EFL teachers' attitudes toward reflective teaching and shed light on hindrances in the way of putting it into practice. Furthermore, the role of these practices in cooperative learning in classroom is studied. This part of the study, therefore, presents a report on the theoretical background of reflective teaching and offer the account of empirical studies carried out on this issue.

As it is also touched above, Dewey (1933) expanded an ethical scheme he named reflective morality in which he argued that every act, even an apparently minor action, is potentially of moral significance because it is joined to other actions. For the same reason, the separate actions of a teacher link together to shape behaviours and then habits, which consequently leave a lasting impression on the personality of the teacher, thus moral development becomes a critical element of teacher development and growth. In the past decades, the terms "reflection" and "reflective

reflection" or in general "reflective thinking" has been present in the educational circles and programs on teacher education. Not unlike other fields of study, in the field of language education this idea that teachers must reshape and reconstruct and renew their knowledge of teaching and learning has become in vogue (Farrel, 2007). This knowledge initially came on the scene in teacher education programs for pre-service teachers, then through reflective teaching practices became a permanent part of teacher education (Tedick, 2005). According to Grant and Zeichner (1984) "reflective practice" is in contrast with "routine action". While "routine practice" was considered as a behaviour which is directed by impulse, tradition and authority, reflective practice is considered as a "behaviour" which involves active, persistent and careful consideration of any belief or practice in light of grounds that supports it and further consequences to which it leads. Also, reflective thinking has a deep root in Cartesian Philosophy and some social movements such as Feminism which are far beyond the scope of the present research. So, what that comes later are among those practical researches done in the field of reflective thinking and its application in language teaching and learning. Al-Issa and Al-Bulushi (2010) carried out a quantitative study and described the responses of 90 final year ELT- student teachers and eight of their trainers at Sultan Qaboos University in the Sultanate of Oman to study the roles, approaches and strategies used to help the student teachers to reflect on their teaching. A 25-item questionnaire was administered on line to collect the data from the student- teachers and trainers' responses for this aim. The results showed that while trainers have helped the development of student teachers as reflective practitioners, there were specific practices done by the trainers that impede the student teachers to be reflective practitioners and they have negative implications for the preparation of the teachers. Similar to this research was one carried out by Armutcu and Yamen (2010) to explore any change in teacher reflection artistry of 4th grade pre-service teachers in English Language Teaching Department (ELT) an on-going practicum was considering sex and type of instruction as independent variables from quantitative point of view. The study aimed to illustrate their thoughts, feelings and experiences qualitatively. Participants in the study were thirty-seven ELT pre-service teachers chosen non-randomly from both day and night. Twenty-nine of them were females while only eight of them were males. In this study, "Teacher Reflection Scale" (Kayapinar & Erkus, 2009) and semi-structured interviews were used to collect data. The results of the study showed that pre-service teachers in ELT department had higher teacher reflection both at the beginnings and through the ends of practicum and no change was observed between these two measures. Also, in one more study, Enisa (2010) investigated the effects of collaborative reflection professional development on EFL teachers. This study was conducted at a preparatory school of an English Medium Turkish University in Istanbul. There were 26 teachers in this school but due to their loaded schedules only three (two female, one male) were able to participate in the study. The data was collected through three qualitative research methods: a) observers' field notes, b) electronic journals and c) notes from the teachers' dialogues. The results of this study showed that collaborative reflection might have positive effects on EFL teachers' teaching and foster teacher dialogue.

RESEARCH QUESTIONS

Taking into account the issues mentioned above, the current study is an attempt to answer the following questions:

- 1- Are Iranian EFL teachers with knowledge of different dimensions of reflective thinking?
- 2- What are main obstacles in the way of doing reflective teaching in Iranian setting?
- 3- Does reflective teaching help cooperative language learning?

METHODOLOGY

The aim of this study was to investigate the knowledge of Iranian EFL teachers about reflective teaching. The second aim was to explore whether any hindrances exist in the way of Iranian EFL teachers to know about the concept of reflective teaching and its practice as a reflective practitioner. Thirdly, the effect of reflective practices in cooperative teaching and learning is investigated. Research designs in studies are vitally important because they, in large part, dictate the type of research design used, the sample size and sampling scheme employed, and the type of instruments administered as well as the data analysis techniques (i.e., statistical or qualitative) used (Mackey and Gass, 2006). Therefore, the design of the study is an inquiry-based qualitative one in which all questions of the research are looked into three different qualitative open ended questionnaire.

Participants

The participants were 100 EFL teachers selected through convenient sampling since the participants were available to the researcher. The teachers were from both Language Colleges and universities in the city of Tehran, Iran. 86 of them had M.A in TEFL and 14 of them had PhD in TEFL or English language and literature. With regard to gender, they were 91 male and 9 female teachers whose age ranged from 28 to 63 years old. Additionally, concerning their teaching experience, they had 5 to 32 years of service. For bringing to light different dimensions of the third question we selected 3 teachers performing reflective techniques and 3 teachers unpractised with reflective techniques in classes of whom we selected 20 students respectively. These teachers were selected purposively based on the results of the first and the second questions. To achieve the homogenous data all these 6 teachers were teaching at intermediate level in different language colleges.

Instrumentation

Three different instruments were used in this study. For the first question, an open-ended questionnaire consisting of 29 items and 5 dimensions was adapted and adopted from Akbari, et al (2010) the validity and reliability of which was considered through a pilot study. The questionnaire brings to light the different dimensions of reflective teaching practice. The first dimension of the questionnaire, 'practical element', includes items that deal with the tools and the actual practices of reflection such as journal writing, lesson reports, audio and video recordings, observations, etc. Second dimension of the questionnaire, 'cognitive element', is concerned with teacher's efforts aimed at professional development such as performing small-scale classroom research project (action research), attending conferences and workshops and reading the professional literatures are among the behaviours are included in this dimension. 'Learner dimension' or 'affective dimension' is the third in the questionnaire. It encompasses the reflection of the teacher on his/her students, the learning of the students, and their emotions. It also deals with the teachers' reflection on cultural linguistic backgrounds of the students, interests and

developmental readiness for lessons. 'Meta-cognitive dimension which is the fourth one which touches teachers and their reflections on their own beliefs and personality, their emotional and affective character and teacher's reflections on the effects of their personalities on teaching practices. The last dimension, the critical one, consists of items referring to the socio-political aspects of teaching and teacher's reflections upon teaching issues. The items of this dimension deal with teacher's reflections on political aspects of teaching practice and teaching topics related to race, gender and social class in the classroom context. The second instrument used in the research was an open ended interview aiming at uncovering the most prominent challenges and obstacles in the way of doing reflective practices in Iran. The third instrument was a questionnaire adopted from Mrglova (2008) to compare the cooperative learning in classes with reflective teachers and those with teachers unfamiliar with reflective practices.

Procedure

The first questionnaire was distributed among the participants through face to face methods. The data collected through interview - the second instrument- were also transcribed, coded and categorized. All interviews were audiotaped. For the sake of the third question we distributed our third instrument among 20 students with their teachers conversant with reflective practices and 20 students with their teachers unfamiliar with reflective practices to compare the amount of cooperative learning and teaching in respective classes.

RESULTS AND DISCUSSION

Results of the First Questionnaire

As mentioned above, in order to explore Iranian language teachers' familiarity with reflective teaching practices, qualitative data are collected and analysed, the results of which are mentioned below:

Familiarity with Practical Dimension of Reflective Thinking

Practical dimension is concerned with the instruments teachers put to use for reflection practice. Several instruments such as 'portfolios', 'journals', 'audio and video recording', 'observation' can be employed for reflective practices. The results of this section brought to light the fact that only 19 percent of Iranian EFL teachers have a file where they keep their accounts of teaching for reviewing purposes. Besides, only 23 percent of teachers talk about their classroom experiences with their colleagues and seek their advice/feedback. In addition, 22 percent of these teachers write about the accomplishments/failures of the lesson or talk about the lesson to a colleague, after each lesson. Too, only 10 percent of teachers discuss practical/theoretical issues with their colleagues. Furthermore, 25 percent of teachers observe other teacher's classrooms to learn about their efficient practices. And finally, 9 percent of teachers like their colleagues to observe their teaching and comment on their performance.

Familiarity with Cognitive Dimension of Reflective Thinking

Cognitive dimension of reflective teaching is concerned with teachers' attempts aimed at professional developments. Conducting small-scale classroom research projects (i.e. action research), attending conferences and workshops related to teachers' field of study, and reading the

professional literature are among the behaviours included in this dimension of reflective teaching. The results of the study showed that 38 percent of Iranian EFL teachers read books/articles related to effective teaching to improve their classroom performance. 23 percent of teachers participate in workshops/conferences related to teaching/learning issues, 12 percent think of writing articles based on their own classroom experiences, 24 percent look at journal articles or search the Internet to see what the recent developments in their profession, 8 percent carry out small-scale research activities in classes to become better informed of learning/teaching processes and finally 13 percent of them think of classroom events as potential research topics and think of finding a method for investigating them.

Familiarity with Affective Dimension of Reflective Thinking

Affective dimension includes items dealing with teachers' reflection on his/her students; the way they learn, emotional behaviours of the students and the way they react emotionally in their classes. Learner dimension also includes reflection on linguistic and cultural background of the students and their interests. The results of the study showed that 17 percent of Iranian teachers talk to their students to learn about their learning styles and preferences. Also, 29 percent of teachers talk to their students to learn about their family backgrounds, hobbies, interests and abilities. Also, only 17 percent of them ask their students whether they like a teaching task or not.

Familiarity with Meta-Cognitive Dimension of Reflective Thinking

Meta-cognitive dimension deals with teachers and their reflections on their own beliefs, attitudes, and personalities. Moreover, it considers emotional character of teachers and the way they define themselves as a teacher. The results of this section showed that only 22 percent of Iranian EFL teachers think about their teaching philosophy and the way it affects their teaching. Also, 17 percent of them think of the ways their biography or their background affects the way they define themselves as a teacher. Too, 49 percent of them think of the meaning or significance of their job as a teacher and 29 percent try to find out which aspects of teaching provide them with a sense of satisfaction. Besides, 69 percent of them think about their strengths and weaknesses as a teacher. Finally, 28 percent of them think of their consistencies and contradictions that occur in their classroom practices

Familiarity with Critical Dimension of Reflective Thinking

Critical dimension refers to socio-political aspects of education and reflection upon them. It takes the broader aspects of society into consideration when defining reflective practice. Critical dimension of reflective teaching associates teaching with its broader social and cultural context. Teachers reflect on political facets of their teaching and issues such as race, gender, social class and how they can empower students for their social live. The results of the study showed that only 9 percent of teachers think about instances of social injustice in their own surroundings and try to discuss them in their classes, 6 percent of them think of ways to enable students to change their social lives in fighting poverty, discrimination, and gender bias, 11 percent of them include less-discussed topics, such as old age, AIDS, discrimination against women and minorities, and poverty in their teaching sessions, 9 percent of them think about the political aspects of their teaching and the way they may affect their students' political views, 9 percent of them think of ways they can promote tolerance and democracy in the class and in the society in general and

finally 14 percent of them think of outside social events that may influence their teaching inside the class.

Results of the interview

The second instrument used in the research was an open ended interview aiming at uncovering the most prominent challenges and obstacles in the way of doing reflective practices in Iran. The Results of this section were audiotaped, transcribed, analyzed and then categorized in the following table, the results of which brings to light the main obstacles in the way of doing reflective teaching in Iranian setting.

Main Obstacles	Main Codes of Obstacles
Personal Obstacles	Lack of time for reflection Past experiences (unfamiliarity with reflection in high school, teacher training centers or universities and both pre-service and in-service courses Unawareness of worth and importance of reflection Negative attitude towards students roles Lack of writing skills
Affective obstacles	Fear of criticism in collective discussion Lack of self- critical mind Low tolerance for being criticized by others Lack of self-confidence for being observed
Structural obstacles	Teachers workload Weak in-service courses (lack of in-service programs) Outdated views about teaching Physical environment of schools Low budgeting and non-facile research condotion

Results of the Second Questionnaire

For the sake of the third question, we selected 20 students in a class with reflective teachers and 20 students in a class with non-reflective teachers. To select the classes with reflective and non-reflective teachers, purposive sampling was done but to select the students in each class, simple random sampling was exercised. A questionnaire adopted form Mrglova (2008) was distributed among students and the following result were obtained. The aim of this section was to shed light on the role of reflective teaching practices on cooperative language learning in class.

Class with Reflective Teacher	Class with Non-Reflective Teacher
90% of Ss enjoy attending the class	80 % of students enjoy attending the class
95% of Ss view most of their classmates as friend	55% of Ss view most of their classmates as friend
95% of Ss can cooperate with anybody in class	45% of Ss can cooperate with anybody in class
5% of Ss think of their mates as rude to them	30% of Ss think of their mates as rude to them
10% of Ss do not like some of their classmates	35% of Ss do not like some of their classmates
50% of Ss can do their homework independently	50% of Ss can do their homework independently
20% of Ss feel bad when they do not know the answer	65% of Ss feel bad when they do not know the answer
75% of Ss want to be the first in the class	80% of Ss want to be the first in the class
95% of Ss believe that relationships in the class are very good	45% of Ss believe that relationships in the class are very good
100% of Ss believe that they have a good relation with their teacher	65% of Ss believe that they have a good relation with their teacher
95% of Ss like to participate in all discussions	55% of Ss like to participate in all discussions
30% of Ss like explanation of grammar, individual work and un-grouped class activity	55% of Ss like explanation of grammar, individual work and un-grouped class activity

Discussion

Concerning the first question which investigated the extent to which Iranian EFL teachers are familiar with concepts and practices of reflective thinking in teaching language, the results of the study showed that almost all of them are not versed enough with the concepts touched in the questionnaire. In the case of the first factor in the questionnaire, namely the practical dimension of reflective practice, the findings are not in line with Farrell (2007) who suggests language teachers come together in teacher development groups to reflect and this reflection helps them complement each other's strengths and compensate for each other's limitations and weaknesses. He also stated that teachers participating in these discussions stimulate each other to articulate their thoughts about their career and this in turn helps them to grow professionally together.

Besides, the findings of the first questionnaire are not in congruence with McDonough (1994) that maintains teachers who write regularly about their teaching experiences and events can become aware of their behaviours and underlying attitudes. With regard with second factor of the first questionnaire aimed at investigating teachers attempt for professional development, we see that these teachers are not at home with concepts such as action research and workshops and etc. These findings are not in line with Rock and Levin (2000) and Chant et, al (2004) who studied the intersection of reflection and action research in pre-service teaching and they stated that involving pre-service teachers in action research makes them more aware of students' learning, classroom complexity, and their own agency as teachers. They also suggested that teachers are more likely to become reflective, critical and analytical when engaging in research actions projects. On top of that, Harmer (2003) discussed conferences, meetings and workshops allow teachers to know about the latest developments in the field of teaching, participate in investigative workshops and discuss about current issues in theory and practice. Participants in such conferences converse with each other about teaching problems and seek some solutions. The third factor of the first questionnaire dealt with teachers' reflecting on his/her students, how they learn, and emotional behaviours of students and the way they react emotionally in their classes. The results of the teacher's responses to this factor indicated that they are not also well up in this factor while understanding individual student learning is crucial for every teacher and she/he should focus on students' needs, interests and abilities. Kagan (1992) discusses a "critical lack of knowledge about pupils" and calls on teacher educators to assist pre-service teachers focus on students' needs and interest. Reflection can be helpful for teachers to recognize and understand their students' styles and preferences emotional behaviours. The fourth dimension of the questionnaire was concerned with teachers and their reflections on their own beliefs, attitudes, and personality. It also dealt with emotional character of teachers and the way they define themselves as a teacher. In spite of the fact that teachers own image influences his career in a great extent, the results of this factor were also frustrating. In one study, for example, Johnson (1994) focused on pre-service English as second language teachers, and she found that images from formal language learning experiences influenced these teachers' images on themselves as teachers, teaching, and the way they perceive their instructional practices. These findings indicated that the pre-service teachers tended to project their role in teaching and their instruction based on their experiences as a language learner. Teachers tended to project their role in teaching and their instruction based on their experiences as a language learner. Results of teacher's responses to the latest questionnaire were also incongruent with literature in favour of reflective

practice. These teachers were little au courant with socio-political aspects of education and reflection upon them. Bartlett (1990) suggested that in order for teachers to become critical reflective practitioners they have to go beyond technicalities of teaching and think beyond the need to improve their instructional techniques. He believes that critical reflection can locate teaching in its broader social and cultural contexts. This reflection will able teachers connect the classroom world to the outside world and both students and teachers made aware of socio-political aspects of their teaching. In the same line, Webb (2001) raises attention to the necessity for guidance for practitioner to question his/her beliefs on ethnicity, gender, and socio-economic classes during reflection so that transformation towards equity and Multiculturalism could take place. Otherwise, he argues that the practitioner could be negatively affected by reflection, since s/he will focus on technical issues and his/her mainstream beliefs, and consequently, presumptions of individuals will remain unchanged. In fact, in his argument, Webb points out the necessity for reflection to move beyond technical level, and the importance of encouragement for critical reflection and its possible impacts on education for transformation.

Concerning the second question, the results of the interviews demonstrated that personal and structural obstacles are the main barriers of practicing reflection and reflective teaching. Personal obstacles include lack of time for reflection, teachers' past experiences, lack of awareness on importance or worth of reflection, teachers' attitude toward the role of students, lack of writing skills and teachers' affective obstacles. Lack of time was mentioned by most of the teachers as an obstacle. According to Day's (1999) research, time and opportunities are the main prerequisites needed to develop complex reflective skills for teachers. The teachers' past experiences was also mentioned by some interviewees. According to Freeman (1992), the character of the people in general and the teachers in particular is under the influence of past experiences. Teaching methods of their teachers and teachers' behaviour, character and the way of managing the class can influence prospect teachers. He also stated that these past experiences gleaned through teachers' observations as a student function as a guide for them in their teaching and determine the way they approach what they do in their classes. Affective barriers were mentioned by some participants in the interviews. These results are in line with Farrell (2004) suggesting that in order to practice reflective teaching teachers need a sense of security. Structural obstacles were also mentioned. Finding a solution these kinds of obstacles is outside the limits of this study and they remain for further study.

The results of the third question, as it is indicated in table 2, shows that reflective practices fosters collaborative teaching and learning in the classroom because it helps teachers and students both, to shape their values and their identities and this in turn brings about good cooperation and collaboration in class (Hall & Hall, 1988). Besides, reflective practices help students to distinguish between "their public display, their blind spots, their dreamer spots, their untapped reservoir and their unknown potential which all in all result in more collaboration and more interaction in class (Easen 1985). Also, reflective practice help teachers to change their perceptions of pupils and therefore student are given more roles and more autonomy in interaction and classroom activities (Pollard, et al, 2005). Everybody will definitely agree with Claxton (1999) and Katz (1995) "that the way that children think of themselves in school will directly influence their approach to learning. The review of the literature shows that reflective

teaching practices help students to develop positive self-concepts among students (Richards, 2008). Reflective teachers provide more opportunities where student's qualities can be appreciated, and these qualities are improved through group works and collaboration (Pollard, et al 2005). Besides, according to Mrglova (2008), reflective teaching techniques, exercised by a reflective practitioner can help the betterment of students' attitude towards family, school, peers at school and the whole community, which this in turn fosters a sense of collaboration and cooperation in social settings. Reflective practices also change students' perception of their teachers. Whenever positive classroom climate is to be established, children's attitudes towards teachers are changed positively.

CONCLUSION

The present study was an attempt to bring to light the amount of familiarity of Iranian EFL teachers with reflective thinking practices, the obstacles in the way of this practice and possible effects of reflective teaching in cooperative learning. The findings of the study showed that a great percent of participants are neither familiar with different dimensions of reflection nor they put it to use while teaching. Also, the results of the study brought to light principal obstacles in the way of doing reflective practice. Finally, the study showed that reflective practice fosters cooperative language learning in classroom context. The results of the study are then discussed from a variety of perspectives. Besides, these results can be discussed from the Piaget's theory of cognitive developments; it is further on than the limits of this study, however. They remain for further study, therefore. The current study has implication for EFL and ESL teachers, teacher-training centers and sociolinguists.

ABSTRACT

This study aimed to investigate the relationship between inquiry-based learning and critical thinking. Inquiry-based learning is an approach which starts with questioning and leads to investigating an issue or idea. A well-organized inquiry-based learning can promote information literacy. Popular discussions on education as well as recent findings have come to the same conclusion that in the present society, new methods of learning and engaging students are required. The aims of this study necessitated the analysis of data produced by 40 advanced Iranian EFL learners who were randomly selected from different universities in Isfahan. The participants were asked to fill out two questionnaires (to see the extent to which they think critically) in the first phase of the study. In the next phase, the participants were divided into two groups as control and experimental group. Inquiry-based learning was taught to the experimental group, whereas traditional method was employed for the control group. The results of this quantitative investigation showed a significant relationship between inquiry-based learning and critical thinking. Among the implications of the study, which could be used by teachers and practitioners, could be that one possible way of having critical thinkers could be exposing them to inquiry-based instruction.

KEYWORDS: Information literacy, EFL learners, Inquiry-Based learning, Critical thinking

INTRODUCTION

Inquiry-Based Learning

Inquiry-based learning (IBL) is an approach, in which students have control over their learning. It begins with questioning and leads to investigation into a reliable issue or idea. Followers of this constructivist approach begin with questioning, gathering and analyzing information, creating solutions, making decisions, justifying conclusions and taking action. In other words, students construct their own recognition about the world.

A well-organized inquiry-based learning can expand problem-solving abilities and develop skills for lifelong learning. Researches have shown this approach is a procedure to motivate students. Students work cooperatively to solve problems and the depth of understanding is greater than other teaching approaches. Students learn better when they are at the center of their own learning progress. Inquiry-based learning is a learning process through questions stemmed from the interests, curiosities, and experiences of the learner. When findings generate from our own questions, curiosities, and experiences, learning is an organic and motivating process that is enjoyable from inside.

IBL is a flexible approach which is open-ended to the students' feedback. Students are supposed to benefit from their own inquiry and build information accordingly. IBL should not necessarily be appeared in the context of assessment. Group activities and peer works can be good examples of IBL contexts. The challenge for IBL in opposition with the traditional methods is embedded in meaningful learning to facilitate deep understanding of the students. (McKinney, 2010)

IBL covers a number of other approaches to teaching and learning. Sub-branches of inquiry-based learning include: (a) problem-based learning: learning that starts with an ill-structured problem or it can be a case-study, (b) project-based learning: in which students make a project or presentation as an indication of their understanding, (c) design-based learning: learning through working for design of a solution to a problem, and (d) constructivism: learning through the physical construction of a concrete object in the real world.

Some studies have shown that inquiry-based learning (IBL) is very helpful and beneficial in promoting different learning outcomes such as deep thinking and the ability to apply knowledge and reasoning skills when compared to the traditional educational approach (Chinn, Duncan, & Hmelo-Silver, 2007).

It worth mentioning there are two models for IBL. The first one is the model in which the students are aware of the process of IBL and the second one is the type of IBL in which students are not aware of the process of IBL. They do what the instructor says without knowing the process of IBL. This study belongs to the second group in which students participate in the study, answer questionnaires, receive pretest and posttest, and participate in experimental and control group with having information about IBL and traditional method of learning.

Critical Thinking

The term critical thinking (CT) can be defined as the ability to think rationally and logically. Critical thinking is a process of actively involving, analyzing, studying, and surveying the problem to come up to a final conclusion. People with self-guided minds attempt to justify at the highest level in a fair-minded way. They want to decrease the power of society tendencies and use principles and logic to strengthen thinking.

Critical thinking is believed to be the cornerstone of higher education, but it is very difficult to measure it because critical thinking is not a stable outcome. It means that an individual is consistently questioning about different assumptions, creating more information, and exploring alternatives (Brookfield, 1987).

A professional critical thinker asks essential and critical questions to ferret out a possible solution, collects a variety of concrete and abstract ideas from different sources, infers reasonable and logical connection among different opinions, and solves the problem through systematic gathering of information. Some researchers have suggested different skills for the development and promotion of critical thinking. These skills can be mentioned as the following: analyzing, applying standards, discriminating, information seeking, logical reasoning, predicting, and transforming knowledge.

LITERATURE REVIEW

As contrasted with more traditional forms of teaching and learning, inquiry emphasizes the process of learning in order to develop deep understanding in students in addition to the intended acquisition of content knowledge and skills. Popular discussions on education as well as recent findings in the learning sciences came to the same conclusion. Instructors should apply various methods for different societies in different times. The model of education of 20th century classrooms was effective for that era of human history, but the society we now live in requires new methods of thinking about the way of learning and engaging teaching. Teachers are now faced with the challenge that former definitions of learning is no longer beneficial in our present world where what we know is less important than what we are able to do with knowledge for various usages.

According to the National Science Education Standards (NRC, 1996), inquiry is an important teaching method in science. It includes various classroom activities, such as creating questions, examining and observing text books and other sources of information, analyzing data, synthesizing different sources of information, and communicating the results. Audet and Jordan (2005) expressed that teachers play the role of facilitator who can guide students to ask questions, state their opinions, and make discoveries in search for new understanding of science. Cowan and Cipriani (2009) even introduced their first-graders into scientific inquiry through an arts-integrated, pattern-searching approach to build a deeper understanding of science content and processes. In fact, the scientific inquiry is congruent to the concept of information literacy, because they both emphasize the reasoning and critical thinking.

A good definition that can be understood more easily is that critical thinking is the correct assessing of statements (Ennis, 1962). This definition suffers from creative aspects of critical thinking. The following definition can be better to minimize confusion in communication. Critical thinking is a kind of reasonable thinking focused on deciding what to believe or do. In other hand, for being reasonable and logical to know what to do, a person must be able to identify conclusions and reasons, judge the quality of argument and acceptability of its reasons and evidences, defend a position on an issue, ask questions to clarify the problem, be open-minded, draw conclusion with caution.

However, Chang and Mao (1998) investigated the effects of an inquiry-based teaching in science and received the meaningful higher achievement scores only at the comprehensive test, not at the factual level. National Research Council (2000) also claimed that inquiry-based teaching may not

be appropriate for the goal which made students to memorize information. In addition, an inquiry-based study conducted by Brickman, Gormally, Armstrong, and Hallar (2009) found that in inquiry students' literacy and research skills have improved, but these students gained less self-confidence in scientific abilities compared to the traditional students. Furthermore, the roots of both inquiry-based and problem-based approaches can be traced back to the progressive movement, especially to John Dewey's belief (Audet & Jordan, 2005; Delisle, 1997; Savery, 2006). Their common characteristics included learner-centered, active learning, as well as real and ill-structured problems. By the same token, research results of inquiry learning were also found in the problem-based learning studies (PBL). Reviewing problem-based learning research from the past 30 years, Hung, Jonassen, and Liu (2008) concluded that PBL curricula had better knowledge application and clinical reasoning skills, but performed less well in basic or factual knowledge acquisition than traditional curriculum. On the other hand, Strobel and Barneveld (2009) used a qualitative approach to find the effectiveness of PBL. They expressed that problem-based learning was more effective for long-term retention, skill development and satisfaction of students and teachers, while traditional approaches were more effective and useful for short-term retention.

RESEARCH QUESTION

The aim of the study was to find an answer to the following research question:
Does inquiry-based learning enhance EFL learners' critical thinking?

METHODOLOGY

Participants

A sample of 40 advanced EFL learners was randomly selected from different universities in Isfahan, Iran. The participants were chosen from English majors who were advanced university students at Khorasgan, Najafabad, and Isfahan University. They aged between 25 and 35 and included both genders. These academic students were all native Persian speakers from different affiliations. They had normal economic status and were from different geographical locations in Iran. They were divided to two groups of experimental and control group. In this study there was an experimental group consisting of 20 participants and a control group with the same number of participants. The study became feasible due to existence of experimental and control group, inquiry-based learning treatment, critical thinking for pretest and posttest, and randomly selected participants.

Materials and Instruments

In order to explore the effect of IBL on CT, 40 participants from different universities filled in two different questionnaires regarding their way of learning and thinking. These two questionnaires were derived from the Internet and their reliability was found to be satisfactory (.81 and .93, respectively) by three EFL experts while they were checking their face and content validity. TOEFL test was used to measure the level of proficiency of the students. TOEFL test was used to neutralize the possible effect of background knowledge of the students. This test included 20 reading comprehension tests which were to be answered by two groups of the

students. There was another questionnaire to measure students' level of CT. It is a deductive test for critical thinking and each question belongs to two different categories. The first one is Delphi conceptualization and the second one is traditional categorization. The questionnaires were devised in Persian (learners' mother tongue) not English. This is because of the main format of these valid questionnaires and misunderstandings which may happen due to lack of the exact correspondence between expressions in two languages. The first questionnaire asked students to answer the questions according to the style of their learning. It asked about the expectations the students may have about themselves or the way they learn more easily. This questionnaire revealed the amount or level of inquiry-based learning in each student. The second questionnaire asked questions which led to the level of critical thinking. The questions were completely challenging in the way that they required concentration and critical thinking.

Procedure

The participants were divided into two equal groups. Each group had 20 members that belonged to experimental group and control group. Before applying the experiments, TOEFL tests were given to 40 members of two groups to ensure that the students were at the same level of proficiency. Then critical thinking questionnaires were given to the 40 members of two groups to ascertain that there were not meaningful differences between critical thinking levels of these students. Afterwards, the first group of student was taught reading comprehension by an ordinary traditional method and the second group was taught reading comprehension by inquiry-based models of learning for one semester, which was about 15 sessions. In this experimental group, most of the learning responsibility was put on the learners' shoulders. After three months, when the semester finished, critical thinking questionnaires were given to all of the students again to measure the effect of traditional method and inquiry-based method on the amount critical thinking development.

RESULTS AND DISCUSSION

In this study, the researcher aimed to answer the question of whether IBL enhanced critical thinking or not. To answer this question, quantitative evaluation using *t* test was employed.

Table 1: Descriptive Statistics of Pretest and Posttest for IBL Learners

Groups	N	Mean	SD	SEM
IBL Pretest	20	9.30	2.886	.645
IBL Posttest	20	14.70	2.203	.493

As it is displayed, for inquiry-based learners the mean of pretest was 9.30, but the mean of posttest was 14.70. So the process of inquiry-based learning increased critical thinking during 15 sessions, as this is also shown in the figure below. This figure shows the mean of pretest and posttest of the experimental group.

Figure 1: The Mean of CT Scores Before and After IBL Treatment

The dark box indicates the mean of the pretest and the light box indicates the mean of the posttest for experimental group.

Table 2: Quantitative Evaluation Using *t* Test for Pretest and Posttest of IBL Learners

<i>t</i>	<i>df</i>	<i>Sig.</i> (2-tailed)	Mean Difference
-6.652	38	.000	-5.40

Based on the results of the *t* test analysis presented in Table 2, there was a significant difference between the two tests ($t = -6.652$, $p = .000 < .05$).

Some studies were done regarding the implication of IBL. One of the studies discussed about the integration of PBL which is a kind of IBL and General Studies for primary schools. This research was done successfully due to having positive effects on information literacy, educational skills, and attitude towards the use of Internet among students.

Another research was done to explore the relationship between engagement in the classroom and active learning. The purpose of this research was to provide quantitative evidence for the effect of problem-based learning on academic performance and students' engagement. The results of the study showed that students in IBL groups were much motivated to take the responsibility of the process of learning.

One of the studies discussed about the integration of PBL which is a kind of IBL and General Studies for primary schools. This research was done successfully due to having positive effects on information literacy, educational skills, and attitude towards the use of Internet among students. Another study was conducted to use inquiry-based laboratory in promoting inquiry in undergraduate students in biotechnology. The results indicated that students gained the ability to measure cellulose activity after inquiry-based laboratory activities. The students found more willingness and enthusiastic in doing given activities than in traditional classes. Another

research was done to explore the relationship between engagement in the classroom and active learning. The purpose of this research was to provide quantitative evidence for the effect of problem-based learning on academic performance and students' engagement. The results of the study showed that students in IBL groups were much motivated to take the responsibility of the process of learning.

CONCLUSION

In conclusion, this study was to explore whether IBL increased the amount of critical thinking in the participants. The researcher performed an experiment to find the answer to this question. The questionnaire of critical thinking acted as pretest before treatment and posttest after treatment. Total scores of pretest were compared to the total scores of posttests. The correlation formula of this comparison answered the second research question. Inquiry-based learning can enhance critical thinking.

To recap what was mentioned previously, it can be implied that upcoming methods of teaching and text books should consider student-centered ways of presenting lessons. It is a good idea to the teachers to use new methods which motivate students to become curious and ask about details of the context. Teachers can promote students' CT to guide them toward IBL. Text books are excellent devices to increase students' motivation to not to be dependent to the teachers. Text books can be promising sources to release students from teacher-centered approaches

Limitations of the Study

In every research, the researcher will be faced with some limitations. This study also had some problems that must be controlled in order to not to reach to deadlock. One of the limitations was the choice of the material that should be taught to the students in both control and experimental groups. Not every reading text was appropriate to be taught according to these two different methods. There are lots of educational books in the libraries but a few of them are challenging enough to be taught in IBL method. The subject of readings was really important in a way that it was to be interesting, attractive, and challenging enough to be taught to the students in IBL method.

It is true that IBL is very different from traditional methods, but teachers themselves are important factors who can have great influence on the amount of learning. Each teacher has an especial method for teaching. On the other hand, some of the teachers can convey the meaning of something in the best way. Some teachers are born with the intrinsic talent of teaching. These teachers are more successful in transferring the material to the students. This can be considered as another limitation for this study because the two teachers who were teaching experimental and control group might not be professional the same as each other. The educational level of the participants was another limitation that the researcher was faced with. IBL is not a method that can be presented freely in schools as a routine. Advanced students are more dependent and willing to use IBL, but lower level students tend to use teacher-centered methods because they direct the way of their own learning. With this point in mind, choosing appropriate participant was difficult. Not every student could take part in this study.

ABSTRACT

Needless to say, for various well-known reasons, the ability to speak English is now an important desire for learners all over the world. Therefore, exploring the impact of different factors on learning this skill seems essential and worthwhile; one of these factors is motivation. This factor has been under the focus of lots of researches in the world, and many study have been conducted to investigate the effect of it on learning in general and the forth skills of language in particular. Similarly, In Iran, motivation and its effect on learning language has received a great deal of attention; nonetheless, the studies to focus on its effect on just speaking skill are very rare (if any). Furthermore, very few studies (if any) have addressed this issue with Kurdish students in Iran whose standard language is Persian. The purpose of this study, therefore, was to find out whether or not there is a statistically significant effect of motivation in Iranian Kurdish senior high school students' speaking ability. To this end, an ex post facto research design has been employed. This research was conducted with a total number of 90 female senior high school students studying at Kosar high school in Kermansha, Iran. The instruments of this research are motivation questionnaire to measure the students' motivation in learning English and speaking test through prepared talk. The result of this research shows that there is a significant effect of students' motivation on speaking ability. Therefore, the writer suggests that English teacher should maintain students' motivation in order to improve students' speaking ability.

KEYWORDS: Motivation, Speaking, EFL students

INTRODUCTION

Many factors such as attitudes, anxiety, age difference, personality factors, cognitive factors, educational program, the kind of textbooks, the way instructions are implemented, and many others are at work in how fast and how well learners learn a new language skill in a second or foreign language learning setting. One of these factors is undoubtedly motivation. This factor is one of the most complicated variables which account for individual differences in learning a language and has been dealt with from a variety of perspectives. It has been considered by Gardner (2001) as a key factor in following anything in our lives. For many other scholars, it is treated as the most contributing factor for explaining EFL learners' failure or success and their crucial performance predictors. It is also a tool to provide a source of energy that is responsible for why learners decide to make an effort to learn another language and how long they are going to continue it (Brewster & Fager, 2002; Mori, 2002). On the account given so far, motivation can play an essential role in learning all four language skills. The skill of our interest in this study is speaking.

Chaney (1998, p. 13) defines speaking as "the process of building and sharing meaning through the use of verbal and non-verbal symbol in a variety of contexts. Most of the time through speaking, we communicate, share our knowledge and information, and establish and maintain social relationships with others. Hence, the ability to communicate is the main aim of many foreign language teaching programs, and as a result, speaking has been given priority over other skills. The importance of this skill is conspicuously reflected in Nazara's (1996) idea, which considers the "speaker" of a language as the people who know that language, and the others as foreign language learners who are primarily interested in learning to speak.

Spoken English is very important for all levels of learners as we could judge a person's English competence and his English knowledge through his speaking competence. According to Bygate (1987), speaking needs more attention due to its usefulness in the learner's current and future lives. Therefore, it is very important for the learners to learn how to speak English.

Needless to say, for various well-known reasons, the ability to speak English is now an important desire for learners all over the world. They would like to be able to express their ideas through English in daily activities. However, most of them find speaking English so formidable and arduous that after spending different courses, they end up with the lack of ability to express their ideas orally. Hinkel (2005) argues that although speaking is most often used to communicate by people, it is the most complex and difficult skill to master.

I have personally witnessed many high school teachers claimed their students mostly have limited mastery of speaking. Teachers often observe in their classrooms that students prefer to be silent; they avoid asking and answering questions in English.

There are two main reasons why some students are not proficient in speaking English. Firstly, their native language is considered as the main medium of communication and also in the classroom. Learning English is not much emphasized and therefore, students tend to neglect the importance of learning English as they have limited exposure to this language. Secondly, the

development of speaking skills has not been greatly emphasized in the curriculum where more priority is given to the teaching of reading, writing and grammatical skills.

Some high school teachers believe that, in order for their students to improve their speaking skill, they need to make their students motivated and bring them into interesting class. But how much this claim is valid need to be investigated through research. Therefore, this study aims to find out whether or not there is a significant effect of motivation in learning English on Iranian Kurdish senior high school students' speaking ability.

As mentioned earlier, this study is done with Iranian Kurdish senior high school students. In Iran, English is one of the compulsory subjects for junior and senior high school students. However, after many years of learning the language students still could not achieve an acceptable level of ability in English. Depdiknas (2006) states that the objective of teaching English at senior high school is that the students are expected to be able to develop communicative competence both in written and in spoken form to achieve informational literacy level. It means that the students have to be able to master a productive skill, like speaking skill. Speaking is perceived as a measurement of people's language mastery. Senior high school students in Iran only have two or three learning hours of English per week in school to accomplish this objective.

In doing this study, I looked at one of the existing internal factors that could help educators improve learners' speaking ability. I believe that by having a clear picture of the effect of motivation on speaking ability, course designer, practitioners, and teachers will better allow themselves to diversify their methods of motivating and teaching L2 students.

In the literature of motivation, different classifications have been proposed, among which intrinsic/extrinsic and integrative/instrumental are very popular. Intrinsic motivation, which is important in promoting success, refers to the motivation inside a person with no reward except the activity itself, while extrinsic motivation refers to the motivation outside a person with an expectation of reward from outside (Chalak & kassaian, 2010; Zubairi & Sarudin, 2009). Gardner and Lambert (1972) argued that integrative motivation means the desire to find out about the culture of SL and learn it to communicate with its members to become a part of that society, this is different from instrumental motivation that refers to the motivation to acquire SL as a means of promoting a career or job or reading technical texts.

Statement of the problem

In spite of including English as an obligatory course by Ministry of Education in Iran, the traditional methods being currently used to teach English at high schools fail to enable students to improve their speaking and enhance their language. High school teachers often complain about the low level of their learners in speaking English language. This may be due to such internal factors as the motivation.

Dörnyei (2001) argues that motivation provides learners the primary stimuli for initiating second language learning, and later motivation become the driving force for learners to be persistent in tedious learning process, so that learners may be able to complete long-term goals if there is

sufficient motivation. The theory implies that motivation is one of the determining factors in developing a second language. In particular, motivation seems to be very important in the development of speaking skill. One who has strong motivation might take a part in speaking. It can be inferred that one might speak well in English as a result of motivation which pushes to speak. So, motivation is claimed to have a main role in developing speaking.

But with regards to Iranian Kurdish senior high school students' speaking skill, what is the role of motivation? Teachers here teach their students hoping that at the end of the course, the students end up with basic skills and knowledge in English to enable them to communicate orally. To put it another way, after finishing the book, it is expected that the students based on their level of ability speak and understand simple spoken English and respond to it appropriately. However, not many teachers especially those in the high schools have a good understanding of how motivation can affect students' learning of speaking skill. Some of them may have a hunch that motivation is one of the factors that play a role in language learning among the students. For all these reasons, conducting a research in this regard seems necessary, and that is why the researcher intends to study the effect of motivation on Iranian Kurdish senior high school students' speaking skill.

Significance of the study

The significance of this study mostly revolves around the importance of speaking skill as an important medium to communicate with others. Mastering speaking is an essential need for any learner whose final goal is to use English. For Celce-Murcia and Olshtain (2000), Speaking in a second language (L2) has been considered as the most challenging of the four skills because it involves a complex process of constructing meaning. This process according to Burns and Seidlhofer (2002), requires speakers to make decisions about why, how and when to communicate depending on the cultural and social context in which the speaking act occurs. Jordens (2006) believes that the primacy of speaking is obvious since it is assumed that language is primarily an oral phenomenon. Speaking is also considered as an effective medium for providing language input and facilitating memorization (Bygate 2001).

The significance of the study derives also from the importance of motivation. As mentioned above, motivation is one of the crucial predictors of FL performance and has a basic role in language acquisition (Mori, 2002). Teachers often observe in their classrooms that students prefer to be silent; they avoid asking and answering questions. This avoidance may be due to lack of students' motivation for speaking. Students' unwillingness to speak and communicate in FL classroom will often lead to unwillingness to communicate in real contexts. Identifying factors that influence student learning in the classroom continues to be an important objective for teachers and administrators at all levels. There is a great deal of interest today in the notions of motivation to learn a foreign/second language. However, unfortunately, few studies, if any, have been conducted to investigate learners' motivation in speaking English with Kurdish senior high school students in Iran. On the other hand, it would be helpful for high school teachers to have a clear picture of the effect of motivation on high school students in Iran so that they can formulate instructional methods to motivate students enhance their English speaking. Therefore, this study comes to investigate the effect of motivation on Kurdish high school students with the hope that

it would yield results and recommendations that can be used to inform educators and teachers in Iran on appreciating motivation of their students and, thus, to look for a suitable approach to teaching English speaking.

Purpose of the study

This study attempts to investigate the effect of motivation on English speaking skill among Kurdish high school students in Iran.

LITERATURE REVIEW

Motivation

Brown (2007, p.117) defines motivation as “the anticipation of reward, whether internally or externally administered; choices made about goals to pursue and the effort exerted in their completion.”

Many scholars have considered motivation as an important factor that plays a considerable role in determining the success of language learning. Gu (2009) for example, believes that motivated learners are more enthusiastic. They are also eager to work hard and concentrate on the tasks given. Therefore, they do not need to be given constant encouragement. Dornyei (2011, p. 116) emphasized that “teacher skills in motivating learners should be seen as central to teaching effectiveness”. For Noels (2001), motivation to learn a second language is of equal importance as language aptitude.

The important role that motivation plays in learning a language is more pronounced in what Dornyei and Ushioda (2011, p. 1) say. They argue that “given motivation, it is inevitable that a human being will learn a second language if he is exposed to the language data”

Oxford and Shearin (1994) have identified six variables that influence motivation in language learning:

- Attitudes (i.e. sentiments towards the target language).
- Beliefs about self (i.e. expectations about one’s attitudes to succeed, self-efficiency, and anxiety).
- Goals (perceived clarity and relevance of learning goals as reasons for learning).
- Involvement (i.e. extent to which the learner actively and consciously participates in the learning process).
- Environmental support (i.e. extent of teacher and peer support).
- Personnel attributes (i.e. aptitude, and language learning experience).

Motivation, as mentioned before, falls into two categories distinguished by Gardner (2010). It may be of an instrumental or an integrative orientation. Based on Brown (2001), an integrative orientation simply means the learner is pursuing a second language for social or cultural purposes, and within that purpose a learner could be driven by a high level of motivation or a low level. On

the other hand, in an instrumental orientation, learners are studying a language in order to further a career or academic goal (Brown, 2001). Gardner (2010) argues that an integrative orientation is more enduring and more directly related to success than an instrumental orientation. Likewise, Garcia (2007) believes that learners who are instrumentally motivated appear to be more driven by external aspects like incentives, which, as believed, are less stable.

There is another dichotomy for motivation apart from integrative and instrumental. Here motivation is of two kinds: intrinsic and extrinsic. According to Deci (1985) cited in Brown (2001, p. 76): “Intrinsically motivated activities are ones for which there is no apparent reward except the activity itself. People seem to engage in the activities for their own sake and not because they lead to an extrinsic reward; extrinsically motivated behaviors, on the other hand, are carried out in anticipation of a reward from outside or beyond the self” (p.77). Many scholars like Maslow and Bruner, according to Brown (2001), find intrinsic motivation more powerful than extrinsic one.

Another aspect contributing to motivation levels could be the manner in which students attribute reasons for their underachievement or success. The core argument of Attribution Theory states that individuals have a tendency to attribute their performance to the effort they give, the difficulty of the activity, or to their capability (Zhang, 2009). Learners more likely to attribute their performance to task difficulty or capability have a tendency to have poorer motivation, because these aspects are regarded to be unchangeable, or outside the learner’s control. In contrast, attributing failure or success to effort may result in higher levels of motivation, since it can be controlled by the learner (Dornyei & Ushioda, 2011).

Since this study aims to investigate the role of motivation in speaking ability, in what follows, this skill is discussed.

Speaking

Speaking has been defined from a variety of perspectives. For Brown (2001, p. 68), “speaking is an action that involves producing, receiving and processing information in spoken language to conveying the information or expressing one’s thoughts and feeling”. Florez (1999) and Chaney (1998) both consider speaking as a process through which meaning is conveyed.

Hedge (2000, p. 261) focuses on the significance of this skill and defines it as a “skill by which people are judged while first impressions are being formed”.

Harmer (2001), on the other hand, distinguishes between two aspects of speaking. Namely, knowledge of ‘language features’, and the ability to process information on the spot, it means ‘mental/social processing’. The first aspect, language features, necessary for spoken production involves, according to Harmer, the following features: connected speech, expressive devices, lexis and grammar, and negotiation language. In order to wage a successful language interaction, it is necessary to realize the use of the language features through mental/social processing – with the help of ‘the rapid processing skills’, as Harmer calls them (p.271). ‘Mental/social processing’

includes three features – language processing, interacting with others, and on-the-spot information processing.

Speaking is one of the main aspects of communication, and for many scholars and teachers, has been considered as the most important skill. Zaremba (2006), for instance, contends that of the four macro English skills, speaking seems to be the most important skill required for communication. Similarly, Richards (1990) believes that the mastery of speaking skills in English is a priority for many schools and second language learners; learners consequently often evaluate their success in language learning as well as the effectiveness of their English course in the basis of how well they feel they have improved in their spoken language proficiency. Brown (2001, p. 267) asserts that “when someone can speak a language it means that he can carry on a conversation reasonably competently”. In addition, he states that “the benchmark of successful acquisition of language is almost always the demonstration of an ability to accomplish pragmatic goals through an interactive discourse with other language speakers” (p.268). The goal of a speaking class should be to encourage the acquisition of communication skills and to foster real communication in and out of the classroom.

Despite the significance of speaking and the importance that many teachers and learners assign to this skill, the complexity of learning to speak in another language has also reported by many researchers and specialist. This complexity is reflected in the range and type of sub skills that are entailed in L2 oral production. Widdowson (1990) emphasizes this complexity and claims that learning just the language system is not the appropriate way for learning how to communicate in the FL because knowledge of the leaching code alone does not explain the demands of communication and interaction with others in the FL. Speaking is not a simple skill, its complete mastery requires some experience and practice. Luama (2004, p. 1) argues that “speaking takes a long time to develop”. Added to this problem is the scarce of opportunity to use the language, which was addressed by Zhang (2009) pointing out students’ limited opportunities to speak English and limited exposure to English speakers outside the classroom.

According to Noor Hashimah Abdul Aziz (2007), learners feel very nervous when speaking in English and face difficulty to express themselves in English. For these reasons, different methods and strategies have been proposed to help students enhance their speaking. Cotter (2007) proposed a method in his work and said that there should be three stages in any language classroom and they are: Preparation which allows the students to prepare for the tasks ahead with an effective warm-up. This gives everyone in the class ample opportunity to get their English wheels turning. Presentation: here the topic is presented for discussion, target grammar, or any vocabularies selected for the lesson are also introduced. Practice: after the presentation, ESL / EFL students need to practice the new material. It's unfair to expect them to make use of the new language without adequate practice. And Free Use: You should always work towards real use of the language. According to Ur (1996) an effective speaking activity has the following features:

1. Learners talk a lot. Classroom activities must be designed in such ways that provide opportunities for learners to talk a lot.

2. All get a chance to speak. A minority of talkative students should not dominate Classroom discussions, and contributions must be fairly distributed. Classroom activities must be designed in ways that help all the students to take risk.
3. Motivation is high. Learners are eager to speak because they are interested in the topic, and want to contribute to achieving a task objective.
4. Language is comprehensible. Learners express themselves in utterances that are relevant, easily comprehensible to each other, and of an acceptable level of language accuracy. The teacher must also base the activity on easy language so that the students can use the language fluently without hesitation.
5. Students speak the target language. The teacher must keep students speaking the foreign language.

To sum up, speaking is regarded as one of the major skills to be developed along the process of language learning because it is necessary for displaying the language proficiency. Although the reasons behind learning the foreign language may vary from one learner to the other, the aim is one, and that is, getting to communicate fluently using the target language.

Previous Studies

The role of motivation in learning a second language has been investigated by many researchers, and in many cases a highly positive relationship has been. Lennon (1993) in a study with advanced German students of English studying at England's University of Reading, found motivation as the most important factor influencing oral proficiency. In much the same way, in 1997, Mason and Krashen reported that improvement in motivation the most important and influential finding which helped unwilling students of EFL to become earnest readers. In another study, Mahboobi and Kaur (2011) have investigated the role of motivation in intensive reading among Iranian EFL university students. Based on their results from the analysis of questionnaires, motivation plays a very important role in intensive reading.

Although a great deal of studies indicate the influence of motivation in language learning, it is worth mentioning that some studies did not find any relationship between motivation and different aspect of second language learning. No significant correlation between speaking achievement and motivational variables has been found in the study done by Lyczak et al. (1976). Similarly, in Abdel-Hafez's (1994) study in Jordan, no significant correlation between the students' motivation and their levels of achievement in the English courses was found.

A large number of studies target the comparison between the effect of integrative and instrument motivation in different aspects of language learning. In a study, the motivational variables (integrative and instrumental) towards learning English as a foreign language among senior students majoring in English at Shiraz State and Shiraz Islamic Azad University was conducted by Roohani (2001). The results of this study supported the advantage of integratively oriented motivation over instrumentally motivated motivation concerning proficiency level. Likewise, Abdul Samad et al. (2012) found a positive relationship between integrative motivation and students' language proficiency. By contrast, Johnson and Johnson (2010) reported that Japanese engineering students were more instrumentally motivated to learn English to a high extent.

In another study no difference has been realized between two kinds. This study conducted by Soozandehfar and Soozandehfar (2010) made attempt to compare integratively and instrumentally motivated students of English at Shiraz University in terms of their speaking achievement. In fact, they aimed to test the following directional hypothesis: the Students of English at Shiraz University are likely to be less successful in English language speaking if the underlying motivation orientation is instrumental rather than integrative. The hypothesis indicates that they have expected integrative motivation stronger than t instrumental motivation in relation to speaking achievement. Despite their biased hypothesis, the statistical analysis of their study, however, revealed no significant difference between the integratively oriented participants and their instrumentally oriented counterparts in terms of their speaking. At the end, based on the results of their study, they suggested that teachers in an EFL context use either instrumental or integrative motivation to develop students' L2 speaking ability. Besides the aforementioned studies, there is abundance of studies conducted in this regard which cannot be included here for the sake of scope. However, there are very few, if any, studies in the literature of motivation which aimed to investigate the impact of motivation on Iranian Kurdish senior high school students' speaking ability, and this study aims to bridge this gap.

RESEARCH QUESTION

Based on the purpose of the study, the following research question can be proposed:

Is there any significant effect of motivation on Iranian Kurdish senior high school students' speaking ability?

The following null hypothesis can be proposed on the basis of the aforementioned question:

NH1. There is no significant effect of motivation on Iranian Kurdish senior high school students' speaking ability.

METHODOLOGY

This research employs a quantitative methodology to collect data. The design of this research is ex post facto research design by using comparative study. The reason for selecting ex post facto research design is because treatment is used to collect data. Rather, collecting the data is done by considering the cause and effect that will happen. Hatch and Farhady (1981, p. 26) states that ex post facto design was used when the researcher does not have control over the selection and manipulation of the independent variable (the researcher do not give treatment in the research).

Participants

What makes this study distinct from others in this respect is the specific participants of the study. As mentioned several times before, this study is going to examine the effect of motivation on Iranian Kurdish students' speaking ability. To this end, a total number of 90 female senior high school students studying at Kosar high school in Kermansha, Iran, have been selected for the study. Persian is the standard native language of these participants while their native dialect is Kurdish. The reason for selecting this school was mainly because of the researcher's easier access

to it. Since in a normal class there are different students with different level of cognitive and language ability, the sample classes have been selected randomly.

Instruments

The independent variable of this study is the students' motivation. This variable is measured through Laine's (1987) Motivation Questionnaire following Soozandehfar and Soozandehfar(2010). The rationale behind using this questionnaire is that its reliability is highly established and assured (with the value of /81). The questionnaire consists of 25 items. The Likert Scale is applied for the questionnaire where each item has mainly four alternative answers. That is, A, B, C, and D. on the other hand, the dependant variable, which is students' speaking ability, is measured through prepared talk activities. The speaking test is scored using the oral ability scale proposed by Heaton (1991).

Procedures

To gather data about students' motivation, the motivation questionnaire will be first translated into Persian to make sure no problem arises understanding the content of the question and enhance validity as a result. Then the questionnaires will be given to the students to fill out them. The students will be asked to give real information and answer the questions honestly. Based on the result of motivation questionnaire, the students will be classified into two groups of high and low motivation. After collecting information about students' motivation, to gather data on their speaking ability, the speaking test will be administered. Here, the students will be asked to make a presentation on a topic of their own interest orally and directly in front of class one by one. What they will say will be recorded to be analyzed later. To do this, the students are required to talk as clear as they can. The measurement of their speaking will be done following Heaton (1991) as a model. After obtaining the results of the test, the reliability of the will also be calculated. If the reliability is fulfilled, then the author will precede to the analysis of the data using SPSS software. That is to say, to find answer to the question of the study, the researcher will analyze the data using SPSS by comparing both of high and low motivated students in One Way Anova computation. If the output of Anova computation displayed that the FValue is much higher than FCritical, then we can conclude that motivation has a significant effect on speaking ability.

RESULTS AND DISCUSSION

As mentioned before, the first instrument used in the study was a motivation questionnaire. The descriptive data obtained from this instrument were summarized in table1.

Table 1: Descriptive Statistics for students' motivation

	N	Minimum	Maximum	Mean	Std. Deviation
motivation	90	31	90	47.54	13.413
	90				

As can be seen from table 1, it was obtained that the high score was90 and the lowest score was 31 and the average was 47.54. On the basis of the results, the participants were classified into two groups, namely 1. Low motivation group: those who got 2 standard deviation score below the mean, and 2. high motivation group: those who scored 2 standard deviations above the mean, and

the rest of the students have been excluded from the study. After the identification of low and high motivated students based on the questionnaire results, the speaking test has been administered with the selected students. The descriptive statistics of speaking test has been estimated and displayed in table 2.

Table 2: Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
speaking	52	10	72	34.04	19.004

Having calculated the descriptive statistics for motivation and speaking ability, in order to answer the research question, the author analyzed the data by using SPSS through comparing both of high and low motivated students in One Way Anova computation. The results are demonstrated below:

Table 3: One way ANOVA of high motivation and low motivation groups

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	7534.185	12	627.849	8.487	.000
Within Groups	961.700	13	73.977		
Total	8495.885	25			

Significant at ($p < 0.05$)

As can be seen, the output of Anova computation shows that the FValue is higher than Ftable (FValue = 8.487, Ftable = 3.164993, FValue > Ftable). It can be seen that there is a significant effect of motivation on their speaking ability with the coefficient significant about 0.000 ($p = 0.000$, $p < 0.05$). Therefore, the research null hypothesis is rejected.

Discussion

This study made attempt to find out whether or not motivation can affect Iranian Kurdish senior high school students' speaking ability. Based on the purpose of the study, the following research question was proposed:

Is there any significant effect of motivation on Iranian Kurdish senior high school students' speaking ability?

Then, we hypothesized that there is no significant effect of motivation on Iranian Kurdish senior high school students' speaking ability.

The results of the study revealed that the students with higher motivation performed much better in speaking test as compared with low motivated students. Therefore, the answer to the research question is that motivation can influence students' speaking ability significantly. Therefore, the null hypothesis of the study has been rejected. Further, what the results of this study suggests is that the more motivated the learners the better their speaking ability will be. Based on this idea, we can claim that when students have good motivation in learning English, they will do anything

that can improve their speaking achievement. They will try to finish speaking assignment. They also will try to practice their speaking with their friends without being afraid to make mistakes. The more practice in speaking, the better their English will be. It also supported Cook (1991, p. 96) who states that some L2 learners do better than others because they are better motivated. So, high motivation can cause high achievement in learning English, especially speaking.

CONCLUSION AND SUGGESTION

Based on the result of the data analysis and discussions, the researcher draws the conclusion as follows: There is a significant effect of motivation in learning English on students' speaking ability. The result shows that the students with very high motivation have better ability in speaking compared with the students with low motivation. It means that the higher their motivation in learning English, the better their ability in speaking will be.

Therefore, the writer suggests the English teacher to maintain students' motivation. The teacher should give interesting material. Besides that, they should also use appropriate teaching method based on students' ability to magnetize students to practice a lot in speaking English. For students, they must have good confidence in speaking English. Having good confidence will encourage themselves to produce spoken English easier without feeling shy.

Several limitations are associated with this study. Firstly, the findings of this study are only limited to the specific participants of the study in terms of age and level of education. Therefore, any generalization of the findings to younger or older and middle school, primary school and college students should be taken with caution. Another limitation concerns with the design of the study. Evidently, it is really difficult to control all other factors or variables except the variable in question in an ex post facto research design. Therefore, it is likely that other unmeasured variables and parameters be at work influencing the results of the study. Finally, although we have done our best to measure the students' motivation with a test of high reliability, on the whole, motivation is an internal construct and cannot be easily measured by tests.

THE EFFECT OF STANDARD DICTATION ON GRAMMAR LEARNING ABILITY OF YOUNG IRANIAN BEGINNER EFL LEARNERS

Javad GH. Domskey

University of Tehran, Faculty of Foreign Languages and Literatures

ABSTRACT

This study intends to investigate the effect of standard dictation on grammar learning ability of young Iranian beginner English as foreign language (EFL) learners. The purpose of the study is to find dictation something beyond a traditional technique in langue teaching and testing, the backwash effect of dictation can help both the students and teachers overcome significantly the grammatical problems and internalizing structures. First, two homogenous classes of twenty subjects from NODET (National Organization of Developing Exceptional Talents), Iran were chosen randomly as control and experimental groups. Both were taught grammatical points simultaneously by the researcher in the same way and the samples were not really aware of the study. The subjects in both groups received a post test. The data obtained from the results of the subjects' performance on the test were analyzed and interpreted by conducting a T.test. The findings confirmed the fact that standard dictation can significantly affect grammar learning ability of young Iranian beginner EFL learners. The results of the current study can be of use in all educational centers. They have direct or indirect implications for and applications to teaching, learning, test development, syllabus design and material development. This study, according to the achieved results, may have some hints for English teachers who might, for sure, pay some attention to teaching grammar or any other four major skills; listening, speaking, reading, writing, because standard dictation can not be limited to any skills or subjects in isolation. As I found out the whole aspects of ELT can be reshaped by this new trend.

KEYWORDS: standard Dictation, Grammar, Learning Ability, Beginner EFL Learners

INTRODUCTION

An experience of twelve years teaching English and practicing different approaches of dictation and spelling, I have found the aim of dictation something beyond some teachers' and students point of view. Dictation is not just spelling practice. The backwash effect of dictation can help both the students and teachers overcome significantly the grammatical problems mostly along side the problems of the other areas of the language.

In fact, students could find a few opportunities in Iran to have a kind of speaking and listening practice. The type of rehearsal on dictation is traditionally limited to long columns of isolated words writing for the sake of spelling. But standard dictation could help them to have a kind of deep reading, vocalizing the sentences and words (speaking), listening to normal pace of speaking, paying attention to important grammatical structures, correct pronunciation, standard

type of stress and intonation, and at last, spelling practice. This is language learning and not learning about the language (Rivers, 1981).

Statement of the problem

Grammar learning is emphasized in language teaching whether the language is first, second or foreign. Although grammar has not always been as a priority in LT, interest in its role has grown rapidly. Teaching grammar and internalizing it through standard dictation would help teachers teach the language in a more communicative way. This study is an attempt to explore the effect of standard dictation on the reinforcement of grammar in LT.

Purpose of the study

The findings of this study would be of great help to those teachers who wish to have more effective language classes. Needless to say, with the widespread institution of standards and high-stakes tests, students are expected to recognize, internalize and use correct grammar. Educators can no longer afford that students acquire an accurate understanding of formal language structures through different skills. Therefore, grammar instruction should be in a way to meet the needs of learners.

REVIEW OF LITERATURE

What is dictation?

Dictation is a valuable language learning device that has been used for centuries. Although linguists have not completely understood how it facilitates language acquisition--it would be extremely difficult to isolate the language competencies that are employed--many have attested to its pedagogical value. One of the 20th century's most influential linguists, Leonard Bloomfield (1942), strongly endorsed the use of dictation as a learning device. Today, many methodologists are at least inclined to agree with Finocchiaro's (1969) summary of its value: "[Dictation] ensures attentive listening; it trains pupils to distinguish sounds; it helps fix concepts of punctuation; it enables pupils to learn to transfer oral sounds to written symbols; it helps to develop aural comprehension; and it assists in self-evaluation" (Alkire, 2007).

Standard dictation is the most frequently-used type of dictation. It is usually defined as a passage of appropriate length (usually set somewhere between 100-150 words) and difficulty with a specified administration procedure. Dictation is usually read and the examinees are required to write down what they hear. Two points are important regarding this procedure. First the consistency of the reader and the manner of reading. Second, the dictation passage should be read 3 times. The first reading gives the examinees a chance to obtain the general idea of the passage. The second reading is the most important part because during this, the examinees should write down what they hear. Finally the third reading is performed in a manner similar to that of the first one. Its purpose is to allow students to check their performance (Farhady, Jafarpur & Birjandi, 1999).

Cullen (2007) states that dictation has always been a useful technique for language teachers. Modern listening exercises usually focus on helping students to extract the overall meaning of a

listening passage, but most language teachers will agree that an occasional dictation with a focus on individual words can be very useful in developing listening comprehension.

Cullen (2007) continues: “As with all teaching techniques, it is best to experiment to find out the ways of song dictation that work best for you and your students. Of course, song dictations do not have to be carried out in class. You can assign a song as homework, preferably one which the student enjoys and chooses himself. If the student already has the lyrics sheet, then you can ask them to only check it after the dictation has been done.”

Rivers (1981) writes that dictation is not just spelling practice. The backwash effect of dictation can help both the students and teachers overcome significantly the grammatical problems mostly along side the problems of the other areas of the language. The dictation will then serve as a form of review, the possibility of error will be reduced and the students will be encouraged by their progress. Segments dictated should consist of meaningful groups.

The importance of dictation

Madsen (1983) claims that dictation is another guided-writing test most teachers know about this technique, but few handle it properly. Actually, he believes it is one of the easiest tests to use, and it gives very good information on the student's language ability. But this is true only if you prepare it right, present it right, and score it right.

Benefits of Dictation

Alkire (2007) in his article states the following benefits for dictation.

- Dictation shows students the kinds of spelling errors they are prone to make.
- Dictation can help develop all four language skills in an integrative way.
- Dictation helps to develop short-term memory. Students practice retaining meaningful phrases or whole sentences before writing them down.
- Dictation can serve as an excellent review exercise.
- Dictation is psychologically powerful and challenging.
- Dictation fosters unconscious thinking in the new language.
- If the students do well, dictation is motivating.
- Dictation involves the whole class, no matter how large it is.
- During and after the dictation, all students are active.
- Correction can be done by the students
- Dictation can be prepared for any level.

Standard dictation could help the students to have a kind of deep reading, vocalizing the sentences and words (speaking), listening to normal pace of speaking, paying attention to important grammatical structures, correct pronunciation, standard type of stress and intonation, and at last, spelling practice. This is language learning and not learning about the language (Rivers, 1981).

The potential problems of dictation

Dictation has been a feature of language classrooms for hundreds of years. However, for many teachers these days, the word '*dictation*' is synonymous with '*old-fashioned*', '*boring*', and '*teacher-centered*'. In fact, it hardly seems to merit a mention in most of the introductory texts for ELT trainees. Is it really as outdated and uncommunicative as it first appears? (Lightfoot, 2007).

The importance of grammar

Based on the importance of grammar Richards and Renandyo (2002) argue people now agree that grammar is too important to be ignored, and that without a good knowledge of grammar, learners' language development will be severely constrained. There is now a general consensus that the issue is not whether or not we should teach grammar. The issues now center on questions such as, which grammar items do learners need most? How do we go about teaching grammar items in the most effective way? Are they best taught inductively or deductively? Swan suggests that the teaching of grammar should be determined by the needs of the students. Thus, the selection of grammar items to be taught must depend on learners' aims in learning English. Furthermore, the teaching of grammar should be based on the principles of comprehensibility and acceptability. Grammar is important, but most of the time, in most parts of the world, people probably teach too much of it. They mention some significant reasons for the importance of grammar:

1. *Because Its THERE*
2. *Its TIDY*
3. *Its TESTABLE*
4. *COMPREHENSIBILITY*
5. *ACCEPTABILITY*

RESEARCH QUESTIONS

To begin with, the following question is posed for the researcher to answer:

Does standard dictation have any effect on the grammar learning ability of young Iranian beginner EFL learners?

METHODOLOGY

This study intended to investigate the influence of standard dictation on the grammar learning ability of Iranian beginner EFL learners. This research was conducted at NODET (National Organization of Developing Exceptional Talents) School where students are talented and really homogeneous. The researcher is their regular teacher and they are not absolutely aware of the study. Simultaneously, both groups received the same instruction but the experimental group had the frequent standard dictation.

Participants

Subjects who participated in the present study were all students from Shahid Beheshti NODET School in Torbat-Heydarieh. They were 40 beginner male students in grade three in junior high school. The subjects took part in the experiment unconsciously.

After being accepted in a national standardized entrance examination of NODET schools, the cases were randomly categorized into two identical groups. The subjects had participated in the same classes for two years and at the end of each year they should have passed standard exams with specific norms of NODET schools. Moreover, they had been taught the English courses of national curriculum textbooks accompanying with their own supplementary materials specific to NODET schools by the same instructor, the researcher. So the process of homogenization was really well organized and there was no doubt that the subjects were homogeneous.

Instrumentation

To achieve the main concern of this study which is to evaluate the effectiveness of standard dictation on grammar learning ability two testing instruments were needed.

The first one which was just for the experimental group was a pack of frequent standard dictations compiled of grammatical patterns (Tajik, 2007). Dictations carried out in this study all focused on grammar learning of the tenses.

The second needed test was a valid and a reliable test of grammar so as to function as the post-test instrument in this study. As a consequence, the formerly standard constructed test from (Tajik, 2007) included sixty items in multiple choice form were chosen.

The next thing to do was to validate the post-test. The test of grammar was administered to another group of twenty eight male learners, sharing almost the same level of language proficiency in Mahdi School in Torbat-Heydarieh. As a result, some ten items which couldn't meet the requirements of item facility (Farhady, et al.1998, p. 101) and item discriminations (Farhady, et al.1998, p 104) were discarded. It led to a final form of a grammar test including fifty items of multiple choices. Due to the nature of items included in the test, it was supposed to take thirty minutes for the students to attempt all the items. Then based on the advantages of KR-21 Method over the other ones, the reliability of the test of grammar was computed as well. Of course, the scores of the items which were to be discarded in the final form of the test were not into account. To put it another way, the test had got a total score of fifty. The reliability index of 0.64 which is obtained for the post-test is moderately high. Hence this test can be trusted in terms of reliability.

Procedure

The subjects were taught the specific lessons of the textbook. They were not aware of the direct study so the situation was really natural. Both groups received the same materials by the same teacher (the researcher). However, one group received standard dictation during the course; the other group received another type of dictation. Finally, they were given the post-test and the results were compared and contrasted.

RESULTS AND DISCUSSION

The scores derived from the experiments, were computerized. To analyze the data, the researcher made use of the most commonly used package program which is statistical package for social sciences (SPSS) and EXCEL.

The following tables and figures show the descriptive statistics concerning these scores.

Table 1: Descriptive Statistics of Experimental group

	N	Minimum	Maximum	Mean	Std. Deviation
Plural s	20	7	10	8.45	.945
Third person s	20	6	10	8.25	1.070
Possessive s	20	12	15	13.90	.912
ed ending	20	12	15	13.75	.910
Experimental	20	42	50	44.35	2.059
Valid N (list wise)	20				

The descriptive statistics is related to the experimental group. On the second column, we could see the number of samples who participated in the test. On the next two columns, there are the minimum and the maximum mark that they have got in the test. On the last two ones, the mean and the standard deviation related to each specific variable have been shown. For instance, in the experimented group, the minimum score of the students in plurals is 7 and the minimum score is 10. In this part, their mean score is 8.45 with the standard deviation.

Table 2: Descriptive Statistics of Control Group

	N	Minimum	Maximum	Mean	Std. Deviation
plural s	20	2	9	6.25	2.023
third person s	20	2	9	6.10	1.917
possessive s	20	5	14	8.85	2.661
ed ending	20	4	15	9.35	2.700
control	20	21	40	30.55	5.826
Valid N (list wise)	20				

In table 2 the descriptive statistics related to control group has been shown. The columns show the number of samples, the minimum and the maximum score, the mean value and the standard deviation of a specific variable in the control group. For example in this case, the minimum score in the third person singular which has been taken by a taste is 2 and the maximum score is 9. The mean value of the third person scores in control is 6.1.

Table 3: T-Test for comparing grammar score in general between control and experimental group

Group Statistics					
group		N	Mean	Std. Deviation	Std. Error Mean
Grammer	exprimental	20	44.35	2.059	.460
	control	20	30.55	5.826	1.303

Table 3: Independent Sample T-Test for comparing grammar score in general between control and experimental group

Independent Samples Test

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Grammer	Equal variances assumed	23.03	.000	9.987	38	.000	13.800	1.382	11.00	16.597
	Equal variances not assumed			9.987	23.673	.000	13.800	1.382	10.95	16.654

By considering this effect that the P-value of the test for equality of variances between two groups equals 0.00 and is less than 0.05, so the equal means assumed for the grammar test scores in two groups is rejected too. We observe that the means of the tests in experimental group minus the scores of control group equals 13.8 and it is a positive amount so we could conclude the standard dictation has had a positive effect on the performance of subjects.

Table4. Graph for comparing scores of Grammar in general between experimental and control group

The above graph compares grammar between two groups in general. We note that the scores of the experimental group is ranged from 42 to 50 but in the control group it is from 21 to 40. Most of the subjects have got 43 in the first group but 28 in the second one. Finally, it shows the significant better performance of experimental than the control group in grammar.

Summery

The basic concern of this study was to investigate the effect of standard dictation on the grammar learning ability of Iranian EFL junior high school learners. It was conducted at NODET School where students were talented and really homogeneous. The researcher was their regular teacher and they were not absolutely aware of the study. Simultaneously, both groups received the same instruction but the experimental group had the frequent standard dictations. Subjects were 40 beginner male students. The materials that were used in this study were the specific lessons from book three for junior high school students in Iran.

To achieve the main concern of this study which is to evaluate the effectiveness of standard dictation on grammar learning ability two testing instruments were needed. The first one which was just for the experimental group was a pack of frequent standard dictations compiled of grammatical patterns. Dictations carried out in this study all focused on grammar learning of the learners. The second needed test was a valid and a reliable test of grammar so as to function as the post-test instrument in this study.

The subjects were taught the specific lessons of the textbook. They were not aware of the direct study so the situation was really natural. Both groups received the same materials by the same teacher (the researcher). However, one group received standard dictation during the course; the other group received another type of dictation. Finally, they were given the post-test and the results were compared and contrasted.

CONCLUSION

As shown in previous chapter, utilizing standard dictation in the experimental group led to a better grammar performance of the students in post test. So it can be concluded that standard dictation can be used for not only assessing students' grammar but also for their learning. The results of the t-test revealed a significant difference between the performance of the students in the experimental and control groups. Based on the results, it was inferred that the experimental group performed better than the control group due to employing standard dictations as treatment. Therefore, the null hypothesis of this study was rejected;

Employing standard dictations improve Iranian EFL learners' grammar learning ability. In other words, employing standard dictation leads to a significantly better performance in grammar learning.

As this study showed, standard dictation can be a means of assessing students' grammar learning ability and helping them to improve their grammar, and more importantly, the motivation implementing such a tool creates in learners to learn the language eagerly and effectively.

Standard dictation helped learners to become aware of their own learning and monitor themselves. The students learned to be responsible for their own learning and become more independent learners.

The findings confirm the previous research on the effect of standard dictation on grammar learning ability of Iranian junior high school EFL learners. These findings have some implications and applications.

Pedagogical implications

The results of the current study can be of use in all educational centers. They have direct or indirect implications for and applications to teaching, learning, test development, syllabus design and material development. This study, according to the achieved results, may have some hints for English teachers who might, for sure, pay some attention to teaching grammar or any other four major skills; listening, speaking, reading, writing, because standard dictation can not be limited to any skills or subjects in isolation. As I found out whole aspects of ELT can be reshaped by this new trend.

The suggested point for teacher in schools, language centers and institutes is that they change the way they assess and instruct the students and move toward a more learner-oriented method. By the use of standard dictation, they can design an assessment system in which the students have to study during the whole term for the course and not just study for the test. This way they will be more motivated to learn and will use meta-cognitive strategies and think about their learning. They will try to document their learning and this way enhances their ability in language skills.

If we change the way we assess our learners, and move away from test-oriented procedures and seek help from alternative assessments like standard dictation, then it will indirectly affect teaching, learning, test development, syllabus design and material development. There's no doubt that implementing standard dictation is a continuous long-term assessment and it's more oriented to process than product. This way the students themselves are also involved in the process of evaluation and teachers can integrate assessment and instruction in order to obtain better results of their classes.

Limitations of the study

No research study can be conducted under ideal circumstances. Every research study has its own set of limitations and problems. This study, being no exception, meets the following limitations;

1. The small sample of students may cause some difficulties in generalizing the results.
2. The subjects are talented students.
3. The focus of study is just on some grammatical points.

Suggestions for further studies

This study can be replicated employing various methods, techniques, samples, levels of proficiency, and language skills:

The effect of standard dictation on all major language skills, speaking, reading, listening, and writing.

The effect of standard dictation on language components, vocabulary, pronunciation as well as grammar which was tried in this study.

The effect of standard dictation can be tested on different language proficiency levels, age, and sex variables (male, female, and coeducational groups). The effect of standard dictation on different subjects at schools and universities.

ABSTRACT

Providing learners with comprehensible input, based on Krashen's Input Hypothesis is the key to ensure second language acquisition. Considering the significance of input, listening instructions aim at enhancing the learners' listening comprehension by focusing on the material and/or through listening strategy training. This study investigates the effect of the implementation of two listening approaches of IMI (Interactional Modification of Input) and MST (Metacognitive Strategy Training) on the listening comprehension of language learners. Furthermore, it compares the effectiveness of these two approaches as two separate options in teaching listening. For this purpose, a quantitative study was conducted on 3 groups of intermediate language learners at ILI (Iran Language Institute): MST (N=21), IMI (N=21), and Control (N=21). During the eight week treatment, all groups received listening instructions based on the ILI traditional listening techniques (pre-listening, listening, and follow-up). The IMI group had the additional chance to interact during the listening phase while the MST group received metacognitive strategy instructions in different phases of the listening tasks. ANOVA analysis for the comparison of means was carried out on the collected data from the pre/post-tests of the listening comprehension at .05 statistically significant level. The results from the Post-hoc analysis, Tukey test, showed a significant difference at $p \leq .05$ level between the post-test of all groups: IMI ($M=7.61$), MST ($M=8.80$), and Control ($M=6.33$). The results indicate that MST and IMI respectively had a greater impact on listening comprehension than the traditional listening instructions. The reasonable conclusion can be made from these results that the incorporation of interactive approaches as well as strategy instructions into traditional listening instructions can lead to enhanced listening comprehension.

KEYWORDS: Listening Comprehension, Input, Interactional Modification, Metacognitive Strategies.

INTRODUCTION

The significance of listening in language learning has been proved by different Language acquisition research in that listening can be considered an important source of input for learners (Rubin, 1995; Rost, 1991; Park, 2005; Krashen, 2004; Cheung, 2010). Having access to comprehensible input, undoubtedly, is assumed to play a crucial role in second language

acquisition (Krashen, 1981; Vanpatten, 2004; Mitchell, Myles, & Marsden, 2013). A noticeable growing interest in and concern for listening instructions has emerged over the last forty years (Goh, 2008). A retrospective examination into the recent trends in language teaching and learning unravels how the emphasis on teaching listening and the target of listening instruction has changed. The focus of the earlier listening comprehension materials was mainly on testing students' ability to listen to oral discourse and answer a couple of general and specific comprehension questions based on the incoming information (Birjandi & Rahimi, 2012). More recent views of research by Vandergrift (2004), and Vandergrift (2006) have shifted attention toward new evidence-based approaches in teaching listening instructions in the last two decades. The growing concern manifests a deeper understanding of listening as a communicative and cognitive skill within the realm of language learning (Goh, 2008).

There are different ways to help learners enhance their listening comprehension. According to Maleki (2012), warm up or raising relevant schemata is one way that teachers often utilize in order to enhance comprehension. Research based on listen-and-do tasks has been directed at investigating the claims of Input & Interaction hypotheses, in particular how properties of modified input affect learner comprehension and acquisition. Ellis (2003) claimed that the learners' comprehension will be enhanced when tasks provide opportunity for the negotiation of meaning. Providing the learner with comprehensible input through interaction has been the target of many investigations. Many researchers (e.g., Gass & Varonis, 1994; Ellis, 1999; Park, 2005) hold a similar view on the significance of input modifications which result from negotiation process in interaction. In all the foregoing studies, Interactionally Modified Input (IMI) has proved effective on the enhancement of listening comprehension.

A new awareness has developed of the extent to which L2 listening is a strategic activity. Field (1998) believed that, in real world encounters, listeners succeed in deducing much less information from speech stream than was assumed based on their performance with graded materials. A number of North American listening specialists (e.g., Mendelsohn, 1995; Chamot, 2004) have argued that listening strategies can and should be explicitly taught. Other research works (e.g., Vandergrift, 2004; Goh, 2008; Yang, 2009; Coskun, 2010; Birjandi & Rahimi, 2012; Bozorgian, 2015) have demonstrated the effectiveness of Metacognitive Strategy Training (MST) on listening comprehension. Moreover research has shown that awareness of metacognitive strategies, whether taught explicitly or not, will make for more proficient listeners. (Bozorgian, 2015; Vandergrift, 2006; Vandergrift, & Tafaghodtari, 2010)

As discussed above, all research works conducted on Interactionally Modified Input (IMI) and Metacognitive Strategy Training (MST) in listening focused on proving the effectiveness of these two approaches. Nevertheless, there hasn't been a comparison between the effectiveness of these two ways of facilitating listening comprehension as two separate options at the teachers' disposal. This is the aim of this study to make a comparison between the effectiveness of these two approaches on listening comprehension of EFL learners.

THEORETICAL FRAMEWORK AND LITERATURE REVIEW

Among those various ways at the teachers' disposal as effective tools for enhancing listening comprehension, Interactionally Modified Input (IMI) & Metacognitive Strategy Training (MST) have gained immense popularity; hence, they have been the target of many research investigations.

Input Modification

Drawing on theories that emphasize the role of comprehensible input in second language acquisition, instructors might resort to tasks in which input is modified to facilitate listening comprehension. The origin of the emphasis on comprehensible input dates back to the Input Hypothesis. Krashen (2012) claimed that if learners receive comprehensible input, acquisition will consequently occur. In his view, acquisition can be defined as the outcome of the subconscious process of internalizing new linguistic forms and meaning. He argued that input is made comprehensible through simplifying the input and providing learners with textual support. In this regard, McDonough (2005) found a positive relationship between progress on the acquisition of question formation and the amount of modified input produced for the learners. Kim (2003) found the modification of input useful in enhancing language vocabulary acquisition through reading. Some researchers (Ellis, 2008; Gass & Veronis, 1994) have somehow supported the input hypothesis by proposing pre-modified input and interactionally modified input as the potential types of comprehensible input. Guided by this theoretical perspective, a lot of language research has been conducted to identify what makes input comprehensible. Anani Sarab and Karimi (2008) investigated the impact of simplified and interactionally modified input on reading comprehension of Iranian EFL learners, and concluded that the performance of the learners was by far much higher under the interactionally modified text conditions.

As the first type, pre-modified input is the simplified input by the speaker through adapting the baseline input in a non-reciprocal way. It is mostly done before the listener hears the text, and can be done, as Park (2005) stated, through repetition or paraphrase of words or sentences and reduction of the sentence length and complexity. The other type of modification as the target of this study is the interactionally modified input, i.e. when the task of listening becomes reciprocal and learners are given the chance to request any kind of clarification, repetition, pause, etc.

Long (1996) argued that input which is interactionally modified through the negotiation of meaning can especially be beneficial for comprehension. In fact, Long's Interaction Hypothesis is regarded as an extension of Krashen's Input Hypothesis. Long (1983) maintained that simplification and contextual clues not only lead to comprehensible input, but they also modify the interactional structure of the conversation. In this regard, an input-based task needs to involve students in responding to the input by requesting clarification when they cannot understand. In order to investigate the impact of different input types on L2 comprehension, several studies were carried out on the basis of listen-and-do tasks. It was claimed by Pica, Young, and Doughty (1987) that IMI resulted in better comprehension than pre-modified input. Other studies by Loschky (1994) and Ellis, Tanaka and Yamazaki (1994) confirmed these findings. Ellis et al. (1994) explored the impact of modified interaction on comprehension and the vocabulary learning, coming up with similar results as the previously mentioned research works. Fang (2010)

emphasized the great importance of interaction with respect to the conditions considered theoretically important in SLA, such as the learners' comprehension of input, access to feedback, and modified output.

In her investigation of word meaning acquisition, Boroghani (2002) examined the impact of modified aural input (pre-modified and interactionally modified). She found that interactional modification of input enhanced word meaning acquisition. Some more recent studies such as Bahrani's (2012) hold a similar view about the effectiveness of interactional modification on language acquisition. Interactional input modification has proved effective in teaching other skills such as reading as well. In a research done by Maxwell (2011), this type of modification has proved effective on teaching reading skills. In conclusion, there is consensus among researchers all around the world, including among those in Iran (e.g., Keshavarz & Mobarra, 2003; Shirinzari, 2011; Boroghani, 2002; Baleghizadeh & Borzabadi, 2007; Maleki, 2012; Bahrani, 2013) on the effectiveness of input modification, in particular IMI, in teaching different skills especially listening comprehension. Maleki (2013) asserted that non-interactive modification of input did not have a significant effect on students' listening comprehension while the interactional modification of input helped the learners to significantly enhance their listening comprehension level. In investigating the effect of input modification on aural comprehension of intermediate level learners, Vessoni De Lence (2010) came up with positive results, revealing that modification had facilitated the learners' listening comprehension of authentic texts.

Metacognitive Strategy Training

There has never been a ceiling for studies on the illusive concept of listening comprehension. Attempts toward facilitating it have always resulted in the introduction of new approaches to make for better listeners. Over the past two decades, there has been a shift in teaching listening from traditional methodology of focusing on the input to guided methodology through metacognitive strategy instructions (Bozorgian & Alamdari, 2013). Field (1998) considered listening as a 'strategic activity', calling for the incorporation of strategy training in listening instructions. Oxford (1990) defined learning strategies as specific actions which language learners take so that they can learn more easily and faster and enjoy the process of learning in a more effective and autonomous way which can be transferable to new situations. In their study, Wang and Xiaoyan (2008) found that more successful listeners were more meta-cognitively aware of the use of various strategies. Their findings verified the claims on the importance of strategy use and metacognitive awareness of those strategies. According to O'Malley and Chamot (1990), learning strategies fall into three major categories: metacognitive, cognitive, and social/affective strategies. Metacognitive strategies concern the use of knowledge about cognitive processes, consisting of efforts to take control of language learning in the light of planning, monitoring, and evaluating. The actions or operations utilized in solving problems which necessitate direct analysis, synthesis or reconstruction of the incoming information are defined as cognitive strategies. Social affective strategies include a wider variety of strategies which deal with either interaction with others or ideational control of affection. Attention in listening comprehension has increasingly been directed, as Vandergrift (2006) put it, at learners self-report of their understanding and awareness of the processes involved in listening, or metacognitive awareness and strategies. It has been argued that awareness of these strategies and other variables

in learning can have a positive influence on language learners' listening development (Victori & lockchart, 1995; Bolitho et al., 2003; Wilson, 2003; cited in Vandergrift et al., 2006).

Metacognition

Today the conceptualization of metacognition is often attributed to Flavell (1979) who broke down metacognition into three elements of: metacognitive knowledge (what one knows), metacognitive skills (what one is currently doing), and metacognitive experience (thinking of what one's current cognitive or affective state is). Metacognitive knowledge is known as the learners' ability to engage in the regulation and management of their own learning, providing an individual view on one's learning abilities and styles (Vandergrift et al., 2006).

There is extensive evidence that learners' metacognition can directly affect the processes and outcome of their learning (Mokhtari and Reichard, 2002; Vandergrift, 2004; Vandergrift et al., 2006; Abdulmalik, 2011). Metacognitive instruction can potentially heighten learners' awareness of their listening processes and consequently enhance their development of their listening comprehension (Goh, 2008). Similar findings from previous studies were reported in O'Malley and Chamot (1990) and Young (1997). Two other studies by Vandergrift (2007) and Zeng (2007) demonstrated a causal relationship between metacognitive instruction and statistically significant improvement in listening comprehension performance. Coskun (2010) tested the effectiveness of metacognitive strategy training (MST) on beginner students' listening comprehension and came up with positive results.

Models of strategy instruction

There are various models of listening strategy training: Brown's (1987) model has been successfully applied in L2 research for years. The model comprises three stages of planning, monitoring and evaluating.

Another instructional model for strategy training was developed by Jones et al. (1987). The sequence of instruction in this model assesses students' current strategy use, explaining the new strategy and modeling the strategy.

CALLA (cognitive academic language learning approach) is another model proposed by Chamot and O'Malley (1990). CALLA includes three components: topics from the major content subjects, development of academic language skills and direct instruction in learning strategies. A more recent model of strategy instruction was introduced by Vandergrift (2004) and Vandergrift and Tafaghodtari (2010). It consists of three phases of pre-listening (planning and prediction), extensive listening (three times, during which hypothesis making, verification of hypothesis, corrections and strategies necessary for better comprehension, are pointed out), reflection stage (based on earlier discussions of strategies used to make up for what was not understood, learners write goals for next listening activities). This model was utilized for metacognitive strategy training in this study.

OBJECTIVES AND SIGNIFICANCE OF THE STUDY

This study aims to further investigate the effect of each of the approaches discussed above (Interactional Modification of Input & Metacognitive Strategy Training) on listening comprehension of EFL learners, and consequently finding the most effective way of listening instruction by considering the extent to which each of these approaches contributes to comprehension performance of the learners. A common method used in teaching listening, especially in Iran, is to ask students to listen to an oral text and tell what they have understood, or answer a number of comprehension questions. These methods are, in fact, more 'testing' than 'teaching' listening. In order to contribute to teaching of listening in a more fruitful way, this study intended to find some options for language institutes and teachers to rethink about their methodology and approaches.

RESEARCH QUESTIONS

This study, therefore, sought answers to the following questions:

- 1- Does Interactionally Modified Input (IMI) have any effects on EFL learners' listening comprehension?
- 2- Does Metacognitive Strategy Training (MST) have any effects on EFL learners' listening comprehension?
- 3- What is the interaction effect of IMI and MST on EFL learners' listening comprehension?

METHODOLOGY

In order to find the answer to the research questions, a quantitative study was conducted on three randomly selected intact classes at ILI (Iran Language Institute). The classes were assigned to two experimental groups (IMI and MST) and one Control group. During the eight-week treatment, the groups received different listening instructions based on the purpose of the study (discussed at length in the preceding sections). Before and after the treatment, pre-tests and post-tests were administered to measure the listening comprehension of the learners in all groups. The data collected from the pre-post-test were finally analyzed by means of ANOVA at .05 statistically significant level.

Participants

The targeted population consisted of 63 intermediate learners of ILI. The reason why these learners were chosen for the study was their fair mastery over different skills, a good time duration regarding the training system of ILI, and consequently, an in-depth understanding of the needs for strategies which could help them enhance their listening skills. The participants were all Iranian EFL learners, aging between 15 and 18. They all had the same amount of exposure to English through formal classes at ILI. To date, they had been studying English for about two years. Similarly, since they came from the same country it was reasonably assumed that they shared a homogeneous EFL background. Moreover, the treatment began at the beginning of the ILI Fall (2014) term when the students had just passed the ILI final examination, as a result of which all qualified to register for a higher class level (Intermediate 3). Their having just passed the qualification test heightened the chance of comprising a homogeneous group.

The population was assigned to the three groups. There were two experimental groups: MST (N=21) who received metacognitive strategy training, IMI (N=21) who received instruction through interactional modification of input, and one Control group (N=21) who received no additional instructions, but were taught listening according to the traditional ILI techniques of teaching listening.

At the beginning of the treatment, a listening pretest was administered to all groups to measure the listening comprehension proficiency of the learners. Another listening comprehension test with the same level of difficulty was administered in a post-test to measure any possible improvement in each of the groups.

Materials and Instruments

Eight listening texts tape recorded by native speakers with different topics such as radio programs, talks between friends, travelling, shopping, etc. were extracted from ILI listening instructions. The activities accompanying the texts were presented in the students' course book. Each task included three phases of pre-listening, listening, and post-listening activities by which treatment was given in different groups.

The ILI listening section of the ILI term qualification examination was utilized before and after the treatment as the pre-test and post-test in all three groups in order to assess any possible improvement in comprehension performance of the learners. The listening test comprised 10 tasks, five of which were short conversations between two native speakers, whereas the next 5 comprehension questions which had to be answered after listening to a short text (cf. Appendixes I to IV).

Procedure and Data Collection

All three groups received an eight-week listening training which took a whole term of 21 sessions (twice a week). Every week, a new task was dealt with in the classes following the traditional teaching techniques. The tasks comprised three phases of pre-listening activities, listening phase and follow up. In pre-listening activity, some new words and concepts which appear in the listening text were introduced. In the listening phase they listened to a tape recorded text three times, the first time was a non-stop playing followed by checking the answers and comprehension questions, the second time the teacher might pause the recording and paraphrase some chunks, or ask the student to repeat some of the chunks. In the follow up, the students interacted with each other based on the topic introduced in the listening text.

All three groups received instruction based on the foregoing steps.

The MST group received additional instructions on strategy use in different phases of listening task. Metacognitive strategies given were based on problem-solving, planning-evaluation, mental translation, personal knowledge or the beliefs about oneself as a learner, and directed attention. The instruction consisted of the following stages:

1. At first, the concept of learning strategies was clearly explained. The instructor briefly explained different types of strategies including cognitive, metacognitive and socio-

- affective strategies. To give further clarification, examples of different strategies were given.
2. Since the focus of attention would be on metacognitive listening strategies, some examples such as note-taking strategies were explained in order to familiarize students with the strategies. In this stage, the learners were informed of the strategies related to planning, monitoring and evaluation. They were also provided with further clarification that they needed to have a plan and/or a map of what they would be listening to, keep on track while listening, and ask themselves every now and then whether they were pleased with what they were doing.
 3. The students were informed of the topic of the oral text.
 4. They were asked to brainstorm whatever words, phrases, or information they might hear and write them on the paper according to their background knowledge. In this prediction phase, they were assigned to pairs or small groups and were told that all logical possibilities should be considered. In this phase, the metacognitive processes of planning and directed attention were involved.
 5. Once they had completed their prediction, they listened to the text for the first time. They were supposed to put a checkmark beside the information which was predicted. They would add anything new that they had heard as well. The metacognitive processes of selective attention, monitoring and evaluation were involved here.
 6. At this point, the learners were asked to work in pairs, comparing their predictions and comprehension of the listening material. They would also discuss the points of confusion and disagreement and decided the particular parts of the text and information that would require careful attention during the second time listening. The metacognitive processes involved here consisted of monitoring, evaluation, planning and selective attention.
 7. The learners listened to the text a second time, trying to make sense of the difficult points after the first time listening, making corrections, and jotting down new information on the paper. Selective attention, evaluation, problem solving and monitoring were the metacognitive processes involved.
 8. They participated in the class discussion to confirm the understanding of the text and how they came over the processes of comprehending: monitoring, problem solving and evaluation.
 9. The third time listening was done allowing the learners to mostly focus on the information gleaned from the class discussion that they might have missed during the previous phases of listening. The metacognitive processes involved here were monitoring, selective attention and problem solving.
 10. Ultimately, each learner individually wrote a reflection of the processes she had gone through, noting any possible strategies that would be used in the last listening.

The students in IMI followed all the same steps mentioned in the control group. The listening phase was, however, different in IMI. During the second time listening,, according to the traditional ILI technique, the students listened to the recording and passively repeated the chunks that the teacher had asked them to, without really knowing what they are doing. In IMI the learners were allowed to decide what they needed to repeat, pause, clarify and so on. In other words, in the second time listening, they were asked to listen carefully. They were also given the

chance to interact with the teacher to repeat a chunk, explain an expression or a word, or give a clarification in case they didn't comprehend something. To ensure the learners' participation the teacher had to be constantly monitoring the learners' listening. The spot checks randomly done further supported their pursuing whatever they were supposed to. In order to prevent the interruption of the flow of the listening they were requested to interact using a number of body signs which had already been defined. After the second time listening, the learners did the foregoing procedures. The ILI listening qualification test was used twice in a pre-test and post-test to assess the listening comprehension of the learners.

Data Analysis

ANOVA analysis for the comparison of means was carried out on the collected data through the pre-test and post-test at .05 statistically significant level. In order to make a comparison between the means of the three different groups and also to compare the pre-post-test in each group, a Tukey test was administered as a Post-hoc analysis.

RESULTS AND DISCUSSION

The main aim of this study was to investigate whether an experimental application of IMI and MST could positively affect the listening comprehension and metacognitive awareness of intermediate English learners at ILI. In so doing, the pre-post-test scores of listening comprehension in the three groups were computed. The mean scores are illustrated in Table 1.

Table 1: Descriptive statistics for the achieved results in listening comprehension pre-post-tests for MST, IMI, and Control groups

	N	Mean	Std. Deviation	Std. Error
IMI-pre	21	5.0476	1.43095	.31226
IMI-post	21	7.6190	.97346	.21243
MST-pre	21	5.1905	1.03049	.22487
MST-post	21	8.8095	.98077	.21402
Ctrl-pre	21	5.1429	1.19523	.26082
Ctrl-post	21	6.3333	1.06458	.23231
Total	126	6.3571	1.80428	.16074

As shown in Table 1, there is a difference between the mean scores of post-test in MST (M= 8.8), IMI (M=7.61), and Control (M=6.33). To determine whether the difference was statistically significant or not, a one-way ANOVA was utilized.

Table 2: Overview of the results from ANOVA

	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	255.310	5	51.062	40.413	.000
Within Groups	151.619	120	1.263		
Total	406.929	125			

The results in Table 2 indicate that there was a significant difference at the $p \leq .05$ level for different groups ($F=40.41$, $p \leq .05$). The results of the Post hoc analysis, Tukey test, are illustrated in Table 3.

Table 3: Overview of the results of Tukey test for pre-post-test of IMI, MST, and Control groups

Tukey HSD

Group	N	Subset for alpha = 0.05			
		1	2	3	4
IMI-pre	21	5.0476			
Ctrl-pre	21	5.1429			
MST-pre	21	5.1905			
Ctrl-post	21		6.3333		
IMI-post	21			7.6190	
MST-post	21				8.8095
Sig.		.998	1.000	1.000	1.000

As shown in Table 3, the difference existed between the post-test results of the three groups. No significant difference was detected between the pre-test means of the three groups.

Post-hoc comparisons using the Tukey HSD test indicated that the mean for MST ($M= 8.80$), was significantly higher than IMI ($M= 7.61$), and the mean score for IMI was higher than control ($M=6.33$). In other words, both MST and IMI had a positive effect on listening comprehension performance of the students compared to the Control group (who received the routine listening instruction of ILI), but the effect of MST was more significant than IMI on listening comprehension performance of the students.

Comparisons between the pre-test mean scores of the three groups in Tukey test reveal that the three pre-test means were in the same category, that is, there was not a significant difference between the mean scores of the pre-test in any of the groups at the $p \leq .05$ level: MST($M=5.19$), IMI($M=5.04$), and Control ($M=5.14$). It can be inferred from these results that the students were of the same level of proficiency before the treatment, and the difference of the means in their post-test merely attributed to the treatment they received during the investigation, not any other factors.

A further examination of Table 3 (the results from the Tukey test) reveals that, in all groups there was a significant difference between the pre-test and post-test of the same group. The greatest difference existed in MST with the pre-test ($M=5.19$) and post-test ($M=8.88$). The next approach, IMI, had a lower amount of difference between pre-test ($M=5.04$), and post-test ($M=7.61$). The least difference belonged to the Control group with the pre-test ($M=5.14$), and post-test ($M=6.33$).

The comparison between the means within and between groups indicates that the instructions that the learners received during the treatment led to a score rise of their listening comprehension performance in all three groups. Even the learners in the control group, who were taught

according to the traditional ILI listening techniques showed an improvement in their listening comprehension in the post-test. Nevertheless, the difference in the results of the post-test showed that among the different approaches at the teacher's disposal, MST proved the most effective method in enhancing listening comprehension. IMI came second in terms of effectiveness and the control group came last.

CONCLUSION

The results of this study were mainly in line with the foregoing research findings on the effectiveness of the two empirical approaches of Interactional Modification of Input and Metacognitive Strategy Training in listening instructions. Moreover, the further comparison between these two approaches, as two separate options, revealed that although both effective, equipping learners with listening strategies in an Iranian EFL context resulted in better comprehension performance. Whenever interaction takes place, the learners become consciously involved in the process of listening, which could result in better comprehension. Therefore, IMI can be considered a potential approach utilized by the teachers trying to raise their learners' listening comprehension. On the other hand, once the significant improvement in listening comprehension is brought about as a result of strategy training, it is reasonable to conclude that what the learners gained in class must have been more than just listening to a text for new information. Since there was no emphasis on developing the learners' phonological skills during the treatment, the out performance of the learners of MST in listening comprehension could be attributed to their being equipped with some sort of tools which had helped them do better in dealing with new contexts. In other words, this claim could be made that metacognitive strategies might have enabled the learners to transfer the skills they learned in class to new contexts.

Limitations of the Study

The findings of the present study provided support for the effectiveness of MST and IMI in listening instructions. Nevertheless, the results might not be generalizable to all other situations owing to the limitations which existed in the sample population, materials, and instruments used in this study.

The targeted population was limited to intermediate EFL learners with a fairly good mastery of English. The impact of these two approaches on beginner and advanced EFL learners needs further investigations. On the other hand, the materials used in this study were confined to tape recorded listening contents specifically provided for classroom instructions; real-life materials such as radio and TV news programs and films which could be used as the source of oral input were not used here. Since the focus of the present study was to investigate the learners' performance in listening comprehension skills at ILI (Iran language Institute), the listening section of the ILI term qualification examination was utilized as the pre/post-tests rather than other standard listening tests such as IELTS and TOEFL, so the results of the listening comprehension tests in this study are not necessarily generalizable to other types of tests.

Appendix I

Listening comprehension pre-test

Short conversations

1. Man: Did Jack show you his photos from his last trip?
Woman: Looking at them, I could picture myself lying on the beach.
2. Woman: My name is Mary Jones. J-O-N-E-S. Can I get a class card for chemistry today?
Man: Oh, no. Registration for students whose last name begin with "J" doesn't start until tomorrow.
3. Man: What will you do after graduation?
Woman: I don't know whether to go out on my own or work for a large company.
4. Man: Your new dresses are beautiful. Where did you find them?
Woman: Well, I bought three of the white I was on vacation in Chicago, but I made the other one myself.
5. Woman: Is there anything I can help you with?
Man: Yes, please. I bought this iron here last month, and it's not working properly. Where is your repair department?

Passage

You learn in school through your ears as well as through your eyes. Scientists who have studied human communication thoroughly have come up with some interesting facts. They show that the average individual spends approximately 70% of his or her time communicating. Only about 9% of this time is devoted to writing, 16% to reading, 30% to talking, and 45% to listening. However, in spite of the large amount of time spent in listening, the average person does not do it well. Estimates of listening efficiency show that the average skill is only about 25% of what it should be.

Appendix II

Pre-test (Questions)

Short Conversations

1. What did the woman do?
 - a. She looked at Jack's pictures with the man.
 - b. She went to the beach on vacation.
 - c. She imagined herself lying on the beach.
 - d. She took some pictures of herself on the beach.
2. What has happened to the woman?
 - a. She forgot to bring her class card.
 - b. She missed registration.
 - c. The man could not spell her last name.
 - d. She went for registration too early.
3. What is one of the woman's choices?
 - a. To work for a small company.
 - b. To start her own business.
 - c. To graduate from college.
 - d. To stop attending college classes.
4. What can we conclude from the conversation?
 - a. The woman finds her dresses easily.
 - b. The woman purchased no dresses in Chicago.
 - c. The woman always wears beautiful dresses.
 - d. The woman can sew.
5. What is the man going to do?
 - a. Get his iron repaired.
 - b. Get his money back.
 - c. Buy an iron.
 - d. Make a complaint.

Passage

6. What is the passage mainly about?
 - a. Learning in school.
 - b. Learning through ears and eyes.
 - c. Some facts about human communication.
 - d. Need for more practice in language skills.
7. What percentage of their time do people spend communicating with each other?
 - a. 17%.
 - b. 70%.

- c. 75%.
d. 7%.
8. Which of the following receives the least time?
a. Writing.
b. Reading.
c. Speaking.
d. Listening.
9. What is the least developed languages skill, considering the time devoted to it?
a. Reading.
b. Writing.
c. Speaking.
d. Listening.
10. How much of the total time is devoted to rating?
a. 25%.
b. 16%.
c. 30%.
d. 45%.

Appendix III

Listening comprehension post-test

Short conversations

1. Man: the air conditioner in my room is broken, and I can't work.
Woman: why not go to the library?
2. Man: what do you think of the final exam?
Woman: I was expecting it to be easy, but at the end of the first hour; I was still on the first page. I barely had time to get to the last question.
3. Woman: is it exaggerating if we say that human beings will soon settle down on the other planets?
Man: no, nothing seems impossible, especially now that scientists are making so much progress in different fields of science.
4. Man: there are supposed to be 45 people registered for this course.
Woman: I know. But I think 13 have canceled their registrations, and others indicated they could not make the first class.
5. Woman: you know, Martha, I always have to write letters, reports, and even articles. I wish that my teachers had made me write more in college.
Man: That's funny. I think my teachers forced me to write too much, even in my science classes. That's why I hardly had enough time to master the subject matter.

Passage

I still don't believe in ghosts even after my experience at the Rose Inn. At least I have never seen one. But ghost stories have made me feel uncomfortable since then. I arrived at the inn late at night and asked the landlord for a room. "There is no room left," he said, "unless you'd like to sleep in number 7." "Why not?" "I said." "What's wrong with it?" "I was so tired that I would have left anywhere." "Nothing," he said slowly. "But something happened there a few months ago." Every old inn has its strange stories, so I thought the sooner he told me about it, the better. "MN came here late at night, like you," the landlord said. "I thought there was something strange about him because he kept looking over his shoulder widely he was signing his name in the book. He asked me which room he could have and I offered him number 7. "There was a man who has said he would kill me with a knife," he said suddenly. He looked so frightened that I thought I had better take him to his room. I locked the door and left him by himself. The next day we found him dead. Do you mind sleeping there now? "Well no one is following me. I wish you had told me this story in the morning. As it is, I will sleep here on the floor in the restaurant if you don't mind."

Appendix IV

Post-test (Questions)

Short Conversations

1. What does the woman mean?
a. The man can find work in the library.
b. She can't help the man because she is working.
c. She can work without air-conditioning.
d. The men can do his work somewhere else.
2. What can we conclude from the conversation?
a. The woman barely finished the first page.
b. It took her one hour to get to the last question.
c. The woman expected the exam to be harder.
d. They exam was too difficult for the woman.
3. What does the man think?
a. There is no way to live on other planets.
b. It is possible to live on other planets.
c. The woman is exaggerating about living on other planets.
d. Scientists are exaggerating about the progress.
4. According to the woman, how many people we attend the first class?
a. 23
b. 22

- c. 32
- d. d.35

5. What's the man sorry about?
- a. He didn't write much at college.
 - b. He wasn't able to master the subject matter.
 - c. He used to write a lot of things.
 - d. He has to write a lot of scientific reports.

Passage

6. After the experience at the Rose Inn, the narrator
- a. doesn't believe in ghosts anymore.
 - b. has always felt uncomfortable.
 - c. doesn't like to listen to ghost stories.
 - d. decided not to stay at haunted houses.
7. Why did the landlord offer room number 7 to the narrator?
- a. The other rooms were occupied.
 - b. He didn't have enough money.
 - c. The other rooms were not ready.
 - d. He looked very strange.
8. According to the landlord, the man who came to his inn some time ago
- a. looked horrible.
 - b. looked very suspicious.
 - c. had a knife with them.
 - d. wanted to stay there for 2 days.
9. According to the passage, which of the following is not true about the man killed?
- a. The landlord took him to his room.
 - b. The letter will lock the door for him.
 - c. He was left all alone in his room.
 - d. He went to the hotel late in the afternoon.
10. What did the narrator decide to sleep at last?
- a. In room number 7.
 - b. In the restaurant.
 - c. In another hotel.
 - d. On another floor.

THE STUDY OF INTERSEMIOTIC TRANSLATION OF “GONE WITH THE WIND” NOVEL IN TO FILM BASED ON SOJOODI’S MODEL

Dr. Sholeh Kolahi

Assistant Professor, Islamic Azad University, Central Tehran Branch
Sh-kolahi@iauctb.ac.ir

Solmaz Mahdavi

Islamic Azad University, Central Tehran Branch, Tehran, Iran
s.mahdavi9096@gmail.com

ABSTRACT

The present research aimed at investigating the intersemiotic translation of the novel –Gone with the wind- (Mitchell,1939) as prototext in to its corresponding film as metatext to make a comparative study between the two semiotic systems of language and cinema in order to see how changes and differences of the prototext and metatext including two different sign systems, affect the process of adaptation. To fulfill this purpose, the researcher followed Sojoodi’s theory of stratificational semiotics (2008). Having seen the movie for numerous times and also reading the novel several times, the researcher extracted ten sequences of the movie and compared them with their corresponding texts. The author has attempted to make a comparative study between the two semiotic systems of language and cinema, taking an alternative view towards adaptation. According to Lhermitte (2005), film adaptation is an intersemiotic translation which involves the conversion of a particular system of signs in to a different configuration. Through investigating the intersemiotic translation and intertextual relations (addition, deletion and creation) between the novel and its corresponding film, it was found out that %77 of the prototext has been translated (repeated) in to the film. Moreover, data analysis revealed that only "deletion" and "creation" has been occurred in intersemiotic translation which have had a significant impact on the transferred concept . Twenty three percent of the prototext have been deleted and creation has been occurred three times. There were no added sections in the movie.

KEYWORDS: Semiotics, Intersemiotic Translation, Metatext, Prototext, Film Adaptation

INTRODUCTION

The last decade has witnessed a research shift in the focus of systemic functional approaches to multimodal discourse analysis (O’Halloran, 2007). Drawing on insights of Halliday’s social semiotic theory of language, the researchers in the 1990s were mainly interested in the extension of systemic – functional grammar to non-verbal semiotic resources and media including displayed art (O’Toole,1994), visual sign (Kress & Van Leeuwen, 1996) action (Martinec,1998)

and music (Van Leeuwen, 1999). By contrast, from the late 1990 onwards, meaning making across different modalities in multi-semiotic text becomes the focus of study. But what actually semiotics is and what semiotics involves?

Semiotics involves the study not only of what we refer to as 'signs' in everyday speech, but of anything which 'stands for' something else. In the semiotic sense, signs take the form of words, images, sounds, gestures and objects. Contemporary semioticians study sign not in isolation but as part of semiotic 'sign-system' (such as a medium or genre). They study how meaning is made and how reality is represented.

Theories of signs appear throughout the history of philosophy from the ancient times onwards (Todorov, 1982). However, the two primary tradition in contemporary semiotics stem respectively from the Swiss linguist Ferdinand de Saussure (1857-191) and the American philosopher Charles Sanders Pierce (1839-1914). Saussure referred to language as 'the most important' of all of the systems of signs (Saussure, 1983). Many other theorists have regarded language as fundamental. Roman Jakobson insisted that 'language is the central and most important among all human semiotic systems' (Jakobson, 1970).

Jakobson (2000) identifies that there are three kinds of translation, i.e. intralingual, interlingual and intersemiotic. He believes that translation can take place within the same language (inter-translation), and even between two systems of signs (intersemiotic translation). She also states that intersemiotic translation, the third type of translation, involves the conversion of a particular system of signs in to a different configuration.

The key emphasis in Jakobson's formulation is on the term "interpretation" and understandably. By giving several examples he tries to exemplify the purpose of all translations, which is in some ways a transfer from the source text to the target text, involving the process of communication from the sender to the receiver. But how does one address the question of translation equivalence in the third category that Jakobson mentions? One problem relates to translation equivalence, in which there is a lack of exact correspondence between single units in the source system and those of the target one.

The most common form of intersemiotic translation is translation of a literary work in to film. In recent years a considerable degree of interest has been developed in the semiology of the cinema, in the question whether it is possible to dissolve cinema criticism and cinema aesthetics in to a special province of the general science of signs. All the yardsticks that is applied to interlingual translation are applicable here too -equivalence, translation strategy, faithfulness to the original, etc. The dimensions like the natural changes that would accompany the transformation of material from one medium to another are also added.

The appropriate parameter to assess an intersemiotic translation would be the carrying through of meaning from the source system to the new representation. They are not supposed to be compared, for one is what the other has become.

It seems better to compare how the meaning of a text is rendered into a movie and in this rendering of meaning what changes have been applied on the text?

To this end the present survey has attempted to make a comparative study between the two semiotic systems of language and cinema, taking an alternative view towards adaptation. The researcher has undertaken to survey the intersemiotic translation process of novel in to the movie by applying Sojoodi (2008) stratificational approach. The aim has been to compare the intersemiotic translation processes between the two different sign systems of literature and cinema. Regarding the aforementioned systems, the researcher has compared the adaptable sequences of the movie 'gone with the wind' with the novel. Literary text and the cinematic production of the present research are respectively taken as the proto-text and the meta-text.

RESEARCH QUESTIONS

Q₁: What is the frequency of the cinematic codes used in the intersemiotic translation of the novel –Gone with the wind- in to film?

Q₂: What is the frequency of repetition or translation, addition, deletion or creation in the process of intersemiotic translation of the novel- Gone with the wind- in to film based on Sojoodi's model?

Q₃: what is the impact of deletions and additions?

METHODOLOGY

Theoretical framework

Jakobson (1959) introduced his own categorization of different types of translation as:

Intralingual translation (rewording): an interpretation of verbal signs by means of other signs of the same language.

Interlingual translation (translation proper): an interpretation of verbal signs by means of [signs of] some other language.

Intersemiotic translation (transmutation): an interpretation of verbal signs by means of signs of non-verbal sign system.

Jakobson introduced the concept of intersemiotic translation, which not only relates to Saussure's stratificational linguistic ideas to translation; but also amazingly widens the realms of translation to art, aesthetics, etc. The researcher decided to analyze two different sign systems – novel and film- according to the third part of Jakobson's intersemiotic translation as well as Farahzad's approach in translation as an inter-textual function (2009). Farahzad believes that translation is partly repetition, partly creation and partly deletion. The aim of the present research is to show the frequency of repetition, creation and deletion in the intersemiotic translation process of novel in to the film. Stratificational semiotics is based on the existing theories, continuing them, and criticizing some of the key concepts of semiotics. In his theory of stratificational semiotics, Sojoodi argues that text is an open network consisting of different layers which are objective textual representations of different code systems. In fact, textual layers interrelate, and are realized and interpreted as a text and as an object resulting from the signifying

codes. Also, the relationship between text and code is bilateral, and code does not precede text. On the one hand, different codes involve in the creation and perception of a text, in other words, every text is a product of an interactive operation of a network of codes, and on the other hand, texts transform codes.

Aside from the relationship with texts, codes also relate to other codes. He also believes that text is physical and objective, so it is inevitably perceived by five senses or media- audio, visual, tactile, gustatory and olfactory. In contemporary world, texts are often perceived by audio- visual media. Furthermore, any medium needs a tool to communicate with its addressee. So television, radio, newspaper, book, internet, etc, are the tools that mediate between the medium and the addressee (Sojoodi, 2008).

Corpus

In the present research the literary text –Gone with the wind- and its cinematic production –its movie – selected as the corpus of the study, are respectively taken as the proto-text and meta-text. Checking more than 20 critics of the novel, the researcher came up with the comments emphasizing that the novel is a brilliant, powerful epic (Berardinelli, 2014; Puccio, 2004). However, there are disagreements on the theme of story. Margaret Mitchel herself has said that if the novel has a theme, it is survival. The novel presents many characters, some who survive, and many who do not. It can be said that It's a story of peace and war, love and loss, hope and despair. More than that, it presents a chronological look at a time filled with uncertainty in America – the Civil War and Reconstruction – while also depicting the moral and psychological growth of its characters as they undergo dramatic changes to their way of life. Margaret Mitchell paints a vivid picture of life in the South, from belles and beaux to Yankees and Confederates and everything in between.

This epic melodrama, directed in 1939 by Victor Fleming, should be viewed less as a movie and more like an institution. Unlike any other piece of seventh art, it actually became the essential part of popular culture in this century. And this shouldn't surprise anyone, since GONE WITH THE WIND looks larger than all the other movies, almost in the same proportion in which an average movie looks larger than real life. Its epic 222-minute length is only partly responsible for such impression. The images of this film are the most recognisable, the scenes are the most memorable, the protagonists are the most iconic and the lines are the most quoted. More than 60 years after its premiere, there are still new generations of viewers ready to be enchanted by its mythical quality. Thus the popularity of GONE WITH THE WIND is perpetuated and it remains the most popular and the most beloved film of all times. (Antulov,2000; Schuartz,2004)

The characteristics of both the novel and the movie are summarized in Table 1.

Table 1: The characteristics of the corpus

	Name	Characteristics
Novel	Gone with the wind	Margaret , M (author),(1936)
Movie	Gone with the wind	O.selznick,D (producer) & Fleming, V (director). (1939)

Procedure

The main purpose of the present study was analyzing intersemiotic translation process between the two different code systems -text and cinema. The researcher has selected ten sequences of the movie “Gone with the wind” which is taken as the metatext, with the corresponding sections of the novel “Gone with the wind” which is taken as the prototext. The rationale behind choosing the sequences comes back to the precise reading of the whole story in detail and about twenty criticisms as well. The main theme of the novel is war and the main character's (Scarlett's) personality. The plot is consisted of three main sections: pre war, the war , and after war periods. Since the corresponding sections in the film are the shortest period as the prewar, and afterwar and the war as the longest one respectively; the researcher has selected the main sequences from the war period and the rest from the two others. Therefore, from the total ten selected sequences, one of them is selected from pre war, three sequences from after war, and the remaining six sequences from the war period. Each selected sequence is divided in to its shuts and each shut is divided in to codes by which the producer has converted the novel in to film. The researcher has compared the adapted film with the novel to see what parts of the prototext have been repeated in the metatext, what parts have been created and what parts have been deleted. To clarify the process of data collection, the details of the cinematic codes used as the basis of the analysis in this study, are illustrated in Table 2.

Table 2: Cinematic codes

Number	Cinematic code	
1	Camera shots	1)An extreme shot 2)A long shot 3)A full shot 4)A mid shot 5)A close-up shot 6)An extreme close-up shot
2	Camera angle	1)A bird'sound eye angle 2)A high angle 3)An eye-level angle 4)Alow angle 5)A dutch angle
3	Camera movement	1)Acrane shot 2)A tracking shot 3)A dolly shot 4)Panning 5)Tilt 6)Crab 7)Hand-held camera 8)Process shot 9)An Evangelion shot
4	Lighting	
5	Fade	1)fade in 2)fade out
6	Dissolve	
7	Sound	1)diegetic (ambient sound,room tone, dialogue, sound motifs) 2)non-diegetic (music or voice over)
8	Sound effects(SFX)	
9	Silence	
10	Color	
11	Clothes	
12	Actor/actress(face appearance)	
13	Make up	

A sample of the details of the analysis procedure is illustrated in figure 1.

Figure 1: Comparing the selected texts of the novel with its corresponding sequences of the movie

Cinematic codes

[illegible]

Design

The present research is a descriptive – corpus based study. Selecting a descriptive approach, the researcher attempted to analyze the meta-text in relation to its corresponding proto-text within the framework generated through the study. The researcher attempted to describe and compare the intersemiotic translation between the novel –Gone with the wind- and its corresponding adapted film. So, the cinematic codes were defined. These cinematic codes (such as sounds, color, camera shots, etc) are used by the director (the intersemiotic translator) to demonstrate the frequency of deletion, addition or creation in the process of translating the novel in to film.

RESULTS AND DISCUSSION

The intersemiotic translation of texts in to the movie sequences has been done using the cinematic codes. The codes were evaluated and then classified with regard to the Sojoodi's stratificational model. The tables of the cinematic codes are presented in Appendix 1. The results are demonstrated as follow: The proportions of cinematic codes and excluded paragraphs for each sequence are shown in figures 2 to 11:

Figure 2: The Proportion of cinematic codes and excluded paragraphs for sequence 1

Figure 3: The Proportion of cinematic codes and excluded paragraphs for sequence 2

Figure 4: The Proportion of cinematic codes and excluded paragraphs for sequence 3

Figure 5: The Proportion of cinematic codes and excluded paragraphs for sequence 4

Figure 6: The Proportion of cinematic codes and excluded paragraphs for sequence 5

Figure 7: The Proportion of cinematic codes and excluded paragraphs for sequence 6

Figure 8: The Proportion of cinematic codes and excluded paragraphs for sequence 7

Figure 9: The Proportion of cinematic codes and excluded paragraphs for sequence 8

Figure 10: The Proportion of cinematic codes and excluded paragraphs for sequence 9

Figure 11: The Proportion of cinematic codes and excluded paragraphs for sequence 10

Figures 2 to 11 demonstrate the approximate use of each cinematic code in the sequences one to ten. It can be seen that generally most of the codes are used equally; only the cinematic code “dissolve” had been used once. So, it is deleted in statistical analysis of the findings of the present research. Moreover, one of the interesting findings of the study was the occurrence of “deletion” which has been occurred in most of the sequences and “creation” which has been occurred in some of the sequences.

Next, the mean of the main cinematic codes used for all 10 examined sequences was calculated. The results are shown in the table 4 and figures 12:

Table 4: Mean of the Main Cinematic Codes Used For All 10 Examined Sequences.

Cinematic codes	The no of sequences which have used the cinematic codes	The average of using cinematic codes in sequences
Cam. Shots	10	8.3000
Cam. Angels	10	8.3000
Cam mov.	10	8.2000
Lighting	10	5.5000
Fade	3	1.3333
Sound	10	11.4000
Sound effect	9	4.8889
Colour	10	4.4000
Clothes	10	6.7000
Actor/Actress	10	7.7000
Make up	10	4.8000
Total	102	6.8725

Figure 12: Mean of Different Cinematic Codes For All 10 Sequences.

Table 5: Analysis of Variance Test in 10 Examined Sequences

ANOVA

Number

	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	520.888	10	52.089	7.424	.000
Within Groups	638.456	91	7.016		
Total	1159.343	101			

As table 5 indicates based on the analysis of variance of the 10 examined sequences ($\text{sig} < 0.05$) so, there is a significant difference in the use of cinematic codes.

So the answer for the first question is shown in table 6:

Table 6: The percentage of different cinematic codes used in each sequence

OVERALL PERCENTAGE	sum of all codes	Creation	Excluded paragraphs	make up	Actor/ actress	Clothes	colour	sound effect	sound	Dissolve	fade	Lighting	camera movements	Camera angels	Camera shots	No.	sequences

		2.70%	2.70%	13.51%	2.70%	13.51%	8.11%	13.51%	2.70%				13.51%	13.51%	13.51%	Percentage	
0.11	79.00		7.00	8.00	8.00	3.00	7.00	13.00					11.00	11.00	11.00	No.	7.00
		8.86%	10.13%	10.13%	3.80%	8.86%	16.46%						13.92%	13.92%	13.92%	Percentage	
0.11	66.00		7.00	7.00	6.00	15.00							8.00	8.00	8.00	No.	8.00
		10.61%	10.61%	10.61%	9.09%	22.73%							12.12%	12.12%	12.12%	Percentage	
0.10	96.00		4.00	12.00	12.00	4.00	3.00	13.00					12.00	12.00	12.00	No.	9.00
		4.17%	12.50%	12.50%	4.17%	3.13%	13.54%						12.50%	12.50%	12.50%	Percentage	
0.10	39.00		5.00	1.00	4.00	4.00	4.00	5.00					4.00	4.00	4.00	No.	10.00
		12.82%	2.56%	10.26%	10.26%	10.26%	10.26%	12.82%					10.26%	10.26%	10.26%	Percentage	

Figure 12 displays the mean of different cinematic codes for all 10 sequences. According to the figure, it is concluded that in translating the text in to movie, the cinematic code “sound” has the highest frequency and the cinematic code “fade” has the lowest one.

Moreover, in order to answer the second research question, the sequences were analyzed to find out whether there is any “deletion” or “addition” or “creation” and the results are shown in table 7, figure 13 and figure 14 .

Table 7: The proportions of “deletion” and “creation” in the intersemiotic translation of novel –Gone with the wind- in to movie

Sequence	No. paragraphs	No. excluded paragraphs	No. creation	Proportion of excluded paragraphs	Proportion of creation
1	9	2	0	0.22	-
2	15	4	1	0.27	0.07
3	10	3	1	0.30	0.10
4	13	4	1	0.31	0.08
5	11	2	0	0.18	-
6	7	1	0	0.14	-
7	11	0	0	0	-
8	8	0	0	0	-
9	16	4	0	0.25	-
10	9	5	0	0.56	-
Total	109	25	3	0.23	0.03

Figure 13: The Proportion of Excluded Paragraphs In Each Sequence

Figure 14: The proportion of the creation of the cinematic codes

According to table 7 and figure 13 and 14, it can be concluded that only “deletion” and “creation” has been occurred in the process of intersemiotic translation. There was no added section in the movie. However, in sequences 2, 3, 4 there are examples of “creation” and, “deletion” has been occurred in 8 out of the 10 sequences.

The high percentage of this occurrence is probably due to the high volume of the text which cannot be entirely converted to the movie.

As table 7 shows, the total number of the paragraphs are one hundred and nine (109). Twenty five paragraphs (23%) have been deleted and creation has been occurred three times (3%). So, it can be concluded that seventy seven percent (77%) of the source text has been translated in to the target text and out of the seventy seven percent (77%), in three percent (3%) “creation” can be seen.

The answer of the third question is actually based on the analysis which had been done by the researcher and is explained in the discussion part of the study.

Discussion

This research was conducted in order to find out whether there is any deletion or addition in translating the novel in to movie. The results indicate that there is no “addition” but “deletion” has been occurred in 8 sequences of the 10 sequences and this is a remarkable event. These deletions may have occurred due to the different reasons. The novel is of a considerable volume and the author has attempted to incorporate different issues in the story at the same time:

- 1) War and its destructive effects on people’s lives
- 2) Complicated characterization, the role of destiny, the character’s reaction to life events.

The text is a single sign system and the author could bring all the intended events and conditions by using the single sign system. But since the movie is a multi-sign system, converting the story with its details is a very demanding task and leads to excessive prolongation of the film. However, there are

some cases of deletion which can directly affect on the audience's interpretation of the characters' personality and behavior.

For example in the first sequence which is the beginning of the story, "buying darkee by the Scarlett's father" has been entirely deleted. Scarlett's father paid a high cost for the darkee. Darkee was a little daughter; his intention was in fact to take care of her. This shows Scarlett's father's kindness and amiability. The author intends to emphasize this characteristic at the beginning of the story and then let the reader judge on both the father and Scarlett's personalities. Deletion of the first scene deprives the audience of being allowed to have such a judgment.

Another example is the deletion of Melani's aunt. She is entirely deleted in the movie; so, her impact on the story is also deleted.

Another important issue implied is the occurrence of "creation". The director has changed the order of the events. For example, in the second sequence it can be seen that Melani first put her wedding ring in the gifts' basket and Scarlett did the same whereas it is quite vice versa in the novel. This "creation" shows the characteristics of Scarlett and Melani differently and makes a kind, sympathetic and devoted picture of Melani in the minds of the viewer's and on the other hand shows Scarlett as a selfish and jealous woman. A little "creation" caused a big change in the actress' characteristic.

So, it can be concluded that "deletion" and "creation" which had been occurred clearly in this story, have a significant effect on the transferred concept.

CONCLUSION

The results of the present research shows that the movie cannot be the entirely similar translation of the text and parts of concepts are changed in the process of intersemiotic translation. They may entirely be deleted or converted to another form. All these changes are affective factors in the intended impact of the movie.

Another issue which is implied of this research is the role of the director. According to the old perspective of translation, it means the replacement of an original text (known as the source text) with a substitute one (known as a target text). But it is a translator who does the act of translation and has a significant role in the process of translation.

In the intersemiotic translation, the director plays the role of a translator. In discussing the impact of translator in the proper translation, different factors are concerned such as the social level of the translator, his/her situation in the family, the financial, etc. All of these factors affects the act of a director in the process of filmmaking. This research shows the important role of a director because he/she is forced to choose among different cinematic codes and manage them so skilled and subtly to create the same impact of the novel.

There are obviously obstacles in the way of every research. Contrary to the great interest in the field of intersemiotics, the number of articles and books related to them and specially related to adaptation

strategy, are few. Another limitation posed to this study is in the line with the corpus which is a movie only available in the black market.

It is obvious that there are so many fields in interdisciplinary studies but in this study the researcher just focuses on the intersemiotic translation of novel to movie.

Hossein Davari

M.A Student of English Literature, Shiraz University

ABSTRACT

With the beginning of the 20th century, England entered into a period much like the Victorian era with its strict hierarchy of social classes, master-servant relationship, and political, social and economic stabilities. Written in 1902, at the beginning of the Edwardian period, Heart of Darkness represents a subjective review of an area where many repressive ideologies established by the Victorian colonizers work latently in another underdeveloped country in order to achieve economic gain and perpetual subordination of the African society to the British Crown and government. These ideologies are so abstruse that they are not recognized by the docile native blacks who are incapable to discern them under the deceiving mask of benevolence and righteousness. Heart of Darkness is a personal record of what has happened in Congo from its first exploration in 1876 to Conrad's travel there in 1890 and the publication of his work in 1902. The unclassifiable and paradoxical Conrad who sets his novel against the imperialist colonizers is ambivalent in portraying the black natives. The ideological language which is employed by the narrator, Marlow, is coalesced with racism, and thus is not very kind and appropriate. In this novel, Conrad tries to clarify how these fake ideological programs of those in power are internalized and naturalized in the black subjects, and how they sustain, reinforce, commodify, and alienate the natives in order to ravage their country and the natural resources to make their history; the history which, by no means, can be treated as an authentic record, since it is written by a biased writer. Here, one can also recognize that even Conrad and his white characters such as Marlow and Kurtz are not spared from these ideological programs which have previously controlled their thoughts and attitudes.

KEYWORDS: *Heart of Darkness*, repressive ideologies, Joseph Conrad, imperialism, interpellation

INTRODUCTION

Marxists are condemned of having no belief in spirituality or any religion. They are criticized of not believing in God and it is because of their emphasis on materials, the real force creating the human experience and structuring human societies. In Marxist terminology, the economic condition referred to as material condition and the ideological atmosphere is generated from a material condition which is called a historical condition. All human events are the results of material/historical condition and have nothing to do with spirituality. These context-related

ideological programs differ in different times and different places, in other words, there is a strong relation between ideologies and the context consisting of these programs. Terry Eagleton (1976) defines ideologies as "the ideas, values and feelings by which men experience their societies at different times"(p.viii).

In his collaborated work with Angle, *The Eighteenth Brumaire*, Marx refers to the theological and political leaders such as, Luther and Cromwell:

They needed to deceive themselves by the use of representation, because they had to believe their cause was absolutely righteous and true. In fact, from a latter historical perspective, their struggles can be seen to have advanced the nascent capitalism, and thus to have served a particular class of people in the name of all humanity.”(qtd. in Hawks, 1996, p.93)

What Marx declares is the difference between the real existence and imaginary representation which is totally different from the truth found in real life. For Marx it is the representation that exerts its influence, deceives and reinforces the naïve people whose minds are predisposed to deception. He challenges these simulacra that make the good subjects—a reinforced individual by the ideologies—unable to distinguish between these two totally opposite realms of imaginary spiritualism and real materialism.

Marx believes that these leaders influence and handle the people by a very strong and secret medium called ideology. He notes "ideology consists of an inability to recognize the meditating function of representation, in assuming that it is an autonomous sphere, and thus mistaking the appearance for the thing-in-itself" (qtd. in Hawks, 1996, p.98). It is therefore the ideologically-based sign or representation which is mistaken for the material existence and reality.

