the materials were focused on grammar. This kind of practice did not promote interaction between teacher and students and between students and other students. And when interaction happened the role of teacher was very dominant. In order to promote classroom interaction using the target language, teacher needs to provide opportunities for students to interact. Gebhard also argues that interactive classroom requires teachers to create situation where students talk more and teacher talk less. This can be done only if teachers are creative in making or providing topics which are interesting to students and accommodative to the students' cultural differences.

A professional foreign language teacher must be able to accommodate every student's cultural differences; otherwise, he/she will not be able to create interactive classroom (Yeh, 2005). Interactive classroom is the one that is culturally responsive (Grant & Gillette, 2006; Boyle-Baise, 2005). According to Grant & Gillette, a culturally responsive teaching means that the teachers must accommodate expectations and needs of all learners. Similarly, Boyle-Baise also argues that teachers who practice culturally responsive teaching accommodate learners' experience. Therefore, in their teaching, they see every learner as a student, family, and community member.

Teachers should also let students express their opinion and ideas in their own ways (Gebhard, 1996). This may mean that what is meaningful for teachers may not be so for students and what is not interesting for teachers may be interesting for students. In promoting interactive classroom, students must be given opportunities to negotiate meaning between students. Teachers should let students ask and clarify their opinion. The topics of interactive classroom should not come from teachers only but can also come from student.

Factors Affecting Teaching Professionalism

In this section, the writers elaborate theoretical issues on aspects that affect teachers' professionalism. Drawing ideas from a number of sources on the issue of teachers' professionalism (Whitehurst, 2002; Alatis, 2007; Bransford, 2005; Sweed, 2008; Kealing, 2008) the writers believe that the acquisition of teachers' professional characteristics does not come from one source. The writers believe that at least six aspects play a significant role on teachers' professionalism. These are general knowledge ability, focused-training, teaching experience, knowledge of subject matter, certification, and academic degree.

General Knowledge Ability

One of the aspects that influences the success of teaching is believed to be the teachers' general knowledge ability (Whitehurst, 2002). This is one of the reasons why a teacher candidate is required to hold a specific degree or qualification. According to Whitehurst, general knowledge ability is the cognitive ability to acquire knowledge. It is a mental action or process of acquiring knowledge through thought, experience, and the senses. This general cognitive ability takes an important role in forming teachers' professionalism (Whitehurst, 2002; Greenwald, Hedges, & Laine, 1996). A teacher with high cognitive ability is able to design learning activities that inspire learners' interest in order to strengthen learners' motivation (Cochran-Smith, 2003).

Focused -Training

Teacher professional development has an important role on teachers' professionalism (Smith, 2005; El-Okda, 2005; Henze, Driel & Verloop, 2009; Levin, Hammer, & Coffey, 2009; Cohen and Hill, in Whitehurst, 2002). Smith (2005) argues that professional development involves learning to improve existing conditions. Similar argument is proposed by El-Okda (2005). According to El-Okda, professional development is part of teacher learning process and it must be conducted continuously along with teacher life-services (El-Okda, 2005). El-Okda also adds that inexperienced teachers must get more training, as there is distinct expertise between experienced and inexperienced teachers. Teacher training is essential for inexperienced and novice teachers because they are often unable to attend students' thinking until they are able to identify classroom routines (Henze, Driel & Verloop, 2009). They add that teacher training is also believed to have an important impact on teacher competence (Henze, Driel & Verloop, 2009). According to Levin, Hammer, & Coffey (2009) teacher training must include many aspects of teaching that comprise curriculum, materials development, teaching techniques, and teaching evaluation.

A study by Cohen and Hill (Cited in Whitehurst, 2002) on the role of professional development training suggests that training has a significant contribution on teacher professional development. Whitehurst suggests that training should be focused on subject matters, academic content, and curriculum.

Teaching Experience

Teaching experience is also believed to be one of important aspects that make up teachers' qualities (Johnston et al., 2005; Yeh, 2005). The role of teachers' experience on the acquisition of professional qualities has been studied by Johnston et al., (2005). Their study revealed that teachers' experience takes a crucial role on the development of teachers' professionalism acquisition. Alatis (2007) also argues that experience contributes to teachers' theory building. Alatis mentions several aspects that make up teachers' theory building. These are teachers' experience as a language learner and as a teacher, professional development (training), classroom practices, and teaching reflection. These all become teachers' collection of cognitive information. The collection of cognitive information then shapes the teachers' characteristics and their characteristics are represented in their daily teaching activities along with their teaching career development.

As has been mentioned, teachers' experience is part of aspects that form teachers' characteristics and this in turn affects teachers' personal theory building that affects teachers' classroom teaching practices (Levin & He, 2008). It is a common practice that teachers learn from their daily activities to improve their teaching performances. Teachers' experience can be derived from two periods which include the period of before teaching services and the period of while teaching services (Alatis, 2007; Woods, 1996). According to Woods, experience during services enriches teachers' theory building along their career. Thus, there is a cyclical process involving teachers' experience and their theory building.

Knowledge of Subject Matter

A teacher's knowledge of subject matters is the essence that directly affects students' achievement (Whitehurst, 2002; Grossman et al, 2005). As Grossman et al. argue, this comprises two major aspects (the knowledge of subject being taught and the knowledge of how to teach the subject). A teacher's knowledge of subject matters is gained from many different sources such as from academic institution, training, and self-development.

Certification

It is a common sense that good teachers are the ones who are talented in teaching and educating learners and good teachers might not be made through certification. Thus, good teachers are communities certified teachers. However, from the authority point of view, certification program can be seen as one of government policies aiming at improving teacher quality (Tamir & Wilson, 2005). Teacher certification has long been at issue in education (Darling-Hammond, Wise, and Klein, 1999; Whitehurst, 2002). In Indonesia, teacher certification has been an important issue. It has been part of professional development policy of the Ministry of National Education which has gained support from the Indonesian law makers (Law No. 14/2005).

Academic Degree

Academic qualification is one of triggers of teachers' professionalism acquisition. The contribution of a teacher's academic degree is in most part resulted from the conceptions of professional teaching standards set up by the academic institution a teacher candidate spent his/her study. The conceptions of professional teaching standards have been designed by policy makers, educators, and teacher educators. The process setting professional teaching standards involves academia from various universities and government agencies.

RESEARCH QUESTIONS

This study was aimed at answering the following research questions:

- Do respondents agree on the positive role of the six variables used in this study towards the development of EFL teachers' professionalism?
- What is the order of importance of each of the variables?

METHODOLOGY

Participants

The participants of this were 119 EFL teachers of senior and junior high schools from 3 districts in Cimahi, West Java-Indonesia. Subjects were taken from 31 schools through quota- random sampling.

Instrument

The instrument used in this study was questionnaire. The questionnaire was designed in two types (Presence-Absence Questions and Rank-Ordering Questions, based on Jackson, 1995). The Presence-Absence questions were to reveal respondents' opinion towards the contribution of the variables used in the study on teachers' professionalism acquisition, while the Rank-Order

questions were used to disclose respondents' opinion as to the order of importance of each of the variables towards its contribution to teachers' professionalism. Six variables used in this study were *General Knowledge Ability*, *Focus Training*, *Knowledge of Subject Matter*, *Teaching Experience*, *Certification*, and *Academic Degree*.

Procedure

Data were taken through a number of steps. First, the researchers chose 31 schools out of 77 schools from three districts. The choice of the schools was based on the status, level, location, and classification of the schools. Of the 31 schools chosen, 14 schools were junior high schools, 10 schools were senior high schools, and 7 schools were vocational schools. The total number of English teachers from the 31 schools was 124. Second, questionnaire was given to 124 teachers with 119 of them responded the questionnaire and 5 of them did not respond it. The final step was analyzing the data using descriptive statistics.

FINDINGS AND DISCUSSION

The findings suggest that *Knowledge of Subject Matter* got the most positive response where 100% (119) of respondents said *Yes* and 0% said *No* towards the contribution of this factor to the acquisition of teachers' professionalism, followed by *Focused-Training* with 116 (97.5%) respondents agreed and 3 (2.5%) respondents disagreed. Third place was for *General Knowledge Ability* and *Teaching Experience* with 122 (94.1%) respondents agreed and 7 (5.8%) respondents disagreed. The fourth place was for *Academic Degree* with 101 (84%) respondents agreed and 18 respondents (16%) disagreed, while *Certification* got the lowest agreement from respondents with 87 (73%) agreed and 32 (27%) disagreed. This suggests that respondents believe that all factors discussed above have important contribution to the acquisition of teacher professional characteristics. The results also show that *knowledge of subject matter* is believed to be the most important aspect of the acquisition of teacher professional characteristics while *certification* is the least aspect that contributes to the acquisition of teachers' professional characteristics.

The findings also suggest that most respondents considered *General Knowledge Ability*, *Knowledge of Subject Matter*, and *Academic Degree* have a strong effect on teachers' professionalism acquisition. On *General Knowledge Ability*, 47% respondents put it in the first rank and 11.7% in the second rank, on *Knowledge of Subject Matter*, 45.37% respondents put it in the first rank and 34.45% respondents in the second rank, and on *Academic Degree*, 47.89% respondents put it in the first rank and 10.08% put it in the second rank. In the middle rank were *Focused-Training* and *Teaching Experience*, while the lowest rank was *Certification* where only 24.36% put it in the first rank and 45.37% respondents put it in the sixth rank.

From the findings, it can be said that most respondents believed that all six factors have positive contribution to the acquisition of teachers' professionalism. These findings confirm the theories that claim the six aspects to have positive contribution to the acquisition of teachers' professionalism (Whitehurst, 2002). Of the six factors, certification is an interesting phenomenon. Although certification is believed to have positive contribution to teachers' professionalism acquisition, the number of respondents who disagree on it is relatively significant

which made up of (27%) of the total respondents. This suggests that certification is not as important as other factors in fostering professionalism development. In addition, although respondents considered that certification has contribution on professionalism, its contribution was relatively minimum.

Respondents agreed on the mastery of knowledge of subject matter as the most contributing aspect of professional EFL teachers because of two reasons. First, knowledge of subject matter is the essence of teachers' qualities. It is the reason for a teacher's presence in the class. Another reason is that teachers without subject knowledge mastery will not be innovative. Knowledge of subject matter can be gained from many different sources such as formal education (academic degree), training, teaching experience, and such individual factors as general knowledge ability, learning motivation, and learning strategies.

General knowledge ability is an individual factor. This deals with a person's level of intelligence. It is believed that smart teachers are able to think creatively and therefore can build their professionalism faster. Teaching experience, academic degree, and focused-training also have positive contribution to the acquisition of teachers' professionalism. Experienced teachers are believed to be more professional than inexperienced teachers as they learn from their experience when dealing with students' problems. Academic degree also has positive contribution to teachers' professional development. Holding academic degree takes a long process of learning which has to be gained from a formal institution such as a college or a university. Focused-training is another factor that is believed to have positive contribution to teachers' professionalism. Focused-training includes activities that have to be taken during teachers' in-service periods as part of teacher professional development.

The controversy over the importance of certification on teacher professional acquisition is due to a number of reasons. Respondents who believe that certification has positive contribution to teachers' professionalism development argued that certification program, indeed, motivates teachers to work better. It also reminds them to teach better. In spite of their positive justification about certification, respondents also acknowledged that certification is a controversial program. For them, certification is also a reward that should have been given automatically without taking a test of it. Teachers who believe that certification does not contribute significant professionalism for teachers also have a number of reasons. For them, certification does not change teachers' personalities and behavior. Respondents who have negative perceptions on the contribution of certification acknowledge that certification is a government effort to improve teachers' performance but they believed that the beneficial effect of certification happens to teachers' welfare instead of to their professionalism growth. Certification does not guarantee teachers' professional acquisition.

CONCLUSION

This paper has discussed EFL teachers' professionalism and its affecting factors from both theoretical contexts and research findings. From theoretical point of view, teachers' professionalism is a broad aspect in which in order to acquire professionalism, one must take into

account a number of aspects that are believed to trigger the acquisition. The finding of the study suggests that the variables used in this study (General Knowledge Ability, Focused-Training, Teaching Experience, Knowledge of Subject Matter, Certification, and Academic Degree) are believed to have positive contribution to the acquisition of teachers' professionalism. This means that, in general, the finding of the study confirms the existing theories. Drawing from the findings of this study, the writers offer three suggestions. First, the policy makers in education take necessary measures to control the quality of teacher education. This is to make sure that teacher candidates undergo all standards mandated by the educational regulations. Second, the process of teacher recruitment should apply high academic standards to make sure that the accepted teachers are those who qualify for the job. Finally, on the issue of certification, there should be periodical evaluations to those who have been certified to make sure that they maintain their qualification and that they improve their quality.

The findings have revealed EFL teachers' beliefs on factors having positive contribution on the development of teachers' professionalism and have provided new insights and elaborative explanations on aspects that support teachers' professionalism development. In addition to its positive contribution, this research also has limitations. First, the number of participants was relatively small (119 EFL teachers), and therefore, the findings of this study may not always apply for different groups in a different period. Second, the design used in this study was descriptive quantitative. Thus, to some extent, the findings may be subjective in nature.

ABSTRACT

This study aimed to investigate how The Los Angeles Times and Tehran Times manifest their attitudinal representations in the discourse dealing with Iran's nuclear program. The two newspapers were selected non-randomly to cover an Iranian and an American newspaper for the purpose of comparison. To narrow down the scope of the investigation, four macro and five micro features were used based on vanDijk's (2002) framework to analyze 300 pieces of news in both of the newspapers. The frequency of the discourse strategies were calculated by two reviewer to arrive at the inter-rater reliability index through Pearson Correlation Analysis as ($r=.725$). The percentages of the structures were calculated and Chi-square analysis was used to show whether the differences were significant. It was found that the two newspapers represent their ideas differently on the same event. They used the macro strategies (i.e., to show positive or negative attitudes against the West or Iran). Thus at the macro level, the newspapers are significantly different. The Los Angeles Times emphasized the positive things about the West while deemphasized the positive things about Iran. At the micro level, there was significant difference between the frequencies of stability, accusing, authority, threatening and blaming used as micro discourse features in both newspapers. The implications of the study could be used for EFL teachers in teaching reading comprehension and ESP courses in politics.

KEYWORDS: Iran's nuclear program, negotiations, newspapers, Tehran Times, The Los Angeles Times

INTRODUCTION

Reading comprehension may be enhancing through the understanding of the textual components including the grammatical, lexical, graphic organizers and the attitudes behind the writers' sentences (Fairclough, 1993; Khaghaninezhad, 2012). The present study used Critical Discourse Analysis (CDA)-based investigation to show the differences between two popular newspapers' (i.e., Tehran Times as an Iranian media and The Los Angeles Times as a sample of the US) attitudes towards presenting positive or negative ideas regarding the nuclear negotiations between Iran and West with the leading power-the USA- and its allies-EU, Russia, and China). Thus it

dealt with discourse features in which the used some macro and micro features from the CDA perspectives.

Using vanDijk (2002) socio-cognitive model, this study tries to reveal how Iran's nuclear program negotiation are represented in the *Tehran Times* and *Los Angeles Times*. Iran's nuclear program negotiations as a political event have attracted the attention of media since 2013. This point should not be ignored that the focus of the study is on the role of language, and the way it is manipulated utilizing the micro and macro- discursive strategies suggested by vanDijk's socio-cognitive model.

The vanDijk's (2002) model was used to analyze the discourse features in the present study. 300 English political pieces of news were critically analyzed both at micro and macro levels in both *Tehran Times* (i.e., 150 news reports) and *The Los Angeles Times* (i.e., 150 news reports). However, the other research conducted by Ahmadian and Farahani (2014a, 2014b) on the same newspapers with the different discourse features among the discourse strategies introduced by vanDijk's model (e.g., hyperbole, distancing, implication, illegality, presupposition, etc. They worked on both micro-level included lexical features based on vanDijk's model and grammatical features based on Fairclough's (2001) framework.

There is a general assumption that the speech of the press shows attitudes against the other sides. Critical Discourse Analysis is an approach aimed at analyzing and describing the attitudinal of discourse features. The CDA practitioners offer need to follow the frameworks through which they check the discourse features at the macro and micro levels to carefully illustrate the ideas behind the pieces of news. These distinctions as macro discourse features are the general ideas of the news in both positive and negative modes (vanDijk, 2004) or at the micro level such as threatening (i.e., shows the threats of the opponents), authority (i.e., shows the power and supporting by legal powers, e.g., the UN, the EU, or The Nuclear Energy Agency (NEA), The International Atomic Energy Agency (IAEA), blaming (i.e., blame the other side), accusing (i.e., accuse the other side to violate the rules) or stability (i.e., resist on their policies without tangible change). There are other frameworks to analyze the discourse features of the media (e.g., Fairclough's (2001) framework). These frameworks deal with relational and expressive values of linguistic features are of considerable significance for analysts.

The focus of this study is on the discourse features of the events, actions, states, relationships, people and other participants involved in Iran nuclear program i.e., on the macro or micro level. Thus vanDijk's (2002, 2004) framework was studied and modified to employ the analysis. Using this theoretical framework, this study was to illuminate how an analysis based on a systemic functional approach, and the aims of CDA can be brought into play in looking at political discourses. The study of cross cultural discourse features in written texts has been an area of growing interest in the last decades. CDA is concerned with discourse in forming and being formed by social political practices (Fairclough, 2001). It is a paradigm of research, a program, or as Wodak (2001) suggests, a school, with leading scholars who have different backgrounds of their own and have their own approaches with different analytical tools. According to Wodak (2001), CDA "allows for open discussions and debates for changes in the aims and goals and for

innovation” (p. 8). However, all CDA methods share a view about the “social processes of power, hierarchy building, exclusion and subordination” (Wodak& Meyer, 2001, p. 3). Other issues like racism, gender inequality, sexism, colonialism, employment, war, nuclear weapons and nuclear power (Fowler, 1996) are among the topics in which most of critical discourse analysts are interested. In general, CDA aims to raise the readers’ consciousness of the power of language in changing the events and influencing the readers’ views(Reisegl&Wodak,2001).

CDA hypothesizes that different cultures may have different ways of organizing ideas which become a very important research area. Casting a brief look at the history of CDA studies, one can see that the growing interest in these studies was for its concern with practical pedagogical purposes and pedagogical implication. One area for which teaching English as a foreign language has received criticism is that, students, when placed in professional settings (e.g. studying ESP/EAP, teaching reading comprehension and translation). These insights help the EFL practitioners not only teach political features of the professional genres, but also aware of the discursive realities of them. Furthermore, in the newspaper genres, the knowledge obtained from identifying discourse features of various types of texts can also allow both the language teachers and students to cope with the important cultural elements that affect the nature, usage and production of these texts. The number of CDA studies investigates discourse cultural patterns in which languages such as English are taught as a foreign language comparing with countries in which English is used as a second (L2) language (Caple, & Knox, 2012). The main objective of this type of studies is to present a comparative genre analysis of newspaper reports across two cultures as represented by the newspapers which are released in Iran as a non-native culture (e.g., newspapers released in United States as a source and native culture in regard to English language). The aim is to describe some of the cross-cultural and discursive differences. In particular, these studies investigate a number of discourse and linguistic features in the newspapers mentioned above. Finally, the fact is that the primary goal of CDA has principally been pedagogical interests in EFL contexts to assist non-native Iranian students with the acquisition of English rhetorical strategies. Moreover, the primary goal of this research is to investigate the pedagogical implications to enhance practical genre knowledge of Iranian students teachers, journalists and news translators. Language is an instrument to be manipulated for fulfilling the purposes which may be in spoken or written form. Effectively, language is deployed for transmitting knowledge, ideas and emotions which are loaded with attitudes and perspectives (van Dijk, 1998).

Understanding the macro and micro structures of Newspapers' reports can help EFL learners to comprehend the meaning of the texts. One of the main problems among Iranian EFL learners is the lack of knowledge on the discourse features which make the meaning unclear, especially in the political texts (vanDijk, 2000, 2004, 2006, 2009). Although there are several studies (e.g., Ahmadian&Farahani, 2014a) which work on macro and micro discourse features, the features in the present study have not covered in those researches. These discourse features included stability, authority, blaming, accusing, and threatening. The language is manipulated by the newspapers in order to fulfill the objectives and ideologies of supporters of the newspapers. Thus, there is no doubt that newspapers' reports are insightful sources of information that covers different events which are (re)presented based on the perspectives and ideology followed by the

newspapers (Reah, 2002). In order to reveal the utilized biased language and raise the students' consciousness about the way they can elicit the comprehension by which the language is manipulated, the researcher attempts to make a comparative study on the representation of Iran's nuclear program negotiation in two newspapers of *Tehran Times* and the *Los Angeles Times*.

Thus, findings from CDA research can indeed offer valuable information to material writers and language teachers for foreign language classrooms (Behnam&Khodadust, 2010). CDA studies are, for example, capable to provide teachers and students with knowledge about the preferred patterns of writing (Connor, 2003). These studies uncover specific discourse features patterns, which might be culturally and contextually specific. Thus, such knowledge can provide the basis for explicit strategies which Iranian students of journalism, news writers and even news translators might use to comprehend and produce effective English news. The other implications of such studies for the ESP teachers is to know more about the sophisticated practice of writing news in a foreign language. News articles comprise significant resources for language teaching which present authentic materials. Effectively, analyzing the social issues presented in the newspapers may reveal the perspectives and ideologies through which Iran's nuclear program negotiation are represented in the two daily newspapers of *Tehran Times* and *Los Angeles Times* which is beneficial in raising the consciousness of students regarding the manipulated language and the hidden meanings of the texts. Hence, equipping the students with the critical reading helps them to get access to the opaque and obscure meanings of the texts. Accordingly, the results of the study will be insightful for language learners, teachers, teachers' trainers and even course designers.

REVIEW OF LITERATURE

This research investigated The Los Angeles Times and Tehran Times discourse features dealing with Iran's nuclear program in a comparative research design. Thus there is a need to take a look at the previous related studies to provide the researchers of the present study with enough theoretical and experimental backgrounds in the analysis these two newspapers. Iran's nuclear negotiations of using discourse features refer back to the history of Iran nuclear history and the two popular newspapers in Iran and the US are introduced briefly as follows:

Iran's Nuclear Program started in the mid-1960s under the authoritarian and pro-American regime of Mohammad Reza Pahlavi with U.S. support for the program. In 1967, the United States supplied Iran with a 5-megawatt nuclear research reactor to establish the Tehran Nuclear Research Center. Iran signed the Treaty on the Non-Proliferation of Nuclear Weapons, known as the Non-Proliferation Treaty (NPT), on July 1, 1968, the first day the treaty was circulated for signatures. Iran subsequently ratified the treaty on March 5, 1970, the same day that the treaty was ratified by the United States. The treaty allows the non-nuclear weapon states further the goal of achieving general and complete disarmament" (International develop nuclear power for peaceful purposes under the inspection of the International Atomic Energy Agency (IAEA)). The member countries with nuclear weapons (United States, Russia, China, Britain, and France) were allowed to keep the weapons but agreed to refrain from spreading them to other countries and promised to work toward nuclear disarmament. Israel, India, and Pakistan are the only nuclear

countries that are not parties to the NPT. The partially completed reactors were severely damaged due to six separate Iraqi attacks launched between 1984 and 1987. The present study selected 300 pieces of news from both Tehran Times and Los Angeles Times to compare their macro and micro discourse features strategies in Iran's nuclear negotiations (Wikipedia, Feb. 15, 2015).

Tehran Times began in 1979 as a foreign-language newspaper to air the voice of the Islamic Revolution. The policy that the newspaper has been following has been based on the guideline set that it is in English language to be searched online and in paper. It shows the Iranian policies from the beginning of Iranian Revolution. In the calendar year 1390 (21 March 2011) all the newspaper's pages are printed in color. In 2002, Tehran Times established a news agency which later came to be known as the Mehr News Agency (MNA) (Wikipedia, Feb. 15, 2015). Its Web site is: <http://www.tehrantimes.com>. It holds a wide circulation around the world. In the present study, the Archived newspapers from 2011 to 2014 were reviewed to study Iran's nuclear negotiations with 5+1.

The **Los Angeles Times**, commonly referred to as the **Times**, is a daily newspaper published in Los Angeles, California, since 1881. It was the largest metropolitan newspaper in circulation in the United States in 2008 and the fourth most widely distributed newspaper in the country. In 2000, the Tribune Company, parent company of the Chicago and local television station KTLA, purchased the Los Angeles Times. It is currently owned by Tribune. It is a daily newspaper with the circulation of 653,868 daily (Wikipedia, Feb. 15, 2015). In the present study, the Archived newspapers from 2011 to 2014 were reviewed to select the news covering Iran's nuclear negotiations with 5+1. Its Web site is: <http://www.latimes.com/>.

The news reports can influence the readers and persuade them to take actions. A news report is defined as a text in a newspaper that gives the opinion of the news writer or a journalist on a topic or item of news. News report in the journalistic terms is explained as soft news which is a piece of news dealing with editorial comments rather than hard news which is a piece of news that avoids editorial comments since it represents the partial, national and private opinion of journalists. The news editors practice the foreign policies of the country rather than reporting just the events (Wodak & Meyer, 2001). For the purpose of any study in analyzing media and their attitudes towards a social and international event, newspaper reporters select the appropriate audience for a number of reasons including the use of discourse features for their political and social interests. First, news report as an important professional text type with a big size of readership in different cultures, constitute a useful set of data for conducting cross-cultural genre analysis. For the sake of this research therefore, we can say that they are written by professional journalists and therefore, reflect discourse patterns of experienced writers representing the types of writing in the aforesaid newspapers. Second, the news reports typically represents the metropolitan values of a society, evaluating government decisions and practices and even it can influence policy making on various issues. And third, unlike hard news, news reports do not represent straightforward information but they are written in a way that their analysis requires greater effort and knowledge from students for decoding the message of them. This indicates that although news reports are not easy to analyze since they are

subjective. Thus using them in the language classrooms may be problematic in terms of their argumentative and discursive nature.

It seems that news reports can be useful resources for assessing and enhancing the linguistic and cultural knowledge of the foreign language learner (Hernandez, 2008). In this respect, a comparative study of news reports across different cultures can be a useful step toward making the pedagogical connections to enhance the students' awareness of certain subtle differences in written discourse structure. This can be used in teaching any language skills to develop ESL writing, reading and even listening and speaking in the classrooms. It can be an attempt to explain and understand the different discourse strategies found in the compositions written by non-native speakers of English.

Several studies (e.g., Ataei & Mozaheb, 2013) have focused on the narrow view of text analysis by looking at texts as finished products and attempted to adopt a more comprehensive view of text analysis (i.e., text not only as product but as process) by analyzing articles. He then proposed a four move model to analyze article Moves as move 1: Establishing the field by showing centrality, Move 2: summarizing previous research, Move 3: Preparing for present research by indicating a gap, raising a question or extending a finding and Move 4: Introduction of the present research by stating the purpose, or briefly describing present research. These studies mainly focus on a "broader" scope of text analysis as discussed above by exploring the nature of the genre of news reports from various perspectives. Based on what was mentioned above, news reports are key texts for students of journalism and so should be key materials for teachers of journalism in English language in EFL contexts (Ataei & Adriani, 2009). The newspapers are considered as resources for language learning since they are authentic, original, interesting and based on the events which are real and can be seen in the environment (Fairclough, 1992). The CDA may give the teachers invaluable resources to be used in the classrooms (1993). This fact is acknowledged by many language learners, being able to read and write a newspaper in a foreign language without too much difficulty for second language acquisition.

New Reports Analysis

Bell (1998) believes that news reports can be effective in terms of their excerpts as their accessibility, their influence on speech communities, culture, politics, ideological beliefs and social life, their disclosing of a great deal about social meanings and embedded stereotypes and finally their formativeness as exemplar instances of text and talk. However, from the point of view of media experts, this process goes through certain stages of selection and transformation that the commonly held belief about the neutrality of the news cannot be anymore authenticated and relied on (Fowler, 1991). In this regard, the mediating role of language in yielding a piece of information which is loaded with a specific line of thought and a particular way of seeing the world is seen to be highly probable which is in turn a testimony for embarking on specific analytical assets (van Dijk, 2009). Moreover, various forms of linguistic expression, including phonological, syntactic, lexical or semantic, are utilized by news producers for certain purposes. Accordingly, a critical discourse analytic framework is deemed to yield better assessment of the purported corpus in this study than a non-critical

one, because as it is argued by Fairclough (1992) “Critical approaches differ from non-critical approaches in not just describing discursive practices, but also showing how discourse is shaped by relations of power and ideologies, and the constructive effects discourse has upon social identities, neither of which is normally apparent to discourse participants” (p.12).

Behnam and Khodadust (2010) showed how lexical features of repetition and synonymy as well as the structural and thematic feature of passivization, nominalization and predicted theme were utilized by discourse producers to impose their desired ideologies to the viewers with regard to the events of September. In one of the few studies with attention on semiotic resources, Bertrand (2009) discussed racial issues with respect to semiotic resources. Bertrand examined exchanges that occurred within the context of a video-taped Focus group of white males. To analyze the data, Fairclough (2001), vanDijk's (1991) frameworks together with Goodwin and Goodwin's (2001) approach for semiotic resources were used. This composite methodology allows for added insight and helps to show positive self and in-group presentation and negative other and out-group presentation if conducted correctly. The analysis of the data showed the ways the participants relied on place names to index race and framed the differences in school quality relative to the archive of SID. Goodwin's approach indicated that men used a range of semiotic resources to float their efforts to present themselves positively and Others negatively.

The textual analysis through a closer reading of headlines revealed a polarization between scared, implicitly Swedish victims and immigrant-outsider perpetrators. The writer finally discussed the little importance of race and color compared with the mere ‘otherness’ of the muggers or robbers. Also, the Swedish youth robber was seen as a scapegoat, as a symbolic tool in a capitalist society. However, the authors of the present paper believe that the comparisons made between Sweden and the UK are inaccurate because Sweden is not a capitalist country in the sense that the UK is. Hakam (2009) helped to explore how ideology was reproduced and resisted in the English-language Arab press. The choice of lexical items by Arab newspaper was also discussed via concordance programs. The researcher investigated discourse to find salient examples of ‘Us’ versus ‘Them’ paradigm.

Some linguistic features were examined in the search for ideological aspects of discourse; modality, naming and description collocation incongruity, presupposition, and signals of affiliation (Rasti & Sahragard, 2012). The data for the study (news reports, editorials, news analyses) came from websites of 19 English language Arab newspapers representing 12 different countries. The results of the research showed that the set of word frequencies and collocations taken from major European news agencies about Arab communities differed significantly from that of Arab-generated or Arab modified samples. Deghat (2009) applied some of the most agreed upon guidelines of CDA to analyze the tape scripts of 2008 presidential campaign speeches of democratic candidates (i.e. Hillary Clinton and Barack Obama) in terms of the discursive structures in the text which carry and enforce certain ideologies. She made use of Hodge and Kress's (1979) framework and compared and contrasted the transcribed texts of fifty tape scripts. She concluded that although the effect of

race and gender were evident in Clinton and Obama's speeches, both nominees did not want to inject race or gender in this presidential campaign and in this regard had strived to win the whole American voters.

One of the comprehensive studies carried out in Iran related to the macro-strategies mentioned above was Rahim and Sahragard's (2007). They analyzed some Persian and English texts to find the ideologically laden words of the texts and their ideological effect of the whole texts. They gave particular attention to euphemization and derogation. They resorted to vanDijk's (2004) theoretical framework. The materials used included the emails on the life, achievements and death of the Late Pope and articles from the economist magazine, Tehran Times, Iran News Persian radio program entitled "The analysis of Foreign Radios and the critiques on the movie Shoran (Hemlock). The analysis of the data proved that the categorization of positive self-presentation and negative other-presentation is an effective tool in the hand of the writers.

RESEARCH QUESTIONS

The research questions of the present study are as follows:

RQ1. Is there any difference between the two newspapers of *Los Angeles Times* and *Tehran Times* discourse features at the macro level (i.e., negative vs. positive US policy against Iran) concerned with attitudes on Iran's nuclear program negotiation?

RQ2. Is there any difference between the two newspapers of *Los Angeles Times* and *Tehran Times* discourse features at the macro level (i.e., negative vs. positive Iran's policy against the West) concerned with attitudes on Iran's nuclear program negotiation?

METHODOLOGY

Data

In order to compare and analyze the macro and micro discourse markers across different newspapers, this study relied on two newspapers of Tehran Times and The Los Angeles Times during January, 1, 2011 to January, 1, 2014. These newspapers were non-randomly selected and the news on Iran's nuclear program was selected based on the availability of the news in the newspapers. In each newspaper, the number of words was the criterion for select the number of pieces of news. Generally, 165 news reports from Tehran Times and 114 news reports in The Los Angeles Times were non-randomly chosen regarding their topics on Iran's nuclear program and the related negotiations in both sides. Thus in Tehran Times, there were 15240 words and in The Los Angeles Times, there were 15450 words. The data included which totally 30690 words were gathered to be analyzed at the macro and micro levels.

While Tehran Times is English and is considered as a domestic newspaper in Iran, The Los Angeles Times is supposed to be a US or foreign newspaper. They could be considered as a non-native or native data. Here, the word data is used since the size of the pieces of news may not be large enough to reach the generalization. There are some reasons behind this selection. First, there is the availability of the newspapers online to be searched very easily. Second the two

different ideas coming from the East (i.e., Iran) and the West (i.e., the US). Finally, the Iran's nuclear program is hot debate in the world and big political powers are now dealing with it seriously.

Instrumentation

The present study employed the vanDijk's (2000) framework for the analysis of the macro and micro levels as discourse features. The framework used was based on the taxonomy of several features. Based on this checklist there are four macro strategies and 28 micro strategies though which 5 ones were non-randomly were selected since the previous studies(e.g., Fairclough, 2001; Gee, 2004; Khaghaninezhad & Rostami, 2014) worked on the other macro strategies and micro strategies.

Procedure

This study began with the collection of English newspapers of Tehran Times and The Los Angeles Times. The pieces of news in each newspaper were selected based on the words in each rather than the number of articles. Thus both newspapers included approximately 30690 words to compare the macro and micro levels as discourse features as discourse devices. Totally, 165 news reports were selected in Tehran Times and 114 news reports in The Los Angeles Times based on non-random sampling. They were chosen with regard to their topics on Iran's nuclear program and the related negotiations in both sides. Thus in Tehran Times, there were 15240 words and in The Los Angeles Times, there were 15450 words. The words were gathered to be analyzed at the macro and micro levels. The analysis included descriptive statistics and the frequency of discourse features and inferential statistics in terms of using Chi-square analysis.

These data were developed by selecting newspapers from 2011 to 2014 and included editorials, columns, and articles published during this period which is more authentic and recent corpora. The authors and columnists were not realized as a factor in selecting the newspapers writings. Just the topics on Iran's nuclear issues were put into consideration. Some samples of these topics were introduced in the Appendix B. The frequency of each macro and micro discourse features was observed by the researcher and a teacher who was expert in finding the related discourse features. The rating was done and the inter-rater reliability of the counting was estimated by Spearman Correlation Analysis as ($r=.892$). However, the counting of the discourse appeared to be a very complicated activity since some instances could be categorized in two categories according to the vanDijk's framework. The meaning of some phrases and sentences had many visible and invisible layers. Thus, preparing higher accuracy could be difficult at the macro and micro levels (Behnam & Moshtaghi, 2008).

There were about 30690 words are generally collected. All the pieces of news were saved on a computer to produce an electronic data in words which showed the number of the words in 179 pieces of news. The counting did not include all the figures and symbols that did not consist of alphabetically letters (e.g., numbers). By doing so, it became possible to make intra-group comparisons. Afterwards, the Word software was used to highlight and count the frequency of each macro and micro discourse features in each newspaper based on the framework presented earlier in this section. Selection of frequency of each macro and micro discourse features was

according to their functions and meaning in the sentences. Although some words appeared to be macro and micro discourse features according to the mentioned framework, they did not function as macro and micro discourse features in the text. So they were not counted as macro and micro discourse features.

The frequency and percentage of each macro and micro discourse feature in each newspaper were calculated separately and then both newspapers were compared with each other. Then, the Chi-square test was used to show whether the differences in the corpora were statistically meaningful or not.

RESULTS AND DISCUSSION

Results of Macro discourse features

The first step taken in the analysis of the macro and micro discourse features in the mentioned newspapers was to run word count to determine the length of the data. A total of 30690 words were calculated among the pool of data. The total average of macro and micro discourse features uses was 2.5 percent of all the words.

The data presented in the following tables show the statistics which were obtained after the analysis of the macro discourse features; rows numbered 1 to 4 representing the features applied here in this study. The frequency and percentage of all features in each of the four categories under study are shown in columns in Table 1.

Table 1: Descriptive Statistics: Frequency and percentage of Macro Structures of Presentations

Features	Emphasize positive things about us		Emphasize negative things about them		Deemphasize negative things about us		Deemphasize positive things about them		Total macro structures	Average
Macro										
	Freq.	(%)	Freq.	(%)	Freq.	(%)	Freq.	(%)	Freq.	(%)
Tehran Times	320	28.90	347	31.34	200	18.06	240	21.68	1107	55.66%
Los Angeles Times	180	20.40	169	19.16	311	35.26	222	25.17	882	44.34%
Total frequency	500		516		511		462		1989	100

Notes: Us refers to the newspapers' country and them refers to the opposite side

Table 1 shows that the macro discourse features in the newspapers of Tehran Times and The Los Angeles Times. In the categories of "Emphasize positive things about us" and "Emphasize negative things about them, the Los Angeles Times used more macro discourse features than Tehran Times while in the "Deemphasize negative things about us" and "Deemphasize positive

things about them” the Los Angeles Times used less macro discourse features. Table 4.2 shows the Chi-square analysis which was run to reveal the difference between the two newspapers.

Table 2: Chi-square Analysis of Macro Structures of Presentations

	Emphasize positive things about us	Emphasize negative things about them	Deemphasize negative things about us	Deemphasize positive things about them	Total	X ² P
Tehran Times	320 (314.49)	347 (291.22)	200 (210.71)	240 (290.59)	1107	9.467 0.000
Los Angeles Times	180 (185.51)	169 (171.78)	311(124.29)	222 (171.41)	882	
Total	500	516	511	462	1989	

Table 2 shows that the two newspapers are significantly different in using macro discourse features since the critical X² (9.467) with df=4 is less than the observed X² (101.259) at the significant level (p<0.05). Descriptive statistics of frequency and percentage of micro structure presentations are shown in Table 3.

Table 3: Descriptive Statistics: Frequency and percentage of Micro Structures of Presentations

Features Micro	Stability		Authority		Blaming		Accusing		Threatening (%)	Total (%)
	Freq.	(%)	Freq.	(%)	Freq.	(%)	Freq.	(%)	Freq. (%)	Freq. (%)
Tehran Times	98	26.18	59	18.28	88	24.30	49	13.52	6817.72	36241.04
Los Angeles Times	77	14.80	116	22.30	135	25.96	91	17.50	10119.42	52058.96
Total frequency	175		175		223		140		169	882(100%)

Notes: Us refers to the newspapers' country and them refers to the opposite side

The data presented in the following tables show the statistics which were obtained after the analysis of the micro discourse features; rows numbered 1 to 5 representing the features applied here in this study. The Chi-square analysis of all features under the study is shown in columns in Table 4.

Table 4: Chi-square Analysis of Micro Structures of Presentations

	Stability	Authority	Blaming	Accusing	Threatening	TotalX ²	P
Tehran Times	98 (57.02)	59 (74.29)	88 (130.01)	49 (45.62)	68 (55.07)	362	1.070 0.000
Los Angeles Times	77 (117.98)	175 (153.71)	135 (268.99)	91 (94.38)	101 (113.93)	520	
Total	175	228	223	140	169	882	

Table 4 shows that the two newspapers are significantly different in using micro discourse features since the critical X² (11.070) with df=5 is less than the observed X² (73.364) at the significant level (p<0.05).

Results obtained from analyzing the types and frequencies of macro and micro discourse features in the two newspapers showed significant differences in using the features. Thus there were significant differences in using macro and micro discourse features in the two newspapers.

Discussion

The focus of VanDijk's (2000) framework is on the discourse and language through which the positive points of the West (i.e., our side) which emphasized and the negative points of West (i.e., our side) was de-emphasized. Furthermore, it clearly shows that the positive points of others (i.e., opposite side) were de-emphasized and the negative points of others (i.e., opposite side) were emphasized. The present study reviewed the emphasized issues concerned with CDA at the macro level. For instance, the presentations of the negative point which was emphasized in the Los Angeles Times is "*lack of cooperation in Iran to talk on the nuclear program*" or the deemphasized of a positive point presented by the same newspapers as "Iran responses the world lately". According to vanDijk's (2000) model, the uses of these emphatic presentations could be intentionally done to minimize the role of the opposite side and to maximize their role in cooperation. Thus, the CDA-based study is an attempt to probe into the manipulation of ideologies in translations of political texts.

The results of the presents study is in line with Fairclough (2001) who believes that the newspapers which belong to the government's policies or they are close to those policies are biased in attitudes towards the other side. VanDijk (2004) was adopted to conduct this research. Three hundred English political pieces of news were critically analyzed both at micro and macro levels. At micro-level, lexical features based on vanDijk's(2004) model and at the micro level the discourse features were selected based on the framework and were analyzed. The most common macro discursive strategies of this framework was "*emphasizing the positive things about us*" with the highest frequency and "*deemphasize the negative things about us*" with the lowest frequency". This showed that the news reports in this study along with descriptions according to vanDijk (2000) who supported the results of the study. Therefore, these strategies used to keep face by stating our positive characteristics first, and then focus on their negative attributes. This could be supposed as socio-cognitive devices which may,

for instance, be employed by the use of demonstrative pronouns instead of naming or describing others. In sum, the difference between the uses of these macro strategies was significant since the two newspapers used these macro structures differently.

Sometimes a situation is compared to positive or negative events in history, either as a positive self-presentation or negative other-presentation strategy. This device by which the out-group members are characterized as criminal or law breaker and they try to show that the other side's good activity is negative while their own negative activity is positive. The frequency of the macro structures showed that the macro structures are a means to show that the writers/speakers are firm to be objective in what they are discussing is not just their opinions but 'facts'. This is a prevalent semantic strategy which divides people in two groups of in-group (US) and out-group (THEM). The results of this study showed that the used these macro structures differently. For instance, the two newspapers of the *Los Angeles Times* and *Tehran Times* use discourse features at the macro level (i.e., negative vs. positive Iran's policy against the West) differently concerned with attitudes on Iran's nuclear program negotiations or the other side. The *Los Angeles Times* has a specific function in the general strategy of emphasizing the West positive things and deemphasizing Iran's negative ones. They also use some presupposition to the sense that most of the meanings of a text are not explicitly expressed but presupposed to be known by the recipients. Presuppositions are used typically to speak about the controversial ideas or to assume the truth of some preposition when such truth is not accepted at all. These findings are in line with Fairclough (2001) who argued that this strategy may be used to overlook others' ideas and emphasize their own ideas. In this case, speakers/ writers do not have specific information about a subject but implicitly put forward that they know about it but they try to degrade the other roles. This kind of an 'apparent knowledge' generally appears in the presentations, like: "*I do not know, but Iran dislikes solving it.*" or "*The US wants not to solve the problem.*"

The sources for data gathering will be two newspapers of *Los Angeles Times* and *Tehran Times*. In effect, the reports on the representation of Iran's nuclear program negotiation will be collected from the websites of these two newspapers. The main issue in these newspapers is that the *Los Angeles Times* and *Tehran Times* are opposite newspapers from two opposite perspectives. This result is matched with Yaghoobi (2009) who believes that the expressions can convey the meanings behind the surface level. Thus, the analysis examines all the presentations which were supposed as macro discourse features according to van Dijk's (2002) model. The macro discourse features were used in this study included "*stability, authority, blaming, accusing and threatening*" which could be found in words or phrases and they became known as the Iran or West policies on the Iran's nuclear program between the years 2011 to 2014. The pool of data was analyzed to find the negative or positive attitudes against the other side and their frequencies were calculated with their percentages. In the "stability" feature, the highest frequency and percentage belong to the *Los Angeles Times* which tried to show the West stability to solve the problem by a means even the military invention. However, on the other side, *Tehran Times*, get the lower frequency and percentage and tried not show the stability but a kind of flexibility to have the talks rather than to be involved in a war against the West.

The macro discourse features "authority", "blaming", "accusing", and "threatening" were used mainly by Tehran Times more than the Los Angeles Times in a significant way. The Iranian side accused the West to follow the US in War policy and threatened that the US bases in the Middle East would be endangered if they wanted to follow their threats. The Tehran Times also blamed the group of 5+1 to follow the US policy and they did not have an independent policy in making decision to take the steps in solving the problem. Tehran Times also confirm that Iran has the right to enrich uranium based on NPT treaty and do this in future. Thus Iran has the authority to follow its nuclear program in a peaceful manner. This finding is in line with Ataei and Adriani (2009) who, among many other studies conducted a research through the CDA frameworks and found about the biased representations of events and social groups in newspapers. Moreover, the findings lend supports to vanDijk's (2000) belief that "discourses express, confirm, instantiate or constitute ideologies" (p. 86), and to the fact that ideologies are injected in discourse by the use of different kinds of discursive strategies like the ones which are included in the framework. As such, the findings of this study call attention to the importance of being aware of the potentiality of language to manipulate the facts and realities. Accordingly, the findings of the Chi-square analysis showed that there were significant differences between the two newspapers in the representation of their sides against the other sides. Their biased representations could be understood through their expression at the macro and micro discourse levels.

After examining the incorporation of different voices throughout the full text stories of the editorials, it was found that there is a sharp discrepancy between representing the either side of the conflict. While Iranian's voice is negatively heard in Western newspaper of The Los Angeles Times, mostly via quoting Iranian president or nuclear case officials, the voice of the Western side is rampantly heard more than Iranians in which the American, European, and the IAEA's officials at every level either president, vice president, or spokespersons, are frequently quoted. It is interesting to note that the infrequency through which the Iranian's voice is heard implicates in a series of negatively loaded quoting verbs while the other side is represented through positive attitudes or even neutral manners.

Iranian officials are shown to be often accusing the others illegitimately while their Western counterparts are demonstrated to be stating or saying something with regard to the nuclear case in a quite legitimized manner. The kind of analyses which were conducted throughout this research compellingly demonstrated that in order to yield a better examination of discursive events. Thus, one must utilize a critical discourse analytic approach so that according to Fairclough (1992), not only the involved practices are optimally described. However, the theses ideas are involved in the interrelationships of power, ideology and discourse would be efficiently revealed. Accordingly, the analysis of the kind of discourse which was used in the sampled editorials of American newspapers and news agencies reveals that Iran's nuclear issues are given negative representations throughout the newspaper's voice by using certain discursive features. Generally, the biased representations of the both sides could be seen in their representations on the negotiations of Iran's nuclear case.

CONCLUSION

The results of the present study showed that there was an existence of a biased reporting arising from the particular world-view of the papers, amounting to legitimization or legitimization of the Iran's nuclear program. Misrepresentation of Iran nuclear program and, the positive image of the West and the negative one in the Iran's side showed hostility towards Iran. Thus in English papers such as the Los Angeles Times the discourse features of positive images of Iran became deemphasized by the West newspaper. On the other hand, It was revealed that the same image was seen in the Tehran Times which tried to emphasize the Iran's authority of pursuing the nuclear program and deemphasizing the role of the US in the negotiations. In addition, The Los Angeles Times showed that in the English newspaper, Iran is mostly portrayed as the illegal power and a social deviant. The dominant pattern that emerges appears to encode a view of a polarized world, a world of us and them, representing the EU and 'Iran' respectively. Reports on the Iran nuclear program often occurred in connection with Iran's secret nuclear activities and its enrichment of uranium for no peaceful purposes (Ataei&Mozaheb, 2013). In particular, the stability of the West on the blockage of Iran's nuclear program and blaming the Iran's officials to pursue ambitious attitudes towards the nuclear programs could be seen so clearly.

The Los Angeles Times clearly accused Iran as a Threat not only to the US but also to the Israel as a close friend. This makes Iran's nuclear program more complicated; however, this issue was seen in Tehran Times as a clear issue in which Iran is authorized to pursue its nuclear program and has the right of uranium enrichment. While The IAEA agency is highlighted the problem and overlooks Iran's legitimate right. The process percentages by themselves were not too illuminating of the messages conveyed; the distribution of the participants and their corresponding number of tokens facilitated the processes of interpretations far more. Both the Iranian conservatives and the reform-seekers agree that Iran is entitled to develop nuclear technology for peaceful purposes and it has fully complied with its international obligations regarding nuclear activities. b) In order to continue its nuclear program, Iran is proceeding on two parallel tracks: a political-diplomatic track with the EU or the UN, and a belligerent track. In its political-diplomatic track with the EU which is mostly taken by the reformists.

Language use and discourse are crucial social practices influenced by ideologies, which in turn also influence how we acquire, learn or change ideologies. Ideologies are not innate, but learnt. We learn most of our ideological ideas by reading and listening to other group members, beginning with our parents and peers (Wodak & vanDijk, 2000). Later, we learn ideologies by watching television, reading textbooks at school, advertising, the newspaper, participating in everyday conversations with friends and colleagues, among a multitude of other forms of talk and text. With respect to the mentioned channels through which ideologies influence us and are reproduced in society, it is suggested that critical awareness of language has to be public knowledge, while the mass media itself may provide discourse study of language in a digestible way to lay people and persuade viewers and/or readers of the value of analyzing mass media itself and other mass print such as textbooks. In the age of globalization and at a time when democratic practices appear to be influx, we believe that the equilibrium that many seek is impossible to create; however, critical language awareness awakens us not to be gulled.

The present study worked on the macro and micro discourse features in a limited way. It is suggested other features come into the inquiry. The Appendix A introduced several discourse features based on vanDijk's (2002) framework. The other international newspapers could be analyzed to study these features deeply.

ABSTRACT

This study investigated the effect of utilizing picture-cued tasks on the learning and recall of English phrasal verbs. A total number of 60 pre-intermediate language learners were chosen from a language institute to take part in this study. The participants were non-randomly divided into control and experimental groups. Then, they sat for a pre-test of the phrasal verbs at the beginning of the study. The results showed that the two groups were homogeneous at the onset of the study in terms of their knowledge of English separable and inseparable phrasal verbs. Both groups were taught phrasal verbs through two different approaches. While the experimental group received picture-cued tasks as their treatment, those in the control group were taught traditionally through translation and dictionary use techniques. After ten sessions, each lasted 45 minutes, the immediate and was given to the participants immediately after the treatment period. Finally, after two weeks interval the delayed post-test was given to the both groups to assess the degree of their recall. The results of Independent Samples t-test showed that the experimental group outperformed the control group on both the immediate and delayed post-tests. Moreover, there was no difference between the results obtained for separable and inseparable phrasal verbs on these two post-tests. Thus the picture-cued tasks could affect the participants' retention and recall significantly. This study suggests that using picture-cued tasks helped learners grasp the abstract meaning of English phrasal verbs through concrete pictures. The implications for learners, teachers, and educators are that they can consider this promising technique in their learning/teaching practices.

KEYWORDS:Picture-cued tasks, Acquisition, Recall, Separable and inseparable phrasal verbs

INTRODUCTION

Second language learning is a demanding enterprise since one would encounter a multitude of difficulties in grasping the meaning of the words. Words are supposedly the prime means of communication and, as one might rightly expect, a limited vocabulary repertoire keeps learners from expressing their real thoughts and feelings. Ample vocabulary, on the other hand, provides

them with the opportunity to use the right words at the right time. Vocabulary learning thus is crucial to success in second language learning.

Numerous authors have highlighted the important role of vocabulary in the process of language learning. Many L2 learners see language mastery as essentially a matter of learning vocabulary, so they spend much time on memorizing lists of words and sections of bilingual dictionaries. Harley (1995) also contends that vocabulary acquisition studies show that vocabulary is a unique window on the process of acquisition of language. Having word knowledge should be, according to Willis (1990), prior to learning of sentence structure since it is the word meaning that determines the grammaticality of structures, not the other way round. Burton and Humphries (1992) also herald the significance of vocabulary in language learning: “Good readers and listeners usually become good writers and speakers but none can be possible without learning sufficient vocabulary” (p.73)

A good number of English words are verbs and a lot of verbs in English are phrasal verbs. A phrasal verb is a verb formed from two or sometimes three constituents: a verb and an adverb or preposition. Most of the phrasal verbs are formed from a small number of common verbs (such as get, go, come, put and take) and a small number of adverbs and prepositions (such as away, out, off, up and in). Phrasal verbs constitute a very important aspect of the language learning. They are not only used in spoken and informal English, but are also a common part of written and even formal English. The meanings of some phrasal verbs can easily be guessed (e.g. sit down or look for). However, in most cases their meanings are idiomatic, that is quite different from the sum of the meaning of the verb and the particle(s) they are formed from. For instance, *boil down to* can mean 'to be the main point or cause of something' and this meaning has no obvious connection with the meaning of 'boiling' something. In this case, phrasal verbs create special problems for students, not only because there are a multitude of them in English, but because the juxtaposition of verb and particle(s) makes up a thoroughly new meaning.

Phrasal verbs are often divided into the dichotomy of separable and inseparable phrasal verbs. Separable phrasal verbs can remain together when using an object that is a noun or noun phrase. An example could be *He paid back the debt* or *He paid the debt back*. They must be separated when a pronoun is used: *We ran it up by \$50,000* not *We ran up it by \$50,000*.

Inseparable phrasal verbs, on the other hand, always remain together. It makes no difference if a noun or pronoun is used. As an illustration, take the following sentence: *They splashed out on new office furniture* not *They splashed it out*. The objective of the present study is to investigate the effect of picture-cued tasks, as a means of teaching vocabulary, on the acquisition of separable and inseparable phrasal verbs.

A picture-elucidation task is one type of cognitive awareness-raising task (Skehan, 1998) in which learners' attention is directed toward salient features of one or a series of pictorial sketches, cartoons or photos rendering a more concrete aspect of the meaning of a linguistic expression. This concrete aspect then gradually leads learners to recognize similar salient features in more abstract pictorial elucidations of the linguistic expression in question. The selection of

pictured-cued tasks, as a technique for teaching English phrasal verbs, in this study is due to the fact phrasal verbs appears to be highly demanding for second language learners, while this class of verbs creates less of an obstacle for native speakers as they come across abundant evidence of their use from an early age (Mandler, 2004; Tomasello, 2003). This early, gradually expanding experience undoubtedly aids the native speaker in forming the necessary *image schemas* whose properties would then scaffold the construction of abstract concepts signifying in turn relevant linguistic expressions which embody abstraction in meaning (Geeraerts&Cuyckens 2007).

A number of research studies have illustrated that native speakers are subconsciously aware of such image schemas and constantly manipulate them in their application and comprehension of figurative language (Gibbs, Bogdonovich, Sykes & Barr, 1997). The researchers believe these image schematic patterns are indispensable to appropriate understanding and use of figurative language.

To sum, as it was stated previously, the aim of the present study is to find out whether picture-cued tasks, as a means of teaching vocabulary, has any significant effect on the acquisition of separable and inseparable phrasal verbs.

REVIEW OF LITERATURE

Every language learner is prone to admit that phrasal verbs are remarkably important in the process of language learning. They also contend that inferring the meanings of these vocabulary items and the appropriate use of them present a challenge for language learners. This contention is also approved of by researchers such as Kurtyka (2001) who claims that phrasal verbs in English can cause problems for many learners because they have idiosyncratic meanings. These difficulties are sometimes increased by the way in which phrasal verbs are presented in course books or by teachers advising their students that they will just have to learn them by heart. Another source of difficulty might be the very nature of English phrasal verbs, some of which are separable and some are not. In an attempt to help EFL learners master English phrasal verbs, a number of vocabulary teaching tasks, including translation, sequential contextualization, metaphorical conceptualization, and picture-cued tasks, have been invented and used by the experts in the field. The present research study will be devoted to investigating the short-term and long-term effectiveness of picture-cues tasks in learning separable and inseparable English phrasal verbs. More specifically, the current study is going to find answers to the following research questions.

The Importance of Multi-Word Units and Phrasal Verbs

MWUs, *lexical phrases*, *chunks*, and *prefabs* are some of the preferred terms used by researchers to refer to different types of word-combination. It is estimated that prefabs account for 58.6 per cent of spoken English and 52.3 per cent of written English (Erman& Warren, 2000). There is also convergent evidence that the number of different multi-word items may exceed the number of individual words in the lexicon (Jackendoff, 1995). Willis (2003) for instance, claims that, “much of the language we produce is made up not of individual words, but of strings of words which we carry around with us as fixed phrases” (p. 43).

As far as PVs are concerned, they are ubiquitous in English. It is generally assumed that PVs are mainly used in spoken rather than written discourse and they are very common in informal rather than formal registers, while their one-word equivalents are more often used in more formal contexts. However, De Cock's (2005) comments in her contribution to the pedagogical mid-matter in the *Macmillan Dictionary of Phrasal Verbs* that "native speakers of English use approximately half as many PVs in formal writing as in informal speech" (p.17). This is confirmed in corpus statistics set out by Biber, Johansson, Leech, Conrad and Finegan (1999), where they find the usage of PVs to be greatest in conversation and fiction with over twice the frequency in academic writing, with news journalism between the two extremes. This suggests that PVs are not completely absent from formal discourse and there are many instances in formal occasions in which the use of PVs is more appropriate and sound more natural in expressing certain ideas (Fletcher, 2005). Apart from that, most PVs are metaphorical in meanings, and it is believed that *metaphoric intelligence* has an important role to play in all areas of communicative competence and can contribute to language learning success (Littlemore, 2001; Littlemore & Low, 2006). This further suggests the importance of PVs to language learners and without having good knowledge of PVs and an ability to use them appropriately, it is almost impossible for learners to gain fluency in English. Thus, it is clear that this particular language form deserves equal attention and better treatment in language teaching and learning.

MWUs and PVS Problematic learners

Despite the importance of MWUs and PVs in language learning discussed above, there is general consensus that they are difficult for L2 learners to master (De Cock, 2005). Many classes of multi-word items, such as PVs, which are the main focus of the present study, are very common and highly productive in the English language as a whole (Celce-Murcia & Larsen-Freeman, 1999). In addition, many multi-word items have multiple meanings themselves. For example, Gardner and Davies (2007) found that the 100 most frequent PVs in the BNC have 559 potential meaning senses, or an average of 5.6 per PV. Thus, learners may find learning MWUs is rather complicated, particularly as there are issues with respect to idiomaticity and semantic non-compositionality, which can be very confusing to learners, as also applies to PVs. Furthermore, the status of particles in PV construction (i.e. preposition or adverb particle), particle movement, and the transitivity of PVs are among other aspects that can cause further confusion for learners. Because of these reasons, most often, learners will avoid using PVs or use their one-word equivalents instead, since these are much easier to learn and understand.

Phrasal Verbs

Many studies have been conducted with respect to PVs (e.g. Liao & Fukuya, 2004; Side, 1990; Schmitt, 2000; Siyanova & Schmitt, 2007) and various terms have been used to refer to this particular language form, such as *separable verb* (Fraser, 1994), *two-word verb* (Taha, 1960) and *verb-particle combinations* (Fraser, 1994).

Separable and Inseparable Phrasal Verbs

In addition to the transitivity of PVs, 'separability' or "the inability of the particle to be moved to a position after [] noun phrase" (Quirk, Greenbaum, Leech & Svartvik, p. 1156) is another important concept with respect to PVs, which is closely related to the notion of transitivity

discussed above. Most transitive PVs are separable and they allow particle movement either before or after the object noun (e.g. Please *turn off* the computer/Please *turn* the computer *off*).

Phrasal Verb Research Studies in Iran

In the context of Iran, many studies have addressed PVs. Some examples suffice to know what Iranian researchers have been interested in. As an illustration, Nassaji and Tian (2010) studied and compared the effectiveness of two types of output tasks (reconstruction cloze tasks and reconstruction editing tasks) for learning English phrasal verbs. They wanted to see if doing the tasks collaboratively led to greater gains of knowledge of the target verbs than doing the tasks individually and also whether the type of task made a difference. The results revealed that completing the tasks collaboratively led to a greater accuracy of task completion than completing them individually. However, collaborative tasks did not lead to significantly greater gains of vocabulary knowledge than individual tasks. The findings, however, showed an effect of task type, with the editing tasks being more effective than the cloze tasks in promoting negotiation and learning.

Khatib and Ghannadi (2011) investigated the effectiveness of interventionist and non-interventionist approaches to the recognition and production of phrasal verbs. The results of the study revealed the superiority of interventionist groups over the non-interventionist group in both recognition and production of phrasal verbs. In addition, the interventional explicit group greatly outperformed the interventional implicit group in both recognition and production.

Behzadi and AzimiAmoli (2014) conducted an experiment to investigate the effect of two task types on phrasal verb's learning on Iranian EFL learners. They selected 60 EFL learners, who were studying in higher levels of English in different language institutes and divided them into two groups. Their study indicated that the context learning condition was more beneficial than the translation learning condition. However, translation learning task was good for short recall learning. Although their participants learned more in translation task group, the retained knowledge was more in context learning group. Moreover, the higher level students preferred not to translate phrasal verbs. Additionally, it was revealed that the translation task was advantageous to learning some complicated phrasal verbs with figurative meanings.

In another study, Ganji (2011) investigated the metaphor's central position in the memorization, retention and prediction of the meaning of phrasal verbs. He selected 45 Iranian EFL learners from Chabahar Maritime University who were divided into three groups. In control group, the phrasal verbs were presented with their Persian equivalents and students were asked to memorize them on their own. One of the experimental groups received the phrasal verbs in the context of a sentence, and students were asked to make new sentences with them in the class. The other experimental group was exposed to the orientational metaphors underlying the meaning of the particles of phrasal verbs. All the three groups took three tests in which the correct particles of the phrasal verbs had to be provided. The first test, carried out just two hours after the instructions, dealt with the taught phrasal verbs. The same test was conducted five weeks later to measure the long term retention of phrasal verbs' meaning. Finally, the third test tested the participants on 20 untaught phrasal verbs which had the same particles as the taught ones. One-

way ANOVA results revealed that the difference between the groups' performances on the immediate test was not statistically significant, while the efficiency of metaphorical conceptualization, and sentential contextualization on the delayed test, and untaught test was considerable. There was, however, an insignificant difference between the two experimental groups.

RESEARCH QUESTIONS

This study attempted to answer the following research questions:

1. Do picture-cued tasks affect EFL learners' recall of separable phrasal verbs?
2. Do picture-cued tasks affect EFL learners' recall of inseparable phrasal verbs?

METHODOLOGY

Participants

Forty EFL learners, studying *American English File 2* in a language school in Ahvaz were asked to participate in this study. The rationale behind choosing pre-intermediate learners was that beginners were highly likely to have unconquerable problem learning phrasal verbs since their vocabulary repertoire was limited and their level of proficiency was not developed enough to learn phrasal verbs. Intermediate and advanced learners, on the other hand, might have encountered and learned the phrasal verbs intended to be taught in the current experiment. The participants of this study were supposed to enjoy the same level of proficiency since they studied at the same level in the institute. However, to further ascertain that they were not very much different in terms of their proficiency levels, the researcher included in the research those whose final scores on *American English File 1* had ranged between 90 and 100. The learners were then randomly assigned to a control and an experimental group.

Materials and Instruments

The pictures, drawings, and photos used in classroom tasks were selected from various sources. Some were conveniently taken from the World Wide Web, while others were drawn by an available cartoonist. One important feature that was kept in mind while choosing pictures or having them sketched was that the pictures had to conspicuously display the intended meaning figured in a certain phrasal verb. For instance, if a schematic image of "hold on" were to be displayed, the researcher made sure the picture chosen contained features that would readily provoke a mental image of "hold on" in the mind of the user.

As for the instruments, pre-test, immediate post-test, and delayed post-test of phrasal verbs, were used in this study. All the instruments were researcher-made tests, the reliability index of each was determined in a small-scale pilot study. The split-half reliability indexes of the pre-test, immediate post-test, and delayed post-test were found to be ($r=.91$, $r=.86$, and $r=.78$) respectively. Tests of phrasal verbs were fill-in-the-blank tests of the phrasal verbs taught in this study. The pre-test was administered to make sure the learners were not different in terms of their knowledge of phrasal verbs. The immediate posttest was administered upon the completion of the treatment sessions. Finally, the delayed post-test was given to the learners after a two-week lapse of time.

Each of these tests comprised 30 fill-in-the-blank items in which the students were expected to complete the sentences with appropriate verbs and particles. Each test comprised 15 questions on separable and 15 questions on inseparable phrasal verbs.

Procedure

At the beginning of the study, the learners took a pretest on phrasal verbs. The aim of this pretest was to help the researcher make sure that the learners in both groups were homogeneous in terms of their knowledge of phrasal verbs. The learners in the experimental group were exposed to picture-cued tasks, while the learners in the control group simply memorized the meanings of phrasal verbs, with their dictionary definitions and Persian translations. At the end of the experiment, the learners sat for an immediate posttest on phrasal verbs. After the passage of a couple of weeks, the learners were asked to take a delayed test to help the researcher see if the learned phrasal verbs could be retained in the learners long-term memory or not. The way the experimental group was treated is explained in the following: The instruction and practice procedures the learners went through essentially included pictures, photos, images, and drawings that were representative of the image-schematic concepts giving rise to a certain phrasal verb meaning. First, students were randomly divided into groups of two or three. Copies of the initial picture and its accompanying sentences containing the use of an English phrasal verb were given to every group. They were told to read the sentences carefully, look at the picture drawing, and try to recognize the meaning of the phrasal verb in context. The teacher would then point out the fact that the picture represented an image which encompassed the meaning they were looking for. After correctly identifying the meaning of the verb, the learners were given time to think over and discuss their explanations of salient picture features before they presented their oral/written, first/second language explanations to the teacher and other groups in class. The purpose for this presentation by students was two-fold: to determine if they had worked out the appropriate meaning of the phrasal verb in focus and to correct any possible misconceptions about the intended features shown in the pictures.

Data Analysis Procedure

The scores of the students on the pretest, immediate posttest, and delayed posttest of phrasal verbs were recorded. Each test had 30 questions, so the scores ranged from 0 to 30. The data were analyzed using the SPSS version 17. Descriptive statistics and Independent Samples *t* -test were employed to see if there were any significant differences between the two groups' performances on these tests, and between separable and inseparable phrasal verbs.

RESULTS AND DISCUSSION

Results of the Pre-test

The purpose of the pre-test was to make certain that the CG and EG was homogeneous with respect to their knowledge of (separable and inseparable) phrasal verbs at the outset of the study. The results of the comparison of the two groups on the separable phrasal verbs pretest are displayed in Tables 1, and 2.

Table 1: Descriptive Statistics for Comparing the CG and EG Pre-test

	Groups	N	Mean	Std. Deviation	Std. Error Mean
Separable Phrasal Verbs Pre-test	CG	20	2.60	1.42	.31
	EG	20	2.40	1.78	.40

Such descriptive statistics as mean and standard deviation are shown for both groups in Table 1. The mean score of the CG ($M = 2.60$) was greater than the mean score of the EG ($M = 2.40$). This difference did not seem to be significant, but to ascertain whether it was or not, one needed to look down the *Sig* (2-tailed) column in the *t* test table below.

Table 2: Independent-Samples *t* Test for Separable Phrasal Verbs Pre-test

T-test for Equality of Means										
		t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference			
								Lower	Upper	
Equal Variances Assumed	1.06	.30	.391	38	.69	.20	.51	-.83	1.23	
Equal Variances not Assumed			.391	36.2	.69	.20	.51	-.83	1.23	

According to Table 2, there was not a statistically significant difference in separable phrasal verbs pretest scores for CG ($M = 2.60$, $SD = 1.42$) and EG ($M = 2.40$, $SD = 1.78$), $t(38) = .391$, $p = .69$ (two-tailed). This was so because the p value was greater than the specified level of significance (i.e. .05). Were the p value less than the alpha level (that is, the level of significance), the conclusion would be that the two groups were heterogeneous prior to the experiment.

Results of the Post-test

The results obtained upon the administration of the separable phrasal verbs posttest are presented in this section. Table 3 depicts the descriptive statistics for the comparison of the two groups on the post-test.

Table 3: Descriptive Statistics for the CG and EG Separable Post-test

	Groups	N	Mean	Std. Deviation	Std. Error Mean
Separable Phrasal Verbs Post-test	CG	20	7.15	1.84	.41
	EG	20	11.15	1.46	.32

As could be seen in Table 3, the mean score of the CG ($M = 7.15$) was less than the mean score of the EG ($M = 11.15$). To make sure whether this difference was statistically meaningful or not, one needed to check the *Sig* (2-tailed) column in the *t* test table below.

Table 4: Independent-Samples *t*-Test for CG and EG Separable Phrasal Verbs Post-test

T-test for Equality of Means										
		t		df		Sig. (2-tailed)		Mean Differ- ence	Std. Error Differ- ence	95% Interval of the Difference
										Lower Upper
Equal Variances Assumed	.97	.32	-7.60	38	.000	-4.00	.52	-5.06	-2.93	
Equal Variances not Assumed			-7.60	36.11	.000	-4.00	.52	-5.06	-2.93	

Based on the information in view in Table 4, there was a statistically significant difference in separable phrasal verbs posttest scores for CG ($M = 7.15$, $SD = 1.84$) and EG ($M = 11.15$, $SD = 1.46$), $t(38) = -7.60$, $p = .000$ (two-tailed). The immediate conclusion could thus be that picture-cued tasks were effective as far as learning separable phrasal verbs was concerned.

Results of the Delayed Post-test

This section presents the results obtained after the administration of the separable phrasal verbs delayed post-test. Table 5 pertains to the descriptive statistics for the comparison of the two groups on the delayed post-test.

Table 5: Descriptive Statistics for the CG and EG Separable Delayed Post-test Scores

				Groups	N	Mean	Std. Deviation	Std. Error Mean
Separable Phrasal Verbs Delayed Post-test	CG				20	4.20	1.43	.32
	EG				20	9.90	1.33	.29

Table 5 shows that the mean score of the CG ($M = 4.2$) was substantially less than the mean score of the EG ($M = 9.9$). However, to make certain this difference was statistically significant, one needed to cast a glance at the *Sig* (2-tailed) column in the *t*-test table which follows.

Table 6: Independent-Samples *t*-Test for the CG and EG Separable Delayed Post-test Scores

		Levene's Test for Equality of Variances	T-test for Equality of Means							
		F.	Sig.	t	df	Sig. (2- tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Equal Variances Assumed		.007	.93	-13.00	38	.000	-5.70	.43	-6.58	-4.81
Equal Variances not Assumed				-13.00	37.7	.000	-5.70	.43	-6.58	-4.81

Table 6 indicated that there was a statistically significant difference in separable phrasal verbs delayed posttest scores for CG ($M = 4.20$, $SD = 1.43$) and EG ($M = 9.90$, $SD = 1.33$), $t(38) = -13.00$, $p = .000$ (two-tailed). It could thus be inferred that the effect of picture-cued tasks on learning separable phrasal verbs could last in the long run. Thus, the difference between the separable phrasal verbs delayed posttest scores of the CG and EG was substantial.

Results of the Second Research Question

The second research question of the study was set up to figure out whether picture-cued tasks could enhance EFL learners' learning and recall of inseparable phrasal verbs or not. To find an answer to this question, like what was done for the first research question, independent-samples *t*-test was conducted three times: the first time for the comparison of the pretest scores of the CG and EG right at the beginning of the study, the second time for comparing these two groups' posttest scores after the completion of the experiment, and the third time to compare the delayed posttest scores of the two groups after the passage of time. The results of the related analyses are presented in this section.

Results of the Pre-test

The rationale behind administering the pretest was to make sure that the CG and EG was homogeneous with regard to their knowledge of phrasal verbs before the commencement of the study. The results of the comparison of the two groups on the inseparable phrasal verbs pretest are displayed in Tables 7, and 8 below.

Table 7: Descriptive Statistics for the CG and EG Inseparable Phrasal Verbs Pre-test

	Groups	N	Mean	Std. Deviation	Std. Error Mean
Inseparable Phrasal Verbs Pretest	CG	20	3.05	1.19	.26
	EG	20	2.85	1.63	.36

Table 7 shows that the mean score of the CG ($M = 3.05$) was greater than the mean score of the EG ($M = 2.85$). Although this difference did not seem to be significant, to make certain whether it was or not statistically meaningful, one had to look down the *Sig* (2-tailed) column in the *t* - test table below (Table 8).

Table 8: Independent-Samples *t* Test for the CG and EG Inseparable Phrasal Verbs Pre-test

T-test for Equality of Means									
	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference			
						Lower	Upper		
Equal Variances Assumed	1.85	.18	.443	.38	.660	.20	.45	-.71	1.11
Equal Variances not Assumed		.443	34.77	.661	.20	.45		-.71	1.11

As Table 8 shows, there was not a statistically meaningful difference in inseparable phrasal verbs pretest scores for CG ($M = 3.05$, $SD = 1.19$) and EG ($M = 2.85$, $SD = 1.63$), $t(38) = .443$, $p = .66$ (two-tailed). The conclusion could be that the two groups were homogeneous in terms of their knowledge of inseparable phrasal verbs prior to the experiment. Thus, the difference between the inseparable phrasal verbs pretest scores of the CG and EG was very small.

Results of the Post-test

The post-test results of the inseparable phrasal verbs are depicted in Tables 9 and 10. Table 9 shows the descriptive statistics for the comparison of the two groups on the post-test.

Table 9: Descriptive Statistics for the CG and EG Inseparable Phrasal Verbs Post-test

	Groups	N	Mean	Std. Deviation	Std. Error Mean
Inseparable Phrasal Verbs Post-test	CG	20	7.85	2.10	.47
	EG	20	11.55	1.39	.31

Table 9 indicated that the mean score of the CG ($M = 7.85$) was smaller than the mean score of the EG ($M = 11.55$). To make sure whether this difference was statistically significant or not, one had to check the *Sig* (2-tailed) column in the *t* test table below (Table 4.10).

Table 10: Independent-Samples *t* Test for the CG and EG Inseparable Phrasal Verbs Post-test

T-test for Equality of Means										
	F.	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference		
								Lower	Upper	
Equal Variances Assumed	3.66	.06	-6.54	38	.000	-3.70	.56	-4.84	-2.55	
Equal Variances not Assumed			-6.54	32.9	.000	-3.70	.56	-4.84	-2.55	

According to the information displayed in Table 4.10., there was a statistically significant difference in inseparable phrasal verbs posttest scores for CG ($M = 7.85$, $SD = 2.10$) and EG ($M = 11.55$, $SD = 1.39$), $t(38) = -6.54$, $p = .000$ (two-tailed). The conclusion could thus be that picture-cued tasks were effective so far as learning inseparable phrasal verbs was concerned.

Discussion

The first research question of the study was “Do picture-cued tasks enhance EFL learners’ learning and recall of separable phrasal verbs?” The experimental and control groups were roughly equal on the pretest; however, their posttest and delayed posttest results showed that picture-cued tasks were indeed effective since the experimental group outperformed the control

group on these two tests, giving rise to the conclusion that the treatment helped the learners learn and recall separable phrasal verbs. It seems that the enhanced recognition of concrete/abstract meanings in English phrasal verbs has been the result of the participants' establishment of meaningful connections between concrete/abstract image-schematic visual stimuli presented to them.

An encouraging dimension of the experimental group performance is their relative success in the effective retention of meaning of phrasal verbs, compared to the significantly low outcome achieved by the control group. It is evident that both groups have been subjected to memory loss over the time lapse between the immediate and the delayed posttest which is a natural part of any short-term course of language instruction. This is already in agreement with findings from other studies of mnemonic variables in pictorial elucidations motivated through a cognitive linguistic approach (Boers & Lindstromberg, 2008). Boers and Lindstromberg, for example, examined ways in which pictorial elucidations of concrete linguistic expressions aided learners' recall of their more figurative usage. Similar to the results in this study, they found that pictorial representations of concrete/abstract meanings were highly beneficial to learners who tended to think in pictures; their data also demonstrated, perhaps surprisingly, that such representations further encouraged learners with a tendency to think in words to opt for visual imagery that seemed more motivating and helpful in nature. The results of the current study are, furthermore, in line with the results of Mohammadi, Farsani, Moinzadeh and Tavakoli (2012) who showed that picture-elucidation techniques was conducive to the learning and retention of English phrasal verbs.

Similar to this conclusion was what Ganji (2011) found to be the case. He found that from among the techniques of translation, sentential contextualization, and metaphorical conceptualization, the second and third techniques were superior to translation in delayed posttest and in a test of untaught phrasal verbs. This conforms to the findings of the current study. However, on the pretest, he found no statistically significant difference among the three techniques. This would also mean that translation was as effective as sentential contextualization and metaphorical conceptualization for short-term purposes.

CONCLUSION

As it was previously stated, this study was set up to investigate the effect of using picture-cued tasks on the learning and recall of English phrasal verbs. After the subjects were divided into control and experimental groups they sat for a pretest, the results of which showed that the two groups were homogeneous at the outset of the study. They then were taught phrasal verbs through two different approaches: while the experimental group subjects received picture-cued tasks as their treatment, those in the control group were taught traditionally. The immediate and delayed posttest results showed that the experimental group subjects outperformed the control groupers. Moreover, there was no difference between the results obtained for separable and inseparable phrasal verbs. All this boils down to the conclusion that picture-cued tasks, as a techniques employed for teaching phrasal verbs, came to learners' assistance in forming picture-schematic structures in their minds. To put it differently, picture-cued tasks helped learners grasp the

abstract meaning of English phrasal verbs through concrete pictures which accompanied those phrasal verbs.

As Mandler (2004) points out, humans create mental image schemas and their relevant abstract conceptual patterns through a process of reanalysis of perceptual experience arising from recurring experiential encounters with the tangible events in the surrounding socio-cultural context. It is a serious mistake to assume that this genuine, enduring process can ever be replaced by a few sessions of experience and activity on the part of the foreign language learner in an artificial classroom environment. Nevertheless, the aim of this research was to demonstrate that such a natural process of sensory experience could be mimicked, though minimally and insufficiently, to enhance learners' awareness and raise their consciousness toward bits and pieces of such experience as to render it slightly more meaningful to them.

The same study could be carried out with the students of differing levels of proficiency to see if the same results will be obtained or not. Furthermore, the method of input delivery could be altered (i.e. instruction can take place in a, say, web-based fashion) to observe if the gains will change accordingly or not. What is more, the technique of picture-cued task could be compared with other suggested techniques which were shown to be effective for teaching English phrasal verbs (e.g. sentential contextualization or metaphorical conceptualization, to name just a few).

ABSTRACT

Over the last decades think aloud-protocols have been used in translation studies researches extensively as a data collecting method. Researchers tried to access to the mental process of translators as subjects of studies. The present paper argues that think aloud protocols (TAPs) not only can be used as a method for collecting data in empirical translational research, but also it can be used as a technique in translation workshops. Think aloud protocols can be effective to improve student translation competence according to the constructive approach toward a pedagogy of translation training. In this study, there are seventy-five English as a second language (ESL) intermediate students who are taught translation for about fifty-five hours, according to a syllabus which was organized based on structures of general English and general Persian Language. In the following the students attended in a ten hour translation process workshop in which think aloud protocols (TAPs) used as a technique in teaching translation. The teacher and students were using think-aloud protocols in translating texts in groups and in joint translation. The study shows using TAPs in teaching translation may increase student translation competence. In this study, four methodologies have been used; think-aloud protocols, screen recording, sight translation and interview. This study is one of the first steps toward teaching the process of translation rather than translation product, and it useful for translator trainer to help students discover learning by observing and analyzing their teacher mind.

KEYWORDS: Think-aloud protocols, Translation competence, Translation training, Constructivism, Cognitive Translation.

INTRODUCTION

One of the merits of using Think Aloud Protocols in pedagogical approach is its non-prescriptively and practicality. (House, 2000: 152), it is first seen through the process of translation, which is conducted by a professional and then help teachers and theorizer to put those finding in theory and in classroom activity.

So far, Think-Aloud, due to the nature of gathering data, helps teachers, practitioners and researchers locate how and when translators and students solve the problems in a translation process (e.g. Amirian & Baghiat, 2013). This study, however, has a different look toward Think

Aloud-Protocol as one of the techniques in teaching translation. It is found that using think-aloud protocol in the class as a technique for teaching or as a drill in translation workshops may help increase student translation competence.