The post Marxist critic, Louis Althusser, in his substantial essay, "Ideology and Ideological State Apparatuses" mentions: "Ideology represents the imaginary relationship of individuals to their real condition of existence"(qtd. in Rivkin & Ryan, 2004, p.693). He divides ideologies into different categories and outlooks such as religious ideology, ethical ideology, legal ideology and political ideology. Althusser equals ideology to illusion; he declares:

While admitting that they do not correspond to reality, i.e. that they constitute an illusion, we admit that they do make allusion to reality, and that they need only be 'interpreted' to discover the reality of the world behind their imaginary representation of the world (ideology = *illusion/allusion*). (qtd. in Rivkin & Ryan, 2004, p.693)

Althusser's view is highly influenced by Antonio Gramsci's idea of hegemony. Hegemony is the concept of domination which is closely related to the notion of ideology. Gramsci believes that it results in spontaneous consent to the dominant values in the society, the society which is dominated by the capitalism. Hegemony makes the individuals unconsciously accept their subordination and become good and non-revolutionary subjects. Gramsci believes that the dominant class intellectuals exercise on the individuals the function of hegemony which comprises, "the 'spontaneous' consent given by the great masses of the population to the general

direction imposed on social life by the dominant fundamental group"(qtd. in Rivkin & Ryan, 2004, p.673).

What all the Marxists accentuate is the imagery and contrary to fact nature of the ideologies. For them, these programs are exercised by the capitalists in order to persuade the good subjects obviate their infelicitous and defective necessities. They contend these illusions need to be interpreted so that the grievous and severe purpose beneath them become apparent and they can be challenged and disapproved by aware people who do not unconsciously accept these repressive programs as natural and incontrovertible.

DISCUSSION

Marxist critics see literature as a mirror reflecting society. They claim that no text can be understood in isolation and without its context; text is the product of a society which consists of different ideologies created by those in power. Therefore, these are the ideologies which handle the writer and his work and the writer's job is only to expound upon these manipulative programs. Marxists argue that, though the writer finds the ideologies oppressive and disapproves them; she/he is inevitably controlled by them because she/he is a subject of his/her society and literature is a superstructure of the government with definite ideological function. In *Heart of Darkness* which is set against the corruption caused by imperialism, Conrad is only a witness to what has been done in a colonized country and his passive hero, Marlow, who is like a cameraman recording what he sees without even a gesture against imperialism or becoming a revolutionary character confronting the ideologies of his own government. He is an ambivalent and powerless hero incapable of facing the capitalist government and its ideological programs because he is inevitably controlled by the ideologies as Conrad is. In his polemic essay, "An Image of Africa", which is set against Conrad, Achebe (1977) condemns Conrad of being predisposed and handled by Western thinking:

Conrad did not originate the image of Africa which we find in his book. It was and is the dominant image of Africa in the Western imagination and Conrad merely brought the peculiar gifts of his own mind to bear on it (p. 8).

There are ambivalent comments concerning Joseph Conrad and *Heart of Darkness*. This novel is assumed as an anti-colonialist novel by many critics such as Hawkins (1979), who finds Marlow as a "sympathetic character":

Although using the language of his time, he calls them 'niggers' and 'savages', he feels that, unlike the imperialists, 'they wanted no excuse for being there'... Marlow is sufficiently sensitive to their culture to realize that in Africa drums might have "as profound a meaning as the sounds of bells in a Christian country (p.296).

Quite different from what Hawkins (1979) has declared, the post-colonial critic, Edward Said (1994), shows the other side of the coin. In *Culture and Imperialism*, he puts forward:

Marlow's audience is English, and Marlow himself penetrates to Kurtz's private domain as an inquiring Western mind trying to make sense of an apocalyptic revelation. Most readings rightly call attention to Conrad's skepticism about the colonial enterprise, but they rarely remark that in telling the story of his African journey Marlow repeats and confirms Kurtz's action: restoring Africa to European hegemony by historicizing and narrating its strangeness (p.164).

For another post-colonial writer, Chinua Achebe (1977), the African people are dehumanized, decanonized and marginalized in this novel. They are portrayed as non-existent in their own country and Conrad has renounced even the ability of speech from them. In his critique of *Heart of Darkness*, Achebe (1977) mentions:

It is not Conrad's purpose to confer language on the 'rudimentary souls' of Africa. In place of speech they made 'a violent babble of uncouth sounds.' They 'exchanged short grunting phrases' even among themselves. But most of the times they were too busy with their frenzy (p. 3).

These contradictory views on Conrad are based on his paradoxical and ambivalent nature as Terry Eagleton (1978) remarks:

Conrad neither believes in the cultural superiority of the colonialist nations, nor rejects colonialism outright. The message of *Heart of Darkness* is that Western civilization is at base as barbarous as African society- a view point which disturbs imperialist assumptions to the precise degree that it reinforces them (p.135).

In *Marxism and Literary Criticism*, Eagleton (1976) states:

The pessimism of Conrad's world view is rather a unique transformation into art of an ideological pessimism rife in his period—a sense of history as futile and cyclical, of individuals as impenetrable and solitary, of human values as relativistic and irrational, which marks a drastic crisis in the ideology of the Western bourgeois class to which Conrad allied himself (p.7).

What is certain about him is that Conrad is highly pessimistic about the nature of human beings and the struggle for reform and improvement. Conrad's contempt for both idealism and materialism is shown in his letters to R.B. Cunninghame; he argues:

Reform is ultimately futile, because human nature is selfish and brutal (letters 5, 8, 17, 18, and 31); because there are no absolute moral criteria, so that one has at best a choice of illusion; and because humanity is at any case destined to perish of cold, amid a mechanistic and soulless universe (letters 4, 5, 7 and 18); so that even consciousness itself may be regarded as an evil, because its survey of our condition removes the illusion of freedom to improve our state (letters 4 and 9). (qtd. in Watts, 1969, p.24)

In letter five Conrad addresses Cunninghame:

You are a most hopeless idealist-your aspirations are irresistible. You want from men faith, honour, fidelity to truth in themselves and others. . . . what makes you dangerous is your

unwarrantable belief that your desire may be realized. This is the only point of difference between us. (qtd. in Watts, 1969, p.6)

Whether written from a racist point of view or not, *Heart of Darkness* shows both the superiority of the whites over the blacks and the evil of imperialism. Conrad who has witnessed the idealism and the materialism of the colonizers attacks the British colonialism though he does not defend the oppressed blacks anyway by showing them as voiceless, non-revolutionary, and docile subjects much like domestic animals. Conrad shows how the oppressive ideologies of the European colonizer, such as imperialism, rugged individualism, education, religion and classicism manipulate, commodify and finally alienate the docile and obedient black subjects who are made to believe, by the false and illusionary concepts, that they are inferior to the superior intelligent whites and for this reason they need their guidance, theological teachings and superintendence.

Congo was the last part of Africa to yield to European explorers. Its colonization refers to its first exploration in 1876 by the Welsh Journalist, Henry Morton Stanley till 1885 when it was affixed as a personal property of King Leopold II of Belgium. Conrad acknowledges that *Heart of Darkness* is based on his own experiences during his trips to Congo in 1890. Being a witness to the brutal treatment of the natives, hypocrisy, exploitation, and disparity between imperialism's rhetoric and harsh reality, Conrad attempts to show through Marlow the very unjust heart of imperialism to the readers. He shows how imperialism, aided by the other companion ideologies, leaves catastrophic consequences in a primitive society and devastates it from within. Conrad depicts a satiric and skeptical treatment of imperialism which not only destroys the colonized country but also ruins the capitalism's voracious agent, Kurtz. He shows how with a mien of benevolence this ideology is the first cause for the intruders to justify their terrible deeds without regarding the colonized country.

Imperialism is rooted from the Latin word "imperium" meaning to rule over large territories. As the definition signifies desiring much and even to extreme, the word is thus no different from avarice which is the connotation of this ideology.

The very famous sentence of *Heart of Darkness* is a key to the aim of imperialism. "The conquest of the earth . . . mostly means the taking it away from those who have a different complexion or slightly flatter noses than ourselves" (Conrad, 1999, p.34). In this novel, imperialism is felt everywhere, it is interesting that there is no sense of God in this place; in other words, God is the ever absent agent because the imperialism is the ultimate power in this place. Here the idealism of the European countries and the material condition matters; imperialism is the ultimate and powerful god here which is embodied in the apparently godly creature, Kurtz. Marlow says, "All Europe contributed to the making of Kurtz; and by and by I learned that, most appropriately, the International Society for the Suppression of Savage Customs had intrusted him with the making of a report, for its future guidance." (Conrad, 1999, p.77). Marlow is cognizant of the innate fake existence of imperialism and is highly skeptical about it. "I've seen the devil of violence, and the devil of greed, and the devil of hot desire; but, by all the stars! These were strong, lusty, red-eyed

devils, that swayed and drove men- men I tell you" (Conrad, 1999, p.44). What Marlow says about imperialism is the avarice which results in ravage and robbery along with violence.

Imperialism reinforces the second repressive ideology, rugged individualism. It focuses on the individual glory and encourages the individual deeds. Though devastating the other countries creates many devilish enemies, it makes these devils the national heroes of the colonizer's nation. Imperialism justifies the attack to another country and prepares its force by deceiving the individuals to reinforce it. The best example is Kurtz with his unspeakable lusts and desires. Marlow says: "Mr. Kurtz lacked restraint in the gratification of his various lusts that was something wanting in him" (Conrad, 1999, p.86). Kurtz searches for glory; consequently, he is sent to a primitive place to find it. Although the natives are afraid of him, they worship this charismatic hero who has stepped even further and become a god for them. This individualism though made him the powerful god among these people, is the most important cause of his destruction because his desires are all united in the avarice for wealth and stability of power. Kurtz wants to be the perpetual and autonomous powerful god there, but he is only an agent of the more powerful and more voracious imperialist authorities who cannot exempt such transgression. His desire for wealth makes him first detached from his fiancée and then from his benefactors. He has chosen a native girl and established a private property; that is to say, he has betrayed both his fiancée and his benefactors. Kurtz is so much deceived by this fake individualism that he thinks he deserves all he has gained so far; no more he sends ivory to the station because he deems that he is an independent person and the ivories are his property but he is just an agent and nothing more. White (1993) argues: "imperialism is enabled by an idealism that is and must remain ignorant of what imperialism actually means in practice" (p.178). Much deceived by this imaginary relationship, Kurtz and his property must be confiscated and the authorities send Marlow for this mission to return the guilty, voracious, and idealist Kurtz who has gone so far and needs to be removed from that critical station.

The private property which Kurtz has established detaches him from his masters and makes him powerful enough to challenge those for whom he has been sent to this place; Kurtz has many faithful servants who serve him faithfully and thus they are the threat for the imperialist employers, as the attack to Marlow's ship attests to this. This property also demands slavery and makes a master-servant relationship between Kurtz and the natives. It is what the idealist Kurtz has considered before going there; indeed, Kurtz has gone there only for idealist and materialist motives. "Kurtz is an embodiment of all the evils created by free enterprise in a capitalist system. His inordinate passion for ivory in the Congo can attest to this." (qtd in Sardar, 2014, p.29)

Kurtz is at the heart of imperialism and the imaginary individualism caused by it. He is both the embodiment and the victim of imperialism. Conrad tries to show how imperialism and its agents are corrupt and greedy and how the covetous and corrupt government removes its agent when its profit is not ensured. Kurtz is highly voracious, materialist, idealist and morally corrupt; that is, he is all that Conrad detests. Beach believes:

Kurtz is a personal embodiment, a dramatization of all that Conrad felt of futility, degradation, and horror in what the Europeans in the Congo called 'progress,' which meant the exploitation of

the natives by every variety of cruelty and treachery known to greedy man. (qtd. in Alcorn, 1994, p.160)

The second repressive ideology is education. Marxist critics assume education as a superstructure offered by the capitalists to stay in power by reinforcing the subjectivity of the individuals through making the false consciousness that the educated are better therefore must be obeyed. Here the whites are better than the blacks because they are educated and the blacks are ignorant. The black subjects then need a guide for being directed and this ideology convinces the blacks to attest to the whites' superiority. Tyson (2006) says:

To colonize the consciousness of subordinate people means to convince them to see their situation the way the imperialist nation wants them to see, to convince them, for example, that they are mentally, spiritually, and culturally inferior to their conquerors and that their lot will be improved under the 'guidance' and 'protection' of their new leaders (p.63).

In this novel, the chief accountant is depicted as a very polished, high class, and educated person who is revered by the natives because his prestige needs a compulsory reverence. Marlow, when he first meets him, says: "I respected the fellow. Yes; I respected his collars, his vast cuffs, his brushed hair. His appearance was certainly that of a hairdresser's dummy; but in the great demoralization of the land he kept up his appearance" (Conrad, 1999, p.45). He is the only person who is identified as an educated person and because of being culturally and mentally superior to the primitive blacks; he is deemed very different from them. The blacks are pictured as animals; they are almost naked, they yell and are frightening to see but this polished and educated agent is very sensitive about his books. "He was devoted to his books, which were in apple-pie order" (Conrad, 1999, p.46). Not only reverence but also worship is granted to Kurtz who is spiritually superior to the natives. He is a religiously knowledgeable person who not only avoids educating these people but also aims to exterminate all of them. Kurtz is a god for them but a contradictory one who is about to suppress them along with their savage custom.

This ideology which is portrayed through the imperialist agents, the chief accountant and Kurtz, is the illusionary light in the middle of darkness; the darkness which is supposed to get luminescent by the existence of these educated whites but gets darker in order not to disclose their true purpose of presence. One egregiously oppressed individual by the British education and behavior is the helmsman, the dressed navigator who is the only black person that speaks English. He thinks that by learning the colonizers' language and behavior he can be different from other natives. In postcolonial terminology it is called "Mimicry (the attempt of the colonized to be accepted by imitating the dress, behavior, speech, and lifestyle of the colonizers)" (Tyson, 2006, p.427). What the Helmsman does is but a tacit acceptance of his inferiority to the superior whites. He is an oppressed black who is neither identified by his own culture nor can be equal to the colonizers. He is caught between two agnostic cultures with any of which he can identify himself.

The next repressive ideology is religion. Marxists believe that religion is a very powerful program of the upper-class society to hold the lower-class in their inferior place and subdue them.

That is why the Marxists are devoid of religion which is defined by those seemingly superior capitalists. They declare that, religion, that is a supreme ideology of the upper class in a split society, completely disappears in a classless one, a Utopian-like place where there is no upper, middle, and lower classes, or in other words where people are all equal. In Congo, the Christian Europeans are the superior and the pagan Africans are the inferior because the whites know the way to get to Heaven but the blacks are doomed to go to Hell. Though the real religion promulgates that all the people are equal, the manipulated one sternly claims the fallible people are doomed to suffer and must be guided and restrained for the sake of their own soul. It claims that those with the genuine religion are the superiors and the heretic superstitious people have to obey these men who are close to God. This ideology is another strong excuse to ravage a primitive culture and territory. It is ironical that there is neither a sense of God nor at least a *Bible* existent in this place, and though their religious leader—Kurtz, is morally degenerate, he is worshiped by the docile and subjugated natives who think of him as a spiritual being. Kurtz is a false god from the upper-class who uses religion to exterminate all the savage customs when unnecessary, though for the time being he reinforces these savage and superstitious deeds in order to be worshiped by the natives and to stay in power. Indeed, were not Kurtz believed as a spiritual character, he would not gain neither the wealth nor the strong position and support of the natives. The customs are wrong and Kurtz is a false person who takes the advantage of this ignorance.

Another ideology which the Marxists strongly detest and disapprove is classism or hierarchy which results in corruption, abuse, and cruel inequity. It is a discriminatory concept which divides the individuals into many distinct and different groups. The group which is deemed to be better gains the power and the inferior groups accept it as superior and acquiesce to its domination. In *Heart of Darkness*, this class difference makes the inferior place of the blacks permanent and reinforces their subjectivity not to revolt against these ostensibly heavenly but innately corrupt white men. Here, the whites have monopolized the power because they are affluent, educated, religious, and hero like but the natives are weak, ignorant, heretic and animal like. The whites have names and titles such as chief accountant, Marlow, manager, Kurtz, and the like but Conrad has withdrawn not only names but also speech from the black people and their primitive place of living which is several times compared to darkness. Marlow calls it one of the darkest places of the earth and deliberately detaches himself from the people and their living place. When prepared to travel with the black crews, Marlow says:

The idleness of a passenger, my isolation among these men with whom I had no point to contact, the oily and languid sea, the uniform somberness of the coast, seemed to keep me away from the truth of things, within the toil of a mournful and senseless delusion. (Conrad, 1999, p.41)

What the prejudiced Marlow wants to signify is the nausea he feels because of the inappropriateness of being in a place where he cannot share anything with those inferiors who cannot perceive him a bit. What Marlow says shows that though he disapproves imperialism he cannot deny that he, as an agent of imperialism, is superior to them.

The last ideology is Stalinism which is both a style of government and a political ideology. After death of Lenin, Joseph Stalin rose to gain the power. Stalin was highly criticized by Trotsky as rude in manner and ambitious in desires. He was an absolute dictator who distorted Marxism along with its supposed Utopia. He executed those who were against him; and though he called himself "pupil of Lenin" he put on trial and executed every single member of Lenin's leadership team and strangled the freedom which Lenin and Marx fought for. Stalinism is an extremely suppressive ideology which concentrates and centralizes the power in an aggressive person or policy and is characterized by the extreme suppression of dissenting political and ideological views. In *Heart of Darkness*, Kurtz centralizes and monopolizes the power. He considers the place he is living in as his own and with the help of the native force, he represses all the dissident and agnostic groups. To protect his policy, this ambitious leader orders the attack to the ship which belongs to his own company. When Marlow gets to the central station, he observes the heads of dissenting rebels on the stakes under Kurtz's window and later on he realizes that Kurtz is there to exterminate all the brutes and suppress savage customs. Kurtz is a covetous and absolute leader like Stalin who for being in power does all sorts of evil things.

In order to be transferred, these ideologies need to be interpellated or put into the heads of the individuals. Interpellation is the creation of a servile subject (that is continually ideological) through hailing. These subjects willingly accept the values and rules which are not definitely theirs but are imposed on them (though they do not recognize it). In *Heart of Darkness*, the colonizers have completely interpellated the natives. The members of Eldorado Exploring Expedition, the crews of Marlow's ship, and Kurtz's protecting army are all natives who serve the capitalist whites. These people search for, protect, and work for those white men who constitute and control their society. Indeed serving them is an obligation which they have accepted freely. Marlow tries to hail the readers by calling the black crews of his ship "pilgrims". The hailed readers accept Marlow as a sympathetic character who avoids discrimination and is so generous to call them pilgrims, a name that signifies the blacks as shipmates rather than servants or instruments; the conscious readers, however, doubt him because Marlow's words by which he modifies the native are inherently mixed with racism.

When for the first time Marlow faces the Eldorado Exploring Expedition gang, he says: "this devoted band called itself the Eldorado Exploring Expedition, and I believe they were sworn to secrecy" (Conrad, 1999, p.58). The devotion which Marlow talks of is granted to the uncle of the manager who is an agent of capitalism. Marlow also sees even more devotion in those who work for, protect and worship Kurtz. Kurtz is a god and his subjects worship him not solely out of belief but also out of obligation.

When the ideologies are interpellated and prevailed over the subjects, they alienate and commodify them. There are two different kinds of alienation in this novel. The first is alienation from self and labor, or in other words, dissociation from the product and labor. Here the workers are paid to gain ivories which are going to be transferred and sold in another country. They are alienated from their labor which is changed into a product that is specified to the whites. Marlow says: "I don't like work—no man does—but I like what is in the work,— the chance to find yourself. Your own reality—for yourself, not for others—what no other man can ever know"

(Conrad, 1999, p.56). It is very ironical to own the products, the producing place, and be the medium of production but have nothing of your own production. Their country is despoiled and is supposed to become the prospective market place of not their own but their European masters who ravage the sources and sell European commodities by which they can still exert their influence. This alienation is not only unjust at the time being but also in the future because it makes the existence of the colonizers stable even after leaving this country.

The other form of alienation which is detected in this novel is alienation from others. In a capital society which labor is treated as a commodity, people assume one another only as tools necessary to obviate their needs. Love, sympathy and humanity are missing in such societies. In Congo, the only black female character is a tool for Kurtz's sexual satisfaction. Besides, being portrayed as domestic animals and nonexistent others, the natives are depicted as commodity; they are explorers, porters, protectors, workers and crew without at least a bit share of power. Marlow speaks about the black helmsman: "for month I had him at my back-a help-an instrument. It was a kind of partnership"(Conrad, 1999, p.78). The partnership that Marlow talks of is but a master-servant relationship; Marlow is actually his master not his partner. This alienation has also affected Marlow and Kurtz. Kurtz is alienated from his fiancée and has completely forgotten his love. Marlow is completely changed after returning from the journey and it sounds the capitalist ideologies have not left any one unaffected in that dark place. This time Marlow shows his detest of his attitude towards his fellow citizens. When he returns from the journey, he finds himself among the people whom he hates:

I found myself back in the sepulchral city resenting the sight of people hurrying through the streets to filch a little money from each other, to devour their infamous cookery, to gulp their unwholesome beer, to dream their insignificant and silly dreams. (Conrad, 1999, p.99)

What Marlow observes in the city is the evil of colonizers manifested in their own people. The alienated Marlow sees them defective and blamable but is unaware of his own faults which are reflected in the people who act as a mirror. Very much like the German philosopher, Arthur Schopenhauer who believes that a man sees everything in a mirror but his own face, Marlow who is afflicted by the darkness he is living in, finds the faults with these people but is unaware of his own shortcomings. Schopenhauer declares:

A man can see other people's shortcomings and vices but is blind to his own. This arrangement has one advantage: it turns other people into a kind of mirror, in which a man can see clearly everything that is vicious, faulty, ill-bred and loathsome in his own nature. . . . He who criticizes others, works at the reformation of himself. (qtd. in Nazari, 2000, p.26)

If all these ideologies be placed in their historical setting at the end of the 19th century and if the novel be scrutinized from a new historical way of evaluating history that contends, history is subjective, the writing of history is a matter of interpretation, no objective truth exists, and there is only access to the basic facts. The text of the novel is therefore only an interpretation of history where different discourses interacting with each other. About Conrad, Edward Genet argues: "his metaphor is revealing, implying as it does that history, a text inscribed by writers, is a fallible,

human endeavor subject to various distortions, not the monolithic, monologic narrative it was often assumed to be"(qtd. in White, 1993, p.173). Brook Thomas scrutinizes *Heart of Darkness* against the traditional view of history and points out:

Conrad's novel debunks the traditional historicist belief that history is progressive, that human species improves over time; and its narrative structure, which obscures plot behind a hazy veil of subjective description, implies that we do not have access to a clear, unbiased view of the past.(qtd. in Tyson, 2006, p.293)

This uncertainty and subjective analysis is also remarked by the Marxist critic Fredric Jameson who describes Conrad's position as unstable and his works as uncertain: "his place is still unstable, undecidable, and his work unclassifiable, . . . floating uncertainly somewhere in between Proust and Louis Stevenson"(qtd. in Nazari, 2000, p.15).

The only objective truths and basic facts in *Heart of Darkness* are therefore as such: there is a clash between two nations; the powerful whites win it against the weak blacks; their ideologies prevail over and omit the colonized nation's ideologies gradually; the whites gain the power and their ideologies are established; the blacks are expelled from the canon and become the others of their own society; they are deceived and reinforced by these ideological programs, and the European colonizers ravage their lands and its sources on this account. What Marlow seeks to disclose is a voice in this mute nation but these people are so manipulated by the ideologies that they become non-revolutionary, speechless, passive, and docile subjects. If they talk a bit, that is the colonizer's language; if they fight, they fight for the European masters; if they work it is for the foreigners; if they search for money and benefit, they grant it to the masters and if they worship a god, it is the foreigner Kurtz. It is then the colonizer's ideologies that make the history of the so called primitive Africans who are, in colonizer's point of view, less developed, uncivilized, barbarous, lawless, Godless, and highly superstitious and for these forged reasons the colonizers become dominant.

CONCLUSION

Joseph Conrad who sees the evil of imperialism and other ideological programs is ambivalent in portraying what he has once experienced during his travel to Congo. He calls the British presence unjust but his narrator Marlow is not very sympathetic towards the black subjects. Marlow indeed calls them savage and primitive people who are like obedient and mute animals; in other words, though Marlow is against the British ideological programs, he does nothing to stop them. Being completely sympathetic or a revolutionary character is impossible for the ambivalent Marlow because his ambivalent creator, Conrad, is not identifiable by any mode. He once defends colonialist ideologies through decanonizing and portraying the blacks as inferior and another time resists the colonialist ideologies through convicting these unjust programs. Made by the context, Conrad is inevitably handled by the Victorian and Edwardian ideologies, two eras with strict and contradictory ideological programs. What Conrad shows is but a subjective record of what he has witnessed in person about the history of the black nation and the intrusion, pretense, misdeeds and degeneration of the idealist and materialist white colonizers whom he denounces and detests.

Conrad's novel is a personal record of history which is unable to show the true history because literature is a superstructure which is controlled by those powerful hands which handle and affect it. Therefore, neither Conrad nor Marlow, neither his work nor its historical setting can be trusted because they are controlled by the ideologies, the programs which wield power to those in charge in order to reinforce the subjectivity of not only the black people but also the idealist individuals of their own like Kurtz whose idealistic thoughts are finally smashed into pieces and changed into "horror".

THE IMPACT OF TEACHING PRACTICE ON PRE-SERVICE TEACHERS' COGNITION IN LISTENING INSTRUCTION

Anissa Khaldi

AbouBekr Belkaid University, Tlemcen
languageteacher13@gmail.com

ABSTRACT

The present case study investigates pre-service teachers' cognition about listening comprehension. The participants were Algerian students studying English as a foreign language, at Tlemcen University. They completed a questionnaire which sought to discover whether their cognitions changed after a course of teaching practice. The main result showed that the majority of the participants changed their beliefs and appeared to adopt the methodology of their trainer. The researcher attributed the findings partly to the trainees' dissatisfaction with their teachers' instructional practices throughout their previous learning experience as EFL listeners, and their satisfaction with the period of training. Thus the article ends with a recommendation that practicum experiences should highlight pre-service teachers' beliefs, and challenge those which are inappropriate early in the training in order to maximize the adoption of new cognitions.

KEYWORDS: listening instruction, pre-service, cognition, teaching practice.

INTRODUCTION

Research into teacher cognition has been growing since the 1990s. This can be indicated in the proliferation of studies which examine what teachers think, know, believe in relation to their work. The literature in this field is concerned with either pre-service teachers or in-service teachers. Regarding the former, Borg's review (2009) of 180 studies reveals that only cognitions related to teachers of grammar and literacy instruction (reading and writing) attracted the most significant attention. Graham et al.(2014) notice paucity of research in listening comprehension saying that: "Our review of the literature on language teaching cognition did not uncover a single study examining teacher beliefs about listening."(p.45). Thus, the present study seeks to investigate pre-service teachers' cognition about listening comprehension in an EFL context. The purpose is to examine how flexible are trainees' cognitions.

LITERATURE REVIEW

Pre-service teachers' perceptions can be grouped into two types: (i) the ones constructed throughout their lives which derive from their memories of their lived experiences as EFL learners (also called apprenticeship of observation), and (ii) the ones constructed during their training. Research into the influence of teaching practice on apprenticeship of observation produced mixed findings. Some researchers reported apprenticeship of observation as being stable and, hence, the dominant source of pre-service teachers' beliefs. Peacock (2001) examined

cognitions of 146 pre-service teachers during a three-year programme and found no significant change. Urmston (2003) also noted resistance to changing beliefs in 30 trainee teachers who enrolled in a TESL course.

However, the idea that training has no or a little influence has been questioned by other researchers. Busch (2010) explored the influence of training on student teachers' beliefs about teaching and learning, and found significant changes. MacDonald et al.'s study (2001) found that the trainees' beliefs shifted from the behaviourists' views to some of the current ideas about language learning theories.

RESEARCH QUESTION

The present case study tries to answer the following research question: Will pre-service teachers' cognitions about listening instruction persist or change after training? It seeks to uncover the nature of such cognitions and the reasons underlying flexibility or persistence.

METHODOLOGY

The participants

The participants of this study are five students who received training in the module of teaching practice. They are third-year learners who study English as a foreign language at Tlemcen University, Algeria. After graduation, they are supposed to teach English in the middle school.

Research instrument

The trainer developed a questionnaire so as to find whether or not the participants' cognitions changed. The first item of the questionnaire investigates the subjects' learning experience (how long they studied English). The second item asks the trainees to describe how they were trained in listening instruction during teaching practice. The third item tries to find whether or not the subjects conducted research about listening comprehension. The following question seeks to find about the participants' experience in listening as EFL learners. Finally, the pre-service teachers were asked about their beliefs regarding the methodology they will adopt, as future teachers of listening.

Procedures

The pre-service teachers were first trained into listening comprehension. The training focused on the three stages of listening: pre-listening, while-listening, and post-listening. They were given opportunities to practise the stages, and they received feedback on such practice, from their instructor. At the end of their course, the researcher gave them the questionnaire. Data was analysed quantitatively using frequencies, as well qualitatively by trying to find the common patterns underlying the respondents' answers.

RESULTS AND DISCUSSION

The participants had been learning English from nine to ten years. When asking the trainees to describe how they were taught listening in teaching practice, only three of them mentioned the three stages. One subject stated only the pre-listening stage, and the fifth trainee did not mention any stage. Concerning the third item, none of the five student-teachers cited conducting research about this skill. When asked about their previous experience with their previous teachers of listening comprehension, four participants did not state the stages they were taught in teaching practice. They mentioned activities like, listening and taking notes or/and answering questions, practicing dialogues. Only one participant said that his teacher went through pre-listening, while listening, post listening stages.

The last item sought to find whether the trainees will adopt the three-stage listening lesson that they were taught during teaching practice sessions, or they will keep the way they were taught this skills as EFL learners. The result showed that four participants believed that a listening lesson should comprise three stages. The other participant, who did not adopt the trainers' methodology, expressed dissatisfaction with the period of training, saying that he needed more time. He also criticized the trainer for not using more visuals.

Interpretations

The findings of this study represent evidence that beliefs can be changed under some conditions: (a) providing an intervention which is long enough for the participants, (b) making pre-service teachers aware of the weaknesses of their previous beliefs (c) taking into consideration the learning styles of pre-service teachers. The participants, whose beliefs changed, were not satisfied with the previous methodology of teaching listening, as EFL learners. Encountering new knowledge in teaching practice was a stimulus for them to adopt a new way which is different than the previous, dissatisfying one. At the same time, they did not complain about length of the training course. In contrast, the participant who did not adopt the trainer's methodology also described the sessions of teaching practice as '*very helpful*', yet the period of practicum, which he perceived as being short, apparently weakened the impact of his trainer. What is more, he appeared to be a visual learner who could not process his trainer's lessons effectively.

Pedagogical Implications

The trainees should recognize that their previous beliefs may be inappropriate. Once they are dissatisfied, they need new knowledge to adopt. Furthermore, practicum should provide educational experiences using a variety of learning styles; it should take place in period which is long enough for the trainees.

In order to weaken the negative impact that apprenticeship of observation may have, trainees can be guided through reflective practice. This latter is "the process of critical examination of experiences, a process that can lead to a better understanding of one's practices and routines" (Richards and Farrell, 2005, p. 7). Reflecting on beliefs entails asking questions about how and why things are the way they are, what values they represent, what limitations underlie such values, and what alternatives may be available (Farrell, 2015). In teaching practice, microteaching experience can be used to provide an opportunity to master specific teaching

skills, as well as experiences that can encourage and develop a deeper understanding of teaching through processes of critical reflection (Richards & Farrell, 2011). At the end of each microteaching activity, reflection can be triggered through questions that should be answered in the form of journal writing, lesson reports, group discussions, and students' viewing videotapes of their teaching. In a lesson report, for example, the student teachers record the main features of the micro-lesson in the form of questions to be answered and, then, discussed. The questions include: what were the main goals? What did the learners learn? What were the teaching procedures that I used? What were problems that I encountered and how did I deal with them? What were the most effective parts and why? What were the least effective parts and why? How was I taught as a student? Would I do anything differently if I taught the lesson again and why? What did I learn about the teaching of this skill/ technique? (Lee, 2004).

CONCLUSION

Pre-service teachers enter teacher education programs with beliefs about learning and teaching that are developed from apprenticeship of observation. A priority to trainers is, hence, to bring these cognitions to light and to try to challenge them in order to maximise the adoption of new ones. This can be done through a gradual process of critical thinking and reflection, taking into account trainees' learning styles.

Limitations of the study

In this research, the researcher used only the questionnaire. Additionally, the bulk of the study is concerned mainly with the impact of practicum on trainees' beliefs without examining whether the trainees turned their beliefs into practice. Thus, future research may examine to what extent the newly adopted beliefs in teaching practice are consistent with the instructional practices of teachers. For this purpose, interviews can be used in order to have rich qualitative data.

ACKNOWLEDGMENTS

The author is grateful to the pre-service teachers who accepted to participate in this case study.

ABSTRACT

This study attempts to compare the speech act of complaints in English in different situations varying in two contextual variables namely social status or power (P) and social distance (D) among male and female Iranian English as foreign language (EFL) learners. Moreover, the performance of students was investigated to see how they perform complaints in the target language. A Discourse Completion Test (DCT), composed of three situations (teacher, roommate and waiter), in each of these situations there are five patterns followed by two multiple choice questions was administered to 20 Iranian males and 20 Iranian females students majoring in the English Language Translation at Abadan University, who were selected based on their score on Oxford placement test OPT (2013). The DCT was administered to the learners and data were collected. Then the data were coded and analyzed based on the taxonomy of complaints developed by Rinnert and Nogami (2006). The taxonomy analyzed the complaint responses elicited from the participants in terms of main components, level of directness, and the amount of mitigation. Independent Samples t-tests were conducted to compare the performance of male and female speakers. With regard to the use of complaint main components, the level of directness and the amount of mitigation, the differences between the complaint strategies employed by male and female learners in waiter situation were statistically significant. However, no significant differences between the two groups were found in teacher and roommate situations. The performance of Iranian male EFL learners showed that they significantly diverged from their female counterparts. The implications of the study could contribute to EFL learners learn not only L2 grammar, but also socio-cultural rules governing the L2 in order to communicate competently in the L2 community.

KEYWORDS: Speech act; complaints; discourse; social distance; social status

INTRODUCTION

Speech acts are “the basic or minimal units of linguistic communication” (Searle, 1969, p.16). The concept of speech act has been suggested by Austin (1962). It is defined as “the level(which) mediates immediately between the usual level of grammar and the rest of a speech event or

situation in that it implicates both linguistic form and social norms” (Hymes, 1979, cited in Farnia, Buchheit & Vedaiei, 2012). Searle (1969) claimed that speaking a language is performing speech acts. In other words, when we say something, we are simultaneously performing communicative acts. A speech act has three types of meaning including locutionary, illocutionary, and perlocutionary meanings. Locutionary meaning is the meaning conveyed by the words that the utterance contains. Illocutionary meaning or force is the effect the speaker wants the utterance to have and perlocutionary meaning is the effect produced by the utterance on the listener’s mind. Based on Searle’s (1976) classification of speech acts, speech acts are fallen into five categories: declarative, representative, directive, commissive, and expressive.

Searle (1976) placed the speech act of complaints into the expressive category, because this category is concerned with the speaker’s psychological state or his expressions of attitudes towards someone’s social behavior. According to Olshtain and Weinbach (1993), *Complaining* occurs when the speaker expresses his/her displeasure to the action that s/he perceives as unfavorable to him/her. Since this speech act potentially is a face-threatening act, second language learners who are not familiar with the conventions of complaining may come up with utterances which are regarded as “impolite” in the target community, and this can result in communication breakdown or threatening the hearer’s face.

There is a positive relationship between indirectness of complaints and politeness; it means the more indirect the complaint the more polite it will be. Several linguistic theories of politeness were proposed. The most well-known theory of politeness was proposed by Brown and Levinson (1987). They believe that every human being has a public self-image called face. They further state that there are two types of face: positive face and negative face. Although politeness is a universal trait, its perception varies across cultures. Brown and Levinson (1987) enumerate power, social distance, and the rank of imposition as the contextual factors affecting the choice of politeness strategies in different situations. When the size of imposition is low, it is the two variables of power and social distance, which affect the choice of politeness strategy in performing a face-threatening act. This study focuses on comparing and contrasting the politeness strategies used in the speech act of complaint in relation to the two social variables, that is power and social distance.

The speech act of complaint involves a face-threatening act (Sauer, 2000). Second language learners should be familiarized with the conventions governing the expression of complaints in the target language in order to employ this speech act appropriately in their speeches so as not to cause communication breakdown or misunderstanding on the part of the hearer or complaine.

This study intends to investigate how the speech act of complaint is realized in English, and to study the complaint strategies in the interlanguage of Iranian EFL learners to see whether there are any significant differences between the complaint strategies produced by Iranian male and female speakers. The findings of this study will be helpful for Iranian EFL learners to develop sensitivity and awareness for English, so as to produce polite and meaningful complaints in English. The study will also have several pedagogical implications for teachers of English to pay

more attention to sociolinguistic aspects of English to help learners to communicate effectively and successfully in the target language.

Significance and Objectives of the Study

Despite the importance of the speech act of complaint, this part of language has not received as much attention as other speech acts like apology, thanking and request in Iran. A number of studies such as Salmani-Nodoushan (2008) were conducted on Persian complaints. This study intends to investigate how the speech act of complaint is realized in English and Persian and to study the complaint strategies in the interlanguage of Iranian EFL learners to see whether there are any significant differences between the complaint strategies produced by male and female Persian speakers. The findings of this study will be helpful for Iranian EFL learners to develop their sensitivity and awareness of English, so as to produce polite and meaningful complaints in English. The study will also have several pedagogical implications for teachers of English to pay more attention to sociolinguistic aspects of English to help learners communicate effectively and successfully in the target language. Consequently, this study intends to illuminate the L1 effect on the production of complaints made by Persian EFL learners.

REVIEW OF LITERATURE

In the process of second language learning, second language learners constantly change some rules to form new ones. Their end product may not match the target language due to the fact that they do not see flaws in it or even see them as grammatical. This idea led to the emergence of the term “interlanguage” which was introduced by Selinker (1972), as he refers to a linguistic system resulting from learners’ attempts to have a functional command of the second language. Interlanguage, as Ellis (1985, p. 45) puts it is “language-learner language”. As its name suggests, it is a separate language knowledge system differing from learner’s L1 and L2 system (Ellis, 1985). Learners’ interlanguage system develops over time as they employ different strategies to achieve the L2 norms. Consequently, interlanguage pragmatics (ILP) as one of the many specializations in interlanguage studies as stated in Kasper and Blum-Kulka (1993, p.3) is “the study of non-native speakers’ use and acquisition of linguistic action pattern in a second language”. Selinker (1972), enumerated five cognitive processes involved in creating learners’ interlanguage:

1. Language transfer: language learners transfer some rules from their L1. This process usually occurs at the early stages of learning.
2. Transfer of training: Sometimes, the ways learners are taught the target language are responsible for some elements of the interlanguage.
3. Strategies of second language learning: some features of the interlanguage may be the result of the specific approach in which the learner is trying to learn the target language.
4. Strategies of second language communication: language learners may produce elements in their interlanguage which result from the way they learn to communicate with native speakers of the target language.
5. Overgeneralization: some elements of the interlanguage result from overgeneralization of the syntactic rules and semantic features of the target language.

Interlanguage studies deal with describing the components of interlanguage system in learner performance and accounting for the processes involved in language learning and use. According to the two studies on interlanguage pragmatics (Bouton, 1994), language speakers will tend to move toward the less severe strategies than do native speakers. In the heyday of Chomskyan linguistics, interlanguage studies focused on grammatical aspects of learner interlanguage, but with the advent of Hymes' (1979) communicative competence their focus shifted. Hymes' (1979) heavy focus on sociocultural knowledge rather than grammatical knowledge inspired L2 researchers to turn their attention to the pragmatics and discourse aspects of language as well as communicative, functional aspects of it beyond grammatical aspects of learner language (Blum-Kulka, House & Kasper, 1989).

Speech Act Theory

The origins of speech acts theory can be extended to philosophy of language but now it is considered as a sub-discipline for cross cultural programmatic. This theory basically explains how human beings achieve and accomplish desired intentions and motives through the use of language by using words in a way that they actually highlight the meaning of the sentence in a manner that the hearer understands what they actually mean besides the literal meaning. Austin (1962) relates the performance of saying words with an act of locutionary and the study of how specific words are uttered and what impact does utterance have on the message that is being delivered .

Speech acts are one of the key areas of pragmatics. The speech act theory came into existence as the result of Austin's (1962) theories of illocutionary acts, and later on, it was developed by Searle (1976). Austin (1962) states that communication is a matter of 'doing'. In other words, when we say something, simultaneously we are performing some communicative acts or speech acts. The term "speech act" was introduced by Austin (1962). He argued that every speech act has three kinds of meaning as follows:

1. Locutionary (propositional) meaning: this is the literal meaning conveyed by particular words and structures which the utterance contains. For example, if someone says "I'm thirsty", the propositional meaning is what the utterance says about the speaker's physical state.
2. Illocutionary meaning: this is the social function of the utterance, or the effect the speaker wants the utterance to have on the listener. The sentence "I'm thirsty" uttered by someone who is thirsty is not only a mere description of his physical state, but also an indirect request to the addressee or someone nearby to bring him something to drink.
3. Perlocutionary meaning: it deals with the effect produced by the utterance. For example, bringing the speaker something to drink is the perlocutionary effect of the utterance "I'm thirsty".

Later on in 1976, Searle, a student of Austin, worked more on speech acts and extended them into five categories:

1. Declarative: a speech act which changes the state of affairs in the world. For example, "I pronounce you man and wife".
2. Representative: the speaker describes states or events in the world. For example, "this car is brown".

3. Directive: the speaker gets the listener to do something, such as a suggestion, or a command. For example, the utterance "Please sit down".
4. Commissive: the speaker commits the listener to do something in the future, such as a promise. For example: "I'll be back soon".
5. Expressive: the speaker expresses his feelings and attitudes about something, such as an apology, or a complaint. Since the focus of the study is the speech act of complaint, next chapter is devoted to discussing it in detail.

According to Searle (1976, cited in Ellis, 2008, p. 160), speech acts fall into five general classes; a) *Representatives*: These speech acts include assertions relating to true or false values (e.g. asserting, concluding); b) *Directives*: In these speech acts, the speaker tries to have the hearer do something (e.g. requesting, ordering); c) *Commissives*: Speech acts which result in an obligation to the speaker; that is, they commit the speaker to do something (e.g. promising, threatening); d) *Expressives*: These speech acts express feelings and attitudes of the speaker (e.g. thanking, congratulating); e) *Declarations*: Speech acts in which declarative statements are performed (e.g. excommunicating, declaring war, marrying, and firing).

The Speech Act of Complaints

The speech act of complaint belongs to expressive category of Searle's (1976) classification of speech act. Olshtain and Weinbach (1993, p.108) stated that "in the speech act of complaining, the speaker expresses displeasure or annoyance as a reaction to a past or going action, the consequences of which are perceived by speaker as affecting her unfavorably". For a complaint speech act to occur, several conditions should be met. According to Brown and Levinson (1987), the speech act of complaining implies that 'S (the speaker) has a negative evaluation of some aspect of H's (the hearer's) positive face' (p.66). From S's point of view, the following preconditions are needed in order for the speech act of complaining to take place:

1. H performs a socially unacceptable act (SUA) which is contrary to a social code of behavioral norms shared by S and H.
2. S perceives the SUA as having unfavorable consequences for him/herself, and /or for the general public.
3. The verbal expression of S relates post facto directly or indirectly to the SUA, thus having the illocutionary force of censure (Olshtain & Blum Kulka, 1984)

A complaint speech act serves many functions; some of them are as follows:

- a) To express displeasure, disapproval, annoyance, censure, threats, or reprimand as a reaction to a perceived offense/ violation of social rules, to hold the hearer accountable for the offensive action and possibly suggest/request a repair (Olshtain & Weinbach, 1993)
- b) To confront a problem with an intention to improve the situation (Brown & Levinson, 1987),
- c) To share a specific negative evaluation, obtain agreement, and establish a common bond between the speaker and addressee. For example: A. "I really think his grading is unfair. I worked so hard for this exam." B. "Same here. He wouldn't be satisfied even if we copied the whole book" (Boxer, 1993).

d) To allow ourselves to vent/let off steam. For example: “oh rotten luck!” and “what a shame!” are utterances expressed by a speaker in order to calm him/herself down (Boxer, 1993).

Studies on Complaint

Although the speech act of complaint has not been widely studied as it is the case with other speech acts like thanking, promise, apology, and request, there are a number of studies conducted in this area, which would help to provide a framework for this investigation. The research is designed to investigate the speech act differences between men and women, especially when they were confronted with complaint situations that force them to convey complaints. Based on evidences that have been explained in the previous section, it is concluded that EFL learners realized the speech act of complaining in eight complaint strategies: hints, annoyances, ill consequences, indirect accusation, direct accusation, modified blame, explicit blame (behavior), and explicit blame (person). The most frequently used strategy was accusation. There is a different way between men and women in employing the complaining act. Men use direct accusations as their major strategy while women use indirect ones. However, in the overall blaming distribution, women tend to use soft blaming as their preferred blaming strategies (Abdolrezapour & Eslami-Rasekh, 2012).

RESEARCH QUESTIONS

The study provides answers to the following research questions:

1. Is there any difference between the complaint strategies used by male and female speakers in English in different situations?
2. If so, how do Iranian EFL learners express their complaint in English?

METHODOLOGY

Participants

In order to conduct the study, the researcher selected two groups of participants. The participants of the first group were 10 Iranian male native speakers of Persian and the participants of the second group were 10 Iranian female native speakers of Persian, majoring in English Language Translation at Abadan University. They were selected among 60 learners based on the Oxford Placement Test (OPT). The age of the participants in the two groups ranged from 18 to 26. They were B.A students and were non-randomly selected among the second year students to have a homogeneous group of the participants.

Instrumentation

Oxford Placement Test (OPT)

To be assured that the EFL learners' language proficiency level, the researcher used Oxford placement test (OPT, 2013). The test was composed of 90 multiple-choice items covering grammar, and reading comprehension. The grammar section contained 40 items including fill-in the blanks, multiple-choice items and selecting the ungrammatical items. The reading comprehension section contained 50 items. In the reading comprehension section, each passage was followed by several multiple-choice items. The test was piloted on 10 B.A learners before

administration and its reliability was calculated through Cronbach Alpha as ($\alpha=0.731$). 60 minutes was allocated to the completion of the test. The students' performance was assessed based on their scores on the test. Their scores for each item ranged from zero to one (wrong=0, right=1), and for the total test ranged from 0 to 90. Then 20 students whose scores were one standard deviation above and one standard deviation below the mean were selected as the participants of the study. Thus the participants were determined as the intermediate level.

DCT Questionnaire

The DCT used in this study, was a modified version of Rinnert and Nogami's (2006). In order to ensure the content validity of the DCT, firstly it was checked by the researcher's supervisor, and then the researcher piloted it on a number of the B.A students other than the participant and those items which did not elicit the desired responses were either changed or modified. It was composed of three situations representing five complaint scenarios for each of which we provided five possible complaint statements varying on the contextual factors of the speaker's social power and his/her social distance with hearer. These five complaints scenarios followed by two multiple choice questions and participants are asked to answer them. The relationships between the speaker and hearer in terms of social distance and social power in three situations are given below in Table 1, followed by a summary of each scenario:

Table 1: Description of DCT Items

Scenarios	P	D	Social status
1. student vs. Professor	-	-	S<H
2. student vs. roommate	=	-	S=H
3. student vs. waiter	+	+	S>H

Note: D=social distance, P= Social power, S=speaker, and H=hearer.
Summary of each situation:

S1: A student goes to his/her professor who has a close relationship with him/her to complain about his/her low grade.

S2: A student complains to his/her roommate about the noise after 11:30 p.m.

S3: A student complains to a waiter, whom s/he meets for the first time in a restaurant about spilling the drink over his/her new shirt.

Procedure

Oxford placement test OPT (2013) was administered to 60 B.A learners majoring in English Language Translation at Abadan University and they were given an hour to complete the test. The Persian EFL learners took the English version of the DCT questionnaire.

Taxonomy of complaints developed by Rinnert and Nogami (2006) was adopted to analyze the data. This taxonomy consists of three main components of complaints, namely the main

component, the level of directness and the number of softeners used in the interaction. These components are presented, as follows, in detail:

1. Main component

A complaint consists of three main components including initiators, complaints, and requests, which are presented as follows:

Initiator (e.g. greetings, address terms, and other opening formulas). Initiators include greetings (e.g., “hi”, and “good morning”) address terms (e.g., “hey guy”, and “sir”), and other opening formulae.

Complaints (expressions of negative evaluation, including justification) Complaints refer to utterances expressing negative evaluation, including justification (e.g., “I studied hard in your class so how come I was given such a low grade”).

Request (direct or indirect attempts to get the hearer to redress the situation). Requests refer to direct or indirect attempts to get the hearer to redress the situation (e.g., “can you explain me why I got this grade?”).

2. Level of directness

Indirect (no explicit mention of offense, implied offense only)

Somewhat direct (mention of offense, but no mention of the hearer’s responsibility)

Very direct (explicit mention of offense and hearer’s responsibility for it)

3. Amount of mitigation (*counting the softening expressions*, e.g. “a little, sort of, you know, would/ could, I think/ I wonder”). The amount of mitigation refers to the number of softeners used in interaction. According to Blum- Kulka's (1982) softeners include hesitation markers (e.g., *um, well*), hedges (e.g., *a little bit*), apologies (e.g., *if you don’t mind*), and use of past tense (e.g., *wanted*) or past tense modals (e.g., *could*).

After the coding was completed, descriptive and analytical procedures were conducted. Frequency of responses containing a given complaint pattern in each DCT situation was calculated by finding out how many times each complaint pattern was used by each group in each situation. The number of softeners used by each group was counted separately in each DCT situation. In order to find out the similarities and differences in the realization patterns of complaints between Iranian male and female Persian EFL learners (PEFL), the data were entered into the SPSS software, version 17. Then Independent Sample t-tests were conducted for comparing the complaint responses in terms of main components, level of directness, and amount of mitigation across all situations.

Data Analysis

In order to determine whether is a difference between complaint strategies used by Iranian male and female EFL learner, the collected data will be analyzed by the taxonomy of complaints developed by Rinnert and Nogami (2006). Then, in order to address the research questions, the data will be entered into the SPSS software version 17 for descriptive and statistical analysis. The following chapter reports the language data gathered from the two groups of participants across the three DCT scenarios.

RESULTS AND DISCUSSION

In this scenario, the speakers and hearers who are roommates are socially equal and there is no social distance between them (=P, -D). In this situation, the male speakers tended to use these patterns more than females (male $M=2.2470$ and female $M=1.9480$). The findings of the statistical tests demonstrated that in dealing with roommate situation, male speakers employed pattern F significantly more frequently than female speakers. Finally, it is concluded that both two groups thought this pattern is socially appropriate. Table 2 shows the results.

Table 2: Descriptive Statistics of the Functions Used by Male and Female Students

A) Reza/Mina, I was hoping you'd try to be a little quieter when you come in at night.	Mean	
	Males	Females
How socially acceptable/appropriate do you think it is in the context?	4.11	3.11
How effective/successful do you think it would be?	3.68	2.81
B) Reza/Mina, I've been wondering if you might have forgotten our agreement recently? If possible, could you try to keep our agreement in mind?		
How socially acceptable/appropriate do you think it is in the context?	2.14	1.72
How effective/successful do you think it would be?	3.58	2.58
C) Reza/Mina, be quiet when you come in at night.		
How socially acceptable/appropriate do you think it is in the context?	2.09	1.68
How effective/successful do you think it would be?	1.44	.81
D) Oh, wow, Reza/Mina! Look at the time. I guess it must be quiet time.		
How socially acceptable/appropriate do you think it is in the context?	.66	1.10
How effective/successful do you think it would be?	.87	1.54
E) Reza/Mina, you've been making too much noise at night recently. Please be quiet when you come in.		
How socially acceptable/appropriate do you think it is in the context?	2.09	1.69
How effective/successful do you think it would be?	1.82	2.11

In pattern B for the first question there is not a significant difference between male ($M=2.14$) and females ($M=1.72$) and less than half of participants in the two groups believed it is socially acceptable because their means are close to the value given to "somewhat rude". In pattern C, less than half of participants of two groups believed it is socially acceptable. Like pattern B, in pattern H, females believe this strategy is rudier. Both groups strongly reject pattern D "*Oh, wow, Reza/Mina! Look at the time. I guess it must be quiet time.*" for the first question "*How socially acceptable/appropriate do you think it is in the context?*". In this pattern both two groups had the lowest mean among all patterns of the second situation; both male participants ($M=0.66$) and female participants [$M=1.10$] are close to the value given to "very rude". Most of male students and female students believe that this pattern is a face-threatening complaint and is not a polite way of complaint to a teacher.

In pattern E, the statistical findings showed that the male respondents ($M=2.09$) performed complaints somewhat similar to the way their female counterparts ($M=1.69$) did, as no statistically significant differences were found between the two groups regarding the use of this complaint pattern. They are close to the value given to "somewhat rude". It can be noticed that the means of male and female groups for the second question "*How effective/successful do you*

think it would be?” in this table are also different. In pattern A, males found this strategy more effective than their female counterparts. The mean of males and females for the second question are respectively (3.68 and 2.81). It indicates that over half of the respondents believe this strategy is effective in dealing with the roommate situation. The majority of male students accept this pattern while over the half of females think it is effective. In pattern B, participants had a performance similar to pattern A. Again males found this strategy more effective than their female counterparts. The mean of males and females are respectively (3.58 and 2.58). It indicates that male students tend to accept this pattern more than females. Both groups strongly rejected pattern C for the second question. In this pattern, females had the lowest mean among all five patterns of the roommate situation; both male participants ($M=1.44$) and female participants ($M=0.81$) are close to the value given to “very ineffective” so we can say male and female students believed that this pattern is not effective to complaint and rejected it. In pattern D, male participants strongly rejected it for the second question. In this pattern male participants ($M=0.87$) and female participants ($M=1.54$) are close to the value given to “very ineffective” and ‘somewhat ineffective’ respectively. In pattern E, the means of male and female groups for the second question are (1.82 and 2.11) respectively and they are close to the value given to ‘somewhat ineffective’. It means that most of the males and more than half of the females believed this pattern is ineffective. One-Sample Kolmogorov-Smirnov (KS) test was conducted to assess the data in terms of normality of scores. Results are presented in Table 2.

One-Sample Kolmogorov-Smirnov (KS) test was conducted to assess the data in terms of normality of scores. Table 3 indicates the normality of the data. The mean score of male participants is ($M=2.2470$) and the mean score of female participants is ($M=1.9480$) and the difference of these two means is (0.299). The mean score of two groups is 2.0975.

Table 3: One-Sample Kolmogorov-Smirnov Test

		VAR00001
N		20
Normal Parameters ^{a,b}	Mean	2.0975
	Std. Deviation	.98445
Most Extreme Differences	Absolute	.183
	Positive	.183
	Negative	-.084
Kolmogorov-Smirnov Z		.817
Asymp. Sig. (2-tailed)		.516

a. Test distribution is Normal.

b. Calculated from data.

Table 3: Descriptive Statistics

VAR00003	N	Mean	Std. Deviation	Std. Error Mean
Male	10	2.2470	1.18410	.37444
Female	10	1.9480	.77086	.24377

Descriptive Statistics Table was conducted to assess the data in terms of mean of scores and shows the descriptive statistics of the participants’ performance in student situation. Table 4

indicates the descriptive statistics of the male and female participants' performance on five patterns in the second situation. The mean score of the male group is 2.2470 and the mean score of the female group is 1.9480. To find out if there is any significant difference between the two groups in the second situation, an Independent Samples t-test was administered. Table 4 shows the results.

Table 4: Independent Samples Test

	Levene's Equality Variances	Test for of	t-test for Equality of Means					95% Interval Difference	Confidence of the Upper
	F	Sig.	t	df	Sig. (2- tailed)	Mean Differen ce	Std. Error Differen ce	Lower	Upper
Equal variances assumed	1.493	.238	.669	18	.512	.29900	.44680	-.63969	1.23769
Equal variances not assumed			.669	15.467	.513	.29900	.44680	-.65083	1.24883

The above table shows the observed t (.669) is less than the critical t (1.753). Since the observed t (.669) is less than the critical t (1.753) with: df= 18, the difference between the males and females in this situation is not significant. Despite differences in the frequencies of complaint patterns used by the male and female speakers, the results of t-tests for this situation showed that the differences were not statistically significant ($p < 0.05$).

Discussion

The speech act of complaint as a face-threatening act may be realized differently in different languages or cultures. This study as a contrastive one investigated the way this speech act was realized in English. It also investigated the performance of Iranian EFL learners to see how they perform complaints in English. In the following sections, research questions are addressed in light of the findings reported in the previous chapter. Discussion of the findings focuses on answering the research questions to accept or reject the null hypotheses. Two research questions and their answers are as follows:

RQ1. Is there any difference between the complaint strategies used in English in different situations?

RQ2. If so, how do Iranian EFL learners express their complaint in English?

There were some differences identified between male and female learners regarding the way speakers of the two groups performed their complaint in lower, equal, and higher settings. Therefore, the answer to the first research question is obviously positive.

Lower Setting

The teacher situation represents lower social settings and the speaker is interacting with someone whom s/he is intimate with (-D). Regarding complaint patterns, it was demonstrated that in this situation male speakers showed more tendency to start their complaining with the least face-threatening complaint strategies as it contains greetings, apologizing expressions, and address terms. However, the findings of the study are in line with the study conducted by Rinnert and Nogami (2006), which demonstrated that English native speakers in the teacher situation employed I+C+R (I; initiator, C; complaint, R; request) complaint pattern more frequently than other complaint patterns and in this study male speakers preferred to use more number of softeners to mitigate the threat to the hearer's negative face.

As an indicator of politeness towards their teacher, male and female speakers used pattern C: *Excuse me, Professor Amiri. Sorry to bother you, but I was hoping to discuss my final grade. I was rather surprised and disappointed with the grade. Could I perhaps find out how the grades were figured?* And pattern E: *Professor Amiri, I was hoping to acquire some information on my final grade. If possible, could I find out how the grades were figured?* Was more than other patterns of the first situation. The means of males and females in pattern C for the first question are (3.11 and 2.39) and for the second question are (4.06 and 4.25) respectively. Also the means of males and females in pattern E for the first question are (3.22 and 3.04) and for the second question are (3.75 and 2.37) respectively. In pattern C, there are several softeners such as *a; sorry to bother you, I was hoping..., I was rather surprised, Could, perhaps*. Also in this pattern the complaint is indirect; *I was rather surprised and disappointed with the grade*. In pattern E like pattern C we have several softeners "*I was hoping, if possible, could*" to mitigate the threat to the hearer's negative face and the complaint is indirect "*I was hoping to acquire some information on my final grade*". It means that both two groups believe these two patterns are both socially acceptable and effective.

On the contrast, patterns D and B had the lowest means among five patterns. The means of males and females in pattern D "*Professor Amiri, I don't understand why you gave me a C. Did you make a mistake?*" for the first question are (0.36 and 1.08) and for the second question are (1.06 and 2.00) respectively. The means of males and females in pattern B "*Professor Amiri, I want to discuss my final grade with you. Please explain why I got a C.*" for the first question are (1.23 and 1.58) and for the second question are (0.75 and 1.25) respectively. In pattern D, there is no softener and in pattern B we have just one softener "*please*" and both two patterns are very direct and face threatening. Wolfson (1989, p. 79) addressed terms such as "very salient indicator of status relationship". In lower settings, interlocutors used address terms more frequently. The result is in line with the findings of Behnam and Niroomand's (2011) study. They found that lower status interlocutors used more address terms than higher status interlocutors. In this study, address terms were more frequent in the first and second situations because just in these two situations the interlocutors were expected to complain to higher status individuals. In lower settings, where the hearer has dominance over the speaker, the speaker tended to express their complaint as indirectly as possible. In the teacher situation, both male and female speakers violated the maxim of manner as majority of them expressed their complaint indirectly. Maxim of manner wants every interlocutor speak directly, not ambiguously and

abundantly. As compared to the teacher situation, both male and female speakers tended to make complaints directly more frequently in the last situation. This difference can be justified on the ground that in dealing with unfamiliar individuals, they feel it more comfortable to challenge the hearer less indirectly. Due to the formality of the teacher situation, male and female speakers showed a tendency to use more polite strategies in this situation than in other situations. They showed deference for the addressees' negative face. Their politeness was reflected in their use of considerable amount of mitigation and less use of direct complaint strategies. In the unfamiliar setting, i.e., the waiter situation, they used politeness strategies fewer than in the familiar setting, i.e., the teacher and roommate situations. This shows that both male and female speakers pay attention to both social power and social distance factors in expressing their complaint. It runs counter to previous studies conducted in Iranian culture on different speech acts, i.e. requests (Abdolrezapour & Eslami-Rasekh, 2012) and reprimands (Ahmadian & Vahid Dastjerdi, 2010) which demonstrated that Persian speakers tend to pay attention to social status and ignore the social distance factor.

Equal Setting

The roommate situation in the DCT represent equal social settings and the speaker is dealing with an intimate (-D). As for the complaint patterns used in the roommate situation, the results showed that all complaint patterns were used by both male and female speakers but pattern F has the highest mean for males and females among other patterns of second situation. Means of male and female speakers for the first question are (4.11 and 3.11) respectively and for the second question are (3.68 and 2.81) respectively. We saw that they employed an initiator (i.e., *Hey Reza/ Mina*) and a request for action (i.e., *I was hoping you would try to be a little more quiet*) and a number of softeners (i.e., *hoping, would, a little*) to avoid producing an act which was too face-threatening to his/her roommate. It shows that in female group, there is a tendency to express complaints to familiar equal status individuals more directly.

In pattern B, we have all three components; initiator: Reza/Mina, complaint: I've been wondering if you might have forgotten our agreement recently? And request: If possible, could you try to keep our agreement in mind? It is an indirect complaint and there are several softeners in it: if you, if possible and could you. Based on the means of males and females for the first question (2.14-1.72) and for the second question (3.58-2.58) it is concluded that male speakers accepted this pattern more than female speakers. In patterns C and E, means of male and female participants for the first question are close together; C (males mean=2.09, females mean=1.68) and E (males mean=2.09, females mean=1.69). It is concluded that over half of the males and majority of females rejected this pattern as a face-saving strategy. Most of the participants believed these patterns are ineffective. Unlike pattern A, pattern D has the lowest mean for males and females among other patterns of the second situation. Means of male and female speakers for the first question are (0.66 and 1.10) respectively and for the second question are (0.87 and 1.54) respectively. It is concluded that both male and female participants believe that pattern D is a face-threatening strategy and strongly rejected it. It is realized that male speakers tend to use face-saving strategies more than females. Regarding the amount of mitigation in equal settings, the findings showed that male speakers used more softeners than female speakers.

Higher Setting

The waiter situation represents lower social settings in which the speaker is interacting with a stranger (+D). Because a power inconsistency exists between interlocutors and the addressees who the speaker is complaining to, the results are different with two previous situations results. Since the observed t of situation one (0.295) and situation two (0.669) are less than the critical t (1.753), then the difference between the males and females in these situations is not significant but in situation three the observed t (2.628) is greater than the critical t (1.753) so the difference between the males and females is significant. In higher settings, interlocutors used address terms less frequently than two previous situations. The results are not in line with the findings of Behnam and Niroomand's (2011) study.

About half of the speakers in the male group preferred performing the FTA directly by the use of somehow direct, very direct complaints and fewer softeners to express their disapproval towards the hearer. As compared to their performance in higher social setting, they employed initiators less frequently and complaints more frequently. This situation can be justified on the ground that they have power over the hearer and do not feel it necessary to use initiators to redress the threat to the hearer's face. The analysis of the amount of mitigation used by male speakers showed that they tended to use softeners rarely. In the situation where the interlocutors know each other very well (roommate situation), most of speakers in the male group tended to use indirect responses with the highest number of softeners in their complaints to redress the threat to the hearer's face. Their performance across these two situations and the third situation indicated that degree of familiarity of the interlocutors is an affective factor in lower settings. The statistical findings of the roommate situations also showed that the female respondents performed complaints similar to the way their male counterparts. There was no statistically significant differences were found between the two groups regarding the use of complaint patterns of the waiter situation in which the participants tended to use more softeners significantly more frequently than the male speakers ($t = 2.628$, $df = 18$, $sig = 0.015$) to redress the threat to the hearer's face. Unlike to their female counterparts, male speakers employed direct complaints more frequently in lower settings than higher settings. The majority of them did so within complaints (e.g., *you spill coffee on my new shirt and I should cancel my appointment just because of your mistake.*).

CONCLUSION

This study explored differences and similarities between complaint strategies used by male and female EFL learners in terms of main components, level of directness, and amount of mitigation. With regard to the use of complaint patterns, the complaint patterns used by the two groups were quite similar, but some significant differences were found between the frequency uses of each complaint pattern by the two groups. In the teacher situation, male speakers used A, C and E complaint patterns more frequently than their female counterparts but no significant differences were found between the two groups.

In the roommate situation, it was demonstrated that although the frequencies of using each complaint pattern were different between male and female speakers, like the first situation the male speakers tended to use more face-saving strategies but the difference between the two

groups was not significant. Regarding the level of directness, it was demonstrated that in situation three the frequencies of using each complaint pattern were different between male and female speakers. As far as the amount of mitigation was concerned, despite differences in the frequencies of using softeners in the patterns between the two groups in the first and second situations, in the third situation the males tended to be more polite and the difference between the two groups was found to be significant.

Implications for EFL

The findings of this study contribute to teachers in accomplishing their challenging task of teaching English in various EFL contexts where students have less exposure to language compared to ESL contexts. Teachers can help learners use appropriate strategies based on socio-cultural rules in order to interact competently with other people. According to the results of this study, it is suggested that EFL teachers implement the findings of this study into their instructional programs to teach their learners how to express complaints appropriately.

The study entails some important pedagogical implications. Its findings will be helpful for EFL learners. They increase the quality of their interactions by learning how to use complaint speech act appropriately. They also will be aware of what factors affect the realization of the speech act of complaint in order to perform complaints appropriately so as to avoid communication breakdown. The implication of this study for material designers would be that they should pay more attention to complaint speech act while designing courses for EFL learners. The findings of the study will be helpful for material developers to include exercises and activities focusing on pragmatic competence of text users in designing textbooks or other educational materials. The material designers should believe that including these elements in the students' textbooks has become a necessity.

There are a number of limitations to the study. One limitation of the study lied in the data-collection method, namely the DCT. In spite of a rationale for the use of DCT as an appropriate method for this study, using only the DCT as a means of data collection is insufficient as they might yield results different from naturally occurring data. Other methods of data collections such as role-plays and oral DCTs are needed in order to authenticate data collected through the DCT. Another shortcoming of the study is the lack of English native speakers in the study. Due to the issue of availability and security, it was hard to find enough number of English native speakers to participate in the study. As the sample of EFL learners, only advanced EFL Iranian learners were selected and gender difference of the participants was taken into account.

In order to fully investigate the speech act of complaint in Persian and English, studies should be conducted using other ethnographic methods such as role-plays, besides the DCT to offer more in-depth data. Other studies are needed to include a large number of participants so that the results will be more reliable and generalizable. Proficiency level may be a factor influencing EFL learners' performance, so other interlanguage studies should be conducted to investigate complaints among EFL learners in different proficiency levels.

ABSTRACT

The present paper investigated the effect of stretched texts on Iranian intermediate English as foreign language (EFL) learners' writing fluency and accuracy. Stretched text is a text displayed on a computer with references (hyperlinks) to other texts which the reader can immediately access, or where text can be revealed progressively at multiple levels of details (also called Hyper Text). To conduct the current study, sample research included 60 male and female English language learners were selected from an English language institute in Poldokhtar city, Iran. They were given a teacher made proficiency writing as a pre-test to select the participants at a homogeneity level. Then they were divided in two equal experimental and control groups. The experimental group received stretched text through the Computer Assisted Language Learning (CALL) medium while the text displayed on a computer with references (hyperlinks). The control group received conventional method of reading texts via reading their text book. Both groups received the same materials and time of instructions. After 10 sessions of treatment, the post-test of writing fluency and accuracy was given to the learners. Data were analyzed through an independent sample t-test to find if there are salient differences between the findings of the two groups in their writing test. Results revealed that there was a significant difference in the performance of the experimental group in comparison to the control group. Results showed the experimental group outperformed the control one in the post-test. In other words, the stretched text could provide EFL learners' with enough exposure in writing tasks and enhance their writing fluency and accuracy.

KEYWORDS: stretched text, English institution, writing fluency, writing accuracy

INTRODUCTION

Stretched text consists of nodes or chunks of information and links between them in a virtual space in the Internet. Stated in this way, it might seem easy to find examples of stretched text any text which references another can be seen as two nodes of information with the references forming the link; any text which uses footnotes can be seen as containing nodes of information the text and the footnote providing the link or pointer from one node to the other (Jahin, 2012).

The idea of a node is very general and there are various rules about how big a node should be or what it should contain. Thus there are some variations governing what information gets linked to the other one.

Recently, writing is receiving great interest and a significant role in English as a second or foreign language (ESL/EFL) educational setting since teaching English L2 writing is different from other language skills as it is used as a supportive skill in language learning (Reid, 2002). On the other hand, writing is an outlet for emotions and thoughts which makes it as a skill that is at the final stage of language acquisition; therefore, it still forms an important component of second/foreign language learning (Fageeh, 2011). Reilly and Reilly (2005) believed that writing is also a skill that many teachers find difficult to teach and, as a result of this, many learners do not enjoy to teach it. That is why during the last two decades there have been new ideas in the introduction of new techniques for helping students become fluent and accurate writers. Thus writing as a productive skill is more complicated than it seems at first and often seems to be the hardest of the skills since it involves not just a graphic representation of speech, but the presentation of thoughts in a structured way (Gabrielatos, 2002). In fact, it plays a significant role in academic writing in educational settings. Consequently, it has become one of the major requirements in English for General Purposes (EGP) as well as English for Academic Purposes (EAP) syllabi. Fluency and accuracy development is an essential component of language learning.

Statement of the Problem

Writing is a complicated process where in most EFL learners have difficulties in expressing themselves by means of this skill either at fluency or accuracy levels. Written communication is a need for people to express their own thoughts and views (Baron, 2007). Hence, in the current study attempts will be made to examine resorting to stretched texts as a facilitating way of mastering on writing fluency and accuracy. Therefore, the researchers will measure the influence of stretched text model on enhancing writing fluency or accuracy achievement. The present research will consider the influence of this approach called stretched texts on Iranian intermediate EFL learners' writing fluency and accuracy.

The present study was supposed to investigate the effect of stretched texts on writing comprehension ability of intermediate EFL learners positively. Put another way, this study will examine the impact of stretched text on the enhancement level of writing among Iranian EFL learners. Thus, the fundamental aim of the present study is solve the research problems of: (1) investigating the effect of the stretched text on EFL learners' writing fluency and accuracy and (2) teaching EFL learners how to work with stretched text to enhancement their writing fluency and accuracy.

Significance of the Study

Writing is one of the important ways of expressing one's thoughts and communicating ideas to others. Some have the innate ability to put their thoughts into words. Writing is more beneficial, specifically for those who are working in an academic setting. This tool allows them to express their ideas, thoughts or their existing mental condition. Writing is one of the basic skills which

people acquire throughout their life. Writing skill is an important part of communication which is a vital mean of communication within an organization. Therefore, the skill of tactful writing is essential for achieving career and business goals. Apart from the workplace, writing is essential in many other areas like academic writing as well. If one wants to achieve his/her goals, the art of superior writing is imperative. Recently, CALL could be a great help in developing a variety of methods to enhance this ability. Good writing skill allows EFL learners to communicate appropriate messages with clarity and ease to a far larger audience than through face-to-face or telephone conversations.

LITERATURE REVIEW

As students create texts, they develop spaces for themselves and others. Just as an architect who designs spaces by means of the resources at hand, learners are constantly engaged in spaces that they create from their resources, frameworks, machinery at hand, and goals. Stretched text is a non-sequential form of composing and writing. Therefore, it provides choices for the reader as to how to navigate such text. While the organization of regular, sequential text may be based on a multitude of criteria and dimensions, the final product freezes the presentation into a single, sequential chain of paragraphs and chapters (Jamal, 2012). The author is to satisfy the reader to accept this text organization or has to resort to a supplementary source such as a dictionary or technology based facilities like e-dictionaries or hyper-reading notes with the help of table of contents, indices and previous notes (Kim & Hirtle, 1995).

Pianfetti (2001) argues for a more prominent place for technology in professional programs for teachers. Some of the features identified in her discussion are administrative support and give time to teachers to learn new skills. They also can learn explorations of the ways in which those technology skills which is integrated in the curriculum, access to up-to-date resources, and develop educational technology. In brief, digital literacy will prevail when teachers address pedagogical changes that may be necessary with the implementation of technology in the classroom. This idea invites the teachers to introduce a pedagogical experience integrating stretched text design to teach fluency and accuracy in writing, so the learners may get the benefit of dealing with this electronic age that demands proficiency in utilizing information. According to Glistner (1997, as cited by Pianfetti, 2001), this format has to do with the main construct of deep research into the usability of stretched text. Stretched text is the ability to link any place in text nodded by some links with any other places in the same or different texts that permit rapid access through buttons and other tools across nonlinear pathways.

The electronic text can be interactive and satisfies specific requirements of a reader. The design of an electronic text can incorporate media that guide the reader in his exploration, promoting and encouraging in reading comprehension. The structure of an electronic text lets the reader search multiple nodes of complementary information and have access to various multimedia resources (i.e., audio, video, animation, photos) (Conklin, 1987). The stretched text comes up as a new textual structure that provides the learners with huge volume of information. Great advances of storing information made easy the digitalization and storing of graphs, audio and video and there is a beginning of creating and designing reading and learning material in hypermedia format

Goldman (1996). Some other stretched text features are focused on rapid browsing. Thus the user must be able to get around in the stretched text quickly and easily which means that the user interface must enable the user to navigate across the links in the system. They can do this through a couple of clicks of a mouse to focus on non-linear discorsal sources and information that are non-linearly structured. It refers to the non-linear structure of the text and non-symmetrical organization (Horn, 1989). Teachers in the same schools with the same years of experience can have different notions about using texts in their classrooms. It was suggested the students could split up and check their ideas on a way to determine the amount of pollution in a local stream using various textual resources. The teacher has some notions of nonlinear texts and opens to various non-linear texts which invite the students to find out information everywhere. The teacher encouraged the students to be interested in webs of information by using non-linear hypermedia or what the authors call in this article non-linear texts. Non-linear texts represent a web of connected knowledge similar to the distributed knowledge which is stored "out in the environment" (p. 202), in books, computers, and many varied sources.

The students became more fluent in using web information available in the real world (i.e., in the classroom, school building, and beyond the boundaries of the school). Authors discovered that teachers have a common-sense definition of text that does not include many formal components and that they see non-linear text as something different from other texts. They wonder if increased effort in the form of writing to non-linear text might lead to better readers. Landow (1992) sees personal textual construction as a major component in his definition of non-linear text. Landow's English students may respond to texts in marginal notes, references, even complete other texts. Although this is possible with paper-based texts, a big difference within computer-based non-linear text is that others may immediately see the newly created text and, in turn, comment on it. This experience is very convenient to incorporate in the school work and to understand that teachers and students need to be familiar with hypermedia environments, structure and functioning. After checking the main features of the stretched text as a non-linear phenomenon, it is necessary to look at its structure whose basis is a kind of concept mapping since it is a developing technology that can ultimately make people more effective researchers (Altun, 2000, 2003). It is a method of giving a text depth, structuring it, and let the computer help you explore it. Stretched text is normally defined as accessing information in a non-linear fashion.

The emergence of computers by a few years has been suggested in 1945 by inventor, scientist, and Vannevar Bush (1890–1974, cited in Flynn, 2002). This led the researchers to use computer as a teaching tool. Stretched text as a teaching tool may give the teachers a chance to use new sources in teaching EFL. Stretched text which is also called hyper linking can link the related pieces of information by electronic connections in order to allow a user easy access between them. Stretched text is a feature of some computer programs that allows the user of electronic media to select a word from text and receive additional information pertaining to that word, such as a definition or related references within the text. In the article "whale" in an electronic encyclopedia, for example, a stretched text link at the mention of the blue whale enables the reader to access the article on that species merely by "clicking" on the words "blue whale" with a mouse. The stretched text link is usually denoted by highlighting the relevant word or phrase in

text with a different font or color. The stretched text links the text with pictures, sounds, or animated sequences. It is the text which is displayed on a computer display or other electronic devices with references (hyperlinks) to other text which the reader can immediately access, or where the text can be revealed progressively at multiple levels of detail (Bolter, 2001). The stretched text pages are interconnected by hyperlinks, typically activated by a mouse click, key press sequence or by touching the screen.

The stretched texts could be operated very similar to the way our brains do in a series of networks or associations that are opposed to a linear path. The stretched text software provides the human beings with the elements in the management of information. They analogize the way our minds normally work (i.e., not in a straight line but in several dimensions at once) and they are also can be considered as a thought machine (Landow, 1992). It may conclude that the stretched text is one of those crucial ideas in intellectual history to the development of the printing press of the computer itself. It is highly significant for all disciplines that are concerned with the creation and providing supplementary information. Providing access to information is a core mission of all libraries; therefore, an important line of inquiry is the effect of stretched text and its nodal organization of information on users' abilities to find and understand texts. At the most basic level, users need general reading skills along with particular equipment and the knowledge of how to use it in order to read stretched text documents. More than that, it is essential for information professionals to understand the reasons that lead clients to seek, consume, and use information in particular ways. In a broader context, there are two distinct structures in stretched text including hierarchical and networked structures. In hierarchical structures, readers are provided with contextual cues and organizational links; whereas in networked structures, readers are provided with relational links. In either of these structures, links could be presented in various modalities (types), among which are verbal and pictorial links.

The idea of stretched text is now emerging as a serious and sensible approach to use the computer for reading and writing. Technical writing and pedagogy such as interactive communication between teachers and students are obvious and important applications for the stretched text systems. However, the stretched texts may apply to the whole range of human literacy, including the writing and reading of fiction (Smuts, 2009). Using the stretched texts as a vehicle for fiction could be a great help in providing enough input for the EFL learners who are using it for technical writing or academic education. It is more usable since fiction seems practical in the pragmatic world of data processing. It also could be useful at least in modern fiction, which is by nature open to experiment, and being open or open-ended in creativity of writing. It is precisely enhancing the quality of text and fostering writing. The point is that the stretched text can change for each reader and for each act of reading. According to Taylor's (2006) meta-analysis, there was a statistically significant difference between two conditions of a CALL gloss group and a traditional gloss group with a large effect size since the CALL gloss group outperformed the traditional gloss group on a reading comprehension test.

RESEARCH QUESTIONS

With regard to the main intention of the present research, the following questions will be made:

RQ1. Do stretched texts affect Iranian EFL learners' writing fluency?

RQ2. Do stretched texts affect Iranian EFL learners' writing accuracy?

METHODOLOGY

Design

The design of this study was based on a pre-and post-test control group design. Sixty EFL learners took part as the participants in two groups of 30 EFL learners. The treatment period lasted 10 sessions. The post-test was conducted to determine the impact of the stretched texts on writing fluency and accuracy of the participants.

Participants

To fulfill the objectives of this study, 60 male and female Iranian EFL students in an English language institution in Poldokhtar city were chosen among 100 pre university students. Then they were given a teacher made language proficiency as a pre-test. They were in the age ranging from 17 to 19 studying participated in this study. The participants' selection procedures were done at the beginning of the semester meaning. Then they were non-randomly divided into two equal control experimental groups.

Instrumentation

For data collection purpose, the following instruments were used: A teacher made writing test was used as a pre-test which included 15 open ended questions which held 100 marks. The pre-test was scored based on using appropriate grammar, vocabulary, and unity. The students answered the questions in explanatory forms. According to the participants' scores, the students' writing fluency and accuracy level was determined. This test was given to a rater for rating and correcting probable errors. This could add the reliability of the test scoring. The reliability of the scoring was met through inter-rater reliability as ($r=.681$).

The post-test was designed based on the pre-test in terms of its difficulty level and the number of open ended questions. The learners' answers were rated in 100 marks and each wrong structures or problematic meanings scored based on a checklist focused on grammar, meaning, spelling errors, cohesion, and sentence development. The papers were scored by two raters to obtain the reliability index. The reliability of the scoring was met through inter-rater reliability as ($r=.808$).

Procedure

In the beginning of the study, based on the teacher made writing test, 60 participants out of 100 learners were randomly selected based their scores at the pre-test and assigned into two groups (i.e., control and experimental groups, 30 students in each group). After they are assigned into two groups, the treatment (stretched text treatment) was begun to see whether it does have any effects on EFL learners' fluency and accuracy. A researcher made checklist was used to score the fluency and accuracy of the learners' sentence completion.

The pre-test conducted to exclude any bias or preference in doing the research regarding the EFL learners' homogeneity level. The teacher made writing pre-test was designed in sentence

completion form to assess the two groups' writing proficiency at fluency and accuracy levels. According to learners' means of the pre-test the trainee got, they were divided in two groups at the beginning of the course. Then they formed a control and experimental groups. The experimental group took benefits of stretched texts as the effect of this trend on their own writing enhancement in the whole semester and the control group did not take benefits of stretched text during the course.

The participants in the experimental group were trained based on a series of stretched texts by means of CALL facilities. They encountered long passages to read and practice grammatical points and writing fluency and accuracy through scrolling (*windowing*) and card (frame) model which are in fact the basic trends and models of the intended stretched text. One major approach is the scrolling (or *windowing*) models in which a node may be contain more information. They could use the stretched texts on the writing fluency and accuracy by means of computer programs. In reality, the classes were held twice a week each time one hour in ten sessions while the control group did not have the benefit such a trend and they were taught in the traditional method of reading comprehension including reading aloud, search the vocabulary meanings, skimming and scanning. The user moves linearly in the node by scrolling its window up or down. The benefit of this model is that a node may contain as much information as is needed to explain whatever concept it is supposed to cover. The other fundamental approach to stretched text is the card (or *frame*) model in which a node has a fixed size and layout, all of which is displayed at once. This model limits the amount of information that can be contained in any given node, and the user has to move to another node to see more. The benefit of the card model is that the author can exercise more control over the appearance of the information and that whatever has been designed to be a node is in fact seen as a unit with everything visible.

After the treatment, a final writing achievement test as the post-test was conducted for both control and experimental groups. In order to determine whether there are any identifiable differences in the writings completed by the learners working individually, the writings were analyzed for the fluency and accuracy issues such as length of each essay in words and then dividing the written work into T-units and clauses, and identifying dependent clauses. Fluency measured in terms of the average number of words, T-units and clauses per text. Accuracy is measured by global units expressed in terms of the proportion of error-free T-units of all T-units (EFT/T) and error-free clauses of all clauses (EFC/C). Errors in lexis (word choice) included only when the word used obscures meaning. All errors in spelling and punctuation were ignored. Then the Independent and Paired Samples t-tests were used to calculate the data.

Data Analysis

The results of the statistical analysis provided direct answers to the research questions. Descriptive statistical, analysis of variance, and inferential statistics between the experimental and control groups showed any significant differences regarding the pre-test and post-test scores. Independent sample t-test was run to compare the writing ability of the control and experimental group on the pre and post-tests.

RESULTS AND DISCUSSION

The Independent Samples t-test was calculated the differences between the two groups which showed that they were homogeneous at the pre-test. The results are shown in Table 1.

Table 1: Independent Samples t-test for both Groups' Performance (Pre-test)

Groups	Mean	SD	N	df	T obs.	T crit.
Group1(Experimental)	58.36	23.38	30	29		
Group 2 (control)	58.70	23.16	30	29	-.055	1.645
Total			60	58		

Table 1 indicates that the t-observed is less than the t-critical at the $p < 0.05$ level of significance. Based on these results, it can be concluded that the difference between two groups is not meaningful and both groups are nearly homogeneous. It indicates the observed t ($t_o = -.055$) is less than the critical t ($t_c = 1.645$) with df (58); therefore, the difference between the two groups is not significant at the level ($p < 0.05$). This shows the groups' homogeneity at the beginning of the experiment. After the treatment period, both groups took the post-test and the data were calculated through the Independent Samples t-test. The results are presented in Table 2.

Table 2: Independent Samples t-test for both Groups' Performance (Post-test)

Groups	Mean	SD	N	Df	T obs.	t crit.
G1(Experimental)	70.00	13.84	30	29		
G2(control)	44.33	11.43	30	29	7.832	1.645
Total			60	58		

Since the observed t ($t_o = 7.832$) is greater than the critical t ($t_c = 1.645$) with df (58), the difference between the two groups is significant at the level ($p < 0.05$). In other words, stretched text media application trait has been effective in developing participants' knowledge of writing fluency and accuracy. Thus, it indicates that students' knowledge of writing in experimental group improved significantly. More specifically speaking, descriptive statistics including minimums, maximums, means, and then standard deviations of pre-test and post-test of all groups were computed. Results indicated that the mean score of control group which had been 58.70 in pre-test exam reached to 44.33 in post-test exam. It also indicated that the mean score of experimental group which had been 58.36 in pre-test exam promoted to 70.00 in post-test exam.

Discussion

Results of the present study showed the positive effect of stretched text instruction on students' post- test since there was significant compared to control group. The results of Independent Samples t-test analysis showed that there was a significant difference between the two groups in terms of stretched text instruction ($p < 0.05$). By the comparison of mean scores of participants,

the instructional method of stretched text media instruction application strategy appeared much more beneficial to the experimental group rather than the control one. The post-test scores indicated that the stretched text group following the appropriate instruction was positively gained higher scores. The post-test scores of the experimental group indicated that the group had better improvement compared to the control one. Descriptive statistics also showed that the mean scores of the experimental group were greater than the control group. Therefore, stretched text media instruction application strategy had positive effects on enhancing in writing fluency and accuracy. EFL students mostly tend to experience considerable difficulty in writing English texts. Not only do these texts most often contain unfamiliar vocabulary, but they also need proper styles. Traditionally, attempts to enhance writing text comprehension for EFL students have focused on familiarizing the students with the vocabulary needed to comprehend the passage. Such instruction, however, is unlikely to raise students' interest in writing the text or to well prepare them for the writings of the standard texts.

The basic question in this study was whether or not the stretched text media instruction application enhances EFL writing fluency and accuracy. The results are straightforward and make a strong argument in favor of considering the stretched text media instruction application with Iranian EFL learners. Investigation of the differential potential of experimental group's writing of the text indicated that EFL writing fluency and accuracy of Iranian EFL learners was more significantly facilitated in doing the writing activities. The activities based on stretched text media instruction might also make writing more enjoyable and thus encourage the learners to participate in more writing activities. This would result in the building of the learners' background knowledge and lead them to a better grasp of the English language. The field of the stretched text has covered so much in the last few years that many researches needed to discover its effects on educational settings and its curriculum. Thus the results of the present study should be studied with care. Rather, it is needed to provide a perspective on the stretched text while offering guidance to the published literature.

Many websites are entirely or largely use the stretched texts. It refers to the presentation of video, animation, and audio, which are often referred to as “dynamic” or “time based” content or as “multimedia.” Non-Web forms of stretched text and hypermedia include CD-ROM and DVD encyclopedias, E-books, and the online help systems we find in software products. It is common for people to use the stretched text as a general term that includes hypermedia. For example, when researchers talk about “stretched text theory,” they refer to theoretical concepts that pertain to both static and multimedia content.

A remarkable difference came about between the two groups at the post-test stage. The data revealed a significant difference between the performances of the two groups. This means that learning writing skills in English by experimental enhances a better understanding of the writing skills. After comparing the two mean scores through t-test calculations, the null hypothesis was justifiably rejected. The results showed the degree of performances of the two groups was totally different since the experimental group demonstrated a more-superior improvement than the counterpart group. The use of the stretched text strategies helped the experimental group learn writing fluency and accuracy and enhance their attention to writing fluency and accuracy. The

stretched text has proved to be effective and has desirable impact on the writing skill. The two groups were not significantly different at the outset of the study but they behaved differently on the final test. Therefore, it seems to be justifiable that holding the idea that the stretched text application has served the intended purpose of the present study. It could be strongly argued that the stretched text application strategy instruction can significantly influence EFL language learners' enhancement of writing fluency and accuracy.

To answer the above-mentioned questions the researchers reached the conclusion that after the administration of the pre-test and determination the homogeneity of the two groups in the ongoing study, the stretched text helped the experimental group to improve their writing fluency and accuracy. It was clearly seen that stretched text media application was effective and had an affirmative influence on Iranian EFL learners' writing fluency and accuracy achievement. It can be claimed that it is clearly seen that there is a positive effect of the stretched text on learners' progress in writing fluency and accuracy.

CONCLUSION

Findings of this study indicated that the stretched text strategy training in a classroom had a significant effect on the students' writing fluency and accuracy skills. Prior to the treatment, the Independent Samples *t*-test was administered to find out any significant difference in pre-and post-test mean scores in both groups. The findings revealed that both groups were nearly equal in their performances at the beginning of the course ($p < 0.05$). After the treatment, the data analysis was done to find out any significant difference in reading post-test mean scores between the both groups. Results indicated that students in the experimental group showed a significant improvement in their writing compared with the students in control group ($p < 0.05$). This study came to a conclusion that the stretched text training can contribute to the improvement of the students' writing fluency and accuracy skills.

The findings of this study will be highly invaluable for EFL teachers, material developers and text designers to consider the usefulness of the stretched text to invest more in designing and applying such materials. However, the present thesis focused on the stretched text strategy training task as a treatment which can be useful and effective in boosting Iranian learners' writing fluency and accuracy. It was supposed that the stretched text strategy training would reinforce the learners' writing fluency and accuracy of learners more effectively than the normal traditional way. Likewise, it seems that the stretched text strategy training tasks are more powerful in testing students writing fluency and accuracy skill. The results also showed that there was a positive impact of the stretched text on the students' writing fluency and accuracy.

This study may be useful to Iranian EFL learners who have serious problems with writing fluency and accuracy. Instruction based on the stretched text prior to the writing activities and before engaging those in writing tasks may encourage the teachers to replace conventional or traditional method of instruction for the purpose of enhancing EFL learners' writing fluency and accuracy. However, teachers and researchers are highly suggested to use this approach in a flexible manner (Braaksma, Rijlaarsdam, Couzijn & van den Bergh, 2002). This can be helpful if

the stretched texts are used with other tasks leading to success. Other studies may be needed to find that whether the stretched text strategy training could affect other language skills or the users' higher levels of self-esteem. Although the stretched text training is perceived as a desirable trend, the technology may have some side effects such as lack of live interaction among the participants or technophobia which affect the learners' motivation in using the computer for learning a language. The limitations of the present study could be the small size of the research sample and slow internet which halted the searching hypertexts difficult.

ABSTRACT

This study compared and analyzed the use of references as cohesive devices in English political news articles written by American natives and Iranian non-natives. It aimed to find the possible similarities and differences in using cohesive, demonstrative, comparative, and personal references. Thus, 200 news articles from international and national online newspapers and magazines were selected from 2011 to 2014. News articles included 100 on American native political news and 100 on Iranian non-native ones. The Halliday's (1994) study was adapted to form the model for analyzing the data in the present study. The number of references used in American native political news included 6308 among 64046 words while the number of references in Iranian non-native political news composed 4353 words among 64054 words. After determining the frequency and percentage of each reference, Chi-square was used to see if the difference between these references in group of writers who used references was significant. Descriptive analysis showed that the reference "the" held the highest frequency and references like "hers" had the lowest frequency among Native American news articles. In Persian political news, the highest frequent reference was "the" and references such as "yours" had the lowest frequency. Thus, the quality and quantity were totally different. Implications of this study for teachers could be useful in teaching effective writing through using cohesive devices like cohesive, demonstrative, comparative, and personal references.

KEYWORDS: Cohesive devices, reference, news articles

INTRODUCTION

A text or discourse is not just a series or combination of sentences for introducing different random topics. It is combining sentences in a logical way, according to their meaning and that helps to create unity for a text. This is what we call cohesion in which sentences stick together to function as a whole. Cohesion, the most important principle and criterion of textuality, is the

connection or the connectedness manifested when the interpretation of one textual element in the text (a word usually but not necessarily in another sentence).

Dooley and Levinson (2001) state that cohesion is achieved by “using linguistic signals in the text as clues to help hearers in coming up with an adequate mental representation. Within a discourse structure, these linguistic signals function as a link which glues the individual parts of discourse together. In addition, Pickering’s (1978) discussion in the introduction paragraph of *Cohesion* implies that how much and fast a person’s mind can accommodate new information depends on how much that piece of new information relies on what the person has already known, that is, old information. This statement relates directly to the concept of cohesion.

Pickering (1978) also views cohesion as something which ties a discourse together in a linear way. Halliday and Hasan (1976) explain that cohesion occurs where the interpretation of some element in the discourse is dependent on that of another element and that one presupposes the other, in the sense that it cannot be effectively decoded except by recourse to it. Thus, cohesion is the use of linguistic means or linguistic devices to knit the unity of a text. Cohesion, the most important principle and criterion of textuality, is the connection or connectedness manifested when the interpretation of one textual element (a word located in one sentence) is dependent on another element in the text (a word usually but not necessarily in another sentence). Cohesion relates to the “semantic ties” within text whereby a tie is made when there is some dependent link between items that combine to create meaning. The foundations of text linguistics were laid down by Halliday and Hasan’s “*Cohesion in English*” in 1976. Cohesion is defined as the set of linguistic means we have available for creating texture (Halliday & Hasan, 1976, p. 2), i.e., the property of a text of being an interpretable whole (rather than unconnected sentences). The purpose of the present study is to compare English political articles in mass media written by American native and Iranian non-native authors concerning the use of references as cohesive devices.

Statement of the problem

Second language acquisition researchers on writing skill as Halliday and Hasan’s work in 1976 (*Cohesion in English*) emphasize the act of producing cohesive discourse in order to ensure texture or cohesion in writing. The effect of discourse devices on writing is very strong since they provide us with various kinds of grammatical devices which are used to stretch any piece of discourse to be cohesive. Thus, since in traditional grammar the focus is on form not syntax, there was a need to have sentences in combination which are created with discourse analysis attempts. This need originates from two factors. One the one hand, researchers such as Halliday and Hasan (1976) see that using linguistic ties makes the text more cohesive and understandable. But, it seems that students do not use grammatical cohesive devices efficiently because the problem noticed by teachers is that students have many problems in writing effective discourse in general and in using cohesive devices in particular. On the other hand, although a number of researchers (Yoon-Hee Na, 2011) have mainly investigated the area of referential cohesion from varying perspectives and in different disciplines, a handful of them have merely conducted a comparative study on using references in the discussion section of English political articles written by American natives and Iranian non-natives.

Significance of the study

This study may help to accelerate the knowledge of ESP students who are going to be the future writers in this domain. Findings of the present research may provide various types of references which are different in the discussion section. It is worth noting that the use of references in political articles can be realized differently among native and non-native authors. By comparing the American native with those of Iranian non-native corpora, one can draw his/her attention to how different authors treat differently with references to make their discussion sections cohesive. Its pedagogical recommendations can lead to enhance the knowledge of those instructors who teach academic political writing and make them be conscious of the standard references of “discussion” section as a subgenre.

This may make their students aware that such references are to be included in their political article discussions. Actually, this will help political students be sensitive to the format of discussion section and the design of references within the text which affect the readers’ comprehension significantly. The role of discussion as an argumentative text could be revealed through analyzing and comparing the native and non-native political discussion section in the present study. In a nutshell, what manifests as the product of this analysis will be utilized for pedagogical implementations including writing and analyzing political papers, especially in ESP courses.

REVIEW OF LITERATURE

Cohesion has been studied thoroughly in various aspects. According to Halliday and Hasan (1976), cohesion enables us to create a text. It is defined by Halliday and Hasan (1976) as the “set of semantic configuration that is typically associated with a particular class of context of situation, and defines the substance of the text”. In their view, the function of cohesion is to relate one part of the text to another part of the same text. Consequently, it lends continuity of the text. Most scholars (e.g., Beaugrande & Dressler, 1981; Halliday & Hasan, 1976) define cohesion as the network of lexical, grammatical, and other relations.

Cohesion has gained prominence in studies on discourse analysis as well as L1/L2 writing research following Halliday and Hasan (1976) seminal work on *Cohesion in English*. Halliday and Hasan (1976) defined cohesion as “the set of possibilities that exist in the language for making text hang together” (p.18). In a similar vein, conceptualized cohesion as “the connectivity of ideas in discourse and sentences to one another in text, thus creating the flow of Hinkel's (2003) information in a unified way.” (p. 279). For Halliday and Hasan (1976) and other researchers in Hallidain tradition, the organization of text is made up of relationships among items in the text and those relationships are realized through the use of cohesive devices. Reid (1992) further extrapolated cohesion devices as “words or phrases that act as signals to the reader; those words or phrases make what is being stated relate to what has already been stated or what soon will be stated” (p. 81). Cohesion is divided into two subcategories: grammatical cohesion and lexical cohesion. Grammatical cohesion in then divided into five main categories: reference, ellipsis, substitution, conjunction. Reference occurs whenever an item indicates that the identity of what is being talked about can be retrieved from the immediate context. Pronouns,

determiners, definite articles, and comparatives such as *he*, *this*, *the*, *less* are reference items. The interpretation of the reference elements depends upon presupposed information contained in the sentences immediately above it.

According to Halliday and Hasan (1976), such cohesive devices which mentioned previously serve to contribute to text cohesion. They believe that text cohesion leads to greater text coherence which in turn enhances quality of writing. Although Halliday and Hasan (1976) did not consider issues of language pedagogy in their research, the effective use of cohesive devices has been identified as one of the important criteria for good writing and thus considered as something to be treated in a pedagogical context (Hinkel, 2001). The theory and practice of grammatical cohesion has been widely analyzed by many foreign linguists (e.g., Baker, 1992; Valeika & Buitkiene, 2006).

Classification of cohesive devices

Halliday and Hasan (1976) provide us with the basic categories of cohesive devices in academic texts which distinguish grammatical cohesion and lexical cohesion and recognize more specific subcategories within them. This model is discussed in the following table:

Table 1: Cohesive Devices (Adapted from Halliday & Hasan, 1976)

Category	Function	Examples
Grammatical cohesion		
	help to guide reader through the text	
Reference	create surface links between sentences	these/her/similar/it/otherwise
Substitution	replace a previous word or expression	one/ones/same/do/so
Ellipsis	leave out words or phrases from sentences	
Conjunction	show the relationship between sentences	moreover/and/but/or/for instance
Lexical cohesion		
	involve the reader in the argument	
Repetition	restate the same lexical item in the later part of the discourse	e.g., newspaper for newspaper
General nouns	refer back to animate and inanimate nouns	e.g., (stuff) for inanimate, (place) for location; (people) for human
Synonymy	express a similar meaning of an item	e.g., “slope” for “incline”
Super ordinates	involves the use of general class words	e.g., “vehicle” for “car”
Collocation	tendency of some words to co-occur	e.g., fruit, skin, citrus, lemon, etc.

Grammatical cohesion refers to the linguistic structure. The highest structural unit in the grammar is "the sentence" (Halliday & Hasan, 1976, p. 28). The structure determines the order in which grammatical elements occur and the way they are related within a sentence. Cohesive relationships with other sentences create a certain linguistic environment, and the meaning of

each sentence depends on it. On the other hand, “Lexical cohesion is ‘phoric’ cohesion that is established through the structure of the vocabulary” (Halliday & Hasan, 1976, p. 318). Lexical cohesion occurs when two words in a text are related in terms of their meaning. References, as one of the groups of cohesive devices, have been defined by some of the scholars to be presented briefly.

The concept of references

Brown and Yule (1983, pp. 27-28) see the nature of reference in text and in discourse as an action on the part of a speaker/writer. It describes what they are doing “not the relationship which exists between one sentence or proposition and another.” Mc Carthy (1991, p. 37) states that we must consider the notion of discourse segments as “functional units, rather than concentrating on sentences and to see the writer/speaker as faced with a number of strategic choices as to how to present them to the receiver.” He adds that reference items can refer to segments of discourse or situations as a whole rather than to any one specified entity in that situation. The main feature that characterizes reference is that the information signals for retrieval. The identity of particular thing that is being referred to has a referential meaning and cohesion is found then the same thing occurs a second time. Reference has the semantic feature of definiteness or specificity. Because of that there has to be reference to the context of situation. Referencing items do not have to match the grammatical class they must have semantic properties (Halliday & Hasan, 1976, p. 31). Reference shows the connection between the real world and the entity, because of that it cannot refer to something that does not exist. Yule (1996) and Lyons (1995) point out that not all referring expressions have identifiable physical referents, they can be imaginary, hypothetical, or fictional entities (such as the Tooth Fairy and Santa Claus), but they do exist in imaginary or fictional world. Expressions themselves cannot be treated as having reference, but the speaker or writer gives the referential function in a context. For us it is left to assume if we can identify what they are talking about, even when the entity or individual described may not exist. Communities which share the common language and culture have certain referring expressions to identify certain entities on regular basis. We usually think that certain referring expressions can only define very specific entities and we may think that a name like ‘Shakespeare’ which can only be used to define a specific person.

One of the options that grammar of English offers creating surface links between sentences is reference. Halliday and Hasan (1976) point out that reference features cannot be semantically interpreted without referring to some other features in the text. A pronoun is the most common linguistic element as referring devices in a textual environment. However, there are other linguistic elements used to fulfill the same function such as: articles, demonstratives, and comparatives.

Reference can be accounted as “exophoric” or “endophoric” functions. This is because simply when we refer to a given item, we expect the reader to interpret it by either looking forward, backward, or outward. Exophoric involves exercises that require the reader to look out of the text in order to interpret the referent. The reader, thus, has to look beyond or out of the text with a shared world between the reader and the writer. “Exophoric reference directs the receiver ‘out of’ the text and into an assumed shared world” (Mc Carthy, 1991, p. 41). For example, *‘that must*

have cost a lot of money' in this example we have to look out of the situation to retrieve the meaning of the sentences (Halliday & Hasan, 1976).

Hessamy and Hamed (2013) attempted to compare and contrast the frequency of the use of cohesive devices in independent and integrated essays written by 95 upper-intermediate Iranian EFL learners to find out about any possible changes in the type and frequency of using cohesive devices due to the nature of writing task. The participants were native speakers of Farsi between 18 to 30 years old, studying English as a foreign language in an English language center in Yazd, Iran. The sample included 58 female and 37 male students. They were asked to compose an integrated argumentative essay after reading a text and listening to a lecture on the same topic as it is designed in TOEFL iBT writing test. The participants first completed an independent task which had to prompt to write about and then completed an integrated writing task with a two-week interval between the writing sessions. The tasks were taken from the TOEFL iBT writing task. Results indicated that there was a significant difference in the use of almost all types of cohesive devices between the two conditions with the independent task producing essays with lower cohesive device counts. The results revealed that in terms of textual cohesion, the participants preferred using anaphoric references to cataphoric references while substitution and ellipsis in both independent and integrated sample writings were rarely used. The students were also found to be better at using references and lexical cohesion in their integrated writings than in their independent essays. Finally, it can be concluded that the integrated writing task has positive effects of test method on writing performance and may advocate the use of integrated writing tasks to provide a better picture of students' writing abilities.

Ghasemi (2013) investigated the use of cohesive devices in second language writings. As far as the communicative nature of writing is concerned, cohesion is regarded as an essential textual component in creating organized texts and rendering the content comprehensible to the reader. Many researchers have explored the connection between the use of cohesive devices (CDs) and the quality of the writing. To gain more insight into this area, this study reviewed some studies focusing on the use of CDs and the relationship between the numbers of CDs and writing quality. The analysis of collected data from different EFL/ESL researchers has shown that the learners were able to use various CDs in their writings. Additionally, the study highlighted some of the cohesive problems in writing and the possible pedagogical implications for teachers. The purpose of the study was to investigate CDs used in different genres composed by learners from around the globe and the relationship between the use of CDs and quality of their essays. The findings also provide insight into the abilities of native and non-native writers to convey their ideas into written forms. The results of the study showed that some CDs were more preferred than some others for a variety of reasons. The dynamic nature in the use of CDs could be contributed to the nature of the data collection procedure since some CDs belong to the conversational data in oral performance. The other reason might be minimal amount of knowledge and necessary discourse in which such structures are used.

There are cross linguistic differences in the use of CDs by native and nonnative learners. Findings proved that language users resorted to pronominal more than other CDs in order for creating textuality between the sentences. There might be some other reasons for the distinct

differences between the natives and non-natives in the use of certain CDs on account of cross-linguistic differences. On the one hand, it could be emanated from the lack of non-natives' English language proficiency, especially, because non-natives may lack knowledge of what makes a written material a meaningful English text. The results of this study provided some insights into the general pattern of CDs in EFL/ESL learners' academic and nonacademic writing. This would help to identify students' problems in using CDs, for instance, overuse or underuse of certain categories, and, thereby, modify teaching writing and incorporate a more precise plan for teaching the appropriate use of CDs. The pedagogical implication is that it is essential to incorporate reading into writing in order to enhance students' awareness of coherence and cohesion. Students can acquire syntactic structures, features of genre, or vocabulary through the process of reading to write. What's more, observing the use of CDs can also enhance students' writing skills and promote writing teachers' teaching quality.

THE RESEARCH QUESTION

The present study investigated the answer to the following research question:

Do non-native Iranian researchers use cohesive references functionally as similar as the American native ones in the political articles?

METHODOLOGY

Data

The research sample that is used in this study consists of 200 political articles and news i.e., American native researchers (100 written by NRs of English and 100 written by Iranian non-native researchers of English). They were randomly chosen from recent publications in prestigious international online newspapers and magazines such as (*US news, Yahoo news, Newsweek magazine, Jame Jam online, & Keyhan International*) in the field of politics. It should be mentioned that they were news articles of media, not the research articles published in political journals. In order to specify whether the native articles are written by American writers, the CV of each writer, that is, the country of birth and the University of their Studies were checked online. The data set were developed by selecting articles published internationally and nationally from 2011 to 2014. In order to compile more reliable and recent corpora, only the articles published since 2011 onwards were selected. There are some rationales behind this selection:

1. Firstly, many natives and non-native authors of English have written significant articles regarding this domain in various journals, etc.
2. Secondly, a bundle of theses have conducted studies on other corpora such as economics, chemistry, physics and so on.
3. Thirdly, the availability of these political articles in Mass Media like magazines, newspapers, or even on-line websites relevant to politics (e.g., *News Week, Iran Daily, Tehran Times, Jame Jam online, US news, Iran news, Keyhan International*, etc.) makes data collection much more feasible.

When conducting studies in contrastive analysis, Connor, Nagelhout, and Rozycki (2008) pointed out that it is important to establish a valid criterion of comparison between data, in other words, to examine sets comparable original texts with “maximum similarity” written in two or more languages. Although one set of articles in the current study were written by Iranian non-native authors, their English writing proficiency can be taken to be at a native or near-native level since the articles have been published in these widely-known national magazines and journals.

As mentioned above, this study relied on just English political articles in two set of corpus written by Iranian natives and American natives, which were compared in terms of references. The first section, political articles written by native authors, comprised of 100 articles with 64,046 words. The latter part, articles written by Iranian writers, comprised of 100 articles with 64,057 words in the articles. On the whole, 200 articles which included 93,019 words were analyzed. The reason for selecting political articles published in media was that writing articles appears to be a very complicated activity with many visible and invisible layers. Moreover, in order to communicate effectively with English language countries via media (e.g., newspapers, magazines, etc.), knowledge of *Lingua Franca* is a pre-requisite and lack of this knowledge leads to misunderstanding. Thus, this comparative analysis enhances native authors’ proficiency in writing highly-qualified political news articles.

Instrumentation

The present study employed a framework for the analysis of references. It was extracted from Halliday’s (1994) classification of references based on Halliday (1994). This checklist contains three or four types of references concerned with cohesive devices including *cohesive*, *demonstrative*, *comparative* and *personal* references. The references were compared to other sources (e.g., *Comparative Analysis* by James, 1980 & *Discourse Analysis* by Brown & Yule, 1983).

Procedure

As mentioned before, the non-native corpus consists of 100 published articles or stories contributed by Iranian authors. Meanwhile, the native corpus contains 100 articles published in prestigious international journals mentioned earlier. Based on the above-mentioned checklist, we extracted all the references used by writers. This researcher read the articles completely to find the full references. The selected RAs which were obtained directly from online magazines and newspapers, converted to Word Format. So, we could count the total number of words in each article and find the references one by one with (*Find*) section in the *Microsoft Word 2007* in order to calculate the distribution of references. Our main focus was only to analyze the function of references not the structures. At first, we highlighted all the references in (*Find*) section of Microsoft Word, and then we began counting those which merely had the function of reference and skipped those which had other functions. For example, sometimes *that* had the function of a cohesive reference, but sometimes a conjunction. e.g., *Friends of former president George Bush are worried that his health may be in a dangerous decline*. The latter one was ignored in counting. Or *it* mostly was a cohesive reference and sometimes acted as an expletive. For example: *It’s inappropriate for Trump to moderate the event*. In addition, the references which equaled to zero or one were not taken into consideration because their frequency was low. Some

references overlapped. In other words, they had more than one function and belonged to two or three categories. Thus, it made the decision challenging for the researcher to put them in which category. Because of that, among the nine categories, only four of them which were the most frequent were chosen in order to narrow down the scope of analysis because this research cannot cover all of them. For instance, *ambiguous pronoun reference* was totally removed from the checklist due to multifunction of some references. The references were calculated twice to estimate inter-rater reliability. The results are presented in Table 2.

Table 2: Inter-rater Reliability of the References

Articles	Inter-rater reliability			
	Cohesive	Demonstrative	Comparative	Personal
American	0.909	0.994	0.783	0.987
Iranian	0.877	0.901	0.834	0.842

By this descriptive analysis, the researcher can determine the frequencies of the selected references in native and non-native articles and stories within the mentioned field. The quantitative analysis also enables the author to come to an appropriate conclusion of any difference or similarity on the using of the references. All the references in all the articles were calculated. As a result, the total word count performed by Microsoft Word Office for the non-native data was about 64,057 words and 64,046 words for the native corpus. In the final stage, various references will be identified using Non-parametric Chi-square procedure, which is a technique for looking at how references function in the corpora. The sole objective of this test here is to identify the probable significant concordance among references in these two separated collection of articles. And in case of no compatibility, or at least slight correspondence, we can figure out how and why non-natives prefer some specific references and overlook some others which natives do not. In summary, 200 articles from one discipline in two languages were randomly chosen from recent published leading journals. First, the overall organization of the articles was analyzed based on Halliday's (1994) model. Then the frequency of references was analyzed in the English political articles.

RESULTS OF DESCRIPTIVE ANALYSIS

The first step taken in the analysis of references in the mentioned articles was to run word count to determine the length of the two corpuses. A total of 4353 references were identified among 64,057 words in the Iranian non-native corpus, and 6308 references were recognized among 64,046 words in American native data.

Frequency and percentage of references

The two sets of political articles investigated in this study were analyzed concerning the frequency of occurrence of references in each of the 4 categories of the checklist used in this study. The data presented in the following tables show the statistics which were obtained after the analysis of the articles; rows numbered 1-4 represent the taxonomy applied here in the present study. The frequency and percentage of all references in each of the two groups (data) of political

articles under study are shown under the columns of native and non-native corpora (data) as well. Total number of references is also given.

Table 3: Native American and Non-native Iranian Articles Using References

American native articles and news					
cohesive references	Demonstrative references	Comparative References	Personal References	Total references	Total words
5464	91	306	447	6308	64046
Iranian non-native articles and news					
3387	81	375	510	4353	64054

Frequency of occurrence of references in articles

Cohesive References

The first category in the classification used here represented the cohesive references. Different cohesive references were found which were mostly situated in texts on politics by native writers. However, the least amount of this category was found in political articles written by Iranian non-native authors. The sum of the occurrence of this category in the two groups of articles equaled 8851 cases (83.02% of all the references) among which the definite article “*the*” had the highest frequency in both native and non-native articles while “*yesterday*” had the lowest.

Demonstrative References

The most frequent demonstrative reference was found in political articles written by native writers. This category had the frequency of 172 cases in all the two groups (1.61% of all the references) among which the demonstrative reference “*those*” had the highest frequency and clearly “*then*” the least frequency in both native and non-native articles.

Comparative References

This category occurred 681 times in the two groups (6.38% of all the references). The most frequent type of this category was found in articles by American native authors and clearly the least amount of this category was found in articles by Iranian non-native writers. Among which, in native corpora “*other*” had the highest and “*identical*”, “*differently*” and “*equally*” had the lowest frequency. Nevertheless, “*more*” had the most and five items, that is, “*additional*”, “*else*”, “*identically*”, and “*likewise*” had the lowest frequencies in non-native articles.

Personal References

The fourth category of references in the classification of references in the present study deals with the personal references. The overall number occurrence of this category was 957 cases equal to 8.97% of the references highlighted in this study. The most frequent type of this category was found in articles on politics by non-native writers, while the least amount of this category was found in American native articles.

Descriptive statistics

There were some differences in the frequency of references used by American and Iranian writers of the news articles.

Table 4: Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation
American	4	91.00	5464.00	1577.0000	2595.46438
Iranian	4	81.00	3387.00	1088.2500	1542.93041
Valid N (listwise)	4				

In this table, N is the number of four items of references we considered in each group. The obtained mean was 1577 for American native articles and 1088 for Iranian non-native articles. It shows that Iranian writers used fewer references in comparison to American native ones. Since descriptive statistics cannot show the significant difference between the groups, data were analyzed through Chi-square analysis.

According to Tables 3 and 4, there are four categories of references in both groups which are compared. The American NSs and Iranian NSs used references in their political news and editorials. The contingency table was used to do the Chi-square calculation. The significance level was at ($p < 0.05$.) which indicated the difference between each category of the references between American NRs and Iranian NNRs regarding the use of references in the political texts.

Discussion

In this section, the results were discussed to give the possible reasons for the results obtained from the study. Moreover, it gives answers to the research question.

Do non-native Iranian researchers use cohesive references functionally as similar as the American native ones in the political articles?

In answering the research question, the researchers proposed the following discussion: The results of the Chi-square analysis showed that there are some differences and similarities between native and non-native news articles. The most frequent types of references used by American researchers were cohesive references, and the least used ones were demonstrative references. For instance, the following examples show this phenomenon.

*In the end, Gingrich emerged where **he** started under sharp attack from his rivals and under increasing security by the media as **he** tries to maintain his position as the GOP front-runner.*

*People who heard the debate on the radio thought Nixon won but **those** who saw it on TV thought he lost.*

In Iranian non-native articles, the most frequent items of references were *cohesive references*, but the least used items were *demonstrative references*. For example, the use of “he and those” in the following examples.

*On Iran’s nuclear program, Gates has said **he** still believes Iranian leaders are intent on building a nuclear weapon and are “getting closer.”*

*A senior advisor to the Islamic Revolution leader says the European Union serves as a tool in the hands of the U.S., adding the policies of the bloc are influenced by **those** of Washington.*

In native news articles, 6308 words out of 64046 were references whereas in non-native news articles they were 4353 words out of 64054. Generally, the writers of American news articles used more references than those of Iranian ones. The probable reasons and justifications for the obtained results may be due to the mastery of native researchers in their writings. Due to the fact that there are some differences between English and Persian grammar, and overgeneralization which sometimes occur by non-native researchers in writing English political news. In other words, Iranian writers feel free to overuse some references in their own language and may omit some of them without clear reasons. The other reason may be due to transferring this habit in writing English texts coming from their L1. In fact, overuse of the references is open to criticism heavily reference-based might appear “layman like” and also readers may lose their trust in what writers try to express. On the other hand, because of uncertainty and lack of sufficient knowledge, some other writers prefer to underuse them. It may expose them with a lot of criticism on the part of readers. Thus, learning how to use references is a must. Difficulty with cohesive devices is either because of discourse conventions or because of the lack of familiarity of Persian writers with a wide variety of techniques in applying these devices. Differences in the use of cohesive references may be due to the knowledge of grammar Iranian researchers may have in using grammatical patterns which help them to feel self-confident in using grammatical elements without referring to the English native samples in using the pre-fabricated structures. Other references such as comparison, personal and demonstrative were not significantly different from Persian researchers’ use of references. This may be due to the lack of enough knowledge on using such references since they hold less frequency and Persian researchers may follow the English native researchers in using such structures.

The result of the present study is compatible with the following works including Abdul Rahman (2013) who has emphasized that there was a vast difference between the natives’ and the non-natives’ use of cohesive devices such as reference in frequency, variety, and control. Similarly, Ghasemi (2013) in his study concluded that there were distinct linguistic differences in the use of cohesive devices by native and non-native learners. In a similar vein, Hessamy and Hamed (2013) in an attempt to compare and contrast the frequency of the use of cohesive devices in independent and integrated essays found out that there was a significant difference in the use of almost all types of cohesive devices between the two conditions.

In American native news and articles, the frequency of cohesive references was 5464 cases, 91 demonstrative references, 306 comparative references, and 447 personal references. On the whole, the total number of used references was 6308. The most frequent types of references used by American writers were cohesive references, and the least used ones were demonstrative references. The following examples present the use of these references.

*In the end, Gingrich emerged where **he** started under sharp attack from his rivals and under increasing security by the media as **he** tries to maintain his position as the GOP front-runner.*

*People who heard the debate on the radio thought Nixon won but **those** who saw it on TV thought he lost.*

Meanwhile, the frequency of these four categories of references in Iranian non-native news articles were 3387 cohesive references, 81 demonstrative references, 375 comparative references, 510 personal references. Totally, Iranian non-native writers used 4353 references in writing news and articles. In Iranian non-native articles, the most frequent items of references were *cohesive references*, but the least used items were *demonstrative references*.

*On Iran's nuclear program, Gates has said **he** still believes Iranian leaders are intent on building a nuclear weapon and are "getting closer."*

*A senior advisor to the Islamic Revolution leader says the European Union serves as a tool in the hands of the U.S., adding the policies of the bloc are influenced by **those** of Washington.*

A comparative analysis between these two sets of articles indicates that Iranian non-native writers used less references than American native writers. This incompatibility may be due to several reasons proposed as follows:

Lack of mastery on cohesive markers can lead to inappropriate use of references.

Iranian students' lack of variety in using references. For instance, some of comparative references are unique in use like *otherwise*, *less*, *identically*, etc. They may not have known the function of each reference and also the context they should use.

Teachers are not competent enough to teach references to students appropriately.

Sometimes students cannot distinguish form from the function. For example, students have difficulty comprehending the difference between the two functions of the same form such as *it*, *this*, or *there* which may be references or expletives in terms of function in different contexts.

CONCLUSION

Cohesive devices are important features of academic writing which connect the sentences together in a text and make it cohesive. The main purpose of cohesive devices is to help readers make logical connections between sentences. Writers use these devices in their academic writing in order to make their writing more accurate and comprehensible. The results of this study showed that the researchers of Iranian political news and articles used fewer references than those of American news. This underuse problem may be related to the impact of first language and culture of non-native writers on the use of references in the second language. Following Atai and Sadr (2006), results of this study showed that familiarizing and involving students with the rules of academic writing may improve their reading ability and can help them to know what kind of discourse they have to produce and understand in academic settings.

Finally, it can be said that even when Iranian non-native researchers have a good knowledge of references, they may be influenced by their first language and culture. Contrastive studies on the use of references in two or more languages could help the writers to be familiar with the differences between the Persian and English structures and cultures and the language use of discourse markers when they write the text.

The most important contribution of this study to English for academic purposes classrooms is that students seem to have little awareness of these cohesive devices and the interactional nature of reading in general. In Iranian context, special instruction should be integrated into ESP or EAP for political courses specially and for writing courses generally to help students become competent and successful writers. There are discrepancies in different disciplines in applying references. A better understanding of these discourse devices by Persian writers can help them to have a good command of using these cohesive devices to be able to write their essays articles with standard academic format and to introduce themselves as members of the academic discourse community. Despite the growing demand for English for specific purposes instruction in Iran, ESP courses are still limited to learning specific cohesive texts rather than a variety of these linguistic elements. With the continued expansion and participation in the international specific arena, much attention should be drawn to the design of ESP courses and the roles of references in binding the sentences together in an ESP passage. This can help to prepare learners for future professional communication. The materials should help learners to be familiar with different strategies which are helpful to comprehend the grammatical structures of the passages deeply. The results of the present study can be useful for both ESP developers and ESP text designers to explain the structure of disciplines which have specific characteristics in terms of using grammatical cohesive devices specially references. Finally, the results of this study can be useful for every EFL teacher and learner who is interested in learning the nature of English political news and articles and their linguistic structures.

This study is limited to the size of two sets of data. We used the “data” here instead of “corpora” due to the fact that this work does not include a wide range of computerized data but only 100 native articles and 100 non-native articles. The researcher merely took an adapted checklist based on Halliday (1994) and four categories of references including cohesive, demonstrative, comparative, and personal. The other references out of the scope of the checklist were not included in the analysis.

For future research, it is hoped that more large-scale, corpus-based studies on non-native and native writers’ articles will be done to enable us to gain a more comprehensive picture on the interlanguage development of references by different group of learners and nations. Another research can be an investigation on the reasons of over-use or under-use of references by Iranian native authors. With regard to pedagogical implications, address to the effective practices in helping the learners to improve cohesion of their writing.

Other studies can provide a list of references in Persian and compare and contrast in order to predict what problems students might encounter based on the differences and to discover whether students over generalize and transfer the use of references from their first language to English. Further studies can be done to compare the frequency and position of references in native and

non-native essays, compositions, and letters to provide important implications for the teaching of references in those genres. The focus of some other studies can be on those cohesive references which were not included in the proposed checklist.

ABSTRACT

The present paper investigates Persian-English codeswitching based on the Matrix Language Frame(MLF)Model of Carol Myers-scotton,1993 in written texts of bilinguals in online communications. Three principles of MLF model is tested on Persian-English bilingual discourse extracted from a website named www.mohajersara.com. The three principles of the model are as follow: the morpheme order principle, the system morpheme principle, the uniform structure principle. The method of this study contains three stages. At first stage, each principle was tested on the corpus of 300 bilingual CPs separately to see whether our data validate the principles or not. Then the morpho-syntactic analysis and explanation for each sample CP was provided. The morpho-syntactic analysis provides general support for the principles of the model although a few counterexamples were founded in the corpus. Finally the numerical results for the principles were calculated using the percentage formula. The results of the numerical analysis reports that the principles of the model are valid for Persian-English written data. The results also design a pattern for Persian-English compound verb formations.

KEYWORDS: codeswitching, MLF model, morpheme order principle, system morpheme principle, uniform structure principle

INTRODUCTION

In some societies, where language speakers apply more than one common language during their conversations, a number of outcomes may result from the grammars of those languages in contact. Among those outcomes, codeswitching is a subject which has strongly attracted linguists and language researchers' attention. The researchers introduce different definitions for CS in the literature but all share the common idea of, in order to codeswitch, language speakers must know more than one language. One of the definitions is by Muysken (2011) which defines codeswitching as "the use of more than one language during a single communicative event". Studies on the subject of codeswitching (CS hereafter) generally look into sociolinguistic approaches but in recent two decades some researchers developed structural theories to find the possible universal structural constraints on CS. Among the studies of such material Poplack's(1980) linear order constraints and other non-linear approaches have been developed

such as Woolford's (1983) government and binding framework and Disciullo, Muysken, and Singh, 1986, the Null Hypothesis of Mahootian in 1993, Myers-scotton's 1993 MLF model, the Functional Head Constraint (Belazi, Rubin, & Toribio, 1994) and the Minimalist approach (MacSwan, 1997). Among the structural approaches MLF model claims to be universal and applicable for languages which are not mutually intelligible. Most of studies in CS in general and within the MLF model in specific focus on oral CS and not written CS.

Matrix Language Frame Model

Matrix Language Frame (MLF) model is a theoretical model which applies a production-based approach for CS. It was first proposed by Myers-Scotton in 1993 in a book named *Duelling languages* and then it has been developed and expanded with adding a new supporting model named 4-M model in some further publications for instance Myers-Scotton and Jake (2000a, 2000b, 2001). According to Myers-Scotton, the participating languages in CS do not participate equally. The language with the larger participation is called the Matrix Language and the other language is called Embedded Language (Myers-Scotton, 2002). This model is designed for intra-sentential CS. In general, intra-sentential CS refers to a switch between languages in a particular clause or sentence but according to Myers-Scotton (2006) clause is the best unit of analysis for bilingual data whether dependent or independent clauses and the sentences can not be considered as the unit of analysis.

This model is built on two oppositions, Matrix Language (ML) vs. Embedded Language (EL) opposition and content vs. system morpheme opposition. It is essential to divide content and system morphemes for identifying which language is ML and which is EL. And it should be mentioned that what 4-M model does is the division of content and system morphemes and clarifying of the three categories of system morphemes. So, the categories are divided as follow: content morphemes such as nouns, verbs, some propositions and system morphemes: 1-early system morphemes for instance determiners, plural –s and some propositions, 2-late system morphemes, 3-bridge late system morphemes e.g. possessive “s and of”, 4-outsider late system morphemes for instance the 3rd person singular –s.

Content morphemes according to Myers-Scotton and Jake (2000a, 2000b, 2001) are those “morphemes which express semantic and pragmatic aspects and assign or receive thematic roles, e.g. nouns, verbs, adjectives and some prepositions”. These morphemes are necessary to transmit messages in communication. System morphemes like function words and inflections, express the relation between content morphemes and do not assign or receive thematic roles. They are crucial in building grammatical frames. In bilingual CPs, system morphemes are coming only from the ML and content morphemes are taken from both the ML and EL.

According to Myers-Scotton (1993a), a bilingual clause may consist of three types of constituents:

“1- ML islands which are made of ML morphemes only and are under the control of ML grammar. They don't have any influence from the EL”.

“2-EL islands, EL islands are also well-formed by EL grammar but they are inserted into an ML frame. Therefore EL islands are under the constraint of ML grammar”. (2002:58)

3-“Mixed constituents include morphemes from both Matrix Language and Embedded Language”.

The following examples show constituents types:

- (1) yeki az sargarmi-ha **walking mall** hast.
ML island + EL island → Mixed constituent
One of hobby-pl walking mall is.
One of the hobbies is walking mall.
- (2) **job offer-am** umad
Mixed constituent
job offer-poss come-3rds-PST
I received my job offer.

Regarding the above information, the MLF model is based on several principles. Three principles of the MLF model which were tested in the present study are:

The morpheme order principle

In Matrix Language + Embedded Language constituents consisting of singly occurring Embedded Language lexemes and any number of Matrix Language morphemes, surface morpheme order will be that of the Matrix Language. (Myers-Scotton, 1993:83; 2002:59)

The system morpheme principle

In a mixed constituent, all system morphemes “which have grammatical relations external to their head constituents will come from the Matrix Language”(Myers-Scotton, 2002).

The uniform structure principle

This principle predicts that “the structure of the Matrix Language is always preferred in bilingual speech”. (Myers-Scotton, 2002)

LITERATURE REVIEW

Studies on MLF Model

Since the arise of the MLF model in 90s when Myers-Scotton (1993) examined a Swahili-English data of conversations in Nairobi and proposed the model after a large corpus was tested, it has been employed to test different contact phenomenon such as CS and convergence for different pairs of languages. A number of studies in CS have applied the MLF model; one of the studies was applied by Margaret Dauchar (2006) who tested three principles of the model on the collected data of informal conversations by bilingual Welsh-English speakers. She examined the model to decide whether Welsh-English can be considered as a classic case of CS or not. The results of her analyses suggested general support for the three principles she tested which were as follow: the asymmetry principle, the uniform structure principle and the matrix language principle. The principles of the model were examined on the collected data of informal conversations by bilingual Welsh-English speakers. Finally the result showed that Welsh-English CS can be marked as a classic case. Another study which was conducted by Laura Callahan in 2004, applied the model on a corpus consist of Spanish-English CS in novels published in the

United States. She found implications for applying oral model to a written corpus and the results of tested principles supported the model on the especial corpus. It has been several studies in different language pairs, like the above studies and other language pairs such as German-English, Russian-English, Turkish-English and etc; still it seems there is a lack of enough study on the corpus consisting Persian language as one of the participating languages in CS. Examples of such studies are two studies which have conducted this model to a corpus consisting Persian language

in 2013. One of them is a study of Azeri-Turkish/Persian CS conducted by Rouhi and Heidri. They employed this model for the features of light verb construction in Azeri/Turkish-Persian. The data collected from the interactions between bilingual students and teachers. The results revealed that Persian finite verbs do not participate in Azeri-Turkish morpho-syntactic frame simply because such verbs are [+thematic role assigner] and carry more syntactic baggage. Another study is a test of this model in 2013 by Rahimi and Dabaghi which is conducted to an oral corpus of Persian-English data. The corpus was obtained from conversations of Persian - English bilinguals on TV shows. Then the three principles of the MLF model were validated. The results of the analyses suggested general support for the principles of the MLF model. They also concluded that Persian-English CS can be considered as a classic case of CS.

RESEARCH QUESTIONS

Considering the Matrix Language Frame model principles, the problem statements are as follow:

1. Is the MLF model which is a model for oral CS, qualified to predict written CS?
2. Is Persian-English written CS a "classic case" of CS?

METHODOLOGY

Data collection procedure

The data used in this study were collected from a website names www.mohajersara.com, and thus this study can be considered as a part of what is known as Computer Mediated Communication (CMC). The website is a virtual community in which the Persian-English bilinguals communicate and write about various topics such as immigration ways to different countries, how to apply for higher education abroad, the life styles outside Iran and etc. The participants are Iranian bilinguals who live/are going to live in English speaking countries. The data which gathered from this website are written texts on different subjects and also the comments which the participants make on each others' texts. A numbers of bilingual clauses with intra-sentential CS were extracted from these written texts. It should be mentioned that according to Myers-Scotton bilingualism is "the ability to use two or more languages sufficiently to carry on a limited casual conversation." (Myers-Scotton, 2006).

Instruments

We have applied Computer and internet as the instruments of the present study in order to collect data, no special software was used to extract the information, and the data was extracted randomly and manually through the pages of Mohajersara website.

Statistical procedure

As mentioned in the previous section this model has some principles for determining the matrix language from the embedded language and therefore the model has a specific design and procedure. In this study two decisive factors which are morpheme order and the source of a special type of system morphemes were considered in each bilingual clause for identifying the Matrix Language. Wherever the two languages involved in CS have distinct surface orders, the morpheme order will be applicable and thus this is true of Persian and English, since Persian is SOV language while English is SVO.

The application of the first factor which is morpheme order results in four possible outcomes:

- (1) “Persian” is marked as the ML if the order of morphemes follow Persian rules;
- (2) “English” is marked as the ML if the order of morphemes follow English rules;
- (3) “either” is marked if the order is well-matched with both of the languages;
- (4) “neither” is marked if the order is not well-matched with either of the languages.