The application of Think Aloud in classroom teaching as a technique refers to teachers verbalizing and helping students understand the process of translation, which is happening in their mind, and also asking students to do the same. Students and teachers should verbalize much of their thought as; what is the aim of their choices when they are uncertain about which option is the best, the translation brief, consisting; What are their clients' needs, and so on. To get to the best result the text which is translated verbally shouldn't be read by the translators, whether they are students or the teachers of the class. During the verbalization of the teachers, students are allowed to ask questions and have some kind of conversation with their teacher. They also can have a joint translation with their instructor.

This study tries to use of this data collecting method, as a way to teach students to be conscious of their and their peers' process of translation. In the classroom, teachers were supposed to verbalize the translation process to their students and students are allowed to ask questions. In join translation activity, students work with their teachers and partners.

REVIEW OF LITERATURE

Think aloud protocol

Since solely evaluating the translation final product wasn't sufficed in understanding of translation, for the last decade, researchers have increasingly been looking for a translation cognitive aspect of translation, they've wanted to know what is happening inside a translator brain while they are translating.

A number of attempts have been made to reach the process of translation in translator minds; one such attempt has simply asked the translator to express themselves during the translation activity, such method of data collection is called think aloud.

Think Aloud-Protocols refer to a type of data, which are collected in empirical translation process research; in this method, the subjects of study are asked to verbalize whatever cross their minds during the performance. The written transcription of this verbalization is called Think Aloud-Protocols (TAPS).

The theoretical method for TAPs is borrowed from cognitive psychology (Ericsson & Simon, 1984/1993). Accordingly, the information is stored in different locations, some of them in short-term memory (STM) which is characterized easy access and harshly limited storage capacity, and in long-term memory (LTM) which is more difficult to access and larger storage capacity. Only the information which is in STM can be verbalized by the subjects because it can be directly accessed and reported.

The first application of this method to translation was carried out by Gerloff (1986), Kring (1986), Lorsch (1986) which was related to classical verbal report in which the person observes their own process of thought. Ericson and Simon (1984/1993) conducted a more serious regulated method of data collection, they stated that when there is a controlled and instructed method of think aloud protocols, TAPs don't change the process of translation except for slowing down. There exists some limitation to what kind of information Think-aloud reveals according to Ericsson and Simon (1984/1993); the information which is in Short-term memory, the unconscious memory, is inaccessible. Think Aloud-Protocols may enclose a shadow of the cognitive process of translation, but not a complete one. To have an integral and reliable picture of mind of translators, Think Aloud-protocol might be accompanied by the product of the process of translation, screen recording, questionnaire, keyboard logging data like Translog. (Jakobsen, 2003).

Translation competence

Translation competence is an important aspect of the cognitive process of translation, which enables the translators and interrupters to render completely the act of translation successfully. The notion of competence has been used in many disciplines within the field of applied linguistics since 1960s. Literature differentiates between competence as the underlying skills and the ability to communicate in specific cognitive situations. Communicative competence consists of some sub competence like grammatical competence (knowing about how to apply grammatical cods), socio-linguistic competence (knowing how to act in a different socio-linguistic context), discourse competence (knowing how to produce an appropriate spoken and written text), strategic competence (knowing how to communicate effectively in case of starting, planning, execution and assessment of speaking).

Competence is related to the field of cognitive psychology, and it is studying about expert knowledge and skills. Competence defined as “consistently superior performance in a specified set of representative tasks for the domain that can be administered to any subjects” (Ericsson & Charness, 1997 as cited in Shreve 2006). It accordingly studies in the field shows that expert knowledge consists of a wider range of complex structural knowledge, which is required by the subjects during a long period of practice and study, and it may need an application of problem-solving and require a high load of meta cognition. There is a distinction between declarative (know what) and procedural knowledge (know how) which both are focused in studying the notion of competence. In the field of psychology, competence is a complex know how, which is comprised of knowledge, skills, and attitude and so on. In pedagogy; competence defined as “a complex know how to act resulting from the integration, mobilization and organization of a combination of abilities and skills (which may be cognitive, affective, psycho-motor or social) and knowledge (declarative knowledge) used effectively in a situation with common characteristics”. (Lasnier, 2000). This model distinguishes between subject specific competence (specific to particular discipline) and generic competence (common to all disciplines).

Translation competence is a combination of knowledges, attitudes and aptitudes that a translator or interpreter must have to render the product successfully. Translation competence or TC is underlies the work of experts in translation and interpretation activity, which enables them to

carry out the cognitive operation which is needed for the adequate translation process. Translation competence was first introduced in the late 1970s (Wilss, 1976; Koller, 1979), there are some other terms which have been used for translation competence: translation expertise, translation skills and translational or translator competence.

Translation is a complex, heterogeneous activity, since translation is a combination of different skills, which are very distinctive from each other in nature, knowledge of a wider range of different subject is necessary, and every brand new situation of translation needs new information to learn (Neubert, 2000). Because of this complexity and heterogeneity, rendering a definition for translation competence is very hard to reach. One of the first definitions of TC is “knowledge and skills the translator must possess” (Bell, 1991: 43). Translation competence is considered as an expert system which is led primarily by strategic components. (Albir & Alves, 2009: 63).

Most models of translation competence are componential models with sub competence (Hurtado Albir, 2001: Hurtado Albir & Alves, 2009). Some of the most componential models of translation competence are categorized by Bell (1991), Gile (1995a), Hurtado Albir (1996/1999), Risku (1998), Wilss (1976), Presas (2000/2004), Neubert (2000), Kiraly (1995), PACTE (2000/2003), Concalves (2005), Kelly (2005), Shreve (2006), Alves and Goncalves (2007).

PACTE sees translation competence as expert’s knowledge, and it defines translation competence as declarative and procedural knowledge, according to the PACTE translation competence comprises seven sub competences in which strategic competence is the most important one; Bilingual sub competence, extralinguistic sub competence, Instrumental sub competence, Strategic sub competence, psycho-physiological sub competence (PACTE 2003).

Shreve (2006) sees translation competence as expertise studies, and he considers translation competence as the individual ability of using some related cognitive resources to perform the translation activity. He subdivided translation competence in four sub competences; linguistic knowledge, cultural knowledge, textual knowledge and translation knowledge which is the ability to use translation tools, resources, strategies and procedures.

From the pedagogy approach Kelly (2005, p. 162) explains translation competence as knowledge, skills, attitudes, and aptitudes of a translator for translating a specific text. Kelly categorized translation competence in some sub competences as communicative, cultural, intercultural, textual, subject area, professional, attitudinal, psychophysiological, strategic, instrumental, and interpersonal (working with others) competence. Pym (2003) criticized the componential models of translation competence. However, and identified two skills necessary for TC; first, the ability to produce more than one acceptable target text for one source text and second one, the ability to choose only one of them quickly with justified confidence.

Alves and Goncalves (2007) categorized translation competence according to relevance-rhetoric as a general and specific translator competence. General translator’s competence is all the knowledge, abilities, skills a translator possesses to render a successful, viable translation, specific translator’s competence, however, related to maximization of interpretative resemblance

and the metacognitive conscious process of translation. Note that most of the models for translation competence have not been empirically tested; just a few of them have been tested experimentally like PACTE (2005) Alves and Goncalves (2007) and Goncalves (2005),

Constructivism, think aloud and Translation Competence

Kiraly (2000) social constructivism approach in teaching translation argues translators actively construct the text which they are translating just as students who are learning a language. Kiraly's constructive approach stands for practical experience, discussion and consensual understanding. Students should learn by finding their ways in group work, and they should speak about what they are doing. In this study, students try to be actively participating in class and moreover, learn translation by looking into their teacher's mind and then analyses and assesses their improvement in translation.

A wide range of classroom situation might explain why they are several approaches and theories about what have to be done in translation workshops and classrooms. One of the of the useful distinctions is made by Kiraly (2000) is between "translation competence" and "translator competence" which, according to Bernardini (2004) there is a significant difference between "translation training" and "translation education" in translation training, translation competence mostly accompanied by linguistic skills, which are needed to render a translation. Translation education, on the other hand, like translator competence is a broad range of interpersonal skills and attitude which a translator needs to acquire. Moreover, the student needs to how to work with other translators, terminologist, project manager and clients. Students are not simply taught linguistic elements, but also applying them and evaluating them is important points as well. The translator student should also work in an authentic situation and young translators must be allowed to work as a member of a team among professional translators in a long-term training program.

Kiraly in constructive philosophy made a distinction between 'transmissionism' and 'social constructivism'. According to the former, knowledge would pass from a passive container to another container. Translation is like a conduit which flows through some kind of passage and goes to another language. Constructive theory, on the other hand, is understood as an individual activity in which an individual will construct knowledge about the world. According to social constructivism, people should construct their knowledge in an interactive situation with others and themselves. And this interaction is exactly what has to be happening in classrooms. This view is opposite of transmissionism view, which sees individual translators as passive receptacles of knowledge which the knowledge of a teacher pass through a conduit to the student knowledge store. The role of the teacher in constructivism is a facilitator, guiding the student, opening the space and facilitate the situation of learning as in choosing which text to translate, evaluates the activity, deciding on the objectives of studies and so on. According to the Kiraly (2000) the teachers remain the authorities, deciding what should be learned and what should be translated and how a successful evaluation should be like.

For Kiraly, the transmissionism model (equivalence model) as well as some other paradigm of pedagogy like Grammar translation belongs to the past. In constructive theory, a translator, actively makes an interpretation for source text and renders distinct target text according to different purposes. Kiraly doesn't exclude discussion, practical experience and consensus in the translation classroom; his method is based on practice, by which student should learn from their own experience and active role in the translation process. Students interactively work in groups. They get together and talk about what they are doing.

Lots of discussion has been carried out on how to apply constructivism in translation classrooms. The basic model is to let students translate a text and read the translated target text and then have them evaluate the text. Nord (1996) instructs some class activity; partial/complete translation, small-group work, sight translation, use of parallel texts, simulating interpreting situations, gist translation, documentation and reviewing. House (2000) emphasizes on small groups and in pairs. Many scholars have emphasized working on the source text and intended function of the source text situation and also working on the communicative purpose of source texts and target texts. (e.g. Ulrych, 1996; Nord, 1997). Kiraly (2000) and Gouadec (2007) are speaking in small groups, including; translator, reviewer, terminologist, project manager. At the earliest stage of translation, many quite different activities have been suggested; as bilingual crossword puzzles, terminology search, filling the blanks and etc. Gonzalez Davis (2004) as an example suggests some discussion forums and acting out some communicative task like oral presentation of translation.

There is a growing research in translating training one of the reasons for this is the non applicability of theory into translating classes and failing the current teaching training. According to study by Li (2002) there is a desirable need toward authenticity in classroom activities. Translation training should more be based on empirical research and the process of translation rather than products. Using think-aloud protocols, keystroke loggings, screen recordings and eye tracking. There are plenty of researches dealing with the difference between students of translators, bilinguals, professional translators in this matter (Shreve 2006, Amirian and Baghiat 2013). These studies show the skills a translator needs to be taught. The finding offers translators to use paraphrase than literalism (Kusssmaul, 1995; Lorscher, 1991; Jensen, 1999). Translate the text in a larger unit of translation (Tory, 1986; Lorscher, 1991; Tirkkonen-Condit, 1992). Read text faster and focus more on the target text than on source text (Jakobsen & Jensen, 2008). Translating based on top-down processes and translating according to the purpose (Fraser, 1996; Jonasson, 1998; KUnzli, 2004; Seguinot, 1989). The importance of encyclopedic knowledge (Tirkkonen-Condit 1989), incorporate the client into the task and risks (KUnzli, 2004), automaticity in some complex tasks (Krings, 1988; Tirkkonen-Condit, 1991; Englund Dimitrova, 2005). Show confidence, critical reading in their decision-making process (KUnzli, 2004).

It is also not advisable to jump from the empirical research findings to pedagogical practical application. This is not just because that empirical studies have been done on small groups it is also because some of these findings are overlapped and in some cases they're rare contradictory. Some of the findings of empirical research may due to the type and kind of methodologies. In that situation, we need to use more methodologies in one research like

triangulation methodology. Some factors which represent the experts' skills may just because of hours practicing rather than form some clear-cut teaching in classrooms. Just keep doing some jobs of translating and in the end, the product is acceptable. Automaticity is one aspect of experienced translator behavior. According to Jensen (2001) professional translators overcoming trivial problems and they ask fewer questions than the novice translators about the texts they are translating. They indeed may pay attention less to the communicative situation of translation; they accept translation as it is without question about clients' instruction.

Process researches deal with some notions, which are scarcely used in product researches; like speed, risk management, the use of external aids like looking up dictionaries and using other interfaces as the Internet and the rule of revision in translation. One way to teach students in the class is to make them aware of their activity base on the constructive theory of Kiraly (2000). Students by using Think Aloud-Protocols, screen recording, sight translation, and eye tracking movement and working in groups and monitoring each other can be conscious about their own translating and their peer translating. They also in joint translation can be aware of the process which is going on their teacher's mind who is considered a professional translator.

In addition to accessing to that nature of translation process Think-Aloud Protocols were used in translational research for better teaching by understanding the process of translation. In fact, mostly, all the research about the process of translation potentially can be helpful for pedagogical purposes (e.g. Amirian & Baghiat, 2013). As an example, scholars may compare the process of translation of professional translators with novice and bilingual translators and sum up to some rules, general pattern and habit which an experienced translator acquire and apply the findings to the classrooms to make translation teaching more purposeful. What's more, we can also locate the students' errors and mistakes in the translation process and make our teacher aware of those mistakes. And as in Wakabayashi (2003) we can create a profile for each student for understanding their level of learning.

RESEARCH QUESTION(S)

Can think-aloud protocol as technique in teaching translation be helpful in increasing students' translation competence?

HYPOTHESIS

There is no significant change in students' translation competence in teaching translation process by the use of think - aloud protocol.

METHODOLOGY

Participants

Think Aloud-protocols have been used for decades as a method for data collecting in empirical research in translation studies. This study attempts to see this method as a technique in translation pedagogy. This study was done on seventy-five upper intermediate ESL students. Students pass FCE (first certificate in English) exams with A or B Grade.

Instruments

In this study, four methods were used; screen recording which is carried by Camtasia 8 software, sight translation method, Think Aloud-Protocols, and interview (think aloud retrospectively).

Procedures

Subjects of study passed First Certificate in English test with the score of A or B. They also in a pass a placement test of Grammar structure, which was organized according to Oxford Grammar practice basic by JAHAD Language Center of University of Isfahan. There are four methodologies in this study; screen recording, sight translation, TAPs, and interview. On screen, recording each student was instructed to translate the texts by a software called Camtasia Version 8, students were allowed to use dictionaries, the Internet and other interfaces provided they are observable by the screen of their computers. Sight translation is ostensibly hybrid between translation and interpretation. The students were asked to read the written text and translate the text orally. The students were instructed to record their voices. This study used the two kinds of think-aloud protocols; retrospective or concurrent verbal report and retrospective verbal report. Introspective or concurrent think-aloud is simultaneous verbalization while retrospective, think aloud happens exactly after the translation is finished. In this study, retrospective verbal report is called interview. This study was conducted in one pre-test and two post-tests:

Pre-test

Students each translated some texts, which be organized according to material of Translation workshop, which was going to be taught. Students were asked to translate the texts by Camtasia v.8 software, there were instructed well not to use any other references apart from softwares or other interfaces observable by their computer screen. Students are allowed to use software dictionaries and other interfaces like the Internet. All the thing should be held in their desktop or laptop computer monitor. Their screen recording data, were analyzed by the author of the paper and then in an interview student were asked about the process of translation, which was happening during the translation process. The evaluation was based on comprehension competence, transfer competence and strategic competence of students in the performance.

Posttest A:

Students were instructed through the translation workshops with a book called 'translation technique' by Pazargadi (2010), students were tested by translating some texts parallel with pretest and posttest. There were three kinds of parallel tests. Students were asked to translate them respectively by screen recording method (Camtasia 8 Screen), sight translation Method, and think-aloud method. After each of the methods, students passed an interview like the one in pre-test. The data were evaluated based on comprehension competence, transfer competence and strategic competence.

Posttest B:

Students in an ten-hour translation workshop were taught translation using Think-aloud protocols. The teacher verbally translates the texts, and students were allowed to participate in the translation process in a joint translation. Students themselves in a group verbalized the process of translation to their partners. Students in three kinds of metods were asked to translate the texts,

parallel to pre-test and post tests A, by screen recording method (Camtasia software 8), sight translation method, and thinks aloud protocol method, and after each student was interviewed about the process of translation happening in their mind. In the interview, they were supposed to verbalize the process of translation, (think aloud retrospectively).

RESULTS AND DISCUSSION

The subjects of this study consisted of seventy-five students of upper intermediate English as a second language. The students had passed FCE test with the score of A or B. Every student in this study before the class had passed a placement test, an English grammar test, which had been organized according to Oxford Practice Grammar (Basic) (Norman Coe et al. 2010). The material of the translation workshop was organized according to Farsi and English Grammar structure. The book which taught was 'Translation Technique' by Dr. Aladdin Pazargadi (2010) table 1 illustrates the syllables of the translation workshop.

After fifty-five hours of teaching translation, Persian into English and English into Persian, according to the syllabus, Table 1, students were exposed to ten hour teaching with Think-aloud protocols. First think-aloud protocols were introduced, and students learned how it works. Then the teachers introduced each lesson and translated some text, which hadn't been translated or overlooked before, by using think-aloud protocols. Students were allowed to ask questions during the verbalization of their teachers in addition, students were permitted to translate the texts in joint-translation with their instructors. Moreover Students in their groups were instructed to use think-aloud protocols and ask and answer questions, finally each group should have prepared a verbal report, and then each report was discussed in the class. The PACTE group has devoted years of study and research on translation competence; they focus on theoretical and procedural aspects of translation. The PACTE which stands for Process of Acquisition of translation competence and evaluation, defines translation competence as "underlying system of declarative and procedural knowledge, predominantly procedural knowledge required to translate," accordingly, translation competence is predominantly procedural non declarative, which comprise some interrelated sub competence. PACTE considers the sub competence of translation competence are; the strategic and knowledge about translation sub competence, strategic competence, which is of particular importance guarantees the efficiency of the .translation process. (Hurtardo Albir, 2010).

***Bilingual competence**, predominantly declarative, which comprises the grammatical, pragmatic, socio-linguistic and textual knowledge of each language.*

***Extra-linguistic knowledge**, predominantly declarative, includes the declarative knowledge both implicit and explicit, general world, domain specific, bicultural, encyclopedic knowledge.*

***Translation knowledge competence**, predominantly declarative, is about knowledge of translation methods, processes, practices and procedures.*

***Instrumental competence**, predominantly procedural, refers to documentation by using technological interface tools applied to the process of translation. (e.g. Dictionaries, translation memory tools, etc.)*

***Strategic competence**, Predominantly procedural, which is functioned to carry out the efficacy of the translation project, selecting most appropriate methods, evaluate the process, activate the differentness sub competence and compensate any shortcomings, uncertainty management and problem solving.*

***Psycho-physiological component** is a different kind of cognitive and attitudinal component like memory span, creativity, logical reasoning and synthesis*

Table 1: Syllabus

SESSIONS	MATERIAL OF TEACHING	EXPLANATION
1	INTRODUCTION	INTRODUCING THE BOOKS, TEACHERS, STUDENTS, GIVING STUDENTS INSIGHTS. TRANSLATION INTRODUCTION (E.G. WHAT IS TRANSLATION, WHAT DO WE NEED TO BE A GOOD TRANSLATOR)
2	TRANSLATION AT WORD LEVEL, AND TRANSLATION OF WORDS AND EXPRESSION.	WORDS, IDIOMS, COLLOCATIONS, PROVERBS, SLANGS, DIFFERENT GRAMMATICAL CATEGORIZATION OF WORDS (E.G. VERB, ADJECTIVE, ADVERB,...)
3	ENGLISH GRAMMAR TENSE AND ITS USAGES	SIMPLE PRESENT TENSE, PRESENT CONTINUOUS, PAST TENSE, PRESENT PERFECT, PAST PERFECT, PAST CONTINUOUS,...
4	PERSIAN TENSE	ماضی /M Z 1/, مضارع /MÜZ R 3/, مستقبل /MÜSTÆQBL/,..., PERSIAN & ENGLISH TENSE CONTRACEPTIVE ANALYSIS.
5	TRANSLATION AT SENTENCE LEVEL, SENTENCE CONSTITUENT	ENGLISH AND PERSIAN SENTENCES KINDS AND STRUCTURES, (E.G. STATEMENT, INTERROGATIVE, IMPERATIVE,...) AS AN EXAMPLE: AGENT, PATIENT, PREDICAMENT, DOER, EXPERIENCE, INSTRUMENT, ALL KINDS OF SUBJECTS, VERBS, OBJECTS,
6	SIMPLE SENTENCES PERSIAN AND ENGLISH	SENTENCES WITH NO OBJECTS ONE OR TWO OBJECTS; (SUBJECT, VERB, TWO OBJECTS)
7	TRANSLATION OF 'IT', 'THERE'. TRANSLATION OF PASSIVE SENTENCES	'IT' AND 'THERE' IN ENGLISH ROLE AS A FILLER AND THEY DON'T HAVE ANY SPECIFIC SEMANTIC IN MEANING. SOME PASSIVE SENTENCES IN ENGLISH HAVE ACTIVE FORM IN PERSIAN AND VICE VERSA.
8	- FUTURE PERFECT, SIMPLE SENTENCES WITH INFINITIVE TO,	SOMETIMES THE FUTURE PERFECT IS TRANSLATED ماضی نقلی /M Z 1 NÆQLI/ IN PERSIAN LANGUAGE OR مستقبل /MÜSTÆQBL/, IN FARSI TO PLUS INFINITIVE VERB IS TRANSLATED AS "که /K3/" (E.G. DIDN'T HE TELL YOU TO BE THERE BEFORE SIX, مگر او به شما نگفته بود ک قبل از ساعت 6 اینجا باشید؟ /MÆGÆR ʊʔ B ΣOM NÆGOFT 3 BʊʔD K QÆBL ÆZ S T 6 ɪNDʒA B ΣID ?/)
9	PRESENT PARTICIPLE VERBAL NOUN, GERUND	I LIKE SITTING IN THE SUN. [من دوست دارم در آفتاب بنشینم /MÆN DʊʂT D RÆM DÆR FT B BENES ɪNÆM /]
10	COMPOUND SENTENCES; QUESTION PHRASES, CONJUNCTIONS	AND, BUT, ... TAG QUESTIONS.
11	CLAUSES; ADVERBIAL, ADJECTIVE AND NOUN CLAUSE.	HE TOLD ME THAT HE HAD SUCCESSFUL. THE MAN WHO WAS SICK WENT TO SEE THE DOCTOR. A DRIVER SHOULD TAKE CARE WHEN HE DRIVES.
12	IF CLAUSE, CAUSATIVES.	ZERO, ONE, TWO, THREE, REAL AND UNREAL TO HAVE, TO GET, TO MAKE.
13	DISCOURSE MARKERS; RESULT, CAUSE AND REASON, AGREEMENT,	AGREEMENT, CONTRAST, CONCLUSION, REFERENCE,... EX: STREETS ARE LIGHTED SO THAT PEOPLE SEE WHERE THEY ARE GOING.

	CONTRASE AND ...	
14	PARAGRAPH WRITING IN ENGLISH AND ITS TRANSLATION	WRITING A PARAGRAPH, OBSERVING TENSE AND PUNCTUATION MARKERS.
15	ESSAY WRITING AND IT'S TRANSLATION	FIVE PARAGRAPH ESSAY WRITINGS.
16	CONTRASTIVE ANALYSIS OF SHORT STORIES	ERROR ANALYSIS OF TRANSLATION.
17	SHORT STORY TRANSLATION	TRANSLATION OF SHORT STORIES
18	SHORT STORY TRANSLATION	TRANSLATION OF SHORT STORIES
19	LETTER WRITINGS	COMMERCIAL LETTERS, FORMAL AND INFORMAL LETTERS.
20	TRANSLATION OF POLITICAL TEXTS	LIST OF POLITICAL WORDS AND THEIR TRANSLATION, TRANSLATION NEWSPAPERS AND MEDIA.
21	TRANSLATION OF LEGAL TEXTS	LIST OF LEGAL WORDS AND THEIR TRANSLATION. TRANSLATION OF LEGAL DOCUMENTS.
22	LITERAL TRANSLATION	VERSE AND PROSE TRANSLATION,
23	FREE TRANSLATION	STUDENT PROJECT.
24	TRANSLATION THEORY	THEORY OF TRANSLATION. EQUIVALENCE, PURPOSE, SYSTEM, DESCRIPTIVE, DECONSTRUCTION AND CULTURAL APPROACH.
25	ETHIC IN TRANSLATION	CODES OF ETHICS IN TRANSLATION
26	TRANSLATION TOOLS	MEMORY TOOLS, MACHINE TRANSLATIONS, DICTIONARIES AND....

As strategic competence is the core competence among other sub competences of the translation, this study mainly argues about translation strategic sub competences. Table 2 shows the overall strategic competence in details.

Table 2: Strategic Competence Specifics.

AUTOMATICITY		
TIME		PHYSICAL FACTORS
INDICATORS	TIME: AVERAGE TIME OF TRANSLATING A TEXT, AVERAGE TIME OF REVISING IN PRODUCTION LEVEL AND IN TRANSFER LEVEL, AVERAGE TIME OF READING & RE READING AND AVERAGE TIME OF USING DICTIONARIES AND OTHER INTERFACES PHYSICAL FACTORS: A NUMBER OF CURSOR MOVEMENT AND A NUMBER OF CLICKS NOTE THAT AUTOMATIZATION IS NOT EXCLUDED TO PHYSICAL FACTORS AND TIME, AUTOMATICITY IS ONE OF THE ASPECT OF EXPERTS' COMPETENCE IN TRANSLATION.	
ERRORS		
SEMANTIC MAJOR ERROR		SYNTACTIC AND STRUCTURAL ERROR
INDICATORS	SEMANTIC MAJOR ERROR: THE ERROR WHICH COMPLETELY CHANGES THE MESSAGE OF THE TEXT IS DUE LACK OF LINGUISTIC KNOWLEDGE IN ENGLISH OR PERSIAN LANGUAGE OR IT'S DUE TO COMPREHENSION OR TRANSFER LEVEL SYNTACTIC AND STRUCTURAL ERROR IS DUE TO LINGUISTIC STRUCTURAL KNOWLEDGE IS CONSIDERED MAJOR IF IT IS ONE OF THE MATERIAL WHICH WAS TAUGHT DURING THE WORKSHOP. NOTE: PARTICIPANTS WHO HAVE MAJOR ERRORS ARE OMITTED FROM THE STUDY.	

Unit of translation

Unit of translation is defined as a communicative, textual and cognitive unity, which is applied by a translator in the process of translation. Textually speaking, there is complex textual unity between parts of a text which a translator at a granted moment pay attention to one particular part of text considering the context. In cognitive perspective, the unit of translation is defined as a comprehension and processing unit which is independent of a particular size or format of the text, the translators at a given moment give attention to a specific cognitive part of a text according to their discerning requirement. In this study, the cognitive perspective of the unit of translation is considered, but the manifestation of it is on the linguistic level. Units of the translations are categorized according to table 3 as word, beyond word, sentence and beyond the sentence level.

Table 3: Unit of Translation

TESTS	WORD LEVEL	BEYOND WORD LEVEL	SENTENCE LEVEL	BEYOND SENTENCE LEVEL	UNCLASSIFIED
PRETEST	43.2%	47.36%	8.44%	0%	1.0%
POST TEST A	35.1%	51%	13.64%	0%	0.26%
POST TEST B	12.3%	45.18%	29.52%	13%	0%

Referring to Table 3, participants who are taught the process of translation by the use of Think-aloud protocol in the process of rendering the text are more likely to translate texts toward the sentence and beyond the sentence level. Table 3, may indicate; students by looking through the process which is happening in a professional translator's mind may get aware to look outside the boundary of textual unit and take the whole text as a unit of reading and translation instead.

Problem solving

Comprehension level

Problem solving metacognitive translational activity may happen in three interrelated translation process stages; comprehension stage, transfer and production stage.

Problem solving in Comprehension location during the process of translation is related to the level of reading the text, understanding the main idea and re express the main idea in mind before utterance or writing on paper. The indicator of recognizing a problem in the comprehension part is extended pause, re-reading, and dictionary looks-up. This location starts from the students' linguistic knowledge about English language structure, words. Students' screen and voice recording and their verbal reports indicate student uncertainty in the comprehension phase of the translation process. Screen recording and voice recording methods show the student way of reading; extended pause, re-reading and checking new vocabulary. Verbal reports show participants' metacognitive activity before their production on paper or utterance (Table 4).

Table 4: Comprehension Level

PARTICIPANTS	PRE TEST	POST TEST A	POST TEST B
UNIT OF READING	WORDS AND TERMS 12%, CLAUSE AND SENTENCES 78%	WORDS AND TERMS 9%, CLAUSE AND SENTENCES 81%	WORDS AND TERMS 11%, CLAUSE AND SENTENCES 89%
GRAMMAR TENSE	83.23%	90%	98.32%
CLAUSES	52.62%	80%	98.32%
PHRASES	68.2%	89.63%	88%
DISCOURSE MARKERS	30%	72%	8.6%
PUNCTUATION	77%	85%	98%
INTERJECTIONS	41.15%	91.2%	98%
SEMANTIC	55.82%	73%	80%
PAUSE	9.2%	6%	4.3%
REREADING	18.6%	10.5%	8.6%
DICTIONARY LOOKS-UP	13.7	9.5	5.6
TOTAL TIME	4:56	3:2	2:54

Participants in posttest B, show the significant difference in linguistic knowledge, which consists of grammatical competence, semantic and syntactic competence; they also respectively show the increase of comprehension competence relevant to decrease a number of pauses, re-reading and total time of reading. Students in post B read the text more holistically at sentence level this means students in translation process workshops acquire the competence of reading.

Transfer level

Whatever happen on paper before the last phase, revising, is called transfer level. This is the most important part in which strategic competence, related to solving problem, applied significantly. Decoding the message into Target language, translators in the process of translating encounter the problems, though, extending pause, re-reading the source text and transfer text, dictionary looks-up and editing are indicators of translators attempt to solve translation problems. Table 5, illustrates the transfer level of the process.

Table 5: Transfer level

participants	Pretest	Posttest A	Post test B
Average number of Pauses 3>	9.2	6	3
Average number of Using a dictionary	8	5.7	4.2
Average number of Using the net	4	3.2	1.9
Rereading the text	25.3	12.5	6.8
Average number of rewriting and revising while translating unit of translation (deleting, adding, and...)	12.2	19.7	24.36
Average number of proposals for problem solving	2.2	4.3	6.8
Average time of reading the translation text	3:20m	3:5m	1:8m
Time of transferring (- reading)	6:50m	4:5m	3:21m
Average time of pause	8 s	5:3 s	2:1 s
Time of writing the last draft	1:58m	1:02m	1:22m
Unit of translation	Lexis 43.2% term 26.4% phrase 06.6 % syntax 14.36% sentential 9.44% macro level 0%	Lexis 35.1% term 29% phrase 11% syntax 11.26% sentential 13.64% macro level 0%	Lexis 12.3% term 14.3% phrase 20.64% syntax 10.24% sentential 29.52% macro level 13%
Number of problem recognition	9.2	10	8.7
Average time of solving problems	10 s	7 s	4.3 s
Average number of clicks	32	29	22
Average cursor movements	182	156	104

Table 5 illustrates student's translation competence, increasing. Students' translation unit in the translation process workshop, post test B, are more towards context, sentence and beyond the sentence level. Moreover, Students with less effort and time manage to solve translation problems; significant lower number of pauses, dictionary looks up, time, clicks, cursor movements and time manifest students confidence and automaticity in problem solving. Student

increasing number of Editing and solution proposals explain students solve the problem of translation on sight, and they don't postpone it to the last level (the production level) as in professional translation according to Angelone (2010).

Production level

Production level or revising the level is the location where students re-read the translation and try to make some amends. Table 6, shows the revising phase in detail.

Table 6 argues participants at the translation process workshop got more aware about the substantiality of production level. They are accordingly more active in revising phase; the increasing number of adding, omitting, replacing and allocation time may confirm the fact.

Table 6: Production level

PARTICIPANTS	PRETEST	POST TEST A	POST TEST B
NUMBER OF OMITTING AND ADDITION PER PERSON PER TEXT	2.5	6.7	9.9
UNIT OF REVISING PER PERSON PER TEXT	SENTENCE 11% TEXT 0% NOT REVISING 89%	SENTENCES 46% TEXT 13.7% NOT REVISING 49.3%	SENTENCES 59.82% TEXT 28.6% NOT REVISING 12.4%
AVERAGE TIME OF REREADING PER PERSON PER TEXT	0:59	2:68	5:4
AVERAGE NUMBER OF PAUSES PER PERSON PER TEXT	1.2	5.1	7.45
TOTAL TIME OF REVISING AND PRODUCTION PER PERSON PER TEXT	1:3	2:9	3:4

Referring to table 7; solving problem levels, students who were teaching translation process by the use of TAPS are solving problems, mostly in transfer level where as students before attending the translation process workshop tend to solve problems in production level.

Table 7: Solving Problem Levels

TESTS	COMPREHENSION	TRANSFER	PRODUCTION	UNCLASSIFIED
PRETEST	14%	30.22%	52%	3.78%
POSTTEST A	17.6%	28%	54.33%	0.07%
POST TEST B	20%	47.32%	29%	3.68%

Problem solving procedure

The first phase of solving problems is recognizing them, which is indicated by an extending pause. Instantly after problem recognition the translator tries to solve the problem by proposing some solutions. Searching on the net, dictionaries and other interfaces show the Meta cognitive attempt of a translator to solve the problems. Translators reread, rewrite the text as many times as they find a better solution. A number of rereading, re editing the text shows the problem. A Number of solution proposals are clearly observable in the translators' ' verbal report. And a

number of problem evaluations can be understood from the translator's screen, voice recording and also TAPs.

Table 8: Translation Problem Solving Procedure

TESTS	PROBLEM RECOGNITION	PROPOSALS FOR SOLVING PROBLEM	EVALUATE THE PROPOSALS	UNCLASSIFIED
POST TEST	31.3%	18%	48%	2.7%
POST TEST A	34.3%	22.5%	41.8%	1.4%
POST TEST B	44.2%	27%	28%	0.8

Table 7 argues that students after participating in the translation process workshop using the verbal reports (TAPs) may act approximately like a professional translator, this means students are getting well aware about what is going to be the problem in the process of translation, and they take more time in comprehending, read and re-reading the text before starting to produce a physical draft.

Students after watching thoroughly the process of translation using TAPs understand that a professional translator gives more time recognizing the problem of translation in the comprehension level. A professional translator read and reread the text before they are going to render any written or spoken format. Participants in the translation process workshop may produce more suggestions, and they are more certain in evaluation due to their professional like behavior requiring during the workshop (table 8).

CONCLUSION

Think-aloud protocols have been used practically as a data collecting method in empirical studies of translation. The theoretical method borrowed from cognitive psychology (Ericson & Simon 1984/1993). Since then scholars have used think-aloud protocols to capture the process of translation activity in professional mind as a guideline for teaching student in a classroom atmosphere. This study considers think aloud protocols not as a data collecting method solely but also as a technique for teaching translation.

Teachers translate a text impromptu for their students to show the real process of translation. Students' role is asking their teacher about the translation process, and they are allowed to help their teachers in translating the text in a joint-translation. Students afterward in groups try to translate texts with their partners, and teachers have an observer role of evaluating student's verbalization. This study has seventy participates, students attended in a translation fifty five-hour translation workshop. Students were intermediate and upper intermediate of ESL (English as a second language). They scored A or B in FCE test. After fifty-five hours of teaching based on organized material, students participated in a ten-hour translation process workshop in which teachers teach the translation process by the use of Think-aloud protocols.

According to the social constructivism approach by Kiraly (2000) translators should actively construct the text they produce just as a student of foreign language actively participates in the process of learning, accordingly using think-aloud as technique of teaching translation may help students in building their knowledge and help them have an active role in the process of

translation. The study argues that TAPs as technique of teaching within the classroom may increase students' competence.

This study argues Think-aloud protocols may be significantly an effective technique in training translators in an increasing student's expert like behavior and competence. Translation classroom approach, designs and practice may be more useful if they deal with the process of translation rather than just product of translation. The translation - process workshops may be the future of translation pedagogy in which students observe, construct and acquire translation competences. Further researches and studies may be needed to find more about how to apply a translation-process workshop in practice.

Limitation of study

As far as validity and reliability of the research concerns this study tries to use four methods to decrease the possibility of student awareness effect of being under study. Students in this study had to record their voices and use screen recording method at home so they may re-record their voices or rewrite their work in order to look nicer toward their teacher's eyes. One of the limitation of this study was non existence of a specific laboratory with an observer to check whether students are following the instructions that they were given correctly. Using think aloud as a technique in teaching translation is a brand new topic in translation training field so lack of prior study was another limitation of this study. So the author had to develop a typology according to the translation competence. Finally, accessing human mind and coming into conclusion is a long run study, which is not going to be covered by a paper on some students in a specific situation. There have to be more theses and papers on this subject to reach to the complexity of human mind of a translator in order to see what have to be taught and learnt in a translation training setting. This study may be one of the first steps toward having more process oriented, student centered classes.

ABSTRACT

This study attempts to compare and analyze the use of hedges in research articles (RA_s) from three disciplines of physics, computer engineering, and applied linguistics written in English. It aims to find the similarities and differences in using hedging devices by English writers of physics and computer articles. It also tries to compare and contrast the use of hedges in applied linguistics written by English and Iranian authors. To achieve this goal, 424 RA_s from international and national journals from 2005 to 2012 were selected: 165 physics, 93 computer engineering, 77 applied linguistics articles written by English writers, and 89 applied linguistic articles written by Iranian writers. A classification of hedges formulated by Salager-Meyer (1997) was used as a model. After determining the frequency and percentage of each hedging devices, Chi-square analysis was used to see if the differences between these disciplines are significant or not. Findings reveal that computer engineering writers used hedges more than physics writers. The intra- discipline analysis showed that Persian writers of applied linguistics RA_s used more hedges than their English counterparts. The implications of this study will be useful for English for Specific Purposes (ESP) to teach hedges in writing and reading comprehension activities.

KEYWORDS: Hedges, Scientific articles, Researchers, Conclusion sections

INTRODUCTION

An important feature of academic writing is to evaluate evidence and draw conclusions from the data. Scientific writing is full of mitigating devices and expression that carry the writers' attitudes. That is, academic writing cannot be considered as exclusively objective and factual, but there are features situated in text that encode the writer's point of view (Crompton, cited in Jalilifar, 2011). These features serve as mediators between the information presented in text and

writers' factual information. Metadiscourse markers such as hedges signal the speakers or writers' points of view in using the spoken or written format.

Scientific writing has special characteristics which make it unique among other types of writing. While most readers expect scientific reports to be quite objective, the fact is that there do exist interactive elements whose role is to show a connection between the writers personal opinion and the data presented in the text. One of these interactive elements is hedging which shows the writer's doubt and uncertainty. Clemen (1996, p. 1) maintains that hedging limits the writer's commitment to what he proposes, and helps him to avoid errors. He argues that the writer may demonstrate reserve by emphasizing the universal validity of his statements and if he is unsure, lacks knowledge or belief, or wishes to avoid dogmatism, he can cite higher authority

A better understanding of hedges can provide insights into the interactional and rhetorical nature of the scientific research articles (RAs). Hyland (1994, p .319) argues that “hedging is a substantial means by which the professional scientist confirms his or her membership of the community”. Therefore, this line of research can make an important contribution to our understanding of the practices of practical reasoning and persuasion in science (Hyland,1999). Hedging does not necessarily refer to uncertainty to all contexts. Hyland (1995) mentions that some writers have suggested that hedges are a means of signaling distance between a speaker and what is said or to convey purposive vagueness in writing. Despite the crucial role of hedges in scientific writing, not many studies have been conducted concerning the presence and frequency of hedges in different disciplines or genres. The purpose of the present study is to compare conclusion sections of research articles written by native speakers of Persian and those written by native speakers of English concerning the use of hedges.

Although a number of researches (e.g., Hyland,1995) have been carried out on the existence of hedging devices in different types of texts, many questions are still unanswered in this relation. For example, one might wonder in what genres hedging happens more or to what extent a certain discipline, e.g. applied linguistics, is hedged. Moreover, the lack of comparative research on the use of hedging strategies has created some sort of unawareness as to which disciplines are more hedged compared with other disciplines. There is no perfect answer to questions like these due to the small number of researches carried out in this regard. Hyland (1995, p .34) maintains that there has been little work into how hedges work in academic genres based on analysis of adequate corpora and we know virtually nothing about the expression and function of hedges in scientific research articles. The previous studies on hedges mainly dealt with specifying the types of hedges present in the research articles on a specific discipline e.g. Research Articles on Cell and Molecular Biology Hyland (1995). Comparative studies on frequency and type of the use of hedging have been rare and this requires more studies to be conducted comparing native and non-native writers in the use of hedging as a pragmatic strategy.

Recently, Jalilifar (2011) in a research accounted for metadiscourse variation in the discussion sections of articles written in English and Persian published in Iranian as well as international scholarly journals focuses on type, frequency and function of hedges in discussion sections of the articles. However, still few published studies have specifically looked at the type and frequency

of hedges in conclusion sections of articles written by native researchers (NRs) and non-native researchers (NNRs) in English (Rahimi, 2012, p. 58). Thus in this study, the researcher focused on the types and frequencies of hedges in conclusion sections of articles in hard science and soft science written by English writers and Iranian writers of English. The research articles under study were selected from three disciplines including applied linguistics from soft applied science as well as computer engineering from hard applied and physics from hard pure science.

The present study investigates the frequency of occurrence and types of hedging devices in conclusion section of research articles written in hard sciences, soft sciences, and applied sciences. Although a number of researches have been carried out concerning the role of hedging devices in different disciplines and different sections of research articles, it seems that, only few have dealt with comparing hedges in conclusion sections.

Thus the purpose of the study is to investigate the use of hedges in conclusion sections of articles published by Iranian writers as NNRs and English writers as NRs in computer engineering, applied linguistics, and physics fields of study. As mentioned earlier, the hypothesis is that Iranian researchers underuse hedges in their scientific articles. It is hoped that the results of this study will shed some light on academic writing problems for Iranian researchers. The insights gained from the results of the study may provide English practitioners with better idea on writing scientific papers through using hedges appropriately and adequately. It is also hoped that the results of the present research will be useful for English for Specific Purposes (ESP) developers, English for Academic Purposes (EAP) developers, translators, teachers and ESP writers in Iran.

REVIEW OF LITERATURE

Metadiscourse markers

Metadiscourse is discourse about discourse, intended to address rather than inform readers (Williams, 1981). Metadiscourse includes linguistic elements which do not refer to aspects of external reality (as propositional or referential elements do) but to the organization of the discourse itself and to aspects of the relationship that develops between the author and the reader (Crismore 1989). What Vande Kopple (1985) labels referential 'meaning' is equivalent to what Halliday (1978) calls 'ideational' meaning. Vande Kopple (1985), using the broad definition of metadiscourse, suggests that metadiscourse conveys interpersonal and/or textual meanings. Dafouz-Milne (2008) states that "metadiscourse refers to those features which writers include to help readers decode message, share the writers view and reflect the particular conventions followed in a given culture" (p.97).

Arguing the importance of metadiscourse devices, Camiciottoli (2003, p. 9) states that "metadiscourse markers produce a desired effect, depending on writer's underlying purposes and perceptions of the reader's expectations". They help writers to present information in a clear, convincing and interesting way to promote acceptance and understanding, as well as reader-writer solidarity. They act as persuasive devices to affect and influence the reader's reactions to texts according to the values and established rules and conventions of a discourse community.

Classification of metadiscourse markers

Hyland and Tse (2004, p.169) propose a model of metadiscourse in academic texts which distinguishes interactive and interactional dimensions and recognizes more specific functions within them. This schema is discussed in detail and summarized in the following table:

Table 1: Metadiscourse markers (Adapted from Hyland & Tse, 2004, p.169).

Category	Function	Examples
Interactive resources	help to guide reader through the text	
Transitions	express semantic relation between main clauses	in addition/but/thus/and
Frame markers	refer to discourse acts, sequences,	finally/to conclude/ or text stages my purpose here is to
Endophoric markers	refer to information in	noted above/see Fig/ other parts of the text in section 2
Evidential	refer to source of information from other texts	according to Y (1999), Z states
Code glosses	help reader grasp the function of ideational material	namely/e.g./such as/ in other words
Hedges	withhold writer's full commitment to proposition	might/perhaps/ possible/about
Boosters	emphasize force or writer's certainty in proposition	in fact/definitely/ it is clear that
Attitude markers	express writer's attitudes to proposition	unfortunately/ I agree/surprisingly
Engagement markers	explicitly refer to or build relationship with reader	consider/note that/ you can see that
Self-mentions	explicit reference to author(s)	I/we/my/our

Hyland and Tse (2004, p.168) further note that “interactive resources are those devices are used explicitly by writers in an argument”. They are used to organize the discourse, help and guide the reader through the text. Readers can get the intended meaning and interpretations of all the text through explicit use of these devices which can be recovered from the text. And interactional devices, on the other hand, engage the readers in the discussion by alerting them to the writer's attitudes and propositional information and readers themselves. Metadiscourse from this point of view is used to express attitudes, judgments, the degree of intimacy, and the degree of reader involvement. This part deals with the way that writer presents his ideas and attitudes in the text and the degree of reader and writer engagement in the argument. Hedges, as one of the groups of discourse markers, have been defined by some of the scholars to be presented briefly.

The concept of hedges/hedging

Schroder and Zimmer (1995, p. 45) maintain that the term “hedging research' refers to a complex research area within the fields of pragmatics, linguistics, semantics, logic and philosophy”. In pragmatics, however, the concept of ' hedge/hedging ' is linked to politeness phenomena, mitigating vagueness and modality. A hedge is either defined as one or more lexico-syntactical elements that are used to modify a proposition or as a strategy that modifies a proposition. Schroder and Zimmer (1995, p. 36) argue that “the term hedging is used to refer to the textual

strategies of using linguistic means as hedges in certain contexts for specific communicative purposes, such as politeness, vagueness, mitigation, etc”.

There are only a few entries in linguistic dictionaries dealing with the concept of 'hedge' and 'hedging'. Furthermore, only in Wales'(1989) *Dictionary of Stylistics* there is a specific entry for 'hedging'. The German dictionary entries present a semantic definition of the concepts while the *Dictionary of Stylistics* gives a twofold definition of hedging from the point of view of semantics and pragmatics (including discourse analysis and speech act theory).

The notion of "hedging" was first introduced by Lakoff (1972, p.195) who spoke of "words whose job is to make things fuzzy" and since then the term has been used to refer to devices which qualify the writer's expression. Lakoff (1972) gives an example of what he means, the way we might talk about birds. Eagles, for instance, are birds; so are kingfishers and albatrosses. But what about, for example, a chicken? Lakoff suggests that we might find ourselves saying: A kitchen is a sort of bird. That 'sort of' is a hedge. According to Lakoff, the logic of hedges requires serious semantic analysis for all predicates.

Zadeh (1972) followed Lakoff in using the designation 'hedge' and analyzed English hedges , such as *very ,much, more or less, essentially* and *slightly* and more complex ones like *technically* and *practically* from the vantage point of semantics and logic.

Hedges vary in their dependency on context. Holmes (1988) studies hedges from the point of view of teaching and learning English as a second language. She defines hedges as devices for attenuating the strength of utterance as a part of epistemic modality.

Skelton (1988, p.37) argues that “there are a very large number of ways in which one can hedge in English. He suggests the following categories: The use of a) impersonal phrases b) the modal system c) verbs like: *seem, look* and *appear* d) sentence introductory phrase, like: *I think, I believe*) the addition of “ish” to certain (but not all) adjectives”. Skelton (1988, p.37) gives the following examples of hedging with unhedged version on the left:

- | | |
|--|--|
| 1. It is good. | It may be good. |
| 2. The world is flat. | It is said that the world is flat. |
| 3. Sarah has red hair. | Sarah has reddish hair. |
| 4. David Gower has a forceful personality. | I doubt if David Gower has a forceful personality. |

According to Skelton (1988), “it is by means of hedging system of a language that a user distinguishes between what s/he says and what s/he thinks about what s/he says”(p.38). Therefore, without hedging the world is purely propositional, a rigid (and rather dull) place. With a hedging system, language is rendered more flexible and the world more subtle. Skelton (1983) believes that it is impossible to avoid hedging, yet describe or discuss the world. Since the early 1970s the concepts of 'hedge' has moved far from its origins, particularly since it was adopted by pragmatics and discourse analysts. Hedges are considered to be of two types: 'shields' and 'approximators'. They suggested that in shields, the speaker is hedged: his or her degree of

commitment to a proposition is stated. On the other hand, in approximators, the proposition itself is hedged: the extent to which it is true is stated. Thus as an instance of shields one might have: *I suspect the moon is not made of green cheese after all*. And as an instance of approximators: *It is made of some sort of rock stuff*.

Yang (2006), focusing on a corpus of 10 texts in material science discipline, explored the use of hedging both by Chinese and English writers. The results of this study showed that RAs written by Chinese writers tend to be more direct and authoritative in tone which may be related to the nature of the language in that particular discipline. Martin (2008) in his study analyzed hedges in English and Spanish written RAs in Clinical and Health Psychology disciplines. The results of his study revealed that there are similarities between the two languages regarding the distribution of hedges across the different sections of the RAs, although a certain degree of indetermination strategy occurs in English texts and showing English RAs in the field of Clinical and Health Psychology provide more protection to the author's face. What is gained is that nationality is less powerful than the discipline in affecting the writing style.

Jalilifar (2011) examined 90 research article Discussion sections' hedges and boosters in two disciplines of Applied Linguistics and Psychology by three groups of writers; English writer, Persian (Iranian writers write in English), and Persian writers (Iranian writers write in Farsi). The results of analyses showed significant differences in frequency, type, and functions of these devices in the texts. Jalilifar claimed that differences might be attributed to lack of awareness of the conventional rules of English rhetoric, limited knowledge of academic English by Persian writers, and lack of explicit instruction and exposure to pragmatic and sociolinguistic rules of English by Persian researchers. It seems that Iranian researchers should be thought enough about the role of hedges in the academic community. To address the theme of the present study, the following research question was proposed.

RESEARCH QUESTION

Is there any significant difference between the types and frequencies of hedges used in conclusion sections of scientific English articles (i.e., including computer engineering, and physics) published by NRs?

METHODOLOGY

Corpora

In order to compare and analyze the hedges across different disciplines, this study relied on RAs from three English native corpora (physics, computer engineering, and applied linguistics) and the non-native corpus of applied linguistics in English. There are some reasons behind this selection. First of all, there is a standard typology for the classification of academic knowledge distinguishing between 'pure' or 'applied' and 'hard' or 'soft' disciplines (Becher & Trowler, 2001). In general, the natural sciences and mathematics are classed as hard-pure, the science-based professions such as engineering are classed as hard-applied, the humanities are classed as soft-pure and the social professions such as education and law are classed as soft applied. In

accordance with this classification of academic discourse, the researcher decided to work on physics as a hard-pure, computer engineering as a hard-applied, and applied linguistics as a soft-applied academic discourse. The reason for which the researcher used applied linguistics is our familiarity with and good command of that. Furthermore, this is the discipline with the deep affinity to linguistics analysis of texts. We are well-acquainted with this discipline, as anyone in the field of TEFL should be. Hence, it seems that these disciplines, as they represent different academic discourses, are good choices for this study and can represent social science disciplines.

Moreover, the researcher compiled a non-native corpus of applied linguistics in English which included RAs written by Iranian authors to see if there is any difference between native and non-native authors in the same discipline (AL) with regard to the hedging devices. Furthermore, as the current generations of researchers are required to be skilled in writing RAs; accordingly, the selection was pedagogically motivated to be in line with the rapid growth in the number of academic papers; especially, among non-native English researchers.

Disciplines

As mentioned above, this study relied on three disciplines- physics, computer engineering, and applied linguistics, each including approximately 37500 words to compare them in terms of hedging devices. Physics discipline comprised of 165 articles with 91 words in the shortest and 823 in the longest conclusion sections. Computer engineering discipline comprised of 93 articles which range in length between 93 words to 1295 words. Applied linguistics discipline consisted of two sections, one written by English native speakers and other one written by Persian native speakers. The first section, articles written by native authors, comprised of 77 articles with 95 words in the shortest and 1287 words in the longest conclusion sections. The latter part, articles written by Iranian writers, comprised of 89 articles which range in size from 78 words to 1354 words in the conclusion sections. On the whole, in all the mentioned disciplines 424 articles which include 150 thousand words were analyzed. These corpora were developed by selecting articles published internationally from 2005 to 2012. In order to compile more reliable and recent corpora, only RAs published since 2005 onwards were selected. The RAs were collected from prestigious journals representing the disciplines in focus. These journals were suggested by experts in the field who have published papers in the journals in each discipline field (see Appendix C for a complete list of the journals). The rationale behind the selection of the RAs was that writing RAs appears to be a very complicated activity with many visible and invisible layers. Thus, preparing to write RAs requires understanding higher levels of discourse (Abdi, Tavangar Rizi, & Tavakoli, 2000).

Instrumentation

The present study employed one framework for the analysis of hedging devices. The framework used was Salager-Meyer taxonomy of hedges based on Salager-Meyer (1997, p. 4). Based on this checklist there are 59 hedging devices among which according to Salager-Meyer (1997) the first category is of the most frequency. On the account that some of hedging devices were not observed in any disciplines, they were excluded from the study. The omitted hedging devices are as follows: 1) fifth category and seventh category which are introductory phrases and compound hedges respectively. Among other categories of hedging devices the following were omitted: *if*

true and occasionally. Accordingly, the rest of the checklist which included 45 hedging devices was analyzed.

Procedure

This study began with the collection of English papers published internationally in prestigious journals to compile three corpora of three disciplines- physics, computer engineering, and applied linguistics. Then a non-native corpus of applied linguistics was compiled by collecting papers written by Iranian authors in English. The selected RAs were obtained directly from the electronic versions of the relevant journals and conclusion sections of the RAs were selected and then converted to Word format. Then the conclusion sections of the RAs were divided into four groupings:

Group A: Articles on Physics written by English native writers (165 RAs).

Group B: Articles on computer engineering written by English native writers (93 RAs).

Group C: Articles on applied linguistics written by English native writers (77 RAs).

Group D: Articles on applied linguistics written by Iranian native writers (89 RAs).

There were about 37500 words in each group. All the conclusion sections of each group were saved on a computer to produce an electronic corpus of about 150000 words which showed the number of the words in all the four groups neglecting all the figures and symbols that did not consist of alphabetically letters (e.g., numbers). By doing so, it became possible to make intra-group comparisons. Afterwards, the Word software was used to highlight and count the hedges in each group based on the checklist presented earlier in this section. Selection of hedging devices was according to their functions and meaning in the sentences. Although some words appeared to be hedges according to the mentioned checklist, they didn't function as hedges in the text. So they were not counted as hedges. Here are two examples in which the word 'about' is used in two different ways:

a) *It leaves unanswered a number of questions **about** the effects of both speaker and listener proficiency in the L2 on intelligibility.*

b) *Concerning the amount of input, the immersion children were supposed to spend **about** 4400 hours on Japanese instruction from kindergarten to the fifth grade.*

In the above examples the word 'about' functions differently: In the first example it is a proposition which means on the subject of or connected with. In the second example it is an adverb which means approximately. In the first case the word 'about' does not function as a hedge while in the second example it does. So in in this study the word 'about' and the like in such examples as example (a) were not taken into account as hedges. Moreover, the researcher calculated the inter-rater reliability through the calculation of correlation between the raters based on Spearman formula to make sure whether he did the analysis in the right way. The results of the inter-rater reliability calculation are presented in the table below:

Table 2: Inter-rater reliability

Disciplines	Computer engineering	physics	Applied native	linguistics	Applied native	linguistics	non-	Total	Inter-rater reliability
Inter-rater reliability (Spearman's rho)	0.97.21**	0.95.23**	0.96.82**		0.99.75**			0.90.00*	

**, Correlation is significant at the 0.01 level (2-tailed).

*, Correlation is significant at the 0.05 level (2-tailed).

The frequency and percentage of each hedging devices in each group were calculated separately and then group A and group B were compared with each other. And so were group C with group D. Then, the Chi-square test was used to show whether the differences in the corpora were statistically meaningful or not.

RESULTS AND DISCUSSION

Results of quantitative analysis

The first step taken in the analysis of hedges in the mentioned articles was to run word count to determine the length of the corpus. A total of 2951 hedges were identified among 150000 words. The total average of hedge uses was 1.97 percent. Of all the hedges found, 788 were used in computer engineering RAs (37600 words), 511 were used in physics RAs (37200 words), 735 were identified in native applied linguistics RAs (37600 words), and 925 in native applied linguistics RAs (37600 words).

Frequency and percentage of hedges in RAs

The four groups of RAs investigated in this study were analyzed concerning the frequency of occurrence of hedges in each of the 5 categories of the taxonomy used in this study. The data presented in the following tables show the statistics which were obtained after the analysis of the articles; rows numbered 1-5 represent the taxonomy applied here in this study. The frequency and percentage of all hedging devices in each of the four groups of RAs under study are shown in columns under each discipline as well. Total number of hedging devices is also given.

Table 3: Frequency and percentage of hedges in RAs

Disciplines	Computer engineering		Physics		Applied linguistics native		Applied linguistics non-native		Total hedges in all the discipline	Percentage of the category
Types of hedges	Freq.	Percent.	Freq.	Percent.	Freq.	Percent.	Freq.	Percent.		
1	391	49.61	274	53.72	363	49.38	561	60.71	1589	53.73%
2	227	28.80	120	23.52	175	23.80	185	20.02	707	23.90%
3	102	12.94	69	13.52	121	16.46	92	9.95	384	12.98%
4	33	4.18	34	6.66	41	5.57	35	3.78	143	4.83%
5	35	4.44	13	2.54	35	4.76	51	7.04	134	4.53%
Total hedges in the discipline	788	2.09	510	1.37	735	1.95	924	2.45	2957	
Total words in the discipline	3760		37200		37600		37600			

Rows 1: modal auxiliary verbs 2: modal lexical verbs 3: adjectival, adverbial, nominal modal phrases 4: approximators 5: if clauses.

Frequency of occurrence of hedges in RAs

In the following the five categories of the taxonomy of hedges presented are introduced:

1. Modal Auxiliary Verbs

The first category in the classification used here represented the modal auxiliary verbs. Different modal auxiliary verbs were found which were mostly situated in texts on applied linguistics by non-native writers. However, the least amount of this category was found in physics articles. The sum of the occurrence of this category in the four groups equaled 1589 cases (53.73% of all the hedges) among which modal auxiliary “can” had the highest frequency while “might” had the lowest.

2. Modal Lexical Verb

The most frequent modal lexical verb was found in computer engineering texts. While the least amount of this category was found in applied linguistics articles written by non-native researchers. This category had the frequency of 707 cases in all the four groups (23.9% of all the hedges) among which Modal lexical verbs “suggest” had the highest frequency while “speculate” had the least.

3. Adjectival, Adverbial, Nominal Modal Phases

This category occurred 384 times in the four groups (12.9% of all the hedges). The most frequent type of this category was found in texts on applied linguistics by native writers, while the least amount of this category was found in physics articles among which the hedge device “possible” had the highest frequency while “apparently” had the least.

4. Approximators

This category was found to be repeated 143 times (4.83%) in the articles studied. Different approximates were found which were mostly situated in texts on applied linguistics by native writers. While the least amount of this category was found in computer engineering articles among which “often” had the highest frequency while “roughly” the least.

5. If clauses

The fifth category of hedges in the classification of hedges in the present study deals with the conditional phrases. The overall number occurrence of this category was 134 cases equal to 4.53% of the hedges highlighted in this study. The most frequent type of this category was found in in texts on applied linguistics by non-native writers, while the least amount of this category was found in physics articles. The amount of inter-rater reliability shows that the recounting of hedges was reliable at ($p < .05$ or $p < .01$)

Descriptive Statistics

There were some differences in the frequency of hedges used by English and Persian writers of the mentioned RAs. Consider the following table to find the details.

Table 4: Descriptive Statistics

	N	Mean	Std. Deviation	Minimum	Maximum
Physics	5	100.4000	104.04951	13.00	274.00
Computer	5	157.4000	152.72950	33.00	391.00
Applied native	5	147.0000	134.06715	35.00	363.00
Applied non-native	5	184.6000	218.39254	34.00	561.00

In this table, the researcher calculated Mean and Std. Deviation to find more details. N is the number of items we considered through our study. Physics articles had the least mean while the applied non-native had the most one. But we need to find Chi-Square to see if the differences are significant or not.

Cross-disciplinary variation of hedges in RAs

The analysis was done using Chi-square analysis to find the difference between physics and computer engineering articles in terms of using hedging deices. The results of the analysis are shown in the following table, where X2 stands for the Chi-square amount and P shows the level of significance:

Table 5: Chi-Square analysis

Categories of Hedges	1	2	3	4	5	mean	Std. Deviation	df	X ²	p
Disciplines										
Physics articles	274	112	69	34	13	100.40	104.04	4	13.6	0.009
Computer engineering articles	391	228	100	33	35	157.40	152.72			

Rows 1: modal auxiliary verbs 2: modal lexical verbs 3: adjectival, adverbial, nominal modal phrases 4: approximators 5: if clauses.

The difference between physics and computer engineering articles was found to be significant at ($p < 0.05$) since the Observed X² (13.6) is greater than the Critical X² (7.81) with $df=4$.

Inter-disciplinary variation of hedges in RA

The analysis was done using Chi-square analysis to find the difference between applied linguistics articles written by native writers and those of written by non-native writers in terms of using hedging deices. The results of the analysis are shown in the following table, where X2 stands for the Chi-square amount and P shows the level of significance:

Table 6: Chi-Square analysis

Category of hedges	1	2	3	4	5	Mean	Std. Deviation	df	X ²	p
Disciplines										
Applied native articles	363	175	121	41	35	147.00	134.06	4	29.3	0.000
Applied non-native articles	561	185	92	34	51	184.60	218.39			

Rows 1: modal auxiliary verbs 2: modal lexical verbs 3: adjectival, adverbial, nominal modal phrases 4: approximators 5: if clauses.

The difference between applied linguistics articles written by native writers and those of written by non-native writers was found to be significant at ($p < 0.05$) since the Observed X² (29.3) is greater than the Critical X² (7.81) with $df=4$.

Results obtained from analyzing the types and frequencies of hedges in computer engineering articles and physics articles showed significant differences in using hedges in the two groups. So the Null hypotheses mentioning that there were no significant differences in the types and frequencies between the two groups was rejected and so were articles written on applied linguistics by English and Iranian researchers.

Discussion

In answering the first research question, the researcher proposed the following discussion: The results of the Chi-square analysis showed that there are some differences and similarities between computer engineering, and physics RAs. The most frequent types of hedges used by computer engineering researchers were modal auxiliary verbs, and the least used ones were approximators like following examples:

1. *Codification processes in the scientific communication structure **can** perhaps be considered as the longer-term selectors upon the variation generated by shorter-term S & T-policy program.*
2. *They create large quantities of postings, and these postings are **often** archived.*

In physics articles, the most frequent items of hedges were modal auxiliary verbs, but the least used items were if clauses. In both disciplines, the fourth types of hedges, approximators, occurred approximately the same times like following examples:

1. *This **would** have several advantages, such as reducing the cost for the lasers, and thus the overall cost of patterning systems.*
2. ***If** the laser diode is operated in pure nitrogen, we observe also the buildup of a thick deposition on the facet.*

In computer engineering articles, 788 words out of 37600 were hedges whereas in physics articles they were 510 words out of 37200. Generally, the writers of computer engineering articles used more hedges than those of physics articles.

The differences between disciplines in using hedges have been approached differently by researchers. Some scholars like Markkanen and Schroder (1997) suggest that the differences in the use of hedges between texts in different fields are not as significant as some scholars have assumed.

Markkanen and Schroder (1997) have considered the different bases of argumentation various fields as the major reason for variation in the use of hedges. According to this view, some fields like linguistics and philosophy would favor more hedging than other fields like natural sciences and technology. This could be matched with Spillner, as cited by Markkanen and Schroder (1997), who stated that argumentation in natural science and technology is based on experimental data and concrete evidence, whereas this end is accomplished in other fields (e.g., social sciences) through the styles of writing. The results also agreed with Markkanen and Schroder (1997) who have stated that the use of hedges and other linguistic devices are significant in convincingness of an argument in the texts belonging to "soft" fields (e.g. philosophy and linguistics). On the other hand, the differences in the overall incidence of hedges in different disciplines can be explained by considering the object and general nature of disciplines as well as the kind of materials and methods used in the study. The field of physics, for example, can be categorized under "hard" sciences which by nature are different from psychology as a "soft" science. The "soft" science is characterized as having a theoretical foundation with tentative

nature, whereas in "hard" sciences are "more closely related to the traditional rigorous empiricism of the natural sciences.

Another source of difference can be traced to the nature of the fields. In researches such as physics, the setting of the experiments is more controlled and the material and procedures can be closely measured. The researchers in these fields can explain the procedures of the experiment and also make conclusions with more confidence. This can partly account for the lower occurrence of hedges in this field as compared to computer engineering.

The possible reason for higher occurrence of hedges in computer engineering is that although computer engineering generally represents technological information, it gives information about some issues which are not absolutely technological; for example one of the articles published in *Journal of Computer-Mediated Communication* was entitled: Social Science Approaches to e-Science: Framing an Agenda. Thus it has some characteristics of "soft" science which is characterized as having a theoretical foundation with tentative nature.

In general, the natural sciences and mathematics are classed as hard-pure; the science-based professions such as engineering are classed as hard-applied. So physics and computer engineering can be considered as hard science; therefore, they are expected to have some common characteristics. This can justify similarity between these two disciplines in terms of using same categories of hedges-in both disciplines modal lexical verbs were of the greatest frequency and also both disciplines use approximators approximately equally.

In the view of the second research question, the analysis showed that there were disciplinary similarities and differences in the use of hedges in applied linguistics RA_s written by English and Iranian authors. In both set of articles, the most frequent were modal lexical verbs. Modal lexical verbs and adjectival, adverbial, nominal modal phrases occur in the second and third position respectively. In applied articles written by native writers the least frequent hedges were *if clauses* while in native counterparts the least frequent ones were approximators. Consider the following examples in which modal verbs are used in applied linguistics written by English and Iranian respectively:

1. The results **may** be interpreted as consistent with a number of recent investigations that have reported intact prosodic processing at the lexical level implicit tasks.
2. However, their perception of the events **may** be very much different from the original event.

As can be seen in examples above the hedging device "may" is used in the two groups of articles. Look at examples in which Modal lexical verbs are used in applied linguistics written by English and Iranian respectively:

1. The results of our study seem to support the use of meaningful output practice as well as meaningful input-based practice in the L2 classroom environment as a means for building fluency and accuracy
2. Most of the sociopragmatics studies seem to be both geographically and culturally restricted to western societies and cultures.

As can be seen in the above examples, the hedging device "seem" is used in the two groups of articles. In computer applied linguistics articles written by native authors there were 735 hedges out of 37600 words whereas in the Iranian ones 924 hedges out of 37200 words. In other words, Iranian writers used 0/06% more than English writers; however, there was not a significant difference.

The results of this study are not consistent with Marandi's (2003) work. Her findings showed that Iranian writers used significantly fewer hedges than English native writers. The results of this study are in conflict with the claim of Hyland (1995). Unlike the results of previously mentioned researchers' findings, the results of this study are in line with Nassiri (2012). The results of his study showed that despite some variations among the types of hedges, no statistically significant differences were observed between the American and Iranian writers in terms of utilizing hedging devices in the discussion sections of their research articles. As it can be seen, both English and Iranian writers in this present study seem to be approximately equally proficient in using various hedging devices to assert their claims in an acceptable manner. This similarity can be attributed to the fact that both sets of articles are from the same discipline or social science. For example, the two groups made the most frequent use of modal lexical verbs which can be indicative of the nature and the rhetorical structures or shared stylistic features of the two groups. This also might be due to their majors which dealt with English language studies and applied linguistics.

Some cultural, social, and educational factors might help to justify the differences between English and Iranian writers in terms of using hedges. The possible reason for the overuse of the hedging devices in RAs written by Iranian researchers can be indicative of the fact that because Iranian writers are not fully mastered in linguistics and are not completely sure of the results, they show this weakness in using more tentative language. They also may be uncertain on the results of their speculations and ideas. Another possible reason is that by using too much hedges, Iranian writers try to avoid the risk of being criticized by readers.

CONCLUSION

This study showed that the distributions of hedges in the RAs are not evenly distributed across disciplines and languages. The writers of physics articles used more hedges compared with the writers of computer engineering articles which showed the different nature between these two disciplines. Iranian researchers of linguistics slightly hedged their statements more than their English counterparts. The difference between this two groups showed variety of differences between the writers of the articles and similarities between these two groups stem from the fact that both of them deal with the same discipline.

Ataei and Sadr (2006) stated that familiarizing and involving students with the rules of academic writing may improve their reading ability and can help them to know what kind of discourse they have to produce and understand in academic settings. If we have a good knowledge and good command of hedging devices, then we will be able to use them adequately and appropriately according to the context and the audiences. Then we know where to hedge and what types of

hedges to use to have a better effect on the audiences and readers in a way that gains readers' attention and creates a reader-friendly text to have maximum interpersonal and persuasive effect.

Finally, the results of this study can be useful for EFL teachers to teach how to use the forms and functions of the hedges in speaking and writing skills.

Further research may be carried out to compare hedges in other disciplines of English articles written by English and Iranian writers to find if these devices are used differently. It is possible to compare scientific articles written by authors with other language background; for example, between German writers and English writers. It is also possible to compare other metadiscourse markers such as boosters in research articles.

ABSTRACT

The purpose of this experimental study was to investigate the effect of bodily intelligence and sound on Iranian English as foreign language (EFL) learners' vocabulary retention. In doing so, 75 female students who enrolled in Sepahan English Language Institute in Ahvaz, Iran took a homogeneity test of Cambridge University Press (2010) and the learners whose scores were one standard deviation above and one standard deviation below the mean were selected as the research sample. Sixty female selected participants were randomly divided into two experimental (N=30) and control (N=30) groups. Before period of treatment, the pilot test was given to eight students who were not participated in the study but with the same background. The aim of the pilot test was to assess the reliability of the homogeneity, pre and post- tests, and the time allocated to take the tests. Furthermore, the bodily intelligence and sound programs were matched with the participants' interests in conducting the research procedures. Then, the participants were given a pre-test on vocabulary achievement to assess their vocabulary knowledge at the beginning of the study. Both the experimental and control groups were taught forty vocabularies during eight sessions, 30 minutes. Students in the experimental group were taught vocabularies through bodily intelligence and sounds, while the students in the control group were taught through conventional method by focusing on oral presentations. Finally, a post-test was administered to two groups and data were collected. Data were analyzed through the Interdependent Samples t-test and descriptive statistics utilized to analyze learners' scores. Results showed that the experimental group outperformed the control group. This study suggests that the use of bodily intelligence and sound could be more effective activities in teaching vocabulary to the beginners.

KEYWORDS: Bodily intelligence, Sound, EFL learners, Vocabulary retention

INTRODUCTION

Learning vocabulary seemed to be one of the easiest things about learning a language but it is somehow burdensome for some learners and also one of the hardest things to do, especially when the students had reached a certain level of proficiency. Fortunately, the need for vocabulary is one point on which teachers and students agree (French Allen, 1983). Moras (2001) claims that students might had a receptive knowledge of a wide range of vocabularies, which means they can recognize the items and their meanings; nevertheless, their productive use of vocabulary is

normally restricted, and this is one of the areas that need greater attention. Based on Hornby's (2004, p. 1091) definition, retention is "the ability to remember things". Those words that are easy to learn will better retain.

In the classroom of second language acquisition, the teacher teaches students with the same teaching method. However, some students acquired the language successfully while others failed. Why does this happen? It may have something to do with some learning strategies. The same learning strategies may be useful for some students but useless for others (He, 2010). Wenden and Rubin state that learners bring a varied repertoire of learning skills in the process of language learning (Wenden & Rubin, 1987, p. xvii). It means that the learners should master some learning strategies to make their L2 learning more effective. Many studies also showed that apart from teaching methodologies, learner strategies are another crucial factor that affected foreign language acquisition. They can help learners become more autonomous and made the learning process more effective (He, 2010).

Gardner (1983, 1995) claims that all human beings had multiple intelligences (MI), which are common among all the people, but with different portions. The MI-based instructions can help learners to acquire words faster and improve academic achievement. The basic theory of multiple intelligences is that there are a number of different types of intelligences. Traditionally, schools used logical and verbal intelligences to teach language- English in this case. However, it is also possible to teach English through the use of other types of intelligences, which the bodily intelligence is one of them. The different intelligences are of neutral value; none of them is considered superior to the others. In their basic form, they are present to some extent in everyone, although a person is generally more talented in some than others.

When you think about communication, you probably think of words. When we converse with someone, we exchange about 200 words per minute. But just because we are speaking does not mean that is the only communication that is going on. About half of our communication is non-verbal and occurs without words. Gestures, postures, facial expressions, eye contact and the way we view and use our personal space convey just as much about what we are thinking as the words we speak.

Sometimes our hearing memory worked better than our visual memory. It is true that a number of words in any language are onomatopoeic (echoing natural sounds). From the birth we learnt most of the words by sounds around us. Sounds are associated with other experience and tied to meaning. Sound like, language, is natural to humankind and as such both phenomena are universal. Sounds accompanied our everyday activities, made learning easier and also made effort lighter, and was used as an excellent pedagogical tool in language teaching. The learning to Listen Sounds is sometimes called Sound-Object Associations: a sound is associated with an object. Sounds and music are defined as powerful aids to language learning, memory and recall. However, learning foreign languages is not easy, as many variables need to be considered (Chion, 2009).

REVIEW OF LITERATURE

Language acquisition has been a major topic of research in linguistics for several decades. In the classroom L2 acquisition, the teacher teaches students with the same teaching method. However, some students can acquire the language successfully while others fail. Why does this happen? It may have something to do with some learning strategies. The same learning strategies may be useful for some students but useless for others. Wenden and Rubin state that learners bring a varied repertoire of learning skills in the process of language learning (Wenden & Rubin, 1987: xvii). It means that the learners should master some learning strategies to make their L2 learning more effective. He (2010) suggests that many studies also show that apart from teaching methodologies, learner strategies are another crucial factor that can affect foreign language acquisition. They can help learners become more autonomous and make the learning process more effective.

Two major kinds of learning strategies have been discussed recently: cognitive learning strategies and metacognitive strategies. The cognitive learning strategies refer to the steps or operations used in language learning or problem-solving that requires direct analysis, translation, or synthesis of learning materials, while metacognitive learning strategies refer to the knowledge of cognitive process and regulation of cognition or executive control or self-management through such process as planning, monitoring and evaluating (Wenden & Rubin, 1987, p. 23). The second type of strategy is called "communication strategies". This stresses the effect of practice and focuses on the process of taking part in a conversation (Wenden & Rubin, 1987, p. 27). The third type of strategy is "social strategies". Rubin defined it as the activities that afford learners the opportunities to be exposed to the target language. They are different from the communication strategies. Social strategies do not provide opportunities to practice the knowledge learnt (Wenden & Rubin, 1987, p. 27).

To start with, we are clarifying what we mean when we use the term "vocabulary". According to the Collins Cobuild English Language Dictionary (Owen, 1989), "the vocabulary of a language is the total number of words in it" and "someone's vocabulary is the total number of words in a language that he or she knows" (p.1629).

When learning the meaning of a word, most learners may find it quite difficult. Aitchison states that there are two main arguments about word meaning, the fixed meaning assumption claims that for every word there exists a basic meaning, and when learners acquire the basic meaning of a word, the core of the word is acquired. Unlike the fixed meaning viewpoint, the fuzzy meaning viewpoint argues that word cannot have a fixed meaning (Aitchison, 2003, pp. 41-52). A word has a fuzzy meaning, which means that a word may have different meanings in different contexts, e.g. *skinny*, in a dictionary it means "very thin" when describing a beauty's slim body, however, it also means "so thin as to be unhealthy or unattractive" when describing a starving old man (Schmitt, 2000, p. 31).

Words do not have fixed absolute values. Word meaning changes through history. During its changing process, some words drop away, some change into new meanings, and some survive

and develop multiple meanings. These words become polysemous (Aitchison, 2003, pp. 151-154).

Bodily Intelligence

This intelligence refers to the ability to use the body to express oneself, to handle physical objects dexterously. According to the ancient Roman saying, *mens sana in corpore sano*; working on this intelligence not only affects health and fitness but also is important for cultivating the powers of the mind. In many classrooms, students sit in rows for hours and are asked to pay attention to verbal input. The human need for movement is totally overlooked and therefore, its potential value for creating higher energy levels and maintaining attention is greatly reduced (Morgan & Fonseca, 2004).

Neurophysiologist Hannaford has studied the relationship between learning and the body, and she points to the benefits of taking the physical side of learners into account and incorporating movement in the classroom, including bringing a greater supply of oxygen to the brain and increasing the energy level of students. Hannaford (1995) summarizes one of the main reasons why movement and the body are important for learning:

Intelligence, which is too often considered to be merely a matter of analytical ability- measured and valued in I.Q. points-, depends on more of the brain and the body than we generally realize. Physical movement, from earliest infancy and throughout our lives, plays an important role in the creation of nerve cell networks which are actually the essence of learning (p. 96). The use of role-plays, drama, games, surveys, project work, shadow puppets, and many activities related to group dynamics directly address the bodily-kinesthetic intelligence in the language classroom.

Non-verbal aspects of communication are also very relevant in language teaching. For example, gestures are movements of the body used to communicate an idea, intention or feeling. Speech-independent gestures (emblems) or autonomous gestures are nonverbal acts that can replace speech or help to organize the flow and rhythm of interaction and to maintain attention by adding emphasis (Knapp & Hall, 1992).

Body Language

Knowing how and what to say to whom is a cornerstone of communicative competence. Our aspiration as teachers of foreign or second languages is to challenge our learners to go beyond the grammaticality of being able to put the subject, verb, and object in the correct syntactic order, and achieve what Canale and Swain (1980) called discourse, strategic, and sociolinguistic competencies. These communicative abilities, however, demand that learners go beyond the linguistic context and heed the nonverbal cues of their interlocutors (Gregersen, 2007). Gregersen says that communicative competence is the ability to communicate successfully in a wide variety of circumstances. With the emphasis of language instruction moving from grammatical accuracy and phonological correctness to making oneself understood, we need to take a closer look at all of the resources at our disposal that enhance mutual intelligibility. Kinesics, or the way gesture, facial expression and gaze behavior is used to communicate messages, is one of those undercapitalized means. Gregersen research suggests that nonverbal

behavior plays an important role in the overall communicative process, yet little attention has been given to practical teaching techniques that will help teachers incorporate this essential element into their language classrooms.

Simply stated, nonverbal communication includes "all communication other than language" (Andersen, 1999, p. 2). Inherent in this definition is that language is solely a human endeavor and that arbitrary symbols are used to convey meaning. DeVito and Hecht (1990, p. 4) describe nonverbal communication as "all of the messages other than words that people exchange."

A research has been done by Gregersen (2007) about the role of nonverbal communication in second language communicative competence. This study considered the interplay of body language, particularly gestures, facial expression and gaze behavior; and also discussing specific activities that bring the visual and auditory channels together through drama, video, role play and interviews. However, in this case the gestures and drama are elaborating.

Studies on Music and Sound Learning

Music is used in many divers' ways in language teaching. Teachers of English as a second language (ESL) from around the globe enthusiastically report about their successful use of music and associated song lyrics with ESL students. Huy Le (2007), a Vietnamese ESL teacher, observed that music is highly valued by both students of English and teachers in the teaching of speaking, listening, reading, and writing. Other reports by teachers from the United States (Baez, 1993), Taiwan (Katchen, 1988), Canada (Magahay-Johnson, 1984), Japan (Moriya, 1988), Mexico (Domoney & Harris, 1993) supported the importance and usefulness of music and music activities in the teaching of ESL learners. Indeed, ESL teachers recognize that music animates their teaching and enlivens their classroom.