After the application of the first factor (morpheme order), the application of the second factor was applied. Identifying the source of system morphemes. According to Myers-Scotton (2002), in a mixed constituent, all system morphemes which have grammatical relations external to their head constituents will come from the Matrix Language. These morphemes are called the outsider late system morphemes. Examples of outsiders are morphemes marking sub /obj-verb agreement and case affixes in some languages. Considering this factor, we can have three different conditions in our bilingual CPs:

- (1) Persian is the source of outsider late system morphemes
- (2) English is the source of outsider late system morphemes
- (3) Both Persian and English provide late system morphemes

After the application of above factors on the data, the percentage of Persian and English as the matrix language is shown in different tables for each principle.

Data Analysis

All of the bilingual utterances were extracted manually. The utterances were then divided so that the resulting units of analysis were bilingual clauses. The data were analyzed according to the MLF framework, in order to identify each clause as having a Persian, an English, either or neither ML. Additionally another classification was defined in the data analysis process, which was the verb formation process for Persian compound verbs found in data. The verb formation processes were involved (1) EL Verb + ML Verb and (2) EL Noun +ML Verb. In fact the samples were descriptively analyzed one after each other. By descriptive analysis we mean that for each example, the reasons which made the CP to mark as Persian, English or etc. were discussed. Then, after the process of descriptive analysis for each CP, the number of each ML categorization was counted and the percentage for each ML category was calculated using the percentage formula for both morpheme order principle and system morpheme principle.

Testing the Morpheme Order Principle on data

According to this principle in any of the bilingual clauses of the data, the Matrix Language dictates the word order of the CP. As we know the word order for Persian language and English language are not equal. The major constituent order of Persian is SOV and the major order for English is SVO.

The following are several examples that show the differences of ML and EL word order and we can obviously see that one of the participating languages which is ML dictates the surface structure of the CP.

- (3) har **state-i** ye **tax-i** dare bara mahsoolat-eš.
each state-indef one tax-indef have.3rds for product-pl-posspr
Each state has different taxes for its products.

This clause simply shows the different patterns for Persian and English word order. The place of object and verb show that the ML is Persian. Another point is that although the word *tax* can be used as a singular mass noun in English, but it uses in plural form when it aims to refer to different kinds of levies. Here the word *tax* which is a noun of EL, embedded in a bilingual CP, have a singular form in the CP refereeing to different kinds of levies. It seems that the word *taxes* tend to be singular here because the morpho-syntactic frame is organized by Persian grammar. But it may sounds ungrammatical if we use the singular form in the same CP of English.

- (4) Ø mixāstim **cell phone** begirim
want-1stpl cell phone get-1stp
We wanted to get (buy) cell phone.

In this example we can obviously see that the word order of the CP obeys Persian grammar. Considering the fact that Persian is a pro-drop language, the subject can be absent and when the subject is absent, the ending of the verb determines the person and number of the subject. Here for the subject *ma* which is a null-subject, we have *-im* clitic which is a subject-verb agreement on both of the verbs in CP. We can also see that the word *cell phone* (which is an EL element) is placed in the Persian object position and placed before the verb *begirim*. According to these two reasons Persian is the Matrix language.

- (5) Ø say konid be Engelisi **communicate** konid. (SCV)
Try do-2ndpl in English communicate do-2ndpl
Try to communicate in English.

In the previous example we pointed out that Persian is a pro-drop language but English is not. When a language is not pro-drop, it means that it is a non-null-subject language. But there are exceptions even for a non-null-subject language as English. For English language, it is standard for clauses in imperative mood to lack explicit subjects. Considering this fact, the above example is a challenging case in determining the ML.

In this CP we can see that the subject position is empty in Persian, and Here we have a null-subject (*šoma*), which is a characteristic of Persian language but not English. Besides since the clause has an imperative mood, it has a null-subject (*you*) in English too. This may cause the CP to seem to be compatible with the word order of both Persian and English. But still, there remain some points which make Persian as the ML. Firstly; here we have inflection on the verbs which is a specific feature of Persian. Secondly, the position of the verb shows that the ML is Persian.

- (6) man tu **highway** ziād ranandegi mikonam. (SACV)
I on highway too much drive do-1S
I drive too much on highway.

As we can see the verb *mikonam* is in the final position in this clause and the word *ziād* which is a complement for the verb, obeyed Persian word order and placed before the verb; but for English the verb complement position is after the verb, thus the clause has obeyed the Persian word order. So we should consider Persian as the matrix language of the clause.

- (7) key **approve-šun** umade?
when approve-POSS come-PST
when did their approve(letter) come?

Here the affix-*šun* is the possessive adjective which joints to the English noun, *approve*. According to the place of pronoun, the ML for this CP is considered to be Persian.

Persian compound verb formations in bilingual Cps

EL verb+ ML verb

- (8) Ø bayad **apply** konam.
should apply do-1sts-PRES
I should apply.

The word order of this CP is SV, and thus the ML can be marked as 'either', because it's acceptable in both of the languages. But before deciding on the matrix language, there is a point about Persian verbs that we should pay attention to. As we know in Persian language like many other languages, verbs are divided into two categories of simple and compound verbs. A compound verb is a multi-word compound that functions as a single verb. For a compound verb in Persian usually a noun or an adjective is combined with a light verb and makes a compound verb. For example:

Noun + Light v → compound v šekast dādan / šekast xordan
Adj + Light v → compound v xaste šodan / xaste kardan

Here we have an English verb (*apply*) in the CP which combined with a Persian light verb (*konam*) and formed the Persian compound verb (*apply konam*). But as we referred to Persian compound verb formations, a v+v compound do not occur in Persian language. Although we do not have such a compound v constituent in Persian but the combination of this English v with a

Persian light v is completely meaningful and possible here in this CP. This makes the decision a little bit hard. So, we mark the ML of this CP as ambiguous. There are several cases in the data in which an English lexical verb is combined with a Persian ¹light verb. The following are some examples:

- (9) Ø bad az yek sāl **instate** šodim.
after one year instate become-1stpl-PST
We instated after a year.

Although in this CP the Persian compound verb formation goes through the same process as number (9), and it makes the decision on what is the matrix language a little difficult but we can simply mark Persian as the ML if we look at the word order which obeys Persian rules, v is located at the final position and verb complement is placed before the verb.

- (10) Øunja ro(-ra) **leave** kardim.
There obj-marker leave do-1stpl-PST
We left there.

The determining factors in this CP are as follow: subject and object position. Subject-verb agreement and verb position. All these elements follow Persian grammar rules.

- (11) key šomā **lease** kardid?
when you -pl lease do-2ndpl-PST
When did you lease?

The surface structure seems to be equal in both Persian and English, so the matrix language can be marked as either by morpheme order principle.

- (12) agar in kar-o bekonid, mojebe **distract** šodane havas-e-šun miše.
If def job-obj do-2ndpl, cause distract become attention-poss become.
If you do this, it will distract them.

- (13) Ø faqat bače ro(-ra) **care** mikone.
just baby obj-marker care do-3rdS-PRES
She/He just takes care of the baby.

Persian is considered as ML in two (12-13) above clauses.

EL noun+ ML verb

In a number of cases an English noun joints to a Persian light verb to built up a Persian compound verb. A number of examples are as follow:

- (14) Ø mitars-am na-tun-am **handle** kon-am.

¹Persian light verbs are as follow :Kardan / šodan / zadan / dādan / dāštan / āmadan / andāxtan / āvardan

afraid-1sts NEG-can-1sts handle do-1sts
I'm afraid (that) I can't handle the problems.

In this CP the English noun (*handle*) combined with the Persian light verb(*konam*), made the compound v (*handle konam*) which means (*edāre konam*) in Persian. The compound verb formation obeyed the Persian formation process. The surface word order seems acceptable in both Persian and English. But since we have subject-verb agreement on verbs and we have a Persian compound verb formation process, we marked ML to be Persian.

(15) Ina ro bayad raayat konid vagarna **detention** mikonan.
These obj-m should respect do-2ndpl otherwise-NEG detention do-3rd pl.CONT
You should respect these (law), otherwise they will arrest you.

Here the noun (*detention*) is added to the verb (*mikonan*), and made the compound v of (*detention mikonan*) which obeys Persian grammar rules. We considered Persian as the ML in number 15.

(16) tā do sāl-e dige **citizen** miše.
In two year other citizen become.3rdS
He will be a citizen in two years.

Table 1: Persian compound verb formations found in bilingual CPs

EL verb + ML verb	EL noun + ML verb
Instate šodan	Handle kardan
Distract šodan	Detention kardan
Apply kardan	Citizen šodan

Testing the System Morpheme Principle on data

As we mentioned earlier, according to system morpheme principle, outsider late system morphemes must come from the ML. There are some examples of outsider late system morphemes:

(17) Ø tuye dog friendly-tarin šahr zendegi mi-kon-**am**
in dog friendly-superlative city live do-CONT-1sts
I live in the most dog friendly city.

(18) bedune passport ne-mitun-**id** check in beš-**id**.
without passport NEG-can-cont-1stpl check in become-2nd pl
You cannot check in without a passport.

(19) Øgofteš ke she drives like crazy.
Say-past-3rds that she drive-3rds like crazy

He/she said that she drives like crazy.

As we can see in above (17, 18) examples, Persian personal endings (-am, -id) which are morphemes that placed at the end of verbs and are used to mark person, and the number of the verb are coming from Persian, these are a typical examples of outsider late system morphemes and thus according to system morpheme principle “Persian” should be marked as the ML here. For number (19), we can see that the personal endings are coming from both Persian (-š in *gošteš*) and English (-s in *drives*), and the ML should be marked as “either” according to system morpheme principle. But if we take a deeper look into this CP we can see that there exists a challenging point which makes it a little hard to decide which language is the ML here. If we consider the morpheme order principle here, at first it seems that the order of morphemes in the whole CP is compatible with both Persian and English, and thus the ML must be marked as “either” according to morpheme order principle, but in a deeper look of Persian and English structure, we know that it’s only in “Persian” that we can have null subjects and not English. Considering this feature, Persian is qualified to be marked as ML according to morpheme order principle and not English, because it is only in imperative mood of English that we can have null subjects. So, the challenging point is that if we have Persian as ML according to both morpheme order and system morpheme, then how can it be possible to have an outsider late system morpheme from the EL? We mark this CP as “ambiguous” for system morpheme principle.

(20) Ø faqat bače **ro(-ra)** **care** mikone.
just baby obj-marker care do-3rdS-PRES
She/He just takes care of the baby.

(21) man **white trash-ha** **ro(-ra)** qabul daram
I white trash-pl obj-marker accept
I count on white trash(Americans) .

(22) aval begir **permīto (-ra)**, ba’ad...
first receive Permit obj-marker , then...
First, receive the permit, then....

(23) Amricai- hā nemipazirand discrimination **o(-ra)**
American-pl NEG-accept-3pl discrimination obj-marker
The Americans do not accept discrimination.

Another type of outsider late system morphemes are case affixes. Considering this fact, we can note that Persian has one overt case morpheme, the accusative suffix –ra which is obligatory on specific direct objects (Ganjavi 2007, Karimi 1991, 2003a, 2005). Although there have been debates on what –ra actually is, most of the linguists suggest that –ra is, in fact the accusative case morpheme. So, Persian is considered as the matrix language according to system morpheme principle in examples number (20) to (23).

Testing the Uniform Structure Principle on data

As it was mentioned before in the definition of this principle, uniform structure principle predicts that the structure of the Matrix Language is always preferred in bilingual CPs. In the previous sections, we saw that content morphemes are supported by both ML and EL, whether each of the languages is the ML in each specific CPs. But outsider late system morphemes supports only from the ML. In other words, English as the EL in our corpus provides only content morphemes. This obviously indicates that the structure of Persian is preferred in our data as the Matrix Language, and thus this is a support of the uniform structure principle.

RESULTS AND DISCUSSION

Having applied the principles on the data, the results indicated that in most of the bilingual clauses in the sample, the Matrix Language can be identified as Persian according to the morpheme order principle. In fact only 15 CPs found for which the matrix language can be marked as 'either' which is equal to 7.00 %. The analysis of the bilingual clauses in the sample according to the System Morpheme Principle showed that Persian provides system morphemes in 91.66percentages of the cases. Table 2 and 3 show the percentage of each principle for the sample data.

Table 2: Percentage of matrix language according to morpheme order principle

Matrix language	Number of CPs	Percent
Persian	265	88.33
English	8	2.66
Either	21	7.00
Neither	6	0.66
Total	300	100

Table 3: Percentage of matrix language according to system morpheme principle

Matrix language	Number of CPs	Percent
Persian	275	91.66
English	8	2.66
Either	17	5.66
Total	300	100

According to the results of this study the answer to the first question reveals that written CS can be predicted by MLF model which is a model developed for speech and therefore there found no limitations for the application of the MLF model to written data and thus the written data can be as much valuable in morpho-syntactic analysis of CS phenomenon as speech data are. For the second question we came to the conclusion that Persian-English CS can be considered as a classic case of CS in order to which only one of the participating languages is the source of morpho-syntactic frame of the CPs. In 88.33% of CPs considering the morpheme order principle and 91.66% of CPs considering the system morpheme principle, Persian is the source of morpho-

syntactic frame of the bilingual CPs. The results of this study are in line with other earlier studies on CS through the framework of MLF model in Persian as a participating language and other language pairs like Welsh-English (Margaret Deuchar, 2006), Spanish-English (Laura Callahan, 2004), Chinese-English (Yu Liu, 2007) etc. Although all these mentioned studies, validate the applicability of MLF principles, but it seems that ambiguous CPs or counterexamples might be found in data samples, like what we found in number (8) and (19), and thus there is a need for further research in this framework.

CONCLUSION

Based on the findings of this study, the data tested was significantly compatible with the MLF principles. This suggest that written Persian-English CS in indeed a classic case of CS and the morpho-syntactic analysis of the data indicates that Persian is the ML which dominantly provides the morpho-syntactic frame for the mixed constituents and on the other hand English is contributed as the EL. The findings have implications for the use of written data in linguistics analysis in our limited corpus. Applying morpho-syntactic models rather than sociolinguistic models can be considered as a tool for analyzing different contact phenomena, such as CS, especially for analyzing bilingual children's CS since its obvious that different developmental factor interact with language contact phenomena. The MLF model also can be applied to classical bilingual written texts in Persian such as S'aadi or Molana books, etc in order to testify the universality of the principles of the model and in order to test the validity of written data for linguistic analysis.

ENGLISH LINGUAFRANCA (ELF) AS A MEANS OF COMMUNICATION AMONG CONSTRUCTION WORKERS IN GHANA

Albert Agbesi Wornyo

University of Education, Winneba, Ghana

ABSTRACT

In countries that English is spoken as a second language, it is mainly learnt in the classroom as a school subject. However, individuals who have not had formal education can acquire and use English in informal settings outside the classroom. This study explores the various social contact situations and instances that motivate or make it necessary for construction workers to acquire and use English at the construction site. It also seeks to discover the communicative strategies employed by the construction workers to communicate. Using observations and interviews, it was discovered that some construction workers acquire and use English through their interaction with workers they do not share the same Ghanaian language with. The findings of the study show the reality of the global use of English as a language for communication beyond academic and official circles. The study concludes that though the English acquired and used among the construction workers is not the Standard English spoken by educated Ghanaians, it enables them to communicate to get their work done at the construction site.

KEYWORDS: construction workers, social interaction, communicative strategies

INTRODUCTION

In Ghana, English is spoken as a second language. In English as Second Language (ESL) countries, the English language is used as the official language of the country as well as for inter-ethnic communication. For this reason the English language serves as the language of rule and it is learnt in school. Though the English language is mainly learnt in the classroom as a school subject because it is spoken as the official language and used for inter-ethnic communication among educated people, the communicative environment serves as language input for people who have had little or no classroom education to acquire English. Rogers (2004) observes that because English is dominantly spoken or is the official language in an ESL context, language learners can make use of social interaction as a source of language input to acquire the language in an informal setting.

In Ghana, just as it is in most African countries, people migrate from the rural areas to the capital city to work. Some of the people, who migrate to the capital city to work or look for job, are people who have had little or no classroom education. Some of these people who migrate to the capital city, Accra, work as artisans, casual workers in factories, labourers, taxi drivers and others engage in all sorts of petty trading.

For some of these people, the environment or the social context in which they work make them come into contact with people who speak English. For this reason, they have the opportunity to learn English in an informal setting outside the classroom.

In addition, people who migrate to the capital city come from different parts of the country and for that matter speak different languages. As pointed out earlier, English is used for inter-ethnic communication among educated Ghanaians. People with little or no classroom education who speak different languages and cannot speak English like the educated Ghanaians are confronted with communication problems when they have to interact with people outside their ethnic group in the city of Accra. How is this communication problem resolved?

As noted earlier, the social context of ESL countries as the case is in Ghana provides the opportunity for some of the people who migrate to the capital city to learn English. Even though the multilingual situation in Ghana has led to the situation where many Ghanaians speak two or more Ghanaian languages, the ESL context still enables some Ghanaians who have not had formal education to learn English outside the classroom in an informal situation.

The kind of work that people who have not learnt English in the classroom do to some extent determine the people they come into contact with. Individuals who by virtue of the work they do or the kind of social interactions that they have expose them to people who speak English, are likely to learn to speak English to some level of proficiency.

Apart from the kind of work or exposure that an individual has had which is a factor that can facilitate the learning of a second language, learning a second language is also facilitated by different kinds of motivation. The inner edge that an individual has toward the learning of language facilitates the learning of a second language. In addition, the purpose of enhancing one's intercultural communication and affiliation serves as motivation for learning a second language.

Gardner (2001), states that learning a second language stems from the integrative motivation of the individual to identify with the speakers of the second language (L2) community. And Dornyei (1990) explains that in the absence of a salient L2 group in the learner's environment (as the case is in the ESL context of Ghana where English is learnt in school) the identification can be generalized to the cultural and intellectual values associated with the L2.

Though social interaction and motivation are not the only factors that facilitate the learning of a second language, they are by far the major factors to consider in any study that investigates the learning of a second language.

This paper seeks to explore the various social contact situations and the factors or the instances that motivate or make it necessary for individuals who have had little or no formal education and work in the construction field to acquire and use English outside the classroom in the ESL context of Ghana. It also seeks to discover the communicative strategies employed by the construction workers to manage communication when they have to use English.

LITERATURE REVIEW

A number of studies have been conducted on the role of motivation and social interaction in the learning of a second language. Social contact situations and motivation play vital roles in the acquisition of a second language. In an informal setting too these factors still play important roles in the acquisition and use of English as a second language. People in ESL countries learn English in informal settings under several different circumstances and for several different reasons. Moreover, the way communication takes place in multilingual communities involves certain negotiation strategies. The literature review focuses on studies that have considered how communication takes place in multilingual communities and also addresses the role of social interaction and motivation in the acquisition and use of a second language with reference to the acquisition and use of English in ESL settings.

Communication in Multilingual Communities

How people communicate in communities which are linguistically heterogeneous is different in many ways from how people communicate in monolingual communities. In multilingual communities the complex language contact situation brings with it different norms. Canagarajah and Wurr (2011) question the theorization of speech community as based on shared language which makes the notion of a speech community homogeneous. According to them, for South Asians, community is based on shared space. Therefore, it can accommodate many language groups living in the same geographical space. Such communities assume diversity and contact. Language diversity is the norm in such communities. This is the kind of communities we have in the situation of Ghana; especially in the capital city Accra and other urban communities in Ghana.

In one neighbourhood in Ghana, one can count as many as more than ten languages co-existing in one community. When one moves out of one's house, one encounters people who speak different languages. One does not assume one will come into contact with others who speak one's own language. Though many people speak more than one language, sometimes, there is no common language to facilitate interaction among interlocutors. In most cases the common language that interlocutors may share may be English or Akan. Canagarajah and Wurr (2011:2) in their description of the situation in Asia, pointed out that what enables people to communicate in such multilingual communities is "not a shared grammar, but communicative practices and strategies that are used to negotiate their language differences." They observe that the speakers negotiate their differences to construct norms that work for them in their conversation. These are intersubjective norms; they are co-constructed. While these norms will work in that particular context, they may not work for another set of communicators.

One of the earliest strategies to emerge in the use of English as a lingua franca (ELF) was documented by Firth (1996) in what he calls the let it pass principle. It is noted that multilinguals do not disturb the flow of communication when one encounters a word or structure that deviates from one's norms or turns out to be unintelligible. The person waits patiently for further occurrences of the item, so that with more clues or additional opportunities the person is able to renegotiate it for him or her to construct meaning. Canagarajah (2007) points out that to know more about the negotiation strategies and communicative practices that facilitate communication,

we have to directly observe and empirically analyze interactions. The strategies we derive from ELF research is a good starting point. They help us develop a more representative taxonomy and a list of strategies that multilinguals adopt in their interactions.

Kramersch (2002) points out that what multilinguals aim to achieve therefore is an alignment of the language resources they have with the purposes in question. He indicates that successful communication depends on aligning the linguistic resources to the social, situational, and physical features operative in a context. Atkinson, Churchill, Nishino and Okada (2007:171) define alignment as “the means by which human actors dynamically adapt to—that is, flexibly depend on, integrate with, and construct—the ever- changing mind-body-world environments posited by sociocognitive theory”. In other words, alignment takes place not just between human beings, but also between human beings and their social and physical environments.

Khubchandani (1997:94) cited in Canagarajah and Wurr (2011:2) identifies two strategies used by communicators to negotiate their language differences. He referred to these two strategies as “serendipity and synergy.” He explains these strategies as follows:

Individuals in such societies acquire more synergy (i.e., putting forth one’s own efforts) and serendipity (i.e., accepting the other on his/her own terms, being open to unexpectedness), and develop positive attitudes to variations in speech (to the extent of even appropriating deviations as the norm in the lingua franca), in the process of coming out from their own language codes to a neutral ground. (Khubchandani, 1997:94)

The communicators in these situations are constantly exposed to codes that they are not familiar with in their interaction with speakers of other languages. In their effort to construct mutual intelligibility, they become more open to unexpected norms.

Several studies have confirmed that multilinguals who use English in contact situations do not adopt a common code. For example, House (2003) in a study, shows how students of English from different countries use culture specific pragmatic strategies to facilitate communication with outsiders. Canagarajah, (2006) found that multilinguals who use English for contact purposes start with their own codes and adopt negotiation strategies to achieve intelligibility. In this sense, LFE is a locally achieved practice.

It has also been pointed out in the literature that the objective of language learning is also different for multilinguals. They do not aim to master a language for all purposes and functions. They master the codes that are sufficient for the functions they want that language to perform. There is no need to develop proficiency in all the languages for the same purposes or the same language for all purposes. Multilinguals adopt different codes in different contexts and for different objectives. From this perspective, the objective of their acquisition is repertoire building rather than total competence in individual languages. Multilinguals prefer to develop a range of codes for a range of purposes.

Based on her observations of multilinguals, House (2003:559) argues that ELF (English lingua franca) users are competent enough to be able to monitor each other’s moves at a high level of

awareness. Canagarajah (2007) observes that the competence of ELF speakers is of course different from that of monolinguals. This competence for cross-language contact and hybrid codes is derived from their multilingual life. According to Canagarajah, because of the diversity at the heart of this communicative medium, ELF is intersubjectively constructed in each specific context of interaction. The form of this English is negotiated by each set of speakers for their purposes. The speakers tend to be tolerant and try to monitor each other's language proficiency to determine mutually the appropriate grammar, phonology, lexical range, and pragmatic conventions that would ensure intelligibility. The speakers involved in the interaction tend to negotiate what is acceptable for the purpose of their interaction.

Motivation in L2 Learning

L2 motivation research started in Canada because of the unique situation of Canada with the co-existence of English and French communities (Gardner & Lambert, 1972). As a result of this, early studies on L2 motivation such as Gardner and Lambert (1972) viewed L2s as mediating factors between different ethnolinguistic communities in multicultural settings.

In this case, an individual's motivation to learn the language of another community is for the purpose of enhancing intercultural communication. The idea of an individual's desire to communicate with people from the other speech community led to the notion of the language learners' desire to integrate into the culture of the second language community. For this reason, the L2 motivation that has been well developed is the integrative motive.

A well known example is Gardner's (1985) motivation theory. Under the integrative motivation approach, it implies that the learner of a second language has a positive affective disposition toward the L2 community or speakers and has the desire to interact with them and associate with them and become similar to the members of that community. This further implies that the L2 learner has respect for the members of the L2 group and wants to be identified with them.

For the case of an ESL situation, there is no salient L2 group that the L2 learner would like to integrate with. Since there is no salient L2 group, Dornyei and Csizer (2002) have expanded the meaning of the integrative motive to also refer to some more basic identification process within the individuals self concept. They pointed out that the concept of 'possible self' and 'ideal self' proposed by Markus and Nurius's (1986) form part of the integrative motivation. According to Markus and Nurius (1986 : 954) 'possible selves' represent "individuals' ideas of what they might become, what they would like to become, and what they are afraid of becoming" and "ideal self represent the attributes that a person would like to possess."

Gardner (2007) states that when considering motivation and second language learning or acquisition, it is possible to consider two types of motivational constructs. According to him research has always contended that there are in essence two types of motivation that should be considered when referring to second language acquisition. The two motivational constructs that are well known are integrative and instrumental motivation.

Instrumental motivation in learning a second language relates to how the learning of a second language can help an individual to improve in his or her career. An example of instrumental motivation for L2 is a study carried out by Wongthong and Sriwanthana (2007). The study reports how a group of taxi drivers experienced problems because of their lack of fluency in English caused by extreme poverty that denied them access to formal education. According to the study, the drivers believe that with improved English competency, they would live their lives and earn a living more comfortably.

Social Interaction in L2 learning

Research on interaction is conducted within the framework of the Interactive Hypothesis, which emphasizes that conversational interaction facilitates language acquisition because it connects input (what learners hear and read); internal learner capacities, particularly selective attention; and output (what learners produce) in productive ways (Long, 1981). Interaction provides learners with opportunities to receive comprehensible input and feedback as well as to make changes in their own linguistic output by making adjustments in what they say to match with the norms of the target language. Long investigates conversations between a native speaker (NS) and nonnative speaker (NNS) and proposes that negotiation for meaning, and especially negotiation work that triggers interactional adjustments by the NS or more competent interlocutor, facilitates acquisition because it connects input, internal learner capacities, particularly selective attention, and output in productive ways (Long, 1983).

Vygotsky (1978) emphasizes the importance of social interaction in the acquisition of language and proposes the “Zone of Proximal Development” (ZPD). The most frequently referenced definition of the ZPD is “the distance between the actual developmental level as determined by independent problem solving and the level of potential development as determined through problem solving under adult guidance or in collaboration with more capable peers” (Vygotsky, 1978:86). Vygotsky laid the foundation for the interactionists view of language acquisition. According to Vygotsky, social interaction plays an important role in the learning process.

Vygotsky suggests that private speech, as is the case of social speech between people who have a great deal of shared knowledge, need not be fully syntactic in its form. Frawley (1997) argues that such utterances serve to focus the speaker’s attention on what needs to be accomplished, how to accomplish it, and when something has been accomplished, and then allows the speaker evaluate what has been accomplished. He points out that different languages offer their speakers different linguistic options for carrying out such mental activities.

Social interaction plays an important role in language acquisition. Dornyei and Csizer (2002), observes that the importance of language learning as a social event is recognized by L2 researchers, resulting in the inclusion of a prominent social dimension in most comprehensive constructs of L2 motivation, related to issues such as multiculturalism language globalization, language contact and power relations between different ethnolinguistic groups. The role of social interaction in the learning of L2 is also emphasized by Williams (1994) when he points out that though L2 is a ‘learnable’ school subject that is taught explicitly, it is also a deeply social event that requires the incorporation of a wide range of elements of the L2 culture.

Social interaction is important in second language acquisition because of a number of reasons. The purpose of learning a language is to communicate with others. For one to learn the language of another group of people is to enable one communicate with that group of people. Bahrani and Sim (2012) point out that whether language acquisition is to take place in formal or informal language learning settings, ESL context or English as a foreign language (EFL) context, language learners need to have exposure and access to a sort of language input.

STATEMENT OF THE PROBLEM

Much of language acquisition studies tend to be classroom based. But we do know that a lot of language acquisition takes place outside the classroom in informal settings. Language acquisition takes place in a number of everyday contexts. Classroom learning strategies may not fully reflect the acquisition in everyday communicative contexts. There is therefore the need to study interactions outside the classroom. There is also the need to conduct studies in communities outside the academic or scholarly environment to enrich knowledge about language acquisition and use.

There is the need for more studies on everyday contexts of language acquisition and use. There is the need to learn more about why adults learn a second language and the negotiation strategies they employ to manage communication and learning. Canagarajah (2007) strongly suggests the need for more studies to be conducted in communities outside the academic setting to provide insight into language acquisition and use in multilingual communities. According to him such studies are important because they reveal that language acquisition is based on performance strategies, purposive uses of the language, and interpersonal negotiations in fluid communicative contexts

RESEARCH QUESTIONS

The objective of the study is to explore the acquisition and use of English outside the classroom in the ESL context of Ghana.

The research questions of the study are:

1. How does social interaction enhance the acquisition and use of English among construction workers who have had little or no formal education?
2. What factors motivate construction workers to acquire and use English?
3. What are the motivated learning behaviours of construction workers?
4. What social contexts facilitate the acquisition and use of English among construction workers?
5. What are the negotiation strategies employed by construction worker to manage communication?

THEORETICAL FRAMEWORK

This study is conducted within the framework of English lingua franca or English as a lingua franca (ELF) which falls within the broad framework of World Englishes (WE). According to

Pakir (2009) the label WE is used to refer to 'new Englishes (institutionalized varieties or nativized and indigenized varieties used in countries that use English as a second language) proposed by Kachru. WE also refer to the wide-ranging approach to the study of the English language worldwide. Kachru (1985) proposes three circles in which the English language is used: the inner circle for native speaker setting, the outer circle for ESL settings and the expanding circle for the spread of English around the world.

An important contribution to the groundbreaking work by Kachru is now occurring for the Expanding Circle English. In this respect, Brutt-Griffler (2002) proposes the term World English. This he explains as language change through the processes of world language convergence and world language divergence (i.e., World English spreads due to the fact that many people learn it rather than by speakers of English migrating to other areas; thus two processes happen concurrently: new varieties are created and unity in the world language is maintained.) World English proposed by Brutt-Griffler (2002) is now used as a general cover term for uses of English spanning Inner Circle, Outer Circle, and Expanding Circle contexts proposed by Kachru (1985). The meaning of the term WE thus now, comprises uses of English within and across Kachru's 'Circles', for intranational as well as international communication.

Some researchers who study the use of English have indicated that the labels inner circle, outer circle and expanding circles are misleading. For example, Schneider (2003) points out that the use of outer circle to refer to ESL countries such as Nigeria, Ghana, India and Singapore, for example is not appropriate because there exists an increasing proportion of indigenous people who grow up speaking some form of English as their mother tongue. From Schneider's point of view, the three overlapping circles proposed by Kachru seems to draw a distinction between English as a native language (ENL), English as a second language (ESL) and English as a foreign language (EFL). But Kachru indicates that English belongs to all who use it and that norms and standards should no longer be determined by Inner Circle/ENL. This revolution started by Kachru has led to the wide spread study of English use among non-native settings.

The study of English use among non-native speakers of English who do not share the same L1 is the new paradigm within the study of English. What is established in the study of English is that it is the inner circle or native speakers' variety that directs the current of English language teaching pedagogies. This is what is usually referred to as Standard English. The definition that is generally accepted to represent this variety is that given by Trudgil and Hannah (1995:1) cited in Pakir (2009:225) as:

The variety of the English language which is normally employed in writing and normally spoken by 'educated' speakers of the language. It is also, of course the variety of English that students as Foreign or Second Language (EFL/ESL) are taught when receiving formal instruction.

The established paradigm is being challenged in the 21st century by the emerging and evolving paradigm of non native speakers' use of English within the world Englishes. Pakir (2009) indicates that it took a long time before admitting WE perspectives in discussions or even recognizing WE as a viable approach to studying English in the world. Schmitz (2012) also

observes that the realization that there are more nonnative speakers than native speakers of English in the world with institutionalized and nativized varieties as well as their own specific communicative, cultural and pragmatic competencies has led to the rethinking of present-day practices in teaching, teacher preparation, and the writing of textbooks. The World Englishes 'revolution' led by Kachru established itself as a new and emerging alternative to teaching and researching English as a language in the world. It is within this paradigm that English used by nonnative speakers for intra-ethnic communication as well as international communication referred to as English as a lingua franca (ELF) is gaining recognition and spread.

Now let us turn to the definition of English as a lingua franca or English lingua franca (ELF) and what it entails. Seidlhofer (2005) states that in recent years, the term ELF has emerged as a way of referring to communication in English between speakers with different first languages. And according to Crystal (2003) roughly, only one out of every four users of English in the world is a native speaker of the language. So, most ELF interactions take place among nonnative speakers of English. What is distinctive about ELF is that, in most cases, it is a 'contact language' for inter-ethnic or inter-national communication.

The widely cited definition of ELF is that of Firth (1996:240) who defines ELF as "a 'contact language' between persons who share neither a common native tongue nor a common (national) culture and for whom English is the chosen foreign language of communication." The website of ELF known as the VOICE describes ELF as an additionally acquired language system which serves as a common means of communication for speakers of different first languages. Jenkins, Cogo and Dewey (2011) observe that no definition of ELF could be complete without considering its similarities to and differences from the well-established World Englishes paradigm. They pointed out that while these two paradigms differ in certain ways, their research orientations have a good deal in common. Both explore the ways in which the resulting 'new' Englishes develop in their own right as a means of expressing their nonnative speakers' sociocultural identities instead of the norms of a native speaker of English.

One difference between WE and ELF pointed out by Dewey (2007) is that while World Englishes research is interested primarily in the study of 'bounded' varieties of English, the position of ELF research is that the world has become so interconnected, and English so bound up with processes of globalization, that a traditional varieties orientation is no longer viable, and that we should, instead, focus on English as fluid, flexible, contingent, hybrid and deeply intercultural by the nature of its use. Pennycook (2007) also points out, that the world Englishes framework places nationalism at its core while ELF, with its built-in scope for variability, is similar to the notion of plurilithic Englishes.

The definition of ELF makes it part of the general phenomenon of WE. The specific instance that ELF is used is when English is chosen as the means of communication among people from different first language backgrounds, across linguistic boundaries.

ELF is described as emerging. It is not a finished product and therefore difficult to describe; it is being developed. Jenkins (2007), who is one of the proponents of ELF, considers it an emerging

language that exists in its own right and is being described in its own terms. Jenkins contends that ELF is a contact language not dependent on native speaker norms (British or American English) and is molded by its many speakers in the world who are multilingual and whose L1s are not English. Jenkins, Cogo and Dewey (2011) also noted that ELF involves not only the frequent systematic use of certain forms (lexicogrammatical, phonological and so on) that are not found in native English, but also a range of pragmatic on-line processes that determine which particular forms are utilized at any particular point in a given interaction. And this calls into question the viability of attempting a description of ELF in the first place, at least according to the traditional sense of 'language description'.

ELF researchers are engaged in exploring ELF use in a number of domains of social contact, particularly those of business, education (both school and university settings), tourism, politics, technology and the media (Jenkins, Cogo and Dewey, 2011). They noted that two domains – business and higher education – have been more extensively studied in relation to ELF than any other. ELF research focus on domains is said to be in line with the observation of McGroarty (2003) that there has been a shift of emphasis in sociolinguistics from the study of language contact across geographical boundaries to domains as fruitful contexts for the study of language contact.

RESEARCH DESIGN AND METHOD

The research design was aimed at finding out how construction workers who have had little or no formal education acquire and use English to communicate with people they do not share the same L1 with. The social contexts that facilitate the acquisition and use of English among construction workers were explored. There was also a focus on the negotiation strategies used by the construction workers in their interaction with others who do not speak their L1.

Participants

The participants for the study were construction workers who were carpenters, masons, painters, electricians, still benders and labourers resident in Accra, the capital city of Ghana. There were between twenty to thirty workers at work at the times that the construction sites were visited for observation. Though these workers reside in the Accra, they travel to other parts of the country to work.

Some of these workers have had little or no formal education and for that matter cannot speak English as educated Ghanaians. These workers come from different parts of the country and speak different languages. Though the majority of them speak more than one Ghanaian language, a few of them speak only their native language. In their interaction with one another they speak the local language common to them.

However at the construction sites they sometimes work together with other construction workers who speak other languages. This is where communication problems arise. Because some of these construction workers speak only their native languages, in their interaction with other construction workers at the construction site it becomes necessary for them to speak English.

This is a challenge in multilingual communities like Ghana. The construction workers who have not had formal education and therefore cannot speak English are sometimes compelled to use English to communicate with other workers they do not share the same Ghanaian language with. For these workers, the acquisition and use of English is spontaneous.

Selection Criteria for Sites and Participants

Five construction sites were visited to observe instances where the construction workers use English in their interactions. The visits were meant to observe the communicative practices and strategies the construction workers use in their interactions.

The construction sites were selected according to how big the sites were in terms of the number of workers contracted from different ethnic backgrounds to work. This was the case because it is when a large number of workers are at the sites that one gets a multilingual situation of workers from different ethnic groups. It is during these instances that it becomes necessary for the workers to use English in their interactions because the workers come from different ethnic backgrounds and speak different languages. Moreover, it is on these occasions that you get workers who have had no formal education using English in their interaction with other workers they do not share the same Ghanaian language with at the site.

After interacting with a number of workers, seven workers were selected for interview. The interviews were conducted to find out from the workers the instances that they have to use English in their interaction with others and the factors that motivate them to use English. The interviews were also meant to find out from the workers who have not had formal education how they learnt to speak English.

The participants for the interview were selected according to workers who have had little or no formal education but speak English with other workers especially at the construction site and their willingness to be interviewed. They were selected in consultation with the master carpenter who works as one of the supervisors. Five workers who have had little or no formal education were interviewed and two workers who have had formal education were also interviewed. In all, seven workers were interviewed.

Research Methods

Research methods comprised the following:

Non-participant site observation with field notes

Interviews with seven workers (some of the interviews were recorded)

The Research Process

Initial contact was made by contacting a master carpenter and a supervisor who has been working with a number of construction workers. This was meant to find out the instances that English is used as the medium of communication among the construction workers. Also, the initial contact was made to find out if there had been some workers he had worked with who have not had formal education and do not speak the languages that he speaks and how he was able to instruct them.

The initial contact was followed by an initial visit to one of the construction sites to meet some of the supervisors and workers. The visit was made to explain the purpose of the study to supervisors of the various sections or divisions of the construction site. There were supervisors for each group of workers. There were masons, carpenters, still benders, painters and electricians.

Five visits were made to the construction sites to observe the use of English among the construction workers. The observations were made to find out how English serves as the lingua franca in the situations where the workers speak different Ghanaian languages. The negotiation skills used by the workers in their interaction with other worker they do not share a common Ghanaian language with were taken note of.

In all, five visits were made to three construction sites. Of the three sites, two of them were visited twice and the third site was visited once, bringing the total number of visits to five.

FINDINGS AND DISCUSSIONS

From the observations and interviews conducted, the acquisition and use of English among construction workers takes place at the construction sites as a result of real communication needs. For these workers, their use of English becomes necessary when there is a communication gap as a result of language barrier. When two workers realize they do not share a common Ghanaian language, they resort to the use of English. This use of English among construction workers serves as a form of input for the workers who have had little or no formal education to acquire and use English to some level of proficiency.

The first objective of the study is to find out how social interaction among construction workers facilitates the acquisition and use of English. For individuals who have had little or no formal education, their interaction with construction workers who have had some formal education and speak English facilitates their acquisition and use of English. Some of the workers interviewed indicated that they began to use English to communicate at the construction sites right from their period of apprenticeship. According to the workers interviewed, the use of English begins with the learning of the names of their tools and how to take measurements.

The supervisors interviewed confirmed that people who have not had formal education acquire some level of English expressions that they interact with at the construction site even before they complete their period of apprenticeship which takes two years. According to them, most apprentice who have not had formal education are able to start using English expressions after a few weeks of going to the sites and interacting with them and other construction workers. The supervisors made it clear that people who have had formal education do not come under apprenticeship to become carpenters or masons. It is individuals who have had little or no formal education who come for training to become construction workers.

The social context that facilitates the use of English among construction workers is when working at the site with other workers who do not share the same Ghanaian language with them. Some of the workers interviewed stated that it is advisable to use English at the site when

working with people one does not share the same Ghanaian language with. According to them, when some workers begin to speak a particular Ghanaian language that the other workers do not understand, it raises suspicion and mistrust because of theft cases at construction sites. In such cases, English becomes the language that all the workers use. These situations serve as English language input for the workers who have had little or no formal education to use English in their interaction with the other workers. This facilitates their acquisition and use of English.

The English language is no doubt perceived as a prestigious language. There are some of the workers who are supervisors but did not have much formal education and are not able to express themselves well in English. Some of these supervisors insist on using English even when one is interacting with them in a Ghanaian language they speak. The motivation for their insistence on the use of English is obviously because of the prestige associated with English. This reflects Dornyei's (1990) explanation that in the absence of a salient L2 group in the learner's environment, the individual's desire to identify with the L2 can be generalized to the cultural and intellectual values associated with the L2.

Some individuals, like the supervisors with little formal education who want to be associated with the prestige that comes with the speaking of English are motivated to learn to speak English. The attitude of these supervisors confirms MacIntyre, Baker, Clement and Donovan (2002) observation that an individual's willingness to communicate is a motivating factor for the acquisition of a second language. A willingness to communicate is a motivating factor in L2 acquisition because there are L2 speakers who avoid communication in the L2 while some less proficient L2 speakers actively engage in L2 conversation.

Communication Strategies at the Construction Sites

The observations carried out reveal some strategies employed by the workers at the construction site to manage communication. One of the strategies used by the workers is to use a different code to respond to something said in English. Some of the labourers who cannot express themselves in English use the local language that they speak to answer questions posed to them in English. One of such scenario was an interaction between a mason who speaks Ewe and English and a labourer who speaks Akan. Questions posed in English were answered in Akan. Yet, the person who asked the question in English (who does not speak Akan) understood the answers given in Akan. Below is an example of a short conversation between the two workers.

Mason: Where is foreman?

Labourer: ɔse ɔreko fie (He said he has gone home)

Mason: Oh! So, when are we going to start the work?

Labourer: ɔse moba a menka nkyere mo se monhye ase (He said when you come I should tell you to start)

Mason: From where?

Labourer: ɔse aha (He said here)

Another communication strategy employed by the workers is translation. Sometimes, certain instructions given in English are translated into Akan by one of the workers to the rest of his colleagues. As if by convention or something agreed upon by the workers, to a large extent,

English and Akan serve as the two languages which are frequently used when there are workers who do not share the same Ghanaian language. There were instances that some workers who could not express themselves in Akan gave instructions in English to a group of labourers but the instructions were translated into Akan by one of the labourers to the rest of his colleagues.

The use of English among the workers goes on with some negotiation of meaning. Often, certain orders or instructions given are not fully understood. In such instances the addressees ask for clarification. Sometimes too, English expressions used were accompanied by gestures to facilitate communication. Much of English expressions used at the construction sites among the workers were not full sentences that were grammatical. Much of the expressions that the workers used were expressions that the workers themselves refer to as “broken English”.

In general, construction workers are not very proficient in English. My interaction with some of the supervisors reveals that in their use of English, their concern is not about grammar. This confirms Canagarajah and Wurr’s (2011) observation that what enables people to communicate in multilingual communities is not a shared grammar, but communicative practices and strategies that are used to negotiate their language differences. In addition to the use of “broken English”, there was codeswitching (a pervasive phenomenon in Ghana) among the workers. There were several instances of English expressions and expressions in Ghanaian languages juxtaposed in the same conversation and the insertion of English words into Ghanaian language sentences.

CONCLUSION

Even though English is mainly learnt in the classroom in ESL countries like Ghana, there are certain social contexts and instances that enable some individuals who have had little or no formal education to acquire and use English (at least to some level of proficiency). The English language acquired in informal settings outside the classroom may not be the Standard English spoken by educated Ghanaians but it enables them to communicate. After all, as pointed out by Canagarajah (2007) language acquisition is based on performance strategies, purposive uses of the language, and interpersonal negotiations in fluid communicative contexts.

The study is limited in its selection of construction sites for observation. Only construction sites where workers had been contracted from different ethnic backgrounds were selected for the study. Moreover, the workers who were interviewed may orient to the use of English differently in different contexts. In spite of these limitations, the findings of the study confirm that ELF is a flexible communicative means that takes place alongside other languages and forms part of a larger framework of multilingualism.

AN APPRAISAL OF KRASHEN'S MONITOR MODEL

Hamza Cherifi

University of Mostaganem, Site ITA, Mostaganem 2700, Algeria

ABSTRACT

Of all the constructs relevant to second language acquisition, Krashen's ideation appears the most "voicing" and, paradoxically, the most arrowed with questions of validity and pedagogical fitness. This disparity has, unfortunately, turned out to be a fashion move in discourses on the Monitor Model, resulting in uncritical 'advocacies' and 'objections'. The present paper, rather, takes to provide an appraisal of Krashen's theory of second language acquisition. In line with Widdowson (1990), the appraisal partly involves a measure of the theory's tenets along internal validity, calling for exposing, and gauging the uptake of the criticism the theory has been generating, alongside an evaluation of the model in the light of variables as input, interaction and interlanguage variation. The second portion effecting our appraisal relates to the assessment of the operational dimension of the theory, where questions of applicability and utility to practitioners and learners are raised. That the model's 'advantages' and 'drawbacks' alternate, it is concluded that judgments of worth make not a proper "marking criterion", for the flaws of the model are not so serious that the claims behind it are to be falsified, but are serious enough to falsify a focal adoption.

KEYWORDS: the monitor model, second language acquisition, the input hypothesis. explicit learning, output, interaction

INTRODUCTION

A salient feature of the language teaching and learning enterprise is that conducts, for their justifiability, have to base on a particular ideation. This component, which discharges the conceptualization of how language competence is attained, renders practices reputable, for they are said to reflect a particular understanding, or as Schouten (1979) calls "a sense of direction". In fact, the inception of second language acquisition (SLA) as a recognizable area of enquiry marked the departure of rival claims, each competing to provide the adequate idealization for the nature of the processes involved in acquisition. This tension, which features in the multitude of constructs, may not be problematic, nor is it, as Schouten qualifies an "indicative of the immaturity of the field" (as cited in Ellis, 1995, p. 73). Tension, perhaps more accurately, does justice to the complexity of language as it touches on a variety of spheres and, thus, identifies with multiple frames of reference. Such multidimensionality hardly allows the persistence of a monologic, self sufficient theory. It is, yet, undeniable that some theories—perhaps for the audacity of their generators—are more attractive than others. Indeed, among the many SLA theories, Krashen's Monitor Model appears of high prominence, for initiating a postulate for the importance of a specific input state, triggering research investigating the role of input in SLA, and for being the theoretical platform from which several models—even opposing ones—

emerged on the surface. This reputation explains the multitude of ‘assessments’ whose very being reasserts such reputation.

Krashen’s model is made up of the intersection of five “inter-informing” tenets, each appearing to provide a partial rationale for another. The acquisition-learning distinction, as the label denotes, shows the ‘duality’ of language competence, while the monitor hypothesis further specifies the functioning of ‘learning’ as represented in the *monitor*. The natural sequence advocates that ‘acquisition’ comprises several stages the movement through which gets explained via both the affective filter and the input hypothesis alike. This combination poses limitations on the act of appraisal, given that proving a tenet’s validity or otherwise cannot subsume the entire model. For this, not only the tenets would be examined, but the very move of their combination as well. In what follows, I shall begin with an interpretation of the model, providing a summary of its central tenets and an examination of ideas “within their own theoretical provenance” (Widdowson, 1990, p. 31). Embarkation, then, will be on a quest of whether the model enjoys pedagogical relevance.

THEORETICAL EVALUATION

The Acquisition-Learning Distinction

Overriding the acquisition-learning distinction is an ontological distinction positing two distinct environments language is possibly learnt in. Formal or artificial environment often identifies with classroom learning whose salient features are, more or less, utterance decontextualization, rule presentation, metalanguage as well as corrective feedback. Informal environment, nevertheless, embodies the setting characteristic of natural, tangible learning of languages. Krashen asserts that “formal and informal environments contribute to second language competence in different ways” (1975, p. 163), resulting in two distinct modes of developing language. The first mode, which Krashen labels *acquisition*, is seen similar to the manner in which children develop competence in their native language. In this mode, learners unconsciously “pick up” language as they are aware neither of the rules underlying the meaning they are consciously involved in negotiating, nor of their ‘acquiring’ language. Krashen maintains that. *Learning*, or “knowing about”, is the other way in which competence in language develops, and gets represented as “knowing about rules, being aware of them and being able to talk about them in non-technical terms” (Krashen, 1982, p. 10). Operating through focus on function, the process of ‘acquisition’ effects and brings about an acquired system that takes the generation of utterances, while, ‘learning’, which is defined by focus on form, makes up a learnt system that discharges checking the “well-formedness” of the generated utterances at various stages. It is worth noting that Krashen does tighten the relatively problematic notions of consciousness and unconsciousness, defining them in terms of attendance to form and mere concern with meaning, respectively.

It is likely to complain, as does Mclaughlin (1990), that the acquisition-learning distinction is unreliable, because it is defined in term of conscious and unconscious processes, which are not open to inspection. It might, yet, be accepted to uphold Krashen’s tightening of these concepts, and regard the identification of consciousness with focus on form. This distinction appears self-evident, as it is undeniable the prevalence of ‘dual’ trends as one tends to interact in—at least—a

second language: “When we read or listen to an utterance in our language, or in a second language in which we are fluent, we become aware of its meaning but we are seldom aware of the complex decoding processes that proceed awareness (Schmidt, 1990, p. 131). In the same vein, Krashen reacts: “Acquisition and learning are no more difficult to define empirically, as their synonyms, implicit and explicit, are terms that Mclaughlin and other critics have no problem using” (as cited in Mehdi et al., 2013, p. 225). Yet, the deviance lies in Krashen associating consciousness with knowledge of rules. Schmidt, yet, asks what he labels *the articulate report question*: “Can learners say what they appear to know?” (1990, p. 131).

It is my contention, thereby, that what is debatable in Krashen’s treatments is not the conceptualization of consciousness and unconsciousness as much as it is the position of, and the relation assumed to hold between both competences. It might, yet, be an adequate practice to point to the gap of explicit specification, as consciousness identifies with attention which may be either intentional or unintentional. It is perhaps the ‘unspecified’ use of the term that generated criticism, though in my opinion, this should have been taken for granted, for it is hard to imagine intentional focus on form during the process of ‘generating’ utterances. Even when postulating the need for noticing and conscious knowledge in ‘acquisition’, Schmidt himself asks: “If noticing is required, is such noticing automatic or must learners consciously pay attention” (1990, p. 134). This presents the likelihood that ‘acquisition’ involves a stage of noticing, especially in the light of the assertion that “people learn much about the things they attend to and do not learn much about the things they do not attend to” Schmidt (2001, p. 30). Later, Krashen reasserts:

The last 30 years of research in language acquisition show that people certainly can acquire language without paying attention to form. The fact that acquirers use rules they have never learnt, rules in fact that linguists have not described, confirms that attending to form is not necessary. John Truscott has an excellent discussion of Schmidt’s claim in his 1998 paper (as cited in Mehdi et al., 2013, p. 225).

Krashen conceives a dichotomy, where each of the two systems resultant from ‘learning’ and ‘acquisition’ respectively stands as a modular entity that “gravitates around itself”. This entails the independency of both ‘processes’, and the unlikelihood for the learnt knowledge to rank as acquired, embodying *the non-interface position*. Bialystok (1981a, 1981b, 2001), while enriching the argument for the acquisition-learning distinction, reverses the idea of their being assigned unrelated roles, raising the notion that ‘learning’ and ‘acquisition’ represent different entries of the same “continuum”. The idea is that language use being an alternate of degrees of analyzability (explicitness) and automaticity (implicitness). Similarly, Mclaughlin (1978) refutes the non-interface position, advancing an approach central to which is the view of “controlled processing”, which underlies the operation of the learnt system, possibly evolving to “automatic processing”, which beholds the functioning of the acquired system: “Interlanguage production requires controlled processes which demand the learner’s attention, but repeated performance leads to the availability of the form via automatic processes” (Mclaughlin, 1978, cited in Maria & Lopez 1997, p. 369). This denotes that attention, which the learnt system identifies with, diminishes as learners practice the form, leading to the automaticity of retrieval characteristic of acquired competence. It is even that the merits of automatization are extended to allow classroom

learners to outstrip naturalistic learners. Similarly, Spolsky (1991) notes that “language knowledge that is analyzed, and so available for recombination, may be intuitive and so not consciously available for the learner (p.47).

In the process of enhancing the claim behind the acquisition-learning distinction, Krashen asserts that ‘acquisition’ and ‘learning’ are complementary processes given that “we learn small parts of our first language in schools” (1982, p.11). This proposal is valid only in case the language spoken outside and the one taught in school are basically the same, given that another possibility prevails in diglossic communities. In the context of Arabic-speaking communities, accordingly, the learnt competence learners develop in schools is not applied to the acquired competence as the former relates to the linguistic properties of Standard Arabic, while the latter concerns the vernacular, or local language which is distinct not only in terms of the attributes of syntax and semantics but in terms of context of use—the vernacular is the medium of daily communication, while Standard Arabic is the codified vehicle deployed in formal settings. This may contemplate certain constraints on the scope of the Monitor Model.

The Monitor Hypothesis

Derived, and extended from the acquisition-learning distinction, is the notion of the *monitor*, embodied in the likelihood of interplay between the acquired and learnt system. The latter, being in its very nature, knowledge of rules, operates as a language editor. In Krashen’s terms, ‘acquisition’ initiates one’s utterances in second language and is responsible for fluency, and the competence gained from learning can only operate as a monitor, or as a self-editing tool, coming into play to check the “well-formedness” of the utterances generated on their way to the status of output. The peripheral role assigned to the monitor does justice to the features of consciousness, since “one of the most peculiar features of consciousness is its narrowness compared to the vast and almost limitless unconscious processing capacity at our disposal (Dorynei, 2009, p. 133). Consciousness is “often seen to help focus the brain’s vast unconscious resources and make them available for specific cognitive use” (Dorynei, 2009, p. 133). Figure 1 models the functioning of the monitor.

Figure 1: Operation of the Monitor (Krashen, 1977, 1981, 1982)

It would, thus, be misleading to think of both competences being of equal contribution. Otherwise, the type of ‘communication’ in which the learnt system approximates the generator in reference is, at its best, artificial, and learners who tend to constantly “help the brain’s vast unconsciousness” can hardly be said to be successful. Indeed, the claim that the learnt system

discharges a peripheral role is subsided by considering conditions for its functioning. Krashen (1982, 2013) notes that for the monitor to operate, three conditions are to intersect: Time, knowledge of rules, alongside focus on form. These three factors, according to Krashen (1981) rarely intersect, and a possible illustration of their intersection and application in performance resides in grammar tests (discrete-points tests). However, grammar tests, in their very nature, require for their fulfillment no activation of the acquired system, but the mere concern with accuracy that the learnt system is, perhaps, the dominant trend in tasks as such. Accordingly, it is plausible to advance that the relation between the learnt and acquired system is bound to the demands of the tasks learners undertake.

Too, allocating the monitor an act of performance edition at times of concern with accuracy does justice to the psychological salience of language learning as represented in anxiety, resulting from duality of cognitive tasks characterizing language learners, for a learner, alongside ‘striving’ to generate utterances, is occupied with self-perception, which poses cognitive demands. In other words, the intrusion of the monitor derives from a relative concern with accuracy as well as from the feeling of losing face as to communicate in a foreign language. In fact, performers are said to differ in their refuge to the monitor. Monitor *over-users* are performers heavily deploying consciously learnt grammar to edit their output. In effect, “such performers may speak hesitantly, often self-correct in the middle of utterances, and are so concerned with correctness that they cannot speak with any real fluency” (Krashen, 1982, p. 19).

For Krashen, monitor over-users do not often acquire enough of the second language that they employ first language competence as an utterance generator, making a way to interference errors. At the other extreme stand monitor *under-users* who, for not having ‘learnt’, tend to base their performance on the mere acquired system. Little or no concern with grammar allows monitor under-users to enjoy fluency, which results from both speed of retrieval and concern with message delivery. On the third way, Krashen positions *optimal monitor users*. Such are performers who “use the monitor when it is appropriate and when it does not interfere with communication” (Krashen, 1982, p. 19). Accordingly, such learners suspend conscious grammar at times of conversation. Krashen considers that, in the written modality, the careful exploitation of the conscious grammar makes optimal users “produce the illusion of being native-like in their writing” (Krashen, 1982, p. 20). Truly, the monitor standpoint, which appears consistent with variables of attitude and personality, indicates that the performance of second language learners, no matter how ‘native-like’ it seems, arises, from a successful deployment of the monitor—though non-natives can hardly ‘conceal’ their refuge to the monitor.

The relative intrusion of the monitor, which sparks relative types and amounts of errors, seems to stand as the attribution of “variable competence”. This denotes that Krashen, unlike many non-variationists who considers external issues irrelevant to the description of idealized competence, seems to reject the pervasiveness of competence, but confines sources of its variation—or “chameleon” state to borrow Tarone’s (1979) words—either to change in comprehensible input or to the interplay between the learnt and acquired system, disparaging the role of contexts. Comprehensible input, in Krashen’s paradigm, positions as the driving force not only for interlanguage development, but for its dynamism across contexts. However, Tarone (1979, 1990)

and other variationists believe that change in learners' interlanguage is constantly related to participation in several contexts:

In the field of SLA research we have tended to err by divorcing the study of the internal development of IL [interlanguage] grammar from the study of the external social context in which the learner develops this grammar. *The social context of the learner is often viewed as unrelated to the internal cognitive processes of L2 acquisition, and so, unworthy of comment* [emphasis added] (Tarone & Liu, 1995, p, 108).

The Input Hypothesis

The input hypothesis marks the most important tenet as it sets to explain how acquisition occurs. The premise prompting Krashen's articulation resides in a challenge to a prevalent assumption: "Most adults second language teaching methods assume that adults do not acquire but depend wholly on conscious learning" (Krashen, 1976, p. 163), siding for a likelihood that "adults can acquire language at least to some extent" (Krashen 1976, p. 163). In effect, this standpoint runs in stark contrast with assertions of child superiority in learning languages on the premise of the "critical period". As evidential basis, Krashen leans on evidence of adults' ability to discriminate grammatical from anomalous utterances while having no metalanguage resources to explain the "well-formedness" of utterances (see Krashen, 1976).

The hypothesis, probably, comes to subside, and account for the assumption that mere exposure to L2 data does not suffice, and that learners need a kind of input suitable to their stage of development. Krashen, in essence, proposes a comprehension-based approach, central to which is the view of acquisition being a matter of an evolution learners make from a current stage in the development to another, or from "i" to "i+1", where "i" stands for "the rule we have acquired", while i+1 marks "the message which contains aspects of language we have not acquired" (Krashen 2013, p. 3). Acquiring "i+1" conditions comprehending the meaning expressed through this structure, partly through building on the previously acquired structure, and partly through inferring through context and knowledge of the world. Krashen (1982) hypothetically, explains the ability to perceive and make this shift in terms of a comparison acquirers make between the nature of "i" and that of "i+1". Comprehensible input embodies *intake*, or "that subset of linguistic input that helps the acquirer acquire language" (1981, p. 101). The 'essentiality' of a specific input state downplays the proclaimed causativeness of mere "heard language" as a factor to which acquisition might be focally attributed, bringing to the surface the learner's attitudinal and cognitive state as decisive of acquisition. This stance, as we shall see later, is compatible with the Affective Filter Hypothesis, which further advocates the the determinism of the learners' affective position. Figure 2 illustrates the input hypothesis.

Figure 2: The Input Hypothesis (source: Original)

At the surface level of the input hypothesis—without indulgence in a talk about whether input alone suffices for acquisition—criticism arises from Krashen tending to confine acquisition in exposure to the comprehensible *kind* of input, a claim that seems to lack plausibility in the light of postulates for several types of input, each with a specific effect on learner's development of language competence. White (1987) argues that incomprehensible input enhances second language acquisition, for “the incomprehensibility of some aspects of the input to language learners draws their attention to some specific features to be acquired” (as cited in Bahrani, 2013, p. 39). In the same vein, Gass and Selinker (1994) opposes the view of input having to contain “ $i+1$ ” for acquisition to occur, and opts for one that advances the possibility for learners to notice the input in its initial state, where it does not necessarily have to be in the range of “ $i+1$ ”.

Viewing the input hypothesis from the lens of accountability reveals the limited scope of the theory in “what it tries to explain”. Primarily, there appear a need for an account of what mechanisms relegate learners' movement from one stage to another as a result of understanding input containing “ $i+1$ ”. For Long (1990), an SLA theory has to suggest mechanisms to account for change. Such are “devices that specify how cognitive functions operate on input to move the grammar at Time 1 to its new representation at Time 2” (as cited in Ellis, 1995, p.79). Krashen, too, does not explain how it is that “ $i+1$ ” is automatically provided without building on learners' “ i ”. This legitimates characterizing the model as property, not transitional theory, which casts doubt over its ‘potential’ for explaining acquisition. The demands for transitional description become mandatory if we think, as Skehan (1995) does, that system construction in SLA operates on cognitive mechanisms. Another way in which the model lacks accountability is that the type of interlanguage resultant is one that is limited to the generation of isolated sentences, discounting their contribution to the elaboration of discourse. The model, thereby, does not cater for a range of capacities underlying the negotiation of meaning in ongoing, real-time, or extempore communicative acts. Hence, “Krashen's theory turns to be a theory of learning

sentences....Although this is a basic component in language knowledge, it is unarguably a restricted goal for the vast majority of language teaching programs” (Spolsky, 1989, p. 30). The demand for the appropriateness criterion features in Hymes’ revolutionary ideation of what competence apart from grammar, the child—and thus the learner—reflects in the conduct of communication:

We have to account for the fact that a normal child acquires knowledge of sentences, not only as grammatical, but also as appropriate. He or she acquires competence as to when to speak, when not and as to what to talk about with whom....This competence, however, is integral with attitudes, values and motivations, concerning language, its features and uses, and integral with competence for, and attitudes for the interrelation of language with the other codes of communicative conducts (Hymes, 1972, p. 277).

A core measure of the acquisition of language is the learners’ ability to exploit the resources afforded by the linguistic types to formulate the indexical, culturally encoded meaning characteristic of tangible communication. The kind of language resultant from comprehensible input is not only restricted to a semantic-only generation of meaning, but is self-sufficient, monologic, and thus, intangible, for communication is dominantly dialogic, and for, as Bakhtin (1981) implies, the meaning of an utterance lies in its dialogic, interactional nature. The Monitor Model ensures the sufficiency of language knowledge for the communicative conduct, confining the act of meaning in language per se, and disregarding the likelihood of communication in terms of “what the speaker wants language to mean”, presenting a discount of pragmatic competence. On this basis, the Monitor Model exposes one example among many of pedagogy-driven and, therefore, distorting idealizations of language acquisition. It is pertinent, too, to note that Krashen’s treatment is empty of cultural consideration given the absence of accounts on the acquisition of sociolinguistic and sociopragmatic elements.

Krashen contends that “we acquire language by understanding messages” (2013, p. 03). This, however, warrants restatements, especially in the light of strong evidence for positive correlation between noticing, or “experiential attendance”, and the retain of intake (see Schmidt, 1990). In other words, acquisition seems to require a relative degree of attendance. This possible gap in Krashen’s paradigm features in Schmidt’s (1990) notion of *the incidental learning question*: Whether conscious awareness at the level of noticing is necessary for language learning [encompassing both ‘acquisition’ and ‘learning’]” (Schmidt, 1990, p. 129).

Krashen’s position towards what significance to allocate to both input and the learner displays might be held inadequate. In fact, to state that intake is the “subset of input that helps learners acquire language” (Krashen, 1981, p. 12), is to lend ‘acquisition’ to the mere ‘quality’ of input. An alternative treatment of intake posits that not all input used in comprehension becomes intake, and that intake construction does not occur in such an abrupt manner. Then, that Krashen sees the comprehensibility of input as a causative factor in acquisition raises the impression that factors gauging acquisition are more external than they are internal. Conversely, Gass and Selinker (1994) state that, on its path towards becoming output, input has to ‘climb’ several stages. The learner initially apperceives, or notices the input thanks to frequency and attention, and then

makes sense of it. Comprehension is followed by a stage of internalization where the input is captured as intake, then integrated in the learner's repertoire, embodying a prior knowledge stored in long term memory and reflected in written or spoken output (Figure. 3).

Figure 3: Gass and Selinker's (1994) Model for Second Language Acquisition

A flaw in Krashen's conception of resources for acquisition resides in a disregard of output, or "practicing" in the process. Swain (1995) writes: "It has been argued that nothing more than a sign for the acquisition that has been taken place, and that it serves no useful role in second language acquisition except as self-input" (p. 125). The output hypothesis (see Swain 1993, 1995) suggests that producing language enhances fluency. This "seems not controversial, particularly if it is not confused with the adage that practice makes perfect" (Swain, 1995, p. 125). It is hypothesized that output, too, fosters the angle of accuracy in language acquisition through the activation of *noticing*, meaning that in producing language, learners notice, and perhaps inspect the functioning of both their output and themselves as they generate it. This implies that a conscious knowledge of, whose sources Krashen confines in the input found in formal instruction, may stem from the activity of producing a language. Adding to this, output, particularly erroneous one, is qualified an indicator that the learner has formulated a hypothesis identified with a particular stage of interlanguage development. It is my contention that learners, in producing language, intend to display their state in the language for possible feedback more than the intention to use language for communication. Later, however, Krashen denies output any potential for acquisition:

According to the Comprehension Hypothesis, we acquire language by input, and not by output. Thus, more output, more speaking will not result in more acquisition. If you speak French to yourself out loud every morning, while driving to work, your French will not improve. Rather, the ability to speak is the result of acquisition, not the cause (Krashen, 2013, p. 03).

Again, the assumption that speaking emerges, and that output serves nothing than a kind of self-input presupposes that competence and use are not that distinct that the latter warrants no specification. Widdowson (1989), however, asserts that the availability of competence is not a guarantee for the act of communication, for differentiating between knowledge about language and *capacity*, which he regards as the ability to exploit the available knowledge in actual use,

which leads to consider performance as governed by operational requirements. Another variable held to be central to determining the link between input and output is that which advances the need for a stage of processing, or the ability to retrieve stored input. The determination of retrieval is illustrated in Bialystok's *library metaphor*: "Learners may know an interlanguage form because they have studied it or learnt it, but under communicative pressure they fail to find it. In terms of the library metaphor, one might say that the book is in the library but they do not have enough time to find it" (cited in Maria & Lopez, 1997, p. 317).

Another way in which the notion of listening-based learning might be refutable comes from looking at the suspension, or the peripheral role of syntactic 'skills' in comprehension. In effect, "if comprehension draws on effective strategy use and on the capacity to relate input to context, it may partly be an autonomous skill whose development may not transfer to other areas [speaking]" (Skehan, 1990, p. 15). To say that production predicates on listening is, indirectly, to advocate that there is no room for consciousness in interlanguage development and change. This stems from the fact that, if learners have the impression that they have to rely on input for production, they will pay more attention to the norms by which the message is constructed, and will use that knowledge as basis for their future input (Skehan, 1995, p. 17).

Another variable proclaimed to be central for acquisition, but one that is missing from the treatments of Krashen, is that of interaction. Long (1985) while subsidizes the notion of input being the major explanatory variable for SLA, sharply differs from Krashen in conceiving what is it that renders input comprehensible. Paradoxically, the making of input comprehensible and adaptive to learners' current competence is, more reliably, achieved through the negotiation of meaning. The rationale for this claim is that good quality input is ensured by the learner, by means of signaling miscomprehension through clarification requests, confirmation checks and comprehension checks. This would render input comprehensible on the pace of the learner and with respect to the state of his linguistic repertoire. This feature may not be prevalent in case of reliance on ready-made input, whose quality is uncertain not only for the unlikelihood of its harmonization with the learner, but for "one have to rely on good luck or the sensitivity of one's interlocutor, and neither of which is dependable" (Skehan, 1990, p. 17).

Interaction, too, matters is the collaborative discourse wherein learners, depending on talk exchange, build on previously occurring utterances and draw on structures, either by adding to them or by substituting some of their parts, given that conversation is, in its very nature, jointly constructed.. To participate in conversations is, for (Widdowson, 1989), not only to learn how to use complete and well-formed sentences, but to learn how to make well-judged interventions with one's interlocutor. Well-judged interventions include appropriate decisions on turn-taking and on the language form required in the exchange of talk whose circulation endangers the acquisition of ellipsis. Interaction, too, provides ready-made chunks of language that would later be used by the learner as automated, rather than controlled speech. The formulaic, or "canned" speech "contributes indirectly to the route of learners' interlanguage by providing raw material to the learner's internal mechanisms to work on" (Ellis 1985, p. 155).

The Natural Order Hypothesis

Seemingly, one among many possible convictions overriding the natural order hypothesis is to validate the input hypothesis. An assumption of a sequence of development is, in fact, a predication on an apparent commonness of difficulty reported to be undergone by second language learners with varying language backgrounds (see Bailey, Madden & Krashen, 1974; Dulay & Burt, 1974). The notion is that the path towards proficiency is identifiably predictable not only as certain structures appear to be acquired before others, but as the errors demonstrated in the route of acquisition are developmental, that is, common to all acquirers for being predetermined by innate universal mechanism. This sequence of development, as claimed, though being distinct from that in first language acquisition, is common to all second language acquirers (see Figure 4).

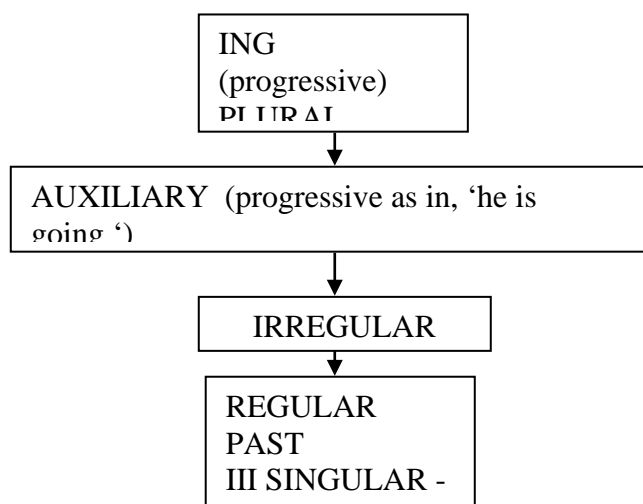

Figure 4: Average Order of Acquisition of Grammatical Morphemes for English as a Second Language (children and adults) (Krashen, 1977, 1981 1982,).

The proposal for a natural sequence seems incomplete, and thus, unconvincing, for Krashen offers no mechanism to explain why learners appear to acquire certain grammatical properties before others. Findings of the natural sequence studies, for Tarone, Bigelow and Hansen (2009), lack reliability, for the population such studies target is deceptive of the ideal language learner. The 'distortion' lies in discounting illiterate learners, and confining sources of data in literate learners only:

Can we base an SLA theory of universal cognitive processes on data drawn from literate learners only? What about illiterate learners who do not participate in the social practice of print literacy at all?...Such learners exist in large number throughout the world, but we know next to nothing about the processes of oral second language acquisition. (Tarone et al., 2009. p. x).

In fact, the natural order claim stands in stark contrast with the notion of *interlanguage*, according to which the approximation of the L2 system is marked by the fusion of learners' mother tongue and target language. Thus, the idea disparages the potential L1 influence has in second language learning. This influence may not be limited to the prevalence of negative

transfer errors, but, as Zafar (2009) indicates, may extend to override the order in which language is acquired. It should be noted that the order is limited to the acquisition of grammatical morphemes that the natural order, in case valid, may stand as a mere peripheral property not decisive of acquisition. Such observation conforms to Gregg (1984), who points to the fallacy of generalizing the acquisition of limited functors to the entire outcome of acquisition.

The Affective Filter

For acquisition to take place, Krashen maintains, acquires, alongside receiving comprehensible input, have to occupy a low-filter position, jointly prompted by low anxiety, higher motivation and self-confidence. If these are to be assigned a causative status, a more complete treatment would have to account for how this state or the otherwise hinders or fosters acquisition. This claim gains more plausibility in the light of the affective filter seeming to be implicated more in production (Figure 5).

Figure 5: Operation of Affective Filter (1977, 1981, 1982)

A main attraction in Krashen's model is his third path he pursues in conceiving SLA. In fact, to say that 'acquisition' is a variable constantly manipulated by the affective position the learner occupies is to recognize the significance of external factors, instead of expressing allegiance to a particular perceptive angle. In other words, if SLA is the outcome of the mere LAD, the learner's syllabus is immune to external influences Ellis (1985). The affective filter hypothesis, thus, represents a getaway for the whole model to escape the criticism that "nativist theories do not have a learner in mind" and that they see language "as something which takes care of itself" (Dodigovic, 2005, p.4). Irrespective of its merits, the affective filter notion reveals a paradox in Krashen's model: If high affective filter, which deteriorates 'acquisition', is caused by interaction, the latter should have been allocated a weight in the enhancement of this process.

CONCEPTUAL EVALUATION IN RELATION TO LANGUAGE PEDAGOGY

In generating pedagogical principles from the Monitor Model, Krashen talks of 'the best method' as one that supplying comprehensible input in low-anxiety situations, and one that does not force early production, but allows students to produce when they are ready. Improvement, as Krashen (2013) contends, rather than thought of as lent to correction, results from the provision of comprehensible input, instead of a deliberate focus on certain forms of grammar. "Comprehensible input-based" syllabuses are designed around activities and discussions with input that is not only comprehensible, but "compelling" as well (see Krashen & Bland, 2014). Similarly, students' errors are not corrected, for "grammatical accuracy is the result of comprehensible input, and not output" (Krashen, 2013, p. 06). Grammar is included only to

satisfy students' 'curiosity' about language structure, or to fill the gap left by 'acquisition', Krashen notes that the rules learnt in grammar lessons—which should be done as homework—are not expected to share the spontaneous generation of utterances.

It is contended that the goal of language classes is to enhance students' understanding of input given that understanding is said to effect 'acquisition'. For this, Krashen advocates that subject-matter teaching is, for focus on message, language teaching. A possible way of rendering input comprehensible is the teacher providing contextual clues or modeling the acts of utterances. Students, Krashen maintains, "are not asked to speak, only to understand" (2013, p. 05). It is recommended that both free and in-school reading subside acquisition, especially when the content of reading and listening is "narrow", or specialized (see Krashen, 2007, 2009).

Indeed, while some principles the Monitor Model offers enjoy sound relevance and harmonization with classrooms, others, however, might lack a "sense of plausibility". Generally, Krashen resorting to the notion of caretaker to render the Monitor Model justifiable, makes deciding whether this notion is compatible with the teacher fundamental in gauging the pedagogical uptake of the theory. The analogy features in the claim that the most interesting aspect of the caretaker speech is that it is not a deliberate attempt to teach language (Krashen, 1982, p. 22). It is, however, advanced that a theory of learning must take account of the human predisposition to teach Lemke (1984). In fact, while drawing on such a notion for theorizing SLA displays respectability, assuming its transferability to language classrooms might not have been an adequate practice.

An interesting feature of the caretaker speech that Krashen highlights, and that perhaps fails against the forces of pedagogical reality, is that the caretaker speaks about the immediate environment, or what the child can perceive. Such properties can hardly be said to apply to language classes, partly because the motivation guiding the language teacher is distinct from that exerting a great deal of influence on the caretaker speech, and partly because the capacity for pedagogy to simulate this authenticity is by no means limited. Supposing that the caretaker approach is more useful for the child compared to unmodified speech, the question that rises is whether the same thing applies to adults learning a second language. Too, a salient feature of the caretaker speech is that mothers pay little attention to the formal correctness of their children's speech, but instead attend to the appropriateness of their utterances. Further mismatch features in the fact that the estimate of a child's language state might differ from that upon which the supply of language to a learner is made. Parents, self-evidently, modify their speech on sound basis, for they know not only their children's state of linguistic repertoire but the contextual reference underlying that knowledge (see Rowe, 2008).

On another scale framework, while interaction appears core to language classes—either as a manner of generating talk or as a skill comprising norms of conversation management—the Monitor Model implies that it is not important to engage learners in interaction whose service Krashen qualifies as a mere "way to obtain comprehensible input". Whereas the class turns around goals and objectives, standing as reference for both teachers' steps and learners' performance, the Monitor Model maintains that it is not important to get learners to speak as

speaking would emerge, nor is it necessary to provide corrective feedback. It might, then, be difficult to show the relevance of the central claims of the Monitor Model to teachers, especially that what is implied is a hard move from judgmental intents, forced partly by pressures of assessments, and partly by the need for teachers to examine learners' progress while teaching.

The mismatch, however, goes not to the extent that the goals of the Monitor Model and those of pedagogy are incompatible. Just as theories may lack the sense of plausibility, it might be argued that pedagogy discounts the particularities of language acquisition by compelling the adaptation of theories. In this sense, Krashen (1982, p.27) argues that "adults and children in formal language classes, are usually not allowed a silent period, they are often asked to produce early in a second language before they have acquired enough competence". Another pedagogy-related deviance is that, while curriculum designers present rules in line with the structural difficulty criterion, the acquisitional difficulty criterion suggests that some structures, which appear basic, are acquired late, and vice versa. For this, Krashen states:

Research has come up with surprising facts about the natural order. First, it is not true that simple rules are acquired early and complicated rules later. Some rules that look simple (e.g. the third person singular) are acquired late. Others that appear to linguists as complex are acquired early. This presents a problem to curriculum designers, who present rules to students from "simple" to "complex". A rule may be very easy for a grammarian, but may actually be acquired late (Krashen, 2013, p. 2).

It is true that Krashen provides evidential basis for the effectiveness of the proposed method. In effect, the above criticism does not prove the otherwise, but casts some doubt over the persistence of these experiments in classrooms, for the latter *might* not provide the same adequate environment granted by improvised research conditions. In other words, it is application, and not empirical assessment that gauges Krashen's proposal.

CONCLUSION

From a theoretical angle, not only does Krashen's theory appear well-supported—at least compared to other SLA theories—but coherent as well: For acquisition to occur, low affective filter has to be subsided with input that is comprehensible and matching to learners' stage in the natural order of acquisition, making available an acquired competence discharged with the generation of utterances, combined with a learnt competence used as a monitor for the accuracy of the generated utterances. This comprehensiveness is, in fact, a double-edged sword, for while it indicates the unity of the theory, gives the impression that Krashen advances certain tenets not out of a conviction of validity, but out of the need to draw a scheme for acquisition. Such move, alongside some waves of assertiveness that Krashen could have avoided, triggers arrows of criticism, questioning the sufficiency of input for acquisition, in addition to the functioning assigned to 'learning' and 'acquisition'. Yet, it is this multitude of tenets—let alone the paradigm shift exerted by the claims—that marks the elegance and uniqueness of the Monitor Model. As for pedagogical relevance, the property-oriented character of some aspects of the model renders limited its direct applicability and compatibility to classrooms. However, the acquisition-learning

distinction along with the monitor hypothesis, enjoy a potential relevance to ESL pedagogy, especially in terms of characterizing both learners and language performance. In fact, it is true that the model has been taking subsequent ‘revisions’, but as Krashen comments, “the changes are additions and expansions...I cannot think of any place in which any of the original hypotheses were wrong Mehdi et al., 2013, p. 227).

Indeed, the Monitor Model did mark a turning point in the field of second language acquisition as it has been influencing all aspects of second language teaching and research, by highlighting the significance of several variables in several processes. Limitations on the model, and perhaps on any other theory attempting to account for language acquisition, are in primacy, lent to the complexity of language, and thereby to the natural unlikelihood of a hegemonic theory to prevail or persist. Accordingly, Ellis (1995, p.78) asserts that “the dangers behind attempting to explain everything about a complex phenomenon are recognizable”. Krashen’s theory represents one among many modes of ideation which should be viewed as complementary rather than rivals. Then, “the main factors involved in determining the uptake of a theory are less its internal qualities than the extent to which it is perceived as purposeful by consumers of the theory” (Ellis, 1995, p. 74) , which entails that our attempt had done very little to either refute or confirm the theory.

ABSTRACT

This study attempts to investigate the effect of integrated listening activities on English as a foreign language (EFL) learners' speaking accuracy within the framework of task-based activities in the hope of improving their competence. A total number of 30 female students from Safir English Institute in Lahijan, Iran participated in this study as a control and an experimental group. Traditional teaching methods of listening were applied for the control group, whereas in the experimental group integrated listening tasks were applied. A standard sample of IELTS speaking test was administered as the pre-test. At the end of the semester, a post-test was given to the students to determine the influence of the treatment on the experimental group. The data analysis using SPSS (version 19.0) revealed that the subjects in the experimental group performed better on the post-test than the control group. The results of the study confirm the strong effects of integrated technique compared to the traditional approach in teaching language skills to Iranian learners. On the other hand it has an incredible effect which could help the students to be motivated in learning correct English from high school or even lower levels. Implementing such a method can provide much of the input and data that learners receive in language learning.

KEYWORDS: Integrated listening activities, EFL learners' speaking accuracy.

INTRODUCTION

The process of listening skill is not given sufficient attention in the classroom and is undervalued globally, specially in Iran. Many of the EFL learners, specially Iranian learners, are shocked and disappointed when they use foreign language in a real interaction for the first time. Lack of listening skill closes the door to full participation in discussions with native speakers. In other words, they are not prepared for spontaneous communication. When learners are in a real discussion among native speakers, they sometimes are at a loss for words and may even feel disappointment in that situation because of an unsatisfactory level and knowledge of listening skill. Listening skills are described as crucial for survival as well as for access to wider and richer experiences in the foreign environment (Littlewood, 1981). For instance, learners need to improve the listening skill in order to expand or share their experiences and views through English. Bently and Bacon (1996) believe that, listeners create meaning from oral input because listening, as an active process, is a critical part of language learning generally and particularly for the second language learning process. On the other hand, Rost (1994) points out that, listening is

vital in the language classroom because it provides input for the learner. Without understanding input, learning would not be occurred. Listening is thus fundamental to speaking.

Listening is the receptive use of language, and since the goal is to make sense of the speech, the focus is on meaning rather than language. Actually the major aim of listening is to improve the ability of speaking and communicating. Bidabadi (2012) believes that, all the learners prefer to be communicative, that is, they desire to work in pairs and in groups. Lines (2005) also considers the teaching of listening skills as fundamental the development of other language skills.

Rivers (1996) in Osada (2004,55) says “ speaking does not of itself constitute communication unless what is being said is comprehended by another person.” Osada (2004,56) says that in order to understand spoken messages, students need to integrate information from a range of sources: phonetic, phonological prosodic, lexical, syntactic, semantics and pragmatic. The fact that we achieve all this in real time as the message unfolds makes listening complex, dynamic, and fragile (Celce_Murica,1995,366).

Listening is assuming greater and greater importance in the foreign language classroom. Rost (2005) points out that listening comprehension involves the following phases: attention, perception, word recognition, syntactic parsing, comprehension and interpretation. Importantly there should be meaningful practices that will help learners reach goals in each part and be more automatic in processing listening (Fang, 2005). For learners who are studying English in a non-English setting, it is very important to expose real communicative situations in which they will learn how to express their opinions and to develop their oral fluency and accuracy. Thus listening is helpful. Integrating different skill will help learners get experience such a situation in which they can interact with each other.

The difficulty which faces the EFL students is few opportunities to speak English outside classroom (Littlewood, 1992). Most learners gain the language skills but they cannot communicate fluently and accurately (Hinkle, 2001). Researchers now agree that there is no solution but changing the way that English is taught. (Chang, 2000; Elli,2002). A reasonable solution is to present an integrated approach which usually follows the rules of the communicative approach (Fink, 2003; Canale & Swain, 1980).

There is an increased value on integrated multiskill instructional approaches which focus on developing learners communicative competence. For instance, teaching reading can be integrated with writing and vocabulary. Pronunciation and speaking can be tied to listening, and cultural features of communication (Hinkle, 2001; Lazaraton, 2001; Kasper & Rover, 2005).

The current research presents an overview of the development of teaching English and the importance of integrated approach.

RESEARCH QUESTION?

The main research question in this study is:

Do integrated listening activities affect EFL learners' speaking accuracy?

METHODOLOGY

This study aims at focusing on integrated listening activities which lead to a better result of learners' performance.

Participants

A total number of 30 female students out of 50 students, from Safir English Institute in Lahijan, Iran participated in this research. All of the participants were aged between 15_20 at the Intermediate level. They were all native speakers of Farsi. The students were divided into two groups; the one which received the treatment was called experimental group and the other group which received different treatment was named control group, each group consisted of 15 students. First of all both groups took pre-test. A sample of International English Language Teaching System (IELTS) test which consisted of a three-part speaking test was used as a pre-test and post-test. The students were evaluated according to IELTS speaking band description.

Instrument

30 subjects were recruited using two kinds of proficiency tests which consisted of speaking ; as pre-test and post-test. The aim of pre-test was to know about the current level of students' performance and the aim of post-test was to check if the treatment was appropriate and had a positive and effective influence on learners' performance or not.

The students speaking pre-test contains three parts including different topics. At the first part, there are some information questions about family, job, and study. The second part is concerned with describing somebody or something. And finally, the last part includes discussion about a general topic.

As mentioned before 30 students have been chosen to be the members of this study as experimental group and control group. In experimental group, the students had the opportunity to expose to different short audio conversations at least 4 hours a week (1 hour in the class and 3 hours at home). Then they were asked to write down whatever they have heard and finally practice with a partner, give their opinions, try to imitate the native speakers' intonation and pronunciation and communicate in a native like way. But in control group, the students only listen to audio materials of the current teaching book for at least 30 _ 40 minutes a week.

Post-test was administrated after 20 sessions teaching English accompanied by listening activities for experimental group. A sample of IELTS as a post-test was administrated to check if the treatment was suitable and if there was any changes in learners' speaking accuracy and fluency. Again the test contained three parts as mentioned in pre-test relating to evaluation of the students learning quality during one semester.

Material

Considering 20 sessions for each classes in Safir English Institute, Lahijan, Iran, the teacher was able to play different short audio conversations in classroom which took about 45 minutes each session. During the term, 3 units of Top Notch book intermediate level were taught which their topics were consisted of fashion, shopping, and famous artists. According to these topics, the researcher selected the relevant aural input to play in the class. The selected listening materials

had to meet some criteria. The first criterion was the useful input such as vocabulary frequency, phrases and new information and also the variety in the topic. The second criterion was the learners' interest in the topic. And finally, the selected materials should be appropriate to the learners' culture and religious norms. Therefore the researcher decide to select the listening materials from the book "Impact Values" by Richard R.Day, Junko Yamanaka, and Joseph Shaules and check the relatedness of them before playing in the classroom.

Procedure

This study was conducted in Safir English Institute of Lahijan, Iran. The first step was to make sure of the students' current level of speaking proficiency. To do so, at first the researcher selected 50 students and then administrated a pre-test among them to measure the learners' speaking proficiency. After administrating the pre-test, 30 students were selected and were put in two groups of 15 students as experimental and control group, then the instruction phase started. One group was required to listen to different aural materials while the other one the audio CDs of the present teaching book which only took about 30 _ 40 minutes once a week. For experimental group, the treatment lasted 20 sessions, 1 hour a session, once a week and 3 hours listening practice at home. During the treatment, in each session, the researcher devoted times to listening to different aural materials for about 30 minutes, and students taking note of whatever they have heard then asking and answering about them, having students participated in a communicative situation and asking about their ideas, feelings, and opinion. During these phase, four types of techniques including note taking, question and answer, discussion, and description were used to work on.

Most of the students took notes while listening then they were asked some questions in order to discover students' comprehension. In addition, the students discussed with each other and gave their opinion. The control group was only conducted the limited number of audio CDs of related book. After the treatment period, a post-test covered all the materials were administered to two groups. Finally, the results of the tests were compared to each other to know the importance of the listening input.

RESULTS AND DISCUSSION

Investigation of the Research Question

The research question of this study sought to find out whether integrated listening activities affect EFL learners' speaking accuracy. In order to answer this research question, independent sample *t*-test was used. Before discussing the results of *t*-test, the related descriptive statistics are represented in Table 1. Table1 shows that the mean and standard deviation of the experimental ($\bar{x} = 12.20$, $SD = 1.02$) and control ($\bar{x} = 12.39$, $SD = 1.14$) groups accuracy scores are not far from each other on pre-test of. On the other hand the results in Table1, indicates that the students in the experimental group ($\bar{x} = 14.11$, $SD = 1.54$) have acted better than those in the control group ($\bar{x} = 12.96$, $SD = 1.13$) on post-test regarding accuracy. Besides, Table1, shows that Skewness and Kurtosis of the four sets of speaking accuracy scores are not beyond +/- 1.96 and therefore are normally distributed. Four assumptions of interval data, independence of subjects, normality and homogeneity of variances should be met before one decides to run parametric tests (Field, 2009).

The first assumption is met because the present data are measured on an interval scale. Bachman (2005, p. 236) believes that the assumption of independence of subjects is met when —the performance of any given individual is independent of the performance of other individual. The other assumption – homogeneity of variances – will be discussed when reporting the results of the inferential statistics.

Table 1: Descriptive Statistics of Two Group's Accuracy Scores on the Pre-test and Post-test

Test	Group	N	Mean	SD	Skewness	Kurtosis
Pre-test	Experimental	15	12.209	1.024	-.561	1.432
	Control	15	12.398	1.140	-.039	-.376
Post-test	Experimental	15	14.112	1.545	-.471	-.860
	Control	15	12.961	1.136	.183	-.732

Table 2 contains the results of independent t-test that was used to compare control and experimental groups' accuracy scores on the pre-test of speaking. Table 2 shows that the assumption of equal of variances is not violated ($p = .38, p > .05$).

Table 2: Independent Samples Test to Compare Two Groups' Accuracy Scores on Speaking Pre-test

Levene's Test for Variances			T-test for Means			
Factor	F	Sig.	t	df	Sig. (2-tailed)	Mean Diff.
Equal variances assumed	.777	.386	-.478	28	.636	-.189
Equal variances not assumed			-.478	27.67	.636	-.189

Independent *t*-test results, as appeared in Table 2 above, indicated that there is not any statistically significant differences in accuracy scores for experimental ($\bar{x} = 12.20$) and control ($\bar{x} = 12.39$) groups on pre-test of speaking ($t(28) = .47, p = .63, p > .05$), in which the *t*-observed (.47) is lower than the *t*-critical (2.04). So, we conclude that the students in the two groups have the same speaking accuracy level before facing any special instruction.

Further, the results of independent *t*-test that was used to compare control and experimental groups' accuracy scores on the post-test of speaking are given in Table 3. A quick look at Table 3 reveals that the assumption of equal of variances is met ($p = .22, p > .05$).

Table 3: Independent Samples Test to Compare Two Groups' Accuracy Scores on Speaking Post-test

Levene's Test for Variances			T-test for Means			
Factor	<i>F</i>	<i>Sig.</i>	<i>t</i>	<i>df</i>	<i>Sig.</i> (2-tailed)	Mean Diff.
Equal variances assumed	1.539	.225	2.323	28	.028	1.150
Equal variances not assumed			2.323	25.72	.028	1.150

Independent *t*-test (Table 3 above) detected a statistically significant difference in accuracy scores for experimental ($\bar{x} = 14.11$) and control ($\bar{x} = 12.96$) groups on post-test of speaking ($t(28) = 2.32$, $p = .02$, $p < .05$), in which the *t*-observed (2.32) is higher than the *t*-critical (2.04). Therefore we reject the first null hypothesis and claim that integrated listening activities develop EFL learners' speaking accuracy. In fact, the students in the experimental group have performed better than the control group with the mean difference of 1.15.

Figure 1 below is a bar graph that graphically illustrates the results. A quick look at Figure 1 reveals that the students in the experimental group have acted significantly better than those in the control group considering accuracy in speaking.

Figure 1: Bar graph of two groups' accuracy means on speaking pre-test and post-test

Discussion

In the past several decades, much evidence has emerged that, in order for learners to attain language competence, teaching needs to integrate linguistic and communicative skills. The overarching goal of integrated instruction is to advance learners' language proficiency required for communication in various contexts. Today, after decades of research in language teaching and learning, it seems clear that, in many cases and for many purposes, the separation of the four macro skills is likely to be less effective than integrated instruction simply because, in reality, communication does not take place in terms of discrete linguistic skills.

The current models of integrated teaching of the four language skills have the objective of developing learners' accuracy, as well as their sociocultural communicative competence requiring adapting the language from context to context and from genre to genre. In light of the fact that at the present time English is widely employed as the medium of international communication, it seems easy to predict that integrated language teaching will continue to dominate among the various types of pedagogical models. Within the framework of this study, it was realized that the students were willing to participate in the tasks as the two skills were presented in integration through different activities, which created real life situations in the classroom.

As a whole the study showed that the listening materials are effective in improving EFL learners' development of speaking skill at the Intermediate level of English. This result can be more approved by this evidence that there were significance differences between the means of pre-tests and post-tests. The means of the post-tests were higher than pre-tests.

One possible explanation of such result is that correct use of listening materials in classroom may help students to enhance their learning and speaking. This explanation is supported by Katchen (2003) who discovered that audio-visual materials can be used as a major course material.

CONCLUSION

Based on the finding, creating a meaningful environment may encourage students to speak. According to Ardriyati (2010) listening materials can make students become more motivated to learn and communicate in the language. The finding of the study conducted by Istanto (2009) support the use of listening input in class and thus is consistent with the outcome of the current study.

In conclusion, it is seen that the results of the test show that students' success increases when these two skills are taught in integration. Moreover practicing the skills through different activities carry up student involvement and motivation mainly because these kinds of tasks are related to real life and thus leads to communication.

Suggestions for further research

Further research could involve different audio aids of diversified content such as news broadcast, documentary films, academic lectures, or movies. Investigating the recall success rate after a long time laps would be a good topic for further research. Some of the experts believe that delayed post-tests are meaningful if implemented in a 3_4 week range, and they are much less likely to be meaningful beyond a four-week delay.

Finally the present study indicates the following as in need for further investigations:

1. Learn more about the various ways to integrate language skills in the classroom.
2. Examine potential research on the effects of integration on particular skill development such as reading and writing; relate such research findings to error analysis of particular skill errors in EFL learners.

3. Explore the incorporation of literature teaching in an integrated skill instructional methodology for developing language skills.
4. Extend culture teaching to integrated skill introduction in the EFL classroom.

ABSTRACT

The issue of biasedness of English Language Teaching (ELT) textbooks has been examined through qualitative and quantitative analyses based on Critical Discourse Analysis (CDA) (Fairleigh, 1989, 2003; Van Dijk, 1993, 2001; Wodak et al., 1990). The present study aimed to examine aspects of meaning as represented in two of the currently used English language textbooks, namely, Summit2B and Passages2 from a Critical Discourse Analysis (CDA) perspective. These textbooks are widely used for advanced adult language learners in numerous language institutes in Bandar Abbas where the study was implemented and many other cities all over Iran based on the high number of circulation and reprints of these books in major Iranian ELT language publishing houses such as Rahnama, Zabankadeh, and Jungle. In effect, the study analyzed the textbooks in terms of three major aspects of meaning including relations, positions, and content. For this purpose, Fairclough's (1989) three-dimensional model, as a well-established CDA model, which emphasizes the importance of language/power relationship, was adopted in order to extract the ideologies consisting the foundation of these textbooks. The findings revealed that the textbooks were apparently following the ideology of neo-liberalism and free market, selected English textbook writers did not have any activity to make English as a Foreign Language(EFL) learners aware of or equip them with strategies to deal with different forms of infringement. Furthermore, the results of data analysis suggested that occupational position with 64% of occurrences was the most frequently occurring position in the textbooks under investigation. English textbook writers did not adopt unequal subject relations in their textbooks. The findings of the present study could be beneficial for language teachers, language learners, textbook designers, and textbook publishers because suggest that a good language teacher needs to adopt a critical outlook towards the sociolinguistic studies. In effect, s/he may discuss related issues with the students with a critical point of view, a point that is ignored by many teachers.

KEYWORDS:discourse, discourse analysis, critical discourse analysis, ideology, linguistic imperialism, fairclough'sframework for CDA

INTRODUCTION

As Fairclough (1989) expressed" language use- discourse -is not just a matter of performing tasks, it is also a matter of expressing, constituting and reproducing social identities and social relations" (p. 196).

The spread of English throughout the world, over the past sixty years or so, has become one of the undeniable facts of education (Giaschi, 2000). Many, however, have been critical of this widespread use of English and are concerned about it (Canagarajah, 1999; Pennycook, 1994, 2002; Phillipson, 1992, 2003; Phillipson & Skuttnab-Kangas, 1996). These scholars have consistently argued that it is not fortuitous that English has risen to be the world's most important language and there have been some hidden hands operating behind the scene (Baleghizadeh & Jamali Motahed, 2010). Phillipson (2003), for example, observed that the diffusion of English has been, and still is, substantially orchestrated, facilitated and led by what he referred to as the Centre, that is, USA and Britain, whose commercial and political interests such diffusion serves. Phillipson (1992) in the same vein, has talked of what he called "English linguistic imperialism", which he defined in the following way: "The dominance of English is asserted and maintained by the establishment and continuous reconstitution of structural and cultural inequalities between English and other languages" (47).

A very important aspect of the politics and economics of English today is ELT (Bourne, 1996; Phillipson, 1992). ELT has become a global activity and to a large extent a business and industry, which can be dated to the 1950s (Dua, 1994; Pennycook, 1994).

Critical discourse analysis (CDA) is the uncovering of implicit ideologies embedded in the texts (Widdowson, 2000). It explores the underlying ideological bias and therefore the exercise of power in texts. In other words, critical discourse analysis and critical language education are concerned with the interests and ideologies underlying the construction and interpretation of textbooks. The purpose of CDA is to analyze "opaque as well as transparent structural relationship of dominance, discrimination, power and control as manifested in language" (Wodak, 1995: 204).

Originally, the theoretical foundations and descriptive recourses of the framework known as critical discourse analysis, or CDA for short has been applied to ELT textbooks to understand whether ELT textbooks content are neutral or they are ideologically oriented based on Western Society and its ELT market. This has been examined through qualitative and quantitative based on CDA (Fairclough, 1989, 1995, 2003; Van Dijk, 1993, 2001; Wodak et al., 1990).

The global spread of English, as well as its causes and consequences, has long been a focus of critical discussions (Rubdy and Saraceni, 2006). A number of research studies have been conducted to find out whether or not the spread of English follows an ideological path. Since ELT stands in the forefront when the spread of English and its ideological effects are addressed, some researchers have tried to spearhead their analysis on ELT textbooks to see if any type of ideology is inspired through them.

Some Iranian researchers have applied critical discourse analysis on both internationally-developed and locally-produced ELT text books which widely used in Iran to examine if these ELT text books including *Spectrum 6*, *New Interchange 3*, *American Cutting-edge 4*, *True to Life: Upper-intermediate*, *New Headway: Upper-intermediate* follow a particular ideology or not.

So far, none of Iranian researchers has applied critical discourse analysis on ELT text books such as Summit2B and Passages2. Therefore, this study aims to investigate if the mentioned text books follow the particular ideology as well by applying Critical Discourse Analysis on some ELT textbooks and determining social relations, subject positions and content included in the selected textbooks.

The findings of this research could be useful for material designers of English courses whose learners are pursuing their experience of a new language by controlling the ideological subtleties which are contained in their texts and often go unnoticed by both language learners and syllabus designers. The findings of the present study can remind material designers that, texts are carriers of ideologies and they should be aware of this point and act responsibly in presenting healthy discourses compatible with the cultures that their materials will be consumed.

LITERATURE REVIEW

The History of Critical Discourse Analysis

The 1970s saw the emergence of a form of discourse and text analysis that recognized the role of language in structuring power relations in society. At that time, much linguistic research elsewhere was focused on formal aspects of language which constituted the linguistic competence of speakers and which could theoretically be isolated from specific instances of language use (Chomsky, 1957).

Much sociolinguistic research at the time was aimed at describing and explaining language variation, language change and the structures of communicative interaction, with limited attention to issues of social hierarchy and power (Labov, 1972; Hymes, 1972). In such a context, attention to texts, their production and interpretation and their relation to societal impulses and structures, signaled a very different kind of interest (Beaugrande/ Dressler, 1981; Titscher et al. 2000).

The work of Kress/ Hodge (1979), Van Dijk (1985) Fairclough (1989) and Wodak (1989) served to explain and illustrate the main assumptions, principles and procedures of what had then become known as CL.

Initially, Fairclough (1989) identified his approach to a study of language as ‘critical language study’ and reviewed a range of mainstream approaches, including linguistics, sociolinguistics, pragmatics, cognitive psychology, artificial intelligence, conversation analysis and discourse analysis. Fairclough(1989) argued that, although all of these areas had something to offer language study, they also presented limitations for a critical perspective.

Kress (1990, 84-97) gave an account of the theoretical foundations and sources of Critical Linguistics. He indicated that the term CL was “quite self-consciously adapted” (1990, 88) from its social-philosophical counterpart, as a label by the group of scholars working at the University of East Anglia in the 1970s. By the 1990s the label CDA came to be used more consistently to describe this particular approach to linguistic analysis. Kress (1990, 94) showed how CDA was by that time “emerging as a distinct theory of language, a radically different kind of linguistics.”

He listed the criteria that characterize work in the Critical Discourse Analysis paradigm, illustrating how these distinguish such work from other politically engaged types of discourse analysis.

Based on Fairclough and Wodak (1997), Critical discourse analysis (CDA) is a quickly developing area of language study. It considers discourse as 'a form of social practice' and takes consideration of the context of language use to be crucial to discourse. It takes particular interest in the relation between language and power.

Since the 1960s, there has been a dispute on the themes and fundamental methodologies in social sciences. A lot of social scholars stated that it is dangerous to limit social science to objective description and representation of facts, without noticing that human beings have their own opinions, interests, and ideologies.

Habermas (1973) summarized a scientific theoretical framework, from which people can seek critical social sciences.

CDA was put forward by Fowler, Hodge, Kress, and Tony in the work titled *Language and Control* in 1979.

CDA is also named as critical linguistics (CL) and critical language study (CLS). Discourse analysis is more interested in observing actually occurring languages with a view to discovering and describing regularities in language use rather than rules of grammar only. Critical studies aim to reveal the relationship between language, ideology, power, and society, and reveal the link between listeners and speakers.

CDA may be described as neo-Marxist; claiming that cultural and economic dimensions are crucial in the creation and maintenance of power relations. The key figures in this area include Fairclough (1989, 1995, 2003), van Dijk (1993, 2001), Gee (1999), van Leeuwen (1993, 1995, 1996), Wodak (1996) and Scollon (2001). It is generally agreed that CDA cannot be classified as a single method but is rather viewed as an approach, which includes different perspectives and different methods for studying the relationship between the use of language and social context (Wang, 2006).

Discourse analysis and critical discourse analysis

Discourse analysis emerged as a field of study in reaction to structural and formal approaches to language which considered the sentence as the ultimate unit of analysis. Discourse analysis is concerned with stretches of language consisting of more than one sentence and has led to the realization that language cannot be studied in isolation from the communicative intentions of language users and the context within which they use language (Stern, 1983:133).

CDA adopts a social definition of discourse and also uses discourse as a countable noun, so that the competing discursive practices of a society can be spoken of as different discourses. Discourse is both constitutive and creative with regard to social conventions and hierarchies, and much of

the creativity arises from the competition between discourses in various social fields and their novel recombinations (Riches, 1999).

Fairclough (1995:131) advocated the adoption of Halliday's (1985) systemic-functional grammar as the proper linguistic theory for CDA to be based on. This theory incorporates the ideational, interpersonal and textual functions of language into the interpretation of texts and sentence constituents. Halliday described it thus:

One of the things that distinguish systemic grammar is that it gives priority to paradigmatic relations: it interprets language not as a set of structures but as a network of systems, or interrelated sets of options forming meaning. Such options are not defined by reference to structure; they are purely abstract features, and structure comes in as the means whereby they are put into effect or realized (Halliday 1985:15-16).

CDA and the ELT textbook

The accepted theory and practices in ELT are evident in ELT textbooks. One may begin by asking if questions of inequality and power are evident concerns of textbook writers, or if there is only the traditional concern with describing discourse.

Conley and O'Barr (1998), noted:

The great strength of conversation analysis has been its attention to ordinary people speaking in everyday contexts... External factors, such as status inequalities or pre-existing relationships among the parties, have rarely been taken into account... This focus... has resulted in interactions between people who are (or are assumed to be) of roughly equal social status... Nonetheless, the fact is that there are few conversations in which status and power are not relevant.... Far from being the norm, relationships of true equality are so rare as to be treasured (Conley & O'Barr, 1998:13).

An important element of CDA is that the dominant discourse of one time is not static and unalterable. Foucault wrote, "Discourse transmits and produces power, it reinforces it" but also undermines and exposes it, renders it fragile and makes it possible to neutralize it" (Foucault, 1978: 101).

This makes it clear that textbook choices are highly restricted. The market leverage enjoyed by large publishers gives them easy advantage with consumers who uncritically place faith in the 'state of the art' textbooks published in the U.K. and the U.S.A. Where alternatives might emerge, it is almost impossible for localized and innovative projects to be deemed economically feasible.

This problem has received little attention, perhaps because many of the books and journals of applied linguistics are published by the same corporations which produce ELT textbooks. One could question, for example, whether there is a conflict of interest in David Nunan's and Jack Richards' pursuit of dual careers as applied linguists and as mass market ELT textbook writers with publishing firms that are also active in both fields.

The question of a potential conflict of interest seems to draw little comment in the literature, and the authors appear not to be volunteering information on the influence their royalty checks on their theory.

Bolitho and Jolly (1998:111) noted the successes of mass-market publishers in Central Europe after the fall of communism, but they then add that "...the initial enthusiasm was quick to wear off and a number of them are now involved in producing their own school textbooks." The logic is unavoidable. However, a logical conclusion which they failed to state explicitly, (but which they may be making implicitly) is that the mass-market textbook is itself bad pedagogical practice.

Bell and Gower (1998:129), speaking of "the great compromise" involved in designing textbooks for the world, claim that it "...is not only inevitable but beneficial." Yet this comment appears in a globally distributed applied linguistics textbook, by a publisher with interests in ELT textbooks. Unexamined are the authors' and the publisher's motives for wanting, in the first place, to design textbooks for the world.

This is not to suggest that there is conscious censorship in all the literature. Longman, for example, has published the "Language in Social Life" series which includes Fairclough (1989, 1995,) Pennycook (1994) and Tollefson (1991). There is evidence of criticism in the field, although it seems to exist only at the margins of discussion (Riches, 1999).

Prodromou (1988) described a "black-and-white cardboard cut-out world" portrayed by ELT textbooks. Brown (1990:13) noted the attempts of many publishers to sell a concept of English as a neutral, culturally nondescript international language.

He asserted "...the new cosmopolitan English reflects a materialistic set of values in which international travel, not being bored, positively being entertained, having leisure, and, above all, spending money casually and without consideration of the sum involved in the pursuit of these ends, are the norm."

Phillipson (1992) and Pennycook (1994) applied critical language studies to ELT. They adopted the same view that language is not a politically neutral tool of communication. Their work gave a broad overview, with a historical and political perspective, of the emergence of English as a global language. Both writers stressed that it is no accident that English has raised to prominence in the world.

RESEARCH QUESTIONS

- 1) Are selected English textbooks neutral in terms of ideology?
- 2) Do selected English textbook writers make EFL learners aware of or equip them with strategies to deal with different forms of infringement of their wishes in the real interactions?
- 3) Are EFL learners placed in a societal position or are they placed in occupational and commercial positions?

4) Do English textbook writers adopt unequal subject relations in their textbooks?

METHODOLOGY

Corpus

The corpora of this study were based on advanced student's book of two series of ELT textbooks recently used in Iran Institutions. The selected textbooks included *Summit 2B* (Second Edition) and *Passages 2* (Second edition). The *Summit 2B* is a multiple-skills general English textbook authored by John Saslow and Allen Ascher, which was published by Pearson Education in 2012. The *Passages 2B* is also a multiple-skills general English textbook authored by Jack C. Richards and Chuck Sandy, which was published by Cambridge University Press in 2008.

Instrument

For the purpose of data collection, Norman Fairclough's (1989) Theoretical Framework was applied. As Norman Fairclough's (1989) three-dimensional model of CDA is supposed to be an interdisciplinary approach to the study of discourse, the researchers laid the foundation of the current study on this sociolinguist and poststructuralist CDA model. This model views language as a "form of social practice" (Fairclough, 1989: 20) and focuses on the ways social and political domination is reproduced by text and talk. This more socially focused conception of texts is considered as comprising of a rather large group of structural properties among which, to mention the most significant ones, one can find aspects of vocabulary, grammar and textual structures as well as non-linguistic textual features. Those features might carry three types of socially originating value: experiential, relational and expressive as defined below (1989, p.112): *Experiential* value presents "a trace of and a cue to the way in which the textproducer's experience of the natural or social world is represented. Experiential value is to do with contents and knowledge and beliefs.

Relational value means a trace of and a cue to the social relationships which are enacted via the text in the discourse. Relational value is (transparently!) to do with relations and social relations. *Expressive* value accounts for "a trace of and a cue to the producer's evaluation (in the widest sense) of the bit of the reality it relates to. Expressive value is to do with subjects and social identities, though only one dimension of latter concepts is to do with subjective values.

Table1: Formal features: Experiential, relational and expressive values Fairclough (1989).

Dimensions of meaning	Values of Features	Structural Effects
Contents	Experiential	Knowledge /beliefs
Relations	Relational	Social relations
Subjects	Expressive	Social identities

In particular, the above-mentioned framework was adopted here as a model of analysis of the selected ELT textbooks because Fairclough specifically invited such projects, and it is amenable to varied applications. According to the model, the conventional use of linguistic features imposes and reflects constraints on the three categories of structural effects.

Design

Although the current study employed some statistical quantification as the data were presented in chapter four, the nature and the overall design of the study is definitely descriptive–analytic.

Procedure

1-The conversations, listening, reading, writing, sections as well as pictures of each unit of selected textbooks were scrutinized to find out different features and aspects of Fairclough model.

2-Aspects and dimensions of meaning including content, relation and position were classified into comprehensible sets of data. In other words, the number of occurrences of each aspect of meaning, i.e. content, relations and subject positions was counted in each textbook, then the data obtained was tabulated to get a clear picture of the dominant pattern of occurrences of these dimensions of meaning.

3-Frequency of aspects and dimension of meaning were tallied.

4-To ensure objectiveness of data collection procedure, the results of the model analysis were double checked with advisor and another expert introduced by him.

5-Relevant data analysis was implemented on data.

Classification of content

Following Taki (2008), five major categories including a) Cultural contrast, festivals and customs, b) Entertainment, human interest stories, discussion starters ranging from trivial matters to social issues, c) Occupational, d) consumer-oriented, e) Interpersonal, introspective and interactional regarding individuals and institutions, for the analysis of content were adopted. Classification of contents proved to be the most challenging of all since they simply defy easy classification and, therefore managing all the data was difficult.

Classification of relations

Relation refers to the social relationships represented via the text like husband-wife or teacher-student or friends. In order to classify social relations, each textbook was reviewed page by page and relations were counted anytime the characters in the conversations were in verbal communication. They were represented either in two words divided by a hyphen such as husband-wife, or the relationship was shown by one word in plural form as in colleagues. In some cases a singular noun appeared in conversations and this indicated that the relation existed with an unseen audience, such as a newspaper reader, TV news audience, and so forth.

Classification of subject positions

Following Taki (2008), the researchers used the following three categories: a) societal, b) occupational, and c) commercial. Subject position refers to the social identity of interlocutors like customer and employer. Subject position occurrences were counted throughout both textbooks every time it appeared in a unit of a textbook under investigation. Then, following Taki (2008), the researchers employed categorized subject positions into three groups: societal, occupational and commercial. In cases where an individual or technically speaking an interlocutor appeared to be functioning in more than one subject position, for example an airline passenger travelling on business, the function that seemed most salient in the context from the view point of the researcher was selected. Even

though there is some kind of confusion in distinguishing subject positions from relations, as Fairclough (1989) declared “all three (relation, subjects, contents) overlap and co-occur in practice, but it is helpful to be able to distinguish them” (p.46).

Data analysis

The obtained data was tabulated to get a clear picture of the dominant pattern of occurrences of these dimensions of meaning. The rationale for examining these dimensions was to see which aspects of the meaning were emphasized or de-emphasized, since these choices reflect the ideological stance on the part of the textbook writer. Descriptive statistics consisted frequency table and percent. The subcategories were compared across each category of content, relations and subject positions by running chi-square analyses to see whether they were significantly different in terms of their frequency. Moreover, in order to make sure about the reliability of the findings, all the data were categorized by two raters.

RESULTS AND DISCUSSION

Descriptive statistics

Descriptive statistics encompassed frequency table and percent related to Content as a whole, Relations as a whole and Positions as a whole.

Content as a whole

Table 2 shows the patterns of content in all the textbooks as a whole. The first category, i.e., interpersonal and introspective and the second category, i.e., entertainment and human interests with 126 number of occurrences make up the most frequently occurring content in the textbooks under investigation. The findings indicated that most characters tended to talk about themselves and their personal experiences.

Table 2: Content as a whole

Category	Number of occurrences	Percentage
1. Interpersonal, introspective	126	38.1
2. Entertainment, human interest stories, discussion starter	126	38.1
3. Consumer-oriented	38	11.5
4. Occupational	34	10.3
5. Cultural contrasts, festivals and customs	6	1.8
Total	330	99.8

The third category, i.e., consumer oriented and the fourth one with 11.5% and 10.3% of occurrences respectively fall next in the above table. It indicates, as a matter of fact, the propensity to position learners within consumer and occupational domains and shows there is an emphasis on market economy and putting the learners in economic positions to talk about market related contents. This is followed by the fifth category with 1.8% of occurrences. The number of occurrences of this category suggests that the textbooks have allocated little amount of their content to the issue of cultural contrasts. This is rather odd as these textbooks are studied by a large number of EFL learners from various countries with different cultural backgrounds. Other

categories such as advertisement, Law enforcement, politics and education had no occurrences in the selected textbooks. This indicates these categories did not play any significant roles in the general trend that the textbooks were following.

Relations as a whole

Table 3 shows the pattern of relations in all the textbooks as a whole. It is clear that the category of speaker-audience is the most common relation presented with 40 occurrences, which makes up 30% of the relations in the textbooks, which appeared mainly in the books. To put it another way, an individual describes an event, his/her life story, describes his/her feeling or attitudes toward something or tells a story. The second most common relation, as presented in table 4.2 below, is friend with 18% of occurrences. This emphasizes that dialogues put on interactions between social equals, which appear to, as (Fairclough, 1989: 10) puts it, “describe discourse as it might be in a better world rather than discourse as it is”

Table 3: Relations as a whole

Row	Category	Number of occurrences	Percentage
1	Speaker-audience	40	30
2	Friends	24	18
3	Colleagues	16	12
4	Citizen	10	8
5	Interviewer-interviewee	10	8
6	Reporter-audience	7	5.2
7	Husband-wife	7	5.2
8	Parent-Child	5	4
9	Consumer-seller	3	2.2
10	Consumer-service provider	2	1.5
11	Airline Passenger-airline clerk	2	1.5
12	Teacher-parent	2	1.5
13	Nurse-Patient	2	1.5
14	Consultant-Client	1	0.75
15	Lawyer-Client	1	0.75
16	Professor-Student	1	0.75
	Total	133	100

The category of colleagues, with 12% of occurrences falls next in the tabulation process. Similarly, in this relation the emphasis is placed on the social equal characters, indicating a very friendly relationship between workers. The category of citizen, with 8% is the fourth frequently occurring relation. Similarly, in this relation the emphasis is placed on the social equal characters, indicating a very friendly relationship between citizens. The interviewer– interviewee relation, with 8% of occurrences, same as citizen is the fifth frequently occurring relation. Apparently, this relation, compared to the previous categories, has little basis as in reality that interviews are held in order to take a job or a position, no instance of which was observed in the textbooks. Based on evidence, there is also a great deal of exercise of power in the interviews in real life situations, though it sounds strange that no instances of this behavior were found in the interviews presented in the given textbooks. The type of relation presented in these textbooks simulates common

interviews on TV and radio news. This finding suggests that individuals are positioned to accept certain relations by the fact that they are presented as normal occurrences. In this case the individual accepts the premise that one willingly offers frank opinions on almost any subject to anyone who asks for them; this is in fact another instance of indicating world in a distorted fashion. The category of reporter-audience, the sixth one with 5.2% of occurrences, resembles what individuals observe on TV, i.e., someone is reporting an event to the audience. The seventh and eighth categories, i.e., family members and wife-husband, with 5.2% and 4% of occurrences respectively, again are examples of interactions between social equals. The category of consumer-service provider is the ninth category with 2.2% of occurrences. This relation indicates the importance placed upon the service industry and social skills training. As with the category of friends, this relation is idealized to be free of struggles and divergences. With customer-service provider, individuals are also being positioned as playing a fruitful role in the economy.

The tenth category, consumer-seller, with 1.5% of occurrences is similar to customer-service provider, but it is fascinating to consider how less frequently these two relations occur. The eleventh category, i.e., Airline Passenger-airline clerk, with 1.5% of occurrences adds a spice of inequality to the relations in the corpus gathered, but the relations portrayed were so friendly that no instance of exercise of power by more powerful individuals could be detected in the conversations. Finally, the categories of Teacher-parent, Nurse-Patient with 1.5%, and Consultant-Client, Lawyer-Client, and Professor-Student all with 0.75% of occurrences, represent unequal encounters, though, similarly no exercise of power was observed. In other words, being friendly was portrayed as a natural process, which is of course not necessarily the same in real life situations.

Considering all categories in this dimension of meaning, it can be suggested that inequality is rarely addressed in the interactions portrayed in these ELT textbooks, and this supports the argument in regard with the tendency to conceal inequality in discourse. Fairclough's (1989) studies of actual micro-discourses between doctors and interns, police and citizens, and so on, revealed how powerful participants exercise power through the conventions of discourse. Once relations, subjects and contents are established, there are observable constraints on such things as turn taking, who can ask questions, who can interrupt, and forms of address, among many other possibilities. However, in ELT textbooks, particularly the ones under investigation in the present study, apparently little attempt is made to make EFL learners aware of such real life issues as dialogue management strategies like turn taking or to even equip them with the verbal self-defense skills required to deal with numerous forms of infringement of their needs, hopes and wishes. What appears to be absent is an explicit teaching of such skills rather than simply exposing them to certain non-authentic forms of language use.

Positions as a whole

Table 4 shows the pattern of subject positions in all the textbooks as a whole. As it is presented in the table, occupational aspect with 64% of occurrences dominates the positions in both ELT textbooks under investigation. This position along with the third category, i.e., commercial position with 10% of occurrences in the analyzed textbooks mainly engage learners in business and economic activities.

The second position belongs to the societal position with 24% of occurrences. Throughout the textbooks, interactants were placed in a position to talk about themselves, to have a friendly chat with friends, to tell an interesting story and other similar positions. In fact, throughout the textbooks individuals were positioned in an ideal way that people take in a very idealized and friendly setting.

Table 4: Positions as a whole

Category	Number of occurrences	Total percentage
Occupational	160	64
Societal	62	24
Commercial	25	10
Total	249	98

Inferential statistics

With inferential statistics, we try to reach conclusions that extend beyond the immediate data alone. Statistical decisions based on evidence observed in samples always involve the possibility of error. Therefore, Statisticians do not deal with decisions based on certainty. They merely estimate the probability or improbability of occurrences of events. The purpose of inferential statistics is to make inferences regarding outcomes, based on a sample. This study used inferential statistics to make decisions to reject or not reject a null hypothesis. Level of significance 0.05 was chosen in the calculations.

Table 5: Chi-Square Test for the Frequency of subcategories of content as a whole

χ^2	df	p
191/03	4	0/001**

According to Table 5, there is a statistically significant difference among the subcategories of content. Since, *Chi-Square Test* affected by the most frequency, therefore, the first and second categories constituted the great part of content as whole ($\chi^2=191.03$, $p=0.001$, $df=4$). Therefore, based on results extracted from tables 4.1 and 4.6 it is concluded that this study rejects the first null hypothesis which was mentioned earlier in chapter one, in other words, the normality of the distribution is not confirmed in the samples of this study.

Table 6: Chi-Square Test for the Frequency of subcategories of relations as a whole

χ^2	df	p
201/79	15	0/001**

According to Table 6, there is a statistically significant difference among the subcategories of relations. Since, *Chi-Square Test* affected by the most frequency, therefore, the first and second categories constitute the great part of relations as whole ($\chi^2=201.79$, $p=0.001$, $df=15$). Therefore, based on results extracted from tables 4.2 and 4.7, it is concluded that this study confirms the second and fourth null hypotheses which were mentioned earlier in chapter one, in other words, the normality of the distribution is confirmed in the samples of this study.

Table 7: Chi-Square Test for the Frequency of subcategories of positions as a whole

χ^2	df	p
118/21	2	0/001**

According to Table 7, there is a statistically significant difference among the subcategories of relations. Since, *Chi-Square Test* affected by the most frequency, therefore, the first category (occupational) constituted the great part of relations as whole ($\chi^2=118.21$, $p=0.001$, $df=2$). Therefore, based on results extracted from tables 4.3 and 4.8, it is concluded that this study rejects the third null hypothesis which was mentioned earlier in chapter one, in other words, the normality of the distribution is not confirmed in the samples of this study.

Discussion

As the findings of the present study showed, the mentioned internationally English textbooks are not ideologically biased as they are apparently following the ideology of neo-liberalism and free market which is an attempt to make individuals ready to engage in the world market, while having no other option to challenge the setting.

The researchers examined all analyzed relations and found out that inequality is rarely addressed in these interactions, and this signals to the point in regard with the tendency to conceal inequality in discourse. Since most of the relations in the textbooks are equal encounters, in the examined ELT textbooks apparently little attempt is made to make EFL learners aware of such issues as dialogue management strategies like turn taking or to even equip them with the verbal self-defense skills needed to deal with various forms of infringement of their wishes.

The results of data analysis suggested that occupational position with 64% of occurrences is the most frequently occurring position in the textbooks under investigation. The results of data analysis indicated that the categories of Speaker-audience and Friends relations are the most frequently occurring relation which is an equal relation between the interactants. There was not any exercise of power by any of the participants in the dialogues.

CONCLUSION

The findings of this study also agreed with those of Riches (1999) who examined a selection of ELT textbooks which were marketed globally by five of the largest publishers in this field. The analysis of relations, roles and content showed that globally marketed textbooks emphasized the market and occupational aspects of these three categories. Even though actual place names, historical figures, dialects and settings were often avoided, it was still apparent that these ELT textbooks reflected the discourses of developed free market Western economies - a very specific cultural context. The analysis also revealed the strong influence of the neoclassical approach in textbook design.

The findings of the present study could be beneficial for language teachers, language learners, textbook designers, and textbook publishers because suggest that a good language teacher needs

to adopt acritical outlook towards the sociolinguistic studies. In effect, s/he may discuss related issues with the students with a critical point of view, a point that is ignored by many teachers. The findings of this study may also be of interest to policy makers since the effects of market ideology and the norms and values inculcated through textbooks should be considered in order to prevent cultural misunderstanding.

Limitations of the study

This research like all education researches included some limitations and delimitations. CDA is likely to remain more akin to literary criticism than a verifiable theory. The process of establishing frameworks and collecting data involves many subjective interpretations, and the conclusions drawn from such a process do not convince everyone. Categorizing the relations, subjects and contents of the ELT textbooks involves much subjective interpretation. No two people would classify the data in the same way. This is a fundamental problem in any textual analysis. It was not feasible for the researcher to apply CDA on all ELT text books; therefore, this study was delimited to advanced student's book of Summit2B and Passage2 which are currently taught in Iranian institutions.

ABSTRACT

This study examined the effects of referential questions on classroom interaction of intermediate learners in conversation classes. The data was collected via self observation. Five EFL (English as a Foreign Language) teachers observed their own classes over five one hour-and-thirty minute session period in Pooyesh Language House Institute in Bandar Lengeh, Iran. Students were asked both display and referential questions and the number of students and responses were calculated for both question types to collect quantitative data. The analysis of quantitative data indicated that intermediate students participated more when asked a referential question. Furthermore referential questions engendered more responses compared to the responses given to display questions. The results suggested that teachers involved in teaching intermediate conversation classes should ask more referential questions to create more classroom interaction. However, display questions shouldn't be missed for checking students' comprehension and progress. It seemed that referential questions create more opportunities for language development and enable students to express their feelings and opinions, so they are believed to be efficient techniques in language classrooms.

KEYWORDS: Referential Questions, Display Questions, Classroom Interaction.

INTRODUCTION

So far teaching English has seen lots of movements starting from teaching grammar and vocabulary in schools to teaching English in a communicative way, which is the most used method in most institutes nowadays. Recently Language educators and language experts have been concerned more about interaction between teachers and students and among students themselves and how to improve it. They believe it is the most effective way in learning how to speak English especially in EFL settings, in which students have fewer opportunities to practice language. Since learners in EFL settings do not have enough ability to start an English conversation, it is believed teachers have to initiate that via asking learners questions. English language teaching has undergone many fluctuations over the years (Mirsharifi, 2007). Although the primary concern of language pedagogy until the mid-1980s was to find more effective "methods" of language teaching, this trend has now been replaced by a new movement, which focuses much more on language pedagogy that involves various aspects of teaching and learning processes and the contributions of the individual teachers to the profession (Widdowson, 1990).

“In the recent years the interactive features of classroom behavior, such as turn-taking, questioning and answering, negotiation of meaning and feedback have taken a great role in EFL programs” (Chaudron, 1988, p.10). “The background of this lies in the fact that second language learning is a highly interactive process” (Richard & Lockhart, 1994, p. 138). and the quality of this interaction is thought to have a considerable influence on learning (Ellis, 1994). “Teacher-student interaction plays an important role in learning since it provides learners with authentic input and feedback viewed influential in building inter language and producing comprehensible input” (Mirsharifi, 2007). This teacher-student interaction gains more importance in EFL settings since learners have fewer opportunities to use their foreign language to ask questions and provide feedback. (Farooq, 1998). Since then teachers' questioning has been the target of investigation for researchers working in the field of classroom second language learning (Banbrook & Skehan, 1990; Brock, 1986; Oberli, 2003). The most important factor within an effective EFL course is student participation. Students need to be stimulated. One of the most common methods and appealing activities in facilitating student participation is asking questions by teachers (Özcan, 2010). Teachers ask lots of questions with different classifications. Thompson (1997) classifies questions in terms of their form, content and purpose. The first category includes Yes/no questions and wh questions. The second category is about the information that the question seeks; whether it asks about information not directly related to the learner, which is called "outside facts" or it asks about "personal facts and opinions". The third category relates to the purpose of the question; whether it is asked to display knowledge or for communication. According to Ellis (1994), these two types are classified as display and referential questions. EFL teachers tend to ask display questions most of the time (Long & Sato, 1983; Thornbury, 1996). Display questions are questions which teachers already know their answers (Thompson, 1997; Thornbury, 1996). However, some researchers believe these questions produce less communication in classrooms (Kumaravadivelu, 1993), since they have only one correct answer. On the other hand, referential questions have more than one answer. They enable students to express their opinions and share information (Ellis, 1994; Thompson, 1997; Thornbury, 1996).

LITERATURE REVIEW

Previous literature on the effects of referential questions on the classroom interaction of students has shown that teachers use display questions more than referential questions to check the students' comprehension and progress. However it has been revealed that referential questions increase the classroom interaction of the students. Many researchers studied the effects of referential questions on the classroom interaction of learners like Long and Sato (1983), Brock (1986), Lynch (1991), Allwright and Bailey (1991), Sulter (2001, 2002), Shomoossi (2004), Liu (2005), Gung Eng Ho (2005), McGrew (2005), Y, Lee (2006), Yang (2006), Tan (2007), Fakeye (2007), and Behnam and Pouriran (2009). To begin with Long and Sato (1983) who studied the questions teachers use in ESL classrooms and compared them with the ones native speakers (NS) and non-native speakers (NNS) use outside the classroom. They found that language teachers ask significantly more display questions in the classroom. While NS and NNS ask more referential questions outside the classroom. Shomoossi (2004) studied the effects of asking referential questions on the students' interaction and the frequency of display and referential questions in EFL classrooms. The findings showed that teachers used display questions more than referential

questions. He justified the high frequency of display questions to the low language ability of the students. He explained that in reading classes teachers need to check students' comprehension. It was also found that referential questions create more interaction in the classroom than display questions do, especially in higher-level language classes. Mirsharifi (2007) introduced a study about effective and less effective teacher questioning and corrective feedback behavior in an EFL context. The results revealed that effective teachers ask significantly more questions than less effective ones and provide more corrective feedback than their less effective counterparts. Moreover the study revealed that effective teachers ask referential questions far more often than they ask display questions. Fakeye (2007) studied teacher's questioning behavior and ESL classroom interaction pattern. He used classroom interaction observation schedule which comprised a checklist on the teacher's use of questions in ESL lessons. The researcher carried out observation on teachers questioning behavior in ESL classroom. The researcher took note of teacher questions, their number, and their function. Moreover he took note of the amount and frequency of teacher-student and student-teacher interaction. Furthermore he took note of the length of students' responses to different questions types. In addition the number of referential questions and display questions were asked and their results were recorded. The study revealed that display questions are used more than referential questions in ESL classes for checking what has been taught previously. Behnam and Pouriran (2009) studied classroom discourse; analyzing teacher/ learner interaction in ESL task-based classrooms in Iran. The results illustrated that display questions are used more than referential questions; however referential questions produce more classroom interaction. Özcan (2010) studied the effect of asking referential questions on the participation and oral production of lower level language learners in reading classes. The results showed that although display questions do not have much effect on students' language development, they should not be dismissed. They are necessary to check students' comprehension and progress. On the other hand, referential questions enable students express their opinions and feelings. They are effective in promoting more student-talk and interaction in the classroom. However, although referential questions can be used for both higher and lower level language classes; they engender better results in higher level ones. Van Lier (1988) points out: "If the keys to learning are exposure to input and meaningful interaction with other speakers, we must find out what input and interaction the classroom can provide... we must study in detail the use of language in the classroom in order to see if and how learning comes about through the different ways of interaction in the classroom". He also pointed out that interaction is essential for language learning which occurs in and through participation in speech events, which is talking to others, or making conversation (Van Lier, 1988:77-78). Seliger's (1983) paper, "Does practice make perfect?: a study of Interaction patterns and L2 competence", was about a practical pedagogic issue. He studied classroom interaction and two types of learners, high-input generators (HIGs) and low input generators (LIGs). He concluded that learners, due to some cognitive factors, are divided to two types; HIGs who generate more interaction and LIGs who generate less interaction and, so, need more practice.

Krashen (1985) attributes the progress in language acquisition to comprehensible input, saying that output is possible as a result of acquired competence. In other words, when performers speak, they encourage input. In contrast, Long (1983) proposed a model in which the role of conversation (interaction) in getting comprehensible input and its primacy are emphasized.

Fillmore (Ellis, 1985:160) has investigated how classroom interaction affects the rate of SLA. He concluded that pupils will learn most successfully when they are given ample opportunities to interact in conversation. So in this sense, we can say how a lesson progresses and whether it is successful largely depend on the interaction between the students and the teacher. Seliger (1983) considered interaction as practicing what has been taught during the lesson. He considered whatever students say even a simple yes/ no as interaction on the part of student. Students' replies vary from a word to several sentences according the questions they are asked.

RESEARSH QUESTIONS

- 1- Does use of referential questions facilitates classroom interaction in intermediate classes?
- 2- Do referential questions engender more responses from the students?

METHODOLOGY

Participants

Subjects who took part in this study were five EFL teachers from Pooyesh Language House and fifty three intermediate-level- learners. Three teachers were female and two were male. Two teachers had M.A in TEFL. The others had B.A in TEFL. The teachers were within different age range and with different experience. A simple random sampling as well as a convenience sampling was used in selecting the participants according to the project conditions.

Instruments

The data was collected through self-observation. This procedure required participants to observe their own internal cognitive or emotional states. The observers, who were five EFL teachers, filled in observation schedule (tally sheets), which was adopted from Seda Özcan, 2010. Two types of tally sheets were used. The first observed teachers' use of questions; what types of questions did they use in the classroom. And how many questions of each type. The second tally sheet identified the number of students who responded to each question and the number of responses.

Procedure

This study was quantitative. The data for this study was collected via quantitative data collection instrument. The data was provided by numerical results in tally sheets to mark the number of questions were asked in each session, the number of students who participated after each question was asked and the number of responses supplied by students. Five teachers observed their own classes. It took 5 one hour-and-thirty minute sessions. The classes were video and audio taped, and the teachers filled tally sheets to state their observation. It took about twenty minutes to complete the tally sheets. They were immediately transcribed, coded and audio taped.

Data analysis

Five teachers observed what kind of question they used, referential or display. The questions were transcribed in both tally sheets. The transcription was done in a written way. Referential questions got one point; display questions got zero point. The number of referential questions and

display questions that were used in each session were calculated. Moreover the total number of questions (referential and display) that were asked each session were calculated. The data collected from first tally sheet was imported and analyzed using the statistical package for the social science (SPSS package). In order to answer the first research question, in the second tally sheet the number of students who responded after each question (referential or display) was asked were calculated. For the second research question, the number of responses after each question was asked was calculated. The data collected from the second tally sheet was imported and analyzed using SPSS package.

RESULTS AND DISCUSSION

Teacher 1

Table 1: Number of Questions, Students and Responses in Sessions 1, 2, 3, 4, 5 in teacher1's class

	Display question	Student responding (Display)	Response (Display)	Referential question	Student responding (Referential)	Response (Referential)
Session 1	3	4	4	3	11	11
Session 2	3	5	5	3	12	13
Session 3	3	8	10	3	12	18
Session 4	3	5	5	3	12	20
Session 5	3	3	3	3	12	19
Total	15	25	27	15	59	81

When display questions were asked, in session 1 26.6% (4 out of 15) of the total students who participated during the 90-minute instruction took part in the question-and-answer exchanges, while this number is 73.3% (11 out of 15) for the referential questions. Likewise, 73.3% (11 out of 15) of the total responses supplied to referential questions, however the percentage of responses were given to display questions was only 26.6% (4 out of 15). In session 2, when display questions were asked 29.4% (5 out of 17) of the total number of students who participated took part in the question-and-answer exchanges, while this number was 70.5% (12 out of 17) for the referential questions.. Likewise, 72.2% (13 out of 18) of the total responses supplied to referential questions, however the percentage of responses were given to display questions was only 27.7% (5 out of 18). In session 3, when display questions were asked 40% (8 out of 20) of the total students who participated took part in the lesson, while this number is 60% (12 out of 20) for the referential questions. Likewise, 69% (18 out of 26) of the total responses supplied to referential questions, however the percentage of responses were given to display questions was only 38.4% (10 out of 26). In session 4, 29.4% (5 out of 17) of the total number of students participated when display questions were asked, while this number is 70.5% (12 out of 17) for the referential questions. Likewise, 80% (20 out of 25) of the total responses supplied to referential questions, however the percentage of responses were given to display questions was only 20% (5 out of 25). In session 5, 20% (3 out of 15) of the total number of students participated when display questions were asked, while 80% (12 out of 15) took part in the lesson when referential questions

were asked.. Likewise, 86.3% (19 out of 22) of the total responses supplied to referential questions, however the percentage of responses were given to display questions was only 13.6% (3 out of 22). Figure 1 is a bar chart that illustrates the frequency of the students responding to each question type and the frequency of the responses supplied to each question type in sessions 1, 2, 3, 4, 5. As obvious in the figure, the students who interacted in the referential question-and-answer exchanges outnumbered those who interacted in the display question-and-answer exchanges. Furthermore the responses supplied to referential questions outnumbered the ones supplied to display questions.

Figure 1: Frequency of students responding and the responses in sessions 1, 2, 3, 4, 5 in teacher 1's class

The justification why there are more responses than the number of students was that some of the questions had for more than one correct response; thus, some students supplied more than one answer. In fact, the remarkable difference in partaking that each question type generates was due to the broad range of probable answers that students could produce when a referential question was inquired.

Teacher 2

The number of students who participated when both types of question were inquired and the number of responses given to those questions in sessions 1, 2, 3, 4, 5 are provided in Table 4.2 below.

Table 2: Number of Questions, Students and Responses in Sessions 1, 2, 3, 4, 5 in teacher 2's class

	Display question	Student responding (Display)	Response (Display)	Referential question	Student responding (Referential)	Response (Referential)
Session 1	3	5	6	3	21	23
Session 2	3	16	17	3	53	53
Session 3	3	3	3	3	25	26
Session 4	3	4	4	3	23	23
Session 5	3	5	5	3	24	26
Total	15	33	35	15	146	151

When display questions were asked, in session 1 19.2% (45out of 26) of the total students who participated during the 90-minute instruction took part in the question-and-answer exchanges, while this number is 80.7% (21out of 26) for the referential questions. Likewise, 79.3% (23out of

29) of the total responses supplied to referential questions, however the percentage of responses were given to display questions was only 20.6% (6 out of 29). In session 2, when display questions were asked 23.1 % (16 out of 60) of the total number of students who participated took part in the question-and-answer exchanges, while this number was 76.8% (53 out of 69) for the referential questions.. Likewise, 75.7% (53 out of 70) of the total responses supplied to referential questions, however the percentage of responses were given to display questions was only 24.2% (17 out of 70). In session 3, when display questions were asked 10.7% (3 out of 28) of the total students who participated took part in the lesson, while this number is 89.2% (25 out of 28) for the referential questions. Likewise, 89.6% (26 out of 29) of the total responses supplied to referential questions, however the percentage of responses were given to display questions was only 10.3 % (3 out of 29). In session 4, 14.8% (4 out of 27) of the total number of students participated when display questions were asked, while this number is 85.1% (23 out of 27) for the referential questions. Likewise, 85.1% (23 out of 27) of the total responses supplied to referential questions, however the percentage of responses were given to display questions was only 14.8% (4 out of 27). In session 5, 17.2% (5 out of 29) of the total number of students participated when display questions were asked, while 82.7% (24 out of 29) took part in the lesson when referential questions were asked. . Likewise, 83.8% (26 out of 31) of the total responses supplied to referential questions, however the percentage of responses were given to display questions was only 16.1% (5 out of 31). Figure 2 illustrates the frequency of the students responding to each question type and the frequency of the responses supplied to each question type in sessions 1, 2, 3, 4, 5. As obvious in the figure, the students who interacted in the referential question-and-answer exchanges outnumbered those who interacted in the display question-and-answer exchanges. Furthermore the responses supplied to referential questions outnumbered the ones supplied to display questions.

Figure 2: Frequency of students responding and the responses in sessions 1, 2, 3, 4, 5 in teacher 2's class

Teacher 3

Table 3: Number of Questions, Students and Responses in Sessions 1, 2, 3, 4, 5 in teacher 3's class

	Display question	Student responding (Display)	Response (Display)	Referential question	Student responding (Referential)	Response (Referential)
Session 1	3	4	4	3	29	41
Session 2	3	4	4	3	24	27
Session 3	3	3	3	3	21	23
Session 4	3	3	3	3	9	9
Session 5	3	3	3	3	16	16
Total	15	17	17	15	99	116

In session 1 when display questions were asked, 12.1% (4 out of 33) of the total students participated in the question-and-answer exchanges, nevertheless this number is 87.8% (29 out of 33) for the referential questions. In the same way, 91.1% (41 out of 45) of the total responses were given to referential questions, yet the percentage of responses supplied to display questions was only 8.8% (4 out of 45). In session 2, when display questions were asked 14.2 % (4 out of 28) of the total number of students who participated took part in the question-and-answer exchanges, while this number was 85.7% (24 out of 28) for the referential questions. Likewise, 87% (27 out of 31) of the total responses supplied to referential questions, however the percentage of responses were given to display questions was only 12.9% (4 out of 31). In session 3, when display questions were asked 12.5% (3 out of 24) of the total students who participated took part in the lesson, while this number is 87.5% (21 out of 24) for the referential questions. Likewise, 88.4% (23 out of 26) of the total responses supplied to referential questions, however the percentage of responses were given to display questions was only 11.5 % (3 out of 26). In session 4, 25% (3 out of 12) of the total number of students participated when display questions were asked, while this number is 75 % (9 out of 12) for the referential questions. Likewise, 75% (9 out of 12) of the total responses supplied to referential questions, however the percentage of responses were given to display questions was only 25% (3 out of 12). In session 5, 15.7% (3 out of 19) of the total number of students participated when display questions were asked, while 84.2% (16 out of 19) took part in the lesson when referential questions were asked. . Likewise, 84.2% (16 out of 19) of the total responses supplied to referential questions, however the percentage of responses were given to display questions was only 15.7% (3 out of 19). Figure 3 illustrates the frequency of the students responding to each question type and the frequency of the responses supplied to each question type in sessions 1, 2, 3, 4, 5. As obvious in the figure, the students who interacted in the referential question-and-answer exchanges outnumbered those who interacted in the display question-and-answer exchanges. Furthermore the responses supplied to referential questions outnumbered the ones supplied to display questions.

Figure 3: Frequency of students responding and the responses in sessions 1, 2, 3, 4, 5 in teacher 3's class

Teacher 4

Table 4: Number of Questions, Students and Responses in Sessions 1, 2, 3, 4, 5 in teacher 4's class

	Display question	Student responding (Display)	Response (Display)	Referential question	Student responding (Referential)	Response (Referential)
Session 1	3	8	8	3	22	25
Session 2	3	4	6	3	18	22
Session 3	3	6	7	3	27	29
Session 4	3	14	16	3	19	22
Session 5	3	7	7	3	21	40
Total	15	39	44	15	107	140

26.6% (8 out of 30) of the total students participated in the question-and-answer exchanges when display questions were asked, on the other hand, this number is 73.3% (22 out of 30) for the referential questions. Correspondingly, 75.7% (26 out of 33) of the total responses were provided for referential questions, however the percentage of responses supplied to display questions was just 24.2% (8 out of 33). In session 2, when display questions were asked 18.1% (4 out of 22) of the total number of students who participated took part in the question-and-answer exchanges, while this number was 81.8% (18 out of 22) for the referential questions.. Likewise, 78.5% (22 out of 28) of the total responses supplied to referential questions, however the percentage of responses were given to display questions was only 21.4% (6 out of 28). In session 3, when display questions were asked 18.1% (6 out of 33) of the total students who participated took part in the lesson, while this number is 81.8% (27 out of 33) for the referential questions. Likewise, 80.5% (29 out of 36) of the total responses supplied to referential questions, however the percentage of responses were given to display questions was only 19.4% (7 out of 36). In session 4, 42.4% (14 out of 33) of the total number of students participated when display questions were asked, while this number is 57.5% (19 out of 33) for the referential questions. Likewise, 57.8% (22 out of 38) of the total responses supplied to referential questions, however the percentage of responses were given to display questions was only 42.1% (16 out of 38). In session 5, 25% (7 out of 28) of the total number of students participated when display questions were asked, while 75% (21 out of 28) took part in the lesson when referential questions were asked. . Likewise, 85.1% (40 out of 47) of the total responses supplied to referential questions, however the percentage of

responses were given to display questions was only 14.8 % (7 out of 47). The illustration of the frequency of the students responding to each question type and the frequency of the responses supplied to each question type in sessions 1, 2, 3, 4, 5 is shown in Figure 4. As the figure depicts, the number of students who interacted in the referential question-and-answer conversations was larger than those who took part in the display question-and-answer exchanges.

Figure 4: Frequency of students responding and the responses in sessions 1, 2, 3, 4, 5 in teacher 4's class

Teacher 5

Table 5: Number of Questions, Students and Responses in Sessions 1, 2, 3, 4, 5 in teacher 5's class

	Display question	Student responding (Display)	Response (Display)	Referential question	Student responding (Referential)	Response (Referential)
Session 1	3	3	3	3	20	20
Session 2	3	4	4	3	24	24
Session 3	3	3	3	3	20	20
Session 4	3	5	5	3	15	15
Session 5	3	5	5	3	17	17
Total	15	20	20	15	96	96

In session 1 13 % (3 out of 23) of the total students took part in the question-and-answer exchanges when display questions were asked, in contrast, this number is 86.9% (20 out of 23) for the referential questions. Also, 86.9 % (20 out of 23) of the total responses were supplied for referential questions, still the percentage of responses provided to display questions was only 13 % (3 out of 23). In session 2, when display questions were asked 14.2 % (4 out of 28) of the total number of students who participated took part in the question-and-answer exchanges, while this number was 85.7 % (24 out of 28) for the referential questions. Likewise, 85.7 % (24 out of 28) of the total responses supplied to referential questions, however the percentage of responses were given to display questions was only 14.2 % (4 out of 28). In session 3, when display questions were asked 13% (3 out of 23) of the total students who participated took part in the lesson, while this number is 86.9 % (20 out of 23) for the referential questions. Likewise, 86.9 % (20 out of 23) of the total responses supplied to referential questions, however the percentage of responses were given to display questions was only 13 % (3 out of 23). In session 5, 25 % (5 out of 20) of the total number of students participated when display questions were asked, while this number is 75 % (15 out of 20) for the referential questions. Likewise, 75 % (15 out of 20) of the total responses

supplied to referential questions, however the percentage of responses were given to display questions was only 25 % (5 out of 20). In session 5, 22.7 % (5 out of 22) of the total number of students participated when display questions were asked, while 77.2 % (17 out of 22) took part in the lesson when referential questions were asked. . Likewise, 77.2 % (17 out of 22) of the total responses supplied to referential questions, however the percentage of responses were given to display questions was only 22.7 % (5 out of 22). Figure 5 is a bar chart that displays the frequency of the students responding to each question type and the frequency of the responses supplied to each question type in sessions 1, 2, 3, 4, 5. The figure illustrates that the students who took part in the referential question-and-answer exchanges outnumbered those who interacted in the display question-and-answer conversations.

Figure 5: Frequency of students responding and the responses in sessions 1, 2, 3, 4, 5 in teacher 5's class

Discussion

The results of the study showed that referential questions produced more classroom interaction in intermediate classes than display questions did. When students were asked about their opinions/ experiences, all of them participated, explaining what did they think/ what happened to them. Some students mentioned more than one experience. Most of the students justified their beliefs and their opinions. They also interrupted each other, expressing their agreement/disagreement. In fact the students were free to say whatever they want/ believe. The communication between students and teacher was much natural and look like the one that may occur outside the classroom. A noticeable point in here was the amount of teacher talk, which was reduced. Therefore it was evidenced during the observation that referential questions engendered more responses from students. It seemed that referential questions create more opportunity for language development and enable the students to express their feelings and opinions. Moreover referential questions seemed to create more realistic situations in language classrooms.

Since referential questions increase the amount of learner output which leads to more language development, then they are believed to be efficient techniques in language classrooms, especially in those contexts where the classroom provides the only opportunity to produce the target language i.e. EFL contexts.

On the other hand, when teachers wanted to check students' comprehension, they asked display questions. Most of the time one or two students could participate, giving the correct answer. In fact the two students were giving the same answer, say, in different words. Sometimes one of the students gave the correct answer; the other supplied an example for what his/her peer said. Usually a silence followed supplying the correct answer in the case of display questions. However, display questions were good opportunities for less proficient students to participate.

Furthermore, it was noticed that in the case of display questions the amount of teacher talk increased; teachers usually extended on the given information.

So it was inferred from the obtained data that display questions, require short answers, which contain small pieces of information e.g. antonyms and synonyms, word pronunciation and meaning, comprehension checks, etc. Thus it is believed that this kind of questions do not produce much classroom interaction. However, it seems that the use of display questions can encourage language learners especially the poor ones to get interested. It may also help teachers provide comprehensible input for learners. While, referential questions usually require long answers which contain interpretation, elaboration, giving opinions, etc. When students were asked about the meaning/the synonym/ the antonym of a word, just one or two students could participate, even the other student could add nothing, just repeating what his classmate said in different words. However, it would be dangerous to generalize that referential questions are more useful for language learning, or display ones are useless. Each context requires an appropriate strategy for itself. Allwright and Bailey (1990) maintain that it is a wrong belief on the part of teachers to aim at just increasing the amount of interaction in the class. Rather they have to adjust their teaching style to learners' strategies (pp. 144-5).

CONCLUSION

The findings of this study allowed the author to draw some conclusions.

Firstly, it seems that referential questions produce more classroom interaction. In fact, students tended to participate more and express their feelings and opinions when they asked a referential question. This finding is in line with Özcan (2010) and Shomossi's (1997) findings who concluded that referential questions enhance students' participation in the classroom. Moreover, the findings confirmed that referential questions engender more responses from students. In fact, this kind of questions gets the students to become more interested to participate (e.g. the students did like to participate and supply more than one answer when they were asked about their experiences and opinions.). This finding is, also, in line with Özcan (2010) and Shomossi's (1997) findings and other researchers' findings (e.g. Behnam and Pouriran (2009), and Qashoa (2013).) who found the students in their studies tend to participate more when asked about their opinions. On the other hand, the findings suggested that teachers use display questions to check students' understanding. (e.g. meaning, antonyms and synonyms, word pronunciation ,and comprehension checks.). This finding is also in line with Özcan (2010) and Shomossi's (1997) findings and other researchers' findings (e.g. Mirsharifi, 2007; Xiao-yan, 2006).

Furthermore, the findings evidenced that display questions produce less classroom interaction. The reason for that is that display questions have limited answers. When a student gets the correct answer, others have nothing to add. This finding is in line with Özcan (2010), Shomossi (1997), and Temiz's (2012) findings. Finally, the results showed that although display questions do not have much effect on students' language development, they should not be dismissed, since they are needed to check students' progress, understanding and comprehension. In addition, display questions are effective tools that enable teachers to elicit language and concepts. On the other hand, referential questions create realistic situations in the classroom enabling students to

express ideas, opinions and feelings. They are effective in generating more responses and promoting more student-talk and interaction in the classroom. However the study was concerned about the effects of referential questions, not the effects of display questions. Moreover it investigated the effects of referential questions on intermediate students' participation, not on other levels' participation. Furthermore the number of intermediate learners who participated in the study was limited which affected the generalizability of the study results.

ABSTRACT

The present study tried to investigate the relationship between Iranian English as a foreign language (EFL) teachers' self-efficacy with their students' Emotional intelligence and speaking anxiety. The participants of present research consisted of 2 groups. The first group consisted of 100 EFL students (male and female) who were selected from among the senior learners of the Islamic Azad Universities of Rodehen and south branch of Tehran. The second group of participants consisted of 30 Iranian EFL teachers. To this end, three questionnaires were used: The first questionnaire was students' speaking anxiety, a self-reporting questionnaire with a five Likert-type scale mainly on the basis of FLCAS developed by Horwitz, et al (1986). The second questionnaire was students' EI inventory developed by Bar-On (1997), and the third questionnaire was teacher's self-efficacy scale. Then, two statistical procedures were used to examine the relationship between independent and dependent variables of the study. Through the use of Pearson product-moment correlation coefficient and Multiple Regression all the null hypotheses were tested. The result of the Pearson correlation showed that there was a significant negative relationship between Iranian EFL teachers' self-efficacy and learners' speaking anxiety. It also proved that there was a significant positive relationship between Iranian EFL teachers' self-efficacy and learners' emotional intelligence. The result of Multiple Regressions indicated that students' gender had no effect on their speaking anxiety and emotional intelligence.

KEYWORDS: Emotional Intelligence, Emotional Quotient, Intelligence Quotient, Anxiety, Foreign Language Anxiety, Self-Efficacy, Teachers' Self-Efficacy

INTRODUCTION

Anyone who has ever taken a foreign language course in school or university can testify to the fact that it is not always an easy task. One interesting question in the field of Second Language Acquisition (SLA) is why some learners successfully learn or speak a second language while other learners do not (Tallon, 2004). Several reasons have been posited for this, including individual factors such as cognitive abilities, personality characteristics, aptitude, and affective factors. This study will focus on one of the most important affective variables, namely anxiety.

There is no doubt that this construct has been a matter of discussion in the last three decades and this is due to its pervasive effects on foreign language learning (FLL) (Idri, 2012). According to Horwitz, Horwitz and Cope (1986), foreign language anxiety is “a distinct complex of self perceptions, beliefs, feelings, and behaviors related to classroom language learning arising from the uniqueness of the language learning process” (p. 31). The major aim of any academic institution is to focus on education and excellence of its students. The access to this reality depends on how to recognize individual’s emotions and cognition of psychological factors such as anxiety which might act as a barrier and inhibits foreign language learning (Mohammadi & Mosalou, 2012; Behjat, 2012). This research is an attempt to deal with the issues and problems such as anxiety, which might hinder the process via which one can learn English language efficiently. Teachers play significant role in reducing anxiety. Thus, they should care about speaking anxiety in the class. In order to decrease anxiety, teachers with high self-efficacy belief can help their student control oral speech anxiety. Thus, they have to provide relaxed and any easy setting for language learners to control anxiety. There is a general feeling that the role of emotions has not been well studied yet in SLA and, as a consequence, there is a growing interest to include the role of emotions as a new source to measure the students’ Individual Differences (ID) in the research agenda (Rodriguez, as cited in Mohammadi & Mosalou, 2012). Recently many studies have been conducted to investigate the relationship between EI and success in learning English as a foreign language academic (Elias & Arnold, 2006; Fahim & Pishgadam, 2007; Motallebzadeh, 2009). Therefore, EI should be considered as an important factor in the field of language education so that language learners can improve their language knowledge and performance through application of their EI skills (Karaman, 2012). Since, among foreign language learning skills, speaking is the most problematic and anxiety provoking area for language learners, the aim of this research is to investigate the ways to overcome foreign language learners’ speech anxiety. Many students feel unpleasant and uneasy when asked them to speak in English in front of others and try to avoid speaking. Most of the time, they feel anxious when they give an oral presentation or speaking in English in classroom activities (Mohammadi & Mosalou, 2012). Moreover, students’ feelings of discomfort and anxiety in English class can’t be over looked. So, teacher’s efficacy is an important factor in confronting this problem. According to Bandura (1997), teachers who believe they will be successful set higher goals for themselves and their students try harder to achieve those goals, and persist through obstacles. Teachers should pay attention to students’ speaking anxiety as a barrier in foreign language learning and to EI as an important factor that affects the language learning process and give learners an opportunity to improve the capacity for English learning design effective teaching methods that can help to reduce language anxiety and to create less stressful learning atmosphere.

The study has significance for universities and language institutions that support students and train them in the area of EQ and language anxiety. The findings from this research also can be used to help students find suitable strategies to overcome their anxiety problem.

LITERATURE REVIEW

The study is based on research about relationship between teacher self-efficacy (Bandura, 1977), learners' emotional intelligence (Goleman, 1995; Bar-On, 1997, 2000; Salovey & Mayer, 1990), and speaking anxiety.

A Brief History and Definition of Emotional Intelligence

Goleman (1995), as a science journalist, formulated emotional intelligence (EI) in terms of a theory of performance through his book *Emotional Intelligence*. He adds that an emotional intelligence theory of performance has direct applicability to the domain of work and organizational effectiveness, particularly in predicting and developing excellence in every kind of job and at every level, from sales to leadership. He defined emotional intelligence "as an ability being able to motivate oneself and persist in the face of frustrations; to control impulse and delay gratification; to regulate one's moods and keep distress from swamping; the ability to think; to empathize and to hope" (p. 34).

Another leading researcher of the emotional intelligence is Reuven Bar-on, the originator of the term emotional quotient (EQ). While Goleman's name is exactly corresponded with the popularization of EI, equally has been influenced on the work of Bar-On (1997, 2000), who has developed the first operational index for the assessment of emotional intelligence. Notably, Bar-On's definition of EI is not that far removed from Goleman's in that he seems to use personality traits (Matthews, Zeidner, & Roberts, 2002). Salovey and Mayer (1990) had published the seminal article emotional intelligence, the most influential statement of EI theory in its current form. Salovey and Mayer (1990) defined emotional intelligence as the ability to perceive, understand, manage and regulate emotion to promote intellectual growth. Emotional intelligence is the ability to perceive, understand and use the knowledge originated from our emotions to reduce impulses and enhance relationship among people (Motallebzadeh, 2009).

Models of Emotional Intelligence

Since its emergence in 1990's, the concept of Emotional Intelligence was introduced in popular media and scientific field, leading to several definitions and two competing models of EQ (Motallebzadeh, 2009). Roohani (2009) mentioned that emotional intelligence can be investigated in two ways: ability models and mixed models. Ability model refers to emotional intelligence as a pure form of mental ability and also as a pure intelligence. On the other hand, the proponents of mixed model expanded the meaning of EQ by combining cognitive ability with personality traits.

Mayer and Salovey (1990) proposed an ability model with a two part form, speaking first of the general processing of emotional information, and secondly specifying the skills involved in such processing (Motallebzadeh, 2009).

Two mixed models of EI were introduced by Goleman and Bar-on. They defined emotional intelligence in different term. Goleman (1998) described a mixed model in terms of performance, individual abilities and competencies, integrating personality trait and employing their similar effects on performance in the work place. While Bar-on's model provided personality basis,

emphasizing the co-dependence of the ability aspects of emotional intelligence with personality traits and their application to personal wellbeing (Nassimi, 2009).

Self-efficacy

Bandura (1977) introduced the theory of self-efficacy beliefs as an assessment of individual's abilities to attain a desired level of performance in a given endeavor.

What is self-efficacy? Linguistics and educators provide us with different definitions of self-efficacy as followed:

Okorodudu (2012) stated that self-efficacy is the belief in one's ability to perform a given task. Self-efficacy is about "learning how to persevere when one does not succeed" (Pajares, 2005, p. 345). Self-efficacy is the beliefs about one's capabilities to manage and complete a future action required to produce given attainments (Bandura, 1997). It refers to "students' sense of ability to perform an activity influences their success, which in turn contributes to increased effort and persistence" (Aliegro, 2006, p.18). As it can be drawn from the definitions of the concept 'self-efficacy', all of the definitions share a common core: individuals' beliefs have a significant role in their life learning journey. Individuals' self-efficacy beliefs have an important effect on how they think, feel, motivate themselves and take actions. These beliefs can heighten or decrease their success in every field of their lives. In other words, individuals design their own future by their sense of self-efficacy (Tilfarlioglu & Ciftci, 2011). The task of creating learning environments conducive to the development of cognitive competencies focuses on teachers' talents and self-efficacy beliefs. Some evidence demonstrates that teacher's beliefs in their instructional capabilities determine how they organize academic tasks in their class and form student's evaluations of their intellectual abilities. Teachers who have a high self-efficacy belief make sustained effort and use proper techniques on the belief that stubborn students are teachable and flexible. In contrast, teachers with low sense of efficacy spend more time on nonacademic activities, make little effort and there is nothing to do in the classroom for motivating and supporting students (Bandura, 1997). According to Bandura (1997, 1977), teacher self-efficacy is a cluster of personal efficacy beliefs that refer to the specific domain of the teacher's professional behavior. Teacher efficacy is about a teacher's expectation that he or she bring about student learning. Teacher efficacy is of interest to school improvement researchers because teacher efficacy consistently predicts willingness to try out new teaching ideas. Teacher efficacy contributes to achievement because high efficacy teachers try harder, use management strategies that stimulate student autonomy, attend more closely to low ability student needs, and modify students' ability perceptions. Teachers' self-efficacy has been shown to predict student motivation and achievement (Ross, 1992; 1998). In addition, teachers' efficacy beliefs also relate to their behavior in the classroom. Efficacy affects the effort they invest in teaching, the goals they set, and their level of aspiration. Teachers with a strong sense of efficacy tend to exhibit greater levels of planning and organization (Allinder, 1994).

Structure of Self-efficacy Scales

Bandura (1997) stated that efficacy belief differ in level, generality, and strength as following:

Level: when tasks are ordered in level of difficulty, the efficacy expectations of different individuals may be limited to the simple activities, extend to moderately difficult ones, or include the most taxing performance demands within a certain range of functioning.

Generality: Efficacy expectations also differ in generality. Individuals may judge themselves efficacious across a wide range of tasks or only in particular domain of functioning. Generality vary on different aspects, including the degree of similarity of tasks, the qualities in which abilities are expressed (behavioral, cognitive and affective) traits of situations, and people characteristics toward which the behavior is directed.

Some experiences create limited mastery expectations. Others have a more generalized efficacy belief that ranges well beyond the specified treatment situation.

Strength: expectancies vary in strength. Weak expectations are easily extinguishable by disconfirming experiences, whereas individuals who have a strong efficacy belief in their abilities will persevere in their making efforts disconfirming experiences and problems. The stronger personal efficacy belief, however, the more perseverance and the higher success will be achieved.

Language Anxiety

Language anxiety is complex and multidimensional issue. Different researchers define notion of anxiety with various perspectives. As Horwitz, Horwitz and Cope (1986) have noted that foreign language anxiety should not be considered as “fear transferred to foreign language anxiety rather ,we need to conceive foreign language anxiety as “a distinct complex of self-perceptions, beliefs, feelings and behavior related to classroom language learning arising from the uniqueness of the language learning process” (p. 128). Horwitz et al. (1986) have also concluded that foreign language anxiety should be identified as a conceptuality distinct variable, well characterized by uniqueness of dynamic traits of language learning in the classroom.

According to Ferdous (2012), anxiety is a kind of troubled state of mind and as an important factor in English as a Foreign Language (EFL) classroom. Anxiety represents physically and emotionally uncomfortable experience for many students in the EFL classroom. So, it has become one of the current challenges in foreign language teaching to provide students with a low-anxiety classroom environment.

Chiang (2012) defined anxiety as feelings of worry; uneasiness, frustration, and unquiet. It happens when people encounter uncertainty, unknown and other situations that people cannot control. When individuals get anxious, they make wrong decision, perform badly. Anxiety is a subjective feeling which is experienced by both foreign and second language learners (MacIntyre & Gardener, 1991). Numerous research (Aida, 1994; Bailey, 1983; Horwitz, Horwitz & Cope, 1986; Horwitz & Young, 1991; MacIntyre, 1995; MacIntyre & Gardener, 1989, 1991, 1994; Price, 1991; Worde, 1998; Young, 1990, 1991, 1992;) have revealed that anxiety can impede foreign language production and achievement.

RESEARCH QUESTIONS

To be able to investigate the postulations set forth in the current study, the following research questions were formulated:

1. Is there any significant relationship between teachers' self-efficacy and their students' speaking anxiety across gender?
2. Is there any significant relationship between teachers' self-efficacy and their students' Emotional intelligence across gender?

METHODOLOGY

Participants

The population of this study involved two groups. The first group consisted of junior students of Islamic Azad Universities of Rodehen and South Branch of Tehran, majoring in English translation and literature. Simple sampling was used to select 100 EFL learners of two universities. The subjects were made up of 60 females and 40 males. Their ages ranged from 23 years to 26 years, the second group of participants consisted of 30 Iranian EFL teachers with 10 to 15 years of experience teaching English. Their ages ranged from 30 years to 52 years. The teachers were both 20 male and 10 female. 26 hold a Master's degree in TEFL.

Instrument

For the purpose of the study three sets of questionnaire were used : 1) Foreign Language Classroom Anxiety Scale (FLCAS), 2) teacher self-efficacy questionnaire, and 3) students emotional intelligence questionnaire.

1-Foreign Language Classroom Anxiety Scale (FLCAS) which developed by Horwitz, Horwitz, and Cop (1986), assessed students' anxiety about target language learning. This questionnaire contains 33 items Likert-type scale with five possible responses ranging from "strongly disagree" to "strongly agree". The possible range is 33 to 165; the higher the number, the higher the level of foreign language anxiety.

2- Teacher self-efficacy questionnaire, developed by Tschannen-Moran and Hoy (2001). This questionnaire includes 24 items which examined the teacher's idea about his/her effective control over Instructional Strategies, Classroom management, and Student Engagement. It used a 5-point Likert scale (ranging from 1(Nothing) to 5(A great deal), to rank the teachers' level of self-efficacy.

3-In order to measure the students' emotional intelligence, Bar-On's EQ-i was administered. Due to the fact that some questions were found irrelevant to Iranian context, Samouei (2003) developed a modified and translated version of the questionnaire which encompassed only 90 questions.

Procedure

To pave the way for this study, four steps were successively taken:

In the first step, 30 Iranian EFL teachers teaching in Islamic Azad university of Rodehen and South Tehran Branch were selected in this present study. In the second step, 100 Iranian EFL learners were selected at two Islamic Azad university of Rodehen and south Tehran branch, majoring in English translation and literature. In the third step, questionnaires were administered 2

weeks after starting new semester. In the forth step, the questionnaires were collected for data analysis.

Statistical Data Analysis

In order to test the null hypotheses, the collected data were put in tables and analyzed with the aid of SPSS 19. 2 the statistical procedures were used: Pearson product correlation and the Multiple Regressions. Multiple Regressions was used to find out the combined and relative contributions of the independent variable (self-efficacy) to the prediction of speaking anxiety and EQ. To ensure the normality of the distribution, inferential descriptive statistics were employed. Pearson correlation coefficient was calculated to understand any positive, negative or zero relationship between the speech anxiety, EI and teacher's self- efficacy.

RESULTS AND DISCUSSION

In this section, first the findings for each of the two research questions of the study will be presented and then a brief discussion of the gained upshots will follow.

Findings Obtained for Research Question One

Q1: Is there any significant relationship between teachers' self-efficacy and their students' speaking anxiety across gender?

The report on the analysis of research question 1 is divided into three sections:

Firstly, in section A, independent variable and dependent variable are normally distributed.

Secondly, in section B, the correlations between teachers' self-efficacy and learners' speaking anxiety are presented. Finally, the correlations between teachers' self-efficacy and learners' speaking anxiety across gender are presented.

A. Teachers' self-efficacy (independent variable) and Learners' speaking anxiety (dependent variable) are normally distributed

Table 1: Sample Kolmogorov-Smirnov Test

One-Sample Kolmogorov-Smirnov Test			
		Anxiety	Self-efficacy
N		30	30
Normal Parameters	Mean	2.35	7.15
	Std. Deviation	0.65	1.023
Kolmogorov-Smirnov Z		0.44	1.08
Asymp.Sig. Sig. (2-tailed)		0.98	0.19

According to the results in Table 1 from the Kolmogorov – Smirnov we can conclude that teachers' self-efficacy and learners' speaking anxiety have the most significant level ($P > 0.05$).

B. The relationship between teachers' self-efficacy and their students' speaking anxiety A Pearson Correlation was computed to assess the relationship between self-efficacy and speaking

anxiety. Table 2 shows that there is a significant relationship between the two variables ($p < 0.05$). This relationship is at the confidence level of 0.95 and the degree of relationship between teachers' self-efficacy and learners' speaking anxiety is 47% and reverse. It is seen that (r) between two variables, is ($r = -0.462$) with the level of significant ($p = 0.10$). As $p < 0.05$, so there exists a negative correlation between teachers' self-efficacy and students' speaking anxiety. This indicates that speaking anxiety and self-efficacy are related to each other. So, the results show that the higher teachers' self-efficacy, the fewer students were anxious in speaking. The negative correlation between self-efficacy and anxiety reject the null hypotheses which stated that: There is no significant relationship between teachers' self-efficacy and their students' speaking anxiety across gender.

Table 2 The Relationship between Teachers' Self-efficacy and Learners' Speaking Anxiety

Correlations			
		Anxiety	Self efficacy
Anxiety	Pearson Correlation	1	-.462*
	Sig. (2-tailed)		.010
	N	30	30
*. Correlation is significant at the 0.05 level (2-tailed).			

C. The relationship between Teachers' self-efficacy and Learners' speaking anxiety across gender

Table 3: Multiple Regressions of Speaking Anxiety

Model	R	R Square	Std. Error of the Estimate	ANOVA	
				F	Sig.
Enter	0.47	0.23	0.56	4.13	0.027

According to table 3 the index of R Square is 0.23 which means that 23 percent of learners' speaking anxiety is under influence of teachers' self-efficacy (independent variable) and learners' gender (moderating variable). As Table 3 the ANOVA table, shows this prediction is meaningful at the 0.027 level of significance.

In order to determine the effect of gender on speaking anxiety, Standardized and non-standardized coefficients table has been drawn.

Table 4: Regression coefficients, Standardized and Unstandardized prediction

Coefficients ^a						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	5.342	0.811		6.585	.000
	Self- efficacy	-0.275	0.102	-.455	-2.699	.012
	sex	0.176	0.205	0.145	0.859	0.398
a. Dependent Variable: Anxiety						

As shown in Table 4 the direct effect of teachers' self-efficacy and learners' gender on speaking anxiety is statistically significance. The absolute value of the standardized Beta coefficients shows the relative importance of each independent variable on the dependent variable. According to table 4 teachers' self-efficacy ($\beta = .455$ $p < .05$) is significant predictor of learners' speaking anxiety. Accordingly, Teacher's self-efficacy accounts for %45 the variation in the learners' speaking anxiety. This finding demonstrates that teacher's self-efficacy is observed to predict significantly learners' speaking anxiety. Nevertheless, teachers' self-efficacy has a direct effect on the degree of learners' speaking anxiety. Thus, we can conclude, gender doesn't act as an important determiner of learners' speaking anxiety.

Findings Obtained for Research Question Two

Q2: Is there any significant relationship between teachers' self-efficacy and their students' emotional intelligence across gender?

To see whether a significant relationship existed between the teachers' self-efficacy and their students' emotional intelligence across gender Pearson Correlation Coefficient had to be run. Prior to this, of course, the assumptions for running this parametric test had to be checked in three sections: Firstly, in section A, independent variable and dependent variable are normally distributed. Secondly, the correlations between teachers' self-efficacy and learners' emotional intelligence are presented in section B. Finally, the correlations between teachers' self-efficacy and learners' emotional intelligence across gender are presented.

A. Teachers' self-efficacy (independent variable) and learners' emotional intelligence (dependent variable) are normally distributed.

To inspect normality, the researcher used Kolmogorov – Smirnov Test to know to what extent independent and dependent variables are normally distributed. According to the results in Table 5 from the Kolmogorov – Smirnov, we can conclude that teachers' self-efficacy and learners' emotional intelligence have the most significant level ($P > 0.05$). So each of the variables was normally distributed. Therefore, they involve the condition of correlation and regression analysis in the assumption.

Table 5: Sample Kolmogorov-Smirnov Test

One-Sample Kolmogorov-Smirnov Test		EQ	Self-efficacy
N		30	30
Normal Parameters	Mean	3.4	7.15
	Std. Deviation	0.24	1.023
Kolmogorov-Smirnov Z		0.81	1.08
Asymp. Sig. (2-tailed)		0.51	0.19

B. The relationship between teachers' self-efficacy and learners' emotional intelligence

As demonstrated by Table 6, it is seen that (r) between two variables, is ($r = 0.531$) with the level of significant ($p = 0.003$). As $p < 0.05$, there exists a positive correlation between teachers' self-

efficacy and students' emotional intelligence. This indicates that emotional intelligence and self-efficacy are related to each other. So, the results show that the higher teachers' self-efficacy, the fewer students were anxious in speaking. The purpose of the running correlation procedure was to check to what extent teacher's self-efficacy had predictability for EFL learner's emotional intelligence. The result proved that for all subjects of this study, self-efficacy had significant predictability for EQ ($p < 0.01$). The positive correlation between self-efficacy and EQ rejects the null hypothesis which stated that: There is no significant relationship between teachers' self-efficacy and their students' emotional intelligence across gender.

Table 6: The relationship between Teachers' Self-efficacy and Learners' Emotional Intelligence

Correlations			
EQ		EQ	Self efficacy
	Pearson Correlation	1	.531**
	Sig. (2-tailed)		.003
	N	30	30

** . Correlation is significant at the 0.01 level (2-tailed).

C. The relationship between teachers' self-efficacy and learners' emotional intelligence across gender

Multiple regressions analysis was carried out to evaluate the effect of gender on learners' emotional intelligence. As shown in, Table 7, the index of R Square is 0.28 which means that 28 percent of learners' emotional intelligence is under influence of teachers' self-efficacy (independent variable) and learners' gender (moderating variable). As Table 7, the ANOVA table shows this prediction is meaningful at the 0.028 level of significance. ANOVA ($F = 5.32$, $p = 0.011 < 0.05$) table of regression shows the suitability of fit and predictive significance level is less than 0.05, The results indicate that gender has no effect on EFL students' emotional intelligence .

Table 7: Multiple Regression of Emotional Intelligence

Model	R	R Square	Std. Error of the Estimate	ANOVA	
				F	Sig.
Enter	0.53	0.28	0.54	5.32	0.011

As demonstrated in Table 7 above, there is a significant relationship between teachers' self-efficacy and their students' EI ($P < 0.05$). Thus, the second null hypothesis is rejected and it is confirmed that there is a significant positive relationship between teachers' self-efficacy and students' emotional intelligence.

Table 8 demonstrates the standardized Beta coefficient which reveals that the direct effect of teachers' self-efficacy and learners' gender on emotional intelligence is statistically significant. According to table 4.8 teachers' self-efficacy ($\beta = .543$ $p < .05$) is significant predictor of learners' emotional intelligence. Accordingly, teacher's self-efficacy accounts for %54 the variation in the learners' emotional intelligence. Moreover, teachers' self-efficacy has a direct effect on the degree of learners' emotional intelligence. This means that the higher self-efficacy teachers are,

the more emotionally intelligent learners are in the process of learning a language. Thus, the gender doesn't act as an important determiner of learners' emotional intelligence.

Table 8: Regression Coefficients, Standardized and Unstandardized Prediction

Coefficients ^a						
Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	-1.024	1.440		-.711	.483
	Self_ efficacy	1.357	.438	.543	3.102	.004
	sex	-.041	.213	-.034	-.191	.850
a. Dependent Variable: EO						

CONCLUSION

A relaxed atmosphere is significant in alleviating anxiety. Students need a setting free from intimation and tension. So a low- stress learning environment is related to the quality of teachers and instructional methods. To this end, teachers with a sympathetic attitude towards the problems and fear of the students can create a positive setting within the classroom learning. According to the findings in this research, teachers with a higher level of self- efficacy try to change the students' attitude toward learning English and consider English as a favorite subject to students. Thus, we can hypothesize that teacher self-efficacy can influence students' emotional intelligence and speaking anxiety in different settings.

Pedagogical Implications

The present study may have some implications for EFL teachers and learners. As the results of the study suggest, there is a statistically significant correlation between teachers' self-efficacy, learners' speaking anxiety and emotional intelligence. These correlations indicate that it is teachers' duties to reduce anxiety and increase emotional intelligence in their class setting. It's hoped that these findings will help English teachers to be aware of anxious EFL learners and create a friendly and affective atmosphere so that learners would learn to communicate rather than fear the English language. It is important for EFL learners to know that speaking anxiety is a common problem in English class that every one may feel the same apprehension and discomfort. So they should devote themselves in the English setting to focus on language learning rather than being distracted by tension or worries.

Acknowledgments:

I Would like to like to express my deepest gratitude to Dr. Bonyadi, my respectful Advisor of Islamic Azad University of Urmia.

I Would also like to thank Dr. Alavinia my professor of Islamic Azad University of Urmia for sharing his knowledge throughout the procedure of this research.

I also want to express my sincere gratitude to Dr.Mosallanejat , my proffessor of Islamic Azad University of South Branch Tehran.

ACQUISITION OF ENGLISH SUBJECT PRONOUNS BY ARABIC-PERSIAN BILINGUALS AND PERSIAN MONOLINGUALS

Noorjahan Ghassemi

Islamic Azad University, Bandar Abbas Branch, Bandar Abbas, Iran

ABSTRACT

This research intends to incorporate some insights to the new field of third language acquisition. So, it investigated the acquisition of subject pronoun of noun clauses in English by L2 and L3 learners within UG framework. To fulfill the purpose of the study, 82 elementary learners who included 45 monolinguals (25 females and 20 males) and 37 bilinguals (20 females and 17 males) were chosen after taking the Nelson Proficiency test. The instrument used in this study was a grammaticality judgment test administered to measure the subjects' performance on English subject pronouns of noun clauses. The participants' performance on this test was analyzed using one way parametric independent T-test and the nonparametric Mann-Whitney U Test. In spite of the fact that the structure of biclauses sentences was similar in Arabic and English, but different in Persian, the results showed no significant difference between the performance of monolinguals and bilinguals. Also, there wasn't a significant difference between the male and female learners. The finding, interpreted in terms of points of two current generative models of L2 A, namely, Full Access Full Transfer and the Failed Functional Feature Hypothesis revealed no dominant role for L2 setting in L3 inter-language grammar as the bilinguals did not significantly outperform their mono-lingual counterparts. Therefore, the findings of the research with respect to language transfer in third language acquisition give rise to the conclusion that the source of cross-linguistic influence in third language acquisition is probably more of the learners' second language than their first language.

KEYWORDS: bilingual, monolingual, subject pronouns, UG

INTRODUCTION

The study of crosslinguistic influence or language transfer has generated much interest in the field of Second Language Acquisition (L2A) for a few decades (see Gass & Selinker, 1992; Odlin, 2003, amongst others). But the last couple of years have seen the line of inquiry branching out into the field of third language acquisition (L3A). Researchers working on L3A attempt to find out the source of transfer in cases of additional non-native or multilingual language acquisition by investigating different potential factors, such as second language (L2)/third language (L3) proficiency (Dewaele, 2001; Hammarberg, 2001), the privileged status of the first language (De Angelis & Selinker, 2001), age effects (Cenoz, 2001), typological proximity between languages (Cenoz, 2001; De Angelis & Selinker, 2001; Hammarberg, 2001), psychotypology (Bouvy, 2000).

Considering the large number of bilinguals in the world such as Iran, the importance of bilingualism in educational and professional opportunities of the bilinguals, the lack of consistency in studies result concerning the issues, the researcher aimed at investigating whether there is any difference between Persian-Arab bilinguals and Persian monolinguals in learning subject pronouns in noun clauses in English as a foreign language.

In this study, the effect of the language background acquired by Arabic-Persian bilingual learners of English will be explored through Full Access/Full Transfer (FAFT) and the Failed Functional Feature Hypothesis (FFFH). So, the performance of the Arabic-Persian bilinguals will be contrasted with that of Persian mono-lingual learners within this framework. This comparative study may help to show whether L3 acquisition is different from L2 acquisition or it is another case of L2 acquisition.

REVIEW OF THE RELATED LITERATURE

Theoretical Framework

Different theories of second language learning make different predictions with respect to both the role of transfer and the ultimate attainment (that is, whether or not the learning of the L2 syntactic properties, i.e., the acquisition of subject pronouns of noun clauses, is possible for L2 learners). The transfer, is concerned with the question of to what extent the properties of the L1 grammar influence L2 acquisition (White, 2003). Two theories which posit L1 transfer are Full Transfer/Full Access theory (FT/FA) (Schwartz & Sprouse, 1996) and the Representational Deficit Hypothesis (RDH), known as the Failed Functional Feature Hypothesis (FFFH) (Hawkins & Chan, 1997). Both theories consider the L1 grammar to be the starting point for the acquisition of L2. But, Direct Access theory (Epstein, Flynn, & Martohardjono, 1996) considers the Universal Grammar (UG) to be the starting point for the acquisition of L2.

Null subject Parameters

UG is "the system of principles and rules that are properties of all human languages" (Chomsky, 1976, p. 29). So, Chomsky (1981) differentiates these universals as composing of principles and parameters. Radford (1997) believes the language is composed of a group of „principles of universal grammar (UG)". Therefore, grammatical learning is not going to engage in learning those aspects of grammar which are established by universal grammatical principles. However, grammatical learning will be constrained to those parameters of grammar which are subject to language special variation. To express that in another way, grammatical learning will be limited to parameterized features of grammar. The useful way to distinguish just what features of the grammar of their first language children have to learn is to scrutinize the group of parametric variation appeared in the grammars of different languages.

The null subject parameter is one parameter of variation among languages– thus, in *null subject or prodrop* languages (on the other hand, [+null subject] languages), pronouns may be null, having the form of an empty category, pro. Some examples are Romance languages like Spanish and Italian, as well as Asian languages like Chinese, Korean and Persian. However, it doesn't mean that null subject languages require all pronouns to be null. both expressed and unexpressed

subject pronouns are possible. However, in Persian like Romance languages, when the subject of the main clause and the subject pronoun of the embedded clause are the same, so the subject pronoun in embedded clause may be unexpressed. The Persian example in (1c) shows this point.

- c. Jan goft ke ?ou - ra dide-ast
John said that him obj-marker saw
John said that (he) saw him.

As shown in this example, rich verbal agreement (formalized in terms of phi-features in Agr) lets unexpressed subjects to be identified in Persian like Romance languages such as Italian and Spanish.

While in Arabic and English the pronoun in embedded clauses should be expressed, that is pronouns are overt. In Arabic a clitic pronoun can be used in a noun clause, as in (1d).

- d. Jan qala beanna- hu ra'a- hu.
John said that – he saw-him.
John said that he saw him.

Therefore, the account of using subject pronouns in noun clauses in English, Persian and Arabic highlights differences and similarities among the three languages. As for English and Persian, the latter is a [+null subject] language, but English is [-null subject] language. On the other hand, Arabic turns to be like English in that the subjects must be expressed, with a few exceptions.

The Role of the L1 and UG in L2 Acquisition

UG-based L2 study has focused on the L2 initial state since the mid-1990s and in this case the most important question is whether L2 learners use all or parts of the 1st language grammar as their initial theory of the target language. Five hypotheses on the L2 initial state vary from each other regarding the influence they assign to L1 transfer and UG. Each of these hypotheses will be reviewed here.

Full Transfer/Full Access

According to this hypothesis, the L1 and L2 acquisition vary at their initial state but appear to be quite comparable with reference to the access of UG. In this hypothesis the beginning point is different because L1 learners do not know anything about another language by birth and can hardly even communicate. By contrast, L2 learners have a different point of origin and all features are transferred, considered to be significant and the U G is completely accessible to the learner. Moreover, the learner is not considered "to be stuck with L1 parameter setting; instead, parameter resetting to the L2 value is possible, on the basis of input from the L2 interacting with a still active UG". In this approach, the role of the first language Universal Grammar are important. Finally, the learner stage of acquisition looks to come close to a native-like proficiency, with the help of UG.

According to White (1988), both L1 learners and L2 learners have access to UG. During SLA, L2 learners start out with parameters set to their L1 values. This shows that full transfer takes place from the L1 to the L2. However, these transferred L1 parameter values merely constitute the

initial state of SLA, and are by no means the sum of the aspects of UG to which the L2 learners have access. On White's view, L2 learners have full access to UG.

But where the L1 and the L2 varies, parameter resetting needs to happen during SLA. This resetting will happen if the input to which the L2 learner is faced contains the relevant positive evidence, i.e. evidence that the target L2 instantiates a parameter value that varies from the value instantiated in the learner's L1. Where positive evidence is not enough to bring about the needed change from the L1 parameter value to the correct L2 parameter value, this change has to be brought about through facing with negative evidence, exposure to direct evidence in the form of corrective feedback or explicit instruction (ibid.).

Full Transfer/No Access

In full transfer/no access hypothesis, the L1 last state is the preliminary state of L2 acquisition. It means that there is access to Universal Grammar by the use of the L1, therefore if the UG is not accessible in the L1, it is not accessible in second language acquisition too. Bley-Vroman (1990) expressed that UG itself is not available during SLA, but it is available through the L2 learner's knowledge of his/her L1. The L2 learner constructs this surrogate UG from his/her L1 knowledge (Bley-Vroman, 1989). This indirect knowledge is not complete and provides the explanation for the success that adult L2 learners show in SLA.

In Bley-Vroman's view (1996, p. 718), *Fundamental Difference Hypothesis* "allows UG-like effects by the L1". On the other hands, the L2 learner does not have access to UG, but observes some aspects of UG instantiated in his/her L1 (aspects such as structure dependency). The L2 learner expects certain things from the L2 because of his/her L1 knowledge; these expected things contain a syntax, a lexicon, a phonological system with syllables, feet and phonological phrases, as well as the potential for a large number of sentences to be produced in the L2 (Bley-Vroman, 1989). The L2 learner makes use of these "expectations", as well as different general cognitive mechanisms (not specifically linguistic, according to Bley-Vroman (1996, p. 718) in the composition of the L2.

Partial Transfer/Full Access

According to this concept, Universal Grammar is completely accessible while only a few parts of L1 are transferred. Following this theory, L2 learners learn in a similar way as L1 learners. The different point is that they already know another language before starting to learn a second one. Second language learners continuously design functional categories in reply to the L2 input. L1 learners usually perform in the same way. They use parts of L1 with a complete UG to learn their target language. Therefore, it looks as if the learner could reach a complete achievement.

The partial transfer/full access theory was originally proposed by Vainikka and Young-Scholten (1996). In this theory, it is claimed that only lexical features are found in the initial L2 grammar. Functional categories are not transferred from L1 to L2 so that the initial state of L2 learners' grammar contains NP and VP (with L1 headedness). DP, TP and CP will generate at the next stage with interaction of the L2, in principle, L2 learners should converge on the L2 grammar. In this respect, the L2 learner's initial state is just like the initial state proposed by Radford (1990)

for children acquiring their L1. Also, according to Vainikka and Young-Scholten's (1994), pp. 267-268) Minimal Trees Hypothesis, L2 learners have direct, but initially limited, access to UG in SLA. What is meant by "initially limited access" is that L2 learners begin with only lexical categories (hence "Minimal Trees"), transferred from the L1, and then acquire functional categories gradually on the basis of the L2 input and with the help of UG. Like White, Vainikka and Young-Scholten (ibid.) claim that L2 learners begin with L1 parameters and then reset the parameters during SLA where necessary.

Partial Transfer/Partial Access

This concept could be explained as a combination of the essential factors of the role of UG, L1 and other acquisition faculties mentioned before. The role of UG is very important in L1 and L2 acquisition. In SLA it is likely to have a partial transfer of L1 features and partial access of UG. Moreover, according to this concept L2 learners use general learning strategies as well. White (1998) believes that Universal Grammar is only one component in the theory of language acquisition and interacts with a variety of others. Unsuccessful acquisition is the result of the other areas and not implicitly to non-operation of UG. In addition, Ellis terms this argument "dual access" and provides the explanation that adult L2 learners can only reach the ultimate attainment if they rely on UG. Since Universal Grammar is somewhat partially accessible for L2 learners, it looks like they will not be able to achieve a native-like competence. Only parts of the L1 grammar are available. Ultimate attainment of an L2 is not possible.

No Transfer/Full Access

This is the only model where there isn't transfer from L1 to L2. But, there is a full access to the UG. It is believed that the L2 grammar is learned via UG rules and strictures. The L2 initial state does not contain the L1 final state or any developmental phase. UG is assumed to constitute the initial state for L2 acquisition. So, it is fully available for L2 acquisition, including new parameter setting, functional categories and feature values. Therefore, L2 acquisition proceeds just like L1 acquisition.

RESEARCH QUESTIONS AND HYPOTHESES

Research Questions

This research intends to answer the following questions:

1. Is there any difference between Persian- Arab bilinguals (L1 Arabic, L2 Persian) and Persian monolinguals (L1 Persian) in the acquisition of subject pronouns of noun clauses in English?
2. Is there any significant difference between male and female learners in the acquisition of subject pronouns of noun clauses in English?

Null hypotheses

1. There is no difference between Persian- Arab bilinguals (L1 Arabic, L2 Persian) and Persian monolinguals (L1 Persian) in the acquisition of subject pronouns of noun clauses in English?
2. There is no significant difference between male and female learners in the acquisition of subject pronouns of noun clauses in English.

METHODOLOGY

Participants

The participants of this study were the junior students studying English as a foreign language at the language institute and public high schools of Bandar-e-Lenge in Iran. In total, 82 participants took part in this study. The first group consisted of 45 Persian monolinguals (L1 Persian). They started learning English as an L2 after puberty (about 13 years old). The second group of participants consisted of 37 Arab Persian bilinguals (L1 Arabic- L2 Persian). (see Table 1. for details).

Table 1: Overview of the subjects

	Mono-linguals	Mono-linguals	bilinguals	bilinguals
sex	female	male	female	male
Number of participants	25	20	20	17
Age range	14-18 (mean=16)	14-18 (mean=16)	14-18 (mean=16)	14-18 (mean=16)

It was essential to target a primary population from which the participants in this study were selected. This primary population was required to include bilingual and mono-lingual English learners. The bilingual learners use the Arabic dialect of Bandar Lengeh as their native language. Moreover, their first and most dominant language is Arabic.

Bilingual and mono-lingual learners were at elementary level. They all had studied English as a foreign language for 3 to 4 years. Most of the participants were in their second or third year of high school so that they had learned subject pronouns in noun clauses such as reported speech in English. In order to maintain the same level of English language proficiency for all the participants, the Nelson Test administered to the participants. Also, the researcher of this study used both male and female in the study and the age of the participants ranged from 14 to 18 years.

Instruments

The following instrumentations were utilized in this study:

First, to ascertain homogeneity of the participants of the study in terms of language proficiency, a standard Nelson test was used. The Nelson Placement Test was administered to 120 participants. Therefore those students whose Nelson score fell within one standard deviation, 7.05, below and above the mean of 31.38 were selected as homogeneous participants for this study. Thus 82 students whose score were between 24 and 38 were chosen. Also, a background questionnaire was used to elicit some personal information about participants' background.

The grammatically judgment and correction task was used in this study in order to examine how the participants use subject pronouns in noun clauses in English (See Appendix). The participants were presented with biclausal sentences with referential main-clause subjects and overt or null embedded pronoun subjects; they were asked to judge whether a given sentence was grammatical or ungrammatical in English. The correction task required subjects to correct those sentences which were judged to be ungrammatical in English. The grammatically judgment (GJT) had

around 32 items to be judged. 16 of these 32 items were ungrammatical and the other 16 items were grammatical. There were 8 fillers items among 32 items. Therefore, in total the test consisted of 40 items.

Procedure

The participants were selected randomly from among all the population studying English as a foreign language in public high school and an institute in Bandar-e-Lenge. Thus 82 students were chosen. Then a grammaticality judgment and correction task was presented. In this task, the participants judged a sentence as correct or incorrect with GJT (grammaticality judgment task); however, with the GCT (grammaticality correction task), they wrote the correct form of incorrect items. This kind of task was consisted of 32 two choice items, which 16 out of 32 items were grammaticality and the other 16 items were in ungrammaticality, as shown in examples 1 and 2.

1. * She thinks that is fat.
True False
.....
2. He said that he bought a book two weeks ago.
True False

Also, for doing this test the participants were told to observe the time limit and in order to increase the credibility of the responses, the researcher reminded the students that they should be sincere in their answers and they should not spend too much time on any of the items. Finally, the questionnaire was collected and the responses were entered into the computer for data analysis.

Data Analysis

After the data were collected, the researcher analyzed and compared the participants' performance on judging sentence structure based on UG principles and generative perspectives. In this study, the students' correct judgment of the items received one point, and in the case of incorrect judgment or not answering the items, they got no points.

The performance of the two groups of participants was compared by using quantitative, descriptive and inferential statistics. In order to determine the similarity or difference between the performances of the both mono-lingual and bilingual groups the parametric independent T-test was applied.

Design

This is a descriptive study based on a survey research conducted for the purpose of making descriptive information about some population.

In this study, quantitative data were collected. They were collected through a grammaticality judgment task (GJT) along with a correction task to examine the participants' syntactic knowledge. Therefore the quantitative data based on precise measurements using structured and validated data-collection instruments. The data displays comparisons means and statistical significance of findings.

In the current study as mentioned before the purpose was to investigate differences and similarities between the bilinguals and mono-linguals in acquisition of subject pronouns in noun clauses. So, the subject pronouns were dependent variable and the bilinguals and mono-linguals were independent variable.

RESULTS AND DISCUSSION

Homogeneity Process

The Nelson Proficiency Test was administered to 120 participants to assure the homogeneity of the participants. Table 2. below provides us with the descriptive statistics of the participant's scores on Nelson Test. So, the mean, median and mode of the Nelson scores are 31.37, 31, and 30 and these central parameters are not very different from each other signifying normal distribution.

Table 2: Descriptive Statistics for Nelson Homogenizing Test

N	Range	Min.	Max.	Mean	Median	Mode	SD
120	31	15	46	31.37	31.00	30	7.059

The One-Sample Kolmogorov-Smirnov Test of normality test results indicated that p value, .77 is more than .05. So they are normally distributed.

Therefore those students whose Nelson score fell within one standard deviation, 7.05, below and above the mean of 31.38 were selected as homogeneous advanced participants for this study. Thus 82 students whose score were between 24 and 38 were chosen.

Investigating the First Research Question

The first research question of this study asked whether there is any difference between Persian-Arab bilinguals (L1 Arabic, L2 Persian) and Persian monolinguals (L1 Persian) in the acquisition of subject pronouns of noun clauses in English. In order to analyze the data to answer this question, Independent Sample Test was utilized. To do so, first the monolinguals and bilinguals' performances on GJT were calculated, and the related results are presented in Table 3. According to the table, the average mean score in bilingual group was 22.08 with the standard deviation of 3.61, and the mean score in monolingual group was 20.82 with the standard deviation of 3.58. The mean score of the two groups are not far from each other.

Table 3: Descriptive Statistics of Bilingual and Monolingual Groups' Subject Pronoun Scores

Group	N	Range	Min.	Max.	Mean	Mode	Median	SD
bilinguals	37	12	17	29	22.08	23	23.00	3.616
monolinguals	45	16	13	29	20.82	23	21.00	3.588

The graphical representation of the results is displayed in Figure 1. below as appeared in Table 3. As obvious in the figure, the two groups have not acted far from each other.

Figure 1: Bilingual and monolingual groups' subject pronoun means

The normality distribution of the subject pronouns scores was checked in order to decide whether to use parametric or nonparametric data analysis. So we used One-Sample Kolmogorov-Smirnov Test. The results of this normality test in Table 4. revealed p values of .24 and .96 for bilingual and monolingual groups respectively. They have normal distribution since the p values for both of them were larger than selected significance level, .05. Therefore, we used parametric Independent Samples Test to compare the mean score of two groups obtained on GJT since we had two independent groups, and the scores of the two groups were normally distributed; otherwise the nonparametric Mann Whitney U Test would be used.

Table 4: One-Sample Kolmogorov-Smirnov Test of Normality for Subject Pronoun Scores in Bilingual and Monolingual Groups

Group	N	Mean	Kolmogorov-Smirnov Z	Sig.
bilinguals	37	22.08	1.021	.248
monolinguals	45	20.82	.490	.960

The results of Independent Sample Test to compare the bilingual and monolingual learners in the acquisition of subject pronouns of noun clauses in English are laid out in Table 5.

Table 5. indicates that the hypothesis of equal of variances is proved because p value of Levene's Test, .74 is more than .05 ($p > .05$).

Table 5: Independent Samples Test to Compare Bilingual and Monolingual Groups' Subject Pronoun Scores

Levene's Test for Variances			T-test for Means			
	F	Sig.	t	df	Sig. (2-tailed)	Mean Diff.
Equal variance assumed	.104	.748	1.575	80	.119	1.259

T-test results in Table 5. indicates that there was not any statistically significant difference between bilingual and monolingual learners in the acquisition of subject pronouns of noun clauses in English with ($t = 1.575$, $p = .11$, $p > .05$), in which the t value, 1.57 was greater than the t critical, 2.02, and also the p value, .11 was larger than the selected significance level, .05. That means the two groups are not far from each other regarding the knowledge of subject pronouns. Therefore, the first null hypothesis as there is no statistically significant difference between bilingual and monolingual learners in the acquisition of subject+t pronouns of noun clauses in English is retained, and it can be claimed that there is no statistically significant difference between bilingual and monolingual learners in the acquisition of subject pronouns of noun clauses in English.

Investigating the Second Research Question

The second research question of the current study inquired whether there is any significant difference between male and female learners in the acquisition of subject pronouns of noun clauses in English. Independent Sample Test was used to answer this question. To do so, the monolinguals and bilinguals' performances on GJT were calculated, and the related results are provided in Table 6. The table shows that the average mean score in male group was 21.46 with the standard deviation of 3.54, and the mean score in female group was 21.33 with the standard deviation of 3.74. The mean score and standard deviation of the two groups are not dramatically different.

Table 6: Descriptive Statistics of Male and Female Groups' Subject Pronoun Scores

Group	N	Range	Min.	Max.	Mean	Mode	Median	SD
Male	37	13	16	29	21.46	19	22.00	3.548
Female	45	16	13	29	21.33	23	21.00	3.742

Figure 2. below is a box plot illustrating the results as presented in Table 6. As can be seen clearly, the two male and female groups have not scored considerably different.

Figure 2: Male and female groups' subject pronoun means

One-Sample Kolmogorov-Smirnov Test was employed to test the normality distribution of the subject pronouns scores. The results of this normality test in Table 7. showed that p values of .29 and .57 for male and female groups respectively. Since the p value for both of them was larger than selected significance level, .05, they were normally distributed. Accordingly, we utilized parametric Independent Samples Test to compare the mean score of two groups obtained on GJT since there were had two independent groups, and the scores of the two groups had normal distribution; or else the nonparametric Mann Whitney U Test could be applied.

Table 7: One-Sample Kolmogorov-Smirnov Test of Normality for Subject Pronoun Scores in Male and Female Groups

Group	N	Mean	Kolmogorov-Smirnov Z	Sig.
Male	37	21.46	.981	.291
Female	45	21.33	.781	.575

Table 8. clarifies the results of Independent Sample Test for comparing male and female groups' subject pronoun scores.

It shows that the hypothesis of equal of variances is met since p value of Levene's Test, .88 was well above .05 ($p > .05$).

Table 8: Independent Samples Test to Compare Male and Female Groups' Subject Pronoun Scores

Levene's Test for Variances			T-test for Means			
	F	Sig.	t	df	Sig. (2-tailed)	Mean Diff.
Equal variance assumed	.021	.885	.155	80	.877	.126

T-test (see Table 8.) failed to find any statistically significant difference between male and female learners in the acquisition of subject pronouns of noun clauses in English with ($t = .155$, $p = .87$, $p > .05$), in which the t value was lower than the t critical, 2.02, and the p value, .87 was larger than the selected significance level, .05. That means the two groups have almost similar knowledge of subject pronouns. Therefore, the second null hypothesis as there is no statistically significant difference between male and female learners in the acquisition of subject pronouns of noun clauses in English is retained, and it can be claimed that gender does not affect the acquisition of subject pronouns of noun clauses in English.

Discussion

The results of this study showed that mono-lingual participants' mean score turned out to be 20.82, and the bilingual participants' mean score was 22.08 on total judgment test. Furthermore the standard deviation of mono-lingual and bilingual groups reached 3.58 and 3.61 respectively, which are very close to each other signifying equal variance of scores around the mean. Their mean values were not far from each other suggesting that there is no significant difference between Persian-Arab bilinguals (L1 Arabic, L2 Persian) and Persian mono-linguals (L1 Persian) in the acquisition of subject pronoun of noun clauses in English.

The results of this research coincide with Schwartz and Sprouse's (1994; 1996) opinion that acquiring will fail if L1 and L2 parameter settings differ, i.e. parameter resetting in the L2 is not possible after the critical period for instantiation of these parametric values has ceased to operate. Consequently, the inter-language (IL) syntactic representations in post-childhood L2 acquisition would vary from the target grammar regardless of obvious native-like performance.

This research supports Leung's (2005, 2006) several studies on language transfer in the acquisition of L3 French by Cantonese (L1)–English (L2) learners. The findings of these researches revealed evidence of L2 interlanguage transfer in word order (i.e. adjective and adverb placement), verb morphology and articles (e.g. specific vs. non-specific and agreement with Determiner Phrase (DP)). Also, Leung's (2006) study on the acquisition of L2 vs. L3 Spanish past tense verb morphology showed that L2 interlanguage is the important source for language transfer in L3 acquisition. Leung (2006) reported that there was not difference between the English (L1)–Spanish (L2) and the Chinese (L1)–English (L2)–Spanish (L3) learners regarding the accuracy in providing the appropriate past tense marking in writing. In addition, the findings of the follow-up experiment on the L3 learners' English show that the Chinese (L1)–English (L2)–Spanish (L3) participants mark past tense in a similar pattern to native speakers, which suggests that L2 plays an important role in L3 acquisition. Moreover, the results of this study are in line with Sikogukira's (1993) findings about French- English cognates. The results of his study showed that the level of proficiency is a very important factor influencing the performance of the learners and the transfer in the language acquisition.

CONCLUSION

Considering to the effect of language background in L3 acquisition, the results of this research showed that bilingualism has no significant advantage in 3rd language acquisition. In other

words, Arab-Persian bilinguals could also benefit from the availability of the [-null subject] feature in their first language to increase their L3 inter-language grammar with regard to the overt pronoun feature of English language. However, the findings of the study made it clear that the L3 learners did not perform significantly higher than the mono-lingual learners in spite of the fact that their first language Arabic shared [-null subject] with English.

Also the finding of the study showed that there was no significant difference between the male and female participants' performance in the acquisition of using subject pronoun of noun clauses in English.

Limitations of the study

One of the limitations of this study is the learners' proficiency level. All of them are beginner EFL learners, because it is difficult to find a reasonable number of Arabic-Persian learners of L3 English at higher proficiency level. Secondly, this research only investigates the effects of bilingualism on subject pronouns in noun clauses. So, this study is restrictive only to investigating some statements and just subject pronouns. Finally, because of some educational constraints and problems it was not possible to involve a sample larger than 82 participants.

Implication

The findings of this research can benefit multi-lingualism and in particular, the L3A. In terms of cross-linguistic transfer, it was appeared that more of L2 was reflected in L3 inter-language grammar than their L1 as the finding of the study made it clear that the L3 and L2 learners' performance on English interrogative constructions were consistent. Moreover, third language learners constitute a big number of adult language learners around the world. The findings of this study showed that the theories of second language acquisition cannot be applied to these learners.

APPENDIX. GRAMMATICALITY JUDGMENT TEST (GJT)

Please read the sentences and circle "True" if you think these are possible sentences in English, otherwise circle "False". Please provide corrections in the given spaces for the randomly selected sentences if you think they are "False".

- | | | | |
|-----|---|------|-------|
| 1. | She thinks that is fat. | True | False |
| 2. | They said that saw a cat in the garden. | True | False |
| 3. | He said he bought a book two weeks ago. | True | False |
| 4. | Your brother thinks that he is a good pilot. | True | False |
| 5. | I don't have no money. | True | False |
| 6. | She said that didn't go to the museum. | True | False |
| 7. | He said he would help me. | True | False |
| 8. | Alex told me that he would come to the meeting. | True | False |
| 9. | He said that wasn't especially interested in green sea turtles. | True | False |
| 10. | The girl who drank the milk entered a room. | True | False |
| 11. | I replied that was drawing a picture. | True | False |
| 12. | Reza said that didn't understand the lesson. | True | False |
| 13. | You said that you should work harder. | True | False |
| 14. | Maryam said that bought a new grammar book. | True | False |
| 15. | The woman instructed the lawyer which the policeman called. | True | False |
| 16. | She said she expected us to be in class every day. | True | False |
| 17. | Mona said that was watching TV. | True | False |
| 18. | My friend said that didn't practice her lessons. | True | False |
| 19. | Amin believes that he is not smart. | True | False |
| 20. | She doesn't need any help. | True | False |
| 21. | She thinks she is an excellent nurse. | True | False |
| 22. | I explained that I was doing a research paper on sea turtles. | True | False |
| 23. | Who says that is going to stay home tomorrow? | True | False |
| 24. | I believe I will stay here for a long time. | True | False |
| 25. | I know the man who bicycle was stolen. | True | False |
| 26. | Maria has said that she reads the newspaper every morning. | True | False |
| 27. | My parents believe that are good parents. | True | False |
| 28. | Sam informed me that was late yesterday. | True | False |
| 29. | Why does she think she is beautiful? | True | False |
| 30. | Mahsa will can help you tomorrow. | True | False |

31. Ahmad says doesn't want to go with his family.	True	False
32. She will say that she travels.	True	False
33. Why does he say that he is the best in the company?	True	False
34. He says that likes his new car.	True	False
35. I go to the park once in a week.	True	False
36. Mina informed me that was going to move to Tehran.	True	False
37. I have said that I want a sandwich for lunch.	True	False
38. He said he saw him.	True	False
39. When does he say that needs some money?	True	False
40. She goes to school in Monday.	True	False

EFFECTS OF A BREAK IN INSTRUCTION ON VOCABULARY ATTRITION OF MALE AND FEMALE IRANIAN EFL LEARNERS AT DIFFERENT PROFICIENCY LEVELS

Rashin Amini

ABSTRACT

The present study aimed at pursuing three objectives: first, to investigate the relationship between Iranian English as a foreign language (EFL) learners' gender and their vocabulary attrition rate; second, to examine the relationship between Iranian EFL learners' language proficiency level and their vocabulary attrition rate; and lastly, to see if certain types of vocabulary are more susceptible to attrition. Using the Quick Placement Test (QPT), from among 100 EFL learners in Nahid Art and Cultural Institute in Shahreza, Isfahan, Iran, 60 male and female candidates were chosen as the participants of this study. In fact, the sample included 15 male high proficient learners, 15 male low proficient learners, 15 female high proficient learners, and 15 female low proficient learners. This classification was done according to the rubrics for scoring QPT, and the participants' gender. The participants aged between 18 and 25, and they were all native Iranian speakers of Persian. A vocabulary size test called the Vocabulary Levels Test which was originally developed by Nation (1990, 2004) was used to measure the size of the test-taker's vocabulary prior to and after the experiment. A series on one-way ANCOVA was used to find answers to the research questions of the study. The findings of the study revealed that gender did not affect the vocabulary attrition of Iranian EFL learners, but language proficiency did affect the process of vocabulary attrition. Moreover, it was found that some certain types of vocabulary like abstract words, polysyllabic words, and false cognates seemed to be more susceptible to attrition by Iranian EFL learners than other ones. The results of this study could come to ELT teachers' assistance since by knowing the barriers of learning, the teachers can organize their activities in class so as to lead to better understanding of the lesson. It should also be mentioned that the findings of this study could enrich the literature in the area of second language acquisition development, especially Iranian EFL learners' vocabulary learning competence.

KEYWORDS: Vocabulary attrition, Break in instruction, Gender, Proficiency level

INTRODUCTION

Even though vocabulary is the sub-skill of a language, it plays a very important role in language learning and teaching. Vocabulary teaching and learning is considered one of the major challenges that face ESL/EFL teachers and learners. Most EFL learners have difficulties in communicating in English language because of their limited amount of vocabulary. In order to overcome these challenges, they should use effective strategies which enhance vocabulary achievement and retention (Al-Zahrani, 2011).

With regard to the importance of vocabulary learning, it has been claimed that “Without grammar, very little can be conveyed; without vocabulary, nothing can be conveyed” (Wilkins 1972, p. 111). This is consistent with Ellis (1994) who affirms that lexical errors tend to obstruct comprehension more than grammatical errors. Besides, Harmer (1991) asserts that choosing words carefully in certain situations is more important than choosing grammatical structures because language learners cannot use structures correctly if they do not have enough vocabulary knowledge.

Vocabulary is one of the important parts of language learning which has been neglected for several decades (Meara, 1980). Coady and Huckin (1997) claimed that after a long period of neglect "second language vocabulary acquisition has recently become an increasingly topic of discussion for researchers, teachers, curriculum designers, theorists, and others involved in second/ foreign language learning" (p. 1). Vocabulary learning has been changed to one of the important parts of language which shifted to the first stages of language learning, as a result of the increasing demands to increasing vocabulary knowledge. Generally speaking, vocabulary plays an undeniable role in the development of all language skills. Schmitt (2008) claims that “one thing that students, teachers, materials writers, and researchers can all agree upon is that learning vocabulary is an essential part of mastering a second language” (p. 329). Hayati and Shahriari (2010) state “Vocabulary learning by far plays an important role in learning language, be it a first language, second language or a foreign language. It is, therefore, conceivable that the words are the building blocks upon which the second language learning is built” (p. 27). Due to the important of vocabulary knowledge, it is suggested learning a second or foreign language involves the acquisition of thousands of words (Celce-Murcia, 2001).

There are several problems facing learning English vocabulary. These include forgetting new vocabularies because learners do not use them in their daily life since they are not surrounded by English speakers (Lin, 2002, cited in Al-Zahrani 2011). This requires looking for effective methods and strategies in order to improve achievement level to acquire vocabulary and motivate learning. Richards and Renandya (2002) emphasize that vocabulary is a core component of language proficiency and provides much of the basis for how well learners speak, listen, read and write. Vocabulary is an important factor in all language teaching (Allen & Valette, 1977).

Factors affecting language abilities have recently been observed and studied for some years. Some of these factors have led to attrition of some language abilities (Oxford, 1982). The term “attrition” means gradual reduction of something. In relation to language learning, it is used when some factors such as duration of the period of disuse, e.g., the summer vacation or the

interruption in instruction between two educational terms, attitude, motivation and the like lead to the gradual reduction of some language abilities (Gardner & Macintyre, 1993; Oxford, 1982). Language attrition refers to a constant overall regression of language ability with decreased or ceased language use. In fact, it is the inverse process of language ability acquisition so that language acquisition research is not complete without studying language attrition (Groot, 2000). Schmid (2002, p.5) defines language attrition as “gradual loss of a language by an individual”. According to Hansen, language attrition is “the gradual forgetting of a language by individual attracters, who are experiencing attrition” (Hansen, 2001, p. 61).

Break in instruction seems an influential factor on second language learning. By a break in instruction, it is meant the interval during which EFL students stop learning English and have no exposure to this language (Ghasemi Bagherabadi, 2005). In Iran, this break lasts for three months for both school and university students when the schools and universities are closed. Of course, this is a formal break known as “summer vacation” however there will be shorter break in instruction for both school and university students such as the holiday of two weeks known as “New Year’s Holiday” or a short stop in instruction between two educational terms in universities or English Teaching Centers within which the students have no exposure to language input.

REVIEW OF THE LITERATURE

Vocabulary or lexicon is often considered the basis of the language. Many difficulties in both receptive and productive use of the target language (TL) arise from learners’ inadequate vocabulary knowledge (Laufer, 1986; Meara, 1980; Nation, 1990). Wilkins (1972) states that “...without grammar very little can be conveyed, without vocabulary nothing can be conveyed” (p. 110). Hatch (1983) points out that “... when our first goal is communication...it is the lexicon that is crucial to make basic communication possible” (p. 74). According to recent research, the average size of English vocabulary that native English speaking university students know and use is more than 50,000 words (Aitchison, 1996). Vocabulary can be classified as potential vocabulary, which are new words to the learners, but can be understood upon first encountering them (Palmberg, 1987). Or, it can be active vocabulary that the learners have learned and can understand or use. Nation (1990) developed a list of the various types of vocabulary knowledge: (a) the spoken form of a word, (b) the written form of a word, (c) the grammatical behavior of the word, (d) the collocational behavior of the word, (e) the stylistic register constraints of a word, (f) the conceptual meaning of a word, (g) the associations a word has with other related words, and (h) how frequent the word is. When learners master all these types of knowledge, they are able to use a word in a fluent manner. Consequently, the main purpose of this section is to study and review the importance of vocabulary in language learning so as to look at what we know about English vocabulary as well as to reflect on how this has been applied in language teaching and learning. Words are the tools learners use to think, to express ideas and feelings, as well as to explore and analyze the world around them. A limited vocabulary keeps them from expressing their thoughts and feelings. On the other hand, a large, rich vocabulary gives them the right words to use at the right time. Kitajima (2001) affirms that without words that label objects, actions, and concepts, one cannot express intended meanings. “The more words one is able to use

correctly, the better one will be able to express oneself easily and with self-confidence and to understand the world one lives in” (Nandy, 1994, p. 1).

Language attrition is defined by Lambert and Freed (1982) in very broad terms as the following: “Language attrition may refer to the loss of any language or any portion of a language by an individual or a speech community. It may refer to the declining use of mother tongue skills by those in bilingual situations or among ethnic minorities in (some) language contact situations where one language, for political or social reasons comes to replace another.” (p.1) “Language attrition” is the most common term used for any “Loss of language skills” that occurs after some years of non-exposure (Moorcraft & Gardner, 1987, p. 327). “Attrition refers to the non-pathological loss of a language in bilinguals; generally speaking, changes in the linguistic environment and termination of an instructional program may lead to attrition” (Kopke & Schmid, 2004, cited in Marefat & Rohshad, 2007).

“Language attrition (language loss) is a multi-dimensional phenomenon which has been studied from a variety of perspectives e.g. psycholinguistics, neurolinguistics, and sociolinguistics” (Gurel, 2004, p.53).

L2 attrition may occur in students who learn a second language in school but do not use it once classes have been completed (de Bot & Weltens, 1995, p.154). Historically, the factors affecting attrition rates have been characterized in terms of student variables, institutional variables, or student-institution interactional variables, resulting in a wide spectrum of findings and interpretations, with different studies offering varying profiles of the attributes and factors associated with attrition (Andres & Carpenter, 1997; Drea, 2004; Grayson & Grayson, 2003; Parkin & Baldwin, 2009; Summers, 2003; Tinto, 1993). With respect to student variables, demographic characteristics (such as age, gender, parental education, socioeconomic status, ethnicity, finances, health, etc.) and psychological variables (such as attitudes, values, norms, expectations, goals, etc.) were found to explain differing proportions of the variance in attrition across three decades of research (Attinasi, 1986; Baxter, 2004; Bean & Metzner, 1985; Brussi re, 2006; Dietsche, 1990; Eccles, 1983; Etherington, 1990; Fishbein & Ajzen, 1975; Gomme & Gilbert, 1984; Lambert & Bussi re, 2004; Ma & Frempong, 2008; Marinaccio, 1985; Thiessen, 2001; Tinto, 1993). For example, gender has long been studied as a factor affecting attrition, with varying results. Some studies have reported higher attrition rates for males (Baxter, 2004; Bussi re, 2006; Ma & Frempong, 2008; Parkin & Baldwin, 2009), females (Lenning, 1982; Looker & Lowe, 2001; Thiessen, 2001; Tinto, 1993), or no correlations with gender (Aquino, 1990; Fischbach, 1990; Mohammadi, 1994; Summers, 2000).

A small study by Cohen (1975) investigated L2 (Spanish) attrition among three immersion school children over a summer vacation. The children had little contact with the target language (Spanish) outside of the school environment. The results showed some support for the regression hypothesis in that certain vocabulary items that were last learned were the first to be forgotten “when learners are removed from the second language contact for a period of time”. Obler (1993: 189) argues, however, that “it is because these late-learned items had been used less, rather than they were learned late, that they appeared to have been forgotten first”.

Cohen (1989) also looked at loss of vocabulary (Portuguese) among two children (ages 10 and 14) who had spent one year in a Portuguese-speaking environment (Brazil). They were tested after 1, 3 and 9 months of non-use. A storytelling task was *Retention and attrition of Irish as a second language* used to elicit productive data. Cohen found evidence for loss in the productive lexicon, especially nouns.

RESEARCH QUESTIONS

This study addressed the following research questions:

- 1-Is there a significant relationship between Iranian EFL learners' gender and their vocabulary attrition rate after a break in instruction for one month?
- 2-Is there a significant relationship between Iranian EFL learners' language proficiency level and their vocabulary attrition rate after a disuse period of one month?
- 3- Are certain types of vocabulary learned by Iranian EFL learners more susceptible to attrition?

METHODOLOGY

Participants

Using the Quick Placement Test (QPT), from among 100 EFL learners, 60 male and female candidates were chosen as the sample participants of this study. In fact, the sample included 15 male high proficient learners, 15 male low proficient learners, 15 female high proficient learners, and 15 female low proficient learners. This classification was done according to the rubrics for scoring QPT. The participants were English language students studying English at Nahid Art and Cultural Institute in Shahreza, Isfahan, Iran. Their age range was between 18 and 25 and they were all native Iranian speakers of Persian. Since gender was one variable in this study, the number of male and female students were chosen equal so as to have reliable data.

Instruments

The following instruments were used to gather data in this research:

The QPT

To identify the proficiency level of the participants, Quick Placement Test (QPT) was used. This test consists of two parts; part one has 40 questions including multiple choice situations (5 questions), cloze passages– testing prepositions, grammar, pronouns, and vocabulary– (15 questions), and completion questions (20 questions). The second part contains 20 questions; 10 questions on cloze passages and 10 questions of completion type questions. All questions are multiple-choice items.

Vocabulary Pretest and Posttest

A vocabulary size test called the Vocabulary Levels Test which was originally developed by Nation (1990, 2004) and Laufer and Nation (1995) was used to measure the size of the participants' vocabulary knowledge both prior to and after the treatment. This test was used because it has been commonly used by other studies and it is easy to administer and score. The test has been accepted in terms of reliability and validity by a number of L2 researchers as an

appropriate measure of vocabulary size (Laufer, 1992, 1996; Yu, 1996). Likewise, in the current study, the KR-21 reliability indexes of the pretest and posttest were found to be .76 and .81 respectively.

Procedure

A total number of 60 EFL students studying at Nahid Art and Cultural Institute in Shahreza, Isfahan, Iran were chosen as the participants of the present study. First Quick Placement Test (QPT) was administered to the students in order to determine their language proficiency level. Based on their QPT scores, they were divided into two groups of low and high proficient students. Then, the vocabulary size test (Nation, 1983, complete test; Appendix B) was administered to the students two times. It was once administered, as a pre-test to determine their vocabulary knowledge at the outset of the study ,i.e., when the students were in contact with language instruction and the other time as a post-test to determine the attrition rate of students' vocabulary after a break in instruction. The duration of break in instruction in this study was 30 days.

RESULTS AND DISCUSSION

The present study, as such, employed a quasi-experimental design to investigate the effect of a study break on vocabulary attrition of the EFL learners, and to uncover the role of gender as well as proficiency level in this regard. From among EFL learners at a Nahid Art and Cultural Institute in Shahreza, Isfahan, Iran, a sample of 60 participants out of 100 available EFL learners was chosen in the light of the administration of a Quick Placement Test (QPT). Based on the QPT scoring rubric and the learners' gender, they were categorized into four groups of equal size: Low Proficiency Male Group (LPMG), High Proficiency Male Group (HPMG), Low proficiency Female Group (LPFG), and High Proficiency Female Group (HPFG). Each group consisted of 15 EFL learners. The vocabulary pretest was given to the four groups of learners at the time of their study, and then the study break, which lasted for a month, began. After this lapse of time, the learners in the four groups sat for the vocabulary posttest, the results of which provided the answers to the research questions of the study.

Results of the first research question

For reasons of convenience, the first research question is rewritten here: is there any relationship between Iranian EFL learners' gender and their vocabulary attrition rate after a break in instruction for one month? To answer this research question, the researcher had to compare the LPMG with those of LPFG. However, to control for any possible differences between the LPMG and LPFG prior to the break, one-way ANCOVA was conducted. This way the researcher could control for any possible differences between the two groups on the pretest and then compare their posttest scores. Moreover, the researcher needed to compare the HPMG and HPFG posttest scores as part of the answer to this research question; thus another one-way ANCOVA was run. The results of the ANCOVA tests are presented below.

Table 1: Results of One-Way ANCOVA for Comparing Posttest Scores of the LPMG and LPFG

Source	Type III Sum of Squares	df	Mean Square	F	Sig.	Partial Eta Squared
CorrectedModel	183.43	2	91.71	62.27	.000	.82
Intercept	14.93	1	14.93	10.14	.004	.27
Pretest	182.90	1	182.90	124.18	.000	.82
Gender	.75	1	.75	.511	.481	.01
Error	39.76	27	1.47			
Total	106788.00	30				
Corrected Total	223.20	29				

Table 2: Results of One-Way ANCOVA for Comparing Posttest Scores of the HPMG and HPFG

Source	Type III Sum of Squares	df	Mean Square	F	Sig.	Partial Eta Squared
CorrectedModel	188.63	2	94.31	188.19	.000	.93
Intercept	1.31	1	1.31	2.62	.117	.08
Pretest	187.80	1	187.80	374.73	.000	.93
Gender	.009	1	.009	.018	.896	.001
Error	13.53	27	.501			
Total	147903.00	30				
Corrected Total	202.16	29				

It could be concluded from Tables 1 and 2 that the high proficiency male and female learners, not unlike their low proficiency counterparts, were afflicted with vocabulary attrition and there was no difference between male and female learners in this respect.

Results of the second research question

The second research question of the current study was “Is there any relationship between Iranian EFL learners’ language proficiency level and their vocabulary attrition rate after a disuse period of one month?” To find an answer to this research question, the low proficiency and high proficiency learners’ posttest scores had to be compared. However, these two groups of learners might have had pre-existing differences before the study break commenced (i.e. their pretest scores might have differed). That is why, like what was done for the first research question, one-way ANCOVA was conducted to help find an answer to this research question.

Table 3: Results of One-Way ANCOVA for Comparing Posttest Scores of the LPG and HPG

Source	Type III Sum of Squares	df	Mean Square	F	Sig.	Partial Eta Squared
CorrectedModel	2043.18	2	1021.59	1021.66	.000	.97
Intercept	13.77	1	13.77	13.77	.004	.19
Pretest	368.37	1	368.37	368.37	.000	.86
Proficiency Level	16.24	1	16.24	16.24	.000	.22
Error	56.99	57	1.00			
Total	254691.00	60				
Corrected Total	2100.18	59				

Now it could be inferred that proficiency level significantly affected the vocabulary loss of the learners, to the effect that high proficiency learners were less susceptible to vocabulary attrition

than did the low proficiency learners (since the adjusted posttest mean score of the HPG turned out to be 65.91, while the adjusted vocabulary posttest score .

Results of the third research question

The last research question of the present study intended to find out whether certain types of vocabulary learned by Iranian EFL learners were more susceptible to attrition. To provide an answer to this research question, the researcher merely pinpointed the wrong answers of all the participants, classified them, and measured the proportion of each type to present them in the following pie chart. These vocabulary items, which were problematic for the learners, were classified into the categories of: abstract words, polysyllabic words, false cognates, and other words.

Figure 1: Percentages of Different Types of Forgotten Words

As it could be seen in *Figure 1*, polysyllabic words (55%) were more susceptible to vocabulary attrition than any other type of word. Then second most susceptible type of word was abstract words (36%), followed by false cognates (5%), and other words (4%).

CONCLUSION

Research on vocabulary attrition has been neglected for a long time however researchers have recently paid attention to this aspect of vocabulary knowledge. So this study was in fact an attempt to examine vocabulary attrition among Iranian EFL learners after a break in instruction. Furthermore An attempt was made to realize if there is any relationship between Iranian EFL learners' gender and language proficiency and their vocabulary attrition rate or not. The findings of the study revealed that gender does not affect the vocabulary attrition of Iranian EFL learners but language proficiency does affect the process of vocabulary attrition. Moreover, it was found that some certain types of vocabulary like abstract words, polysyllabic words, and false cognates seem to be more susceptible to attrition by Iranian EFL learners than others.

This study, like any other study, has a number of limitations, some of which could influence the findings and restrict the generalizability of the results. Here are some of the limitations of the research in hand: first, lack of a rich literature in dealing with the subject under investigation was one of the major shortcomings in this field. In other words, there was a lack of comprehensive helpful studies in relation to the effects of the vocabulary attrition on vocabulary learning competence of Iranian EFL learners. The second limitation of this research seems to be the sample size. As it was pointed out earlier, the participants of this study included sixty EFL learners from Nahid Art and Cultural Institute in Shahreza, Isfahan. Due to this fact, a word of caution should be taken in to account while generalizing the results of the study.

THE COMPARATIVE IMPACT OF SONG AND NONSONG VOCABULARY INSTRUCTIONS

Somayeh Akbarpour

MA Student of TEFL, Shahrekord University, Shahrekord, Iran

Ali Roohani*

Assistant Professor, Shahrekord University, Shahrekord, Iran

ABSTRACT

This study investigated the effectiveness of teaching English vocabulary through song and nonsong methods to elementary Iranian English as a foreign language (EFL) learners. To answer the question of the study, the researcher adopted a quasi-experimental design. The participants were randomly assigned into two experimental groups and two control groups within the age range of 9-12. The experimental groups, which consisted of 25 male and 25 female learners, and control groups, which consisted of 25 male and 25 female learners, received different treatments by the same teacher. The experimental groups were instructed through song and the control groups were instructed through nonsong methods. The length of time spent on vocabulary instruction for each group was approximately 12 sessions. Before starting the treatment, a 40-item vocabulary test, consisted of multiple-choice, matching type items, and true or false items was developed, validated and used as the pretest and posttest. The statistical technique of analysis of covariance (ANCOVA) utilized to analyze the collected data. The ANCOVA results revealed that both song and nonsong instructions had a similar positive impact on Iranian EFL learners' vocabulary gains and there was not a statistically significant difference between the two types of vocabulary instructions.

KEYWORDS: Song and nonsong Instructions; EFL learners; Vocabulary learning

INTRODUCTION

One aspect of language learning that has been disregarded in the past, is vocabulary (Prince, 1996). It has been treated as the "Cinderella of foreign language learning" (Beheydt, 1987, p. 55). Vocabulary teaching or learning has never received the same degree of attention as have the other aspects as reading, writing, or grammar (Hedge, 2008; Richards & Renandya, 2002), but now it has become a candidate for much research and attention (Amiryousefi & Vahid, 2010). According to Folse (2004), this is a myth that "vocabulary is sufficiently covered enough in our curricula and courses" (p. 1). Careful scrutiny of English as second language (ESL) textbooks will show the fact that the order of presenting materials in the books is according to grammar points. Also, the most parts of the books are allotted to grammar boxes, pair work activities, and pronunciation activities. Vocabulary lists are either consigned to the back of the book or confined to a few questions about their meanings in a reading passage. ESL learners, even those who have passed an English course, have expressed, in an exit survey by James (1996), their needs to more vocabulary practice and instruction (Folse, 2004).

In addition to the scarcity of specific, sufficient, and systematic attention to vocabulary, this important aspect of second language learning (SLL) has suffered from the scarcity of interesting methods of vocabulary instruction in most curricula. The necessity of more vocabulary practice seems to be obvious for ESL learners. However, it appears that second language (L2) vocabulary learning is not welcomed by many students because they have problems not only in memorizing the meaning, pronunciation, and spelling of English words but also in recalling and remembering them (Thornbury, 2002). Thus, it is necessary to improve the techniques of teaching L2 vocabulary to students and to break the routine that has made the students bored and discouraged them from vocabulary learning.

One of the techniques that L2 teachers can use to promote students' interests and motivations in learning L2 vocabulary is using song (Medina, 1993; Murphey, 1992). "Songs are ubiquitous" (Schon, Boyer, Moreno, Besson, Peretz, & Kolinsky, 2007, p. 2). The most popular function of song/music, is their affective attractions (Trainor, Austin, & Desjardins, 2000). Apart from the emotional appeal of song/music, though, a number of cognitive and linguistic functions have also been identified in favor of their use (Schoepp, 2001). Thus, the current study was conducted to investigate the effect of using song as an alternate instructional method of teaching and learning L2 vocabulary (i.e., English words) at the elementary level in language schools in Iran and compare it with the traditional method (i.e., using pictures, flashcards) which does not use song to teach English vocabulary to young L2 learners.

LITERATURE REVIEW

The enterprise of learning a second language has been a theme of many studies. In learning a second language "your whole person is affected as you struggle to reach beyond the confines of your first language into a new language, a new culture, a new way of thinking, feeling, and acting" (Brown, 2000, p. 1). Theories about how people learn second language are various. Each of these theories can illuminate one aspect of the language learning process. The theories which are most directly related to song/music and second language learning, which support the basis of this study, come from theories such as Krashen's second language acquisition (SLA) hypotheses and Gardner's multiple intelligences (MI). Of Krashen's five hypotheses, affective filter hypotheses have received the most attention (Medina, 2002).

Some researchers (e.g., Anton, 1990; Ayotte, 2004; Hsu, 2009; Wilcox, 1995) have claimed that the affective filter hypothesis is the best known in research that focus on music for teaching purposes, though, all of Krashen's hypotheses are widely-known in the literature of L2 research. According to this hypothesis, song/music may be able to assist in lowering high levels of stress and increase motivation and competence of L2 learners. In addition, song/music can be a great source of making optimal attitude and positive atmosphere in the classroom, enhancing total use of the linguistic input from environment. Because the melodious music and patterned lyrics in songs may be able to create a happy and low pressure environment that help lower the affective filter and bring about effective language acquisition (Butzlaff, 2000; Johnson & Memmott, 2006; Shen, 2009). Also, Jackson and Joyce (2003) state that "Group singing can lower the walls between people, decrease competitive instincts and build cooperation in its place" (p. 7).

Medina (2002) also states that applying music as a useful tool for L2 learning is compatible with Gardner's theory of multiple intelligences. It can be used in various ways for teaching second language to learners. For example, students can listen to instrumental background music while writing an essay. To elicit verbal responses, they may be asked to listen to classical or jazz music. To acquire new vocabulary, when the teacher points to pictures and illustrations of key words, they may listen to a story song or sing songs within which there are key target language structures. Obviously, there are many ways for using music in L2 teaching, therefore, musical intelligence will be cultivated in this way. Thus, those students with higher musical intelligence will experience more joyful and prosperous instruction.

In addition, music inherently creates a cooperative and task sharing environment and involve the use of all other intelligences, thus giving it the potential to reinforce the effect of the instruction for the students (Arnold & Fonseca, 2004). While singing a song, L2 learners use their linguistic intelligence to keep the flow of the going language, while clapping or dancing to the rhythm, they use kinesthetic intelligence; while chanting as a whole group, they use interpersonal intelligence. This process contributes to L2 learning/acquisition because the playful characteristic of songs increases the children's interest in linguistic features of the target language through singing (Christison, 1995; Wiggins, 2007), and instructing students explicitly during singing assists students to be conscious about target sentence forms and meanings, hence, enhancing their vocabulary acquisition and retention.

The relationship between language and song/music was also investigated by Murphey. He introduced song-stuck-in-my-head (SSIMH) phenomenon in 1990. Murphey (1990) claimed that song can be an important tool for activating the Language Acquisition Device (LAD). Murphey also found a similarity between SSIMH phenomenon and Krashen's Din, which is the involuntary rehearsal of a foreign language in one's mind. The characteristics of popular songs were examined by Murphey (1992) to reinforce the opinion that music can facilitate the stimulation of the LAD into the Din mode of involuntary language rehearsal. Krashen (1983) hypothesized that the LAD put the Din in action when the conditions of "comprehensible input" and "i + 1 structure" are met.

The majority of the existing studies have identified positive effects of using song/music on learning and retention of vocabulary in L2 classroom. One of the major studies that examined the effects of music upon the acquisition of English vocabulary was that of Medina (1990). She used three sources of instruction: stories, song stories and illustrations for 48 second grade Spanish speaking children with limited English proficiency. Her reason for selecting these sources of instruction was that children learned a large portion of their first language orally before they attended school, had formal instruction, and were able to read. In fact, she concluded that stories, song stories and illustrations seemed to be among the most common sources of incidental vocabulary learning for children.

Medina conducted the research for four groups of 20 Spanish children. She divided the children into four groups of twenty: the no-music group who listened to a the story spoken; the music group who listened to the same story in its song version; the illustration group listened to the

story song using illustrations of the story; and the no-illustration group who listened to the story spoken without pictures. Prior to the treatment, a vocabulary pretest was administered. After the four-day treatment period, students were given the first vocabulary posttest and one and one-half weeks after the last treatment the second posttest was administered. Results of computing scores of the four groups on two achievement vocabulary posttest, and comparing them with the vocabulary pretest scores indicated no statistical significant difference between the four groups. When the results were examined, vocabulary gained scores for the music group were considerably higher than for no music group.

Also, Medina (1990) concluded that listening to song stories was more enjoyable than listening to oral stories for all of the participants. This shed light on the value of the story-songs which were recognized as different from standard speech and on the value of using illustrations which were identified as an aid in making the words of stories more comprehensible. The interaction between music and illustration groups was not statistically significant, but vocabulary gained scores showed that the highest average gains were in the group music and illustration were used together. The conclusions for the use of music in the L2 classroom clearly indicate that “music can be as a viable vehicle for second language acquisition as stories, so songs should not be treated as extra-curricular entities without any instructional value” (p. 18).

Despite the above positive effects, some researchers (e.g., Winter, 2010) report that the use of song neither improve significantly nor hinder vocabulary learning. Winter (2010) investigated the relationship between using song and productive vocabulary gains of second grade English language learners. The study was conducted in one elementary school in a rural public school district in the upper Midwest. The ESL students were pulled out from the four regular second grade classrooms that the school had. Placement of the ESL (English as a second language) students was based on the school regular schedule, not their language proficiency. Seven ESL learners made up the control group and eight ESL students made up the experimental group. The control group had the traditional vocabulary instruction and the experimental group was instructed by listening to song. Three sets of vocabulary were presented through three stories. The researcher administered pretests (self-assessment and cloze tests), end-of-story oral assessments, and posttests (a replica of pretests). The results showed that students in the song group performed slightly better than the students in the traditional group which were not exposed to songs. However, Winter believed that the findings were not conclusive. Also, she found that songs raised students' confidence in producing vocabulary.

To the researcher's best knowledge, there are few experimental studies investigating how the use of song influences Iranian EFL learners' vocabulary learning, especially in the area of their fundamental linguistic functions such as English word recognition and vocabulary recall. Furthermore, most of the existing studies (e.g., Mori, 2011; Winter, 2010) in this area predominantly have focused on college level students. Therefore, there was a need to conduct research on EFL children in this regard. The paucity of research in this field, indicated that further studies would be needed in order to draw conclusions regarding the use of song in enhancing vocabulary at the elementary levels.

RESEARCH QUESTION

Does the song method improve elementary learners' English vocabulary learning more than the nonsong method?

METHODOLOGY

Participants

The participants in this study were 100 Iranian EFL learners. The participants who were selected from four intact classes were at elementary level within the age range of 9-12. They were randomly assigned to four groups: two experimental groups and two control groups (in two language institute in Isfahan). The first experimental group included 25 male EFL learners; the second experimental group included 25 female EFL learners; the first control group included 25 male EFL learners; and the second control group included 25 female EFL learners. The sampling was an accessible random sampling type. Having learned English alphabets and practiced reading and writing some English vocabulary in these institutes, the participants were able to read the words which were used in vocabulary pretest and posttest of this study.

Instrumentation

As to the instruments, the present researchers designed a vocabulary test for the pretest and the posttest. The test was an achievement test which included 40 items. In order to score this test objectively, true or false, multiple-choice, and matching type items were developed. The items were developed based on the content vocabulary which were included in the textbooks (*Song Time Starter*, *Song Time 2* (Shahsavari & Yeganeh, 2010) and *Song Time 1* (Holisaz & Yeganeh, 2010). The test was classified into four sections. Each section, which formed one type of items, consisted of ten items. In the first section, the EFL learners should look at the words and write the number of a word under the corresponding picture. In the second section (i.e., true or false type items), they should look at the picture and choose true or false. In the third section (i.e., multiple-choice type items), they should look at the picture and choose the correct answer. In the fourth section (i.e., matching type items) they should match number of a word with the corresponding pictures. The weight for each item was one mark.

To establish internal consistency for this study, Cronbach's alpha was computed. The Cronbach's alpha for the vocabulary pretest was .70 which is considered an acceptable reliability for the constructed vocabulary test. The validity of the test was investigated through content and construct validity. The content validity of the test was represented through the development and use of an elaborate specifications for items as the blueprint, content experts' advice, and pilot testing to ensure that the test is a representative sample of the content the test was designed to measure, that is, English vocabulary of L2 learners. The 40-item vocabulary test, which was administered to 100 students, was subjected to confirmatory factor analysis (CFA) using AMOS.

Procedures

This research adopted a quasi-experimental design since the participants were selected from four intact classes and randomly assigned to four groups: two experimental groups and two control groups. The first experimental group included male EFL learners; the second experimental group

included female EFL learners; the first control group included male EFL learners; and the second control group included female EFL learners. When the students registered in the institutes they were interviewed in order to be placed in their appropriate level of L2 language proficiency; hence having a more homogenous sample before the study. Besides, the selected students were at elementary levels within the age range of 9-12.

The researcher followed several stages for the study. First, the previous vocabulary knowledge of both the experimental and control groups were examined through an activity. In this activity, the students had to circle the words they do not know or the words they had doubts about their meanings. The words were selected from the textbooks of *Song Time Starter*, *Song Time 2* (Shahsavari & Yeganeh, 2010), and *Song Time 1* (Holisaz & Yeganeh, 2010); the students in the control group did not have access to the song books. The selected words of the song books were presented to the control group through flashcards. Second, a 40-item test was developed. Care was taken to include item formats which suit their level of language and cognition. The students' already-known vocabulary was crossed out from the test. Third, the test was piloted on similar subjects to see if there were any problems with the test items for the main study. Fourth, content validity and construct validity were checked. It was given to the three experts in the field of testing in order to examine its content validity and check the content and table of specification. The factor analysis was also employed. Fifth, the reliability of the test was obtained through Cronbach's alpha method.

Sixth, the revised test was administered to both experimental and control groups as a pretest to assess what the subjects already know. Forty-eight sessions were held to teach the whole vocabulary in both experimental and control groups. The length of time spent on vocabulary instruction for each group was approximately 12 sessions. After 12 sessions, the posttest of English vocabulary in this study was administered to both control and experimental groups to find out the participants' acquisition of the target vocabulary after the instructional intervention was completed.

Data obtained from the pretest and posttest was analyzed using an SPSS package. The technique of ANCOVA was run to investigate the significant differences in mean scores of vocabulary test between the experimental and control groups.

RESULTS AND DISCUSSION

Descriptive statistics of pretest and posttest vocabulary scores in both groups (song and nonsong) were obtained and summarized in Table 1. As Table 1 indicates, the minimum pretest scores were 0 and 2 in song and nonsong groups respectively, which were below the possible median score (20) and the maximum pretest scores were 25 in song group and 26 in nonsong group, which were above the median score (20) on a 40-point scale. Also, Table 1 demonstrates, the minimum posttest scores were 10 and 9 in song and nonsong groups respectively, which were below the possible median score (20) and the maximum posttest scores was 37 in both groups, which was above the median score (20) on a 40-point scale.

Table 1: Descriptive Statistics of Vocabulary Scores in Both Groups

Group	Variable	N	Min	Max	Mean	Std. Deviation	Skewness Statistics	Kurtosis
Non Song	Pretest Vocabulary	50	2	26	10.38	6.06	.544	-.389
	Posttest Vocabulary	50	9	37	23	7.32	.015	-.706
Song	Pretest Vocabulary	50	0	25	10.26	5.28	.502	.765
	Posttest Vocabulary	50	10	37	23.34	7.09	.122	-.929

According to Table 1, the pretest mean score in nonsong group (10.38) was a little larger than the pretest mean score in song group (10.26). But it seems that the difference was small. This supported the homogeneity of pretest scores. The posttest mean scores in the nonsong and song groups were 23 and 23.34, respectively. That is, the difference was not great. Besides, both groups showed, to some extent, an increase from the pretests to posttests.

The research question intended to see if using songs was more effective than the traditional method (which did not use songs) in teaching L2 vocabulary. To address the research question of the study, covariate analysis was conducted. However, before running the covariate analysis, several assumptions were checked to make sure that vocabulary scores had similar variances across both groups, and there was no interaction between the treatment and the pretest scores; Levene's test of equality of variance showed that there was no significant difference between both groups in terms of vocabulary scores ($p = 1.66$). Also, the treatment for the pretest scores was not statistically significant, $F = .935$, $p = .336$.

The results of analysis of variance for the impact of the treatment on the posttest vocabulary scores are reported in Table 2. The results in Table 2 revealed that the treatment of the study had no significant effect on the students' posttest vocabulary scores because the p value was greater than .05, $F = .137$, $p = .712$. The corresponding effect size was found to be .001, which was very small. Obtaining estimating marginal means, which identifies the adjusted means on the dependent variable for each of the groups, indicated that the song group ($M = 23.385$) performed slightly better than the nonsong group ($M = 22.955$) on the posttests (see Table 3), but the difference was very small. Thus, results in Table 2 and 3 show that the song and nonsong instruction did have statistically different impacts on L2 vocabulary learning among Iranian EFL learners. The results also suggests that the mean scores improved from the pretests to posttests in both groups.

Group 1= Song; Group 2 = Nonsong

Discussion

The descriptive statistics showed that the song groups appeared to perform better the nonsong groups. However, the ANCOVA analysis revealed no significant difference between the two groups on the posttests, indicating that song method was not statistically more effective in improving the students' vocabulary learning as compared with the nonsong method. The results were contradictory to El-Nahhal's (2011) findings which revealed a statistically significant difference in mean scores of vocabulary test in favor of the experimental group who learned English vocabulary through listening to children song. But the above finding is consistent with the previous studies by Ayotte (2004), Medina (1990), Mori (2011), and Winter (2010), who found that using song fail to assist learners gain large amount of second language vocabulary.

Several plausible reasons may explain why no significant differences were observed. First, it may be related to the length of the instruction. That is, a short-term instruction (about a month) for each of the song group with 30 minutes a day might be insufficient for the EFL beginners to learn English vocabulary. If the length of time for instructing vocabulary through song had been increased, the learners might have improved their word knowledge in English. In order to facilitate the learning and internalization of vocabulary especially for EFL learners, repeated exposures and manipulation of the vocabulary might be needed (Belisle, 1997; Swain & Lapkin, 1991). Thus, as discussed above, the length of treatment and consequently inadequate reinforcement of the English vocabulary might have affected the performance on the posttest and the non-significant result of the study.

The second reason is probably related to the function of song/music for Iranian EFL learners. That is, they may use song/music as an outlet (outburst) for energy. For them listening to song is a source of entertainment rather than an educational tool. It seems that they are so attracted to the elements of music such as rhythm, melody, and harmony that the meanings of target vocabulary in the lyrics are undermined (subordinated). In fact, due to the limitation in incorporating English song in curriculum and lack of trained teachers for this purpose, students are not probably familiar with the features of song/music and their educational value.

The third reason may be related to the matter of rote memorization of song. Music was found to benefit rote memorization when the information and music were presented simultaneously (Gfeller, 1983; Schuster & Mouzon, 1982). Also, the rhythmic presentation of meaningful verbal information was found to benefit memorization (Glazner, 1976; Shepard & Ascher, 1973; Weener, 1971). Salcedo (2002) found that the use of song in the foreign language classroom was considered to be helping memory of text. Although using song is one of the quick, easy, and enjoyable techniques of memorization for children, reciting the whole text does not mean that learners have learned all the words or even the majority of content words of a song. Stated differently, they may know the plot of the song story and know it from memory word for word, but they pay little attention to the meaning of each word. As Murphey (1992) states, no matter how enjoyable or memorable, singing songs fail to teach anyone to use the language and transfer the words into use.

The above results of the present study can lead to drawing two conclusions. First, the use of song might be generally beneficial in facilitating vocabulary learning. This finding also confirmed the general benefits of song in foreign language context by previous studies (Medina, 1990; Mori, 2011; Schunk, 1999; Winter, 2010). As Ayotte (2004) states, presenting authentic language into the classroom through song might arise the EFL students' interests and help them to learn L2 vocabulary. Second, using pictures (e.g., flashcards), like using song, might be generally effective in learning vocabulary. The beneficial effect of picture in recalling information is based on Paivio's dual-coding theory. In proposing this theory, Paivio (1971) assumed that both visual and verbal codes could aid in representing or recalling information (Sternberg, 2003). This theory was also psychologically supported. Many researchers have agreed that only words and images are used in mental representation (Pylyshyn, 1973). Further evidence indicates that recalling learned materials will be facilitated if verbal information and the corresponding visual image are presented together (Doff, 1988; Richards & Rodgers, 2001; Shapiro & Waters, 2005). In addition, using pictures in teaching vocabulary aids EFL learners to notice the words consciously. In fact, it is a way for young L2 learners to learn target words quickly and easily.

CONCLUSION

The above findings of the present study showed that both song and nonsong instructions had a similar positive impact on Iranian learners' English vocabulary learning at the elementary level, the difference between the two methods (types of instructions) was not statistically significant. The main conclusion that can be drawn is that using song as a method of instruction is beneficial for L2 vocabulary learning, but "the extent of its value in comparison to more traditional

vocabulary instruction is still in question. More research needs to be done in this area to allow for a more definite conclusion” (Winter, 2010, p. 71). According to Salcedo (2002), using song/music in English should not be “a panacea, replacing all other methods as the only viable teaching tool”, instead, they should be employed as an acceptable material for classroom instruction (p. 127). Similarly, as Ayotte (2004, p. 87) states, using song can be served as “an alternative approach to presenting and teaching foreign language material”, but it should not be considered as the most successful and innovative method of teaching L2 vocabulary to young L2 learners.

ABSTRACT

Wiki is a major component of Web 2.0, the emergent generation of web tools and applications. Wikis are newcomers to the Internet and have recently been recognized as viable tools for teaching and learning. The present study tried to investigate the effect of using Wikis on improving Iranian English as a foreign language (EFL) learners' reading comprehension. To achieve this purpose, a reading comprehension test was administered to 60 language learners and ultimately 36 pre-intermediate language learners were selected and randomly assigned to two groups. The same pre-test was administered for two groups before any treatment. During the experiment, group one participants had exposure to using Wikis as an interactive teaching tool for specifying assignment texts in-and out-side the classroom and practicing reading comprehension through wikis for one and a half months. The participants in group two had not used wikis in-and out-side the classroom. At the end of the experiment, two groups took a post-test which was absolutely the same as pre-test to see whether or not any changes happened regarding their reading proficiency. The results of the posttest showed that the two groups performed differently on the posttest which was indicative of the fact that greater exposure to specific wikis-oriented language reading material promotes the Iranian EFL learners' reading proficiency. The comparison of the participants' gain scores indicated that though group one could improve their reading comprehension, wikis were more effective Web2.0 tools in enhancing Iranian EFL students' reading comprehension. New technologies in teaching have never been greater and with the recent addition of the Wiki Assisted Language Learning (WALL), teachers are able to integrate this tool into their lessons. The WALL is not only an innovative tool which meets cognitive and learning styles, but also different intelligences in a group class. This recent

technology has inspired many teachers to further their expertise in teaching and facilitate learning.

KEYWORDS: wiki, reading comprehension

INTRODUCTION

Since 1990s, language classes have been open to different tools available to teachers through multimedia technology. A great change has taken place in the use of computers in language learning: computers function as tools that enhance foreign language learning. The rapid growth of technology on the one hand, and learners' interests in fostering their language learning autonomously on the other hand, have led researchers to try new ways to use modern technology and the Web in language learning. With the advent of Web intervals, Web 1.0, 2.0, and the newly developed one, Web 3.0, investigators are focusing on the tools available through the net so that every individual can work on his language skills autonomously. A large number of studies have so far been done on the effectiveness of these tools in language learning in general and reading comprehension in particular (Polleti & Freitag 2011).

Wiki is characterized by ease of use and rapidity of deployment, making possible powerful information sharing and supporting collaborative writing activities and improving student interaction (Boulos, 2006). Arreguin (2004) stated that “Wikis could provide unique collaborative opportunities for education combining freely accessible information, rapid feedback, simplified HTML, and access by multiple editors, wikis are being rapidly adopted as an innovative way of constructing knowledge” (p.1). Moreover, a wiki could accumulate users' opinions, and cultivate active on-line communities on the web (Wang & Lu, 2005).

Studies that investigated the direct effect of foreign / second web-based language learning on learners are still not numerous. Some previous studies revealed that web-based writing improved learner attitude and decreased their writing apprehension (Alia & Hussin, 2002). Besides, some previous studies revealed that web-based language instruction could help learners produce better writing quality and more writing quantity than traditional classroom instruction (Braine, 1997). However, some other studies showed that web-based language writing had no significantly effect on learners' performance and on reducing their writing apprehension (Biesenbach-Lucas & Weasenforth, 2001).

What are wikis?

Wikis are socially oriented; software based web pages that enable free cross platform editing and redistribution of original content (Buffa & Gandon, 2006). Choy and Ng (2007) provide a good overview of the processes available in wikis and their potential uses in educational institutions. While wikis have been around since approximately 1995 (Leuf & Cunningham, 2001), they are part of the so called 'Web 2.0 phenomena' –the read/write web, the natural successor to web 1.0 – the read only web. The read/write web is a hypertextual system for editing and sharing information (Schwall, 2003), more commonly identified as the interactive web.

O'Neill (2005) states that wikis are a collaborative medium designed to promote content sharing. Wikis allow collaborative editing of pages by participants as well as many other features, depending on the wiki software used. Wikis often allow a history of editing undertaken by members showing an evolving process of page development with a concurrent evolution of participant knowledge and engagement. All wiki page edits are open for debate and critique from any angle by any member of the community. Augar, Raitman and Zhou (2004) highlight that a wiki environment is perfect for what they call computer supported collaborative learning, as they are student centered, giving students shared authority and responsibility for their own knowledge. Sharing of authority is central to a wiki epistemology, as is empowering participants. Any user can participate in the creation of shared documents, which evolve through shared community goals. The empowerment of users tends to be ignored in wiki research. There are clear definitions of what the technology can do through collaborative endeavors, but little evidence pointing to what values are required to facilitate the successful achievements in one.

LITERATURE REVIEW

Research into 'wikis for learning' is in its infancy, although unlike the parallel early Internet learning research, it seems much more focused on pedagogical requirements. This is because the very nature of a wiki provides access to the developmental aspects, which are often hidden from the teacher's view. For this reason, the majority of wiki research has focused on the technical aspects of the wiki (Tazzoli et al., 2004), or the development of a special use 'technical' wiki, instead of attempting to understand the underpinning epistemology required to build content and community. Lanier's (2005) thought provoking article on "hive" mentality and the thoughtful response from Tumlin et al (2007) shows how these issues are now coming up for debate.

Technology has introduced new tasks and activities learners can use for their reading comprehension. Studies have shown that Internet access motivates many students to read extensively (Yang, 2009). Izquierdo and Reyes (2009) pointed out the Internet has rapidly become a basic medium not only for information and communications, but also reading comprehension in the twenty-first century. A typical Internet-based reading practice requires students to move to a higher level of comprehension tasks such as summarizing and paraphrasing, making inferences and respond with online communication tools such as an e-mail message or blog post. The Internet gives the opportunity to learners to get familiar with search engines and Websites besides using conventional knowledge of vocabulary and informational text structures (Coiro & Dobler, 2007).

Computers and the Internet technology have introduced what is known as hypertexts or online texts through which one can have more access to other reading materials just by clicking on a certain word being underlined in the text. Cumley (2009) mentioned several characteristics for all online reading sources. They include being standard and authentic, having books adapted for access, requiring low-tech modifications to text, accompanying pictures/symbols with texts, being supplemented with text reader with study skill support.

Rahimi and Behjat (in press) did an empirical research on online and offline reading comprehension for Iranian EFL learners and concluded that the learners' reading is fostered to a higher degree when they are exposed to online texts which have links to other sites providing more reading materials. Comprehending hypertexts can sometimes be difficult as they require readers utilize different skills and strategies to overcome comprehension problems. The great advantage of reading hypertexts on the net is that learners can have access to authentic texts.

Verezub and Wang (2008) showed how using the net hypertexts empower language learners' comprehension of texts. As the media is equipped with images, videos and audios, comprehension would be facilitated, and it is easier to remember and later to retrieve it (Brown, 2000).

Murphy (2007) explored the role of online reading and feedback in comprehension and showed how designers should cater for different levels of language proficiency in supplying the Web with hypertexts by providing an online feedback that promoted both reading comprehension and interaction. Szymańska and Kaczmarek (2011) argued that in order for learners to become proficient readers in a foreign language, they need to have access to online texts which can help them to respond in an authentic way to what they have read.

Polleti, and Freitag (2011) posted authentic texts in a website and a number of exercises, and stated that implementing this web site, learners were prompted to actively apply a wide range of different reading skills and strategies to increase their comprehension of written texts. Yet, another advantage of reading on the net is that it can help learners be able to analyze the texts by themselves, reflect on them and try to comprehend them independent of asking for help from a teacher. Krajka (2007) claimed that "Learners autonomy is essential in the Internet-based classroom, where the learner is frequently in charge of the choice of materials, evaluation of their own progress, selection of learning strategies" (p. 194).

In the technology-oriented era, as the Web 2.0 came to the fore, it brought a couple of tools with itself. The distinctive feature of all these tools is that they are interactive not just between two but among a large number of people to share their knowledge and interests. In other words, while Web 1.0 tools such as e-mails were initially exchanged between only two people, Web 2.0 tools are those by which the emitted information can be used by all who like to have access to. That's why they are known as social networks. Among all Web 2.0 tools, wikis and blogs have shown having a positive impact on learning a language (Sharma and Barrett, 2008). Coiro (2009) mentioned that social networking sites well meet learning standards for reading comprehension as they demand online readers are personally productive, socially responsible, and able to collaborate with a diverse team.

There are some pieces of evidence in the literature to support the positive impact of wikis and weblogs in the improvement of reading comprehension. Izquierdo and Reyes (2009), for example, explored the effectiveness of blogs to promote reading comprehension and concluded that for freshman EFL students, weblogs, though difficult to understand at the beginning, can

play a vital role in the improvement of their reading comprehension. Kear and Woodthorpe (2009) confirmed that students' use of wikis in a distance learning course plays a role in their communication skills specially their comprehension of the texts appearing on the screen. Though research has shown that both wikis and blogs can enhance reading comprehension, the question which can be raised is which of them can help language learners foster their reading comprehension more.

There is still a lack of research that investigates the pedagogical potentials of Wiki for collaborative learning (Elgort, Smith & Toland, 2008). Some research also indicates that collaborative reading and writing is more the exception than the norm (Lin & Kelsey, 2009). There is thus a challenging idealistic hypothesis that Wiki is natural beneficial. Empirical studies usual focus on how Wikis work (Hoisl, Aigner & Miksch, 2007).

The limited research that has been done is also mainly prescriptive (Staley, 2009). With all these studies done, the literature on Wiki and language pedagogy seems to be in its infancy. On one hand, the application of Wikis in general and Wiki in particular needs to be justified at the theoretical level and on the other hand, there is no inclusive report of how such a tool can be used in EFL contexts with complex net of learning and teaching variables. Accordingly, the present study attempted to show the feasible ways in which this tool can improve the learners' reading skill in Iranian context.

RESEARCH QUESTIONS

To begin with, the following question is posed for the researcher to answer:

Does the application of Wikis effect on the improvement of reading comprehension ability among Iranian pre-intermediate EFL Learners?

METHODOLOGY

Participants

The present study tried to investigate the effect of using Wikis on improving Iranian EFL learners' reading comprehension. To achieve this purpose, a reading comprehension test was administered to 60 language learners in language schools of Andimeshk, Khuzestan, Iran and ultimately 36 pre-intermediate language learners were selected and randomly assigned to two groups.

Instruments

Initially, the subjects in two groups took the reading comprehension section of a sample proficiency test. The test contained 25 multiple-choice items. The reliability of the test was .732 based on KR-21 method. The test was extracted from How to prepare for the TOEFL Test: Test of English as a Foreign Language (Sharpe, 2010). The second instrument was the materials which were selected from Internet reliable sites (such as, *Wikipedia.com*, *bbc.com* and *cnn.com*) and other authentic sources such as *New interchange series* (Richards, 2005). In order to account for the influence of Wiki on reading comprehension, two types of materials were proposed: materials

that were delivered on Wiki space and materials that were assigned offline in written form which were provided for the two groups throughout the whole treatment. The difficulty level of these materials as determined by systematic functional grammar criteria (Shokrpour 2004:pp.5-25) was calculated to make them appropriate for pre-intermediate EFL learners.

Procedure

The same pre-test was administered for two groups before any treatment lesson. During the experiment, group one participants had exposure to using Wikis as an interactive teaching tool for specifying assignment texts in-and out-side the classroom and practicing reading comprehension through wikis for one and a half months. The participants in group two had not used wikis in-and out-side the classroom. At the end of the experiment, two groups took a post-test which was absolutely the same as pre-test to see whether or not any changes happened regarding their reading proficiency. The English proficiency level of most of these learners is pre-intermediate. At language school, the medium of instruction is English. Therefore, they get a lot of exposure to the English language.

To select the homogeneous subjects, the researcher administered a sample reading comprehension proficiency test to sixty English language learners in private language institutions selected based on their availability, including both males and females. The thirty six participants were selected out of sixty. Having administered the necessary statistical calculations, these one hundred students who had scored between 5.5 and 47.5 out of 100, two standard deviation above and below the mean, in the proficiency tests were selected as pre-intermediate language learners. For the purpose of this research, the selected subjects were both male and female and were randomly divided into two groups of 16.

RESULTS AND DISCUSSION

The research question was put forward regarding the efficiency of applying Wiki as an aid in improving reading comprehension of Iranian EFL students. In what follows, first the results of the two main groups i.e. the Wiki and the traditional classes are represented and then the comparison of both groups participating in the study would be demonstrated followed by the results obtained from statistical analysis.

The present study was based on a hypothesis which claimed that the application of the main software tool offered by ICT, namely Wiki in EFL reading comprehension classes leads to better acquisition and performance of students in comparison with the traditional methods of reading textbooks. In order to confirm this claim, the final grades of the participants in both traditional and experimental classes were compared. Table 1 illustrates the results descriptively.

Table 1: Descriptive statistics for final grades

Group	N	Mean	Std. Deviation	Std. Error Mean
Traditional	18	11.9444	2.34451	.55261
Wikipedia	18	16.1111	2.19997	.51854

As the results in table 1 show, there seems to be a difference in the final performance of the two traditional and experimental classes. In order to check the significance of the observed differences between the final grades of the two classes, the obtained data were subjected to a paired t-test using Statistical Package for the Social Sciences (SPSS) software, version 18. Table 2 represents the t-test results.

Table 2: Independent t-test results for the level of participation

	T	df	Sig.(2-tailed)	Mean Differences	Std. Error Differences
Grades (Equal variances not assumed)	2.001	21.272	.050*	5.41667	2.70650

= statistically significant ($p < .05$)*

The statistically significant difference between the final grades of the participants in two experimental and traditional classes suggests that students in Class B (Wiki Class) have performed much better on their final exam in comparison with Class A (Traditional Class). Hence, the superiority of the application of ICT tool, Wiki, in Iranian EFL classes is confirmed. The results of the post-test are also illustrated in figure 1.

Figure 1: The mean difference of post-test between control and experimental group

The existing literature shows that the application of ICT tools such as Wiki offers numerous potentials for both teachers and learners. The present quasi-experimental study sought to present a comparative overview of one of the most practical tools offered by ICT, namely Wiki. As the research findings depict the participants who took part in Wiki classrooms collaboratively surpassed those who had participated in traditional classrooms. In addition to a higher level of participation, they exceeded them in final performance. The affective data gathered in this study portrayed the impression of students participating in the study. The participants in Class B (Wiki Class) reported their higher motivation, sense of community, collaboration, and pleasure and less confusion than the participants in Class A (Traditional Class).

The history of the application of technology to teach in general and English language teaching in specific has proved to be an area of contention meaning that in some studies there has been supportive evidence whereas in other investigations pitfalls of the implementation of the technology have been highlighted.

Some experts active in the field of computer assisted language learning have dealt with the issue of normalization stage in the use of technology and its probable effects on the learning of English as an EFL. One recently carried out study is by Salehmahdi (2013) in that he dealt with the issues of computer assisted language learning normalization in EFL contexts.

According to him the use of computers in language learning is increased widely in most countries. Many educational institutions all over the world have integrated computer technology into language instruction. However, this integration is not successful in many institutions. There are many issues that hinder the integration of Computer-Assisted Language Learning (CALL) into language learning. His paper reported on the literature associated with issues of CALL normalization. It highlighted the issues of CALL normalization in English as foreign language (EFL) contexts and explores the most important factors to be considered to improve the use of CALL in these contexts. The study also added some issues that were not mentioned in the previous studies. It was suggested that for CALL normalization to be occurred, five major issues should be addressed (i.e., personal, technical, pedagogical, socio-cultural, and institutional). Some suggestions were presented to help CALL to be normalized in EFL contexts. The findings of the present investigation are in line with the research carried out by Salehmahdi (2013).

CONCLUSION

The results of the present study well support the positive role of using Web 2.0 tools like wikis and weblogs in language classrooms to foster the learners' reading comprehension. The results of this study also indicate that compared to weblogs, wikis are better tools in enhancing reading comprehension. This might be due to the distinguishing feature of wikis which enjoy a high level of exposure to other Websites as the texts have links and they are available to the users only through clicking the underlined word in a hypertext. The editability of wiki pages helps the users add, delete, or change some parts of the hypertext and this increases the wiki attraction. Language teachers can search through the net and design their own weblogs and find suitable wiki pages to use them in their reading comprehension classes. Language classes will be more interesting if technology enters them as it has already stepped into all aspects of human life.

Limitation of the study

This study is conducted in a senior high school in Andimeshk city, Iran. Thus, the place was limited and more research is needed in similar context to find more about the effect of Wikis on improvement of reading comprehension ability. Therefore, the results may not be generalized to all language school learners and all other areas. Eight sessions were run to see the effects of the treatment which is a limited time. Moreover, this study was conducted on a small size of the learners enrolled in the program due to the availability of the participants. Moreover, the students were pre-intermediate EFL Learners and other levels were not considered.

ABSTRACT

This study aimed at investigating pragmatic knowledge contained in newly published Iranian English as a foreign language (EFL) textbook, Prospect 1 (2013), and Prospect 2 (2014) which is taught at first and second grade of junior high school in Iran. For this purpose, content analysis of the dialogues was performed to examine speech act information. Speech act information in this study consists of types, frequency and distribution provided for each speech act. Searle's (1979) model of classifying speech acts was applied in order to investigate different speech acts. Using descriptive and inferential statistics it was revealed that the conversations in the newly published Prospect series (1&2) have a number of significant shortcomings, such as the lack of declaration speech act. The results of chi-square analysis also reflected the inequality and variation in the distribution of speech acts within and between these books. To be regarded as pragmatically competent, the conversations in these two textbooks must include all types of speech acts which are all used in the real-life communications. Even though linguistic contents would naturally be of primary concern, the pragmatic content of the EFL textbooks cannot be overlooked. By sharing the results of analyses of other EFL textbooks, curriculum developers can further provide more pragmatic sensitive materials suitable for language learning.