Shabani and Torken (2014) conducted a study to examine the relationship between musical intelligence and foreign language learning. To this means 140 Persian native speakers (100 females, 40 males) ages 15 to 18 participated in this study. They were students in Kish Mehr institution at intermediate level of English language proficiency. To conduct this study, two instruments were employed: English language proficiency test and a musical intelligence questionnaire (Howards Gardner Multiple Intelligence Questionnaires, 1983). To find the relationship between musical intelligence and foreign language proficiency a Pearson correlation was used. Briefly, the statistical results illustrated that there is positive strong correlation between musical intelligence and language proficiency. In other words, high level of musical intelligence correlated with high level of language proficiency.

Li and Brand (2009) did a research for the purpose of examining the relative effectiveness of use of songs on vocabulary acquisition, language usage, and meaning for adult university-level students in the People's Republic of China. Results of the study showed that for these Chinese students, varying the degree of use of songs produces different English language achievement scores. Specifically, the subjects who were exposed to the most music obtained higher posttest scores immediately following treatment as well as on the delayed posttest three weeks following treatment. Curiously through, the results for the study showed that ESL instruction containing no

music is apparently more effective than instruction containing a mix of music (half music and half no-music).

Also, Zybert and Stepien (2009) research showed that musical aptitude is a determinant and a predictor of success in foreign language learning. It also indicated that musical training had a positive effect on FL learning. Medina (1990) showed that primary students improved their rate of vocabulary recall significantly when they were exposed to stories accompanied by musical and visual stimuli.

THE RESEARCH QUESTION

The present study aimed at answering the following research question:

Does bodily intelligence and sound learning have any effect on Iranian EFL learner's vocabulary retention?

METHODOLOGY

Participants

To select the homogeneous participants, the researcher administered the unlimited placement test, prepared by Cambridge University Press (2010) to seventy five students who enrolled in Sepahan English Language Institute in Ahvaz, Iran. Following that, sixty students who scored one standard deviation above and one standard deviation below the mean were selected as the participants of the study. The selected participants were female students and their ages were ranging from 11 to 13 years old. Then they were randomly divided into two experimental (n=30) and control (n=30) groups. Participants enrolled in vocabulary achievement sessions during the summer term, 2014, a period of 15 sessions, three times a week.

Instrumentation

Initially, the participants took a homogeneity test (Cambridge University Press, 2010) to determine their level of linguistic knowledge. The test contained fifty multiple-choice items of vocabularies. Based on Cronbach Alpha method the reliability of the test was ($\alpha = .821$).

The second instrument was a researcher-made matching and multiple-choice pre- test of vocabulary; including 30 items (i.e., 10 definitions, 10 pictorials, and 10 aural items) used as a pre- test by the researcher in the first session of the research period. Reliability index of the pre- test was calculated based on Cronbach Alpha as ($\alpha = .721$). Another instrument was a vocabulary post- test which immediately after the treatment (at tenth session) administered. Its contents were modified in format but similar to the pre- test (i.e. 30 vocabulary items; including 10 definitions, 10 pictorials, and 10 aural items). The test reliability index was met based on Cronbach Alpha as ($\alpha = .811$).

Materials

Forty vocabularies were extracted from Institute books "Tiny Talk1A and 2B" written by Susan Rivers (1997); "Pockets 3" written by Mario Herrera and Barbara Hojel (2005) ; "Hip Hip

Hooray (Starter)" written by Beat Eisele, Rebeca York Hanlon, and Barbara Hojel (2001); and "First Friends 1 and 3" written by Susan Lannuzzi (2009). The experimental students were exposed to CD record sounds and body language activities.

Procedure

For the reliability of the test instruments a pilot test conducted on eight students at the same level (beginners) for homogeneity, pre and post- tests. A homogeneity test (prepared by Cambridge University Press, 2010) conducted to the seventy five female students enrolled in Sepahan English Language Institute in Ahvaz, Iran, one week prior to the study. Sixty students whose scores were one standard deviation above and one standard deviation below the mean (beginner level) were selected as the participants of the study. Sixty participants were divided randomly into two groups of thirty, experimental group and control group. The treatment performed during the summer term, 2014 in a period of fifteen sessions, three times a week.

In the first session a self-designed matching and multiple-choice test of vocabulary were administered as a pretest by the researcher for both experimental and control groups. The pretest was included thirty questions; ten definition questions, ten pictorial questions, and ten auras questions. The first question of each section was answered as an example. The part of auras questions were played twice for the examinees. They had forty five minutes to answer the questions.

During the treatment students were learned forty new vocabularies through eight sessions (five vocabularies each session), as an extra activity beside their book. Each session, about fifteen minutes the teacher had a review on the previous lessons, and then she taught their book through thirty minutes, after that the five new vocabularies were taught to and practiced by the participants in thirty minutes. Through the experimental group the forty new vocabularies were taught via different kinds of strategies such as: body language, physical demonstration, using mime and gesture, role play, imitation, and listening to CD record sounds. For example through the bodily intelligence learning the meaning of a word like "exercise" was demonstrated by stretching hands up, left and right. Another example for learning by means of sound is that participants listened to the sound of raining and then teacher said the vocabulary "Raining". In experimental group instruments were used and repeated several times as to clarify the vocabularies meaning. When the teacher finished her teach, she wrote the new vocabularies on the board and asked of the students to write them down on their note books, and follow that the teacher asked them to imitate her role, mime, and role play in small groups.

Through the control group the teacher used of the traditional method to taught the forty new vocabularies. She wrote the vocabularies on the board, and was used of flash cards and her natural sound for demonstrating their meanings. Then she wrote the vocabularies meanings (in Persian) and reading them aloud several times, students repeated after their teacher. Follow that students read the vocabularies aloud one by one, and then the teacher asked of them to write the vocabularies and their meanings down on their notebooks.

Teacher gave homework to the both experimental and control groups. They were asked to write about half of the page for each new word; by this exception that the students of control groups wrote vocabularies within their meanings in Persian.

Immediately after teaching the forty vocabularies, at ninth session students took a post- test which was identical to the pre- test. Both experimental and control groups pre and post- tests were held in the same time, so that they were unable to collaborate with one another.

RESULTS AND DISCUSSION

The pre- test was given to both groups of learners and results are presented in Table 1.

Table 1: Descriptive Statistics (Pre-test, Experimental vs. Control)

Groups	N	Mean	Std. Deviation	Std. Error Mean
Experimental	30	8.1333	3.37060	.61538
Control	30	8.7667	2.72515	.49754

The Table 1 shows that the mean of pre-test among the experimental group ($M=8.13$) is nearly the same as the mean of pre-test among control group which is 8.76. There is no much difference between these two tests. In order to find out whether the similarity among the performances of the two groups in pre-test was statistically significant, Independent Samples t- test was applied. The results are presented in Table 2.

Table 2: Independent Samples t-Test (Pre-test, Experimental vs. Control)

	Levene's Test for Equality of Variances		t-test for Equality of Means					95% Confidence Interval of the Difference	
	F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Lower	Upper
Equal variances assumed	1.602	.211	-.800	58	.427	-.63	.79	-2.21	.95
Equal variances not assumed			-.800	55.5	.427	-.63	.79	-2.21	.95

Table 2 shows that the observed t ($O_t=.800$) with $df= 58$ is less than the Critical t ($C_t=2.000$). Thus, the difference between the groups is not significant. This showed that the groups were homogenous before the research period at the pre-test. To analyze the post- test, the researcher presented descriptive statistics in Table 3.

Table 3: Descriptive Statistics (Post-test, Experimental vs. Control)

Groups	N	Mean	Std. Deviation	Std. Error Mean
Experimental	30	19.1667	5.76005	1.05164
Control	30	15.6000	6.52105	1.19058

Table 3 shows the descriptive statistics of the experimental and control groups' post- test shows that the mean of experimental post- test ($M=19.16$) is higher than the mean of control one which is 15.60. Therefore, there is a difference between these tests. As the data analysis in this Table indicates that there are significant difference between bodily intelligence and sound treatment (experimental group) and traditional treatment (control group), it reveals that experimental group and control group both performed better in post- test, but bodily intelligence and sound in experimental group outperformed. However, to find out whether the difference among the performances of the two groups in post- test was statistically significant, Independent Samples t- test was applied. The results are presented in Table 4.

Table 4: Independent Samples t-Test(Post-test, Experimental vs. Control)

	Levene's Test for Equality of Variances		t-test for Equality of Means					95% Confidence Interval of the Difference	
	F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Lower	Upper
Equal variances assumed	.387	.536	2.245	58	.029	3.56	1.58	.38	6.74
Equal variances not assumed			2.245	57.12	.029	3.56	1.58	.38	6.74

As Table 4 indicates that the observed t ($O_t=2.245$) with $df= 58$ is greater than the Critical t ($C_t=2.000$). Thus, the difference between the two groups is significant.

Discussion

The descriptive statistics and means of experimental and control groups showed that there is no difference between these groups and they are homogeneous at the pre- test stage. The mean of experimental post test ($M= 19.16$) was higher than the control one ($M= 15.60$). So, there is a difference between experimental and control group. Within a comparison by the pretests means (experimental group ($M= 8.13$); control group ($M= 8.76$)). Table 1 reveals that the experimental and control groups both performed better in post- test, however, the bodily intelligence and sound

group outperformed. As far as the mean could not indicate whether the difference among the two groups is significant, the Independent Sample t- test was applied results.

The observed t ($O_t=2.245$) with $df= 58$ is greater than the Critical t ($C_t=2.000$); therefore, the difference between the two groups is significant. The mean of pre- test versus post- test of the experimental group was -11.03 and the mean of pre- test versus post- test of the control group was -6.83, which indicates that there is a difference between these groups. The observed t of the bodily and sound group (-14.540) is significantly higher than the control one, which is -6.127. Therefore, students in bodily intelligence and sound group performed better than the students in the control group. So the results rejected the null hypothesis, which claim that bodily intelligence and sound learning do not have any effect on the Iranian EFL learners' vocabulary retention.

The improvement of bodily intelligence and sound can be due to that the students are less bored in experimental class since they act constantly in class and collaborate with each other. Using of role-plays and mime makings them eager and it also observed that students fearless volunteer for repeating actions after teacher. Working in small groups was fun and also beneficial for those students who were ashamed to do actions individually. When students are learning a word while acting, it stuck on their heads. In addition, students were eager for listening to record sounds and learning the related vocabularies, while trying to guess the words. The students listened to the CDs and recorded sounds to use later. This reinforced their vocabulary knowledge.

Learning foreign language vocabularies seems to be difficult especially for beginner students who want to start the process of learning with a wide range of vocabularies. Therefore, teachers are always looking for new and the most effective methods to teach the materials to the students. Most teachers still use the traditional methods; however, the main purpose of this study was to find new methods to ease the process of teaching and learning English vocabularies to beginner students. The results rejected the null hypothesis. Beginner students were found to perform significantly through the bodily intelligence and sound group; however, both experimental and control groups had promotion. These findings are in line with the study of Kuo, Hsu, Fang and Chen (2013) who claimed a highly positive level of acceptance toward the proposed learning approach (embodiment-based TPR approach). The results of this part seem to endorse Zybert and Stepien (2009) who emphasized that musical aptitude is a determinant and a predictor of success in foreign language learning. It also indicated that musical training has a positive effect on FL learning.

CONCLUSION

This study began with the assumption that bodily intelligence and sound method could enhance the beginner language learners' vocabulary retention. The instruction lasted for five weeks. During this time, the teacher (researcher) employed bodily intelligence and sound methods and taught the thirty female subjects in the experimental group. The participants ($N=30$) in the control group, on the other hand, did not receive any instruction on the use of these strategies. Having administered the pre, post- tests and analyzing the data through specific statistical analysis of descriptive statistics and Independent Samples, the results indicated that the instruction of using

the bodily intelligence and sound had positive effect on the beginner EFL learners' vocabulary retention.

Results of this study conformed to the studies (e.g., Hsu and Lin, 2012) conducted a study in field of TPR. The immediate and maintaining effects of TPR on listening comprehension for learning English vocabulary were found. Huy Le (2007), a Vietnamese ESL teacher, also observed that music is highly valued by both students of English and (ESL) teachers in the teaching of speaking, listening, reading, and writing. Other reports by teachers from the United States (Baez, 1993), Taiwan (Katchen, 1988), Canada (Magahay-Johnson, 1984), Japan (Moriya, 1988), and Mexico (Domoney & Harris, 1993) support the importance and usefulness of music and music activities in the teaching of vocabularies to L2 learners.

The application of the body movements and sound resulted in successful vocabulary learning among beginner female EFL language learners. It is suggested that EFL learners intending to promote their vocabulary learning in body language and sound classes, first by listening carefully to the teachers instructions and then by being active in class, taking part in role- plays, and listening carefully to sound record parts (Gorjian, Mombeini & Pazakh, 2013). The implications of the present study may bring out for language teachers for teaching vocabulary to beginners. Language researchers may use bodily intelligence and sound for teaching vocabulary retention and recall.

ABSTRACT

This study investigated the effect of lexical density awareness (LDA) on reading comprehension skills among Iranian high school students. To do the experimental design, four groups of learners were selected from one high school in Khuzestan Province, Iran. Two homogeneous groups as high achievers as experimental and control groups and two as low achievers of experimental and control groups were chosen. Therefore, third grade of high school students were considered as high achiever groups and first grade ones selected as low achievers because the amount of English knowledge of lexical and grammatical among third grade students are naturally more than first grades. At first 4 pre-tests according to learners' English text books lexical from the reading parts of their text books were administered to high achiever groups and low achievers. The LDA just given to the experimental groups but two control groups just were taught reading without LDA. At the end of each treatment, the learners were tested. In order to test this hypothesis, and at the end of treatment period post tests were administered to check reading comprehension of four groups of high and low achievers. The results showed that there were significant difference between these two experimental groups of high and low achievers than their control groups test scores. The mean score experimental groups were higher than the control groups. The result showed that there were significant differences between experimental groups of both high and low achievers than their own control groups. Implications of this study could be used for effective teaching of reading comprehension.

KEYWORDS: Lexical density awareness (LDA), Reading comprehension, High achievers, Low achievers

INTRODUCTION

In EFL contexts such as Iran, which English used as a foreign language not a second language, language learning is limited to some textbooks at high schools, some courses at university and some English institutes. Iranian EFL learners receive restricted amount of input concerning listening and speaking skills so, they have tendency toward reading. For many years reading

comprehension has drawn the attention of second or foreign language practitioners and researchers and it has been studied from different perspectives. Reading comprehension is an inseparable part of teaching and the most important and irreplaceable skill in learning a foreign language (Mirhassani & Farhady, 2012).

Reading is a valuable input for language learning (Hulstijn & Laufer, 2001). Reading is gradually being recognized as one of the main sources of language input, particularly for students in learning environment in which fluent speakers of English are generally not available to provide other kinds of language input. Furthermore, reading reinforces the learners' other language skills. Krashen (1985) confirms that those who read more have larger vocabularies, do better in grammar tests, write better, and spell better (Kim & Krashen, 1997). Reading is regarded as a skill of great importance to the learners because (a) it provides them with access to the great quantity of further experience of the language, and (b) it gives them a window onto the normal mean of continuing his personal education (Mirhassani & Toosi, 1996).

Reading according to Rivers (1981), is not only as a source of information and pleasurable activity, but also as a means of consolidating and extending ones' knowledge of the language. In. Rivers (1981) believes that reading texts provide 3 levels of meaning: lexical meaning, grammatical meaning and social-cultural meaning. Reading comprehension is the process of extracting meaning from a text, it becomes more complicated when reader cannot grasp meaning from that piece of text. One reason refers to lexical in the text that hinder comprehension when learners are not mastered on lexical items in the text. Lexical knowledge has been defined as a crucial underlying construct for EFL reading comprehension. For grasping and understanding meaning of a text readers need to connect their background knowledge of lexical words to the new knowledge to comprehend the new one. Vocabulary knowledge is very crucial in reading comprehension and plays the role of background knowledge (Coady, 1979). Thus, deficiency of vocabulary competence would cause reading comprehension difficulties. If learners' knowledge of vocabulary is not enough, it is probable that their reading comprehension will be negatively influenced by lack of lexical knowledge, so we need to consider the effect of lexical awareness on learners' reading comprehension and how students can improve their reading comprehension by receiving LDA and background knowledge of lexical items.

Reading seems to be mainly used by English as foreign language (EFL) learners than the other skills thus, knowing vocabulary is one important feature of comprehending reading. According to Celce-Murcia (2001) learning a second or foreign language involves the acquisition of thousands of words. Traditionally, nouns, verbs, and adverbs are four classes belonging to lexical items since they have autonomous meaning even in isolation and new members can be added to these categories (Yule, 1996). Lexical words are known as content or information words that carry information in a text. Halliday (1975) defines lexical density as "a measure of the density of information in any passage of text, according to how tightly the lexical items have been packed into the grammatical structure. It can be measured, in English, as the number of lexical words per clauses". One significant way to improve reading comprehension seems to be the use of lexical density awareness in teaching this skill and discovering its effect on reading comprehension among EFL learners. The present study addresses the use of lexical density awareness (LDA) on

developing reading comprehension in terms of high versus low achievers among high school EFL learners in Iran. This study also tries to compare reading comprehension skill of two groups of students who are different in terms of proficiency level of lexical density consciousness and discover their differences in achieving meaning of English texts.

Reading comprehension is one of the most important skills of a language specifically for EFL students. Richards and Renandya (2002) believe that in many second or foreign language teaching situations, reading receives a special focus. There are a number of reasons for this. First, many foreign language students often have reading as one of their most important goals. They want to be able to read for information and pleasure, for their career, and for study purposes. In fact, in most EFL situations, the ability to read in a foreign language those students ever want to acquire information. Second, written texts serve pedagogical purposes. Extensive exposure to linguistically comprehensible written texts can enhance the process of language acquisition. In Iran, reading comprehension is believed to be one of the most important skills for educated people in general and for university and high school students in particular (Farhady & Mirhassani, 2001). A great deal of attempt has been made to help students improve their reading ability. Nearly half of each lesson in high school English text books is devoted to reading comprehension. Students start their lesson with a list of words in different contexts, then immediately go to a passage followed by a number of explanatory questions. The researcher believes that in spite of the attempts which have been made by the text book writers to encourage the students to read passages and answer the questions many students are not willing to read the passages. The lack of background knowledge and lexical knowledge would be one important reason of students' poor performance. One of the concerns of the researcher (as an English teacher in high school) has been to search more effective ways of teaching reading comprehension at high school level. It seems to the researcher that shifting from traditional ways of teaching reading comprehension toward more communicative ones would help the learners to comprehend better.

In many EFL classes, teachers have made lots of attempt to help students learn vocabularies in order to comprehend EFL texts (Akbari & Mirhassani, 2000). Many students always ask their teachers to give them new techniques for learning lexical words. The problem seems to be whether EFL learners can improve their reading comprehension in a text by having more LDA in a text or not. Many researchers have been done on reading comprehension in foreign language but less is done on the role of lexical density on reading comprehension of lexical density on reading comprehension. So, shedding more light on the effectiveness of LDA on developing reading comprehension of EFL learners seems to be necessary.

REVIEW OF LITERATURE

Reading comprehension is one of the main objectives of teaching English in EFL contexts and it is the most tested construct in language teaching. Reading can be defined as the translation of graphic symbols into sounds and words coupled with the ability to gain meaning from individual words and word sequences. Goodman (1973) described reading as "interaction between language and thought in reading. The writer encodes thought as language and reader decodes language to

thought" (p. 160). He also described the factors involved in the mind of the reader for decoding the language: In written language a message has been encoded by the writer in graphic symbols spatially distributed on the page. The reader does not merely pass his eyes over written language and receives and records a stream of visual perceptual images. Goodman (1973) believes the reader "must actively bring to bear his knowledge of language, his past experience, his conceptual attainment on the processing of language information encoded in the form of graphic symbols in order to decode the written language, through the reader attempts to reconstruct a message from the written" (p. 261). In fact, reading is a receptive skill through which the reader is receiving a message from the writer for decoding the messages that activate the reader's background knowledge. Most recent researchers in reading describe the reading process in a way that it implies active reader intent upon using background knowledge and skills to recreate the writer's intended meaning. Chastian (1988) asserted that "reading is a process involving the activation of relevant knowledge and related language skills to accomplish an exchange of information from one person to another. Reading requires that the reader focus attention on the reading materials and integrate previously required knowledge and skills to comprehend what someone else has written" (p. 216). Widdowson (1975) described reading as a "discourse between interlocutors and believes:

Reading is regarded not as reaction to a text but as interaction between writer and reader mediated through the text. Reading is an act of participation in a discourse between interlocutors. It seems to follow from this that reading efficiently cannot be measured against the amount of information contained in a text. This is incalculable since it depends on how much he wishes to extract from it. Rather, reading efficiently is a matter of how effective a discourse the reader can create from the text either in terms of rapport with the writer or in terms of his purpose in engaging in the discourse in first place. (p. 174)

Therefore, reading in a complex communication process involving the activation of relevant knowledge and related language skills to accomplish an exchange of information from one person to another. It can be claimed that reading as one of main skills in language never lost its importance and dominance in language learning. Reading is a basic and complementary skill in language. Second language students need to learn to read for communication and to read greater and greater quantities of authentic materials. Students can probably learn to read more easily than they can acquire any other skill and they can use reading materials as a primary source of comprehension input as they learn the language (Chastain, 1988).

Rivers (1981) points out "in many countries foreign languages are learned by numbers of students who will never have the opportunity of conversing with native speakers, but who will have access to the literature and periodicals, or scientific and technical journals, written in the language they are learning. Many will need these publications to assist them further studies or their work; others will wish to enjoy reading in another language in their leisure time to keep them in touch with the wider world" (p. 260). Celce-Murcia (2001) points out that:

Reading is more important than speaking. She says that: students are not just concerned with speaking; they want to be able to read and write English as well as

speaking it. Even in audio-lingual programs which stress listening and speaking, the student needs to know how to read, for many university foreign students reading skills are perhaps even more important for academic success than speaking ability. Reading is a skill that everyone needs whether she is a student in elementary, secondary, university or adult school. Yet it is a skill that gets slighted in most ESL teacher-training programs (pp.129-130).

Goodman (1973) looks on reading as information processing: The reader, a user of language, interacts with the graphic input as he seeks to reconstruct a message encoded by the writer. He concentrates his total prior experience and learning on the task, drawing on his experiences and concepts he has attained as well as the language competence he has achieved (p. 162). According to Fries (1963), the student is "developing a considerable range of habitual response to a specific set of patterns of graphic shapes" (p. 121). He also argues that there are three levels of meaning: "lexical meaning (the semantic content of the words and expressions), structural or grammatical meaning (derived from interrelationships among words), and social-cultural meaning (the evaluation that people of our culture attach to the words and groups of words we are reading" (pp. 104-12).

Procedures used for measuring readability mostly, emphasize the role of word length (number of syllables of a word) and sentence length (number of words in a sentence) as determining factors in text difficulty formulas (Urquhart & Weir, 1998). It is, however, believed by some authorities (e.g., that there are so many other factors in determining text difficulty. They criticized these formulas for considering only the average length of words and sentences, ignoring other factors, such as syntactic complexity, textual cohesion, propositional density, and background knowledge of the students. Also they have criticized word and sentence length as determining factor of the difficulty of the texts and mentioned that there are so many texts with so many short sentences and one syllable words that are very difficult to comprehend (Carrell, 1991).

RESEARCH QUESTION

The study attempts to examine the effectiveness of LDA on reading comprehension of EFL learners. Therefore, the following research question is presented.

Is there any significant difference between the students with high and low proficiency levels exposed to LDA on developing their reading comprehension?

METHODOLOGY

Participants

This study was done at one high school in Khuzestan province. A number of 80 high school students with forty first grade students and forty third grade students took part in this investigation. They were selected among 160 Iranian EFL students at that high school. With respect to the year of study half participants were in first grade and half ones in third grade of high school. The reason why these students were chosen as participants was that they were in two different levels so, according to their grades third grade students naturally have more English

knowledge and this distinction seems reasonable, although some students have self-study or attend English institutes but the selected school was in down town where most students were not rich to access to private teachers or English institutes. Low achievers randomly divided in two groups of experimental and control groups and high achievers randomly divided into two groups of experimental and control groups. Each group included 20 participants. They were just females with the age range between 15 and 16 for low achievers and from 17 to 18 for high achievers.

Instrumentation

Six different instruments were implemented in this research. The first instrument was a reading comprehension which was designed based on their high school textbooks as pre-test. A series of tests were given in the classroom to the experimental and control groups weekly. The last test was a post-test and was administered at the end of the treatment period.

Materials

The participants in the control and experimental groups were taught English high school Text books. Each lesson was taught every other week. The experimental participants were given awareness on lexical density, they were taught vocabularies of each passage by giving definition, pictures, examples and so on but for control groups there is no LDA before teaching reading comprehension and they were taught reading in usual way.

Procedure

A group of 80 students in one of high schools in the Khuzestan province was selected. The first grade students were considered as low achievers due to their less lexical and back ground knowledge of English language according to what they had acquired in their previous English text books and two third grade were chosen a high achievers of English in comparison with first grade due to more lexical and grammatical materials that they had covered in first and second grades of high school text books. This distinction is normal in high school because as students cover one book the next high school book has new words and new materials that are more difficult than previous books although we cannot ignore students who have self- study and attends English institutes to increase their English lexical knowledge in order not to have this interference a high school in the middle of city was selected whose students were average and most them just learned English at school and their knowledge was based on their text books.

As the school, the researcher did her experiment in a natural class of high school as school teacher, so first she administered a lexical pretest of half of English book one for low achievers and another test of half of English book three to high achievers to check their lexical background knowledge. All the students in each group participated in the exam. The papers were collected and scored. Mean and standard deviation of the scores were calculated. The mean of 9.8 for pretest scores of experimental low group and the mean 10.7 for control low group was achieved and the mean of 10.75 for the pretest scores of experimental high achiever group and the mean of 10.40 for control high group were proved.

After dividing the participants into four groups and determining the pretest scores, the students in the control group were given four passages followed by a set of explanatory, true/false, and

multiple-choice questions. After teaching and practicing each reading passage a treatment test was administered to them, for control groups there was no LDA. It took the researcher four sessions of forty-five minutes to do the activities. On the other hand the students in the experimental groups of both high and low achievers received the same four passages, the teacher introduced them the topic of their English text books and then gave them some background knowledge on vocabulary and tried to increase their lexical knowledge related that specific text and the teacher focused on working on lexical items and reviewed previously acquired vocabularies and the passage was read and comprehended by students and teachers. This kind of activity seemed more motivating for students and they had more willing to learn and review most of the lexical items in their textbook reading passage. The students were not allowed to use their English-Persian dictionaries for translation because they were supposed to learn and practice lexical in the classroom, after giving LDA by teacher they worked on the passage and their comprehension problems were solved by teacher or advanced students, so students had interaction with each other in experimental groups and advanced students helped others in some cases. Then a treatment test based on the reading comprehension administered to students and after that the papers were selected and corrected by the teacher.

After four sessions of instruction, the students in all groups participated in a post- test exactly the same as the pre-tests. Each test composed of 40 multiple-choice questions. The exam lasted for 40 minutes and all the students were present. The papers were gathered and scored objectively. Again, the means, and standard deviations of all sets of scores were calculated indicating that any change in the means of scores was due to the influence of the type of instruction in each group.

RESULTS AND DISCUSSION

Pretest

The participants in both experimental and control groups were given a pretest. The test had 40 multiple choice reading comprehension questions based on the materials to be taught to the participants in both groups. The aim was to make sure that the participants were homogeneous. The results of the tests are shown in Table 1.

Table 1: Descriptive Statistics (Pre-test, High and Low Achievers)

	Groups	N	Mean	Std. Deviation	Std.Error Mean
Experimental(H)	1.00	20	10.75	3.80	.85
Control (H)	2.00	20	10.40	4.03	.90
Experimental(L)	1.00	20	9.80	2.23	.50
Control (L)	2.00	20	10.70	4.72	1.05

Table 1 shows that the experimental group and control group of each set in this research have almost equal mean value. However, the descriptive table cannot prove this homogeneity between

two groups of each set is significant. Thus Independent Samples t-test was used to show the homogeneity between the experimental and control groups in Table 2.

Table 2: Independent Samples t-Test (Pre-test, High vs. Low Achievers)

Groups		t	df	Sig. (2- tailed)	Mean Diffe rence	Std. Error Differe nce	95% Interval Difference	Confidence of the Upper
							Lower	
Experimental(H) vs. Control (H)	Equal variances assumed	.282	38	.779	.35	1.24	2.16	2.86
	Equal variances not assumed	.282	37.8	.779	.35	1.24	2.16	2.86
Experimental(L) vs. Control (L)	Equal variances assumed	.770	38	.446	.90	1.16	3.26	1.46
	Equal variances not assumed	.770	27.1	.448	.90	1.16	3.29	1.49

As the above table shows the observed t ($t_o=0.282$) is less than the critical t ($t_c= 2.021$) with $df=38$, the difference between high and low achievers in both group are not significance. In other words, the two groups are homogeneous in each set.

Post-test

After the sessions of treatment the same test (the pre-test) was given to both groups. Results are shown in Table 3.

Table 3: Descriptive Statistics(Post-test, High and Low Achievers)

	Groups	N	Mean	Std. Deviation	Std. Error Mean
Experimental(H) Control (H)	1.00	20	16.4500	3.47131	.77621
	2.00	20	14.2000	3.18880	.71304
Experimental (L) Control (L)	1.00	20	17.9000	2.91818	.65253
	2.00	20	14.3000	3.72898	.83382

Table 3 shows the mean value of the low control group improved 3.60 points after the treatment, it was 10.7 improved to 14.30 in post-test and the mean value of high control group improved 4 points after treatment, it was 10.40 improved to 14.20 As it was mentioned before, the control groups were taught in the usual way of teaching reading comprehension in the high school of

Iran; that is the students weren't given LDA and they just were taught reading in a usual ways as most teachers teach in Iran.

The mean value of the experimental groups improved more than the control groups after treatment. The mean value for low experimental group was 9.8 points at the pretest, but it turned to 17. The mean value for high experimental group improved 5.7 as it was 10.75 improved to 16.45. As this descriptive table cannot show the significant difference between each set of groups, an Independent Samples t-test was used to compare the two means of the high and low groups on the pre-tests and post-tests.

Table 4: Independent Samples t-Test (Post-test, High vs. Low Achievers)

		t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
Groups							Lower	Upper
Experimental(H) vs. Control (H)	Equal variances assumed	2.135	38	.039	2.25	1.050	.11	4.38
	Equal variances not assumed	2.135	37.7	.039	2.25	1.05	.11	4.38
Experimental(L) vs. Control (L)	Equal variances assumed	3.400	38	.002	3.60	1.05	1.48	5.74
	Equal variances not assumed	3.400	35.9	.002	3.60	1.05	1.45	5.74

Table 4 shows the mean value of the experimental groups were higher than the mean value of the control groups on post-test. However, a quantitative superiority of the experimental group mean value over the control group mean value was not regarded as a proof for the rejection of null hypothesis. Therefore, the researcher moved to the next step to calculate the t-test which is probably the most widely used test for the comparison of the two means. Again, the researcher used a t-test for the pretest and post-test of the experimental groups to make sure that the differences in the means was statistically meaningful.

The null hypothesis stated that the two samples were from the same population in each set and the difference between the two sample means represented the population means was insignificant. To see whether the observed t-value was statistically significant or not, the researcher checked the t-distribution table. He had 40 participants in each group. This gave her total of 80 and as a result a df=78. The t- observed for group low was 3.40 and for the high group was 2.135 and they were greater than $t_{c=2.021}$, so the two groups in each set are not homogenous after treatment. In other words the null-hypothesis was rejected. Statistically speaking, as the above table showed, the t-observed exceeded the t-critical. It means that the instruction worked well in the experimental group and the LDA really improved the reading comprehension performance of

Iranian high school students. Thus, it can be said that there existed a statistically meaningful difference between the average performance of two groups of low and high achievers on the post-test which could be attributed to the treatment they received rather than sampling error.

Descriptive statistics of High vs. Low Achievers

In the Table 5, the means of all groups in pre and post-tests were analyzed through Paired Samples t-test to see the differences between pre and post- tests means.

Table 5: Paired Samples t-Test (Pre and Post-tests, High vs. Low Achievers)

		Paired Differences				t	df	Sig. (2-tailed)
		Mean	Std. Deviation	Std. Error	95% Interval Difference LowerUpper			
Pair 1	EX-Pre-test (High) vs. EX-Post-test (High)	5.70	1.86	.41	6.574.82	13.65	19	.000
Pair 2	EX-Pre-test (Low) vs. EX-Post-test (Low)	8.10	2.80	.62	9.416.78	12.90	19	.000
Pair 3	Con-Pre-test (High) vs. Con-Post-test (High)	4.00	1.62	.36	4.753.24	11.02	19	.000
Pair 4	Con-Pre-test (Low) vs. Con-Post-test (Low)	3.60	2.32	.52	4.682.51	6.92	19	.000

Table 5 compares all groups in terms of the effect of LDA on reading comprehension. Among four groups of students, low achievers who have received LDA performed better on the post-test. As it is shown in the table experimental high group the mean value improved 5.30 after the treatment while control group improved 4.20, also the mean value for experimental low group improved 8 points and control low groups improved 3.60 points in this research. The most progress devoted to experimental low group

Discussion

The main research question in the present study was whether lexical density awareness has any impact on the reading comprehension of Iranian high school students. The sample included the students who studied English in the high school-grades 1 and 3. The answer to the research question was very important because they had experienced that lack of lexical knowledge caused to demotivate students to read their textbook passages. They needed to search for new ways of teaching reading comprehension to improve students' understanding of the passages. It was found that lexical awareness as the probable answer to the question. Lexical awareness seemed more motivating than Persian translation of the passages. One reason might be that students in low levels might have more motivation in learning lexical items and they are more active than high achievers.

Groups who were given LDA improved better in their reading comprehension than learners in the control group who haven't been given LDA. It is proposed that other teachers and researchers to give LDA in teaching English texts in order to help students to have a better comprehension. This idea is in line with the Anderson's (2001) findings of the present research. Sometimes students cannot comprehend the texts and lose their motivation in learning and comprehending because of lack of background knowledge so they prefer to use guide books and memorize Persian translation of the texts, this is a very important problem that English teachers have in high schools of Iran. Thus, one solution to this problem can be giving LDA to enhance students' lexical knowledge to encourage them focus on comprehending the texts not memorizing Persian translation. Furthermore, the learners in the experimental groups participated more actively in the learning process than the ones in the control groups, because they found out that by knowing lexical and enough background knowledge understanding of the high school textbooks is not that kind of difficult job that they always thought. For the Experimental groups, the participants were taught reading but there was great focus on LDA, the teacher taught each lesson every other week during school first term, the teacher focused on reviewing previous lexical items to the students and also new vocabularies were practiced by using pictures, definitions, synonyms and antonyms and so on. Then they read the text to find any unfamiliar vocabulary. Thus, they were provided with the meaning if there was any forgotten or new vocabulary which they did not know their meaning then after comprehending the text a treatment test was administered to them. Comparing the two means in the post-tests clearly show that the treatment in the experimental group worked much. On the other side, for both control groups, there was no focus on LDA in the classroom by the teacher and passages were taught as a usual way, the teacher introduced the topic gave explanation on the topic and the text was read and comprehended by students, She did not remind them the vocabularies in the text then at the end a test based on the lexical of the passage was administered to them.

CONCLUSION

The results shows that LDA has positive effect on reading comprehension among Iranian high school students as the average of scores for students who have received LDA on reading comprehension was more than students who did not receive LDA. The result showed that LDA has a direct relationship with reading comprehension the more vocabulary a person knows the better she/he can comprehend the text. Laufer (1998) confirms this idea and believes that most important part of learning a language is learning its vocabulary because according to his idea lexical errors makes disruption in communication than grammar errors: Is there any significant difference between the students with high and low proficiency levels exposed to LDA in developing their reading comprehension? By comparing the result of experimental groups we can conclude LDA is more effective for low achievers as they their mean average after treatment improve eight points in comparison with high group which improved six points. It seems that low achievers have more motivation to learn lexical items than high achievers in this study (Koda, 1999). The learners in the experimental groups participated more actively in the learning process than the ones in the control groups, because they found out that comprehending textbooks is not that kind of difficult job that they always thought. By knowing lexical and enough background

knowledge understanding of the high school texts becomes easier. It is worth mentioning that this research was done in real situation of school class; however, the small size of the research sample and the limits of class hours could be the limitations of this research.

ABSTRACT

This study was an attempt to investigate whether using word sorting techniques had any significant effect on pre-intermediate English as foreign language (EFL) learners' vocabulary retention. To fulfill the purpose of this study, 60 female students among 90 learners within the age range of 19 to 32 years were selected. They were studying English at Narcissus and Talk language school in Dezful, Iran. They were at the pre-intermediate level. The participants were divided into two equal experimental and control groups. Both groups took a vocabulary pre-test designed based on the materials were taught in both groups' classrooms. The same content was taught to both groups throughout the 19-session treatment with the only difference that the experimental group was taught word sorting techniques while in the control group the common approach to teach vocabulary such as definition and explanations were applied. At the end of the instruction, the vocabulary post-test parallel to the vocabulary pre-test was administered to the participants of both groups after an interval of two weeks. Finally, the mean scores of both groups on the post-test were compared through an Independent Samples t-test which led to the rejection of the null hypothesis. The results of this study may be used in teaching word sorting techniques effectively to improve the intermediate EFL learners' vocabulary retention.

KEYWORDS: Word sorting; Vocabulary retention; EFL Learners

INTRODUCTION

Word sort is a strategy that helps students learn and better remember new vocabulary. Students work in small groups, with each group given an envelope containing key terms on separate slips of paper. Students are instructed to discuss what they think the relationships among the words might be (Weimer, 2010). Exploring how the words relate to each other means that the students

are building a framework that puts the words in context, also making the words easier to remember in both the short and long terms (Weimer, 2010).

Besides, word sorts (Bear, Invernizzi, Johnston & Templeton, 1996) help students recognize the semantic relationship among key concepts. They are also an excellent method of teaching the complex reasoning skills of classification and deduction. As a method of word study (Scraper, 2002) word sorting deals with a wide developmental range and a variety of needs. Picture sorts are useful tools for phonological awareness in children who are just learning to or have not yet learned to read. Students are asked to perform tasks that construct awareness of phonemes, the very small part of language, by categorizing or matching initial, middle or final sounds. Sorts can help build understanding of graphemes as well, the small parts of written language, by asking students to match particular sounds to their written representations. Research continues to show that this ability to recognize that written words are made up of letters that represents sounds-the alphabetical principles-is one of the strongest predictors of successful reading(Scraper, 2002).Research also suggests that word study and word sorting are effective way of teaching these essential elements. Word study and word sorting are not only for emergent readers. When students have mastered basic sound symbols, correspondences and patterns, they may experience difficulty with morpheme, or unity of meaning such as affixes and base works.

Word sorting activities that want students to compare words by their roots or base words or manipulate words with prefixes and suffixes teach these elements in meaningful way. Research suggests that word sorting is an excellent way to increase vocabulary and reading comprehension skills for an older student. Word sorting works particularly well for students with special needs. Studies indicate that word sorting boost word knowledge, reading and comprehension of children with learning differences and disabilities (Scraper, 2002). Students learning English as a second language can also benefit a lot in reading and word knowledge with word sorting exercises (Strickland, Ganske, & Monroe, 2000).

Vocabulary is so important for EFL learners that Wilkins (1972) claimed that, “without grammar very little can be conveyed, without vocabulary nothing can be conveyed” (p. 111). Wallace (1984) added that knowledge of vocabulary spelling, its meaning and application are crucial to learn vocabularies of foreign languages. Though some teachers may assume that vocabulary learning is easy, learning new vocabulary items has always been difficult for the learners. Different ways of learning vocabularies are usually utilized by the learners such as using flash cards, notebook, referring to bilingual and monolingual dictionaries to comprehend the meaning, or giving some synonyms and antonyms to name but a few. In spite of these efforts and invariably experiencing so many difficulties, vocabulary is undoubtedly the most sizable and unmanageable component (Nemati,2009). In many EFL classes, even where teachers have allocated much time to vocabulary teaching, the results have been disappointing, especially where English is not the main medium of communication.

Therefore, it seems that EFL learners need appropriate and efficient strategies to retain the new words and EFL teachers also need to find efficient approaches and practices to equip learners

with those strategies. Based what is mentioned above, the present study investigated whether using word sorting techniques could improve EFL learners' vocabulary retention.

REVIEW OF LITERATURE

Studies throughout the 1980s and 1990s revealed that vocabulary skills and knowledge are the precondition for most other language abilities and, besides, the main source of variance in the final state of such abilities (Nemati, 2009). It is now clear that vocabulary acquisition does not happen by itself to a satisfactory degree particularly as needed for first language literacy or in second language learning.

Lexical growth must therefore be provided for in language instruction. To reach this goal the best technique of presenting and teaching vocabulary should be used especially in EFL environments. Since instruction can affect lexical growth, and since there are different ways of teaching and learning, those exercises which address deeper engagement of words should be considered and used by the teachers in the classroom. Because learning of the vocabulary of a foreign language is far from initial learning or basic recognition, the aim of teaching and learning is rather long term development of vocabulary. To this aim, exercises must be congruent with the depth of processing hypothesis (Nemati, 2009).

For over a century, researchers and scholars have been writing about the importance of actively engaging students in their own learning process. Dewey (1963) believed in active engagement of the learning process, or “experientialism,” because it is through this active involvement in what one is learning that knowledge is constructed and therefore owned by that person. Lindeman (1926) wrote about the importance of discussions as a method of instruction. He advocated that all students should be taught a set of analytical skills that could be applied to a range of situations, beyond curriculum, and he believed the best way to teach and hone these skills was through small-group discussions. One of the key features of the word-sort strategy is the discussion that occurs among students as they work their way through the terms, discussing the relationships of the words to each other and deciding how to categorize and organize the terms and concepts.

The concept of a word is rather difficult to explain and there are several different views concerning what a word really is. Singleton (1999, p. 9) emphasizes that words have a rather privileged status in the popular understanding of what a language is since they are vital to linguistic communication. Indeed, without vocabulary there is no tool to communicate and everybody realizes it. However, different people see words and vocabulary differently and therefore defining a word has its problems.

On the other hand, according to Singleton (1999), there can be some logical phenomenon in the language which helps to describe the concept of a word. Singleton (1999) mentions the vowel harmony in Finno-Ugric languages to be an example of a logical phenomenon. Carter (1998) offers a slightly different view for the definition of a word in comparison to Singleton (1999). Carter (1998) points out that in some sense, everyone knows what a word is. He argues that the

most accurate definition of a word would be to describe it as the minimum meaningful unit in a language. In this sense, a word is a word which can stand on its own as a reply to any question or statement (Carter 1998).

The grammatical properties of a word include the grammatical category of it, possible and impossible structures associated with the word and idiosyncratic grammatical information. Lexical properties of a word include the word combinations and appropriateness. Also the meaning of a word has its problems since it includes both, a general meaning as well as a specific meaning (Cook, 2001). Whereas a grammar of a language describes the principles or rules of the form and meaning of words, phrases, clauses and sentences and interacts with other components of language (e.g. phonology, graphology, semantics and the dictionary or lexicon), the lexicon for a language deals with the vocabulary. It includes the information about pronunciation, spelling, meaning and grammatical properties of the lexical item. Singleton (1999) accentuates that the traditional distinction between lexicon and grammar is proving increasingly difficult to maintain since the two are closely connected due to, for instance, multi-word items and patterns. However, a distinction between grammatical and lexical words can also be made. Grammatical words work as functional words whereas lexical words (nouns, verbs, adverbs) are seen as content words (Carter, 1998).

To sum up, there are several different views on how to describe a word and it is impossible to create one, absolutely accurate description of a words. Nevertheless, as Carter (1998) mentions, everyone knows what a word is and it can be seen as the minimum meaningful unit in a language and it can operate on its own. This view is adopted in the present study and the different approaches are not discussed in more detail.

Vocabulary Retention

Vocabulary retention has been defined as “the ability to recall or of what has been taught (e.g. grammar rules and vocabulary) may depend on the quality of teaching, the interest of the learners, or the meaningfulness of the materials” (Richards & Schmidt, 2002). As it is obvious in the domain of vocabulary learning, the problem is not just in learning second language words; rather in remembering them. Bahrack (1984) states that how well people remember something depends on how deeply they process it. Therefore, various procedures have been recommended to facilitate vocabulary retention.

Concentration on features of the new word and its textual environment is supposed to facilitate retention. Learning in context depends on repeating, re-cycling, and re-presenting vocabularies as well as re-noticing them by the learner. It has been suggested (e.g. Hedge, 2000) that retention is related to the condition in which the meaning is yet another aspect to the condition of inferring meaning of the word which enhances vocabulary retention. That is, retention depends in some way on the amount of mental and emotional energy used in processing a word and readers have developed certain strategies that could assist emotional and mental processing such as meta-cognitive strategies.

Vocabulary is now a current focus in ESL pedagogy and research and has been increasingly recognized as essential to language use because inadequate vocabulary can lead to the learners' difficulty in language reception and production (Jenpattarakul, 2012). Vocabulary knowledge is important because it encompasses all the words we must know to access our background knowledge, express our ideas, communicate effectively, and learn about new concept. Vocabulary is the glue that holds stories, ideas, and context together, making comprehension accessible for the readers. However, it is useless if the students learn a lot of words or possess a large number of vocabularies but they can't remember or retain in their long-term memories (Jenpattarakul, 2012).

Khabiri and Pakzad (2012) stated that as it is obvious in the domain of vocabulary learning, the problem is not just in learning second language words; rather in remembering them. Bahrick (1984) stated that how well people remember something depends on how deeply they process it. Craik and Lockhart (1972) mentioned that according to "Depth of Processing Hypothesis", the more cognitive energy a person exerts when manipulating and thinking about a word, the more likely it is that they will be able to recall and use it later. This hypothesis implies that it is not important how recently learners have learnt something. What is of more importance in learning is, in fact, the depth of processing; in other words, students must be taught on how to process information deeply. Such implications extend to pedagogy as well, suggesting that exercise and learning strategies which involve a deeper engagement with words should lead to higher retention compared to shallow activities. Marefat and Ahmadi Shirazi (2003) stated that "Language learning strategies are any set of actions, plans, tactics, thoughts or behaviors that the learners employ to facilitate the comprehension, storage, retrieval, and use of information" (p. 47).

Word Sorting

Using appropriate presentation methods enables learners to obtain a deeper impression of and richer information about the target words to make them enter the long-term memory (Zhang, 2008). Cognitive psychologists and language acquisition scholars working within the framework of cognitive psychology believe that retention and recall of information is determined by the way in which the information is processed (Hulstijn & Laufer, 2001).

Carlisle (1993, pp. 97-105) also writes "effective vocabulary instruction include such practices as building semantic relationships, providing ways to remember basic word meaning, integrating information with prior knowledge, and facilitating multiple exposures to words".

According to Lauritzen (2010), word sorting is defined as "an instructional technique in which students organize words printed on cards into columns on the basis of particular shared conceptual, phonological, orthographic and meaning related-features"(para, 5). Gehsmann (2008) described word study in the following paragraph:

Word study is an approach to teaching phonics, vocabulary and spelling and is supported by nearly four decades of research, beginning with the work of Charles Read and Edmund Henderson in the 1970s and continues through the work of many today (Gehsmann,

2008). Underlying this approach is an understanding that English orthography, or spelling, has three layers: alphabet (sound), pattern, and meaning. (p. 1)

Gehsmann continues:

Students uncover the layers of orthography with each new word they learn to read and spell. For instance, when a beginning reader matches the letters of “cat” to the sounds she hears (/c/-/a/-/t/), she is demonstrating knowledge of the *alphabetic layer* by establishing 1:1 correspondence between letters and sounds. Later, as the reader discovers sound and spelling contrasts between words such as “fit” and “fight,” or “cap” and “cape,” she moves into the *pattern layer* of orthography. Over time and with considerable practice and instruction, the student will eventually discover that groupings of particular letters represent meaning units – prefixes, suffixes, base words, and roots, thus uncovering the meaning layer. The mature reader carefully orchestrates his or her understanding of the three layers of English orthography when reading, writing, listening, and speaking (p. 1).

Word sort is a strategy that helps students learn and better remember new vocabulary. Students work in small groups, with each group given an envelope containing key terms on separate slips of paper. Students are instructed to discuss what they think the relationships among the words might be. The strategy was developed for use in science courses, where terms have more precise meanings and fit more readily into categories. Students do this initial sort before reading about the terms or hearing them defined and discussed in lecture. After exposure to the words in the text or lecture, students get back into their groups and re-sort the words; comparing their new arrangements with the ones they first constructed (Weimer, 2010).

Word sorting activities provide instructors with a framework for more individualized instruction at students’ developmental spelling levels. In word sorting activities, students organize word cards into columns on the basis of a shared conceptual, phonological, or orthographic feature (Zutell, 1996, 1998). Word sorting is based on four principles outlined by Zutell (1996). First, the English language is not arbitrary. There are extensive sound, visual, and meaning patterns. Second, more than rote memorization, learning to spell includes a strong conceptual component. Children learn how words work. Third, spelling development follows a set of stages in which children produce more accurate spellings and more sophisticated misspellings. Fourth, relationships are first recognized in familiar words, and then extended to less familiar words, which become more memorable as the child fits the new words into the scheme of the old words (Zutell, 1996). While word study is supported by all four of the principles, the fourth principle outlines the rationale for word sorting activities (Fresch, Wheaton, & Zutell, 1998).

Recent research indicates strong evidence that students in grades first through fifth show an increase in word knowledge after participating in word sorting activities. Additionally, children with learning and cognitive disabilities participating in word sorting activities also show an increase in spelling ability (Fresch et al. 1998). In 1998, Fresch et al. asked children to “think aloud” while they sorted words into categories. This allowed researchers to analyze the thought process of students as they sorted words. The results of the study implied that less sophisticated spellers placed words into categories based on either auditory or visual features of words. As

spellers became more sophisticated, they chose the categories for the words based on both auditory and visual features of words, thereby suggesting that they were realizing the connection between the two. The think aloud process also gave students a reason to talk about words and use the “language of language” (long and short vowels, prefixes, suffixes, syllables, etc.). Fresch et al. suggested that think aloud sorting can guide teachers to a better understanding of children’s misconceptions about words, which in turn drives future instruction. The developmental spelling level suggests the type of words the student needs to sort. Word sorting takes place at a less difficult level than a student’s reading or writing level. Just because a student can read and write a word does not mean that he or she can accurately analyze the word in relation to spelling patterns. Finally, when word sorts are designed to teach toward strengths, students are able to build on prior knowledge and develop new approaches for spelling words (Fresch et al., 1998).

RESEARCH QUESTION

In order to fulfill the purpose of this study, the following research question was formulated:

Does using word sorting techniques have any significant effect on EFL learners' vocabulary retention?

METHODOLOGY

Participants

The participants of the present study were adult EFL learners aged within the range of 19 to 32 years. They were at the pre-intermediate level of English language proficiency studying at Talk and Narcissus language schools in Dezful, Iran. In the present study, the sample selection was done at two stages. At the first stage, a larger sample of 90 pre- intermediate EFL learners was selected non-randomly and a piloted language proficiency test, sample Preliminary English Test was administered to them. Following the administration of PET, 60 EFL learners, whose scores fall within the range of one standard deviation above and below the sample mean, were chosen as the participants to take part in the second stage.

At the second stage, in order to have a homogeneous sample in terms of vocabulary knowledge and to make sure that the target sample did not know the target vocabularies, which were supposed to be covered during the study, the 60 selected participants took part in a piloted teacher-made vocabulary test. Those participants who answered less than 25% of the questions were assumed not to know the majority of the target vocabularies and were thus selected as the target sample (N=60).. The selected participants were thus randomly divided into two groups, one experimental and one control with 30 learners in each. Since 30 is too large a number for the students in one English class, all the participants were seated in a collection of two classes of 15 for each group. That is, two classes of 15 and 15 for the control group and two classes of 15 and 15 for the experimental group. It should be noted that, 30 pre intermediate students formed the pilot group participants who were studying English at the same language schools where the main study was conducted and had the same characteristics and language proficiency level as those of the target sample.

Instrumentation

Vocabulary pre-test

An 83-item vocabulary test, which was designed and piloted by the researcher based on the materials of the treatment were used at the onset of the study to test the participants' degree of familiarity with the target vocabularies. This test consists of multiple-choice items, each of which tests one single vocabulary. It is worth mentioning that for these multiple-choice items, the students had to find the most appropriate word from among the alternatives to complete the stem. The pretest was used to homogenize the participants in terms of their vocabulary knowledge.

Vocabulary post-test

The post-test included two sections: a) A 65-word list and b) A piloted 65-item teacher-made vocabulary test which was a parallel form of the 83-item vocabulary pre-test which used at the onset of the study for homogenizing the participants, with the only difference that the vocabularies which the participants answer correctly at the homogenization stage were omitted from this test (18). The purpose of the word list which contained the same vocabularies as the test was to make sure that the students did not mark the correct answer in the test by chance. The post-test was administered two weeks after the termination of treatment. The procedure of designing the tests is fully described in the procedure section.

Materials

One of the text books used in this research was Top Notch 2A by Joan Saslow and Allen Ascher (2011). This textbook is used in Talk and Narcissus language schools for pre-intermediate learners and it consists of 5 units. It is usually taught in a semester of 19 sessions. The goal of Top Notch course is to make English unforgettable through multiple exposures to language, numerous opportunities to practice it, and systematic and intensive recycling. Top Notch emphasizes the cultural fluency which enables students to navigate the social, travel, and business situations that they will encounter in their lives.

Procedure

In experimental group, in the first session, word sorting techniques were presented and described explicitly by the teacher. Then, it was explained to language learners why, when, how these techniques could be used. Teacher asked students to sort new words based on their conceptual and phonological, orthographic and meaning related features. To do this, the teacher used two basic ways to conduct the sorts: close and open sort. In close sorting (teacher-directed), the students sorted words based on categories (and the specific features of each) provided by the teacher, usually shown by keywords that head columns. The students then matched the words with the features to create the word collections. In open sorting (student-centered), the students decided how to categorize the words and the teacher provided only the list of words. Students could work together to discern the common features and to describe the categories for collecting the word groups. Steps to a Word Sort were:

First the teacher listed between 10 and 20 key vocabulary words from the target material on the board or on index cards in every session. Then she divided the class into small groups of 3 or 4 students and distributed the index cards.

For a Closed Word Sort, she provided students with the categories into which they could sort the vocabulary words. For an Open Word Sort, she instructed the student teams to suggest categories for organizing the words. Next she allowed 10 to 15 minutes for the student teams to assign the words to the appropriate categories.

And finally she conducted a class discussion with each group presenting their word list for one of the categories requires the students to defend their sorting of terms by asking about the common features of the categories and how each specific word meets these criteria. Every session before the new instruction the teacher reviewed the previous categories.

On the other hand, the control group was taught through the traditional techniques of teaching vocabulary which is the typical method of teaching vocabulary in the mentioned language schools. According to Gairns and Redman (1986), traditional techniques of teaching vocabulary are classified in to three categories: visual, verbal and translation. Visual techniques concern with visual memory such as photographs, blackboard drawings, wall charts, realia, mime and gesture. Verbal techniques include illustrative situations, synonym and definition, contrasts and opposites, scales and examples.

Two weeks after the termination of the treatment, the post-test was administered to both groups. Interval of two weeks was chosen because less than this time the students might use their short-term memory to answer the questions and in more than two weeks further learning may occur (Pishghadam, Khodadady, & Khoshsabk, 2010). The posttest included two sections. The same 65 target vocabularies which none of the participants knew at the onset of the study were presented in two forms, one a vocabulary checklist in which the participants were required to write a synonym or a definition in L1 or L2, and the other in the form of a vocabulary test with multiple choice which was a parallel form of the vocabulary pre-test. The reason for having the two forms for the post-test was to make sure that the students did not mark the correct answer in the test by chance. It took 30 minutes to administer the vocabulary list and 65 minutes was allotted to administer the vocabulary post-test. Every individual was awarded a score of one for each vocabulary in the post-test provided that he/she had both selected the correct response from among the alternatives on the vocabulary post-test and provided the correct synonym or definition in Persian or English on the post-test checklist indicating retention of that vocabulary. If only one of these were correct, the candidate could have guessed the answer on the multiple choice test and would receive a score of zero on that vocabulary indicating lack of retention. At the end, the obtained data were analyzed to test the null hypothesis of the study.

Data Analysis

Various descriptive and inferential statistics were employed throughout the study. First, descriptive statistics were used for the homogenization process, pre and post-test. The reliability of pre and post-test were estimated. To address the null hypothesis, an Independent Sample T-test was run to study the effect of word sorting techniques on improving EFL learners' vocabulary retention. The result of the analysis will appear in the next chapter.

The data gathered from the pretest and post-test of both groups was analyzed with the aid of the Statistical Package for Social Sciences (SPSS). The Cronbach α was employed for calculating the reliability of the test scores gained by the participants on the PET. An Independent Sample T-test was run to compare the two groups' means on the pretest of vocabulary in order to prove that they were homogenous in terms of the vocabulary knowledge prior to the main study. An Independent Sample T-test was run to compare the two groups' means on the posttest of vocabulary in order to investigate the effects of word sorting techniques on EFL learners' vocabulary retention.

RESULTS AND DISCUSSION

Descriptive statistics of vocabulary pre-test is illustrated in Table 1.

Table 1: Descriptive Statistics of Vocabulary Pre-test of Experimental and Control groups

	N	Min.	Max.	Mean	Std. Deviation	Variance
Pre-test	30	3.00	11.00	6.6000	2.40115	5.766
Valid N (listwise)	30					

Table 1 shows the 60 descriptive statistics of vocabulary pre-test among the participants who were randomly divided into two groups of experimental and control. Table 2 demonstrates the descriptive statistics of the scores.

Table 2: T-Test of the Vocabulary Test Pre-test of Experimental and Control groups

t-test for Equality of Means								
		t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Interval of the Difference Lower	Confidence of the Difference Upper
Equal variances assumed		1.748	58	.086	.633	.36	-.09	1.35
Equal variances not assumed		1.748	57.92	.086	.63	.36	-.09	1.35

Table 2 shows the results of the *t*-test with the assumption of the homogeneity of the variances ($t = 1.748$, $df = 58$, $p = 0.650 > 0.05$) indicated that there was no significant difference between the two groups' mean scores on the vocabulary pre-test prior to conducting the main study. As a result, the researcher being confident with the required conditions of the research continued the study by conducting word sorting techniques in the experimental group and employing the typical method of teaching vocabulary in the control group.

Descriptive Statistics of the Vocabulary Post- Test Administration

When the treatment was over and after a two-week interval, the post-test including the 65-item checklist along with the 65-item vocabulary posttest was administered to both experimental and control groups. Prior to running an independent-samples *t*-test, the normality of the distribution of post-test scores in both experimental and control groups had to be checked. Table 2 shows the descriptive statistics of the control and experimental groups' post-test scores.

Table 3: Descriptive statistics of Vocabulary Post-test of Experimental and Control Groups

Groups	N	Min.	Max.	Mean	Std. Deviation	Variance	Skewness	Std. Error	Kurtosis	Std. Error
Control group	30	18	50	30.80	8.29	68.71	.61	.42	.18	.83
Experimental group	30	27	64	41.60	8.06	65.07	1.05	.42	1.21	.83

Table 3 shows the mean score of the experimental group came out to be 41.60 and higher than 30.80, which was the mean score of the control group; moreover, the skewness ratios fell within the acceptable range of ± 1.96 signifying that the score distributions in both groups represented normality. Table 4 shows the descriptive statistics of the control and experimental groups' post-test scores

Table 4: T-Test of the Vocabulary Test Post-test of Experimental and Control groups

t-test for Equality of Means								
		t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Interval Difference	Confidence of the Upper
Equal variances assumed		5.114	58	.000	10.80	2.11	6.57	15.02
Equal variances not assumed		5.114	57.95	.000	10.80	2.11	6.57	15.02

Table 4 displays the results of the Independent Samples *t*-test run on the post-test mean scores of the two groups. Results show a significant difference between the two groups.

Discussion

As reported in the results section, the data strongly suggested that using word sorting techniques can increase the pre-intermediate learners' vocabulary retention. It is worth mentioning that the results were obtained under the condition that the same amount of vocabularies had been taught to both groups the only difference was the application of word sort techniques in the experimental group. As it was shown in the result section the experimental group outperformed

the control group. One reason for obtaining a better result in the word sorting group might have been that sorting activities are active, thoughtful; problem solving tasks (Fresch, 2000). Word sorting gives hands-on opportunities for students to work through the complexities of language. It also promotes word analysis, which can benefit students in other reading and writing activities (Fresch, 2000). They can be beneficial for helping students to spell words, recognize words, make word connections, become aware of the phonemic structure of words, and gain meaning of words (Joseph & Orlins, 2005).

A word sort is an active-learning, critical-thinking strategy that involves students in small groups of three or four actively discussing words that have been provided for them by the instructor (Vacca & Vacca, 2002). So grouping students is one of the most important elements of word sorting instruction that promotes literacy success, especially for at-risk students. These groups should always remain flexible and dynamic. Teachers should regroup when necessary to best meet the changing needs of students (Invernizzi & Hayes, 2004).

It is worth mentioning that prior knowledge also plays a significant role in active learning. Freire (1970) maintained that students don't come to school "blank slates" or "empty vessels" waiting to be filled with information from their instructors' lectures. Instead, all students come to class with prior knowledge and life experiences. In addition, there is a need to find ways to tap into that prior knowledge so are able to help students make connections between their prior knowledge and what they are learning in classes. During the word sort, students use their individual and collective prior knowledge to make meaning of the terms and to understand the relationships between and among the words and to make decisions regarding their initial categorizations; consequently, the content and depth of their discussions within their small groups directly reflect this as well.

CONCLUSION

Based on the research findings, this research presents the following implications for EFL teachers, learners, syllabus designers while dealing with language learning, teaching, and developing EFL materials. Many language teachers in EFL contexts treat the vocabulary teaching in a traditional way. In addition to, in teacher-centered classes where the students have a passive role in learning, teachers are considerably remiss in teaching this paramount component of language, overlooking the insight that they can give language learners by using language learning strategies in general and cognitive strategies in particular. As teachers, they should endeavor to abandon taking the full responsibility of teaching and engage the learners in the process of learning and bring up independent and autonomous language learners.

Teachers should try to familiarize their students with innovative vocabulary teaching strategies such as the one explored in this study, that is, word sorting techniques. However, before teaching students how to use strategies effectively, teachers should be trained in strategy instruction and assessment. They should be equipped with appropriate strategies to be able to propose to students the appropriate ones and can deal with difficult academic tasks. If, for instance, one strategy does not work they should be able to suggest another alternative. What is more, teachers should design

activities that will require them to make use of a variety of strategies and after the completion of the task they should held a discussion session with students talking about the strategies they use, whether these strategies proved to be useful or not. In this way, while the teachers will have the opportunity to see to what extent each of the students is successful in the orchestration of the strategies, the students will be able to hear or see what strategies their peers use. Thus, they will be given the opportunity to make self-evaluation, decide which is better for them, or learn an alternative way of doing a particular task.

The findings of this study suggest that EFL learners need to take more responsibility for their learning and rely less on teachers and adopt cooperative learning. Learners' autonomy is the ultimate goal of language teaching. Language teaching learners' autonomy implies that in the absence of language teachers and classes, language learners continue their learning. If learners are solely and completely depend on their teachers and classes to be involved in language learning activities, as soon as they will be left by themselves, they easily quit their learning. Strategy training is a useful way to eliminate this problem. Language learning strategy training is the path through which learner autonomy can appropriately be achieved. As a result, learners are also recommended to get familiar with innovative vocabulary teaching strategies, especially concept sort and its underlying principles in order to benefit from its advantages. Language learners are recommended to gain some knowledge concerning concepts such as mental map, schematic knowledge and conceptual mapping.

Curriculum and material developers should infuse strategy training into materials in teacher training courses. Also, EFL practitioners should arrange some in service courses for EFL teachers to familiarize them with strategies and their benefits and advantages in teaching. Through these courses EFL teachers can properly exploit strategies and in improving their teaching success. Consequently, curriculum developers and material producers should collect feedback from teachers and students in order to identify the weaknesses and strengths of their products. This will enable them to produce better and developed materials. All in all, curriculum developers and material producers should work cooperatively with teachers and students so that they can design a better program with appropriate materials and tasks that will promote a more efficient and a more effective language learning atmosphere. According to the findings of this study, it is suggested that material designers develop teaching materials based on strategy-instruction, especially on word sorting techniques.

This study can be replicable to male learners and the results can be compared with the females to see whether using word sorting techniques are more effective for males or females. More comprehensive research on different variables such as participants' cultural background and different proficiency levels of English is necessary. In addition, learners with different language proficiencies could be studied to investigate the effect of word sorting strategies. Future studies can investigate the comparative effect of different word sort techniques such as picture sort, sound sort and digital word sort on vocabulary retention and recall.

ABSTRACT

This study investigated the effectiveness of discourse structure-based graphic organizers on pre-intermediate students' reading comprehension. The purpose of the study was to determine whether students who used discourse structure-based graphic organizers as a post-reading activity would perform better on post-test compared to those who were involved in conventional method of reading comprehension activities including question and answer, true/false, cloze tests, etc. This study also explored the differences between using graphic organizers and the conventional comprehension method in developing English as foreign language (EFL) learners' reading comprehension. Two pre-intermediate-level EFL classes were randomly selected at oxford foreign language school and were assigned to experimental and control groups. Data were collected through the administration of a pre-test and post-test of reading comprehension on the materials covered in 10 sessions. The reliability coefficients of the tests were calculated through KR-21 formula. The experimental group structured their own graphic organizers for reading texts studied in the class hour and presented them to their classmates in groups while the control group received conventional reading comprehension activities as a reading aloud, explaining the new words and answering the questions of the items. The statistical analysis included Paired and Independent Sample t-tests. Results revealed that the students who completed discourse structure-based graphic organizers as a post-reading activity performed significantly better in the post-test than the students who participated in the conventional method. The implications of this study could be used in reading comprehension classroom to familiar the learners with graphical structures of the reading passages.

KEYWORDS: Discourse structure; Graphic organizers; Reading comprehension

INTRODUCTION

In both first and second language (L1 and L2) contexts, reading is an essential skill to master for students. In formal educational settings, critical importance is attached to reading skill because students' success mostly depends on their reading comprehension skills (Jiang, 2007). Most of the input students are exposed to be in written form and this necessitates that they develop effective reading strategies. In an L2 situation, students should be provided with special attention because reading in L2 is naturally more challenging and demanding than reading in L1 (Jiang, 2007). In order to scaffold EFL learners in their approach to reading tasks, the discourse structures of reading passages might be exploited. Since focusing on discourse structures facilitates following the flow of ideas in a text in an effective manner, teachers might guide their students to be alert to text structures and text organization.

While comprehending a passage, most students mentally translate the content into their first language. Students may even respond to the comprehension questions through the time-consuming process of thinking in their first language and then translate it into English. Students cannot verify the accuracy of their translation of the meaning of the passage into their mother tongue (Lin & Chen, 2006). Using graphic organizers gives students alternatives to these inefficient methods of reading or comprehending a passage. In contrast to their usual approach to reading or comprehending a passage, they classify the content of the passage and then try to decode it (Lee & Schallert, 1997). This study explores how classifying a reading passage using graphic organizers has shown better results compared with reading a passage without using these organizers.

Learning through visuals helps students in comprehending passages more effectively than other reading strategies like skimming, scanning, note making, etc. According to Slavin (2011), research in pedagogy and psychology demonstrates that visual learning is among the most effective methods for teaching comprehension skills to students of all ages. Helping students organize the content helps them to comprehend texts for information such as main ideas supporting details, facts, opinions, comparisons and contradictions. According to Keene and Zimmerman (1997), students must be encouraged to make connections with the text they read to increase the effectiveness of reading. Graphic organizers can play a vital role establishing the connections. The text will be very clear to students when a graphic organizer is incorporated depicting the theme or content of a text they read. Moreover, graphic organizers using diagrams illustrate concepts and relationships between concepts discussed in a text.

Graphic Organizers

A graphic organizer is a diagram that represents a relationship directed by a thinking-skill verb. The verb "sequence" calls for a diagram of a series of boxes connected by arrows that shows the "event" of one box leading to the "event" of another box (Hibbard & Wagner, 2003). In 1992, Jay McTighe in his book, *Graphic Organizers: Collaborative Links to Better Thinking*, outlined three main ways teachers may use graphic organizers in their teaching and a number of ways that students can use them to aid their learning process. In the reading process, graphic organizers can be used at three levels: Before instruction, during instruction and after instruction. Before instruction, graphic organizers are used to understand the level of the students in terms of the

content. During instruction, graphic organizers allow students to approach the content cognitively because they assist thinking. It also allows students to construct maps that are appropriate to their learning styles. After instruction, they help students as a summarization tool or technique and they help the students to understand their improvement in terms of understanding passage. If a student can connect prior knowledge with what was learned and identify relationships between those ideas, it means graphic organizers have successfully assisted them in the course of their learning process.

The strategy that has received the most attention from the research community is the graphic organizer (Barron, 1969). Graphic organizers are representations, pictures or models used for processing textual information. They facilitate understanding of knowledge when there is a large amount of information to work with, in a given limited time Lee and Schallert (1997). There are various functions of graphic organizers. In reading comprehension, they assist learners to clarify and organize information into categories (main idea, supporting details, topic sentence, facts opinion, etc), organize information in a paragraph for better understanding, construct meaning of difficult words and sentence dividing into lexis, understand the context by associating with prior knowledge and identify conceptual and perceptual errors that may occur in the course of reading a passage.

Graphic organizers have been classified into five major categories according to their structures: star web, chart matrix, tree map, chain, and sketch. Graphic organizers have also been classified into eight categories according to their purposes for learning. The eight categories of graphic organizer are KWL chart, history frames, word map, zooming in and zooming out – concepts, zooming in and zooming out-people, Inquiry chart, venn diagram, column notes. KWL charts can be used as a teacher-led activity to introduce a new topic at any grade level. A history frame allows students to look at historical events and break the information down to understand its significance, the people and places involved and any other pertinent information. A word map helps students analyze a new or complex vocabulary word from many different angles. Zooming in and out-concept graphic organizer allows students to delve deeper into a more complex concept. There is a box in the middle of the page for the concept; then there are five other boxes branching out from the middle, and zooming in and out organizer is similar to the one for concepts, but focuses on people instead. The center box is for the name of a person and the surrounding boxes include spaces for the most and least important information, similar people, related events, surprising facts and a summary statement. An inquiry chart or I-chart is a way to organize information obtained during research. It contains four columns across the top, each for a different question. A Venn diagram is used to compare two ideas, events or people. It contains two overlapping circles. A column notes organizer is simple to set up and versatile in its applications. To organize notes, all a student needs to do is divide a piece of paper into two sections, each with its own heading (Jiang, 2007).

REVIEW OF LITERATURE

It is a well-accepted fact that reading is of utmost importance. In our modern world, where we are inundated by print, being a good reader is a prerequisite to deal with large amounts of

information that is made available to us. In short, possessing reading skills is a means of survival. However, being a skilled L1 reader is not enough to be an active and successful participant of society. If one is to pursue a career and achieve advancement, L2 reading skills constitute a significant challenge. Therefore, a very large percentage of people around the world are encouraged to learn to read a second language as students in formal academic settings. Most school systems around the world demand that their students learn English because it is a global language that could guarantee the capacity for economical and professional competition (Grabe, 2009).

Reading has varying definitions and interpretations in the literature. Aebbersold and Field (1997) define reading as “what happens when people look at a text and assign meaning to the written symbols in that text” (p. 15). Grabe and Stoller (2002) add one more component into this definition. In their interpretation, reading comes forward as “the ability to draw meaning from the printed page and interpret the information appropriately” (p. 9). However, these definitions fail to reflect the complex nature of reading. A more comprehensive viewpoint is necessary if we are to fully define what reading is. Grabe (2009) claims that in order to appropriately define what reading is, one needs to clarify the characteristics of reading by fluent readers. Under the umbrella of his interpretation, the true definition of reading comprises some salient characteristics which could be observed in the act of reading performed by fluent readers. Firstly, reading is a rapid and efficient process which aims at comprehending; that is, understanding what the writer has intended to convey in writing. Reading is also interactive in the sense that it is an interaction between the writer and the reader. Another feature of reading is its strategic nature because a reader has to employ a number of skills and processes to anticipate text information, select key information, and organize and mentally summarize information. Reading is at the same time a flexible process. A fluent reader adjusts his or her reading processes and goals to the shifting purposes and interests in reading. The evaluative quality of reading stems from the fact that it is combined with readers’ attitudes and emotional responses to the text as well as a strong set of inferencing processes and the use of background knowledge. Apart from the aforementioned qualities, reading is inherently a linguistic process because the processing of linguistic information is central to reading comprehension. Finally, all reading activity is a learning process in one sense or another.

According Grabe and Stoller (2002), in order to gain a comprehensive understanding of reading, it is important to dwell on the nature of reading. When people read, they read for a purpose and this purpose is usually determined by the genre of what they are reading. To exemplify, people do not read newspapers in the same way they read research articles. They highlight seven purposes for reading, which include reading to search for simple information, reading to skim quickly, reading to learn from texts, reading to integrate information, reading to write, reading to critique texts and reading for general comprehension. Good readers of a language activate two kinds of processes while reading. These are lower-level and higher-level processes. While the lower-level processes are more automatic linguistic processes and are typically seen as skills-directed, the higher-level processes generally require comprehension processes that make use of the reader’s background knowledge and inferencing skills (Grabe & Stoller, 2002).

Lower-level processes include lexical access, syntactic parsing, semantic proposition formation and memory activation. In lexical access, the reader focuses on a word and recognizes its meaning in an automatic way. If the ultimate aim in reading is to achieve comprehension, then the importance of word recognition cannot be underestimated. Grabe and Stoller (2002) use a metaphor to explain the relation between word recognition and reading comprehension. Word recognition is “like the gasoline of the car which is made up of reading comprehension skills” (Grabe & Stoller, 2002, p. 22). Syntactic parsing makes it possible for the readers of a language to clarify the meanings of words that have different meanings in different contexts. Readers combine words in order to derive basic grammatical information and support clause-level meaning. Semantic proposition is the task of putting together word meanings and structural information in order to form basic clause-level meanings (Grabe & Stoller, 2002). When the aforementioned processes are operating well, they work together effortlessly in working memory, which is best understood as “the network of information and related processes that are being used at a given moment” (Grabe & Stoller, 2002, p. 24). Grabe and Stoller (2002) liken the working memory to the “engine of the car which is called reading comprehension” (p. 25).

Higher-level processes related to reading include the text model of comprehension, the situation model of reader interpretation, background knowledge use, and inferencing and executive control processes. One of the salient higher-level processes is the text model of reading comprehension. During the processing of text information, the reader starts to see the ideas that are repeatedly used and that facilitate useful linkages to other information as the main ideas of the text. In short, the text model amounts to an internal summary of the ideas present in a text. In this model of comprehension, attempts are made by the reader to link the main idea from the first sentence to the one emerging in the second one, while the less important ideas get “pruned off” in the process (Grabe & Stoller, 2002, p. 26). However, in the situation model of reading comprehension, the reader interprets the information from the text in terms of his or her own goals, feelings and background expectations. Both the background knowledge and inferring skills of the reader have important functions in this interpretation process. Readers are likely to be misguided in cases where they interpret the text wrongly, have insufficient background knowledge or draw wrong inferences. Executive control processing represents the way in which the readers of a language assess their understanding of a text and evaluate their success, so it can be argued that, as readers, how well we comprehend a text depends on an executive control processor (Grabe & Stoller, 2002).

Models of the Reading Process

The literature suggests that three reading comprehension models have been influential in reading research: bottom-up, top-down and interactive (Celce-Murcia & Olshtain, 2004; Grabe & Stoller, 2002; Nunan, 1999; Nuttall, 1996). Different cognitive processes are emphasized in these models. In the bottom-up model, the reader deals with letters, words and then sentences in an orderly fashion. If the idea is taken to an extreme, the reader can be thought of as processing “each word letter-by-letter, each sentence word-by-word and each text sentence-by-sentence” (Grabe & Stoller, 2002 p. 32). In this model, there is little influence from the reader’s background knowledge. Overreliance on text-based or bottom-up processing is referred to as “text-based processing” or “text-boundedness” (Carrell, 1996, p. 102). As a result of this text-boundedness,

readers may remember only isolated facts without integrating them into a cohesive understanding, which in turn brings the drawback of focusing on trees rather than paying attention to the whole forest (Nunan, 1999; Nuttall, 1996). This model has been criticized from the perspective that it underestimates readers' ability to think and the effects of background knowledge on the reading process (Grabe & Stoller, 2002).

Whereas the bottom-up model emphasizes lower-level processing at the textual level, the top-down model of reading is concerned with higher-level processing. In this model, the reader relies on his intelligence and experience while using the text data to confirm or deny the hypotheses he or she brings to the text (Celce-Murcia & Olshtain, 2004). According to Nuttall (1996), a reader using top-down processing assumes an eagle's eye view of the text so it can be claimed that it is useful in order to understand the overall meaning of the text. Not only does the reader's background knowledge about the content area of the text play a significant role in this top-down view of reading but also the rhetorical structures of the text are to be considered as important. It can be argued that there is a clear distinction between the bottom-up and top-down models of reading. In the former, the reader processes the text word for word, accepting the author as the authority, while in the latter the reader puts a previously formed plan into practice and has the option of omitting parts of the text which seem to be irrelevant to his or her purpose in the reading process. The top-down view of reading, also known as Goodman's model or the reader-driven model, has also been criticized by some researchers on the grounds that what a reader can learn from a text is questionable if the reader must first have expectations about all the information in the text. As a result, few reading researchers support strong top-down views.

The literature review showed that graphic organizers used across several content areas (science, social studies, mathematics, Spanish as a second language, vocabulary, reading, and writing), multiple grade levels (first through senior high school), and different student populations (regular education students and students with learning disabilities). Thus in the 29 experimental and quasi-experimental SBR studies cited throughout this chapter. All of the studies included in this review have shown that using graphic organizers led to improved student performance as measured by various forms of assessments (classroom-based, observation, textbook, and standardized).

Graphic organizers also have been found to result in superior student performance when compared with more traditional forms of instruction (e.g., lecture, linear note taking, question/answering). SBR supports the use of graphic organizers at the upper elementary and middle level grades (sixth through eighth) (Alvermann & Boothby, 1986). Some SBR (Brookbank, Grover, Kullberg & Strawser, 1999) also exists to support the use of graphic organizers in the lower elementary grades (kindergarten through third). Positive results have been shown with secondary grade level (ninth through twelfth) students as well (Doyle, 1999). For the special population of students with learning disabilities, graphic organizers have been used with success (Boyle & Weishaar, 1997). Students with learning disabilities typically have difficulty comprehending content area texts and lack reading comprehension skills (Scanlon *et al.*, 1992). Graphic organizers have been found to be effective tools for helping these students organize information and make connections with existing schemas. As a result, for the students with learning disabilities studied, comprehension and recall of information was enhanced.

RESEARCH QUESTION

This study will investigate the following research questions:

Do discourse structure-based graphic organizers affect students' reading comprehension?

METHODOLOGY

Participants

The study was conducted in Oxford Language Institute in Ahwaz. The participants of the study were 50 learners at pre-intermediate level and with age ranging from 13 to 16 years old. They were selected out of the research population ($n=90$) after administering a teacher-made homogeneity test. Fifty learners who got the scores within one standard deviation (SD) below and one (SD) above the mean were selected as the participants of the study. Then they were randomly divided in two experimental and control groups through systematic random sampling.

Instrumentation

In this study, two tests were used including the homogeneity test was used as the pre-test to determine the learners' level of reading comprehension of selected texts at the beginning of research period and a post-test to determine the effect of discourse structure-based graphic organizers on students' reading comprehension of selected texts. The reliability of the tests were calculated through KR-21 formula as ($r=.720$, and $r=.798$ respectively).

Materials

The materials used in this study were four reading texts (School on Water, Marital Art, Pet Heros, and Old San Juan) that were chosen from a reading text book, Connect (Jack C. Richards, 2009). While selecting the reading passages, the researcher made an effort to create a combination of texts that had different discourse structures as the aim was to expose the students to as many discourse patterns as possible during the course of the study. The text structures of the four reading passages that were used in the study included *description*, *definition*, *sequence*, *procedure*, *cause-effect*, *classification*, and various graphic organizers that reflected the discourse structures of these texts, a homogeneity test, that was used as the pre-test and a post-test were administered.