KEYTERMS: Speech act, communicative competence, pragmatic competence, text-book analysis

INTRODUCTION

Textbooks play a fundamental role in English as a foreign language because through textbooks learners get familiar with target culture, social norms and values. Kemp (1977) states that EFL textbooks are vital parts of an appropriate and balanced curriculum. The content of every textbook contains the most fundamental executive guidelines for achieving the aims of any educational system. Learning a foreign language is regarded nowadays as an essential component in the curricula at different educational levels. However, in order to make learners communicatively competent in English, there is a shift from previous theoretical frameworks, which considered language as a formal system based on grammatical rules, towards a more communicative perspective.

Pragmatic Competence

Accordingly, different approaches analyzing communicative competence have considered pragmatic competence as the basic component, on the other hand, within pragmatic competence increasing attention has been drawn to interlanguage pragmatic (ILP) studies most of which have been carried out on production of different speech acts. Following Kasper (1997), pragmatic competence can be defined as the knowledge of communicative action and the way to carry it out, and the ability to use language appropriately according to the context. In addition to the language user's ability in using the language, termed as linguistic competence, it is a requisite that s/he possesses pragmatic competence, an aspect of communicative competence indispensable for communicating successfully in the target language (Ji, 2007; Kim & Hall, 2002; Saville-Troike, 2006).

Pragmatic competence is so vital that lacking it may lead to communication breakdown. It can cause misunderstandings, serious miscommunication, and even distort the communication goals when learners understand only the literal meaning of words but do not know the rules for interpreting them (Kasper, 1997; Lin, 2008). Many studies on pragmatic competence have shown that there is a difference between the pragmatic of native speakers and learners of the target language for certain reasons (Yuka, 2008). First, although there is considerable amount of universal pragmatic knowledge which can be transferred for free from the learners' L1 if there is a corresponding form-function mapping between L1 and L2, learners always fail to use what they know (Kasper, 1997). Second, classroom instruction may be a cause of pragmatic failure. Finally, learners may not realize the existence of different ways or many linguistic forms to be used in conveying their intention.

Speech acts and its classifications

Since this study was based on speech act theory different definitions and classification of speech acts were provided in the following lines. The concepts of speech act was coined by Austin (1962) and expanded by Searle (1979). Austin defines speech acts as “acts performed in saying something”. Further, he distinguishes three different levels of action beyond the act of utterance. Austin distinguishes the act *of* saying something, what a person does *in* saying it, and what he or she does *by* saying it, and dubs these a *locutionary*, an *illocutionary*, and a *perlocutionary* act.

Searle (2005) starts with the notion that when a person speaks, he/she performs three different acts, including utterance acts, propositional acts, and illocutionary acts. Utterance acts consist simply of uttering strings of words. Meanwhile, propositional acts and illocutionary acts consist characteristically of uttering words in sentences in certain context, under certain condition, and with certain intention. Searle categorizes the illocutionary acts based on varied criteria as the following: i) Assertive or Representative, ii) Directive, iii) Commissive, iv) Expressive, and v) Declaration. For the purpose of this research, we have decided to use Searle's classification because it is actually a modification of Austin's general theory of speech acts. Searle's classification is based on what the speaker wants to imply in his/her utterances. In addition, this classification is more specific and detail than other classifications.

Thus, the study of speech acts appears to be necessary to the understanding of intercultural studies. The main contribution of speech act theory is to explanation of communicative competence. Pragmatic speech acts such as invitations, refusals, suggestions, and apologies are significant components of communicative competence.

Within the last few years, great deal of studies have been carried out with regard to different speech acts, such as: request (e.g. Jalilifar, 2009; Taguchi, 2006), apology (e.g. Eslami-Rasekh & Mardani, 2010; Harris, Grainger & Mullany, 2006), compliment (e.g. Sharifian, 2008; Wolfson, 1981) and refusals (e.g. Allami & Naeimi, 2010; Tanck, 2002) among which speech act of suggestion has absorbed scant attention. In order for students to learn how language really works, they need authentic materials of authentic communication situations. The demand for pragmatic input is particularly relevant when upper secondary school teaching materials are concerned, because at this level, students are expected to be quite proficient language users. Kasper (1997) suggests the inclusion of activities such as role-play, simulation, and drama to engage students in different social roles and speech events.

The Role of Textbooks in TEFL

Richards (2001) states that textbooks can serve as a tool to train the EFL teachers. Considering the advantages, Richards (2001) states that without textbooks a program may have no path, therefore they provide structure and a syllabus. In addition to the use of a textbook in a program, it can guarantee that students in different classes will receive a similar content and therefore can be evaluated in the same way. He concludes that textbooks are efficient in that they allow much time for the teacher to focus on teaching rather than material's development.

Some scholars support this perspective. Elliott and Woodward (1990) state that textbooks form a part of schooling that is enduring and very influential; and such textbooks also describe what is mostly learnt by students and their instructors. Also it is deemed that textbooks form the core of attention of learning materials in modern schooling (Westbury, 1990). Finally, Sheldon (1988) states that textbooks depict the heart of an ELT program that can be visualized.

In 2013, Iran's Ministry of education has introduced the new series of EFL textbooks entitled *Prospect* to be taught in junior high schools. Therefore, the present study intended to investigate the pragmatic content of newly developed English textbooks, Prospect 1 and Prospect 2 to examine the types and frequency of speech acts used in the dialogues of the above mentioned books published by Iran's ministry of education. The newly developed and published Iranian EFL textbooks (Prospect 1 and 2) are claimed by the authors to follow the principles of communicative language teaching. However, the books have not been investigated in terms of speech act use; therefore, this research aimed to scrutinize the newly developed Iranian EFL textbooks (prospect 1 and prospect 2) in terms of speech act. The textbooks are recently introduced and being taught nationwide.

In order to use the textbooks effectively, it is essential for the practitioners to evaluate the materials since evaluation plays a key role in education and can provide valuable information. In other words, if we accept the value of textbooks in ELT, we must be sure of usefulness of the

textbooks, and their appropriateness for the context and people with whom they are being used. Sheldon (1988) has offered several reasons for textbook evaluation. He suggests that the selection of an ELT textbook often signals an important administrative and educational decision in which there is considerable professional, financial, or even political investment. A thorough evaluation, therefore, would enable the teaching staff of a specific institution to discriminate between all of the available textbooks on the market. Moreover, it would provide a sense of familiarity with a book's content thus assisting educators in identifying the particular strengths and shortcomings in textbooks already in use.

Although there have been studies about the content of EFL textbooks, the investigation on pragmatic information in newly developed English textbooks, Prospect 1 and Prospect 2, has not yet been conducted. There is paucity of pragmatic contents and their presentations are marginalized as compared to other language items. There are no courses offered to pre-service language teachers in the area of pragmatics as a result of which teachers do not complement textbooks with inputs to help learners acquire pragmatic competence. This study hence intended to examine the pragmatic aspect of the students' textbook to find the availability of opportunities to teach pragmatic competence to EFL learners. More specifically, an attempt was made to answer the following research questions.

REVIEW OF THE LITERATURE

Hamiloglu and Karlova (2009) examined and evaluated five selected English language course books from the viewpoint of vocabulary selection and teaching techniques they employ. As an evaluation method, content-analysis was preferred in this study. Regarding the national studies on textbook evaluation, no study can be found on newly developed and published Prospect series (prospect one and two), particularly with regard to the pragmatic dimension applying Searle's (1979) models.

Another study was performed by Vellenga (2004) who compared EFL and ESL textbooks. She argues that learners hardly acquire pragmatic competence due to the lack of information in textbooks. She concluded that EFL/ESL textbooks did not provide enough metalinguistic and explicit metapragmatics information. In spite of this shortage, the comparison shows that most of EFL textbooks enjoy pragmatic information.

Matsumra (2001) conducted a valuable study on the utilization of advice and suggestion speech acts by Japanese ESL learners. He found that the participants, quite different from their common habits in their own culture, used direct speech acts, e.g. you must, you should ... for advice and suggestions when answering teacher's question, "Please tell me what I could do in order to make this class more interesting to you all" (p. 637). However, this style was considered inappropriate and rude.

Another research was conducted by Cohen and Olshtain (1993) in search of describing ways in which non-native speakers use speech acts. They scrutinized three speech acts of apology, complaint, and request, which measured through role-playing. After they videotaped each speech

act context, they applied retrospective verbal report in order to analyze processing strategies in speech act formulation. The results show that most students do not use specific language strategies and think mostly in two languages or three. They ignore grammar, vocabulary, or pronunciation and only conduct general assessment.

With respect to Iranian EFL context, Ansary and Babaie (2002) investigated a corpus of 10 EFL/ESL textbook reviews plus 10 EFL/ESL textbook evaluation checklists conveniently sampled while presenting a summary of common-core characteristics of standard EFL/ESL textbooks in their studies, too. They aimed at looking for some universal, theory-neutral, and broad consensus-reached features of EFL or ESL books, and draw up some guidelines for the generation as well as systematic evaluation of EFL or ESL books. They revealed that however perfect a book is, it is merely a simple tool in the hands of teachers and what is more important than a textbook is what we, as teachers, can do with it. For the area of task-based and pragmatics, Iraj (2007) performed a research and made a careful analysis on New Interchange series based on the principles of communicative and task-based approach to investigate to what extent the principles of CLT and TBLT approaches have been considered. In this perspective, she used Ellis's model (2003). Iraj (2007) criticizes *New Interchange* since the series do not follow the principles of communicative and task-based approaches as the author claimed. The book also has no frequency of meta-pragmatic information.

Razmjoo (2007) employed the Hymes' (1972) scheme to investigate the extent to which the Iranian high school and private institute textbooks represent the CLT principles. For that purpose, the textbooks of the Iranian high schools and private institutes were analyzed descriptively and inferentially. The results indicated that while high school textbooks are not conducive to CLT implementation, the textbooks in private institute represent the CLT foundations to a greater extent.

In another story, Riazi and Aryasholouh (2007) studied the four high school and pre-university English textbooks focusing on the consciousness-raising aspect of vocabulary exercises. They concluded that of all exercises in the four books, only one percent of exercises may be categorized as consciousness-raising. They also showed that the exercises mainly concentrated on individual words (approximately 26%) with no emphasis on fixed expressions, lexical collocations (approximately 15%) and grammatical collocations (approximately 2%). They found that students are mainly dealing with meanings of individual words and not with how words are used with other words or in what combinations. Zare Moayed (2007) performed an evaluation on a series of ELT materials namely, Interchange third edition. For their purpose, Littlejohn's (1998) detailed framework was used in this attempt. Results revealed that the Interchange series are not completely in line with the objectives intended for it. These series do not use learners or even the teachers as a source for its content. In addition, supra sentential level has been ignored for both the expected output and input of the learners. What is more, these are not the learners who initiate the tasks. On the other hand, Interchange series focus mainly on pair works and meaning. These series also encourage learners to use the language and more importantly, they more often require them to express themselves than to be a listener.

In Iranian context where English is taught as a foreign language, most studies have been contrastive in a way that native speakers of Persian and English were investigated for their pragmatic production of a specific speech act and the strategy they employed to fulfill that aspect in their native language (Shariati & Chamani, 2010; Shams, 2015; Soozandefar & Sahragard, 2011). No doubt these kinds of studies shed some light on specific linguistic cases, but what seems to play a crucial role in foreign language learning is to equip the learners with the practical knowledge of language which is demanded by immediate conversational instances. It can be concluded from the studies on pragmatic information in different ESL and EFL context reviewed above that most course materials failed to provide adequate amount of pragmatic knowledge for students to develop their pragmatic competence. The newly developed and published Iranian EFL textbooks (Prospect 1 and 2) are claimed by the authors to stick to the principles of CLT. However, the books have not been investigated in terms of speech act analysis ; therefore, this research is going to scrutinize the newly developed Iranian EFL textbooks (prospect 1 and prospect 2) which were published by the publishing company of Iran. The textbooks are recently introduced and being taught nationwide.

RESEARCH QUESTIONS AND HYPOTHESES

There were four research questions that this study aimed to answer which were as follows:

- 1-What are the types and frequencies of speech acts used in the dialogues of Prospect 1 (2013) published by Iran's ministry of education?
- 2-Is there a significant difference in distribution of speech acts in Prospect 1?
- 3-What are the types and frequencies of speech acts used in the dialogues of Prospect 2 (2014) published by Iran's ministry of education?
- 4-Is there a significant difference in distribution of speech acts in Prospect 2?

METHODOLOGY

Design of the Study

Textbooks as the major source of teaching and learning process in Iranian EFL context should contain the adequate number of speech acts to promote teachers and learners' pragmatic competence. To develop textbooks with sufficient number of speech acts suitable to the norms followed by native speakers of the language, EFL textbook authors should be linguistically and pragmatically competent in the target language to be able to incorporate the right numbers of speech acts in EFL textbooks. To put it another way, the speech acts deserve further attention when designing material and textbooks for Iranian learners of English. This study was performed using a mixed method. According to Creswell (2001), qualitative research is descriptive in that the researcher is interested in process, meaning and understanding through words or illustrations. For this purpose, we attempted to determine the type and the number of speech acts used in dialogue section of two textbooks (Prospect 1 and Prospect 2) Searle's (1979). Previous research proved that speech acts categories are considered as one of the universals of all languages and these categories are said to be found in all languages nearly with the same range or frequencies. On the quantitative stages inferential statistics were applied to make within book comparison of the speech acts.

Materials

The materials used in this study were the dialogue and conversation sections included in the two series of EFL course books. "Prospect 1" and "Prospect 2" are newly developed textbook series for national purposes taught in Iranian junior high school. Prospect 1 is one of the series English textbooks for school children is designed to help the children in the first year of secondary school to learn English for communication. "Prospect 1" authored by Alavi, Ananisarab, Forozandeh Shahraki, Ghorani, Khadir Sharabian and Kheirabadi was published in 2013. "Prospect 1" has 8 main units and 4 reviewing units followed by a photo dictionary. Each main unit is divided into three parts: the first part is listening and speaking that starts with a dialogue and continues with pair/group practices; the second part is writing skill. In this part alphabet letters and the relationship between the sounds of the letters and their forms and different allophones of one sound are taught to the learners; the third part is role play/your conversation.

"Prospect 2" authored by Alavi, Forozandeh Shahraki, Nikoopoor, Khadir Sharabian and Kheirabadi was published in 2014. The book includes work book, student book, audio CD and teacher's guide. It consists of 7 main units and 4 reviewing units followed by a photo dictionary. These series are based on all language skills (listening, speaking, reading and writing). They assign a different role to teacher and learner in contrast with traditional books. The role of teacher in these textbooks is designed based on the communicative approaches and therefore; the role of the teacher is considered as a co-worker and an assistant in language learning process and the role of learner changes from implementation of instructor's instruction to an active role in every aspect of language learning process.

Instruments

The instrument used in this study to analyze the materials was Searle's (1979) model of classifying speech acts: Commissives, Expressives, Assertives, Directives, and Declarations. Each of these categories consists of some subcategories. As it can be seen in the Table 1, the category of directives includes several sub-categories like inviting, suggesting, daring, defying, ordering, requesting, commanding, advising, recommending, and challenging.

Table 1: Searle's (1979) Classification of Speech Acts

Category	Sub-categories
Assertives	stating, boasting, complaining, claiming, reporting, asserting, describing, announcing, insisting, guessing, forecasting, predicting, introducing, calling, complimenting concluding, reasoning, hypothesizing, telling, insisting, or swearing
Directives	requesting, warning, inviting, questioning, ordering, commanding, advising, reassuring, summoning, entreating, asking, directing, bidding, forbidding, instructing, begging, recommending, suggesting, daring, defying, and challenging.
Expressives	Greeting, thanking, apologizing, regretting, commiserating, congratulating, condoling, deploring, welcoming, surprising, blaming, praising.
Commissives	Promising, vowing, offering, threatening, refusing, pledging, intending, vowing to do or to refrain from doing something
Declarations	Declaring, christening, firing from employment, resigning, dismissing, naming, excommunicating, appointing, sentencing, blessing, firing, baptizing, and bidding.

Data Collection Procedure

No one can deny the role of dialogues and conversations IN providing situations for speakers to make use of different speech acts in their speech. Guerin (2004, p. 6) stated that “to have an appropriate sample size in Conversation Analysis, we need to analyze samples of “natural” conversations based on the topics, or recall of such conversations if necessary, and find out how the topics are being used in those conversations: are they jokes; are they serious of issues in which the speakers try to persuade each other; are they to entertain the group listening; are they gossiping devices?” Therefore, in order to obtain a measure regarding speech acts, the conversation parts in both textbooks of *Prospect 1* and *Prospect 2* were examined. Though in qualitative research, analyzing 10% of the whole population is considered enough, the researchers decided to analyze all the conversation available in both textbooks. The conversations were different both in length and in number. Prospect 1 and 2 consists of various conversations, some lengthy and some short dialogues. Nevertheless, all conversations and dialogues were investigated in search of speech acts based on Searle's (1979) classification of speech acts.

Data analysis procedure

For the qualitative section of the study, the main statistical analysis used is frequency to indicate the distribution level of speech acts. No special statistical analyses have been required there due to its qualitative nature. Thus, the entire analysis was carried out by careful inspection of the conversations included in the two books of Prospect 1 and prospect 2 on the basis of Searle's (1979) speech acts. The purpose of this observation was to find out the types of speech acts involved in the contents of the dialogues. Fundamentally, some simple statistical analyses like counting the frequencies of the occurrence of each sub-category of Searle's (1979) speech act taxonomy as well as their percentages presented in different tables were done.

Furthermore, the chi-square test was reported in order to better illustrate the distribution levels of these pragmatic variables. Therefore, a chi-square test has been applied to manifest whether the distribution level of speech acts is equivalent or not. The frequency of each speech act each textbook was counted and calculated. The main focus of the researchers was on the content analysis of the textbook through which they examined the contexts of using speech acts in these textbooks.

As it is mentioned, after the types of speech acts in the two groups were all determined, the frequency of occurrence and the percentage for each category were determined to answer the first two questions raised in this research. Finally, the reliability of the results was checked by two independent raters, and inter rater reliability was calculated.

On the quantitative part of the study Chi-square formula was applied to make a comparison between the distribution rate of the speech act types within each book and answer the third and fourth research questions.

RESULTS AND DISCUSSION

Analysis of Speech acts in Prospect one

In this section, all the dialogues of the abovementioned textbooks were scrutinized in terms of Searle's (1979) speech act category. The results which revealed some significant findings are presented in this section. The codification of the dialogue in the first lesson is presented here as an example.

Lesson one (sample)

1. Shayan: Mr. Chaychi, this is my cousin Sam. (*Assertives: introducing*) He speaks French, English, and a little Persian. (*Assertives: informing*).
2. Teacher: Oh, (*Expressives: praising*) nice to meet you, Sam. (*Expressive: greetings*)
3. Sam: Nice to meet you, too. (*Expressive: greetings*)
4. Teacher: Are you from Iran? (*Dirrectives: requesting inf.*)
5. Sam: Yes, I'm originally Iranian, (*Assestrives: admitting*) but I live in France. (*Assertives: informing*)
6. Teacher: Welcome to our class. (*Expressives: welcoming*). How do you like it in Iran? (*Dirrectives: requesting inf.*)
7. Sam: Iran is great! (*Assertives: describing*). I love it. (*Assertives: stating*) It's a beautiful country. (*Assertives: claiming*)

The frequency, mean and percentages related to the speech act use in Iranian EFL textbooks prospect one are summarized in Table 2.

Table 2: Descriptive statistics of speech act categories in Prospect One

Speech act Category	Frequency	mean	percentage
Assertive	33	6.4	40.5%
Directive	30	6	37.97%
Expressive	14	2.8	17.72%
Commissive	3	0.6	3.79%
Declarative	0	0	0%
Total	80		

According to Table 2, assertive speech act (mean= 6.4; percentage =40.5) was found as the most frequently used speech act in *Prospect one* followed by directive speech act (mean=6; percentage=37.97), Expressive (mean=2.8; percentage =17.72), and Commissive speech acts (mean= 0.6; percentage= 3.79), respectively. Furthermore, it was found that that declaration speech acts were never used in the dialogues of *Prospect one* with mean score of 0. Analyzing all speech acts based on Searle's (1979) classification revealed the most and the least frequently used speech acts in more details.

Assertive as the most frequent category comprised 40.5 percent of the whole data, while both categories of directive and expressive occurred 37.97 and 17.72 percent (see table 4.1). The main body of speech acts performed in both textbook series belonged to the three categories of

assertive, directive, and expressive. The frequency of occurrence of these categories is 77, altogether. This number equals 96.19 percent of the total 80 speech acts.

Results of analysis of Speech acts in Prospect Two

The dialogues of the second book were also codified according to Searle's (1979) speech act category. The results of which revealed are presented in this section. The codification of the dialogue in the first lesson is presented here as an example.

Lesson 1 (sample)

1. Shayan: Mr. Chaychi, this is my cousin Sam. (*Assertives: introducing*) He speaks French, English, and a little Persian. (*Assertives: informing*).
2. Teacher: Oh, (*Expressives: praising*) nice to meet you, Sam. (*Expressive: greetings*)
3. Sam: Nice to meet you, too. (*Expressive: greetings*)
4. Teacher: Are you from Iran? (*Dirrectives: requesting inf.*)
5. Sam: Yes, I'm originally Iranian, (*Assestrives: admitting*) but I live in France. (*Assertives: informing*)
6. Teacher: Welcome to our class. (*Expressives: welcoming*). How do you like it in Iran? (*Dirrectives: requesting inf.*)
7. Sam: Iran is great! (*Assertives: describing*). I love it. (*Assertives: stating*) It's a beautiful country. (*Assertives: claiming*)

Table 3: Descriptive statistics of speech act categories in Prospect Two

Speech act Category	Frequency	mean	percentage
Assertive	37	7.2	41.37%
Directive	33	6	37.93%
Expressive	16	3.2	18.39%
Commissive	2	1.2	2.29%
Declaration	0	0	0%
Total	88		

As shown in Table 3 regarding speech act use in conversation sections of *Prospect Two*, assertive with the mean of 7.2 and percentages of 41.37 was found to be the most frequently used speech act. Directive (mean=6 and Percentage=37.93) was the next speech act use in the conversations. The third rank of speech act use belong to expressive (mean=3.2 and Percentage=18.39) followed by commissive speech act (mean=1.2 and Percentage=2.29) with the least frequency and percentage. Similar to the other book declarative speech acts were not found in the dialogues of Prospect Two.

Comparison of speech act within Prospect 1 and 2

To answer the second and fourth research questions of whether there are any significant differences in the distribution of each speech act in the in the dialogues of Prospect 1 and Prospect 2, two chi-square test was performed. The results of analysis for Prospect One and Two are presented in Tables 4 and 5 respectively.

Table 4: Chi-Square for Goodness of Fit of Speech Acts in Prospect One

Speech Act	Observed	Expected	Difference	Difference Sq.	Diff. Sq. / ExpFr
Assertive	33	20	13.00	169.00	8.45
Directive	30	20	10	100.00	5.00
Expressive	14	20	-6.00	36.00	1.80
Commissive	3	20	-17.00	289.00	14.45
Total					29.700

The Chi² value is: 29.7 The P-Value is < 0.001. The result is significant at $p \leq 0.05$. Table 4 shows the chi-square test of distribution of each speech act in the conversation section of the *Prospect One*. As the results reveal the chi-square value is: 29.7, and the P-Value is < 0.001. Therefore, the result is significant at $p \leq 0.05$. so as the results of chi-square test reveals the distribution of speech acts in prospect one were not equally preferred $\chi^2 = (3, N=80) = 29.70$, $p \geq 0.05$. According to the statistical conventions, the use of the chi-square tests is inappropriate if any expected frequency is below 1 or if the expected frequency is less than 5 in more than 20% of your cells. Therefore, declaration speech act whose frequency is zero is not included in chi-square test.

Table 5: Chi-Square for Goodness of Fit of Speech Acts in Prospect Two

Speech Act	Observed	Expected	Difference	Difference Sq.	Diff. Sq. / ExpFr
Assertive	37	22	15.00	225.00	10.23
Directive	33	22	11.00	121.00	5.50
Expressive	16	22	-6.00	36.00	1.64
Commissive	2	22	-20.00	400.00	18.18
Total					35.545

Based on the data in Table 5, the chi-square test of distribution of each speech act in the conversation section of the *Prospect two* reveals some interesting information. The results show that there is a significant difference among subcomponents of speech acts in prospect two $\chi^2 = (3, N=88) = 35.54$, $p \geq 0.05$. Again, according to the statistical conventions, the use of the chi-square tests is inappropriate if any expected frequency is below 1 or if the expected frequency is less than 5 in more than 20% of your cells. Therefore, declaration speech act whose frequency is zero is not included in chi-square test.

According to the points discussed in the previous research questions with regard to the types and the frequency of speech acts in the conversations, it is revealed that the conversations in the newly published Prospect series (1 & 2) have a number of significant shortcomings, such as the lack of declaration speech act, and the inequality and variation in the distribution of speech acts. To be regarded as pragmatically competent, the conversations in these two textbooks must include all types of speech acts which are all used in the real-life communications. Besides, these speech acts must be used and distributed among the conversations in such a systematic way that when being read, studied, and practiced, all types of them can be recognized by learners' and applied in their speaking performance. In other words, not only must all types of Searle's (1979)

speech acts be present in the conversations of the books, but also they must be distributed equally and at the same frequency or percentage among all of the conversations.

Furthermore, with regard to what Guerin (2004) states in terms of the type of sampling and the criterion for this sample to be analyzed, this equality in the distribution of speech acts must be on the basis of topical or thematic contexts. These contexts in these textbooks are, actually, in the same line with different units or chapters of the books, each of which deals with a particular and real-life topics or themes. One suggestion is that teachers can select the materials in the classrooms that model the real language situations. To familiarize learners with different components of communicative competence especially in the use of speech acts, some activities such as tape recordings, role-playing activities, video films, and TV shows are suggested by the researchers. Textbooks as the major source of teaching and learning process in Iranian EFL teaching settings should contain the adequate number of speech acts to promote learners' pragmatic competence. To design textbooks with sufficient number of speech acts conforming to the norms followed by native speakers of the language, EFL textbook writers should be linguistically and pragmatically competent in the target language in order to be able to incorporate the right number of speech acts in EFL textbooks. To recap, the speech acts deserve further attention when designing material and textbooks for Iranian learners of English. Therefore, these pragmatic variables, i.e. speech acts, must be distributed equally not only all over the entire conversations of these two books, but also in each one of the units, which focuses on a particular and natural theme in everyday life.

Therefore, according to what has been said up to this point, the *Prospect One* and *Two* which are claimed to have significant improvements in terms of communicative language teaching principles comparing with the previous series (*Path to English*) have serious problems with regard to the pragmatic dimension. In other words, the results of the present study revealed that the conversations in *Prospect One* and *Two* are not pragmatically competent and learners are strongly recommended to be more careful of these two beginner-level textbooks if they choose them to start improving their speaking performance through their conversations. In fact, taking a quick look at the results, one can easily recognize the above-mentioned pitfalls.

Unlike the common belief and considering the problems in syllabus design, being newly published does not guarantee the appropriateness of textbooks for language teaching programs. Similarly, this study proved that the two newly published textbooks *Prospect 1* and *Prospect 2* are not pragmatically competent and suitable for learners who now feel the need to gain communicative competence more than ever. Furthermore, the researchers thoroughly examined all conversations in the *Prospect* series and it was revealed that the series fell short of supporting the communicative competence. Owing to inequality of speech acts' distribution, the learners exposed to these textbooks might be competent in using one speech acts but unable to produce another.

This study can be of great consideration to those who claim responsibility for EFL/ESL courses and syllabus designers. In choosing or developing textbooks and other kinds of teaching materials, textbook writers need to be aware of the research findings in order to select materials

that are authentic and motivating for learners. Conversation has recently become a focus of interest for speech act theory and several proposals have been formulated concerning the possible extension of speech act theory to the analysis of conversation. There is a common sense argument shared by philosophers and linguists in favor of the possible extension of speech act theory to textbook evaluation. Speech acts are not isolated moves in communication. They appear in more global units of communication, defined as conversations or discourses. Therefore, a course book must meet a number of criteria, in order to legitimately claim the title of Communicative Language Teaching.

First and foremost, it should correspond to the learners' communicative needs. In this context, it is crucial for the syllabus designers to include a wide variety of speech acts. It seems that syllabus designers should consider the recent classification of speech acts such as requesting, inviting, complaining, apologizing, etc. in designing textbooks because it appears that these categories are universal in all languages and they deserve more attention. One possible solution would be the using of successful dialogues reflecting the sociocultural norms of the target language to increase learners' understanding of linguistic behavior of the Iranian EFL learners. The second suggestion is modifying textbook dialogues authored by the Iranian textbook writers. This study can also provide material developers and textbook writers with the necessary information regarding the pragmatic dimension of the conversation sections of these beginner-level textbooks. Textbook developers can take the pragmatic pitfalls of the conversations of Prospect 1 and Prospect 2 into consideration as a useful source to modify and revise other developing textbooks. This study recommends the developers and the editors of Prospect 1 and Prospect 2 to take the reported pragmatic shortcomings under the rigorous scrutiny so as to consider and use all types of language functions and speech acts, and to balance them to the same range or level.

CONCLUSION

This study was partly descriptive and partly comparative. In the descriptive part, it first attempted to determine the type and the number of speech acts used in two textbooks. In the comparative part, it tried to investigate if there was an equal distribution in the number and type of speech acts categories performed in the two series. Previous research proved that speech acts categories are considered as one of the universals of all languages and these categories are said to be found in all languages nearly with the same range or frequencies. The results showed discrepancies in the use of speech acts between the two series. The frequencies of speech act categories in the above mentioned textbooks were different. In this section, we have presented concluding remarks regarding the hypotheses with respect to the results. This study intended to examine the pragmatic aspect of the students' textbooks to find the availability of opportunities to teach pragmatic competence to EFL learners. The pragmatic content of newly developed English textbooks, Prospect 1 and Prospect 2 was investigated to examine the types and frequencies of speech acts used in the dialogues. According to the points discussed in the previous research questions with regard to the types and the frequencies of speech acts in the conversations, it is revealed that the conversations in the newly published Prospect series (1 &2) have a number of significant shortcomings, such as the lack of declaration speech act, and the inequality and variation in the distribution of speech acts. To be regarded as pragmatically competent, the

conversations in these two textbooks must include all types of speech acts which are all used in the real-life communications. Besides, these speech acts must be used and distributed among the conversations in such a systematic way that when being read, studied, and practiced, all types of them can be recognized in learners' speaking performance. In other words, not only should all types of Searle's (1979) speech acts be present in the conversations of the books, but also they should be distributed equally and at the same frequency or percentage among all the conversations.

ABSTRACT

This study aimed to investigate and explore the motivational strategies employed by good language learners and examine students' differences in using the most-highly used motivational strategies with respect to the gender of the participants. The procedures were done with participation of twenty male and female (10 male and 10 female) students majoring Teaching English Foreign Language at Islamic Azad University of Sanandaj, Iran. The researcher, having divided the students into two groups, used focus group interview. The researcher acting as a facilitator guided the groups based on a predetermined set of topics. The result of quantitative and qualitative investigations and calculations showed that the learners mentioned 158 cases of motivational strategies categorized into 17 factors. These factors were both integrative, such as engaging in problem-solving activities, enjoying success, positive attitudes towards L2 speakers as well as increasing self-esteem and instrumental, like finding job, getting higher degrees, and promoting in current work. Also, the most commonly cited factors from the most to the least included pursuing studies (12.7%), finding good job (11.4 %), spending more time (10.1 %), engaging in problem-solving activities (10.1 %), and getting higher marks (9.5 %). The difference between the five most frequently-used motivational strategies with respect to the gender of the participants who were good language learners showed that: a) female students were more motivated in learning English, b) as for finding good job, male students were more motivated to learn English, c) as for spending more time, engaging in problem-solving activities and getting high grades, the difference between male and female students was not significant.

KEYWORDS: Motivational Strategies, Good Language Learner

INTRODUCTION

Traditionally, research on L2 motivation has focused on the social-psychological perspectives that create interest in learning and facilitate in sustaining it among which factors such as "integrative motivation" and "intrinsic motivation" (Gardner & Lambert, 1972, p. 132) were more prominent. Later on, the impact of motivation was examined from cognitive psychology

perspectives and motivation was regarded as “intrinsic motivation” (i.e., doing something as an end in itself) and “extrinsic motivation” (i.e., doing something as a means to some separable outcome) (Ryan & Deci, 2000, p.41).

Nevertheless, motivation, itself, has not been sufficient since there is also another aspect to motivation that every learner most likely has encountered at some point: Motivational strategies. Similar to research carried out on learning strategies, Dornyei (2001) underscored the use of discussion and joint experience in raising learners’ awareness of the strategies. As a matter of fact, it is rather difficult to theorize the motivational strategies. It can be taken as a driving force that energizes human behavior and orients it for better performance.

It has already been documented that motivation performs an effective role in second language acquisition. A sheer number of research explored L2 motivation, examining its complex nature and the way in which it influences the L2 learning process (Clément, 1980; Gardner, 1979; Oxford & Shearin, 1994; Ushioda, 2009, to name but a few). So there is a benefit to such sorts of research works because of linking theory to practice by transferring motivational theories into techniques and strategies that can be applied by EFL teachers in the classrooms. The present study set out to explore and examine motivational strategies from the perspectives of EFL student in the context of Iran.

During the last five decades, much research has been conducted in the field of L2 motivation and its relevance to the success in L2 learning (e.g., Dörnyei, 2005; Gardner, 1985). The primary studies of L2 motivation are influenced by the work of Gardner and Lambert (1959, 1972), focusing on the social psychological approach. A key issue to this perspective is the view of L2 motivation as a determining factor which leads to L2 achievement. A noteworthy development in L2 motivation research occurred in the 1990s during which research in the field expanded to incorporate cognitive and educational views of L2 motivation (e.g., Noels, Clément, & Pelletier, 1999; Oxford & Shearin, 1994; Ushioda, 1996a). During this time, research into L2 motivation emphasized the teacher’s role in motivating students as well as the importance of the learning environment.

Since the current study is to focus on the contribution of motivational strategies to good language learners, it should be mentioned that research in the area of characteristics of good language learners has been the home of choice for SLA researchers since mid-1970. According to Griffiths (2008), in conducting such research, both learning and learner variables should be taken into account. However, one topic that has not been touched in this domain is the relationship between the characteristics of good language learner and the use of motivational strategies. It is evident that good language learners are motivated students.

BACKGROUND AND OBJECTIVES OF THE PRESENT STUDY

One of the key factors to determine success in learning a foreign language is Learner’s motivation. Motivation researchers suggested that motivational strategies that learners’ motivation toward learning a foreign language can be effectively influenced by using teachers

(e.g., Banya & Cheng, 1997; Dörnyei, 1994a; Fives & Manning, 2005; Stipek, 1996). In 2001, Dörnyei demonstrated the motivational strategies in his text, *Motivational Strategies in the Language Classroom*. Creating the basic motivational conditions, generating initial motivation, maintaining, and protecting motivation and rounding off the learning experience (encouraging positive self-evaluation) are the groups of motivational strategies. Based on this idea, the concept of all these strategies is teacher behavior and beliefs significantly affect students' motivation for learning a foreign language. For this reason, an important aspect of motivation toward learning a foreign language is strategies in motivating language learners.

Therefore, motivational techniques have been constructed and summarized in several research studies for teachers in classroom application (e.g., Alison & Halliwell, 2002; Brown, 2001; Chambers, 1999; Williams & Burden, 1997). Moreover, several relevant motivational components into a multilevel are integrated by Dörnyei (1994a), motivational construct in second-language is based on understanding the second language motivation from an educational view. He made a practical motivational strategy list based on these components comprised of thirty strategies for helping language teachers better understand what motivates their students in the second language classroom. The result shows that not only motivational strategies can influence learners' motivation, but also that teachers play significant roles to help learners establish self-confidence and achieve successes that can crucially influence motivation (Fives & Manning, 2005; Gardner, Masgoret, Tennant & Mihic, 2004).

Accordingly there is a severe lack of research on the determining role of L2 learner's motivational strategies in terms of the new perspectives of motivation including the social and cultural context of motivation in promoting good language learners. The problem lies in the fact that most of the students just focus on cognitive aspects and strategies to improve their English, and they underrate the role of emotional factors in their success. Likewise, research on L2 motivation deals with what makes a person want to learn a second language and what maintains him or her interested in learning. However, motivation to learn a second language is a complex construct, taking into account that language is always socially and culturally bound and hence, quite different from other school subjects (Dörnyei, 2001). Particularly, to gain mastery over a L2 is also a social event that is unavoidably accompanied by some elements of the L2 culture.

The current study, as an initial attempt, tries to identify the motivational strategies that learners employ to function well in English language, and in so doing, focus group interview is the focus of this study to figure out the relevant data. Having identified the motivational strategies, the researcher explores the most influential strategies used by good language learners. What mainly prompted this study was the novelty of this particular area of research, that is, the relationship between motivational strategies and good language learner. Based on Vygotskyian Sociocultural theory of mind (1978), higher order cognitive functions are internalized from social interaction with more competent others. Therefore, using group discussion and interaction, finding out the strategies employed by learners who are successful in learning a second language would lead to better understanding of the strategies that play significant roles in learning. L2 motivation is needed to help learners expend and persist in their effort in an L2 learning process which might extend over a long period of time.

Therefore, this study investigates the motivational strategies which EFL learners use to promote their learning process in Iranian context. In particular, it considers the perceptions of EFL students about different motivational strategies. This definition assumes that teachers can apply some motivational strategies in order to raise learners' motivation.

RESEARCH QUESTIONS

In order to examine the application of motivational strategies by successful L2 learners, the current study set out to provide answers for the following questions:

1. What factors do determine the motivational strategies employed by good language learners?
2. What is the frequency and order of importance of the motivational strategies employed by good language learners?
3. Are there any significant differences between motivational strategies and good language learners with respect to the gender of the participants?

The first research question of the present study mentioned above is a qualitative question; therefore, no research hypothesis is formulated for it. However, the following null hypotheses were formulated for the two quantitative questions (i.e., the second and third research questions) of the current study:

H02: There are no significant differences between motivational strategies and good language learners with respect to the gender of the participants.

THEORETICAL FRAMEWORK

The present study follows two theoretical frameworks to explore and examine the association between the motivational strategies and good language learners: 1) "Motivational strategies" proposed by Dornyei (2005) and "characteristics of good language learners" suggested by Rubin and Thomson (1983, cited in Nunan, 1999). The guidelines suggested by Dornyei (2005) are factors based on which the individual's goal-related behavior are promoted. The present study followed the guidelines proposed by Dornyei (2005) regarding the L2 Motivational Self System, including the following three components:

- (1) Ideal L2 Self, which is the L2-specific facet of one's 'ideal self': if the person we would like to become speaks an L2, the 'ideal L2 self' is a powerful motivator to learn the L2 because of the desire to reduce the discrepancy between our actual and ideal selves. Traditional integrative and internalized instrumental motives would typically belong to this component.
- (2) Ought-to L2 Self, which concerns the attributes that one believes one ought to possess to meet expectations and to avoid possible negative outcomes. This dimension corresponds to Higgins's ought self and thus to the more extrinsic (i.e. less internalized) types of instrumental motives.
- (3) L2 Learning Experience, which concerns situated, 'executive' motives related to the immediate learning environment and experience (e.g. the impact of the teacher, the curriculum, the peer group, the experience of success). This component is conceptualized at a different level

from the two self-guides and future research will hopefully elaborate on the self-aspects of this bottom-up process.

Since the dependent variable in this study is good language learner, the present study also pays attention to the perceptions of good language learners regarding the reasons that they offer for their successes and their attributions for their successes. The theoretical framework that frames the characteristics of good language learners for the present study refers to Rubin and Thomson's (1983, cited in Nunan, 1999, p. 57) theory of efficient including the following features: 1) finding their own way, 2) organizing information about language, 3) being creative and experiment with language, 4) making their own opportunities, 5) finding strategies for getting practice in using the language inside and outside the classroom, 6) living with uncertainty and develop strategies for making sense of the target language without wanting to understand every word, 7) using linguistic knowledge, including knowledge of their first language in mastering a second language, 8) letting the context (extra-linguistic knowledge and knowledge of the world) helps them in comprehension, 9) learning production techniques (e.g., techniques for keeping conversation going), and 10) learning different styles of speech and writing and learn to vary their language according to the formality of the situation.

Therefore, The aims of the study were to 1) identify, analyze and categorize the motivational strategies employed by good language learners at Islamic Azad University of Sanandaj, 2) tabulate the frequency and order of the most highly used motivational strategies, and 3) investigate the association between motivational strategies and good language learners in terms of the most frequently-cited factors emerged from L2 learners' responses. The researcher tried to collect the relevant data regarding the major variables including good language learner characteristics as dependent variable, and motivational strategies as independent variable, and used relevant statistical procedures to carry out his research work. To conduct the interview, the researcher followed Semi-structured focus group interview.

METHODOLOGY

Participants

The participants in this study were 20 male and female EFL students majoring in TEFL at Islamic Azad University of Sanandaj. To select the students, first, the researcher chose those students who were between 6th and 8th (junior & senior) semester since they have had enough experience of engaging with learning English language. Then, he went for those students whose average points met certain criteria, that is, they had the required mean score that was 16+ to confirm the sample homogeneity. Following this, the researcher distributed Nelson Test of Proficiency to them and, finally, 20 students were selected based on their higher scores on the test. The students were willing to take part in the study and they were divided into two groups including 10 male and 10 female students. The number of students in each group was small enough to give everyone the opportunity to express an opinion and simultaneously, large enough to provide diversity of opinions. The researcher named the two groups as Group A (including male students) and Group B (including female students).

Instrumentation

The major instrument used in this study was “focus group interview” to collect data from multiple individuals simultaneously.

The researcher used “semi-structured type of focus group” (Dornyei, 2007, p. 144) to conduct the research which is the most common format because it included three major questions (See appendix A) posed by the researcher rather than giving the participants freedom to discuss some broad topics.

Procedures

To collect data for the study concerning the extent to which students employ the motivational strategies introduced by Dornyei (2001), the researcher, having divided the students in two groups, used focus group interview since a focus group is a group interview of approximately six to twelve people who share similar characteristics or common interests. The researcher acting as a facilitator guided the group based on a predetermined set of topics. She created an environment that encouraged participants to share their perceptions and points of view.

The researcher held four sessions for each group separately in a quiet classroom and each session and since focus groups typically last about 60 minutes, she tried to pose the questions and leading hints in a way that the session did not last more than around 60 minutes. The researcher guided the group through the discussion and kept the group focused on the topics for discussion. She also asked one of her friends to act as the note-taker and recorder during the sessions. The note-taker was just an observer and did not interact with the group. The notes included a sense of what each person said; identifying how comments were said; and recording when transitions occurred from one topic to the next. She was also responsible for recording the focus group discussion. The recordings were then transcribed by the researcher to figure out and categorize the common themes elicited from students' responses.

To collect the data from students' response three alternatives were possible. Indeed, Focus group data can arise from one of the following three types: individual data, group data, and/or group interaction data (Duggleby, 2005). Focus group theorists disagree as to the most appropriate unit of analysis for focus group data to analyze (i.e., individual, group, or interaction). Some theorists believe that the individual or the group should be the focus of the analysis instead of the unit of analysis (Kidd & Marshall, 2000). However, most focus group researchers use the group as the unit of analysis (Morgan, 1997). The researcher of the present study also used the group as the unit of analysis since it also included the interaction between group members. The researcher believed that out of interaction themes arose that was more than the individual data. By doing so, the researcher coded the data and presented emergent themes.

The researcher provided a focus group guide for herself which included a series of questions and prompts to use during the interview sessions. She asked the relevant questions of the group and allowed time for participants to respond to each other's comments. The focus group guide served as a “road map” and memory aid for the facilitator. The same focus group guide was used for each focus group.

To analyze the data gathered from students' responses and interactions, the researcher first explored different techniques used to analyze the data. Indeed, the frameworks of Leech and Onwuegbuzie (2007) suggest several qualitative analysis techniques that can be used to analyze focus group data. Specifically, the analytical techniques that lend themselves to focus group data are constant comparison analysis, classical content analysis, keywords-in-context, and discourse analysis (for a review of analytical techniques, see, for example, Leech & Onwuegbuzie, 2007).

The researcher of the present study made use of both constant comparison analysis and classical content analysis to analyze data. With reference to constant comparison analysis, she followed the three major stages of the constant comparison analysis (Strauss & Corbin, 1998). During the first stage (i.e., open coding), the data were chunked into small units. The researcher attached a descriptor, or code, to each of the units. Then, during the second stage (i.e., axial coding), these codes were grouped into categories. Finally, in the third stage (i.e., selective coding), the researcher developed one or more themes expressing the content of each of the groups.

With regard to classical content analysis, the researcher created smaller chunks of the data, placing a code with each chunk. However, instead of creating a theme from the codes (as with constant comparison analysis), with classical content analysis, these codes then were placed into similar groupings and counted. The researcher, first, identified whether each participant used a given code, then, she assesses whether each group used a given code, and finally, she identified all instances of a given code. The researchers not only provided information regarding the frequency of each code (i.e., quantitative information) but supplemented these data with a rich description of each code (i.e., qualitative information), which would create a mixed methods content analysis.

RESULT AND FINDING

Results from Focus Group Interview with Good Language Learners

To explore the first research question, the researcher employed Focus Group Interview, following the guidelines proposed by Leech and Onwuegbuzie (2007) through which initially the researcher acting as a facilitator posed open-ended questions and closed-ended questions in English language and let students express their ideas while her friend acting as note-taker, wrote down the verbal and non-verbal communication data and she also recorded their voices using audio-tape recorder. The researcher finally came up with common themes employing the techniques of open-coding, axial-coding and selective coding to analyze data.

The researcher started the interview with demographic question as follows: Would you please introduce yourself one-by-one in brief to the group, and immediately asked the questions already constructed to follow a semi-structured focus group interview. Here are the questions and some common statements elicited from the two groups including Group A (10 male students) and Group B (10 female students).

Question 1:

1. Could you talk about the characteristics of a good language learner?

The group interviews obtained from transcribing the responses out of group analysis revealed the following findings:

Group A:

Good language learners have self-esteem and they are confident. They practice as much as possible. They try their best to learn in the classroom and concentrate on whatever they study. A good language learner participates actively in class discussion. Students should rely on themselves not the teacher and a good language learner should be competent in listening skills more than anything else. Moreover, good language learners attribute their success to themselves not significant others, and their success is the result of their effort not their intelligence.

Group B:

Good language learners are willing to attend the classes. They pay attention to details more. They think that a good language learner should speak fluently and has good accent. They write their homework well. They should memorize vocabulary and grammatical points. They are more reflective than impulsive, reflecting on what they have learned and on their lectures. They like to be checked by the teachers and they attribute their success to significant others, not their own effort. They have good marks.

Question 2:

2. To what extent does motivation determine your success in learning English?

Group A:

Motivation is a key factor in successful language learning because if we have possessed motivation, we could put away the obstacles and always tries to learn more. When we are motivated, we spend more time to learn. A good language learner has a driving force and will not leave his studies if he finds the task difficult. When we see that we are developing, we expect ourselves to progress more and this is a good indication of having motivation. We not only study our lessons but also learn from outside textbooks and films.

Group B:

To a great extent, learning depends on our motivation. Motivation increases our desire to learn English and become successful learners. Sometimes, some students say that if I fail to pass the final test in this or that course, I will give up my studies. Or, there are students who say that what is the difference between getting 12 or 20? We believe that they have not enough motivation and they think about how much they get at the end of the term, but, we think about both how much we get at the end of the term and how much we learned from the course at the end of the term. We like to learn more vocabulary because we are interested in learning them. Motivation helps us enjoy our learning. Indeed, when the teacher or our family praises us, we feel happy and when we see our good course grades, we become excited.

Question 3:

3. What motivational factors do help you sustain in learning English?

Group A:

We like to promote in works (teaching in private institutes) in English language. Learning English language increases our self-confidence and we feel satisfaction, say, when we see that we are watching an original film and can understand the films. We like to find the answer to the questions ourselves when listening to a track and we like to have teacher but as a mediator who provides hints for us not giving the answer at once. Indeed, we like to engage in problem-solving activities. We do not need to have forces from outside to study; we are worried if we find a good textbook about English language skills or components unread. We also learn English language to continue our studies and find a good job. We like to go abroad and communicate well with other people through English language. Motivation increases self-esteem and self –efficacy. When we are motivated, we participate actively without worrying about our mistakes.

Group B:

We like to pursue our studies. We are studying with together and we have a calm environment and we support each other in our lessons and our homework. We learn better in classes where the teacher does not cause stress for us. When we speak in English like native speakers or we write an E-mail in English language, we feel happy. We have a positive attitude towards English culture and try to learn the good points from their cultures; for example, to be honest, to be frank, and to be lively. We like to learn both linguistically and non-linguistically, such as performing well on the tests and paying attention to cultural values. Moreover, educated people are expected to know English language.

Frequency and order of motivational strategies

To find an answer for the second research question, the researcher, first, made use of three stages of coding. He chunked the data into small units during the stage of open coding. Then, he attached a code to each of the units, and these codes were grouped into categories during the stage of axial coding. Finally, the researcher developed one or more themes expressing the content of each of the groups in the stage of selective coding. In the last stage, these codes then were placed into similar groupings and counted. The number and frequency of the categories that motivated the students to learn English were tabulated by the researcher using Descriptive Statistics. Therefore, the first research hypothesis with regard to the frequency of motivational categories was rejected.

Altogether, 158 cases were elicited from focus group interview and they were categorized into 17 factors. The results from the SPSS Software for Windows version 21: 00 yielded interesting frequency. The most commonly cited factors included pursuing our studies (12.7%), finding good job (11.4 %), spending more time (10.1 %), engaging in problem-solving activities (10.1 %), and getting higher marks (9.5 %).

The relationship between the most frequently cited motivational strategies and good language learners with respect to gender

Pursuing studies

Table 1: The number of cases pursuing their studies

		pursuing studies		Total
		Mentioned	not-mentioned	
Gender	Male	6	14	20
	Female	14	6	20
Total		20	20	40

As displayed by Table 1, the number of cases for pursuing studies mentioned by males was 6 and by female were 14.

Table 2: Chi-square test for pursuing studies

	Value	df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	6.40a	1	.01		
Continuity Correctionb	4.90	1	.02		
Likelihood Ratio	6.58	1	.01		
Fisher's Exact Test				.02	.01
Linear-by-Linear Association	6.24	1	.01		
N of Valid Cases	40				

a. 0 cells (.0%) have expected count less than 5. The minimum expected count is 10.00.

b. Computed only for a 2x2 table

To see if the difference between the two categorical variables is significant, we refer to the next table. The main value that should be checked in from the output is the first chi-square value which is presented in Table 3, headed Pearson Chi-Square. In the table, the value is 6.40, with an associated significance level of .00 (this is presented in the column labeled Asymp. Sig. (2-sided)). To be significant the Sig. value needs to be .05 or smaller, and in this case, the value of .01 is less than the alpha value of .05; thus, it is concluded that the result is significant. This means that the difference between male and female students with reference to pursuing studies is significant; female students are more motivated to learn English language in order to pursue their studies.

Finding good job

Table 3: The number of cases for finding good job

		finding good job		Total
		Mentioned	not-mentioned	
Gender	Male	12	6	18
	Female	6	12	18
Total		18	18	36

The number of cases discussed by the good language learners for finding good job with reference to male students was 12 and the number of cases for female students was 6. Out of 20 students, 18 students mentioned it in their talks (See Table 3).

Table 4: Chi-square test for finding good job

	Value	Df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	4.0a	1	.04		
Continuity Correctionb	2.7	1	.09		
Likelihood Ratio	4.0	1	.04		
Fisher's Exact Test				.09	.04
Linear-by-Linear Association	3.8	1	.04		
N of Valid Cases	36				

a. 0 cells (.0%) have expected count less than 5. The minimum expected count is 9.00.

b. Computed only for a 2x2 table

With reference to Table 5, the results demonstrated that the difference between the two categorical variables for finding good job is significant. The main value obtained from the chi-square is 4.00, with an associated significance level of .04. The significant value is .04 which is less than the alpha value of .05, so that it is concluded that the result is significant. This means the difference between male and female students with reference to finding good job is significant; male students are more motivated to learn English language in order to finding good job.

Spending more time

Table 5: The number of cases for spending more time

		spending more time		Total
		Mentioned	not-mentioned	
Gender	Male	9	7	16
	Female	7	9	16
Total		16	16	32

As shown in Table 5, the number of cases discussed by the good language learners for spending more time with reference to male students was 7 and the number of cases for female students was 9.

Table 6: Chi-square test for spending more time

	Value	Df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	.50a	1	.48		
Continuity Correctionb	.12	1	.72		
Likelihood Ratio	.51	1	.47		
Fisher's Exact Test				.72	.36
Linear-by-Linear Association	.48	1	.48		
N of Valid Cases	32				

a. 0 cells (.0%) have expected count less than 5. The minimum expected count is 8.00.

b. Computed only for a 2x2 table

As for spending more time, the results demonstrated that the difference between the male and female students is not significant. Indeed, this time, the main value obtained from the chi-square is .50. The significant value is .48 which is larger than the alpha value of .05; thus, the result is not significant. This shows that both male and female students spend more time for studying

appropriately in the same amount. This means that the difference between male and female students with reference to spending more time is not significant. This shows that both male and female students spend time for studying appropriately in the same amount (See Table 6).

Engaging in problem-solving activities

Table 7: The number of cases for engaging in problem-solving activities

	engaging in problem-solving activities		Total
	mentioned	not-mentioned	
Gender male	8	8	16
female	8	8	16
Total	16	16	32

As displayed by Table 7, the number of cases engaging in problem-solving activities mentioned by males and females was the same, that is, male students mentioned it 8 times and female students mentioned it 8 times.

Table 8: Chi-square test for engaging in problem-solving activities

	Value	Df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	.00a	1	1.00		
Continuity Correctionb	.00	1	1.00		
Likelihood Ratio	.00	1	1.00		
Fisher's Exact Test				1.00	.63
Linear-by-Linear Association	.00	1	1.00		
N of Valid Cases	32				

a. 0 cells (.0%) have expected count less than 5. The minimum expected count is 8.00.

b. Computed only for a 2x2 table

Regarding engaging in problem-solving activities, the results showed that the difference between the male and female students is not significant. Indeed, this time, the main value obtained from the chi-square is .00. The significant value is 1.00 which is larger than the alpha value of .05; thus, the result is not significant. This means that the difference between male and female students with reference to engaging in problem-solving activities is not significant (See Table 8).

Getting good grades

Table 9: The number of cases for getting high grades

	getting high grades		Total
	mentioned	not-mentioned	
Gender male	6	9	15
female	9	6	15
Total	15	15	30

The number of cases discussed by the good language learners for getting high grades with reference to male students was 6 and the number of cases for female students was 9.

Table 10: Chi-square test for getting high grades
Chi-Square Tests

	Value	Df	Asymp. Sig. (2-sided)	Exact Sig. (2-sided)	Exact Sig. (1-sided)
Pearson Chi-Square	1.20a	1	.27		
Continuity Correction ^b	.53	1	.46		
Likelihood Ratio	1.20	1	.27		
Fisher's Exact Test				.46	.23
Linear-by-Linear Association	1.16	1	.28		
N of Valid Cases	30				

a. 0 cells (.0%) have expected count less than 5. The minimum expected count is 7.50.

b. Computed only for a 2x2 table

Regarding getting high grades, the results showed that the difference between the male and female students is not significant. Indeed, this time, the main value obtained from the chi-square is 1.20. The significant value is .27 which is larger than the alpha value of .05; thus, the result is not significant. This means that the difference between male and female students with reference to getting high grades is not significant (See Table 10).

Discussion

The results of the present study are mostly in line with previous research conducted in Iran (e.g., Dastgheib, 1996). Iranian people usually learn English in order to enter prestigious universities and thereby proceed to the highest levels of education and strata in their society (Sadeghi & Maghsudi, 2000). They also have a tendency to study English in order to live and study abroad and get access to rich resource as well as get familiar with cultural aspects of western societies (Tagughi, Magid & Papi, 2009). On the contrary, the results of the present study was not in line with what Matin (2007) found in the context of Iran. Matin (2007) examined the motivational characteristics of university students in Tehran. The results of the study indicated that the participants did not differ in terms of their general orientation to learn English. Indeed, the students were motivated instrumentally and had integrative forces. The knowledge promotion and employment were the highest and lowest factors on the instrumental scale, and interest in the English language ranked the highest and interest in English culture ranked the lowest on the integrative scale.

In sum, based on the findings of the present study and similar findings with regard to motivational forces in the context of Iran, it is obvious that good language learners tend to have prestigious social status in the classroom and in the society. Norton (2000, p. 10) refers to "investment" according to which learners invest in learning a new language so that they can improve their cultural perspectives, their conceptions of themselves and their desires for the future. Indeed, they want to improve their professional identity in the educational communities of practice.

CONCLUSION

Based on the findings, major conclusions can be drawn from the present study. Firstly, the line research on motivational strategies in the past two decades is not country-specific because similar pattern has been found in some other countries like Hungary and Japan (Dornyei, 2005). This confirms the fact that motivational research has external validity. Secondly, the findings highlight the fact that both integrativeness and instrumentality are important to become good language learners in the context of Iran. Instrumentality can be classified into three major constructs including continuing studies and employment, and integrativeness can be classified into two major constructs entailing spending more time and problem-solving strategies.

The kind of data elicitation in this study was focus group interview based on which interaction and discussion between good language learners confirmed the content validity of the categories emerged and cultural differences were taken into consideration. Although the two groups selected for this study were homogeneous based on their proficiency, the findings revealed interesting facts regarding the gender of the participants. As an example, female students have greater tendency than male students to continue their studies. It is evident today in our universities that female students at MA and PhD levels outnumber male students; however, male students are worried about finding job because of socio-economic factors to be able to afford their future lives and for this reason, the male students outnumber female students in this respect. There are some shared discourses among the individuals, that is, everyone likes to spend more time and learn English better or have a good job. Motivation is the gate for expectancy of success for them, that is to say, those who see their progress, promote in learning since success increases motivation and self-esteem. A critical principle to the maintenance of motivational strategies is that motivation should emerge from the within, that is, from the learner rather than controlled by the teacher.

ABSTRACT

This study investigates the impact of visual scaffolding on reading comprehension of impulsive and reflective young learners. A group of 110 was chosen randomly out of 200 elementary 11-13 year-old students from Kish Institute of Science and Technology, Shiraz, Iran. They were given a KET-for-schools test to choose a homogenous group of 80 elementary students. Then a Persian version of Impulsivity Subscale of Barratt's Impulsiveness Questionnaire (BIS-11) was given to students to divide the participants into two groups of Impulsive and Reflective. A KET-for-school test (reading part) was given to all participants as pre-test. Students, then, were assigned to three groups of 25, 25, 30, two experimental groups of 25, one impulsive and other reflective students and a control group of 30. Impulsive and reflective groups were taught using visual instructional scaffolding during 12 sessions. Every session, students were given instructions and were exposed to modeling in order to retell a story, to discuss, to find a solution for a proposed problem, to illustrate data which is driven from a video on a diagram, flowchart or map, to do puzzle while control group received no treatments. A KET-for-school test (Reading part) was set up as post-test to see whether or not teacher's visual instructional scaffolding makes significant impacts on reading comprehension of impulsive and reflective students. It was obviously observed that utilizing the techniques of visual scaffolding has an effect on students' reading comprehension. Moreover the effect of it on reflective students was more than impulsive ones. The analyses of this study indicates that the importance of modeling and teachers' awareness of students' learning style are clearly recognized in young learners classes.

KEYWORDS: Impulsivity, Reading Comprehension, Reflectivity, Visual Scaffolding

INTRODUCTION

As students themselves bring a certain wide range of learning styles, teachers, either consciously or unconsciously, select methods that offer ways of approaching desired language learning. Kneefe (1979, p.4) defined a learning style as "Cognitive, affective, and physiological traits that are relatively stable indicators of how learners perceive, interact with, and respond to the learning environment" while Oxford, Holloway and Horton define it as a whole range of social and affective factors, too. Students' learning styles is influenced by their previous learning experiences, their culture and the society they live in.

To answer why teachers should be aware of students' different learning styles, Sue Davidoff and Owen van den Berg (1990) suggest four important steps: plan, teach / act, observe and reflect.

- Students learn better and more quickly if the teaching methods used match their preferred learning styles.
- As learning improves, so too does self-esteem. This has a further positive effect on learning.
- Students who have become bored with learning may become interested once again.
- The student-teacher relationship can improve because the student is more successful and is more interested in learning.

On the other hand, one of the techniques that could be used to enhance language learning is called scaffolding.

Visual scaffolding is a strategy for teaching English language learners (ELLs) that utilizes drawings, photographs and other visuals in order to help students to better understand the language used in each lesson (Herrell, 26). This strategy encourages active involvement from all students in each lesson. Using methods and resources that add context to the language that a student is learning, such as props, gestures and pictures, contributes to that child's language acquisition and ultimately to the production of new language. Diaz-Rico and Weed (220), and Ovando, Collier, and Combs (2003), believe that teachers who constantly use scaffolding strategies, including visuals and graphics, to assist English learners in multiple areas of learning, are supporting their students in making significant achievements in comprehension of both academic English and curriculum content. The teacher only attempts to help the student with tasks that are just beyond his current capability. "Scaffolding is actually a bridge used to build upon what students already know to arrive at something they do not know. If scaffolding is properly administered, it will act as an enabler, not as a disabler" (Benson, 1997).

Until students can demonstrate task mastery of new or difficult tasks, they are given more assistance or support from a teacher or a more knowledgeable other (MKO). Zhao and Orey (1999) summarize, "scaffolding is a metaphor to characterize a special type of instructional process which works in a task-sharing situation between the teacher and the learner." The authors further delineate this basic idea into two key aspects (or rules): "(a) help the learner with those aspects of the task that the learner cannot manage yet; and (b) allow the learner to do as much as he or she can without help" (p. 6).

Scaffolding benefits:

- Provides individualized instruction
- Greater assurance of the learner acquiring the desired skill, knowledge or ability
- Provides differentiated instruction
- Creates momentum—Through the structure provided by scaffolding, students spend less time searching and more time on learning and discovering resulting in quicker learning
- Engages the learner
- Motivates the learner to learn

- Minimizes the level of frustration for the learner
- Another major benefit of scaffolding is that it supports the five principles of effective teaching highlighted in Ellis, Worthington and Larkin's Executive Summary of the Research Synthesis on Effective Teaching Principles and the Design of Quality Tools for Educators.
These five principles are:
 - *Principle 1:* Students learn more when they are engaged actively during an instructional task.
 - *Principle 2:* High and moderate success rates are correlated positively with student learning outcomes, and low success rates are correlated negatively with student learning outcomes.
 - *Principle 3:* Increased opportunity to learn content is correlated positively with increased student achievement. Therefore, the more content covered, the greater the potential for student learning.
 - *Principle 4:* Students achieve more in classes in which they spend much of their time being directly taught or supervised by their teacher.
 - *Principle 5:* Students can become independent, self-regulated learners through instruction that is deliberately and carefully scaffolded.

Purpose and significance of the study

The purpose of this study was to determine and analyze the impacts of the nonverbal support for language comprehension provided by teachers' use of visual scaffolding, including pointing, representational gestures, diagrams, and other methods of highlighting visual information on reading comprehension of impulsive and reflective young EFL learners and to determine the consistency of these effects through this descriptive pedagogical tool.

Previous studies have shown that visual scaffolding may facilitate listeners' comprehension of speech, particularly when the verbal message is ambiguous or highly complex. These findings suggest that visual scaffolding may be particularly important in instructional settings, in which students' comprehension is often challenged by new concepts and unfamiliar terms. However, little is known about how teachers actually use visual scaffolding in instructional communication or about whether such gestures influence impulsive or reflective students' reading comprehension. Regarding previous studies in this field, some believe in the positive role of effectiveness of visual scaffolding, some others argue this kind of instruction has little or no effect on students' reading comprehension. This study had two aims: (1) to investigate whether visual scaffolding promotes students' reading comprehension, and therefore their learning; and (2) to compare the effects of visual scaffolding on impulsive vs. reflective young learners, by facilitating students' encoding of visual information.

This study examined the effect of teacher's visual scaffolding on reading comprehension of impulsive vs. reflective young EFL learners and is significant in the sense that:

1) ESL/EFL students come to our classrooms with assumptions, usually unconscious, about how learning occurs. As teachers, we also come to our classrooms with assumptions, which are also

usually unconscious, about how learning occurs. When these two sets of assumptions are different, both students and teachers become frustrated. As an ESL/EFL teacher, one needs to address this variation in learning. When teachers want to take decisions about whether or not, for instance, to use visual techniques for impulsive learners, they should consider the aim for using visuals. If the purpose can be achieved in another way, it may be better not to use visuals. Another implication, relates to the dimension of impulsivity versus reflectivity as two learning styles. By using the data on language learning styles, teachers are better able to spot any style conflicts in the language classroom. Teachers can also vary their instructional techniques to meet the needs of students with contrasting styles of learning, to give reflective learners, for instant, more time to think about the new items in a given text.

2) Visual scaffolding data with regard to learning style can help the teacher prepare a language learning environment that accommodates different learners, here reflective and impulsive, alike. The learning environment can establish the class as inclusive, welcoming everyone.

3) Teachers often desire to take incremental steps checking for comprehension and attainment of the desired skills. This study could help teachers to do their best in this controversial issue by initially setting a high goal for students to attain, then, recognizing the skills the students have, building up their skills to meet that goal,.

4) The bulk of the studies conducted on the effectiveness of scaffolding have been done with adult L2 learners. Few of the studies on the effects of teacher visual scaffolding have been conducted on younger learners. The results of this study would provide learners and language teachers with evidence concerning the effectiveness of visual scaffolding by teacher in L2 writing classes.

5) It is important to study this approach at the level of young learners. If the reading curriculum adopts teacher's scaffolding in early classes, students would internalize the techniques of utilizing the hierarchical learning at early ages, and consequently it might take less effort in the most challenging skill in learning English.

REVIEW OF THE RELATED LITERATURE

Scaffolding is based on the socio-cultural theory popularized by Vygotsky (1978). Vygotsky believes that success in gaining knowledge can only be achieved through scaffolding from a knowledgeable person to a novice. This view is shared by other researchers such as Franklin (1996), Mayer (2003) and Mercer (2000). Thus scaffolding can be defined as a metaphor which is derived from the work of Wood et al., (1976) and it is based on Vygotsky's concept of the zone of proximal difference (ZPD) to capture the nature of support and guidance in learning.

The ultimate goal for learning is to gain knowledge. Knowledge is gained when meanings or attributes are attached to information and the learner has clearly defined and stored that information (Tokoro & Steels 2003). Many scholars within the socio-cultural tradition have

shown that language learning is not an individual cognitive process because ELLs are more likely to succeed in learning English as a second language (ESL) when they have teachers, peers, and community members who affirm their cognitive and linguistic capacities and provide support (August & Hakuta, 1997).

Drawing upon pioneering research conducted by Wood, Bruner, and Ross (1976) and other scholars (Maloch, 2002; Rogoff, 1990, 1997) who studied the role of knowledgeable others (e.g., tutor or teacher) in scaffolding, Rodgers (2005) revealed the interactive nature of scaffolding through empirical research that documented the growing control of reading words and independence in the reading process among struggling readers in one-on-one instructional settings. To provide scaffolding that leads to students' successful reading, teachers begin with careful observation of individual learners, respond thoughtfully to learners' needs, and use appropriate instructional materials (Rodgers & Rodgers, 2004). Specific types of teacher questions as a scaffolding technique can promote ESL students' disposition for learning and language development (Cazden, 1988). Kao, Lehman, and Cennamo (1996) postulated that scaffolds could be embedded in hypermedia or multimedia software to provide students with support while using the software. They realized that soft scaffolds are dynamic, situation-specific aids provided by a teacher or peer while hard scaffolds are static and specific.

A series of investigations of reflectivity –impulsivity in children has demonstrated impressive stability over both time and tasks. In addition, the construct has produced meaningful findings concerning IQ (Bryant & Gettinger, 1981; Camara & Fox, 1983) , modifiability (Butter, 1979; Laval, 1980), fluid ability (Cronbach & Snow, 1977) , and a variety of problem solving and decision- quality exercises(Kagan, 1966; Mann, 1973) . Impulsive subjects, in contrast to reflective subjects of similar age and verbal skills, make more errors in reading prose when in the primary grades, make more errors of commission on serial recall tasks, and are more likely to offer incorrect solutions on inductive reasoning problems and visual discrimination tasks (Stahl, Erickson & Rayman, 1986).

The research findings on reflective subjects are commonly the opposite of those obtained with impulsive s. in general reports describe the reflective child as one who pauses before beginning a task or making a decision and as one who spends time evaluating the differential validity of alternatives (Kagan, 1965 a,c). The reflective subject tends to make fewer errors in word recognition tests, serial learning and inductive reasoning(Zelniker & Oppenheimer, 1973). researchers have also found that a number of personality factors tend to contribute to the impulsive cognitive style–specially minimal anxiety over committing errors, an orientation toward quick success rather than avoiding failure, low performance standards , low motivation to master tasks, and less careful attention to and monitoring of stimuli (Kagan, 1966; Messer, 1970).

Kagan's theory falls under the realm of intellectual development, and specifically measures cognitive “tempo” or pace. Through observation and testing, Kagan made several conclusions. First, reflection increases with age. Second, impulsiveness or reflectiveness is relatively stable for the first 20 years, regardless of repeated attempts to alter it. Third, impulsiveness or reflectiveness

shows up in the performance of many tasks. Finally, impulsiveness or reflectiveness appears to be linked to personality. The first application of Kagan's theory was to "a child's ability to learn to read". The reflective child took their time to sound out words and read accurately. The impulsive child tended to slide over unfamiliar words and passages, decreasing levels of comprehension.

RESEARCH QUESTIONS AND HYPOTHESES

- Q1:* Does visual scaffolding have any effect on reading comprehension of EFL young learners?
Q2: Does visual scaffolding have any effect on reading comprehension of impulsive EFL young learners?
Q3: Does visual scaffolding have any effect on reading comprehension of reflective EFL young learners?
Q4: Does visual scaffolding have more effect on reading comprehension of reflective than impulsive learners?

Regarding the questions proposed above, following hypotheses were projected:

- H01:* Visual scaffolding has no effects on reading comprehension of EFL young learners.
H02: Visual scaffolding has no effects on reading comprehension of impulsive EFL young learners.
H03: Visual scaffolding has no effects on reading comprehension of reflective EFL young learners.
H04: Visual scaffolding has more effect on reading comprehension of impulsive than reflective learners.

METHODOLOGY

Participants

The participants of the present study were 80 Iranian EFL 11-13 year old students chosen out of 110 students based on their scores of KET-for-school test. The students were from Kish Language Institute of Science and Technology Shiraz, Iran. By applying a Persian version of Impulsivity Subscale of Barrett's (1995) Impulsiveness Questionnaire the students were assigned to three groups: impulsive group (25 students), reflective group (25 students) and control group (30 students). The students in experimental groups benefited from visual scaffolding techniques and 30 students in control group received no treatments.

Instruments

Two instruments were used in this study:

The first instrument was KET-for-schools as proficiency test. Key English test for schools is a proficiency test which consists of 35 reading questions including 13 multiple-choice, 10 matching, 7 true-false questions and 5 gap-filling questions, 21 writing questions including 20 gap-filling and 1 small writing, 25 listening questions including 10 multiple-choice and 15 matching questions and finally a 2-part speaking test. The reading part, was used as post-test.

The second instrument was a Persian version of Impulsivity Subscale of Barrett's (1995) Impulsiveness Questionnaire to divide the participants into two groups of Impulsive and Reflective. *The Barratt Impulsiveness Scale, Version 11 (BIS-11)* is a 30-item self-report questionnaire designed to assess general impulsiveness taking into account the multi-factorial nature of the construct. The structure of the instrument allows for the assessment of six first-order factors (attention, motor, self-control, cognitive complexity, perseverance, cognitive instability) and three second-order factors (attentional impulsiveness [attention and cognitive instability], motor impulsiveness [motor and perseverance], non-planning impulsiveness [self-control and cognitive complexity]). A total score is obtained by summing the first or second-order factors. The items are scored on a four-point scale (Rarely/Never [1], Occasionally [2], Often [3], Almost Always/Always [4])

Procedure

First, 110 students were selected randomly out of 200 students of Kish Institute of Science and Technology, Shiraz, Iran. Second, a proficiency test, KET-for schools, was conducted to select 80 elementary 10-12 year-old students. A KET-for-school test (reading part) was given to all participants as pre-test. Then they were given a Persian version of Impulsivity Subscale of Barrett's (1995) Impulsiveness Questionnaire to divide the participants into two groups of impulsive and reflective, each containing 25 students as experimental groups and a group of 30 as the control group. Students in experimental groups were taught using different techniques of visual scaffolding during 12 sessions. At the end, a KET-for-school test (Reading part) was given to both experimental and control groups as post-test.

RESULT AND DISCUSSION

In order to answer the research questions raised for the purpose of this study, the data were analyzed in both control and experimental groups.

Table 1: Mean and standard deviation of post-test scores for control and experimental groups

Group	Mean	Std .deviation
Control group	44.12	5.75
Impulsive group	45.48	4.64
Reflective group	48.40	3.92
Total	46	5.09

To investigate the data normal distribution, Kolmogorov-Smirnov test was used . The result is shown in table 2 below.

Table 2: Results of Kolmogrove-Smirnov test

Group	Z	Sig.
Control group	1.010	0.251
Impulsive students	1.048	0.222
Reflective students	0.567	0.905
Total	11.49	0.143

As seen in table 2, sig. for all tests is bigger than α ($\alpha = 0.05$), therefore data is normally distributed. Hence, data is parametric and can be used for the purpose of t-test.

Q1: Does teacher's visual scaffolding have any effects on reading comprehension of EFL young learners?

To answer the third question, as shown in table 3, regarding the results of independent t-test, p is smaller than alpha level ($\alpha = 0.05$), therefore there is a significant difference between post-test scores of experimental group and control group. It is concluded that utilizing visual scaffolding techniques has an effect on students' reading comprehension.

Table 3: Results of independent t-test of post-test scores of experimental and control groups

Group	Mean Difference	DF	t-value	p-value
Reflective	46.32	48	-2.67	0.002
Control	44.12			

Q2: Does teacher's visual scaffolding have any effects on reading comprehension of impulsive EFL young learners?

To answer the second question, as shown in table 4, regarding the results of independent t-test, it is observed that there isn't a significant difference between post-test scores of impulsive group and control group ($p > 0.05$), it is concluded that utilizing visual scaffolding techniques has no effect on impulsive students' reading comprehension.

Table 4: Results of independent t-test of post-test scores of impulsive and control groups

Group	Mean Difference	DF	t-value	p-value(sig)
Impulsive	45.48	48	-0.919	0.362
Control	44.12			

Q3: Does teacher's visual scaffolding have any effects on reading comprehension of reflective EFL young learners?

To answer the third question, as shown in table 5, regarding the results of independent t-test, p is smaller than alpha level ($\alpha = 0.05$), therefore there is a significant difference between post-test scores of reflective group and control group. It is concluded that utilizing visual scaffolding techniques has an effect on reflective students' reading comprehension.

Table 5: Results of independent t-test of post-test scores of reflective and control groups

Group	Mean Difference	DF	t-value	p-value
Reflective	48.40	48	-3.07	0.003
Control	44.12			

Q4: Which one is more influenced by utilizing visual scaffolding, impulsive young learners or reflective ones?

To answer the fourth question ,as seen in table 6 and regarding the results of the independent t-test , it is observed that there is a significant difference between impulsive and reflective groups ($p < 0.05$). In other words, the effect of utilizing visual scaffolding on reflective group is more than impulsive group. So, all null hypotheses were rejected.

Table 6: Results of t-test for mean of post-test scores of impulsive and reflective groups

Group	Mean	DF	t-value	p-value
Impulsive	45.48	48	-2.40	0.020
Reflective	48.40			

By rejecting the first hypothesis, it was concluded that visual scaffolding has a positive effect on learners' reading comprehension. This is, to a great extent, in line with Hogan and Pressley (1997) study in which the researchers found a significant positive relationship between scaffolded instruction and answering the follow-up questions after reading a text.

The three next hypotheses were related to students' learning style. The findings of this part of study seeking the effect of impulsivity and reflectivity on responding to scaffolding techniques are consistent with those carried out by Morgan (1997). In mentioned study, results indicate that reflective students are more affected by visual techniques. Concerning the effect of visual scaffolding on reflective learners, the finding is consistent with some researchers' view (Clarck & Roof, 1988; Salmani, 2006) that reflective learners perform better than impulsive ones in learning tasks that require analysis and attention to details, like reading .

On the whole, the findings of the present study supported the findings of Sudzina(1993), Abu Romman (2005) researches. They reported that the overall language learning can be enhanced when students' cognitive style is matched with the teaching methods. They are also consistent with Daoud's (2008) claim that the only factor affecting individuals' language learning is matching instruction with learners' cognitive style. How ever the findings of the present study is not in line with El-Koumy's (2001) study which showed that students' achievement in reading comprehension increases when there is a mismatch between learners' cognitive style and teaching method. Furthermore, it should be born in mind that the contradictory findings of some studies regarding the effectiveness of utilizing scaffolding techniques can be due to the fact that learners' other individual differences have been neglected in most of these studies.

CONCLUSION

As mentioned earlier, the present study was supposed to answer four questions about the effect of utilizing visual scaffolding on impulsive and reflective young EFL learners' reading comprehension. Before the outset of the study, four null hypotheses were developed. The results of the study revealed that using visual scaffolding has a positive effect on reading comprehension of young students in general, then judging by students' learning style it was observed that reflective students' reading comprehension is more influenced by utilizing visual scaffolding than impulsive ones, which is in line with the study done by Collier and Combs (2003) on adult learners. The findings seem to have important implications for L2 teachers. If they know and learn more about different kinds of scaffolding, visual in particular, as well as different learning styles, they can change and adapt their teaching procedures to the needs of the learners more effectively.

Limitations of the study

The technique requires the teacher to give up control as fading occurs, but as this research is taking place in kid's classes, giving up control is not fully implementable. Scaffolding is time-consuming. Teachers might encounter lack of sufficient time due to institutional restrictions. Teachers may be occupied by daily teaching activities - has to teach a course book, therefore she will devote only a part of class time to scaffolding programme. As a result, the face-to-face teacher scaffolding to weaker students might not be possible every session.

Topic selection can not be broad, due to learners' low level of general knowledge. Although this study aims at studying the impact of teacher's visual scaffolding and its effects on students' subsequent drafts, the results of this study cannot be generalized because of the small number of the participants. Only 55 males and females 10-12 year-old students, will be enrolled from a private English institute, the sample might not be representative of the target population of L2 elementary students.

ABSTRACT

By increasing people who speak and learn English, it is necessary to do research in different skills of this language. Although extensive studies have been done in reading and writing; the share of listening is tiny. This poor share would be clear enough when our focus goes to metadiscourse markers and their impact on listening comprehension, so this study's aim was investigating the impact of these markers on listening comprehension. To do so, 240 English as a foreign language (EFL) learners through administering a proficiency test (TOEFL) were selected and divided into two levels of low and high language proficiency. Sixteen listening tasks-eight for each level-were selected based on the number of metadiscourse markers and also their readability values. So as to test the impact of metadiscourse markers on listening comprehension Independent Samples T-test was utilized. The results showed that metadiscourse markers had a positive impact on listening comprehension of Iranian EFL learners at both levels. In fact, not only learners but also teachers can benefit from metadisocurse markers as failitative devices to ease the process of understanding of English, a language which learning it is a must in today's world.

KEYWORDS: Metadiscourse, Metadiscourse markers, Listening comprehension, Language proficiency

INTRODUCTION

Discourse is the communication that happens in a specific context. For example, we can talk about the discourse of science, legal discourse, and so on (Bloor & Bloor, 2007, p. 7); however, it is not the whole story. Crismore (1985) believes that discourse has two levels: *primary and metadiscourse*. Primary discourse transfers just the information about subject matters to the audiences and it does not have any comments by the author, whereas another level of discourse which is called metadiscourse annexes another proposition to the message, in fact, despite prepositional meaning, an author tries to convey his thoughts, personalities and attitudes by this level of discourse. An example of primary discourse is: *The test is so difficult* and an example of metadiscourse is the underlined parts of this sentence: *My idea is that this test is so difficult*.

Metadiscourse has been broadly defined as "discourse about discourse" (Vande Kopple, 1985, p. 83) or narrowly as "the language used to express the author's explicit awareness and management of the discourse as process; which includes awareness and of the organization of the text, of the participants of the discourse process: the reader and the self, and of the author's attitude toward the discourse process" (Burneikaite, 2008, p. 39).

Furthermore, Vande kopple (1985) gives the broad definition to metadiscourse and mentions that metadiscourse transfers *interpersonal* and *textual* meaning. Interpersonal metadiscourse assists authors to show their attitudes, personalities and thoughts toward what is being transferred by them, whereas textual ones "helps writers relate and connect bits of ideational material within a text and helps the text makes sense in a particular situation for readers" (Crismore & Abdollehzadeh, 2010, p. 196).

On the other hand, Crismore (1985) has divided metadiscourse into two types: *informational* and *attitudinal*. Informational metadiscourse is "explicit rhetorical devices that signal the presence of an author" (p. 12). In fact, informational metadiscourse makes the statements clear to the readers and helps them know more about the author's personality, attitude and so on. An example of this kind of metadiscourse is the underlined parts of this sentence: "I am arguing that it is not progress to produce more and more goods". However, attitudinal metadiscourse is "rhetorical means that signal the author's attitude about the subject matter" (p. 12). As a matter of fact, these devices tell us about the attitude of the author toward the content. An example of this kind of metadiscourse is the underlined parts of this sentence: "It is possible that it is not progress to be the biggest or go the fastest" (p. 12). In fact, the purpose of communication is not just transferring information. The speaker/writer not only wants to send the message but also tries to facilitate his ideas and purposes toward what is being transferred, so metadiscourse can help speaker/writer shape messages to make them clear enough for his recipients.

An investigation into metadiscourse brings us to old Roman written texts, poetry and old Greek as well (e. g., Plautus, Virgil, Ovid, & Aristotle). This means that from the past, writers have been fond of using metadiscourse in order to facilitate the process of understanding for their audiences. Besides, the importance of using metadiscourse has been discussed by many scholars in different cultures, genres, and disciplines because they have believed in using metadiscourse as facilitative tools for better understanding of author's intention (Crismore & Hill, 1988).

Vande Kopple (1985) believes that it is obligatory to us to write on two levels of discourse. He says: "On one level we supply information about the subject of our text and on the level of metadiscourse, we help our readers organize, interpret, evaluate, and react to such material" (p. 8). To Hyland (2005) metadiscourse is important in teaching and learning language and students should be familiarized with metadiscourse because learning metadiscourse helps them know that language has different functions and there are different possible interactions in different situations. They would know that a text is not simply a text but it has addresser, addressee and a text itself, in fact, all these elements should be taken into account for communication. Turning to listening, it has been claimed that metadiscourse markers help students understand better (Chaudron & Richards, 1986; Jung, 2003; Smit, 2006; Eslami & Eslami-Rasekh, 2007; Hashemi

et al. 2012; Tajabadi & Taghizadeh, 2014). In the field of reading and writing, many studies have been done to test the impact of metadiscourse markers but the share of studies on listening comprehension in this case is poor. The impact of discourse markers on listening, first of all, tested by Hron et al. (1985, cited in Jung, 2003). They tested the impact of discourse signaling cues in L1 and concluded that these cues result in better understanding. Bearing this finding in mind, the researchers hypothesized that these cues can also help the L2 listeners.

To test this hypothesis, Chaudron and Richards (1986) were the pioneers. They classified discourse markers into two parts of macro and micromarkers. To them, macromarkers “signal the macro-structure of a lecture through highlighting major information and the sequencing or importance of that information” and micromarkers “indicate links between sentences within the lecture, or which function as fillers” (p. 116). They concluded that macromarkers help listeners more than micromarkers.

Flowerdew and Tauroza (1995) also investigated the role of micromarkers on listening comprehension and claimed that they can help the listeners too. The lack of support for the results of previous studies, forced Jung (1999) to test the impact of discourse cues more empirically. His study demonstrated that these cues help listeners because a group that listened to a lecture with discourse markers recalled more information than a group without facing discourse cues.

Four years later, Jung (2003) again conducted a study aimed at investigating the impact of discourse markers on L2 listening comprehension. Through the use of language proficiency test 80 Korean learners were selected and divided into two groups of signaled and nonsignaled. Two lectures, one with discourse markers and the other one in which these markers had been deleted were given to both groups. Signaled group received a lecture with discourse markers and nonsignaled group received the next version. In comparison with nonsignaled group, the signaled group recalled more information.

Eslami and Eslami-Rasekh (2007) also studied the role of discourse markers. To do their study, they selected three texts from textbooks and asked an educated native speaker to give a lecture on them (some discourse markers were included in this lecture), this version was used as an original lecture and in the next one, those discourse markers were deleted. Two other experienced native speakers were asked to check these two lectures to confirm their authenticity. 72 intermediate students were selected by using of TOEFL proficiency test and randomly divided into two groups. One group received the original lecture and the next one received the modified lecture. The result showed that a group which listened to a lecture with discourse markers had better comprehension.

Hashemi et al. (2012) also tested the influence of metadiscourse markers on listening comprehension of EFL learners. By a derived form of a proficiency test of TOEFL, 120 students at intermediate and advance levels were selected and divided into 4 groups, each with 30 members. Using a native-like voice to record, five monologues from section four of IELTS were got and assumed as original listening texts and deleting their metadiscourses provided other five

monologues. At each level control groups received modified monologues and experimental groups listened to the original ones. Although no noticeable difference was seen at the intermediate level; the performance of high proficient learners on listening tasks with metadiscourse markers was better than those in a control group.

In a recent study, Tajabadi and Taghizadeh (2014) attempted to study the impact of discourse cues on listening comprehension as well. Like Chaudron and Richards' study, they examined the impact of micro, macro and a combination of micro and macro-markers. The difference of their study from Chaudron and Richards's comes back to their focus on the function of markers for selecting micro and macro markers not the length of them. 105 upper-intermediate adult L2 learners through a test of proficiency were selected and made the final participants. 3 expository reading texts from upper-intermediate level were selected and three sets of tests for each, with micro, the next with macro and the last with a combination of both were prepared and then a native speaker was asked to record them. In contrast to Chaurdon and Richards (1986) they found that micro markers had more facilitative roles rather than macro markers.

What was explained as studies in the realm of discourse markers and listening comprehension suffer from fundamental problems. Generally, the faults of discussed studies can be categorized into four areas. The first one comes back to detemining the level of language proficiency. Except Flowerdew and Tauroza (1995), Eslami and Eslami-Rasekh (2007), and Hashemi et al. (2012), other studies such as Smith (2006) and Tajabadi and Taghizadeh (2014) did not utilise standardized tests of language proficiency and some like Chaudron and Richards (1986) and Jung (2003) just relied on listening section of a standardized proficiency test to put the participants at correct level. Neither the first and second group nor the third were not successful in detemining the correct level of participants because the first group just paid attention to the language proficincy level and neglected the level of listening comprehension and the third group determined the participants' litsening comprehension ability without detemining their lanaguge proficiency level. Needless to say, calculating both is a need to listening comprehension studies.

The seconnd category which can be discussed is using authentic materials. Except Jung (2003) who used lectures in which because of deleting discourse markers they are also unnatural non of the other studies used authentic materials. What were used were read-aloud texts which were got from reading books.

The third category which can put the findings of above mentioned studies aside is definitely related to implementing and deleting discourse markers. All mentioned studies suffer from this point and it is clear that this policy removes naturalness, so it can be clamied that all studies which have been done so far suffer from unnaturalness. The last but not certainley the least, calculating text difficulty (readability) is another major fault of discussed studies. Non of them except Tajabadi and Taghizadeh (2014), which is somehow vague, considered this important point and it is not clear that utilised texts in other studies were appropriate for the aprticiapants or not. The concept of metadiscourse and offering it to the world of English language teaching and also Applied Linguistics has been an attempt to say that communication and also language is not just exchanging of information but it gets involved in the personality, ideas, and thoughts of those

people who do the act of communication (Hyland, 2005). In sum, using of metadiscourse differs, based on rhetorical context, and as Crismore (1985) says; these means can be utilized on the level of word, phrase, or clause and can signal the covert or overt presence of an author. What is clear is that metadiscourse markers play an important role in language because they facilitate and help our understanding.

RESEARCH QUESTION

Based on above mentioned studies and also their inconsistencies this study addressed the following question:

1. Do metadiscourse markers have any significant impact on the listening comprehension of Iranian EFL students?

And the null hypothesis was:

1. Metadiscourse markers have no important impact on listening comprehension of Iranian EFL students.

METHODOLOGY

Participants

The total number of participants who took part in this study was 300 Iranian EFL students at both BA and MA levels from three universities in Sanandaj (the capital city of Kurdistan province in the west of Iran) namely: Kurdistan, Payame Noor, and Islamic Azad University. Utilising a proficiency test of TOEFL, participants' levels of language proficiency were specified and 240 students selected to both levels. To determine the listening tasks' reliability and validity, 120 out of 240 students were used and to answer the research question, the next 120 students made the final participants. What's more, in order to be sure about participants' listening comprehension level, the **researchers** used one-way ANOVA for the scores got from listening section of the used TOEFL. The results showed no great difference among selected students for the study.

Materials

The first instrument which was used in this study was a proficiency test of TOEFL (2003) consisting of 140 items: Listening: 50 items; structure: 40 items; and reading comprehension passages: 30 items. This test was utilized to determine the levels of language proficiency of the participants.

The second instrument which was utilized was sixteen listening tasks, eight for each level. These were taken from different editions of TOEFL tests including PBT and IBT editions. The first criterion for selecting these listening tasks was the number of metadiscourse markers and the second criterion was their readability values.

Procedure

So as to do this study, 240 students out of 300 were needed. To gain this aim, a language proficiency test, i.e., TOEFL (2003) was given to the total participants. The criteria for assigning the participants to high and low level was the Mean and Standard Deviation (SD) of scores

obtained from the administration of aforementioned TOEFL test. Those who scored +1SD above the Mean were assigned to high level group and those who scored -1SD below the Mean were assigned to low level group. After analyzing the data more than 40 students were discarded because they fell between -1SD and +1SD. The total number of participants who met the criteria at this phase of research was 240. Then participants were divided into two 120-member groups. The first group included the participants of high level of language proficiency and the second group included the participants of low level of language proficiency. 120 out of 240 students were selected for the main phase of the study in which the participants of high level of language proficiency were randomly divided into two 30-member groups, and the participants of low level of language proficiency were also randomly divided into two 30-member groups. Furthermore, 120 students out of the above population (240) were selected for the purpose of establishing reliability and validity of the tests.

In the next step, sixteen listening tasks-eight for each level- were taken from different editions of TOEFL tests including PBT and IBT editions. The first criterion for selecting these listening tasks was the number of metadiscourse markers. Over 50 listening tasks were meticulously investigated and their metadiscourse markers were identified. The number of their metadiscourse markers was between 0 to 14 so that those listening tasks containing less than 7 metadiscourse markers were considered as listening tasks with low metadiscourse markers and those listening tasks which had 7 or more than 7 metadiscourse markers were considered as listening tasks with high metadiscourse markers. It is noteworthy to say that the selected taxonomy of metadiscourse for this study was Crismore's because of its being explicit and comprehensive.

The second criterion for selecting these listening tasks was their readability. Using Flesch-Kincaid Grade Level their readability was calculated. Then the Mean value and the Standard Deviation were also calculated. Those listening tasks which had readability values over +1SD were considered suitable for the students of high level and those listening tasks which had readability values less than -1SD were considered appropriate for the students of low level of language proficiency.

Since these listening tasks were taken from different editions of TOEFL, calculating the validity and reliability of them was a must. For this purpose, 120 out of 240 students were selected based on the criterion used to select the main participant for the main phase of the study, and were given these listening tasks. To estimate the reliability of the test, Cronbach Alpha method of estimating reliability was used. Cronbach's Alpha estimated the reliability of the whole items as 0.823, as displayed by table 1. The reliability of each of tests was also examined as follows: Test 1 (14 items): 0.749, Test 2 (15 items): 0.752. Test 3 (14 items): 0.781, Test 4 (11 items): 0.723.

Table 1: Reliability of the test

Cronbach's Alpha	N of Items
.823	54

To estimate the concurrent validity of the test, Pearson product-moment correlation coefficient was used between the test of pilot study and the final test. The concurrent validity of the test is displayed in Table 2.

Table 2: The correlation between the test of pilot study and the final test

		the test of pilot study	the final test
The test of pilot study	Pearson Correlation	1	.869^{**}
	Sig. (2-tailed)		.000
	N	120	120
The final test	Pearson Correlation	.869 ^{**}	1
	Sig. (2-tailed)	.000	
	N	120	120

^{**}. Correlation is significant at the 0.01 level (2-tailed).

As Farhady et al. (2003) suggested, “validity and reliability coefficients below .50 are considered low, .50 to .75 are considered moderate, and .75 to .90 or above are considered high” (p. 154). Therefore, the test used in this study had high reliability ($r = 0.82$) and high validity (0.86). Finally, after establishing the validity and reliability of the tests, they were given to the main participants of the study in the following way:

HH: participants of high level with high metadiscourse markers listening tasks

HL: participants of high level with low metadiscourse markers listening tasks

LH: participants of low level with high metadiscourse markers listening tasks

LL: participants of low level with low metadiscourse markers listening tasks

Design of the Study

Indeed selecting the group at both levels of this study was done randomly, however, the factors aside from language proficiency and also metadiscourse markers which might have affected the results were not controlled. In this case, participants got no treatment, so a controlled design named Ex Post Facto Design was utilized.

RESULTS AND DISCUSSION

To testify the truth or falsity of the research hypothesis, the relevant data were analyzed. Table 3 shows Mean and Standard Deviation of two types of metadiscourse.

Table 3: Mean and standard deviation of the two types of metadiscourse

	metadiscourse	N	Mean	Std. Deviation	Std. Error Mean
Listening comprehension scores	high	60	11.23	1.442	.186
	low	60	8.47	1.535	.198

Table 3 represents the Mean and Standard Deviation for high metadiscourses ($M=11.23$, $SD=1.44$) and low metadiscourses ($M=8.47$, $SD=1.53$). The total number of students participated in the study was 120. On the other hand, the results obtained from the Independent Sample T-test revealed the significant difference between metadiscourse markers and listening comprehension of Iranian EFL learners.

Table 4: Independent samples T-test for metadiscourse markers and listening comprehension

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
listening comprehension scores	Equal variances assumed	.90	.342	10.1	118	.000	2.767	.272	2.228	3.305
	Equal variances not assumed			10.1	117	.000	2.767	.272	2.228	3.305

Independent Sample T-test offers two lines as displayed by Table 4. With reference to the Table, the Sig. value is larger than .05, therefore, the first line should be followed which refers to Equal variances assumed. That is to say, since in this table, the significant value is .342 which is larger than .05; the first line is used to report findings. To discover if there is a significant difference between metadiscourse markers and listening comprehension of Iranian EFL students, the researcher checked column labeled Sig. (2-tailed). Since the Sig. (2-tailed) value is *less* than .05 which is .000, then there is a significant difference in the mean scores on the dependent variable for each of the metadiscourses. Thus, the research question of the study was rejected.

To determine the effect size between the groups, the researcher used eta squared, as the most commonly used formula. Eta squared can range from 0 to 1 and represents the proportion of variance in the dependent variable that is explained by the independent (group) variable. SPSS does not provide eta squared values for t-tests. Therefore, the researcher calculated it manually. The procedure for calculating eta squared is provided below.

The formula for eta squared = $t^2 / t^2 + (N1 + N2 - 2)$

As the table shows, in this study, $t=2.21$. Therefore:

$$(10.1)^2 / (10.1)^2 + (60+58) = 102.01/220.01 = \mathbf{0.463}$$

The guidelines (proposed by Cohen, 1992) for interpreting this value are:

.01=small effect,

.06=moderate effect,

.14=large effect.

Therefore, the effect size of .463 is *large*.

CONCLUSION

Bearing the results in mind, we concluded that the participants at high and low levels of language proficiency benefited from the presence of metadiscourse markers in the listening tasks which were given to them. This is in line with Crismore and Abdollehzadeh (2010) who believe

“learners at different language proficiency levels benefit from effective metadiscourse instruction and awareness-raising in their comprehension and written production” (p. 214). So, the null hypothesis which states that metadiscourse markers have no important impact on listening comprehension of Iranian EFL students was rejected. Findings of this study confirm (Crismore, 1985; Crismore & Hill, 1988; Rubin, 1994; Dastgoshadeh, 2001; Jung 2003; Smit, 2006; Eslami & Eslami-Rasekh, 2007; Parvaresh, 2007; Crismore & Abdollezadeh, 2010) who unanimously believe that metadiscourse markers facilitate the process of comprehension and assist students to get the intended meaning easier.

Giving a further explanation, the presence of metadiscourse markers in listening tasks makes them more understandable and helps the listeners understand the propositional content of the listening tasks without expanding the propositions. As Rubin (1994) asserts, discourse signaling cues are one of those effectual factors which influences on listening comprehension and must be taken into account. This statement is also confirmed by Dastgoshadeh (2001) and Parvaresh (2007) who say, knowledge of metadiscourse can compensate learner’s inadequate pragmalinguistic competence and elevate their comprehension.

Additionally, the benefits of metadiscourse markers are not just limited to the students and learners. By teaching metadiscourse markers and their functions to students, teachers help the students grasp the intended meanings. Teaching metadiscourse can be a primary teaching activity in class due to the significant roles of these elements in breaking the rigid blocks formed by propositions and moving beyond what is written in surface structure. As Smit (2006) says, teaching metadiscourse help students understand and communicate better.

Furthermore, material developers while preparing listening tasks, writing textbooks, and also preparing class materials can benefit from metadiscourse markers too. In fact, they can consider the crucial roles of metadiscourse markers by providing the students with opportunities to make them aware of metadiscourse, different functions of metadiscourse, and the way they are employed by lecturers/writers to convey specific intentions. Lastly, as Mauranen (2010) says, metadiscourse “is a distinctive characteristics of language, ubiquitous in our speech, and it deserves close attention from linguists.” (p. 18). So, accentuating on this important facet of our speech is a must because it is definitely helpful to facilitate the process of understanding of English which is a wish to everyone.

ABSTRACT

With the rapid expansion of technology, globalization and cyber-communication, the focus on writing accuracy in English as the lingua franca has recently been emphasized. The explicit teaching of grammar to enhance students' writing skills has been revived to tackle the issue. The present study, as an initial attempt in the context of Iran, examines the role of explicit teaching of common grammatical errors in improving writing accuracy. In so doing, a pool of 30 students who are studying English at Kimia English Institute participated in an experimental study. The study aimed at: 1) examining the effect of explicit teaching of common grammatical errors on the EFL learners' writing accuracy studying at an English Institute in Sannandaj, 2) investigating the significant difference between explicit teaching of common grammatical errors and aspects of grammatical rules including 'used to for habitual actions', 'adverbs of quantity with count and non-count nouns', 'evaluations and comparisons with adjectives', and 'simple past vs. present perfect', and 3) exploring the learners' reactions towards the implementation of explicit teaching of common errors in improving writing accuracy. The results obtained from the study, using Independent Sample T-test, One-way ANOVA and Semi-structured Interview rejected the null hypotheses of the study, and therefore, teaching explicitly common errors proved to be effective in students' development and among four grammatical rules, students had a better performance on tenses of English following the treatment phase of the study. A further implication of the study is for language teachers to raise student' awareness regarding the common errors and help them notice the common errors in order not commit the common errors but apply the grammatical rules correctly in their writing.

KEYWORDS: Explicit Teaching, Accuracy, Common Errors

INTRODUCTION

Explicit teaching is a kind of instructional approach to language teaching in which the focus is on form. It is intended to give students explicit instruction about the forms and raise their

awareness. It moves systematically from extensive teacher input and little student responsibility to total student responsibility and minimal teacher involvement. So the last and most important aim of the study is to help students to reach self-dependency and self-correction stage. This study intended to shed light on the efficiency of explicit teaching especially when the focus was on the EFL learners' most occurring grammatical errors in writing.

Those who are concerned with language teaching and learning have always tried to find alternative methods and approaches to increase quality second language acquisition (SLA). In order to fulfill the above-mentioned goals many linguists and researchers interested in topics like EFL, raised awareness and consciousness and introduced explicit instructions and feedback in order to increase students' accuracy and fluency in language skills. Writing has been one of the most different skills for learners to develop being a recursive process. It takes several times for learners to revise their writings before submitting their final drafts (White & MacGovern, 1994).

Received feedback and critical comments from teachers help language learners breakthrough in the process of composing an essay with the least errors as well as the maximum accuracy and clarity. Therefore, the necessity of teachers' support and frequent monitoring regarding how to fulfill different writing assignments correctly is of importance from educational point of view (Cremes Lea, 1997; Ennis, 1996; Ferris, 2002; Harmer, 2001; Krashen, 1987; Krol, 2001).

Noting that grammar teaching is usually treated separate from the teaching of writing, this study presents one of the first attempts to use explicit focus on forms instruction to increase Iranian EFL learners writing accuracy. The study's focus is on students most common writing errors and its aim is to help students overcome these problematic forms and also concerns the extended use of explicit feedback and awareness raising activities in order to fulfill this aim.

Theoretical background

Continuing in the tradition of more than 2000 years of debate regarding whether grammar should be a primary focus of language instructions, should be eliminated entirely or should be subordinated to meaning-focused use of target language, the need for grammar instruction is once again attracting the attention of second language acquisition researchers and teachers. This focus has been motivated in part by debates in the field of cognitive psychology over the role of explicit vs. Implicit language learning and whether such learning occurs through conscious manipulation of information or primarily through unconscious process when people are exposed to language input (Bialystok, 1990, 1994; N. Ellis, 1994; Rober, 1967, 1989, 1993). Theoretically the debate was represented by Krashen's (1981) distinction between conscious learning and unconscious acquisition of teaching approaches where the focus is primarily on meaning-focused communication and grammar is not addressed so there is reconsideration of grammar teaching in L2 classes as the result of the evidence of the positive effects of grammar instruction. This evidence comes from a large number of laboratory classrooms based studies as well as extensive reviews of studies on the effects of instruction over the past 20 years (R. Ellis, 1985, 1990, 1994, 2001, 2002a, Larsen-Freeman and Long, 1991; Long, 1983, 1988, 1991). As

the result from focused instruction (FFI) is taken as an alternative that has been received much attention recently.

The term Form-Focused Instruction (FFI) is defined by Ellis (2001, p. 2) as any planned or incidental instruction activity that is intended to induce language learners to pay attention to linguistic form. It served as a generic term for analyzing teaching on form, focus on forms, correction feedback/error correction, and negotiation of form. Research shows that traditional instruction on isolated grammar forms are insufficient to promote learners' acquisition (Long, 1991; Long & Robinson 1998), yet purely communicative approaches have been found inadequate for developing high levels of TL accuracy (Harley & Swain, 1984; Swain 1985, 1998; Swain & Lapkin, 1998). Two general solutions have been proposed in the research literature: one is to encourage the students to attend to target forms by noticing them in input (Schmidt, 1990, 1993; Doughty and Williams 1998a; Ellis 1994a, 2001a), thus assisting in their processing. The other is to provide learners with opportunities to produce output containing target forms, again enabling learners to notice the gap between their current TL ability and the correct use of the target form (Swain, 1985, 2005).

One of the first classifications that has been widely cited and has had a considerable impact on our understanding of the concept of FFI, is the distinction that Long (1991) made between focus on form and focus on forms. FoFs according to Long (1991;2000; Long & Robinson, 1998) is based on traditional structure and synthetic approaches to language teaching (Wilkins, 1976) in which language is segmented into discrete items and is then presented to the learners in an isolated and de-contextualized manner. FoRs on the other hand involves drawing the learners' attention to linguistic forms, as they arise incidentally in lessons whose overriding focus is on meaning and or communication (Long, 1991, p. 46).

Error correction is a response either to the content of what a student has produced or to the form of the utterance (Richards & Lockharts, 1996, p. 188). As Truscot (1996, cited in Ferris, 2003, p. 42) states, 'the correction of grammatical errors can help students improve their ability to write accurately'. In addition, numerous researches indicate the importance of correction feedback which impacts learners' writing accuracy. (Lalande, 1982; Ferris, 1999; Ferris & Robber, 2001).

In terms of output as FFI, Swain (1985,1995, 2005) emphasized that importance of production to develop learners' awareness of the gap between current TL production ability and the TL. Input enhancement has also been used to develop learners' awareness of target forms. Structures have been made salient through high-lighting, underlining or other treatments (Folos, 1993, 1994; Williams & Evans, 1998; Nassaji Press). The term consciousness raising has been widely used in SLA research; in formal instruction it was frequently used to refer to any attempt to focus learners' attention on a specific target structure. Several recent literature reviews provide an overview concerning the role of a number of related concepts such as conscious, awareness, attention, noticing and focus on form in second language learning (Doughty & Williams, 1998; Long & Robinson, 1998; Norris & Ortega, 2000, Spada, 1997). As this literature show, a considerable amount of work suggests there is a positive role for some kind of attention to form

that is either through explicit teaching of grammar and explicit error correction, or at least through indirect means such as input enhancement.

RESEARCH QUESTIONS

The study seeks to find appropriate answers to the following questions:

- 1) Do teaching grammatical errors have any significant effect on EFL learners' writing accuracy?
- 2) Is there any significant difference between explicit teaching of common grammatical errors and aspects of grammatical rules including 'used to' for habitual actions', 'adverbs of quantity with count and non-count nouns', 'evaluations and comparisons with adjectives', and 'simple past vs. present perfect'?
- 3) How do the learners react towards the implementation of explicit teaching of common errors in improving writing accuracy?

METHODOLOGY

Participants

A pool of 30 female students participated in the study at Kimia English Institute in Sannandaj, Kordestan province. They were EFL learners, and all of them had studied English Conversation Courses for three years in the institute. They had two sessions of English per week, with an English instructor. In order to make sure about the homogeneity of the subjects in terms of their language proficiency, the teacher included those students who had already passed Interchange Series (Intro & 1) by Richards, Hull and Proctor (2005). Moreover, they were asked to participate in Nelson Proficiency test which includes 50 items consisting of vocabulary, structure, and close passages in multiple choice format. Students whose score were one standard deviation above and below the mean were selected for the study. The mean of the scores was 30.80 and the standard deviation was 12.53. Therefore, students whose scores were between 18 and 42 were selected to participate in the study. Out of 36 students, 30 students had scores between 18 and 42. The learners were randomly assigned to one condition: Experimental group and control group and each group had 15 students.

Instrumentation

The first major instrument used in the study was Nelson English Language Proficiency Test developed by Fowler and Coe (1978) (Appendix A) for the purpose of making the sample homogeneous in terms of language proficiency level. This multiple-choice test contained cloze passages, vocabulary, structure, and pronunciation. The reliability coefficient of this proficiency test was high, Cronbach Alpha = 0.82 (Hashemian, Roohani&Fadaei, 2012). The researcher also determined the reliability of the test using Cronbach Alpha as 0.81 that is acceptable. As Farhadi, Jafarpur and Birjandi (1994) suggested, "validity and reliability coefficients below .50 are considered low, .50 to .75 are considered moderate, and .75 to .90 or above are considered high" (p. 154). Therefore, the test used in this study had high reliability ($r = 0.81$).

The second major instrument distributed to the participants to assess their grammatical knowledge was from the Interchange/Passages Objective Placement Test, version A and version B developed by Lesley, Hanson and Zyukowski/ Faust (2005). Version A was used as the pre-test and Version B was used as the post-test. This placement test contains three main sections including listening, reading, and language use. The section used here was language use and from this section, the questions that referred to Interchange intro, 1 and 2 (units 1 -4) were taken out from Version A by the researcher and distributed to the students to measure their grammatical knowledge. As for the post-test, questions referred to interchange 2 (unit 1-4) were taken out from Version B. The reliability and validity of the test were already measured by the authors of the test and were reported high including 0.87 and 0.81, respectively. Moreover, the researcher calculated the reliability of tests as 0.83 and 0.78. For ease of calculation, students' scores on pre-test and post-test were calculated from 50.

Procedure

Before Mediation Phase

Since the study was experimental research, the researcher, first, divided the learners into two equal groups and each group included 15 female EFL learners. The learners were required to take the conversation course, and the researcher, as the teacher of both classes, introduced Interchange 2, written by Richards, Hull and Proctor (2005). The course included 15 sessions to teach the first four units of the textbook. The textbook contained 16 units, and each 4 units was worked during a single term with the learners. The class started in December, 2013 during which the learners were required to attend the class two sessions per week and each session lasted 1:30 minutes.

One week prior to the beginning of the treatment phase, during the first session, the pretest was administered to the two groups during regular class time in order to determine their grammatical knowledge. The test consisted of 60 question items in multiple-choice format taken from the grammar section of Interchange Objective Placement Test, Version A. Some of these items were taken from interchange 2 (Unit One to Unit Four) which the researcher intended to use in the experiment. The pre-test condition was identical in the two groups. This activity took about 40 minutes.

During Mediation Phase

The treatment phase lasted for 12 sessions during which the teacher in the two classes allocated 20 minutes of his classes to teaching writing. Each group received a different treatment, in accordance with the experimental condition it was assigned to. As for the control group, the teacher followed the regular method of teaching writing accuracy during which the learners were exposed to the grammatical rules and the grammatical rules were explained and exemplified by the teacher, and then, the students were required to complete the exercise, and finally, they were asked to write sentences and short paragraphs. The teachers corrected their writings and provided them with direct corrective feedback.

However, as for the students in experimental group, the teacher, first, presented the grammatical rules and exemplified them, and then, she taught the common errors committed by the EFL learners with respect to the grammatical item. The teacher used her previous experience regarding the common errors pertinent to the grammatical rule under study and he also already consulted with three experts who have had more than 10 years experience in teaching grammar at university and private institutes. Moreover, during the first presentation of the rules, the teachers asked the learners to write their own sentences and short paragraphs and, in this way, he collected their mistakes and errors and worked on them several times during the next session. There were four units and the teachers worked on the grammatical rule of each unit during the class hour and he finished each unit in 4 sessions. For example, as for the grammatical rule presented by the teacher regarding the use of *used to* for habitual actions, common errors by the learners were as follows:

- 1) Learners' mistake in distinguishing between *use* and *used to*: For example, the use of "Mike *use to play* hide and seek" instead of "Mike *used to play* hide and seek".
- 2) Learners' mistake in differentiating between *used to* for past actions and *be used to* for present actions: *Used to* is followed by infinitive, but *be used to* is followed by gerund. For example, "Mike *used to study* late at nights" and "Mike *is used to studying* late at nights".
- 3) Learners' mistake in using infinitive not bare infinitive after *used to*. For example, "Mike *used to read* loudly" instead of "Mike *used read* loudly".

In experimental group, the students were bombarded with the common errors practices and exercises, and they were asked to attend to the mistakes in order not to repeat the same error in their own writings. The teacher tried to help students raise their consciousness and followed the focus on error strategy. She brought some examples for the students that contained mistakes writing by students at previous term. Interchange textbooks include writing tasks apart from grammatical exercises; therefore; the teacher used the writing tasks in each unit asking students' to apply what they have learned during the class time. In control group, the teacher did not expose the students to common errors and the students were asked to learn the grammatical rules and apply them in writing tasks.

Students' mistakes mainly resulted from:

- 1) Interference from their native language, here Persian language. They made mistake in distinguishing count nouns from non-count nouns resulting from negative transfer. For example, some of the students thought that transportation is countable so that they used the sentence *few transportation* instead of *little transportation*. Therefore, the teacher paid attention to interference as teaching common errors to the students.
- 2) Insufficient application of rules in their production. They were accustomed to memorize the grammatical rules and when asked to do the writing task, they were unable to use the structure they memorized in practice accurately. Thus, the teacher engaged students in writing exercises and tasks and asked them to write as much as they could. In so doing, he assigned some assignments for them to do at home, too.

3) Lack or inadequate knowledge of collocations. They did not know the precise word combination and because of this, they made mistakes. For example, some students while doing the writing task of unit 2 (section 6) regarding the traffic problems, made collocational errors. For example, there were instances of the sentence: “The problem is that the traffic is not quick” instead of writing “The problem is that the traffic is not fast”.

The word traffic collocates with fast but not with quick. The teacher also tried to help student’s focus and notice such errors resulting from lack of collocational knowledge in her explicit teaching of common errors.

After Mediation Phase

Having finished the treatment phase, the researcher distributed the post-test containing questions regarding the first four units. The questions were in multiple-choice format and students were required to choose the correct answer from the four alternatives. The test was taken from Interchange/Passages Objective Placement Test, version B. The students were asked to participate in the test in session 14, when the teacher completed the teaching of the first four units.

Following this step, to gather data for the second research question regarding the significant difference between explicit teaching of common grammatical errors and aspects of grammatical rules, the teacher distributed for writing tasks to the students in session 15, and asked them to write a short paragraph for each of the topic. The researcher chose the topics so as to elicit students’ grammatical knowledge with respect to the four aspects of grammatical use that she taught during the mediation phase to the experimental group.

Finally, during the last step of the study, the teacher interviewed with four students to find out their reactions towards the application of explicit teaching of common errors and its influence on their writing accuracy. In so doing, these learners were interviewed in face-to-face interaction with the researcher. They were selected based on purposive sampling so that qualitative data were collected through interviews from these four students who were in experimental group. A semi-structured interview has a sequence of themes to be covered, as well as suggested questions while, at the same time; there is openness to changes of sequences and forms of questions in order to follow up the answers given (Dörnyei, 2007).

RESULT AND DISCUSSION

Homogeneity of the Participants

To homogenize students with respect to their language proficiency, the researcher just included those students whose scores on Nelson Proficiency Test were one standard deviation below and above the mean.

Table 1: Nelson Proficiency Test

N	Valid	36
	Missing	0
Mean		30.8056
Std. Deviation		12.53753

The mean of the scores is 30 and standard deviation is 12. Therefore, given one standard deviation above and below the mean, students whose scores obtained from Nelson Proficiency Test are between 18 and 42 are selected to take part in the study. Therefore, out of 36 students, 30 students were remained to participate in the study.

Explicit Teaching of Common Errors and Students' Performance on Writing Accuracy
Pre-test between Two Groups:

Table 2: Mean and standard deviation of the two groups before treatment

Groups	N	Mean	Std. Deviation	Std. Error Mean
Pre-test scores				
Control	15	20.33	4.337	1.120
Experimental	15	22.07	3.731	.963

Table 2 represents the mean and standard deviation for control group (M=20.33, SD=4.33) and experimental group (M=22.07, SD=3.73). The total number of students participated in the study was 30.

Table 3: Independent samples T-test for the two groups before treatment

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	T	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Pre-test scores	Equal variances assumed	.67	.41	-1.17	28	.251	-1.733	1.47	-4.75	1.29
	Equal variances not assumed			-1.17	27.3	.251	-1.733	1.47	-4.76	1.29

Independent Sample T-test offers two lines as displayed by Table 3. With reference to the Table, the Sig. value is larger than .05, therefore, the first line should be followed which refers to Equal variances assumed. That is to say, since in this table, the significant value is .41 which is larger than .05; the first line is used to report findings.

To figure out if there is a significant difference between the control and experimental groups, having checked the column labeled Sig. (2-tailed), the researcher discovered there is a significant difference in the mean scores on the dependent variable for each of the two groups. Because the value in the Sig. (2-tailed) column is more than .05 (which is .25), there is *no* significant difference between the two groups before the treatment phase.

Post-test between Two Groups

Table 4: Mean and standard deviation of the two groups after treatment

Group Statistics		N	Mean	Std. Deviation	Std. Error Mean
post-test scores	Control	15	23.33	4.624	1.194
	experimental	15	27.33	3.331	.860

As displayed by Table 4, the mean and standard deviation for each of the groups differ from those of pre-test. The results obtained showed that students at experimental class ($m=27.33$) performed better than the students at controlled class ($m=23.33$).

Table 5: Independent samples T-test of the two groups after treatment

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	T	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
post-test scores	Equal variances assumed	2.85	.102	-2.71	28	.011	-4.00	1.47	-7.01	-.986
	Equal variances not assumed			-2.71	25.44	.012	-4.00	1.47	-7.02	-.972

Since the Sig. value in Table 5 is larger than .05 so that the first line is used to report the data, which refers to Equal variances assumed. To discover if there is a significant difference between the two groups, we refer to the column labeled Sig. (2-tailed).

Since the Sig. (2-tailed) value is *less* than .05 which is .01, then there is a significant difference in the mean scores on the dependent variable for each of the two groups.

In Table 5, the Sig. (2-tailed) value is .01. As this value is *less than* the required cut-off of .05, we conclude that there is a statistically significant difference in the mean scores for the two classes. Thus, the first research hypothesis of the study was rejected.

Calculating the Effect Size for Independent-samples t-test

To determine the effect size between your groups, the researcher used eta squared, as the most commonly used formula. Eta squared can range from 0 to 1 and represents the proportion of variance in the dependent variable that is explained by the independent (group) variable. SPSS does not provide eta squared values for t-tests. Therefore, the researcher calculated it manually. The procedure for calculating eta squared is provided below:

The formula for eta squared = $t^2 / t^2 + (N1 + N2 - 2)$

As the table shows, in this study, $t=2.71$. Therefore:

$$(2.71)^2 / (2.71)^2 + (15 + 13) = 7.34/35.34 = 0.20$$

The guidelines (proposed by Cohen, 1988) for interpreting this value are:

.01=small effect,

.06=moderate effect,

.14=large effect.

Therefore, the effect size of .20 is large. It means that experimental class performed better than control class, the effect size was considerable.

Students' Performance on Writing Accuracy with Respect to Aspects of Grammatical Rules

Table 6: Mean and standard deviation of students' scores on aspects of grammatical rules

	N	Mean	Std. Deviation	Std. Error
used to for habitual actions	15	15.80	1.320	.341
adverbs of quantity with count and non-count nouns	15	14.73	1.387	.58
evaluations and comparisons with adjectives	15	15.80	1.146	.296
simple past vs. present perfect	15	13.27	1.387	.358
Total	60	14.90	1.654	.214

Table 6 represents the mean and standard deviation for students' scores on grammatical rules under study. The mean score of the students on *used to for habitual actions* is 15.80, that of *adverbs of quantity with count and non-count nouns* is 14.73, that of *evaluations and comparisons with adjectives* is 15.80 and that of *simple past vs. present perfect* is 13.27. The table also gives the number of people in each group which is 20.

Table 7: Test of Homogeneity of Variances for scores on grammatical rules

Levene Statistic	df1	df2	Sig.
.537	3	56	.659

Checking the significance value (Sig.) for Levene's test, since this number is *greater* than .05, the assumption of homogeneity of variance has not been violated. As Table 7 shows, the Sig. value is .659 and as this is greater than .05, the homogeneity of variance assumption is not violated.

Table 8: On-way ANOVA for scores on grammatical rules

Scores					
	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	64.733	3	21.578	12.500	.000
Within Groups	96.667	56	1.726		
Total	161.400	59			

Using the statistical formula of one-way between-groups ANOVA, the researcher examined the significant difference between the students' scores on grammatical rules, as measured by the Grammar Post-test. There was a statistically significant difference at the $p < .05$ level in students' scores for the three age groups [$F(3, 57) = 12.50, p = .01$] (See Table 8). Therefore, the second research hypothesis was rejected.

Table 9: Post-hoc test for grammatical rules

Scores

Tukey HSD

(I) levels	(J) levels	Mean Difference (I-J)	Std. Error	Sig.
used to for habitual actions	adverbs of quantity with count and non-count nouns	1.067	.480	.129
	evaluations and comparisons with adjectives	.000	.480	1.000
	simple past vs. present perfect	2.533*	.480	.000
adverbs of quantity with count and non-count nouns	used to for habitual actions	-1.067	.480	.129
	evaluations and comparisons with adjectives	-1.067	.480	.129
	simple past vs. present perfect	1.467*	.480	.017
evaluations and comparisons with adjectives	used to for habitual actions	.000	.480	1.000
	adverbs of quantity with count and non-count nouns	1.067	.480	.129
	simple past vs. present perfect	2.533*	.480	.000
simple past vs. present perfect	used to for habitual actions	-2.533*	.480	.000
	adverbs of quantity with count and non-count nouns	-1.467*	.480	.017
	evaluations and comparisons with adjectives	-2.533*	.480	.000

*. The mean difference is significant at the 0.05 level.

Post-hoc comparisons are used to conduct a whole set of comparisons, exploring the differences between each of the groups or conditions in the study. Having calculated the overall F ratio and finding the significant differences among aspects of grammar, the researcher went on and performed additional test to identify where these differences occur. The post-hoc test is used to exactly determine where the differences among aspects of grammar occur. Look down the column labeled **Mean Difference**, we look for any asterisks (*) next to the values listed. If an asterisk is found, this means that the groups being compared are significantly different from one another at the $p < .05$ level. The exact significance value is given in the column labeled **Sig.** As displayed by Table 4.9, Post-hoc comparisons using the Tukey HSD test indicated that the mean score for grammatical rule, *simple past vs. present perfect* was significantly different from other grammatical rules.

Calculating the Effect Size for Grammatical Rules

Since SPSS does not generate the effect size formula, the effect size can be calculated using eta squared, as one of the most common effect size statistics. The formula is:

Eta squared = Sum of squares between-groups / Total sum of squares

In this study, the researcher divided the Sum of squares for between groups (64.73) by the Total sum of squares (161.40). The resulting eta squared value is .40, which in Cohen's (1988) terms would be considered a *great* effect size. It means that the effect size between the three groups is great.

Cohen classifies .01 as a small effect, .06 as a medium effect and .14 as a large effect.

Results from Interview

As for the last research question, the researcher employed Semi-structured Interview, following the guidelines proposed by Dornyei (2007) through which initially the researcher acting as a facilitator posed open-ended questions in English language and let students express their ideas while taking notes, and using audio-tape recorder. The researcher finally came up with common themes employing the techniques of open-coding, axial-coding and selective coding to analyze data. Here are the questions and some common statements elicited from the responses by the students:

Question 1: What are the major problems in writing skills?

The results from the interview revealed that students mostly complain about their grammatical mistakes and they do not know how to write accurately. They believed that structural issues are important in arranging the sentence correctly and making the sentence well-formed and vocabulary is important in writing fluently. They like to gain mastery over grammatical rules and apply what they learn to other context and written communication.

Question 2: What do think of exposing to common errors before starting writing?

The students interviewed mentioned that the technique was useful because when we learn the rules and mostly we memorize them, we cannot apply the rules and we indeed forget the correct rule when we start writing in practice. Being exposed to the common errors regarding the issue under question, help us much because we do not need to just memorize the rules. In this way, we become aware of the mistakes we may commit. So while engaging in doing writing tasks, we review the common errors in our mind and avoid committing those mistakes.

Restatement of the Problems

In this study, the major problem addressed was to examine the relationship between explicit teaching of common errors and students' performance on writing accuracy with regard to 30 students studying at Kimia English Institute in Sannandaj, Kordestan province. The difference between students' performance on writing accuracy with respect to the aspects of grammatical rules was also investigated. The results from semi-structured interview were also reported by the researcher. The first and second questions in this study were quantitative and the last question was qualitative. Therefore, this study is seeking to answer the following three major questions:

- 1) Is there any relationship between explicit teaching of common grammatical errors and EFL learners' writing accuracy?
- 2) Is there any significant difference between explicit teaching of common grammatical errors and aspects of grammatical rules including 'used to for habitual actions', 'adverbs of quantity with count and non-count nouns', 'evaluations and comparisons with adjectives', and

'simple past vs. present perfect'?

3) How do the learners react towards the implementation of explicit teaching of common errors in improving writing accuracy?

These are the main topics addressed in the study and readers are asked to reflect on them.

Summary of the Findings

In the previous chapters, a complete report of the findings of the study has been presented with respect to the three questions posed in the first chapter. In this section, the findings of the study are summarized briefly as follows:

To answer the first research question of the study, 30 female students in two groups (15 in control group and 15 in experimental group) were asked to participate in the study. Following the treatment phase, the results obtained from Descriptive Statistics revealed that students in experimental group ($M=27.33$, $SD=3.33$) outperformed students in control group ($M=22.33$, $SD=4.62$). Moreover, the results from Independent Sample T-test showed that there was a significant difference in scores obtained from the post-test of explicit teaching of common errors in writing accuracy [$t_{(28)} = -2.71$, $p < 0.05$]. The magnitude of the differences in the means was large ($\eta^2 = .20$). Thus, the effect size of .20 was large.

The current study is in line with the earlier studies on explicit teaching of errors. A more common finding among these earlier studies is that teachers' error correction occurs frequently, irrespective of pedagogical focus and classroom setting and that explicit error treatment is desired by most L2 learners (Leeman, 2003; Leki, 1991). These studies, however, also reveal that teachers' provision of explicit feedback is often arbitrary, idiosyncratic, ambiguous and unsystematic, which in turn invites the question as to whether error correction in the classroom is of any value (Loewen, 2002). More current investigation undertaking the role of negative feedback and the relative effects of different types of explicit feedback in the context of language teaching (e.g., Doughty, 1994; Han, 2001) has sometimes been more explanatory and experimental. The results from Han (2001) findings showed that explicit teaching of grammar contribute more to the success of the students in writing performance. Classroom-based studies mainly center on correction provided by the teacher; for example, whether the feedback is immediate or delayed.

As for the second research question of the study, the researcher, first, checked homogeneity of variance, using Levene's test, and found that the assumption of homogeneity of variance was not violated. Then, she generated one-way between-groups ANOVA to examine the significant difference between the students' scores on grammatical rules, as measured by the Grammar Post-test. The results indicated that there was a statistically significant difference at the $p < .05$ level in students' scores for the three age groups [$F(3, 57) = 12.50$, $p = .05$]. The significant F test indicated that the null hypothesis could be rejected; however, since it did not indicate which of the levels differ, post-hoc test was conducted. Post-hoc comparisons using the Tukey HSD test demonstrated that the mean score for grammatical rule, *simple past vs. present perfect* was significantly different from other grammatical rules.

As for the last research question regarding students' reactions towards the use of explicit teaching of common grammatical errors, the researcher explored the issue using semi-structured interview containing two open-ended questions. The results reported that the students were mostly eager to work on explicit teaching of common errors since although they learn grammatical rules, they learn them by heart. They are not able to apply the rules accurately in writing; however, through working on the common errors, they practically try to avoid grammatical mistakes and write well-form sentences. They believed that while engaging in the process of writing, they have in their mind common error regarding the issue and this helps them much not to do the same mistakes.

CONCLUSIONS

Based on the findings, major conclusions can be drawn from the present study. The results of this experimental study revealed that, when second language learners receive explicit teaching which enhances their awareness and draws their attention to the common errors committed by L2 learners, and when they are provided with the opportunity to interact, and discuss these common errors with their peers and the teacher, in the revised and redrafted version, they move progressively towards greater accuracy in producing the target-like forms. As a result of following explicit teaching of common errors, the students not only could improve their written accuracy in the short term but also develop their internalized grammatical system and improve their level of proficiency in general.

Comparing the performance of the experimental group with that of the control group, it can be concluded that raising students' consciousness of different types of errors performs a more effective role than just raising students' awareness by explicit teaching. Traditionally, among language skills, writing has been regarded as the most difficult in second language acquisition, and today it is the most practical language skill that can be used by learners to interact internationally, especially with the rapid expansion of globalization and cyber-communication. Therefore, using writing accurately is influential in this regard. Prominent researchers in second language writing mention that form-focused feedback can be effective, especially when accompanied by classroom explicit instruction (White, Spada, Lightbown & Ranta, 1991). According to Ferris (2002), learners who are provided with explicit teaching over a period of time can improve their language accuracy. A case in point is the study conducted by Chandler (2003) who tracked students' writing over one semester and found that both underlining and direct teaching of errors reduced grammatical and lexical errors in subsequent writing.

Since recent findings on SLA, focusing on form-focused instruction (Long, 1991; Ellis, 2001) and noticing hypothesis (Schmidt, 1990), put emphasis on instructed SLA, explicit teaching of grammatical errors is in line with such perspectives, and learners can promote in writing accurately by means of direct instruction presented by the teacher. In this way, students' awareness is activated while listening to the teacher and reactivated while engaging in writing tasks assigned by the teacher. Students can comprehend the rules more deeply and apply them more precisely. It can be concluded that explicit teaching has a significant effect on improvement

of writing accuracy of the experimental group and the current study confirms the positive effect of direct teaching of common errors on students' writing skills. Point taken, the scholarly literature on the effectiveness of explicit grammar instruction in writing accuracy, especially in L2 settings, should be well investigated to reveal more in-depth information. Although in English language classrooms, grammar has been the topic of hot debate and controversy in public and academic arenas for more than 50 years, it has not been examined widely to be more confident in generalization issues. For example, in a current study undertaken by Penn, Park and Lim (2013), the content analysis of 238 empirical research studies involving Korean participants was found that not even a single study with respect to Korean participants was published in the previous 20 years exploring this relationship between explicit grammar instruction and writing (Penn, Park & Lim, 2013). Unfortunately, with reference to the short list of articles in this regard, unlike much interest in the role of corrective feedback in L2 writing, it seems that there has almost been no interest in investigating the role of explicit grammar instruction in second or foreign language writing (Andrews et al., 2006). Therefore, it can be concluded that more valid and reliable evidence is wanting in this area of investigation (Tomlinson, 1994; Wyse, 2001).

“PASSAGES” IN PERSPECTIVE

Mehrnush Ebrahimi

Department of TEFL, Bandar Abbas Branch, Islamic Azad University, Bandar Abbas, Iran

E-mail: m.ebrahimi_job@yahoo.com

ABSTRACT

It is beyond doubt that English language has become the platform of communication all over the world. In fact, it is one of the main reasons why English is taught as a foreign language in many countries. Moreover, it has already become a medium of communication in many educational settings such as public schools. Among the teaching and learning materials, textbooks or course books play a crucial role. A textbook should aim to provide as much as possible in one book and should be adequate to meet the needs of the students during the course. The English as foreign language (EFL) instructors then face the challenging task of opting a textbook not just based on fads and fashions. Another feature that blurs the instructors' judgement may be the publisher's reputation. In order to select an effective and appropriate textbook, they are bound to implement material evaluation following certain guidelines and criteria. This article tries to evaluate an English textbook series, namely Passages (Richards & Schmidt, 2002), based on Tomlinson (2003)'s criteria. The textbook was examined according to two broad criteria (reliability and validity) by which one can have a bird view of most of all its vices and virtues. Based on the data collected through the checklist, the English textbook series, Passages, do not enable the students so much to operate effectively in their future academic or professional life. That is, they are not based on learner needs. However, the textbooks encourage independent language learning. It is hoped that this textbook evaluation provides the necessary insight for all language teachers to conduct such a procedure in their own practice of textbook selection. Both teachers and material developers should notice that a variety of factors should be taken into account in designing and selecting a book. Moreover, the needs of the students as well as the course objectives need to be considered in the very beginning stages of evaluating a textbook.