Procedure

As mentioned previously, the text structures of the four reading passages that were used in the study included *description*, *definition*, *sequence*, *procedure*, *cause-effect*, *classification*. In each text, two or three of these structures were nested within one another. The researcher developed graphic organizers that directly reflected the discourse structures of the selected texts. In order to understand whether these graphic organizers were appropriately designed, the opinions of five teachers were sought. They all agreed on the appropriateness of the graphic organizers developed by the researcher. In order to test the practicality of the graphic organizers, four reading teachers from the pre-intermediate level were asked to sit down and complete the graphic organizers with the texts; they all successfully completed the graphic organizers.

Before the experiment started, the participant teacher had tried to make the students familiar with the procedure of the study by using several samples of text structure-based graphic organizers for some texts in their course books and by asking the students to fill them in. Both the selection of the texts and the development of the related graphic organizers were done by the researcher. The participants of the study participated in both the graphic organizers and the conventional treatments, so it can be claimed that they acted as their own experimental and control groups. After the preparation sessions, in the first week of the experiment, a homogeneity test, that was used as pre-test was administered. The test included 20 open -ended questions extracted from the reading texts, the test material was designed based on the scope of the study. It was made up of 4 passages, totaling 20 questions which can be classified into four types of reading questions: (1) Identifying the main idea, (2) finding the supporting details, (3) understanding vocabulary and (4) making inferences. Out of 20 questions, there were 8 main idea questions, 4 supporting detail questions, 4 vocabulary questions and 4 inference questions. Each question was worth 1 mark and the sum total of the test was 20, students answered these questions during 90minutes. The learners who got the scores within one standard deviation below and above the mean were accepted as the participants of the study. Then two experimental and control groups were selected through systematic random sampling. During 10 sessions of instruction, 90 minutes each, the texts were worked.

In the experimental group at the beginning of the instruction, the researcher familiarized the students with what graphic organizers are and how to use them effectively while reading a text. The students were also trained to use different organizers for different types of passages. The students learned a variety of existing graphic organizers and they also started creating their own organizers. In the following 10 sessions the participants in the experimental group structured their own graphic organizers for reading texts studied in the class hour and presented them to their classmates in groups. Some of the graphic organizers were also presented by the students to the whole class by drawing on the board. Then, reading comprehension questions were answered by the participants and checked by the instructor. The instruction material and content provided for both the experimental and control groups were the same but the control group was not exposed to the use of graphic organizers and implementing the same in reading process. The control group adopted conventional methods where students were made to read the passage again and again to understand the content and answer the comprehension questions. They were able to understand the meaning conveyed in the paragraph or passage but they could not classify a paragraph into main idea, topic sentence, supporting details, etc. In the final session, after 10 sessions of treatment, a post-test was administered, pre-test was modified for the post- test. It was 20 open-ended questions from reading texts for each group. They replied those questions during 90minutes. The reliability of the tests were calculated through KR-21 formula Then the data was statistically analyzed.

Data Analysis

In this study, data were collected through the administration of post-tests. In the analysis of this quantitative data, the Statistical Package for Social Sciences (SPSS) version 17 was used. In order to examine the effects of the discourse structure-based graphic organizers on students' reading comprehension, parametric statistical methods were used for the analysis as the data were

normally distributed. Independent and Paired Samples t-test were conducted in order to explore how the discourse structure-based graphic organizer treatment affected the participant students' comprehension of each text as well as the students' overall reading performance in the study.

RESULTS AND DISCUSSION

This study discusses the effect of using graphic organizers on the EFL learners' scores derived from different types of comprehension questions. Paired and Independent Sample t-tests were performed to evaluate the impact of the two instructional approaches – using graphic organizer and the conventional comprehension method on all participants' answers to comprehension questions. Before administering the pre-test, it was important for the researcher to examine whether the proficiency level of the students in both the experimental and controlled groups were the same or different. In the first session of the experiment, a pre-test was given to all the participants in the two groups. Table 1 shows the descriptive statistics in the pre-test.

Table 1: Descriptive Statistics (Pre-test)

Groups	N	Mean	Std. Deviation	Std. Error Mean
Experimental	25	14.28	2.606	.521
Control	25	13.84	2.478	.496

The means presented in Table 1 showed that the mean of experimental (M=14.28) and control (M=13.84) groups were same. The results of the pre-test also proved that the comprehension skills of both the groups were at the same level. The results of the pre-test were illustrated in Table 2.

Table 2: Independent Samples t-Test (Pre-test, Experimental vs. Control)

t-test for Equality of Means							
						95% Interval of the Difference	Confidence of the
	t	df	Sig. (2- tailed)	Mean Differe nce	Std. Error Differe nce	Lower	Upper
Pre-test, Experimental vs. Control	.612	48	.544	.440	.719	-1.006	1.886

The mean scores of the experimental and control groups were compared by using an Independent Samples t-test. Since the observed t (.612) was less than the critical t (2.064) with $df = 48$, the differences between the groups' pre-tests were not significant. Table 3 shows the results on the post-test.

Table 3: Descriptive Statistics (Post-test, Experimental vs. Control)

Groups	N	Mean	Std. Deviation	Std. Error Mean
Experimental	25	16.7600	2.61852	.52370
Control	25	14.7200	2.20832	.44166

The means presented in Table 4.3 showed that the experimental group received higher scores on the post-test than the control group. The graphic organizer group performed significantly better than the control group. Thus, it could be claimed that the graphic organizer group outperformed the control group. The mean scores of the experimental and control groups were compared the difference by using an Independent Samples t-test in Table 4.

Table 4: Independent Samples t-Test (Post-test, Experimental vs. Control)

t-test for Equality of Means							
	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
						Lower	Upper
Equal variances assumed	2.97	48	.005	2.04	.685	.662	3.41

Since the observed t (2.978) was greater than the critical t (2.021) with df 48, the differences between the groups' post-tests were significant at the level of ($p < 0.05$) and the experimental group performed significantly better than the control group on the post-test. It was thought that it would be appropriate to make one single comparison by comparing pre and post- test scores of experimental group with pre and post- test scores obtained by the control group. The aim was to arrive at a final conclusion about the effectiveness of the graphic organizer treatment.

Discussion

The findings of the current study regarding the effects of discourse structure-based graphic organizers on students' reading comprehension of selected texts will be presented and discussed with reference to the literature. Then, the findings related to the differences between using graphic organizer and the conventional comprehension method will be presented and discussed. Suzuki (2006) supports the findings of the study and noted that graphic organizers might work well when students are required to find key points and note information in the text. Graphic organizers improve active processing and reorganization of information so it is recommended

that they should be exploited as a support or an alternative to note-taking and summarizing. The success of the experimental group could be explained from two perspectives on the basis of this information. While completing the graphic organizers, the students felt an urgent need to find the key points in the text so they had an opportunity to reorganize the information in the reading passage. The graphic organizer treatment caused the participant students in this study to perform significantly better on the post-tests.

The findings of the current study are also in line with the propositions of the Paivio (1991) Dual Coding Theory. The theory posits that enhanced processing of information can take place if linguistic input is presented with congruent visual input because this facilitates dual coding of information. Since the graphic organizers used in the present study included lines, arrows and spatial arrangement, the students had an opportunity to store the contents of the texts in the form of both verbal information and visual images. This might be one of the reasons that led to the higher scores in the post-tests given after the students had been involved in graphic organizer activities. A study carried out by Suzuki, Sato and Awazu (2008) found that the spatial graphic display enhanced EFL readers' comprehension of sentences more than the sentential display did. The results of the current study appear to support their finding.

The present study confirms the findings of Grabe and Jiang (2010) study; they propose a set of guidelines that teachers should pay utmost attention to while developing graphic organizers. According to Grabe and Jiang (2010), well-developed graphic organizers should highlight the most salient information in the text. One of the aims should be to reflect the macro level structure of the text as well as the local structure. Moreover, the teacher should be sensitive about making the interrelationships and patterns of organization in the text clear to the students. Apart from these, it is a necessity to present the content of the text in a way that is closest to the original while developing discourse structure-based graphic organizers. If the graphic organizers in question are partially completed, the teacher should make sure that they have effective clues for the blanks. If the texts and the related graphic organizers used in this study are scrutinized, it could be observed that the graphic organizers meet the criteria proposed by Grabe and Jiang (2010). This might have been one of the reasons that caused the experimental group to perform significantly better than the control group.

CONCLUSION

The quantitative data gathered from the students' performance which were administered at the end of each procedure during the ten sessions of treatment shed some light on the use of the discourse structure-based graphic organizers in reading comprehension. The post-test scores of the two groups for both the graphic organizer and the conventional performances were calculated and compared with each other to see the effects of the graphic organizer treatment. This comparison indicated that the learners performed better on post-tests when they completed discourse structure-based graphic organizers as a post-reading activity in comparison to those that took part in a conventional method. The success of the graphic organizer treatment was consistent across the four texts used in the study. This finding supports what the literature indicates about the use of graphic organizers in reading comprehension.

The present study also confirms the findings of previous studies (Carrell, 1984, 1985; Martinez, 2002; Wang & Cao, 2009) that have highlighted the link between drawing students' attention to discourse structures in texts and facilitating improved reading comprehension. Thus the use of text structure, as a tool, can facilitate EFL students' reading comprehension of a text written in English. It is concluded that when EFL readers were made to consciously focus on the discourse structure of a text, their performance in reading comprehension was positively affected and they were able to reproduce more ideas from the text in question. Similarly, in the current study, the experimental students were able to reproduce more macro and micro level ideas from the texts in the summaries they wrote after completing the discourse structure-oriented graphic organizers.

There is a need to conduct a study that explores whether the inclusion of discourse-structure based graphic organizers has any effect on students' reading comprehension skills would be enlightening. Finally, it would be interesting and informative to learn the results of experimental studies that explore the effectiveness of the graphic organizer treatment in improving language skills other than reading.

ABSTRACT

This paper aimed to examine how signals of verbal turn-takings and wait-time strategies enhance the quality of speeches and conversations regarding the choice of various turn-takings. Movie clips from the New Interchange course book 1 (Richards, 2011) were chosen and considered as the materials of the study. Sixty participants were selected based on the homogeneity test at the pre-intermediate level and then they were non-randomly divided into two control and experimental groups. The participants took a conversation exam as a pre-test and talk in pairs on various subjects. The pre-test scores were recorded at the beginning of treatment. During the treatment period, the experimental group received treatment of turn-taking and wait-time strategies through explaining theses conversation strategies in the classrooms. The control group received traditional method of teaching conversations including role playing, class activities on different topics and the New Interchange Students' book 1. Both groups received the same time and materials. The treatment lasted 10 sessions each 60 minutes to observe and collect data through recording the participants' conversations in the classrooms considering their uses of turn-taking and wait-time strategies. Finally, they took a post-test on the same subjects they had in the pre-test. The scoring of participants' utterances in turn-taking and wait-time was rated by two raters to arrive at inter-rater reliability indexes. The reliability of scoring was calculated through Pearson Correlation analysis. Independent and Paired Samples t-test were used to determine the differences between the two group oral performances in the pre and post-tests. Results showed that the experimental group significantly outperformed the control group in terms of using more turn-taking and wait-time strategies. Thus, this study suggests the explicit method of teaching turn-taking and wait-time strategies in teaching conversations and oral performances.

KEYWORDS: Turn-Taking, Wait time, English language classroom, Oral performances

INTRODUCTION

The concept of turn-taking covers a wide range of concern which it is not just a theoretical construction in the linguistic field of discourse analysis, but an important pattern in

communicative events, governing speech-acts and defining social roles as it establishes and maintains social relationships. One cue associated with turn-taking is that of wait time. Within turn-taking, wait time may cue the hearer to know that they have a turn to speak or make an utterance. Turn-taking is considered to play an essential role in structuring people's social interactions in terms of control and regulation of conversations. Therefore, the system of turn-taking has become object of analyses both for linguists and for sociologists. As a matter of fact, turn-taking refers to the process by which people in a conversation decide who is to speak next. It depends on both cultural factors and smart cues. Turn-taking is one of the basic mechanisms in conversation, and the convention of turn-taking varies between cultures and languages (Bakeman & Gnischi, 2005).

Rich turn-taking is an available feature of human- spoken dialogue. A *turn* is the essential factor within turn taking, which is attached to a speaker. Each speaker takes *turns* within conversation. A speaker is someone creating some sort of utterance or speech act directed towards an audience of one or more people. Very generally, turn-taking in linguistics can be defined as "the process through which the party doing the talk at the moment is changed, (Walsh, 2011). Thus, turn-taking has to do with the allocation and acquisition of turns i.e. how turns are exchanged in a talk or conversation (Brock & Hopson, 2008). Turn allocation is about giving turns to the next speaker(s), while turn acquisition describes how turns are received. In other words, turn acquisition determines the kind of action(s) the next speaker(s) can or should take when it is his/her turn.

Turn-taking is one of the basic mechanisms in conversation and the nature of turn taking is to promote and maintain talk. For smooth turn-taking, the knowledge of both the linguistic rules and the conversational rules of the target language is required. According to Bailey, Plunkett and Scarpa (1999), during a conversation, turn-taking may involve a cued gaze that prompts the listener that it is their turn or that the speaker is finished talking. There are two gazes that have been identified and associated with turn-taking. The two patterns associated with turn-taking are mutual-break and mutual-hold. Mutual-break is when there is a pause in the conversation and both participants use a momentary break with mutual gaze toward each other and then breaking the gaze, then continuing conversation again. This type is correlated with a perceived smoothness due to a decrease in the taking of turns. Mutual-hold is when the speaker also takes a pause in the conversation with mutual gaze, but then still holds the gaze as he/she starts to speak again (Brown, 1994).

Turn-taking as a pedagogical approach is at the core of teaching and learning in any subject. It comprises instructional and regulative components as it takes into account what kind of knowledge is to be exchanged and how it should be transmitted (Brockne, Desai & Oorro, 2001). Since common attitudes, beliefs, and values are reflected in the way language is used Conversational rules vary in different cultures and different languages. One of the essential observations of conversational analysis is that, when conversing, participants obviously change their roles of speaker and hearer, i.e., they take turns (Walsh, 2011).

In the second language class, interactions between teachers and students serve as the main point for learning how to use the language. After the teacher asks a question, students mentally process their answers (Auer, 1996). They hear the question, determine the sounds and recognize its meaning and begin to form an answer. How long does it take to answer a question? How long should a teacher wait for an answer? Does it take longer to answer a question in the target language than in English? These are some of the questions that this study investigates.

Wait-time—the pause for thinking after questions and answers refers to the process by which people in a conversation decide who is going to speak next. It depends on both cultural factors and smart cues. In fact, the participant as Ellis (1997) states, look at language learning as an outcome of participating in discourse, particularly face-to-face interaction. This interpersonal interaction is thought of as a fundamental requirement of second language acquisition (SLA) (Bangerter, Clark & Katz, 2004).

A more important nonverbal behavior is *wait-time*, which is considered as the pause between conversational turns. In reality, wait time marks when a conversational turn begins or ends. If a teacher asks a question, the wait time both allows and prompts students to formulate an appropriate response. Studies (e.g. Good & Brophy, 2002), of on classroom interaction generally show that wait times in most classes are remarkably short-less than one second. Unfortunately, wait times this short can actually interfere with most students' thinking; in one second, most students either cannot decide what to say or can only recall a simple, automatic fact (Tobin, 1987). Increasing wait times to several seconds has several desirable effects: students give longer, more elaborate responses, they express more complex ideas, and a wider range of students participate in discussion (Bortfeld, Leon, Bloom, Schober & Brennan, 2001).

As with eye contact, preferred wait times vary both among individuals and among groups of students, and the differences in expected wait times can sometimes lead to ashamed and difficult conversations (Luu, 2010). Though there are many exceptions, girls tend to prefer longer wait times than boys-perhaps contributing to an opinion that girls are unnecessarily shy or that boys are self-centered or without thinking. Students from some ethnic and cultural groups tend to prefer a much longer wait time than is typically available in a classroom, especially when English is the student's second language (Toth, 2004). When a teacher converses with a member of such a groups therefore what feel to the student like a respectful pause may seem like hesitation or resistance to the teacher. Yet other cultural groups actually prefer overlapping comments-a sort of negative wait time.

In these situations, one conversational partner will begin at exactly the same example as the previous speaker, or even before the speaker has finished (Chami-Sather & Kretschmer, 2005). The negative wait time is meant to signal lively interest in the conversation. A teacher who is used to a one-second gap between comments, however, may regard overlapping comments as rude interruptions, and may also have trouble getting chances to speak. Even though longer wait times are often preferable, therefore, they do not always work well with certain individuals or groups (Donato, 2000).

For teachers, the most widely useful advice is to match wait time to the students' preferences as closely as possible, regardless of whether these are slower or faster than what the teacher normally prefers. To the extent that a teacher and students can match each other's pace, they will communicate more comfortably and fully, and a larger proportion of students will participate in discussions and activities. As with eye contact, observing students' preferred wait-time is easier in situations that give students some degree of freedom about when and how to participate, such as open-ended discussions or informal conversations throughout the day (Ansarey, 2012).

In order to begin a conversation, participants must form a relationship, and to do this they must in some sense be of the same order. Any relationship must necessarily be based on partial equivalence. There is a need to establish a temporarily-shared reality among participants. Participants, to some degree, must agree upon a world-view, a cosmology. Common ground-a set of propositions which make up the contextual background for the utterances to follow-must be established.

Conversation is a type of discourse: it is spoken dialogic discourse. Thus, conversation analysis may be seen as a subfield of discourse analysis. Conversation analysis involves close examination of internal evidence within the (spoken) text. One type of conversation analysis is conversational ethno-methodology: Ethno-methodologists are primarily concerned with the tacit rules which regulate the taking-up by speakers of the running topic, and hence the change-over from speaker to speaker (Walsh, 2011).

The importance of conversation to our normative life is increasingly evident. Everything you do, say and present is a conversation or the opportunity for a conversation: what you say at a networking event, your website, your business card, your use (or misuse of social media), what you say at a meeting or event. All of these things are an opportunity to engage. Conversation is a form of interactive, spontaneous communication between two or more people who are following rules of politeness and ceremonies. It is polite give and take of subjects thought of by people talking with each other for company. A conversation works unpredictably for particular purposes since it is of a spontaneous nature (Walsh, 2011).

REVIEW OF LITERATURE

Turn-taking skills and learning how to wait are critical skills needed to develop cooperative play skills. Waiting is a required in life including waiting in line, waiting to get someone's attention, waiting while someone else is talking, waiting for a turn during play (Goodwin, 1981). As boring as it is, taking turns and knowing how to wait goes a long way. Turn taking for language refers to the back and forth interaction whether it is with gestures, signs, sounds, or words. Because conversations need to be organized, there are rules or principles for establishing who talks and then who talks next. This process is called turn-taking. Turn taking skills and learning how to wait are critical skills needed to develop cooperative play skills.

Turn-taking is usually considered to follow a simple set of rules, enacted through a perhaps more complicated system of signals. The most significant aspect of the turn-taking process is that, in

most cases, it proceeds in a very smooth fashion (Auer, 1996). Speakers signal to each other that they wish to either yield or take the turn through syntactic, pragmatic, and prosodic means. The organization of turn-taking provides "an intrinsic motivation for listening." As any given listener might be selected to speak next, s/he must cope with responding to the previous utterances. Bickmore and Cassell (2005) observed a number of characteristics in conversation, among them: Variable turn order and size; variable distribution of turns; overlapping is common, but brief; and overlapping is promptly repaired (when two parties find themselves speaking at the same time, one of them will stop). Given these characteristics, it is obvious, according to Sacks et al., that turn-allocation techniques are being used. The current speaker may select a different next speaker, or either party may self-select (Luu, 2010).

This paper is concerned with those turn-allocation techniques that are "obviously" present. In summary, turn-taking consists of a set of rules, which are enacted through the use of signals (Duncan, 1972, 1973). Goffman (1981) refers to a turn at talk as an opportunity to hold the floor, not what is said while holding it. Though most researchers use the terms turn and floor interchangeably, Edelsky (1981) maintains that the concept of floor correlates with "the acknowledged what's-going-on within a psychological time/space" (p. 209). A floor may therefore consist of several turns, just as it is possible to take a turn without having the floor. A person may even continue to control the floor while s/he is not talking. Although turn-taking mechanisms seem to be universal, they are subject to cultural variation. Fox, Jean and Schrock(2002) also consider turn-taking as a complex process, possible through the interaction of both phonological and syntactic cues.

Turn-taking is usually considered to follow a simple set of rules, designed through a perhaps more complicated system of signals. The most significant aspect of the turn-taking process is that, in most cases, it proceeds in a very smooth fashion. Speakers signal to each other that they wish to either yield or take the turn through syntactic, pragmatic, and prosodic means. Goodwin (1981), reporting on a comparison by Good and Brophy (2002), proposes that everyday conversation is resembled to short-wave radio as to how the turn-taking is performed. The speaker provides an end-of-message signal, after which the hearer holds the channel, bringing about a change in the speaker/hearer roles.

The difference between the two types of interaction is that, in a normal conversation, speakers benefit themselves of other means or mechanisms to provide that end-of-message signal. BickmoreandCassell (2005) observed a number of characteristics in conversation, among them: Variable turn order and size; variable distribution of turns; overlapping is common, but brief; and overlapping is promptly repaired (i.e., when two parties find themselves speaking at the same time, one of them will stop). Given these characteristics, it is obvious, according to Sacks et al., that turn-allocation techniques are being used. The current speaker may select a different next speaker, or either party may self-select. .

Bikmore et al. (2005) propose a set of rules that apply at each transition-relevance place, that is, at the point where a next turn can be expected. In each transition relevance place, choices are presented to both speaker and hearer(s) as to who is to utter the next turn-

constructional unit. However, Sacks and his colleagues did not explain the signals employed in communicating such choices. Their rules only specify that, at any given transition-relevance place, the turn-so-far might be “so constructed” as to involve, or not to involve, the use of speaker self-selection. In summary, turn-taking consists of a set of rules, which are enacted through the use of signals.

What is a Turn?

A turn is different from the situation where a speaker produces backchannel signals (Walsh, 2011). Backchannel signals, such as uh-huh, right, yeah, etc., are signals that the channel is still open, and they indicate at the same time that the listener does not want to take the floor. Duncan (1972) also establishes a distinction between simultaneous turn and simultaneoustalking. Instances of the first involve true overlapping, whereas instances of simultaneous talking do not always imply that the current hearer intends to take the turn; they might just be the result of backchannel signals overlapping with the current speaker’s turn. According to Edelsky (1981), turn definitions can be grouped in two main camps: Mechanical and interactional (Fouche, 2005). Goffman (1981) says that a turn is the opportunity to hold the floor, not necessarily what is said while holding it. On the other hand, interactional definitions are concerned with what happens during the interaction, and take into consideration the intention of the turn taker. Edelsky (1981) points out that speakers are more concerned with completing topics than structural units. Therefore, she defines turn as instances of on-record speaking, with the intention of conveying a message.

Speaking Skill

"Speaking" is the delivery of language through the mouth. To speak, we create sounds using many parts of our body, including the lungs, vocal tract, vocal chords, tongue, teeth and lips Groepe (2009). When we learn our own (native) language, learning to speak comes before learning to write. In fact, we learn to speak almost automatically. It is natural. But somebody must teach us to write. It is not natural. In one sense, speaking is the "real" language and writing is only a representation of speaking. However, for centuries, people have regarded writing as superior to speaking. It has a higher "status". This is perhaps because in the past almost everybody could speak but only a few people could write.

Modern influences are changing the relative status of speaking and writing. Speaking is a communication skill that enables a person to verbalize thoughts and ideas (Donato, 2000). There are two instances when such a skill is required and these are: interactive and semi-interactive. In the first instance (interactive), this would involve conversations with another person or group of persons whether face-to-face or over the phone, wherein there is an exchange of communication between two or more people. In the second instance, semi-interactive happens when there is a speaker and an audience such as in the case of delivering a speech, wherein the speaker usually does all the talking, while the audience listens and analyzes the message, expressions, and body language of the speaker. Every single day, we are given opportunities to speak (Ansarey, 2012).

At home, the interaction with family members and neighbors and ask driving directions from passersby. We converse with the waitress at the local pub. At work, talk to colleagues and

superiors and in addition discuss business issues and concerns during business meetings (Bortfeld, Leon, Bloom, Schober&Brennan, 2001). People with less average communication skills, particularly speaking skills, may have difficulty in gatherings, including social, personal, or business-related. The speaker does not know how to put his thoughts and ideas into words or he simply does not have enough confidence to speak in the presence of other people. Regardless of what may be the reason for this, it leads to one thing: ineffective communication. And a person who cannot communicate effectively would find it difficult to strike a good impression on others, especially on their superiors (Ansarey, 2012).

RESEARCH QUESTIONS

With regard to the intended contents of the ongoing research the following research questions are raised:

RQ1. Can wait-time strategies improve Iranian pre-intermediate learners' speaking skills in conversations?

RQ2. Do turn-taking strategies affect Iranian pre-intermediate learners' speaking skills in conversations?

METHODOLOGY

Participants

In the present study, the population was 90 male students who studied English as a foreign language in Danesh institution in Dezful, Iran. Non-random sampling method was used for the selection of these participants. They took part in a homogeneity test based on Oxford Placement test at the pre-intermediate level to homogenize the participants. Then sixty students whose scores were one standard deviation above and one standard deviation below the mean were chosen as the participants of the present study. The level of the placement test was designed for pre-intermediate learners. They were non-randomly divided into two groups, one experimental and one control. Each group included thirty participants. Experimental group has benefited from turn-taking and wait- time in conversation while the control group used the traditional way of talking in the conversation sessions or role playing and they were exposed to turn-taking and wait-time strategies implicitly. The participants were within the age range of 15 to 17.

Instrumentation

In order to accomplish the objectives of the present study, the following instruments were employed:

The oxford placement test for the pre-intermediate learners was used to determine the homogeneity of the participants. This test featured 50 multiple choice-items covering vocabulary and grammar. The allocated time was sixty minutes to answer. Pre-test and post-test were designed by giving the learners the topics used in the course book and their conversation were recorded to test their wait-time and turn-taking strategies. Their presentations were rated by two raters to assess the inter-rater reliability index. The main sources of data collection for this

study were direct classroom observation and recording conversation between 2 or 3 minutes in each small group conversing related topics.

Materials

Interchange Book 1, fourth edition (Jack, C. Richards, 2011): It consists of ten units. The materials used in this study included reading and topics concerned with turn-taking and wait-time while students are interact together and proposed the topics and managed the conversations.

Procedure

To accomplish the purpose of the study, first 90 male were selected from Danesh institution in Dezful in district one, then a homogeneity test based on Oxford Placement Test: The pre-intermediate level was administered to the participants under study to determine their homogeneity and to divide the sample population into two groups. The two groups, 30 learners each, were selected non-randomly: one experimental and one control group. They met for one hour and a half, once a week.

In the first session of the course, a pre-test containing working on the given topics was administered to the participants before treatment in order to determine how well the participants know the wait-time and turn-taking strategies in performing oral performances before treatment. Then the conversations in pairs or peers were recorded and scored by two raters to estimate their inter-rater reliability of the scores. The Pearson Correlation Analysis was used to calculate the reliability index as ($r=.685$). The treatment was based on the actual lesson instructions and technical terms on the topics regarding turn-taking and wait-time in the sessions. In each session, the first hour was allotted to lesson instruction and the rest to explain and teaching the turn-taking and wait-time in the experimental group. The same procedure was used in the control group but the turn-taking and wait-time strategies were taught implicitly. The whole research took place in language institution classroom circumstance. To motivate and encourage the participants to pay enough attention and to play more active role in the research program, they were told that the purpose of the extra instruction was to improve their quality in conversation and how got the meaning of the partner intention through wait time while their conversation.

The entire research project took place in ten sessions. In the experimental group, 10 topics were chosen regarding to conversation with change of the roles between teacher and participants or between the participants. During four sessions of instruction, 90 minutes each, 60 minutes were allocated to main performances and the 30 minutes of the time dealt with discussion on the turn-taking and wait-time through showing some clips within the book. The experimental groups were considering turn-taking and wait time and while the other one were in a traditional way and ordinary conversation in which the above strategies were taught without awareness in an implicit method. In order to teach and investigate on the effect of the turn-taking and wait-time in the experimental classes, the following phases were carried out:

In the first session, first of all, it was supposed to teach main lesson and then describe and explain about turn-taking and wait-time as clarification the point and get the student familiar to turn-taking and wait time and how they should get turn to answer the questions and in their

conversations through showing some clips within the book and clarify some signals and cues which showed as turn-taking and wait-time signals.

In each session, after reading the passage, the teacher presented the students with the challenging turn-taking and wait time to ask questions and answers of the students and also in their conversation together. When the teacher is the current speaker, then firstly the teacher can nominate a student to be the next speaker. If the teacher does not nominate the next speaker, then the teacher must continue the turn. If a student is the current speaker then they select the next speaker and the teacher takes the turn. If the student does not select the next speaker then anyone can self-select as next speaker, with the teacher taking the turn if they self-select. If the teacher or another learner does not self-select then the student continues the turn.

The students were asked individually to come the board and interact with teacher based on considering the turn-taking and wait time and also in pairs between students as show the point and clarify the turn-taking and wait time by changing the role speaker and hearer directly and tangible as sample to other students until the time let us. After during forth session and continue that way, it was tried to record some conversation actually some clips with high quality by using camera and video-tape from forth session to last session and finally were tried to transcribe them on paper. After recording some clips as sources to assess the performances, the topics were discussed.

The control group receives the same strategies implicitly and was taught in traditional and ordinary conversation. The participants in the control group conversed with no turn taking or wait time strategy in the classroom interactions and conversation, whereas the experimental group got benefit of turn-taking and wait time while talking to each other in the form of conversation. In reality, the basic aim behind the study was exploring the impact of turn taking and wait time upon conversation enhancement and satisfaction from what has been spoken as a concluding remark.

These conversations on the post-test were recorded in each group and rated by two raters to estimate the inter-rater correlation (i.e. Pearson correlation analysis). The pre-test reliability index for the post-test was ($r=.808$) which showed appropriate scoring. Both the pre-test and the post-test were performed as part of the classroom evaluation activities under the supervision of the instructor. Having data collected, the researcher processed the data using the statistical package for social sciences (version 17). Independent Samples t-test was used to determine the differences between the two groups' pre and post-tests.

RESULTS AND DISCUSSION

Results of the Pre-test

At the beginning of the study, two groups were given a pre-test which their statistical data is presented in Table 1.

Table 1: Descriptive Statistics (Pre-test , Experimental vs. Control)

Tests	N	Mean	Std. Deviation	Std. Error Mean
Pre-test Experimental	30	51.266	24.586	4.488
Pre-test Control	30	48.900	13.717	2.504

As can be seen in Table 1, the number of the students in the two groups is 30. Initially, each student's pre-test score on the proficiency test was obtained. Then descriptive statistics of mean and standard deviation of each groups, were calculated. Results indicated that the average means for two groups was near to each other. Regarding the standard deviation (SD), it was found out that the SD of the experimental group was 24.586 to compare the SD of control group that was 13.717. In order to find out whether the difference among the performances of the two groups was statistically significant, Independent Sample t- test for the two groups was applied.

Table 2: Independent Samples Test (Pre-test, Experimental vs. Control)

t-test for Equality of Means							
Pre-test Experimental vs. Pre-test Control	t	df	Sig. (2- tailed)	Mean Differen ce	Std. Error Differen ce	95% Confidence Interval of the Difference Lower	Upper
Equal variances assumed	.460	58	.647	2.366	5.140	-7.922	12.655
Equal variances not assumed	.460	45.45	.647	2.366	5.140	-7.983	12.716

Since the observed t (.460) is less than the critical t (2.000) with df=58 the difference between the Pre-test of the groups is not significant. Thus the groups are homogeneous at the beginning of the study.

Results of the Post-test

Descriptive statistics of the post-tests' oral performance in the pre-test was calculated in the Table 3.

Table 3: Descriptive Statistics (Post-test , Experimental vs. Control)

Tests	N	Mean	Std. Deviation	Std. Error Mean
Post-test Experimental	30	70.000	13.838	2.526
Post-test Control	30	58.366	23.388	4.270

Table 3 shows the number of the students in two groups is 30. Initially, each student's post-test score on the proficiency test was obtained. Then descriptive statistics of mean and standard deviation of each group were calculated. Regarding the standard deviation (SD), it was found out

that the SD of experimental group was 13.838, and SD of the control group was 23.38. To estimate the exact difference between the post-tests of the two groups, Independent Sample t-test was run in Table 4.

Table 4: Independent Samples Test (Post-test, Experimental vs. Control)

t-test for Equality of Means							
Post-test Experimental vs. Post-test Control						95% Interval Difference	Confidence of the Upper
	t	df	Sig. (2- tailed)	Mean Differe nce	Std. Error Differen ce	Lower	
Equal variances assumed	2.345	58	.022	11.63	4.961	1.701	21.565
Equal variances not assumed	2.345	47.09	.023	11.63	4.961	1.652	21.614

Table 4 shows that the average means for two groups was not near to each other and the difference among the two groups is significant. Since the observed t (2.345) is greater than the critical t (2.000) with df=58 the difference between the Pre-test of the groups is significant. Thus the groups are homogeneous at the beginning of the study.

Discussion

Results of the study showed that the control and experimental groups were almost homogeneous based on the pre-test scores. To answer the research question, an Independent Sample t-test was conducted to find if there were any meaningful differences between the results of the experimental and control groups in the post-test. The analysis of covariance rejected the null hypothesis revealing a significant difference between turn taking and wait time users and nonusers. The main aim of learning a language is to use it in communication in its spoken or written forms. Classroom interaction is a key to reach that goal. It is the collaborative exchange of thoughts, feelings or ideas between two or more people, leading to a mutual effect on each other. Through interaction, students can increase their language store as they listen to or read authentic linguistic material, or even output of their fellow students in discussions, skits, joint problem-solving tasks, or dialogue journals. In interaction, students can use all they possess of the language-all they have learned or casually absorbed-in real life exchanges (Gass & Sellinker, 1994).

Therefore, in line with the above mentioned statements and the present study, it could be strongly argued that Turn taking and wait time activities strategy instruction can significantly influence EFL language learners' developing conversation. Simply, this study represents a preliminary effort to empirically examine the effect of Turn taking and wait time upon Iranian institution in Dezful city. Further researches are needed for a thorough understanding of this issue and for the confirmation of its findings. This is especially true when conducting research with more variables than those in the present study. It is also recommended that this study be replicated with a larger

number of participants and over the whole semester or the whole year. In addition, it would be interesting to compare results across levels of proficiency as well as gender.

The results of this study are matched with Brown (1994) who emphasize the importance of interaction among human beings and using language in various contexts to “negotiate” meaning, or simply stated, to get one idea out of your head and into the head of another person and vice versa.

The results showed that there was not a significance difference among students’ performance in pre-test, but in contrast there was a significant difference among the performances of the two groups in the post-test. Thus, it could be observed that students who received turn-taking and wait-time strategy instruction got better marks and their performance was better than another group. By looking at the groups’ means the results of post-test by Independent Sample t-test revealed that experimental group had the greatest improvement in their scores based on their conversations. The learners of experimental group after ten sessions outperformed the other groups. Therefore, the second research null hypothesis was rejected. The reasons behind this result could be discussed in terms of the effectiveness of turn-taking and wait-time on the quality of conversation in classroom interaction. Results showed a significant difference with between the experimental and control group. The above mentioned reasons might be the explanation of why the experimental group did better than the control group. The fact that experimental group outperformed the control group indicates that use of turn-taking and wait-time strategy in conversation let the students to think more and more about utterances and lead to mutual understanding and also give and ask opinion to be qualified the conversation.

The present study raised a number of questions requiring further research in the area of wait-time and turn-taking and its influence on conversation development. First of all, it is of importance to confirm more normative data with typically developing learners for wait time and turn taking. Similar research in respect of this trend might be valuable, especially with respect to interference programs in conversation classes. Turn-taking as pedagogical strategy which has shown turn-taking is a complex process which is influenced by various factors including classroom power relation and enhances the quality of conversation between students. The similar research which confirms this study is Turn-taking in the classroom which was conducted by Bakeman and Gnischi (2005) at University of Rome, Italy which has shown turn-taking could identify interactive patterns characterizing teachers’ strategies which could contribute to a mutual and better understanding of the teaching-learning process.

Furthermore, it is important to determine whether similar results in terms of wait time and turn taking trends would be found when studying a larger plenty of participants. It would also be beneficial to study samples outside of Iran to determine if the same outcome applies not only for non native English speaking learners but also to children speaking British, Australian and American English or languages other than English. Moreover, wait time and turn taking trends regarding conversation require further investigations. Although a positive correlation with conversation was observed in the current study. Future findings might contribute to a better

understanding of the fact that some students benefit more from interference programs and, therefore, show better treatment outcomes than others.

CONCLUSION

The results showed that turn-taking and wait-time had a significant impact on experimental group performance in conversation aspect. In simple terms, conversation improvement of Iranian EFL learners could be attributed to turn taking and wait time instruction. The results of the study also indicated that the members of the experimental group achieved better results in the conversation than their counterparts in the control group did.

In the course of this study many questions have risen some of which are included here with the hope that they will be pursued and investigated. It is strongly suggested that a research with the same characteristics of this study including more participants to be conducted in an attempt to find the obtained results. Similar studies can be done on other proficiency levels, namely intermediate, upper-intermediate and advanced. Variables other than the ones used in this study can help the investigation of the same issue. For instance, the same experiment with male or female learners within the same age range is necessary to confirm the result of this study. This study lasted for ten sessions. Successful studies can allocate more time to the instruction of turn-taking and wait time to improve conversation and understanding better.

This study like any other research has its own limitations. The sample size was slightly limiting. Although it was moderate, more participants from different socioeconomic backgrounds may have reflected more natural results and a larger plenty of participants would have provided greater validity to the findings of the study and in addition to take part male and female. For finding out more investigation with considering both male and female, due to distribution of participants was not possible and lead to working on just one gender.

ABSTRACT

The current English language teaching (ELT) is based on the communicative principle whose aim is not only the acquisition of language knowledge but mainly the acquisition of the reading comprehending and answering the standard tests easily and correctly. However, the present method through the article should not be overestimated because there should be always a balance between the acquisition and learning of foreign language knowledge and skills so that pupils could achieve corresponding communicative competences. Of course, it is necessary to mention that the present study compared the use of distinct test taking strategies by Iranian Experimental group and Control groups test takers while taking multiple choice reading comprehension tests. In addition, the reading language skill should be integrated in ELT classes, so that pupils could focus more on functional use of language. Therefore, the purpose of this article is firstly to evaluate the role of using strategies through the standard tests; secondly, to explain the importance of strategies for learning the language very well through the test and exam; and finally, to propose methodological approaches to the successful development of the reading comprehension and taking test like MCRT test. Finally, the present research determined that all participants have a tendency towards the use of test-taking strategies and both male and female participants act similarly in terms of the use of test-taking strategies while performing MCRTs.

KEYWORDS: Language Learner, Testing, Test-Strategies, Reading

INTRODUCTION

There are a number of limitations and delimitations which are imposed on this study. This research requires the use of limited number of items in MCRTs. The reason for this limitation is to give enough opportunity for the test takers to take the test and think about the processes used by them while taking the test. Generalizability of the findings is limited to upper-intermediate level since such findings have been achieved on the basis of upper-intermediate male and female test takers' participation. This study is also limited to and mostly applicable with the adult test takers owing to the fact that test takers should have intellectual growth for thinking about the thinking process.

For the sake of manageability of research, the researcher used a single dependent variable, i.e. gender variation, to test the types of strategies used by test takers in performing MCRTs. As it is discussed in the introduction, MCRTs can be used to assess learners' reading comprehension, writing skill, knowledge of grammar and knowledge of vocabulary. However, the researcher delimited this research to the use of multiple choice test of reading comprehension. The reason for choosing only one type of MCRTs lies in the nature of manageability of research at this level.

One of the fruitful ways of measuring learners' reading comprehension is to ask them to carefully and deeply read the text and then answer a number of multiple choice questions. Weir (1990) defines a multiple choice test item as the selection of a correct answer from a number of options. This process requires the individual tests takers to opt for the best answer from among other options. However, it is not a direct and precise issue to talk about reading the text and selecting the best choice. In the process of test taking, the test takers are always fully involved to choose the best answer. This participation not only necessitates the use of specific language knowledge but also active and conscious operation on the process of answering the items. These processes are assumed as test-taking strategies which are closely related to language use strategies. According to Cohen (1998), language use strategies are mental operations or processes that learners consciously select when accomplishing language tasks. The prominent objective of the present study is to investigate the types of strategies used by the two different genders while taking MCRTs. In fact, this study seeks an opportunity to study the strategies and processes in Iranian EFL test-taking context. Taking language tests must not be viewed as a product; rather, it is a process in which test takers undertake a number of mental operations. Gaining an understanding of the underlying operations and strategies will help the teacher (in the classroom assessment) and the test administration experts (in large-scale testing) to design proper MCIs with reference to the various genders.

LITRATURE REVIEW

Accuracy

There are a number of researches carried out on accuracy. One important research which has an important effect on language teaching is EFL learners' oral accuracy which has been studied by Farrokhi and Cherazad (2012). According to Farrokhi and Cheahrazad (2012), historical background for focus on form is so important; that is, the researcher should have information about that to make a new and acceptable study. As explained above, Farrokhi and Chehrazad believed that the popular position in language teaching has been that the teachers or syllabus designers' first task is to analyze the target language. Eventually, it is the learner's job to synthesize the parts for use in communication, which is why Wilkins (1976) called this the synthetic approach to syllabus design. Depending on the analyst's linguistic preferences, the L2 is broken down into words and grammar rules, and etc. and presented to the learners in a linear and additive fashion according to such criteria as frequency, or difficulty. According to Long and Robinson (1998), synthetic syllabi, together with the corresponding materials, methodology, and classroom pedagogy, leads to lessons with a focus on forms. Moreover, as it is mentioned in Long and Robinson (1998), —synthetic syllabi, methods, and classroom practices either ignore language learning processes or tacitly assume a discredited behaviorist model in a way that the

learner's role is to synthesize the pieces for use in communication (p. 17). In addition to these problems, there is no needs analysis to identify a particular learner's or group of learners' communicative needs.

Recognition that the traditional synthetic syllabi and teaching procedures were not working as they were supposed to, led teachers, syllabus designers, and SLA theorists, to advocate the abandonment of a focus on forms in the classroom in favor of an equally single-minded focus on meaning. To this end, Communicative language teaching (CLT) was initiated in an effort to shift away from a sole focus on forms evident in the earlier structural approaches towards a focus on meaning and language use. Inspired by a theory of communicative competence (Hymes, 1971), its primary concern was to develop the ability of learners to use the second language meaningfully and appropriately in real life communication. CLT is not a uniform approach, however. One can distinguish between a strong and a weak form of CLT (Howatt, 1984). According to Wilkins (1976), therefore, a weak form of CLT is synthetic in its approach, as it advocates the teaching of linguistic units in isolation without allowing learners to infer rules during the holistic use of language. Conversely, a strong form of CLT argues that —language is acquired through communication (Howatt, 1984, p. 279). The strong version, thus, reflects what Wilkins refers to as an analytic approach to teaching, i.e. an approach in which it is the learner's task to analyze and discover the language. For language educators (Ellis, 2003), Task-based language teaching represents a strong form of CLT. It views —tasks as a means of enabling learners to learn a language by experiencing how it is used in communication (Ellis, 2003, p. 28)

Focus on Form

As mentioned above, different ideas and hypotheses have been described and explained about focus on form. Some researchers who have presented different ideas and explanations about focus of form are Hymes (1971), Wilkins (1976), Long and Robinson (1998), Ellis (2003) and so on.

Hymes' idea about focus on form

Understanding that the traditional synthetic syllabi and teaching methods were not working as they were supposed to, led teachers, syllabus designers, and SLA theorists, to advocate the abandonment of a focus on forms in the classroom in favor of an equally single-minded focus on meaning. To this end, CLT was initiated in an effort to change from a sole focus on forms evident in the earlier structural approaches towards a focus on meaning and language use.

Wilkins' idea about focus on form

One of the important and necessary duties of language teachers and syllabus designers is to analyze the goal, second or foreign language (Wilkins, 1976). As Wilkins explained the L2 or foreign language should be broken down into words, grammar rules and so on. Then the broken parts should be presented to the language learners in a liner additive fashion according to such criteria as frequency, or difficulty (1976). Of course it is important to know that according to Wilkins (1976), a weak form of CLT is synthetic in its approach, as it advocates the teaching of linguistic units in isolation without allowing learners to infer rules during the holistic use of language.

Long and Robinson's about focus on form

Although a purely analytic, a meaning-based form of task based teaching was an important step forward from synthetic approaches, SLA research believes that, if native-like proficiency is the goal of training, such an approach will not suffice either. There is an ever-growing consensus among L2 researchers, investigators and second language trainers that, in order to be effective, task based syllabuses, and analytical approaches in general, need to be augmented, at least at times by some type of grammar instruction (Long & Robinson, 1998). This study was based on researches that describing those learners are to get native-like grammatical competence, despite even extensive contact with the target language (Long & Robinson, 1998).

Ellis's idea about focus on form

But it is important to have some information about Ellis's idea about focus on form. According to Ellis (2003), the great version, therefore, describes what Wilkins refers to as an analytic approach to teaching, i.e. an approach in which it is the learner's task to analyze and discover the language. For language educators (Ellis, 2003 as cited in Farrokhi & Chehrazad, 2012), task-based language teaching represents a strong form of CLT. It views tasks as a means of enabling learners to learn a language by experiencing how it is used in communication (Ellis, 2003, p. 28 as cited in Farrokhi & Chehrazad, 2012).

Schmidt's idea about focus on form

As Long (2000) explains, focus on form is largely motivated by, albeit not exclusively, by Schmidt's Noticing Hypothesis (Schmidt, 1990, 2001). This described hypothesis holds that noticing, a cognitive process that involves attending to the input learners receive, is inevitably a conscious process and is a necessary condition for second language learning. Schmidt (1990, 2001) has believed that attention and its subjective correlates noticing, i.e. registering formal features in the input, and noticing the gap, i.e. identifying how the input to which the learner is exposed differs from the output the learner is able to generate, are essential processes in L2 acquisition. Attention is generally considered a necessary condition for converting input into intake in the field of SLA (Schmidt, 1990, 2001 as cited in Farrokhi & Chehrazad, 2012; Smith, 1993). Gass (1990), for example, explains that nothing in the target language is available for intake into a learner's existing system unless it is consciously noticed (p.136).

According to Skehan and Foster (1999), these studies found no impact of task structure on the accuracy of performance. Although many researchers (Tavakoli and Skehan, 2005, Tavakoli, 2009) explained that task structure facilitates accuracy by devoting more important resources to it, Skehan and Foster (1999) found out that accuracy of the performance is affected by task structure when learners have the chance to engage in some kind of pre-task activity prior to task performance. So according to these studies, it can be concluded that task structure had no effect on the accuracy of the performance in the current study because the participants were not involved in any kind of pre-task activities before they performed the tasks. Accuracy was operationalized in terms of number of errors per a hundred words (Mehnert, 1998; Skehan, 1996; Sangarum 2005). It was gotten by dividing participants' total number of errors by the total number of words produced and multiplying the result by 100. All errors in syntax, morphology or

lexical choice were counted, including repetitions. Errors which were immediately self-corrected were not counted and errors in pronunciation were not included in the analysis.

Task-based language Teaching

As early as 1970s, (CLT) method became popular among second language acquisition (SLA) researchers and second language teachers (Skehan, 1996). According to Skehan (1996), Task-based language teaching (TBLT) is a realization of communicative language teaching. It is indeed the strong version of CLT, as tasks provide the foundation for an entire language program. Of course it is important to mention that Foster and Skehan (1999) found that there were some pre-mid- and post task activities that could be utilized to help language learners pay a balanced attention to both form and meaning simultaneously and improved the quality of learner language. As Ellis (2005) explained, planning is one of the task condition factors that affects second language production and has been of both theoretical importance to second language acquisition (SLA) researchers and of practical importance to language teachers. According to the importance of task planning factor in learners' task performance, there have been plenty of researches which have concentrated on the interaction of planning and task performance of language learners (Ellis, 1987; Foster & Skehan, 1996; Ortega, 1999; Robinson, 1995; Skehan & Foster, 1997, 1999; Yuan & Ellis, 2003; Mochizuki & Ortega, 2008).

Test Taking Strategies

In an informative article, titled *Strategies and Processes in Test Taking and SLA*, Cohen (1999) is concerned with how test-takers make use of strategies and processes while taking a test. In order to describe such processes, Cohen (1999) gives a definition of test-taking strategies and also introduces devices and methods of data collection. Finally, Cohen elaborates on the strategies for taking tests of reading and writing.

According to Cohen (1999), during the late 1970s, researchers felt a need to study the strategies students use in order to derive correct answer to class of items. This interest even increased in 1990s and language testing researchers related such studies to reliability and validity. It has been always assumed that a wrong answer to a question may not be traced to the participant's lack of proficiency, item inappropriateness but rather it may be the result of participant's inappropriate selection of test-taking strategies. Thus, strategy investigation attracted the attention of those working in the realm of SLA research tasks and instructional achievement testing approaches. Test-taking strategy is subservient to and an element of language use strategy. Thus, in order to explain test-taking strategies, one needs to have an understanding of language use strategies. Language use strategies are mental operations or processes that learners consciously select when accomplishing language tasks. This definition highlights some degree of consciousness and a matter of selection. Language use strategies constitute test-taking strategies when they are applied to tasks in language tests (Cohen, 1999). An important feature of test-taking strategies, as mentioned by Cohen (1999) is that strategies are context dependent; thus, different situations may require the use of various types of strategies. Besides, the frequency of strategy use varies from, context to context. Frequent use of test-taking strategies may be valued in some context. However, it may be inappropriate to use strategies in other contexts.

According to Cohen (1999), test-taking strategies can be identified and scrutinized using three different methods of data collection:

- Observation: observing what respondents do during the test.
- Designing items: designing specific items which elicit specific strategy use.
- Verbal reports: use of verbal reports while the items are being answered, immediately afterward, or sometime later.

The author of this article, Cohen (1999) provides detailed information on verbal reports. Cohen reports that verbal reports were used in first language research for the first time and were extended to SLA research afterwards. In fact, such reports help determine how respondents actually take tests of various kinds. Also, Cohen discussed two general testing formats, i.e. direct and indirect, in relation to strategy use. Indirect tests are tests that do not reflect real-world tasks. Such test types may encourage the use of strategies solely for the purpose of coping with the test format. Several researchers have studied the use of test-taking strategies while taking Multiple Choice Tests (MCT) as one type of indirect testing format (Mackay, 1974; Haney & Scott, 1987; Larson, 1981; Gordon, 1987 and Anderson et. al. 1991, all cited in Cohen, 1999). The general comment of the researchers working in this field was that participants may use different test taking strategies to arrive at answers; however, the efficiency is based on when the strategies are used and how effectively they are applied.

The aim of research in the case of Cloze Test is to see whether such a tests measure global reading skills as they are devised to do so. The research results suggest that Cloze Tests would suggest that such tests assess local-level reading more than they measure global reading ability. Furthermore, Cloze Tests are more likely to test for local-level reading when they are used in a foreign language test.

Direct tests resemble tasks of non-test condition or target language use. Three types of direct tests have been studied in relation to the test-taking strategies used. In the case of summarizing, respondents usually react to a set of perceived and real expectations on the part of the reader Cohen (1994), for example, claims that one strategy that test-takers use is to summarize by lifting material directly from the passage rather than restating it at higher level of abstraction. Like summarization, open-ended questions allow respondents to copy material directly from a text in their response. One strategy is to lift one material from immediate stimulus and use it as the answer. Another strategy is to introduce prepackaged, unanalyzed material and combine it with analyzed forms. Finally, Cohen (1999) studied composition as the third type of direct tests. The interpretation of essay topic is crucial and for this reason it is provided in a mini text. One strategy to succeed in writing compositions is to evaluate the nature of the task and its topic fully. Generally, an important consideration of the studies concerning test-taking strategies is to discuss the methods of elicitation. That is, tools which can be properly used to elicit the processes and operations selected by the test takers. Verbal report (Cohen, 1984, cited in Cohen 2006) is the primary research tool for this endeavor. He claims that verbal reports include data that reflect self-report, self-observation, and self-revelation. There are also two other ways of identifying test-taking strategies. The first one which is called observation is the process of observing what respondents do during the test. The second method is designing specific items which are

specialized in eliciting specific test-taking strategies. The researcher of the present study makes use of the test taking strategies to elicit proper answers from the Experimental group and Control group's test takers while taking MCRTs.

Multiple Choice Tests as a Kind of Test Method

"Test methods or test facets are aspects of the test method that may have an impact upon test scores (Fulcher & Davidson, 2007, p. 376)". As implemented in this definition, every test has specific aspects which can influence test score. What are those aspects which may change learners' performance? There have been distinct views on what constitutes a test. Researchers such as Carroll (1968), Clark (1972), Weir (1990) and Bachman (1990) have provided different frameworks of test method facets.

Carroll (1968) discussed test methods in terms of the stimulus and response characteristics. Later on, Clark (1972) added details to the stimulus and considered stimulus modalities as taking written, spoken, or pictorial form. Weir's (1990) framework is more informative while compared with the previous formworks proposed for test method facets. The framework given by this researcher included general descriptive parameters of communication, dynamic communicative characteristics, and task dimensions. During the history of development of test method facets, every researcher added more details to the previous framework. However, Bachman's (1990) framework seems to be more elaborated than the previous frameworks. Bachman (1990) classifies five major characteristics of test method facets including testing environment, test rubrics, input, response, and interaction between input and response.

What is of great concern is the fact that all these frameworks will lead to specific types of test based on the selection feature of underlying components. That is, distinct matching of elements will result in various kinds of tests which are used for measuring four major language skills. For testing reading comprehension, Weir (1990) introduced multiple-choice questions as a method of testing that requires the candidate to select the answer from a number of given options, only one of which is correct. According to Fulcher and Davidson (2007), multiple choice items contain two elements: stem and choices. In contrast to the stem which is a question or statement, the choices are correct and incorrect answers which the test taker needs to decide on as the response to the statement or question. The second method for testing reading comprehension, as stated by Weir (1990), is short answer questions. These are in fact questions that require the candidate to write down specific answers in spaces provided on the question paper. One more type of testing reading comprehension is the cloze test where words are deleted from a text after following a few sentences of introduction (Weir, 1990). Selective deletion gap filling and information transfer are the two other testing methods which were given by Weir (1990) for testing reading comprehension of learners.

There are a number of advantages for multiple choice tests. The widely known nature of multiple choice test exhibits its usefulness and acceptability in many context of language testing. The uses are not blind. Hence, they bear some advantages. Weir (1990) explains the following advantages:

- Multiple choice tests have marker reliability.

- It is possible to estimate in advance the difficulty level of each item and the test as a whole in the pre-test phase.
- The format of multiple choice tests makes it easy for the candidates to understand what they are required to do.
- The completion of other test types require the use some other skills which are not the subject for testing, but the completion of multiple choice tests do not.

The main objective of this study is to examine the types of strategies used by Experimental group and Control groups test takers while taking MCRTs. In fact, the researcher seeks an opportunity to study the strategies and processes in Iranian EFL test-taking context.

Test taking Strategies and MCRT

Cohen (1998) studied the strategies for taking reading and writing. He distinguished between indirect and direct testing formats. By indirect testing formats, Cohen (1998) referred to MCRTs and cloze tests. He also described direct tests as summarization, open-ended questions, and composition. Regarding the relationship between test-taking strategies and MCRTs, Cohen (1998) introduced a series of strategies respondents may utilize in order to arrive at answers to multiple choice questions. Strategies for taking multiple choice reading comprehension test are present in Table 1.

Table 1: Strategies for taking a multiple choice reading comprehension test (Cohen, 1998)

Strategies for taking a multiple choice reading comprehension test
Read the text passage first and make a mental note of where different kinds of information are located.
Read the question for a second time for clarification.
Return to the text passage to look for the answer.
Find the portion of the text that the question refers to and look for clues to the answer.
Look for answers to questions in chronological order in the text.
Read the questions first so that the reading of the text is directed at finding answers to those questions.
Try to produce your own answer to the question before you look at the options that are provided in the test.
Use the process of elimination- i.e., select a choice not because you are sure that it is the correct answer, but because the other choices do not seem reasonable, because they seem similar or overlapping, or because their meaning is not clear to you.
Choose an option that seems to deviate from the others is special, is different, or conspicuous.
Select a choice that is longer/shorter than the others.
Take advantage of clues appearing in other items in order to answer the item under consideration.
Take into consideration the position of the option among the choices(first, second, etc)
Select the option because it appears to have a word or phrase from the passage in it- possibly a key word.
Select the option because it has a word or phrase that also appears in the question.
Postpone dealing with an item or selecting a given option until later.
Make an educated guess- e.g., use background knowledge or extra-textual knowledge in making the guess.
Budget your time wisely on this test.
Change your responses as appropriate-e.g., you may discover new clues in another item.

As it is assumed by Cohen (1998) the effectiveness and value of such strategies depend on two issues. The first issue relates to when such strategies are used. Secondly, the effectiveness of such strategies depends on how effectively test-taking strategies are used.

RESEARCH QUESTION

For the purpose of investigating and comparing the Experimental and Control group's test-takers' preferences in using different test-taking strategy-types in MCRTs, the following research questions are developed:

There is difference among Experimental group and Control group in performing MCRT test?

METHODOLOGY

Participants

The general classification of this study included two subordinates; that is, the participants were divided into pilot group and project group. According to Dornyei (2007), a skilled researcher should always pilot his research instruments and procedures before launching his project. Also piloting is an important procedure in quantitative studies which possess psychometric properties. It is specially recommended in questionnaire surveys to achieve acceptable results (Dornyei, 2007). For this reason the researcher of this study explains the characteristics of each group separately under the following subheadings:

Participants through the present research

The main participants of this study were 40 EFL learners learning English at Alef Language Institute in Tabriz, Iran. As the purpose of this study was based on the comparison of Experimental and Control groups, two intact classes were chosen so that one class included 20 language learners and the other class had also 20 ones. The age range of participants in Experimental group was 20 to 38 (mean= 27 years old) and its counterpart in Control group was 18 to 26 (mean= 26 years old). The initial homogeneity of the two groups was examined through the use of the same standardized language proficiency test which was used by pilot group; that is the researcher used Preliminary English Test (2004) to estimate the homogeneity of the participants. In fact, the researcher used Reading section of PET which consisted of 35 questions to investigate the homogeneity of participants in terms of reading comprehension skill. The data from PET was analyzed using independent samples *t*-test (see Table 3.1). The results showed that there was not a significant difference between the groups, $t(38) = 0.33$, $p = 0.842$. The participants in both groups were mature enough to provide insightful information on what mental processes they would select while taking MCRTs. The Experimental group was given the strategies which were considered and the Control group was not given any quid.

Instruments

The researcher used three types of instruments in the present study. The instruments included a Preliminary English Test (PET), Multiple Choice Reading Comprehension Test (MCRT), verbal report, and finally list of strategies for taking a MCRT.

Procedure

The researcher of the present study compared the use of distinct test taking strategies by Iranian Experimental group and Control groups test takers while taking multiple choice reading comprehension tests. He also assumed and hypothesized that Iranian Experimental group and

Control group's EFL learners undertake various test taking processes and perform differently while trying to answer multiple choice reading comprehension tests. In this chapter, the researcher will give the details of the research design, participants, instrumentation, procedure, and data analysis. One of the fruitful ways of measuring learners' reading comprehension is to ask them to carefully and deeply read the text and then answer a number of multiple choice items. Weir (1990) defines a multiple choice item as the selection of a correct answer from a number of options. This process requires the individual tests takers to opt for the best answer from among other options. However, it is not a direct and precise issue to talk about reading the text and selecting the best choice. In the process of test taking, the test takers are always fully involved to choose the best answer. This participation not only necessitates the use of specific language knowledge but also active and conscious operation on the process of answering the items. These processes are assumed as test-taking strategies. Test-taking strategies are closely related to language use strategies. According to Cohen (1998) language use strategies are mental operations or processes that learners consciously select when accomplishing language tasks. It is assumed that Control group's test takers use more distinct mental operations than Experimental group's test takers while performing on a MCRT.

RESULTS AND DISCUSSION

This study was an attempt to scrutinize the type of test-taking strategies used in MCRTs by Experimental EFL learners. It also investigated Iranian Control EFL learners' use of test-taking strategies while taking MCRTs. The three research questions of the present study all focused on the use of test-taking strategies by Iranian EFL learners. After collecting data from both groups of Iranian EFL learners through the use of standardized English proficiency test and Cohen's list of test-taking strategy use, the researcher used the Statistical Package for Social Sciences version 11.5 to analyze the data. Furthermore, the same test, i.e. Independent-samples t-test was used for estimating the relationship between independent categorical variable, i.e. gender variation and the use of test taking strategies. The results of the data analyses are presented in the following sections.

The Use of Test-taking Strategies by the Experimental Group

Data Analysis of the Use of Test-taking Strategies by the Experimental Group

One of the main issues concerned in this study was investigating the type of test-taking strategies used by Iranian Experimental EFL learners who are taking part in multiple choice reading comprehension tests. In this part the researcher will present the type of strategies used by Experimental participants based on Cohen's (1998) list of test-taking strategies.

Table 2: Descriptive Statistics for The Use of Test-taking Strategies by the Experimental Group

P = Percentage

Discussion of the Use of Test-taking Strategies by the Experimental Group

To test the Experimental group's use of test-taking strategies, the researcher estimated the frequency and percentage of participants' replies to the questions which were presented by Cohen (1998). The first question which presented the first reading strategy was learners' ability to read the text passage first and to make a mental note of where different kinds of information are located. The results of Table 1.1 indicates that 40% of the participants in the Experimental group always use this strategy. In the case of second strategy which was elicited using the second question, the researcher tested participants' willingness to read the question for a second time for clarification. It is evident that about 45% of the Experimental participants always make use of this strategy. Furthermore, the researcher tested a type of test-taking strategy which is concerned with learners' ability to return to the text passage to look for the answer. The results indicate that 50% of the participants always utilize the available strategy and around 45% of the participants in this group sometimes use this strategy.

Finding the portion of the text that the question refers to and looking for clues to the answer were the two elements in the next test taking strategy which were examined by the researcher. The results indicate that 45% of the participants always undertake this strategy. Also 40% of the Experimental group often finds the portion of the text that question refers to and look for clues to the answer. Moreover, the rest of the participants sometimes use this strategy. The fifth question of Cohen's (1998) list deals with looking for answers to questions in chronological order in the text. 60%, 25% and 15% of the participants in Experimental group often, sometimes and never

use the next strategy, respectively. This strategy, in fact, is concerned with reading the questions first so that the reading of the text is directed at finding answers to those questions.

Cohen (1998) presented another test-taking strategy which is reading the questions first so that the reading of the text is directed at finding answers to those questions. Actually, the participants in this group were different in their use of this test-taking strategy. In fact, 20% of them always use this strategy while undertaking MCRTs. Besides, 35% of Experimental test-takers often use this strategy. It is important to note that 10% of participants sometimes utilize this strategy mentioned by Cohen (1998); the same percentage of participants never use this strategy. Moreover, the rest of the participants, i.e. 25%, seldom use this strategy. Trying to produce their answers to questions chronological before they look at the options that are provided in the test can be considered as the 7th type of strategy used for taking MCRTs. The results of Table 2 indicated that this strategy is a rather rare strategy among participants. In fact, except for 5 and 10 percent of the participants who always and often use this strategy other sometimes, seldom and never use it. The participants' reflection to the process of elimination, as another type of test-taking strategy, was mainly focused in center. That is, 455 of the participants sometimes use selected a choice not because they were sure that it was the correct answer but because the other choices did not seem reasonable.

“Choose an option that seems to deviate from the others is special, is different, or conspicuous”. This was the topic of 9th test-taking strategy which the participants thought about. Generally, most of the participants in this group often use this strategy. In other words, 40% of test-takers often use this strategy while taking reading comprehension tests. What is interesting in this study is the findings of the research to the next question, i.e. question No. 10 which deals with test-takers opt for choosing longer or shorter options. In fact, the results of the above mentioned table shows that 40% of the participants never use this strategy. Respectively, 25% of the participants seldom use this strategy and only 15% of them often use it.

Question No 11, which relates to taking advantage of clues appearing in other items in order to answer the item into consideration, presents some other information. 50% of the participants in this group often take advantage of clues in other items to find the correct answer. The next test taking strategy which is identified as question No.12 focuses on the central scale that is, often. Also 30% of test-takers in this group often take into consideration the position of the option among the choices. The next question which presented the 13th reading strategy was learners' ability to select the option just because it appears to have a word or phrase from the passage in it-possibly a key word. The results show that 45% of them often use this strategy. Besides, 30% of them always use it. 15% and 10% of the test-takers sometimes and seldom use this strategy. Selecting an option because it has a word or phrase that also appears in the question is the title of the next test-taking strategy which has been studied in this research. It is evident that 45% of the participants often use this strategy. In his list of test-taking strategies, Cohen (1998) discussed test-takers' preferences in postponing dealing with an item or selecting a give item until later. Test-takers' answers to this question has been also investigated and the results are presented in Table 4.3. As it is clear 45% of them sometimes postpone dealing with and answering item until later. Meanwhile, 20% of the test-takers in this group seldom postpone answering the item. This

table also shows that 15% of the participants often and never use this test-taking. Also, 5% of the participants always make use of this test-taking strategy.

The next three strategies reveal diverse results. In fact, question No. 16 which is concerned with making an educated guess has been investigated in this research. The results show that 15%, 20%, 45%, and 20% of the test-takers always, often, sometimes and seldom use this strategy, respectively. The results show that 25% of participants always and often budget their time. Also 20% of them sometimes and seldom manage their time. And only 10% of such participants never attend to budgeting their time. Finally, the last strategy which was related to changing test-takers' responses as appropriate has attracted the attention of the researcher. The results show that 45% of the participants often change their responses and only 35% of them sometimes do the same.

Studying test taking strategies have been a significant issue while test-takers' mental processes came to take a role. The major motive for this study was to complement the findings of previous researches. In a fruitful research, Powers (1995) studied the effect of gender variation on answering reading comprehension questions without the passage. The purpose of this study was on analyzing the gender differences in performance on a task requiring examinees to answer reading comprehension questions without reading the passages on which questions were based. In fact, the results obtained from his study indicated a very few and inconsistent differences between the two genders. Presumably, the present research was in line with the findings of Powers' (1995) paper. In a study which was related to test-takers' differences with regard to their cognitive style, Blanton (2004) focused on standardized reading test administered in three different formats. The prime goal of this paper was to investigate the means of scores on three forms of a standardized reading comprehension test taken by college students in developmental reading classes. The three forms of the test were administered in three different ways. The first way was a timed multiple-choice test; in contrast, the second format was a constructed response test. Finally, the last was an un-timed multiple-choice test. The results of this study showed that cognitive style had more impact on students' performance on a standardized test of reading comprehension than ethnicity or gender. Generally, learners' gender and ethnicity were critical factors considering this format. Thus, as opposed to style, strategies seem to have not a significant relationship with the test-takers' gender.

The Use of Test-taking Strategies by the Control Group

Data Analysis of the Use of Test-taking Strategies by the Control Group

In the previous section, the researcher analyzed the data generated from the Experimental group. In this section, the researcher will examine the type of test-taking strategies used by Iranian Control group's EFL learners who are taking part in multiple choice reading comprehension tests. Table 3 shows frequency and percentage of scales which were accompanied by every test-taking strategy. In fact, using this table, the researcher presents the type of strategies used by Control group based on Cohen's (1998) list of test-taking strategies.

Table 3: Descriptive Statistics for The Use of Test-taking Strategies by the Control Group

	Always		Often		Sometimes		Seldom		Never	
	F	P	F	P	F	P	F	P	F	P
Q1	7	35%	5	25%	4	20%	2	10%	2	10%

Discussion of the Use of Test-taking Strategies by the Control Group

To test the Experimental group's use of test-taking strategies, the researcher estimated the frequency and percentage of participants' replies to the questions which were presented by Cohen (1998). The first question which presented the first reading strategy was learners' ability to read the text first and make a mental note of where different kinds of information are located. The results of Table 3 indicates that 40% of the participants in Experimental group always use this strategy. In the case of second strategy which was elicited using the second question, the researcher tested participants' willingness to read the question for a second time for clarification. It is evident that about 45% of the Experimental participants always make use of this strategy. Furthermore, the researcher tested a type of test-taking strategy which is concerned with learners' ability to return to the text passage to look for the answer. The results indicate that 50% of the participants always utilize the available strategy and around 45% of the participants in this group sometimes use this strategy.

Finding the portion of the text that the question refers to and looking for clues to the answer were the two elements in the next test taking strategy which were examined by the researcher. The results indicate that 45% of the participants always undertake this strategy. Also 40% of the Experimental participants often find the portion of the text that question refers to and look for clues to the answer. Moreover, the rest of the participants sometimes use this strategy. The fifth question of Cohen's (1998) list deals with looking for answers to questions in chronological order in the text. 60%, 25% and 15% of the participants in Experimental group often, sometimes and

never use the next strategy, respectively. This strategy, in fact, is concerned with reading the questions first so that the reading of the text is directed at finding answers to those questions.

Teaching and testing have always been considered as two sides of the language learning coin. Recently, the appeal in the realm of language teaching was toward explorations in the underlying processes and strategies which are involved in language learning context; the same interest is inevitable in the testing context as well. This interest even becomes tangible when we are keen to increase our understanding of the use of test-taking strategies employed by distinct genders. Thus, a research which compares the use of test-taking strategies used by Iranian Experimental and Control group's EFL test-takers was essential. The main concern of the present study was based on this issue. The first research question was concerned with the type of test-taking strategies used by Iranian Experimental EFL learners. This research question required the researcher to request the participants to complete a questionnaire prepared by Cohen (1998). For doing so, the participants had enough time to choose the best answer for every question in an 18-item questionnaire. Based on the available data, the researcher estimated the use and frequency of the test-taking strategies. The results showed that all types of test-taking strategies were used by Iranian Experimental EFL participants. What was significant was the difference in the frequency of the use of MCRT strategies which were undertaken by the participants while taking MCRTs.

CONCLUSION

The present research would achieve better results if he could apply these tests to a large number of test-takers. Moreover, if this study was conducted on learners at different proficiency levels, different results could be achieved. In conclusion, the results of this study show that all participants have a tendency towards the use of test-taking strategies and both male and female participants act similarly in terms of the use of test-taking strategies while performing MCRTs.

Implications for Language Instructors and Experts

Testing has changed concept over the last few couple of decades. Testing has become an integral part of the classroom context and all the participants involved in teaching will necessarily be affected by it. One such participant in the teaching system is the language instructor who is equipped with the knowledge of language and complementary knowledge base to scaffold the learners' progress and help them to increase their language proficiency. Testing which has been considered as an inseparable part of language teaching context will also be affected by the instructors' ideas. If the language instructor is aware of the mental processes which act as the learning strategies in the process of learning and also attends to them while being implemented to the testing context, he will motivate learners to consider such important factors. That is the instructor's awareness will bring along some relevant knowledge to the learners as well. Besides, the language instructor can match the learning strategies which are of great advantages to the learners to the testing context.

ABSTRACT

This research investigated the effects of conformity and teacher's control on pre-intermediate EFL learners' oral achievement at Mehr English Institute in Mahshahr, Iran. The participants included 24 students who were selected out of 60 participants and divided into two experimental and control groups. The participants took the pre-test of speaking skill. During the treatment period, the control group received conventional activities in speaking skills such as class interaction and discussion. The experimental group received control, conformity and corrective feedback. Students' mistakes were corrected by the teacher immediately in the experimental group while these mistakes were corrected in the control group implicitly. After 16 sessions of treatment, a post-test of speaking skill was given to the participants of both groups to assess their oral achievement. Independent Samples t-test was used to analyze the data to compare the scores of both groups. The results showed that the experimental group had less progress compared to the participants in the control group in terms of conformity and teacher's control; however, they outperformed the control group in using structure and accent components. Moreover, the control group showed more progress in fluency, speaking confidence and communication components of speaking. The implications of this study may be useful for teaching speaking and pronunciation.

KEYWORDS: Conformity; Teacher's control; EFL learners; Oral achievement

INTRODUCTION

Many variables such as family life, community and school environment can affect students' achievement. These variables can be related to each other and to students' failures or successes in academic settings. It should be noted that we cannot ignore the effects of all these variables in education. Many researchers (e.g., Aarosan & Barrow, 2007) believe that, teachers are the most significant school-based factors in education and teachers' characteristics play major roles to shape students' achievement. Focusing on the effects of teachers' characteristics that can affect students' achievement is very helpful for administrators and teachers to increase students' achievement and involvement in the classroom activities. Regarding teachers' characteristics, two terms are very significant in this study: conformity and teachers' control.

The first term, conformity, refers to one's agreement to the majority position. There are many reasons that support the agreement to the majority position. People match their ideas and behaviors with the group members because of the desire to be fit, in order to be accepted or matched with the social rulers and norms. These three reasons are called normative, informational and identification conformity (Kelman, 1958).

Conformity is regarded as a powerful force that can have overt social pressure or subtler unconscious influence. It refers to the tendency of people to match and change their attitudes, beliefs and behaviors concerned with the people or group members in the classroom. Conformity shows its effects on peoples' ideas in the case of subtle unconscious influence, and behavior in the form of overt social effects (Arats & Dijksterhuis, 2003). Bond and Smith (1998) believe that conformity is directly related to the education and educational systems all over the world by considering the role of cultural values and it plays a major role in academic settings.

Educational systems all over the world can be classified into two main categories, the individualistic and the collectivistic systems. The individualistic system has been the educational ideal of many western countries. It helps to foster analytical skills and critical thinking in students and to liberate students in education. On the other hand, a collectivistic system believes that education needs to be fit into the needs of society as a whole. It more often emphasizes the obligations of the individuals for the benefit of the group in the focus. Skillman (2000) believes that cohesion, cooperation and conformity are very important in collectivistic societies. He maintains that people in these societies try to make more references to others and follow the norms, regulations and expectations of the groups and societies. Desai (2007) refers to individualistic societies and characteristics that involve diversity that distinguish one person from others. He believes that teachers will encourage creativity by showing more tolerance for the diverse ideas of their students and allowing them more freedom to follow up their ideas.

Different cultural values play major roles in individualistic-collectivistic distinction. Such cultural differences mean that people in different cultures have different ideas of the self and others. For collectivistic societies, interdependence is the accepted norm: the self and community are related to each other. Autonomy becomes secondary in this relationship (Mark & Kitayama, 1999). For more individualistic systems, autonomy, independence and uniqueness are important and they are the main characteristics of individualistic societies (Mark & Kitayama, 1999). Cross-cultural studies have shown that collectivistic societies are more concerned about conforming to social norms than individualistic ones (Bond & Smith, 1998). Conformity can be regarded as an informal means of control. There are some strategies in the classroom to control students in the classrooms. It is important to note that the demand for control is necessary in schools; because teachers cannot teach if the class is out of control. However, it is a problem if we define control as conformity and obedience.

One type of teacher control is corrective feedback that consists of several forms (Ellis, 2009). The main point is that we cannot ignore the advantages of corrective feedback in the teaching and learning process and it is essential especially when the errors cannot be self- corrected by students themselves (Chu, 2011). However, using a lot of corrective feedback in the process of

speaking may affect learner's motivation, and eagerness to take part in discussion or to take risk in the process of teaching and learning (Trusscot, 2007).

The present study intends to investigate the effects of conformity and teachers' control on pre-intermediate EFL learners' oral achievement. The focus of this study was the role of conformity and control in academic settings for speaking purposes.

Nowadays, speaking is the most demanding skill for learners to learn English for different purposes and speaking fluency is one of the main targets for both teachers and students (Gardner, 2009). Although many students spend a lot of time, energy and money in English institutes, schools and universities, some of them are not fluent in English and cannot communicate with others properly. Some of them may have a good command of English but have low confidence for speaking and taking part in the classroom oral activities and discussions (Ahangari & Amirzade, 2011).

REVIEW OF LITERATURE

Conformity

Conformity is the most general concept in the psychology science which refers to any changes in behavior caused by another person or group effects (Breckler, Olson & Wiggins, 2006). It refers to any social influence involving a change in belief or behavior in order to fit in with a group. This change is in relation to real or unreal group pressure. Real group pressure refers to the real physical presence of people and the unreal group pressure refers to the rules, norms and expectations (Crutchfield, 1955). Conformity can be defined as yielding to group pressure that can take different forms, for example persuasion, teasing, criticism, etc. Conformity is also known as majority influence or group pressure. The term conformity is often used to indicate an agreement to the majority position, brought about either by a desire to fit in or be liked or because of a desire to be correct, or simply to conform to a social role (Arats & Dijksterhuis, 2003).

Turner (2005), states that conformity acts as a powerful force that can take the form of overt social pressure or subtler unconscious influence. It is the act of matching and changing ones' ideas and behaviors in response to others in the societies or classroom groups at schools. He states some reasons such as the desire to be liked. Reber and Allen (2004) state that we are experiencing conformity in every situation if we have to change our ideas or behaviors based on the accepted regulations and rules and follow the rules without considering our beliefs.

Classroom Management

Classroom management refers to the process of creating and maintaining the best opportunities for the students to learn (Mendler, 2001). Mendler believes that an effective classroom management should be the main responsibility of teachers. He maintains that classroom management does not mean providing set of rules and procedures for the students in the classroom, but it should refer to the sensitivity and caring of teachers to students.

Classroom management focuses on three major components: content management, conduct management and covenant management (Froyen & Iverson, 1999). Content management refers to the management of the materials, space, equipment and lessons. Conduct management deals with set of procedural skills that teachers employ in their attempt to address and resolve discipline problems in the classroom. It is important to note that the procedural skills that teachers use in conduct management, may vary from teacher to teacher. These different skills refer to teachers' knowledge and their personal experiences. Covenant management focuses on the classroom group as a social system that has its own features that teachers have to take into account when managing interpersonal relationship in the classroom. In this system, teachers and students' roles and expectations shape the classroom and their relationships are very essential to ensuring a positive school atmosphere. The last component has an important role in the classroom management because it takes the classroom interpersonal relationships into consideration (Froyen & Iverson, 1999).

Teachers' Control and Feedback

An important means of control in academic settings is providing feedback or corrective feedback by teachers, in this exchange, the teacher provides feedback on a students' utterance that contains an error (Flynn & Chatman, 2001). Corrective feedbacks can be defined as information provided by an agent, a teacher in the classroom. In this case, there is a chain of performance and feedback. Thus feedback can be defined as a response to a learner's erroneous utterance (Ellis, 2009). It has no effect in vacuum and it could be powerful in its effects, if there is a context to which the feedback is addressed (Timperley & Parr, 2005). It refers to any indication to the learners that their use of target language is incorrect (Lightbown & Spada, 1999). Ellis (2009) states that the feedback can consist of several forms: (a) to indicate the errors, (b) to provide the correct forms of errors committed and (c) extended (meta-linguistic) information about the error. It is necessary to note that errors are natural and common characteristics of learning process. They show learners' development in the process of language acquisition and learning (Tornberg, 2005). When learning to speak a second or foreign language, any learner makes errors and they are natural part of mastering a new language. The errors can be of various kinds, for example, pronunciation, syntax and word choice errors. As errors cannot be self-corrected by learners, teachers' reaction toward errors in the form of corrective feedback is essential (Ahangari & Amirzadeh, 2011).

One of the major issues of language teaching is the effect of teachers' control on students' outcomes in different skills, especially speaking because it is one of the most important skills to be developed as a means of effective communication (Gardner, 2009).