KEYWORDS: English Language Teaching (ELT); English text books; Material Evaluation; Checklist

INTRODUCTION

English language instruction has many important components but the essential constituents of many ESL/EFL classrooms and programs are the textbooks and instruction materials that are often used by language instructors. As Hutchinson and Torres (1994) suggest:

"The textbook is an almost universal element of English language teaching. Millions of copies are sold every year, and numerous aid projects have been set up to produce them in various countries...No teaching-learning situation, it seems, is complete until it has its relevant textbook."
(p.315).

The choice of language teaching materials can determine the quality of learning-teaching procedure. As a part of the materials used in the language classroom, the textbook can often play

a crucial role in students' success or failure. Therefore, particular attention must be paid to evaluate such materials based on valid and reliable instruments. One of the common methods to evaluate English Language Teaching (ELT) materials is the checklist. An evaluation checklist is an instrument that provides the evaluator with a list of features of successful learning-teaching materials. According to these criteria, evaluators like teachers, researchers as well as students can rate the quality of the material. (Mukundan, Nimehchisalem & Hajimohammadi, 2011)

Evaluation is a process of inquiry in which data are gathered through different instruments and from different sources. This information is interpreted to make important decisions based on the research results. These decisions might require a change and effect a drastic alteration in the outline and process of a language program instruction. All these efforts are made to the betterment of a course of study and bringing about satisfactory results. Rea-Dickens and Germaine (1994) defined Evaluation as a dynamic process which investigates the suitability and appropriateness of an existing practice.

To do this appropriately, books have to bear certain characteristics in their every aspect including physical and thematic considerations. With this respect, in last decades a movement known as "textbook evaluation" began to emerge whose goal was to construct checklists based on which a book could be analyzed in detail in order to assure its usefulness and practicality with such factors as proficiency level of students, learners' needs, course objectives, gender, and other contextual factors. All these factors have to be properly met through textbook's content. So textbooks greatly influence how content is delivered. (Sarem, Hamidi & Mahmoudie, 2013)

LITERATURE REVIEW

Role of Textbooks in English Language Teaching

A textbook has always been the most preferred instructional material in ELT. They are best seen as a resource in achieving aims and objectives that have already been set concerning learner needs (Cunnings worth, 1995). Textbooks play a prominent role in the teaching /learning process and they are the primary agents of conveying the knowledge to the learners. Besides, one of the basic functions of textbooks is to make the existence knowledge available and apparent to the learner in a selected easy and organized way.

Hutchinson and Torres (1994) argued that the textbook has a very important and a positive part to play in teaching and learning English. They state that textbooks provide the necessary input into classroom lessons through different activities, readings and explanations. Thus, they will always survive on the grounds that they meet certain needs. Allwright (1981) added a further dimension to the role of the textbook by characterizing the lesson as an interaction between the three elements of teacher, learners and materials. This interaction enhances the opportunities to learn.

Regarding the multiple roles of textbooks in ELT, Cunnings worth (1995) identified textbook as a resource in presenting the material, a source for learners to practice and the activities. They also provide the learners with a reference source on grammar, vocabulary and pronunciation. What is

more, textbooks serve as a syllabus and a self-study source for learners. They also serve as a support for the beginning teachers who have yet to gain in confidence.

Richards (2001) stated that textbooks act as a key component in most language programs. They provide the learners with the necessary input that the learners receive and the language practice that occurs in the class. They also serve as the basis for the language content and skills to be taught and other kinds of language practice that the learners take part in. Regarding the advantages, Richards (2001) stated that without textbooks a program may have no path, therefore they provide structure and a syllabus.

Besides, the use of a textbook in a program can guarantee that students in different classes will receive a similar content and therefore can be evaluated in the same way. In other words textbooks provide the standards in instruction. Moreover, they include a variety of learning resources such as workbooks, CDs and cassettes, videos, etc., which makes the learning environment interesting and enjoyable for the learners. As for inexperienced teachers, Richards (2001) stated that textbooks can serve as a tool to train them.

Similarly, Grant (1987) presented the opinions of teachers about the textbook in his book. Most teachers state that a textbook shows the order what is to be taught and learned and in which order it is to be taught and learned. They guide the teachers as to what methods to be used and as Richards (2001) stated above, a textbook saves the teacher an extraordinary amount of time.

Despite the impact of new technologies, textbooks will doubtless continue to play an important role in language teaching and provide a useful resource for both teachers and learners. What is more it has significant impact on the learners' meeting their language learning objectives. The role of the textbook in the language classroom is undeniable. Both teachers and students need a framework on which to build and textbooks definitely provide this.

Approaches to Materials Evaluation in English Language Teaching

Rea-Dickins and Germaine (1994) stated that 'evaluation is an intrinsic part of teaching and learning' (p.4) Evaluation plays a key role in education and it is important for the teacher since it can provide valuable information for the future going of classroom practice, for the planning of courses, for the management of learning tasks and students. Finally, evaluation is essential for the use of instructional materials such as textbooks.

Jones (1985) emphasized that "evaluation in LL (language learning) and LT (Language Teaching), evaluation generally refers to the theoretical or empirical assessment of the curriculum itself and its components from various perspectives: assessment of teacher performance, learner achievement, materials and so on" (p.21). As mentioned, evaluation is quite an important part of the educational process. It is as the means by which we can gain a better understanding of what's effective, what's less effective and what appears to be no use at all.

Ellis (1997) distinguished two types of materials evaluation, namely, predictive evaluation and retrospective evaluation. A predictive evaluation is designed to make a decision regarding what

materials to use. Teachers who are required to carry out a predictive evaluation determine which materials are best suited to their purposes.

Ellis (1997) indicated that there are two principles ways in which teachers can carry out predictive evaluation. One is to rely on evaluations carried out by expert reviewers who identify specific criteria for evaluating materials. However, in reviews of individual course books the criteria can be inexact or implicit. The other way is that teachers can carry out their own predictive evaluations by making use of various checklists and guidelines available in the literature. The idea behind using such guides is to assist teachers carry out a predictive evaluation systematically, yet the author points out that ‘there are limits to how scientific such an evaluation can be’ (p.37).

It is for the reason mentioned above that there is a need to evaluate materials retrospectively because such an evaluation provides the teacher with feedback so as to determine whether it is worth using the material again. Thus, Ellis (1997) stated that ‘a retrospective evaluation serves as a means of testing the validity of a predictive evaluation and what is more, it may point to ways in which the predictive instruments can be improved for future use (p.37). As can be understood from the above definitions, both predictive and retrospective evaluations aim at making the teaching/-learning environment more effective. They both help teachers to make appropriate judging concerning the effectiveness of their teaching.

Moreover, as Hutchinson (1987) pointed out materials evaluation not only serves the immediate practical aim of selecting teaching materials but also plays a critical role in developing teacher’s awareness in a number of ways which are providing teachers to analyze their own presuppositions about the nature of language and learning, forcing teachers to set their prerequisites and helping them to see materials as an essential part of the whole teaching/learning situation.

There are two main approaches that have an important role for the purpose of selecting, improving and modifying materials to suit the needs of learners and teachers in a particular teaching/learning context. These are called as macro and micro approach to evaluation of materials. A macro evaluation focus on an overall assessment of whether an entire set of materials has worked in relation to the needs identified. In a micro evaluation, however, the focus is on the evaluation of effectiveness of the tasks. A micro evaluation of a task can both show to what extent a task is appropriate for the particular group of learners and reveal certain weaknesses in the design of a task for future. (Ellis, 1997)

Empirical Studies on Textbook and Materials Evaluation

There are some empirical studies carried out on the evaluation of textbook and materials evaluation. Ayman (1997) conducted a materials evaluation study which involved a macro level evaluation of an in-house textbook in relation to the perceptions of the instructors and students on the overall effectiveness of the textbook after the implementation of it. The purpose of the study was to find out how the students and the instructors evaluate a textbook which was based on English for Academic Purposes (EAP).

The results of the study revealed that both the students and instructors were generally positive about textbook. However, there were some aspects that they felt negative about the textbook. These were insufficiency of some activities, inappropriateness of content/topics and ineffectiveness of the teacher's book. The results obtained from the study indicated that the instructors were more positive about the textbook than the students. Based on the findings of the study, the researcher suggested that those aspects of the textbook that both the students and teachers viewed negatively should be improved. Ayman (1997) made some further recommendations about the instructors that they should be well trained in how to use the textbook effectively in their classes and they should also find ways to raise students' awareness in using the textbook.

Yumuk (1998) also conducted an evaluation study and investigated the effectiveness of English Language Support (ELS) 210 Course Materials for Bureau Management and Secretarial Studies (BMS) at Bilkent University School of English Language (BUSEL). This case study was conducted through both macro and micro level evaluations on the basis of five criteria developed. These were content, organisation of content, consideration of perceptual learning style differences, integration of learning training elements to develop autonomy, and physical appearance to enhance learning.

Data were collected through questionnaires administered to 41 students and interviews carried out with two curriculum level coordinators, two instructors and nine students. Also, content description of the materials was provided to obtain information about the materials in relation to the criteria developed.

The data collected from the curriculum level coordinator, instructors and student interviews and the observations were also analyzed using descriptive statistics. The results of the study revealed that the materials were effective to some extent in relation to content, organisation of content and Physical appearance of the materials. However, to a large extent the materials were not effective due to the fact that they did not consider perceptual learning style differences in general and failed to integrate learning training elements to develop learner autonomy.

Yakhontova (2001) conducted an evaluation study on an EAP textbook called Academic Writing for Graduate Students by Swales and Feak in the Ukrainian University classroom. The purpose of the study was to evaluate the intellectual and emotional reactions of the students toward a new kind of textbook. The subjects of the study were 12 students whose reactions and opinions were based on three sources. First of all, the students were asked to express their opinions of the textbook by providing the answers to a short questionnaire at the end of the course.

RESEARCH QUESTIONS

- 1-What are the pedagogic values of the 2nd edition of Passages series?
- 2- What are the strengths and weaknesses of the 2nd edition of Passages series?
- 3-Is the English textbook, Passages based on learner needs?

- 4-Does the textbook encourage independent language learning exploit learner's prior knowledge and experience and provide opportunities for further developments to some extent?
5-Does the textbook offer opportunities for cooperative learning?

METHODOLOGY

Participants

In this study, only the researcher and two other teachers played the role of the participants. They have taught *Passages* for some years and accordingly they are familiar with it. One of the researchers teaches passages private for students ages 20 to 25.

Instruments

This study employed a checklist (Appendix A) to collect data on the points of view of the researchers about the mentioned textbook. The checklist was developed by the researchers according to Tomlinson (2003)'s criteria and it was used to obtain quantitative data. It is composed of two dimensions: reliability and validity of the aforementioned textbook. It is also consisted of 106 items related to five criteria to conduct a macro level material evaluation.

Procedure

The participants were asked to complete the textbook evaluation checklist by checking a point on the Likert scale which best shows their perception. Also they were asked to write a number between 0 to 4 which shows what they exactly feel about the textbook. The checklist was expected to take approximately 30 minutes for the participant to complete. The closed questions required respondents to choose from a five-point Likert scale indicating varying degrees of agreement or disagreement (4 = complete agreement, 0 = No agreement). 0 indicates learners' disagreement, 1 indicates learners' agreement as limited, 2 indicates learners' agreement moderately, 3 learners' agreement extensively, and 4 indicates learners' agreement completely. Seven open-ended questions tapped into subjects' conceptions of learning and their interpretations of a specific learning context.

Data Analysis

The checklist evaluates the English textbook *Passages* from two aspects: reliability and validity. Each of these dimensions consists of items grading the textbook on a scale of 0_4, representing the criterion strongly available (level 4) to strongly unavailable (level 0). These items relates to five criteria, namely Psychological Validity, Pedagogical Validity, Process and content validity, Educational validity and Reliability, through which the researcher conducts a macro level material evaluation.

RESULTS AND DISCUSSION

Results of the evaluations are presented in the tables.

Tables 1 to 4 evaluate the aforementioned textbook series regarding their validity.

Table 1: Psychological Validity

Psychological Validity	Zero	limited	moderate	extensive	complete
Rationale/learner needs		Yes			
Independence and autonomy			Yes		
Self-development				Yes	
Creativity			Yes		
Cooperation			Yes		

Based on the data collected through the appended checklist, the textbook Passages has moderately process and content validity.

Table 2: Pedagogical Validity

Pedagogical Validity	Zero	limited	moderate	extensive	complete
Guidance					Yes
Choice	Yes				
Reflection/innovation			Yes		

Regarding pedagogical validity, the textbook has proved to be complete in this respect.

Table 3: Process and content validity

Process and content validity	Zero	limited	moderate	extensive	complete
Methodology				Yes	
Content	Yes				
Appropriacy				Yes	
Authenticity	Yes				
Cultural sensitivity	Yes				
Layout-graphics					Yes
Accessibility	Yes				
Linkage					Yes
Selection/grading					Yes
Sufficiency		Yes			
Balance/integration/challenge			Yes		
Stimulus/practice/revision			Yes		
Flexibility		Yes			

Table 4 indicates that the mentioned textbook series have extensive educational validity.

Table 4: Educational validity

Educational validity	Zero	limited	moderate	extensive	complete
Educational validity	Yes				

Table 5 evaluates the aforementioned textbook series regarding their reliability.

Reliability

Table 5: Reliability

Reliability	Zero	limited	moderate	extensive	complete
	Yes				

The data collection related to reliability indicates that the mentioned textbook series are completely reliable.

Discussion

Based on the data collected through the checklist, the English textbook series, Passages, do not enable the students so much to operate effectively in their future academic or professional life. That is, they are not based on learner needs. However, the textbooks encourage independent language learning, exploit learner's prior knowledge and experience and provide opportunities for further developments to some extent. Not only the mentioned textbooks offer opportunities for cooperative learning, through pair and group work activities and information exchange tasks; they also involve the learners as human beings rather than just as language learners.

In these text books, there is enough guidance for teachers and students. Also they encourage teacher creativity, imagination and exploration and foster him to add, delete, change and improvise the content of the material. Although the level and the intended audience are clearly spelt out, the text generates limited 'real-life' communication processes. That is, the material does not provide extensive exposure to authentic English through purposeful reading and/or listening activities.

The units and exercises are well linked in terms of theme, situation, topic, pattern of skill development or grammatical/lexical progression. The selection and grading of tasks and activities are based on a clearly discernible system. But the books are complete enough to stand on its own to be workable. Therefore, the teacher should use other supplementary material to expose students to real-life situations.

The activities in these textbooks allow the learner to go beyond a merely superficial understanding of the text/discourse. However, the materials do not allow for flexible use of tasks/texts/activities, permitting them to be exploited or modified as required by local circumstances.

The textbooks also accord with broader educational concerns extensively (e.g., the nature and role of learning skills, concept development in younger learners, the function of 'knowledge of the world', etc.), and they have the same effect with different groups of target learners. So, they are completely reliable.

CONCLUSION

In conclusion, according to Wang (2011), the case study of one particular EFL course book gives us more insights into the understanding of our teaching materials. Through the process of evaluation some important issues have appeared. By evaluating the teaching material teachers can understand more about language learning and this leads to new concepts and ideas, which in turn contribute to the adjustment, modification and eventually improvement of their own teaching. Furthermore, we should have the right attitudes towards textbooks. The underlying message being that we should not regard a textbook as an absolute authority and depend on it too much, but rather take whatever is beneficial to teaching and learning and adapt, complement or modify what's not satisfactory. In this way we are making use of the textbooks to achieve our own purposes. As we have seen from the analysis and discussion, our textbooks may have problems of various kinds. Much therefore needs to be done on the part of the teacher is to apply creativity and imagination in bringing out the most effective results of teaching and learning. Finally, I conclude with Cunningsworth's remark,

No course book will be totally suited to a particular teaching situation. The teacher will have to find his own way of using it and adapting it if necessary. So we should not be looking for the perfect course book which meets all our requirement, but rather for the best possible fit between what the course book offers and what we as teachers and students need.(1984:89)

Limitations of the study

Like the other survey studies, the present had some limitations. The first limitation is that due to the time limitation, only the English textbook series, namely Passages were selected. Therefore, the results are context dependent and they should be generalized with great care. The second limitation is about the number of the participants. The number of teachers who participated in the study is limited and this may have affected the results of the study.

APPENDIX A: CHECKLIST

A.1. Validity

A.1.1. Psychological Validity

Rationale/Learner Needs

1. Have the aims and objectives of the materials been clearly spelt out? 0 1 2 3 4
2. Are the materials appropriate and are they likely to be effective in helping learners to acquire English?
0 1 2 3 4
3. Do the materials make a positive contribution to heightening and sustaining learner motivation?
0 1 2 3 4
4. Do the materials give the learner confidence to initiate communicative events and persist with the attempted communication despite difficulties? 0 1 2 3 4
5. Do the materials cater for the development of language skills that would enable them to operate effectively in their future academic or professional life? 0 1 2 3 4

A.1.1.1.Independence and Autonomy

1. Is the learner a decision-maker or just a receiver of information? 0 1 2 3 4
2. Do the materials encourage independent language learning? 0 1 2 3 4
3. Do the materials encourage learner to guess, predict, discover, take risks, or try out several alternatives?
0 1 2 3 4
4. Do they give learners plenty of opportunities to make choices which suit their linguistic level, their preferred learning styles, their level of involvement in the text and the time available to them?
0 1 2 3 4
5. Do the materials involve the learner in thinking about the learning process and in experiencing a variety of different types of learning activities? 0 1 2 3 4
6. Do they allow sufficient time to think and reflect on their learning? 0 1 2 3 4
7. Do the materials help individual learners discover their learning styles and preferences, study habits and learning strategies? 0 1 2 3 4
8. Do the materials provide explicit instruction on various language learning strategies and suggest ways of using and developing them? 0 1 2 3 4
9. Is a sufficient range of strategies provided? 0 1 2 3 4
10. Do they encourage learners to evaluate the strategies or the learning activities or its content?
0 1 2 3 4
11. Do the materials allow self-monitoring and feedback? 0 1 2 3 4

A.1.1.2.Self-Development

1. Do the materials/texts engage the learners both cognitively and effectively? 0 1 2 3 4
2. Do the materials credit learners with a capacity for rational thought and problem-solving? 0 1 2 3 4
3. Do they also involve the learner's emotions in the learning process? 0 1 2 3 4
4. Do the materials allow for the development of creative and critical thinking skills? 0 1 2 3 4
5. Do the materials allow scope for the development of a desirable set of attitudes? 0 1 2 3 4
6. Do the materials allow the individual to develop his or her talents as fully as possible? 0 1 2 3 4
7. Do the materials involve the learners as human beings rather than just as language learners? 0 1 2 3 4
8. Do the materials help build personality and learner voice and give learners an understanding about themselves?
0 1 2 3 4

A.1.1.3.Creativity

1. Do the materials exploit the learner's prior knowledge and experience and provide opportunities for further developments? 0 1 2 3 4
2. Do the materials allow sufficient opportunities for student inventiveness and energy and encourage their participation in resource generation? 0 1 2 3 4
3. Do the materials provide additional challenging activities for highly motivated learners? 0 1 2 3 4
4. Have opportunities been built into the materials for learners to contribute? 0 1 2 3 4

A.1.1.4.Cooperation

1. Do the materials offer opportunities for cooperative learning, through pair and group work activities and information exchange tasks? 0 1 2 3 4
2. Are students encouraged to learn from and help one another and, more importantly, able to work in a less stressful atmosphere in the classroom? 01 2 3 4
3. Do they encourage positive interdependence by giving each individual a specific role to play in the activity allowing him/her to contribute actively to the group interaction?
0 1 2 34

A.1.2.Pedagogical Validity

A.1.2.1Guidance

1. Are the teacher's notes useful and explicit? 0 1 2 34
2. Is there enough guidance for teachers and students? 01 2 3 4
3. Are the transcripts, answer keys, vocabulary lists, structural/functional inventories and lesson summaries provided in the teacher's book? 0 1 2 3 4
4. Is allowance made for the perspectives, expectations, and preferences of non-native teachers of English?
0 1 2 3 4

A.1.2.2Choice

1. Are teachers encouraged to present the lessons in different ways? 01 2 3 4
2. Do the materials offer the teacher scope for adaptation and localization? 01 2 3 4
3. Do they encourage the teacher to add, delete, change and improvise? 01 2 3 4
4. Do they foster in teachers a sense of choice and control in exploiting the content? 0 1 2 3 4

A.1.2.3Reflection/Exploration/Innovation

1. Do they foster teacher receptivity to innovation and experimentation? 0 1 2 3 4
2. Do they encourage teacher creativity, imagination and exploration? 01 2 34
3. Do they help to raise the teacher's critical consciousness by facilitating reflection about the materials themselves and the methods implicated in them? 0 1 2 3 4
4. Is the teacher encouraged to evaluate each lesson? 012 3 4

A.1.3.Process and Content Validity

A.1.3.1.Methodology

1. Does the course book reflect the insights and findings from current theory and research on second language acquisition? 0 1 2 34
2. Do learners need to know what the sentences/texts mean or simply to manipulate forms? 0 1 234
3. Do the materials make use of what we know about the value of permitting a silent period at the beginning stages or in the learning of a new feature? 0 1 2 3 4
4. Do the materials help develop both the declarative knowledge and procedural knowledge of the learners as well as contribute to broader educational goals? 0 1 2 34
5. Is there a sufficient balance between analytical and experiential modes of learning? 0 1 2 34
6. Is there an explicit and conscious focus on rules and explanations or are there opportunities for the learners to discover the patterns in the first place? 012 3 4
7. Is there existing knowledge which learners expected to bring to the materials? 0 1 2 34
8. Is learner's knowledge of communication exploited? 0 1 2 3 4

A.1.3.2.Content

1. Do the materials provide a rich, varied and comprehensible input in order to facilitate informal acquisition as well as conscious attention to linguistic and pragmatic features of the texts? 0 1 2 34
2. Are the topics/texts current and cognitively challenging? 0 1 2 3 4
3. Do the topics/texts help enrich the learners' personal knowledge and experience and foster a positive personality?
0 1 234

4. Are there varied activities at different levels of task difficulty? 0 1 2 3 4
5. Are the materials well contextualized? 0 1 2 3 4
6. Do the materials call for a sufficiently good mix of closed and open-ended responses? 0 1 2 3 4
7. Are the grammatical explanations adequate? 0 1 2 3 4
8. Do the materials use complex metalanguage? 0 1 2 3 4
9. Do they suffer from terminological looseness? 0 1 2 3 4

A.1.3.3.Appropriacy

1. Are the level and the intended audience clearly spelt out? 0 1 2 3 4
2. Is it pitched at the right level of maturity and language and at the right conceptual level? 0 1 2 3 4
3. Is the material interesting, varied and topical enough to hold the attention of learners? 0 1 2 3 4
4. Is the author's sense of humour or philosophy obvious or appropriate? 0 1 2 3 4
5. Is the authorial voice friendly and supportive or patronizing? 0 1 2 3 4

A.1.3.4.Authenticity

1. Do the materials provide extensive exposure to authentic English through purposeful reading and/or listening activities? 0 1 2 3 4
2. Is the content realistic, reflecting topics and events and texts from real-world situations? 0 1 2 3 4
3. Do the activities relate to pupils' interests and 'real-life' tasks? 0 1 2 3 4
4. Do the tasks exploit language in a communicative or 'real-world' way? 0 1 2 3 4
5. Do the texts generate 'real-life' communication processes? 0 1 2 3 4

A.1.3.5.Cultural sensitivity

1. Are the materials relevant/suitable/appropriate to the learners' cultural context and sensitive to their values and beliefs? 0 1 2 3 4
2. Do the materials reflect awareness of and sensitivity to sociocultural variation? 0 1 2 3 4
3. Does the book show parallels and contrasts between the learners' culture and others? 0 1 2 3 4
4. Is this done in a non-patronizing way? 0 1 2 3 4
5. Does the coursebook enshrine stereotyped, inaccurate, condescending or offensive images of gender, race, social class or nationality? 0 1 2 3 4
6. Are accurate views of the USA or Britain presented; e.g., are uncomfortable social realities (for instance, unemployment, poverty, family, breakdowns, and racism) left out? 0 1 2 3 4

A.1.3.6.Layout-Graphics

1. Is there clarity of design and layout? 0 1 2 3 4
2. Is there an optimum density and mix of text and graphical material on each page? 0 1 2 3 4
3. Are the artwork and typefaces functional and colourful? 0 1 2 3 4
4. Is there enough white space on each page? 0 1 2 3 4

A.1.3.7.Accessibility

1. Are there indexes, vocabulary lists, section headings and other methods of signposting the content that allow the student to use the material easily, especially for revision or self-study purposes?
0 1 2 3 4
2. Is the learner given clear advice about how the book and its contents could be most effectively exploited?
0 1 2 3 4
3. Are the instructions for carrying out activities clearly and concisely but adequately articulated?
0 1 2 3 4
4. Can learners navigate with ease their way through the material in order to have a clear view of the progress made?
0 1 2 3 4

A.1.3.8.Linkage

1. Are the units and exercises well linked in terms of theme, situation, topic, pattern of skill development or grammatical/lexical progression? 0 1 2 3 4
2. Does the textbook cohere both internally and externally (e.g. with other books in a series)?
0 1 2 3 4

A.1.3.9.Selection/Grading

1. Is the linguistic inventory presented appropriate for the students' purposes, bearing in mind their L1 background?
01 2 34
2. Is the selection and grading of tasks and activities based on a clearly discernible system (e.g., frequency counts for vocabulary, cognitive load for tasks)? 01 2 3 4
3. Do the introduction, practice and recycling of new linguistic items seem to be shallow/steep enough for the intended students? 0 1 2 3 4

A.1.3.10.Sufficiency

1. Is the book complete enough to stand on its own to be workable? 01 2 34
2. Can the course be taught using only the student's books? 0 1 234

A.1.3.11.Balance/ Integration/Challenge

1. Do the activities allow the learner to go beyond a merely superficial understanding of the text/discourse?
0 12 3 4
2. Is there a good balance between receptive and productive knowledge, skills and abilities? 0 1 2 34
3. Is focus on the process of learning/product or both? 012 3 4

A.1.3.12.Stimulus/Practice/Revision

1. Are there sufficient opportunities for students to use and practice their conversational strategies and skills?
01 2 34
2. Is there sufficiently rich exposure to language data through opportunities for extensive reading?
0 1 2 3 4
3. Do the materials provide for recycling of content, of vocabulary and structures? 0 1 2 3 4
4. Are self-checks provided? 0 1 2 3 4

A.1.3.13.Flexibility

1. Do the materials allow for flexible use of tasks/texts/activities, permitting them to be exploited or modified as required by local circumstances? 012 3 4
2. Is it too rigid format, structure and approach? 0 1 2 3 4
3. Do they allow for alternative sequences/routes/paths? 0 1 2 34
4. Is the order of activities in the curriculum and the pace at which they must be done quite fixed? 01 2 34
5. Do the materials make too many demands on teachers' preparation time? 0 1 2 3 4
6. Do the materials expect students to spend too much time on their homework? 0 1 2 3 4
7. Is there a wide range of supplementary materials and teaching aids available? 0 1 2 3 4

A.1.3.14.Educational Validity

1. Does the textbook accord with broader educational concerns (e.g., the nature and role of learning skills, concept development in younger learners, the function of 'knowledge of the world', etc.)? 0 1 2 34

A.2. Reliability

1. Would they have the same effect with different groups of target learners? 0 1 2 34

THE EFFECT OF TEACHERS' INDIVIDUAL VERBAL FEEDBACK AND PRAISE ON EFL LEARNERS' ACHIEVEMENTS

ABSTRACT

Teachers use different methods to enhance students' motivation and hence their achievements. One method is giving individual verbal feedback and praise which is used to encourage students and provide remediation. This study aimed to explore the effects of teachers' verbal feedback and praise on students' achievements. A pre-post test was used as the research tool and two groups of female students participated in this study (N=30) under two conditions: no feedback, feedback and praise provided by the instructor. The findings showed that teachers' verbal feedback and praise had a significant positive impact on the learners' motivation and hence their achievements. As a result of giving feedback and praise to the students and their effects on motivation and achievements, it can be argued that the more motivated students are, the more and the better they will learn. This study has implications for instructors, learners and researchers especially in Iran both to do more serious researches on the teachers' perceptions as the most involved actors of Foreign Language Teaching regarding various aspects of feedback, motivation and their roles in language teaching and to make changes in the manner of feedback giving and even the method of teaching English.

KEYWORDS: individual verbal feedback – motivation – praise - achievement

INTRODUCTION

Background

The enhancement of student motivation and interest is an issue of major concern and focus to most teachers and education researchers. Educators are often concerned about the low motivation level of students in learning a second language. As reviewed by Dörnyei (1994a, 1994b, 2001a, 2001b), there are motivation strategies teachers can adopt in a language classroom. One of the effective motivational teaching strategies is the provision of motivational feedback and praise by teachers.

The present study arises from our own experiences in working with English teachers in secondary schools and English Institutes in Jahrom, Iran. Over teaching career, the researchers had an ideal opportunity to work in different schools and English Institutes with students of different backgrounds and levels, but most teachers from these different schools and institutes indicated that they faced similar problems with learners having low level of motivation and interest. Teachers were concerned that their students had little interest and motivation in class, failed to remember completely or partially what their teachers had taught, performed poorly academically and had little or no desire to improve. From our teaching experiences and observations of other teachers' practices, the researchers felt that motivation was a wide area of concern that had considerable impact on the students' learning outcomes. A comprehensive understanding of learners' motivation could make a significant contribution to the educational field. This study was designed to investigate how teachers can improve students' motivation and hence their achievements in learning English through more effective verbal individual feedback and praise. Since class assessment and class participation are carried out each session regularly and continuously, the researchers saw them suitable vehicles for exploring teacher feedback in Navid English Institute.

Statement of the problem

In the realm of education, many variables can affect learning and determine whether instruction will be effective or not. Many of these effective factors are related or intertwined with one another. One of the most critical pieces of the educational puzzle is motivation. If students are not motivated enough to learn, they are unlikely to learn, and there is little chance that instruction will be effective.

Verbal individual motivational feedback as an immediate and direct response to student academic performance is one of the most powerful classroom interventions that teachers can use to foster learning and improve student motivation and achievements. Effective feedback plays an important role in motivating further learning as it informs learners about the degree of their learning or their needs for improvement (Hyland & Hyland, 2006b). Effective feedback is essential for improving both teaching and learning. It enables the students to close the gap between the actual and the desired performance. (Carless, Joughin & Lui, 2006 as cited in Lee, 2007).

Praise is also considered to have beneficial effects on learners' motivation and performance. One group of researchers and teachers claim that normally a feedback message of praise increases motivation and leads to improvement in learners' performance (Cameron & Pierce, 1994; Dev, 1997; Pintrich & Schunk, 2002). Some researchers state that feedback which contains praise can be more effective since it causes a positive affective reaction, which is often linked to increased motivation and higher goals (Delin & Baumeister, 1994; Ilies & Judge, 2005).

The researcher hopes the results of this study would provide educators and language teachers in Iran with evidence concerning the effectiveness of teachers' motivational verbal feedback and praise in L2 classes.

Significance of the study

The concept of motivation within educational systems has been studied for many years. The domain of educational motivation is a continually evolving area of thought; therefore, the viewpoints regarding the significance of motivational factors within the educational realm are continually changing. To be able to provide the most suitable and best suited instruction for learners in each of the domains to be explored in this study, instructors, curriculum designers, and student advisors must understand the motivations of the students they teach. In addition, these professionals should be provided with contemporary, research-based and reliable information about relationships among motivators and specific academic ability domains. Effective individual verbal feedback and praise as two important motivational factors can take a great part in this regard.

REVIEW OF RELATED LITERATURE

Based on Hattie and Timperley (2007), feedback is conceptualized as information provided by an agent with regard to aspects of one's performance or understanding. The present study focuses just on teacher feedback. According to Black, and Wiliam (1998) having a desired aim is one of the three essential elements in feedback: 'When a learner is trying to learn, feedback about the effort has three main elements: recognition of the final goal, evidence about the present position, and clear understanding of a way to close the gap between the two situations' (Black & Wiliam, 1998, p.141). To close this gap, students need to improve their knowledge and receiving enough constructive feedback is the means to this goal. They strongly stress the significance of feedback to students to improve their current performance.

The following discusses two kinds of feedback and their effectiveness. They include 'traditional' feedback and dialogic feedback.

'Traditional' teacher feedback-giving practice

'Traditional' refers to a summative method of feedback delivery by teachers where feedback is from time to time and only given at the end of a summative assessment, in a written form on the report card.

In 'traditional' feedback-giving, teachers often perceive feedback as a simple acquisition process. Nicol and Macfarlane-Dick (2006) state that, feedback is often conceptualized by teachers as a transmission process where 'they 'transmit' feedback messages to learners about what is right or wrong in their academic work, about its weaknesses and strengths, and learners use this information to make improvements' (p.200). As a result, feedback delivery is mainly controlled by and seen as the responsibility of teachers, so undermining the active engagement of students.

These basic arguments against the sole use of point scale without appropriate descriptors can pave the way for a detailed discussion of the use of other sorts of feedback in the next section. They include constructive feedback – feedback with suggestions, and evaluative feedback, which are discussed more in the section that follows.

The process of conducting dialogic feedback

Most criticisms of the 'traditional' way of feedback-giving have given teachers deep insight into what makes educator feedback more 'constructive' and effective. As proposed in the previous section, the two-way dialogic feedback is always more effective and motivating than the 'traditional' way of feedback-giving practice. The sections that follow first explore the ways to conduct dialogic feedback properly, then its content and tone. Below are three different methods to deliver dialogic feedback: verbal, written and non-verbal non-written feedback:

Verbal feedback

In the conduct of verbal feedback, an effective motivational feedback strategy is 'prompting an exchange of comments between educator and student. In this process, a two-way direct interaction between students and teacher is facilitated while at the same time helping educator-assessors check to what extent learners understand their learning goals. This can inform both teaching and learning regularly.

As stated by Nicol and Macfarlane-Dick (2006), to conceptualize feedback as a mutual dialogue rather than as information transmission can enhance the effectiveness of feedback because learners can play a more effective and active role and use the feedback to develop and regulate their performance. What is important is to generate a formal or informal discussion between learners and educators so that learners can develop a clear understanding of standards and expectations.

Written feedback

Educators can have verbal interaction with learners in the form of a real dialogue; they can also deliver their feedback in written form. It can be done in a structured manner with success criteria and rubrics; with open positive comments embedded with praise, suggestion and criticism.

When examining the role of written feedback, Hyland and Hyland (2001) came upon the point that feedback can function well as praise, criticism and/or suggestion. They recognized in their research that praise was generally used to soften suggestion and criticism. Their survey also shows that learners vary significantly in what they want from educators in the form of feedback, so that there is a great need for teachers to change their feedback to fit specific learners and their personalities and needs. This gives importance to the issue of the need to deliver 'individualized feedback'.

Non-verbal and non-written feedback

This section investigates feedback that is neither written nor verbal. It takes the form of gestures, facial expression, rewards, etc. Tunstall and Gipps (1996) propose that there are four types of evaluative feedback - rewarding, punishing, approving and disapproving. Rewarding as a type of evaluative feedback can be provided in the form of symbols (e.g. stickers). Approving is a positive type of feedback, joined with the normative in relation to social and educational values. Non-verbal means of approving feedback embraces physical touch like holding learners' arms and a tap on the shoulder. Disapproval can be demonstrated in using physical gestures and a firm tone like pointing while speaking.

Content of dialogic feedback

Constructive feedback – feedback with suggestions

As mentioned above, knowing about one's weaknesses and strengths is not enough. Konold, Miller and Konold (2004) stress that learners need to be helped to progress suitable strategies to gradually improve their performance. One of the suggested ways is to give constructive feedback. This means students should be given as much help and guide as they need to employ their knowledge.

In sum, constructive feedback assists learners to find their weaknesses and provide them with the strategies and skills in making improvement.

Evaluative feedback

As stated by Tunstall and Gipps (1996), evaluative feedback is judgmental which is opposite if just being descriptive. It is either positive or negative and the judgments are made based on implicit and explicit norms. Moreover, evaluative feedback relates more to affective aspects of learning than do descriptive kinds.

Below is a brief discussion of the tone of two-way dialogic feedback which includes positive and negative feedback:

Positive feedback

One prevalent way to classify feedback is whether it is positive or negative. 'Positive feedback is seen as pleasing, complimentary, and consistent with the learner's self-image' (Nicols, 1995, p.289). While receiving positive feedback, students are more likely to feel supported since it improves the students' self-esteem.

A popular type of positive feedback is 'praise'. Salili (2001) maintains that praise is a positive feedback stating teacher's approval of learners' behavior or academic work. It is also claimed that praise is more than just a simple feedback on performance as it shows educators' positive affect and provides information about the value of the learner's behavior. This explanation emphasizes that praise is a type of positive feedback which is embedded with the teachers' positive affection and it is rich enough in information. A more significant aspect of praise is that it also consists of information telling students the positive value of their performance.

Moreover, it is discussed that positive feedback in the form of praise has a motivating function in maintaining students' learning. Nonetheless, it is vital to mention that praise can have negative effects on learners' motivation if it is misused or overused. Brophy (1981) proposes that 'praise delivered to the wrong student, or in the wrong way, or under the wrong circumstances may be not only ineffective but counterproductive' (p.21).

Negative feedback

Negative feedback refers to feedback that is 'critical that may be rejected if not delivered skillfully' (Nicols, 1995, p.289). This section examines the facets and functions of criticism in addition to its relationship with learners' motivation to learn.

Criticism is a type of negative feedback. As stated by Salili (2001): ‘Criticism is described as showing disapproval of learners’ academic work or behavior’. (p.81). With regard to the application of criticism by educators, Brophy (1981) proposes that criticism and praise would better be used together. Teachers do so to reinforce learners systematically.

As reviewed above, positive feedback does not necessarily motivate learners. If it is used inappropriately, it can have negative effects on learners' motivation to learn. In the same way, negative feedback such as criticism does not necessarily bring harmful effects to learners' motivation.

The above has examined the tone of feedback – positive feedback and negative feedback, including praise and criticism respectively.

Motivation

The significance of motivation in improving foreign/ second language learning is undeniable. Lifrieri (2005, p. 4) reports that “most people would defiantly mention motivation among the factors which affect individual levels of success in any activity – like language learning –”. In the same way, Gardner (2006, p. 241) reports that “learners with stronger motivation will do better and more successful than learners with lower levels”. He also claims that “if a learner is motivated, he/she has enough reasons (motives) for being involved in the same activities, puts more effort, persists in the activities, pays attention to the tasks, has more desire to reach the goal, enjoys the activities more and more, etc.” (Gardner, 2006, p. 243).

Research Studies concerning individual variables in L2 learning also show the close relationship between motivation and achievement. In one research study, Gardner et al (1997) claim that language learning causes motivation, and this motivation in turn affects attainment.

A large number of research studies have demonstrated that motivation is vital for L2 learning since it directly influences how much effort learners make, their level of proficiency and how long they maintain and persevere in L2 skills after completing their language study (Cheng & Dornyei, 1998; Trang & Baldauf, 2007). Cognitive skills in learning the target language are not a guarantee that a student can successfully master that language. In fact, in many cases, learners with greater L2 learning motivation get better grades and achieve better language proficiency (Wu & Wu, 2009).

Praise

Praise has been considered as “favorable interpersonal feedback” (Baumeister, Hutton, & Cairns, 1990, p. 131) or “positive evaluations made by an individual of another’s products, performances, or attributes” (Kanouse, Gumpert, & Canavan-Gumpert, 1981, p. 98). In general, praise is considered to have beneficial effects on learners’ self-esteem, motivation, and performance. Therefore, educators are encouraged to use praise effectively as a reinforcer of a desired behavior (Dev, 1997).

Feedback which contains praise can be more effective since it causes a positive affective reaction, which is often linked to increased motivation and higher goals (Delin & Baumeister, 1994; Ilies & Judge, 2005).

Evidence of a direct or mediated positive effect of praise on performance and motivation is abundant but not without flaws. There are also instances of the negative effect of praise on individuals' learning. An early study by Baumeister's et al. (1990) presented evidence that praise can both facilitate and impede students' performance. The analyses demonstrated that although positive feedback improved learners' performance on effort tasks, it led to impairment in skilled performance.

Studies on Feedback, Praise, Motivation and achievement

In an action research case study, Magilow (1999) suggests that once positive affect is enacted—by use of humor, etc.—the teacher will be able to correct learners' errors without damaging their self-perception. The survey conclusion is that the issue of feedback may be inseparable from that of rapport. When a teacher-student rapport is created, explicit error correction may be completely effective.

Kubota (1994) (as cited in Burrell's literature review, 2000, p.26) finds that an experimental group receiving explicit linguistic and metalinguistic feedback performs better on language learning tasks than a group receiving no feedback. In this survey both implicit and explicit feedback are found to facilitate SLA.

Imai's (1989) thesis aim is to find whether praise or correction is more likely to improve oral L2 proficiency. In brief, Imai hypothesizes that Japanese EFL university students' grammar and pronunciation improve by error correction, but fluency would improve by praise.

Moskowitz (1976) reports teacher techniques related to feedback giving practices. Moskowitz (1976) claims that effective feedback should be immediate and direct. This kind of feedback is best given in a warm, accepting classroom climate. He also stresses that effective praise for learners' behavior is frequent, varied, and often nonverbal.

Some researchers (Fadzil et al., 2011) conducted a research to examine the relationship between various socio-psychological variables like motivation, attitude, anxiety and instrumental orientation on performance in English as L2. The findings demonstrated that these variables were significantly correlated with students' performance. Furthermore, the regression analysis indicated that all the variables except for personal motivation had significant effects on performance with attitude and instrumental orientation having positive effects while anxiety having a negative effect.

Based on Gardner and Lambert (1972), in acquiring a foreign language, motivation is affected by attitude. Evidence for positive correlation of English proficiency with positive attitude and being highly motivated towards learning English as a second language has been accumulating, for both

integrative (Nida, 1956; LoCastro, 2001) and instrumental motivation (Gardner, 1960; Brown, 2000).

Liu's (2007) survey on Chinese university students' motivation and attitude to learn English and the correlation of both variables with the learners' English proficiency also indicated similar findings. Moreover, correlation analysis indicated that learners who had more positive attitudes towards learning English tended to score better in the proficiency test. Accordingly, Liu proposed that higher instrumental and travel orientations and more positive attitudes might also be the result of students' higher English proficiency.

According to Haitema (2002) and Saracaloğlu (2000), there is a positive relationship between foreign language achievement and affective characteristics. In her survey, Saracaloğlu (2000) refers to the learners' attitudes that they differ in.

Bartley (1970) reported that his studies have indicated that there was a direct relationship between high achievement and positive attitudes as well as low achievement and negative attitudes. That positive attitudes enhance achievement has been insisted on and explained by Lambert et al. (1963), and Spolsky (1969).

Gardner (1985) maintained that motivation has close relationship with students' achievement. He analyzed the role of motivation and attitude in second language acquisition through his previous survey. The findings revealed that the attitudinal-motivational factors were significantly related to learners' achievement.

RESEARCH QUESTION

In order to explore the effects of individual motivational verbal feedback and praise on Iranian EFL learners' achievements, the study addressed the following research question:

- 1) Do teachers' verbal feedback and praise have any effects on Iranian EFL learners' achievements?

Hypothesis

H₀: Teachers' verbal feedback and praise have no effect on Iranian EFL learners' achievements.

METHODOLOGY

Setting

This study was conducted at Navid English Institute in Jahrom. The Institute contains a student population of 1400 students in total. Classes in this institute ranges from KIDS 1 (age 7) to FCE (advanced level). 25 English teachers are teaching English in this Institute (10 MA, 14 BA and 1 PHD students).

Participants

The participants of the study were all EFL learners of Navid English Institute in Jahrom. The researcher randomly selected two female classes. The number of the participants was 15 in each class. All the participants were native speakers of Persian and their age ranged from 17 to 24. The participant students were all at a high intermediate proficiency level. Some of them were High school students and some others had completed 12 years of schooling while a few of them had graduated from different universities in Iran at BA level and some were following their education at the university. The teacher participant was an English-major holder and had a master degree in education. Mr. Jafarian, the teacher participant, has been teaching in this Institute for 10 years. He is one of the most successful instructors in this institute.

Data Collection Procedure

In order to collect the data required for the fulfillment of the objectives of this study, one of the teachers agreed to participate in the study. Two classes were selected randomly. Both classes were the same in terms of their level of English proficiency and gender and also they had the same English teacher. One class was considered as the control group (class A) and the other one was the experimental group (class B). The students' achievements were measured twice by the prepared pre and posttest. The teacher was provided with a list of positive sentences and praise which had to be used as motivational tools during the semester while giving feedback to the learners. All the participants in class A received motivational supportive feedback and praise along with required help and guidance individually and regularly. The teacher helped the learners know where they were going, how they were going and what to do next. In this way they would feel confident enough to follow the teacher's guidance closely.

Research Design

The research design for this study was an analytical (quantitative) survey which provided a numerical description of the variables.

In the process of the study, teacher motivational feedback and praise were considered as the independent variable that was expected to bring about changes in students' motivation, and hence their achievements which would be the dependent variable. The change in students' motivation and hence their achievements depended on the positive motivational feedback and praise they received.

Instrument

In order to meet the objectives of this study, the following instrument was used:

- Pre and posttests: The tests were prepared by a group of experts and university professors in Central Navid Institute in Shiraz and then they piloted the tests in some classes and calculated their reliability. When they were sure of their reliability and validity, they passed them to other branches and classes to be used regularly. Each test was composed of 50 items in reading, listening and writing based on the students' course book, the second edition of Top Notch, in Navid Institute.

Data Analysis Procedure

The data in the present study is quantitative. The quantitative data of the pre and posttest was analyzed in terms of means, using the Statistical Package for Social Sciences (SPSS). To report, describe, and summarize the important general characteristics of the sets of the obtained data, descriptive statistics were used.

In order to find out whether there is a statistically significant difference between the experimental and control groups in the pretest and posttest before and after the treatment and to check whether the teacher's individual verbal feedback and praise had improved the participants' achievements or not, both the paired samples *t*-test and the independent samples *t*-test were run.

RESULTS AND DISCUSSION

Preliminaries

The purpose of this section is to provide the analysis of the data collected for the study designed to address the research question, "Do teachers' verbal feedback and praise have any effect on Iranian EFL learners' achievements?" The purpose of the study was to investigate the effects of praise and feedback on changing motivation toward the English language and hence their achievements.

Descriptive Statistics

To report, describe and summarize the important general characteristics of the sets of the obtained data, descriptive statistics were used.

Table 1 reports the descriptive statistics for the achievements of the experimental group. The mean scores and standard deviations are illustrated as well.

Table 1: Descriptive Statistics for achievements of Experimental Group

	Mean	Std. Deviation	Minimum	Maximum
Pretest	75.9333	8.81935	62.00	94.00
Posttest	90.8667	3.54293	86.00	98.00

As Table1 shows the mean score of the achievements of the experimental group is 75.93 in the pretest and 90.86 in the posttest. The participants in the experimental group have the standard deviation of 8.81 in the pretest whereas that of the participants in the posttest is 3.54. Table 2 reports the descriptive statistics for the achievements of the control group. The mean scores and standard deviations are illustrated as well.

Table 2: Descriptive Statistics for Achievements of Control Group

	Mean	Std. Deviation	Minimum	Maximum
pretest	82.6000	5.90157	74.00	94.00
Posttest	84.2667	5.48331	76.00	96.00

As Table 2 shows the mean score of the achievements in the control group is 82.60 in the pretest and 84.26 in the posttest. The participants in the control group have the standard deviation of 5.90 in the pretest whereas that of the participants in the posttest is 5.48.

Figure 1: Mean differences of achievements between pretest and posttest of experimental and control Group

Inferential Statistics

In order to find out whether there is a statistically significant difference between the experimental and control groups in the pretest and posttest before and after the treatment and to check whether the teacher's individual verbal feedback and praise improved the participants' achievements or not, the paired and independent samples *t*-test were run.

In order to find out whether there is a statistically significant difference between the mean score of the experimental group in pre and posttest, a paired samples *t*-test was run.

Table 3: Paired samples statistics for the effect of verbal feedback on the achievements of the experimental group

	Paired Differences					t	df	Sig. (2-tailed)
	Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
				Lower	Upper			
Pre and posttest	-14.93333	7.27488	1.87836	-18.96202	-10.90464	-7.950	14	.000

According to Table 3, there was a significant difference in the scores for no verbal feedback in pretest ($M=75.9333$, $SD=8.81935$) and verbal feedback in posttest ($M=90.8667$, $SD=3.54293$), $t(-7.950) =$, $p < .05$

Table 4: Paired Samples Statistics for the effect of verbal feedback on achievement of the control group

	Paired Differences					t	Df	Sig. (2-tailed)
	Mean	Std. Deviation	Std. Error Mean	95% Interval of the Difference	Confidence of the			
				Lower	Upper			
precon – postcont	-1.66667	4.62395	1.19390	-4.22733	.89399	-1.396	14	.184

According to Table 4 there was not a significant difference in the scores for lack of verbal feedback in the pretest ($M=82.6000$, $SD=5.48331$) and posttest ($M=84.2667$, $SD=5.90157$), t (-1.396), $p > .05$. In order to find out if there was a statistically significant difference between the treatment and control groups in pretest, an independent samples t -test was run.

Table 5: Independent Samples t -Test for Difference between Treatment and Control Group in Pretest

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	T	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Interval of the Difference	Confidence of the
									Lower	Upper
	Equal variances assumed	1.852241	0.1843	2.4331	28	.0816	-6.60000	2.739946	1.054143	12.279191
	Equal variances not assumed			2.4331	23.9	.0826	-6.60000	2.739946	1.017125	12.316209

An independent-sample t -test was run to see if there was a significant difference in achievement scores of control group ($M=82.6000$, $SD=.75.9333$) and experimental group ($M=75.9333$, $SD=8.81935$), t (23) = 2.4331, $p = 0.08$. The results suggest that there is no significant difference between the experimental and control group in pretest. In order to find out if there is a statistically significant difference between the treatment and control group in post-test, an independent samples t -test was run.

Table 6: Independent Samples t -Test for Difference between Treatment and Control Group in post-test

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	T	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Interval of the Difference	Confidence of the
									Lower	Upper
	Equal variances assumed	2.667	.114	-3.916	28	.001	-6.60000	1.68561	-10.05281	-3.14719
	Equal variances not assumed			-3.916	23.955	.001	-6.60000	1.68561	-10.07927	-3.12073

An independent-samples *t*-test was conducted to compare the difference in achievement scores in oral feedback and no oral feedback conditions. There was a significant difference in the scores for oral feedback ($M=90.8667$, $SD=.91478$) and no oral feedback ($M=84.2667$, $SD=1.41578$), $t(23) = -3.916$, $p < 0.05$. As Tables 5 and 6 show, the results suggest that giving verbal feedback really does have an effect on students' achievements. Specifically, our results suggest that when the participants receive feedback, their achievements in tests increase.

Discussion on Research Question

In discussing the findings, this part answers the research question raised in this study:

1) Do teachers' verbal feedback and praise have any effect on Iranian EFL learners' achievements?

Research Question

This section addresses the research question: Do teachers' verbal feedback and praise have any effect on Iranian EFL learners' achievements?

The research question asked whether teachers' verbal feedback and praise affect Iranian EFL learners' achievements. To this end, a paired and an independent samples *t*-test were performed. The result of the paired samples *t*-test revealed that the difference between the experimental group in the pretest and posttest, when the experimental group received teacher's verbal feedback and praise, was significant. There were also changes in their achievements. The control and experimental groups were equal in all conditions, so the difference between them was due to the teacher's verbal feedback and praise. The learners' achievements in the experimental group were significantly improved in learning English. After the treatment many participants got better scores in the posttest.

The above findings support Latif, et al., (2011) research findings. The results indicated that socio-psychological variables like attitude and motivation were significantly correlated with learners' performance in the English course conducted at Open University of Malaysia.

The findings echoes clearly what researchers previously found. It was found that evidence for positive correlation of English proficiency with positive attitude and being highly motivated towards learning English has been accumulating, for both instrumental (Brown, 2000) and integrative motivation (LoCastro, 2001). Liu's (2007) study on Chinese university students' attitudes and motivation to learn English and the correlations of both variables with the students' English proficiency also revealed similar findings. In addition, correlation analysis showed that students who had more positive attitudes towards learning English tended to score higher in the proficiency test.

In line with the findings of this study Bartley (1970) stated that his studies showed that there was a direct relationship between positive attitudes and high achievement as well as negative attitudes and low achievement. That positive attitudes enhance achievement has been confirmed and described by Lambert et al. (1963), and Spolsky (1969).

The findings of the study are also in line with the results of previous studies by Haitema (2002) and Saracaloğlu (2000). They revealed that there is a positive relationship between affective characteristics and foreign language achievement.

Finally, the findings supports Catano, 1975, 1976 who states that praise improve adults' performance greatly at skilled tasks, comparing the performance of a control group. In another study by Henderlong and Lepper (2002), in line with the findings of the present study, they report the positive effect of praise on students' performance. Although the findings of the present study seem contradictory to what was reported by Baumeister's et al. (1990). They presented evidence that praise can both facilitate and impede students' performance. A possible explanation for such a result may be over-use or under-use of praise or using praise for a wrong person.

CONCLUSIONS, IMPLICATIONS AND RECOMMENDATIONS

Conclusions

According to Hattie and Timperley (2007), feedback is information provided by an agent (e.g., parent, teacher, peer, book, experience) regarding aspects of one's performance or understanding. It occurs typically after instruction that seeks to provide knowledge and skills or to develop particular attitudes. Feedback is among the most critical influences on student learning.

On the other side, feedback can have negative effects on the learners if the teachers do not pay enough attention to the students' emotional feelings. As a solution to this threat, this study followed a new strategy to overcome this danger to the students' motivation and feelings. Therefore, the writer took the benefit of the positive effects of praise and positive feedback in order to sugar the pill and enhance the positive effects of feedback on the students' motivation and achievements.

The second strategy which the writer took in conducting this research study was giving the feedback verbally and individually. Accordingly, the verbal feedback which is given individually can help the students to speak about all aspects of teaching and learning face to face with the teacher and this can help both the teacher and the learner to have a real comprehension. Moreover, learners can play a more proactive role in the learning process by participating in feedback-giving practice, building up the habit of self-evaluation, communicating with the teachers and making open dialogue with them. Teachers can also offer support to students in this respect to enhance their self-regulating skills and guide them step by step. Finally, when the feedback is given verbally and individually, teachers can improve their communication strategies, enrich and polish the content of feedback and build rapport with their students.

To respond to the research question, the learners' achievements in the experimental group were significantly improved in learning English. After the treatment, many participants got better scores in the posttest. The control and experimental groups were equal in all aspects, so the difference between them was due to the teacher's verbal feedback and praise.

The instructors, student advisors, curriculum designers, and all other educators involved in the teaching, instructing, and, consequently, motivating of students, must understand the motivation of the students they teach. These professionals should be provided with contemporary, research-based information about the relationships among the motivational factors within specific academic ability domains.

The findings in this research began to dissect the motivational factors of students in the hope that educators will be able to design teaching strategies and curricula more effectively to help their students achieve success. This finding can be used by educators in the development of their instruction.

Implications

This research study has its practical implications for various aspects of language teaching profession. These implications can encourage the relatives of the related field, especially in Iran, both to do more serious researches on the teachers' perceptions as the most involved actors of foreign language teaching stage regarding various aspects of feedback, motivation and their roles in language teaching and to make changes in the manner of feedback giving and even the method of teaching English.

Teacher training programs must pay more attention to the elements of motivation, praise and feedback. A course in the role and method of effective feedback-giving skills and motivation can enhance foreign language teachers' awareness and competence.

In order for the teachers to be aware of the more new beliefs, attitudes, and studies about the role of these elements, teacher training programs must be continued to appear as in-service trainings, and it is better to be a lifelong program for the teachers. The last but not the least important group that this study has a lot of words with is the group of language teachers. Iranian foreign language teachers should be aware of the importance of motivation and feedback in the language classroom, and they should try to improve their knowledge of feedback-giving techniques and motivation. This section presents in detail some implications of this study.

Implications for teaching practice

As for pedagogy, this study has revealed the importance of teacher feedback which can motivate students to learn and hence improve their achievements. This section discusses some implications for teaching practice.

This study implies that teachers need to gain some feedback delivery skills to motivate learners. The relationship between teachers and students, and how students perceive their teachers, can also determine how students interpret the corresponding feedback. This study also implies that teachers should acquire some strategies to deliver feedback that is motivating to students. Hence, communication strategies are one of the important areas teachers can focus on.

Feedback strategy is prompting an exchange of comments between teacher and pupil. As a result, it is important for teachers to build up a positive relationship with the students as it is a major facilitating factor for enhancing students' motivation to learn.

The findings of this study also imply that teachers have to be better equipped theoretically in order to make effective use of teacher feedback as a motivating tool. To support teachers' professional growth in this regard, it is suggested that teacher education providers should cover theoretical background knowledge such as motivation theories with different motivation constructs, so that teachers can tailor their feedback to these ends. Training offered to in-service and pre-service teachers should also include feedback-giving techniques as one of the core elements in pedagogy.

Limitations of the study

There were a number of limitations to the present study which should be highlighted so as to avoid any overgeneralizations and misinterpretations of the results. Although this study aimed at studying the impact of teacher feedback and praise on motivation and hence on achievement, the results of this study cannot be generalized because of the small number of the participants. Only 30 students in the two groups (experimental and control group) were involved in the study; the sample might not be representative of the target population of EFL students. To determine its broader application, other populations would need to be examined.

Moreover, the study was mostly conducted during the third semester of the academic year; a thorough study should be done to reveal the effects on the long term. Sufficient time and practice were needed to reveal successful results. Finally, various instruments such as teachers' interviews, learners' interviews, class observations etc. should be used to triangulate and validate the results as much as possible.

Recommendations for further research

This study investigated the role of teacher's individual verbal feedback and praise in enhancing student motivation and hence their achievements. Despite the pedagogical significance of this study, I propose several areas for further investigation in the future:

It would be insightful to explore if the results of this study can be replicated in settings such as other schools and institutes of a different background in Iran or even other places outside Iran, where the context and cultural backgrounds are different.

This study did not plan to, and thus had not done any follow-up work in regard to how students put teachers' feedback into action. In any future longitudinal research, this can be done through lesson observations, study of student works, and follow-up interviews, so that student responsibility can be studied. For lesson observation, if teachers find it intimidating or if students find it uncomfortable for a research observer to be present, researchers can use a video-camera instead.

ABSTRACT

Improving language learning process has been the main concern of educational authorities during the past decades and many researchers have been looking for the effective methods and techniques which may lead to the improvement of this process. This study aimed to investigate the relationship between Iranian intermediate English as a foreign language (EFL) learners' logical intelligence and their use of speaking strategies in communication. To this end three hundred and sixty undergraduate EFL learners from several universities in Iran were provided with McKenzie's Multiple Intelligences Inventory and oral communication strategy inventory (OCSI). A semi-structured interview was also conducted to collect qualitative data and twenty-five participants were randomly selected to participate in this section. Results of data analysis indicated significant relationship between logical intelligence and accuracy-oriented and attempt to think in English strategies. Qualitative data analysis revealed that message reduction strategies are the most frequently mentioned strategies among both male and female learners. This study has encouraging implications for EFL teachers, EFL learners and syllabus designers. EFL teachers and syllabus designers are recommended to have a special attention to the instruction of different strategies.

KEYWORDS: Language Learning Strategies; Speaking Strategies; Logical Intelligence; Gender

INTRODUCTION

Individual differences have been one of the most important research topics in language learning area. According to Gardner's Multiple Intelligences theory, all individuals are genius but in different ways. Howard Gardner introduced theory of Multiple Intelligences in early 1980s and defined intelligence as a composite of different abilities or aptitudes and proposed that intelligence is not a single universal unchangeable entity; rather, it is made up of seven subcategories that every individual possesses to different extents and can be nurtured and developed through education (as cited from Hashemian & Adibpour, 2012, p.26).

Gardner introduced seven intelligences in 1983 (i.e. logical-mathematical, linguistic, bodily-kinesthetic, interpersonal, intrapersonal, musical and spatial intelligences). Then in 1999 he added naturalist intelligence and existential intelligence as the eighth and ninth intelligences to this list. Different studies were conducted in order to investigate the relationship between Multiple Intelligences and other learning variables for instance Motallebzadeh & Manouchehri, (2009), in their study investigated the relationship between EFL learners' Multiple Intelligences and their scores on the reading section of IELTS and found a positive relation between logical-mathematical intelligence and reading score of EFL learners. The issue of learning strategies plays a crucial role in language learning area. According to Oxford (1990), "learning strategies are behaviors or actions which learners use to make language learning more successful, self-directed and enjoyable" (Cited from Davar Asl Bandarabbasi & Karbalaie, 2013, p. 144). Speaking strategies are important parts of language learning strategies. Speaking as a specific language skill is very important especially in communication, but many [English as a Foreign Language (EFL)] learners believe that it is more difficult than other skills. Using some strategies can help students to overcome linguistic difficulties.

Although there are variety of studies which have investigated the relationship between individual variations and other variables such as use of language learning strategies but a limited number of researches have focused on speaking strategies especially in the context of Iran, consequently this study aims to investigate the existence of any significant relationship between Iranian intermediate EFL learners' logical and their use of speaking strategies in communication.

REVIEW OF LITERATURE

During the last few decades, a large body of research in language learning area has been devoted to individual differences. It seems that the learners' performances are different based on their multiple intelligences.

Multiple Intelligences

Introducing multiple intelligences theory challenged the traditional view about intelligence. Traditional intelligence view, considered intelligence as a single, fixed ability and focused on verbal-linguistic and logical-mathematical intelligences, leaving the other types of intelligence disregarded. Early IQ tests just measured individuals' ability on these two intelligences, so students who were better logically or verbally were considered as intelligent.

Language Learning Strategies

Studies about second language learning strategies were prominent in 1970s when the researchers were very interested to know why some learners were more successful in their learning. Then the researchers tried to discover the characteristics of "good" learners and subsequently strategies which were used by these learners. According to Stern (1992), language learning strategies are broadly conceived intentional directions and learning techniques employed by learners when they consciously engage in activities to achieve certain goals. In this section some related studies on multiple intelligences and speaking strategies will be reviewed.

Related Studies on Multiple Intelligences

Spirovska (2013) in a study reviewed Gardner's theory of multiple intelligences and definition of different types of intelligences. He exemplified some activities and tasks which are appropriate for different students based on different intelligences. Spirovska (2013) further mentioned that implementation of multiple intelligences theory is important because students can use their strengths to foster learning. She concluded that there are not enough tests in order to measure different types of intelligences. Furthermore, before implementation of MI theory practically, there is need for trainings and workshops in order to raise instructors' awareness of multiple intelligences. Preparation for choosing enough activities and tasks which cater different types of intelligences is another issue; however, benefits of implementation of MI theory should not be ignored. Enhancing learner centeredness in class, using diversity of activities which are appropriate for different intelligences, and raising teachers' awareness about diversity of potentials in the classroom are beneficial issues in implementation of MI theory in the classroom (Spirovska, 2013).

Koura and Al-Hebaishi (2014) conducted a study with the purpose of investigating the relationship between multiple intelligences, self efficacy, and students' academic achievement. Total participants in this study were 85 Saudi female third intermediate students including 43 gifted and 42 regular students. Instruments which were used in this study consisted of Multiple Intelligences Inventory, Self-efficacy Scale and Language Achievement Test. Findings revealed that interpersonal intelligence was the leading intelligence among both gifted and regular groups. Also it was found that gifted students had higher level of self efficacy in comparison with regular students. Among gifted students, significant positive correlations were found between logical intelligence and their grammar scores, interpersonal intelligence and their speaking scores, but negative significant correlations were found between bodily intelligence and their listening scores, intrapersonal and their listening scores and musical intelligence and their reading scores. Furthermore, for regular students there was not significant correlation between MIs and their achievement in different language skills. There wasn't any significant relationship between self efficacy and EFL achievement.

Related Studies on Language Learning Strategy

A study was conducted by Roohani and Rabiei (2013) in order to explore the relationship between Iranian EFL learners' LLS on one hand and their multiple intelligences, L2 proficiency on the other hand. Participants in this study were ninety undergraduate EFL learners (males and females), who were presented by Strategy Inventory, Multiple Intelligences Scales, and Test of English as a Foreign Language. Data analysis revealed a significant positive relationship between learners' LLS and their MI and a positive but not significant relationship between L2 proficiency and LLS. The result of further analysis indicated significant correlations between some strategy types and several individual intelligences. The highest correlation was found between intrapersonal intelligence and cognitive strategies and the lowest one was found between naturalist intelligence and affective strategies. Shangarffam and Zand (2012) in their study investigated the relationship between Communicative Strategies (CS) and three of the Multiple Intelligences. To this end participants of this study, who were senior English language students majoring in English Literature or English Translation at Islamic Azad University in Iran

were presented with two questionnaires including MIDAS as Multiple Intelligences inventory and OCSI as the inventory for Communicative Strategies. Findings revealed a significant correlation between using oral communication strategies and these three types of intelligences. Moreover, a significant correlation was found between interpersonal intelligence and OCSI speaking strategies while interpersonal intelligence had the lowest correlation with listening strategies.

In sum, review of the literature indicated that individuals with different characteristics have different performances in EFL context. It seems that students' performance is different based on their multiple intelligences. The purpose of this study is to explore the relationship between Iranian EFL learners' logical intelligence and their use of speaking strategies in communication.

RESEARCH QUESTIONS

Q1. Is there any significant relationship between Iranian intermediate EFL learners' logical intelligence and their use of different speaking strategies?

Q2. Are there any significant differences between Iranian male and female EFL learners regarding their use of speaking strategies?

METHODOLOGY

Participants and Setting

The sample for the current study consisted of three hundred and sixty intermediate undergraduate EFL learners including 188 females and 172 males from several universities in Iran (Tehran, Mashhad, Esfahan, Birjand, and Gorgan). According to Morgan's table, (Morgan, 1970 "Determining Sample Size for Research Activities", Educational and Psychological Measurement) this study's sample size should be three hundred and sixty four (Considering the 95% of the level of confidence and 0.05 degree of accuracy). The questionnaire was distributed in both forms of paper and via the internet among more than 1000 Iranian EFL learners at these universities (Tehran, Mashhad, Esfahan, Birjand, and Gorgan) but three hundred and sixty intermediate EFL learners answered the questionnaire completely. All of the participants were native speakers of Farsi, whose age varied from 18-25 years old. They had already studied English as a part of their curricula in their secondary school or high school. These students were from different subfields of the study within English Language field and all of them were studying in public universities. Twenty five participants (14 females and 11 males) participated in post-survey interview.

Instrumentation

Following instruments were utilized in the process of the development of the present study.

McKenzie's Multiple Intelligences Inventory

To determine the participants' MI scores, McKenzie's Multiple Intelligences (MI) Inventory (1999) was administered. The questionnaire includes nine sections measuring nine types of intelligences including natural, musical, logical/mathematical, intrapersonal, interpersonal,

bodily/kinesthetic, linguistic, existential, and spatial/visual intelligences and each section consists of 10 items. Overall internal consistency of 0.85 to 0.90 was reported for this questionnaire (Al-Balhan, 2006; Hajhashemi & Wong, 2010; Razmjoo, 2008; Razmjoo, Sahragard, & Sadri, 2009) (cited from Khosravi & Saidi, 2014). The items were five-point Likert scale ranging from 1 (completely disagreed) to 5 (completely agreed). To avoid any misunderstanding on the part of the participants, Persian version of this questionnaire was used. Validity of the Persian version of this questionnaire has been checked in the study of Hajhashemi and Bee Eng (Hajhashemi & Bee Eng, 2010). Hajhashemi and Bee Eng (2010), have reported, a high reliability for the Persian version of this questionnaire. In this study the researcher had a special focus on logical intelligence. The reason for choosing this intelligence was that although study about using language learning strategies and other variables like multiple intelligences has received much attention in recent decades, but it seems that there are not enough studies with a special focus on different types of intelligences. Furthermore the researcher is interested to investigate the existence of possible relationship between this intelligence and EFL learners' use of speaking strategies.

Speaking Strategy Questionnaire

Nakatani (2006) has developed Oral Communication Strategy Inventory (OCSI). This questionnaire includes two sections, strategies for coping with speaking problems (32 items) and strategies for coping with listening problems (26 items). Shangarffam and Zand (2012) in their study used Oral Communication Strategy Inventory (OCSI) and they reported the reliability index of 0.96 for this questionnaire. This study aimed to investigate the relationship between EFL learners' logical intelligence and their use of speaking strategies in communication, for this reason speaking strategy section was taken from OCSI. The reliability of speaking section of this questionnaire was calculated via Cronbach's alpha, and it was 0.83. Speaking strategy section consists of eight categories: social affective strategies, negotiation for meaning while speaking, fluency-oriented strategies, accuracy-oriented strategies, message reduction and alteration strategies, message abandonment strategies, nonverbal strategies while speaking, attempt to think in English strategies. This is a Likert scale type questionnaire and students should choose their answer based on the frequency which they use speaking strategies ranging from "never" to "always". It should be mentioned that participants were asked to provide some demographic information, such as age, gender, and level of language proficiency.

Semi-Structured Interview

In order to elicit in-depth and open-ended responses, three interview questions concerning speaking strategies were developed. The interview questions were about problems which EFL learners encounter when speak with others, participants' idea about usefulness of speaking strategies and particular useful speaking strategies. Twenty five participants (14 females and 11 males) were selected randomly to participate in post-survey interview. Interview from each individual lasted about 15 minutes. Qualitative data were used as supplement to the quantitative data. The interview questions were:

- What problems do you encounter when you speak English?
- Why speaking strategies are useful?
- What helpful speaking strategies do you use when you speak English?

Procedure

Participants for the current study were three hundred and sixty intermediate undergraduate EFL learners including 188 females and 172 males from several universities in Iran (Tehran, Mashhad, Esfahan, Birjand, and Gorgan). These students were from different subfields of study within English Language field and their age varied from 18 to 25 years old. As instruments, McKenzie's MI Inventory (1999) and speaking strategy inventory (Nakatani, 2006) were used to collect the data. In order to be easier on the part of participants, the researcher integrated the two questionnaires in form of one test.

Furthermore, the test included some demographic information, such as age, gender, and level of language proficiency. The reliability coefficient of McKenzie's MI Inventory was calculated via Cronbach's alpha, which was 0.73. Similarly, the reliability of speaking strategy questionnaire was measured with the use of Cronbach's alpha and it was 0.83. To collect the required data the questionnaire was distributed in both forms of paper and via internet among more than 1000 EFL learners, and from all EFL learners who received questionnaire; three hundred and sixty intermediate EFL learners answered the questionnaire completely. The researcher analyzed questionnaires which their participants' levels of language proficiency were intermediate. Participants' level of language proficiency was determined by themselves based on the courses they had passed in language institutes. At the beginning, participants were informed about the purpose of study, also they were assured that their information would be kept confidential. Then they were asked to fill out the questionnaire. The data collection procedure lasted about one month during the academic year of 2014-2015. Collected data were analyzed using SPSS software 20.0.

Twenty-five of the participants (14 females and 11 males) were selected randomly to take part in the interview section of the data collection procedure in order to collect qualitative data. Participants were informed that their answers would be tape recorded. Interview from each individual lasted about 15 minutes. Participants' responses on interview questions were transcribed and then coded for further data analyses. To elicit more valid information from the participants, the interview questions were asked and answered in Farsi.

RESULTS AND DISCUSSION

Participants' Demographic Information

Before presenting the results related to the questions, in this section, participants' demographic information including their number and gender is given in Table 1 below.

Table 1: Participants' Demographic Information

		Frequency	Percent	Valid Percent	Cumulative Percent
Gender	Female	188	52.2	52.2	52.2
	Male	172	47.8	47.8	100.0
	Total	360	100.0	100.0	

According to Table 1, 360 language learners participated in this study out of which 188 participants are females and the rest (N=172) are males.

Reliability Index of the Instruments

In order to ensure the questionnaires' reliability indexes, Cronbach's Alpha was calculated for both of the questionnaires using SPSS 20.0 (Table 2).

Table 2: Results of Reliability

Speaking Strategies	32	.83
Multiple intelligences	30	.735

Table 2 shows that both instruments, Speaking Strategies ($\alpha=.83$) and logical Intelligence ($\alpha=.735$) enjoyed relatively high reliability indexes.

Logical Intelligence

In order to investigate participants' logical intelligence, descriptive statistics including mean, minimum, maximum and standard deviation were calculated. The results are shown in Table 3.

Table 3: Descriptive Statistics for Logical Intelligence

	N	Minimum	Maximum	Mean	Std. Deviation
Logical	360	22.00	42.00	34.07	3.60123
Valid N (listwise)	360				

Speaking Strategies

Similarly, descriptive statistics related to speaking strategies, e.g. social affective, fluency-oriented, negotiating for meaning, accuracy-oriented, message reduction, nonverbal strategy, message abandonment, and attempt to think in English are shown in Table 4.

Table 4: Descriptive Statistics for Speaking Strategy

Descriptive Statistics					
	N	Minimum	Maximum	Mean	Std. Deviation
SA	360	2.17	4.83	3.6542	.49047
FL	360	2.33	5.00	3.8657	.61237
NFM	360	2.25	5.00	3.9368	.69318
AC	360	2.00	5.00	3.8467	.60879
MES	360	3.00	5.00	3.8646	.53301
NVS	360	1.00	5.00	3.9861	.84845
MA	360	1.25	4.25	2.5243	.71562
ATE	360	1.00	5.00	3.2500	.93000
Valid N (listwise)	360				

According to Table 4, nonverbal strategy (NVS) ranks first ($M=3.98$). Then comes negotiation for meaning (NFM, $M=3.93$). Fluency-oriented (FL, $M=3.8657$), Message reduction (MES, $M=3.8646$), Accuracy-oriented (AC, $M=3.84$), Social affective (SA, $M=3.65$), Attempt to think in English (ATE, $M=3.25$), Message abandonment (MA, $M=2.52$) hold third to eighth places respectively. According to these data, it can be concluded that nonverbal strategy was the most preferred strategy among these participants. Accordingly, message abandonment gained the lowest mean among the speaking strategies.

Relationship between Logical Intelligence and Speaking Strategies

Correlation between logical intelligence and each component of speaking strategies was investigated. Data are shown in Table 5.

Table 5: Results of Correlation between Logical Intelligence and Speaking Strategies

Correlations		logical	SA	FL	NFM	AC	MES	NVS	MA	ATE
logical	Pearson Correlation	1	.068	.098	-.032	.133*	-.009	.046	-.021	.170**
	Sig. (2-tailed)		.195	.064	.550	.011	.869	.384	.685	.001
	N	360	360	360	360	360	360	360	360	360

*. Correlation is significant at the 0.05 level (2-tailed).

**. Correlation is significant at the 0.01 level (2-tailed).

Note: SA stands for social affective; FL stands for fluency oriented; NFM negotiation for meaning; AC stands for accuracy-oriented; MES stands for message reduction; NVS stands for non-verbal strategy; MA stands for message abandonment; ATE stands for attempt to think in English.

As table 5 displays, there is a statistically significant correlation between logical intelligence and accuracy-oriented strategies [$r=.133$, sig (two-tailed) $=.011<.05$], and attempts to think in English strategies [$r=.17$, sig (two-tailed) $=.001<.05$]. Other speaking strategies are not significantly correlated with logical intelligence (sig $>.05$). It can be concluded that participants who are more logically intelligent make more frequent use of strategies which are in accuracy-oriented and attempt to think in English categories.

Results of Semi-Structured Interview

Twenty-five participants (11 males, 14 females) were selected randomly to participate in post-survey interview in order to gather qualitative data about students' speaking difficulties, helpful speaking strategies and the usefulness of speaking strategies. With regard to the first interview question, "What problems do you encounter when you speak English?" most of the males (63%) and females (64%) believed that lack of vocabulary knowledge is their most important speaking difficulty. For example, one interviewee said "I don't have enough vocabulary knowledge,

sometimes I can't find an appropriate word to express what I mean." Lack of grammatical knowledge (males, 54%, females, 50%) and fear of making speaking mistakes (males, 36%, females, 42%) were reported as other important speaking difficulties. Pronunciation and intonation ranked as the two last speaking difficulties.

Table 6: Speaking Difficulties for both Male and Female Interviewees

Speaking difficulty	Frequency (Female)	Percentage	Frequency (Male)	Percentage
Vocabulary	9	64%	7	63%
Grammar	7	50%	6	54%
Fear of making speaking mistake	6	42%	4	36%
Pronunciation	4	28%	3	27%
Intonation	1	7.14%	1	9.09%

As far as helpful speaking strategies are concerned, the analysis of interview data revealed that message reduction strategies are the most frequently mentioned strategy among interviewees. The majority of interviewees referred to using familiar words and short utterances as the most helpful strategies. For example one of the females said that "I try to use words which are familiar to me to reduce my anxiety." None of the participants referred to strategies of attempt to think in English or message abandonment. Repeating utterances, using gestures, paying attention to rhythm and intonation while speaking were reported as other speaking strategies. Message reduction strategies were the most frequently mentioned strategy among males and females. Females reported message reduction strategies and negotiation for meaning while speaking strategies with a higher frequency in compare with males.

Table 7: Helpful Speaking Strategies for both Male and Female Interviewees

Strategies	Frequency (Females=14)	Percentage	Frequency (Males =11)	Percentage
MES	9	64%	6	54%
FL	5	35%	4	36%
AC	3	21%	3	27%
NFM	7	50%	3	27%
NVS	6	42%	5	45%
SA	1	7.14%	1	9.09%
ATE	—	—	—	—
MA	—	—	—	—

Discussion of the Results

The present study was conducted in order to investigate the relationship between Iranian intermediate EFL learners' logical intelligence and their use of speaking strategies in communication.

According to the results of this study a positive significant correlation was found between logical intelligence and accuracy-oriented and attempt to think in English strategies. It is similar to the

findings of Koura and Al-Hebaishi (2014) who found positive relationship between logical intelligence and students' grammar scores. Since accuracy-oriented strategies concern about grammar and rule and attempt to think in English strategies deal with construction of sentences, it can be concluded that the results of the current study confirm what was found by Koura and Al-Hebaishi (2014).

Results of the interview in the case of helpful speaking strategies indicated that message reduction and alteration strategies were reported as the most helpful speaking strategies, which is in line with what was found by Nakatani (2006), Li Lin (2013), and Metcalfe and Nook-Ura (n.d) on oral communication research. It seems that using familiar words and simple expressions are very effective and by using these strategies the speaker will be able to decrease the probability of making errors. Furthermore, it was found that message reduction strategies and negotiation for meaning while speaking strategies are mentioned more frequently by females. According to Færch and Kasper (1980), using message reduction strategies helps students to avoid making speaking errors. It seems that females are more worried about making speaking errors and prefer to use familiar words and short utterances instead of taking risk. Negotiation for meaning which happens in the situation of misunderstanding makes the input more comprehensible for the people who are involved in the interaction. Higher frequency of reporting of this strategy by females may be explained in this way that women's main purpose of using the language is to create and maintain social cohesiveness and their activities are generally co-operative rather than competitive, therefore, they feel more comfortable to negotiate with others. On the whole, females are more interested to participate in interactions and are more able to maintain negotiation.

According to the results of the interview regarding speaking difficulties, lack of vocabulary knowledge was reported as the most frequently mentioned speaking difficulty. This finding supports what was found by Li Lin (2013) who referred to insufficient vocabulary knowledge as one of the main communication difficulties. Lack of grammatical knowledge, fear of making speaking mistakes and having problem with pronunciation and intonation were detected as other speaking difficulties respectively among both males and females. Li Lin (2013) explained that negative psychological reactions such as anxiety and fear affect oral communication of college students. No significant difference was observed between males and females with regard to their reported speaking difficulties.

CONCLUSIONS

Current study aimed to explore the relationship between Iranian intermediate EFL learners' logical intelligence and their use of speaking strategies in communication. In order to serve the purpose of the study, a null hypothesis was proposed. The null hypothesis which claimed that there is no significant relationship between Iranian intermediate EFL learners' logical intelligence and their use of different speaking strategies was rejected. Results of the study revealed that there is a significant relationship between Iranian EFL learners' logical intelligence and their use of speaking strategies. It is similar to the findings of Shangarffam and Zand (2012)

which revealed significant correlation between learners' three types of multiple intelligences and their use of oral communication strategies.

Qualitative data analysis in the case of helpful speaking strategies revealed that message reduction strategies are the most frequently mentioned strategies among the participants. Besides, it was found that message reduction and negotiation for meaning while speaking strategies were reported with higher frequencies by females. Most of the participants believed that using speaking strategies is very helpful for them in order to overcome speaking difficulties, also by using such strategies they can equip themselves in case of any speaking deficiencies. Lack of vocabulary knowledge was detected as the main speaking difficulty among these participants which is in agreement with the finding of Lin (2013) who found insufficient vocabulary knowledge as one of the common oral communication difficulties.

Pedagogical Implications

This study has promising implications for EFL teachers, EFL learners and syllabus designers. Since many EFL learners are not familiar with some speaking strategies and the effectiveness of applying such strategies, EFL teachers and syllabus designers are recommended to have a special attention to the instruction of different strategies.

With regards to speaking difficulties, it is suggested that teachers use different techniques of learning vocabulary, encourage language learners to improve their vocabulary knowledge and create a friendly atmosphere in the class so that every individual is able to speak without any fear of making mistakes in order to improve learners' speaking skill. EFL learners are recommended to use different speaking strategies. Using speaking strategies help learners to overcome speaking difficulties and speak more fluently. Learners should be aware of their strengths and weaknesses in applying different strategies. Syllabus designers can use the results of the current study in order to add strategy training to EFL materials.

Suggestions for Further Research

Results of the present study can be a guideline for conducting numerous valuable studies on speaking strategies. Although investigating language learning strategies has been one of the main research topics during the past decades, it seems more studies with a focus on specific strategies are needed. In addition, the current study attempted to focus on speaking strategies, while investigating other strategies including reading, writing and listening may provide more in-depth and rewarding information for EFL contexts. Other studies can also be conducted on the possible relationship between learners' variables such as their field of study, social class and cultural background and their use of speaking strategies.

FROM LACK OF HUMANITY TO SELF-CONSCIOUSNESS AND VISION IN *LORD OF THE FLIES* AND *BLINDNESS*

Maryam Sadeghi

Department of English, Mahshahr Branch, Islamic Azad University, Mahshahr, Iran
Email: m.sadeghi45@yahoo.com

ABSTRACT

Civilization and industrialization are two important factors that make people believe they are just depriving of savagery and brutality. But practical studies show exactly something different. How groups of people behave, when they are put in extreme situations is the very unpleasant truth about human being in general. Both Blindness and Lord of the Flies deal with fragility of human society, no matter the people who are playing role are children or grown-ups, who by definition should know better. Both novels have got beautiful plots in which no one enforces rules and laws on the characters, so they begin to show their true nature. The present study is undertaken to investigate the process of a journey from lack of humanity to a sort of self-consciousness which happens at the end of both Blindness by Saramago and Lord of the Flies by Golding. In order to get the best result the two novels have been studied precisely and lots of different articles and critical essays have been analyzed, which shows people drift into cruelty and savagery easily but can also drift out of it. In Blindness losing sight, and being a part from society in a deserted tropical island in Lord of the Flies causes limitation. Limitation in any form makes people to rebel. Although in the process of both novels, any kind of savagery, brutality, filth and social collapse can be observable and both writers believe that human being has the potential of being animal images, but they both also want to show that the very nature of human being is divine. Children's weeping at the end of Lord of the Flies and Doctor's remark at the end of Blindness "I don't think we did go blind, I think we are blind, blind but seeing, blind people who can see but do not see", show exactly the matter of insight at the end of both novels. The fact that divinity exists in the very nature of human being is the indubitable aim that makes this research truly valuable.

KEYTERMS: savagery, animal images, divinity.

INTRODUCTION

Humanity is the most unsolved crucial problem of today's world. Many experts are now wandering to find a reasonable answer to the question of divinity of human nature. Whether human being is essentially divine and is always connected to a powerful source of divinity, or he has been left alone in the world, is the very essential problem human being is trying to answer. Many psychologists, sociologists, writers and humanist experts have long been interested to know, as Gioia (1985) states "how groups of people behave when put in extreme situations". They wanted to reveal an unpleasant truth about society. Many story tellers have asserted their point of views regarding this issue of humanity and human nature through their writings. Some have an optimistic view regarding the very nature of human beings, some have got pessimistic

view. The present paper is intended to investigate a different view regarding human nature in a parallel study on Saramago's *Blindness* and Golding's *Lord of the Flies*. Both novels represent people who are left alone to deal with themselves, grown-ups in *Blindness* and young boys in *Lord of the Flies*. In such a situation Chase (2009) believes "without sight, there is an awful disrobing of human nature, a nakedness of the worst kind". Their difference with the boys in *Lord of the Flies* is that "they don't, hoarding food, attacking others, raping and killing." The process from lack of humanity to self-consciousness and vision is going to be discussed step by step and surely with a positive point of view. Although it seems Saramago is much more positive than Golding, due to the fact that characters in *Blindness* are not as wild and cruel as the boys in *Lord of the Flies*, the formers are grown-ups having some experiences and the later are young boys who love power and insurrection. From the publication of both novels lots of different critical essays tried to prove that human being is essentially savage. And will come back to its essence whenever it is appropriate. But the present paper is aimed at proving the fact that man is capable of savagery, but he is also capable of peace and order. How at the end of both novels a sort of vision and self-consciousness takes place is a matter of consideration. What both authors are going to show is a sort of struggle between right and wrong. The very negative view point that "human nature has a wicked side and without punishment to keep it in check, society would degenerate into a barbaric anarchy" would be referred to, investigated, criticized and at last will be rejected to some extent, in the present paper. Both novels have got some common images which lead the characters toward self-consciousness. Images of fire, loneliness, lack of interaction, food are the most important images in both novels. These images portray the gradual decline of morals and a gradual return toward pure humanity in general.

A PASSAGE FROM DEPRAVITY TO HUMANITY

The very essence or nature of human being and his capability of indecency and brutality is a very challenging point which creates an unconscious pessimism regarding human being in general. In both *Blindness* and *Lord of the Flies* the authors want to focus on the fact that there is a fundamental potential in every person to commit evil acts. Chase (2009) states that "people slowly deal with their lack of seeing and lack of insight towards one another.....without sight, life and history fade in favor of death and disease." A gradual decay and shift toward animality is observable during the process of both novels. Losing sight is the very prime image, which lead people to lose their humanity gradually. Pointer (1995) believes that "the blind prisoners, as well as the blind residents of the city depicted after the mental hospital burns to the ground.... Have forgotten how to use toilet, and they defected in the streets which run for filth." What happens that people move toward collapse and while they are at the edge of despair, they can have the power to come back to their pure nature? Basic human needs are the most important points which lead the society toward a so called jungle.

IMAGES WHICH LEAD TO BRUTALITY AND ANIMALITY

Need for food and Love of Power

The first and almost the most important need of a human being is need for food. People need food to be alive and lack of food makes them rebel against one another and against society. As

the story-*Blindness*- goes on the condition and situation of the people is getting worse and worse. At the beginning parts of the novel they share food, but after a while they came to fact that in order to survive, any savagery is acceptable. In such an environment, even the basic necessities of life- food, medicine, and clear water- are often lacking. Snedeker mentions that “they find themselves in a society that no longer functions. Blind people roam the streets looking for food and shelter”. The blind are placed in quarantine without any leader or any rule, so they have to deal with themselves. Their first and most important need is food. So the blinds drifted apart from society are drifting apart from humanity towards animality; self-serving and ultimately geared toward survival.

That is what exactly happened in *Lord of the Flies*, finding food and keeping oneself against wild animals are two important factors which forced the children to gradually disrupt their childhood innocence. Hunting a pig and putting it as a sign of power shows that children are becoming cruel even toward each other. When the children were divided into two groups, the risk of cruelty becomes more and more. Although despite all these movements toward animality, both authors, at the bottom of their hearts believe that human nature is divine and is connected to a source of divinity. Cioia believes “for this author [Saramago], people under extreme conditions are neither unabashedly evil nor purely benevolent. Rather they are unnerving combination of both. In terms of crisis, our response to circumstances are intensified and transformed, but rarely simplified.” Struggle over power is the most crucial issue which made the boys to become almost enemies.

Love of power also made the situation worse and worse for the blinds in *Blindness*. Conditions degenerate, as an armed clique gains control over food deliveries, “subjugating their fellow internees and exposing them to rape and deprivation.” Faced with starvation, internees do battle and burn down the quarantine. And this is the turning point of the story which helps the prisoners to escape that unpleasant condition to a civilized world.

Sexual Desire

Another natural need which treats human society is sex. Although as Chase (2009) mentioned “sex in the novel [*Blindness*] isn’t erotic if anything approaches salacious, it is the cruelty men reap on people they cannot see.” Human being is capable of treating like an animal whenever he understands that no one can see him. Thus he is going to transgress social norms. The blinds acquiesce to send their wives to another ward and instead they can have food. Fortunately sexual desire is not observable in *Lord of the Flies* because they are all boys and they might not experience it before.

Inability to Interact

Human being is to some extent similar to animals. The only power which makes them different is the power of mind and logic. People are able to interact with each other. They can sympathy. They need empathy when they are in need. Losing sight gradually made the blind to lose insight and not having any logic or so they are just by definition human beings. They act exactly like animals due to inability to interact. Conventional rules of behavior no longer apply and a social and behavioral collapse is rapidly spreading. Pointer (1995) believes that “Saramago’s goal was to demonstrate the fragility of human society, using allegory, to show that basic human decency

is, in his view at least, an illusion and that it too would largely vanish, if society collapsed.” What helps the blind to escape quarantine is the murder of hoodlums. After escape something new happens for the prisoners. A new horizon, exactly like what happened in *Lord of the Flies*.

Lord of the Flies starts with a group of innocent boys around fourteen or so, who are left alone on a deserted tropical island and gradually their innocence fade and savagery, replaced it. Both Golding and Saramago have got a dual perspective toward human nature. In *Lord of the Flies*, at the beginning the boys pay more attention to playing than other things and just enjoyed their life. Without grown-ups and without any rules to be controlled by, life was really enjoyable. But after a while finding food and being responsible for one’s own life and survival, changed the innocents to a savage one. As it was mentioned in the previous part, food was the basic need of the boys.

The time when Simon was killed by the other boys is the climax of savagery, brutality, and animality. Hunting Ralph as an animal with other boys, or jacks action to ignite the forest all were symptom of savagery and brutality in *Lord of the Flies*. But the question is why those innocence creatures changed so much and is there any hope they regain their innocence and childhood purity. To some extent Golding believes that people are innately savage or evil, and only the constraints of society of society keep people from exhibiting full savagery. As the novel progresses Golding very professionally and acutely shows how well-behaved, orderly children are longing toward barbarity and cruelty he shows how destructive human being can be. Children in chapter twelve are completely different from the one in chapter three.

Images which lead to humanity

In both novels some images are very important clues which lead the characters and even the readers to a source of divinity and purity.

Fire

In both novels fire became a bridge to let the characters escape the prison like situation. So symbolically they get rid of their inside beasts and enter the civilized world. The signal fire functions as a kind of measurement for the desire of the boys to get rid of that deserted island. At the beginning of *Lord of the Flies* they are all eager to maintain the fire to be rescued as quickly as possible. But in the middle of the novel the boys lost their interest to be rescued and return to a rule based society. But, at the end of the novel, igniting fire everywhere in the forest, symbolically shows their inner wish to get out the present evil centered position. Steinbach (2013) mentions “One of the most vivid and haunting uses of imagery can be found in the description of the patch of island which the boys burn what they intended to be a "small fire." In *Blindness* when internees battled and burnt down the asylum, they could escape and make some basic changes in their condition.

Blindness and loneliness

Blindness as a disease and being on an island both are images for loneliness and demonstrate a sort of internal conflict for the characters. In *Blindness*, the characters do some actions for gaining food and responding to their natural needs which might be against their will and at the end they come to a sort consciousness that being blind is just an excuse for acting against

morality. That's what exactly happens in *Lord of the Flies* where both internal and external conflict can be seen. Ralph as the leader of the civilized group is in conflict with Jack who is the leader of savage group. Literary analysis essay asserts "Golding reveals the growing tension between civilization and savagery in three key moments...he uses the setting, characters, and symbolism in *Lord of the Flies* to give reader a detailed description of these two faces of man." There are also sentences which exactly show how some of the boys suffer from being on that unpleasant island. "...Ralph wept for the end of the innocence, the darkness of man's heart, and the fall through the air of a true, wise friend called Piggy (202).

Symbolic Characters in Lord of the Flies and Blindness

Piggy, Jack, Simon, and Ralph can all be seen as symbolic characters in William Golding's novel *Lord of the Flies*. Jack's role in *Lord of the Flies* is to show the desire of power. The change from good to evil is shown in *Lord of the Flies* by the shift from Ralph to Jack as the boys' choice of leaders. Piggy is a very good representation of intellectual aspect of civilization. Simon represents natural human goodness and unfortunately the boys who are getting savage day after day being on that devil island murdered him. They actually sacrifice their own natural goodness for the sake of brutality and animality. Therefore, it is easy to see that the four main characters in *Lord of the Flies* are used by William Golding to symbolize different aspects of the inevitable change from civilization and happiness to primitivism.

In *Blindness* all the people went blind unless the wife of the ophthalmologist who is, like Simon, natural representation of human goodness. It might be the fact that she didn't go blind; to help the blinds survive their bad situation. Fragility of society can be seen in both *Blindness* and *Lord of the Flies*, but the condition of grown-ups seems to some extent better than the situation of the young boys.

Both Golding and Saramago try to design a journey from humanity to brutality and again to humanity. The difference is, Golding uses the children who seem to be more innocent than adults but Saramago uses typical grown-ups, actually without nameless, with generic labels to emphasize the fact that anybody might be the traveler of the so-called journey. At the end of both novels the characters come to a sort of vision. When the boys cry at the time of survival, looking back to the island, and when almost at the end of *Blindness* one of the characters remarks "I don't think we did go blind, I think we are blind, blind but seeing, blind people can see, but do not see." A shift in the people's view point toward humanity and the fact that they regain their sight suddenly and without any reason are all some other images which make a bridge to humanity. Chase (2009) states "the novel's final fading of cruelty makes you suddenly aware of beauty as reprieve. The city may be horrifying, but somehow, it is not hopeless. People drift into cruelty easily, but they can drift out of it. It is as easy as waking up."

CONCLUSION

The present paper aimed at proving the fact that although human being is capable of being evil and committing some devil actions but the very essence of human being is divine and man is connected to a powerful source of divinity. With the use of character, conflict, as well as

symbolism, Golding and Saramago slowly lead up to their theme that, man is born with evil tendencies. Through the boys, Golding attempts to show the true nature of humankind, the good, the evil, and the in between. Saramago's nameless characters are also representation of typical human being in a society, ready to collapse. Through the novel some images and signs like finding food, inability to interact, sexual desire, will of power and loneliness lead the characters toward brutality and filth. While at the same time some other images help them to come to a sort of vision and consciousness. Fire, blindness and loneliness, are all images which show characters in both novels are getting tired of being in a wild life like society. Through the use of symbolic characters both authors signify the path from humanity to brutality and getting back to humanity again. In *Lord of the Flies*, at First, most of the boys were followers of Ralph because of their innocence but after a while when savagery became dominant, they decided to obey Jack who is the real representation of love of power and evil actions- lose of innocence. Simon as a truly representation of goodness was killed by the boys in the middle of the story. Doctor's wife like Simon represents pure nature. She helped the prisoners to wash themselves, finds food for them and protects them from dangers. The hoodlums, one of them possesses a gun, treat exactly like Jack. They abuse the other people and their love of power at the end annihilates them.

The central themes of *Lord of the Flies* and *Blindness* are the conflict between two challenging impulses that exist within all human beings: the instinct to live by rules, act peacefully, follow commands, value the good of the many over the instinct to fulfill one's immediate desires, act violently to gain supremacy over others, and enforce one's will. *Lord of the Flies* and *Blindness* are two novels that exhibit both, the good-hearted nature of humans, along with man's evil flaws. What is really most important is that both novels end with a sort of self-consciousness and getting back to pure natural essence of human being.

ABSTRACT

Today, motivation and learning are joined to each other like music and cooking. Many teachers recognize this and are diligent to better their students' motivation to maintain data on their long-term memory for a long period of time. Because a motivated student practice and practice the learned material more often, which leads to keep in his/her long term memory for a long duration. The present study intended to investigate the effect of motivation on long-term memory of Iranian EFL advanced learners. The participants were 30 female EFL advanced learners at an English Language Institute. To meet the aim of the study, a 40-point Michigan test was administered to the participants as a pretest in the first session and the same test as a posttest at the end of the semester. The results revealed differences in pretest and posttest. Additionally, a motivated strategy for Learning Questionnaire (MSLQ) instrument was utilized to measure their motivation in English after posttest. The findings of the study affirmed that motivation is a useful and facilitating factor for improving and increasing long-term memory. This research affirmed that motivation can help learners improve their learning and retrieve learned topics in their long term memory. It shows that motivation can affect long-term memory and ZPD increases when the learning environment is stress free.

KEYWORDS: motivation, long-term memory, interaction, achieving activities.

INTRODUCTION

Long-term memory can be defined as maintaining memory of data for a long cycle of time. It is usually divided into two types: conscious (explicit) memory or unconscious (implicit) memory (Baddeley, & Hitch, 1974). We recognize explicit memory for facts, notions and events also known as declarative or conscious memory.

Explicit memory can be subdivided into semantic and episodic memory (Baddeley, 1991). In other words, semantic and episodic memories are two types of long-term memories. In semantic memory, we understand the meaning of different things such as words, the names of colors, the sounds of letters also knowing facts about the world.

The idea of semantic memory was presented in 1972 as the result of cooperation between Endel Tulving of the University of Toronto and Wayne Donaldson of the University of New Brunswick on the impact of organization in human memory.

Tulving, in his book, "Elements of Episodic memory" paid attention to differences between semantic and episodic in how they function and kinds of information for processing. Episodic memory is special events in time in our memory, so it can be different from someone else's memories of the same experience. In other words, in episodic memory we experience personally. In comparison to explicit (conscious) memory, a memory that is repeated for the development of procedures of doing actions over time is implicit (unconscious) memory also known as procedural memory (Tulving, 1985).

For example: exercising skills are one type of implicit memory. You learn the skills and practice them more often, and then unconsciously you are authoritative during a game. Playing a kind of music or practicing for learning are another examples of implicit memory. Doing everyday tasks like cooking, driving a car, riding a bicycle happen automatically and rendered to actions without us realizing it.

REVIEW OF LITERATURE

Up to lately, researchers did not investigate straightly the approachability and accessibility of information stored in working memory during assembled cognitive processes. Instead, they made deductions about working memory from studies of general memory capacity. The modulus procedure has been to present a list of irrelevant items and to entail reproduction with either urgent free recall or free recall after some interpolated activity. In the common model of human memory (Atkinson & Shiffrin, 1968), immediate free remind yields items nearly retrieved from an interim short-term memory (STM) and items recovered by retrieval cues from a more durable storage in long-term memory (LTM). STM is supposed to have a finite span of around seven chunks (G. A. Miller, 1956), a chunk corresponding to an intimate pattern formerly stored in LTM. Storage in STM is interim, and when attention is diverted to another requesting task, information originally stored in STM becomes unavailable in a matter of seconds (Brown, 1958). In contrast, the storage span of LTM is supposed to be broad and much more durable than that of STM. The time required for storage of a new retrievable memory trace in LTM has been guessed to be respectively long--about ten seconds (Simon, 1973).

The main pinch for retrieval from LTM is the infrequency of retrieval cues that are connected by association to the desired item, stored in LTM. During free reminding materials are asked to retrieve a list they studied earlier. If some of the cues in the context for recall were still available in the context for study of the list, they should be part of the retention trace and thus serve as retrieval cues for points in the list to be reminded. Once some items have been reminded, they can serve as extra retrieval cues. Constant with this proposed mechanism, free remind in most list-learning experiments is relatively poor and reduces as a function of the number of lists the subjects have previously studied and thus related to the same contextual cues.

In most of the tremendous research on memory, scholars have tried to separate different memory systems and to determine their storage and retrieval characteristics with general measures that are independent of materials and of subjects' specific history knowledge. Researchers have concentrated on estimating maximal capacities by studying memory performance in simple tasks

that examine only memory. It is generally supposed that the same distinctions and capacity limitations observed for simple tasks enforced to working memory in complex cognitive activities.

In criterion theories of memory (Atkinson & Shiffrin, 1968) data can be stored in LTM just after it has been stored in STM, and even then, storage in LTM is a probable event. Originally, Atkinson and Shiffrin supposed that the likely of storage in LTM is a subordinate of the time an item was preserved in STM. Recently, Anderson (1983) suggested that the probability of storage is a function of the number of times an item enters STM. Subjects' control of the tank of data appears to be limited. Furthermore, in more meaningful tasks subjects' remind of presented information is not progressed when they are instructed to study that information for later recall (Craik& Lockhart, 1972). This discovery mentions that subjects cannot achieve reliable storage of information in many of the standard memory tasks. Anderson (1983) goes even so far as to discuss that subjects' inability to control storage in LTM is beneficial since they cannot predict what information will be useful later on.

In the end, last research has demonstrated that working memory does not consist of a single general span, but rather contains of various subsystems that can be depended on to complete various types of tasks (Baddeley, 1991).

RESEARCH QUESTIONS

The following research questions were proposed to manage and control this study:

Is motivation a useful way to increase long-term memory?

Is motivation a facilitating factor to improve long-term memory?

RESEARCH HYPOTHESES

The study addressed the following research hypotheses:

Motivation to EFL learners is a facilitating factor to improve long-term memory.

Motivation is a useful way to increase long-term memory.

MEHODOLOGY

Participants

Thirty (N =30) students took part in this study. They were female EFL learners at an English language Institute. The average age of students was about 18, ranging from 14 to 25. All of them were at the same proficiency level according to the syllabus of English language Institute. The level of students was advanced.

Instruments

In order to have a more homogeneous sample, a pretest was administered to participants to determine their level of their proficiency. Participants took 40 points of Michigan Test of English language proficiency in order to measure their proficiency level.

Procedure

At the beginning of the session of semester, the teacher started with introduction, explanation and motivation. During these sessions, the teacher controlled motivation in all classroom activities particularly in discussions and role-plays. Summit 2A English book, the main book for advanced level was taught.

At the end of the semester, the same test was administered as a posttest to discover that motivation in the foreign language learners is a useful and facilitating factor for improving long-term memory. In order to test the effect of motivation on long term memory, the motivated strategies for learning questionnaire (MSLQ) instrument was distributed among the participants after the posttest (A 7 point Likert Scale Questionnaire). The MSLQ is based on a general cognitive view of motivation. McKeachie, Pintrich, Line and Smit (1986) present the general theoretical framework that underlies the MSLQ. The questionnaire included 31 questions for gathering data about changes in learner's long-term memory. The collected data was analyzed by SPSS.

RESULTS AND DISCUSSION

The results of the pretest and posttest show that learners performed are better than on posttest to pretest. The mean in pretest was 80/0 and in posttest was 81/8.

Table 1: The results of the pretest and posttest

	Pretest	Posttest
N	30	30
Mean	80.0	81.8
SD	13	12.8
t	2.8	2.8

This study shows that there is a significant difference between pretest and posttest, $t\text{-test}=2.8$ and $P<0/05$. This table shows that the means are different and difference between the pretest and posttest is significant. The present study was an attempt to survey the effect of motivation on long-term memory of Iranian EFL learners.

The important duty of EFL/ ESL teachers is to motivate learners to learn in-depth understanding to preserve information for a long period of time in their long-term memory.

The scores of the posttest were higher than the pretest. Within motivation and low anxiety in students, we can achieve more chance to hold information in our long-term memory. Several studies indicate the influence of motivation in reminding or producing personal memories. Specifically, motivation can affect the level of emotional severity experienced when recalling autobiographical¹ memories, and the selection, content, and process of autobiographical memories (Brunot & Sanitioso, 2004). Level of emotional intensity is higher with remembered

memories related to current long-term goals than memories irrelevant to long-term goals (Singer, 1990).

According to the results of the questionnaire which studied the effect of motivation in learners' long term memory, participants selected the options of 47% very true of me (option7), 32% more true (options4,5,6,), 12% less true (options2,3), and 9% not at all true of me (option1).

The results show that motivation can affect long-term memory. The prime learning on long-term memory happens when there is no difficult and afraid situation, and there is a feeling of comfortable and pleasure of the class activities.

CONCLUSION

For measuring the effect of motivation on long-term memory, the instrument used for data collection was a 40-point Michigan test as a pretest at the beginning of the semester to the participants and the same test as a posttest at the end of the semester after motivating them. A 40-point Michigan test was administered to 30 female EFL learners at an English Language Institute.

As shown, the mean scores of the two tests are different, and the result of t-test indicates 2.8. The difference between the means is approximately significant. Therefore, with a 95 percent probability, it may be claimed that there is a statistically significant difference between the two tests (pretest and posttest) on the performance of our language learners in their learning before and after motivating them.

In end, a 7-point Likert scale questionnaire, the motivated strategies for learning questionnaire (MSLQ) instrument, was also utilized to measure their motivation level after the end of the semester. The findings of the study confirmed that motivation is a useful and facilitating factor for improving and increasing long-term memory. The present study noticed motivation and its impression on learners' long-term memory of Iranian EFL learners. It is clear that people will learn when they want to learn. Even in the face of bad textbooks, bad schools, bad teachers, whatever, motivated students will learn.

With respect to the research hypotheses, it was perceived that motivation to EFL learners is a facilitating factor to improve long-term memory and motivation is a useful way to increase long-term memory.

Motivation is one of the powerful actions of agent among students. This, in turn causes the information stored in long term memory that leads to a better remembering. Teacher in this study controlled motivation and caused the students acted the classes better. By comparison pretest and posttest, the students were in a better understanding of topics in posttest. Through using motivation and challenging students can improve their learning and retrieving the learned topics in their long-term memory.

Researchers generally believe in two major types of motivation: Intrinsic and extrinsic. Intrinsic motivation is the desire to do something because one really wants to and takes pleasure or sees value in doing so. Extrinsic motivation is the desire to do something not for the fun of the things itself, but because doing so leads to a certain result (Pintrich, 2003). It is often difficult to divide motivation as merely Intrinsic or extrinsic.

The major findings of this study show that motivation can affect long-term memory. ZPD increases when there is no difficult and afraid situation, and there is a feeling of comfort, pleasure, and fun in the class activities.

The questions related to the intrinsic motivation in the survey are:

In a class like this, I prefer course material that really challenges me so I can learn new things.

In a class like this, I prefer course material that arouses my curiosity, even if it is difficult to learn.

The most satisfying thing for me in this course is trying to understand the content as thoroughly as possible.

When I have the opportunity in this class, I choose course assignments that I can learn from, even if they don't guarantee a good grade.

And the questions related to the extrinsic motivation, the items:

Getting a good grade in this class is the most satisfying thing for me right now.

The most important thing for me right now is improving my overall grade point average, so my main concern in this class is getting a good grade.

If I can, I want to get better grades in this class than most of the other students.

I want to do well in this class because it is important to show my ability to my family, friends, employer, or others.

For being successful, intrinsic and extrinsic motivation is very necessary.

This study was limited to female learners and it can be repeated by male students too.

THE EFFECT OF TEACHING VOCABULARY THROUGH TRANSLATION APPROACHES VS. USE OF VISUAL AIDS ON VOCABULARY LEARNING OF IRANIAN EFL LEARNERS

Nahid Gharehchahi & Mohammad Sadegh Bagheri (corresponding author)

English Department, Faculty of Humanities and Foreign Languages, Shiraz Branch, Islamic Azad University, Shiraz, Iran
nahidgh2418@yahoo.com
bagheries@gmail.com

ABSTRACT

This study was an attempt to investigate the effect of teaching vocabulary through translation approaches vs. the use of visual aids on vocabulary learning of Iranian EFL learners. To this end, the performance of participants in retention of vocabulary through translation approaches and visual aids was studied. To conduct the study, two types of tests in the form of multiple choice and production test including fill in the blanks, and wh-questions were used as the instruments for both the pre and post-tests to measure the participants' retention of new vocabularies. The participants were 30 Iranian female EFL learners between ages of 13 to 15 studying LET'S GO 4 (3rd edition) at a language institute in Shiraz. Paired samples t-test and independent samples t-test were utilized. The results of the study indicated that both approaches (visual aids and translation) were effective regarding vocabulary retention of new vocabularies. The results also showed that students learned vocabulary better through translation approaches. Therefore, translation approaches were more effective than visual aids in retention of new vocabulary items.

KEYWORDS: Vocabulary, Translation, Visual Aids, EFL Learners

INTRODUCTION

Learning a second language needs some skills and components to be mastered. Among those skills and components, vocabulary is one of the most crucial ones in language learning without which communication is not possible. Translation approaches and visual aids are effective techniques that teachers can use to teach vocabulary to their students that can cause long-term retention of newly-learned vocabulary.

According to Kim (1996, p. 3), "teaching vocabulary is an important factor in language teaching." Because through words we can express our feelings, emotions, and ideas to others, language teachers should use the most effective ways to teach vocabulary in their classes. Vocabulary is an important element in every language because without sufficient vocabulary students can't understand each other or express their opinions. Teaching vocabulary helps

students understand and communicate with others in English. Wilkins (1972, p.111) mentioned that “while without grammar very little can be conveyed, without vocabulary nothing can be conveyed.” Lewis (1993, p. 89) said that “lexis is the core or heart of language”. Swan and Walter (1984) stated that acquisition of vocabulary is the largest and the most essential task facing the language learner.

There are many studies that show translation has a positive effect on acquisition of second language. There is much agreement on the benefits of using translation in learning L2. Ellis (1985) for example, stated that learners can use their first language to overcome their limitations while learning a second language. Auerbach (1993) argued that using translation in L2 classroom will have a positive impact on learner’s second language learning especially in vocabulary area.

Using visual aids should be an important part of the learning process. Teachers should use visual aids in their classes to motivate their students, to help them understand and recall the materials better. As Harmer (2001) maintains, visual aids make the learning process easier. English teachers feel that if they use visual aids such as pictures, charts, realia, etc. in their classes the learning process can be enjoyable and memorable. Most of the time it becomes difficult for students to remember the meaning of some words; therefore, the teachers investigated to increase student’s learning through visual aids. Nelson (1979) argued that visual aids such as pictures and charts are very effective for learners memory as they are various.

LITERATURE REVIEW

Learning vocabularies of a foreign language has long been emphasized in language teaching. There are many different techniques to teach vocabulary. However, the important issue is which techniques learners should use in order to learn vocabulary effectively so that they can recall them easily. Wilkins (1972, p. 111) states that “without grammar very little can be conveyed, without vocabulary nothing can be conveyed.” So if learners do not have a strong base of vocabulary knowledge they cannot communicate their thoughts and ideas successfully.

Henning (1973) stated that from the beginning stage vocabulary should be recognized as a central element in language instruction. Meara (1980, p. 192) stated that “Vocabulary is one of the important parts of language learning which has been neglected for several decades”. According to Allen (1983), “for many years teachers were sometimes told that they ought not to teach many words before their students have mastered the grammar and sound system of the language”(p. 1). He continues that, “pronunciation and grammar were emphasized, but there was little or no emphasis on vocabulary” (p. 1).

Vocabulary is defined by Hubbard (1983) as a powerful carrier of meaning. Hatch and Brown (1995, p. 468) defined vocabulary as “the list of words that speakers of particular language use.” Ur (1999) stated that vocabulary is the words that are taught in a foreign language. Furthermore, Henriksen (1999, p. 303) defined vocabulary knowledge as “ precise comprehension which is

operationalized as the ability to translate the lexical items in to L1, the ability to find the right definition in a multiple-choice task, or the ability to give a target language paraphrase". Allen (1983) stated that knowledge of vocabulary is necessary for communication. Thus, communication breaks down if people do not use the exact words. Moreover, vocabulary plays an important role in the success of foreign language learners (Kasper, 1993; Krashen & Terrell 1983).

Fortunately, most teachers and students agree that knowledge of vocabulary is essential for acquiring other skills of language. According to Thornbury (2002), if learners spend most of their time studying grammar, their English will not improve very much. They will see most improvement if they learn more words and expressions. Thornbury (2002, p. 13) stated that "You can say very little with grammar, but you can say almost anything with words."

Nowadays, using translation as a way of teaching vocabulary is a controversial issue. Using L1 in L2 classroom for teaching vocabulary might be seen as a negative and unfashionable way. Nevertheless, research has found clear advantages in using L1 to teach vocabulary more significantly at the initial stages of the learning process (Cook, 2003; Jiang, 2002; Liu, 2009; Schmitt, 2008). Vocabulary expert Nation (1982) concludes that if teachers give the meaning of the words through L1 translation first, learning vocabulary becomes easier and faster for many learners. Nation (1982) concludes that if teachers use translation to teach new vocabulary in their classes learning vocabulary becomes faster for many learners. Butzkamm (2003) believes that successful learners usually rely on their mother tongue when they want to learn a second language.

Nowadays it is common for EFL teachers to use the students' mother tongue as a tool to teach both in English language institutes and in the classroom. Research shows that it is not appropriate to delete L1 in L2 classroom. (Butzkamm, 2003; Larsen-Freeman, 2000; Nation, 2003; Schweers, 1999). If teachers use translation appropriately, it can be very beneficial. Schweers (1999) encourages teachers to use the native language in their classes to influence the classroom dynamic, and suggests, "starting with L1 provides a sense of security and validates the learners' lived experiences, allowing them to express themselves" (p. 7). Brown (2000, p. 68) claims, "first language can be a facilitating factor and not just an interfering factor".

Research shows that translation is a good way to teach and learn new vocabulary. As Nation (2002) maintains, translation is a technique for teaching vocabulary. If teachers use L1 in EFL classes, they can save their class time. Sometimes using translation of vocabulary items or explanation of a grammar point would be much easier and also more efficient. According to Morahan (2007), whether to use translation in the second language classroom or not has been debated for many years.

Recently, the taboo against using translation in the classroom has shattered, and the attitude and feeling to L1 and translation in language classes has witnessed a positive change due to the fact

that some learners use L1 as a communicative strategy to learn and use the foreign or second language (Cook, 2001; Gill, 2003; James, 1998; Odlin, 1989). In fact, translation is a new teaching method, which can be used in second language classes and can help both teachers and learners. Faltis (1990) cited that translation is the new technique, which requires both teachers and learners to balance the use of the L1 and foreign language.

In language learning situation, a knowledgeable learner is assumed the one who is proficient in all four language skills and also sub-skills. As research findings reveal, L1 use is important in both teaching and learning aspects of these skills. For example, Nuttall (1996) by addressing the reading skill emphasizes the importance and value of translation in training reading-based library skills, for the discussion of students' worksheets and in reading summary test. In relation to the concept of language response, he adds, "inability to express themselves (students) in the target language necessarily limits both the kind and the quality of the responses students give. It is quite possible that students who are permitted to use their L1 in responding will explore the text more accurately and thoroughly than those who are restricted to target language responses" (p. 187).

Visual learners learn primarily through the visual channel and learn best by seeing. They usually think in pictures and prefer to learn materials, diagrams, images, pictures, colors, videos, flipcharts and handouts. They can simply visualize objects and plan in their mind. This type of learners prefer to see an activity rather than just explain about an activity verbally. In general when reading, the visual learner will remember images and pictures in order to understand the text they are reading. They will often remember faces rather than names.

Teaching vocabulary through the use of visual materials is very useful. Goodman (1987) suggested that usually, visual materials were more easily understood by learners of all ages because a picture seemed worth a thousand words and avoided lengthy, difficult and complex word definitions. Harmer (2001) stated that visual aids can help students to learn the materials easier. Abebe and Davidson (2012) point out that students like to learn vocabulary with the help of visual aids, and that the use of visual aids increases the students' ability and opportunity to use language to express their thoughts, ideas and feelings.

Moreover, Hill (1990) states that using different types of visual materials in teaching vocabulary in classroom can increase the intrinsic motivation of the students. When students show interest towards what they learn, they can engage themselves in the activities. In this way, they can learn language meaningfully. Koren (1996) points out that the learning of foreign vocabularies with pictures can be easier and more memorable than vocabularies without pictures. In the same vein, Armstrong (2001) believed that learning vocabulary through the use of visual aids is more helpful and effective than learning vocabulary without perception of visual aids. Horn (1998) stated that visual aids such as pictures and charts can solve many learning problems.

Harmer (2001) also reported that real objects, some books, newspapers or magazines can help students to make the learning process easier. Therefore, teachers use them for better teaching and

learning. Anderson and Shiffrin (1980) cited that using pictures, charts and images for children can be very helpful because in this way they can learn vocabulary items better. Porter and Margaret (1992) assert that visual materials can help teachers to teach more comprehensively to their students. They can make learning process more interesting as well. Allen (1983) adds that children have a strange ability for learning language. In contrast to verbal instruction, teaching vocabulary through visual aids helps teachers to save their class time. So, they can allocate their time for necessary classroom activities such as drills and other exercises. Mayer and Sims (1994) indicate that an increasing body of research evidence supports that presenting words and illustrations or pictures together, affects students' learning in a positive way.

Among all types of visuals, pictures are perhaps the simplest and commonly used. Yet pictures are also very effective and useful. In the language learning of young children. Pictures are often used as to provide associations for the learning of new vocabularies. We cannot use pictures for every unknown word because some words are abstract and cannot be illustrated easily. If a word is concrete then it is easier to find and use a picture for its illustration (Anderson & Shiffrin, 1980).

Using pictures in teaching learning process is an enjoyable activity because pictures keep the students from getting bored. The use of pictures makes the vocabulary material more meaningful, and also helps learners to memorize the new words easily and to represent the real object or things. Furthermore, the use of picture is a fantastic educational tool and makes learning more fun than usual.

There has been much research on pictures in learning generally, and a little also in the area of second language learning. For example, Koren (1999) points out that learning foreign vocabulary with association of pictures can be easier than words without these associations. Indeed many teachers of young children in the English language classrooms use photo dictionaries in order to improve the vocabulary and speaking skills of students.

According to Bush (2007), using picture is a simple way for simultaneous attention to the building blocks of second language learning. Using picture for teaching new vocabulary has been a fundamental principle in many methods in TEFL or TESL (Richards & Rodgers, 2001). For example, in direct method, it is supposed that there should be a direct relationship between form and meaning. According to Doff (1988), demonstration is direct, interesting, and has a great impact in the class. As Shapiro and Waters (2005), hold, "it is well documented within the cognitive literature that visual stimuli create very strong memories" (p. 131).

Flash cards have also been used as an important tool in teaching English as second language (Hart, 1982). They are used not only for teaching vocabulary but also for teaching many different things such as propositions, articles, tenses, sentence structures, and phrasal verbs (Palka, 1988). In addition to teaching vocabulary, flash cards have been used to improve both reading speed and comprehension of learners. (Tan & Nicholson, 1997). As Wright (1990) pointed out, word

flash cards are very useful in teaching reading and writing. Nevertheless, they will find their use in teaching vocabulary too, offering valuable help mainly in teaching the spelling of newly learnt words, which definitely should not be neglected as it often is.

According to Nunan (1999), realia is defined as objects and teaching props which are outside the classroom and are used for teaching and learning. Under this statement, realia is considered as real objects, which are used to help students learn a new language, as a way to present meaningful examples from the real world. Along with this idea, the British Council site states that “realia refers to any real objects we use in the classroom to bring the class to life”.

Richards and Platt (1992, p. 289) regard realia as “real objects and things which are brought in to a classroom as examples or as aids to be talked or written about and used in language teaching such as articles of clothing, kitchen utensils, items of food, etc”. Zukowsky and Faust (1997) defined realia as concrete objects and the apparatus of everyday life. Hunt and Beglar (1998) state that realia can help learners a lot because they can hear the word and also receive visual reinforcement. French (1983) states that whenever we have real objects in the classroom, it is better to use them instead of pictures.

Charts, maps and diagrams are other common visual tools that can be used for learning purposes. Kleinman and Dwyer (1999) examined the effects of specific visual skills in facilitating learning. Their findings indicate that the use of color graphic as opposed to black and white graphics promotes better achievement in the learning of concepts. An earlier study by Myatt and Carter (1979 as cited in Heinich et al., 1999) suggests that most learners prefer color visuals to black and white visuals, but usually there is no significant difference between them in the amount of learning except when color is related to the subject to be learned.

As Cable (1977) mentions drawing on board has an important role in teaching and learning vocabulary. Teachers can draw stick figures to represent people and in this way, they can teach a dialogue or a new word. According to Doff (1988), it is not necessary for teachers and learners to be wonderful artists to draw a picture in order to teach vocabulary, the most important thing is to communicate the message.

RESEARCH QUESTIONS

Q1. Is there any statistically significant difference between teaching vocabulary through translation approaches versus use of visual aids on vocabulary learning of Iranian EFL learners?

Q2. Does translation based approach have any effect on teaching vocabulary?

Q3. Does teaching vocabulary through visual aids have any effect on teaching vocabulary?

METHODOLOGY

Design

This research was done within a pretest, treatment, post-test, quasi-experimental design in which the collected data were analyzed quantitatively. There was one independent variable with two levels of translation and visual aids.

Participants

The participants were 30 Iranian female EFL learners (N=30) between ages of 13 to 15 studying LET'S GO 4 (3rd edition) at a language institute in Shiraz. The participants were all native speakers of Persian who had learnt English for about two years.

The participants were selected based on convenience sampling and from among two different intact classes. Their scores in the pretest and posttest would not affect their final class activity scores but these tests had a positive effect on students midterm and final scores. However, a bonus was considered for all the participants as a sign of encouragement.

Instruments

Two types of tests in the form of multiple choice, and production test including fill in the blanks, and WH-questions were used as the instrument for both the pre-test and the post-test to measure the participants' retention of new vocabularies. The total number of items was 30 and the number of items of each part is as follows: twenty multiple-choice tests in which students had to find the correct answer to each sentence, five fill-in-the-blank sentences in which students had to write only one word according to the meaning of the sentences, and five WH-questions. Students had to answer these five questions according to the pictures.

Data collection

In order to conduct this study, LET'S GO 4 (3rd edition) was used. This book has eight units each with a title such as Birthdays, The Great Outdoors, Hopes and Dreams, Schools, Indoors and Outdoors, People, Future Plans, and Work and Play. Each unit starts with a conversation, some new vocabularies, grammar points and a reading at the end of each chapter.

First, the teacher divided the book into two parts. In order to teach vocabulary all the new vocabularies were chosen. For ten sessions, the teacher used visual aids in order to teach them. During these ten sessions, she taught four lessons to the learners, which contain 64 new vocabularies by the use of posters, flashcards, board drawings, charts and realia. For the other ten sessions, again the teacher taught four lessons, which contain 66 vocabularies by the use of translation approaches such as teacher translation, student translation, and some translation exercises and activities as their homework to teach new vocabularies. At the beginning of the term, the teacher applied a pretest and after teaching new vocabularies by the use of visual aids, she used the same test as a posttest. In order to determine the effectiveness of translation approaches, the same procedure was employed both for the pretest and for the posttest.

Scoring rubrics

Each learner's paper was corrected. For each multiple-choice test, half mark and for each production question one mark was assigned. The total scores were calculated out of twenty.

Data analysis

After collecting the data, correcting their papers, and giving scores, the SPSS software (version 16) was used and descriptive statistics such as mean, standard deviation, etc were calculated. Moreover, inferential statistics such as paired samples t-tests and independent samples t-test were employed to analyze the data and to find out which approach (translation approaches or visual aids) is more effective in retention of new vocabularies.

RESULTS AND DISCUSSION

Research Question 1

Is there any statistically significant difference between teaching vocabulary through translation approaches versus use of visual aids on vocabulary learning of Iranian EFL learners?

To answer the first research question, an independent samples *t*-test was run.

Table 1: Independent Samples *t*-test

	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	T	df	Sig. (2-tailed)	Mean Difference	Std. Difference	Error 95% Interval Difference Lower	Confidence of the Upper
Equal variances assumed	0.653	0.422	-3.36	58	.001	-3.11667	0.92631	-4.9708	-1.2624
Equal variances not assumed			-3.36	57.7	.001	-3.11667	0.92631	-4.9710	-1.2622

With reference to Table 1, it is obvious that there was a statistically significant difference between these two groups. The sig (.001) was less than 0.05.

Research Question 2

Does translation based approach have any effect on learning vocabulary?

Table 2: Paired Samples t-test for translation condition

	Paired Differences							Sig. (2-tailed)
	Mean	Std. Deviation	Std. Error Mean	95% Interval of the Difference		T	df	
				Lower	Upper			
Pre & post translation	-8.550	3.35885	0.61324	-9.80422	-7.29578	-13.942	29	.000

*= $p < 0.05$

As Table 2 shows, the results of the paired samples *t*-test for translation are statistically significant due to *p* value which is smaller than .05. The sig was (.000) which is smaller than *p* value .05.

Research Question3

Does teaching vocabulary through visual aids have any effect on learning vocabulary?

Table 3: Paired Samples t-test for visual aids condition

	Paired Differences						Sig. (2-tailed)	
	Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference		T		
				Lower	Upper			
visual aids pre and posttest	-5.00	3.57674	0.65302	-6.33558	-3.66442	-7.657	29	.000

As Table 3 shows, the result of the paired samples *t*-test for visual aids was statistically significant due to the *p* value which is smaller than .05. The sig is (.000) which is smaller than *p* value .05.

Research question 1 was whether there was any statistically significant difference between teaching vocabulary through translation approaches vs. use of visual aids on vocabulary learning of Iranian EFL learners? The results of independent sample *t*-test revealed that there was a statistically significant difference between teaching vocabulary through translation approaches vs. use of visual aids on vocabulary learning. Research question 2 was does translation based approach have any effect on teaching vocabulary? The results of paired sample *t*-test revealed that the results for translation is statistically significant. Research question 3 was does teaching vocabulary through visual aids have any effect on teaching vocabulary? The results of paired sample *t*-test revealed that the results for visual aids was statistically significant. In general results showed that students learn vocabulary better through translation approaches.

CONCLUSION

According to the grades of participants in the posttest, it is concluded that both visual aids and translation approaches were effective in retention of new vocabularies. So, one may come up with the conclusion that visual aids and translation approaches are essential and helpful for learning new vocabularies.

The final word about these two approaches (translation, visual aids), is that translation is more effective than visual aids in retention of new vocabularies.

Implication of the study

This study shows that it is necessary for teachers to use different strategies to teach new vocabularies in a second language. For example, translation method can be used at the initial stages of learning. Translation strategy is a helpful strategy especially for learning vocabulary for EFL learners who are at the elementary levels of English proficiency. Ellis (1985) states that learners' L1 works as a resource that learners can use for translation to overcome their limitation in learning a second language. Sridhar (1981) believes that the use of L1 in the learning of L2 does not interfere with the learning of the second language in any way as some people thought. Using visual aids is another method that teachers can use in classroom to teach new vocabularies. When students learn new words by visual teaching, it helps them to learn and remember them easily.

This study has a positive effect on teaching and learning process. From this study, teachers may gain insights in to the role of both translation and visual aids in learner's learning process and integrate these two methods in their teaching process. The findings of this study may also encourage teachers to use appropriate techniques for teaching vocabulary. The findings of this study are also useful for students. They can identify the best ways through which they can learn a new vocabulary.

Materials developers can also use the findings of this study. They can design sections of vocabulary in which the learners have to translate sentences, which contain newly learned vocabularies. Therefore, it is recommended that materials developers include exercises in their materials, which require learners to translate some parts that contain new vocabularies.

ABSTRACT

This study attempts to investigate the possible selves of efficacious language teachers to know to what extent their ideal, ought-to, actual, and feared selves affect their attitudes towards their effective teaching. In order to achieve the objective of the study, the Teachers' Sense of Efficacy Scale (TSES) developed by Tschannen-Moran and Hoy (2001) administered to 50 English language teachers of state schools and institutes to measure their self-efficacy beliefs. The data were analyzed using chi-square test. It should be noted that the efficacious teachers were selected based on the median score of 176.5. Then they were asked to answer The Possible Selves (PSs) questionnaire developed by Dastgoshadeh (2013) which measured four main domains of ideal-self, ought-to-self, actual-self, and feared-self, each of which in turn measured some subdomains. The first research question was analyzed for these 16 subdomains. An analysis of chi-square was run to compare the four domains of ideal, ought-to, actual and feared selves in order to probe the second research question. Based on the results it can be claimed that majority of the respondents indicated that the teachers significantly believed that ideal-self shaped possible selves. Teachers' sense of job satisfaction, teaching efficacy, career identity, and language identity are the most dominant selves of efficacious teachers.

KEYWORDS: Efficacy, Efficacious Teachers, Possible Selves

INTRODUCTION

Teachers always have the most important effect on learning process as the leaders of education path and also their way of thinking and their beliefs pave the way for their students to be successful in their education. Learning a new language is one of the most challenging fields of study that students face at school. Teachers have a very crucial role in the success or failure of each educational system. In fact as Galluzzo (2005) states "one of the most often-expressed statements about teaching is that nothing is more central to student learning than the quality of teacher".

Teachers' sense of efficacy has been related to positive teaching behaviors and student outcomes (Henson, Kogan & Vacha-Haase, 2001), and teachers with high teacher efficacy beliefs tend to implement new teaching ideas and techniques (Ross, 1992). As Bandura (1995) points out 'the task of creating environments conducive to learning rests heavily on the talents and self-efficacy of teachers.' Since teachers' efficacy may lead to students' efficacy and the improvement of educational practices, it is considered salient in the teaching and learning process.

Possible selves are the future-oriented aspect of self-concept; that is, the positive and negative selves one fully believes and expects to become or wants to avoid becoming (Markus & Nurius, 1986). By providing concrete positive expected and negative to-be-avoided future images, possible selves personalize goals and connect current behaviors to future states. In this way, possible selves improve self-regulatory capacity (Cross & Markus, 1994; Oyserman & Markus, 1990; Oyserman, Terry, & Bybee, 2002) and make one's current situation seem meaningful (Cross & Markus, 1991). The present study is an attempt to explore the possible selves' development of teachers who feel success in their job and known as efficacious teachers.