Oral Proficiency

Richards and Renandya (2004) believe that most learners all over the world study English to develop proficiency in speaking. Many foreign language learners study a foreign language and try to learn English in order to become fluent and accurate to master the English sophisticated structures and vocabularies. However, second language acquisition (SLA) specialists are still unsure of what makes up the myriad factors that contribute to second language (L2) proficiency. To establish a baseline view of the complex interactions among traits, the researchers (Iwashita,

2008) focused on four key dimensions and components: fluency, lexical diversity, grammatical accuracy and complexity. These four components of oral proficiency may vary from study to study because of the use of diverse definitions of these components and dimensions of oral proficiency by many researchers in different studies. Dastjerdi (2012) focused on the effects of corrective feedback on students' speaking. 20 female intermediate EFL learners aged from 15 to 20 participated in his study. The participants were divided into 2 groups of 10. For one group, the errors were corrected immediately and for other group, the errors were corrected with some delay, i.e. after finishing speech. At the end of the term, each student was asked to discuss one of the topics that they had discussed during the term while their voices were recorded. Measures of accuracy, fluency and complexity were developed and the results showed that the delayed error correction had positive effect on fluency and accuracy but not on complexity. For the second aim, a Foreign Language Anxiety questionnaire was given to all the participants at the end of the term and the results indicated that the second group with delayed correction experienced less anxiety in class. This study focused on the effect of teacher control on students' anxiety.

RESEARCH QUESTION

This thesis specifically attempted to reflect on the following research question:

Do conformity and teacher's control affect pre-intermediate EFL learners' oral achievement?

METHODOLOGY

Participants

The present study conducted with the help of 24 students who were selected out of 60 EFL students from Mehr English institute in Mahshahr, Iran. They were all females and ranged in age from 16 to 20 years old. Standard Speaking Test (SST, 2006) was used to measure the oral proficiency of participants. Based on the students' scores, the students who achieved the levels 4, 5 and 6 were selected as the participants of this study since they achieve the average level of speaking proficiency. Then, they were randomly divided into two groups of 12: one experimental group and one control group.

Instrumentation

Four different testing instruments were utilized in the process of the development of the present research. Initially, a Standard Speaking Test (SST, 2006) developed by ALC Press was used to determine the students' proficiency level it consists of 5 stages. This test was used to determine the students' oral achievement in English at the pre-intermediate level. Accordingly, the scores 4, 5 and 6 were assumed as pre-intermediate level. SST contained five steps and each student was supposed to answer them in ten to fifteen minutes. The students' performances were scored by two raters at the same time. Before administration of homogeneity test, it was piloted by the researcher in the group of 20 of the same proficiency level in the same institute. The inter-rater reliability of this test was computed through *Pearson Correlation* analysis as ($r = 0.80$) to calculate the reliability of the test scores.

The second instrument of this study was a pre- test. It was based on the topics and activities of the Touch Stone Series Book 2 in both experimental and control groups to do the related activities to assess the participants' initial levels in speaking English before treatment. The inter-rater reliability of this test was computed through Pearson Correlation analysis as ($r=.83$) to calculate the reliability of the test scores. The third instrument of this study was a post-test. It was done to determine the effects of treatment: teacher's control and conformity on participants' oral achievement. Moreover, the post-test included the same topics and passages used in the pre-test. The inter-rater reliability values of the post-tests was calculated through Pearson Correlation analysis as ($r=.76$) to calculate the reliability of the test. Finally, a modified checklist of speaking (Hughes, 2003; Chalhoub-Devil, 1997) was used in both pre-test and post-test to measure oral abilities of participants. This checklist had 7 components. 6 components of the checklist were developed by Hughes (2003) and the last one was added based on the Chalhoub-Devil's (1997) speaking checklist.

Materials

Considering 16 sessions for both classes at the English institute, the researcher was able to select 4 lessons of Touch Stone, book two that were related to participants' proficiency level. Time of each class was 60 minutes. Students' speaking was checked based on Huthes (2003) and Chalhoub-Devil (1997) checklist of speaking for both pre-test and post- test. During 16 sessions of instruction, students were prepared for being successful for speaking purposes. Each student's oral production on the specific topics in both groups for both pre-test and post-test was recorded by an MP3 player to be analyzed and scored carefully by the researcher herself and another English teacher of the English institute based on the checklist of speaking.

Procedure

This study was conducted at Merhr English Institution in Mahshahr. The first step was to make sure of the students' homogeneity. Before administration of homogeneity test, the researcher piloted it in the group of 20 at the same proficiency level of both groups in the study. Then a week before the instruction, the researcher administered the SST homogeneity test (2006) to 60 participants in order to select 24 participants. Those participants who achieved the level of five and six were selected and divided into two groups randomly: one experimental group and one control. Both groups included 12 participants. Before starting instruction *pre-test* was administered to discover the students' levels of speaking at the beginning of research period. It was related to speaking purpose by focusing on teaching techniques such as question and answer, description, telling related memories and discussion and role play). Each production was recorded by an MP3 player and then scored according to the checklist developed by Hughes (2003) and Chalhoub-Devil (1997) by two raters. After selecting and dividing the participants on the bases of random judgment sampling, the instruction phase started. In the experimental group, the researcher focused on teacher's control, giving corrective feedback as a means of teacher's control and conformity. Each mistake was corrected by the teacher immediately while students were speaking. The participants had to follow the norms provided by the teacher during the instruction session; such as the kinds of activities, the topics discussed in the classroom and the correct answers. In this case, only the exact answers were rewarded and accepted. There was no chance for partial answers or incomplete answers of participants in the experimental group. The

same activities were conducted in control group which were done in experimental group. The only difference was related to the role of teacher's control, feedback and conformity. In the control group the incorrect forms were shown and practiced by teachers or in the group when the students finished their speech. The norms were not defined only by the teacher. The participants had active roles even in deciding on the activities and topics. They had a chance for partial knowledge, for expressing themselves even wrongly. The treatment lasted 16 sessions, 60 minutes a session, twice a week. During the treatment, in each session, the researcher devoted times to listening to the CD, practicing new words, and talking about related parts. As it was mentioned before, during each session, four types of techniques including suggesting new topic for each passage, question and answers, description and role play were used for speaking purpose. After listening to the CD some questions were asked to discover students' comprehension. In addition, the students discussed the passages and topics and gave their opinions about them. The same activities that were done in the experimental group were used in the control group. Finally, after the treatment period, a post-test of speaking achievement that covered all the materials, was administered to two groups. Finally, the results of the post-tests were compared to each other to know the importance of teacher's control and conformity in the speaking classes

Analysis

In order to determine the effects of teachers' control and conformity on pre-intermediate EFL learners oral achievement, once the scores of the pre-test and post-test are obtained, the mean and standard deviation of the scores were calculated. Then, analysis of Independent Samples t-test was run in order to find out whether the differences between the two groups were statistically significant.

RESULTS AND DISCUSSION

To test the first research hypothesis, the researcher dealt with comparing the two groups based on the effects of conformity and teacher's control on participants' oral achievement. To do so, students' pre and post-tests were conducted at the beginning and the end of the term. The analysis went further to find out whether conformity and teacher's control in the classroom affects students' oral performance. Independent Sample t-test was applied to study the differences between the preand post-tests in the experimental and control groups. It is important to note that the researcher employed all the analysis at ($p < 0.05$). Table 1 provides the descriptive statistics of students' speaking pre-tests in terms of the number of participants (N), mean(M), standard deviations (SD), and standard errors of mean (SE) for both groups.

Table 1: Descriptive Statistics(pre-test)

Groups	N	Mean	Std. Deviation	Std. Error Mean
Experimental	12	15.2500	1.76455	.50938
Control	12	15.5833	1.67649	.48396

According to the Table 1, the mean score of the participants in the pre-test in the experimental group (Mean=15.25, Standard Deviation=1.76) was less than the mean score of participants (Mean=15.58, Standard Deviation=1.67) in the control group. Table 2 shows the results of Independent Samples t-test of pre-test in both experimental and control groups.

Table 2: Independent Samples t-Test(pre-test)

Experimental Vs. Control	Levene's Test for Equality of Variances		t-test for Equality of Means					95% Confidence Interval of the Difference	
	F	Sig.	t	df	Sig. (2- tailed)	Mean Differen ce	Std. Error Differen ce	Lower	Upper
Equal variances assumed	.037	.850	-.474	22	.640	-.33333	.70263	-	1.12383
Equal variances not assumed			-.474	21.9 4	.640	-.33333	.70263	1.79050 -	1.12405 1.79072

Table 2 shows that t-observed (0.474) was less than t-critical (2.066) with df of 22 in the experimental group. Furthermore, t-test analysis shows that the significance level as (0.640) which is greater than (0.05). This means that there was no statistically significant difference between mean performances of two mean scores in the experimental and control groups in the pre-test. More over, the above table shows that the amount of t-observed is not statistically significant; therefore, it can be claimed that the two groups were homogeneous at the beginning of experiment regarding their prior knowledge. Descriptive statistics of students' oral performance in the post-tests is summarized in Table 3.

Table 3: Descriptive Statistics(post-test)

Groups	N	Mean	Std. Deviation	Std. Error Mean
Experimental	12	17.5800	2.10928	.609
Control	12	21.6767	2.27069	.655

Table 3, shows the mean score of the post-test in the experimental group as(17.58) and the mean score of post-test in the group was (21.67). It indicates that the mean scores of both groups in the post-tests improved but the participants in the control group outperformed the participants in the experimental group. Table 4 shows the results of the Independent Samples t-test of post-test of both groups.

Table 4: Independent Samples t-Test (post-test)

Experimental Vs. Control		Levene's Test for Equality of Variances	t-test for Equality of Means						95% Confidence Interval of the Difference	
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Lower	Upper
Equal variances assumed	variances	.037	.849	4.566	22	.000	-2.41667	.85686	-4.19370	-.63964
				-4.566	21.38	.000	-2.41667	.85686	-4.19666	-.63668

As presented in Table 4, the t-observed (4.566) of both groups is greater than t-critical (2.066). at the significance equals (0.00) which is smaller than the significance level (0.05). It shows that there is a statistically significant difference between the experimental and control groups. In other words, the control group outperformed the experimental group in the post-test and this means that the first null hypothesis of this study was accepted. In other words, teacher's control and conformity did not have any effect on the participants of the experimental group.

Discussion

Based on the results of the Independent Samples t-test of pre-test and post-test, the mean scores of both groups improved and the mean scores between experimental and control groups were significantly different. The mean score of the control group in the post- test was greater than the mean score of the experimental group. It supports the idea that conformity and teacher's control did not show a better effect on the participants' performance compared to the focusing on students' active roles and their creativity in the control group. As a whole, the study showed that the conformity and teacher's control had a less effective role in enhancing EFL learners' oral achievement in the experimental group at the pre-intermediate level of English compared to the control group.

The results can be more approved by this evidence that there were significance differences between the means of pre-tests and post-tests of both experimental and control groups. That is to say, the learners in the control group outperformed the learners in the experimental group with the focus on conformity in the classroom. This is very much compatible with the results of the research conducted by Milgram (2010). His experiment discovered that more than half of the participants in the study showed conformity. More ever, the results of this study are in line with the study conducted by Berns (2005) who noted that the participants of the study that experienced conformity did not want to stand against the majority position or to be rejected by group members. In his study, the participants showed levels of conformity similar to those in the Arats

and Dijksterhu's (2003) studies. It showed that participants in two different situations conformed to the defined norms. The results indicated that focusing on conformity in different situations such as schools leads to lack of creativity among the students, because following the norms is very important in these situations. One possible explanation of such results is that defining different norms by teachers in the classroom and making the students follow them will affect students' motivation and consequently students' behavior in oral achievement. This may decrease students' self-confidence and make them disappointed when they are regularly interrupted by the teacher.

One possible explanation on these findings is that providing a lot of corrective feedbacks in the process of teaching and learning by teachers in the classrooms especially while the students are participating in the activities and discussions may act as a negative factor on participants' self-confidence and finally on their participations in the classroom. When the students are afraid of speaking and taking part in the classroom activities, it will affect their communication strategies and fluency negatively. However, it may enhance their accuracy and accent. One of the main reasons may refer to the students' hesitations and pauses to monitor their performances. Thus they may show better progress in accuracy and accent rather than flow of speech, communication and speaking confidence.

CONCLUSION

This research aimed to investigate the differences between the two experimental and control groups with the focus of conformity and teacher's control in experimental group. The null hypotheses of the study were accepted since there were significant differences between both groups performance ($p < 0.05$) in the post-test; however, the control group out-perform the experimental group. Although the mean scores of the participants in the post-test increased compared to the mean scores of participants in the pre-test in experimental group, the mean score of participants in the control group was significantly greater than the experimental group. It showed the effects of teacher's characteristics such as conformity and control on students' motivations and consequently students' outcomes.

The participants of control group with the focus on the students' creativity and activity based on the main goals of the speaking classes such as creativity, students' active roles and the use of feedback in necessary cases, may benefit more than students in the experimental group that the researcher focused on conformity and control in all activities in the classroom during the instruction period. Some of administrators and teachers believe that highly controlling behaviors and defining a lot of norms and rules for students for taking part in the classroom activities and answering the questions play a major role in students' performance. Perhaps it is the main reason of some EFL students' reticence and lack of motivation to take part in the classroom activities and discussions inside or outside the classrooms. It should be noted that the main responsibility of teachers is enhancing the students' self-confidence to take part in the related activities and establishing rapport and less stressful atmosphere for the learners. This atmosphere is supposed to increase learning much more than where learners receive instruction based on conformity and control in the classroom.

To sum up, the findings of this study may be effective if the teachers try to focus on students' creativity, critical thinking and learners' involvement in the classrooms for teaching speaking skill. The teachers should be tolerant with the students' mistakes or unwillingness to take part in the classroom and try to build up their speaking confidence.

It is suggested to teachers to consider the effects of conformity and control in the learning and teaching processes in the academic settings and involvement in the classroom activities and try to provide enough opportunities for students in the classroom to enhance their level of motivation and effort to participate in the classroom discussions. The teachers should give the students time and opportunities to take the active roles, especially in a non-threatening environment. The teachers should incorporate the new findings of psychological and experimental studies related to teachers' characteristics and behaviors on students' motivation and achievements and try to enhance learners' motivational desire and speaking confidence especially in lower levels of teaching English in institutes and schools. If teachers focus only on teaching effectively by focusing on transferring the information to the students without providing a non-threatening teaching environment for learners to participate in the classroom activities and tasks, the teaching will be less effective for providing students to take part in classroom discussions, tasks and activities and to improve students' confidence for speaking and to enhance their fluency alongside their accuracy.

By taking insights from the present study and materials designers might include oral tasks that focused on fostering learners' creativity not conformity in the classrooms and help the learners to be creative in carrying up the activities in the text books. Moreover, they should add some open ended activities and provide some opportunities for the learners to support and enhance the learners' creativity in the classrooms. These materials encourage the students to take active roles in the classroom and fight the issue of students' reticence in the classroom and society. This study was conducted at Mehr institute in Mahshahr, Iran. Other contexts could be used to conduct a similar research to support the findings and to find more about the role of conformity and teacher's control on speaking skills. Also, only 16 sessions were run to see the effects of the treatment. Moreover, this study was fixed on females enrolled in the program and it should be investigated on male students. Females just took part in this study but the researcher can have both males and females in their future studies and compare them. Learners who studied English as a foreign language took part in this study. Moreover, the same study can be replicated in other situations such as ESL situations and even among native speakers' contexts. Furthermore, this research was conducted on the pre-intermediate EFL learners at Meher institute in Mahshahr. Other levels of language skills can also be studied if the researchers like to make generalizations about language learners at different proficiency levels. Eventually, this study lasted for two months. Succeeding studies can allocate more time to study the effects of teacher's control and conformity on EFL learners' speaking skill.

ABSTRACT

The role of motivation in language learning, especially in research articles, is so important that language teachers can transfer their ideas and views through emotional perspectives. Large number of different factors affects the success of students in learning foreign languages. Two of these factors can be motivation and attitudes of students toward learning a target language. Positive attitudes of students and different kinds of motivation can have a great influence on the success or failure of students in learning languages. Researchers also can get more information from articles through evaluating these issues and can specify their views about the articles. The function of emotional perspectives in interpersonal relationship, texts and articles is as a vital role that helps both readers and writers. The present paper investigates the kind of motivation and the attitudes of the students in the province of Tabriz in Iran towards learning English. 100 students from three well-known language learning centers of this city by the names of Chitsazan, Farhang and Albourz were surveyed using the AMTB (Attitude, Motivation Test Battery) questionnaire. Different domains were surveyed to get the goal of this paper such as interest in English, integrative orientation, instrumental orientation, desire to learn English, parental encouragement and attitudes towards learning English. The result of this survey shows that University of Tabriz have both integrative and instrumental motivation but their attitudes towards English are not strongly positive. Of course, it is important to state that the findings of the present study revealed that motivation and attitude were similar considered among the students.

KEYWORDS: Motivation, Extrinsic, Intrinsic, Attitudes, Instrumental, Integrative.

INTRODUCTION

According to different investigations and researches motivation is one of the most important factors that cause success or failure in learning a foreign language. The kind of motivation and the amount of it in students are very important too. Winne and Perry (1962) define motivation as: “an internal state that arouses directs and maintains behavior” (p.354). By his definition motivation is an internal factor of learning and if one person has this inner desire, learning can be important for him. And by knowing the importance of learning he tries to allot more time and

energy to learn it. Therefore he learns better and speeds up learning. Motivation is a very strong desire that by the help of it one person doesn't give up trying to achieve his goal.

Brown (2007) gives different definitions according to different schools of thought.

- a) From a *behaviorist* perspective: motivation is seen in very matter of fact terms. He believes that they base their idea on external factors. Giving rewards and having positive reinforcement are the key points in this school of thought.
- b) From *cognitive* perspective: motivation places much more emphasis on individual's decisions. People have choices to what they should experience as their goals and what they should avoid.
- c) From *constructivist* perspective: motivation places even more emphasis on social context as well as individual personal choices. Each person is unique and can be motivated differently.

Motivation cannot be seen but we can understand it from the behavior of the learners such as their participation in the class, being active in answering to the questions and etc. On the other hand the amount of the motivation in the class among the students of the same class can be completely different. For example some people go to different language centers by their own interests and they are very eager to learn one new language but in contrast some people go to different language centers because of their parents' force or maybe because of their parents' satisfaction or because of large number of different reasons. These people have different motivations towards learning a foreign language.

Intrinsic and Extrinsic Motivation

Intrinsic and extrinsic motivation means that internal or external factors affect learning. Some motivations are based on the internal factors such as needs, interests and enjoiments. On the other hand some motivations are based on external factors such as rewarding and punishing and etc. Motivation that refers to intrinsic factors is called intrinsic motivation and the motivation that refers to external factors is called external factors.

Some researchers such as Maslow (1970) believe that intrinsic motivation is much more important than extrinsic motivation because we are motivated to get "self-actualization". But on the other hand Winne and Perry (1962) believe that both of these two motivations are necessary in EFL classes. Some activities in the classes are interesting and attract the interests of students and these activities create intrinsic motivation. But sometimes external factors such as taking exam can be very helpful because it gives students enough motivation to study.

Instrumental and Integrative Motivation

When a person learns a language in order to be a member of one community, he has an integrative motivation. The people who want to migrate from one country to the other one have this motivation. One of the most important aspects of this kind of learning is using language for social interactions. It seems this kind of motivation leads to much more success than the instrumental one.

Instrumental motivation refers to using language to get instrumental goals such as getting a job, reading technical texts, translation and etc. the people that have this motivation don't have any desire to be the member of the target society. They are just studying language to meet their needs.

Some linguists believe that mixture of these two motivations can lead to success. But on the other hand we know that every person is unique and has different characteristics and we cannot say that which way is the best way. Everybody has different ways of learning.

Sometimes some situations are inevitable. That means one person gets use these two features unconsciously. For example one person studies academic texts in target language setting. This person benefits from both instrumental use of language in one hand and on the other hand lives and becomes the member of that country(integrative motivation).

Attitude

Oxford Advance Dictionary (2010) defines attitude as: "the way that you think and feel about somebody or something. And, the way that you behave toward somebody or something shows how you think and feel". As we see from this definition attitude is a collection of beliefs towards language, people or things that have been formed gradually in passing of time. Ellis (2000) says that having positive motivation enhances learning a foreign language while negative attitude stops learning or makes it difficult. But on the other hand the teacher himself should have positive attitude towards a foreign language too. In new approaches of teaching the mistakes of students are tolerated and they are asked to use language in their everyday lives and they have a close relation with their teachers, so if teachers don't have positive attitudes they can transfer these attitudes to the students too.

Most of our attitudes towards the target language and its users are from unreliable sources. Mostly we get negative attitude just by watching movies or reading the stories or other resources that are not reliable. It is the duty of the teachers to explain, clarify and bring concrete examples to change this negative view of students and enhance learning.

LITERATURE REVIEW

Different researches and explorations have been conducted on the importance of motivation and attitudes in second language learning; that is, Chalak (2010) investigated motivation and attitudes of Iranian undergraduate EFL students towards learning English. The result of the study showed that the students of English translation were both intrinsically and extrinsically motivated. Moreover, the answers revealed that the students did not always try very much; they reproved

themselves for their failure in learning English. Therefore, as another motivating factor, more efforts by students could guarantee their success in learning English. Another factor is the attitude that they have toward English. Their responses in the questionnaire items reported that they believed that English was very important and they needed to learn it for both instrumental and integrative reasons (Chalak, 2010).

Al-Haj (2011) concluded that enhancing motivation in the EFL classrooms is the solution. The finding of the study showed that: First, teachers in secondary schools of the Gezira State do not give motivation to their students in EFL classes; second, these teachers are not professional enough to use motivation while teaching, this claim combines with the fact that these teachers do not use learning activities-like games, debates, etc.-which motivate the students while they are learning English as a foreign language. The role of using modals in writing, especially in research articles is so important that by them writers can convey their ideas and views in their writings, thesis or articles. Researchers also can get more information from articles through evaluating these markers and can specify their views about the articles. The function of meta-discourse in interpersonal relationship, texts and articles is as an appointment role that helps both readers and writers (Aboulalaei, 2013).

Fernandez (2001) investigated exploring the student's motivation in the EFLclass. The finding of the study revealed that the female students exhibit a higher degree of motivation than their male ones. Furthermore, the scores assigned by the girls to all the items in the battery of questionnaires were somewhat more and, in some cases, much more than those assigned by the boys. The greater motivational level of female students in comparison with that of the male ones in the L2 classroom has been evinced by previous studies.

According to Poursalehi et al., (2014), "investigations done by some researchers conclude that language learners who study L2/FL for educational benefit or personal profit accrue no advantage outside of the classroom. Undoubtedly, the chances and opportunities to utilize the L2/FL in the classrooms are always limited since language is taught as a subject only, and is not commonly used as communication outside the language classrooms. As Ellis (1994, p. 214) states, "formal learning takes place through conscious attention to rules and principles and greater emphasis is placed on mastery of the subject matter that was treated as a de-contextualized body of knowledge" (Ppoursalehi et al., 2014).

Lightbown and Spada (2002, p. 92) found that the "teacher's goal is to see to it that students learn the vocabulary and grammatical rules of the target language" and "the goal of learners in such courses is often to pass an examination rather than to use the language for daily communicative interaction." Against the above-mentioned statements, Lightbown and Spada (2002, p. 91) believe that through natural context "the language learner is mentioned to the language at work" or "in social interaction or where the instruction is directed toward native speakers rather than toward learners of the language." Therefore, the social significance is emphasized more than mastery of the subject matter (Lightbown & Spada, 2002, p. 92).

However, the important issue which determines and specifies the good language learners is their ability to utilize their class learning to raise their speaking skills. Macaro (2001, p. 38) studied the characteristic of effective speakers and mentions that these learners do not quit or hesitate for too long when they cannot consider how to say something. Often they find solution to solve the problem or ask the person they are speaking with to help them. In this way, they are involved in much more exposure and interaction with the L2. When they are not directly involved in the interaction, successful learners seem to use strategies to help them stay focused in the classroom."

According to Macro (2001), the more active ones will use strategies to attract the teacher's attention to them. It is believed that being aware of certain strategies in enhancing L2/FL speaking skills would help learners to acquire good speaking skills." This assumption is based on several theories in language learning strategies which postulate that learners' success in language learning or lack of it is attributable to the various strategies which different learners bring to tasks and not solely relying on environment per se. Therefore the role of classroom learning should not be underestimated (Macaro, 2001).

According to Lewis (1999, as cited in Poursalehi et al., 2014) language learners could take part in language classes through some questions. That is, they were asked by the teacher's explanation on how to translate a passage, sharing their ideas with their classmates and teachers, for example, by commenting briefly on the topic of discussion, making a connection between the current lesson and the previous ones, reporting the reading predictions, making inferences, making generalizations and determining their perspectives. According to Lewis (1999, p. 159), "learners took part in the language classes by adding data and information to someone else's perspective, agreeing or disagreeing, asking for clarification, giving examples from other readings, own experience or of other people's, presenting both sides of an argument and suggesting an untested hypothesis." According to Essberger (2000) and Rubin and Thompson (1982), the language learners take the opportunity to answer the questions asked by the teacher and do all classroom activities. Besides paired or group activities, communicative participation could also be accomplished by means of presentations which were presented by Essberger (1998).

RESEARCH QUESTIONS

The aims of this study will be investigated through the following research questions:

- 1- Are the students of Tabriz highly motivated towards learning English?
- 2- How does attitude of students of Tabriz increase towards learning English?

METHODOLOGY

The main purpose of this study was to explore and describe the motivation and attitudes of EFL students of Tabriz toward learning English. To achieve this purpose, a mixed method research with greater emphasis on qualitative approach was employed. This section is divided into different sections. The first section discusses the research question. The students' data were also gathered and described in the chapter. In order to address the questions about the various uses relevant to L1 and TL use in the classroom, the second section of the chapter defines the different

instruments that were employed. The data used for the transcriptions and subsequent data analysis were gathered using a teaching in order to capture the details involved in student interactions over a visit to the mentioned class. Then, the design of the study, materials along with procedures, and testing procedures was demonstrated. Also, the participants and the context of the study was introduced; that is, the present research explored and investigated the language attitudes and motivation of the students of the Tabriz in Iran where they are studying English as a foreign language in different institutes of this city. The study tried to find motivation orientations of the students of Tabriz towards English language and their attitudes towards learning English, and their cultures. Of course, the researcher checked the students' averages in last semester and according to them found the students' proficiency and level of studying.

Participants

The subject were 100 students who are from intermediate to advanced English speakers. 70 of them were female and 30 of them were male. They were from 15 to 35 years old. All of them had different course of study at school and university but since they had been studying there at least three years, they could use and understand English acceptably.

Context of the study

The sites for carrying out the field work for this observation was three private English language centers in Tabriz by the name of Farhang ,Albourz and Chitsazan. English is taught in different levels in these institutes from elementary to IELTS and TOEFL levels. Classes are three sessions a week and each session is 90 minutes. The main instruction materials which are used in these institutions are the series of Interchange books.

Instrument

Questionnaire which was adopted from Gardner's AMTB (1985) was used in this research. He classified the answers into 6 parts which include: strongly disagree, moderately disagree, slightly disagree, slightly agree, moderately agree, and strongly agree. This questionnaire has 104 items. Since all of the students know English, the questions were in English without their translations to their native language. Students answered the questions in the class in a whole session and didn't take them home. They were asked to read carefully and understand the questions and answer them precisely. They were told that if they had any problem in understanding the text they could ask them in their own language or in English. Students didn't have any stress to finish them on time because they were given enough time to answer to all of the questions.

Procedure

It was explained and clarified to the students that these questions were just used in the research and they are not used for identifying any specific students. The sample of these questions was given in the appendix. Different data were extracted from the questionnaire such as: interest in English, integrative orientation, instrumental orientation, desire to learn English, parental encouragement and attitudes towards learning English. Different number of other data could be extracted from this questionnaire but because it is unrelated to the research question we ignore it.

RESULTS AND DISCUSSION

The students' responses to the questionnaire were analyzed in descriptive form. The range of questions are: 1) Strongly disagree, 2) Moderately disagree, 3) Slightly disagree, 4) Slightly agree, 5) Moderately agree, 6) Strongly agree. Raw data was given to Microsoft Excel program and its mean (average) was calculated according to each of the research question. Seven factors were analyzed as follows.

Different questions in the questionnaire are about the interest of students in learning a foreign language.

Table 1: The average of the questions one by one

The number of questions	Average
Question 1	5.28
Question 12	1.98
Question 21	5.32
Question 32	1.71
Question 42	5.42
Question 55	1.94
Question 65	4.9
Question 76	2.74
Question 85	5.08
Question 95	3.44

Figure 1: The average of the questions one by one

The mean or average of scales used for this domain is 3,763. That means students answered to the questions of interest in learning a foreign language, between slightly disagree and slightly agree. That means the people of Tabriz are not strongly interested in learning a foreign language. Some other questions (items) in this questionnaire reveal the motivation intensity of the students of Tabriz. These questions are as follows:

Table 2: The average of the questions one by one

The number of questions	Average
Question3	3.03
Question 13	4.73
Question 23	3.16
Question 33	4.1
Question 44	2.76
Question 56	4.76
Question 67	2.42
Question 77	4.49
Question 87	3.92
Question 96	4.56

Figure 2: The average of the questions one by one

The mean or average of scales used for this domain is 3,804. That means students answered to the questions of motivation intensity, between slightly disagree and slightly agree. That means the people of Tabriz are not strongly motivated in learning a foreign language. The following set of questions is about the attitudes of students towards learning English language. Students of Tabriz answered these questions to show that they have positive or negative attitude towards learning English.

Table 3: The average of the questions one by one

The number of questions	Average
Question6	5.39
Question 18	1.4
Question 26	5.47
Question 38	2.86
Question 47	4.28
Question 62	1.38
Question 70	5.47
Question 82	1.63
Question 90	5.46
Question 100	1.92

Figure 3: The average of the questions one by one

The mean or average of scales used for this domain is 3,526. That means students answered to the questions of attitudes towards learning English, between slightly disagree and slightly agree. That means the people of Tabriz don't have strong attitudes that means positive attitude towards learning English.

The other domain for investigating is integrative motivation. The items that we consider to get the answer are:

Table 4: The average of the questions one by one

The number of questions	Average
Question8	5.63
Question 28	5.33
Question 50	5.02
Question 72	5.53

Figure 4: The average of the questions one by one

The mean or average of scales used for this domain is 5,377. That means students answered to the questions of integrative orientation, between moderately agree and strongly agree. That means the people of Tabriz have strong desire towards integrative orientation. This data shows that for the people of Tabriz integrative motivation that means having interaction and communication with native people are very important and they appreciate the way of living and the culture of native speakers.

The other feature that this paper investigated is the feature of instrumental motivation. As it was mentioned before this motivation deals with using language instrumentally in the situations such as getting a job, having exam and so on. The following items deal with this motivation.

Table 5: The average of the questions one by one

The number of questions	Average
Question15	5.01
Question 35	5.49
Question 59	5.35
Question 79	4.27

Figure 5: The average of the questions one by one

The mean or average of scales used for this domain is 5, 03. That means students answered to the questions of instrumental motivation, between moderately agree and strongly agree. That means the people of Tabriz have strong desire and motivation towards learning English instrumentally.

The following set of questions is about attitudes of the students of Tabriz towards learning English. It shows that they want to learn English as a foreign language or not. The questions are:

Table 6: The average of the questions one by one

The number of questions	Average
Question9	4.99
Question17	1.89
Question 29	4.61
Question 37	2.23
Question51	5.52
Question61	2.35
Question 73	5.53
Question 81	2.38
Question92	5.51
Question99	2.73

Figure 6: The average of the questions one by one

The mean or average of scales used for this domain is 3,743. That means, students answered to the questions of desire to learn English, between slightly disagree and slightly agree. That means the people of Tabriz don't have strong desire to learn English as a foreign language. The last domain of investigation is about parental encouragement. These items helped us to know how much parents are interested in English and encourage their children to learn it as a foreign language. The questions are as follows:

Table 7: The average of the questions one by one

The number of questions	Average
Question2	4.26
Question22	4.79
Question 43	4.42
Question 48	4.2
Question57	4.17
Question66	4.12
Question 86	4.69
Question 103	4.55
Question2	4.26
Question22	4.79

Figure 7: The average of the questions one by one

The mean or average of scales used for this domain is 4, 4. That means, students answered to the questions of parental encouragement, between slightly agree and moderately agree. It means that the parents of students in Tabriz encourage a lot their children to learn English as a foreign language. The general table for above mentioned domains is as follows. Number one to seven is different domains and 0 to 6 are mean or average of agreement.

According to above mentioned table and figures and numbers which were accessed by the researcher 7 items were analyzed and the accessed figure was demonstrated as below:

Figure 8: 7 items were analyzed and the accessed

In this table:

- 1: Interest in learning a foreign language
- 2: Motivation intensity

- 3: Attitudes towards learning English
- 4: Integrative orientation
- 5: Instrumental motivation
- 6: Desire to learn English
- 7: Parental encouragement

CONCLUSION

At the end, it is essential to point out that research is typically conducted with some limitations. Among the limitations of this study, we can refer to the reluctance or unwillingness or perhaps fear that most English as a Foreign Language EFL learners had before volunteering to participate in the study. Therefore, it is suggested to interpret results with some caution. The findings of the present investigation revealed that most EFL learners participating in this study held similar ideas toward the motivation and attitude. While the present investigation focused on English learners in Iran, the same issue can also be taken up in many other parts of the world. If the language researchers and teachers have information about students' attitude and motivation, they will be able to teach them in correct way and time.

Appendix A

Attitude/Motivation Test Battery (AMTB)

Student's level: -----

The following questions ask about your motivation in and attitude toward learning the English language. Remember there is no right or wrong answers; just answer as accurately as possible. Use the scale below to answer the questions.

1= Strongly disagree
2= Moderately disagree
3= Slightly disagree
4 = Slightly agree
5= Moderately agree
6= Strongly agree

1. I wish I could speak many foreign languages perfectly.	1	2	3	4	5	6
2. My parents try to help me to learn English.	1	2	3	4	5	6
3. I don't pay much attention to the feedback I receive in my English class.	1	2	3	4	5	6
4. I don't get anxious when I have to answer a question in my English class.	1	2	3	4	5	6
5. I look forward to going to class because my English teacher is so good.	1	2	3	4	5	6
6. Learning English is really great.	1	2	3	4	5	6
7. If Iran had no contact with English-speaking countries, it would be a great loss.	1	2	3	4	5	6
8. Studying English is important because it will allow me to be more at ease with people who speak English.	1	2	3	4	5	6
9. I have a strong desire to know all aspects of English.	1	2	3	4	5	6
10. My English class is really a waste of time.	1	2	3	4	5	6
11. I would get nervous if I had to speak English to a tourist.	1	2	3	4	5	6
12. Studying foreign languages is not enjoyable.	1	2	3	4	5	6
13. I make a point of trying to understand all the English I see and hear.	1	2	3	4	5	6
14. I don't think my English teacher is very good.	1	2	3	4	5	6
15. Studying English is important because I will need it for my career.	1	2	3	4	5	6
16. I never feel quite sure of myself when I am speaking in our English classes.	1	2	3	4	5	6
17. Knowing English isn't really an important goal in my life.	1	2	3	4	5	6
18. I hate English.	1	2	3	4	5	6
19. I feel very much at ease when I have to speak English.	1	2	3	4	5	6
20. I would rather spend more time in my English class and less in other classes.	1	2	3	4	5	6
21. I wish I could read newspapers and magazines in many foreign languages.	1	2	3	4	5	6
22. My parents feel that it is very important for me to learn English.	1	2	3	4	5	6
23. I don't bother checking my assignments when I get them back from my English teacher.	1	2	3	4	5	6
24. I feel confident when asked to speak in my English class.	1	2	3	4	5	6
25. My English teacher is better than any of my other teachers.	1	2	3	4	5	6
26. I really enjoy learning English.	1	2	3	4	5	6

27. Most native English speakers are so friendly and easy to get along with, we are fortunate to have them as friends.	1	2	3	4	5	6
28. Studying English is important because it will allow me to meet and converse with more and varied people.	1	2	3	4	5	6
29. If it were up to me, I would spend all of my time learning English.	1	2	3	4	5	6
30. I think my English class is boring.	1	2	3	4	5	6
31. Speaking English anywhere makes me feel worried.	1	2	3	4	5	6
32. I really have no interest in foreign languages.	1	2	3	4	5	6
33. I keep up to date with English by working on it almost every day.	1	2	3	4	5	6
34. The less I see of my English teacher, the better.	1	2	3	4	5	6
35. Studying English is important because it will make me more educated.	1	2	3	4	5	6
36. It embarrasses me to volunteer answers in our English class.	1	2	3	4	5	6
37. I sometimes daydream about dropping English.	1	2	3	4	5	6
38. I'd rather spend my time on subjects other than English.	1	2	3	4	5	6
39. It doesn't bother me at all to speak English.	1	2	3	4	5	6
40. I wish I could have many native English speaking friends.	1	2	3	4	5	6
41. I enjoy the activities of our English class much more than those of my other classes.	1	2	3	4	5	6
42. I would really like to learn many foreign languages.	1	2	3	4	5	6
43. My parents feel that I should continue studying English all through my life.	1	2	3	4	5	6
44. I put off my English homework as much as possible.	1	2	3	4	5	6
45. I am calm whenever I have to speak in my English class.	1	2	3	4	5	6
46. My English teacher has a dynamic and interesting teaching style.	1	2	3	4	5	6
47. English is a very important part of the school program.	1	2	3	4	5	6
48. My parents have stressed the importance English will have for me when I leave university.	1	2	3	4	5	6
49. Native English speakers are very sociable and kind.	1	2	3	4	5	6
50. Studying English is important because it will enable me to better understand and appreciate the English way of life.	1	2	3	4	5	6
51. I want to learn English so well that it will become natural to me.	1	2	3	4	5	6
52. To be honest, I really have little interest in my English class.	1	2	3	4	5	6
53. Native English speakers have much to be proud about because they have given the world much of value.	1	2	3	4	5	6
54. It would bother me if I had to speak English on the telephone.	1	2	3	4	5	6
55. It is not important for us to learn foreign languages.	1	2	3	4	5	6
56. When I have a problem understanding something in my English class, I always have my teacher for help.	1	2	3	4	5	6
57. My parents urge me to seek help from my teacher if I am having problems with my English.	1	2	3	4	5	6
58. My English teacher is one of the least pleasant people I know.	1	2	3	4	5	6
59. Studying English is important because it will be useful in getting a good job.	1	2	3	4	5	6
60. It worries me that other students in my class seem to speak English better than I do.	1	2	3	4	5	6
61. I'm losing any desire I ever had to know English.	1	2	3	4	5	6
62. Learning English is a waste of time.	1	2	3	4	5	6
63. I would feel quite relaxed if I had to give street directions in English.	1	2	3	4	5	6
64. I like my English class so much; I look forward to studying more English in the future.	1	2	3	4	5	6
65. If I planned to stay in another country, I would try to learn their language.	1	2	3	4	5	6
66. My parents are very interested in everything I do in my English class.	1	2	3	4	5	6
67. I tend to give up and not pay attention when I don't understand my English teacher's explanation of something.	1	2	3	4	5	6
68. I don't understand why other students feel nervous about speaking English in class.	1	2	3	4	5	6
69. My English teacher is a great source of inspiration to me.	1	2	3	4	5	6

70. I plan to learn as much English as possible.	1	2	3	4	5	6
71. I would like to know more native English speakers.	1	2	3	4	5	6
72. Studying English is important because I will be able to interact more easily with speakers of English.	1	2	3	4	5	6
73. I would like to learn as much English as possible.	1	2	3	4	5	6
74. To be honest, I don't like my English class.	1	2	3	4	5	6
75. I would feel uncomfortable speaking English anywhere outside the classroom.	1	2	3	4	5	6
76. Most foreign languages sound crude and harsh	1	2	3	4	5	6
77. I really work hard to learn English.	1	2	3	4	5	6
78. I would prefer to have a different English teacher.	1	2	3	4	5	6
79. Studying English is important because other people will respect me more if I know English.	1	2	3	4	5	6
80. I get nervous when I am speaking in my English class.	1	2	3	4	5	6
81. To be honest, I really have no desire to learn English.	1	2	3	4	5	6
82. I think that learning English is dull.	1	2	3	4	5	6
83. I would feel comfortable speaking English where both Iranian and English speakers were present.	1	2	3	4	5	6
84. I look forward to the time I spend in English class.	1	2	3	4	5	6
85. I enjoy meeting people who speak foreign languages.	1	2	3	4	5	6
86. My parents encourage me to practice my English as much as possible.	1	2	3	4	5	6
87. I can't be bothered trying to understand the more complex aspects of English.	1	2	3	4	5	6
88. Students who claim they get nervous in English classes are just making excuses.	1	2	3	4	5	6
89. I really like my English teacher.	1	2	3	4	5	6
90. I love learning English.	1	2	3	4	5	6
91. The more I get to know native English speakers, the more I like them.	1	2	3	4	5	6
92. I wish I were fluent in English.	1	2	3	4	5	6
93. I have a hard time thinking of anything positive about my English class.	1	2	3	4	5	6
94. I feel anxious if someone asks me something in English.	1	2	3	4	5	6
95. I would rather see a TV program dubbed into our language than in its own language with subtitles.	1	2	3	4	5	6
96. When I am studying English, I ignore distractions and pay attention to my task.	1	2	3	4	5	6
97. My English teacher doesn't present materials in an interesting way.	1	2	3	4	5	6
98. I am sometimes anxious that the other students in class will laugh at me when I speak English.	1	2	3	4	5	6
99. I haven't any great wish to learn more than the basics of English.	1	2	3	4	5	6
100. When I leave university, I will give up the study of English because I am not interested in it.	1	2	3	4	5	6
101. I would feel calm and sure of myself if I had to order a meal in English.	1	2	3	4	5	6
102. English is one of my favorite courses.	1	2	3	4	5	6
103. My parents think I should devote more time to studying English.	1	2	3	4	5	6
104. You can always trust native English speakers.	1	2	3	4	5	6

THE EFFECT OF CONTEXTUALIZED SPELLING ACTIVITIES ON IMPROVING HIGH SCHOOL EFL LEARNERS' SOUND- SYMBOL INTERACTIVE WRITING ERRORS

ABSTRACT

The present study investigated the effect of contextualized spelling activities on improving learners' sound/symbol interactive writing errors among high school students. To achieve this purpose, a dictation test was administered to seventy-five female language learners of Alzahra third grade high school in Ahvaz, Iran. Forty-five third grade learners were selected and non-randomly assigned to three experimental groups of contextualized, decontextualized and sentence level, each with fifteen participants. The participants in the decontextualized group received direct instruction in spelling rules at a time. The participants in the contextualized group learned spelling through reading passages. The participants in the sentence group produced spelling through writing sentences. In each group, every session was allocated to dictation and allowed students to correct their own misspelling words. Three groups used self-correcting technique, explicit spelling instruction, and multiple intelligence techniques for improving spelling through two months in the Fall semester, 2014. Statistical analyses were conducted through One-way ANOVA and Post-hoc Scheffe tests. Descriptive analyses of the post-tests showed that contextualized group improved effectively compared to the decontextualized and the sentence level groups. The study suggests that contextualized spelling rules may enhance learners' sound/symbol interactive writing and help them to develop their spelling in English language.

KEYWORDS: Contextualized spelling activities, Spelling, Writing errors

INTRODUCTION

Writing is the process of conveying thoughts and ideas into written messages. Writing is a contemplated and cognitive process which requires sustained intellectual effort over a considerable period of time. Good writing requires the writer to state himself/herself in a more effective way to concern spelling and dictation. Many writing components are including in writing thus, to accomplish a composition task, writers go through different stages of writing. Jenks (2003) stated that "the writing process is categorized in a five stages sequential pattern (pre-writing, drafting, revising, editing and publishing)" (p. 1). In second language (L2) instruction, writing ability is also a difficult skill and basic learning element for English as

foreign language learners. Unfortunately, writing is a difficult skill to be improved in a short period of time. The gravity of writing skill and its outstanding role in demonstrating students learning extent is obvious in the first or the second language.

Academics (e. g., teachers and professors) most favorably evaluate students through their writings. Thus, poor writing ability of students may endanger their academic success to a deliberate ability (Tan, 2011). Poor spelling also confines the writer's choice of words, which negatively affects creativity and guides to short and sometimes incoherent pieces of writing. However, it is more important for non-natives especially EFL learners in Iran provided with only restricted exposure to write in English. In order to transfer messages effectively, accurate spelling is strongly required. Spelling includes the connection of several skills, involving semantic and grammatical knowledge, knowledge of phonological representations, formulation of analogies with words in visual memory, knowledge of orthographic rule and conventions (Bradley & Bryant, 1985). Fagerberg (2006) suggested that, spelling is essential since one misspelling may change the meaning which the writer wanted to convey in the text. Teaching sound/letter corresponding to Iranian learners could be very complicated and that makes dictation as a time consuming task.

Spelling errors can be classified into phonological and orthographic errors. Al-Jarf (2009) indicated that phonological problems refer to errors in which the misspelled word does not sound like the target word because the whole word, a consonant, a vowel, a syllable, a prefix, a suffix, a grapheme or grapheme cluster is misheard. On the other hand, "orthographic problems refer to errors in which the misspelled word sounds like the written target word, but grapheme used for the misspelled part does not correspond with the target grapheme "(p. 9). Accordingly, there is no one-to-one match between letters of spelling and the sounds they present. Thus the mismatch between sound and spelling makes the problem of realizing the appropriate spelling for the sound which is heard by the learners.

Treiman and Bourassa (2000) indicated that although the English sound/spelling correspondence is inconsistent or not completely regular, knowledge of these with visual memorization can help spelling development. There are two different mechanism by which spelling of a word can be produced that affirm by dual-route model of spelling. First is a lexical route that words are processed orthographically through visual whole word recognition using the top-down approach. Second is a non-lexical route where by words are processed phonologically that is the transfer of letter-sound associations using the bottom-up approach (Brown & Ellis, 1991). It is commonly accepted that the connection of orthographical and phonological is essential for good spelling.

Kamhi and Hinton (2000) indicated that all assumption of spelling are involved a dominant role for phonological knowledge. Phonological knowledge is very important in the development of spelling and from the beginning stage of learning to spell. Learners without sound realization and phonological knowledge face problems in acquiring orthographic knowledge and will be embarrassed. Phonological knowledge is the most important in the development of spelling, reading and writing. However, language development has been closely related to the concept of phonological knowledge.

Multiple-intelligence is a technique that improves transfer of correct spelling into written. The International Dyslexia Association (2000) indicated that multiple-intelligence technique connects listening, saying, looking and writing in different associations. Thus, this technique helps visual and auditory of the learners to be successful in spelling. All learning intelligences and style could be involved in spelling instruction. The multiple intelligence technique can be connected to many different learning areas. It includes several subcategories including visual intelligence which commits to the ability to represent the spatial world internally in your mind. Interpersonal intelligence which is an understanding of other people which is a technique that asks of the learners work with a partner to spell words. Naturalist intelligence discriminates the human ability to distinguish among living things (animal, plants) and the researcher emphasizes the development of the verbal and writing. Self-correcting is a technique that students reread their own writing and make corrections.

Rana and Perveen (2013) indicated that utilize of self-correction increase the learners linguistic competence. In addition, learners would be able to define specific difficulties with their written work and this motivated those to review their work until they would be capable generate better quality work. This indicates that it is suitable and valuable for learners to correct their own work frequently. Hall (2014) argued that because spelling learning is so significant to young learners reading and writing development, it is important that explicit instruction and differentiated strategies be utilized to expand the favors of spelling teaching since the beginning years. She added that instructors can utilize formal and informal strategies along with data about their students in order to continually develop their instruction and improve students' outcome.

REVIEW OF LITERATURE

Spelling has always been of paramount important in Iranian educational system, and writing of both general and academic text has been the aim of many educational enters for years (Cook, 1999). This precisely can be due to the fact that there have been many people wishing to write the text of both academic and non-academics want to say in the target language, so that they can follow their aims regarding their profession and/or any other motivation they have. There for, in many language centers and institutions much attempt has to make by teachers to teach students the appropriate technique for writing accurate texts of target language they learn.

Kenuing and Verhoeven (2007) indicated that student's ability to spell is affected by diversity of skills, such as orthographic knowledge, phonological knowledge, knowledge of spelling rules and morphological awareness. Spelling instruction has been in the English curriculum since 1783, when Noad Webser prefaced the first Blue-Baced speller (Bloodgood, 1991, p. 11). Schlagal (2003) suggested that this book through teachers can teach grammar, spelling and pronunciation. Includes "series of words for all of students, and they are to be read as a rote memorization task" (p. 23). Rote memorization was utilized as the study technique. Templeton and Morris (2001) indicated that this technique conducted to the attention of instruct pupils to expand spellings of words (p. 18). In the beginning of the 20th century, a question was heightened by Schlagal (2003) whether "spelling must be taught in the context or to go on utilizing a series of words" (p. 27).

They admitted that words in series were persisted over teaching words in context, Thus for teaching spelling memorization persisted to be a way.

There were two basic system for teaching spelling in the 1930s, test-study-test system (i.e. take a pre-test at the center of the week, read misspelled words during the week, and take a re-test of all the words at the end of the week), and study-test system (i.e. read words during the week and take the test at the end of the week). Templeton and Morris (2001) equaled the two systems and indicated that test-study-test system was over the study-test system. Teachers indicated this approach frequently utilized in the students' daily writing that as way of read series of words.

Teachers carried much criticism about the words utilized in spelling guide books *Basal spellers* in the 1950s. They indicated that the words may have been considered for difficulty, but were not developing orthographic knowledge. Because of research results in this field and this criticism, Schlagal (2003) indicated that "authors began to plan a more functioning spelling system that included popular in the series words for instance common letter-sound patterns" (p. 43). The utilizing of series words in spelling texts was still persisted more the utilizing of spelling in context, during that period of time.

Spelling Instruction in the Classroom

Across the past thirty years, there has been deliberately argument between researchers and teachers relating suitable spelling instruction (Schlagal, 2003). The debate of spelling instruction has been existed among researchers and teachers with a reformist view and those with traditional view. Marten and Graves (2003) indicated that "Traditional spelling is more a rote routine and an engaging craft; the focus is on memorization, the lessons, the word series, and the spelling tests"(p, 22). Schlagal (2003) added that "the words themselves should be memorized as separated items but the words that are given to students may have an overall common character (i.e. homophones). By memorizing those words, many learners will have lost the spelling of the words by next day but may aid some learners proposed on the spelling test" (p. 35). Scott (2000) suggested that a teacher with traditional view delivers her/his learners a series of words at the starting of the week, accomplish drill during the week, and gives a test at the end of the week. Learners will not be able to spell or utilize the words correctly when putting the words to actual utilize or when writing, if they cannot remember spelling of some words by next day of the test.

In accession, as well instructors with traditional view depend weightily on the utilizing of a spelling textbook. Scott (2000) indicated that the "activities or methods in a workbook or text book furnish little or no instructions for students to usage what they learned in tangible writing tasks"(p. 18). Schlagal (2003) indicated that these spelling books are utilized regardless of the different needs of the learners in the class and invented for a specific grade of instruction. Larson, Hammill and Moats (1999) added that "it can make obscure for some learners to accomplish the activities from a workbook or textbook because all learners are not at the same level developmentally" (p. 37).

Spelling and Writing

Moats (2006) stated that, there is a strong connection between spelling and writing. She added that, writing is a mental manipulating task that depends on automatic utilization of fundamental skills, such as grammar, handwriting, punctuation and spelling, so that the writer can hold follow of such matters like word choice, authentic needs, topic and organization. Writers who should think too hard about how to spell utilize expensive able cognitive resources required for higher level of composition (Singer & Bashir, 2004).

Moat (2006) added that, poor spellers may limit what they write to words that they can spell, with unavoidable loss of verbal power, or they may lose follow of their thinks when they spell a word. It is required for learners to have endured with verbal and written language, containing phonemic knowledge, to certain that learners are victorious in their own written work.

Baiely, Borczak, and Stankiewicz (2002) concluded that, "the first factor affecting the success of writers was a lack of experience with language". They added that, "in order for children to be successful in written language, they must have a strong verbal language developed, which is often based in phonemic awareness" (p. 22). The basic problem among most learners is to spell words accurately and this shows the limit of useful spelling knowledge and these learners can inhibit their ability to write (Baleghizadeh & Dargahi, 2011).

On the basis of the argument of the El Koumy (2002) argued that there were two chief approaches for pretend the teaching learning process and foreign language instruction and learning area for over the last two decades: (1) "the skill-based approach, sometimes appeared as the "formal" or "intentional", "direct" instructional approach and (2) the whole-language approach, sometimes appeared as the "informal", or "indirect", "incidental" learning approach" (p. 11). Each approach will be described in the following section.

The Skill-Based Approach

The skill-based approach takes its theoretical feathers from structural linguistics and behavioral psychology. Supporters of the skill-based approach believed language as a set of disunited skills. Each skill is distributed into pieces and bits of sub skills. These sub-skills are progressively trained in a predetermined following through modeling, exception and direct explanation. El Koumy (2002) indicated that the skill-building instructor permanently utilize discrete point test (e.g. true or false, fill in the blanked, and multiple-choice) to evaluate the principle of each sub-skill before go to the next. The skill-based approach believes in spelling as one of the sub skills included in reading and writing. It also considers that spelling includes many micro-skills like as word structure, phonetic, and letter-naming. Spelling rules may be learned through mechanical drills (Baleghizadeh & Dargahi, 2011).

Studies Related to Developing Spelling

In order to see the effect of self-correction and strategy-instruction, or no-correction technique in improving spelling performance and spelling consciousness program, a research was designed by Cordewener, Bosman, and Verhoeven (2014). In this study, the population of the research included 73 third grade students between 7 and 9 years old. Students were divided based

on a median split, into low-skilled and high-skilled spellers. Assignment to the three conditions was based on the scores on the standardized spelling pre-test, consciousness score on the pre-test, their age and their sex. Instruments of the study were pre-post test and, retention test. The matching procedure resulted in a distribution of the students in the three conditions did not differ on standardized word spelling. After gathering of the data, the results showed that students in all three conditions made develop between pre-test and post-test. This study explained how spelling performance and spelling consciousness can be improved by a spelling training. This study also indicated that instruct students as a structured way to spell words lead to positive outcome for their spelling performance. It study indicated that strategy instruction was effective for low-and high-skilled spellers. Self-correction may lead to self-confidence. Self-confidence may have had an influence on the development on spelling consciousness. Direct self-correction appeared to be more effective to improve spelling consciousness, self-correction directly after dictation to stimulate their thinking about spelling and, self-correcting directly after dictation is also effective to improve both spelling performance and spelling consciousness.

In a program of explicit and implicit instruction, Cordewener, Bosman and Verhoeven (2014) aimed to help good and poor spellers for the acquisition of morphological and phonological of spelling rule. In this program 193 students (94 girls, 99 boys) between the age of 5 and 9 years old take part. The learners were assigned into low-and high skilled speller based on their scores on word-spelling test. The learners were specified to the implicit, explicit, and control conditions were matched based on their scores on reading and spelling test. Prior to the training, the pre-test was performed, two week after the pre-test, the morphological spelling training started. The training involved of six sessions, the week after the training, the post-test was administered. In implicit training sessions, visual dictation was utilized and for explicit training the morphological rule for words was taught. And explicit training started with an explanation of the purpose of training to explain the differences in development between pre-test and post-test for learners in the explicit instruction, implicit, and control condition and for control condition there was no training. Subsequent post-hoc tests cleared that learners in explicit condition made more progress than learners in control condition, the learners in explicit instruction made progress between pre-test and post-test consciousness. Explicit- rule instruction and explicit spelling instruction of a structured approach to spell words are effective ways to teach learners how to spell. Moreover, applying a metacognitive aspect to explicitly stimulate learners to think about their spelling was also effective. Explicit instruction of spelling rules or a structured approach to spell words appeared to be effective for both poor and good spellers. However, in their studies explicit instruction approach to most effective for both high- and- low skilled spellers and explicit instruction most likely lead to explicit learning.

RESEARCH QUESTIONS

The main research questions of the study are as follows:

RQ1: Is there any difference between the learners who learn contextualized, de contextualized, and sentence level spelling rules?

RQ2: Do contextualized spelling rules develop learners' sound/symbol writing?

RQ3: Do de contextualized spelling rules develop learners' sound/symbol writing?

METHODOLOGY

Participants

To select the homogeneous participants, a dictation test was administered following Kibble and Milles (1994) and Feez (2001) to ten students to pilot the reliability of the pre-test in Alzahra high school, Ahvaz, Iran. Meeting the reliability, forty-five students out of 75 students were selected based on their performance on the pre-test. The selected participants were female and they were non-randomly divided into three experimental groups, fifteen participants each. They were decontextualized, contextualized, and sentence level groups. The research took two months in Fall semester, 2014.

Instrumentations

Three instruments were utilized in the process of the development of the present research. Initially, the pilot test was made to make the pre-test reliable and practical based on the Kibble and Milles (1994) and Feez (2001) dictation test, who suggested the use of already familiar words in the dictation tests. The test consisted of words which will be chosen from the passages of their course book. The reliability of the test was ($r=.691$) based on KR-21 formula. The second instrument was a pre-test that functioned as a homogeneity which test included 80 words. The third instrument was a post-test (i.e., a modified pre-test) which was administered to determine the effectiveness of experimental groups spelling techniques. At the end of the treatment 80 words were used in the post-test of the experimental groups. Regarding the treatment, word and sentences as well as the passages were prepared and taught in the three experimental groups. The reliability of the piloted post-test was calculated through KR-21 formula as ($r=.736$).

Materials

The third grade English text book which was used as the materials. The book contain six lessons, each lesson contains a list of vocabulary, reading comprehension, speaking, listening, writing and grammar with exercises such as complete the sentences, and answer the questions. The learners were encouraged to study target words of each lesson. In each session, words from the list were chosen and used in the dictation tasks.

Procedure

This study was conducted at Alzahra high school of Ahvaz, Iran. The first step was to accomplish this study, to do so, a week before the instruction the researcher administered a pilot test as a dictation test (Kibble & Milles, 1994; Feez, 2001) to 10 learners in order to make pre-test practicality and reliability that contained 80 words. In the next step, the researcher administered pre-test of spelling developed based on Kibble and Milles (1994) and Feez (2001) to 75 learners that function as homogeneous test 45 female EFL learners out of 75 third grade high school will be chosen through a pre-test which is used in order to determine how well the subjects know the content and to compare the results of test to see the effect of treatment. Based on the results of this test, 45 EFL learners non-randomly divided into three experimental groups, decontextualized group, contextualized group and sentence level group. The participants in the decontextualized group received direct and explicit instruction in spelling rules at a time. Example, add (s, es, ies) to form plural from singular nouns. In this group, the researcher takes a board dictation circle the misspelled words, spell it and write the correct form in every session. The participants in the

contextualized group learned spelling through reading. In this group, students observed how the spelling rules were applied in reading passages. They also developed visual image of the words in this passage. Also, teacher give papers to students that they should underline the misspelled words and teacher said them look the correct form of the word-say-write-check it again.

The participants in sentence group produced spelling through writing. In this group, the students applied the spelling rule explained to actual writing task such as short sentences, answers for written question. Additionally, the teacher gave papers to students to select the misspelled words underline and work with a friend to say/spell words. In each group, the emphasis in the classroom was on the development of verbal ability of the learners. Practices like, add-ending-prefix-suffixes, draw the words- illustrate the meaning, draw the words as they sound-arrange your words into-chains-letters, and form peer-coaching teams to help learn words were performed in the three groups. Generally, the spelling techniques such as self-correcting, explicit instruction, and multiple intelligence techniques were selected on the basis of exercises which were mainly used in English books for general purposes and for improving spelling and writing achievement for third grade high school students. The treatments introduced to the learners for six weeks including one session each week with each session in each session one lesson will be taught lasting 45 minutes, having provided the three groups with different type of treatment. Throughout the 2 months of the Fall semester, the participants in the experimental groups made their endeavor to practice and apply the spelling techniques of the explicit instruction, self-correcting and multiple-intelligence to promote their spelling skill. The participants in the experimental groups were constantly reminded to use comprehensive spelling techniques during the whole treatment course when they were engaged in spelling tasks. Finally, two weeks after the end of the treatment period, the post-test of dictation given to the participants to test improving spelling proficiency and to see the real effect of the treatment. Some items were modified or changed to remove the learners reminding of the pre-test. The present study consists of the two variables, the dependent variable is considered to be the performance of students on spelling and the independent variables are the comprehensive techniques of explicit instruction technique, self-correcting technique, and multiple-intelligence technique.

Data Analysis

In order to determine the effect of using spelling techniques on Iranian high school EFL learners, the data were collected through spelling the pre-test and post-test. Descriptive statistics including means, standard deviations and variances of the scores were calculated. Data were analyzed by One-way ANOVA to find out whether the differences between the three groups' pre and post-tests were statistically significant.

RESULTS AND DISCUSSION

This section deals with the results obtained throughout the research and analytically scrutinizes the groups' performance in the study in the three experimental groups. Descriptive statistics of the pre-test in the three groups is presented in the Table 1.

Table 1: Descriptive Statistics(pre-test)

Tests	N	Mean	Std. Devia tion	Std. Error	95% Confidence Interval for Mean		Min.	Max.
					Lower Bound	Upper Bound		
Contextualized	15	14.33	1.92	.49	13.26	15.40	12.25	18.75
Decontextualized	15	15.30	1.46	.37	14.48	16.11	13.00	18.50
Sentence level	15	15.28	2.98	.76	13.63	16.93	12.00	19.50
Total	45	14.97	2.21	.33	14.30	15.63	12.00	19.50

Table 1 shows that in the present study, there were 15 students in each of the three groups were females. The results of the pre-test and post-test showed that mean of score in contextualized group was 14.33. The mean of score in decontextualized group was 15.30. The mean of score in sentence level was 16.2. The total mean of three groups was 15.28. In order to understand the degree of proximity among the pre-tests, One-way ANOVA was administered and after the statistical analysis.

Table 2: One-way ANOVA (pre-test)

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	9.186	2	4.593	.934	.401
Within Groups	206.592	42	4.919		
Total	215.778	44			

Table 2 shows that that since the observed F (1.775) is less than the critical F (3.22) with $df=42/2$, the difference between the pre-test in the three groups is not significant ($p<.05$). Descriptive statistics on the post-test is presented in Table 3.

Table 3: Descriptive Statistics(post-test)

	N	Mean	Std. Devia tion	Std. Error	95% Confidence Interval for Mean		Minimum	Maximum
					Lower Bound	Upper Bound		
Contextualized	15	17.78	2.17	.56	16.57	18.98	11.50	19.75
Decontextualized	15	15.78	2.73	.70	14.27	17.29	12.00	19.75
Sentence level	15	16.80	2.09	.54	16.64	18.95	14.00	20.00
Total	45	17.12	2.48	.37	16.37	17.86	11.50	20.00

Table 3 shows that the mean of the score in the contextualized group was 17.78. The mean of score in the sentence level group was 17.80 and the mean in the decontextualized group was 15. of mean of the scores among three groups' significance differences was observed.

Thus there was a significant difference between the experimental groups. Since the present study investigate the effect of decontextualized, contextualized, and sentence level rules on the EFL spelling learner's proficiency, the performance of the participants of each group was taken into consideration. Therefore, One-way ANOVA was used to determine whether the observed F was significant at .05 level. The results of the One-way ANOVA are presented in Table 4.

Table 4: One-way ANOVA (post-test)

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	40.33	2	20.168	3.651	.035
Within Groups	231.99	42	5.524		
Total	272.32	44			

Comparing the observed F (4.678) with the critical F (3.22) with df=42/2, the difference between the post-tests in the three groups is significant ($p < 0.035$). It means that the three groups are different due to the treatment of the present research. Results of the post-hoc Scheffe test which determine the exact difference between the groups.

Table 5: Post-hoc Scheffe test, Multiple Comparisons

(I) Tests	(J) Tests	Mean Difference (I-J)	Std. Error	Sig.	95% Interval Lower Bound	Confidence Interval Upper Bound
Contextualized	Decontextualized	2.000*	.858	.078	-.17	4.17
Decontextualized	Sentence level	-.016	.858	1.000	-2.19	2.16
	Contextualized	-2.000*	.858	.078	-4.17	.17
Sentence level	Sentence level	-2.016*	.858	.075	-4.19	.16
	Contextualized	.016	.858	1.000	-2.16	2.19
	Decontextualized	2.016*	.858	.075	-.16	4.19

*. The mean difference is significant at the 0.05 level.

Table 5 shows that the Post-hoc Scheffe test which analysis, it made clear that there is a significant difference among the three groups in the post-test. Post-hoc Scheffe test was performed to show the multiple-comparison of the three groups. It shows that, difference between contextualized and decontextualized was significant. Consequently, the result showed that participants who worked in sentence level group outperformed the participants who worked in decontextualized. It was concluded that the participants who worked in the sentence level group did better than the participants who worked in the decontextualized group. Difference between sentence level and contextualized was also significant. In short, the participants in the contextualized group had better performance than the participants of sentence level group.

Discussion

The results showed that, the spelling of three groups improved and there was a significant difference between the contextualized group and the other groups. As a whole, the study showed that the spelling techniques were effective in improving EFL learners' development of the spelling proficiency at the third grade high school level of English. This result can approve that, the learners who learned spelling rules in the contextualized group outperform the learners who learned spelling the rules in the sentence level and the decontextualized groups. According to the results of this study, the most effective group among the three groups was contextualized group who were outperformed the other groups in achieving the higher mean in spelling proficiency post-test since they have been more successful in using the spelling rules. Results revealed better results among contextualized than decontextualized and sentence level group in sound/symbol interactive writing development. The reason might be due to the fact that the contextualized group pays more attention to this rule and those three techniques while writing in the context which support the meaning of the word and its spelling /sound relation to other words in association.

Generally, contextualized group used the self-correcting, explicit instruction, and multiple intelligence technique and this might be due to their potential attention of those factors in the text. However, this does not mean that the decontextualized and the sentence level group have ignored the role of those three techniques in developing sound/symbol interactive writing. In other words, the decontextualized and the sentence level group used those three techniques but they had the spelling/sound relations out of the context and this made them confused due to the lack of contextualized support. The context may help them the contextualized groups monitor their own writing based on their phonological knowledge, develop their fluency, made meaningful context, and develop their visual image of the word in the text. This lacked among the decontextualized and the sentence level groups. Thus using context or sentence structures for teaching spelling may promote sound/symbol interactive writing of female learners. One possible explanation on these findings is that providing a lot of corrective writing and spelling activities and techniques in the process of teaching and learning by teachers in the classrooms especially while the students are participating in the writing activities may act as an affective role on participants' writing and on their participations in the classroom. When the students do not have motivation for writing and taking part in the classroom activities, it will affect on their accuracy negatively. Thus they may show better progress in accuracy and spelling proficiency by

providing appropriate spelling techniques such as, explicit instruction, self-correcting, and multiple intelligence technique.

The results showed a significant improvement in the participants' sound/symbol interactive writing. Compared to the result of their performance in pre-test, the mean score of their pre-test was less than the mean score of their post-test. It was observed that the difference between the post-test was significant ($p < .05$). However, it was less than the contextualized group. Sentence level group turned out to have improved better than the decontextualized group sound/symbol interactive writing. Based on these findings, The reason for the develop performance of students in sentence level group might be due to the fact that utilizes of writing activities and writing exercise of their course book may help learners to develop spelling at the sentence level. The findings of this study are against Scott (2000) who suggested that, activities in a text book divided little or no management for learners to exercise what they learned in actual writing task. Moreover, the results of this study are opposite with the study that Johnstone (2001) did. Book exercises and sentence activities are not satisfactory to develop spelling proficiency. In the present study context was reduced to sentence level to evaluate the effect of sentence as a mini text on learners spelling proficiency.

The results also showed that its effect was less than the effect of contextualizes level. The development of learners in spelling proficiency might be due to the fact that, learner's motivation in learning and spelling target word increase through sentence practice. It showed that pedagogical activities might provide strong motivation for students to learn English and to practice language and writing activities might stimulate thinking. Most importantly by using self-correcting technique in sentence level group as a means of correcting misspelling word learners might encourage and this help them to monitoring their writing at the sentence level develop their accuracy. One possible explanation of these finding is that providing writing exercises in the process of teaching and learning by teacher in the class especially while students have purpose may be very interesting for them because these drills help them to be reflective and responsible and give them a chance to produce something.

CONCLUSION

This study began with the assumption that contextualized, decontextualized, and sentence level spelling rules could enhance the third grade high school language learners' spelling proficiency. The instruction lasted for the two-month semester. During this time, the teacher (researcher) employed the spelling rules and self-correcting techniques, explicit instruction techniques, and multiple intelligence techniques to teach spelling. The null hypothesis of the study in the contextualized group was rejected since there was a significant difference between the pre-and the post-tests. The null hypothesis in the sentence level group was rejected since there was a significant difference between the pre-and post-tests. The null hypothesis of the study in decontextualised group was accepted since there was not a significant difference between the pre-and post-test. The results of the post-test indicated that the instruction of spelling rules of the contextualized group did affect the third grade high school female language learners spelling proficiency. That is, the spelling proficiency of the contextualized group who had made the use

of contextualized spelling rules and activities such as self-correcting, explicit instruction, multiple intelligence techniques to outperform the decontextualized and the sentence level groups.

The application of contextualized spelling rules for writing and spelling proficiency resulted in successful learning among females. Language learners who are successful in their writing and spelling proficiency might draw on this strategy more frequently than do those who are poor in their writing and spelling proficiency. Of course, poor spellers may utilize other contextualized spelling activity but they are less frequent users of this activity. The value of contextualized spelling activities use of contextualized spelling rules should be discussed by teachers who teach at the high school level. Therefore, the use contextualized spelling activities use of contextualized spelling rules of should be more brought to notice among students of writing classes in particular based on what results of the study suggested.

The results of this research can lead the future researchers to investigate other language skills. Other skills such as listening comprehension or reading skills are recommended to be investigated in future. Females just took part in this study but both males and females may participate in future studies as well. Learners who studied English as a foreign language took part in this study. Moreover, the same study can be replicated in other situations such as ESL situations and even among native speakers' contexts. Furthermore, this research was conducted on the high school EFL learners at Alzahra high school in Ahvaz. Other levels of language skills can also be studied if the researchers like to make generalizations about language learners at different proficiency levels. Eventually, this study lasted for two months. Succeeding studies can allocate more time to study the effects contextualized spelling activities on EFL learners' writing and spelling proficiency.

ABSTRACT

Due to the lack of preparation for the speaking activities, some of the English as a Foreign Language (EFL) students face serious problems in speaking skill. The present study aims at investigating the relationship between brainstorming and role-play as the two widespread pre-speaking activities which was carried out between the two class groups –students undertaking a full-course of study in Lang. Lab. 2 in Islamic Azad University, Dezful branch, Iran and through a standard proficiency test derived from NTC's TOEFL Test, it was observed that the students were homogeneous. Each class group was given necessary treatment separately to implement each of the mentioned pre-speaking activities as a warm up before the speaking phase in five sessions. Then, based on the speaking scale developed by Farhadi et al (1994) an interview ranging from 1 to 6, where 1 means memorized proficiency and 6 stands for native proficiency, was utilized for each class group to assess EFL students' speaking proficiency, and the obtained scores were applied in one independent sample t-test. Since the t-observed was more than the t-critical, the first hypothesis was verified. That is, those who implement brainstorming as their pre-speaking activity have a stronger performance in their speaking phase than those who utilize role-play as their pre-speaking activity. The pedagogical implications of the present study are 1) recognizing the EFL students' tendency to brainstorming as the most provoking pre-speaking activity 2) providing the students with an atmosphere wherein brainstorming can be implemented before the speaking phase.

KEYWORDS: Brainstorming, Role-play, Pre-speaking, speaking phase

INTRODUCTION

Most of the EFL students face serious problems in speaking skill because of inadequate preparation for the speaking activities. They should be taught how to prepare for the speaking phase when they arrive in language classes. The purpose of pre-speaking is to activate language, motivate speakers, prepare ideas, and help students bring their background knowledge (schemata) to the specific context of the lesson. As stated by Rezaei (2013), in pre-speaking activities, four features need to be determined, i.e., the topic of speaking lesson, the purpose of speaking lesson, the audience to which speakers speak, and the format of speaking, or whether it is a conversation, discussion, monologue, presentation, formal speech and so forth. Likewise, based on Vilimec

(2006), this stage includes two focus areas: engage-instruct-initiate sequence, and grouping students. The first area concerns engagement of students, techniques for drawing attention or involving students, providing students with instructions and initiating students to start the activity. The second area deals with setting students into groups, providing this is required by the nature of the activity. Kayi (2006) introduced some of these activities including discussion, simulation, role-play, simulation, story -telling, information gap, brainstorming, story completion, reporting and so on among which brainstorming and role-play seem more influential than others. Brainstorming as a pre-speaking activity motivates students to produce ideas in a limited time. Depending on the context, either individual or group brainstorming is effective and learners generate ideas quickly and freely. The good characteristic of brainstorming is that the students are not criticized for their ideas so students will be open to sharing new ideas. Another pre-speaking activity is role-play in which students pretend they are in various social contexts and have a variety of social roles, and the teacher gives information to the learners such as who they are and what they think or feel (Harmer, 1984).

REVIEW OF LITERATURE

Speaking Theories

According to Gower et al. (1995), speaking as a productive skill has many different aspects including two major categories – accuracy, involving the correct use of vocabulary, grammar and pronunciation practiced through controlled and guided activities and, fluency, considered to be ‘the ability to keep going when speaking spontaneously’. Bygate (1987) states that in order to achieve a communicative goal through speaking , there are two aspects to be considered – knowledge of the language, and skill in using this knowledge. It is not enough to possess a certain amount of knowledge, but a speaker of the language should be able to use this knowledge in different situations. Based on Bygate (1987) , speaking skill is viewed as comprising two components: production skills and interaction skills, both of which can be affected by two conditions: firstly, processing conditions, taking into consideration the fact that ‘a speech takes place under the pressure of time’; secondly, reciprocity conditions connected with a mutual relationship between the interlocutors. Production skills involve two aspects – facilitation and compensation, brought about by processing conditions. Both devices help students, besides making the oral production easier or possible, sound more naturally. Interaction skills, on the other hand, involve routines and negotiation skills. Routines present the typical patterns of conversation including interaction and information routines. Negotiation skills serve as a means for enabling the speaker and listener to make themselves clearly understood. This is achieved by two aspects: management of interaction and turn-taking. With regard to the elements of speaking that are crucial for fluent oral production, Harmer (2001) distinguishes between two aspects – knowledge of ‘language features’, and the ability to process information on the spot or mental/social processing. According to Harmer (2001), to wage oral communication, participant should possess knowledge of language features, and the ability to process information and language on the spot. Language features involve four areas – connected speech, expressive devices, lexis and grammar, and negotiation language. If the speaker possesses these language features, processing skills, ‘mental/social processing’, will help him or her to achieve successful

communication goal. Processing skills include language processing, interacting with others, and on-the-spot information processing.

Speaking with Regard to Communicative Competence

As Revell (1991) stipulates, beginning with Noam Chomsky (1965) and his distinction between competence as the speaker's intuitive knowledge of the rules of his native language', and performance as 'what he actually produces by applying these rules', the theory of communicative competence has gone through a serious development so far. Brown (1994) discusses several theories of communicative competence as they developed through periods of time, of which the most notable ones include the studies by Hymes (1967), Savignon (1983), Cummins (1979) or Canale and Swain (1980). In accordance with Brown (1994), the newest views are probably best captured by Lyle F. Bachman (1990) in his schematization of what Bachman calls 'Communicative Language Ability' (CLA) which comprises two basic features – firstly, knowledge, competence in the language, and, secondly, the capacity for implementing or using the competence. Bachman proposes three components that in his view 'communicative language ability' framework includes language competence, strategic competence, and psychological mechanisms. While language competence is a set of specific knowledge components that are utilized in communication via language, strategic competence is the term that Bachman uses to characterize the mental capacity for implementing the components of language competence in contextualized communicative language use; the third component, psychophysiological mechanisms present the neurological and psychological processes involved in the actual execution of language as a physical phenomenon.

Speaking Activities in Relation to Communicative Language Teaching

As Brown (1994) describes, it has been the philosophy of communicative language teaching (CLT) for many years to teach foreign languages through communicative approach which focuses 'on speaking and listening skills, on writing for specific communicative purposes, and on authentic reading texts'. Brown (1994) defines the most important features of CLT:

- 1) Classroom goals are focused on all of the components of communicative competence and not restricted to grammatical or linguistic competence.
- 2) Language techniques are designed to engage learners in the pragmatic, authentic, functional use of language for meaningful purposes. Organizational language forms are not the central focus but rather aspects of language that enable the learners to accomplish those purposes.
- 3) Fluency and accuracy are seen as complementary principles underlying communicative techniques. At times fluency may have to take on more importance than accuracy in order to keep learners meaningfully engaged in language use.
- 4) In the communicative classroom, students ultimately have to use the language, productively and receptively, in unrehearsed context.

Harmer (2001) when suggesting features of CLT implies that 'the language learning will take care of itself' and agrees with Brown that the accuracy of the language is less important than successful achievement of the communicative task. In relation to communicative language teaching, Revell (1991) reminds that 'theories of communicative competence imply that teachers

must do more than just supply learners with a number of language structures to manipulate' and suggests that it is necessary to make a link between 'linguistic competence' and 'communicative competence'. Accordingly, Littlewood (1991) raised a solution for bridging the gap by categorizing activities into two groups: pre-communicative activities, and Communicative activities. The aim of the pre-communicative activities is to 'help the learners develop links with meanings that will later enable them to use this language for communicative purposes'. Pre-communicative activities are therefore divided into two subcategories: 'structural activities', such as mechanical drills or verb paradigms, for producing accurate and appropriate language forms; and, 'quasi-communicative activities', such as question-and-answer activities, giving directions to a stranger basing learner's replies on, for example, a town plan, or questionnaires, which bear a potential functional meanings of the language (Littlewood 1991). Correspondingly, Millrood (2001) believes that Speaking lessons are normally offered in three main phases, namely pre-speaking, while-speaking, and post-speaking phases and classroom activities are accordingly divided into three main categories, i.e., pre-speaking, while/during-speaking, and post-speaking activities. Pre-speaking activities are considered as a warm-up and prepare the learners for the main speaking activity. In order to activate language, motivate speakers, prepare ideas, and helps students bring their background knowledge (schemata) to the specific context of the lesson. Students are asked to encourage ideas about the topic by means of fruitful pre-speaking activities such as brainstorming. In pre-speaking activities, four features need to be determined, i.e., the topic of speaking lesson, the purpose of speaking lesson, the audience to which speakers speak, and the format of speaking, or whether it is a conversation, discussion, monologue, presentation, formal speech and so forth. While-speaking activities compose the body of speaking lessons. Students are encouraged to engage in some sort of interactive exchange of information or communication. They may be asked to play a role given to them in as in role-playing activities, to find a solution to a problem posed for them as in problem-solving activities, or to play in an interesting game that teacher introduces, and all these activities aim to provide them with suitable opportunities to express their feelings, describe things, explain them clearly, ask questions and ask for what they need, discuss things in small or larger groups, and so on. And in post-speaking activities a rethinking process is at work. The learners are encouraged to reflect on the activities which were just done and on their own performance, bring language they have acquired into more focus, further focus on the ideas they have just come up with, and produce spoken language integrated with the other skills, that is not merely oral production, but a combination of two or more skills simultaneously. They aim to promote critical thinking in learners which paves the more language development.

RESEARCH QUESTIONS

The aim of this study was to answer the following questions:

1. Is there a significant relationship between brainstorming and role-play in pre-speaking phase?
2. Is brainstorming more effective than role-play in pre-speaking phase?

Hypotheses

Hypothesis 1: It is believed that those who implement brainstorming as their pre-speaking activity have a stronger performance in their speaking phase than those who utilize role-play as their pre-speaking activity.

Null Hypothesis: There is no relationship between brainstorming and role-play.

METHODOLOGY

The study aims at investigating the relationship between brainstorming as one of the most applicable pre-speaking activities through which students can produce ideas freely in a limited time and role-play as another widespread pre-speaking activity in which students are assigned different roles which they may have outside the classroom environment, in real life . It is to be noted that the students in both two classes were involved in a context in which they were incapable of speaking fluently due to the lack of any preparatory steps which could help foster their speaking ability.

Setting

The setting for this study included the language laboratory in the Humanities faculty of Islamic Azad university, Dezful branch, Dezful, Iran.

Participants

The investigation of pre-speaking activities was intended for 60 typical second – semester college students of Islamic Azad University, Dezful branch, Dezful, Iran who were studying "Lang Lab 2" as their main course in two homogeneous classes. The criterion for focusing on this selected population was a proficiency test in grammar, reading comprehension and vocabulary in English. There were 30 students in each class. Each class group whose teacher was the same was taught separately to speak based on one specific pre-speaking activity, in one class Brainstorming and in another one Role-play.