REVIEW OF THE LITERATURE

Self-efficacy

The idea of self-efficacy was first proposed by Bandura (1977) within his social cognitive theory and refers to "beliefs in one's capabilities to organize and execute the courses of action required to manage prospective situations" (Bandura, 1995). According to Tschannen-Moran & Hoy (2007) Self-efficacy beliefs do not necessarily reflect people's actual ability, but show their perception of it. Therefore, they may underestimate or overestimate their real abilities. Self-efficacy is a social-psychological construct and refers to 'people's judgments of their capabilities to organize and execute courses of action required to attain designated types of performances' (Bandura, 1986). These judgments, which are affected by a person's previous successes and failures, messages that other people communicate, successes and failures of others and successes and failures of a group as a whole, are central and pervasive to human action since they have the power to determine people's choices, goals, effort, and persistence (Bandura, 1989; Bandura, 1995; Ormrod, 2006).

Teacher Efficacy

The construct of teacher efficacy was derived from Bandura's theory of self-efficacy (1977). Applied to the context of education teacher efficacy has been defined as "the extent to which teachers believe they can affect student learning" (Dembo & Gibson, 1985). Teacher efficacy is seen as a multidimensional construct with Ashton and Webb (1982), for example, identifying two dimensions as "teaching efficacy" and "personal efficacy". The first factor represents a teacher's sense of teaching efficacy or belief that teachers can overcome factors external to the teacher such as the background of students. The second dimension, personal efficacy, is the belief of an individual teacher in their own personal capacity to deliver the necessary teaching behaviors to influence student learning.

Possible Selves Theory

As Lee and Oyserman (2006) mentioned “Self-concept is one's theory about oneself, the person one was in the past, is now, and can become in the future, including social roles and group memberships. A well-functioning self-concept helps make sense of one's present, preserves positive self-feelings, makes predictions about the future, and guides motivation”. The contents of the future-oriented component of self-concept have been termed *possible selves* (Markus & Nurius, 1986). As observed by Higgins (1994), three possible selves are seen as particularly significant in motivating and directing behavior: the *ideal self*, the *ought self*, and the *feared self*. Possible selves are shaped by a given individual's hopes and fears, but they are also reconciled with the individual's social, socio-cultural, and historical context (Norman and Aron, 2003); an individual may, thus, possess a combination of these three for any future domain. Following is a brief description of each self from this model.

Implications of possible self theory for teachers

Oyserman and Lee (2009) noted that “Teachers, parents, and students all have possible selves—images of how things might be in the near and more distal future. These images illustrate that change is possible. Possible selves can undergird self-improvement by showing a path toward the future and by highlighting where one might end up if effort is not maintained. Intervention to help teachers, parents, and students focus on what they want to become and avoid becoming, what they value, and how they expect to engage in becoming like their desired selves and avoiding becoming like their undesired selves can be highly effective. Indeed, the theory of possible selves has been used to understand progress and life transitions for both youth learners and adults in continuing education and other settings. Perhaps the most important message that educators can take from the research on possible selves is that possible selves are malleable and can be influenced by intervention to enhance the content of possible selves”. Changing possible selves through intervention can lead to positive changes in academic behavior, in better academic performance and lower risk of depression (Oyserman et al., 2002; 2006).

Common to all this early research is recognition of the importance of an understanding of self to beliefs, attitudes and actions, and thus the kinds and effects of such actions. In teacher education also, much research literature demonstrates that knowledge of the self is a crucial element in the way teachers construe and construct the nature of their work (Kelchtermans & Vandenberghe, 1994) and that events and experiences in the personal lives of teachers are intimately linked to the performance of their professional roles (Ball & Goodson, 1985; Goodson & Hargreaves, 1996; Acker, 1999).

Several researchers (Nias, 1989, 1996; Hargreaves, 1994; Sumsion, 2002) have noted that teacher identities are not only constructed from technical and emotional aspects of teaching (i.e. classroom management, subject knowledge and pupil test results) and their personal lives, but also 'as the result of an interaction between the personal experiences of teachers and the social, cultural, and institutional environment in which they function on a daily basis' (Slegers & Kelchtermans, 1999).

RESEARCH QUESTIONS

The study seeks to answer the following questions:

1. What shapes the possible selves of efficacious language teachers?
2. Which sense of possible selves is the most dominant one in making efficacious language teachers?

METODOLOGY

Participants

The sample for this study consisted of 50 (male and female) junior and senior high school English language teachers of Kurdistan, Iran and also English language teachers who work in institutes of this state. The teachers in the sample had 3 to 15 years of teaching experience and ranged in age from 20 to 50. Based on the total score of efficacy and its median score of 176.5, the participants were divided into two groups of efficacious and non-efficacious groups (each having 25 participants). The analyses were run on the 25 efficacious participants, i.e. the other 25 were omitted.

Instruments

Two kinds of questionnaires were used to find answers to the questions raised by this study. One of them was *The Teachers' Sense of Efficacy Scale* (TSES) developed by Tschannen-Moran and Hoy (2001) was used to measure teachers' self-efficacy beliefs. The other scale which was used in this study was *Possible Selves Questionnaire* prepared by Dastgoshadeh (2013) to better understand what has actually shaped the different L2 selves of EFL teachers. The Cronbach's alpha reliability indices for the efficacy questionnaire and ideal, ought-to actual, feared and total possible selves were 0.94, 0.91, 0.80, 0.58, 0.63 and 0.92 (Table 1)

Table 1: Reliability Statistics for efficacy and possible selves development

	Cronbach's Alpha	N of Items
Efficacy	.948	24
Ideal-Self	.916	28
Ought-to-Self	.803	10
Actual-Self	.584	13
Feared-Self	.631	3
Possible Selves	.922	54

Procedure

In the first step 50 English teachers were selected randomly. They were asked to answer Teachers' Sense of Efficacy Scales in person. Next, out of 50, 25 were selected as efficacious teachers since they scored above 168. They were requested to answer the second questionnaire which was on teachers' possible selves development. These questionnaires submitted to them in person. Participants were asked to answer each question by choosing one of the six possible answers ranged from strongly agree to strongly disagree. Time was not considered as an important factor in completing the questionnaires. The researcher herself was also available to provide them with guidance and answers if they came across any ambiguities.

Data collection and analysis

In order to investigate the research questions of the study, some statistical analyses were conducted. SPSS program was used to analyze the data gathered from the questionnaires. Chi Square test was used for analyzing the data. Based on the total score of efficacy and its median score of 176.5, the participants were divided into two groups of efficacious and non-efficacious groups (each having 25 participants). The analyses were run on the 25 efficacious participants, i.e. the other 25 were omitted.

Sixteen chi-square plus frequency and percentages were used to probe to what extent efficacious teachers have each of the 16 subdomains. This probed the first research question. The subdomains under each domain were compared through chi-square in order to probe the second research question to find which one is more dominant. For example the three subdomains of personal-self, teaching efficacy and career identity were compared for ought-to-self.

RESULTS AND DISCUSSIONS

First Research Question

What shapes the possible selves of efficacious language teachers?

The possible-self questionnaire measures four main domains of ideal-self, ought-to-self, actual-self, and feared-self; each of which in turn measures some subdomains. The first research question was analyzed for these 16 subdomains.

Ideal-Self

A chi-square test was run to probe any significant differences between the teachers' perception towards the subdomains of Ideal self. Based on the results displayed in Table 2 it can be claimed that majority of the teachers (N = 89, Residual = 59) strongly agreed with the idea that career identity was an aspect of ideal-self. The other 46 responses (Residual = 16) agreed with this idea. On the other hand only one response (Residual = -29) disagreed with the idea that career identity shaped ideal-self. Two responses (Residual = -28) slightly disagreed with this idea. And finally 12 responses (Residual = -18) slightly agreed with the idea that career identity was part of ideal-self. Based on the results displayed in Table 2 it can be claimed that majority of the teachers (N = 36, Residual = 21) strongly agreed with the idea that person self was an aspect of ideal-self. Another 27 responses (Residual = 12) had the same idea.

On the other hand only one response (Residual = -14) disagreed with the idea that person-self shaped ideal-self. Two responses (Residual = -13) slightly disagreed with this idea. And finally nine responses (Residual = -6) slightly agreed with the idea that person self was part of ideal-self.

The results of chi-square (Table 2) indicated that majority of the teachers (N = 44, Residual = 29) strongly agreed with the idea that language identity was an aspect of ideal-self. Another 17 responses (Residual = 2) had the same idea. On the other hand only one response (Residual = -14) disagreed with the idea that language identity shaped ideal-self. Six responses (Residual = 9) slightly disagreed with this idea. And finally seven responses (Residual = -8) slightly agreed with the idea that language identity was part of ideal-self.

The results of chi-square (Table 2) indicated that majority of the teachers (N = 41, Residual = 26) strongly agreed with the idea that teaching efficacy was an aspect of ideal-self. Another 23 responses (Residual = -2) had the same idea. On the other hand only one response (Residual = -24) disagreed with the idea that teaching efficacy shaped ideal-self.

Based on the results displayed in Table 2 it can be claimed that majority of the teachers (N = 28, Residual = 15.5) agreed with the idea that cultural identity was an aspect of ideal-self. Another 26 responses (Residual = 13.5) strongly agreed with this idea. On the other hand only one response (Residual = -11.5) disagreed and another one response (Residual = -1.5) strongly disagreed with the idea that cultural identity shaped ideal-self. Five responses (Residual = -7.5) slightly disagreed with this idea. And finally 14 responses (Residual = 1.5) slightly agreed with the idea that cultural identity was part of ideal-self.

Based on the results displayed in Table 2 it can be claimed that majority of the teachers (N = 39, Residual = 26.5) strongly agreed with the idea that language efficacy was an aspect of ideal-self. Another 22 responses (Residual = 9.5) agreed with this idea. On the other hand only two responses (Residual = -10.5) strongly disagreed and another one response (Residual = -11.5) disagreed with the idea that language efficacy shaped ideal-self. Three responses (Residual = -9.5) slightly disagreed with this idea. And finally eight responses (Residual = -4.5) slightly agreed with the idea that language efficacy was part of ideal-self.

The results of chi-square (Table 2) indicated that majority of the teachers (N = 45, Residual = 25) strongly agreed with the idea that sociopolitical identity was an aspect of ideal-self. Another 38 responses (Residual = 18) had the same idea. On the other hand only one response (Residual = -19) strongly disagreed with the idea that sociopolitical identity shaped ideal-self. Three responses (Residual = -17) disagreed with this idea. And finally 13 responses (Residual = -4) slightly agreed with the idea that sociopolitical identity was part of ideal-self.

The results of chi-square (Table 2) indicated that majority of the teachers (N = 54, Residual = 35.3) strongly agreed with the idea that job satisfaction was an aspect of ideal-self. Another 16 responses (Residual = -2.8) had the same idea. On the other hand only two responses (Residual = -16.8) strongly disagreed with the idea that job satisfaction shaped ideal-self. Three responses (Residual = -15.8) slightly agreed with this idea

Table 2: Frequencies, Expected and Residual Values; Ideal Self

domain	Sub domain	Values	Strongly Disagree	Disagree	Slightly Disagree	Slightly Agree	Agree	Strongly Agree	Total

		Expected N	18.8			18.8	18.8	18.8	
		Residual	-16.8			-15.8	-2.8	35.3	

Note1. The frequencies refer to the responses not number of cases.

Note2. Positive residuals indicate that the option was selected more than expectation.

The results of chi-square (Table 3) indicated that there were significant differences between the teachers' attitude towards each sub domains as main factors of ideal-self. The teachers significantly believed that career identity, personal self, language identity, teaching efficacy, cultural identity, language efficacy, sociopolitical identity, and job satisfaction shaped ideal-self.

Table 3: Chi-Square; Ideal Self

domain	Sub domain		Choices

0 cells (0.0%) have expected frequencies less than 5.

The minimum expected cell frequency for career identity is 30.0., for personal self and language identity is 15.0., for teaching efficacy is 25.0., for cultural identity and language efficacy is 12.5., for sociopolitical identity is 20.0., and for job satisfaction is 18.8.

Ought-to-Self

The results of chi-square (Table 4) indicated that majority of the teachers (N = 56, Residual = 31) strongly agreed with the idea that personal-self was an aspect of ought-to-self. Another 18 responses (Residual = -7) had the same idea. On the other hand only one response (Residual = -24) slightly disagreed with the idea that personal-self shaped ought-to-self.

The results also indicated that majority of the teachers (N = 32, Residual = 19.5) strongly agreed with the idea that teaching efficacy was an aspect of ought-to-self. Another 31 responses (Residual = 18.5) had the same idea. On the other hand three separate one responses (Residual = -11.5) strongly disagreed, disagreed and slightly disagreed with the idea that teaching efficacy shaped ought-to-self. Nine responses (-3.5) slightly agreed with this idea. Based on the results displayed in Table 4 it can be claimed that majority of the teachers (N = 44, Residual = 24) strongly agreed with the idea that career identity was an aspect of ought-to-self. Another 41 responses (Residual = 21) agreed with this idea. On the other hand only one response (Residual = -19) strongly disagreed with the idea that career identity shaped ought-to-self. Four responses

(Residual = -16) slightly disagreed with this idea. And finally ten responses (Residual = -10) slightly agreed with the idea that career identity was part of ought-to-self.

Table 4: Frequencies, Expected and Residual Values; ought-to self

domain	Sub domain	Values	Strongly disagree	disagree	Slightly disagree	Slightly agree	agree	Strongly agree	total
Ought-to self	Personal self	Observed N			1		18	56	75
		Expected N			25		25	25	
		Residual			-24		-7	31	
	Teaching efficacy	Observed N	1	1	1	9	31	32	75

		Expected N	20		20	20	20	20	
		Residual	-19		-16	-10	21	24	

The results of chi-square (Table 5) indicated that there were significant differences between the teachers' attitude towards personal-self, teaching efficacy and career identity as main factor of ought-to--self. The teachers significantly believed that personal self, teaching efficacy, and career identity shaped out-to-self.

Table 5: Chi-Square; ought-to self

domain	Sub domain		Choices
Ought-to self	Personal self	Chi-Square	63.440 ^c
		Df	2
		Asymp. Sig.	.000
	Teaching efficacy	Chi-Square	90.520 ^d
		Df	5

	Career identity	Chi-Square	86.700 ^e
		Df	4
		Asymp. Sig.	.000

0 cells (0.0%) have expected frequencies less than 5.

The minimum expected cell frequency for personal self is 25.0., for teaching efficacy is 12.5., and for career identity is 20.0.

Actual-Self

The results of chi-square (Table 6) indicated that majority of the teachers (N = 41, Residual = 22.3) strongly agreed with the idea that teaching efficacy was an aspect of actual-self. Another 23 responses (Residual = 4.3) had the same idea. On the other hand two responses (Residual = -16.8) slightly disagreed and another nine responses (Residual = -9.8) slightly agreed with this idea. It is also indicated that majority of the teachers (N = 25, Residual = 8.3) agreed and slightly agreed with the idea that career identity was an aspect of actual-self. Another 17 responses (Residual = .3) strongly agreed with this idea. On the other hand 15 responses (Residual = -1.7) slightly disagreed, 11 responses (Residual = -5.7) disagreed and finally seven responses (Residual = - 9.7) strongly disagreed with this idea. The results of chi-square (Table 6) indicated that majority of

the teachers (N = 28, Residual = 15.5) agreed with the idea that sociopolitical identity was an aspect of actual-self. Another 22 responses (Residual = 9.5) strongly agreed with this idea. On the other hand 14 responses (Residual = 1.5) slightly agreed, two responses (Residual = -10.5) strongly disagreed, three (-9.5) disagreed and finally six responses (Residual = - 6.5) slightly disagreed with this idea. The results of chi-square (Table 6) indicated that majority of the teachers (N = 32, Residual = 19.5) agreed with the idea that personal self was an aspect of actual-self. Another 18 responses (Residual = 5.5) strongly agreed with this idea. On the other hand 18 responses (Residual = 5.5) slightly agreed, two responses (Residual = -10.5) strongly disagreed, four (-8.5) disagreed and finally one response (Residual = - 11.5) slightly disagreed with this idea.

Table 6: Frequencies, Expected and Residual Values; Actual self

domain	Sub domain	Values	Strongly disagree	disagree	Slightly disagree	Slightly agree	agree	Strongly agree	total
Actual self	Teaching efficacy	Observed N			2	9	23	41	75
		Expected N			18.8	18.8	18.8	18.8	
		Residual			-16.8	-9.8	4.3	22.3	
	Career identity	Observed N	7	11	15	25	25	17	100
		Expected N	16.7	16.7	16.7	16.7	16.7	16.7	
		Residual	-9.7	-5.7	-1.7	8.3	8.3	3	
	Sociopolitical identity	Observed N	2	3	6	14	28	22	75
		Expected N	12.5	12.5	12.5	12.5	12.5	12.5

0 cells (0.0%) have expected frequencies less than 5.

The minimum expected cell frequency for teaching efficacy is 18.8., for career identity is 16.7., for sociopolitical identity is 12.5., and for personal self is 12.5.

Feared-Self

The results of chi-square (Table 8) indicated that majority of the teachers (N = 17, Residual = 4.5) strongly disagreed with the idea that feared-self was an aspect of possible-self. On the other hand, 15 responses (Residual = 2.5) agreed and slightly agreed with this idea. Seven responses (Residual = -5.5) strongly agreed, nine responses (Residual = -3.5) slightly disagreed and 12 responses (-.5) disagreed with this idea.

Table 8: Frequencies, Expected and Residual Values; Feared-Self

domain	Sub domain	Values	Strongly disagree	disagree	Slightly disagree	Slightly agree	agree	Strongly agree	total
Feared self	Personal self	Observed N	17	12	9	15	15	7	75
		Expected N	12.5	12.5	12.5	12.5	12.5	12.5	
		Residual	4.5	-.5	-3.5	2.5	2.5	-5.5	

The results of chi-square ($\chi^2 (5) = 6.04$, $p = .302$, $r = .28$ representing a weak to moderate effect size) indicated that there were not any significant differences between the teachers' attitude towards feared-self.

Table 9: Chi-Square; Feared Self

domain	Sub domain		Choices
Feared self	Personal self	Chi-Square	6.040 ^d
		Df	5
		Asymp. Sig.	.302

0 cells (0.0%) have expected frequencies less than 5.

The minimum expected cell frequency is 16.7.

Second Research Question

Which sense of possible selves are the most dominant in making efficacious language teachers?

An analysis of chi-square (crosstabs) was run to compare the four domains of ideal, ought-to, actual and feared selves in order to probe the second research question. Each cell (Table 10) contain three pieces of information; frequency, percentage and standardized residual (Std. Residual). The former two are descriptive indices based on which no statistical inferences can be reached; however, the latter is a standardized index based on which the frequencies of vertical cells can be compared for detecting significant differences. Any Std. Residual higher than +/- 1.96 denote that the frequency was significantly beyond expectation (+) or significantly lower than expectation (-). Based on these results it can be claimed that;

Majority of the respondents (N = 384, 54.9 %, Std. Residual = 3.5 > 1.96) indicated that the teachers significantly believed that ideal-self shaped possible selves. The Std. Residual for actual-self (-4.2) and feared-self (-4.7) was significantly lower than what was expected.

Table 10: Frequencies, Percentages and Std. Residuals; Domains of Possible Selves

		Choices						Total
		Strongly Disagree	Disagree	Slightly Disagree	Slightly Agree	Agree	Strongly Agree	
Ideal	Count	6	5	21	67	217	384	700
	% within Domain	0.9%	0.7%	3.0%	9.6%	31.0%	54.9%	100.0%
	Std. Residual	-2.9	-3.2	-1.8	-2.1	-.4	3.5	
Ought-to	Count	2	1	6	19	90	132	250
	% within Domain	0.8%	0.4%	2.4%	7.6%	36.0%	52.8%	100.0%
	Std. Residual	-1.8	-2.2	-1.5	-2.1	1.2	1.6	
Actual	Count	11	18	24	66	108	98	325
	% within Domain	3.4%	5.5%	7.4%	20.3%	33.2%	30.2%	100.0%
	Std. Residual	.8	3.2	2.5	4.1	.4	-4.2	
Feared	Count	17	12	9	15	15	7	75
	% within Domain	22.7%	16.0%	12.0%	20.0%	20.0%	9.3%	100.0%
	Std. Residual	10.6	7.1	3.1	1.9	-1.8	-4.7	
Total	Count	36	36	60	167	430	621	1350
	% within Domain	2.7%	2.7%	4.4%	12.4%	31.9%	46.0%	100.0%

T

he Std. Residuals for the selection of the “agreed” choice were all within the ranges of +/- 1.96, i.e. they did not show any significant differences.

On the other side of the table, the feared-self (N = 17, 22.7, Std. Residual = 10.6 > 1.96) indicated that the respondents significant disagreed with the idea that feared-self shaped possible selves. This was coupled with (Std. Residual = 7.1) for the selection of disagree, and (Std. Residual = 3.1) for the selection of slightly disagree. These results indicated that the respondents significantly disagreed with the idea that feared-self shaped possible selves.

Of interesting results was that respondents significant disagreed (Std. Residual = 3.2) and slightly disagreed (Std. Residual = 2.5) with the idea that actual-self shaped possible selves, while (Std. Residual = 4.1) slightly agreed with the idea that actual-self contributed to possible selves.

Thus it can be concluded that; a) ideal-self was considered as the best factor in shaping possible selves, b) feared-self was the weakest factor, c) actual-self seemed to have a weak contribution and finally, d) the attitude towards the contribution of ought-to-self did not seem unanimous.

The results of chi-square (χ^2 (15) = 309.69, $p = .000$, $r = .47$ representing an almost large to moderate effect size) indicated that there were significant differences between the teachers' attitude towards domains of possible selves.

Table 11: Chi-Square Tests

	Value	Df	Asymp. Sig. (2-sided)
Pearson Chi-Square	309.693 ^a	15	.000

	%	0.0%	0.0%	0.0%	1.3%	30.7%	68.0%	100.0%
	Std. Residual	-.8	-.7	-1.5	-2.3	-.1	1.5	
Cultural Identity	Count	1	1	5	14	28	26	75
	%	1.3%	1.3%	6.7%	18.7%	37.3%	34.7%	100.0%
	Std. Residual	.4	.6	1.8	2.5	1.0	-2.4	
Language Efficacy	Count	2	1	3	8	22	39	75
	%	2.7%	1.3%	4.0%	10.7%	29.3%	52.0%	100.0%
	Std. Residual	1.7	.6	.5	.3	-.3	-.3	
Sociopolitical Identity	Count	1	0	3	13	38	45	100
	%	1.0%	0.0%	3.0%	13.0%	38.0%	45.0%	100.0%
	Std. Residual	.2	-.8	.0	1.1	.3	-1.3	
Job Satisfaction	Count	2	0	0	3	16	54	75
	%	2.7%	0.0%	0.0%	4.0%	21.3%	72.0%	100.0%
	Std. Residual	1.7	-.7	-1.5	-1.6	-1.5	2.0	
Total	Count	6	5	21	67	217	384	700
	%	0.9%	0.7%	3.0%	9.6%	31.0%	54.9%	100.0%

Based on these results it can be claimed that the following Std. Residuals were significant;

- 1) the subjects slightly disagreed with language identity (Std. Residual = 2.5 > 1.96) more than what was expected.
- 2) The subjects slightly agreed with teaching efficacy (Std. Residual = -2.3 > -1.96) less than what was expected.
- 3) The subjects slightly agreed with cultural identity (Std. Residual = 2.5 > 1.96) more than what was expected.
- 4) The subjects strongly agreed with cultural identity (Std. Residual = -2.4 > -1.96) less than what was expected.
- 5) The subjects strongly agreed with job satisfaction (Std. Residual = 2 > 1.96) more than what was expected. The other values were lower than +/- 1.96.

The results of chi-square (χ^2 (35) = 67.14, $p = .001$, $r = .30$ representing a moderate effect size) indicated that there were significant but moderate differences between the teachers' attitude towards sub-domains of ideal self. The results should be interpreted cautiously due to the

moderate effect size value of .30 and also due to the fact that 50 percent of cells had expected frequencies less than 5 (refer to footnote of Table 12).

Table 13: Chi-Square Tests

	Value	Df	Asymp. Sig. (2-sided)
Pearson Chi-Square	67.149 ^a	35	.001
Likelihood Ratio	74.625	35	.000
Linear-by-Linear Association	1.066	1	.302
N of Valid Cases	700		

a. 24 cells (50%) have expected count less than 5. The minimum expected count is .54.

Figure 3: Percentages; Domains of Ideal Self

Figure 4: Percentages; Sub-Domains of Ideal Self

Are there any significant differences between the sub-domains of the ought-to-self?

Table 14 displays the frequencies, percentages and Std. Residuals for the three sub-domains of the ought-to-self. Based on these results it can be claimed that only two Std. Residuals were significant; 1) the subjects slightly agreed with personal self (Std. Residual = -2.4 > -1.96) less than what was expected. And 2) their strongly agreed with personal self (Std. Residual = 2.6 > 1.96) more than what was expected.

Table 14: Frequencies, percentages and Std. Residual; Sub-Domains of Ought-to-self

		Choices						Total
		Strongly Disagree	Disagree	Slightly Disagree	Slightly Agree	Agree	Strongly Agree

	%	0.8%	0.4%	2.4%	7.6%	36.0%	52.8%	100.0%

The results of chi-square ($\chi^2 (10) = 27.40$, $p = .002$, $r = .33$ representing a moderate effect size) indicated that there were significant but moderate differences between the teachers' attitude towards sub-domains of ought-to-self. The results should be interpreted cautiously due to the moderate effect size value of .33 and also due to the fact that 50 percent of cells had expected frequencies less than 5 (refer to footnote of Table 14).

Table 15: Chi-Square Tests

	Value	Df	Asymp. Sig. (2-sided)
Pearson Chi-Square	27.400 ^a	10	.002
Likelihood Ratio	33.083	10	.000
Linear-by-Linear Association	13.216	1	.000
N of Valid Cases	250		

a. 24 cells (50%) have expected count less than 5. The minimum expected count is .54.

Figure 5: Percentages; Domains of Ought-to-self

Are there any significant differences between the sub-domains of the actual-self?

Table 15 displays the frequencies, percentages and Std. Residuals for the four sub-domains of the actual-self. Based on these results it can be claimed that six Std. Residuals were significant; 1) the subjects strongly agreed with teaching efficacy (Std. Residual = 3 > 1.96) more than what was expected. 2) They disagreed with teaching efficacy (Std. Residual = -2 > -1.96) less than what

was expected. 3) They strongly agreed with career identity (Std. Residual = -2.4 > -1.96) less than what was expected. 4) They slightly disagreed with career identity (Std. Residual = 2.8 > 1.96) more than what was expected. 5) They disagreed with career identity (Std. Residual = 2.3 > 1.96) more than what was expected. 6) They strongly disagreed with career identity (Std. Residual = 2.4 > 1.96) more than what was expected.

The results of chi-square (χ^2 (15) = 60.82, $p = .000$, $r = .43$ representing a moderate to large effect size) indicated that there were significant but moderate differences between the teachers' attitude towards sub-domains of actual self. The results should be interpreted cautiously due to the fact that 29 percent of cells had expected frequencies less than 5 (refer to footnote of Table 16).

Table 17: Chi-Square Tests

	Value	Df	Asymp. Sig. (2-sided)
Pearson Chi-Square	60.821 ^a	15	.000
Likelihood Ratio	64.869	15	.000
Linear-by-Linear Association	2.487	1	.115
N of Valid Cases	325		

a. 7 cells (29%) have expected count less than 5. The minimum expected count is 2.54.

Figure 6: Percentages; Domains of Actual-self

The last one has one sub-domain. That is to say the domain and sub-domain are the same.

CONCLUSION

The main objectives of this study were to investigate the factors that shape the possible selves of efficacious language teachers and also exploring the most dominant of those factors.

The results of chi-square indicated that there were significant differences between the teachers' attitude towards domains of possible selves. It showed that; a) ideal-self was considered as the best factor in shaping possible selves, b) feared-self was the weakest factor, c) actual-self seemed to have a weak contribution and finally, d) the attitude towards the contribution of ought-to-self did not seem unanimous. It can be claimed that majority of the respondents indicated that the teachers significantly believed that ideal-self shaped possible selves. Teachers' sense of job satisfaction, teaching efficacy, career identity, and language identity are the most dominant selves of efficacious teachers.

For the next question four domains were explored separately to know which sub-domain is the most dominant in shaping possible selves of efficacious teachers. The results of chi-square indicated that there were significant but moderate differences between the teachers' attitude towards sub-domains of ideal self. It means that almost all efficacious teachers have the same degree of ideal self development. This shows that they think job satisfaction is a dominant sense of self to be developed. They have developed this sense to a great extent.

There were significant but moderate differences between the teachers' attitude towards sub-domains of ought-to-self. It showed that they were not extremely concern about the different sub domains of ought-to self including personal self, teaching efficacy, and career identity. They have developed the sense of ought-to self to a limited extent.

There were significant but moderate differences between the teachers' attitude towards sub-domains of actual self. In other word, they were concern about their teaching efficacy more than career identity and personal self. Their actual sense of teaching efficacy has developed to a great extent.

The feared self has one sub-domain. That is to say the domain and sub-domain are the same. Considering the findings of the current study, there were no dominant sub- domains among each of the four domains. In other word, each of the teachers' selves is as important as the others. For example; teachers' sense of language efficacy is as important to them as their sense of teaching efficacy.

Limitations of the study

Similar to other studies, there were particular limitations while conducting the present study. The summary of limitations which were identified in this study is as follow:

1. The study is confined to developing language teachers' sense of efficacy.
2. This study is restricted to efficacious language teachers.
3. The participants are junior and senior high school language teachers of Sanandaj.
4. Teachers in the sample have 3 to 15 years of teaching experience.

THE RELATIONSHIP BETWEEN CRITICAL THINKING AND IMPULSIVE AND REFLECTIVE LEARNING STYLES AMONG IRANIAN FEMALE EFL LEARNERS

Samira Aliyari

Payame Noor University of Tabriz, Tabriz, East Azarbayjan, Iran

ABSTRACT

This study investigated the relationship between female English as a foreign language (EFL) learners' critical thinking and the learning styles of impulsivity and reflectivity. To this end, a total of 75 Iranian female EFL English learners took part in the study. This study was conducted in one of the famous institutes called Iran Language Institute (ILI) in Urmia, West Azarbayjan, Iran. By means of NELSON Test, 75 learners out of the pool of 200 were selected for the study. The participants were within the age range of 15-20 having at least a 2 year-experience of learning English at the institute. The instruments utilized for data collection procedures were: 1) Impulsivity Subscale of Eysenck's Impulsiveness Questionnaire (I7) (IVE), 2) Questionnaire for Reflective Thinking (QRT) (Kember et al., 2000), and 3) Cornell Critical Thinking Test (CCTT). Before embarking on the study, the researcher made sure that all the participants were homogeneous through NELSON in intermediate level. The data was collected in 3 sessions during the term. The researcher administered Cornell critical thinking test to the population to find out about the participants' critical thinking. Then, the learners were asked to fill out the questionnaires on reflectivity and impulsivity learning styles in two sessions. The reliability of the questionnaires was calculated as well. Having collected all the data, the researcher coded and scored the data in order to get interval data for the purpose of data analysis. Pearson Product correlation coefficient was used for data analysis. The findings indicated that there was a strong positive relationship between critical thinking and reflectivity, however, a weak negative one between critical thinking and impulsivity.. The results appear to have some valuable practical implications for teachers to pay special attention to learners' critical thinking ability if they want to encourage reflective learning style among their students.

KEYWORDS: Learning styles, impulsivity, reflectivity, critical thinking

INTRODUCTION

In an effective educational setting, the concept of critical thinking should be taken into account. This concept is not newly developed and everybody should be encouraged to be a critical thinker. It also became one of the major responsibilities of teachers and material developers to provide the opportunities for learners to practice critical thinking (Mohammadi Forood & Khomeiniani Farahani, 2013).

Critical thinking which is a major concern among educators and psychologists is one of the most important thinking abilities that should be acquired by learners in school and university. There are many contradictory opinions about whether critical thinking should be taught in education.

Various types of approaches and models to teaching, measuring and assessing critical thinking skills and abilities have been proposed. Although there are many conflicts on teaching critical thinking skills, everyone believes that thinking critically is the crucial goal of education (Reed, 1998).

The concept of critical thinking has developed throughout centuries and various definitions have been proposed, therefore, "there is no consensus on a definition of critical thinking" (Fasko, 2003, p. 8), and a single definition is not widely accepted (Halonen, 1995). Norris and Ennis (1989) terms critical thinking as "reasonable and reflective thinking that is focused upon deciding what to believe and do" (p.3). Similarly, Halpern (1993) calls it as "the use of those cognitive skills or strategies that increases the probability of a desirable outcome, thinking that is purposeful, reasoned, and goal oriented" (p. 6). According to Ennis (1985), critical thinking is a logical and reflective thinking which needs various proficiencies, tendencies, and abilities that result in reasonable reflective thinking. Nickerson, Perkin and Smith (1985, p. 58) defined the term as "understanding what to trust in various contexts reasonably and requires the ability to judge the truth value of some assertions, to measure the proof available, to evaluate the dependability of inferences, to build arguments and alternative hypothesis".

There is a general lack of agreement on how critical thinking is best defined, what critical thinking skills should be taught, and determining a framework for this teaching. As a whole, educational reformers have not even agreed on terminology (Mohammadi Forood & Khomeinjani Farahani, 2013). Other areas of disagreement and concern include the extent to which critical thinking is subject specific, the extent to which novice thinkers can learn to think more critically like experts, the difficulties in separating higher order and lower order thinking skills for instructional purposes, and whether critical thinking should be considered a process or a set of skills (Beyer, 1985; Facione, 1986; Perkins, Farady, & Bushey, 1991; Resnick, 1987).

Taking people's learning styles into consideration is a prerequisite for developing critical thinking. "Everyone has a learning style. Our style of learning, if accommodated, can result in improved attitudes toward learning and an increase in productivity, academic achievement, and creativity." (Griggs, 1991, p. 85). Getting to know the different learning styles is important in educational progress and academic success. Students can easily keep up with the syllabus and find their own weak points so that they can excel in the course only if they recognize their own learning style.

Research studies have investigated learners' learning styles since they are influential in the process and outcomes of learning. "Learning styles refer to an individuals' characteristics and preferred way of gathering, interpreting, organizing and thinking about information" (Wang, 2008, p. 30). Moreover, cognitive styles are a crucial part of learning styles. According to research studies, individuals use different methods and have their own preferences and methods to receive and process information (Kumar, Kumar & Smart, 2004). Two of the cognitive styles which are mostly related to problem solving behaviors and has been identified by Kagan (1966) and some other researchers sequentially, are impulsivity and reflectivity.

Impulsivity (I) and Reflectivity (R) are two characteristics of human beings in cognitive domain. Oxford Advanced Learner's Dictionary (2006) defines impulsive people or their behavior as "marked by sudden action that is undertaken without careful thought" and gives the synonym of "thoughtful" for reflective (pp. 653-1067). Kagan, Rosman, Day, Albert, & Philips (1964), as cited in Duckworth (1974, p. 59), define the notion of conceptual tempo as "a behavioral dimension which may be described as the degree to which an individual reflects upon the differential validity of alternative solutions in problem situations where several possible responses exist simultaneously". Kagan (1965), as stated in Duckworth et al. (1974), classifies reflective person as "the individual who takes relatively longer respond and make fewer errors" (p. 59).

Kagan et al. (as quoted in Kagan et al., 1966), believe that "impulsive attitude begins its growth during the preschool years and may be a deeply entrenched habit" (p. 359). According to Block et al. (1974), reflectives are "slow deciders in uncertain situations" while impulsives are "quick deciders in uncertain circumstances" (p. 611). Kagan (1965), Kagan, Pearson, & Welch (1966), and Selinker et al. (1976) believe that "in general, reflective children have been found to perform better on visual discrimination tasks, serial recall, inductive reasoning, and reading in the primary grades, than do those identified as impulsive" (p. 322).

Kagan (as cited in Jamieson, 1992) stated that "the impulsives reach decision and report them very quickly with little concern for accuracy" (p. 492). However, some students are slow and accurate learners and take longer to respond and make fewer errors. Such learners are referred to as reflectives. They weigh all the possibilities in answering a question. Then, after reflection, they give a response to a question, a solution to a problem, or make a decision in a situation. Messer (1976) believes that "reflectivity/impulsivity is the extent to which a person reflects on a solution to a problem for which several alternatives are possible" (p. 532). Kagan, Rosman, Day, Albert, and Philips (as cited in Jamieson, 1992) added to this definition "the high uncertainty over which is correct." (p. 492).

Human beings are critical thinkers, but they are different from each other in their level of critical thinking which can be increased through practice. Some factors can affect critical thinking ability including learning styles. Young (as cited in Karamloo, 2014) believed that if teachers utilize effective and appropriate instructional methods and materials, they can enhance the students' critical thinking ability.

Given what was said above regarding the growing salience of critical thinking and its observable ignorance by EFL teachers, there is a lack of research on nurturing critical thinking in EFL contexts and its association with learning styles. Thus, the purpose of this study was to find out if there is a relationship between critical thinking and the female learners' learning styles, of course with the focus on impulsivity and reflectivity.

RESEARCH QUESTIONS

The following research questions were put forward to examine the results from a practical point of view with the aim of searching for the previously claimed concepts to achieve the goals of study.

- 1) Is there any relationship between critical thinking abilities and impulsive learning style of Iranian female EFL learners?
- 2) Is there any relationship between critical thinking abilities and reflective learning style of Iranian female EFL learners?

Correspondingly, in order to investigate this research question and to take the safe side, the following null hypotheses were proposed:

- 1) There is no relationship between critical thinking abilities and impulsive learning style of Iranian female EFL learners.
- 2) There is no relationship between critical thinking abilities and reflective learning style of Iranian female EFL learners.

METHODOLOGY

Participants

A total of 75 females were considered to take part in the study in order to yield more significant and at the same time trustable results. This study was conducted in one of the famous institutes called Iran Language Institute (ILI) in Urmia, West Azarbayjan, Iran. By means of NELSON test, 3 intermediate intact female classes (25 students in each class) were selected. The participants were within the age range of 15-20 having at least a 2 year-experience of learning English at the institute and speaking Azari and Farsi as their native languages. The classes were held twice a week.

Instruments

Embarking on any study entails utilization of a number of instruments which help it to smoothly run toward achieving its intended goals.

Nelson Proficiency Test

To select the participants, the researcher administered the validated NELSON proficiency test to homogenize the prospective students for the study. This test included 20 vocabulary items and 15 reading items in multiple-choice format. 75 female participants out of 150 whose scores were within the one SD above the mean and one SD below it were selected. The researcher calculated the reliability of the test which was 0.82.

Impulsivity Subscale of Eysenck's Impulsiveness Questionnaire (I7) (Ive)

Eysenck's (1990) Impulsiveness Questionnaire contains 54 items. A Farsi version of this questionnaire was prepared by Salimi (2001), and its Impulsiveness subscale was also validated with 1820 subjects. The reliability of the Persian Impulsiveness subscale was tested using

Cronbach's alpha and Spearman-Brown's unusual-length split half reliability. Alpha reliability was found to be 0.86 and split half reliability was found to be 0.86, which are acceptable indicators of reliability. The same Farsi version of impulsivity subscale served the Impulsivity scale of the present research. Moreover, the researcher herself calculated the reliability of the Farsi version of the questionnaire which equaled 84%.

Questionnaire for Reflective Thinking (Qrt) (Kember Et Al., 2000)

The Questionnaire for Reflective Thinking (QRT) comprises four constructs that span a range of thinking. Within the Questionnaire for Reflective Thinking (QRT), Kember, Leung, Jones, and Loke (2000) have identified four constructs that cover a broad spectrum of reflective thinking. These comprise habitual action, understanding, reflection and critical reflection. The questionnaire was translated into Farsi. The researcher calculated the reliability of the questionnaire which was 79%.

Cornell Critical Thinking Test

The Cornell Critical Thinking Test (CCTT), inspired by the Cornell/Illinois model of CT and developed in 1985 by Robert Ennis of the University of Illinois at Urbana-Champaign and Jason Millman of Cornell University, develops a clear picture of the students' critical thinking abilities (Ennis, Millman, & Tomko, 2005). The Cornell Critical Thinking Test series offers two levels of testing: level X for grades five through twelve and level Z for grades ten through twelve and at the college level as well. It can be used to teach critical thinking skills, to predict students' performance on proficiency exam, critical thinking courses, college admissions, careers, and employment. It aims at measuring five aspects of CT: deduction; semantics; observation and credibility of sources; induction; definition and assumption identification. Each aspect is measured in a separate section in the test, but induction is split into two sections, namely, on the use of induction in hypothesis testing and in planning experiments. The test contains 52 items, all of which are in a forced-choice format. The CCTT uses multiple-choice questions.

Procedure

Before embarking on the study, the researcher made sure that all the participants were homogeneous by NELSON test. During the study, through NELSON test, 75 female students including 25 students in each class were selected out of the pool of 200 randomly in intermediate level. The data was collected in 3 sessions during the term. The researcher administered Cornell critical thinking test to the population to find out about the participants' critical thinking. Then, the learners were asked to fill out the questionnaires on reflectivity and impulsivity learning styles in two sessions. The reliability of the questionnaires was calculated, too. Having collected all the data, the researcher coded and scored the data in order to get interval data for the purpose of data analysis.

Data Analysis

In this study, after coding and scoring the items in the questionnaires and obtaining interval data, Pearson Product correlation coefficient was used to discover the relationship between critical thinking abilities and impulsive learning style of Iranian female EFL learners and also between critical thinking abilities and reflective learning style of Iranian female EFL learners.

RESULTS AND DISCUSSION

In order to analyze the relevant data, the researcher used Statistical Package for Social Sciences (SPSS), version 16. In order to test the first and second hypotheses, the researcher conducted

At first, having administered NELSON test, the researcher, out of the pool of 200 learners, selected 75 females. To ensure that the subjects were at the same level of proficiency, that is, to ensure the homogeneity of the subjects, the researcher checked the normality of the sample using Kolmogorove-Smirnov which indicated that the sample was normally distributed (i.e., $p=.19 > .05$).

Then, Pearson product-moment correlation coefficient was used to explore the correlation between critical thinking and reflectivity/impulsivity among females (Table 1).

Table 1: Descriptive Statistics for the Relationship between Critical Thinking and Reflectivity/Impulsivity among Females

	Mean	Std. Deviation	N
Critical	60.56	6.014	75
Impulsive	87.54	4.156	75
Reflective	58.26	5.551	75

The results of Pearson product-moment correlation are presented in Table 2.

Table 2: Pearson Product-Moment Correlation Coefficient for the Relationship between Critical Thinking and Reflectivity/Impulsivity among Females

		Critical	Impulsive	Reflective
Critical	Pearson Correlation	1	-.265*	.856**
	Sig. (2-tailed)		.021	.000
	N	75	75	75
Impulsive	Pearson Correlation	-.265*	1	-.225
	Sig. (2-tailed)	.021		.052
	N	75	75	75
Reflective	Pearson Correlation	.856**	-.225	1
	Sig. (2-tailed)	.000	.052	
	N	75	75	75

*. Correlation is significant at the 0.05 level (2-tailed).

**. Correlation is significant at the 0.01 level (2-tailed).

Table 2 shows that there was a significant strong and positive association between critical thinking and reflectivity [$r = .85$, $n=75$, $\text{Sig}= 0.00 < 0.01$]. However, There was a weak and negative significant association between critical thinking and impulsivity [$r= -.26$, $n=75$, $\text{Sig}= 0.02 < 0.05$].

Discussion

Improving critical thinking skills in higher education has remained a topic of discussion and a focus of varying importance for many years. Even in an educational climate that focuses its funding and attention to learners' success, it is a general consensus among higher education faculties that research relating to the development of critical thinking skills is of paramount importance (Paul, 1993). Thus, the overarching aim of the research reported here was to investigate the relationship between female EFL learners' critical thinking and reflectivity as well as critical thinking and impulsivity. The results of Pearson product-moment correlation coefficient indicated that there was a strong positive relationship between critical thinking and reflectivity; however, the relationship between critical thinking and impulsivity was weak and negative.

The findings of the present study are in line with Borkowski, Peck, Reid, and Kurtz (1983), Heidari and Bahrami (2012), Meichenbaum and Goodman (1969), and Palladino, Poli, Masi, and Marcheschi (1997) who investigated the relationship between learning styles and critical thinking ability. Their results revealed that children with reflective cognitive style utilized metacognition more than those with impulsive style. Consistent with the results of this study, Cano and Martinez (1991) reported a positive relationship between student cognitive ability and students' critical thinking ability. It can be due to the fact that reflective learners perform better when learning calls for inductive reasoning (Kagan, Pearson, & Welch, 1966). Brodzinsky (1985) stated that reflective students can learn more since they can use their knowledge related to academic problems better than impulsive learners. In the case of simple tasks, impulsive children benefit more, while in analytical purposeful problem-solving tasks, the reflective learners perform better than impulsive learners.

In most educational settings, the effect of these learning styles is taken for granted and educators mostly do not take it into account as an influential variable in the process of learning. Even researchers in the field sometimes ignore the effect of this variable as an influential variable, which may change the acquired results (Rezaei, Boroghani, & Rahimi, 2013). By considering the difference between reflective and impulsive people, the result of study by Rezaei (2010) emphasized the effectiveness of the awareness raising activities. It seems that learners with different learning styles (i.e., reflective/impulsive) take advantage of the awareness raising activities to varying degrees. It seems that even after raising learners' awareness about different aspects of language, this factor has an important role in the learners' success because reflective learners are more analytical and more sensitive about the information and pay more attention to the awareness raising. Thus, they notice the activities more than the impulsive learners.

The development of critical thinking skills is dependent upon instruction. Teachers should encourage the development of critical thinking by arranging the learning environment, demonstrating critical thinking, and implementing techniques that encourage active student engagement. The most prevalent mode of instruction in higher education classrooms unfortunately continues to be the traditional approach of content delivery in the form of teacher lecture designed to promote the memorization of isolated facts and serves to reduce student interest. Among the best educated faculties it is the general consensus that the development of

students' critical thinking skills is necessary to prepare individuals to perform optimally in an ever-changing world.

Evidently, higher education doesn't have any strong effect in the promotion of critical thinking skills of students. Lack of attention to critical thinking skills in Iranian schools and universities

may be regarded as an important factor in unawareness of students. According to Hashemi and Zabihi (2012), Iranian education system's emphasis on knowledge transmission and learning is limited to memorizing materials and the main problem that Iranian education system encounters is the goal-centered being instead of being process-centered. Perhaps, if schools and universities apply critical thinking as one of their goals, students would become better critical thinkers. According to Lundy et al. (2002), critical thinking can be enhanced during one semester if the class is designed to enhance critical thinking skills.

CONCLUSION

When it comes to language learning, particularly learning English as a second or foreign language, where a combination of historical, social, cultural, and political issues is involved, the necessity of working on critical thinking among ESL/EFL learners is more severely felt, and needs to be equally highlighted by lesson planners, materials developers, teacher educators, and teachers (Hashemi & Zabihi, 2012). However, it is unfortunate that only a few studies (e.g., Birjandi & Bagherkazemi, 2010; Fahim et al., 2010; Ghaemi & Taherian, 2011) had been conducted so far to throw some light on the importance of critical thinking in English language classes. Moreover, impulsivity has rarely been seen on the lists of learner factors and worked on.

Thus, the present study aimed at exploring the relationship between female EFL learners' critical thinking and reflectivity as well as critical thinking and impulsivity. Based on the findings of this study, the researchers arrived at the following conclusions, that is, there is a strong positive association between critical thinking and reflectivity. However, the relationship between critical thinking and impulsivity was negative and weak.

The results appear to have some valuable practical implications for teachers. Teachers need to pay special attention to critical thinking ability if they want to encourage reflective learning style among their students. It is important to note, however, that the enhancement of critical thinking ability depends on the nature of the curriculum. Thus, educational settings should provide a very wide range of choice and options for both teachers and learners to increase critical thinking in learners.

Furthermore, teachers should provide any chance for the students to think about learning second/foreign language and boost a sense of problem solving to develop their ability to select the best and easiest way to get their goals. In fact, instructors can increase the logic of selecting the most appropriate strategies for language learning by promoting and emphasizing the ability of

critical thinking skill. Also, teachers should try to make learners conscious of their behavior and learning styles.

Another implication is for the wider world of national policymakers and curriculum developers of teacher education programs. Those programs should increase novice teachers' awareness of how to enhance learners' critical thinking and reflectivity through learner-centered tasks. Therefore, pre-service language teacher education programs should incorporate the methods of enhancing critical thinking ability in their schedules.

As any human production, this study has some limitations. A serious limitation of this study was that it failed to incorporate the proficiency level. The researcher addressed just one proficiency level, that is, intermediate. In this regard, the findings may not be generalizable to other proficiency levels such as elementary, pre-intermediate and advanced. Moreover, this study focused on a number of EFL learners from one educational context. In other words, the researcher delimited the subjects to institutions students. In addition, the used tool in this study was the questionnaire, and the other useful tools such as interviews and observations were not used.

Despite some studies conducted on learners' critical thinking, there are still some problems that need to be tackled and some gaps can be seen in the literature which gives avenue for further research in the area. Researchers should triangulate the findings both qualitatively and quantitatively in order to get reliable data to generalize. It is also necessary to conduct a research to investigate the relationship between critical thinking and reflectivity as well as critical thinking and impulsivity across various proficiency levels, gender, and in different contexts. This study can be replicated in a larger scale to make it more generalizable.

ABSTRACT

This study aimed at investigating the impact that Cooperative Learning techniques may have on reading comprehension among EFL learners in Gachsaran, Iran. The EFL population for this study was Iranian EFL learners from Talieye-Danesh Institute in. 60 out of the hundred students who scored one standard deviation above and below the mean based on the reading comprehension pre-test were qualified to attend the research. An experimental-control group method was followed. The participants were then randomly divided into three groups, namely A, B and C. Groups A and B were considered as experimental groups and group C as the control group. Each of the three groups received different trainings namely STAD, GI, and CI techniques respectively. The instruments utilized in this study included a reading comprehension pre-test and a reading comprehension post-test based on the students' textbook (Top Notch1A). Several paired samples t-tests, and a one way ANOVA were used to determine whether there were significant inter and intra-group differences. Results of the analyses were indicative of the fact that as a means to teaching reading comprehension, CL is better than traditional method since the groups that received CL techniques outperformed the other group that received conventional instruction. The second findings confirmed the superiority of STAD over GI method. Based upon the findings of the study, STAD is thus recommended to be integrated into the English reading course.

KEYWORDS: cooperative learning, STAD, GI, CI, reading comprehension

INTRODUCTION

Perhaps reading skill can be regarded as the foundation and as one of the fundamental skills in second and foreign language learning. Due to the rapid explosion of science and technology in the world, as Farhady (1998) argues, the ability to read in English has received priority over other objectives of English language teaching. As a result, the main goal of English instruction in most countries, especially within the educational programs, is to improve the reading ability of the students in order to enable them to grasp new information from the original sources in their field.

Many researchers and psychologists in the field have attempted to develop a conceptual view about the notion of reading. Reading is defined as a “complex activity that involves both perception and thought” (Pang et al, 2003, p. 6). According to Beck and Margaret (2005), reading is a complex process composed of a number of interacting sub-processes and abilities. Reading is also defined as a process of problem solving, which involves working to build up a sense from a text. Not only this process involves making sense from the words and sentences written on the page, but it also goes to ideas, memories and knowledge evoked by those words and sentences (Schoenbach et al. 1999). Therefore, we can conclude that reading refers to the active process of extracting and interpreting information and messages from different written materials.

The importance of reading comprehension has urged many researchers to find an efficient way or method which can facilitate English learning and help learners comprehend better. Some new studies in this regard have proposed Cooperative Learning (CL) as a beneficial method to augment learners’ reading comprehension. Hollingsworth, Sherman, and Zaugra (2007), for instance, claim that CL as a method of teaching is a valuable tool in helping students learn comprehension strategies while encouraging positive interactions among peers. They further proposed that students can achieve academic success, and their enthusiasm and motivation towards reading will be increased through increasing their reading levels and knowledge of comprehension skills.

Among a myriad of models and activities which have emerged and currently applied in the field of cooperative learning, Student Team Achievement Divisions (STAD), and Group Instruction (GI) have attracted much attention. According to Slavin (1987), STAD has been used in a variety of subject areas including math, language arts, social studies, and science. The STAD technique was chosen in this study because, as Ghaith and Yaghi (1998) believe, it has consistently been shown to be among the most simple and effective CL methods in enhancing students’ achievement of well defined objectives in various subjects. In addition to STAD, GI is the next issue of interest in this research which according to Kagan (1995) is a student-directed technique and that in GI technique cooperation and learning are complimentary.

Reading comprehension is also very important in educational system in Iran and nearly all objectives of formal English instructions in schools and universities are reading comprehension and techniques used to develop this skill. Despite the growing importance and interest in learning English as a foreign language in Iran, students at the pre-university level, as Faramarzy (2003) believes, are rarely proficient enough to read and comprehend foreign language texts.

REVIEW OF LITERATURE

Even though CL methods are mostly similar in that students work in groups to achieve a common goal, they are different from one another in particular. While some methods like STAD, and TGT are structured with well specific group tasks and rewards, GI and Learning Together are structured with fewer well specific group rewards (Slavin, 1990). Due to the shortage of time and space, only STAD and GI which were the foci in this study are presented in brief in the next section.

Student team -achievement divisions (STAD)

According to Slavin (as cited in Hardegree, jr, 2012), STAD is a “peer tutoring format” which includes such principal elements like biracial heterogeneous student teams and achievement divisions. He suggested that achievement division is a tool applied to ensure an equal and considerable possibility of success for each student provided that he/she utilizes maximum effort. It is further used as a reference group for student scores. Students in this activity are assigned to 4-5 members, in heterogeneous learning teams. Each team is comprised of high, average, and low performing students, boys and girls of different ethnic backgrounds, so as for the team to be representative of the class as a whole.

After assigning the students to the small groups in this method, the teacher presents a lesson and students are then required to work within their teams to make sure that all team members have mastered the lesson. In each group, students tutor each other on the material in the course and prepare each other for weekly quizzes. Students then take individual quizzes. Success is based on improvement, that is, quiz scores are compared to past averages and points are awarded based on the degree to which they exceed those past performances. Scores of the teams are obtained through summing those points.

STAD technique, therefore, operates on the principle which involves students work together to learn and be responsible for their own learning as well as their teammates. This method also necessitates having team goals and success teams that are dependent on the learning of all group members. Three central concepts of STAD outlined by Slavin (1990) are namely team rewards, individual accountability, and equal opportunities for success.

Group investigation

GI, as Slavin (cited in Hardegree, jr, 2012) argues, is a powerful structure used to encourage learners to learn group organizational skills and to think creatively. Slavin further referred to GI as an organizational approach in which students work in small groups while using cooperative inquiry, group discussion, and cooperative planning and projects. He adds that in GI, students are assigned into 2-6 member groups and they can choose the topics based on their interest. After dividing the investigation into smaller parts, the groups further break their subtopics into individual tasks, and they should be responsible for synthesizing the information to prepare group reports. Each group member then participates in the class presentation. Jacobs (1994, p. 4), in this regard, emphasized the “philosophy of Dewy and humanistic psychology” as the theoretical basis for GI approach. According to him, GI comprise the first five ideas of Dewey which are listed below:

- Students should be active in learning by doing an act,
- They should be intrinsically motivated,
- Knowledge is not fixed, but changing,
- Learning occur based on students’ needs and interest,
- Education should include learning to work with, respect, and understand others,
- Learning should be related to the world beyond the classroom and should help to improve the world (p. 4).

Previous studies regarding the effectiveness of using cooperative learning in reading class

One of the most widely researched peer learning models is cooperative learning which has been investigated in a variety of academic disciplines including reading comprehension. According to Fielding and Pearson (1994), CL can serve as the most effective technique if the students clearly understand the teacher's goals, and when goals are group-oriented and the criterion of success is satisfactory learned by each group member, when students are expected and taught to describe things to one another instead of just providing answers, and when group activities supplement rather than supplant teacher-directed instruction.

As one of the earliest studies Bejarano (1987), studied the effects of two cooperative small-group learning techniques (STAD and GI) and of the traditional whole- class method on the general achievement of junior high school EFL learners and on their acquisition of specific language skills. This study lasted five sessions a week for 4½ months involving 33 seventh-grade classes in Israel. The results showed that STAD had no significant and positive effect on the achievement of the reading comprehension skill. The results also revealed that GI technique had no significant effect on the achievement of the reading comprehension skill.

In a more recent time frame, and in their study Hollingsworth, Sherman, and Zaugra (2007) pointed out that CL is an effective tool, which helps students learn comprehension strategies while encouraging positive interactions among peers. The students achieved academic success by enhancing their reading levels and knowledge of comprehension skills, and there was also an increase in enthusiasm and motivation towards reading.

In another recent study Kassim (2006) examined the effectiveness of CL model and the whole class instruction in improving learners reading comprehension, vocabulary acquisition, and motivation to read. Forty-four grade five EFL learners participated in the study. The results indicated no statistically significant differences between the control and the experimental groups on the dependent variables of reading comprehension and vocabulary acquisition. However the results revealed statistically significant differences in favor of the experimental group on the dependent variable of motivation to read and its dimensions, the value of reading, and reading self concept.

RESEARCH QUESTIONS

In light of the above mentioned, this study investigated the effects of two methods of CL namely STAD and GL in improvement of students' reading comprehension ability.

1. To what extent does implementing STAD affect the reading comprehension of Iranian EFL learners?
2. To what extent does implementing GI affect the reading comprehension of Iranian EFL learners?
3. To what extent does implementing CI affect the reading comprehension of Iranian EFL learners?

METHODOLOGY

Participants

A total of 60 Iranian EFL learners from Talieye-Danesh Institute in Gachsaran, one of the towns in Kohkiloye and Boyerahmad province participated in this study. In order to select the participants, first, a sample of 100 students who were at same age (17-18) were asked to take a reading comprehension pre-test to ensure homogeneity of the participants regarding their proficiency at reading skill. 60 out of the hundred students who scored one standard deviation above and below the mean based on the reading comprehension pre-test were qualified to attend the research. They included both female and male students. When the reading proficiency homogeneity was assured, the participants were randomly divided into three groups, namely A, B and C. Groups A and B were considered as experimental groups and group C as the control group. There were 20 students in each group under consideration. Each of the three groups received different trainings namely STAD, GI, and CI techniques. The following table demonstrates the population and the related treatment.

Table 1: The Population of the Study and the Related Treatment

N	Group	Treatment
20	A	STAD
20	B	GI
20	C	CI

Materials and instruments

The materials and instruments which were utilized in the study were students' textbook (Top Notch1A), reading comprehension pre-test, and reading comprehension post-test. The reliability of the tests was gained, through a pilot study on the EFL learners ($n=20$) who were similar to the learners of the main study in terms of age, sex, and proficiency level. The results of Cronbach's alpha analysis showed that the tests were reliable (pre-test $r = 0.81$, post-test $r=0.79$). It should be mentioned that after interpreting the collected data, some weak, malfunctioning and non-functioning items were removed from the whole test, and some were modified. The content validity of the tests was then evaluated, and accepted, by three experts who were PhD holders of applied linguistics with more than five years of teaching and testing experience at different universities. Finally, the researcher decided to include the tests as the pre and post-tests for the study.

Procedures

In order to collect the required data, a reading proficiency test was first selected from the students' textbook by the researchers and administered to all the participants of the study, once as a reading comprehension pre-test before embarking on the study and another time as a post-test at the end of the study. Furthermore, the scores of the reading pre-test were used to divide the students into three groups. After homogenizing the participants of the study with respect to their reading proficiency based on the reading comprehension pre-test, each group received the assigned treatment. All the three groups were taught by the same teacher (researcher). All sessions took place in the students' classrooms about 45-minitues reading period. The treatment lasted for two months (sixteen sessions) and covered five instructional units (reading comprehension parts of the students' textbook).

Procedures for the first experimental group

After assigning the participants of STAD group to the small teams including 4-5 members, the teacher presented the first reading lesson. Teaching, team study, individual quizzes, and team recognition are the four important stages for implementing STAD in the classroom (Ghaith, 2004). As such, the teacher first presented the explanation of material for the participants of the group A. Doing so the teacher followed the usual practices of reading activities included in reading comprehension texts such as reading warm-up, while reading activity, and post reading activity. Then, the participants worked within their teams to ensure that all team members mastered the lesson. Students in this group then tutored each other while they were utilizing different reading strategies (predicting, skimming, scanning, inferencing, guessing the meaning of unfamiliar words, and self monitoring). The participants then tried to complete activities or worksheets, took individual quizzes, and finally recognized their team achievements. This required the students to help their team mates and they were not in competition with each other since all or none of the teams could achieve rewards depending on how they scored. Team rewards took the form of certificates or other rewards (like giving the opportunity to present the answers first) which were given to the team provided that the team achieved above a required criterion.

Procedures for the second experimental group

Following Sharan and Sharan (1999), four key components in the implementation of GI in the classroom were applied which were namely, investigation, interaction, interpretation, and intrinsic motivation. At investigation stage the topic was first assigned and subtopics were determined. As the next step, the groups of students were formed according to their interest with respect to the subtopics. Then the students carried out the learning plan with assistance from the teacher. Afterwards, the students planned their group investigations through interaction. Group discussion and exchanging ideas were also done in this stage. The students were then given opportunity for intellectual as well as social interaction.

As the third stage, the GI group carried out their investigations by interpreting and integrating their findings. Each participant contributed his or her own perspective on the topic. The last component of GI technique according to Sharan and Sharan (1999) is intrinsic motivation. They believe that motivation becomes intrinsic when students determine what and how they will learn, besides the ability of students to control their own learning. In order to promote the intrinsic motivation, it was tried to let the participants of this group have their control over the materials to be learned. Doing so, during the treatment, besides their freedom to choose their interest group they were given power to choose about what and how to learn the reading comprehension materials.

Procedures for the control group

The control group (group C) was also taught the same content by the same teacher, but according to a Conventional Instruction technique (CI). As the conventional practice of teaching technique, before presenting the reading comprehension passage, the teacher first asked some warm-up questions in order to tap the students' background knowledge. As the next step, the teacher asked one of the students to read out the page loud and explained the points in which they had

problems. The process was mostly in a way that the teacher translated new vocabulary and explained the general points of the reading. As the final step the students were required to answer their textbook post reading exercises.

After the treatment period was over for the three groups, all of the participants were asked to take the reading comprehension post-test. The obtained results were then gathered and coded into SPSS version 20 to be analyzed based on the purposes of the study.

RESULTS

Results of the reading comprehension pretest

In order to ensure about the homogeneity of the three groups in terms of the reading comprehension prior to the administration of the treatments, a one-way ANOVA was run to compare the three groups' means on the reading comprehension pretest. As displayed in Table 2, the first experimental ($M = 9.38$, $SD = 2.44$), second experimental ($M = 9.68$, $SD = 2.62$) and control ($M = 9.84$, $SD = 2.59$) groups gained close means on reading comprehension pretest.

Table 2: Descriptive Statistics; Pretest of Reading Comprehension by Groups

Group	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean		Minimum	Maximum
					Lower Bound	Upper Bound		
EG1	20	9.38	2.446	.499	8.34	10.41	4	14
EG2	20	9.68	2.626	.525	8.60	10.76	4	15
CG	20	9.84	2.593	.519	8.77	10.91	5	15
Total	60	9.64	2.530	.294	9.05	10.22	4	15

EG1=Experimental Group 1 (STAD), EG2=Experimental Group 2 (GI), CG= Control Group (CI)

The results of one-way ANOVA ($F(2, 57) = .20$, $p = .813 > .05$ representing a weak effect size), depicted through Table 3, indicated that there were not any significant difference between the three groups' means on the pretest of reading comprehension. Thus, it can be concluded that they enjoyed the same levels of reading comprehension ability before the main study.

Table 3: One-Way ANOVA; Pretest of Reading Comprehension by Groups

	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	2.724	2	1.362	.208	.813
Within Groups	464.425	57	6.541		
Total	467.149	59			

Investigating the effectiveness of the three different methods

After ensuring about the homogeneity of the participants regarding their prior proficiency in reading ability, to detect the group which benefited the most regarding the treatments applied,

another one way analysis of variance (ANOVA) was run on the post test results of the three groups. As displayed in Table 4, the first experimental ($M = 16.28$, $SD = 2.407$) showed the best group of the three, and the second experimental ($M = 13.29$, $SD = 3.014$) and control ($M = 11.28$, $SD = 2.665$) followed this group and ranked second and third respectively. Even though the descriptive statistics demonstrated better results for the first experimental group or STAD group, we should continue the analysis to be sure about these findings.

Table 4: Descriptive Statistics; Prost-test of Reading Comprehension by Groups

Group	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean		Minimum	Maximum
					Lower Bound	Upper Bound		
EG1	20	16.28	2.407	.481	4.046	7.154	7	18
EG2	20	13.29	3.014	.615	2.423	5.410	4	16
CG	20	11.28	2.574	.515	.102	2.778	6	17
Total	60	13.61	2.665	.537	2.190	5.114	4	18

EG1=Experimental Group 1 (STAD), EG2=Experimental Group 2 (GI), CG= Control Group (CI)

The results of one-way ANOVA ($F(2, 57) = 14$, $p = .000 < .05$ representing a large effect size) (Table 5) indicated that there were significant difference between the three groups' means on the posttest of reading comprehension. Thus, it was confirmed that the three groups were not the same and the predicted results seems to be true, but we could not make early conclusions on these results.

Table 5: One-Way ANOVA; Posttest of Reading Comprehension by Groups

	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	200.002	2	100.001	14.003	.000
Within Groups	507.038	57	7.141		
Total	707.041	59			

In order to detect the group that benefited the most from the assigned treatments and made the difference in the results, taking the results of post-hoc tests in to account could be of utmost importance.

Table 6: Post-Hoc Scheffe's Tests; Posttest of Reading Comprehension by Groups

(I) Proficiency	(J) Proficiency	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
					Lower Bound	Upper Bound
Experimental 1	Control	5.0*	.764	.000	.10	3.92
	Experimental1	3.01*	.764	.039	.08	3.90
Experimental 2	Control	2.01	.756	.069	2.11	5.89

The initial findings of the study, based on the results of Post-Hoc test were proved to be significant. According to Table 6, the first experimental group which experienced STAD with the purpose of improving their reading comprehension successfully did the best of the three and

outperformed GI (Mean Difference = 3.01, $p < .05$) as well as CI (Mean Difference = 5.0, $p < .05$) groups. Even though the GI group did better on the post test compared to that of control group, since their difference was not very significant (Mean Difference = 2.01, $.069 > .05$), we could not draw effective conclusions on these results. We could then conclude that GI did not have a meaningful impact on reading comprehension of EFL learners compared to CI technique.

After being ensured about the final results of the three groups and detecting the group which stood out as the best group, we could now continue the analysis to test the within group effectiveness of these methods. The quantitative content analyses were statistically tested by conducting several paired-samples t-tests. The purpose of these tests was to study the effect of the type of training (STAD, GI, or CI) on the participants of the three groups, in order to answer the three questions of the study. This way, we could gain a clear picture of these methods and their impact within their groups. To this end, three paired-samples t-tests were computed on the pre and post test scores of all three groups to investigate any statistically significant differences in reading comprehension before and after the training period. The results are discussed below.

Answering the first research question

1. To what extent does implementing STAD affect the reading comprehension of Iranian EFL learners?

According to the descriptive statistics displayed in Table 7, the first experimental group (STAD) showed a higher mean on the posttest of reading comprehension ($M = 16.28$, $SD = 2.40$) than pretest ($M = 9.68$, $SD = 2.62$).

Table 7: Descriptive Statistics, Pretest and Posttest of Reading Comprehension (STAD Group)

	Mean	N	Std. Deviation	Std. Error
Posttest	16.28	20	2.407	.481
Pretest	9.68	20	2.626	.525

As the next step, a paired-samples t-test was run on these results. According to Table 8, the findings of this test ($t(19) = 7.43$, $p < .05$, $r = .83$ representing a large effect size) indicated that there was a significant difference between the STAD group's mean scores on the pretest and posttest of reading comprehension.

Table 8: Paired-Samples t-test, Pretest and Posttest of Reading Comprehension (STAD Group)

Paired Differences							
Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of thet		df	Sig. (2-tailed)	
			Lower	Upper			
6.600	3.764	.753	4.046	7.154	7.439	19	.000

Based on these results, it was concluded that the training method namely STAD was an effective method in enhancing Iranian EFL learners' reading comprehension.

Answering the second research question

2. To what extent does implementing GI affect the reading comprehension of Iranian EFL learners?

Another paired-samples t-test was also conducted to compare the GI groups' means on the pretest and posttest of reading comprehension. As displayed in Table 9, the GI group also showed a higher mean on the posttest ($M = 13.29$, $SD = 3.01$) than pretest ($M = 9.38$, $SD = 2.44$).

Table 9: Descriptive Statistics, Pretest and Posttest of Reading Comprehension (GI Group)

	Mean	N	Std. Deviation	Std. Error Mean
Posttest	13.29	20	3.014	.615
Pretest	9.38	20	2.446	.499

The results of the paired-samples t-test ($t(19) = 5.42$, $p < .05$, $r = .74$ representing a large effect size) (Table 10) further indicated that there was a significant difference between the second experimental group's mean scores on the pretest and posttest.

Table 10: Paired-Samples t-test, Pretest and Posttest of Reading Comprehension (Second Experimental Group)

Paired Differences								
Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference		t	df	Sig. (2-tailed)	
			Lower	Upper				
3.917	3.538	.722	2.423	5.410	5.424	19	.000	

These results were the bases to conclude that the training method namely GI, standing as second in effectiveness after STAD, was an effective method in enhancing Iranian EFL learners' reading comprehension.

Answering the third research question

3. To what extent does implementing CI affect the reading comprehension of Iranian EFL learners?

A paired-samples t-test was run to compare the control group's means on the pretest and posttest of reading comprehension. As displayed in Table 11, even the control group showed a higher mean on the posttest ($M = 11.28$, $SD = 2.57$) than pretest ($M = 9.83$, $SD = 2.59$).

Table 11: Descriptive Statistics, Pretest and Posttest of Reading Comprehension (Control Group)

	Mean	N	Std. Deviation	Std. Error Mean
Posttest	11.28	20	2.574	.515
Pretest	9.84	20	2.593	.519

The results of the paired-samples t-test ($t(19) = 1.22$, $p > .05$, $r = .21$ representing small effect size) (Table 12) indicated that there was not a significant difference between the control group's mean scores on the pretest and posttest.

Table 12: Paired-Samples t-test, Pretest and Posttest of Reading Comprehension (CI Group)

Paired Differences							
Mean	Std. Deviation	Std. Mean	95% Confidence Interval of the Difference		t	df	Sig. (2-tailed)
			Lower	Upper			
1.440	3.241	.648	.102	2.778	1.221	19	.066

Based on these results, it was confirmed that the training method namely CI was not an effective method in enhancing Iranian EFL learners' reading comprehension.

DISCUSSION AND CONCLUSION

According to the findings of this study, it is obviously clear that STAD has a significant effect on the reading comprehension of the Iranian EFL learners. Given its many benefits and advantages, STAD can be regarded as the best techniques of CL. Previous studies also reported similar results with regard to the positive effects of CL and STAD in augmenting reading comprehension of the learners. The findings are congruent with previous studies such as Fielding and Pearson (1994), Bejarano (1987), Sherman, and Zaugra (2007), and Kassim (2006), which proved the CL techniques to be positive in developing the participants' language learning and reading comprehension. What seems to make the present study significant is the superiority of STAD as one technique of cooperative learning among other techniques.

It is therefore reasonable to assert that positive interdependence, as the basic key components of CL, encouraged all group-mates in helping each other and applying more effort to achieve group success. On the contrary, in the conventional classroom negative interdependence, as Jalilifar (2009) also confirms, is discouraging since the success of some students, especially high achievers, may result in decreasing the opportunities for their low achieving counterparts.

As a result of positive interdependence, students in STAD group received support and help from their more proficient group mates which in turn resulted in the success of the whole group. This was because they believed that their cooperation is expected and valued in their learning process. Thus when they encountered a problem they could rely on their partners and they were available to help them when they needed a solution to a problem.

The domination of STAD, according to Johnson et al. (1998), can be explained from the perspective of behavioral learning theory which proposes that students will work harder on tasks that provide a reward, whereas they will fail to work effectively on those tasks which provide no reward or punishment. Thus, it could be claimed that the rewards assigned to the STAD groups with the best performance during the treatment reinforced the expansion of group process skills.

The study was in fact an attempt to shed more light on the point whether cooperative learning could bear any influence on the reading comprehension of Iranian EFL learners. The final purpose of the study was to study and find the most effective method of CL to be applied in order to get the most preferred results concerning reading comprehension. It was confirmed that learning reading comprehension through STAD would lead to better learning than GI or traditional method for some important reasons. First, in STAD students would be able to experience a friendly learning environment which seems appealing to them. STAD facilitates students' involvement in both class and home activities by encouraging them to take part in answering the questions or solving the problems through cooperation and active group work. Second, positive interdependence, interaction, and team rewards were the factors which helped the STAD group outperform the other groups since these activities ultimately resulted in higher interactional potentials of the learners and led to the understanding of problematic areas. In fact, the students can come to feel that they are positive contributors, not only to their teams, but to the class as a whole.

These findings suggest EFL teachers, educators, course designers as well as researchers to integrate CL techniques, and especially STAD, in EFL setting with all learning levels so that EFL learners become able to achieve comprehension in reading texts at the early stages of learning English as a Foreign Language.

METACOGNITIVE STRATEGIES AND READING COMPREHENSION SKILL

Bahare Farahmand

Department of English, Ahvaz Branch, Islamic Azad University, Ahvaz, Iran

ABSTRACT

The present study investigated the role of inferencing, analyzing and memorizing as metacognitive strategies on promoting language learners' reading comprehension skill. Some articles were studies and the results of the related literature showed that students who used inferencing analyzing and memorizing as a metacognitive strategy had good results comparing to other students that did not use the strategies. And the use of learning strategies in this way can be of help in promoting reading comprehension among students.

KEYWORDS: motivation, reading comprehension, inferencing, metacognitive strategies

INTRODUCTION

English has gained importance all over the globe due to political, economical, and technological reasons. It is generally believed that English as a foreign language (EFL) plays a crucial role in Iranian educational system in which reading comprehension has its own dominance among other teaching skills. Reading comprehension is a very complex process, the importance of which has been mentioned in many of the studies. Kirby (2007, p.1) states that a process by which we understand the texts we read is called reading comprehension. This process is the purpose of reading and also reinforces meaningful learning from text. According to Richards and Schmidt (2002, p. 443), reading for comprehension happens when we perceive a written text to understand the contents. This perceiving can be done silently According to Richard and Schmidt (2002, 249), metacognition is referred to as reading awareness and monitoring processes. These processes are parts of the readers' cognition about reading and the self-control that readers apply in monitoring and regulating text comprehension. It is the teachers' task to use the metacognitive reading strategies for which they have gained knowledge.

Reading comprehension is a complex process in itself, but it also depends upon other important lower-level processes. It is a critical foundation for later academic learning, many employment skills, and life satisfaction. It is an important skill to target, but we should not forget about the skills on which it depends. To improve the reading comprehension skills of poor performers, we need to understand that there is no "magic wand", and no secret weapon that will quickly improve reading competencies for all poor readers. Careful assessment is required to determine individuals' strengths and weaknesses, and programs need to be tailored accordingly; most poor readers will need continued support in many areas. Generally speaking, reading comprehension is always a grand task for the students who want to learn a foreign language. Cohen (1998, p.1) states that strategies are different in nature, they can be metacognitive, cognitive, performance, and affective. When we plan the organization of our learning, it is called metacognitive strategy.

When we apply mnemonic devices for learning vocabulary, it is called cognitive. When we practice what we want to say, and affective strategy is when we booster self-confidence for a language task by means of self-talk it is performance. It is important to teach students reading techniques to facilitate their reading comprehension. Students might be unaware of reading strategies that can be of help to them. The role of metacognitive strategies in reading comprehension needs to be clarified until students become independent in reading for meaning. One metacognitive strategy is inferencing which is used in many reading and teaching texts. In this regard, Richards and Schmidt (2002, p. 255) define inferencing as the "process of arriving at a hypothesis, idea, or judgment on the basis of other knowledge, ideas, or judgments"(p. 255). So from the above definition, inferencing can be defined as extraction of implied meaning from the texts using the world knowledge and background information with the aid of textual characteristics

The use of proper strategies by learners with the aid of teachers in developing reading comprehension is of considerable importance. The role of inferencing, memorizing, and analyzing are important in improving reading are important. It is necessary to help learners to use proper strategies in developing their reading comprehension in a way that they can monitor and evaluate their own ability in processing the different texts . This study is a review to improve out knowledge about reading comprehension in general and is about reviewing the use of three metacognitive strategies of inferencing, memorizing, and analyzing on reading comprehension in reading comprehension.

REVIEW OF LITERATURE

Reading comprehension has always been of paramount importance in all educational system, and comprehension of both general and academic texts has been the aim of many educational centers. There are many people wishing to understand what the texts of both academic and non-academic wants to say so that they can follow their aims according to their profession and their motivation. Therefore, in many language centers and institutes much attempt has to be made by teachers to teach students the appropriate strategies for understanding the texts of the target language they learn.

Yin and Cheong conducted a study, with the aim to examine the metacognitive knowledge and use of metacognitive strategies by good and poor readers of the English language in Singapore. The subjects in the study came from general and academic courses. The awareness and knowledge of metacognition were measured with the Index of Reading Awareness, while the Reading Strategy Use scale measured the readers' use of metacognition. Thirty students, consisting of 14 good and 16 poor readers, participated in the study. Participant recruitment first involved the administration of the Stanford Diagnostic Reading Test for identifying the students who are good or poor in reading comprehension. To investigate the students' use of metacognitive strategies during the reading of the science text, the pupils were requested to read a passage extracted from a science textbook, and then to respond to questions that checked on their understanding of the text. Following that, the students were asked to respond to an adapted version of the Reading Strategy Use scale to determine their use of metacognitive strategies when

reading a text in this different domain. The data were computed through t-tests. The t-test computed on the Index of Reading Awareness scores demonstrated that the good readers attained higher scores than the poor readers.

The t-test computed on the Stanford Diagnostic Reading Test comprehension scores showed that the Express Course students attained higher scores than the Normal (Academic) Course students. The t-test computed on the (Index of Reading Awareness) scores demonstrated that the Express Course students selected more strategic responses than the Normal (Academic) Course students. Computation of the t-test on the scores of the Reading Strategy Use scale showed that the Express and Normal (Academic) Course students, however, did not differ in their use of metacognitive strategies.

Feryal (2008, pp. 83- 91) conducted a study of the teacher trainees in the English department who had received instruction in metacognitive awareness for reading comprehension. Students were taught metacognitive strategies for reading in a five- week program they had joined voluntarily. The students used the reading logs to reflect on their own thinking processes as they were engaged in reading tasks. The purpose of the study was to determine the effectiveness of systematic direct instruction of multiple metacognitive strategies designed to assist students in comprehending text. Specifically, the reading comprehension and vocabulary achievement of 130 third-year university students were investigated to determine whether instruction that incorporated metacognitive strategies led to an increase in the reading comprehension of expository texts. The students received 45 minutes of reading comprehension instruction a week for five weeks. In each class hour they were taught two metacognitive strategies and they applied them to the passages. The strategies were using strengths, inferencing, background information, evaluating, searching according to the goals, distinguishing, revising, and guessing the later topics. The experimental group received explicit instruction on metacognitive strategies based on cognitive academic language learning approach model of teaching learning strategy. At the end of the course, both the control group and the experimental group were given the vocabulary and reading comprehension tests and the results of the tests were compared to find the effects of the training. The results of the study confirmed that reading comprehension could be developed through systematic instruction in metacognitive language learning strategies. Systematic explicit instruction about the concept of metacognition and learning strategies helped students of the experimental group to better comprehend this new approach and how to apply it to different learning tasks on reading.

Zhang (2007, p. 4) states that metacognition is of much importance in reading comprehension; so, those who are metacognitively aware of the nature of reading and types of appropriate strategies are different from those who are not in terms of success in reading comprehension. Zhang (2007, pp. 5-7) conducted a study which was set up to explore the types of metacognitive knowledge of reading strategy EFL learners of different proficiency levels have while learning to read EFL. In doing so, ten EFL readers were selected from a sample of 312 participants. For the purpose of comparison, an orthogonal design was adopted. In both the high-scorer and the low-scorer groups, five students were sampled. Results from a subjects' background questionnaire showed that they started their formal education in Chinese when they were in kindergarten or

primary school. The data also showed that they began to learn English as a foreign language at the age of 13, as required by the ministry of education. They had a total of about seven years of classroom EFL learning. Their average EFL proficiency was estimated to be equivalent to about 450 on the TOEFL. Their Chinese reading abilities ranged from good to excellent. Their average age was around 19 on the basis of ordinal scale.

The subjects were divided into high scorers and low scorers according to their performance. A score of 60 out of 100 was regarded as a cut-off point. A scheme for coding the verbal data from the interviews was developed on the basis of the results obtained from the pilot stage for this study. All the audio-recordings of the subjects were browsed and randomly chosen to transcribe and analyze five subjects' transcripts. Then another judge, whose native language was Chinese and who had extensive training in applied linguistics both in her home country and overseas, independently analyzed the same transcripts. Thereafter, the data were classified into different categories with reference to the coding scheme. Results showed that the subjects' metacognitive knowledge of which strategies they used independently of EFL reading tasks varied across EFL proficiency levels, with high scorers predominantly showing clearer awareness of strategy use. In contrast, the low scorers did not realize that reading EFL required them to adopt different reading strategies to solve the problems they might encounter. They said that most often they had to handle reading tasks by chunking, detailing every linguistic element in print. In addition, they reported that they were reluctant to stop using dictionaries or translating into Chinese to make meanings clear.

Yang (2002) conducted a study to analyze how readers monitor their comprehension processes and how teacher intervention provides facilitation. The participants of the study were recruited from the freshmen English classes at the department of business management and the department of space design in national Yunlin University of science and technology; the numbers of freshmen in each class were 54 and 42 respectively. The top 14% of the students in the referential criteria of each class were considered to be proficient readers, and the lowest 14% percent of the students of each class to be less proficient readers. The texts for selection were from the commonly used college-level textbooks in Taiwan. The teachers of each class were asked to choose texts that their students had never read before. The study included two consecutive stages: a think-aloud procedure, and a diagnostic and remedial procedure. All participants were met individually by their experimenter in each of the two stages, in a small classroom. After the subjects understood the think-aloud procedure, they were given a text for training. Five days after the think-aloud training task for all subjects, the formal experimental session began, and the new text began for the first time. In the first experimental think-aloud procedure, the subject was asked to think aloud when reading the assigned text. If the experimenter's intervention succeeded in helping the subject to describe his or her thoughts, he/she was allowed to go directly to the succeeding sentences. If not, the experimenter tried different ways to invoke a verbal report. One fact that cannot be ignored is that even the less-proficient readers had some competence in comprehension monitoring since they were able to access the appropriate meaning of certain words or sentences. The most significant difference between the two groups in the comprehension process was the fact that the proficient readers seemed to monitor their on-going reading process retrospectively, while the less proficient readers seemed to be mostly limited to the lexical level of the word.

To motivate students to become involved in the learning process and to have more participation in their reading class, Shen and Huang (2007) conducted a study in Taiwan. They found that during reading classes, the students of the second semester of academic year who were generally considered to be relatively inadequate in terms of vocabulary size, grammar knowledge, and strategy use, looked up every difficult word in the dictionary and were unable to draw inferences or to guess the meaning of unknown words. So they designed their project on the basis of the key concept of collaborative action research. An understanding of the learner's backgrounds and needs formed the prerequisite for their follow-up teaching. Moreover, a diagnostic reading assessment was used to identify student's strengths and weaknesses in reading. The students also became aware of the results in the use of reading strategies. Therefore, the lesson plans were carefully designed according to the results and were developed through collaborative discussions between the teacher-researcher and her assistant. Then, the teacher self-evaluated the teaching process. Towards the end of the semester the teacher achieved more success in making her students aware of the reading processes as well as the reading strategies taught.

Erten and Karakas (2007, p. 114) conducted another study to understand possible divergent influences that reading activities could exert on the comprehension of short stories. The study was carried out at MartUniversity in Turkey with a number of forty-seven third year students. Eight of the students were male while thirty-nine were female, reflecting the natural demographic gender distribution. The participants had an advanced level of English language proficiency. A Rose for Emily by William Faulkner was the story which was chosen with an appropriate level of linguistic ability. The theme of the story was relevant to students' lives in that the participants were able to make comments and express their own experiences, which could activate their prior knowledge. A post-test was prepared to measure two types of comprehension of the story: literal and evaluation. The activities which were given to the experimental group, mostly involved procedures directed towards literal comprehension while those given to the control group tended to involve more than literal comprehension and required some reflection on the textual information. Neither group was given a pre-test before reading a short story. At the pre-reading stage, both groups were given two activities. The control group received brainstorming and surveying while the experimental group received previewing and key words. Both groups were asked to do a predicting activity as a transition activity into the story. The analysis revealed that the experimental groups' performance was considerably higher on literal comprehension than evaluation. However, there was no significant difference between the performances of control group students on different parts of the post-test. According to Erten and Karakas (2007, p. 116), those who make use of the strategy of inferencing reach at the meaning of the text which has not been explicitly stated

Saricoban (2002, p. 2) aimed to see if any differences would exist in terms of the strategies employed by the successful and the less successful readers during their reading activities in language classrooms that could lead them to better comprehension. The subjects were 110 preparatory students for language studies in English department at HacettepeUniversity. Following a homogeneity test, to determine the sort of reading strategies of both successful and less successful readers at proficiency level, the researcher designed and administered a reading

strategy inventory to the subjects. The inventory included strategy types for the three reading stages of pre-reading, reading, and post-reading during instruction. Finally, an achievement test was given to distinguish the successful readers from the less successful readers. The results showed that the three-phase approach has not to be carried out mechanically on every occasion. Sometimes, the teacher may wish to cut out the pre-reading stage and get the learners to work on the texts directly. Sometimes, the post-reading work may not be suitable. Therefore, the three-phase approach leads to the integration of the skills in a coherent manner so that the reading session is not simply isolated.

Mckown and Barnett (2007, p.1) conducted a study on reading comprehension of second grade and third grade students. The teacher researchers intended to improve reading comprehension by using higher-order thinking skills such as predicting, making connections, visualizing, inferencing, questioning, and summarizing. In their classrooms, the teacher researchers modeled these strategies through the think-aloud process and graphic organizers. This was followed by students using these strategies through the whole class, small group, and independent practice. The teacher researchers gathered information prior to implementing the reading strategy interventions. The metacomprehension strategy index indicated a lack of student knowledge of strategies to use before, during, and after reading. The state snapshot of early literacy given to the second grade students identified nine of the sixteen students below target level and others were at risk for reading comprehension failure. They mentioned that effective learners are able to cope with the difficulties of unfamiliar language and missing information. They are able to think critically which is of their characteristics. Teachers can help students to deal with the problems by teaching them the proper strategies such as inferencing, which is meant to make educated guesses. They explained inferencing as guessing the meaning of words in unfamiliar language structures based on the topic being discussed, content, background knowledge, knowledge of language structures, contextual clues and world knowledge.

They believe that students need to be independent and cope with challenges of language in problem-solving situations. Inferencing is of much use in the two skills of listening and reading and is considered as one of the fastest and most effective ways in acquiring additional vocabulary. It would be very easy for the learners to remember the words when they are actively involved in constructing meaning. They suggested that inferencing as a metacognitive strategy falls within problem-solving strategy that teachers should use so that students can be put to challenge for trying to understand the missing information in texts. And this practice must be encouraged by teachers. According to Barnhardt, the strategy of inferencing is used by many students. However, there is difference between more and less effective learners in that effective learners use all types of knowledge to make inferences. And less effective ones rely more on contextual clues such as pictures. Effective learners have been observed to be more active in construction of meaning and less effective learners normally lack confidence enough to make guess at the meaning.

CONCLUSION

Results of the study showed that using metacognitive reading strategies of inferencing, memorizing and analyzing for reading comprehension skill result in successful learning among EFL learners. Language learners who are successful in their reading comprehension skill might use these strategies more frequently in their reading comprehension skill. The study indicated that when students used inferencing analyzing and memorizing as a metacognitive strategy, they had good results comparing to other students that did not use the strategies. It is suggested that EFL learners use learning strategies to be able to improve their reading comprehension in the process of EFL learning.

Implication of the study

Reading comprehension is a very important factor in the process of language learning. The study reviewed using different reading strategies for EFL learning and reading comprehension. Zhang's (2007) believes that metacognition has an important role to play in the reading process; hence, readers who have clearer metacognitive awareness of the nature of the reading task and of their own strategies for text processing will differ from those who do not. Therefore, the use of metacognitive strategies should get more attention.

ABSTRACT

The ability of employing the language as a communicational tool often judges one's successfulness in speaking class in language learning. This study sought to investigate the impact of instructional conversations on speaking ability of Iranian English as Foreign Language (EFL) learners. Forty-nine Iranian intermediate EFL learners from three language institutes in Sarakhs, Khorasan Razavi, Iran were selected as the participants of the study based on their scores in Nelson Proficiency Test. Administering Nelson General Proficiency Test, participants were measured to make sure they are homogeneous. These participants were randomly assigned into to control and experimental groups. Participants in both groups sat for IELTS speaking test. Results of independent samples t-test indicated lack of any significant difference between the two groups in speaking ability at the outset of the study. Throughout the study lasting for 12 sessions participants in experimental group received the treatment, instructional conversations, as a means for instructing speaking materials. Participants in the control group were taught the same materials as those practiced in the former group through other techniques such as role playing, peer dialogues. Finally participants in both groups sat for the posttests being the same as those administered as pretests. Results of t-test indicated the experimental group performed significantly better than the control one in IELTS. The present findings provide pedagogical implications for employing instructional conversation in EFL speaking classrooms. Students' use of instructional conversation not only develops their understanding of the language via interaction, but also it increases their speaking abilities by interaction.

KEYWORDS: Instructional conversations, speaking ability

INTRODUCTION

Background and Purpose

The ability to speak English as foreign language (EFL) appears to be the primary purpose of EFL students. Speaking can be improved through a variety of techniques introduced by EFL teachers to their students. According to Brown and Yule (1983) many language learners view speaking as the criteria for knowing a language and one's progress is assessed in terms of his/her achievement

in spoken communication. Speaking a foreign language seems to differ from speaking a native one due to different structures, vocabularies, cultural factors, and so on. The process of learning to speak a foreign language is, therefore, complex. Richards and Renandya (2002) view the ability to speak a second language well as a very complex task.

Overall, it can be concluded that speaking skill is worthy to bring up the newly developed issue, instructional conversation method, which might significantly affect the development of speaking ability. Before dealing with the issue it is worth presenting a background of it.

Communicative competence, according to Boyd and Miller (2000), involves the ability to interpret and enact suitable social behaviors and requires the learner to actively participate in producing the target language. Thus the learner needs to do more than one-word answers in the target language or memorize separated sentences (Pinkevičienė, 2011). The learner needs to be actively engaged in building and clarifying meaning. EFL teachers, on the other hand, need to provide opportunities in the classroom to engage students in talking.

Wells and Haneda (2005) view learners as active agents who, along with their teachers, participate in a form of conversational discourse aims at improving understanding rather than the one-way transmission of teacher-directed instructional talk. In this case the target language becomes the vehicle for communicating ideas rather than an instructional tool (Pinkevičienė, 2011). According to Wells and Haneda (2005), Tharp and Galimore (1988) coined the term "Instructional Conversation" (IC: Talk about text). Instructional Conversation: contains a paradox: 'Instruction' and 'Conversation' appear contrary, the one implying authority and planning, the other equality and responsiveness (Tharp & Gallimore, 1988 as cited in Wells & Haneda, 2005, p.151).

Reveles (2004) describes IC as a teaching strategy in which conversation takes place among small groups of students. These conversations are not random rather they are academically goal-oriented. In such classrooms, Reveles (2004) explains, the students speak more than the teacher; the teacher therefore becomes a listener and facilitator. "IC protocol is a way to transform a classroom into a more productive learning community through dialogic teaching" (Reveles, 2004, p.1).

IC is most often enacted in a small group through employment of familiar forms of conversation to improve learners' language production and understanding. Teachers who employ IC take the advantage of ordinary conversation about an interesting stimulus or activity to tempt their students to employ social and academic language and to share prior knowledge (Dalton & Sison, 1995). In the interaction, teachers determine levels of students' independence and necessary assistance (Gallimore, Dalton, & Tharp, 1986, as cited in Dalton & Sison, 1995). In IC, teachers investigate to gather information about students' Zones of Proximal Development (ZPD). Therefore, the format of an IC, from the beginning, is neither exactly prescribed nor pre-scripted; however, it mirrors a plan composed of anticipated options and some unanticipated ones to gain selected outcomes. Outcomes are proximal in collecting information of students' prior knowledge

and their ZPDs, and distal for facilitating students' understanding and knowledge construction (Dalton & Sison, 1995).

Evidence shows that IC is effective in improving reading comprehension scores of limited English proficient students (Teaching Transformed, Tharp et al., 2000, as cited in Reveles, 2004). ICs (Tharp & Gallimore, 1988, 1989, 1991; Saunders & Goldenberg, 1992, as cited in Shen, 2005) include small-group discussions where teachers and students discuss the themes of the unit, students' written responses to reading, and related personal experiences. Shen (2005) considers five instructional elements for this model of literacy pedagogy which include thematic focus, activation and use of background and relevant schema, direct teaching, promotion of more complex language and expression, and elicitation of bases for statements or positions. The five conversational elements of this pedagogy include fewer known-answer questions, responsiveness to student contributions, connected discourse, a challenging but not-threatening atmosphere, and general participation, including self-selected turns (Saunders, Patthey-Chavez, & Goldenberg 1997, as cited in Shen, 2005). These dimensions can be helpful for students since through attending peer discussion, student can enhance their own comprehension, knowledge, and experiences. Teachers, according to Shen (2005) can also take advantage from taking part in discussion with students in terms of improving their teaching practices since they can "(a) hear students articulate their understanding of the story, theme(s), and related personal experiences; and (b) in the process of facilitating the discussion, challenge but also help students to enrich and deepen their understandings" (Saunders & Goldenberg, 1999, p.297, as cited in Shen, 2005).

Curenton and Zucker (2013) view instructional conversations as planned discussions with small groups of children where teachers improve students' collaborative reasoning by using challenging questions which necessitate students to use complex language to talk about their experiences, knowledge, and opinions.

IC method with the aim of improving learning through conversation (AssadiAidinlou, & Tabeei, 2012), was implemented as the treatment in order to address the following research question:

REVIEW OF LITERATURE

Speaking and Instructional Conversation

Speaking is one of the four main skills required for actual communication in any language, chiefly when presenters are not employing their mother tongue. As English is commonly used as a way of communication, particularly in the internet domain, English speaking skills should be advanced along with the other capabilities so that these unified skills will augment communication accomplishment both with native speakers of English and other associates of the global community. Owing to the important role of speaking in action, Bailey (2005) and Goh (2007) explained how to increase the expansion of speaking by means of syllabus scheme, principles of instruction, sorts of tasks and materials, and speaking evaluation. Though reading and listening are taken to be the two receptive abilities in language education and use, writing and speaking are two productive abilities essential to be combined in the expansion of effective communication. Among all the four macro English abilities, speaking appears to be the most vital

skill obligatory for communication (Zaremba, 2006). Real communication through speaking frequently generates a number of profits for both speakers and business organizations.

There are some issues linking to speaking abilities to be measured for actual English speaking performance. Pronunciation, vocabulary, and collocations are pulled out as central influences to be highlighted in constructing fluency for EFL speakers. Giving students a diversity of circumstances and regular speaking tasks plays a noteworthy role in the development of students' eloquence when speaking (Tam, 1997).

Self-assurance and capability usually bring about strong point of English speaking abilities. Patil (2008) declared that strengthening the learner's self-confidence to abolish fear of making errors was a significance that the instructor should contemplate in order to make the student feel relaxed with their language usage. Self-confidence and capability in speaking could be established from suitable syllabus design, methods of instruction, and adequate tasks and materials (Bailey, 2005; Songsiri, 2007). For efficiency of speaking, Shumin (1997) argued a number of elements, counting listening abilities, socio-cultural elements, affective influences, and other linguistic and sociolinguistic capability such as grammatical, discourse, sociolinguistic, and strategic skill. So as to carry meaning, EFL learners must have a comprehension of words and sentences; that is, they must comprehend how words are put into different sounds, and how sentences are stressed in specific ways.

Dalton and Sison (1995) described four ICs taught by a novice teacher. The ICs aimed at fostering interaction about math concepts in small groups of seventh grade students who were ordinarily excluded from classroom participation by their regular teacher. Results indicated that all the students participated comfortably in academic conversation using math lexicon with increasing appropriacy and focus. Intersubjectivity emerged in the conversations and was apparently built on the students' and teacher's similar and shared experience in constructive social interaction about math. Students' participation in IC increased dramatically and stabilized across the four ICs which indicated the effectiveness of this pedagogy to include often excluded language minority students in classroom interaction (ibid).

Concerning the effects of IC in EFL contexts several studies have been already conducted. For example Aidinlou and Tabeei (2012) in their study on the effects of using instructional conversation method on reading comprehension of Iranian EFL learners indicated advantages of instructional conversation in English students' reading comprehension. It was found that the participants in the IC groups performed better than those in control group in reading comprehension post-test. Moreover, significant differences were found between performances of two experimental groups. These findings showed that a combination of instructional conversation method and traditional method was more effective than instructional conversation alone (Aidinlou, & Tabeei, 2012).

Miller (2010) in her article under the title of "Instructional Conversations: Improving Reading Comprehension in English for English Language Learners" concentrated on improving teaching of reading comprehension skills via instructional conversations. She believes that an

instructional conversation engages students in a structured discussion to activate background knowledge before reading a text, to help them think of a text while reading, and to analyze and ponder on a text after reading. Finally, the findings indicated positive effects of using instructional conversations (Miller, 2010).

Meskill and Sadykova (2011) in their article entitled “Introducing EFL faculty to online instructional conversations” state that while the availability of teaching models was until recently limited to face to face observations, videotaped classes and transcriptions of classroom interaction, language educator professional development can now use online discussions between language educators and their students as instructional models for language faculty in training. Such technology-based models, like those of traditional classrooms, are those that make optimal use of the affordances of the given instructional context. Concerning online asynchronous language coursework, according to Meskill and Sadykova (2011), “exemplary teaching sequences can be examined as both representing effective teaching overall and effective teaching given the specific affordances of Computer Mediated Communication (CMC)” (p.201). Online instructional conversations between language educators and students as effective training tools can help educators conceptualize effective online instructional processes as well as effective instructional processes overall (Meskill & Sadykova, 2011).

RESEARCH QUESTION

The following research question was posed by the researcher:

Q: Does the use of Instructional Conversation have any significant effect on Iranian intermediate EFL learners' speaking ability?

METHODOLOGY

Participants and Setting

Forty-nine Iranian intermediate EFL learners studying English as their foreign language in three language institutes in Sarakhs, Khorasan Razavi, Iran were selected as the participants of the study. Sample selection was carried out by administering Nelson Test developed by Fowler and Coe (1976). All of them were female and their age ranged from 18 to 24.

Instrumentations

The following instrumentations were employed by the author.

Nelson Proficiency Test

To assure the homogeneity of the participants, a Nelson proficiency test series 200A (developed by Fowler and Coe, 1976) was administered to 110 EFL learners in Sarakhs. The test contained 50 multiple-choice items and participants were allowed to respond in 40 minutes. The test mainly assessed the participants' vocabulary knowledge and grammar.

After analyzing the results of this test, 49 participants who could obtain at least 70% of the total score were selected as the participants of this study (Appendix A).

IELTS Speaking Test

Composed of three parts, speaking test assessed the participants' speaking ability. The questions included personal information (family members, description of an influential teacher, and discussion topics, e.g. different styles/methods of teaching and learning, a national education system). The speaking test took 11-14 minutes and consisted of an interview with an examiner (Appendix B).

Procedure

Forty-nine Iranian intermediate EFL learners from language institutes in Sarakhs were selected as the participants based on a Nelson Test. These participants were randomly assigned to control (n=24) and experimental (n=25) groups. IELTS Speaking module was administered at the beginning of the study.

During the course which lasted for 12 sessions, instructional conversation was employed in the experimental class. Every session the teacher brought 20 copies of a reading text into this class. These students were allowed to work together as a whole class, in small groups, or even in pairs to maximize their own language learning. These participants were provided with a time (25 minutes) to analyze and talk about the text. The teacher managed the process of discussion to correct the mistakes committed by the students. The text details were discussed by the students through oral discussions. Sometimes the teacher, herself, attended the discussions to explain more and clarify the issues.

Students in experimental class were provided with opportunities for conceptual and linguistic development through making connections between academic content, students' previous knowledge and cultural experiences.

Role playing and peer dialogues were used in the control group. To do so, they were given a topic (e.g. holidays in Iran, music, hobby) to practice in groups or pairs before the class. The groups or pairs were asked to perform the task in the class. Finally participants in both groups sat for the posttest which was the same as the pretest. Finally data were analyzed using SPSS.

RESULTS AND DISCUSSION

Having gathered the required data, the researcher analyzed them by SPSS to test the formulated null-hypothesis

Results of Normality of Data

To make sure that the data are normal, a normalizing test, Smirnov-Kolmogorov Test, was conducted. Results are shown in Table 1.

Table 1: One-Sample Kolmogorov-Smirnov Test

		Nelson	speakpre	speakpost
N		49	49	49
Normal Parametersa	Mean	37.7347	4.8571	5.2449
	Std. Deviation	2.12892	1.91485	1.93144
	Most Extreme Differences	.160	.144	.121
	Positive	.160	.144	.108
	Negative	-.112	-.093	-.121
Kolmogorov-Smirnov Z		1.118	1.006	.850
Asymp. Sig. (2-tailed)		.164	.263	.465

a. Test distribution is Normal.

Note: speakpre stands for speaking pretest; speakpost stands for speaking posttest

Table 1 summarizes the data related to normalizing test. Null-hypothesis of Kolmogorov-Smirnov Test indicates that the data are normal. Since P-values obtained in the test for the instruments administered are greater than .05, (p-value for Nelson=.164>.05; p-value for speakpre=.263>.05; p-value for speakpost=.465>.05) the null-hypothesis is supported.

Results of Independent Samples t-test for Nelson

Table 2 shows results obtained from independent samples t-test for Nelson proficiency test.

Table 2: Results of independent samples t-test for Nelson

Group	N	M	SD	Df	T	Sig (2-tailed)
Control	24	37.66	2.21	47	.21	.82
experimental	25	37.80	2.08			

As Table 2 shows there is not any significant difference [df=47, t=.21, sig (2-tailed)=.82>.05] between control (N=24, M=37.66, SD=2.21) and experimental (N=25, M=37.80, SD=2.08) groups in Nelson. Therefore, the homogeneity of the participants was confirmed at the outset of the study.

Results of Independent Samples t-test for Speaking (pretest)

Table 3 summarizes the performance of the two groups in speaking at the beginning of the study.

Table 3: Results of independent samples t-test for Speaking (pretest)

Group	N	M	SD	Df	T	sig(2-tailed)
Control	24	4.58	1.83	47	.98	.33
experimental	25	5.12	1.98			

Table 3 indicates lack of any statistically significant [df=47, t=.98, sig (2-tailed) =.33>.05] difference between control (N=24, M=4.58, SD=1.83) and experimental (N=25, M=5.12, SD=1.98) groups in speaking pretest. Therefore, the participants were shown to be homogeneous with respect to speaking ability.

Results of Independent Samples t-test for Speaking (posttest)

Table 6 shows results obtained from independent samples t-test for speaking test which was administered after the treatment.

Table 4: Results of independent samples t-test for Speaking (posttest)

Group	N	M	SD	Df	T	sig(2-tailed)
Control	24	4.33	1.90	47	3.62	.001
experimental	25	6.12	1.53			

As Table 4 shows, participants in the experimental group (N=25, M=6.12, SD=1.53) significantly [df=47, t= 3.62, sig (2-tailed=.001<.05)] outperformed those in control (N=24, M= 4.33, SD=1.90) in the speaking posttest. Accordingly, the first null-hypothesis "Use of Instructional Conversation does not have any significant effect on Iranian intermediate EFL learners' speaking ability" was rejected. It can be deduced that the treatment was significantly effective in improving speaking ability of intermediate EFL learners in Iran.

Discussion

The purpose of the present study was to explore the effects of instructional conversations on EFL learners' speaking ability. Concerning the research question "Does use of Instructional Conversation have any significant effect on Iranian intermediate EFL learners' speaking ability?" data analysis showed that use of instructional conversation has significant effect on Iranian intermediate EFL learners' speaking ability. Significant effects of instructional conversation on speaking ability may be due to the involvement of students in further talk. According to Goldenberg and Patthey-Chavez (1994, as cited in Saunders & Goldenberg, 2007, p.?) during ICs teachers talk significantly less, students talk significantly more, and the actual content of lessons is more likely to be mutually shaped and defined by student and teacher understandings. Aidinlou and Tabeei (2012) found out advantages of instructional conversation on improvement of reading comprehension of second language learners.

CONCLSUION

This study sought to investigate the impact of instructional conversations on speaking ability of Iranian English as Foreign Language (EFL) learners. The findings of this study indicated that the experimental group, which studied and practiced instructional conversations, performed significantly better than the control group in IELTS. The findings of this study illuminate the way for the teachers whose major purpose is to develop students' speaking abilities. Applying instructional conversations in a speaking classroom can enhance their understanding, speaking abilities and motivate them to participate in conversations with more self-confidence. The participants were only female intermediate EFL learners from Sarakhs, Iran. The major focus of the present study was on instructional conversation as independent variable and other techniques were not considered. Finally, the researcher explored the effects of the treatment on speaking ability and other skills such as writing, reading, listening were excluded.

APPENDICES

Appendix A

Nelson English Language Test (Book, Intermediate, 050A) by Fowler, and Coe, (1976)

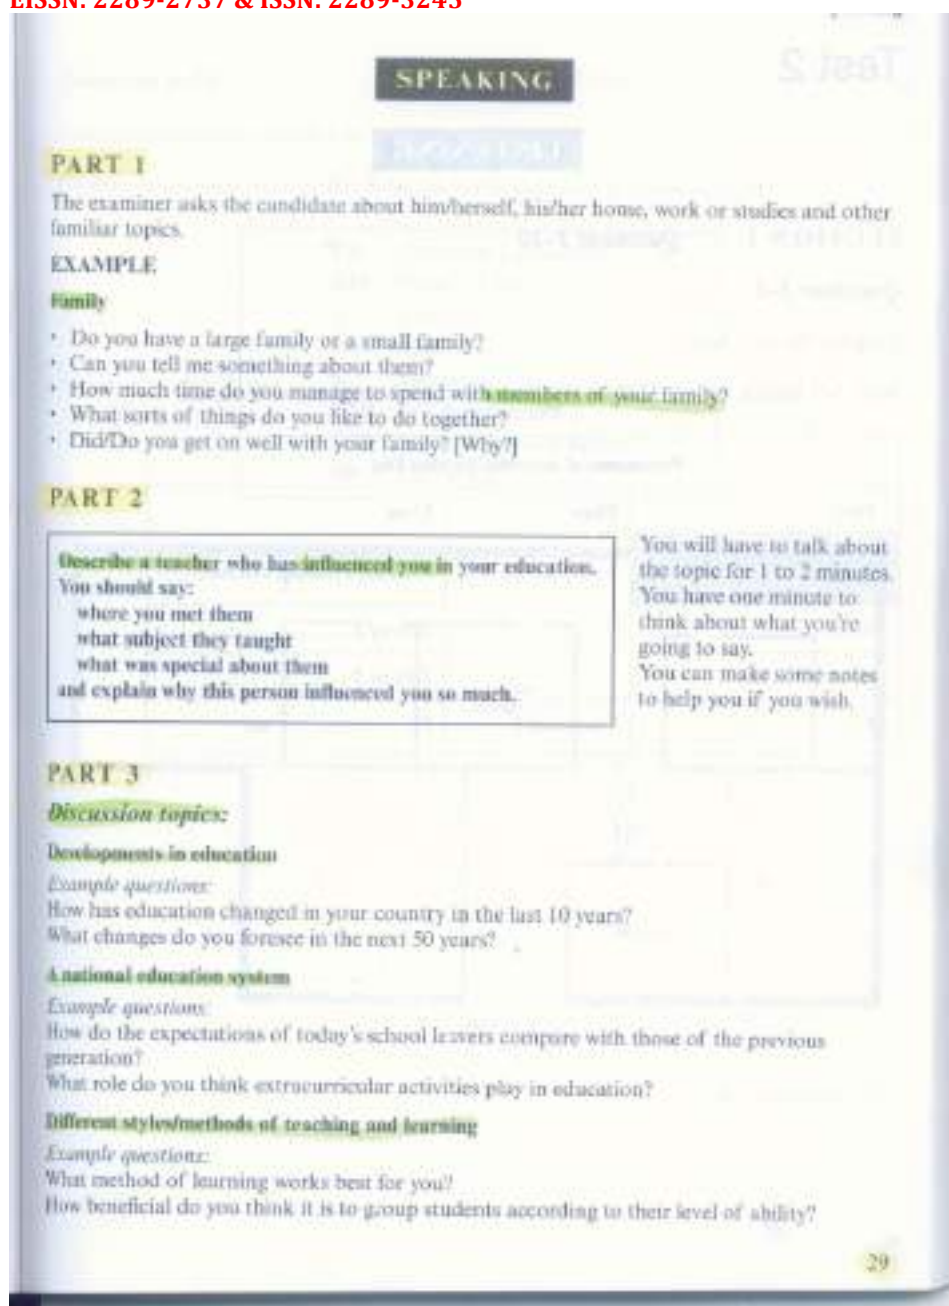

Choose the correct answer. Only one answer is correct.

1. A) The sun is in a sky B) The sun is in the sky
C) Sun is in a sky D) A sun is in a sky
2. What John doing?
A) Are B) do C) does D) is
3. John and Mary the radio.
A) are listening on B) are listening to C) is listening on D) is listening to
4. Bill and I here.
A) We're B) we C) we are D) are
5. Sarah, what doing?
A) She is B) are you C) are D) is
6. Mary's the garden.
A) In B) at C) on D) into
7. Are there six books on the table?
A) No, are five B) No, there are three C) No, there's one D) No, there are any
8. Tom often sings, but
A) Sings Sarah? B) Sarah sings? C) Sarah does? D) does Sarah?
9. Tony is looking at
A) She B) he C) her D) here
10. Who's that boy?
A) Is Bill B) It's Tom C) It's a boy D) Peter's that
11. Where's the book?
A) There's it B) He's under the chair C) It's he D) There's on a chair
12. Are you happy?
A) Yes, I'm B) No, I aren't C) Yes, I am D) No, I not
13. What's his name?
A) It's name Jack B) It's a Jack C) It's Jack's name D) It's Jack
14. Do you dance or draw?
A) I'm dance but I'm not draw B) I dance but I don't draw

- C) I'm dancing but I not drawing D) I dance but I'm not drawing
15. Is that a book?
A) Yes, there is B) Yes, it is C) Yes, that's D) Yes, is a book
16. Is that horse big?
A) No, that's a little B) No, that's little horse
C) No, It's little horse D) No, It isn't
17. What's her brother doing?
A) Playing football B) Is playing football
C) He playing football D) She's playing football
18. How many chairs are there in the room?
A) Are four B) Are five chairs there C) There's one D) there's a chair
19. A) Is that table big brown? B) Is that big brown table?
C) Is that big table brown? D) Is brown that big table?
20. A) Mary can dance tomorrow B) Mary cans dance tomorrow
C) Mary she can dance tomorrow D) Mary can tomorrow dance
21. The lamp is the television.
A) at B) next to C)near of D) between
22. The tree is the door.
A) between B) in front C) beside D) next
23. What's that girl?
A) It's a student B) She's student C) She's a student D) She's a student girl
24. Do the girls know Tom?
A) Yes, they knows her B) No, they isn't
C) Yes, they know D) No, they don't
25. A) John's looking at I and you B) Your looking at John and
C) I'm looking at you and John D) John and I am looking at you
26. A) That girl is some of my friends B) This girl is one of my friends
C) That girl is me friend D) This girl's are friends
27. A) This is Mr. Smith there B) That is the Mr. Smith there
C) This is the Mr. Smith here D) That is Mr. Smith there
28. My brother is writing
A) by a pencil B) with pen C) in a paper D)in a book
29. A) Who now in London lives?
B) Who in London now live?
C) Who lives in London now? D) Who live now in London?
30. Monday is the first day.
A) Tuesday is the second. B) The second is Thursday.
C) Tuesday is the fourth. D) The fourth is Thursday.
31. Jane is in front of Tom. Tom is Jane.
A) beside B) behind C) before D) between
32. Tom is Mrs. Smith' son.
A) She is his son. B) She is her son. C) He is her son. D) He is his son.
33. A) Come here to us! B) Go here to we!
C) Go there to us! D) Come here to my
34. A) Don't look at us! B) Don't looking at us!
C) No looking at we! D) Not look at us
35. A) Some girl are listening to the old men B) An old man is listening to the girl
C) An old men are listening the girl D) The old man are listening to a girl
36. A) Listen to he and he's brother! B) Listen to he and his brother!
C) Listen to him and his brother! D) Listen to him and he's brother!
37. Whose hats are those? They are Hats.
A) he's B)Mr. Black's C) Mrs. Black's D) she's
38. A) Where are you going to put the cups? B) Where are you going put the cups?

- C) Where you're going put the cups? D) Where you are going to put the cups?
39. Jane's tall and
A) John's, too B) Tom is, too C) Tom is to D) Tom are two
40. Does Brain play football?
A) Yes, and Sam doesn't, too B) No, but Sam doesn't
C) Yes, but Sam doesn't D) No, and Sam does, too
41. James is talking to
A) they B) them C) she D) your
42. These pens are
A) Pats B) of Pat C) Pat's D) to Pat
43. Sarah cat.
A) haves a B) haves some C) has some D) has a
44. This is
A) second lesson B) the lesson two C) lesson the second D) lesson two
45. A) Lena cans have Mikes' radio B) Lena can has Mikes' radio
C) Lena can have Mikes' radio D) Lena can has Mikes' radio
46. It's 21.00.
A) Yes, it's nine in the evening B) Yes, it's nine clocks
C) Yes, it's nine in the afternoon D) yes, it's nine hours
47. 164 is
A) hundred sixty four B) a hundred sixty four
C) hundred sixty and four D) a hundred and sixty four
48. A) The girls don't do the homework B) The girls don't the homework
C) The girls doesn't do the homework D) The girls don't does the homework
49. Do Mr. and Mrs. Smith speak English?
A) He does but she doesn't B) He speak but she doesn't
C) He do but she don't D) He speak but she don't
50. Who are those boys? One is my brother and
A) the big boy is Peter B) a big boy is Peter
C) the big boy is a Peter D) a big boy is a Peter

ABSTRACT

The present study was intended to investigate the Impact of Blended learning on Iranian EFL learners' acquisition and long term retention of passive sentences .In order to this end, a group of 44 EFL learners were randomly placed in three groups, after conducting the placement test. The participants were placed in two experimental groups, namely Blended Learning (N=15), Web-based (N=15), and one Control (N=14).The participants of the Blended Learning received traditional teaching methods of grammar (passive structure) plus learning via the web. In the second group, the Web-based, the participants received materials and instructions merely through the web. Participants of the control group, however, were taught based on the traditional teaching methods of grammar and received the materials, instructions, and feedback through traditional methods. In order to collect the data, first a pre-test, then posttest and the last one delayed posttest consists of 30 multiple -choice items was given to the participants. The results of the one way analysis of variance and repeated measure tests showed that the participants of the Tradition group outperformed of two other experimental groups in their acquisition and long term retention of passive structures. Having a more meticulous look at the results, it was observed that participants of the Web-based group although had a lower performance in the post-test and delayed posttest, too. It did not significantly outperform those of the Tradition and Blended group. In conclusion, the results of the study revealed that employing a Blended Learning method cannot create a desirable condition to enhance the EFL learners 'acquisition and long term retention of passive sentences. This is because participants are not completely familiar with the benefits the method can have for EFL learners. Therefore, an important implication of the study is that EFL learners need to be familiarized with such techniques and try to benefit from their positive effects, as shown by the literature in the field.

KEYWORDS: Blended Learning; Passive Structure; Web- based Learning; CALL

INTRODUCTION

Technology has made a huge change in learning a second language. It can improve teaching and learning processes. Technology lies in providing a learning environment that helps learners succeed in improving understanding where other methods have failed. Digital technologies have led to more integration between computer-mediated instructional elements and traditional face-to-face learning practices. The most important result of combining technology and education is the emergence of e-learning. Nowadays, e-learning has grown and expanded in exponential ways at the expense of traditional face-to-face learning that has been around for centuries.

Research over the last several years has indicated that students learn as successfully in online environments as in traditional face-to-face classroom settings (Brew, 2008). Electronic learning has become popular and has had a huge impact on language education. Learning English as a foreign language in recent years has been accompanied with the revolution of changes in the field of technologies. One of these changes is the use of computers in learning English or technically speaking, it is Computer-Assisted Language Learning (CALL).

Undoubtedly, CALL is one of the most important technologies used to contribute to language learning. It should be pointed out that the computer has caused significant variation to every aspect of education. Numerous English as a foreign language research studies (Blake, 2000), suggest that integration of technology can improve academic performance, enhance motivation, and promote learning. Learning English as a foreign language has a lot of changes due to the field of technologies.

CALL programs provide interactive computer activities for language learning which helps learners to interact in a communicative way. Traditionally, computers have been considered a good fit to teach grammar (Hubbard & Siskin, 2004). When we use the computer for presentation, explanation, and application of grammatical structures, more classroom time can be saved for real communication in order to focus on expressing meaning and using appropriate grammatical structures to express that meaning. Additionally, this makes the process of language teaching and learning more fun for the learner as well.

Not only EFL grammar course instructor feel frustrated in teaching grammar, but also learners usually face greater challenges. Proponents of online learning have seen that it can be effective in potentially eliminating barriers while providing increased convenience, flexibility, currency of material, customized learning, and feedback over a traditional face-to-face experience (Hackbarth, 1996; Harasim, 1990). Opponents, however, are concerned that students in an online environment may feel isolated (Brown, 1996), confused, and frustrated (Hara & Kling, 2000) and that a student's interest in the subject and learning effectiveness may be reduced (Maki, Patterson, & Whittaker, 2000).

In the learning process, a large number of comparative studies of traditional and on-line learning education have concluded that on-line learning can be as effective as traditional learning. On-line learning provides students a convenient and efficient way for learning. On-line methods or

merely traditional might not lead to desirable results. In order to facilitate learning and communication theories suggest that a third alternative, i.e., blended learning.

Blended learning is “integrating the online and face-to-face formats to create a more effective learning experience” (Brew, 2008, p. 98). With blended learning, teachers can use online resources in their daily classroom activities to engage students and help them become more active and more effective learners. The study was intended to investigate the effects of blended learning on grammar instruction with a particular focus on passive structures.

In learning a second or foreign language, grammar has always been an important component and is something both language learners and teachers are concerned about, especially in traditional grammar classes. They get bored easily due to traditional methods of teaching. Language learners may not have sufficient metalinguistic knowledge (i.e., grammar terminology) to understand the topics and explanations of grammatical points (Hasselgard, 2001). Traditional methods of teaching grammar are time-consuming. It seems that because of the inefficiency of grammar teaching methods, new approaches and techniques are needed to assist language teachers and learners.

In order to help students find language classes, especially grammar lessons more interesting and to achieve the best quality of learning, in addition to traditional methods, on-line instruction can lead to new potential in learning. It is believed that a combination of traditional instruction and on-line instruction, called blended learning, can be employed in language classrooms. Blended learning can be a practical and effective way to make students attracted and motivated to learn grammar better.

Therefore, regarding limitation and problems in traditional classes (time-consuming, lack of interest and motivation), the need for the integration of modern technology into traditional classrooms, to improve their grammar skills. Although, the use of the computer and the internet has been introduced in language classrooms, studies are needed to examine the effectiveness and impact of blended learning on Iranian EFL learners.

The main objective of the study is intended to examine and compare the impact of blended learning, web-based learning and traditional classroom learning on the acquisition and retention of passive structures among Iranian EFL learners. In addition, the study is intended to scrutinize the role these teaching methods play in long-term retention of the target structure in question and which one results in better learning among Iranian EFL learners. Therefore, based on what mentioned above the following research question can be posed:

LITERATURE REVIEW

Computer serves as a language-learning tool and as an instrument to help researchers. According to Chappelle in (2001), the first needs of CALL were planted during the 1950s. In effect, CALL was considered as an instructional help instrument during the 1960s. In the 1960s and 1970s, the application of CALL in second language contexts was considered; and CALL was firstly applied

in small scale personal projects called Computer Applications in Second Language Acquisition (CASLA) Chapelle (2001).

Computer-Assisted Language Learning (CALL) was the expression agreed upon at the 1983 TESOL convention in a meeting of all interested participants. This term is widely used to refer to the area of technology and second language teaching and learning despite the fact that revisions for the term are suggested regularly (Chapelle, 2001, p.3). Computer Assisted Language Learning (CALL) may be defined as the search for and study of applications of the computer in language teaching and learning (Levy, 1997, p.1). Given the breadth of what may go on in computer-assisted language learning (CALL), a definition of CALL that accommodates its changing nature is any process in which a learner uses a computer and, as a result, improves his or her language (Beatty, 2003, p. 7).

There are a variety of approaches used by CALL researchers, like the other areas of second language learning. Although quantitative studies probably dominated in the early literature, qualitative and mixed-method studies are now common, especially in the area of computer mediated communication (CMC). An edited volume by Egbert and Petrie (2005) did a credible job of covering the more dominant research approaches along with some less common ones, presenting criticisms and offering suggestions for improving the overall quality of CALL research. Levy and Stockwell (2006) illustrated that quite clearly in their chapter on research by contrasting two articles in computer mediated communication that have looked at a similar phenomenon but through very different lenses, one interactionist (Fernandez-Garcia & Martinez-Rabelais, 2002) and the other sociocultural (Drawer, 2002).

By understanding the development of CALL, we can understand the innovative applications of CALL. Development of CALL Moras (2001) has divided CALL into three distinct phases: behaviorist, communicative and integrative: Behaviorist CALL was implemented when the Audio-lingual Method was popular (around the 1960's and '70) and it viewed the computer as a tutor which presented drills and non-judgmental feedback to practices. The "programs were designed to provide immediate positive or negative feedback to learners on the formal accuracy of their responses" (Warschauer & Kern, 2005, p. 8). In language learning, grammar plays a significant role and thus, many language educators have made an effort to inculcate technology in the learning process, in the hope that technology helps to improve students' knowledge in grammar. Some researchers have tried to get some insights on the effects of web-based learning on students' performance in grammar class. Another research that focused on grammar teaching and web-based environment is a research done by Frigaard (2002). The research was participated by high school students and their performance on Spanish vocabulary, grammar and listening was investigated after they participated in language lab activities. The findings, which were from the analysis of the students' data and surveys from the five units of lesson, revealed that the students preferred to learn vocabulary and grammar in the classroom, but not the listening skills. Hence, the findings reveal that environment plays an important influencing factor in language learning.

Blended learning has become a popular form of education. It "means integrating the online and face-to-face formats to create a more effective learning experience" (Brew, 2008, p. 98). With

blended learning, teachers can use online resources in their daily classroom activities to engage students and help them become more active and more effective learners. Badawi defined blended learning as "a flexible approach that combines face-to-face learning activities with online learning practices that allow students to exchange collective and individual feedback and responses [in] four specific areas, namely, learner feedback, learner strategies, and alternative assessment synchronously or asynchronously" (Badawi, 2009, p. 15).

The blended learning classes in all the studies combined two modes: face to-face and CALL. The location of the face-to-face mode was the classroom and the CALL mode the computer lab or student home. The technology used in the CALL mode included CALL programs, learning management systems (LMSs), and the web. Most of the studies used LMSs (WebCT or Moodle) to deliver instruction, sometimes in conjunction with computer-mediated communication tools. The authors of the studies paid attention to the integration of modes, the second parameter in Neumeier's framework, by making some activities obligatory. Many studies have suggested the fundamental shift blended learning proposes. One study, conducted at Brigham Young University (BYU), examined how blended learning was changing instructional practices and the prevalence of blended learning at BYU (Graham & Robinson, 2007). Data collected came from faculty surveys and interviews. The data revealed that female teachers were more likely to use blended learning strategy, and adjunct professors were three times more likely to use blended learning strategy than not. Findings also revealed that faculty rarely substituted online instruction for face-to-face instruction.

The Graham and Robinson (2007) study opened a clear distinction between enabling, enhancing, and transforming blends. Enabling blends merely create greater access and convenience for students, whereas enhancing blends increase student and teacher productivity. However, a transformational blend moved from information transmission pedagogy to active learning constructivist pedagogy (p. 96). The authors of the study concluded that for blended learning to reach the transformational level, the primary objective of the teacher should first focus on the teaching and learning relationship and then efficiency or productivity (p. 107).

As blended learning becomes more established, it offers the opportunity for educators to develop new methods of communication with and among students, develop learning activities that are engaging to the digital native learner, and differentiate instruction to meet the needs of the diverse learners' styles presented in any classroom (Bonk & Graham, 2007). Studies in this field indicate that it is important to consider some elements in the design of instruction that creates a setting for greater student learning.

RESEARCH QUESTIONS

Based on the background presented above the following research questions can be posed:

1. Does blended learning lead to the acquisition of passive structures among Iranian EFL learners?
2. Does web-based learning lead to the acquisition of passive sentences among Iranian EFL learners?

3. Is there a significant difference among the three teaching methods of passive structures (i.e., blended, web-based, and traditional)?
4. Does blended learning have any effect on long-term retention of passive structures among Iranian EFL learners?
5. Does web-based learning have any effect on long-term retention of passive sentences among Iranian EFL learners?
6. Which of the three grammar teaching methods (i.e., blended, web-based, and traditional) has more long-lasting effects on long-term retention of passive structures among Iranian EFL learners?

METHODOLOGY

Participant

The participants of the study were 44 Iranian EFL learners who were learning English in a language institute in Isfahan. These participants were selected from among a larger sample of 75 EFL learners after taking the Solution Placement Test. Both male and female learners participated in the study. Attempts were made to include an equal number of each gender, so that gender could be controlled. Since the study was intended to investigate the impact of blended learning on mid-proficiency participants, it was necessary to administer a placement test to make sure that the participants were homogenous. After the placement test, the 44 participants who were from the required level of proficiency were placed in two experimental and one control groups.

In one of the experimental groups, Blended Learning (BL), participants (N=15) received traditional teaching methods of the passive structure plus learning via the web. In the second experimental group, Web-based (WB), participants (N=15) received materials and instructions through the web. Finally, in the control group, Traditional, participants (N=14) were taught based on the traditional teaching methods of the passive structure and received the materials, instructions, and feedback through traditional methods in the classroom.

Instruments

In order to conduct the experiment and collect the required data, the following types of materials were employed:

The Solution Placement Test

In order to choose homogeneous participants and place them in the relevant groups, Solution Placement Test (Edwards, 2007) was used. It is essential to mention that the test has been designed to assess general knowledge of the key language as well as the receptive and productive skills and gives insight into what level language learners are. The test consists of three sections; the first part includes 50 multiple-choice items that assess learners' knowledge of key grammar and vocabulary from elementary to intermediate levels; the second part consists of 10 graded reading comprehension items, and the third section is a writing task which assesses learners' ability to produce the language. It should be noted that learners can be placed in different

proficiency levels based on the scores they receive and the placement criteria the test developer has identified.

A grammar pamphlet

In addition to Solution Placement Test, the participants were given a pamphlet which was taught during the course. The pamphlet was gathered from many books at intermediate level. The pamphlet contained several lessons explaining the target structure and providing plenty of lessons and exercises. In this pamphlet, different types of situations were presented to show where passive sentences can be used. For example, the passive voice was taught and presented in tenses, especially and other types of structures. It should be noted that all the experimental and control groups were required to study the pamphlet and do the exercises. For the Web-based and Blended Learning groups, the electronic version of the pamphlet was also uploaded so that they could access the materials and do the exercises.

A Weblog

Since an essential part of the course was online and participants had to send and receive their materials and assignments through the web, a weblog was designed. The content of this weblog was in correspondence with that of the course. In other words, all the participants in all the groups received the same amount of information. In fact, participants of the BL group, who also received instruction in the classroom, received the extra information and exercises through this page. In addition, they received their feedback through this page. Nevertheless, the page was more important for participants of the Web-based group. The students in this group also received all the material related to their course, including the pamphlet, exercises, and feedback through this weblog. In addition, participants were given an email address which they used in case there were any internet crashes or they wanted to get in touch with the instructor of the course.

Pretest and Posttest and delayed posttest

In order to make sure that participants were homogeneous in terms of their knowledge of the target structure, namely the passive structure, a pretest was administered. The test included 30 multiple-choice items, focusing on passives in different types of tenses and structures. It is essential to mention that the reliability and validity of the test had been checked before the study. In fact, in order to check the reliability of the test, it was given to a similar group of learners in a different institute and after checking the items and making sure that the test was reliable ($r=.81$), it was administered in the target samples. In addition, the test was given to two professional teacher to check the items and provide the researcher with suitable feedback.

In the last session of the study, the participants took a post-test, including 30 multiple-choice items to examine the efficiency of the instruction. It is imperative to mention that the post-test was the same as the pretest. However, the order of items was different. It was done because it was necessary to make a comparison between the performances of participants in the pretest and posttest.

In order to scrutinize the long-term effects of the instruction presented in the experiment and one week after the post-test, a delayed post-test was conducted. Like the pretest and the posttest, it was imperative to use the same test so that proper comparison could be made.

Procedure

At first, in order to select and place participants of the courses, the Solution Placement Test (Edwards, 2007) was administered. It should be noted that the validity and reliability of this test have already been established. That is, the test has been used to evaluate EFL/ESL learners' level of proficiency for years and in many countries with diverse first language backgrounds.

In order to do the experiment and implement the treatment, the following procedure was followed. First, the placement test was conducted with 75 Iranian EFL learners who voluntarily participated in the test and had mentioned that they were of mid proficiency levels. The participants of the study were EFL learners from a language institute in Isfahan.

From among the 75 EFL learners who participated in the placement test, 44 EFL learners were randomly placed in one control and two experimental groups. The participants of the control group received the materials and instruction in the classroom. They were given the course pamphlet at the beginning of the course. Each session, they covered one grammar point from the material along with exercises. In addition, they were given some extra materials exercises to do during the course. They were familiarized with the structure of passive and how to use it.