Instrumentation

To use necessary items for proficiency test, 20 vocabulary questions 20 grammatical items and regarding reading comprehension, 10 questions were raised from NTC'S TOEFL test. All together, the proficiency test included 50 questions and each question had a two- point mark with the total of 100 points. Based on the statistical description of the proficiency test, it was observed that the Mean of the first group was equal to 84.59, the Minimum score was 68 and the Maximum score was 98. The Mean of the second group was equal to 84.00. The minimum score was 70 and the Maximum score was 96. Regarding the results of the proficiency test, the mean difference of the proficiency tests was equal to 0.59 that showed a reasonable difference level to compare the two classes for this research. Having taught each class group how to initiate their speaking activities via one of the two pre-speaking activities, brainstorming and role-play, and having extended the same trend within five sessions, the researcher who was also the instructor of the two "Lang Lab 2" classes utilized an interview based on the speaking scale developed by Farhadi et al (1994) an interview was utilized for each class group to assess the EFL students' speaking ability in terms of the following components:

1. Accent
2. Structure
3. Vocabulary
4. Fluency
5. Comprehension

The scale used by the teacher and the researcher both as the raters of the students spoken performance made it essential to give careful attention to the following points suggested by Farhady et.al. (1994) in order to make the scoring as reliable as possible .

1. Each interview must be carefully structured.
2. The number of raters will not be less than 20 for each case.
3. The candidates should be put at ease in order to make the results both more valid and reliable .
4. Each interview will be recorded for scoring and future reference.
5. Scoring will be discrete rather than holistic .

Procedure

Scores were given on a 6 point scale ranging from the least appropriate (1) to the most (6). However, since native and native-like proficiency do not usually occur, levels (5) and (6) were ignored. Then, each student's voice was recorded so that their speaking ability could be rated deliberately based on the above discrete factors.

The interview session was held separately for each class group and each student was given a specific score on the basis of the mentioned speaking components. In order to see which one of the two pre-speaking activities was more effective on the EFL learners' speaking, the researcher applied an independent sample t – test based on the scores obtained from the students' interview results.

RESULTS AND DISCUSSION

Results

Having collected the data based on the above mentioned data collection instruments and procedures, the researcher conducted the analysis of data and tested the hypothesis formulated for the present study. Accordingly, an independent sample t-test was utilized so that it could be shown which one of the two pre-speaking activities, brainstorming and role-play was more effective on the EFL learners' speaking.

Table1: Group Statistics

Prespeaking		N	Mean	Std. Deviation	Std. Error Mean
Scores	Brainstorming	30	15.67	1.807	.330
	Roleplay	30	10.10	1.583	.289

Table2: Levene's Test for Equality of Variances

		Levene's Test for Equality of Variances	
		F	Sig.
Scores	Equal variances assumed	.925	.340
	Equal variances not assumed		

Tables 3&4: Independent Sample T-test

		t-test for Equality of Means			
		T	Df	Sig. (2-tailed)	Mean Difference
Scores	Equal variances assumed	12.692	58	.000	5.567
	Equal variances not assumed	12.692	57.018	.000	5.567

		t-test for Equality of Means		
		Std. Error Difference	95% Confidence Interval of the Difference	
			Lower	Upper
Scores	Equal variances assumed	.439	4.689	6.445
	Equal variances not assumed	.439	4.688	6.445

Based on the results given in table one, the mean and the standard deviation of the scores obtained from the students implementing brainstorming were 15.67 and 1.80. The mean and the standard deviation for the second group of students who utilized role-play group were 10.10 and 1.58 respectively. At the 95% confidence interval of difference one can conclude that as P is less than 5% ($P < 0.05$) $p = 0$, the difference between the means obtained from the t – test is statically different. That is to say, the means of the first and second group were 15.67 and 10.10 respectively. There is a difference value of 5.57 of the mean of the two groups on the same test. According to Levene's test for equality of variances, since $F = 0.925$, $p > 0.05$, the equal variances assumption is accepted. Likewise, $t(58) = 12.69$; $p < 0.05$ and as the first hypothesis is one-tailed, P value, which is obtained by dividing Sig.(2-tailed) by two, equals 0.000, it can be concluded that the first hypothesis is verified; that is, those who implement brainstorming as their pre-speaking activity have a stronger performance in their speaking phase than those who utilize role-play as their pre-speaking activity.

In order to assure whether the result was acceptable, the researcher got another teacher who taught the same course to interview the same groups separately based on the same scale. Then, on the basis of the obtained score, an independent sample t-test was applied. The following tables provide the results obtained from the independent sample t-test conducted by the second rater.

Table 5: Group Statistics

Prespeaking		N	Mean	Std. Deviation	Std. Error Mean
Scores	Brainstorming	30	16.60	1.354	.247
	Roleplay	30	10.43	1.813	.331

Table 6: Levene's Test for Equality of Variances

		Levene's Test for Equality of Variances	
		F	Sig.
Scores	Equal variances assumed	.729	.397
	Equal variances not assumed		

Tables 7&8: Independent Sample T-test

		t-test for Equality of Means			
		T	Df	Sig. (2-tailed)	Mean Difference
Scores	Equal variances assumed	14.923	58	.000	6.167
	Equal variances not assumed	14.923	53.676	.000	6.167

		t-test for Equality of Means		
		Std. Error Difference	95% Confidence Interval of the Difference	
			Lower	Upper
Scores	Equal variances assumed	.413	5.339	6.994
	Equal variances not assumed	.413	5.338	6.995

Regarding the results given in table one, the mean and the standard deviation of the scores obtained from the students implementing brainstorming were 16.60 and 1.354. The mean and the standard deviation for the second group of students who utilized role-play group were 10.43 and 1.813 respectively. At the 95% confidence interval of difference one can conclude that as P is less than 5% ($P < 0.05$) $p = 0$, the difference between the means obtained from the t – test is statically different. That is to say, the means of the first and second group were 16.60 and 10.43 respectively. There is a difference value of 6.17 of the mean of the two groups on the same test. According to Levene's test for equality of variances, since $F = 0.729$, $p > 0.05$, the equal variances assumption is accepted. Likewise, $t(58) = 14.92$; $p < 0.05$. In addition, because the first hypothesis is one-tailed, P value, which is obtained by dividing Sig.(2-tailed) by two, equals 0.000, so it can be realized that the first hypothesis is verified; that is, those who implement brainstorming as their pre-speaking activity have a stronger performance in their speaking phase than those who utilize role-play as their pre-speaking activity.

To sum up concerning the main question raised in this study, one can be safe to conclude that there is a significant relationship between brainstorming and role-play as the two most applicable pre-speaking activities. According to the second question, as the first hypothesis was verified, those who implement brainstorming as their pre-speaking activity have a stronger performance in their speaking phase than those who utilize role-play as their pre-speaking activity.

Discussion

It goes without saying that this study profited by a mixed method design which included qualitative and quantitative aspects of research; that is, interviewing the students and utilizing a

range from 1 to 6 based on the Likert test which is considered as a non-parametric and ordinal test has to do with the qualitative aspect of the research and applying an independent sample t-test which is interval and parametric refers to the quantitative or experimental aspect of research. Similarly, as the use of qualitative and quantitative methods is predetermined and planned at the start of the research process, it is regarded as a fixed mixed method on one hand, and since the use of such a mix method arises due to issues that develop during the process of conducting the research, it is referred to as an emergent mixed method on the other hand. Hence, this type of mixed method design falls somewhere in the middle of the continuum with both fixed and emergent aspects of the design. Likewise, this research benefits from a true experimental design since each group was given the necessary treatment and afterward they were evaluated with regard to the mentioned treatment.

CONCLUSION

This study aimed at investigating the relationship between brainstorming and role-play as the two most applicable pre-speaking activities and realizing which one of these two can affect students' speaking more than the other one. For these purposes, two groups of second – semester college students of Islamic Azad University, Dezful branch who were studying "Lang Lab 2" as their main course in two homogeneous classes were selected. The criterion for focusing on this selected population was a proficiency test in grammar, reading comprehension and vocabulary in English. There were 30 students in each class. Each class group whose teacher was the same was given necessary treatment separately to implement each of the mentioned pre-speaking activities as a warm up before the speaking phase in five sessions. Then, based on the speaking scale developed by Farhadi et al (1994) an interview ranging from 1 to 6, where 1 means memorized proficiency and 6 stands for native proficiency, was utilized for each class group to assess the EFL students' speaking proficiency, and the obtained scores were applied in one independent sample t-test. Since the t-observed was more than the t-critical, the null hypothesis which stated "there is no relationship between brainstorming and role-play was rejected and the first hypothesis was verified. In other words, those who implement brainstorming as their pre-speaking activity have a stronger performance in their speaking phase than those who utilize role-play as their pre-speaking activity.

Needless to say that the students' interest to brainstorming or role-play will be determined by providing each class students with a specific treatment on either of the two activities. In accordance with brainstorming, it should be considered as the most widespread pre-speaking technique through which EFL students share their ideas freely without hesitation. In fact, it will help them boost their fluency and since there is no limitation to seize them, they try to talk automatically and nonstop. Furthermore, as they are taught how to brainstorm during five consecutive sessions, they will adapt to implementing such an intensive process before speaking. Conversely, role-play as another pre-speaking activity seems quite useful for native or native-like speakers due to the fact that it is based on the sociocultural factors which exist in authentic native or native-like contexts. So EFL students refrain from going through role-plays thanks to the lack of the necessary sociocultural aspects background knowledge which have to be utilized in their conversations. According to brainstorming as the most adequate activity for EFL students before

speaking, Lang Lab teachers are recommended to prepare a situation in which students feel free in order to participate in class discussions and answer the teacher's questions enthusiastically away from affective filters. Similarly, the topics are suggested to be selected based on the students' interest, and teachers should provide the students with general background knowledge. Likewise, speaking activities are expected to be selected in such a way that they fit the previous brainstorming activity. It is to be noted that since there is no chance for EFL students to extend their English-speaking situations outside the classrooms, teachers are recommended to make fruitful, nonthreatening and provoking situations inside the classrooms and assign some tasks for the students to do it outside the classroom.

Limitations of the Study

Although the above objectives were met and the priority of brainstorming to role-play in EFL classrooms were illustrated, the researcher faced some limitations while getting along with the current study. First, based on Farhadi et. al. (1994), in an interview, the number of raters are not expected to be less than 20 for each case, while it will be so time-consuming for the researcher to employ the mentioned number of raters for each case. Furthermore, the way the interviewers recorded the participants' voices was based on the existing facilities in the laboratory, whereas interviewers need to get their recordings via the most modern instruments so that they can have a more exact judgment on the students' performance.

ABSTRACT

The present study aimed at investigating the effect of dynamic assessment on Iranian pre-intermediate English as a foreign language (EFL) learners' acquisition of English tenses. To fulfill the purpose of the study, the placement test was administered to 120 pre-intermediate EFL learners. Those learners with scores of one standard deviation above and below the mean were selected for the purpose of the study. There were 58 students who were then divided randomly into experimental and control groups. Next, the pre-test was administered to the subjects of each group. The participants in the experimental group received mediation in dynamic assessment model. The control group received deductive grammatical rules during twelve sessions. Moreover, to observe any development in the learners' attitude towards dynamic assessment a researcher-made questionnaire was filled out by the learners in the experimental group both before and after the treatment. The results indicated that the learners in the dynamic group not only could outperform the other group in terms of learning English tenses but also they had positive attitudes toward learning through dynamic assessment. The results obtained from this study can definitely be valuable for the EFL learners to improve their learning. They need to be informed that instruction through assessing helps them to become aware of their weaknesses and strengths; therefore they have opportunities to decrease their deficiencies in their subsequent assessments.

KEYWORDS: Dynamic Assessment, Deductive grammar teaching, EFL, English tenses.

INTRODUCTION

During the first decade of the twenty first century many L2 researchers have tried to envisage a monistic view of language instruction and assessment which is termed as Dynamic Assessment (DA) (Ableeva, 2008; Anton, 2009; Birjandi & Ebadi, 2010, 2009; Jacobs, 2001; Kozulin & Garb, 2002; Lantolf, 2009; Poehner, 2008, 2007; Summers, 2008). As Pishghadam, Barabadi & Mehri Kamrood, (2011) state this post-psychometric view of assessment is a direct attack on the traditional psychometric views that support a dualistic view of instruction and assessment. They

add that based on the Socio-Cultural Theory of mind (SCT) originated from the Russian psychologist Lev Vygotsky's ideas, DA researchers claim that dialectical integration of instruction and assessment into a dynamic activity will bring about successful education. This requires sensitivity to the learners' Zone of Proximal Development (ZPD) during the assessment procedures which is achieved through the mediators' intervention in terms of providing hints, prompts, and feedbacks.

DA, as a new approach to assessment is mostly grounded in both Vygotsky's SCT, on the one hand, and in his concept of ZPD on the other hand. Saeidi and Hosseinpour (2013) add that based on SCT, process of learners' development is a key to analyze their cognitive abilities. DA intervention refers to mediation, which helps students develop their abilities to apply appropriate L2 knowledge in an EFL setting. Assessment and instruction through DA are inseparable (Saeidi and Hosseinpour, 2013). Accordingly, this study aims at seeking the effect of presenting five English tenses including simple present, present continuous, simple past, past continuous and future through dynamic assessment, which is considered an instructional tool.

For decades, teaching English in Iran has been dominated by a teacher-centered, examination-oriented, grammar-based method (claimed by Zohrabi, Torabi and Baybourdiani, 2012; Molavi Vardanjani, 2013). Teachers explain grammar rules in detail, and students are busy taking notes and have few opportunities for meaningful practice. Memorization and rote learning are used as basic acquisition techniques. This method is greatly influenced by the Grammar-Translation Method, which emphasizes the teaching of the second language grammar; its principle "practice" technique is translation from and into the target language. As a result, though most students in Iran learn English for at least three years in junior high schools and four years in senior high schools, the outcome is not satisfying. Another problem is that a plenty of teachers feel that teaching through a test is an inappropriate and useless job while some teachers believe that teaching through testing can be completely communicative and enjoyable for learners even if achieving this can sometimes be quite demanding of our creativity as teachers.

Bachman (1990) has defined the effect of testing on teaching and learning as backwash, and believes that it can be harmful or beneficial. If the content of the test and testing techniques are inconsistent with the objectives of the course, the test may cause harmful backwash. The basis of traditional testing methods such as the translation method was considered subjective and the accuracy and fairness of such evaluations were considered at best questionable. On the other hand, in traditional assessment methods the relationship between examiner and the examinee is neutral and disinterested while in dynamic assessment the examiner is interested in the examinees' development and assessment is performed in a very helpful atmosphere. The most distinguishing feature which differentiates the traditional assessment methods and dynamic assessment is the process of providing feedback. In the traditional methods there was usually no specific plan for giving feedback during the process of assessment meanwhile in dynamic assessment the process of assessment is mediated. Limited number of studies that will be mentioned in the review of related literature part implies that more studies are needed in the field of language learning in order to better understand the effects of dynamic assessment on language learning, and in order to provide more guidance to language teachers who wish to use dynamic

assessment in their language classrooms. The present study tries to develop a dynamic test of English tenses learning and provide answers for the research questions.

REVIEW OF LITERATURE

Poehner and Lantolf (2005) define DA as the interaction between assessor as intervener and learner as active participant with the aim of making cognitive changes in the learner during the process of learning and assessing. Unlike other sub-skills, grammatical knowledge has not received much attention as far as DA is concerned. They add that various studies have been conducted on reading and writing the results of which show the effectiveness of DA in comparison to the conventional forms of assessment.

Dynamic Assessment and Non-dynamic Assessment Comparison

Current and traditional approaches to curricula and assessment of learners' abilities have been the subject of strong criticism, criticisms that draw on the nature of the relationship between instruction and assessment. DA grounded in Vygotsky's notion of the ZPD, focuses on what a learner is able to do with the assistance of a more knowledgeable another and the type and amount of mediation needed for a learner to be able to do a task. DA indicates the learner's learning potential. That is, the learner is able to overcome performance problems by working through his or her independent limitations as they engage and collaborate with the teacher who offers just the mediation(s) needed to assist the learner in moving themselves forward in the given activity. Thus, assessment and instructional activities are brought together in DA so that learner development is fostered. According to Caffrey, Fuchs, and Fuchs (2008), DA differs from NDA, i.e. non-dynamic, traditional, static assessment, in many respects such as relationships between an examiner and learners, nature of the feedback provided, and nature of learning. As for the relationships, they point out that while in NDA the atmosphere between an examiner and the examinees has been a threatening one, in DA it is a supportive one that focuses on a joint activity towards learners' learning. With regard to feedback, whereas in NDA no or very little learning-friendly feedback may be provided, in DA feedback has to be fine-tuned to match person(s)-specific ZPDs. While in NDA the emphasis has been exclusively on the product of learning, in DA it is, over and above the product, on the process(s) of learning.

Models of dynamic assessment

There are different approaches and models to DA. Poehner, (2008) and Thouësny (2010) state that models generally differ in how they approach mediation. In Feuerstein's interactionist model, assistance emerges from the interaction between the examiner and the learner, and is therefore highly sensitive to the learner's ZPD. Interactionist DA focuses on the development of an individual learner or even a group of learners, regardless of the effort required and without concern for a predetermined endpoint. In Brown's interventionist model, forms of assistance are standardized, therefore emphasizing the psychometric properties of the assessment procedure. Interventionist DA is concerned with quantifying, as an 'index of speed of learning' (Brown & Ferrara, 1985: 300), the amount of help required for a learner to quickly and efficiently reach a pre-specified end point. Brown's Graduated Prompt (GP) model is grounded on the number of prompts needed to elicit a desired response. The learner's learning potential which is defined as a

gain score (from the pretest to the posttest) is estimated by the number of prompts needed to get the goal and the level of transfer of learning to other tasks (Gutierrez, 2000). This model of DA is different from Feuerstein's Mediated Learning Experience (MLE) in that the mediation in Brown's GP model of DA is arranged from most implicit to most explicit and culminates with a correct answer (Poehner, 2008). The tests are also administered in an almost standardized manner and the examiner gradually provides the child with prompts if the child is not able to complete the task.

Grigorenko and Sternberg, (2002) claim that there are two formats within interventionist DA models. The cake format is more integrated, offering mediation throughout the administration of the assessment. In the cake format, the examinee is provided with mediation drawn from a standardized menu of hints, ranging from implicit to explicit, during the administration of the assessment itself. Thus, the 'cake' metaphor alludes to the layering of test items and hints in such a way that a menu of hints can be accessed, as required, for each question or problem before moving on to the next item on the test. The sandwich format primarily relies on a pretest-intervention/training-posttest format administered in either an individual or group setting, and reminiscent of traditional experimental research designs. This is also the more widespread dynamic assessment format (Cited in Duvall and Naeini, 2012).

Approaches to teaching English tenses

Teaching English Tenses can be done through deductive and inductive approach. Both of the approaches have their own strengths and weaknesses. Chalipa, (2013) states that deductive approach starts with the presentation and explanation of the rules, and then it is followed by the examples of the sentences using the rules. She adds that in deductive approach the teachers directly explain the rules of the English tense. The explanation is completed with discrete sentences, and it is followed with samples of sentences by the learners to confirm their understanding. An inductive approach starts with examples from which a rule is inferred (Chalipa, 2013). If the teachers apply inductive approach, they do not give the rule directly to the learners, they just give list of sentences and from the sentences they ask the learners to discover the rule by analyzing the provided sentences in a discourse level. It is just like acquiring the first language, in which parents do not introduce the rules of the first language but because it is practiced everyday and continuously with many exposure then the grammatical rules of the first language are acquired naturally and effortlessly. In regard to the strengths and weaknesses of both deductive and inductive approaches to teaching grammar, the researcher tried to apply deductive approach for teaching English tenses to the participants in control group.

Previous researches on DA in language education

Although DA is a newcomer in second language acquisition (SLA), it is by no means the case in other disciplines. As Haywood and Lidz (2007) contend, DA is no longer a new approach to psychological and educational assessment as some of its current applications have been around for more than a half century.

Tajeddin and Tayebipour (2012), pointed that the following studies fall within L2 DA studies: Aljaafreh and Lantolf (1994), Nassaji and Swain (2000), Kozulin and Garb (2001), Poehner (2005), and Ableeva (2010).

In Iranian context the following researchers have conducted their studies to investigate the effect of DA on Iranian EFL learners' abilities. Pishghadam, Barabadi and MehriKamrood (2011), investigated the effectiveness of using a computerized dynamic reading comprehension test (CDRT) on Iranian EFL students. The results revealed that providing mediation in the form of hints contributed significantly to the increase of students' scores, and consequently to the improvement of their text comprehension. Jafary, Nordin and Mohajeri (2012) investigated the effect of dynamic assessment on learners' syntactic knowledge. The results showed that at a 0.05 level of significance the mean of experimental group was more than the mean of control group for different scores. The findings of a study by Tajeddin and Tayebipour (2012) in order to investigate the effect of DA on inter-language pragmatics (ILP) revealed that DA groups outperformed NDA groups and that DA groups of both high and low proficiency levels differed significantly from pretest to posttest to delayed posttest. Naeini, and Duvall (2012), reported the results of a research project aimed at studying improvements in English Language Training (ELT) university students' reading comprehension performance by applying the mediations of a dynamic assessment approach to instruction and assessment. In their study, DA procedures were conducted with 10 ELT university students. The descriptive and analytic analyses of the results revealed dramatic, measurable progress in participants' reading comprehension performance. In another study by Ghahremani (2013), the researcher investigated the effects of implementing three forms of assessment namely, summative, formative and dynamic assessment on Iranian freshmen's listening ability and listening strategy use. The results indicated that the learners in dynamic group not only could outperform the other groups in terms of listening ability, but they also used more listening strategies. Khodamoradi, Iravani and Jafarigohar, (2013) in their study investigated the extent to which teacher's scaffolding and peers' collaborative dialogue could contribute to the acquisition of English tenses in Iranian EFL learners with different levels of grammatical knowledge. It was found that those low achievers who received assistance from the teacher and those who collaborated with high achievers had significantly better performances than those low achievers who collaborated with low achievers. In another study by Zoghi and Malmeer (2013), the researchers tried to explore the effect of an interactionist model of DA on Iranian EFL adult learners' intrinsic motivation. The results indicated a significant difference between the two groups in terms of their amount of intrinsic motivation. At last the findings of a study by Saeidi and Hosseinpour (2013) aiming at investigating the effect of DA as an instructional tool on Iranian EFL learners' vocabulary learning indicated that vocabulary learning rate of learners can be enhanced using DA.

RESEARCH QUESTIONS

To achieve the study goals, the researcher sets the following main research questions as a guide throughout this study:

Q1. Does dynamic assessment have any significant effects on Iranian pre-intermediate EFL learners' acquisition of English tenses?

Q2. Does dynamic assessment have any significant effects on Iranian pre-intermediate EFL learners' attitude?

METHODOLOGY

Participants

To accomplish the task, fifty-eight male students participated in this study. The subjects who contributed in this research were selected out of 120 Iranian EFL learners studying in grade three at junior high schools in Mashhad, Iran. After administering the placement test, in order to homogenize the participants and make sure about their general proficiency level, the researcher chose the subjects who scored one standard deviation below and above the mean (34 to 45) and then he randomly divided them to control and experimental group with 29 students in each one. The learners in the third grade of junior high school were chosen by the researcher, because upper levels were not accessible for the researcher. All the subjects were between the ages of 12 to 15 years old and their first language was Farsi.

Instrumentation

For achieving the required data the following instruments were employed in this study:

First, the participants' general proficiency was assessed using a pre-intermediate English placement test to ensure the homogeneity of the groups at the very beginning of the course. This test is available at: <http://www.macmillanstraightforward.com/resources/tests> and accessed on 6 February 2014. Since the reliability of this test was unknown to the researcher and in order to make sure about the appropriateness of the test for the subjects under investigation, the test was piloted with parallel group (pre-intermediate EFL learners). The reliability of pre-intermediate placement test was estimated through KR-21 formula which is 0.76. This test consisted of two sections: grammar and vocabulary. It consisted of 50 items in the form of multiple choice questions, the 40 first items of which were grammar and the last 10 items were vocabulary items and the time allotted was 50 minutes.

Second, a researcher-made diagnostic test which aimed at evaluating the participants' entry behavior in the domain of English tenses including was administered as pretest. The purpose of the pre-test was that the result of the pre-test was an indicator of the participants' level of grammatical knowledge before the treatment. To make sure about the appropriateness of the pre-test (a teacher-made test) for the subjects under investigation, the test was piloted with parallel group (pre-intermediate EFL learners). The reliability of pre-test (or post-test) was estimated through KR-21 formula as 0.61.

Third, two quizzes in the form of multiple-choice and completion items were administered to the participants in both control and experimental groups on the sixth and tenth sessions of the treatment. Each test consisted of eight multiple choice and four completion items and the time allotted for each test was twelve minutes. These two tests were piloted by the researcher on the parallel group of the learners. The reliability of both quizzes was estimated through KR-21 formula which was 0.56 and 0.58 respectively.

Fourth, the final post-test which was the pre-test, was administered to the participants in both control and experimental groups. In terms of the test layout, the pre-test/post-test included two sections of multiple choice items and completion items. In the first section, the participants were required to answer 25 multiple choice items while in the second section they were provided with 15 test items to fill in the blanks with appropriate forms of the given verbs in parentheses.

Finally, an attitude questionnaire was designed by the researcher and used in this study. Since the participants were pre-intermediate, the items were written in Farsi so that the students were able to answer the questions. This questionnaire consisted of twelve items in the form of 5-point Likert scale. Each question was used to represent whether or not there is a positive response to the use of dynamic assessment as an instructional tools in learning English tenses. It should be mentioned that items 11 and 12 were prepared to find out the participants knowledge of dynamic and static assessment. The reliability of this questionnaire was estimated through Cronbachs' Alpha as 0.90.

Procedures

To accomplish the purpose of this study, the following procedures were applied:

At first the placement test was administered to 120 lower intermediate learners who were studying in grade three at a junior high school in Mashhad, Iran. After analyzing the data, fifty eight students who scored one standard deviation above and below the mean (the learners who scored 34 to 45 from their test) were chosen for this study. They were numbered from one to fifty eight. Then, they were randomly assigned into experimental and control group with 29 students in each group.

Participants in both groups took pretest. In order to make sure that all the test items were new and unfamiliar to both groups; the researcher analyzed the students' responses on the pretest. As mentioned in Motallebzadeh, BehAfarin and Daliry Rad, (2011) when 80 percentages of students (23 students in each group) answered one question correctly, we should omit that question because almost all the students could recognize the grammatical structure. As a result in this test, there were no items that twenty three students or more in each group could response correctly. After estimating reliability of the pretest, 40 acceptable items of this test were given to the subjects under the investigation, both subjects of the control and experimental groups.

After that, participants in experimental group were asked to fill out the attitude questionnaire to collect their attitudes towards dynamic assessment before participating in the treatment. It should be mentioned that since the participants in the experimental group were not familiar with dynamic assessment treatment at first the instructor explained about the dynamic assessment treatment and after that they took part in a sample of dynamic assessment session. When the instructor was sure that the participants in experimental group knew what dynamic assessment is he emphasized to avoid writing their names at top of the page, and coded the attitude questionnaire by numbers so that the students could honestly respond the questions with no limitation.

At the heart of the process, during 12 sessions of treatment, five weekly post tests were administered to students. The participants in the experimental group received mediation in dynamic assessment model which involved some strategies like looking for clues, eliminating the

answers that do not fit and comparison strategies. In the experimental group five English tenses were taught to the participants through dynamic assessment in the following method: Five English tenses including simple present, present continuous, simple past, past continuous and simple future were put in five short tests. The tests were distributed among the participants. After allocating one minute for the participants to be prepared for the treatment, dynamic assessment was applied by the instructor in the following way to help the participants learn and get the right answer through these stages: A) Asking the participants to read the question silently; B) Asking the participants to look for clues in the stem of the question; C) Asking the participants to eliminate the answers that do not fit; D) Providing the participants with more examples and asking them to compare the question with these examples; E) Providing the correct response if the previous stages could not lead the participants to the correct response.

In view of the fact that dynamic assessment has been shaped based on "step by step" learning and "ZPD", the course had been devised in a way that it could fulfill this purpose. The instructor first started with the first step and moved thoroughly to the other stages by the time the participants had been able to get the correct answer. The mediation processes were designed to enable the instructor to mediate each of the items in an interactive way. In the experimental group, dynamic assessment was conducted in a scheduled pattern, two times a week on Saturdays and Tuesdays. These five weekly post-tests were delivered to the participants in control group, too. In control group, the participants received deductive grammatical rules during twelve sessions. A sample of deductive grammar teaching session will be appeared in appendices, too.

Moreover, participants in both groups took two quizzes without knowing the date of administration. On the sixth session when the participants in experimental group had taken part in five dynamic assessment sessions, the first quiz was administered. After that, the participants took the second quiz on the tenth session when they had taken part in ten dynamic assessment sessions. These two tests were administered to the participants in control group on the sixth and tenth sessions, too. Both groups were assessed statically and had only twelve minutes to answer the questions.

Having finished the treatment (6 weeks, 12 sessions), students in both groups participated in the post-test. The researcher administered the pretest as posttest to see the effects of the treatment during the study. At the end, the participants in experimental group were asked to fill out the attitude questionnaire once more in order to find out whether their attitudes for the applying dynamic assessment to learn English tenses have changed or not. After that the data analysis stage was carried out. Next, through the application of the t-test, the mean scores of the subjects in the experimental group were compared with the mean scores of the subjects in the control group.

RESULTS AND DISCUSSION

In order to answer the research questions regarding the difference between the two different instruction methods i.e., dynamic assessment and deductive grammar teaching, this study carried out four independent sample t-tests and three paired sampled t-tests. Each t-test compared the difference of means between the two conditions.

Table 1: Result of T-Test for Independent Samples of Pretest

Groups	No.	M	SD	t	df	Sig.(2-tailed)
Cont.	29	9.1	3.95	-.051	56	0.959
Exp.	29	9.17	5.1			

As shown in Table 1 participants in experimental group ($M = 9.17$, $SD = 5.1$) did not outperform [$t(58) = -.051$, $P = 0.959$ (two-tailed)] those participants in control group ($M = 9.10$, $SD = 3.95$). It means that there is no significant difference between two groups at the beginning of the treatment and they are nearly homogenized.

Table 2: Result of T-Test for Independent Samples of Quiz 1

Groups	No.	M	SD	t	df	Sig.(2-tailed)
Cont.	29	3.93	1.64	-.354	56	0.726
Exp.	29	4.13	2.41			

As Table 2 reveals participant in experimental group ($M = 4.13$, $SD = 2.41$) did not significantly outperformed [$t(58) = -.354$, $P = 0.726$ (two-tailed)] those participants in control group ($M = 3.93$, $SD = 1.64$) in Quiz 1.

Table 3: Result of T-Test for Independent Samples of Quiz 2

Groups	No.	M	SD	t	df	Sig.(2-tailed)
Cont.	29	5.06	2.71	-1.28	56	0.209
Exp.	29	5.93	2.26			

As shown in Table 3 the participant in experimental group ($M = 5.93$, $SD = 2.26$) did not significantly outperformed [$t(58) = -1.28$, $P = 0.209$ (two-tailed)] those participants in control group ($M = 5.06$, $SD = 2.71$) in Quiz 2.

Table 4: Result of T-Test for Independent Samples of Posttest

Groups	No.	M	SD	t	df	Sig.(2-tailed)
Cont.	29	12.79	5.14	-2.77	56	0.010
Exp.	29	17.58	8.33			

As Table 4 reveals the participant in experimental group ($M = 17.58$, $SD = 8.33$) outperformed [$t(58) = -2.77$, $P = 0.010$ (two-tailed)] those participants in control group ($M = 12.79$, $SD = 5.14$) in posttest session but it is not much significant.

Table 5: Result of T-Test for Paired samples of Control Group

Groups	No.	M	SD	t	df	Sig.(2-tailed)
Cont.	29	9.10	3.95	-4.71	28	.000
Cont.	29	12.79	5.14			

As Table 5 reveals after ten sessions of treatment the participant in control group ($M = 12.79$, $SD = 5.14$) significantly outperformed [$t(28) = -4.71$, $P = 0.00$ (two-tailed)] those participants in control group before the beginning of treatment ($M = 9.10$, $SD = 3.95$). It means that the participants in control group developed their learning of English tenses after receiving deductive grammatical teaching.

Table 6: Result of T-Test for Paired samples of Experimental Group

Groups	No.	M	SD	t	df	Sig.(2-tailed)
Exp.	29	9.17	5.1	-6.72	28	.000
Exp.	29	17.58	8.33			

As shown in Table 6 after ten sessions of treatment the participant in experimental group ($M = 17.58$, $SD = 8.33$) significantly outperformed [$t(28) = -6.72$, $P = .000$ (two-tailed)] those participants in experimental group before the beginning of treatment ($M = 5.06$, $SD = 2.71$). It can be concluded that the participants in experimental group developed their learning of English tenses after receiving dynamic assessment during ten sessions of treatment.

Seemingly both control and experimental groups achieved grammatical knowledge of English tenses after they received different treatment based on the aims of this study. The results obtained from the T-tests revealed that the participants in experimental group outperformed the participants in control group but it was not much significant (Tables 2, 3 and 4). Moreover the results revealed the fact that the more the participants in experimental group took part in dynamic sessions, the much they significantly outperformed the participants in control group on English tenses test. These results showed that compared with deductive grammatical teaching, dynamic assessment does not improve pre-intermediate EFL learners' knowledge more effectively.

A paired sample T-test was carried out to compare the means of two administration of attitude questionnaire both before and after the treatment. The result of this T-test is presented in Table 7.

Table 7: Result of T-Test for Paired samples of Attitude Questionnaire Scores

			Paired Differences					t	df	Sig. (2-tailed)
			Mean	Std. Deviation	Std. Error Mean	95% Interval Difference	Confidence of the			
						Lower	Upper			
Pair 2	Postq2 PreQ2	-	0.96552	0.1857	0.03448	0.89488	1.03615	28	28	0

As Table 7 reveals after twelve sessions of treatment the participants in experimental group had more positive attitudes than those before the beginning of treatment. This illustrates a positive perspective toward learning through DA.

As revealed in Tables 1 to 7, in the control group of this study the routine and deductive trend of teaching English tenses was proved to have been resulted in the improvement of their syntactic

knowledge. However, finally, the results of the comparison of the post-tests in control and experimental groups proved that DA had been more effective and helpful. In this study, DA made the subjects aware of their learning potentialities and facilitated the process of learning English tenses for them. Moreover according to collected information through questionnaire, most of the learners agreed that dynamic assessment prevented their mental agitation and through dynamic assessment they could show what they knew. They also agreed that dynamic assessment was motivating and could help them to prepare for their working tasks. The results reported through the tables confirm the previous discussions for the research questions. The results indicate weighty development of the syntactic knowledge in the dynamic group. It is worth mentioning that this development can be related to both the quality and quantity of feedback that the learners have received throughout the treatment.

In sum, the results of this study, confirms the results of other grammar related studies. The fact of the matter in all similar studies is that dynamic assessment proves to be very helpful for grammar learning. Learners who received DA related treatment ended up having good scores in their evaluation. The results showed that dynamic assessment can be used as an instructional tool for teaching English tenses and also it is necessary and enjoyable in improving learners' ability.

CONCLUSION

Taking the results of this study into consideration, based on the statistical results of the paired sample t-test, there was a significant difference between the results of pre-test and post-test of English tenses learning in the control group. Also with regard to the results of paired sample t-test of experimental group, there was a significant difference between the results of the pre-test and post-test of English tenses learning, which showed that DA had been proved to be successful. In the end, based on the results of independent sample t-test the experimental and control groups differ significantly in a way that experimental group outperformed the control group in the post-test. It must be noted that the main characteristic of DA, the theory underlying this study, is not the assessment per se, rather instruction.

The present study gave credit to the usefulness of DA procedures in English tenses learning. It could be inferred that the success of DA might be due to two remarkable reasons at hand: firstly, its effectiveness in learning processes of language and secondly, its creating a different and innovative context of language learning in comparison with traditional ones, both for the learners and teachers. This in turn can bring about lots of benefits for ELT contexts. The outcome of this study analyzed through SPSS (version 20) software indicated that teaching through testing can be an appropriate and useful job and dynamic assessment is completely communicative and enjoyable for the learners. The results also showed that deductive grammatical teachings and teaching through dynamic assessment has meaningful effect on learning of English tenses among Iranian pre-intermediate EFL learners. In addition the findings manifested that those learners who received dynamic assessment during twelve sessions of treatment outperformed the learners who received deductive grammar teaching. On the other hand they had positive attitudes toward learning English tenses through dynamic assessment. It was evidently shown in their posttest scores. The results obtained from this study can definitely be valuable for both EFL teachers and

learners. EFL teachers must have access to the finding of this study to be able to be provided with an appropriate and helpful way of integrating assessment with instruction and EFL learners need to be informed that instruction through assessing (dynamic assessment) helps them to become aware of their weaknesses and strengths; therefore they have opportunities to decrease their deficiencies in their subsequent assessments.

(De) Limitations of the study

The results of this study cannot be generated since like any other study some inevitable limitations were imposed on. First of all, the number of the participants in this study was relatively small for the findings to be generalized to the whole population of EFL students in Iran. Since the sample was small and may not be representative of the larger population of EFL students, and because of segregation rules in Iranian schools, this particular study might have been better studied for qualitative rather than quantitative analysis. Second, the reliability of pretest/posttest fell below 0.70 which is a low reliability and might have affected the results of the study. Third, variables such as gender, age and personal variables were not taken into account because the researcher was not able to take into account these variables for the purpose of this study.

ABSTRACT

This study examined how Iranian English as a foreign language (EFL) learners in the non-English speaking communities handled communication in story-retelling, and uncovered the repair strategies, which they deployed in order to overcome communication break downs and pass comprehensible messages to their interlocutors. In addition, the present study analyzed factors governing the EFL learners' preferences for employing repair strategies. It examined two repair strategies used by male and female EFL learners; self-initiated repair and repetition. The participants were volunteer junior students enrolled in the English Department at Shahreza Azad University, Iran. The results of the analysis revealed that both male and female Iranian English learners resort to strategies of repair in order to compensate for their lack of linguistic items or to gain time to retrieve linguistic item(s) and maintain conversation. Moreover, results indicated that male subjects used strategies of repair more frequently, attributed to the fact that they produced more story events. Another finding was that repetition was used more frequently than self-initiated repair by both groups and that that female participants used less self-repair strategy compared with males. Results implied that, repetition and self-initiated repair can be reinforced for student-student or student-teacher in EFL classroom interaction. In addition, since repair is an element of natural conversation for both native and nonnative speakers, syllabus designers can include these repair strategies in English teaching textbooks.

KEYWORDS: Communication strategies, Self-initiated repair, Repetition, Discourse analysis, Repair strategies

INTRODUCTION

EFL learners try to transmit a comprehensible message to their interlocutors, and they sometimes fail to do so. Students' limited competence can create miscommunication between the students and their teachers and the students themselves. In many situations, students try to solve these miscommunication problems between the teachers and other students to gain an appropriate understanding. Liebscher and Dailey-O'Cain (2003) define conversational repairs as the persistent behaviors that are observed immediately subsequent to the occurrence of a communication breakdown, defined as a situation in which the goal or intent of the behavior is not understood or is misunderstood by the communication partner and, therefore, is not followed by a desired outcome within a reasonable length of time. Understanding how students treat these

communication breakdowns will provide teachers with more insights into how to develop lessons to assist students in the development of their language proficiency. It is proposed that "if educators are aware of the types of conversation breakdowns and the employed repair strategies, they can utilize the necessary instructional strategies to assist students in the development of more sophisticated repair strategies." (Cho & Larke, 2010, p. 2).

Schegloff et al. (1977, p. 361) defined repair as dealing with "recurrent problems in speaking, hearing, and understanding." In addition to linguistic problems (pronunciation, vocabulary, syntax, etc.), it may also relate to acceptability problems, such as saying something wrong in a broad sense, that is untrue, inappropriate or irrelevant (Schegloff, 2007). The particular segment of talk to which the repair is addressed, is called the trouble source or the repairable. Drew (1997) suggests that "self-repair is also a mechanism of remedying mistakes in conversation." Research on repair has identified a variety of repair strategies, namely self-initiation self-repair, other-initiation self-repair, other initiation other repair, repetition, paraphrase, confirmation checks, clarification requests and comprehension checks (Schegloff et al., 1977; Schegloff, 2000; Nagano, 1997; Drew, 1997). Research has also shown that repair, which is a language phenomenon, is necessary for keeping communication smooth and accurate, and it has been evident in the literature that language learners are able to employ many repair strategies in second language interaction (Schegloff et al., 1977, 2000, 2007).

According to Schegloff et al. (1977), self-initiated self-repair takes the form of initiation with a non-lexical initiator, followed by the repairing segment. These non-lexical initiators include cut-offs, lengthening of sounds, and quasi-lexical fillers such as uh and um. In order to repair their errors in problematic talk, language users repeat words and use fillers to gain time and achieve their communicative goal. Schegloff et al. (1977) state that self-initiated and self-completed repair (self-initiated self-repair) occurs when the inter locator who is responsible for the trouble source both initiates and completes the repair. Research on the repair of second language learners (e.g., Krahnke & Christison, 1983; Schegloff, 2000) shows preference for self-initiated repair, although variations can be seen in the amount of initiation (cf. Krahnke & Christison, 1983). Repetition is also a common strategy whose role in communication could be one of the "most effective strategies for promoting comprehension that a speaker can use" (Hoekje, 1984). Rieger (2003) states that repetition, which is a type of self-repair is the most common type of repair consisting of a particular set of repair strategies where the repairable and repairing segments occur in the same turn and the repair is performed by the initiator of the repairable.

One way of modifying, organizing and maintaining conversation is using repair as a communication strategy. Researchers suggest that using communication strategies to prevent communication breakdowns, and to get a message across to the listener lead to second/foreign language learning (Rababah & Bulut, 2007). Therefore, the present study tried to investigate whether there was any significant difference in using strategies of repair (self-initiated repair or repetition) among Iranian EFL learners in a story-retelling task. Moreover, this research sought to examine if gender has any significant effect on the usage of repair strategies by Iranian EFL learners.

RESEARCH QUESTIONS

The present research will only investigate repetition and self-initiated repair since based on the findings of previous studies these two strategies seem to be the more prominent features of daily communication, and that knowing why and how these strategies are used could help Iranian EFL learners become aware of these strategies, which would help them maintain conversation with their interlocutors. The following questions were addressed in the present study.

- Is there any significant difference in using repair strategies (self-initiated repair or repetition) among Iranian EFL learners in a story-retelling task?
- Does gender have any significant effect on the use of repair strategies by Iranian EFL learners?

Based on the questions of the study the following hypotheses were formulated:

- There is no significant difference in using repair strategies (self-initiated repair or repetition) among Iranian EFL learners in a story-retelling task.
- Gender has no significant effect on the use of repair strategies by Iranian EFL learners.

METHODOLOGY

Participants

The course of students was the same. The participants who took part in this study were 30 male and female, in two mixed-sex classes. Since this study is aimed at identifying the repair strategies of discourse that are used by Iranian EFL learners therefore, EFL learners educating in Shahreza Azad university, Iran were considered as the participants. Among them, intermediate level students were chosen based on their English score in the Quick Oxford Placement Test (QOPT).

Instruments and materials

Quick Oxford Placement Test (QOPT)

The QOPTs offer an extremely reliable basis for the initial assessment of students of English. This test is a highly economical and easy-to-administer objectively scoreable test, which provides consistently meaningful scores from CEF level A1 upwards. The objective of conducting QOPT was to find intermediate level participants.

Short stories

Another instruments that were used to obtain the required information for the present study comprised five short stories which were selected from the book of "Steps To Understanding" by Hills. All participants were given a print copy of the stories to read 2 days before the performance session. They were then asked to perform a story-retelling task based on these five short stories.

Oral test

At the end of the term, the participants completed an oral English test, which was a way to evaluate their performance in story retelling. Each participant took the test individually. To put it another way, they were asked to perform a story-retelling task based on the five short stories. With the subjects' consent, the oral tests were recorded.

Procedure

The oral test was taken after the QOPT to identify repair strategies which EFL learners use when they speak. Using a digital recorder, the participants were individually audio-recorded while retelling the stories to the researcher. The researcher used gestures, such as nodding, to show that he was following, and interested, and to encourage the participants to continue their retelling. Since real-life conversations require more interaction between speakers, the researcher also tried to interrupt the participants, using words and expressions, such as then, aha, oh my God!, did he do that? oh really! and what happened then? This had a positive impact on the participants' performance, and their motivation to complete the task. The participants' production was carefully transcribed. All pauses and sound lengthening were included in the transcript.

The researcher detected repair strategies in the transcripts of the spoken discourse of the Iranian EFL learners and classified them into two categories of repetition and self-initiated repair base on markers of repair. Markee (2000) identified markers of repair stating that "From a CA perspective, all repairs are likely to be signaled by various markers of incipient repair (pauses, silences, sound stretches, cut-offs and phrases like 'you know' and 'I mean'".

Example of self-initiation self-repair:

Harry Marsh that Emm...in a polite way said why I am Emm... doing.... Emm...the thing like this and driving

Example of repetition:

On the way, the driver said to Harry politely: "could you, could you telling me why we are doing all these things?"

In order to maximize the reliability of the researcher's classification, it was passed to three raters, who were MA English instructors. In order to make the raters' task easier, the strategies were highlighted and classified in context. The raters were asked to verify whether that the researcher's classification was accurate based on the definition of each strategy and their comments were taken into consideration in arriving at the final categories and frequencies.

Data Analysis

In order to investigate the hypotheses of the study, frequencies and percentages of self-initiation, self-repair, and repetition strategies were calculated. The transcription of the short stories were taken into consideration in arriving at the final categories which showed the frequencies and percentages of repair strategies. In order to investigate differences between the strategies of repair employed by EFL learners a Chi-square test was used.

RESULTS AND DISCUSSION

Difference between self-initiated repair and repetition strategies

As can be seen in Table 1, male participants recorded 179 instances of repair strategies while retelling the story. It was observed that they did their best to report as many events as they could; this was evident in the average number of words used in their oral production, which by means of MS Office word count, was found to be 118 words per story on average. It was also observed that

all the male participants used some instances of repair, either repetition or self-initiated repair. They resorted to the two strategies under investigation at the rate of 124 and 55 instances, respectively.

Table 1: Frequencies and Percentages of Strategy Use among the male Participants

Strategy Type	Frequency	Percentage
Repetition	124	69.273743
Self –Initiated Repair	55	30.726257
Total	179	100%

In addition, Table 2 shows that the female participants used fewer strategies than the males; they employed a total number of 144 strategies of repair, representing both types. Contrary to the male participants, it was noted that the female subjects described only the key events; very specific details were not reported. It was also observed that the female learners were more generic in their story-retelling. This was manifested in the average number of words they produced, which was 70 contrary to the male participants. It was observed that all the participants used instances of repair, repetition and self-initiated repair. But females group used fewer self- initiated repair strategy compared with the male group. They resorted to the two strategies under investigation at the rate of 10 and 55 instances, respectively.

Table 2: Frequencies and Percentages of Strategy Use among Female Participants

Strategy Type	Frequency	Percentage
Repetition	134	93.0555
Self –Initiated Repair	10	6.94444
Total	144	100%

In order to find out whether these differences were significant or not, a Chi-square test was used. The results of this statistical analysis procedure are illustrated in Table 3.

Table 3: Chi-Square Test Analysis Results

Table 57. Chi-Square Test Analysis Results			
Strategies	Male	Female	Sig
Repetition	124	134	.0001
Self - initiation	55	10	
$\chi^2 = 26.619$			
df = 1			

The results of Chi-Square, reported in Table 3, reveals that there are significant differences between the two groups, males and females on each strategy (self-initiated repair and repetition)

at $\chi^2 = 26.619$, $P < 0.1$. This implies that the male participants used more strategies because they encountered more problems while retelling the two stories.

Repetition

Repetition was recorded when the subjects repeated some language items in order to delay the production of following lexical item or to gain time to retrieve the required difficult item(s). A closer look at the repetition cases in the present study revealed that the most frequently employed repetition subcategories were repetitions of nouns, personal pronouns, conjunctions, prepositions, definite and indefinite articles and demonstrative pronouns.

It was noticed that the repairing segment and the repaired segment were lexically identical (repetition). The use of pauses and fillers, such as *er* and *em* indicated that the subjects encountered some difficulties in retrieving the following lexical item(s) they needed. The male participants performed 124 instances of repetition and female participants performed 134 instances of this. The following excerpts were taken from the performance of the male participants. The repeated words and phrases are italicized, and every three dots mean a second's pause.

- 1) it *it* took a long time.
- 2) After the lecturer finished *er* the writer thanked the translator *translater er* for his good work.

Similarly, the female participants employed repetition as a strategy of repair (134 cases) in order to gain time, retrieve the following lexical item(s), and maintain conversation. The following excerpts (4- 6), which are self-explanatory, are taken from the oral performance of the female group, with the repeated words and phrases presented in italics.

- 3) Many years ago *er* a woman from Africa was invited to *er*... .. *a beth, to bath, bath* house.
- 4) I am looking you because *I want to I want to* know which *er* taps you're turning on.
- 5) One day *er* he came out *er* his office and saw a car.

The most prominent feature of the above excerpts is that the participants stumbled during their speech although there were errors corrected. Levelt (1983) called this a covert error or a potential error which has been discovered before articulation. The editing expressions (*er*...) and (*em*...) signal that the participants thought for some time that an error might be committed in the following lexical item, or they used them because they needed more time to produce the next lexical item(s).

Self-Initiated Repair

In the present study, the male participants resorted to self-initiated repair on 55 occasions. In the following excerpts taken from their oral discourse, the repairing segment and the repaired segments are italicized. In excerpt 7, the speaker might have been planning to produce "how did you translate this long story to a short one?", but, due to her limited linguistic resources he stopped after 'did you', and started a new plan. After hesitation and some pauses, which indicate

the presence of a problem, he produced "how did you er... .. made my long story in a short one?"

- 6) How did you er made my long story in a short story?

The speaker, in excerpt 7, produced "singing" (repairable segment), but she immediately discovered that she was making a mistake in verb tense. Therefore, she corrected it as "is singing" (repaired segment). In the speech event "the man who has (sorry) who had er two patrols", the repairing segment "has", was repaired by telling (sorry). It appears that the speaker was confused by the tense of the verb and fortunately, she could retrieve it, as clearly manifested in her excuse.

- 7) The man who has er sorry who had two petrol.

In excerpt 8, the size of the problem is big for this speaker, and this is evident in this short utterance, which includes two instances of self-initiated repair. First, the speaker corrected the repairing segment "was told" by the repaired segment "he was" and finally by "he told". In the speech event "All her grades have been tense of the verbs", the speaker paraphrased it, but while paraphrasing, she initiated the repair and corrected it. She produced a passive verb then to be verb and at last past verb.

- 8) He wanted to have an interpreter, but during his lecture he *was told*, he *was*, he *told* an amusing story.

The female participants in the present study, on the other hand, resorted to self-initiated repair strategy in 10 cases. For example, the speakers in the following excerpts (9 -10) had a plan they wanted to execute, but due to some difficulties in retrieving the required lexical items, they repeated the repairing segment and corrected the error.

- 9) I have had just a throat operation *my ear er... .. my hearing* is good, but I can't speak.
10) On the way the driver said to Harry politely *would you er could you* telling me why are we doing their things?

Overall, results revealed that repetition was used by both groups as an attempt made by the speaker to plan for a new utterance or to gain time to recall the next lexical item, while in self-initiated repair, the male and female participants' aim was to monitor and modify an utterance when s/he felt that s/he made an error. The males used fewer repetition strategies, which could be attributed to the fact that they were more concise in story-retelling. The females used less self-repair in compare with males. There are high significant differences between males and groups in the use of strategies.

Discussion

Based on the results, it can clearly be understood that repetition was used by Iranian EFL learners and both male and female speakers, as an attempt made by them to plan for a new utterance or to gain time to recall the next lexical item. In self-initiated repair, the male and female participants' aim was to monitor and modify an utterance when s/he felt that s/he made an error. Self-initiated repair was used when the speakers encountered problems with retrieving the target language

item. It was also noticed that self-initiated repair was not always successful; that is, the speakers tried to correct what they thought to be a mistake, but they did not do that successfully. This finding is thus a verification of the view that self-initiated repair is a well-organized, orderly, and rule-governed phenomenon and not a chaotic aspect of spoken discourse (Schegloff et al., 1977; Rieger, 2000).

The findings with regard to the second hypothesis of the study shed light on the impact of gender on the usage of repair strategies by Iranian EFL learners. Based on the results of the Chi-square test it was also found that both groups were keen on taking the risk to transmit comprehensible messages to their interlocutor, who was the researcher in the present study. They repeated to retrieve ideas and lexical items and maintain conversation, and they repaired to produce correct forms or ideas. The participants' use of such strategies made their oral production comprehensible, despite the presence of hesitations and pauses. Although the man used fewer repetition strategies, which could be attributed to the fact that they were more concise in story retelling, i.e., they reported only the major events in the stories. The study also revealed that although self-initiated repair was used by all the participants, the male EFL learners used it more frequently.

All in all, the results of the present study confirm the use of two types of repair: repetition and self-initiated repair by male and female EFL learners. These findings are in line with the results of previous research on strategies of repair (Rieger, 2000; Rieger, 2003; Rababah, 2001). However, it was found that there were significant differences between the male and female groups in terms of the frequency of strategy use. The statistical analysis revealed that the female learners utilized significantly more repetition but less self-initiated repair strategies in the story retelling task, when compared to the male learners' performance. This may have been due to the number of words they produced, which almost doubled that of the females, which could be attributed to fact that influences, since males tried to say all of the events which happened.

CONCLUSION

As mentioned earlier, the present research sought to investigate the usage of repetition and self-initiated repair strategies among Iranian EFL learners in a story-retelling task. Moreover, the second aim of the study was to examine if gender had any significant effect on the implementation of these two strategies by Iranian EFL learners. The findings revealed that there were significant differences between the male and female participants in terms of the frequency of strategy use. Additionally, it was found that male learners used fewer repetition strategies while female students used less self-repair strategies.

With respect to the implications, this study was in fact an attempt to shed more light on providing some useful insights into syllabus design and language teaching. Analyzing the language teaching books, the researcher has noticed that the repair strategies and initiation techniques used by native speakers of the target language are excluded. Syllabus designers should include these repair strategies in English teaching textbooks because the use of repair is an element of natural conversation used by both native and non-native speakers. As non-native speakers of the target

language do not sometimes know how to repair, if they do, they might rely heavily on transfer from their native languages (Cokal-Karadas, 2010).

In the language classroom, repetition and self-initiated repair should be reinforced for student-student or student-teacher classroom interaction. The realization that these two strategies are natural in everyday conversation, that repetition performs a wide range of functions (Brody, 1986), that self-initiated repair plays a major role in producing comprehensible input (Shehadeh, 1999), and that comprehensible input leads to language learning makes it important for language teachers to implement and encourage their students to resort to these two strategies. Language teachers should encourage students to be risk-takers, and use these strategies, which were classified as communication strategies (Faerch & Kasper, 1983).

This study also has some limitations which include the relative lack of control over the characteristics of the individual accent and the tone of voices whose specific features such as their potential intonation, stress may not have been fully controlled. It should be noted that this study was limited in terms of its context: only a relatively small number of participants at a single proficiency level from one Iranian university took part. Further, due to time limitations, the reliability of the data collection instrument was not calculated. In addition, there were only 5 short stories, the results with other more complicated stories may be different. Another limitation of the present research had something to do with the participants; the study was restricted to Intermediate level EFL students of just one university in Iran. Due to aforementioned facts, a word of caution should be taken in to account in generalizing the results.

Therefore, as a suggestion for future research, it is recommended to study other discourse communication strategies such as paraphrasing, substitution, coining new words, language switch, asking for clarification, non-verbal strategies, avoidance, among Iranian EFL learner. In addition, it is suggested to carry out more characterization study on repair strategy usage by hearing-impaired adults and how they use discourse strategies. Finally, it is worth to investigate repair strategies in aphasic discourse.

ABSTRACT

In the English for academic world, the advent of international standardized tests has started a new array of textbook generations for exam preparation. IELTS or TOEFL teachers have a variety of materials available which potentially makes it difficult to choose the right one. In the present paper, Barron's IELTS textbook (Lougheed, 2006) is evaluated using Mc Donough and Shaw's (1993) framework of internal and external evaluation. Evaluating exam preparation textbooks based on the related exam criteria will help teachers select a textbook matching to their students' needs. The results of the evaluation is hoped to benefit English teachers in many of language institutes in that it might give them insight into the course book they use and how they can exploit it better. The result of the external evaluation showed that Barron's IELTS preparation textbook is useful and applicable for candidates who start to prepare for IELTS; the organization of the book is clear and easy to follow for candidates as each module with its related skills is separated from the other. Although the author claims that Barron's IELTS textbook is designed to be used as the 'core' course, candidates need to take as many tests and extra sources and materials as possible. Also the result of the internal evaluation shows that the book is generally valid and is in line with the IELTS standards except that its degree of difficulty is insignificantly lower than the real IELTS test.

KEYWORDS: Internal and external evaluation, textbook, standard tests, IELTS

INTRODUCTION

With the variety of English Language Teaching (ELT) textbooks available in the market, each following a different methodology, it can be difficult to choose the best for a particular teaching situation. In the English for Academic world, the advent of International Standardized Tests has started a new array of textbook generation, i.e., textbooks for exam preparation. IELTS or TOEFL teachers have a variety of materials available which potentially makes it difficult to

choose the right one. According to Hutchinson and Waters (1984), most ESP or EAP courses, and subsequently textbooks, are based on the needs of such sponsors as universities, companies, and agencies. However, this view overlooks the views of other parties involved such as the teachers, the learners, and the teaching institutes. That's why prior to any textbook evaluation, conducting needs analysis is necessary. With the myriad of available exam preparation course books, it is important that teachers make informed choices when selecting course books which is detrimental to students' success in the exams. Meanwhile, teacher-made materials with a specific group of students and their needs in mind will always assist professional, published materials (Stern, 1992).

Harwood (2005) believe that teachers and learners need the independence and autonomy to take responsibility for their own teaching and learning, and materials writers should modify their textbooks accordingly. He suggests two views towards the material development in EAP: The anti-textbook view which asserts the deficiency of the EAP textbook syllabus. Many teachers may believe that a textbook is the product of a careful collaboration between theoreticians and practitioners. But, there seems to be a lack of fit between how academic writers write and what the textbooks teach about writing. Textbooks are found to understate the variation in style and language which corpora reveal. It is felt that EAP textbook writers rely on intuition or folk beliefs. The second view is the pro-textbook view which considers textbooks as developers. There is plenty of research evidence that many teachers adapt commercial materials, using them to stimulate their thinking and as the basis for providing the most appropriate classes in their context.

Cunningsworth (1995) provides some interrelated disadvantages to the use of a single course book: There can be a lack of variety in teaching procedures; individual student's needs may be overlooked; and creativity and flexibility are underestimated. Although teachers adapt and adopt materials; still the core material for an exam preparation course is the textbook. Textbooks can be relatively suitable for student's needs, even if not specifically designed for them and allow students to review the previous lessons and look ahead to the future topics (O'Neill, 1982).

Johns and Dudley-Evans (1991) that ESP teachers find themselves in a situation where they are expected to produce a course that exactly matches the needs of a group of learners, but are expected to do so with no, or very limited, preparation time. Nunan (1991) states that the selection process can be greatly facilitated by the use of systematic "materials evaluation procedures" (p. 209) which help ensure that materials are consistent with the needs and interests of the learners they are intended to serve, as well as being in harmony with institutional ideologies on the nature of language and learning. According to Garinger (2001), due to the recent growth of materials in the ESL publishing industry, guidelines are necessary to raise teachers' awareness to various course book designs. Relevant evaluation criteria should instruct teachers how to best select course books that fit their certain needs.

The Barron's IELTS textbook (Lougheed, 2006) is going to be evaluated in this paper to provide a framework for more IELTS textbook evaluation in the future. Evaluating exam preparation textbooks based on the related exam criteria will help teachers select a textbook matching to their students' needs. In the following, an explanation of the different types of textbook evaluation and the full description of the IELTS exam will be given. In the second part of the present paper, result of the evaluation based on Mc Donough and Shaw's (1993) framework of the internal and external evaluation will be reported. The model's procedural format and flexibility will allow researchers to fully assess the strengths and weaknesses of the materials being evaluated. In the following, an explanation of the different types of textbook evaluation and the full description of the IELTS exam will be given then the result of the evaluation based on Mc Donough and Shaw's (1993) framework textbook evaluation will be reported.

LITERATURE REVIEW

Course book evaluation methods

According to one classification, there are three types of textbook evaluation: pre-use, in-use, and post-use evaluations (Cunningsworth, 1995; Ellis, 1997). The pre-use or predictive evaluation of textbooks helps teachers to select the most appropriate textbook for a given language classroom by considering its prospective performance. In-use evaluation aids teachers in the exploration of the weaknesses or strengths of textbooks while they are being used. Finally, post-use, or retrospective evaluation helps teachers reflect on the quality of the textbook after it has been used in a particular learning-teaching situation.

Although requiring adaptation before being submitted to the personal requirements of individual teachers, checklists are effective tools for course book evaluation (Breen & Candlin, 1987; Skierso, 1991; AbdelWahab, 2013). The creation of extensive evaluation checklists by leading experts provides criteria for detailed course book analysis (Cunningsworth 1995). There are a number of valid textbook evaluation checklists, e.g., Cunningsworth's checklist for evaluation and selection contains 45 questions, covering criteria such as aims, design, language content, skills, and methodology, as well as practical considerations such as cost and obtainability. Sheldon (1988) provides an expansive checklist of 53 questions classified under 17 major criteria, which appraises content factors such as accessibility, content, layout and authenticity. Evaluation is made easier, more objective and valid when it is based on a reliable instrument. Most checklists available in the literature lack the expected validity or reliability. This necessitates the need for developing a checklist that is of high validity in terms of the construct domain of its evaluative criteria that accounts for the consistency of the scores resulting from its items. Evaluation checklists must cover the following areas (Sheldon, 1988): Characteristics of textbooks such as layout, organization, methodology, aims; The degree to which a set of materials is not only teachable, but also fits to the needs of the teachers' approaches as well as the

organization's general curriculum; Criteria related to gender and cultural components; The extent to which the linguistic items, subjects, content, and topics match up to students' personalities, backgrounds, needs, and interests as well as those of the teacher and/or institution.

McDonough and Shaw (1993) provide a flexible two-stage model for the comprehensive evaluation of course books. Textbooks can be evaluated internally or externally (Mc Donough & Shaw, 1993): An external analysis of textbooks initiates the examination of the information given about the textbook on the cover of students' or teachers' book and what is indicated in the introduction and table of contents. The main purpose behind the external evaluation of textbooks is to determine the real function of a specific textbook. The physical appearance of the textbook can be evaluated regarding the cover durability and the attractiveness of textbook elements such as the cover, page appearance and the binding. From the blurb or the introduction part of textbooks, the intended audience, proficiency level, the context in which the materials are to be used, the presentation of language items, and the author's views on language and methodology (Mc Donough & Shaw, 1993). On the other hand, internal evaluation of textbooks entails an in-depth investigation into the materials. The internal evaluation shows how much the factors analyzed in the external evaluation stage have internal consistency and relevance. It deals with the presentation of the skills in the book and the grading and sequencing of the materials. For example, where listening skills are involved, are recordings authentic or artificial? Or in the case of speaking, do the exercises reflect real life skills or not? Unique in their coverage of criteria, their 22-point framework is designed both for teachers looking to select a course book, a predictive evaluation, as well as for those teachers looking to identify strengths and weaknesses in course books already used in their working context, a retrospective evaluation.

The IELTS exam

The International English Language Testing System (IELTS) is an international standardized test of English language proficiency for non-native English language speakers. It is jointly managed by Cambridge English Language Assessment, the British Council and IDP Education Ltd, and was established in 1989. IELTS is one of the two major English-language tests in the world, the other is the TOEFL. There are two versions of the IELTS: the Academic Version and the General Training Version. The former is intended for those who want to enrol in universities and other institutions of higher education and for professionals such as medical doctors and nurses who want to study or practice in an English-speaking country. The latter is intended for those planning to undertake non-academic training or to gain work experience, or for immigration purposes. No minimum score is required to pass the test. An IELTS result or test report form is issued to all candidates with a score from "band 1" (non-user) to "band 9" (expert user) and each institution sets a different threshold. There is also a "band 0" score for those who did not attempt the test. Institutions are advised not to consider a report older than two years to be valid, unless the user proves that he has worked to maintain his level. Candidates receive scores on a band scale from 1

to 9. IELTS is based on the integration of the four skills and it includes all types of questions from multiple choices to written tests. The skills are as follows, respectively:

Listening

Candidates will have to listen to four recorded texts, monologues and conversations by a range of native speakers, and write answers to series of questions. These include questions which test the ability to understand main ideas and detailed factual information, ability to understand the opinions and attitudes of speakers, ability to understand the purpose of what is said and ability to follow the development of ideas. A variety of voices and native-speaker accents is used and each section will be played only once. The Listening component is the same for both Academic and General Training modules.

Reading

The Reading module consists of 40 questions. A variety of question types is used in order to test a wide range of reading skills. These include reading for gist, reading for main ideas, reading for detail, skimming, understanding logical argument, recognizing writers' opinions, and attitudes and purposes. The Academic version includes three long texts which range from the descriptive and factual to the discursive and analytical. The texts are authentic and are taken from books, journals, magazines and newspapers. These have been selected for a non-specialist audience but are recognizably appropriate for anyone entering undergraduate or postgraduate courses or seeking professional registration.

Writing

The Writing component of the Academic version includes two tasks. Topics are of general interest to, and suitable for anyone entering undergraduate or postgraduate studies or seeking professional registration.

Task 1: In the academic version, candidates will be presented with a graph, table, chart or diagram and are asked to describe, summarize or explain the information in their own words. They may be asked to describe and explain data, describe the stages of a process, how something works or describe an object or event. In the general module, candidates are to write a letter based on a topic for task 1.

Task 2: Candidates will be asked to write an essay in response to a point of view, argument or problem. Responses to both tasks must be written in a formal style.

Speaking

The Speaking component assesses candidates' use of spoken English, and takes between 11 and 14 minutes to complete. It includes three parts: the personal information dialogue, the monologue, and the discussion part. Every test is recorded. The Speaking component is also the same for both Academic and General Training versions.

RESEARCH QUESTIONS

The present study aims at exploring and evaluating the Barron's IELTS preparation textbook to find out to what extent this book helps IELTS candidates prepare for IELTS exam. Based on Mc Donough and Shaw's (1993) framework for textbook evaluation, the research questions to be answered in this paper are:

- Does the internal evaluation of Barron's IELTS preparation textbook show that it is in line with the objectives of IELTS test?
- Does the external evaluation of Barron's IELTS preparation textbook show that it is in line with the objectives of IELTS test?
- What are the strengths and weaknesses of Barron's IELTS preparation textbook based on its internal and external evaluation?

METHODOLOGY

Materials

Barron's IELTS preparation textbook is the main material used in this study. Mc Donough and Shaw's (1993) book with the chapter related to textbook evaluation is the main framework to evaluate the Barron's IELTS book.

Procedure

Since the external evaluation precedes the internal one, the evaluation starts with the investigation of the following characteristics of Barron's IELTS book by simply looking at the preface, blurb, and the table of content part of the book. In the first phase of evaluation, the intended audience, the proficiency level, the context in which the materials are to be used, how the language has been presented and organized into teachable units/lessons, the author's views on language and methodology, the availability of the book in the market, etc. are investigated.

The second phase of the evaluation is the internal evaluation in which the following characteristics of the Barron's IELTS book will be explained:

- The grading and sequencing of the materials where reading/discourse skills are involved.
- The presentation of the skills in the materials
- Where listening skills are involved, are recordings 'authentic' or artificial?
- Are the tests and exercises related to the learners' needs and the content of the course?
- Do you feel that the material is suitable for different learning styles...and is it sufficiently transparent to motivate both students and teachers alike?

RESULTS AND DISCUSSIONS

External evaluation

The external evaluation is done by looking at what has been stated explicitly in the "blurb" or claims made on the cover of the text book, the introduction and table of contents (McDonough & Shaw, 1993, p. 67). The following questions are given in McDonough and Shaw's (1993) model:

The intended audience

Although there is no specific age range for taking part in the IELTS exam, the majority of candidates are over 15. Adults or elder teenagers who intend to continue their studies abroad or pursue their dreams by living overseas are the potential audience of this book. It covers both general and academic IELTS preparation skills. Based on the introduction part of the book, international students represent the highest percentage of candidates who take IELTS. An IELTS score is a standard measure of English language proficiency around the world. Government departments and businesses around the globe also require IELTS score or equivalent score for employment or immigration.

The proficiency level

Since Barron's IELTS textbook is a skill book to prepare candidates for an exam to measure their language proficiency, no specific level of proficiency is given by the author. Students at any level of proficiency can take part in the IELTS exam. However, experience shows that pre-intermediate candidates are more likely to benefit from preparation materials than the elementary ones. So at least the pre-intermediate level is needed to make the best of this book.

The context in which the materials are to be used

As stated earlier, Barron's IELTS' main purpose is to prepare candidates for the IELTS exam. Hence, this book is useful for people who need to demonstrate their English proficiency for a specific purpose, e.g., immigration or academic in an English speaking country or somewhere overseas.

How the language has been presented and organized into teachable units/lessons

The content of the book is organized in modules for each skill. The order of the presentation of skills is the same as the test i.e. Listening, Reading, Writing, and Speaking. The units are organized as follows,

- Unit 1, introduction
- Unit 2, questions and answers about IELTS
- Unit 3, preparing for IELTS (including the study plan, tips for success etc.)
- Unit 4, listening module
- Unit 5, reading module
- Unit 6, writing module
- Unit 7, speaking module
- Unit 8, model tests

Each module /unit includes small lessons which are called "target" in this book. Each target is a full explanation of an exam skill followed by a number of exercises to practice that specific skill. The answers are provided at the end of the book. The listening module (unit 4) includes 13 targets, reading module includes 5 targets, writing module has 8 targets, and speaking module consists of 8 modules. At the beginning of each module, different types of IELTS questions are given with samples before the targets.

The author's views on language and methodology

The author claims that the English used in IELTS can be British, Australian, American, or New Zealand English. However, it is more British and Australian oriented. The author also asserts that the language tested will be comprehensible to any learner of English and that test-takers who studied another form of English will not be penalized. The common differences between American English and the English used in other parts of the world are pointed out in the book.

Are the materials to be used as the main 'core' course or to be supplementary to it?

Barron's IELTS textbook is designed to be used as the 'core' course. However, due to the nature of IELTS test, the candidates need to take as many tests as possible and teachers need to make use of as many sources and materials as possible. Hence, this book can also be used as a supplementary material.

Is the teacher's book in print and locally available?

Most, if not all, of the exam preparation courses have the answer key and the typescripts inside them. Even sample essays to the writing tasks are provided within the book. Consequently, no specific teacher's book is needed for these books.

Is a vocabulary list/index included?

There is no separate section for the teaching of vocabulary and structure; instead, they are integrated in the four modules, i.e., during listening, reading, writing, and speaking.

What visual material does the book contain and is it actually integrated into the text?

For some listening, writing (task1), and reading questions, there are maps, charts, graphs and tables. For process type essays some pictures are given. All of the maps and pictures are in black and white. The texture of the paper is of no good quality, the A3 papers with no color tend to be boring for students.

Is the layout and presentation clear or cluttered?

The layout is very professionally presented and this is a very important factor that must not be taken for granted especially in exam preparation textbooks because candidates challenge enough with the test skills and they need not confuse with the layout. As mentioned above, in this book,

each module /unit includes targets. Each target includes the explanation of an exam skill followed by a number of exercises.

Is the material too culturally biased or specific...[or]...represent minority groups and/or women in a negative way?

Barron's IELTS is not written for a certain nationality or cultural group; since IELTS exam claims to have an international and intercultural approach, the topics which divide each unit are universal in nature. Although it seems a certain attempt has been made by the authors to focus on British and Australian accent and culture. The topics of conversation in the listening sections are all about places in Australia, New Zealand, or Britain which is pretty biased. All paragraphs must be justified alignment. With justified alignment, both sides of the paragraph are straight.

Internal evaluation

In this stage of the analysis, as designed by McDonough and Shaw (1993), the "internal consistency and organization of the materials" (p.67) is examined, to discover the extent to which external claims made by the author/publisher correlate with the internal content. Internal evaluation is an in-depth investigation into a book and includes the following questions as proposed in McDonough and Shaw's (1993) model of textbook evaluation:

The presentation of the skills in the materials

Modern course book design entails the integration of the receptive and productive skills (Brown, 1994; White, 1988; Stern, 1992). In IELTS, each test module includes several skills, e.g., in order to answer the listening questions, candidates need to read the questions, and write the answers in essay type questions. The grammar and spelling will be penalized in listening questions. The reading questions also need essay type answers.

The grading and sequencing of the materials where reading/discourse skills are involved.

The sequence of unit presentation is based on the sequence of skills tested in IELTS, i.e., listening, reading, writing, and speaking respectively. With regards to the grading and the degree of difficulty, authenticity plays the key role. Candidates need to take as many real test samples as possible to prepare best for the exam. The exam administration and timing conditions must be practiced and met during the preparation courses. Since Barron's IELTS is a practice book, the skills and even sample exercises are too simple. The main purpose is to teach candidates the exact IELTS skill needed to answer a particular type of question and therefore the material is simplified and cut in small parts for pedagogical purposes. However, the students need to practice on authentic materials. This characteristic of Barron's IELTS is a flaw and necessitates the application of more authentic supplementary materials.

Where listening skills are involved, are recordings 'authentic' or artificial?

The CD provided with the book includes both authentic and artificial recordings for the listening module. The authentic recording in this book may entail two senses: authentic as related to the real world and authentic as used in a real IELTS test before. Some of the recordings are made slower and really shorter than the real IELTS listening so that the candidates can practice skills separately. However, real IELTS needs holistic amalgamation of all question types and skills. The model tests at the end of the book can provide good practice on the interaction of all the skills.

Do you feel that the material is suitable for different learning styles...and is it sufficiently transparent to motivate both students and teachers alike?

Candidates who are willing to take the IELTS are strongly motivated either intrinsically or instrumentally. Easy exercises and clear examples and targets in Barron's IELTS help novice test-takers gain more self-confidence, hence, more motivation. Clear explanations are also useful for teachers especially the inexperienced ones. It is worth mentioning that only for a beginner course on IELTS this book can be very encouraging. For more advance practices supplementary sources are needed.

Are the tests and exercises related to the learners' needs and the content of the course?

The results of the initial needs analysis show that IELTS candidates have the following expectations from their IELTS preparation course and this book relatively meets their needs. Most candidates need

- To have their course as short as possible
- To have a clear vision of the whole exam and the course
- To face real tests and test situations
- To be motivated by the textbooks and the teachers
- To be exposed to the real writing and speaking samples of other candidates.
- To have a textbook which is organized and easy to work with
- To be able to follow some tasks through self-study.

CONCLUSION

The evaluation presented in this paper was based on a prior needs analysis of IELTS exam candidates and a valid model (McDonough & Shaw, 1993). Teachers can evaluate textbooks, make adaptations, and make the most of them. Textbooks are too inflexible and they reflect the pedagogic, psychological, and linguistic preferences and biases of their authors. Some proponents of authentic classroom language models have argued that the problems with many textbooks are not necessarily the fact that they are culturally or socially biased, but that they are artificial in their presentation of the target language. The scripted unauthentic language found in many textbooks does not lead to communicative practice, but instead can lead to an oversimplification

of language and unrealistic views of real-life situations. However, they actually help teaching and learning, one cannot deny the fact that textbooks still maintain enormous popularity and their evaluation and improvement is crucial.

ABSTRACT

Considering the advantages of formative assessment over summative assessment on the one hand and the importance of vocabulary knowledge for EFL learners on the other hand and reviewing the results of previous empirical studies on success of formative assessment the present study aimed at completing the studies in the related literature by comparing the success of two commonly used formative assessment types namely quiz and oral questioning on learning vocabulary and retention of the learned items. To this end 41 pre-intermediate learners participated in this study and were randomly assigned into two experimental groups of oral questioning and quiz and underwent 36 hours of treatment. The results of this quasi-experimental study with pre-test, immediate and delayed post-tests revealed that there is not a significant difference between the success of these assessment types on neither vocabulary learning nor retention. The findings imply that language teachers can take the advantage of any or both of these formative assessment types based on their learners' needs and teaching context.

KEYWORDS: Formative assessment, vocabulary learning, vocabulary retention, oral questioning, Quiz, summative assessment

INTRODUCTION

Learning vocabulary is considered as a drudgery for foreign language learners. The problem, however, is not just learning vocabulary, but forgetting the learned vocabulary items sometime after learning them. Vocabulary knowledge has been neglected or considered as a secondary emphasis in foreign language programs since it is felt that students need to master basic grammatical patterns and the ability to communicate in English. Some researchers (Twaddell, 1973; Wilkins, 1974; Richards, 1976; Carter & McCarthy, 1988) claim that little importance has been given to vocabulary and the teaching of vocabulary or learning new words and phrases is often seen as an unimportant value, and even it is neglected most of the time in foreign language teaching. It was found by Janjula et al. (2010) that EFL learners need good knowledge of vocabulary to be successful in language learning, and they must be able to use them fluently and appropriately to be efficient language users. This sufficient vocabulary knowledge will result in effective language learning and use (Al-Jarf, 2007). As Wilkins (1974, p. 111) states, "without

grammar very little can be conveyed, without vocabulary nothing can be conveyed". So vocabulary knowledge is an important component for developing language skills. Consequently, limited vocabulary knowledge hinders both communication and language learning of EFL learners. In EFL contexts that most learners learn English only in classroom and their teachers rarely use fluent English language as the medium of instruction the importance of vocabulary learning increases even more.

Twaddell (1973) admits that learners get an ability to understand and use words in the foreign language, but claiming the reason why it is not really taught is that no single method has gained a general acceptance in teaching vocabulary. Hedge (2000) highlights the neglect of vocabulary learning and teaching research in literature and maintains that "this neglect sits uncomfortably with the significance placed on vocabulary learning by learners themselves" (p.110). Language learners need to master vocabulary to meet their communicative needs in the classroom.

Some researchers believe that effective vocabulary instruction provided through intervention instruction is essential for students struggling to acquire vocabulary (Qian, 2002; Coyne, McCoach, & Kapp, 2007). In order to provide effective vocabulary instruction, teachers need a vocabulary assessment that can identify students who are at-risk in vocabulary development. This assessment would show which students require extra vocabulary support through whole class instruction or vocabulary interventions. One approach to deal with learning issues is to use assessment tools for the sake of learning. Formative assessment serves the dual purpose of giving the teacher information on the effectiveness of the lesson and giving students information on the current state of their learning. Such information can guide future instruction decisions. Formative assessment is tightly linked with instructional practices. Teachers need to consider how their classroom activities, assignments, and tests support learning objectives and allow students to communicate what they know, then use this information to improve teaching and learning.

REVIEW OF THE LITERATURE

Vocabulary learning and retention has been the center of scholarly debates and empirical investigation (Kamuche, 2005; Kapricke & Roediger, 2007; Kwan, 2010; Mutai, 2012; Babaie & Nourdad, 2014). Many researchers have looked at the issue of the vocabulary learning and retention from different perspectives and they have adopted different methodologies to examine the effects of manipulations of vocabulary presentation on the nature of its learning and retention .

Mutai (2012) for instance investigated the extent to which oral questioning, as a teaching strategy, affected the performance of EFL students in Kenya. The study employed the mixed methods research design. To collect data, the study used questionnaires, interviews, documentary data and non-participant observation. Both qualitative and quantitative data analyses were employed. It emerged that oral questioning as a method of teaching was not being utilized as recommended in secondary schools. Teachers' awareness of oral questioning was limited. Teachers were not guided enough to use oral questioning properly, for example they did not pause to give learners time to respond to the questions. Rendering formative assessment tools repeatedly is a vital part of effective learning (Kwan, 2010). Kwan (ibid.) investigated the effect

of two assessment tools of formative assessment: 'one-minute paper' and 'daily quiz'. Comparing major characteristics of the one-minute paper and the daily quiz, he referred to the weaknesses of one-minute paper. He proposed that daily quiz should be used instead. Although both tools allowed useful feedback between teachers and students, the daily quiz facilitated the process of retrieval which assisted learning. He also conducted the end-of-term survey based on students' opinions about the usefulness of the daily quiz and the results proved its' usefulness .

Gholami and Moghadam (2013) also investigated the effect of weekly quizzes on Iranian high school students' performance on final achievement test. They reviewed the literature in chronological order from the earliest study of testing on learning, grounded on washback effect theory. They mentioned that proponents of the idea claim that frequent quizzes motivate practice and review and provide feedback to students and teachers. They conducted a quasi-experimental study and the participants of their study were divided in two experimental and control groups. The former group received weekly quizzes and the latter just took midterm exam. T-test procedure compared two groups' mean scores and the result showed outperformance of quiz group over no quiz group .

Babaie and Nourdad (2014) in their study on the effectiveness of commonly used formative assessment types on vocabulary learning and retention found out that both quiz and oral questioning during instruction helped learning the vocabulary items for pre-intermediate EFL learners and also caused better retention of the learned items. They recommended that EFL teachers to include these two types of formative assessment in their academic management to obviate the problem of vocabulary knowledge for their learners.

Reviewing the related literature, one can find the rarity of studies that examine the assessment impact on vocabulary learning and retention. The studies mentioned above each has looked at the effect of assessment on learning. They have not, however, made a clear comparison between the effect of various assessment types on learning and retention of learning. To close this fundamental gap in the literature of formative assessment and complete the previous studies this study attempted to compare the efficacy of two assessment types of oral questioning and quiz on vocabulary learning and retention.

RESEARCH QUESTIONS

Since previous studies prove the positive effect of formative assessment specially quiz and oral questioning in EFL contexts this investigation just focused on a comparison between these positive effects. In line with this purpose the present study aimed at answering the following two research questions:

1. Do oral questioning and quiz differ in their effect on vocabulary learning?
2. Do oral questioning and quiz differ in their effect on vocabulary retention?

METHODOLOGY

Participants

The participants of the present study were 41 female pre-intermediate EFL learners within the age range of 16 to 25. Since it was important to have the same teacher for both of the experimental groups and due to some limitations in the number of pre-intermediate classes participants were selected based on convenient sampling.

Instruments

The following instruments were used for data collection in the present study:

Preliminary English Test (PET)

The standardized PET test was administered to participants in the two intact classes to ensure their homogeneity in terms of English proficiency. PET includes speaking, listening, reading and writing sections designed for the speakers of other languages by Cambridge University.

Vocabulary Pre-Test, Post-Test, and delayed post-test

The researchers developed a question bank consisting 100 vocabulary-items from which three parallel 30-item vocabulary- test sets were made. They were used as vocabulary pre-test, post-test, and delayed post-test.

Procedures

The study was conducted using a quasi-experimental design because although it lacked random selection, it had benefited from random assignment. There were two experimental groups of oral questioning and quiz with 20 and 21 learner in each under investigation. Pre-test, post-test and delayed post-test approach was applied to estimate the impact of the independent variables, written quiz and oral questioning, on vocabulary learning and retention as the dependent variable.

At the first stage of the study participants were randomly assigned into two experimental groups. The instructor of both groups were one of the researchers and the same teaching method and materials were used. The homogeneity of the groups was verified using PET. Three sets of teacher made parallel vocabulary tests each including 30 items were applied as pre-test, immediate post-test and delayed post-test.

After the pre-test participants in both groups underwent treatment for 36 hours during two months, during which they had the same test contents each session but different assessment methods (oral questioning vs. quiz). On the last session, both groups were given the immediate post-test. And after a time interval of seven weeks they were given their delayed post-test.

FINDINGS AND DISCUSSION

To answer the research questions of the study, the mean scores of four sets of tests for the two groups were compared by t-test formula. An independent t-test was used for each of the following between group comparisons: two mean scores of PET test; two mean scores of the pre-test; two mean scores of the immediate post-test; and two mean scores of the delayed post-test.

To make sure that the proficiency level of the participants was not intervening with the findings it was considered to be equal for the two experimental groups and somehow taken under control in the study design. Consequently, at the beginning to have a sound basis for the comparison of the two groups, PET test results of the both were compared. Table 1 reflects the results of this initial comparison.

Table 1: Proficiency test mean score comparison for the two groups

	Levene's Test for equality of variances		t-test for Equality of Means	
	F	Sig.	t	df
Equal variance assumed	.05	.82	.73	58
Equal variance not assumed			.73	57.67

As table 1 shows there was no significant difference between the proficiency level of the two experimental groups at the beginning of the study ($t=.73$, $p\leq 0.05$) so it was concluded that the two groups were almost at the same level of proficiency at the beginning of the study. The second independent samples t-test was applied for making a comparison between the vocabulary pre-test scores of the quiz and oral questioning groups. The results of this comparison are shown in Table 2.

Table 2: Pre-test mean score comparison for the two groups

	Levene's Test for equality of variances		t-test for Equality of Means	
	F	Sig.	t	df
Equal variance assumed	.15	.70	2.61	58
Equal variance not assumed			2.61	57.89

As demonstrated in Table 2 the difference between the means of vocabulary pre-test for the quiz and oral questioning groups was not significant ($t= 2.61$, $p\leq 0.05$). In other words at the beginning of the research the participants in both groups were similar as far as their knowledge of the vocabulary was concerned.

After presenting the two experimental groups with their own specific formative assessment types (oral questioning and quiz) as the treatment of this research design their vocabulary learning were compared by comparing the mean scores of the immediate post-test for the two groups. The results of this analysis are presented in Table 3.

Table 3: Immediate post-test mean score comparison for the two groups

	Levene's Test for equality of variances		t-test for Equality of Means	
	F	Sig.	t	df
Equal variance assumed	.17	.68	4.34	57
Equal variance not assumed			4.34	56.22

Table 3 shows that there is not a significant difference between the mean scores of quiz and oral questioning groups' immediate post-test. It could be inferred that these two formative assessment types were not different in their effect on vocabulary learning.

The second dependent variable of the present study was retention of the learned vocabulary items. To show the effect of the two above mentioned formative assessment types the last comparison was done between the delayed post-tests of the two groups, the results of which are shown in Table 4.

Table 4: Delayed post-test mean score comparison for the two groups

	Levene's Test for equality of variances		t-test for Equality of Means	
	F	Sig.	t	df
Equal variance assumed	.39	.53	3.43	58
Equal variance not assumed			3.43	57.97

Table 4 shows that the mean scores of the two groups' delayed post-test were not significantly different ($t= 3.43$, $p \leq 0.05$). It could be inferred that the two types of formative assessment investigated in this study namely quiz and oral questioning were equally helpful in retention of the learned vocabulary items.

As analysis of the data revealed, there was not a significant difference between the two types of formative assessments investigated in this study (quiz and oral questioning) in terms of vocabulary learning and retention. This study was a supplement to a previous research in the literature (Babaie & Nourdad, 2014) which had proved the positive effect of both quiz and oral questioning on EFL vocabulary learning and retention but had not made a comparison between the two assessment types.

From a practical point of view, many teachers in EFL classes ignore the importance of true formative assessment approach and they just devote their time to assess the learners' achievement in a traditional summative way. Therefore, the present study suggests that English teachers considering the findings of the related literature as well as the findings of the present study can benefit from two appropriate assessment types, namely, oral questioning and written quiz, regarding their own context of teaching. Knowing that formative assessment is better, more complete, more modern, more precise and more useful than summative assessment. They can benefit from both types of oral questioning and written quiz and they can choose each on the basis of their context, affective and cognitive needs of the learners, the nature of subject matter and educational objectives, because the present study showed that in practice there is no difference between the two. The findings of this study can be used in the fields of syllabus design, language assessment, material development and teaching methodology.

CONCLUSION

Vocabulary learning and retention are among the major problems of EFL learners and are considered as drudgeries for most foreign language learners. A solution solely focusing on teaching manipulation, without considering other educational aspects such as assessment methods cannot be fully accomplishing for sure. This serious issue was taken into account in this study and two types of formative assessment namely oral questioning and quiz which are commonly applied in Iranian academic context including foreign language classes were

compared in terms of their efficiency in vocabulary learning and retention of EFL learners. Based on findings emerging from this study, it was concluded that there is not a significant difference between the positive results of these types of formative assessment, so based on the needs of their learners and their learning context language teachers can take the advantage of any of them in order to have a better vocabulary learning and retention. The findings can also have implications for curriculum developers in decisions on the nature and type of instruction/assessment to include in various educational systems.

Limitations of the study

Like many other studies, this study also suffers from some limitations. Firstly, the type of sampling which was employed in the present study was the convenient sampling and not the random sampling. The research was limited to available group selection, instead of individual subject selection through randomization. Secondly, the participants of the study were all female EFL learners.

ABSTRACT

Learning the vocabulary of the language to be learned is essential for its learning and an average learner needs to know at least 3600 English words in order to read an unsimplified text (Nation, 1975). The situation even gets worse when the reading material contains some polysemious words for which there are no idea to assign which meaning. This problem is accentuated among learners who have little contact with the L2 words and contexts and it seems to be a great problem for Payam Noor University students in Iran who are parts of distance education system with little access to authentic contexts and materials. So, they need to have a good understanding of the problematic vocabulary like polysemious words and their meaning in languages they want to learn. This paper investigates some of the high rated difficulties of 48 English translation major students of Payam Noor University (PNU) of Khalkhal Branch in learning and using English Polysemious words gathered based on the problems occurred during their class hour in courses of "Simple English Poetry, An introduction to English Literature 2, and Simple English Prose". For gathering the required data which consisted of high-rated problematic English Polysemious words, the researchers used a record player which recorded the students' voices answering the instructor's questions directed at having them use the different vocabularies based on some of their textbooks and assuring whether their interpretations of the polysemious words were correct or not together with checking of their meaning and state of polysemy in Persian. Alongside it, based on an error prediction of Persian English as a foreign language (EFL) learners, some of the areas contributing to the problems were investigated and some suggestions to solve the problems were suggested. It was found that the students had difficulties in learning and being able to use the underlying meanings of the words due to the problems like the poor kind of instruction they had undergone which may be resulted from factors like the insufficient class sessions for PNU students and also the students' insufficient efforts in getting the underlying meanings of the words. It is suggested that more class sessions should be devoted to such students by the officials of PNU alongside specifying more talented instructors who teach based on the underlying meaning and making students familiar with the active vocabulary learning techniques.

KEYWORDS: Polysemious words, PNU (Payam Noor University), underdifferentiation, underlying meaning

INTRODUCTION

The history of language teaching has always seen the ongoing debates between the proponents of the either the theory of “vocabulary first” or “grammar primary” as the building block of language teaching and the shifts in recent decades towards teaching grammar inductively seems to emphasize the great significance Vocabulary knowledge considered by both first-language and second-language researchers in language competence (Grabe, 1991; Frederiksen, 1982). And so, language learners should have a long-term plan for learning and retention of vocabularies actively or passively using any strategies and techniques at their disposal and it seems that learning problematic word with two or more related meanings (known as polysemous words) should be given due importance in learning the language.

Polysemy is believed to be the central phenomenon of lexical semantics (Ricoeur, 1975) and it is a term used in semantic analysis to describe the situation in which a word has two or more related meanings (Ibarretxe-Antuñano, 1999). In spite of the simplicity of the definition, there seems not to be a clear-cut boundary for the definition and as for the importance of the term in our study, it is better to define this “somehow muddy field in linguistic research” (p.14). In order to understand polysemy better and based on the category given by Ibarretxe-Antuñano(1999), words should be analyzed in three layers in order to determine their state of polysemy: first, etymological information about the words should be gathered in order to show that those words which are of the same origin are polysemic. Another criterion for the analysis of words is based on unrelatedness vs. relatedness of their meaning based on the native speaker’s feeling about the connectedness or irrelevance of certain meanings. And finally, based on the central or core meaning of the word we can elaborate on its state of polysemy. The selection of the polysemous words and their state of polysemy in the current article will be based on this categorization.

Pustejovsky (1995, as cited in Krifka, 1998) believes that polysemy occurs in one of the following forms:

- count/mass alternations
- Animal/meat
- Object/Stuff an object is made up
- Stuff/Kind
- Stuff/Portions
- Plant/food alternation
- Containers and contained
- Figure/Ground reversal
- Product/producer alternation
- Process/result alternation
- Alternations involving location
- Place/people
- Capital/government

The reason why PNU students were selected as the participants of this study goes back to their improper exposure to English classes and subsequently their due problems in recognizing and learning active and passive vocabularies through limitations of exposure and contact with

different kinds of vocabularies –like polysemous ones--. For instance, in the courses under study (Simple English Poetry, An introduction to English Literature 2, and Simple English Prose), the students are partially present in the classes in less than 4 sessions for each course and in fact, the officials have declared that these classes are held for the aim of just problem-solving on the part of the students and if there are no problems mentioned and faced on their sides—as the nature of such classes with most students studying at the final days before the exam--, then the instructor has no obligation to start teaching units. So, such students seem to have numerous problems regarding the main skills of language learning and areas like pronunciation and vocabulary learning and retention.

An important point which is of crucial importance in discussing the findings of the study is that the problems that students encounter in assigning meanings to polysemous words can be categorized into different levels and the category which is mostly used in the current study is the hierarchy of difficulty presented by Prator (1967) in which he categorizes the learner's problems into the following levels:

Hierarchy of difficulty:

1. Transfer - no difference
2. Coalescence - one item covering two in L1
3. Underdifferentiation - absence
4. Reinterpretation - different application of existing item
5. Overdifferentiation - new item
6. Split -two items covering one in L1 (Prator, 1967).

REVIEW OF THE LITERATURE

Teaching the students about the different senses and meanings of the polysemous words is not that simple. Nagy (1997, cited in Parent, 2009) believes that language learners can deal with related senses of polysemous words in two basic ways:

The first is sense selection through which the language learner is expected to select the appropriate sense among those senses using his mental power.

The other is Reference specification which requires a core or underlying concept for all the words, having the same senses for all contexts.

The model of vocabulary acquisition proposed by Meara (1997, cited in Schmitt and McCarthy) seems to be of great importance to both language teachers and learners. Some of the key findings of this model are as follows: the mental lexicon is a network; learning a word is a matter of connecting the newly encountered word to one, or more, already known. This could be a first language word or a second language one. Links may be one-way or, ideally, two-way. Words connected with one-way links are those that exist in our passive vocabulary—words we know when we hear them but not necessarily available for productive use. Both native speakers and L2 learners have such words. Further, the number of connections varies: the more connections, the more well-known the word is.

It is the remarkable simplicity of the model that deflects significant criticism. The counterargument, that the lexicon does not resemble a network, is the more untenable position. The appeal Meara's model has for polysemy is the ease in which it can be developed to accommodate it.

Klepousniotou's (2001) in his study of learning polysemous words showed that there must be a single mental representation and a single basic sense for learning polysemous words. He believed that the process of sense creation is the building block of polysemy and during this process, based on a basic sense; extended senses are generated for polysemous words.

In his experimental study with seventy low English proficiency level Japanese high school students, Nakahara (2005) compared two approaches to teaching polysemy known as the widespread sense selection approach and core meaning one (the experimental group).

The group taught by core meaning gained better results than the control group. One of the main findings and conclusions of the study was that based on cognitive linguists' analyses of metaphoric and metonymic relations, it is the task of the teachers to improve the students' understanding of the core and peripheral meanings of polysemous words and their relationships. Nakahara (2005) further concluded and declared that teachers having difficulty in teaching polysemous words will have two options left: either to present students with all of the meanings of the polysemous words, or presenting the overall underlying meaning.

This notion of underlying meaning comes from the work of Nation (1990, 2000) who introduces it reporting on the work of Visser (1989), based on a pedagogical procedure for teaching polysemes during which students are presented with two meanings of a polyseme in context and are given a simple task for each meaning followed by asking a state of what features are common to both senses. Srinivasan and Snedeker (2011) also asserted that the understanding of polysemous words primarily in the first stages of meaning development is based on a conceptual and meaningful base, different from those of homophones which seem to be represented at phonological level.

RESEARCH QUESTIONS

1. What polysemous vocabularies are the high-rated problematic words for PNU students'?
2. What are the reasons for such words to be problematic and make students difficulties in understanding and interpretation?

METHODOLOGY

Participants

The population of the present study consisted of 48 students in English translation major who were studying in Payam Noor University (PNU) of Khalkhal Branch during the fall semester of 2014-2015. The students had the proper and right command of English language based on the information elicited from their grades and scores in the previous semesters which were beyond

the mean score 15 out of 20 and they were in their third year of education, however, some of them showed difficulties in understanding the essential words in the reading materials.

Instruments

For gathering the required information which consisted of high-rated problematic English Polysemous words, these data were gathered using a record player which recorded the students voices answering the instructor's questions directed towards having them use the different vocabularies and assuring whether their interpretation of the polysemous words was correct or not. This information was elicited from the reading materials during their class hour in courses of "Simple English Poetry, An introduction to English Literature 2, and Simple English Prose"--which are published by Payam Noor University publication and taught by the corresponding author of the study--together with the checking of their meaning and state of polysemy in Persian. Alongside it, based on an error prediction of Persian EFL learners, some of the areas contributing to the problems were investigated and some suggestions to solve the problems were suggested.

Procedure

Based on the findings, 20 high-rated problematic English polysemous nouns and verbs in English were chosen and after checking their meaning and state of polysemy in English and Persian, the researchers had an error prediction of Persian EFL learners. The researchers just accepted those vocabularies as polysemous words that all of the meanings of that word were found under one lexical entry in Longman Dictionary of Contemporary English 5th Edition (2009).

RESULTS AND DISCUSSION

Here, the results of the study of analyzing the PNU students' high-rated problematic English polysemous words are presented and discussed using the following table.

Table 1: the analysis of the PNU students' high-rated problematic English polysemous words

Number	English polysemous word (percentage of being problematic)	English state of polysemy	Persian meaning	Persian State of polysemy	Error prediction of Persian EFL learners
1	Literature (68%)	1. Written works, especially those regarded as having artistic merits 2. Books and writings on a particular subject 3. Promotional or advisory leaflets and other material	ادبیات	ادب و هنر نوشتجات مطبوعات مواد چاپی	As you can see here, the three meanings mentioned for the word "Literature" have mental relationships with each other. They all refer to written works in some ways, so the language learner seems not to have much difficulty in learning and applying them in his own language, however; most of the students made mistakes to match the meaning when it referred to the second meaning and associated it with the first meaning.

2	Protection (35%)	<ol style="list-style-type: none"> 1. The action of protecting 2. A person or thing that protects 3. The document guaranteeing safety 4. The payment of money to criminals to prevent from their attack 	محافظت	سايه(بالاي سر كسي) حراست حمایت حفاظ	Here we have different alternations for the word " <i>Protection</i> ". The relationship between them is much more abstract and so its meaning potential will be highly dependent upon its surrounding context. So, it can have the meaning of an action, a person, a document or a payment and that's why language learners made mistakes in its meaning association as there is an " <i>Underdifferentiation</i> " in Persian meaning.
3	Tail (42%)	<ol style="list-style-type: none"> 1. The hindmost part of an animal 2. Something downwards or backwards 3. The final, more distant or weaker part 4. The lower or hanging part of a shirt or coat 5. The side of the coin without the image of the head 6. A person's buttocks 7. A person secretly following another one 	دم	دنياه عقب پرووي دنيه تعقيب	This is the word which made some students make mistakes in the understanding the phrases like "head and tail of a coin" and a proverb like "not being able to make head and tail of sth" which seems to be culturally embedded in different languages and so, students with lower familiarity with the target language culture and its idiom and proverbs is exposed to errors.
4	Country (72%)	<ol style="list-style-type: none"> 1. A nation with its own government 2. Districts outside large urban areas 3. An area or region with regards to its physical features 4. relating to country or western music 	کشور	ديار ملت آحاد وطن	Evaluating students' understanding about this word, they only had the meaning "an area of land with its own government" in their minds even when the other meanings were sought. The students believed that it was their teacher's problem to only give this meaning to the word country and they overlooked the other meanings of this word especially the one that refers to districts outside large urban areas.
5	Pure (34%)	<ol style="list-style-type: none"> 1. Not mixed or adulterated with any other substance 2. Innocent or morally good 3. Perfectly in tune and with a clear tone 4. Theoretical rather than practical 5. Complete, nothing but. 	خالص	پاك محض عفيف اصيل بي شائبه	In the 3 rd and 4 th meanings there seems to be a kind of " <i>Underdifferentiation</i> " in Persian meaning and the the Persian translation seems no to conform to it, however; the other meanings are the level one transfer which a meaning can easily be transferred to the target language, so the difficulties produced may be attributed to the teacher's

					competence in the teaching and the student's intake of the word.
6	Suit (38%)	<ol style="list-style-type: none"> 1. A set of outer cloths made of the same fabric aimed to be worn together 2. Any of the sets into which a pack of playing card is divided 3. A complete set of sails for a ship or for a set of spars 	يك دست لباس	ست لباس جامه	Look at the three meanings in English. There is a word in common in the three meanings: "SET" the understanding of which is the key to learn the meanings of the word "Suit". In Persian meaning this word is neglected and it is not transferred in the Persian translation. So this word is challenging for those learners who haven't noticed the core concept SET.
7	Stage (30%)	<ol style="list-style-type: none"> 1. A point, period or step in a process 2. A section of a journey or race 3. A raised floor or platform for the act of actors or speakers 4. A floor of a building 	صحنه	مرحله منظره سن نمایش	In this example we can see another layer of meaning included called "Homonymy". So the first 2 meanings are totally different from the second 2 meanings and it is a source of difficulty, but wiser students may have minor problems regarding this word as for the word <i>صحنه</i> we have both meanings <i>مرحله</i> and <i>سن نمایش</i> which are contributing to the English meanings mentioned.
8	Material (44%)	<ol style="list-style-type: none"> 1. The matter from which a thing is or can be made 2. Items needed for an activity 3. Cloth or fabric 	ماده	جنس جسم مناسب مربوط مادي	This example seems to be easily transferred and not problematic at first but it is not that simple. The word "MATERIAL" has a greater range of meaning and usage in English rather than in Persian. For example, the meaning which refers to a cloth can't be grasped so easily by Persian speaker and so in error prediction this meaning is a candidate for students' mistakes.
9	Coach (26%)	<ol style="list-style-type: none"> 1. A comfortably equipped single-decker bus used for longer journeys 2. A railway carriage 3. Economy-class seating in an aircraft or train 4. A closed horse-drawn carriage 	کالسکه	واگن راه آهن کالسکه کودک	You can have a look on the different ranges of meanings in the two languages and can infer that the Persian language learner will have difficulty in transferring the meaning. It is obvious that the Persian meanings listed here can't be of equal meanings with the English counterpart and so, we can say that this example will produce difficulty for those who have not acquired the whole range of meanings of the word <i>Coach</i> .
10	Trade (7%)	<ol style="list-style-type: none"> 1. The buying & selling of goods. 2. A transfer in sports 3. A job requiring manual 	تجارت	حرفه داد و ستد مبادله نقل و انتقال	In this example you can exactly see that the meanings mentioned for the word "Trade" actually have the same counterparts in Persian too.

		skills & training 4. A particular area of business			The transfer of meaning is rapid in this example. For instance, when we talk about "نقل و انتقال" in Persian, you can easily perceive that we are talking about a special field (sports) and the activation of new meaning is highly automatic. This can be related to the collocation which exists between one entity (here "نقل و انتقال") and the other one (sports).
11	Principal (34%)	1. The most important person in an organization, the head of a school 2. A fully qualified practitioner 3. A sum of money on which interest is paid 4. Main (adj.)	مدیر	مهم اصلي رئيس	For the word " <i>Principal</i> " there are four meanings, three of which can be inferred from one another and they have mental relationships with each other. The only meaning which is totally different from the other three is the third meaning which is the monetary shadow of meaning of the word Principal. So, neglecting this case this word also doesn't seem challenging unless the learner would be mistaken between this word and the word " <i>Principle</i> ".
12	Forge (22%)	1. Make or shape a metal object by heating or hammering it 2. Create (sth strong) 3. Produce a fraudulent copy or imitation	جعل کردن	ساختن کپی کردن مکاری کردن	This is a word which has 3 different meanings which are culturally embedded. Without having knowledge of English how a Persian speaker can know that the word has a meaning like "آهنگری" in Persian? So the Persian learner of English will have difficulty in transferring this word and it will be a point of difficulty.
13	Rob (28%)	1. Take property unlawfully from 2. Steal 3. Overcharge 4. Deprive someone of something deserved	دزدیدن	چاپیدن لخت کردن غارت کردن ریودن	This word seems to be of middle difficulty for the language learner. The first two meanings are " <i>Coalesced</i> " into the Persian word "دزدیدن" while the other 2 meanings (<i>Overcharge</i> & <i>Deprivation</i> which show the effect of culture in constructing them) are examples of " <i>Underdifferentiation</i> " for the word Rob in Persian. So the learner will do have a problem in this word.
14	Encounter (64%)	1. Unexpectedly meet or be faced with 2. Having an unpleasant struggle with	مواجه شدن	تصادف کردن مصادف شدن دست به گریبان شدن دچار شدن	This example seems to be the opposite of the previously mentioned example. There are 2 meanings in English for the word " <i>Encounter</i> " in English while the Persian word "مواجه شدن" can be interpreted in 4 different ways. So the word " <i>Encounter</i> " will have

					both Reinterpretation (different application of existing item) and Overdifferentiation (new item being introduced).
15	Border (47%)	1. Form a border around or along 2. Be adjacent to 3. Come close to	مرز گذاشتن	حاشیه گذاشتن محدود کردن	The meanings provided here in English and Persian are only the same at the first meaning. The other two are totally different and the meanings in one language are absent in the other. So the language learner will have difficulty in assigning meaning to the word if the aim of vocabulary is not the first meaning.
16	Spring (63%)	1. Move suddenly upwards or forwards 2. Cause to rise from cover 3. Originate or appear from 4. Move suddenly by the action of a spring	جهیدن	قابل ارتجاع بودن ظاهر شدن جست و خیز کردن جوشیدن	The internal relationship between the English meanings makes their go togetherness high even if they refer to different entities. The meanings are culturally interwoven with English so it is not surprising that because of cultural differences, the meanings provided by the Persian learner are different from that of English.
17	Compact (26%)	1. Exert force on to make more dense 2. Form by pressing the component parts together 3. compress	به هم فشردن	سفت کردن جمع و جور کردن متراکم کردن	In this word we can see another key word which is the same in three meanings related to the meaning of the word "Compact" and it is revealed in the third meaning "Compress". If we only have this specific meaning in our mind when we hear the word, depending on the context we can have a clear meaning of that word. Fortunately we have the Persian equivalents of the English form and so the Persian learner of English if trained well seems not to have any problem with this word.
18	Direct (34%)	1. Control the operation of 2. Supervise 3. Tell or show the way 4. Give an order to	هدایت کردن	نظارت کردن دستور دادن معطوف داشتن	The word "Direct" is a word that can have a host of meanings depending on the context. For example in movies, the word has a meaning different from what we expect in Persian. Or we can say that as the Persian word is polysemous too, the polysemous meanings of the Persian word don't sound like the original English word. As an example, the word " " doesn't seem to mean <i>direct</i> in situations like observing the rules or observing as

					an civil engineer. So the words and their meanings should be treated cautiously.
19	Weigh (9%)	1. Find out how heavy sth is 2. Have a specified weight 3. Balance in the hands to assess its weight 4. Be cumbersome	وزن کردن	سنجیدن موازنه کردن روی باسکول رفتن (اصطلاح ورزشی)	The word seems to be of medium difficulty. Having a look on different meanings of the word "Weigh", we can see that some of the meanings are absent in Persian (like the forth meaning) but it doesn't seem to make any problems because this meaning of the word can be arrived at by <i>Analogy</i> . So for the English learner it is vital for understanding of the text to have a kind of creativity and to think higher than what the word exactly means and can mean.
20	Tear (26%)	1. Pull or rip apart or into pieces 2. Make a hole or split in 3. Damage by overstretching 4. Demolish something	پاره کردن	دراندن گسیختن بریده شدن	The word "Tear" has lots of meanings from among which we only focused on these four meanings which have come under one entry. As you can see, the meanings mentioned in the have different flow of meaning, so if somebody wants to assign meaning to the word, not only should he have a clear understanding of what meanings the word may have, but he should also use context to assign proper meaning. If he think about the word as having the only meaning of " " without the other meanings that it can have, he won't be able to think about "Damaging" when we are talking about "Tearing".

Based on the findings of this study, some of the problems of the PNU students in interpreting the polysemous words can be related to the poor kind of instruction they have undergone and the fact that most of the English teachers and instructors do not seem to have a clear picture for teaching words and they just go with translating words from the L1 to L2 without referring to other underlying meanings. It is also generally believed that when the teachers come across with the polysemous words which they find problem with explaining it, they should have in mind that teaching a polysemous word which definitely is different from teaching an ordinary vocabulary and it has its own difficulty. One finding which is supported by the findings of the current study in teaching polysemous words comes from Yarowsky (1992) who uses Roget's Thesaurus to disambiguate word senses of English words using statistical models of major categories. He believes that the most probable categories of words can be determined by searching the surrounding words for indicators of each category. These indicator words are obtained and weighted during training and by examining the hundred surrounding words for indicators of each

category. The system used by Yarowsky's (1992) is a large training corpus and a thesaurus based one and he uses a list of indicator words along with their weights for each category subsuming the words are to their root forms in order to gain more useful statistics. One of the main benefits of association of vocabularies in the system is that the problems of disambiguation of concrete nouns are solved by the broad context.

Another method for teaching polysemous words supported by the findings of the current study is using the findings of corpus and corpus studies. A corpus is simply defined as a large collection of linguistic evidence mainly naturally occurring data either written texts or a transcription of recorded speech. Such data can easily be used for different purposes in different contexts and situations. A large variety of corpora in English and in other languages have been compiled in electronic format for various purposes over the past few decades. Mosavi Miyangah uses corpus to teach the vocabulary and especially polysemous words and she also emphasizes the importance of dictionaries by asserting that "a straightforward way to find translations of the given terms is to use a bilingual dictionary; however, this method alone faces some problems due to one-to-many correspondences in a bilingual dictionary" (p.5) and it paves the way to using the corpora for the aim of teaching vocabularies and polysemous words.

Another interesting method of vocabulary teaching with the aim of reducing the chance of getting mixed up comes from Nation (1990) in which he recommends using something like picture messages or pictogram alongside the polysemous vocabulary in order to make it better understood. It can be achieved by teaching the underlying concept by showing several uses. For example, the word fork has different meanings to refer to a utensil for eating, a part of a bicycle, a part of a road, and a part of a branch. Nation offers using a simple shape like this $_C$ to teach the word. This way, the learning process will be more meaningful and it won't require a heavy mental burden for learning it.

Öztürk also talks about a sense called the core meaning sense or the basic sense which is the most concrete, frequent and literal of all the meanings of the word and therefore conceptually easier to understand and it is central to the understanding of other meanings because the latter are often figurative extensions from the core meaning (p.25) and it has shown that L2 learners have superior knowledge of these senses a polysemous word has when they want to refer to an entity.

CONCLUSION

The aim of the current study was to find and analyze the PNU students' high-rated problematic English polysemous words. As the results of the study showed, one of the most important factors leading students to uncertainty in assigning meaning to words rises from the point that most of Iranian teachers and instructors do not have a broader picture in vocabulary teaching and as the students complained, most of them suffice to only translate a given word from the target language to the native one without referring to other areas of meaning, denying the underlying concept of how to teach a vocabulary suggested by most of the researchers like Nation (1990) and Laufer (1997). Nation (1990) believes that only when a student can talk about a learned vocabulary that he knows its written and spoken form, its meaning, its grammatical pattern, its collocation,

association, frequency, as well as its register. For this reason, he refers to two types of vocabulary knowledge: receptive knowledge—being able to recognize words while reading or listening—and productive knowledge—being able to produce words while reading or speaking. One of the main objectives of a teacher should be enhancing this ability in vocabulary usage and use in students. The result of the Laufer's (1997) review of several researches about the definition of a word is summarized in a list of word features involved in the learning of a new word, including word form, word structure, and some other aspects of the word like its syntactic pattern, its relation with other words like its synonyms, antonyms, common collocations, and hyponyms, as well as its multiple meanings like metaphorical, cognitive, and affective meanings.

Another problem of these students was their insufficient talents and efforts in dealing with unknown vocabularies and assigning different meanings to words—especially those which were underdifferentiated in the target language—which can be resulted from their lack of familiarity with different techniques and strategies in reading comprehension and guessing the unknown words from the context. This problem can be referred to the system of education known as “Distance Education” supported by PNU which is aimed at adult students who are too busy to attend the classes, while most of the students in the conducted study were did not have such qualification.

The findings of the current research should be taken as an alarm by PNU officials who do not specify much class sessions for translation major students and for example, the sum of the sessions for the three courses investigated by the current researchers held by PNU was overall 8 sessions—three sessions of which should be devoted to mid-term exams as specified by PNU system of education—and the word “Distance Education” which is the main ideology behind such instruction and classes, should not be any excuse and give way to raising students who are dependent to only inauthentic materials in print and only attend classes for the sake of taking the score of 6 out of classroom sessions and studying just for the exams.

Limitations of the Study

One of the main limitations of the study, as mentioned in previous sections, was the insufficient class sessions for PNU students. For example, the course “Simple English Poetry” was held only for two sessions (one of which was specified for mid-term exam). Another problem the researchers faced was the nature of distance education which supposes the students as rightful even when they are absent. So, even a student who does not attend any classes, can gain the highest score in such system. It was one of the main limitations of the study which caused most students to attend classes partially.

ABSTRACT

This study is an attempt to investigate the effect of pragmatics-focused instruction on promoting sociolinguistic competence and language ability confidence of Iranian intermediate EFL learners involved in writing. It was carried out at Kanoon Zaban Institute in Semnan (Iran) among 60 intermediate female learners with the age range of 19 to 26 through a quasi-experimental research design. The researcher administered a Nelson test to determine the homogeneity of the participants regarding their general English language proficiency level. Participants were not randomly assigned into two groups. After coming up with the conclusion that the two groups were homogeneous, both groups completed written discourse completion tasks (WDCT) and self-assessment questionnaire (SQA) as pretests. During 8 weeks of treatment, in the experimental group, students received instruction in compliment that consisted of lessons about Persian compliment, English compliment, comparing Persian and English compliment and they were also provided with meta-pragmatic information. It should be mentioned that the control group was not provided with any meta-pragmatic information after the treatment was over. At the end of the treatment, the participants in both groups answered the same WDCT and SAQ as posttests. A t-test was used to compare the mean scores of the two groups, the result showed that the learners' mean score in the experimental group was significantly higher than the learners' mean score in control group. In sum, the results of analyses are indicative of the fact that applying pragmatics-focused instruction has significant effect on both the sociolinguistic competence and language confidence of Iranian intermediate EFL learners in language ability.

KEYWORDS: Pragmatics, Pragmatics-focused Instruction, Sociolinguistic Competence

INTRODUCTION

Background

For many years, learning a second or foreign language was equated with linguistic or grammatical accuracy. But now, the communicative approach to language learning has put grammar – centered classes to one side and has fostered the use of communicative strategies

(Kasper & Rose, 2001, p.76). Communicative competence is concerned with the achievement of functional abilities in the target language (TL) with the final purpose of understanding and producing language that is appropriate to communicative situations in accordance with specific sociocultural parameters (Kasper & Rose, 2001, p.24).

Sociocultural factors such as differences between the first and target culture can mislead the learner in language production and interpretation. Whether we are speaking in our first or second language, we are influenced by sociocultural norms or constraints that affect the way we communicate (Kasper & Rose, 2001, p.93).

Sociolinguistic competence as one of the aspects of communicative competence enables us to create and interpret language that is appropriate to a particular language use setting (Harley, Allen, Cummins, & Swain, 1990b, p.14). According to Levinson (1997), pragmatics and sociolinguistics share many areas of common interest. Sociolinguistics has contributed much to certain areas of pragmatics, especially the study of social deixis, speech acts and their use.

However, pragmatics in turn has much to contribute to sociolinguistics; for in trying to understand the social significance of patterns of language usage, it is essential to understand the underlying structural properties and processes that constrain verbal interaction. Although, there is a small body of data, based on research of pragmatics instruction in second or foreign language classrooms, there is no evidence of empirical research on the effects of pragmatics- focused instruction on sociolinguistic competence of EFL learners.

Pragmatics

Pragmatics can be defined as the study of linguistic phenomena from the point of view of their usage properties and processes. Inter language pragmatics mainly concerns with how native speakers differ from non – native speakers in interpreting and producing a speech act in the TL (Kasper & Rose, 2001). Leech (1993) and Thomas (1983) divided pragmatics in two components: pragma linguistics and socio- pragmatics. Pragma linguistics refers to the sources for conveying communicative acts and rational or interpersonal meanings. Such resources include pragmatic strategies such as directness routines and a large range of linguistic forms which can intensify or soften communicative acts. Socio – pragmatics is considered as the social perceptions underlying participants' interpretations and performance communicative actions.

Pragmatics - Focused Instruction

It is clear that various aspects of pragmatics can be developed through instruction. Similarly, studies in classroom research claim that explicit instruction is more effective than implicit instruction. (Kasper & Rose 2001, p.29)

Meta Pragmatic Information

This concept concerns the explicit knowledge a learner has of the pragmatic weight of language and whether the learner can contribute to what is acceptable and what is unacceptable in the target culture (House and Kasper, 1981)

Sociolinguistic Competence

The concept of sociolinguistic competence is linked to Hymes' notion of communicative competence. Hymes argued that language users need to be able to not only create and understand grammatical utterances, but also learn knowledge about cultural norms in order to judge the social situation correctly so as to produce appropriate speech. The sociolinguistics goal might be to show how specific differences in pronunciation or grammar lead members of a speech community to make judgments about the education or economic status of a speaker (Canal & Swain, 1980; Canale, 1983).

Statement of the Problem

For many years, linguistic "grammatical competence" has been a major feature of second language acquisition. A learner was said to have acquired a new language, when he or she could produce sentences that were grammatically correct. However, that same person often had difficulties when establishing a conversation with a native speaker. Learning the form of a language does not necessarily mean that a speaker is able to use that language in a way that is socially and culturally appropriate (Kasper & Rose, 2001, p.115).

Since even fairly advanced learners often lack communicative competence, the need to develop learner knowledge of different aspects of communicative abilities seems imperative. However, much less attention has been given to provide opportunities for learners to practice communicative ability in classroom research thus far.

Now in this study, by considering the instruction of pragmatics as the purpose of classroom research, we intend to know whether it helps learners produce and recognize socially appropriate language in context. For example, whether learners will be able to use social deixis according to social distance, social power, rights, obligations, and degree of imposition involved in a particular communication. Also, a self-assessment questionnaire will be used in this study, since that instruction may have a facilitating or debilitating effect on confidence in language ability. For that purpose, we suppose that SQA might serve as an interesting pretest /posttest indicator of self – confidence.

Significance of the Study

A learner in the process of acquiring a second language must be able to process linguistic input successfully; however, without the ability to understand the context in which an utterance is produced, the ways through which the context is affected, the discourse properties and sociolinguistic impact of the utterance, the learner cannot be said to have acquired the new language (Kasper & Rose 2001, p.88). Until recently, studies in second and foreign language acquisition have focused mostly on the phonological, morph - syntactic and lexical levels, investigating how learners come to acquire the form of the language. But now, it is emphasized that more attention should be paid to the cultural aspects of language learning with the recognition of language as an essential means of Human communication.

Since the main purpose of language learning is communication, a learner must develop in terms of not only linguistic competence, but also sociocultural awareness, attaining a useful

understanding of how language functions in social and cultural contexts. (Kasper & Rose 2001, p.89)

Due to the difficulty of teaching communicative knowledge, teachers of EFL especially in our country often overlook teaching it, and instead focus on the grammatical aspects of language. At institutions, only textbooks with conversation are designed to be models for learners. These textbooks cannot provide realistic input to the learners, cannot help learners in interpreting and producing a speech act in a particular context, and also cannot provide an opportunity for learner to recognize the appropriateness of an utterance within a given context. As a result, EFL students are extremely weak in this regard.

LITERATURE REVIEW

Early in the twentieth century, language teaching focused primarily on grammar and translation of written text. The shift of focus to speaking competence in more recent years fostered the idea of communicative competence that is the ability to speak a language proficiently (Kasper & Rose 2001). Different notions of communicative competence, proposed by Hymes from the perspective of linguistic anthropology (1971) and by Habermas (1984) from the vantage point of social philosophy, served as guiding constructs for the design of communicative competence as the overall goal of language teaching and assessment. An influential and comprehensive review of communicative competence and related notions was offered by Canal and Swain (1980), who also proposed a widely cited frame work of communicative competence for language teaching and testing.

Pragmatic competence

The concept of pragmatic competence was originally identified by Canale and Swain (1980) under the term “sociolinguistic competence” and considered a component of the construct of communicative competence (Hymes, 1972). Even today pragmatic competence, although widely used, remains a fairly extensive and vaguely defined term (Vyatlina, 2007).

The common idea of all the model of communicative competence is the fact that grammatical knowledge is not sufficient for successful communication and learners need to develop their pragmatic competence. Kasper and Roever (2005, p. 318) explain becoming pragmatically competent as the process of establishing sociopragmatic and pragma linguistic competence and the increasing ability to understand and produce sociopragmatic meanings with pragma linguistic conventions (Soler & Martinez -Flor, 2008, p.6).

Speech act theory

Speech act theory (SAT) describes how language can be used to do things instead of merely commenting on the state of the world. SAT describes sentences that make things happen. For example, a couple is not married until the pastor utters the word, “I pronounce you man and wife”. Another example is a worker becoming unemployed after his boss tells him, “you are fired”. This phrase once uttered, causes the employee to lose his job. In both of these situations, it is the act of saying the phrase that is important (Mwiyelee, 2005).

Goffman defines speech act as frames with a conversational meaning or intent such as request, apologies, orders, and advice. This theory was originated from John L. Austin's work in the 1940s and 1950s. Which he published in 1962 as a book entitled *How to Do Things with Words*. John R. Searle (1969, 1979) developed and codified the speech act theory. The emergence of SAT theory is attributed a direct reaction to the philosophical tradition of logical positivism. The approach claims that if a sentence can be verified or objectively assessed as true or false, that sentence is said to be meaningful.

Pragmatics in language teaching

The findings of studies indicate that pragmatics is covered in a wide range of courses across programs (sociolinguistics, Discourse Analysis, Introduction to linguistics, Teaching Method, SLA, etc.) and the time spent covering pragmatics varies from no time at all, to more than 8 weeks, depending on the program. A great deal of variation was also found in graduate program directors and faculty members beliefs about the role of pragmatic in the TESOL curriculum, another study was conducted by Riddiford and Joe (2010) about the tracking the development of socio pragmatic skills. Socio pragmatic skills have been identified as important aspects of communicative competence in the workplace (e. g. Clyne, 1994; Geluykens & Pelsmaekers, 1999; Candlin, 2002). Most earlier studies in the area of socio-pragmatic instruction focusing on requests have involved short interventions conducted in English as a foreign language (EFL) contexts with little input beyond the classroom (e.g., Alcon-Soler et al.2005; Rose, 2005; Takahashi, 2001 & 2005). Moreover, research instruments used to analyze socio-pragmatic features have mostly yielded controlled elicitation data such as discourse completion tasks (DCT) and oral interviews rather a combination of both controlled and spontaneously occurring discourse data, which ensures greater reliability (Geluykens, 2007).

Sociolinguistic competence

Second language (L2) learner's use of sociolinguistic features of discourse has attracted the attention of a number of scholars since the late 1980 (Bayley & Preston, 1996; Bauley & Regan, 2004; Dewaele & Mougeon, 2002, Preston 1989; Regan, Howard & Lemee, 2009). Several special issues in international journals have been devoted to the development of sociolinguistic competence in the L2 in the last two years (Baylay and Regan, 2004; Dewaele and Mougeon, 2002, 2004).

To be sure, several authors (Etienne & Sax 2006, Leister, 1994, Van Compernelle, 2009; Van Compernelle & Williams, 2009 a; among others) have advocated pedagogical models for teaching sociolinguistics and stylistic variation in classroom settings.

Previous studies have certainly shown that classroom learners typically have for opportunities to develop their sociolinguistic competence given the relatively formal level of teacher and textbook discourse to which they are exposed (see, e.g., Mougeon, Rehner, Nadasdi, 2004; Van Compernelle & Williams, 2009 b). Even when pedagogical models are proposed, they tend to ascribe great importance to the mechanistic process of input-output, whereby exposure, in the sense of input, to naturally occurring language is purported to be beneficial for learners, that is, their eventual output or performance. Consequently, the role of the teacher becomes secondary,

one in which he or she simply presents materials or presses the play button to start a film rather than engaging students in collaborative teaching learning activity (Van Compernelle, 2009; Van Compernelle & Williams, 2009a).

Within second and foreign language education context, recent assessment research, and policy have acknowledged the importance of incorporating sociolinguistic competence into the measurement of language ability. The national standard in foreign language education project (1996) emphasized that it is (the acquisition of the ability to communicate in meaningful and appropriate ways with users of other language that is the ultimate goal of today's foreign language classroom (p.3; Long & Norris in press). Common to such measures is the use of criteria for scoring, reporting, and interpreting examines performances according to degree of sociolinguistic appropriateness exhibited, in light of the particular contextual constraints represented with assessment tasks (Kasper & Rose, 2001).

RESEARCH QUESTIONS AND HYPOTHESES

To fulfill the purpose of this study, which is the effect of pragmatic – focused instruction on the sociolinguistic competence of Iranian EFL learners involved in speaking, the following questions are investigated:

Q₁: Does pragmatic – focused instruction have effects on the sociolinguistic competence of Iranian EFL involved in writing?

Q₂: Does pragmatics – focused instruction have a facilitating effect on confidence in language ability?

The null hypotheses formulated for this study are as follows:

H₀₁: Applying pragmatics – focused instruction does not have any effect on the sociolinguistic competence of Iranian EFL learners involved in writing?

H₀₂: Applying pragmatic – focused instruction does not have any effects on learner confidence.

METHODOLOGY

Participants

For the purpose of this study, two classes from Kanoon Zaban institute in Semnan (Iran) were chosen. Because of institutional constraints, it was not possible to assign students randomly, thus making it necessary to work with intact groups. They were 75 Persian speaking female learners and the age range of students varied between 19 and 26 years old.

A Nelson battery test (see Appendix A) was administrated to find out the homogeneity of participants regarding their proficiency level. After analyzing the data, those who were located one standard deviation above and below the mean in the normal distribution curve were chosen for the purpose of the study. Finally two groups of 30 students were the participants of this study. Since our groups were selected intact, one of them was considered as control group and the other one as an experimental group randomly. It must be mentioned that the other students, who did not have the necessary requirements for the purpose of this study, were not virtually excluded from

the groups but received the treatment within the group, even though their scores were not taken into consideration in any stage of this study.

Instrumentation

Data were collected using three instruments: language proficiency test, self-assessment questionnaire (SAQ) and written discourse completion taken test (WDCT).

Language proficiency test

First a Nelson test was administrated to the students. After gathering the data regarding to the Nelson test and estimating the mean scores of both groups, those who were located one standard deviation above and below the mean score were selected as homogenous and took part in this study. (The reliability of the test was estimated through Cronbach's Alpha formula which was 0.845).

Pre-test and post-test

Pre-test

Self-assessment questionnaire (SAQ) and written discourse-completion task test (WDCT) were carried out as pre-tests. Both of these questionnaires incorporated the same eighteen compliment scenarios (see the Appendix B for the scenarios). The SAQ format, as used in this study, was developed by Hudson, Detmer and Brown (1992, 1995). This questionnaire presents a number of scenarios involving potential language use and requires participants to indicate what they believe to be the level of their ability to respond appropriately in those contexts. Essentially, then, the SAQ measures participant's level of self-confidence in their own sociolinguistic competence. Given that instruction may have a facilitating or debilitating effect on confidence in language ability (Rose & Kasper, 2001), we felt that the SAQ might serve as interesting pre-test/ post-test indication of self-confidence. We also would like to note that Hudson, Detmer and Brown (1995) found that learner's self-rating on their SAQ correlated highly with Ns rating of their speech act performance, indicating that SAQ might reasonably serve as a useful rough estimate of sociolinguistic competence, although certainly not as the basis of any high-stakes decisions. The WDCT used in this study also incorporated the same scenarios that appeared on the SAQ, and was modelled essentially on the ubiquitous discourse-completion task (DCT) format (see, e.g., Blum-Kulka, Mouse & Kasper, 1989). This test requires the students to read a written description of a situation (including such factors as setting, participant roles, degree of imposition) and asks them to write what they would say in that situation. (For research on WDCT, readers are referred to Blum-Kulka, 1982, 1983; Bergman & Kasper, 1993; Rose, 1995; Johnston, Kasper & Rose, 1998). The fact that both of the instruments used in this study were written questionnaires merits some discussion. As with other classroom-based research in pragmatics, sociolinguistic ability as well as other areas of second language acquisition, it is often not feasible to measure instructional effects other than through the use of written questionnaires designed for that purpose (Rose & Kasper, 2001, P.156). Although in some cases it may be possible to observe learners interacting in the target language (as was the case with Billmyer, 1990a, 1990b) a foreign language context generally does not afford such possibilities. Use of written instruments, then, appears to be inevitable (Kasper & Rose 2001, p.156).

We would like to make clear, however, that we are fully aware of the limitation of questionnaire, particularly regarding the sort of information they yield (Rose & Kasper, 2001). It is crucial to understand that questionnaires are indirect measure- that is, the data resulting from responses to questionnaires are not the result of direct observation (Kasper & Rose, 2001). It is worth noting that the responses were scored by three raters on a 5-point Likert scale. (Ranging from 1 very bad to 5 very good), with the sum of the average ratings for each item as the score on the WDCT.

Post-test

The same post-tests were administrated as pre-test, then a T-Test was calculated to see whether there is a significant difference between two means or not.

Procedure

The data collection procedure went through various steps. At first, a Nelson test considered of 50 items was administrated to these two classes including only woman participants. This was an attempt to see whether they are eligible participants with respect to the purpose of the present study. In the second phase of the study, both control and experimental answered the same self-assessment questionnaire (SAQ) and written discourse completion task test (WDCT) as pre-tests. Then the treatment sessions were offered over 8 weeks (90 minutes, per week). Finally, the same (SAQ) and (WDCT) were administrated as post-tests to all two groups.

Treatment

Two intact groups took part in this study: one experimental group and the other as control group. The control group received no treatment, but completed both written discourse completion tasks (WDCT) and self-assessment questionnaire (SAQ) during the same periods as the experimental group. Both control and experimental classes covered the same textbook as part of the regular course curriculum. In the experimental group, students received instruction in compliment over eight weeks that consisted of lessons about Persian compliment, English compliment, comparing Persian and English and they were also provided with meta-pragmatic information.

The treatment lasted approximately 30 minutes in every session. The rationale for beginning first with L1 in pragmatics-focused instruction is discussed in Rose (1994b), who argues that such an approach makes pragmatic concepts more accessible to learners. In the first session, compliment was introduced as a speech act which is the focus of instruction in the next following sessions. The experimental group received three types of materials in each session. One was handouts in which detailed metapragmatic information on the target compliment forms was provided. Of course, metapragmatic explanations were presented in both first language and target language, as suggested by Bardovi-Harlig (1996) in order to boost their self-confidence and enhance their motivation.

In addition, examples from Persian help students to examine how compliment function in their own language. Care was taken to refer to the actual use of the target compliment forms in the discourse (role-plays) and their function in the particular relationship (i.e., the status low to high, social distance). In other words, the teacher explained variables such as relative power and social distance that involved the power of the speaker respective to the hearer, distance between the

speaker and hearer, and degree of familiarity and solidarity respectively. For each session, the participants were required to compare their Persian compliment expressions and those applied by the native speaker in the corresponding situation and discover any differences in compliment realization patterns according to social context.

Second treatment was involving students in translation activities, which categorized under motivation phase of pragmatic awareness-raising tasks by Eslami-Rasekh (2005). One of the voluntarily performed role-plays was written on the board in Persian. Then, the students were asked to translate the compliment made in the conversation into English. All suggested alternatives were selected to be written on the board, followed by the teacher's explanation on pragma-linguistic and socio-pragmatic characteristics of compliments in English.

The last treatment included film segments containing compliment exchanges, as Rose (1997) suggested that film is capable of providing both the target language for detailed discussion and analysis, as well as the rich contextual detail useful for such analysis. It should be mentioned that the control group was not provide with any meta-pragmatic information after the treatment was over.

The participants in both groups participated in the post-tests. After that, the scores on the pre-test and post-test were used for the purpose of validation. Then, the correlation between the scores of pre-test and post-test was estimated through a T-test.

Design

Among the several research designs, the one which seems to best fit the purpose of the present study is quasi-experimental design. The participants in this study were selected intact. In order to compensate for the main problem of this design, lack of internal validity, the researcher took advantage of the Nelson Battery Test before the treatment got started. Through this, the researcher made sure that all learners were at the same level of English language proficiency. Therefore the suitable design for this research would be an intact group pre-test- post-test design.

RESULTS AND DISCUSSION

This study is an attempt to investigate the effect of pragmatics-focused instruction on promoting sociolinguistic competence and language ability confidence of Iranian EFL learners involved in writing. As mentioned before, two classes from Kanoon Zaban institute were chosen for the purpose of this study. A Nelson battery test was administrated to find out the homogeneity of subjects regarding their proficiency level. After analyzing the data, those who were located one standard deviation above and below the mean in the normal distribution curve were chosen for the purpose of the study. Finally, two groups of 30 students were the participants of this study. Since our groups were selected intact, one of them was considered as control group and the other one as an experimental group randomly. It must be mentioned that the other students who did not have the necessary requirements for the purpose of this study, were not virtually excluded from the groups but received the treatment within the group, even though their scores were not taken into consideration in any stage of this study.

Table 1 and figure 1 present the descriptive statistics of the initial participants of this study who took the NELSON test.

Table 1: NELSON test descriptive statics

	N	Range	Minimum	Maximum	Mean	Std. Deviation
score of Nelson-test	75	32	18	50	42.21	5.171
Valid N (listwise)	75					

Figure 1: NELSON test scores of the participants

Since those students who were located one standard deviation above and below the mean in the normal distribution curve were chosen for the purpose of the study, students with NELSON test scores within 47.38 and 37.03 were finally selected to collect the necessary data.

Data analyses

As mentioned earlier in the previous chapter, in the second phase of the study, both control and experimental groups' participants answered the same self-assessment questionnaire (SAQ) as a measure of confidence and written discourse completion task test (WDCT) as a measure of sociolinguistic competence on the pre-test. After that, the treatment sessions were offered over 8 weeks (90 minutes, per week). Finally, the same SAQ and WDCTs were administrated as post-tests to the two groups.

In order to carry out the data analyses of this study, first descriptive statics were calculated, and then the mean comparisons statistics such as t test and ANOVA were employed. Below, each research question is investigated separately.

Q₁: Does pragmatics – focused instruction have effects on the sociolinguistic competence of Iranian EFL involved in writing?

In order to answer this question, the students' scores on WDCTs were used on the pretest and posttest. Since three raters rated the WDCTs, it was necessary to calculate the inter-rater reliability of the ratings. This was done by computing Intraclass correlation (ICC) coefficients among the three raters' ratings on the two groups' pretests and posttests. Table 2 presents all the ICC coefficients, which are evidently acceptable, that is above .90.

Table 2: ICC coefficients among the raters

Average of raters	Number of cases	Number of raters	ICC correlation
Pretest-control	15	3	.98
Posttest-control	15	3	.97
Pretest-experimental	15	3	.97
Posttest-experimental	15	3	.98

Next, the average of the three ratings was used as the final data for the investigation of this research question. Table 3 presents the descriptive statistics of these average ratings for the two groups.

Table 3: Descriptive statistics of the average ratings on WDCTs

	N	Min	Max	Mean	Std.	Skewness
Pretest – control	15	31.67	49.00	41.8667	5.30319	-.835
Posttest – control	15	31.00	49.67	41.8444	5.75680	-.447
Pretest - experimental	15	31.00	51.67	42.8000	7.00204	-.634
Posttest - experimental	15	41.00	58.33	51.1556	5.16992	-.728
Valid N (listwise)	15					

In order to see whether each group had improved on the posttest after the treatment, the means of pretest and posttest of each group were compared via paired-samples t test the results of each are presented in Table 4. Evidently, all the skewness values (table 3) are within the acceptable range (between -1 and 1) to allow for running paired-samples t test as a parametric test which requires the data to be normally distributed.

Table 4 presents the results of paired-samples t tests, which is indicative of the fact that only the experimental group has shown significant improvement in terms of sociolinguistic competence on the posttest; experimental group $t(14) = -5.194$, $p < .05$, control group $t(14) = .020$, $p > .05$.

Table 4: Paired Samples Test

		Paired Differences					t	df	Sig. (2-tailed)
		Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
					Lower	Upper			
Pair 1	Control-pretest/posttest	.0222	4.40502	1.13737	-2.4172	2.4616	.020	14	.985
Pair 2	Experimental-pretest/posttest	-8.3556	6.23032	1.60866	-11.8058	-4.9053	-5.194	14	.000

Although the above analysis shows significant improvement on the posttest for the experimental group, the posttests of both groups were compared with one another by employing ANOVA to take into account the pretest differences between the two groups. In other words, as the descriptive statistics show the pretest means of the groups are not equal, and in order to compare the posttest means of the two groups one needs to control the differences of the pretest means (covariate) of the two groups by means of employing ANOVA. In order to employ ANOVA, several assumptions need to be checked initially. The first of these is the assumption of normality, which was just found to have been observed since the descriptive statistics provided above showed that the skewness values are within the acceptable range (i.e. between 1 and -1). The next assumption is to do with the homogeneity of variances, which was found met based on Table 5 ($p > .05$).

Table 5: Levene's Test of Equality of Error Variances (a)

F	df1	df2	Sig.
.035	1	28	.853

Table 6 demonstrates the results of the check on the assumption of homogeneity of regression slopes and the main ANOVA results. The first row in Table 6 indicates that the assumption of homogeneity of regression slopes is met; Interaction $F(1,27) = 1.681$, $p > .05$.

The second row shows that the groups were indeed different on the pretest; Pretest effect $F(1,27) = 13.668$, $p < .05$, and finally the next row shows that the groups are significantly different on the posttest; Group $F(1,27) = 28.231$, $p < .05$, eta squared = .51 large effect size.

Table 6: ANOVA results

Source	Type III Sum of Squares	df	Mean Square	F	Sig.	Partial Eta Squared
GROUP * pretest (interaction)	33.792	1	33.792	1.681	.206	
Pretest (covariate)	281.690	1	281.690	13.668	.001	.336
GROUP	581.841	1	581.841	28.231	.000	.511
Error	556.473	27	20.610			
Total	66355.889	30				
Corrected Total	1488.389	29				

Tables 7 and 8 provide the posttest means of the groups before and after being adjusted after taking into account the effect of pretest mean differences (i.e. covariate). Evidently, the experimental group is of higher mean both before and after ANOVA adjustments. In sum, the results above indicate that the null hypothesis of this study is rejected. In other words, applying pragmatics – focused instruction has significant effect on the sociolinguistic competence of Iranian EFL learners involved in writing.

Table 7: Unadjusted means before controlling the covariate (Pretest)

GROUP	Mean	Std. Deviation	N
Experimental	51.1556	5.16992	15
Control	41.8444	5.75680	15
Total	46.5000	7.16406	30

Table 8: Adjusted means after controlling the covariate (Pretest)

GROUP	Mean	Std. Error	95% Confidence Interval	
			Lower Bound	Upper Bound
Experimental	50.917(a)	1.174	48.508	53.326
Control	42.083(a)	1.174	39.674	44.492

Q₂: Does pragmatics–focused instruction have a facilitating effect on confidence in language ability?

In order to answer this question, the students' scores on SAQ were used on the pretest and posttest. Table 9 presents the descriptive statistics of SAQ scores for the two groups.

Table 9: Descriptive statistics on SAQ scores

	N	Min	Max	Mean	Std.	Skewness
Pretest-control	15	18.00	32.00	25.6667	4.08248	-.733
Posttest-control	15	22.00	32.00	26.8000	3.02844	-.385
Pretest-experimental	15	23.00	32.00	27.6000	2.99523	-.437
Posttest-experimental	15	27.00	35.00	31.4667	2.32584	-.501
Valid N (listwise)	15					

In order to see whether each group had improved on the posttest after the treatment, the means of pretest and posttest of each group were compared via paired-samples *t* test, the results of each are presented in Table 10 below. Evidently, all the skewness values (Table 9) are within the acceptable range (between -1 and 1) to allow for running paired-samples *t* test as a parametric test which requires the data to be normally distributed.

Table 10 presents the results of paired-samples *t* tests, which is indicative of the fact that both groups have shown significant improvement in terms of confidence in language ability on the posttest; experimental group $t(14) = -4.549$, $p < .05$, control group $t(14) = -2.915$, $p < .05$. In order to see which group has shown more improvement in terms of confidence on the posttest, the effect sizes for the above *t* test analyses were calculated. The effect size for the experimental

group was 1.45 while the one for the control group was .32. This means that the experimental group has shown more improvement in terms of confidence in language ability.

Table 10: Paired Samples Test

		Paired Differences					t	df	Sig. (2-tailed)
		Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
					Lower	Upper			
Pair 1	Control-pretest/posttest	-1.1333	1.50555	.38873	-1.9671	-.2996	-2.915	14	.011
Pair 2	Experimental-pretest/posttest	-3.8667	3.29213	.85002	-5.6898	-2.0435	-4.549	14	.000

Despite the fact that the above analysis shows a little more significant improvement on the posttest for the experimental group, the posttests of both groups were compared with one another by employing ANOVA to take into account the pretest differences between the two groups. In other words, as the descriptive statistics show, the pretest means of the groups are not equal, and in order to compare the posttest means of the two groups one needs to control the differences of the pretest means (covariate) of the two groups by means of employing ANOVA.

In order to employ ANOVA, several assumptions need to be checked initially. The first of these is the assumption of normality, which was just found to have been observed since the descriptive statistics provided above showed that the skewness values are within the acceptable range (i.e. between 1 and -1). The next assumption is to do with the homogeneity of variances, which was found not met based on Table 11 ($p < .05$); however, this could not cause any serious problem since the groups were of equal size.

Table 11: Levene's Test of Equality of Error Variances

F	df1	df2	Sig.
12.414	1	28	.001

Table 12 demonstrates the results of the check on the assumption of homogeneity of regression slopes and the main ANOVA results. The first row in Table 12 indicates that the assumption of homogeneity of regression slopes is met; Interaction $F(1, 27) = 6.680$, $p > .05$.

The second row shows that the groups were indeed different on the pretest; Pretest effect $F(1, 27) = 26.114$, $p < .05$, and finally the next row shows that the groups are significantly different on the posttest; Group $F(1, 27) = 24.040$, $p < .05$, eta squared = .47 large effect size.

Table 12: ANOVA results

Source	Type III Sum of Squares	df	Mean Square	F	Sig.	Partial Eta Squared
GROUP * pretest (interaction)	21.211	1	21.211	6.680	.086	
Pretest (covariate)	100.364	1	100.364	26.114	.000	.492
GROUP	92.393	1	92.393	24.040	.000	.471
Error	103.769	27	3.843			
Total	25830.000	30				
Corrected Total	367.467	29				

Tables 13 and 14 provide the posttest means of the groups before and after being adjusted after taking into account the effect of pretest mean differences (i.e. covariate). Evidently, the experimental group is of higher mean both before and after ANOVA adjustment.

In sum, the results above indicate that the null hypothesis of this study is rejected. In other words, applying pragmatics – focused instruction has significant effect on the language confidence of Iranian EFL learners in language ability.

Table 13: Unadjusted means before controlling the covariate (Pretest)

GROUP	Mean	Std. Deviation	N
Con	26.8000	3.02844	15
Ex	31.4667	2.32584	15
Total	29.1333	3.55967	30

Table 14: Adjusted means after controlling the covariate (Pretest)

GROUP	Mean	Std. Error	95% Confidence Interval	
			Lower Bound	Upper Bound
Con	27.311(a)	.516	26.252	28.370
Ex	30.956(a)	.516	29.897	32.014

In sum, the results of the above analyses are indicative of the fact that applying pragmatics – focused instruction has significant effect on both the sociolinguistic competence and language confidence of Iranian EFL learners in language ability.

CONCLUSIONS

The findings are based on the research questions and the results of pre-test and post-tests of SAQ and WDCT at the beginning and ending of the study.

The mean score and differences mean of pre-test, post-test of self-assessment questionnaire (SAQ) are presented in table 4.9 Table 4.9 displays the pretest and post test result of the SAQ for the control and experimental groups. Participants were asked to rate their ability to respond appropriately in a given scenario, with 1 being very unsatisfactory and 2 completely appropriate. As the table shows, the posttest scores indicate a rather high degree of confidence in the ability to

use English appropriately; it appears that instruction had a positive impact on the self-confidence of the experimental group. According to Rose and Kwain-fun (1999) instruction may have a facilitating or debilitating effect on confidence in language ability. The result of post-test in this study showed that the effect is facilitating. Of course the result of the present study reject finding of Rose and Kwain-fun that claimed the effect of instruction on learner's self-reliance was negative.

The mean score and difference mean of pre-test and post test of written-discourse completion tasks (WDCT) are presented in table 4.3. The data obtained from the post-test showed some valuable findings to be considered. The table indicates that there were improvements in the experimental group. This group was able to demonstrate significantly better improvements than the control group. This finding is in line with major finding of (e.g., Billmyer, 1990a, 1990 b; Kubota, 1995) that showed a greater degree of effectiveness for meta pragmatic instruction over no instruction. The Written discourse completion task test were scored by three raters, then inter rater reliability (percentage of agreement) was calculated.

Limitations and Delimitations

The present study, like other studies, suffers from some limitations. Some factors and conditions are beyond the control of the researcher.

First, in the foreign language in which these data were collected, the students did not interact spontaneously in English outside the classroom. The context for the use of English, then, was pedagogical.

Second, as Babbie (1998, p. 274) points out, questionnaires cannot measure social action. Also, according to Rose and Kasper (2001), questionnaires are inherently artificial. But use of written instruments in classroom- based research appears to be inevitable (Rose & Kasper, 2001).

In the present study, SAQ and WDCT were used for gathering data, however, we are fully aware of limitation of questionnaires, that is, and the data gathering from responses to questionnaire are not the result of direct observation.

There are also other limitations and delimitations were imposed upon the research design.

1. The students' age, gender and personal variables were not controlled.
2. In EFL setting, natural native speaker data is not easily accessible.
3. The evaluation of learners' sociolinguistic competence in terms of how much it approximates native speaker norms is a very difficult task.
4. This research was delimited to Iranian EFL learners; hence the result will be applicable only in the domain of Iranian EFL teaching.

Suggestions for further research

Seliger and Shohamy (1989, p.254) stated that every research project opens new ways for further study (The nature of research is such that the more answers are obtained, the more questions arise). Researchers have indicated that gender is an important variable in every study with regard to the purpose of the study gender finds more importance, but because of the institutional constraints, it was impossible to take both male and female participants in the same class. So, it is

recommended to replicate the experiment with a representative sample of female and male participants. Learners who took part in the present study were intermediate learners in Kannon Zaban and their abilities were high. As indicated by their high scores on proficiency test (Nelson test). So, it is not clear whether similar results would be obtained with a less advanced students. Although limited, the work by Wildner-Bassett and Tateyama et al (1997) appears to indicate that pragmatics is teachable to beginning learners. This should be encouraging to language instructors particularly in foreign language settings where learners do not have as many opportunities to interact with NSs of the target language as in the second language (L2) setting and the role of instruction becomes more important. Future research could look at how pragmatic-focused instruction affects beginner learners in a foreign language context.

The advantage of oral discourse completion task (ODCT) over written discourse completion task (WDCT) is that ODCT encourage oral production (both listening and speaking). The researcher in the present study was eager to use ODCT for gathering data, but because of institutional constraints, it was difficult to administer, it requires two audio cassette recorders, so, it is recommended to replicate the experiment with using ODCT instead of (WDCT).

THE EFFECT OF GESTURES ON VOCABULARY ACQUISITION AND RETENTION

ABSTRACT

The lexicon regarded as the building blocks of any language causes some difficulty in the course of language teaching and learning. Particularly, due to lack of language input, learners in foreign language contexts experience such trouble more than those in second language contexts. On way through which the teachers can help their beginner learners to tackle such a demanding job is to accompany the target words with the related gestures. That is because such attempt brings more modality into the scene leaving more traces in the memory along with better retention of the words. The present study investigates the possible effect of gestures in vocabulary acquisition and retention. To this end, 20 children as true beginners were selected and assigned into two groups of experimental and comparison. Then, 12 frequent words of English which were able to easily “pictured” or “gestured” were put forward. Producing and repeating the words, participants in the experimental group had to gesture. However, those in the comparison group were required to show the picture of the words posed to them. Then, their answers were tallied on an individual-based approach. The answers were compared applying an independent samples t-test. The results indicated that the gesture group had a better performance in the retention of the selected words compared to the picture counterpart. This study might have messages for both language teachers and learners as well as syllabus designers. In beginning level, it is believed that books with pictures can help the learners learn the vocabulary items. Moreover, teachers can use the gestures in the class to convey the meaning of the unknown words to the learners.

KEYWORDS: Gesture, mnemonic span, retention, vocabulary learning

INTRODUCTION

Language is at the center of human life. We utilize this powerful apparatus to express our love and hatred, to chat and gossip, to praise and insult, and so forth. Without it many of our daily activities are meaningless. Interestingly, some people are able to do all these things in more than one language. Nowadays, learning a foreign language is regarded as an essential component in the curricula at different educational levels. In particular, learning the English language due to its widespread use around the world has become a necessity in our society. Gass et al. (2013) put forward an idea that “learning vocabulary is not a one-time affair. It is unrealistic to believe that a learner hears a word or, in the case of some pedagogical methods, memorized a word, with the outcome being full knowledge of the word” (p. 212).

There is unanimous agreement among the experts in the field that lexical items are the building blocks of any language (Thornbury, 2002). By referring to the issue of vocabulary as a neglected area of research put forward by Meara (1980), Boers (2013) convincingly argues that building a broad and deep foundation in vocabulary is something inescapable in the process of learning any second or foreign language including English. Therefore, one of the first and foremost responsibilities of language learners is trying to develop a broad and deep knowledge of this language component. Accordingly, the most important duty for a teacher that can have a determinant role in his succeeding, is not only to provide the students with useful words in their education but also with more general words, rich vocabulary and the skills for learning and using those words in their life (Pikulski & Templeton, 2004). Cook and Singleton (2014) claimed that “in some languages the very term for word indeed also has the sense of “speech” or “talk”. We can refer in this context also to the English expression *to have a word with someone*, which obviously means having a talk with someone rather than just uttering a single word to someone” (p. 38).

Classifying vocabulary studying into two broad areas of intentional and incidental learning, Nation (2001) states that for the former, there are a lot of techniques and activities for doing so ranging from memorization to vocabulary learning strategies to guessing from context and so on. These techniques and tactics have to be suited to learners’ levels of language proficiency, their age, personal interest and their cognitive growth. For the latter, however, extensive reading and listening have been proposed by experts including Krashen (1989). Nonetheless, research has indicated that incidental learning in terms of vocabulary tends to be a very slow process (e.g. Laufer & Roitblat-Rozovski, 2011). Spolsky et al. (2015) supported a claim that “memory for vocabulary is, in part, innate –a key element in a person’s intelligence, since verbal skills play a significant role in determining how intelligent someone is” (p. 275).

Having scratched the surface of the above claims and counterclaims, it goes without saying that, intentional learning will pay the price at least in the short run. So, one way through which the teacher can approach the burden of vocabulary teaching, the focus of the present study, is to use gestures in vocabulary learning with beginners. Generally speaking, these learners have not formed an oral foundation of the language they are learning. Therefore, it would pay the price to equip them with other less demanding tools such as gestures.

REVIEW OF THE LITERATURE

When we speak, we regularly gesture as an integral part of communicating. Broadly speaking, gesture is “a movement of the face or body which communicates meaning, such as nodding the head to mean agreement” (Richards & Schmidt, 2010, p. 246). Many spoken utterances are accompanied by gestures which support or add to their meaning. Sign language, for example, is a system of communication based entirely on gestures. Gestures can be described in terms of their formal, structural properties such as the configuration of the articulators (hands, arms, etc.), the place of articulation (gesture space), and the form of the movement (Yule, 2010).

In the second language classroom, especially when it comes to children, teachers behave in a specific way: the way they speak and the way they gesture are altered by the classroom situation and the type and level of learners (Gullberg, 2008). They slow down their speech, and they intensify the articulation of every word and of the prosodic parameters to make sure that the students will understand them better. For the same reason, they use gestures. In fact, gestures help the teacher give an odor of multimodality to the learning process, i.e. leaving a host of traces in the memory (Foster, 2009).

In addition, providing the young learners with the relevant gestures is a multidimensional process. First, it opens up the first requirement for learning vocabulary items, i.e. noticing (Schmidt, 1990). As Nation (2001) argues, in order to learning take place paying attention to linguistic items especially lexical items is necessary. In other words, learners need to consciously notice the words if the ultimate aim is to subsume those items into the system of mental lexicon (Schmitt, 2010). This noticing might be influenced by different factors including the importance of the word in the provided input, earlier encounters of linguistic items, learners conception of the efficiency of those items, and the instructor's preoccupation with the selected items (Ellis, 1990).

Closely related to the issue of noticing in vocabulary learning, is the notion of involvement load put forward by Laufer and Hulstijn (2001). Put simply, this hypothesis states that the learning, recall, and retention of vocabulary items depends on the total amount of the mental effort invested on the learning experience. In other words, the more involved the learner in learning experience, the higher the chance of learning and retaining lexical items. They argue that involvement in a task consists of three factors of need, search, and evaluation (Hulstijn and Laufer, 2001). While teaching a new word, attempt must be made to include as many of these factors as possible. Moreover, in order to have a long-lasting learning experience especially in terms of young learners, language teachers must consider the usefulness of utilizing a myriad of modalities to increase the chance of learning and long-term retention of vocabulary items (Laufer, 2005).

Language teaching experts dealing with young learners advise teachers to use gestures to illustrate their speech and thus to improve the children's understanding and memorization of the foreign language items, particularly words. As empirical findings indicate, the learning of vocabulary during second language acquisition appears to be facilitated by associating words with gestures (Kelly, McDevitt, & Esch, 2009). Specifically, learning emblematic gestures with vocabulary words (Allen, 1995), learning and producing a gesture while repeating the words (Tellier, 2007), and using gestures to provide redundant information relative to the meaning of the word by the teacher (Kelly et al., 2009), have all been demonstrated to produce significant learning and retention when compared to learning words without gestures.

It should be mentioned that the concept of gesture itself is not that much clean, neat and straightforward. Gesture can be functionally used for different purposes. For instance, Tellier (2007) argues that gestures can be employed in at least three ways: the first one is using them for classroom management purposes (e.g. initiating and ending the class hour), the second is for

evaluative aims (e.g. error correction), and the third is explanatory goals (e.g. giving explanation of new vocabulary items). It is this last category that the present study has been dedicated.

Empirical Studies

Before going to the main study some research endeavors of the previous studies are reviewed. The first relevant study that I could spot was a research by Cohen and Otterbein (1992). Working with three groups of adult subjects, their participants had to watch a video containing several different sentences in their L1 and then to write down as many sentences as they could remember in a free recall task. Each group received the same verbal input but the videos were slightly different: one just presented the sentences, the second showed somebody illustrating each sentence with pantomimic gestures, and in the last video, sentences were accompanied by non-pantomimic (i.e. meaningless) gestures. The results indicated that those subjects who were exposed to sentences illustrated by pantomimic gestures remembered significantly more sentences than subjects who did not see the gestures and subjects who saw non-pantomimic gestures.

Another related study by Allen (1995) is on the impact of gestures on memorization of L2 sentences. Allen (1995) worked with 112 American university students in French. A control group and a comparison group were shown 10 French sentences and their English equivalents on a screen and they also heard a teacher pronouncing them 3 times. The students were told to repeat them. The experimental group's procedure differed only in that the students were also provided with an illustrative gesture for each sentence, which they saw three times (with the three repetitions of the sentence) and had to reproduce. However, they did not repeat the sentences, only the gestures. Then, immediately after all 10 sequences, a posttest was given in which the teacher produced the 10 French sentences in a different order and during the pause after each sentence the subjects had to write down the English equivalent. The comparison group and the experimental group were given the gestures as well. There were 5 sessions of this kind with different groups of 10 French expressions. The results showed that the students presented with illustrative gestures recalled more sentences than the others. The experimental group who reproduced the gestures did significantly better than the comparison group who only saw them during the posttest. Therefore, this study confirmed the effect of reproducing gestures on vocabulary recall in L2 by adult learners. However, it suffers from two limitations. First, the L2 sentences were always given to the subjects with the L1 translation, but the sentences to be memorized were French idiomatic expressions which are not always directly translatable. Second, subjects were asked during the post-test to give the L1 equivalent of the L2 sentences that were only used as stimuli. The study thus does not assess how many expressions in L2 subjects have remembered with gestures, but rather how many expressions they can translate. The experiment therefore dealt mainly with passive knowledge of the vocabulary, that is, the ability to recognize and translate but not to produce the L2 items. It is therefore not clear whether gestures affect active knowledge of L2 vocabulary. It is also not known whether gestures affect the memorization of lexical items in L2 in child learners.

The other relevant study comes from Tellier (2005, cited in Tellier, 2007). It involved 32 French children with the age range of 4 to 5 who were divided into two groups. They had to watch 3

videos (each contained a list of 10 words in the L1). The children watched the videos alone with the experimenter and had to do a free recall task immediately afterwards. The three videos watched by the control group only presented them with words pronounced by a person on the screen. The first video watched by the experimental group was the same as the control group, the second video was illustrated with gestures and the third with pictures. The experimental group had significantly better results with video 2 and 3. This suggests that the use of visual modalities (pictures and gestures) improves short-term memorization in a free recall task. However, there was no statistical difference between the effect of the picture and of the gesture on memorization. In this case, gestures acted as a mere visual modality since they were only looked at.

The last similar study was conducted by Tellier (2007). Employing 42 French speaking children, it examined whether reproducing gestures has a greater impact on children's memory span than merely looking at them with the children ranging from five to six. Everything was similar to the study reviewed above except that images were not used and that children were asked to repeat the words out loud in their first language after listening to them. There were three groups for the study. A control group listened to the words and repeated them. A first experimental group (EG1) listened to the words and repeated them as well but also looked at illustrative gestures with each word. A second experimental (EG2) group was told to listen to the words, repeat them, look at the gestures and reproduce them. They were then given a free recall task. Results show that the second experimental group (EG2) did significantly better than the two other groups (control and EG1). This points to an effect of the reproduction of gestures on short-term memorization in the L1.

PURPOSE OF THE STUDY

In order to bridge the existing empirical gap i.e., whether pictures and gestures significantly influence the process of vocabulary learning and reproduction by children using their L2 meaning system as the point of departure, based on the studies reviewed above, the aim of the present study is to investigate the role of gestures in second language learning compared to pictures, particularly in the realm of vocabulary development, i.e. vocabulary acquisition and retention by children as true beginner learners of English. More specifically, this research attempt tries to answer the following research question:

RESEARCH QUESTION

RQ: *Does gestures help the children remember the meaning of new words better than pictures?*

METHODOLOGY

Participants

Twenty children were selected from among the starter learners aspiring to learn English as a foreign language in Rezvan Language Institute in Ardabil, Iran. They were all aged 5 years. As there is a strict policy in this institute to place their language learners at the same level as

accurately as possible, based on the interview, two classes which had not studied English and did not have any previous English background were picked up as the participants of the study. Then they were placed in the so-called two groups of “picture” and “gesture”. The participants in the former formed the comparison and the latter shaped the experimental group, hence, 10 children in each group. This grouping is done this way since there are two groups each of which uses a type of treatment (picture or gesture).