The treatment for the experimental groups was different. The participants of the Blended Learning group attended classes and received the pamphlet and instructions in the classroom similar to those of the control group. Nevertheless, unlike participants of the control group, they had to send their assignments and receive the instructor's feedback through the net and also download the extra materials and exercises through the class weblog. In addition, they could use email in order to get in touch with the instructor in case they faced any difficulty.

Participants of the Web-based group, who had the same specifications as the participants of the Control and Blended Learning groups, were required to do everything through the net. After taking the placement test and being placed in the relevant groups, participants of the Web-based group were given the instructions about what to do to during the course. Participants had to visit the weblog frequently and download the lessons, the course book, and the assignments. They were told to send their material to the researcher through an email which was given to them in the instructions. In addition, they were told to be in touch with the teacher by email and ask any question they had.

RESULTS AND DISCUSSION

Results of the Pretest

In order to examine the impact of blended learning, i.e., the independent variable, on Iranian EFL learners' acquisition and retention of passive sentences, the dependent variable, participants of

the study had to do several test during the course. The first test of the participants was considered to be the pretest. Table (1) presents the descriptive statistics of the pretest.

Table 1: Descriptive Statistics for the Pretest

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean	Min.	Max.
					Lower Bound	Upper Bound	
Web-based	15	7.20	1.74	.45	6.24	8.16	3.00
Blended	15	6.73	2.55	.66	5.32	8.14	2.00
Control	14	8.21	1.81	.48	7.17	9.26	5.00
Total	44	7.36	2.11	.32	6.72	8.01	2.00

In order to test the homogeneity of variances for the pretest scores, the Levene test was conducted. The results, as presented in Table (2) indicate that the difference was not significant and that the participants were quite homogeneous. This helped the researcher run the inferential statistics, i.e. one-way ANOVA to see whether there was a significant difference among the participants.

Table 2: One-way ANOVA for the Pretest

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	16.49	2	8.25	1.92	.16
Within Groups	175.69	41	4.29		
Total	192.18	43			

The results show that there was no statistically significant difference at $p > .05$ level among the three groups: $F_{(2, 43)} = 1.92$, $p = .16$. In other words, there was no statistically significant difference among the participants of the Blended group ($M = 6.73$, $SD = 2.55$), the Web Based group ($M = 7.20$, $SD = 1.74$), and the Control group ($M = 8.21$, $SD = 1.81$) in the pretest. The results ensured that any possible effects that happened during the experiment would be the result of the treatment.

Results of the Posttest

In order to examine the impact of blended learning, i.e., the independent variable, on Iranian EFL learners' acquisition and retention of passive sentences, the dependent variable, participants of the study had to take three tests during the course, namely pretest, posttest, and delayed posttest. Their second test was considered as the posttest. Table (3) presents the descriptive statistics concerning the posttest. The table shows information about each group in terms of the number, mean, and standard deviation, standard error of measurement, the minimum, and the maximum scores, respectively.

Table 3: Descriptive Statistics for the Posttest

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean	Min.	Max.
					Lower Bound	Upper Bound	
Web-based	15	17.40	3.92	1.01	15.23	19.57	10.00
Blended	15	21.47	4.47	1.15	18.99	23.94	15.00
Control	14	25.93	3.56	.95	23.87	27.99	19.00
Total	44	21.50	5.25	.79	19.90	23.10	10.00

Similarly, Levene's test of homogeneity was run to make sure that there was no significant difference among the participants of the posttest.

Table 4: One-way ANOVA for the Posttest

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	526.74	2	263.37	16.35	.000
Within Groups	660.26	41	16.10		
Total	1187.00	43			

As the results of the table above show, there was a statistically significant difference among the participants of the Blended Learning group ($M = 21.47$, $SD = 4.47$), Web-based group ($M = 17.40$, $SD = 3.92$) and Control group ($M = 25.93$, $SD = 3.56$). Nevertheless, in order to locate the difference among the control and experimental groups, the one-way ANOVA was followed by post-hoc tests.

Results of the Delayed Posttest

In order to examine the impact of blended learning, i.e., the independent variable, on Iranian EFL learners' retention of passive sentences, the dependent variable, participants of the study had to take a delayed posttest, which was their last test. Table (5) presents the descriptive statistics concerning the delayed posttest. The table shows information about each group in terms of the number, mean, and standard deviation, standard error of measurement, the minimum, and the maximum scores, respectively.

Table 5: Descriptive Statistics for the Delayed Posttest

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean	Min.	Max.
					Lower Bound	Upper Bound	
Web-based	15	16.80	3.73	.96	14.74	18.86	11.00
Blended	15	21.73	4.27	1.10	19.37	24.10	11.00
Control	14	25.50	3.44	.92	23.52	27.48	20.00
Total	44	21.25	5.19	.78	19.67	22.83	11.00

Similarly, Levene's test of homogeneity was run to make sure that there was no significant difference among the participants of the delayed posttest.

Table 6: One-way ANOVA for the Delayed Posttest

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	553.42	2	276.71	18.82	.000
Within Groups	602.83	41	14.70		
Total	1156.25	43			

As the results of the table above show, there was a statistically significant difference among the participants of the Blended Learning group ($M = 21.73$, $SD = 4.27$), Web-based group ($M = 16.80$, $SD = 3.73$) and Control group ($M = 25.50$, $SD = 3.44$). Nevertheless, in order to locate the difference among the control and experimental groups, the one-way ANOVA was followed by post-hoc tests.

Repeated Measurement

In order to examine the long-term effects of the treatment on the retention of passive structures, a repeated measures ANOVA was conducted. Table(7)presents the results.

Table 7: Descriptive Statistics for Repeated Measures

	Group	Mean	Std. Deviation	N
Pretest	Web-based	7.20	1.74	15
	Blended	6.73	2.55	15
	Control	8.21	1.81	14
	Total	7.36	2.11	44
Posttest	Web-based	17.40	3.92	15
	Blended	21.47	4.47	15
	Control	25.93	3.56	14
	Total	21.50	5.25	44
Delayed	Web-based	16.80	3.73	15
	Blended	21.73	4.27	15
	Control	25.50	3.44	14
	Total	21.25	5.19	44

Table 7 shows descriptive statistics of the participants' scores in experimental and control groups in the pretest, posttest, and delayed posttest). As the results of Table(7)show the mean scores of the control group in all the tests was higher than both experimental groups.

Table 8: Multivariate Tests

	Value	F	Hypothesis df	Error df	Sig.	Partial Squared	EtaNoncent. Parameter	Observed Power ^b
Pillai's trace	.96	432.39 ^a	2.00	40.00	.000	.96	864.77	1.00
Wilks' lambda	.04	432.39 ^a	2.00	40.00	.000	.96	864.77	1.00
Hotelling's trace	21.62	432.39 ^a	2.00	40.00	.000	.96	864.77	1.00
Roy's largest root	21.62	432.39 ^a	2.00	40.00	.000	.96	864.77	1.00

Table 8 shows the results of analysis of variance for the effects of passing the time on the scores. Then this hypothesis that passing the time does not effect on the Participant's scores is rejected at the level of confidence, 95%. Because the significance level of this test is lower than 0/05,p<0/05.It is concluded that participant's scores changed through passing the time. Based on the effect size of time variable, repeated measure specified 96% of participant's scores changes.

Discussion

Research Question One

The first research question states: "Does blended learning lead to the acquisition of passive structures among Iranian EFL learners?" As indicated in Chapter four, blended learning strategy used in the current study did not significantly affect students'achievement.However, in this study the control group significantly outperformed the experimental groups, as the results of statistical analyses indicated.

Of course it is imperative to mention that there are studies which have had positive results using the blended learning teaching methods. For example, Al-Zumor (2013) investigated the advantages and limitations of face-to-face language instruction and online language learning in the Blended Learning approach. The results indicated the positive effects of blended learning on students' reading opportunities and enriching their English vocabulary. Moreover, based on advantages demonstrated how Blended Learning provided an environment for more effective employment of indirect language learning strategies (Oxford, 1990). It showed that Blended Learning could enhance their writing, listening, grammar, pronunciation and speaking skills.

Similarly, Jia, Chen, Ding and Runa (2012) investigated vocabulary acquisition in a Blended learning class. They conducted surveys and interviews in order to demonstrate the positive effects of Blended learning on vocabulary acquisition. The result showed that students were more interested in this kind of class (Blended) than the traditional one. Blended learning could improve the students' performance in vocabulary acquisition. The results are in contrast to the ones in the present study in which participants of the Blended Learning group performed more poorly than the traditional group.

Keshta and Harb (2013) examined another study related to the effectiveness of Blended learning on developing English writing skills. They reached positive effects of Blended learning. Their findings showed that there was a statistically significant difference for the experimental groups. Their results showed that Blended Learning was quite effective in improving English writing.

Research Question Two

The second research question of the present study was intended to assess the effects of web-based learning on the acquisition of passive sentences among Iranian EFL learners. Online presentation of materials and instruction followed in this study did not impact the students' acquisition of passive structure. In other words, making EFL learners participate in online or exclusively virtual classes would not necessarily result in better performance. The difference between the means scores of the Web-based group and the control group was so salient. Thus, the proposed web based learning did not improve learners' acquisition the passive structure in English. In another study, Al-Jarf (2004) investigated the effects of web –based learning on struggling EFL college writers. The results of the study showed that using web-based instruction in online writing classes resulted in a significantly more effective performance than the one in traditional classroom instruction. Although web-based instruction has been considered to be an important factor in enhancing the writing quality, this has not been supported by the results of the present study.

Research Question Three

The third research question was aimed to examine whether there is a significant difference among the three teaching methods of passive structures (i.e., blended, web-based, and traditional). The results of post hoc tests indicated that the traditional teaching methods of writing as presented to the participants of the control group was more effective and the participants of this group significantly outperformed those of the Blended Learning and Web-based groups in terms of their acquisition of passive structures. Comparing the control and experimental groups, the results revealed a significant difference in this regard. However, a closer look at the results, i.e., the

means and the level of significance showed that participants of the control group had a better performance than those of the experimental groups.

The participants of the Blended Learning group had a slightly better performance than their counterparts in the Web-based group. Yusofa and Saadonb (2012) investigated the effects of web-based language learning on university students' grammar proficiency. Their study was intended to determine the effects of learning grammar, in three different English classes using three different methods of teaching, namely face-to-face method, blended method (traditional and web-based materials) and web-based learning method. The results indicated that for all the three modes, the pretest and posttest showed a significant difference. Thus, those three methods of instruction could improve students' performance in grammar. The findings of Yusofa and Saadonbs' study revealed that there were significant differences between the two groups in their knowledge of English grammar. The online grammar instruction contributed to students' achievement in their English course.

Research Question Four

Research question four was aimed to examine whether blended learning had any effect on long-term retention of passive structures among Iranian EFL learners. As indicated in Chapter four, the results of post hoc comparisons for the delayed posttest indicated that the participants of the traditional group significantly outperformed those of the Web-based and Blended Learning groups in terms of their long-term retention of passive structures. Therefore, blended learning did not have a significant effect on the retention of passive structures. The results of this study clearly revealed that after conducting the posttest, participants of the Blended group showed a negative performance in remembering the passive structure in future performances. It is essential to mention that there was no study to date to make any comparison for similar and different results.

Research Question Five

The fifth research question was asked to scrutinize whether web-based learning had any effects on long-term retention of passive sentences among Iranian EFL learners. The results showed that participants in this group had lower scores in terms of long term retention of passive sentences. The performance of this group in the delayed posttest was the same as that of the posttest and had a lower mean score.

Research Question Six

The last research question was aimed to ask which of the three methods of teaching grammar (i.e., blended, web-based, and traditional) had more lasting effects on long-term retention of passive structures among Iranian EFL learners. As indicated in Chapter Four, the results of the experiment showed that the Blended Learning group did not actually affect the retention of passive structures and that the control group showed a better result. The results showed that the traditional method of teaching grammar had more lasting effects on long-term retention of the passive structure.

CONCLUSION

A few conclusions could be drawn from the findings of this research that help English language teachers and learners in both public and private schools to have some insights about teaching and learning English grammar, especially passive structures. The results of this study indicated that the proposed blended learning method did not improve participants' acquisition and long-term retention of the target structure. Nevertheless, it should be mentioned that some students were quite satisfied with the proposed blended learning method in learning passive structure.

For all the three methods, it was found that the pretest, posttest and delayed posttest had a significant difference. Thus, these three methods of instruction can affect learners' performance in learning and producing grammar. The findings revealed that the integration method (blended) was not the best method to be used in the grammar class as it helped to improve participants' score. This finding gives the idea that teachers should encourage their students to use more of the internet and computer. This is because learners will enjoy using the benefits of technology in learning and can understand grammar lessons (e.g., the passive structure) more efficiently and easily. Blended Learning remains a relatively new concept at many English institutions; however, recent research appears to indicate that when "appropriately" implemented, blended learning can significantly improve the learning experience (Marsh, 2012).

The present study contributed to proving the effectiveness and impact of Blended Learning for EFL learners. Although for certain reasons Blended Learning did not have any significant effect on learning the passive structure, the positive effects shown by other studies cannot be ignored. In fact, in some other related research, the researchers consistently noted the clear advantages of this experience in learning skills and sub-skills. In this study, there were some limitations that need to be addressed and results of the study should be interpreted having these limitations in mind. Many problems can be related to the type of students who enroll in a blended learning class. The Blended classes were not suitable for every participant. Some students who did not have self-discipline and could have benefitted more in a face-to-face traditional class. In the web-based class there was a lack of spontaneous feedback and some students needed the interaction with teacher, so they failed to get good results. In the online part of the blended learning and web-based classes, participants had some problems sending their assignment and even observing the blog through the net, most of them did not have any email at first and took some time to make one. In addition, using the blog was somehow difficult for them, especially at the beginning of the study. This resulted in some problems for the teacher too. For example, sometimes they had to wait and it was quite time-consuming. Also, preparing the materials for the blended learning group was difficult and time-consuming. Participants in the online part needed to have verbal interaction. The researcher sometimes observed that students were eager to have face to face learning because of the emotional aspects of direct feedback. Students sometimes felt that they were given more work to do when on line materials were used. They often preferred the paper versions of the materials. Some of them were interested in going to the weblog but they did not like to type and send their assignment. This problem is related to their knowledge of the computer.

ABSTRACT

Learner centred communicative language teaching classrooms allow teachers to do a wide variety of researches in different contexts; the action researches and the classroom researches are synonymous in their process and outcome too; they may be adjudged as the wash back sequence of globalization; these pedagogical exercises with the teachers as facilitators and monitors depend more on the teachers' ability to observe and their invincible belief in remedial approaches towards deficient performances of the learners. The present article deliberates on the diagnostic test administered to the first year engineering students of Dr. M. G. R. Educational and Research Institute University in Chennai; it was administered immediately after their induction into the course i.e. in the month of September, 2014. It was administered subsequent to a pilot study which investigated the students as the members of different language groups struggling to learn English as second language against the lack of parental and societal cooperation and the different variables that are detrimental to the learning of English as second language; the diagnostic test was designed to assess the cognitive and communicative implications in the overall English language proficiency of the new comers. The feedback proved that the students had not sharpened their listening and speaking skills at the tertiary level and hence their lack of oral communication. Pondering over the feedback, and taking the clue from action researches carried on in the English as second language (ESL) and English as foreign language (EFL) classrooms across the world, the researcher planned for the action research; with supporting technology intervention and oral communication practices in the form of role plays, the action research looked for honing the oral communication skills of the students for effective inter personal and academic communication in English.

KEYWORDS: globalisation, wash back sequence, action research, diagnostic test, preponderant connective

INTRODUCTION

When the students get inducted into Dr. M.G.R. Educational and Research Institute University as new entrants in the professional course of their choice, the university takes responsibility to mould them as employable global citizens. As faculty of the university, the onus of developing the students' communicative skills with all its components squarely rests on the university English teacher. The prior knowledge about the students' language ability may show the direction for future course of action. As a first step, a pilot study was organised. It made use of a customised questionnaire (research instrument 1) to investigate the participants' personal factors such as age, and parental factors that usually influence second language learning at the early stages. The next step was to investigate the pattern of learning in the schools (medium of instruction and method of English learning), and then infer the socio political and cultural factors that might have influenced the students. The importance of English in the learner's perspective was to be ascertained. The analysis and findings suggested that the students have not honed their oral communication throughout their school education. So an action research was planned to hone the oral communication skills of the new entrants. On the basis of the findings of the pilot survey, the diagnostic test (research instrument 2) was designed with the purpose of reflecting how the students stood in relation to the attainment of the goals of the course in which they had got admitted on the basis of their knowledge acquired in the past. The findings helped the researcher to identify oral proficiency of the first year engineering students was not sufficient for the purpose of using English for inter personal and academic communication.

LITERATURE REVIEW

Test/assessment/ evaluation

Generally speaking, all classroom tests whether formal (paper and pencil tests: administered under controlled conditions) Hedge (2008) or informal (administered during classroom procedure) are formative in nature and they judge the students' level of performance on a specific task or unit in a syllabus during the course of learning. By and large all classroom tests are 'assessments for learning' because they give descriptive feedback to the students for self-realization and improvement in their academic performance; the teachers on their part can rely on these 'assessments for learning' to decide on required changes in the teaching learning process to achieve the desired outcome. In this view, classroom assessment has become an important medium that can support and enhance teaching learning (Shepard, 2000). The semester examinations at the end of a learning period, probably at the completion of the course itself are assessments of learning. They are summative in their function as they assess the learning outcome of a process as a product; they are usually considered separate entity. They categorise learners on certain criteria and offer least scope for learners' improvement. By way of their utility to sieve the learners for the next higher grade in the learning process, the present research considers them out of its purview.

The behaviourists consider classroom assessments and tests as cognitive strategies to focus on learner development (Linn & Gronlund, 2000). Linn and Gronlund (2000) posit that classroom assessments can address both the learning process and learning outcomes: these measurements can provide ways for teachers to know both the effectiveness of the process used to perform a

given task and the outcome of the performance. For Hedge, (2008) the classroom based assessments are “concerned with gathering useful information that the teacher can use to support student language learning” (p.384). Evaluation or assessment: used interchangeably (Nunan, 1991; O’Malley,1996) is exploratory to assess the learning outcome. In a teacher’s perspective, “A major reason for carrying out assessment and evaluation is to determine whether learners are progressing satisfactorily or not, and, if they are not, to diagnose the cause or causes and suggest remedies” (Nunan, 1991).The feedback from the assessments urge the teacher to be inquisitive about the possible methodologies and learning strategies in language learning for the benefit of the learners and help her to provide the less proficient students with constructive guidance for improvisation.

While discussing the syllabus based diagnostic achievement test for ESP (English for specific purpose) students, Bachman and Palmer (1996) suggest the diagnostic achievement test- other way of expressing ‘assessment for learning’, “should make it relatively easy for the test takers to perform at their best”(p.294). The types of feedback that the test takers receive enlighten them about their test performance quite directly. So the test developers and users should make the feedback relevant, complete, and meaningful to the test taker. While the scores to be appropriate to the demands of questions on the test taker, the verbal descriptions could be used to interpret the test scores, and personalised debriefing by the test administrator with the test taker could develop a positive affective response toward the test by the latter. Bachman and Palmer add that the feedback should be impartial and fair to regard the test taker as per se. The feedback could help a teacher to be decisive whether to continue the present instructional strategies or to bring a change in them. “... all those activities undertaken by teachers, and by their students in assessing themselves will provide information to be used as feedback to modify the teaching and learning activities in which they are engaged” (Black and William,1998, p. 2).

Diagnostic test

Though the assessment tests can be diagnostic by their outcome, the diagnostic tests per se, a category on their own, enjoy a special significance in the teaching learning process. Unlike the assessments of learning, a diagnostic test is administered at the beginning of a course to assess the actual language ability of the students and to design a methodology by which the students can be facilitated to learn the target language. Before starting a diagnostic procedure, the teachers need to understand the teaching beliefs and the appropriate teaching practices used in similar classes; such attitude and fine observation, could help teachers to design and administer the test to the beginners. The teacher like a physician uses the test instruments to obtain scientific and definite proof for better diagnosis and the remedial measure thereafter. Therefore, a diagnostic test may be defined as the test which can provide a detailed picture of strengths and weaknesses in the learners’ relevant area of learning. For Bachman and Palmer (1996) “diagnosis involves identifying specific areas of strength or weakness in language ability so as to assign students to specific courses or learning activities” (ibid: p. 98). A diagnostic test can plug the gaps in students’ learning. Nevertheless, it should be in congruence with the objectives of the tests designed and administered in similar EFL and ESL contexts.

Diagnostic feedback

Diagnostic feedback is quite valuable to both the teacher and learner; Black and William (1998) opine that descriptive diagnostic feedback could improve the learning outcome. It helps the teacher to identify slow learners, less proficient and also the cause for the problem; to identify the specific areas of remediation; while accelerating the process of learning it can make the learning process effective and customised to the learner need. The learner is relieved of his test and new course anxieties and sets himself to get adjusted to the learning of new syllabus and a new environment. Though the method of learning and the syllabus of the content they learnt till then are not necessarily the focus of the teacher, a diagnostic test presumes that the students had the opportunity to learn what can be considered the requisites to continue the present learning and hence it perfectly synchronises with the notion of Brumfit and Roberts (1983) about diagnostic test: “right at the beginning of a new course and its content designed to reflect the goals of the course, so that one would then know how students stood in relation to attainment of those goals on the basis of knowledge acquired in the past” (p.126). Furthermore the diagnostic test must be customised for the purpose of identifying the present proficiency level of the students in terms of what they have learnt in the past and what they stand to learn in the future (Ur, 1991).

Certain diagnostic assessments are specifically designed for providing diagnostic feedback (Alderson, 2005; Gorin, 2007). Therefore, in the present context of professional education in a university, the students’ language ability to handle interpersonal communication and academic language performance must be assessed. The diagnostic test customised for the purpose must include cognitive tasks and communicative tasks suited for diagnosing learners’ strengths and weaknesses in the language skills. Such a diagnostic test requires a systematic design framework involving multiple steps (Davidson & Lynch, 2002; Mislevy, Steinberg, & Almond, 2003; Pellegrino, Chudowsky, & Glaser, 2001). Bachman and Palmer have pointed out the benefits of diagnostic feedback for the researchers in second language learning context. Bachman and Palmer suggest that the test scores can be used to describe levels or profiles of language ability for a variety of research purposes. The language tests that the researchers design may shed light on the test taker’s language knowledge and language ability including the effects of their characteristics and that of language tasks on language test performance, and the relationships among tests of different areas of language ability.

Alderson (2005) opines that a diagnostic test should be more exposing test takers’ weaknesses than strengths. Effective diagnostic feedback is not only his concern but also that of Black and William, (1998) and Zhao, (2013). Zhao (2013) enumerates a number of empirical studies on diagnostic language tests. According to her recording, the diagnostic test administered by Sewell (2004) to a number of adult learners in UK provided feedback on their language skills and abilities. It employed multiple choices and open writing tasks. The result was that the learners benefited by the comprehensive diagnostic feedback on their strengths and weaknesses as language learners. Surely, the observations made by Zhao are fit to be considered a bird’s eye view opinion about the existing diagnostic tests and their validity in assessment in general; a diagnostic test needs to be reliable and valid lest it cannot be a decision making and preponderant connective in an action research.

Reliability and validity

It is widely believed that the available literature on language testing do not offer the required guidance to teachers about the content and conduct of diagnostic tests and also the measures to make them reliable and valid. Generally, a test can be a reliable device “if it is so constructed that performances on it are not random, but are procured in a systematic way through the interaction of the test with the knowledge and ability of the individuals tested, so that if the test were repeated, the results should still place the candidates in the same rank order” (Brumfit & Roberts 1983). They further add that the teachers should eliminate ambiguous phrasing of questions and should check for the appropriate scoring for the question in view of their demand on the test user. In short, reliability refers to the consistency of the assessment procedure; better still to the score consistency (AERA, 1999; Brown & Hudson, 2002; Henning, 1987; Sari Luoma, 2004) considers “reliability is important because it means that the scores are dependable so that we (teachers) can rely on them for decision making”.

As for validity, it refers to the purpose of the test and to see whether the purpose is achieved or not. A test should have ‘face validity’- that it tests the knowledge already exists with the candidate or “the situations in which the language was subsequently to be used; the test should show ‘content validity’ that it relates to the task for which proficiency is required; the test may be said to have ‘concurrent validity’ if its result is in concurrence with similar tests on the candidates placed on the same proficiency level; lastly if the test is constructed in such a way as to reflect current thinking on the aims of language teaching and the nature of language learning, it may be said to have construct validity (Brumfit & Roberts 1983; Savignon 1987). In short, they profess integrative or global language tests which are updated to the current thinking and criterion referenced to the communicative needs of the real world can be appropriate diagnostic tests. They add communication needs a working together of linguistic skills and other skills that are part of communicative skills. As such the construct validity of the diagnostic tests can be guided by the objectives of the learning process and its context.

Appropriateness of the customised diagnostic test

The orthodoxy of communicative language teaching believes learners are to be active participants in a teaching learning process as such they need to be active test takers too. Of late the communicative language classes have recognised the discrete language skills, such as grammar and vocabulary as essential components of oral communication to depict mastery over the language in the context of globalization. Bachman and Palmer believe that for language testing purposes teachers must consider the test takers’ language ability within the interactional framework of language use. The language ability involves two components: language competence or language knowledge and strategic competence or metacognitive strategies. The test developed may permit these components to interact within the frame work of language use in a given test task which demands the use of appropriate vocabulary and grammar. According to Larsen Freeman (2003), the exponent of linguistic heuristic principle, language exists through form, meaning and use. “As our principle tells us, with the difference of form comes a difference in meaning”(p. 44). As per her ‘challenge principle’, “It is impossible to separate form from meaning, meaning from use” (p. 45) Though it is possible to focus on any one of these dimensions in classroom for pedagogical reasons, it is true that classroom assessment based on

cognitive and constructive views of learning can provide both students and teachers with understandable information in a form to improve performance. . However, Bachman and Palmer suggest that the test scores can be used to describe levels or profiles of language ability for a variety of research purposes. The diagnostic test being a research instrument to assess the strengths and weaknesses of the engineering students to learn the academic language the cognitive and communicative aspects of language learning were part of its constructs and hence it had the construct validity.

RESEARCH QUESTIONS

The Research questions addressed were as follows:

1. What is the participants' overall proficiency in English as second language?
2. Is it true that the new entrant students lack oral proficiency as they have informed in the questionnaire?
3. How can the students be facilitated to hone the required oral communication skills to meet the demands of the professional education?

METHODOLOGY

The diagnostic test spoken here was the sequence of the pilot study undertaken by the present researcher as a preliminary step to the 'Action Research to Hone Oral Communication Skills of Engineering Students' in Dr. M.G.R. Educational and Research Institute University in Chennai "The first step in a teaching process, is the collection of information about learners in order to diagnose the objective needs of the students (Richterich,1972), and it is more so with the action research. Action research is not exploratory in nature rather it is the process of posing the problem and identifying a solution which will give scope for exploring our teaching beliefs. "It is a cyclical process that follows a series of repeated steps like setting a goal, planning an action, to reach this goal, acting on this plan, observing the action, reflecting on the observation and setting the next goal"(Gebhard,1999 p.63). As such the research methodology has included a questionnaire to investigate the interrelationship between the various components of L1 and L2 language proficiency. The pilot study made use of a customised questionnaire (research instrument 1) to investigate the participants' personal factors such as age, and parental factors that usually influence language learning at the early stages and which act as affective filters in Second Language Learning. The next step was to investigate the pattern of learning in the schools (medium of instruction and method of English learning), and then infer the socio political and cultural factors that might have influenced the students. The importance of English in the learner's perspective was to be ascertained. It was a survey research because it was conducted by using questionnaires to collect the data, thoughts and feelings of participants. The descriptive survey method was adopted to scrutinise the responses and explain them" (Rajeswaran, 2015).

The appropriate objective inferences and findings from the pilot study guided the researcher to design a diagnostic test to identify the present proficiency level of the students in terms of what they have learnt in the past and in relation to the demands of the engineering course in which they

have been inducted and most importantly to ascertain the specific area of weakness in their learning and the mode of remediation to rectify it.

Participants

The research was conducted in the undergraduate engineering programme of Dr. M.G.R. Educational and Research Institute University in Chennai. The participants were sixty five in number. They were from the different states of India and hence heterogeneous by virtue of their mother tongue, culture and tradition. They got admitted to the university after passing plus2 public examinations in Science, Mathematics, and English as second language.

Measuring conceptual skills through diagnostic Test

A diagnostic test was given in the course of the week after the students' induction into the course. The test investigated the class of sixty five to find if there were marked differences in the students' listening, speaking, reading and writing abilities. Though diagnostic tests should not be restricted into time limit, one hour and forty minutes was available for the purpose. It had the following components:

Sl. No.	TASKS	TESTED SKILLS	Marks
1	Dictation	L, W, C	5
2	Expanding the nominal compounds	L, W, C	5
3	Listening comprehension/Recalling the gist of an academic lecture:	L, W, C	5
4	Using a proverb in a context and presenting the write up orally	W, S, C	5+5=10

Each task was allotted five marks, explaining a proverb task was to be written and presented orally; it was allotted ten marks: writing: 5 marks; oral presentation: 5 marks; and hence the total assessment was for twenty five marks.

RESULTS AND DISCUSSION

Dictation

A dictation test, the oldest form of listening and writing assessment was given to ascertain the cognitive ability of the participants to comprehend the English speech sounds and encode them by letters remembering spelling rules like silent letters, doubling of the consonants, the micro techniques, etc.,. Five words of scientific terms were dictated. Fifty six students could write correct spellings, the remaining nine did not write all the words correctly.

Expanding nominal compounds

To expand nominal compounds one should use appropriate prepositions with an innate common sense to mean the particular object referred to. While expanding them, the use of prepositions will vary depending upon the object and its function in the context. Thirty five students could expand the nominal compounds with appropriate prepositions; eleven students made few mistakes; nineteen students used confused sort of prepositions or no prepositions at all.

Listening comprehension

The students were to be assessed for their ability to listen, recall and write. At the beginning of the diagnostic test, a CD containing a lecture on 'Barriers to Listening' was played (Dutt, K. et al. 2008) and the students were advised to listen carefully to the lecture and take note in order that they could recall the lecture to answer the question asked. Only thirty students could take notes in phrases and write in the chronological order while the rest were not able to take notes and their comprehending ability was too poor to recollect that they remembered only at random.

Using a proverb in a context

Cultures are as different as languages themselves; it is true that many situations are common and universal in any language. So the exercise on proverb was included in the test. As proverbs are intricately intertwined with the common situations in a culture the researcher wanted to ascertain the students' ability to use a proverb of their choice in a context and write the same in a paragraph. The exercise on proverb was given to check not only their rote learning ability but to assess their ability to find the association of such proverbs in their own life and culture that they try to express their meaning in English. It was to check the test takers' retention ability for a long time (long time memory) whether they could recollect a common proverb and use it in the context; whether they were able to write a few grammatically correct sentences in a cohesive order and present the same orally.

The learners orally presented their write-ups. The following may give some idea of the rubrics for assessment.

Table 1: Holistic scoring rubric

Rating	Description
5	Speaks fluently-uses appropriate vocabulary and structure
4	Less fluent- with occasional errors in vocabulary and grammar
3	Speaks with difficulty- has vocabulary- no coherence
2	Speaks in single word utterance- searching for phrases and words
1	Lacks content - keeps silent- looks for prompts-no words- no grammar

The quantitative comments appearing in the form of 1,2,3,4, 5 in each column are indicative of student's oral proficiency in English: 1&2 – below the mark 3- fair 4- good 5 excellent. Further, it is a common assumption that lexical phrases or lexical chunks comprise a considerable part of a person's total vocabulary; probably a native speaker will know thousands of them easily. In a non- native speaker and ESL context though such expectations will not hold, the researcher expected a reasonable output since the proverbs are multiple word units that can easily be retained, recalled, interpreted and used in appropriate context. But, the performance of the students both written and oral showed poor grammar, lack of vocabulary, and poor content comprehension; fluency, cohesion and coherence were relegated to insignificance. Yet, although nine students professed to be fluent in English, they could not give a satisfactory oral performance.

Table 2: The number of students and the components that they lacked

components	grammar	vocabulary	content	coherence	fluency
No. of students	35	30	56	56	56

Discussion

As for dictation, the feedback could underpin the reason for poor performance of the nine students as they were from vernacular medium instruction at school. They were not able to comprehend the pronunciation of the words; their listening skill needed practice; moreover, probably test anxiety could have been a barrier that did not permit them to listen to properly. Attaining better pronunciation habits is intimately linked with listening process. Listening instructions at both beginning and intermediate levels of second language proficiency, greatly enhances the language learning potentials of ESL students (Dunkel, 1986; Krashen & Terrel, 1983). Stevick (1976) wrote that in teaching of pronunciation all too often, self-consciousness leads to tension, tension leads to poor performance, poor performance leads to frustration, frustration leads to added tension, and so on around a downward spiral (p.146).

As for listening comprehension, 'Recalling the gist of an academic lecture' it was clear that listening to authentic audio CDs was new to the students. They have not groomed their listening skills to comprehend the spoken language and that too on the audio player. In the communicative approach, honing listening and speaking skills is the most important; they are the primary skills which are receptive and productive in their functions respectively. Listening is an active process of gathering the information passed on as input and the speech production is a multilevel interactive process of meaning creation. Proponents of comprehension approaches recognise the importance of listening in language comprehension, retention of information in memory and acquisition of second language competence. ESL methodologists argue that L2 pronunciation practice needs to be linked with the listening process. With better listening habits, Stevick (1976) assured better recognition of pronunciation for an anxiety free EFL learning. A view of listening comprehension describes comprehension of a speaker's message as the internal reproduction of that message in the listener's mind. So that successful listening produces the meaning much as the speaker intended (Clark & Clark, 1977).

As for expanding nominal compounds, the result that nineteen out of sixty five students used confused sort of prepositions or no prepositions at all showed the students' poor grammar skill and lack of vocabulary knowledge. It proved what Haynes (1993) said about students: they (students) "sometimes made an incorrect guess about what an unknown word meant in a text, and then stuck with that meaning even though it made no sense in the context". Morphology deals with affixes and their derivational effects. Laufer (1997) opines that as long as the derivational affixes are transparent identifying their meaning is easy; if they are not, the meaning is not clear. The researcher has identified the same problem with the noun affixes (nouns affixed before another noun) in the nominal compounds. While expanding them, the use of prepositions will vary depending upon the object and its function in the context. While talking about teaching pragmatically appropriate choices to the students, Freeman (2003) says, "At best all that we can do is call our students' attention to the norms of linguistic usage. ...we can, however, help our

students to become sensitive to differences among forms in general as a way to make them aware of the possible implications of their choice” (p.61). The nominal compounds did not pose much of a problem for many students and it elated the researcher to find that the students had an aptitude oriented towards technology to infer and interpret the meanings.

As for using a proverb in a context, the exercise on proverb was given to check not only their rote learning ability but to assess their ability to find the association of such proverbs in their own life and culture that they try to express their meaning in English. Cultures are as different as languages themselves; it is true that many situations are common and universal in any language. “Proverbs often, have equivalents across languages” (Schmitt, 2008, p.100). So it was assumed that the students will find it an easy exercise. However, the written and oral performance of the students showed poor grammar, lack of vocabulary, and poor content comprehension; fluency, cohesion and coherence were relegated to insignificance. Although nine students professed to be fluent in English, they could not give a satisfactory oral performance.

While defining multiword units which comprise phrasal verbs, idioms and proverbs Schmitt says this kind of lexical phrases are common in a language to have functional utility, as such they facilitate clear, relevant and concise language use. They are important for pragmatic competence and communication in general that such lexical phrases are stored in human brain as a single unit of information in order to speed up the processing and use of language. Quoting John Sinclair, Schmitt continues lexical patterning allow variable expressions to have a syntagmatic structure. In this view, lexis and grammar “are combined into a single lexicogrammatical force” (p.113).

The fact that many students could not remember proverbs and find their relevance in some context has confirmed that their rote learning in schools was not conducive for lexical chunking to facilitate multiple storage in the mental lexicon. So, now it is the turn of the university teacher to familiarise the learners with lexical phrases advocating a focus on inducing lexical patterns from language input and also to concentrate on larger lexical phrases rather than individual words. This will help them to learn “the idea of lexical cohesion which is thinking about vocabulary not as discrete words but as interrelated members of cohesive discourse” (p.113); this kind of notion will be useful for students to organise ideas in academic writing and in oral discourses.

As for the assessment of students’ oral performance the components for the evaluation included content, language and delivery. The criteria need not be rigid but may accommodate the proficiency level of the class and the instructional goal (Gonzalez Pino, 1988). In a large class of students speaking different languages and no way near the zone of proximal development, pronunciation and accuracy were not stressed. Pronunciation is of least importance, only intelligibility is necessary in the non-native speaker to non-native speaker interaction context (Patil, 2007). Negotiation of meaning between non-native speaker students of English of different linguistic background stresses the importance of the co-operative nature of lingua franca communication. Since English is the lingua franca within the university campus and outside it, the non-native hybrid English is accepted as long as it is intelligible and comprehensible. The overall interpretation of the oral delivery was that the students were not fluent in speaking in

English. They were least motivated and were anxiety ridden that they were not ready to speak in English in front of their teacher and peers.

The assessment involved a detailed investigation method of scoring oral L2 performance and the interrelationship with the delivery of the content. This type of assessment gave insight into the overall weakness in their language learning. The pattern of their narrating had inflectional errors. Struggling to read what they themselves had written in English, for the reason that they were not sure of their sentence structure and their own handwriting was not helpful for reading in public under the pressure of language anxiety; hence their oral presentation was poor. Many of them used their mother tongue to explain and looked for prompting, which indicated that their vocabulary repertoire was not adequate to help their communication. It was observed that the students could write in English and they were not anxiety ridden to write but to speak in English. The most obvious problem in their learning was not having appropriate cognitive and metacognitive skills to sustain oral communication. The diagnostic test confirmed participants lacked oral communication.

Why role plays to enhance communication skills?

The literature available on various language learning strategies extrapolate that within the communicative approach, role plays can help the students to realise their communication goal. Though they are not cognitively demanding they give opportunity for the learners to use their cognitive and metacognitive skills to handle the language with confidence; they also help the students to shed off their inhibitions and language anxiety as the latter practice real world activities and academic functions.

Role plays can be used to express any content depending on the students' knowledge gained either from incidental reading or listening to teacher's introduction on certain topics for discussion or the situation for which the dialogues are created. The activity gives the students practice to think and speak without the strain of memorising. Role plays introduce the students to the socio cultural variations in speech acts, pragmatic aspect of the language such as requests and complaining, and discourse competence of coherence and cohesion. Students learn to understand the situation and appropriate linguistic choices made in the dialogue; at certain contexts teacher's introduction of prototypical phrases are also helpful.

It was decided that the students could present scripted role plays because as they wrote they could find the grammatical errors and rewrite taking the help of the teacher. The scripted role plays will help the teacher monitor the activity and the dialogues would not go out of her control (Alden, 1999). It was also identified that technology aided practices such as viewing authentic video would circumvent the tedious process of modelling and would inspire self-confidence (Terrell, 1993), and repeated watching and listening to the videoed drama, soap opera etc., could help the students to reflect and improve their language ability. Weyers (1999) proved that the increase in the quantity and quality of input provided by the authentic video would result in enhanced oral production of the second language learners.

Anne Lazaraton (2001) feels EFL teachers who teach a heterogeneous (by native language and ethnicity) class of learners in non- English speaking environment, against the odds of large classes which deny them freedom to throw opportunity to provide feedback to the learners, also equally lack the motivation and opportunity to talk. So she suggests, “EFL teachers need to be particularly adept at organising class activities that are authentic, motivating, and varied. The use of authentic, engaging materials should be the basis for in class activities. If the necessary technology is available, showing movies, or recorded television programs and playing audio tapes of programs can be enjoyable for students and can provide them with authentic practice in listening to native speakers’ speech”(p.110).

Recording their pair performance of role plays will help them to identify their errors in role play performance and rectify them in repeated performance till they were satisfied of their performance. The process oriented approach with in the frame work of constructivist theories of language acquisition, self-observation and reflection help the learners to evaluate their L2speaking performance and adopt appropriate learning strategy to enhance the same (Castaneda & Gonzalez, 2011); task repetition (repeated role play performances) will direct learner attention and focus on form (Hawkes, 2010), which is essential for handling academic language. Bygate (1996) opines improved performance in a repeat task will enhance students’ grammar skills and lexis.

Gaining experience in oral communication by performing role plays as participants, the students can manage any situation demanding communication in English within the university and in the real world outside the university. “Role play is a classroom activity which gives the student the opportunity to practice the language, the aspects of role behaviour, and the actual roles he may need outside the classroom” (Livingstone, 1983, p.6). The interactive classes and the students’ participation in role play activities will help the students to hone their oral communication skills. As they shed off their fear and shyness, their confidence level increases (Saint Leger 2009), they will come to realise the recent global demand for people with communication skills in English. Indians, particularly students have come to realise the vanity of denying English its rightful place in academic and official language functions. This social awakening can definitely lead the enlightened engineering students to enhance their oral communication skills.

CONCLUSION

In the context of teaching the first year engineering students who are in the age group of seventeen years to twenty years the present research identifies them as young adults. The literatures pertaining to the adult learners consider them as ‘self- directed learners’ (Hills & Sutton (2001). Wenden (2002) says Self –directed language learners (SDLL) choose their learning strategies in accordance to their needs and beliefs; those who believe in learning language opt for cognitive strategies like memorization, rote learning and intensive reading to familiarise with vocabulary and structural aspects of the target language; but those whose priority is using the language pay more attention to communicative strategies. Holec (1981: p.16) says that a self-directed adult learner, adjusts his learning rhythm to his acquisition rhythm as he monitors the process of his learning which is aimed at certain specific outcome. Ultimately, the

learner evaluates at the end of a learning project to check whether the selected means of learning contributed to the desired objective.

Brown et al (1983) and Naiman et al (1978) have documented elaborately the use of learning strategies by young children, adolescents and adults to shed light on the effective learning strategies that could provide teachers guidance in improving the learning skills of low proficient language learners. As adult learners the engineering students analysed the diagnostic test feedback themselves to recognise their weakness in oral communication. They could underpin the gap between their language ability and the actual requirement in the context of studying a professional course. In such a context introducing them to a communication enhancing strategy like technology integrated role play activities will help them gain language attainment by taking an active part in actual communication. By practicing role plays they will learn interpersonal communication and academic language function for professional lineage.

It is worth mentioning the opinion of Dornyei (1995) on teaching communication strategies (CS). He says “raising learner awareness about the nature and communicative potential of CSs, encouraging students to be willing to take risks and use CSs, providing L2 (second language) models of the use of certain CSs And providing opportunities for practice in CS use will provide them a sense of security in the L2 by allowing them room to manoeuvre in times of difficulty...learners may decide to try and remain in the conversation and achieve their communicative goal. Providing learners help towards accomplishing this is, I believe, a worthy objective of communicative language instruction” (ibid.: pp. 80).

Scope and limitations of the study

In view of the findings and their usefulness in planning and designing further course of the action research, the researcher feels such customised diagnostic tests may be conducted for the benefit of student community. However, it is true that the pilot study and the diagnostic test were limited to a limited number of first year B.Tech. students of Dr. M.G.R. Educational and Research Institute University in Chennai.

Barriers to Listening (CD)

I'm sure all of you have come across people who are poor listeners and also some who are good listeners. If the person you are talking to is not listening to you actively, you do not feel encouraged to continue the conversation any further. So, it's important that you listen attentively to the person who is talking to you. This is very important when you are a student or when you are at work. To be an active listener, you must do several things.

First, look into the eyes of the person talking to you. Yes, make eye contact with that person. We communicate more through our eyes than through spoken words. That is why you find it difficult to communicate with a person who is wearing dark glasses because you miss the communication through the eyes.

Listening is not a passive activity. You communicate through gestures and facial expression. Such non-verbal communication can be helpful to the speaker. A stony, expressionless face can be very discouraging to the speaker. So, to be an active listener, learn to communicate through, gestures and facial expressions. If you're surprised, show surprise. If you're happy, smile. If you do not agree with what the other person says, signal your disagreement.

Thirdly, you must show your enthusiasm for what the speaker is saying. Your posture communicates your enthusiasm. If you sit back relaxed, you show disinterest. If you're an active listener, you should sit leaning forward and not backward. Finally, learn to respond to the speaker's words. Use responses such as ...mm..., ok, all right, perhaps, certainly, no, not at all, yes, very well, etc. Such responses help the speaker to understand whether you are with him or her.

The first thing to remember is that nobody is born a poor listener. There are many factors that lead to poor listening. The first reason for poor listening could be that the listener is not interested in the subject or the topic being discussed. In such cases, the listener does not make an effort to listen to and understand the content. As a result, he or she does not understand what the speaker is talking about. If you're not interested in history, you may not listen attentively to lectures on history.

Some listeners are partial listeners. They do not listen fully to the speaker's words. Again, this results in inadequate understanding. So, the second factor may be partial listening.

Some speakers speak very fast. Have you had an occasion when you found it difficult to understand someone because he or she was speaking too fast? That's the third factor – fast pace of delivery by the speaker. After listening to the speaker for a while, if you realize that you are not able to cope with the pace, you give up and stop listening. This can happen in classroom lectures. So, remember to speak at a pace at which the listener is comfortable.

Let's now talk about a fourth factor. What do you do when you do not understand what the speaker says? If you remain quiet or pretend that you have understood, you are making a mistake. Your failure to ask for clarifications can cause inadequate comprehension. It's interesting to learn why people don't ask for repetitions or clarifications. Some are shy, so they don't ask questions. Some do not have the chance to ask for a repetition because the speaker speaks continuously. Some do not ask questions or voice their doubts because they are unsure of their language competence. In all these cases, the listener stands to lose. So, do not make the mistake of not asking questions or seeking clarification.

Let me now talk about a fifth barrier to listening. Sometimes, the physical environment around you can make listening difficult. If there is too much external noise it can affect listening. Listen to this person who is standing in the middle of the street and is struggling to listen to the speaker.

A : I can barely hear you.

B : What I want you to do is ...

C : I can't hear you. I 'll call you back in 20 minutes.

You experience similar difficulty when there is loud music or loud noise from a machine.

Lastly, you can be a poor listener if you are engaged in other activities while listening to someone. You would have seen people doing other things while talking on the phone. Some continue reading the mail on the

computer, while some others continue watching television while talking to someone on the phone. In both cases, their attention is divided between the two activities they are involved in. This hampers their listening. Listen to a conversation where a man is working on the computer and listening to someone on the phone.

A : We should be able to deliver the goods on time as long as you assure us of payments on time.

B : Yes, yes.

A : Excellent. I will see that the goods are delivered today. Can I assume that your cheque will reach us in a week?

B : Yes. No, no, no. What did you say?

Let me sum up what we have discussed so far. To be good listener, you must do five things. Firstly, show interest in what the speaker is talking about. Secondly, listen fully, not partially. Partial listening leads to partial understanding. Thirdly, ask for clarifications. If you have not understood the speaker because he's too fast or because of any other reason, do not hesitate to ask for repetition or further explanation. Fourthly, avoid speaking or listening in a noisy environment. Finally, avoid doing something else while you're speaking to someone. If your attention is divided, it will hamper your listening severely.

Answer the following question: How can you be a good listener?

4. Explain a proverb in a context and present your write-up orally. (10)

EXPLORING CONTRIBUTIONS OF REFLECTIVE DISCUSSIONS TO EFL PRE-SERVICE TEACHERS' PROFESSIONAL IDENTITY

Reza Biria

Assistant Professor, Islamic Azad University, Isfahan (Khorasgan)

Fariba Haghighi Irani

Ph.D Candidate in TEFL, Islamic Azad University, Isfahan (Khorasgan)

ABSTRACT

Teachers' professional identity formation is one of the most significant aspects of teacher education program. Research suggests that teacher identity construction can be enhanced in different ways. One such way is conducting reflective discussions in teacher education programs to help teachers to teach thoughtfully and professionally. Due to the lack of extensive research in this particular area in the context of Iran, this study is intended to explore how incorporating reflective discussions into pre-service teacher education programs can help to develop student teachers' professional identity. Following this, ten Iranian student teachers (three males and seven females) attended a training program at a higher education institute in Tehran for 240 hours, five hours per week. After observing each sample teaching, either done by their peers or shown in video clips, the participants critically analyzed and discussed different aspects of the teachers' performance. The student teachers participated in an interview and wrote two reflective journals, at the end of each phase of the program, focusing on their teaching beliefs and identities. In addition to the recorded discussions and reflective journals, the teacher educator conducted a focus group session where the student teachers shared their ideas about the training program. The content analysis of the data supported the idea that reflective discussions affect the growth of pre-service teachers' professional identity. Finally, a cyclical model for conducting a systematic reflective discussion in teacher training programs is provided. Teacher educators and teacher education curriculum developers benefit from the findings in developing appropriate activities for teacher training courses and encouraging pre-service teachers in shaping their teacher identity.

KEYWORDS: *Reflective discussions, Professional identity, Teacher Training Course (TTC), Teacher identity construction, EFL pre-service teachers*

INTRODUCTION

The significance of contributing different techniques to teacher training courses (TTC) and enhancing language teachers' self-confidence to construct their role as a teacher has been discussed in various ways in the field of teacher education program (Cole & Knowles, 2000; Gee, 2000; Cattley, 2007; Maclean & white, 2007; Townsend & Bates, 2007; Trent, 2010; Ghasedi, 2013). However, the need for closer attention and more exploration on the process of the

transition from student teacher to teacher has been emphasized (Izadinia, 2013). Teacher educators like Walkington (2005) advise dedicating sufficient time to empower the ability of decision-making and judgment in pre-service teachers to encourage the teacher identity formation in teacher training courses. They believe that the process of identification and personification of the teacher's professional role is a complex phenomenon which grows by active participation in tasks like talking about their beliefs and ideas to develop the ability to judge the strength and weaknesses of their own and their peers' performance. Incorporating variety of reflective activities such as autobiographical stories, reflective journals, autoethnographic narratives, reading group forum to teacher education courses (Estola, 2003; Webb, 2005; Cattley, 2007; Maclean & White, 2007; Vavrus, 2009; Sutherland *et al*, 2010) reveals the significant role of reflective practices in the formation of teacher identity, as it is widely regarded they increase the teachers' self-confidence and empower their judgment ability. To shape a sense of self-awareness, beginner teachers need to professionally think themselves as teachers through a series of continually practicing activities during pre-service training career. Observations, role plays, readings, and performances would not be effective only through performing, knowing, and reading about teaching techniques (Wenger, 1998). Moreover, simply recording the classroom events can be misleading (Tomlinson, 2013).

While there have been plenty of reports on the studies of teachers' identity formation, implementing a systematic model for reflective discussions as part of the teacher training course materials has been lacking. Additionally, studies seldom have discussed on using appropriate pedagogical tools or specific activities leading to the emergence of teachers' professional identity in TTC programs. Further, the literature suggests that research on identity formation is absent in underdeveloped and developing countries (Izadinia, 2013) to the extent that it is called to a particular attention of researchers to focus on student teachers' identity in other contexts including Iran.

The present research aims to discover how Iranian pre-service teachers' professional identity is constructed through incorporating reflective discussions into the TTC program. Then, it will answer the question of what other particular activities can influence such a process and the implications of the findings on student teachers, teacher educators, and teacher education curriculum and materials developers will be discussed.

LITERATURE REVIEW

Professional identity construction

Becoming a teacher requires the development of a professional identity and the construction of a special kind of self-image (Feiman-Neimser, 2000, in Wanzare, 2007) involving the transition from pre-service to in-service training in the profession of teaching (Wanzare, 2007, p. 343). While teacher's professional identity has been interpreted in multiple ways (Bijaard *et al.*, 2004; Cattley, 2007; Sutherland, Howard, & Markauskaite, 2010), it has been commonly defined as a continual and complex process (Cattley, 2007; Maclean & White, 2007; Izadinia, 2013) that is developed during the training career and grows under the influence of a variety of internal and external variables including social (e.g. context), affective (e.g. attitude), and cognitive (e.g.

prior experience) factors (Samuel & Stephens, 2000; Findlay, 2006; Olsen, 2008; Cook, 2009). Professional identity of a teacher emerges at a point when the student teacher is involved in the training activities; develops and changes, and gradually is formed as a professional image of the self that never fixed. This is why some scholars such as Izadinia (2013), in a review, finds no clear definition of the teacher identity across the literature and states that “identity” is not predetermined and stable, but it is shaped and reshaped during a process of active learning and practicing to teach. On the other hand, it is a process of transition from personal goals and dreams to professional accountability in a shape of a new self. Due to the strange nature of the professional identity of teachers, other notions like “openness to change”, “vulnerability”, “uncertainty”, and “fluidity” have been attributed to the image of self as a teacher (Cattley, 2007).

Given the significant role of student teachers as professional teachers, Bejaard et al. (2004) identified four characteristics of a teachers’ professional identity. Bejaard believes that a person’s identity and specifically professional identity is not a fixed entity, it is formed as a result of the interaction between the person and her/his context. He states that sub-identities such as teachers’ prior knowledge and beliefs are unique to individual teachers. Then, if the idea of individualized sub-identities happens to be true, it may increase the complexity of teachers’ identity and the teacher training programs. On the underlying factors and components contributing to teacher identity formation, Tajeddin and Khodarahmi (2013) found some more factors such as the role of self-efficacy, self-regulated professional development, and intrinsic job motivation in shaping EFL teachers’ professional identity. Having a better understanding of these features and the factors involved in the formation of teachers’ identity, for instance, context, motivation, and prior experiences are highly recommended as prompts that facilitate the process of the identity construction (Larsen & Phillips, 2005; Findlay, 2006; Schepens et al., 2009; Olsen, 2008).

Reflective discussions as a pedagogical tool

Reflection is defined as a special form of thought (Kremer-Hayton, 1988; Hatton & Smith, 1995) and *reflective teachers* is illustrated as “those who construct meaning from their work by monitoring, analyzing, and modifying their behavior according to their actions.” (Costa & Kallick, 2000). This idea is mainly directed to the active role of the student teachers in relation to their context of learning and teaching. They are called reflective practitioners (Abednia, 2012) and transformative intellectuals (Giroux, 1992) as their dynamic construct is transforming from teachers’ initial beliefs and expectations of professional identity during a reflective teacher education course. Since the reflective behavior of teachers is difficult to analyze, most evidence of reflective activities are documented through some of the written works such as journals, essays, and narratives (Hatton & Smith, 1995; Loughran, 1996; Lee, 2000; Geyer, 2008).

A pioneering scholar in reflective studies, Schön (1983) emphasized using reflective activities as a tool in professional developments in order to stabilize teaching practices in the early stages of teacher training courses and in his paper (1987, p. 31), defined “Reflection-in-action” as “a reflective conversation with the materials of a situation”. Following Schon, reflection and discussion happened to play a key role in a rich description of classroom activity and in the process of teacher development by other scholars (Richards & Lockhart, 1994; Tomlinson,

2013). In the same line, Sherry and Gibson (2002, in Wanzare, 2007) used reflection and discussion with mentors and between peers about action research outcomes in their model of effective strategies for the stages of promoting learning in teachers. In another study, Tapline, et al. (2007) argued that “through observing their peers conducting demonstration lessons and through engaging in reflective discussions about these lessons and their attempts, in general, teachers were able to provide a great source of support and inspiration to each other (p. 533).”

Given the above-mentioned ideas, the literature suggests that over the past decades, reflective activities as pedagogical tools have been implemented to explore the process of pre-service teachers' identity construction. For instance, Webb (2005), Maclean and White (2007), and Sutherland et al. (2010) found “reflective research group” as a powerful process for debriefing and finding commonalities and “video reflection cycle” as an appropriate tool for shaping student teachers' identities. Also, “online-seminar groups” appeared as an effective technique in making changes in student teachers' cognitive and professional stance. Some other reflective activities such as reflective journals (Loughran, 1996; Weber & Mitchell, 1996; Walkington, 2005; Cattley, 2007; Poulou, 2007), autobiographical stories and autoethnographic narratives (Estola, 2003; Vavrus, 2009), and portfolios (Chitpin & Simon, 2009; Antonek et al., 1997) are documented as promising reflective pedagogical tools in the formation of student teachers' professional identity through reflection on their own teaching practices. Similarly, Loughran (1996) supports using reflective practices as a teaching tool and highlights the need to be reflective in teaching careers. He suggests “journal writing” as an encouraging tool for student teachers to reflect upon their own practices and experiences. In support of Loughran, Fletcher (1997) considers reflective activities as an “explicit analysis of practice” and mentions that “Explicit analysis of practice can be a valuable tool in learning to teach” (p. 242).

According to studies, Tomlinson (2013) argues that the teacher-learners need to know the reason of applying some activities in class and suggests observing peers and discussing the scenes they have observed. Therefore, it can be concluded that for thinking and discussing reflectively, teacher educators need to develop intellectual skills in pre-service teachers. In other words, it can be inferred that in the process of teachers' professional identity formation, cognitive and intellectual skills should be developed in parallel to teaching skills. Taken the above-mentioned definitions, the *reflective discussion* is generally understood to mean discussing purposefully and intellectually through monitoring and analyzing the intended activity. All the studies show that reflective discussions can be used as an effective pedagogical tool in teacher education and as a powerful stimulus to the student teachers' professional identity growth.

Teacher education program and teachers' professional identity

Teacher education is considered as an important step and a focal point in developing intellectual and reflective teachers and it is defined as “the art and science of educating focusing on the relationship between learning and teaching such that one does not exist as distinct from the other” (Loughran, 2006, p. 2). How can the teacher education program help shaping the teachers' professional identity? “Teaching is a highly complex series of acts that cannot be learned easily and cannot be done by formula or recipe” (Huling-Austin et al., 1989). In other words, teaching is not simply acquiring a prepackage of knowledge, but constructing and reconstructing a certain

concept of professional image in a given context. It is appeared to say that teacher education acts as a bridge to link the initial entry of identity to professional identity and subsequent long-term learning. Huling-Austin (1990) mentions the continuum role of teacher education and describes it as “a continuum extending from pre-service through induction into teaching to ongoing in-service and career-long development” (Townsend & Bates, 2007, p. 359). Abednia (2012) also considers professional identity as the major outcome of teacher education and argues that the ways through which this process progresses and is shaped are influenced by teachers’ perception about both themselves and their students.

Supporting the above-mentioned ideas and sociocultural point of view, teachers’ cognition appears to be a “socially situated” activity and the process of teachers’ learning is considered to be a “socially negotiated” practice (Geyer, 2008, p. 628). In other words, teachers learn through practice in different contexts rather than through mere training programs. Similarly, Abednia (2012) highlights the critical role of context in teacher education in relation to constructivist approach and claims that the preliminary step in learning to teach is passing through the process of constructing professional identity rather than acquiring knowledge. He calls for more studies on the critical TESOL teacher education and believes that in Iran, teacher education “excludes the teachers’ voices and beliefs to a greater extent” (p. 707). Activity theory acknowledges social settings as an important factor in human development (Smagorinsky et al., 2004). Although, some other scholars found some tensions in teachers’ identity as a result of contextual changes such as the structure of the workplace and the relationship with colleagues (Smagorinsky et al., 2004; Findlay, 2006) and value the contextual factors on the formation of teachers’ identity. Given the fact that teacher education is the initial context of the emergence of teachers’ professional identity, turning a considerable attention to the design and contents of the teacher education leads to deeper understanding of positive and negative factors influencing teachers’ identity.

The evidence presented in this section suggests that professionalism, in general, and teachers’ professional identity in particular, is a dynamic process that can be facilitated initially through the stages of development, change, and becoming by incorporating pedagogical instruments to teacher education programs.

RESEARCH QUESTIONS

The present study is directed to answer the following questions:

1. How participation in reflective discussions with a group of Iranian pre-service teachers shape their professional identity as teachers?
2. What are the factors influencing the development of teachers’ professional identity?

METHODOLOGY

The present study was conducted in a 240-hour teacher education program at a higher education institute in Tehran. The content of the course was selected according to a syllabus from the

Ministry of Education with minor modifications to the materials by the teacher educator to tailoring the course to the needs of the candidates. The course was in two phases. The first one allocated to the theoretical issues of language teaching and the second phase was a sort of integrating theory into practice. As part of the class activities of phase one, student teachers were supposed to watch videos on different teaching methods, analyze their teaching techniques, discuss reflectively, and make comments. Collectively, ten videos on language teaching methods were presented during five months in the phase one. As part of the class activities of the second phase, student teachers were required to role play teaching different language skills and components they learned through the course materials and critically discuss on their peers' and self performances. The purpose of selecting reflective discussions as a pedagogical tool is for the pre-service teachers can believe in themselves as teachers, be able to judge their own as well as peers' teaching, and grow purposefully and professionally. At the starting session of reflective discussions, the teacher educator asked questions after videos and performances as prompts and introduced the task in a systematic way. Accordingly, the student teachers, in pairs, first described the whole classroom events in videos or the performances, analyzed the techniques used by the presenter, discussed on their strong and weak points, and made comments. Leaving comments was in response to the question of "*If you were the teacher of the presented classroom, how would you conduct that criticized part of the teaching?*". A systematic model is presented as it is learned that some of the student teachers may remain baffled at the initial stages of reflective discussions or in Loughran's (1996) words "thinking aloud". Then, the educator provided them with some clear guidelines for avoiding the same problem.

The class met once a week for five hours, lasted for ten months and all student teachers had an equal chance to discuss critically and make comments on the teaching performance. The teacher educator gave feedback and necessary guidelines for each comment to finalize the discussion. The design of the study is presented through a schematic representation in figure 1:

Figure 1: The schematic representation of the research design

Participants

The participants of the present study who were from different university disciplines and degrees were ten Iranian pre-service teachers comprised of three males and seven females enrolled in a ten-month teacher training program certified by the Ministry of Higher Education in Tehran. They were upper-intermediate to advanced level of English proficiency according to a placement test that was made through the English department as an initial requirement of the course. Only one of the candidates had taught in private classes before starting this course and others didn't have any experience of teaching. They were selected through convenience sampling (Best and Kahn, 2006; Farhady, 1995) where the researcher as a teacher educator was conducting the teacher training courses. It should be mentioned that in this study, the researcher is the same as the teacher educator and the names used for the participants are pseudonyms.

Materials

Reflective journals have proved four advantages as fostering self-awareness, constructing and expanding personal understanding, developing reflection and reasoning skills, and engaging in dialog with the teacher educator and peers (Abednia, 2013). To improve the use of reflective discussions (Ref. D), the research instruments are comprised of two reflective journals (Ref. J) at the end of each phase were collected and one focus group discussion at the end of the course was conducted. In addition, to know about the student teachers' initial motivation and their impression about the first day of the course, an initial interview was conducted at the end of the first day of the course asking two questions: *Why have you registered for this course? What is your impression about the first day of the course?*

Data Collection Procedures

To explore how pre-service teachers' professional identity is formed through contributing reflective discussions to teacher education program, after each video presentation, student teachers participated in a systematic reflective discussion. To help them go through the process of discussions and avoid confusing about how to start and how to proceed the discussions, the teacher educator gave them clear structured instruction on systematically passing through the stages of: 1- "*Describe*", that is describing the whole event, 2- "*Analyze*", that is identifying the teaching methodology and techniques, 3- "*Discuss*", that is discussing on different aspects of the teaching methodology, and 4- "*Reflect and Comment*", that is summing up the points discussed in the previous stage and suggesting constructive ways of improvement in response to the question of: "*If you were the teacher of this class, how would you manage the class events or how would you improve the poor section of the class?*". In phase two, as one of the course activities, the student teachers role-played teaching skills and techniques and after each performance, either their classmates' or their own performance, they went through the same systematic procedures of reflective discussions as they did in the first phase. The research instruments were two reflective journals and one focus group session. At the end of the first day of the course, the teacher trainees were asked to answer two interview questions: *Why did they register for this course? And what was their first impression regarding the class events?* The purpose of asking such questions was to learn about their purpose, expectations of the course, motivation, and their initial impression about the class before going through the stages of the study. The first reflective journal was collected on the last day of the first phase, including five questions and the second one at the end of the second phase consisting of six questions. The questions focused on student teachers' beliefs about the course activities and their own identity formation. Three of the questions in the first journal were also asked in a different form in the second one in order to explore the transition process of becoming a teacher and the construction of teachers' professional identity. Enhancing the efficiency of the study, the teacher educator, conducted a focus group session where the participants shared their ideas about the whole program, the materials and the techniques used, at the end of the second phase that is the end of the program.

Data analysis

The data were subjected to a thematic process (Moustakas, 1990) and were conducted in two stages. Initially, to have a background information before starting the training period, the participants' answers to the first two interview questions were analyzed based on two themes: 1- their motivation to register for the course; 2- their first impression of the first day class events.

Then, the questions of the two following reflective journals and the focus group were categorized under two main themes of “the effectiveness of reflective discussions” and “the formation of their teacher identity”; the answers were analyzed separately for each, and compared in terms of the content (Weber, 1990) to explore the changes upon the student teachers’ identity formation over time.

FINDINGS AND DISCUSSIONS

As the purpose of the present study was examining the process of student teachers’ professional identity construction throughout a teacher training course contributing reflective discussions, only the two reflective journals, and the focus group were analyzed and the reflective discussions were taken as a pedagogical tool to facilitate the process of identity formation and the first interview at the beginning of the course was regarded as a background information before going through the two phases of the program. Therefore, the data collected from three sources after each phase of the program were read over and over, analyzed upon the participants’ ideas on the two main themes of the “*effectiveness of reflective discussions*” and their “*identity formation*”, and themes were identified accordingly and separately.

Cattley (2007) proposes that applying frameworks to the analysis of data can help the researcher to determine indicators of professional identity. Given that such a framework will facilitate the identification of teachers’ professional identity formation, the researcher used content analysis on a model which was comprised of integrating Fund et al.’s (2002) multi-dimensional classification scheme with Sutherland et al.’s (2010) professional model (Table 1). According to the defined items, the questions and answers of reflective journals and the focus group were subjected to be categorized as *Identifying*, *Analyzing*, *Critical Evaluating*, and *Problem Solving*, to investigate the changes in the cognitive process and the development of teachers’ professional identity over time. The table was designed into two columns: *Theoretical and Linkage*. *Theoretical* introduces the nature of the evaluation category, and the linkage describes the application of the theoretical aspect in the research steps.

Table 1: Professional focus model: description of categories

Categories	Theoretical	Linkage
Identification	Discusses an issue and/or experience from personal/theoretical perspective.	Discusses classroom techniques. Teacher identity is present, but not prominent.
Analysis	Identifies contributing personal beliefs/reactions and discusses relationships between these to issue and/or experience.	Examines the interaction between personal belief/reaction to issue and/or experience and relevant educational concept. Implications on the efficiency of reflective discussions.
Critical Evaluation	Evaluates reactions to the issue and/or experience in terms of their personal beliefs about teaching/learning.	Evaluates/reconsiders their beliefs/reactions using relevant educational concept. Evaluating the course activities.
Problem Solving	Discusses the possible solutions or identifies possible course of actions from the personal perspective.	Discuss possible solutions or courses of action justified by reference to relevant educational concepts. Suggestions for improving the course.

First, the interview with the participants was recorded and analyzed to save a record of their initial motivation for becoming a teacher and initial impression before starting the course.

Interview

The interview about student teachers' motivation and their first impression of the course was recorded and transcribed for the analysis. The results indicated that they, unanimously, loved the profession of teaching and all of them had a positive impression about the starting session of the term. Almost all of them claimed not having any previous experience of teaching before joining the program. The followings are some examples: (all the names are pseudonyms.)

I don't have any experience of teaching, but I love teaching English. (Shirin)

The subject of teaching is completely new to me. I like teaching English and learning about modern technologies and methodologies in language teaching. (Baran)

I like to learn how to teach and I like to teach besides my professional major. (Dina)

Since it was the first session and they didn't have any idea about the contents of the course, some signs of the low self-confidence were recognized on four of them.

I have an old dream of teaching English. I want to be a trained teacher and learn its methods, however, I'm worried about being a good teacher. At the end of this session, I felt that I can be a good teacher with your help. (Arash)

I love teaching, but I don't know whether I can be a qualified teacher. At the end of this session, now I feel that the course would be satisfied and effective. (Sina)

I was not sure to be a teacher because I was afraid of not being able to manage the activities. This session made my heart full of joy in a way that now I feel I can be a good teacher at the end of the program. (Tina)

Becoming an English teacher has been my childhood dream. This session was really good, however, a little stressful about the idea of not being able to be a good teacher. But I will do my best. (Taban)

Reflective Journals

Reflective journals have been commonly used in teacher education programs to help student teachers to think about their own teacher selves through a process of identification and analysis around the world (Abednia, 2013; Farrell, 2004). To avoid participants' confusion about what to write and how to write in the journals and to guide them, six questions for the first journal and five for the second one were designed carefully as reflection prompts. There wasn't any limitation on the length of the answers to questions. The first journal was to be completed at the end of the first phase and the second one at the end of the second phase that was actually the end of the course. Each phase lasted for five months and the questions in both journals were focused on two main themes of "the effectiveness of reflective discussions" and "the teacher identity construction". The questions and answers were read carefully and classified according to the developed four-dimensional model and coded. Each participant's answers to the questions of the first journal were analyzed in terms of the four developed categories and compared to the similar types of the questions and answers in the second journal to determine matches and mismatches

and to detect any changes in the process of their identity formation. The content analysis also examined the existence of self-perception and self-confidence of becoming a teacher in constructing teacher identity during the program.

The first question of the first journal asked about the student teachers' motivation to become a language teacher. The purpose of asking this question similar to the ones the researcher had in the interview was to find any changes in their motivation under the influence of the course materials. Almost all participants claimed that they loved teaching and they believed that teaching was an interesting challenge and dynamic. The analysis of answers to this question showed an increasing motivation to continue the course as it proceeded.

Now, I have a good feeling of becoming a teacher and I love teaching more than before. (Arash)

First, I was afraid of being a teacher. Gradually, I liked it and found it enjoyable.

(Elnaz)

I love teaching and helping people. (Amin)

It's a nice feeling of self-confidence and usefulness. (Shirin)

Identification

The fifth question of the first journal and the first question of the second one asked student teachers to reflect upon the course sessions and especially the techniques used by the teacher educator and identify the parts which were effective in the formation of their teacher identity or were interesting to them. To increase the credibility of the study, these two questions were designed to elicit the same idea in two ways: first directly and then indirectly to find the changes in personal concepts relating to their identity formation. As a result, in response to the question five of the first journal: "Which activities helped you in the formation of your feeling as a teacher during the course?", eight of the pre-service teachers raised issues such as group discussions and giving feedback after role plays as the most effective techniques in the gradual construction of their identity as a language teacher. Only Amin and Shirin gave priority to writing lesson plans and maintained:

Writing lesson plans caused me to think of a real teacher. (Amin)

Writing a lesson plan for an imaginary class is one of the activities that made me think like a teacher. (Shirin)

To answer the first question of the second journal as "Which activities were interesting to you as a language teacher?", there was not a consensus among the participants. They mentioned almost all activities. Dina believed that the presentations were the most interesting activities while Baran, Hira, Elnaz, Sina, Tina, Taban, and Arash named watching videos about teaching methods, linking to teachers' forums, giving assignments according to the introduced websites as their interesting activities. In addition to the activities mentioned by others, Amin and Shirin liked discussions.

To me, the interesting activity of the course were discussions. Through discussions, I could share my own ideas with others and get feedback which taught me a lot. (Amin)
Presentations and discussing possible solutions in a class and different methods used in that situation were interesting activities. (Shirin)

Analyzing

Student teachers' professional identity can be constructed through the promotion of the self-description (Winslade, 2002, p. 35). The ability to describe selves is developed through the processes of critical and analytical reflection that play a central role in the development of teacher learners' professional knowledge and identity (Shulman & Shulman, 2004) and can be observed in their language (McLaughlin & Oliver, 1998). The second type of the questions asked about the participants' personal reaction about the efficiency of reflective discussions in the process of the formation of professional identity. Questions two, three, and four in the first journal intended to ask the student teachers analyze the steps they passed and compare their feelings as a teacher during the previous phase under the influence of the discussions. To make sure that student teachers understood about their own changes and could reflect them in their writings, the term "reflective discussions" was used explicitly and implicitly in the questions. In the question two of the first journal, student teachers were asked to compare their feelings as a teacher to that of the first day of the course: "*How are you feeling now as a teacher comparing to the first session you attended the class?*" Almost all of the participants regarded reflective discussions as an opportunity for emerging their latent self-confidence and they felt some sorts of changes in themselves as teachers in terms of their organization and attitude toward teaching and knowledge of teaching.

Now, it's more than what I used to think about teaching. Now, I know what is the meaning of teaching. (Dina)

I have learned a lot of techniques that I can use in my own classes. (Arash)

I feel more confident now. (Shirin)

Well, many things have changed since then. I'm more organized now. I know many strategies for facing different problems and for the students' needs. (Amin)

I feel more confident, I know how to behave in class and how to select materials.

Now, I'm aware of many things happening in the class time. (Hana)

To avoid fallibility of single items, Dornyei (2010) suggests the need of more than one item to address each identified content area, all aimed at the same target but asking about a slightly different aspects of it. Accordingly, question three of the first journal asked about the participants' feeling of becoming a teacher more directly leading them to their changes after class discussions: "*How class discussions after watching sample classes were effective on your feeling of becoming a teacher?*". Also, the fourth question asked, somehow the same idea in a different way: "*How talking about the strong points and weak points of your classmates' presentations played a role in the formation of your teacher identity?*". The participants regarded discussions and role plays very helpful in the formation of their teacher identity and they felt a change in their ability to teach.

First, role plays made me nervous, but after passing the time, now I think I have a lot of good abilities and ideas as a teacher. (Arash)

Also, questions three and four of the second journal which was given to the participants at the end of the program, asked about describing the changes in student teachers' selves as teachers: "How are you feeling as a language teacher now? Compare your feeling and attitude towards becoming a teacher with that of the starting day of classes." and "Describe your feeling in each step of changing from the beginning of the term." Analyzing participants' answers to these questions obviously shows the changes in their beliefs and identity. Studies show that teachers' awareness of their own teaching beliefs and areas of strength, improve their teaching practice. In addition, doing reflective tasks can increase teachers' self-awareness (Abednia, 2013).

At the beginning, I was shocked and confused. There were lots of new experiences. After a while, I could get used to them. I was changing my mind by getting knowledge about teaching. Now, I feel more responsible as a teacher. It's a nice feeling. I belong to a community of teachers and it's encouraging. (Arash)

First, I wasn't sure that I'd made a right decision. Gradually, I became more motivated. The peek of the changes in me was after accomplishing the classroom observations. Now, I feel more confident about being a language teacher. (Shirin)

Passing the course gave me more confidence in teaching. It made me more aware of the job. (Elnaz)

At the beginning, I had no idea about being a teacher. Moving from phase one to phase two, and doing more discussions and activities, gradually, I felt as a teacher. (Hana)

The responses to the questions about this section revealed evidence of changing and growing a sense of self-confidence, responsibility, motivation, and self and professional awareness in preservice teachers.

Critical Evaluation and Problem Solving

Pedagogical problem solving proved to be one of the primary benefits of writing reflections in Greiman and Covington' (2007) study. According to the created model, at the evaluation and problem solving level the student teachers were asked to reflect upon their own personal beliefs about the course activities and to discuss possible solutions and suggestions for improving the course. This type of question appeared at the end of both journals in different wording as a final remark: "Please evaluate the strong and weak points of the term. If you were the teacher of this class, how would you improve the sessions?" While teacher learners felt satisfied with the course materials, they suggested taking more time for classroom discussions.

Nice management of the sessions motivated me to follow all the sessions and the new techniques to develop my characteristics as a teacher. (Arash)

They were all merits! Suddenly, I realized that I'm able to think like a teacher. (Amin)

Responses show that following a regular exercise on critical reflection and discussion about the details of teaching can grow pre-service teachers professionally to achieve the ability of evaluation and judgment over teaching and curriculum.

Focus Group

Given the dynamic, authentic, and the multivocal nature of the focus group, it was implemented as a final data collection instrument to uncover pre-service teachers' perceptions of professional identity in a friendly atmosphere to reveal hidden factors in the process of its construction, and to put individual ideas into a collective practicum with all participants. . The focus group meeting, involving ten participants, took place at the last session of the program. The whole session was audio taped, transcribed, and analyzed upon the same identified themes as in journals. The discussions centered on the "*reflective discussions*" and the process of student teachers' "*professional identity construction*" to answer the research question and lasted for one hour.

In order to identify and evaluate the student teachers' reaction to this ten-month program, I encouraged them to reflect on their learning throughout the course. This allowed me to discover how they felt about the activities and their involvement in the teacher education program and how the course had influenced in shaping their teacher identity. The session started when the teacher educator (the researcher) shared an overview of the whole program from the first session to the last and reviewed the activities and pedagogical tools, focusing on the discussions after the performances and videos. The first question was: "*Try to remember your perception of becoming a teacher the first day you started the course. Then, focus on your teacher identity today that is the last day. How can you identify and describe the changes?*" and the second one was about their understanding of the factors involved in the forming their teacher identity: "*What are the factors that have shaped your identity as a teacher?*"

Not surprisingly, in discussions about the first question, eight participants regarded themselves as teachers with a high level of confidence that can be enhanced by having a positive feeling of taking risks in dealing with the problems about their teaching role (Walkington, 2005). This supports Izadinia (2015) who mentions that feeling positively about one's abilities as a teacher can impact on the pre-service teachers' identity formation. However, two of them showed more stress about teaching in their real classes that can be attributed to the dynamic nature of the student teachers' identity during its formation. As Tina mentioned:

At first, I thought teaching was so easy to handle. Now, I notice that it is a very sensitive task. A teacher should be really an organized and a professional person. I don't know whether I can be a good teacher.

Comparing Tina's first impression about teaching as her "old dream" with her idea in the last day of the course, reveals that her initial emotional stress about the starting point of learning to teach has been subjected to some fluctuations during the process of shifting from personal to professional identity. The same happened to Arash who obviously presented some fluctuations in the process of his identity construction. First, he started with a low confidence: "*I'm worried about being a good teacher.*" Then, as the course readings and techniques were progressing, he

said that he understood the meaning of “teaching” and believed that he achieved lots of good teaching skills and techniques to incorporate into future classes. Furthermore, he acknowledged the benefit of class discussions and the course precise schedule in putting him in a controlled context and forming his characteristics as a teacher. However, he felt stressful in discussing the first question.

Teaching is a sophisticated task as well as a sensitive responsibility that needs years of practice and experience. I feel there is a long distance to be a standard teacher.

In discussions about the second question, some of the participants found reflective discussions to help them think as a teacher while others took observation reports as a central factor in the formation of their professional identity. They also added other activities such as peer evaluation, role plays, videos, linking to international teachers’ forum, and lesson plans as important factors in shifting from student teachers to teachers. Among the participants, Taban named both observation reports and reflective discussions as strong stimuli for the construction of her teacher identity that made her think of creative techniques for classroom activities.

Focus group came to an end with student teachers’ suggestions for further programs such as incorporating more time for their presentations in different language levels and reflective discussions afterward. The focus group revealed that through participation in professional development, teachers expanded a range of positive and negative skills with implications for teacher education programs. For instance, self-confidence, self-awareness, decision making, professional knowledge, critical thinking and commenting, and a sense of feeling like stressful to start in the profession. Finally, it was found that the focus group can be used both as a facilitator in constructing teachers’ professional identity and a data collection tool in further studies.

As mentioned earlier in this paper, the development of teacher identity is a very complex and dynamic procedure that requires in-depth studies for exploring the factors and changes at the practicum. Although, teacher educators can benefit from the effectiveness of the program components, techniques, and pedagogical tools if they incorporate organized practices in the teacher education program. Practicing organized stages during the teacher training courses will organize the teacher students’ mind, enhance the cognitive processes of teacher identity formation, and will help pre-service teachers maintain their professional identity. Supporting Hatton and Smith’s (1995) classification system who identified three stages of reflection as *descriptive, dialogic, and critical* in students’ reflective utterances, a four-dimensional systematic cognitive model was designed to stabilize teaching practices and to stimulate the formation of professional identity of teacher students. Therefore, the student teachers went through the four levels of *Describe, Analyze, Discuss, and Reflect and Comment* as a systematic procedure after each performance, either on videos, their own practices, or peers’ performances. The schematic representation of this model is depicted in figure 2.

Figure 2: A Schematic representation of a systematic model for classroom Reflective Discussion

CONCLUSION

The present investigation examined the role of systematic reflective discussions after videos and performances on teacher students' professional identity construction. However, the question "how teachers' professional identity gets shaped?" is not easy to answer. It is a complex concept, including many cognitive, affective, and social factors such as the ability to control the practices, language, tools, values, beliefs, and contextual interactions may also lead them to a profession. It is actually a continual flux and unstable. Considering the complexity of the process of identity development in pre-service teachers, teacher-learners in this study, through one interview, two reflective journals, and one focus group session, presented a level of responsibility, organization, confidence, teacher voice, cognitive knowledge, professional competence, awareness of selves and the job, and skills of judgement, evaluation and problem solving which were supported as components of teachers' professional identity (Cattley, 2013; Izadinia, 2013; Abednia, 2015). The participants of the present study were found to consider reflective discussions to have a primary impact on the formation of their teacher identity. They also mentioned other pedagogical techniques such as linking to international teachers' forum, course readings, preparing lesson plans, observing in-service teachers' teaching and commenting to help them to shape their teacher identity. However, it seems none of the participants valued the psychological, contextual, and administrative factors like the teacher educator's motivation and attitudes, timetabling and the organization of the class time, the syllabus of the program, and the rapport she created between the student teachers and herself as the core of their identity formation. Furthermore, the relationship between the pre-service and in-service teachers at the time of classroom observations may also affect the changes in their identity. The data analysis revealed the changes in the level of growth towards a more professional status in the teacher learners' contributions in selecting classroom activities. They showed abilities for making decisions, planning lessons, and developing professional competence. In addition, the components of teacher identity like self-confidence, organization, the ability of judgment, and feeling of accountability were clustered in the findings of the present study. As it was realized at the final class sessions, the student teachers were able to select materials for the class to help their own knowledge promotion. Emerging this

skill proves the fact that reflective discussions can lead to teachers' autonomy, self-awareness, and decision making skills to emerge in the beginning teachers.

In line with above-mentioned findings and the developed model, it is recommended that systematic reflective discussions need to be integrated into teacher training courses across the program to shape the pre-service teachers' professional identity. Also, teacher educators create a motivating context for teacher-learners, giving them dare to freely discuss their ideas and generate creativity through systematic reflective discussions. As Pennington (1990, p. 133) argues about professionalism, he suggests that student teachers be trained on both required skills and the ability of the judgment. Making judgments by pre-service teachers about strong and poor practices will enhance their confidence and the ability to take the risk to challenge opinions (Walkington, 2005). In the present study, classroom observations were considered as one part of the required assignment and did not include in the analysis. Future studies can add the analysis of the student teachers' report on the classroom observations, as Geyer (2008) strongly advises incorporating both observation and evaluation as essential techniques into the teacher education programs.

Concentrating on the development of professional identity in student teachers and understanding the details of its process over teacher education program will assist teacher educators to prepare pre-service teachers for the complexities of teaching. In this process, the outstanding role of teacher educators and teacher education curriculum developers cannot be ignored. An implication of this is that the teacher educators select and conduct the classroom activities encouraging pre-service teachers in shaping their new identity as teachers. Developing the ability of reflection in teacher learners is the responsibility of all teacher educators. Furthermore, curriculum and teacher education materials developers will benefit from this knowledge to design and develop supportive programs, which can help teacher educators in their practice. A Supportive teacher education curriculum is recommended to include pedagogical tools to enhance the feeling of self-confidence and risk-taking abilities to challenge the problems of the teaching profession and help the pre-service teachers grow intellectually and educationally. As a result, throughout the journey of the professional identity construction, they will be able to pass through the transitional stages, moving from a dependent student teacher with a low level of confidence to an independent teacher. Along with this process, they will shape ability in teaching to grow a sense of becoming a teacher that can reflect critically upon their own practices, identify the contextual challenges, evaluate and judge their experiences, and can solve their own problems. An appropriate teacher education program should include professional development to deal with difficult students and the threats to professional identity. Furthermore, beginning teachers need to be equipped with psychological and educational skills in order to be able to suppress the frequency of stress and misbehavior at the first year of teaching.

The dynamic nature of the professional identity and the variation in factors affecting the identity formation of the student teachers suggest the limitations of the study. The limited number of candidates enrolled in this program can be extended and examined in more teacher education centers in different contexts. Also, the pre-service teachers' comments on the observation

sessions can be analyzed and taken into consideration to discover the changes through their practice and interaction with in-service teachers.

ABSTRACT

Journalistic writing has been a welcome source of typical language data for metaphor analysis. Since the metaphorical wording explains the situation more interestingly and formally in comparison with non-metaphorical language, it seems that even newspapers are no exceptions in terms of extensive use of metaphors, specifically of grammatical metaphor (GM). Inspired by Halliday's Systemic Functional Grammar (1994), as an appropriate framework for analysis, this study explores the first type of GM known as ideational grammatical metaphor (IGM). In doing so, a corpus comprising 8 scientific and 8 sports texts of English newspapers (approximately 12000 words), were analyzed, compared and contrasted to pinpoint their similarities and dissimilarities in terms of nominalization and process types. The results revealed that the ideational metaphor has indeed pervaded scientific and sports texts, while indicating some differences. It's hoped that the findings of this study will bring a deeper understanding of GM in the sense that teachers and learners could recognize the importance of GM in the process of reading / writing instructions.

KEYWORDS: Grammatical Metaphor- Ideational Grammatical Metaphor- Systemic Functional Grammar- Nominalization

INTRODUCTION

Since special English is used in the press, so knowing the features in news English can help us get more accurate information around the world, and can fully enjoy the fastness and convenience

of the information age (Wu & Tang, 2010). One of these features is grammatical metaphor which is proposed first by Halliday, who treated it as an important component of the theory of system language functions and made significant contribution to the metaphor study. According to his theory of grammatical metaphor, grammatical metaphor includes two types – ideational metaphor and interpersonal metaphor, nominalization is the most common grammatical metaphor form, especially in the science and technology discourse and news discourse.

Through the work of Halliday (1994) and his colleagues, systemic functional linguistics (SFL) is recognized as a very useful, descriptive and interpretive framework for viewing language as a strategic meaning making resource. One of Halliday's major contributions to linguistic analysis is showing how simultaneous strands of meanings are expressed in clause structure. Systemic functional linguistics studies the grammatical metaphor from the point of view of expressing the grammatical meaning, and they consider that the metaphor is not limited in the vocabulary level, but is often seen in the syntax level.

Ideational grammatical metaphor is the first type of grammatical metaphor. Nominalization as the most common form of ideational grammatical metaphor, makes action or process become concept and also, it reduces the number of clauses and more information is compressed into each nominal group. Nominalization can turn a dynamic process (*verbs*) into a static entity through re-categorization and thus provides us with a different way of construing the world, or of conceptualizing experiences from a different angle (Murar, 2004). Due to efficiency and convenience of being able to compact large amounts of information into a single word, nominalization is a widely exploited linguistic technique in news, scientific and political discourses (Choi, 2006). As Halliday has argued in his IFGs (Introduction to Functional Grammar; in all three editions of 1985, 1994, 2004), each nominalized or metaphorical wording in the metaphorical domain has its congruent wording in the congruent domain. The metaphorical domain explains the situation in more interesting and more formal ways in comparison with the congruent one.

Through the function of the grammatical metaphor in the building of the news discourse, we can comprehend more about the news features and understand the news texts. The study of the uses of grammatical metaphor is particularly useful in revealing how processes are changed into objects. Grammatical metaphor in this case changes not only the grammar of the texts but also the reader's reaction to texts. In this spirit, it seems that journalistic genre especially scientific and sports texts have been an interesting area for analysis and discussion, and since using grammatical metaphor in newspapers satisfies with readers' curiosity and excitement, it sometimes causes difficulties for readers to understand. In IGM, lexico-grammatical features are re-arranged to put forth a certain view of reality, i.e. they constitute an alternative way of constructing a picture of reality. One type of clause is expressed as another type and the processes and qualities are construed as if they were entities, through the process of nominalization (Halliday, 1994). Halliday (1985) defines that Nominalization is the single most powerful resource for creating GM. By this device, processes (congruently worded as verbs) and properties (congruently worded as adjectives) are reworded metaphorically as nouns; instead of functioning in the clause, a Process or Attributor, the function as Thing in the nominal group (Halliday, 1985, 1994; Cehan, 2004).

Halliday (1994), Vandenberg et al. (2003), and Taverniers (2006) maintain that traditionally metaphor is viewed as variation in the use of words, i.e. variation in meanings and hence the consequence of lexical or lexico-semantic processes. This is a view *from below*, taking the words as starting point and then saying something about the meanings these words realize (this has now come to be known, in a more accurate sense, as lexical metaphor). Metaphor is, however, employed in SFL in a relatively new sense to refer not to *the variation in the use of words* with a transferred meaning but to *variation in the expression of meaning*, following a SFL to the study of grammar proposed by Halliday (1985, 1994). Unlike the former view, this one is a view *from above* where the starting point is a particular meaning and the relevant question is how it can be expressed or realized. Taking this from *above view*, it is recognized that metaphorical variation is lexico-grammatical rather than purely lexical, and that lexical selection is just one aspect of lexico-grammatical selection or wording; the other aspect is grammatical (Vandenberg, et al., 2003). The two alternative perspectives are visually represented in figure 1 (based on Halliday's figure (1994/1985, p.342)) (as cited in Taverniers, 2003, p.6).

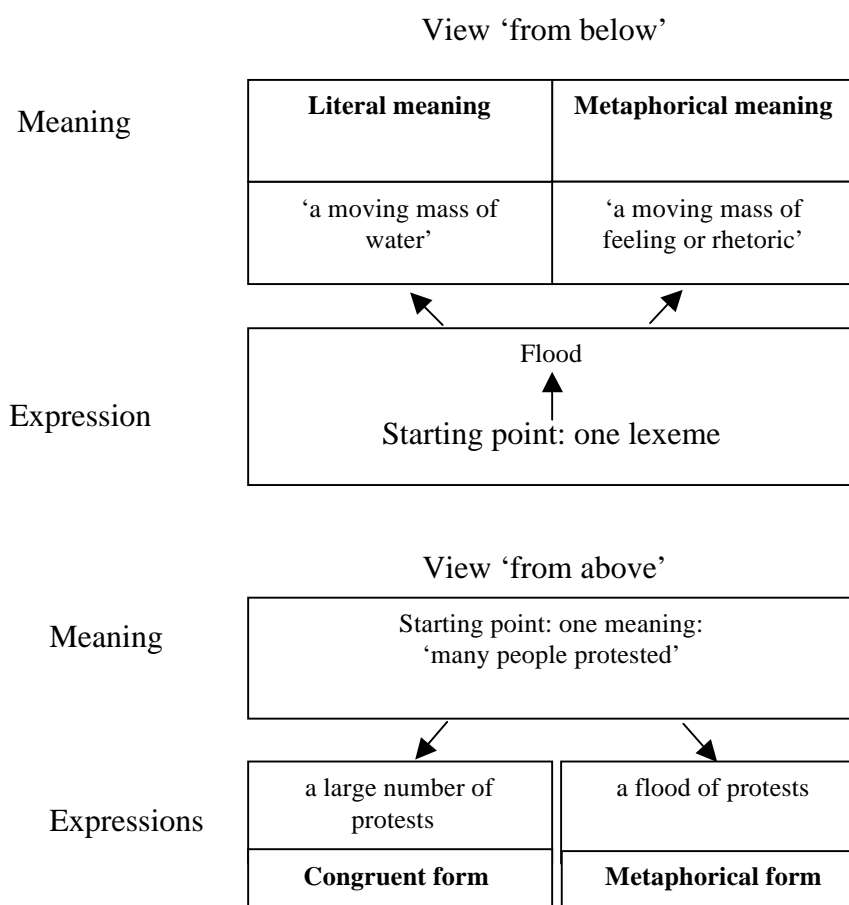

Figure 1: Two perspectives on metaphor (after Halliday 1994/1985, p.342)

Processes are central to transitivity. They center on the part of the clause which is realized by the verbal group and by nominalization; processes (congruently worded as verbs) and properties

(congruently worded as adjectives) are reworded metaphorically as nouns. Processes are also regarded as what *goings-on* and suggest many different kinds of goings-on which necessarily involve different kinds of participant in varying circumstances, while participants and circumstances are essential upon the doings, happenings, feeling and beings. Processes can be subdivided into different types.

Table 1: Overview of Process Types (Adopted from Halliday, 2004)

Process type	sub-category	
Material :	'doing'	
Action	'doing'	bodily, physically, materially
Event	'happening'	
Behavioral :	'behaving'	physiologically and psychologically
Mental:	'feeling'	
Perception	'sensing'	
Affection	'seeing'	emotionally, intellectually, sensorilly
Cognition	'thinking'	
	'emotive'	
Verbal:	'saying'	lingually, signaling
Relational:	'being'	
Attribution	'attributing'	
Identification	'identifying'	equal to, or some attribute of
Existential:	'existing'	there exist

The significant and important role of GM has always been a great area of research and investigation for many researchers. Halliday and Martin (1993), in a seminal study conducted a survey based on GM on scientific texts and found that when the lexical density goes up to some extent, the passage becomes difficult to read.

Holtz (2009), in her major study, has done a research titled *nominalization in scientific discourse: A corpus-based study of abstracts and research articles*. The corpus used in her work contains 94 full English scientific journal articles compiled from 12 sources covering four scientific domains, i.e., computer science, linguistics, biology, and mechanical engineering, and comprising over 420,000 words. The results indicate that Nouns are the most frequent lexical word both in abstracts and research articles. Nominalization occurs much more often in abstracts than in research articles, and that the difference in this occurrence is statistically significant. Moreover, abstracts generally show a much wider vocabulary range concerning the use of nominalizations than their research articles.

In another study, Hadidi (2012) analyzed a corpus comprising three business and three political texts to see how many instances of ideational metaphor are used and what the respective frequencies are. His findings revealed that ideational metaphor has pervaded political and business texts and is used approximately with the same frequency in both text types. In a similar study, Tabrizi 2013 analyzed a corpus comprising 5 political and 5 health texts of English newspapers in terms of IGM. Based on the findings, both text types include all types of processes, but the frequency and percentage of nominalization of ideational grammatical metaphor used in political texts are more than health texts in English newspapers.

To the best of the researcher's knowledge, as it seems, less research has focused attention on the analysis of newspaper texts from SFG perspectives. It is also worth mentioning that to date there are few comparative studies related to GM and IGM and none as the researcher knows has used the theories of the SFG to compare the nominalization of ideational grammatical metaphor used in scientific and sports texts of English newspapers, and nearly all of the studies have exclusively investigated one text type, and if there are any, they have confined themselves to a small number of texts.

Most of the times, readers relate metaphor to the lexical domain of language and literature and don't know the important role of metaphor in a grammatical sense. And also, they think that there is only one way to convey their intended meanings, as a result, they express their meaning in informal and simple way. It is believed that identifying and comparing IGM in texts of English newspapers raise readers' awareness regarding the role and function of GM in written text and help them to know different ways of expressing the same meaning and convey their meanings in a more interesting and vivid way.

The principle purpose of this study firstly was to identify the ideational grammatical metaphor used in scientific and sports columns of English newspapers on the base of Halliday's (2004) framework and then to investigate how meanings are constructed and interpreted by application of ideational metafunctions in English newspapers across two text types, to highlight the nominalization of ideational grammatical metaphor to determine their processes and to compare them with each other, and also the congruent mode of each clause will be given to uncover the difference between two text types.

RESEARCH QUESTIONS

In line with the above arguments, the following research questions and hypotheses were posed:

RQ#1. Is ideational grammatical metaphor (IGM) likely to be used more frequently in scientific texts than in sports texts?

RQ#2. Are the process types of IGM likely to be used more frequently in scientific texts than in sports texts?

H1. Ideational grammatical metaphor (IGM) is likely to be used more frequently in scientific texts than in sports texts.

H2. The process types of IGM are likely to be used more frequently in scientific texts than in sports texts.

METHODOLOGY

In the following section, the corpus, i.e., the kinds of materials, and instruments, i.e., the kinds of model or models used to analyze the texts, procedure and design of the study will be discussed.

Corpus

Due to the paramount importance of selecting authentic and native texts in scientific and sports writings, an effort was made to choose those texts randomly from various sources of English newspapers, such as *Washington Times* (2013), *Washington Post* (2013), *New York Times* (2012) and *International NewYork Times* (2013). Because of time constraints, only 8 scientific and 8 sports texts, approximately 6000 words of each text type, were used as the corpus in order to pinpoint and analyze the frequency of metaphorical expressions (Nominalization) and process types for each nominalized word, and also to compare and contrast to find similarities and discrepancies between two text types in terms of IGM. This research was a comparative study and both text types should comprise the same number of words to be investigated appropriately. Thus, it was the same number of words that acted as our yardstick and enabled the researcher to say, for instance, how many instances of GM were used and which process type was dominant in either of the text types.

The design of the present study was descriptive-analytic which concentrated on the frequency of occurrences of IGMs and their congruent wording and process type in scientific and sports texts. It should be mentioned that in analyzing the data (identification and interpretation of IGM instances), this study employed the qualitative research method. Moreover, in order to find out the frequency, process type, role and function of IGM through SPSS software the quantitative research method was adopted.

Instruments

In order to compare and contrast possible similarities and dissimilarities and also to find congruent and metaphorical expressions as well as process types, in these 16 texts (approximately 12000 words) of scientific and sports texts, it was essential to choose a model or models to analyze the data. Therefore, the ideas of Martin, Matthiessen and Painter (1997) and Halliday and Matthiessen (1999) provided a reliably comprehensive groundwork to be utilized as the main theoretical foundation of the present research. According to Martin et al (1997), 6 process types in English are as followed:

- 1) Material: material clauses construe doings and happenings.
- 2) Mental: mental clauses construe a person involved in conscious processing, including processes of perception, recognition and affection.
- 3) Relational: relational clauses construe being and do this in two different modes – attribution and identification.
- 4) Behavioral: behavioral clauses construe human behavior.
- 5) Verbal: verbal clauses represent processes of saying.
- 6) Existential: existential clauses resemble relational clauses in that they construe the participant involved in a process of being , but differ from relational ones in that there is only one participant.

According to Halliday (1994), each metaphorical wording must have its equivalent congruent wording. So, in this research not only process types but also congruent domains of extracted IGM instances were discussed and displayed.

Procedure

To identify the instances of IGM in scientific and sports texts, the researcher read the texts thoroughly and pinpointed IGMs (nominalized wordings). It was noticed that nominalization is the most dominant feature of both scientific and sports texts that leads to IGM. After establishing and extracting IGMs, an effort was made to render metaphorical expressions in congruent expressions because elaborating both the congruent and metaphorical domains lead us to fully grasp the concept of transitivity system and IGM. It is worth noting that unpacking metaphorical wordings into congruent forms were based on inventories represented by Eggins (1994), Halliday (1994), Halliday and Matthiessen (1999), Martin et al. (1997), and Thompson (2004). Comparing metaphorical and congruent wording indicated that in most of the cases both of them allow us to explain the same situation, but the metaphorical wording describes the situation in a more encapsulated, brief, precise and concise way. Since IGM is closely tied with transitivity system which enables us to construe the world of our experience into a limited set of process types, an attempt was made to identify process types in all the extracted and rendered IGM instances.

DATA ANALYSIS AND RESULTS

As mentioned before, the main purpose of the current study is to analyze, compare and contrast a corpus comprising 8 scientific and 8 sports texts to pinpoint their similarities and dissimilarities in terms of nominalization and process types, approximately 6000 words in each text type. These texts were analyzed in order to find out the number of IGM's instances and their respective frequencies in two text types. Furthermore, the data has been investigated to find out the role and function of IGM in these texts.

IGM in Scientific Texts

Scientific texts are generally concentrated on highly technical terms, and they are troublesome to understand due to their complexity in forms and meanings. The language of science is, by its essence, a language in which theories are built and its features are definitely those that make theoretical discourse potential. There are two types of resources in Scientific language: lexical and grammatical. Lexical ones include technical terminologies that scientific realm continuously construct i.e. technicality. Grammatical resources include constructing organized nominal categories so that they can be merged to construe a particular form of reasoning and sequential argument. Scientific genre is a highly nominalized discourse. Nominalization is indispensable since it is engaged both in technicality and rationality.

The following table shows samples of IGMs selected randomly from analysis of 8 scientific texts. In each table, in addition to the metaphorical wording, the probable congruent form, type of process and its frequency in per text are represented as well:

Table 2: Samples of IGMs extracted from 8 Scientific Texts

No.	Metaphorical wording	Congruent wording	Process type	Frequency in each text
1	that discovery	something which was discovered	Material	2
2	heat exposure	to expose to the heat	Material	1
3	suggesting that	and suggest that	Verbal	1
4	enthusiastically recommending	recommended enthusiastically	Verbal	1
5	leave us in the dark	darkens our view	Material	1
6	have trouble understanding a ...	not to understand a ...	Mental	1
7	epidemic of daydreaming	most of people daydream	Behavioral	1
8	loneliness	to be alone	Relational	1
9	individual registration	to register individually	Material	2
10	anatomical comparisons	to compare anatomically	Material	1

In the examples above, the processes (such as *discover*, *expose*, *register* and *compare*) become nouns (*discovery*, *exposure*, *registration* and *comparison*). It is worth noting that nominalization, as a form of GM, allows a large amount of information to be packed into a comparatively small space (such as, a noun group). This has the effect of *condensing* information within the sentence; it contributes to *language economy*.

Out of 658 nominalizations in total 8 scientific texts, 492 are material, 110 are relational, 15 are mental, 32 are verbal, 6 are behavioral and 3 are existential processes. By comparing the congruent and metaphoric versions in above instances, it implies that unpacking a text often involves re-inserting human actors often rendered unnecessary, by nominalization. The ability of nominalization to condense meanings is also clearly shown when we simply compare the length of the original nominalized text with the length of the unpacked version. Significantly, this unpacked version has lost much of its prestigious sound: it now seems very much more ordinary (and perhaps more accessible) than the original text (Eggins, 1994).

IGM in Sports Texts

Academic writing and adult writing frequently use nominalizations, and the sports discourse also is not excepted from this phenomena. As everybody knows, sports news has always been a great area of interest and entertainment, especially for adults. In these texts, lexis and grammar are re-arranged in a way to capture the mind of readers. Journalists in sports columns of some newspapers especially the ones analyzed in the current study, have used IGM to a great extent, so the application of grammatical metaphor comes to be one of the important stylistic features of English sports texts, since, sports texts must be motivating enough in capturing, arresting and getting the readers' attention and bringing them to the world of sports.

The following table represents samples of IGMs selected randomly from the analysis of 8 sports texts:

Table 3: Samples of IGMs extracted from 8 Sports Texts

No.	Metaphorical wording	Congruent wording	Process type	Frequency in each text
1	patriot's vulnerabilities	patriot is vulnerable in s.th	Relational	1
2	for a long gain	to gain success for a long time	Material	1
3	little choice	can be chosen by little chance	Material	1
4	tears in Naples	Naples cried	Behavioral	1
5	disbelief	not to believe in something	Mental	1
6	Neymar's movement	Neymar moved	Material	3
7	creativity	to be creative	Relational	1
8	no wasted motion in her legs	She moves very effectively and professionally	Material	1
9	exclusiveness	to be exclusive	Relational	1
10	Kidd said in a statement released by ...	Kidd stated something which was released by ...	Verbal	1

The instances of IGM in 8 sports texts indicated that nominalization was also utilized in these types of texts. In these 8 texts, there are 351 IGMs in which 269 go for material, 36 for relational, 28 for mental, 14 for verbal, 3 for behavioral and 1 for existential.

Frequency of IGM instances in Scientific and Sports Texts

In order to find out the frequency of IGM in these texts, the Chi- square test was found as an appropriate statistical procedure. The data were analyzed and conducted in SPSS program and tables and graphs were also extracted from SPSS too. Table 4 shows the number of IGMs observed in scientific & sports texts:

Table 4: The number of IGMs in scientific & sports texts

text type			
	Observed N	Expected N	Residual
scientific	658	504.5	153.5
sports	351	504.5	-153.5
Total	1009		

As shown in Table 4, the total frequency of IGM instances in scientific texts is 658, while in sports texts it is 351. Results of chi-square test revealed that there is a meaningful difference in the frequency of IGM in these two text types. So the hypothesis H1, indicating that *Ideational grammatical metaphor (IGM) is likely to be used more frequently in scientific texts than in sports texts*, was confirmed.

The comparison of process types in scientific and sports texts

A Chi-square test was used to compare and contrast the process types used in these texts. The following tables show the frequency and percentage of Process types in scientific & sports texts as well as the results of Chi-Square Test:

Table 5: Process types in scientific & sports texts

text type * Process type Cross tabulation

			Process type						Total
			Behavioral	Existential	Material	Mental	Relational	Verbal	
text type	scientific	Count	6	3	492	15	110	32	658
		Expected Count	5.9	2.6	496.3	28.0	95.2	30.0	658.0
		% within text type	.9%	.5%	74.8%	2.3%	16.7%	4.9%	100.0%
	sports	Count	3	1	269	28	36	14	351
		Expected Count	3.1	1.4	264.7	15.0	50.8	16.0	351.0
		% within text type	.9%	.3%	76.6%	8.0%	10.3%	4.0%	100.0%
Total	Count		9	4	761	43	146	46	1009
	Expected Count		9.0	4.0	761.0	43.0	146.0	46.0	1009.0
	% within text type		.9%	.4%	75.4%	4.3%	14.5%	4.6%	100.0%

Table 6: Chi-Square Test

	Value	df	Asymp. Sig. (2-sided)
Pearson Chi-Square	24.706 ^a	5	.000
Likelihood Ratio	24.009	5	.000
Linear-by-Linear Association	2.399	1	.121
N of Valid Cases	1009		

a. 3 cells (25.0%) have expected count less than 5. The minimum expected count is 1.39.

As seen in Tables 5 and 6, the results of chi-square showed that there is a meaningful difference in the process types which exist in these texts. According to the results, in addition to the employing the material and relational types to a great extent in these two types of texts, the mental process type in sports and relational one in scientific texts occupy a large space. Figure 2 displays the frequency of IGM in scientific and sports texts:

Figure 2: Frequency of process types in both scientific & sports texts

From 658 instances of IGM which were extracted from eight scientific texts, 74.8% are material, 16.7% relational, 2.3% mental, 4.9% verbal, 0.9% behavioural, 0.5% existential process types were obtained. The scientific texts represent the dominant textual forces of material and then relational process types than any other types.

351 instances of IGM were extracted from sports texts. Out of this number, 76.6% of them have material processes, 10.3% of them are relational, 8% mental, 4% verbal, 0.9% behavioral and 0.3% of them are existential. It should be stated that in each of the text types of the study, there aren't exactly the same numbers of GMs, but, the dominant process types in both are material (actions and doings, 492 in scientific , 269 in sports), and relational (based on being and having, 110 in scientific, 36 in sports).

So, regarding the use of all six process types in both of the text types and also having the material, and then relational process types, as their dominant process types; and on the other hand, some differences in the frequency of process types of IGM in two text types, can lead us to conclude that, the hypothesis H2, indicating that the process types of IGM are likely to be used more frequently in scientific texts than in sports texts, was confirmed.

Frequency of IGMs per 1000 words in each text type

The following Table and Figure show the frequency of IGMs per 1000 words in the scientific and sports texts:

Table 7: Frequency of IGMs per 1000 words in two text types

text type		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	scientific	110	65.1	65.1	65.1
	sports	59	34.9	34.9	100.0
	Total	169	100.0	100.0	

Figure 3: Frequency of IGMs per 1000 words in two text types

As it's evident in the above table and figure, scientific texts on the whole, have employed 110 instances (65.1%) of the IGM, and sports texts have employed 59 instances (34.9%) of IGM per 1000 words.

Discussion

Ideational grammatical metaphor is an incongruent representation of the experiential meaning in the configuration of the clause. Logical grammatical metaphor refers to ideas that are organized in an incongruent form at the level of discourse. Texts with a high degree of GM tend to be considered prestigious, abstract, objective, academic and formal.

In scientific texts, IGM plays a significant role and has a special ground in these types of texts; however in sports texts, the instances of GM are of a low level of frequency compared to the scientific ones. Nominalization has been used in both text types, turning the process (verb) into concept (noun). As a result, the tone of writing seems more formal and abstract.

This research finds support in the research findings of Halliday (1985), that the ideational grammatical metaphor or transitivity analysis should bring out a material process type. A rather obvious expectation that was construed by the analysis of congruent wording in scientific and sports texts was the higher frequency and dominant textual force of material process types in both of the text types. The results of the present study revealed that both scientific and sports texts of English newspapers employ IGM and approximately make use of all the six process types, but the level of IGM manifestation in scientific texts is higher than that in sports texts (scientific: 65.2 & sports: 34.8 percent). Furthermore the material and relational process types were found as the dominating textual forces in both text types and low frequency of other process types.

Considering the frequency of IGM per 1000 words in both texts, the findings also showed the high frequency of the material and relational processes compared to other processes.

Although the material and relational processes were regarded as the most frequent and dominant process types, it was found that the mental process in sports texts and relational process in scientific texts occupied a large space.

The next finding that the study reached was that not always a noun form standing as a sample of GM would be raised out of a verb form, but sometimes a noun form which has no verb form, plays the role of a GM. For example, in the following sentence, 'tear' is an example of GM which stands for the verb of 'crying'.

'But that goal will go down as beautiful in Dortmund's history- and it reduced Gonzalo Higuain, Napoli's Argentine striker, to *tears* in Naples'.

In the congruent wording of the above sentence, 'cried' is the verb form offered for 'tears'.

Furthermore, in some cases instead of verbs, the adjectives are nominalized. For example, the word *flexibility* doesn't have verb form. Rather, it is nominalized form of the adjective *flexible*. This is also true about the word *difficulty* from adjective form *difficult*.

CONCLUSION

In the current comparative study, based on systemic functional approach, a functional analysis was carried out in an attempt to identify IGM elements, in English newspapers across scientific and sports texts.

Nominalization- a typical process, leading to grammatical metaphor is a striking feature of scientific and sports texts, making the writing more interesting, lively, convincing and colorful. Based on the findings which address proposed research questions, nominalization has been used in both of the text types, turning the process (verb) to a concept (noun). Both of the scientific and sports texts, include all types of processes, but the frequency and percentage of nominalization of ideational grammatical metaphor used in scientific texts, was more than sports texts in English newspapers. So, it can be concluded that, the type of text affects on the manifestation of IGM. In other words, the manifestation of IGMs is text-specific; since, the same number of texts from each text types (8 texts from each category), with approximately the same number of total words (6000 words of each category) were under analysis.

It was also noticed that, the occurrence of a GM in each text, increases the general volume of information, the clause or the sentence expresses: the greater the number of included nominalizations, the greater the volume of the information expressed by the sentence. Thus, GMs are crucial, ideal for the journalistic discourse especially scientific and sports texts which place high quality on the transference of information in an economical and condensed way. In each text, the goal is the conveyance of the intended meaning to the reader or the audience in a vivid, tempting and interesting way. Another conclusion drawn from through the identification of GM throughout the 16 texts (8 texts from each category), was the advantage of application of GM in increasing the lexical density. In both of the text types, the purpose of using an ideational metaphor is to render the lexis and grammar in the way the journalist wants in order to inform or produce a certain effect on his/her reader or audience. Without ideational grammatical metaphor both written texts would sound artificial and informal.

Grammatical metaphor instances in scientific texts of this study, serve several important functions like condensing, compacting, abstraction and creating technical and professional terms as well as lexical density, assuming the job of initiating the reader into certain economic world views or rigged states of affairs, in a quick, compact and desirable manner. GM happens in science, to be a powerful device to condense information about the context of situation. The condensing feature just corresponds to the characteristic of the news discourse that is using fewer words in a sentence to express more messages and also creating technical, expert and professional terms that are available to the beauty of clause and absorbs the reader's attention to follow the writing.

Grammatical metaphor in sports texts serves several functions such as condensing, compacting, encapsulation and produces certain effects on the reader's mind causing more ambiguities.

Limitations and delimitations of the study

Owing to grammatical metaphor usage in languages which is really wide and diversified, it is beyond both the scope of this study and researcher's personal capabilities to address the other types of grammatical metaphor such as interpersonal metaphor and also all texts of English newspapers. Instead, the present study is just restricted to the analyzing scientific and sports texts of English newspapers regarding ideational grammatical metaphor in SFL.

As is well-known, in statistics, the sample population, is of vital importance to the validity and credibility of research itself. However, the number of texts for analysis is to some extent limited and only eight texts were selected randomly from each category among the aforementioned newspapers. So, one should be very cautious in generalizing the results to other scientific and sports texts of other English newspapers or other genres and even one should choose more texts in both text types to expand his or her study scope. On the other hand, the study has approached the phenomena of grammatical metaphor only from a single theoretical framework, that is Halliday (2004).

ABSTRACT

The main purpose of this study is to explain the relationships between the critical thinking and translation quality to clarify the critical thinking abilities of undergraduate students and to provide insight into this relationship. Explanatory research design, among mixed research designs, was used. Data were collected from 106 undergraduate students in the department of English Language Teaching at Ataturk University in Turkey. In the first phase of the study, a questionnaire was conducted to the students to test the relationship between critical thinking skills and translation. In the second phase, students were interviewed to explain the effect of critical thinking abilities on their translation quality. For quantitative data analysis, descriptive and inferential statistics were used. Quantitative data were analyzed with MINITA package program. The independent variables in the study are gender and the dimensions of critical thinking. The dependent variable is translation quality. For quantitative data, paired t-test and correlation analysis were conducted. As the qualitative data, textual analysis was done. The results of the study show that there is a positive relation between critical thinking skills and translation quality. Moreover, according to the results, critical thinking increases the translation quality of undergraduate students. Moving from these results, it is implied that critical-based activities in courses contribute to the translation performance of students and these activities help students to reflect on their translations with a critical perspective. At this point, this study recommends the teachers to use critical thinking –based techniques in their courses and to teach their students how to use their critical thinking skills.

KEYWORDS: Critical thinking skill, language learning, Translation theories.

INTRODUCTION

There is not a constant definition of CT, and the definitions of critical thinking have been changing (Huitt, 1998). Several definitions of critical thinking have been introduced in the education field. Fasko (2003) reported that “perhaps a hybrid definition would facilitate a synthesis of these various perspectives” (p.8). Beyer (1995) took into account critical thinking as the processes of 'making reasoned judgements' (p.8). Kurfiss indicated that critical thinking is an investigation whose aim is to see the sights of a situation, phenomenon, question, or problem to

arrive at a conclusion about it and to integrate all available data that can be convincingly justified (Kurfiss 1988; cited in Ab Kadir, 2007). Critical thinking is purposeful, reasoned, and goal-oriented included in problem solving, inference formulation and decision making procedures (Halpern, 1999).

Metacognition is considered, by Facione (1990) to be a core skill which has impact on a learner's critical thinking ability, and impacts on a learner's academic success (Facione 1990; cited in Deborahm 1993). "Metacognition is being aware of one's thinking as one performs specific tasks and then using this awareness to control what one is doing" (Jones & Ratcliff, 1993, p. 10; cited in Srinivasan & Crooks, 2005). Critical thinker engages in certain types of conversations and relations with others (Burbules, 1999). They think critically about what the others say and do not believe whatever they hear or see without pondering about it.

Indeed, the critical thinkers, use both the disposition (or propensity) and the relevant knowledge and skills to engage in an activity with reflective skepticism (McPeck, 1985). That is, not only are they prone to question things, but they have relevant knowledge and understanding to do productive performances. The term critical thinking refers to the use of those cognitive skills which lead to the approach a desirable outcome (Halpern, 2002). According to two conceptions of critical thinking, i.e. 'pure skills' and 'skills plus tendencies' (Siegel, 1988, p.6), the teaching approaches of critical thinking can be classified into two groups; (1) the teaching of critical thinking referring trainable and assessable reasoning skills and processes, and (2) teaching of critical thinking as well as dispositions and awareness along with critical thinking. Study demonstrates that it is important to involve students actively in different critical thinking processes, such as analysis of ideas through discussion, reflection and writing to make it significant (Solon, 2003).

LITERATURE REVIEW

Critical thinking has pivotal role in some key skills such as problem solving and decision making (Kallet, 2014). According to scholars, CT skills can be taught directly or explicitly but as teaching CT needs high capacity and confidence of both students and teachers, applying CT won't be that easy. So, teachers have to make the students ready to think critically and creatively in order to achieve their objectives. They can form discussion groups such as debating team and jigsaw groups to increase the students' interaction, debate and reflection (MacKnight, 2000). Similarly, Yuretich (2004) believed that teaching critical thinking is the teaching of reasoning skills, for example, analysis, synthesis and evaluation and let the students do active learning. Through applying active learning strategies, students were given the opportunities to process and evaluate information through discussion with each other. Therefore, giving students a critical thinking opportunity, for instance, allowing time to pause, reflect on, analyses and discuss an issue in a context to support critical thinking, is the key to critical thinking education. Also, in terms of teaching, engaging students in different types of reflection, exchange of information and group discussion in a context are main strategies for developing students' critical thinking skills (ibid).

On the other hand, utilizing different critical thinking skills by teachers or students and as a method of teaching can increase the efficiency of translation classes and it helps to enrich the quality of translation. Since last decades, translation has been taken into account as a novel discipline along with its theories, techniques, principles, and approaches. And the new perspectives to translation substituted with the old ones i.e., per se literary translation training. The colossal development of cybernetics, electronics, computers and the sciences of information require any training to cover most possible types of translation-interpreting (Gonzalez, 2008). Ho (2005) advised that translation studies should be carried out based on studying the cause-effect relationship between translation research and translation practice.

On the other hand, according to Zainudin (2012), translation is an activity of mediate meaning from a source language to a target language. The ability to choose the correct and appropriate translation technique is a prominent skill to translators; therefore, it is essential for translation students to be aware of what particular technique should be used and why. The new approaches to teaching translation include theories of translation regarding text type and function (Newmark, 1988). It means that in most of the places, English translation is being offered in various universities. And the “read and translate” strategy is the most favorable method (Gonzalez, 2004).

Indeed, translation instructions and consequently putting theory into practice are not usually taught to the students in class. What is asked from the students in most classes is reading and translating without pondering about what they are translating i.e., literary translation. Nowadays the world enquires competent and proficient translators in the most cases such as politics, commerce, and economy and so on. Hence, training competent translators is vital. Translation studies theories open new windows toward translation education. They contribute to the increase of efficiency in translation teaching, which leads to bringing up more qualified translation graduates.

These theories include linguistics, functional and theories of cultural turn. Toury's model, as one of the theories of cultural turn, focuses on the fact that translation is between complete equivalence with the source text and complete acceptability in the target language through norms (2011). Toury (2000) declares that norms are not constant entities and sometimes, some kind of changes have occurred during translation process due to nature of norms. Sometimes, these changes occur more quickly, and sometimes the process may take longer, and this does not mean that translators are passive. Rather, many of them help shape the process of changing.

Translator choices in the process of translation are monitored by the norms. It is clear that incorporating theoretical components into translation process “accelerate and enhance the scope of the student's progress, helping him/her to make appropriate decisions and manipulate appropriate strategies and tactics” (Gile, 1991, p.185). Ennec (1996) states that not only is critical thinking applicable to individual decision making but also to group decision making as well. While engaging in CT, students require monitoring their thinking process, evaluating their progress, making sure about accuracy and making decisions about the use of time and mental effort (Halpern, 2003). Darray (1999) concludes that the author constructs a text through his ideas

and images. The translator strives to transfer the meaning from SL to TL. S/he tries to translate as if the reader would not be able to feel that as a translated text; i.e. translator requires diagnosing a distinction between assumptions and facts. He needs to be capable of differentiating facts from inferences and evaluate the author's point of view.

Hence, according to Gaber (2002), CT contributes to activate the translator cognition and let the translator be able to utilize his/her mental activates in order to have a perfect performance during the translation process. Translation is a type of decision-making process categorized into some prominent activities such as: planning translation, analyzing information, translation, revision, editing, and proof reading reviewing, completing translation and delivering translation (Darwish, 2004). Dahroug (2007) also states that training students to strive consciously to use their CT skills to understand and manage their translation process is so important. That is exactly what CT believes on it. Commeyras (1989) stated that in order for evaluating possible interpretations to determine the meaning of the text, the learner has to comprehend the text via reasoning skill. Reasoning is one of the main characteristics of critical thinking and its necessity to use in translation is felt, as well. So, the students' need to use it as they read a text such for clarifying what they mean, giving reasons, evaluating reasons, elaborating, supporting their evidence and so on. Translation, especially translation of journalistic texts, directly relates with a variety of cognitive or critical thinking abilities. In other words, critical thinking ability is the one that deals with deep understanding of reading and translating.

RESEARCH QUESTIONS

1. is there any relationship between translation quality and development of critical thinking ability in translation education?
2. To what extent does critical thinking empower translation quality of undergraduate student's translations?

METHODOLOGY

Research Design

This study is a concurrent validity study between a general critical thinking skills test, the California Critical Thinking Skills Test (CCTST), and translation test outcome evaluation. In this study, explanatory research design, among mixed research designs, was used. In the first phase of the study, a questionnaire was given to the students to test the relationship between critical thinking skill and translation. In the second phase, students were interviewed to explain the effect of critical thinking abilities on their translation quality. For quantitative data analysis, descriptive and inferential statistics were used. Quantitative data were analyzed with MINITA package program. As to qualitative data, textual analysis was done.

Participants

106 undergraduate students (65 female, 41 male) in the department of ELT at Ataturk University in the spring of 2014 participated in the current study.

Data collections Instruments and procedure

The students, in the first phase, were given the critical thinking skill questionnaire and they were asked to translate five paragraphs consequently. The questionnaire consisted of 34 questions and 45 minutes time to fill in. Within a week they were taught CT skills and method of translating via CT skills. The study lasted from April until June. The instruments used in the current study were CCTST (California critical thinking test), a test for translation including paragraphs from Oliver Twist and BBC, tutorial course design and interview. The CCTST makes available a collection of scale scores describing strengths and weaknesses in different skill areas. The California Critical Thinking Skills Test gives scores on these scales: Evaluation, Inference, Deduction, Induction, Analysis skills and an overall critical thinking score (Facione, 1990). There are two methods of teaching critical thinking. One of them is teaching CT directly or overtly. It means that the teacher explains the definition of CT, its skills and dispositions and elaborates the prominence of learning CT not only in the students' academic life but also in their everyday life. This method mostly is taught in psychology courses. As CT is approximately abstract and hard to explain. Most of the teachers prefer to teach it directly in class. Test takers can get 0 to 34 scores in the test. Total scores ranging between 10 to 20 are considered as norm level. The common score is 16 with 4.45 SD. The reliability of the questionnaire was carried out by Delphi strategy and its validity was measured. In second part of the disposition test, 9 decision-making and problem solving questions were asked from the students to answer in Turkish. In the 2nd part, the students were asked to give feedback about the test. In this study, direct method of teaching CT was used. It took 30 minutes. The definition of CT and why it is used in our academic life especially in reading and translation were presented. Indeed, the presented PowerPoint slide at the beginning could draw the students' attention to the topic and made them follow the lesson eagerly. Firstly, a general question asked from the students to get them involved in the topic and some of the students' positive answers broke the ice and led to the pleasant interaction during the lesson.

Another method of teaching CT is indirect teaching. On the other hand, the students can learn CT skills covertly and indirectly; that is, students are able to know what CT skills are subconsciously during learning their own course. It is similar to what occurs in learning and acquisition distinguishes. In CT indirect teaching, teachers make students acquire skills without knowing exactly what happens in learning. This method of teaching needs much more time and experienced teachers, as well.

In this study, direct method of teaching CT was used. It took 30 minutes. The definition of CT and why it is used in our academic life especially in reading and translation were presented. Indeed, the presented PowerPoint slide at the beginning could draw the students' attention to the topic and made them follow the lesson eagerly. Firstly, a general question asked to the students to get them involve in the topic and some of the students' positive answers broke the ice and led to the pleasant interaction during the lesson.

After taking second translation test, some volunteer students were given an interview. The conducted interview was recorded and the students' feedback was analyzed consequently. As interview is one of the most widely-used instruments in qualitative research, it is used to make researchers provide the opportunity to collect data concerning the stages or the processes. As it

can be inferred from the interview, the participants mainly focused on efficient changing created by teaching CT skills in tutorial and its positive effect on their translation. Under such categories and codes, it was concluded that most of the participants believed in CT beneficial effect in their translation.

Data analysis

Both descriptive and inferential statistics were applied to evaluate the research questions. The data were analyzed using MINITAB statistical package. The independent variables in the study are gender and the dimensions of critical thinking. The dependent variable is the translation quality. Paired t-test and correlation test were conducted. According to Fisher (1925), 0.05 level of significance could be used as the alpha level to test each hypothesis (Cowles, 1982).

RESULTS AND DISCUSSION

The total score reveals one's overall reasoning and, consequently, critical thinking skill level. The total includes the sum score of analysis, inference, and evaluation, which are the key skills in critical thinking. The CT overall scores of the translation students on the CCTST are summarized in figure 1. The mean score of the students on CT skill is 17.05 with the standard value of 5.20. The minimum and maximum scores are 5 and 29, respectively.

Figure 1: The CT overall scores of the translation students on the CCTST

The total translation score of the students on the translation tests were summarized in Figure 2. The mean score of the students is 99.35 with the standard deviation value of 39.46. The minimum and maximum scores are 21 and 223 respectively. The coherence scores' distribution with 99% confidence is normal.

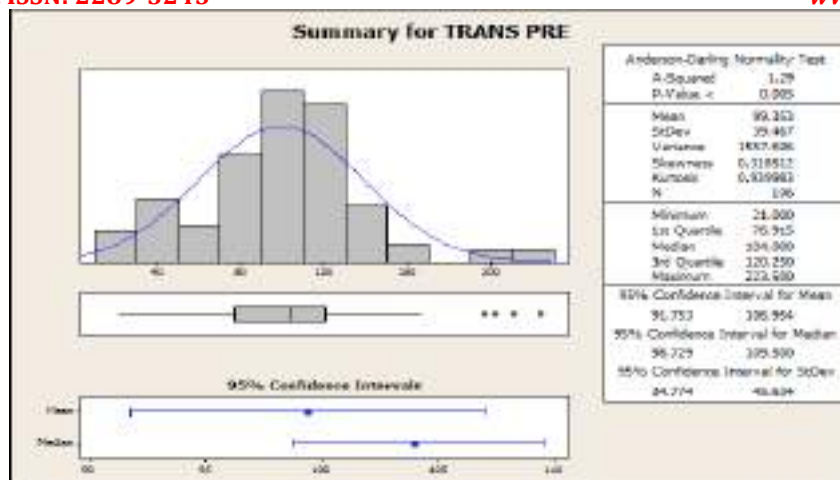

Figure 2: Results of translation test before CT course

The translation scores of the students after CT course translation tests are given in figure 3. The mean score of the students on the word is 165.19 with the standard deviation value of 27.28. The minimum and maximum scores are 93.0 and 217.1, respectively. The post translation scores' distribution with 90% confidence is normal.

Figure 3: Results of translation test (overall) after CT course

Paired t-tests were used to compare the extent of changes in Translation quality before and after attending short CT training. Figure 4 shows the average pre- and post-test scores for all participants included (n=106). An overall increase in the scores is again seen from pre-to post-test, with very similar findings to the previous figures. A paired-samples t-test was conducted to find out the effect of the training on participants' knowledge. There was a significant difference between pre-test scores (M=99.35, SD=39.47) and post-test performances after training (M=165.19; SD=27.28); $t(106)$, $p < .001$. The mean of total score advanced.

Figure 4: Comparison of pre-and post-test scores on translation quality

Discussion

The comparison of average pre- and post-test word scores for all participants shows an overall increase in scores from pre-to post-test. A paired-samples t-test was taken to determine the effect of the CT training. There was a significant difference between pre-test scores and post-test performances after training.

The pre- and post-test scores for all participants demonstrate an overall increase in scores seen from pre-to post-test. A paired-sample t-test was prepared to determine the effect of the training participants' knowledge. There was a significant difference between pre-test scores and post-test performances after training. In pre-test performance, students mostly translated traditionally. It means that word by word was preferred in the first test. Students translated the texts according to their surface meaning (denotative meaning). While in the second test, there was an obvious change in their performance. Indeed, the change was the result of tutorial and the presented CT skills, Interpretation, as one of the main skills was clarified and activated students' cognition to what they had already known; this is what we call background knowledge and it contributes to reading comprehension and translation consequently. Under the umbrella of CT, students' picked equivalents changed, as well.

Paired t-tests were used to compare the change in translation quality before and after attending short CT training. The average pre- and post-test scores for all participants show an overall increase in the scores. A paired-sample t-test was conducted to determine the effect of the training on participants. There was a significant difference between pre-test scores and post-test performances after training. The participants' understanding about the paragraphs was different on the shadow of presented tutorial. Pre-test results show that the participants could not mostly grasp the text coherence according to their translation equivalents. However, post-test results indicate that the participants could get the most delicate concept and such an understanding could lead to a better performance in the post-test performance.

In showing the probability of any relationship between translation quality and development of critical thinking ability it can be said that who has higher score in CT skill presents better performance in translation as well. On the other hand, translation theories are indirectly related to CT skills. For instance, according to Toury model, translation is a decision making process and norms play key roles in this process. Indeed, preliminary norms lead to the choice of what to translate in the first place and operational norms direct decision making during the translation process (Herman, 1991). In comparing the CT skills and translation process, it can be inferred that the same procedure takes place. On the other hand, overlapping CT skills including deductive inference, inductive inference, and inference to value judgements leads to decision making process results from Toury norms (Ennis 1987; cited in Aloqaili, 2012). Students' performance in evaluation is high, which means that students are capable to evaluate the text in order to critique or judge the value of its components syntactically, semantically and pragmatically, as well. On the other hand, evaluation skill makes the students evaluate the text and choose the best alternative according to their interpretation.

CONCLUSIONS

According to the results of the study, it is recommended to teachers to tutor CT skills in translation courses. It means that applying CT skills in translation classes can enhance the quality of students' performance and make them think critically about their own translation and reflect on it to present a good performance. Findings show that there is correlation between translation theories and critical thinking skills. As translation theories effect on translation performance, critical thinking can be impressive, as well. On the other hand, if teachers apply critical thinking skills in their translation classes and make students learn how to utilize such skills in translation activities, they will encounter with high quality performance of translation. Also, it can be inferred that learning translation technique equipped with logical thinking instruments, would expand the translators perspective and it would not limit them with traditional style of translation per se.