Instrumentation

In this study, there were twelve words at the lower level of cognitive demand on the part of the children. They were selected in a way that would be able to be “pictured” or “gestured”. The words were: ‘book’, ‘cold’, ‘cry’, ‘drive’, ‘heart’, ‘look’, ‘scissors’, ‘snake’, ‘swim’, ‘think’, ‘walk’, ‘write’. These words were cross-checked against Longman 3000 Common Words (Longman Dictionary of Contemporary English, 2009, 5th Edition) in order to make sure that they belonged to the first thousand frequent words of English. Then, after the treatment, an individual-based assessment session was held for the children as the subjects of the study and their scores were tallied. In gesture group, the teacher showed twelve pictures and the subjects were required to present the corresponding words. It accompanies with physical movement (gestures) on the part of the teacher. However, in picture group, the teacher provided the learners with twelve pictures and they made an attempt to produce the corresponding words. Each correct answer gets one positive point out of twelve. The tests were based on counting frequency.

Data Collection

The study lasted four weeks, one session per week. In each session, four words were presented to the subjects. And the last session was used for assessment purposes. The selection of the four items in each session was done according to the notion of mnemonic span. It refers to the number of items a subject can memorize from a list heard once (Baddeley, 1999). The average score is 7 items plus/minus 2 (Miller, 1956) for an adult. However, it is lower for children and increases with age and cognitive development (Baddeley, 1999). The mnemonic span is about 2 items at the age of 2, 4 items at the age of 5, 5 at the age of 7, 6 items at the age of 9 and 7 at the age of 12 (Foster, 2009).

The children in the experimental group were given the words with the accompanying gestures pantomimed by their teacher. At the same time, they were asked to repeat each word and “gesture” the word for five times. For the comparison group, the subjects were supposed to see the pictures and repeat the corresponding words. Since both experimental and control groups had their own specific treatment, namely “learning by **gesture** for experimental group and learning by **picture** for comparison group”, hence, the design of the research is *comparison group design*. After completing the treatment cycle, they were assessed on their ability to remember those words in the fourth session of the last week of the treatment phase. In other words, to see the strength of the associative learning in two modes (picture vs. gesture), the same subjects were tested on the same words; recording the results. Finally, the two pieces of the assessment were cross-checked against each other using a t-test to see any significant difference on the effect of gesture in vocabulary learning and retention. However, it needs to be mentioned that, in the

course of treatment during other sessions, the participants in both groups were busy learning the English alphabet.

Data Analysis

The purpose of this section is to determine if the variation observed among the mean scores of the two groups participating in the study was larger than would be expected by chance. The scores of the retention assessment were fed into the Statistical Package for Social Sciences (SPSS) version 16. Then using a t-test the two groups were compared to spot any possible statistically significant difference. What follows is first the descriptive statistics table then the table of t-test:

Table 1: Group Statistics

Grouping		N	Mean	Std. Deviation	Std. Error Mean
Score	Experimental "Gesture"	10	6.20	1.033	.327
	Comparison "Picture"	10	4.10	.994	.314

As the Table 1 shows, the total number of subjects is 20 (in fact two groups 10 each). The mean scores for experimental (gesture) and comparison group (picture) are 6.20 and 4.10 respectively with the standard deviations of 1.033 for the former and .994 for the latter group. At first glance, as the mean scores indicate, there is a perceptible difference between the participants in terms of their performance on the retention of the mentioned 12 words which were the basis of the assessment. But the question is: Does this difference reach statistical significance or not? To this end, an independent samples t-test is run in order to pinpoint any possible significant difference from a statistical point of view:

Table 2: Independent Samples Test

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
Score	Equal variances assumed	.151	.702	4.632	18	.000	2.100	.453	Lower	Upper
	Equal variances not assumed			4.632	17.974	.000	2.100	.453	1.147	3.053

RESULTS AND DISCUSSION

As it was mentioned earlier, the purpose of the assessment was to examine whether children were able to produce the English words by looking at the pictures or gestures in a different order than the one of the repetitions and had to name them. The picture group gave a mean of 4.10 correct

words ($SD = .9941.17$) and the gesture group 6.20 words ($SD = 1.033$). The difference between the means of answers of both groups was thus 2.10 words. As it can be observed from the Table 3.2, the F value is .151 which means that we have not violated t-test's assumption in this regard (Dörnyei, 2007). Based on the results of Table 3.2, the value of Sig. (2-tailed) is .000 which is an indication of a significant difference between the experimental and comparison groups. Therefore, it should be determined which line in the table should be used in reporting the results. It is shown that the value of Sig. is .702 which is larger than .05. So the first line of the table is reported. Taking a look at the first line, it is obvious that Sig. (2-tailed) is .000 and less than .05. As a result, we can conclude that there is a statistically significant difference between the experimental and comparison groups. In other words, the results of the independent samples t-test confirmed that the observed difference was significant and revealed the effect of the reproduction of gestures on the retention of the mentioned words.

As it was inferred in our research question, the experimental (gesture) group did have a good performance compared to the comparison (picture) group in recalling the mentioned 12 words. It seems that when several modalities are combined in teaching and learning vocabulary items the ultimate achievement is accomplished by more efficiency and effectiveness. This findings is in line with the results of the studies reviewed above. Therefore, the take-home message of the present study for teachers is to involve the children in process of learning as wholly as possible. In other words, the teachers should involve children both physically and mentally to take advantage of the best of the both worlds.

It is necessary to mention that the findings of the present study and similar studies must be interpreted with caution. Even if the findings in the literature in this domain are somewhat contradictory, it would nevertheless be interesting to assess the impact of gestures on the memorization of different classes of words in second language acquisition. For instance, one may wonder whether or not action verbs are easier to memorize with gestures than nouns. This is because some research seems to suggest that some words are learned differently that others (Nation, 2001) based on their distinct characteristics.

CONCLUSION AND IMPLICATIONS

The present study aimed to examine the effect of gestures on the acquisition and retention of the English vocabulary by the young children who were true beginners. As it turned out, the gesture group outperformed the picture group in recalling the twelve target lexical items. The superiority of gestures over pictures can be attributed to the number of modality that they include. Gestures involve the three modes of modality, i.e. auditory, motor, and visual (Tellier, 2007). The first one deals with the teacher repetition of the pronunciation of the words while providing the relevant gestures. The second one refers to body movement as the gesture is employed. And finally, the third one refers to being able to see gesture while producing the relevant word. This is in line with the trace theory of memory (Baddeley, 1999) which argues that if a phenomenon leaves more traces in the memory chances are that will be remembered with a high probability. However, when these traces are in different modes of modality they make the tracing process in memory richer and facilitate retention.

Therefore, involving the body in the learning process is relevant in the classroom which is the cornerstone of some language teaching methods such as Total Physical Response (Richards & Rogers, 2001). However, to make best of the gesture world, the language teacher should make sure that the children reproduce the gestures while repeating the words; otherwise, they will not have the desired and desirable effects. All this is done in order to have a mixed complementary effect on the process of tracing in the memory which helps the memorization of words be approached easily and much more efficiently. Of course, it should be born in mind that when it comes to vocabulary learning, all words are memorizable but some words are more memorizable than others. For example, in the experimental (gesture) group, the two items of 'cry' and 'walk' had the maximum frequency among other words (seven for the former and eight for the latter). Or in the comparison (picture) group, the highest frequency went to 'book' and 'cry' with six for the former and five for the latter (See the Appendix). All in all, as it we saw in the Results, those subjects in the "gesture" group remembered more words than the counterpart group. Therefore, we can conclude that gestures speak louder than pictures in vocabulary learning and retention for children.

Language teachers particularly those who are busy with teaching kids have to remember the findings of the present research endeavor. They must try as far as possible to make use of gesture in their classrooms. As it went earlier, this helps to have an active classroom in which their learners energetically spend their full potential on learning new stuff. Consequently, this investment of energy results in more learning and retention on the part of children. In addition, it leads to a favorable environment which is conducive to have a better and long-lasting learning. Furthermore, the materials developers and syllabus designers should attempt to include in the initial modules of their materials those words being capable of easily gestured or pictured in order to have an optimum learning rate.

Suggestions for further research

The results of the present study must be interpreted with caution. In other words, it suffers from some limitations which need to be addressed in other replication studies. One of those limitations is the number of participants. Examining 10 children in each group of experimental and comparison puts the findings of the study in danger when it comes to external validity. Also, as it went earlier, the mnemonic span is different for children at different age ranges. Therefore, trying to replicate the study with children of different ages is desirable. Another issue is the type of words. Some words are remembered better due to their length, a good denotation or connotation or their equivalents in the source language (Nation, 2001). Another issue is the number of repetition in each attempt. For example, the mean of remembered words in the picture group was 4.10 out of 12. One possible explanation for this small number is the number of repetition which was five in the present study.

ABSTRACT

Decades of research has supported strategy instruction and; by the same token, the integration of technology into different aspects of language learning seems to be worthwhile or perhaps an indispensable part of language learning and teaching. Hence, the present study investigates the effect of computer-assisted language learning or technology-based approach as a kind of strategy invested in order to enhance Iranian English as a foreign language (EFL) learners' reading comprehension by engaging the learners in the task. To this end, 60 grade three EFL learners of a highschool in one of the districts of Tehran were selected on the basis of an availability sampling procedure. Readings were instructed to the experimental group by applying Information and Communication Technology (ICT); however, the control group was taught the readings in the traditional way using only the book. To investigate the learners' improvement, a t-test was run. The results of the posttest were significantly different, accordingly ($p < .05$). Based on the findings of the study, technology enhanced instruction in the field of language learning particularly in reading comprehension contributes to EFL learners' accomplishments in the task. In addition, the teachers are proposed to be aware of their learners' needs and interests; in this regard, the teachers themselves act like major decision makers who ought to employ strategies to solve learning problems and facilitate language learning in order to have successful learners in their classes. Finally, research demonstrates that CALL is required to be an essential part of learning and teaching.

KEYWORDS: Computer assisted language learning, technology, strategies, reading comprehension, engaged learner.

INTRODUCTION

The focus of this research study is to investigate the impact of technology; in other words, Information and Communication Technology (ICT) on teaching English readings in an EFL setting. A setting like Iran in which reading, as one of the significant and major sources of input to EFL learners, plays an essential role in language learning. On the other hand, as it is evident,

the Iranian EFL learners especially the ones receiving English instructions at schools, come across serious problems dealing with English readings.

Based on the researchers' careful observations, the students consider reading as a difficult and complicated activity; consequently, they tend to show no interest, or better say, unwilling to deal with English readings. Thus, the researchers made an attempt to find a solution and exert a strategy in order to facilitate language learning and render the learners into interested and diligent students who wish to solve their language learning problem. Accordingly, technology based approach is utilized, due to the fact that one of the important outcomes of a study done by UK Research on ICT-based program was to change the learners' attitudes, ultimately led to learning and learner achievement in the related field (Marzban, 2011).

LITERATURE REVIEW

The Logic behind Technology and Engaged Learner

Technology and its relation with education was once declared by Ehrmann who persuaded other researchers to set forth some relevant questions about the usefulness of technology on education in 1997 (Ehrmann, 1997).

The sole concept of technology is not functioning alone; nevertheless, it is capable of presenting language teachers the chance to think about their classrooms, teaching and learning goals, what and hows of learning, and learner needs; finally, find the answers to the aforementioned questions and apply technology where it is required (Egbert, 2007). It is worth mentioning that technology needs to be integrated to education in regard with learning and instructional goals.

The main goal, according to the teachers, is language learning. Moreover, it is preparing a learning environment which enhances language learning. To achieve this goal, they may use a tool like technology. Likewise, learning goals must be taken into account the time when personal goals for studying a language is discussed. For doing a task, other factors such as individual differences, competencies, and motivations should also be considered. Finally, teachers as researchers ought to realize the necessity of being proficient in '21st century skills' (Egbert, 2005). The skills, according to Egbert, are: knowledge acquisition, problem solving, critical thinking, production, inquiry, communication, and creative thinking. These skills should be emphasized without which the learners will not be prepared for their future lives.

Based on Egbert (2005), the skills are comprising the main part of the learning and playing a major role for learners' goals in such technology-filled lives where teachers as experts need to choose, adjust, and then, if the need arises produce 'technology based media'. For changing the students into engaged learners, the teachers should cast utmost attention on the learners' needs, wants, and interests. Further, according to McKenzie (1998), students can be supposed as engaged learners if they participate in real life tasks, interactive learning, discovery learning, collaborative learning, strategic learning and at the last point, take responsibility of their language learning task.

As Meltzer and Hamann (2004) argued, the teacher can rely on three helpful strategies for engaging the learners in the activity. The strategies comprised of establishing a class environment in which real life and authentic activities regarding the learners who should be involved and interacted in the tasks which are also 'challenging and differentiated'. Differentiated tasks remarked since according to the scholars, all of the learners should achieve the one similar goal but they may have different ways to achieve that goal.

Technology (here computers) can support language learners or learning and also language teachers in creating 'language and content resources' entailing a great deal of variety, interaction, a very big database and inquiry, problem solving, supporting 'multimedia input', and at the end, meaningful learning (Egbert, 2007).

In addition, Egbert (2007) demonstrates the advantages of technology use. To begin with, it is mainly used for making language learning more efficient. It can be repeated endlessly and quickly, function as a nonhuman instructor which is also objective one, providing plenty of resources for learner choices. Further, they are designed to motivate the learners and prepare the means for the learners to master the basic skill (Kleiman, 2001).

Since reading is not an easy activity, if it is particularly set out without considering different levels of reading ability, can lead to reluctant but not engaged readers. For engaged readers, Egbert (2007) proposes 'Thinking Reader Software' as a sample software for the teachers to utilize for teaching reading effectively.

Cognitive Strategies

The current study is discussing strategies from a new dimension. Strategies and their application were discussed since 1970s (O'Mally & Chamot, 1990; Rubin, 1975). Based on Oxford (1990), strategies are supposed to be related to the main goal of language learning, often a conscious effort aimed to solve problems.

Among Oxford strategies, cognitive strategies, as direct strategies are strongly deemed to be necessary for both comprehension and production. From strategy classification, using resources for receiving and sending messages listed as a subpart of receiving and sending messages is one of the cognitive strategies applied to four skills and thought to bring benefits to language learners. In addition, application of technology is previously mentioned in the practicing part. Further, it is suggested to be among 'a nonprint resource' which is employed to gain the meaning of what is heard or read in the target language and produce messages in the target language as well. Using such resources can also aid the learners to get ready for speaking skills (Oxford, 1990).

CALL

Computer assisted language learning (CALL), a recent matter of debate has been used so extensively every where, ranging from homes to workplaces, that language teachers now commence to think about the way they can exploit the computers for language learning (Warschauer, 1996). In order to grasp CALL, its development, and the way it is used for language learning, a brief overview on the history of CALL which entails examining the

following three phases of CALL apparently needed to be discussed. According to Warschauer (1996), the phases are Behavioristic CALL, Communicative CALL, and Integrative CALL.

History of CALL

Behavioristic CALL

Although Behavioristic CALL existed in 1950s, it came into use in 1960s and 1970s. The period comprised of programs targeted to provide repetitive language drills which were called 'drill and practice' (also 'drill and kill'). 'PLATO' system is one of the examples of Behavioristic CALL. It entails doing vocabulary drills, grammar explanations, and translation tests many times (Ahmad et al, 1985).

Communicative CALL

The second phase of CALL, Communicative CALL, began with the advent of communicative approach in the 1970s and 80s, the time when the need for real life communication instead of mechanical drills in Behavioristic CALL existed. The logic of Communicative CALL was to design the activities with the purpose of building 'intrinsic motivation' and establishing 'interaction' between the learners themselves and computers as well (Stevens, 1989 cited in Warschauer, 1996).

During the Communicative CALL, three kinds of CALL programs were utilized. In the first program, the computer is working like a 'tutor' in an extensive way. Based on Taylor and Perez (1989), the second model of communicative period entails computers working both as a tutor and 'stimulus' designed to stimulate the learners' participation in authentic activities and critical thinking. 'Sim City' is one of the programs related to the second model. In the third model, computer is called a 'workhorse' or a tool which supports language learning through enabling the learners to use the language. Among the examples of this period, 'concordancers' acting like a tool or means used for learning (Taylor and Perez, 1989).

Integrative CALL

The foundation of Integrative CALL is decided by two technological resources, 'multimedia' and 'Internet'. Through multimedia or 'hypermedia', the learners find their own way by using a mouse. In this case, the learners will benefit in some ways. In addition to creating real world environment for the learners, it brings skills together in one activity. 'Dustin' as one of the examples, designed to represent the actions, a student arriving at U.S.A airport take at different parts of the airport (Schank and Cleary, 1995). Another technology of integrative period is the Internet or 'Computer Mediated Communication' (CMC) which helps the users send and receive information they wish by using emails. They can also use web for a variety of purposes.

In spite of the fact that CALL and its use is becoming widespread, the case of 'normalization' of technology in education and classrooms has not occurred completely. Based on Bax (2003), normalization happens when technology is getting one part of the individuals' daily life as CALL (Book Assisted Language Learning) and PALL (Pen Assisted Language Learning) have already become; plus, when individuals are working with computers with no fear and acting like a normal part of their life. The last point, normalization happens when it becomes a part of learning by

examining learner needs first and then applying technology in order to serve those needs (Bax, 2003).

Reading Comprehension

English has recently been considered as one of the most significant subjects the educational system of Iran; consequently, it has been one of the necessary subjects taught at all levels of study. Among the four language skills, reading is supposed to be one the crucial skills for EFL learners. As Richards and Schmidt (2010, p.483) state "reading is an activity of perceiving a written text in order to understand its contents. This can be done silently (silent reading). The understanding that results, is called reading comprehension". In addition, many methods of teaching reading have been implemented so far. However, the results yield success with some of methods with a specific group of learners (Hassanzadeh, 2013). Based on National Education Act of 1999: (as cited in Wichadee, 2011, p.1), "In organizing the learning process, educational institution and agencies concerned, shall provide substance and activities in line with the learners' interests and aptitudes, bearing in mind individual differences".

RESEARCH QUESTION

Therefore this study aims to find an answer to the following research question.

Research Question: Does CALL and technology affect Iranian EFL learners reading comprehension positively?

In line with the above research question, the following null hypothesis was posed:

Null Hypothesis: CALL and technology does not affect Iranain EFL learners reading comprehension positively.

METHODOLOGY

The purpose of the study was to investigate the effect of computer assissted language learning and technology on Iranian EFL learners' reading comprehension. The method of the study including the participants, instrumentation, procedure, design, and data analysis are explained.

Participants

For the sake of this study, sixty participants were chosen from among 75 female grade 3 students studying English at grade three in one of the highschoools of Robat Karim (one of the districts of Tehran in Iran). Their age range was approximately 16-17 years. Having used the quasi-experimental group research design, the researcher assigned two grade three classes to the control (n = 30) and the experimental group (n = 30), arbitrarily.

Instrumentation

The main purpose of the study was to find the impact of utilizing technology in EFL classrooms on reading comprehension ability. In this regard, three instruments were employed. They can be explained as follows:

Proficiency Test

A Proficiency Test namely, Nelson 100A English Proficiency Test was administered to guarantee the homogeneity of the subjects. A pilot study had also been done with 30 female grade three students of the same highschool in order to check the reliability of the test before it was administered to the participants of the study. Accordingly, Cronbach's Alpha reflecting reliability turned out to be 0.80.

Reading Comprehension Test

A test of reading from PET was selected from the Preliminary English Test and administered as the pre-test and post-test. The reliability and validity of the test were supported and determined by University of Cambridge ESOL. To further check the reliability of the mentioned test, it was piloted among 30 grade three students of that highschool. The resulting reliability which was calculated using Cronbach's Alpha, yielded a higher reliability that was 0.77. It should also be claimed that the readability of these reading tests and the readings used in the study were both checked to ensure that the reading tests selected for this test were at the level of examinees.

Students' Textbook

The reading materials selected to be taught in this research study were all chosen from grade three English book in highschool. The book includes 6 reading comprehension passages. Both control and experimental groups were taught the same passages; however, as noted before, the readings were taught to the experimental group applying powerpoints and multimedias made by the teacher herself.

Procedure

The following steps were taken in order to test the research hypothesis of this study:

In order to homogenize the participants in this study, the standard Nelson 100A Test was administered at the outset of the study after being piloted. It consisted of 50 multiple choice items of knowledge of English structures. The time allotted to take the test was 30 minutes and the scoring was estimated out of 50. In this respect, sixty participants were chosen from 75 female grade three students as target participants of the research and divided into two control and experimental groups, 30 participants in each group. After considering the reliability of the reading test and estimating the readability of the reading materials in order to ensure they are close to each other, one of the tests in PET was chosen and first piloted among other students and then administered to the participants as the pretest, including 5 parts followed by 35 multiple choice questions. The time allotted was 35 minutes (one minute for each question). The participants in the experimental groups had 8 sessions of treatment between the pretest and posttest. As mentioned before, the experimental group was instructed applying technology; accordingly, the readings were taught using powerpoints and multimedia program. The powerpoints were made up to combine sound, images, and written text together in order to keep the learners motivated for better outcomes. At the end of the experiment, the reading test was given to two groups again to find out if there are any significant differences caused by the treatments.

Design

This study was conducted through a quasi-experimental pretest-posttest control group design. It was non-randomized because both control and experimental groups were selected from already formed groups of TEFL learners.

Data analysis

In order to test the hypothesis formulated in this study an independent t-test was used. It was used to examine the effect of technology on the students' reading comprehension.

RESULTS AND DISCUSSION

To probe the effect of technology-enhanced instruction on the improvement of the reading comprehension of Iranian EFL learners, an independent t-test was applied to analyze the data coming from pretest and posttest as well. As displayed in Table 1, the assumption of normality of groups before the treatment was met through the results of t-test in the pretest ($p > .05$).

Table 1: Independent t-test: Pretest of Reading Comprehension

Pretest	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	T	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Equal variances assumed	2.457	.122	-.518	58	.606	-1.23333	2.37907	-5.99555	3.52889
Equal variances not assumed			-.518	56.630	.606	-1.23333	2.37907	-5.99801	3.53134

As revealed in Table 2, the experimental group ($M = 24.1333$) showed a higher mean in comparison with the control group on the posttest of reading comprehension after controlling for the possible effect of the pretest. This was followed by the control group ($M = 16.5000$)

Table 2: Descriptive Statistics; Posttest of Reading Comprehension by Groups

Groups		N	Mean	Std. Deviation	Std. Error Mean
Posttest	CONTROL	30	16.5000	8.02904	1.46590
	EXPERIMENTAL	30	24.1333	7.16184	1.30757

Based on the results displayed in Table 3, $p < .05$, representing a large effect size, it can be concluded that technology-enhanced instruction had a significant effect on the EFL learners' reading comprehension. Thus the null-hypothesis that technology-enhanced instruction does not affect the learners' reading comprehension positively **was rejected**.

Table 3: Independent t-test: Posttest of Reading Comprehension

Posttest	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	T	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Equal variances assumed	.065	.800	-3.886	58	.000	-7.63333	1.96433	-11.56536	-3.70130
Equal variances not assumed			-3.886	57.258	.000	-7.63333	1.96433	-11.56645	-3.70022

According to the results of this study, it can be argued that CALL affects the learners' reading comprehension positively; further, it caused a noticeable improvement in their reading comprehension. Also, according to the researchers' vigilant observation, technology integrated instruction could help the learners remain involved and engaged in the task. This finding is in full agreement with Marzban (2010). The researcher surveyed the improvement of the learners in reading comprehension through CALL. The results of his study revealed that CALL could significantly affect the learners' reading comprehension. Further, Smith (2000) asserted that CALL programs facilitate learning with respect to speed, individualized instruction, authenticity, efficiency, and administration (cited in Marzban, 2011). As a final point, the findings of some other research studies support this study in the way that all claim a positive relation between achievement in English and technology. (Navdal, 2007; Rahimi & Yadollahi, 2011; Satharasinghe, 2004; Taylor et al., 1999).

CONCLUSION

Based on the findings of this study, technology enhanced instruction in the field of language learning especially in reading comprehension contributes to EFL learners' accomplishments in the task. Accordingly, utilizing technology as a type of strategy is intended to make learning more effective and aid the learners in order to become engaged in the reading task. In addition, as noted before, research demonstrates that CALL is required to be a part of learning and teaching or perhaps an indispensable part quickly. The results of this study may also bring some important implications for EFL teachers and specifically for Education Office. First, teachers should be aware of their learners' needs and interests; in this regard, the teachers themselves act like major decision makers. Nonetheless, this study proposes technology-enhanced language learning and teaching in order to make the learners both interested and involved in the language learning task.

Second, Education Office is suggested to hold several theoretical and practical workshops on CALL for some reasons. Since the researchers, as teachers, believe that for keeping the students as engaged learners, they ought to employ strategies or tactics in order to solve learning problems and facilitate language learning in their classes as well. Like wise, the workshops are recommended to be held in order to eradicate the teachers' computer anxiety (esp. those who are immigrants of CALL), make the teachers acquainted with CALL and how it works in language classes, and instruct them how to utilize CALL, for instance, by making their own powerpoints and multimedias in order to have successful language learners. However, the current study encountered a few limitations. This study did not compare two genders; all of the subjects were female; moreover, the center of attention in this study was mainly restricted to teaching the readings in the learners' highschool book; the teacher wished to teach some other new and authentic readings outside the book but due to the case of time limitations, it was not possible.

ABSTRACT

This study examined English as a foreign language (EFL) teachers' perceptions of factors affecting their integration of Computer Assisted Language Learning (CALL) in the classrooms. The data was collected through questionnaires distributed to fifty EFL teachers who taught elementary level of Students' proficiency in five different English language institutions in Bandar Abbas, Iran. In order to get in-depth results, interview was conducted by fifteen EFL teachers based on the results of the questionnaire. The results revealed the positive perceptions of teachers toward the use of computer and also the finding indicated the positive perceptions of the factors that affect their teaching. The results promise implications for renewing EFL programs and teacher training/ education courses. It is hoped that the outcomes of this study can be used in shaping innovational practices in the Iranian EFL Educational System.

KEYWORDS: EFL Teachers' Perceptions, Computer Assisted- Language – Learning (CALL)

INTRODUCTION

Computers are increasingly widespread, influencing many aspects of our social and work lives, as well as many of our leisure activities. As different tasks involve human computer interaction, computer skills and knowledge have become more positively correlated with both occupational and personal success. In most cases, the teacher is key to effective implementation of the use of computers in the educational system and they have tremendous potential to transmit perceptions and values to students, it is important to understand the biases and stereotypes that teachers may hold about the use of computers and the factors that act as facilitators to teachers' positive computer usage (Askar & Umay, 2001). Therefore, the decision regarding whether and how to use computer technology for instruction rests on the shoulders of classroom teachers.

In the literature, few studies have been accomplished in order to investigate what makes English language teachers use computer, the internet materials, resources and software in the language classroom. In order to help language teachers learn about and use technology effectively, we need to know more about the transfer of CALL experience, background and knowledge to the classroom. More specifically, we need to know to what extent computer attributes (availability, complexity, relative advantage, observability, and finally trainability) on the one hand and

teachers' perceptions, computer competence, influence teachers' use of the computers in the language classrooms (Albirini, 2004).

The perceptions of teachers play an important role in educational interaction as well as instructional choices and as such are fundamental in examining the outcome of technological integration in the classroom (Albion & Ertmer, 2002; Becker, Ravitz, & Wong, 1999; Pajares, 1992). In fact, teachers' perceptions of technology have been found to be among the most critical variables in predicting the successful use of technology during educational activities (Becker et al., 1999).

A growing number of studies on CALL focus on CALL-classroom comparisons (e.g., Gerosa, & Giuliani, 2008), students' perceptions and attitudes of CALL. Clearly, previous research already offers new insights that come through vividly from students' own voices and experiences in CALL environments. However, To the best knowledge of the researcher, very limited research has been undertaken to evaluate the perceptions of language teachers on the implementation of CALL. Furthermore, while there is still limited research addressing the perceptions of EFL teachers toward the implementation of CALL. (Aydinli & Elaziz, 2010; Wiebe & Kabata, 2010). The present study is designed to examine Iranian EFL teachers' perceptions of the use of CALL. The study findings offer important insights for Iranian EFL teachers who want to support their language classrooms with technology such as computers, multimedia, the Internet, and educational software. Also, this study will provide information that proves effective to teachers embracing CALL integration for a wide range of teaching English. Finally, understanding the different qualities of teachers' roles in CALL-enhanced language learning classrooms might aid teachers in implementing effective CALL curricula for EFL students. More specifically, this study explores the factors that affect implementation of CALL in EFL classrooms in Iran; (b) Iranian EFL teachers' perceptions of CALL in EFL classrooms in Iran and whether Iranian EFL teachers have a clear-cut understanding of the roles of teachers in CALL classrooms.

LITERATURE REVIEW

Previous literature on the attitudes of EFL instructors has shown that EFL instructors have positive perceptions of the integration of CALL in teaching languages. To begin with, Cope and Ward (2002), conducted a study on perceptions of CALL of experienced teachers, asserted that teachers with little or no professional development in the use of technology in the classroom were less likely to use it in the classroom and were less likely to see the benefit of technology usage in the classroom. Royer (2002) found that the more teachers were involved in actually setting up classroom technology the more likely they were to use that technology for instruction (Royer, 2002). This is why it is important for teachers to receive technology skill training. This is not to say that the progress of technology use in the classroom changes the role of the teacher. Wang (2002) found that teachers saw their roles as being more teachers centered and fewer students centered in classrooms that did not have computers. However, teachers did not think that they would teach differently or that their roles would be different in a classroom with computers. Alshumaimeri (2008) found the positive correlation between a teacher's attendance during training, both for computer as well as CALL, and a positive attitude toward the use of IT

approaches to learning in the Saudi classroom. He also, recommended actions include specialized training for EFL teachers who are required to integrate CALL into regular classroom instruction. Teachers are seen to be active agents in the process of changes and implementation of new ideas as their perceptions may support or impede the success of any educational reform such as an innovative technology program or the integration of technology to support teaching and learning (Woodrow, 1991). Thus, attention has recently been paid to the role of teachers in technology supporting classrooms, some researchers focused on the relationship between teachers' perceptions and technology integration. Some researchers have directly examined teachers' perceptions of CALL in various linguistic contexts. For example, Burnett (1998) conducted a case-study evaluation of teachers' attitudes, behaviours, and beliefs toward a writing program called Assistant Francais in the computer-equipped French classroom. This study found that studied teachers had diverse experiences of the implementation of computer into language teaching in classrooms. Teachers preferred to use students' first language (English) to explain technical vocabulary and provide lesson instructions in the belief that this will make content comprehensible for language learners. Specifically, "teaching students how to use the computer programs was considered more important" than teaching the second language (Burnett, 1998, p.114). As a result, teachers focus on students' learning product instead of learning process in computer-equipped classrooms. Kessler and Plakans (2008) explored seven ESL/EFL teachers' attitudes, and confidence in using CALL with a particular emphasis on digital audio and video in ESL classrooms. The findings indicated that the participants were integrating CALL in their course assignments. Specifically, they used audio or video for teachers' feedback, listening or speaking assessment, and students' self-assessment or self-study. To be more exact, the participants only used audio or video as an assessment tool. In terms of the types and levels of confidence, Kessler and Plakans (2008) divided them into three categories: highly confident, contextually, and less confident, and summarized his findings: "high confidence is not synonymous with high/integrated use" and "the teachers who used audio the most in integrated ways were those expressing contextual confidence" (p.278). The highly confident teachers spent less time using CALL than contextually confident and less confident teachers. Kessler and Plakans (2008) further suggested that teachers should start thinking about the importance of familiarizing themselves with technology for language teaching through repetitive practices. In addition, having time for practice, high quality of instructions and technical supports are needed. Park and Son (2009) conducted a study on the perceptions of Korean in-service EFL teachers of the use of CALL. The authors found that the teachers have positive perceptions of the use of CALL in EFL courses. The EFL teachers believed that computers were very beneficial to provide sufficient input as well as authentic materials and contexts for students. In another study on the perceptions of Arabic and English teachers on the use of technology in their classes in schools of the United Arab Emirates (UAE), Ismail, Almekhlafi (2010), using questionnaires and interviews, found that the teachers were agreed with integration of technology in their teaching.

RESEARCH QUESTIONS

- 1 What are Iranian EFL teachers' perceptions of the factors affecting their integration of CALL in the classrooms?
2. What are Iranian EFL teachers' perceptions of their integration of CALL in the classroom?

3. What are Iranian EFL teachers' perceptions of their roles in CALL integrated classrooms?

METHODOLOGY

Participants

A total of fifty EFL teachers volunteer were selected to participate in the study. All of them were experienced teachers working at Shokooh, Dana, Farhikhtegan, Ariya, Arta language institutes in Bandar Abbas. Iran. The sample was comprised of twenty five male and twenty five female teachers, identical in number (ranging from 20-40 years) and their teaching experience ranged from 3 years to 13 years while their experience in using computers for work-related purposes ranged from 4 years to 6 years.

Instruments

Questionnaire

The design of questionnaire came from previous research on computer- assisted – language learning (Albirini, 2004; Bordbar, 2010; Dashtestani, 2012& Sahin Kiozil, 2011).The33 items questionnaire consisted of two parts based on five points Likert Scale format with ('Strongly Agree', 'Agree', Neutral, 'Disagree' and 'Strongly Disagree') was used. The questionnaire was composed of two parts. The first part dealt with background information of the participants (ages and level for students; years of teaching experience and which language skills and CALL applications integrated in their teaching).

The second part was about the factors that influence CALL integration in their classrooms, general perceptions of using CALL and teachers' perceptions of their roles in CALL classrooms with sub scales of "Perceived experiences with CALL", "The roles of ESL and EFL teachers" and "The factors affecting teachers' CALL integration". The content validity of the questionnaire was established by a panel of three EFL experts. To determine the reliability of questionnaire Cronbach Alpha analyses were conducted as measures of consistency and a reasonably high rang of reliability (0.8) was found.

Interview

In order to gather concrete data about the use of CALL, a sample of fifteen teachers with randomly selected from the teachers participated in face-to-face interview. The questions for the interview paralleled the sections in the questionnaire. Similar to the questionnaire study, three EFL and educational technology university professors validated the content of the interview questions. All research participants gave their verbal consent to the recording of their interview, as well as having them used for research purposes. In this study, 20-minute interview was conducted with 15 EFL individually to follow up their responses to the questionnaire. The participants' names are not real; the researcher used pseudo names for the participants.

Procedure

At first questionnaire employed in the study was piloted with representative samples of the correspondent group of EFL teachers. Second the piloted questionnaire was administered to convenient sample of fifty EFL teachers in institutions in Bandar Abbas. Due to different locations of the participants, questionnaire handed in to the teachers participating in the study in

their working place. It took about thirty three minutes to complete the survey. After quantitative phase had been completed, the qualitative phase started. A sample of fifteen teachers participated in the interview. The interview took place in their workplace. The interview lasted between fifteen to twenty minutes and all audio –taped and then transcribed. Data from the interview were analyzed qualitatively and described according to the main interview questions and presented as statements of the teachers responses to the questions.

Data analysis

The data collected from the questionnaire imported and analyzed using SPSS (version 19.0) package. Frequency means and standard deviation (SD) utilized to report descriptive data. Frequency distributions used to measure how often certain scores occur (Salkind, 2008). In addition, mean is “the sum of all the values in a group, divided by the number of values in that group” (Salkind, 2008, p.20), whereas SD “represents the average amount of variability in a set of scores” (Salkind, 2008, p.37). The qualitative data analyzed using interpretive qualitative approach (Glesne, 1998). Within this paradigm, “it is possible to understand the subjective meaning of action (grasping the actor’s beliefs, desires and so on) yet do so in an objective manner” (Schwandt, 2000, P.193).

The interview was conducted with the teachers individually to follow up their responses to the questionnaire. Each interview was recorded and transcribed. Data from the interviews were analyzed using interpretive qualitative approach and described according to the statements of the teachers’ responses to the research questions.

RESULTS AND DISCUSSION

Investigating the First Research Question

The first research question of this study inquired what are Iranian EFL teachers’ perceptions of the factors affecting their CALL integration. The frequency and percentage of the teachers’ responses to all 15 items of the perception questionnaire are provided in Table 1 below. As can be seen in the figure, the item that received the most positive responses (*Disagree*=74.0%) and (*Strongly disagree*= 14.%) of the participants was *Item 14: “I do not use CALL because I lack technical support for the use of technology”*; however, the table indicates that the item that got the least positive responses (*Agree* =36.0%) and (*Strongly agree* = 10.0%) from the participants was *Item 3: “I use CALL because I have pedagogical knowledge of how to integrate CALL for language learning?”*.

Table 1: Frequency and Percentage of Teachers' Responses to All Items Related to Factors Affecting Their CALL Integration

Item	SD		D		N		A		SA	
	f	%	f	%	f	%	f	%	f	%
1. I use CALL because I am aware of how CALL impacts my teaching.	0	.0	2	4.0	13	26.0	26	52.0	9	18.0
2. I use CALL because I have a positive attitude toward CALL.	1	2.0	2	4.0	5	10.0	24	48.0	18	36.0
3. I use CALL because I have pedagogical knowledge of how to integrate CALL for language learning.	0	.0	5	10.0	22	44.0	18	36.0	5	10.0
4. I use CALL because I have the ability to use technology.	0	.0	4	8.0	15	30.0	26	52.0	5	10.0
5. I use CALL because I know how to integrate CALL into my classroom.	0	.0	3	6.0	11	22.0	32	64.0	4	8.0
6. I use CALL because I have administrative support.	0	.0	4	8.0	22	44.0	22	44.0	2	4.0
7. I use CALL because I have students with the ability to use technology.	0	.0	2	4.0	13	26.0	32	64.0	3	6.0
8. I use CALL because my students understand the purpose of the use of technology.	1	2.0	3	6.0	20	40.0	25	50.0	1	2.0
9. I do not use CALL because my students lack the language levels to use technology.	6	12.0	29	58.0	12	24.0	3	6.0	0	.0
10. I do not use CALL because I rely on textbooks.	4	8.0	37	74.0	7	14.0	2	4.0	0	.0
11. I do not use CALL because I do not have time to integrate CALL into my language classrooms.	5	10.0	37	74.0	5	10.0	3	6.0	0	.0
12. I do not use CALL because I lack technology in my language classrooms.	5	10.0	35	70.0	7	14.0	3	6.0	0	.0
13. I do not use CALL because I lack training with technology.	8	16.0	35	70.0	7	14.0	0	.0	0	.0
14. I do not use CALL because I lack technical support for the use of technology.	7	14.0	37	74.0	5	10.0	1	2.0	0	.0
15. I do not use CALL because my students lack previous exposure to technology.	8	16.0	37	74.0	3	6.0	2	4.0	0	.0

The descriptive statistics of the teachers' responses to the perceptions questionnaire were assessed and set forth in Table 2. It should be noted that we assigned 0 point for "Strongly Disagree", 1 point for "Disagree", 2 points for "Undecided", 3 points for "Agree", and 4 points for "Strongly Agree" choices in the questionnaire. The average of the teachers' answers to the 15 items of the questionnaire was computed for more analysis. The table reveals that 50 teachers responded to the questionnaire. The mean turned out to be 3.79, which is above the median (3), with the standard deviation of .41.

Table 2: Descriptive Statistics of Teachers' Perceptions of Factors Affecting Their CALL Integration

N	Range	Minimum	Maximum	Mean	Std. Deviation
50	1.93	2.53	4.47	3.79	.415

The results of interview

The results of interview showed that teachers used CALL since they believed that it is the most powerful way to improve students' pronunciation, listening and speaking skills. The teachers agreed that computer is useful for improving language skills. It seemed that CALL has great impact on developing listening and speaking skills. The EFL teachers pointed out that CALL has effect on students' accent and also provide native situation and students will be more familiar with native like. Below are some examples of what they have said:

Sara

It is important for student to hear native speakers so, I use audio via computer.

Vahid

One of the useful ways to improve accent and pronunciation in the classroom is throw CALL. I and my students can improve our pronunciation by listening to native speakers throw CDs or DVDs. Also, I have too much information about using computer so it makes me to use computer much more in my classrooms.

Investigating the second Research Question

The second research question of the current study asked what are Iranian EFL teachers' perceptions of the integration of CALL in their classrooms.

The frequency and percentage of the teachers' responses to all 15 items of the perception questionnaire are provided in Table 3 below. According to the table, the item that received the most positive responses (Strongly disagree= 100.0%) of the participants was *Item 25: "CALL is beneficial in improving listening skills"* And *Item 27: "CALL is beneficial in improving speaking skills"* with (Strongly disagree= 100.0%); on the other hand, the table indicates that the item that got the least positive responses (Agree =24.0%) and (Strongly agree = 6.0%) from the participants was *Item 22: "I am frustrated because I am not trained to integrate CALL into my class"*, and *Item 23: "I am overwhelmed because there are numerous CALL resources to select from"* with (Strongly disagree= 100.0%).

Table 3: Frequency and Percentage of Teachers' Responses to All Items about the Integration of CALL

Item	SD		D		N		A		SA	
	f	%	f	%	f	%	f	%	f	%
16. CALL makes my language lessons more interesting and enjoyable.	2	4.0	2	4.0	3	6.0	30	60.0	13	26.0
17. Integrating CALL into my English teaching is a motivational experience.	0	.0	5	10.0	8	16.0	29	58.0	8	16.0
18. I am clear about the purpose of the integrating of CALL in my English teaching.	3	6.0	2	4.0	5	10.0	33	66.0	7	14.0
19. I feel ready to integrate CALL in to my English teaching.	0	.0	1	2.0	12	24.0	29	58.0	8	16.0
20. Through the integration of CALL my students can increase their English learning.	0	.0	0	.0	11	22.0	30	60.0	9	18.0
21. I think that I have time to integrate CALL into my English teaching.	0	.0	2	4.0	11	22.0	31	62.0	6	12.0
22. I am frustrated because I am not trained to integrate CALL into my class.	1	2.0	17	34.0	17	34.0	12	24.0	3	6.0
23. I am overwhelmed because there are numerous CALL resources to select from.	1	2.0	20	40.0	14	28.0	11	22.0	4	8.0
24. CALL is beneficial in improving reading skills.	0	.0	0	.0	4	8.0	30	60.0	16	32.0
25. CALL is beneficial in improving listening skills.	0	.0	0	.0	0	.0	0	.0	50	100.0
26. CALL is beneficial in improving writing skills.	0	.0	0	.0	29	58.0	21	42.0	0	.0
27. CALL is beneficial in improving speaking skills.	0	.0	0	.0	0	.0	0	.0	50	100.0

The descriptive statistics in Table 4 shows that the mean was 3.90, which is more than the median (3), with the standard deviation of .37.

Table 4: Descriptive Statistics of Teachers' Perceptions of the Integration of CALL in Classrooms

N	Range	Minimum	Maximum	Mean	Std. Deviation
50	1.75	3.00	4.75	3.9017	.37521

The results of interviews

All of the fifteen teachers considered using the computer as essential and necessary in an era of modern technology. It appeared that they naturally accepted the use of technology as an undeniable part of instruction. Some teachers asserted that CALL has made many more materials available to students and teachers need to be much more prepared to know what is available to students online and make resources available on the Learning platform.

Changing all of the previous and traditional systems with CALL is better, because this kind of learning is completely different with traditional system and it is much better for learning and teaching too. Also, teachers should be familiar with new technology and methodology using CALL applications and also should involve in use of computer materials. Teachers also need training by improving the technology.

Investigating the Third Research Question

The third research question of the current study asked what are Iranian EFL teachers' perceptions of their roles in CALL integrated classrooms.

The frequency and percentage of the teachers' responses to all 6 items of the perception questionnaire are displayed in Table 5 below. A quick look at the table hands on that the item that received the most positive responses (Agree =60.0%) and (Strongly disagree= 22.0.0%) and of the participants was *Item 30: "I encourage my students to play an active role in their English learning."* ; conversely, the table indicates that the item that got the least positive responses (Agree =28.0%) and (Strongly agree = 2.0%) from the participants was *Item 28: "I demonstrate how to use technology in support of English learning."*, and *Item 23: "I am overwhelmed because there are numerous CALL resources to select from"* with (Strongly disagree= 100.0%);

Table 5: Frequency and Percentage of Teachers' Responses to All Items about their Roles in CALL integrated Classrooms

Item	SD		D		N		A		SA	
	f	%	f	%	f	%	f	%	f	%
28. I demonstrate how to use technology in support of English learning.	3	6.0	14	28.0	18	36.0	14	28.0	1	2.0
29. I prepare my students to become more skilled at using technology.	1	2.0	4	8.0	13	26.0	28	56.0	4	8.0
30. I encourage my students to play an active role in their English learning.	0	.0	1	2.0	8	16.0	30	60.0	11	22.0
31. I provide extra support to my students to improve their English learning.	0	.0	3	6.0	8	16.0	28	56.0	11	22.0
32. I select technology tools and applications I need in classrooms.	0	.0	3	6.0	7	14.0	29	58.0	11	22.0
33. I troubleshoot technological problems.	3	6.0	8	16.0	21	42.0	15	30.0	3	6.0

The results of interviews

The results also indicated that the teachers go beyond traditional teaching and they are close to the new technology and new teaching style. It also appeared that CALL motivates students in learning and teachers in teaching language. A large proportion of language teachers mentioned their role as a facilitator, manager, observer, designer and helper. The finding showed that the teachers in this study had positive perceptions of their role in CALL integrated classrooms. Aram and Azim for example said:

Aram

Teachers guide the students and organize their activities. Teachers play a main role to do the task and reduce students stress. Teachers are computer specialist. I think teachers are a CALL observer, designer, implementer and manager.

Azim

Teachers should be familiar with new technology and methodology using CALL applications and also should involve in use of computer materials. In my idea, teachers are facilitator helper guide and have responsibility of student's learning. Teachers are scaffold.

Discussion

The results of the study showed that the teachers' perceptions of CALL are generally positive. As evidenced by the teachers' responses to the questionnaire and interview, all teachers believed that the use of computers adds value to their teaching and CALL is an effective way for improving the quality of their teaching because CALL can provide both teachers and students with useful information and resources, various modes and authentic contexts. It seemed that CALL is accepted among the teachers because they were aware of the benefits of using computers in foreign language learning and teaching. This is supported by findings put forth in the literature (e.g., Beatty, 2003; Healey, 1999) which indicated that CALL application may be helpful for developing learners' skills and also for teachers in improving their teaching skills. The teachers agreed that the quality of education relies on exclusively on the quality of teachers. This confirms that the roles of teachers are important in organizing the activities and structuring the learning process. Also they thought that their perceptions can introduce new technology and brings effective learning and teaching in to the classrooms as emphasized by many researchers (e.g., Pennington, Lam & Lawrence, 2002).

It appeared that teachers agreed that CALL could improve their language skills as well as their students. Also, the expectation that teachers should be experts in the use of computers is not fully supported by the teachers since just one of the teachers mentioned that teachers should solve the computer problem as experts. This does not support the finding of Soo and Ngeow, (1997) indicating that teachers are computer exports in the CALL classrooms. Although they seem to be convinced that CALL makes language learning interesting. Also, the teachers emphasized that they are facilitators, guide, engineer and manager in classrooms integrated with CALL. This is consistent with finding of (Davies & Cronther, 1995; Kurnum, 1992; Beret, 1993). Teachers accepted that computer technologies are helpful for enhancing students' language learning. They

also agreed that teachers and students can communicate with native speakers of English with computer due to the fact that all institution instruction is to help students to have native accent. The results of these studies also indicated this finding (Park and Son, 2009; Al-Mekhlafy, 2010; Kessler and Plakans, 2008). Although, this study aimed to investigate EFL teachers' perceptions of factors affecting their CALL integration in their classrooms. The results of the study confirmed that factors such as teachers' computer skills, computer facilities, knowledge about CALL students' perceptions and teachers perceptions of CALL are factors affect the implementation of CALL significantly. This is consistent with Ertmer et. al. (1999) who suggested that internal and external factors influence teachers' perceptions of the technology integration. On the other hand, it seemed that the factor such as experience was important for teachers who use technology in the classrooms. The study showed that more experience teachers have positive perceptions of the use of technology in the classrooms. This may also be supported by findings in the literature (Atkins & Vasu, 2000).

CONCLUSION

This study examined teachers' perceptions of their integration of CALL in language teaching by investigating the perceptions of teachers towards the use of CALL and computers in general, the teachers' roles, and factors that affect teachers' use of CALL. The finding of this study suggested that teacher's perceptions made the huge improvement in teaching. As a result of examining the perceptions received from the teachers to this study, the researcher had identified the widespread use of CALL by the EFL teachers.

This study showed the important role of technological support in the classrooms .Also, the study found that the teachers' personal perceptions had influence on their use of CALL. This might be because of teachers' knowledge of CALL programs and development of technology. Besides, the results indicated that computer use for general purposes among teachers was very common. Most teachers used computers for listening and speaking curse. They also asserted that they used computer to show video to their students. However, using computers made them more efficient in their lives and that they have positive perceptions of using computers in language instruction. Such responses were to be expected considered this fact that computer technology is fast identified in the field of learning and teaching a foreign language (Gruich, 2002). On the other hand, no any report of online use of computer in their classrooms, might come from their lack of much more time, weak internet and no any internet support.

The results of the investigating factors that affect EFL teachers' perceptions of using of CALL in language instruction showed that teacher's lack of training in using CALL affected their teaching with computers. Moreover, teachers also reported that the perceptions of their students affect their teaching with computers. Thus, students' lack of motivation in computer sessions may have an effect on teachers' motivation while teaching with computers. Finally, the finding indicated that, having enjoyable classrooms and funny time with student are also the important factors that teachers use CALL in the classrooms.

The findings of the study indicated that teachers demonstrated positive perceptions of the use of computers in language instruction. In addition, the findings showed that teachers believed that

training was required and they believed that they needed training to learn and teach with computers. The qualitative data also indicated that the teachers were affected by the student's needs and ability in CALL classrooms. So teachers were more convenient to use CALL. Briefly, all these findings might show that teachers had positive perceptions of technology integration in general.

As a further study the impact of training on teachers may be analyzed as an experimental study. Moreover, this study added a contextualized description of the Iranian EFL teachers' perceptions of integration of CALL in their classrooms. There is much more context that can be gathered about teachers' perceptions of the integration of technology in the classrooms. The limitation of this study was that there was only one specific group of EFL teachers were selected to participate in the study. They thought elementary level of students. Other groups of EFL teachers, including university teachers and school teachers, could have provided useful data for the purposes. This study also provided some implications that would improve the success of integration of CALL for teachers, students, institutions and policy makers. Teachers are a key factor in whether students have a positive perception of this technology, which leads to better achievement in learning. Therefore, teachers should have a positive perception of this technology to help their students. The institutions must ensure that teachers develop positive perceptions of use of CALL. They should be decreased any fears and qualms that teachers may have to use technology. Since positive perceptions of CALL usually foretell future computer use, policy makers can make use of educators' positive perceptions of CALL to prepare them better for incorporating CALL in to their teaching practices.

ABSTRACT

The current study aimed at investigating the effect of using songs on Iranian young English as a foreign language (EFL) learners' vocabulary performance. This quasi-experimental research was based on a pretest-posttest control group design. For the purposes of this study, 60 young EFL learners were divided into two groups. Before the treatment, both groups were administered a vocabulary pretest. The experimental group (n=30) was taught the new words through songs. However, the control group (n=30) received the traditional vocabulary instruction. The treatment lasted for an academic semester. After the treatment, the same vocabulary post-test was administered to the groups. The data analysis through the statistical test of t-test indicated that the use of songs in class had a significantly positive effect on vocabulary performance of young EFL learners. The positive effects of songs are result of their role in making a very relaxed atmosphere and decreasing anxiety. Through making use of songs learner feel free and since songs are enjoyable there is no such a burden on memory in the process of learning that is ,it might be concluded that cognitive load is significantly low.

KEYWORDS: Vocabulary knowledge, Song, Traditional instruction

INTRODUCTION

There is no doubt that vocabulary is essential in learning a language in general. It can be said that vocabulary learning is even more challenging for foreign language learners given the limited exposure to language and insufficient opportunities to make use of the learnt items in real-life situations. Vocabulary is more than single words; it means the words of a language, including single items and phrases or chunks of several words which convey a particular meaning. In 1930s, it was found that there is a close relationship between word knowledge and achievement in life (Celik & Toptas). Success in earning and management was correlated with vocabulary scores. When vocabulary knowledge is not enough, people have difficulty in expressing their thoughts and ideas, and this usually results in physical aggressiveness. (Shoari, 2013). It can be said that limited vocabulary is a kind of imperfection. For understanding what someone hears and reads and also to communicate effectively with others, vocabulary size is so crucial (Shoebottom, 2013). Wilkins on the importance vocabulary knowledge in communication stated that "Without grammar very little can be conveyed but without vocabulary nothing can be conveyed". (as cited

in Schmitt, 2010, p.3). According to Schmitt (2010), a large vocabulary is required for someone to use language in a desired manner. In English, vocabulary size results in limiting the type of texts someone can read; in other words, there is a close relationship between number of words someone knows and how well s/he performs in terms of different language skills. (Nation and Meara, 2002, p.46). Krashen on the importance of vocabulary stated that “a large vocabulary is of course essential for mastery language” (Shoari, 2013). Alderson on the role of vocabulary knowledge in language use states: “what would appear to show is that the size of one’s vocabulary is relevant to one’s performance on any language tests, in other words, that language ability is not quite a large extent a function of vocabulary size” (as cited in Schmitt, 2010, p.5). According to Carlo & August (2005), English language learners who are slow in vocabulary learning could not comprehend the texts of advance levels. They believe those students “are of poor performance and are at the risk of being diagnosed as learning disabled students” (August, 2005). Consequently in teaching vocabulary the type of the instruction is of great importance. For many years so many studies have been done for finding the most effective vocabulary learning strategy (Yong Gu, 2003).

Statement of the problem

Undoubtedly vocabulary is central of English language teaching, since without acceptable word knowledge students cannot understand others or express their own ideas. Every one surely experiences the situations in which s/he without grammar, with some useful words and expressions, was able to manage communication. When speakers don have a rich word repertoire they cannot express their ideas. In most of the cases this results in physical aggressiveness. Generally speaking the lack of word knowledge is a kind of imperfection. When students cannot find the relevant words from their mental dictionaries while listening or reading have serious problems in understanding new concepts and also in connecting them to what they already know and in using them. These problems can make it difficult for a student to learn as quickly as someone who doesn’t have similar problems. Mostly these students are at risk of being recognized as disable learners.. It seems the learnt items don’t move into long-term memory, maybe because they are not learnt in effective and meaningful manner. As a result there is strong need for more effective strategies in teaching/learning process.

Main Objectives of the study

In order to try to fill the gaps of which discussed above this study was performed. Because of the nature of songs they can be used for a large range of purposes in EFL situations. Songs result in deeper engagement in vocabulary learning. Through making use of songs learners besides learning new words in more relaxed conditions would also be familiar with dialect, culture.

LITERATURE REVIEW

Songs are parts of life from the early days. According to Gugliemino(1986), adults sing for various purposes for example at religious services, bars, in the shower so on. Songs are one of the integral parts of our language experience. Songs would be of great value if used in coordination with a language lesson they. There is no doubt that technology facilitate having access to different songs. Teachers can take songs into classrooms for educational purposes.

There is a large amount of literature which points to the role of using songs in ESL/EFL classrooms but not empirically. The first theoretical rationale for using songs in the classroom, goes back to the types of listening processes. Two processes involved in listening, and both can be used when songs are applied in the classroom. The activity of which is selected for a particular song determines which of these processes is active. Cullen (1999) states that:

The first is bottom-up processing where the listener builds up the sounds into words, sentences and meaning. The second is top-down processing where the listener uses background knowledge to understand the meaning of a message. Practicing both of these processes is essential for developing listening comprehension.

Music and, Song, and vocabulary learning

There are studies on the effects of using authentic materials, such as instructional games, songs and stories, on improving students' progress but empirical supports are also required (Razmjoo, et.al, 2012). Because of the melody of the songs, they facilitate learning and, music helps learners in developing the cognitive skills and in improving language skills. Through singing songs, children learn rhyme and vocabulary (Yuliana, 2003). Music is universal factor in all cultures. Language and communication are also universal (Salcedo, 2002). According to Richman (1993) there are three types of human vocalization. Expressive sounds (e.g., sighing crying, laughing), speech and singing (which is in between of two first types) (as cited in Salcedo, 2002, p 2).

Plato believed that "musical training is a more potent instrument than any other, because rhythm and harmony find their way into the inward places of the soul, on which they mightily fasten... making the soul of him who is rightly educated graceful" (as cited in Stansell, 2005). According to Yuliana (2003) singing a song is enjoyable for learners and, because words are repeated several times, learners are able to memorize them easily. Another feature of songs is that they are learnt by heart and as a result lead to learners 'development.

Making use of the music in the ELT is not new task. Bartle (1962) and Richards (1969) or Jolly (1975), and other scholars have been studying the effect of music in language learning because of its linguistic, and motivational advantages (as cited in Engh, 2013). There are number of studies of which prove strongly the positive effectiveness of the music on various language fields. In Audio Lingual method of the language teaching music was used in order to reduce the negative effects of repetitiveness of the practices of the 1950s to 1970s (Bartle, 1962, Kanel, 2000). It was believed that making use of music resulted in a relax state for mind, and as a result improve learning. (Lozanov, 1978).

Most of the students listen to music when they study may be because they believe that music helps them to concentrate on tasks, but some people believe that music is a kind of distracter, and stops learning. Martin (1988) worked on the effect of the music and found that through listening to the background music students' scores increased significantly. Kiger (1989) shows that, students' scores in comprehension tests increased through using soft music and repetitive rhythm. Li (2008) is one of the researchers who worked on the importance of the music on vocabulary. In

his experimental study he found that China's learners' scores increased significantly under the effect of the using songs (both lyrics and music). Huy LE (2007) found that music is very effective in improving all language skills.

There are also other supports for positive role of music on language learning by (Katchen, 1988 & Puhl, 1989; Baez, 1993). Brand (2007) found theoretical and psychological reasons for the use of music in language teaching. He believes that the ultimate aim in English learning is not only speaking English, but interacting with people from other cultures (Brand, 2002). It was found that music processing and language processing are placed in the same area of the brain (Maess & Koeleish, 2001).

According to Ayotte (2004); "music and language share the same auditory, perceptive, and cognitive mechanisms that impose a structure on auditory information received by the senses" (p.10). Music is a type of language package that connects the cultures, but there is an important point here, that pop songs are more effective in ESL environments, because, for example: first of all these songs are at 11-year-old native speakers' level and, as a result simple vocabularies will be more appropriate for ESL learners, the lyrics are repetitive within each song, and because the words mostly are short, as a result vocabulary learning would be facilitated. These songs are conversational and are sung at approximately slow rate with frequent pauses, and give more chance to understanding (Murpley, 1992).

Gorjian et.al (2012) also studied the role of the songs on vocabulary learning. In that study they aimed at finding the effect of songs on upper-level learners. The results of the research strongly support the successful role of songs on teaching vocabulary. Kahraman (2008) studied the effect of songs on listening comprehension, and found that regardless the origin of the singer, songs improved listening comprehension. Making use of songs, lower the cognitive load during learning. Cognitive load means: The total cognitive activity imposed by task/ problem on working memory. Gerven states, the base of cognitive load theory is that our working memory is limited with respect to the amount of information that it can store (Ayres, 2006). Cognitive load theory was originated in 1980. This theory results in framework for cognitive processes and instructional design (pas, 2003). The term cognitive load is used in psychology for illustrating the related load to the control of working memory.

According to Sweller (1988) "Cognitive load has been designed to provide guidelines intended to assist in the presentation of information in a manner that encourages learners' activities that optimize intellectual performance". In this theory aspects of information processing theory are employed for emphasizing the inherent of concurrent working memory load on learning during teaching and schemas are used as unit of analysis for designing the materials (Sweller, 1988). Principles of Cognitive Load Theory:

1. Working memory is extremely limited.
2. Long term memory is essentially unlimited.
3. The process of learning requires working memory to be actively engaged in the comprehension (and processing) of instructional material to encode to-be-learned information into long term memory.

4. If the resources of working memory are exceeded then learning will be ineffective (Cooper, 1998). As it is evident there should be an instruction tool that helps learners to learn successfully. The instructional tools should result in low cognitive load, and since songs result in relaxed and enjoyable environment and as a result facilitate learning are strongly supported by this theory.

RESEARCH QUESTIONS

Does using songs in class have any effect on Iranian young EFL learners' vocabulary performance?

Does using songs in class result in improving Iranian young EFL learners' vocabulary performance?

METHODOLOGY

Based on a pretest-posttest design, this study tried to investigate the role of using songs as instructional tool for teaching vocabulary items. This is quasi-experimental, that is without random assignment.

Group	Pretest	Treatment	Posttest
Intervention Group	O	X	O
Control Group	O		O

X = intervention is administered

O = measurement is taken

Context

This was conducted in one of the institutions in Tabriz. Iran. In this institute a course consists of 15 sessions which meet three times a week. The course books are based on interactions in different contexts. The course includes teaching new topics, vocabulary, function and grammar. Communication is one of the most important points of L2 teaching in this institute. Materials are used to activate new vocabulary learning and activate using in real situation.

Participants

A total number of 60 language learners all female with an age range of 11-14 participated in this research. The learners were from Turkish background. They were selected from 5 classes of the one of the institutes of Tabriz. The subjects have been assigned to classes based on their scores on their proficiency levels.

Instruments & Materials

Pre-test and post-test of which, have been conducted, included the words which learners were supposed to learn through relevant songs. There were 40 questions in each with reliability of .85.

Target words were selected from the source book of the institute which was *New Parade*. The researchers made use of songs of which include those target words. During practicing the new words light music was used in order to provide more positive and relaxed atmosphere.

Procedures

At the beginning of the program language proficiency test was administered to both groups, in order to assure their proficiency levels. After that one pre-test on vocabulary knowledge was conducted. Then the researchers started the program. The target words were from various songs of which were suitable for the level of the learners. The words are those that are included in the course book, and as a result were suitable for learners' levels. In experimental group learners listened to the words in songs, in each session after listening to songs, learners were asked to practice the new words for the next sessions through listening to the same songs. But in control group the same words were taught through traditional instruction. That is new words and their meanings in learners' first language were given in each session, and they were asked to memorize them. The students made use of dictionaries on their own way that is without any instruction. At the end of the study one post-test was conducted for measuring the effectiveness of the treatment. The collected data was analyzed by means of SPSS. Because there were two groups in this study the researchers used t-test for comparing the results, and measuring the effectiveness of the treatment

RESULTS AND DISCUSSION

Statistical Analysis

After gathering the data through pretest and posttest, it was analyzed by means of SPSS. Firstly the scores are shown in Excel sheets of which the answer of the first question is given by:

The first question was loaded one. In fact there is only one question to be scientifically answered in this study. Two groups were approximately at same level on vocabulary knowledge at the beginning of the program; it can be showed by comparing the means of them on pre-test. The mean of experimental group in pre-test was 12.9, and the mean of control group was 12.8. Before describing the tables, it is clearly shown in figures. In figure 1 it is there is a comparison of the pre-test and post-test of the control group. There is no growth in groups' scores on post-test.

Figure 1: Pre test control & Post test control

In figure 2 which is the comparison of the pre-test and post-test of the experimental group, there are apparent differences in scores of the two tests.

Figure 2: Pre test Experimental & Post test experimental

It can also be proved while comparing the means of both groups in post test. Mean of post-test for control group was 12.4, while for experimental group was 17.2.

The research hypothesis was:

Iranian EFL learners' vocabulary learning will be improved through using Songs.

The null hypothesis was:

There would no significant differences on the effect of Songs on vocabulary learning.

The statistical task is to reject the null hypothesis, and to show that there is a difference on the effect of songs. Table 1 is t-test of the control group:

Table 1: (t-test control)

	Variable 1	Variable 2
Mean	12.80600607	12.4
Variance	5.981609195	4.524137931
Observations	30	30
Pooled Variance	5.252873563	
Hypothesized Mean Difference	0	
df	58	
t Stat	0.78859485	
P(T<=t) one-tail	0.216780196	
t Critical one-tail	1.671552763	
P(T<=t) two-tail	0.433560392	
t Critical two-tail	2.001717468	

As it is evident from the table 1 P(T<t) two-tail is greater than 0.01, as a result there is no significant difference in results, so traditional instruction was not successful in teaching vocabulary. Table 2 shows the results of the experimental group. P(T<t) two-tail is smaller than

0.01, it proves that there is significant difference on the effect of songs, consequently the null hypothesis has been rejected. The researcher hypothesis is accepted.

Table 2: (t-test experimental)

	Variable 1	Variable 2
Mean	12.9	17.2
Variance	5.334482759	2.993103448

t Critical two-tail	2.001717468	

Through using an experimental approach, this study examined the effects of applying songs on Iranian young EFL learners 'vocabulary learning. There are conflicting results gained from studies on the effects of songs on ESL vocabulary learning. But it is worth to say that in EFL classrooms songs yield in positive effectiveness. The results of this study support the study conducted by Schunk. He has found that music benefits vocabulary acquisition. Lozanov also applied music and songs as a learning tool and emphasizes the relaxed state of mine and increased retention as a result of inherent nature of songs and music. He claimed that atmosphere created by music enhanced the ability of the students to remember vocabulary words and shortened the study period of the foreign language. Lowe also studied the impact of songs second grade French immersion students in New Brunswick.

CONCLUSION

In this study the experimental group outperformed in posttest. Songs result in very relaxed atmosphere for learners. Stress stops learning, when it is eliminated learning takes place in effective manner. Songs lower the cognitive load on learners' brains and as a result, facilitate learning. Consequently the positive role of applying songs as instructional tools has been supported.

Limitations of the study

It is worth to say that just like most of the studies; this study also suffers from some limitations. It is believed that maybe the main limitation was the effect of cross cultural differences on the selection of song types. The second one is that this study was conducted for female learners, and also the number of participants also is another limitation that limits the generalizability of the research. The researcher also believes that delayed post-tests are to be conducted in order to measure the long-term effects of the songs on vocabulary learning.

ABSTRACT

The present study was an attempt to investigate the relationship between English Language Teachers' Teaching Styles and Autonomy. To this end, a group of 200 experienced English language teachers at various language schools in Tehran were given two questionnaires namely Grasha's Teaching Style Inventory (1994); and Teaching Autonomy Scale (Pearson & Moomaw, 2005) among which 162 instruments were returned. After being verified, 129 questionnaires were selected. Since the teaching styles are categorized into low, moderate, and high levels, each teaching style - Expert, Formal Authority, Personal Model, Delegator and Facilitator, is considered as a nominal variable. Moreover, as the autonomy is on an interval scale, the choice of statistic to measure the relationship between one nominal variable and one interval variable is eta. However, since the frequencies of some of the styles' levels were very low, it was decided to choose non-parametric Kruskal Wallis and Mann Whitney tests to compare the levels of each style in terms of autonomy scores. As a result of data analysis, a significant relationship was found between teachers' Expert, Personal Model, and Delegator styles and curriculum autonomy. Furthermore, the findings of this study could be utilized in the field of teacher education, particularly, by language school directors and owners.

KEYWORDS: Teachers' teaching styles, teachers' curriculum and general autonomy

INTRODUCTION

With the spread of globalization, language learning and teaching, as many other skills, are gaining more and more prominence every day. This phenomenon, language learning and teaching, has two sides: teacher and learner who influence the process in different ways. Menken (2000) believes that half of all teachers may anticipate educating an English language learner during their career. Along the same lines, according to Vieira and Gaspar (2013), with regard to impact on education effectiveness, teachers arise as a significant factor, accounting for about 30% of the variance on pupils' achievement.

Students have different learning styles and familiarity with learning style differences will, to a large extent, help instructors; so teachers apply different teaching styles that suit their setting and their students' needs. To overcome mismatches between learning styles of learners and the teaching styles of the instructors, teachers should tailor their approach to meet students' learning needs meaning that they can combine teaching styles for different types of content and diversity of student needs. According to Purkey and Novak (1984, p. 13), "Good teaching is the process of inviting students to see themselves as able, valuable, and self-directing and of encouraging them to act in accordance with these self-perceptions".

To this end, institutions initially need to prepare the ground through empowering their teachers. Multiple intellectuals involved in the field of educational reform assert that empowering teachers is where we can commence solving the schools' problems (Melenyzer, 1990; Short, 1994). . Pearson and Moomaw (2006) stated that:

if teachers are to be empowered and regarded as professionals, then like other professionals, they must have the freedom to prescribe the best treatment for their students as doctors or lawyers do for their clients. This freedom is *teacher autonomy*. (p.44).

In line with that, according to Masouleh and Jooneghani (2011), the term autonomy has sparked considerable controversy, inasmuch as linguists and educationalists have failed to reach a consensus as to what autonomy really is. In fact, autonomy in language learning is a desirable goal for philosophical, pedagogical, and practical reasons. Street (1988) believes teacher autonomy is "the independence teachers maintain in exercising discretion within their classrooms to make instructional decisions". (p. 4).

The purpose of the present study was to inspect if there was any significant relationship between teachers' teaching styles and their autonomy – curriculum and general.

REVIEW OF THE RELATED LITERATURE

Teachers' Teaching Styles

Different educationists have different perspectives on teaching and learning a language through which the teaching styles that a teacher chooses play an important part. In accordance with Richards and Rogers (1986), the teacher's role is to facilitate communication among the learners during the set activities, to provide learners with insight on how to become a successful language learner by sharing his/her own personal experiences of language learning and to organize resources.

Grasha (1996) defines the teaching styles as the pattern of belief, knowledge, performance and behaviour of teachers when they are teaching. He divided the teaching styles into five dimensions which are the expert style, formal authority style, personal model style, delegator style and facilitator style. Peacock (2001), on the other hand asserted that the teaching style is the manner a person teaches by nature, habitual, inclination or even a custom that s/he uses to convey information and skills in the classroom.

Along with the same line, Stein and Miller (1980) grouped teaching styles into two types: expressive teaching styles (the emotional relationship created by the teacher to the student or the class as a whole) and instrumental teaching style (the way teachers carry out the task to assist students, planning the lesson, setting up the classroom standard and ensure that students achieve the standards set).

Autonomy

In the last few decades, the diversity of ideas in the field of teaching and learning has been obvious and could have been the reason to many of the current developments in these fields. One of the subjects yet to be debated has been autonomy, inter alia, teachers' autonomy. Hill (1991) asserts that "little progress can be made in debates about autonomy until these different ideas are sorted" (p. 44). In the same line, Barfield et al (2002) stated that although researchers have clearly defined many aspects of learner autonomy, teacher autonomy requires a more focused and contextually sensitive definition. Furthermore, it could be said that autonomy is not a solid concept that has only one face but a complex one that is multi-faces; Hill and Holmbeck (1986) declared that 2 conceptualizations of autonomy "detachment from parents" and "freedom from social (largely parental) influence" have dominated recent research. Little (1991) held that autonomy is not a synonym for self-instruction; it means, autonomy is not limited to learning without a teacher; it does not entail an abdication of responsibility on the part of the teacher; autonomy is not another teaching method; and it is not a single, easily described behavior.

Arguing that 'autonomy, in the perspective of complexity, encompasses properties and conditions for complex emergence, Paiva and Braga (2008) contended it is inextricably linked to its environment'. (cited in Paiva, 2011, p.63) Likewise, Masouleh & Jooneghani (2012) claimed that its dynamic structure governs the nature of its interactions with the environment in which it is nested. Reviewing the literature on language teaching and learning, we face the fact that there is multiple basic ideas of autonomy. Some research, such as Smith (2000), identified four aspects of teacher autonomy: a capacity for self-directed teaching, freedom from control over teaching, a capacity for self-directed teacher learning and a responsibility to take actions and bear consequences.

RESEARCH QUESTION

Is there any significant relationship between Iranian EFL teachers' teaching styles and their autonomy.

METHODOLOGY

Participants

The participants of this research were comprised of 129 teachers in the 22-45 age range who were yet teaching English at different language institutes of Tehran, Iran, inter alia, Asre Zaban Language Academy. The selection was based on willingness to participate and teachers were selected non-randomly based on convenient non-random sampling. A supervisor from each

institute was also involved in the study.

Instrumentation

Grasha Teaching Style Inventory Questionnaire

A 40-item what named Grasha's Teaching Style Inventory:Version 3.0 (1994), was used in this study. Teachers were asked to complete the scale about themselves and their teaching preferences. The questionnaire itself starts with an unfinished sentence: "When teaching my class, I would most be likely to:". Each item is scored using a 5-point Likert scale from 1 (strongly disagree) to 5 (strongly agree). Responses are scored for each teaching method on this 5-point scale. The five teaching styles (Grasha, 1994) considered in this questionnaire are Expert (Qs: 1,6,11,16,21,26,31,36), Formal Authority(Qs: 2,7,12,17,22,27,32,37), Personal Model (Qs: 3,8,13,18,23,28,33,38), Delegator(Qs: 5,10,15,20,25,30,35,40) and Facilitator (4,9,14,19,24,29,34,39).

Teacher Autonomy Survey (TAS)

Pearson and Moomaw's Teacher Autonomy Survey (2005), is comprised of 18 questions originally designed so as to elicit the extent to which teachers perceive themselves autonomous in the following areas: (1) instructional planning and sequencing, (2) personal on-the-job decision making, (3) selection of activities and materials, and (4) classroom standards of conduct. The options vary from "Definitely True" to "Definitely False" and "More or Less True" and "More or Less False" comes in between. Items 1, 2, 3, 4, 7, 9,10,11, 13, 15, 16, 17 were utilized to form the general autonomy scale. On the other hand, the curriculum autonomy scale was constructed by adding items 5, 6, 8, 12, 14 and 18. Moreover, items 1, 2, 3, 5, 7, 8, 10, 12, 14, 16, 18 were recoded so that the high score denoted increased autonomy.

Procedure

In a descriptive study, the procedures should be described as accurately and completely as possible so that the replication of research by other researchers would become possible (Best & Kahn, 2006).At the outset of this study, in order to collect data, researcher distributed two questionnaires namely Grasha's Teaching Style Inventory: Version 3.0 (1994), and Teaching Autonomy Scale (Pearson & Moomaw, 2005) among 200 teachers in various English language schools inter alia Asre-Zaban Language Academy. The teachers were requested to complete the survey during non-instructional times at their convenience, enclose and return them to the researcher within 1 week of receipt. The participants responded anonymously to the questionnaires. Out of 200 questionnaires, 162 instruments were returned. After being verified, 129 questionnaires, which were thoroughly done, were selected. The responses of all participants were carefully examined and scored. Afterwards, the correlation between the variables underwent statistical analyses..

RESULTS AND DISCUSSION

Testing the Null Hypothesis:

There is no significant relationship between Iranian EFL teachers' teaching styles and their autonomy.

In order to test the above null hypothesis, the frequencies of five aforementioned teaching styles in the sample were calculated, which are provided in tables 1 to 5.

Table 1: Expert Frequency Statistics

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Low	14	10.9	10.9	10.9
	Moderate	113	87.6	87.6	98.4
	High	2	1.6	1.6	100.0
	Total	129	100.0	100.0	

Table 2: Formal Authority Frequency Statistics

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Low	96	74.4	74.4	74.4
	Moderate	33	25.6	25.6	100.0
	Total	129	100.0	100.0	

Table 3: Personal Model Frequency Statistics

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Low	104	80.6	80.6	80.6
	Moderate	25	19.4	19.4	100.0
	Total	129	100.0	100.0	

Table 4: Facilitator Frequency Statistics

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Low	48	37.2	37.2	37.2
	Moderate	81	62.8	62.8	100.0
	Total	129	100.0	100.0	

Table 5: Delegator Frequency Statistics

		Frequency	Percent	Valid Percent	Cumulative Percent
Valid	Low	9	7.0	7.0	7.0
	Moderate	120	93.0	93.0	100.0
	Total	129	100.0	100.0	

Tables 1 to 5 show that 113, 33, 25, 81, 120 participants in Expert, Formal Authority, Personal Model, Facilitator and Delegator teaching styles, respectively, had the moderate level of the styles. Moreover, Personal Model had the highest number of low category with 104 by contrast to delegator style with 9. In addition, two teachers had a high level of Expert teaching style which

was, in effect, the only style with a high level. Tables 6 to 10 also present the descriptive statistics on curriculum and general autonomy scores alone and in terms of different levels of each teaching style separately.

Table 6: Curriculum and General Autonomy Descriptives

		Statistic	Std. Error
General Autonomy	Mean	35.8605	.32382
	Variance	13.527	
	Std. Deviation	3.67794	
	Skewness	.249	.213
	Kurtosis	-.645	.423
	Mean	16.8915	.26304
Curriculum Autonomy	Variance	8.926	
	Std. Deviation	2.98758	
	Skewness	-.356	.213
	Kurtosis	.545	.423

As table 6 demonstrates, general autonomy with 35.8605 owns a higher mean in comparison to curriculum autonomy with 16.8915. In addition, skewness for general autonomy is .249 which is quite different from that of curriculum autonomy (-.356).

Table 7: Curriculum and General Autonomy Descriptives for Different Levels of Expert Teaching Style

	Expert		Statistic	Std. Error
General Autonomy	Low	Mean	35.4286	1.26541
		Variance	22.418	
		Std. Deviation	4.73472	
		Skewness	.580	.597
		Kurtosis	-1.563	1.154
	Moderate	Mean	35.8584	.33469
		Variance	12.658	
		Std. Deviation	3.55786	
		Skewness	.242	.227
		Kurtosis	-.404	.451
Curriculum Autonomy	Low	Mean	18.0714	.85462
		Variance	10.225	
		Std. Deviation	3.19770	
		Skewness	-.322	.597
		Kurtosis	-1.249	1.154
	Moderate	Mean	16.9027	.25639
		Variance	7.428	
		Std. Deviation	2.72542	
		Skewness	-.087	.227
		Kurtosis	.315	.451

a. General Autonomy is constant when Expert = High. It has been omitted.

b. Curriculum Autonomy is constant when Expert = High. It has been omitted.

Table 8: Autonomy Descriptives for Different Levels of Formal Authority Teaching Style

	Formal authority	Statistic	Std. Error
General Autonomy	Mean	35.5104	.36274
	Variance	12.631	
	Low Std. Deviation	3.55408

	Variance	10.849	
	Low Std. Deviation	3.29383	
	Skewness	-.296	.343
	Kurtosis	-.230	.674
	Mean	16.8025	.31201
	Variance	7.885	
	Moderate Std. Deviation	2.80811	
	Skewness	-.452	.267
	Kurtosis	1.354	.529

Table 11: Curriculum and General Autonomy Descriptives for Different Levels of Delegator Teaching Style

	Delegator	Statistic	Std. Error
General Autonomy	Mean	35.2222	1.32054
	Variance	15.694	
	Low Std. Deviation	3.96162	
	Skewness	1.370	.717
	Kurtosis	.311	1.400
	Mean	35.9083	.33494
	Variance	13.462	
	Moderate Std. Deviation	3.66908	
	Skewness	.180	.221
	Kurtosis	-.611	.438
Curriculum Autonomy	Mean	20.2222	.49379
	Variance	2.194	
	Low Std. Deviation	1.48137	
	Skewness	-.485	.717
	Kurtosis	-.706	1.400
	Mean	16.6417	.26695
	Variance	8.551	
	Moderate Std. Deviation	2.92424	
	Skewness	-.318	.221
	Kurtosis	.750	.438

As can be seen from tables 7 to 11, Facilitator with 17.0417 has the lowest mean by contrast, Personal Model teaching style possesses the highest mean with 35.6827 regarding the low level. On the other side, in terms of the moderate level, Personal Model teaching style with 15.8800 has the lowest mean while Formal Authority teaching style with 36.8788 owns the highest.

Since the teaching styles are categorized into low, moderate, and high levels, each teaching style is considered as a nominal variable. Moreover, as the autonomy is also on an interval scale, the choice of statistic to measure the relationship between one nominal variable and one interval variable is eta. However, since the frequencies of some of the styles' levels are very low, it was decided to choose non-parametric Kruskal Wallis and Mann Whitney tests to compare the levels of each style in terms of autonomy scores. The reason for choosing non-parametric tests was that the test of normality results in tables 12 to 16 indicated non-normality of the data ($p < .05$).

Table 12: Tests of Normality Regarding Expert

	Expert	Kolmogorov-Smirnov ^a			Shapiro-Wilk		
		Statistic	df	Sig.	Statistic	df	Sig.
General Autonomy	Low	.267	14	.008	.782	14	.003
	Moderate	.109	113	.002	.969	113	.010
Curriculum Autonomy	Low	.177	14	.200*	.908	14	.146
	Moderate	.131	113	.000	.967	113	.007

This is a lower bound of the true significance.

a. Lilliefors Significance Correction

b. General Autonomy is constant when Expert = High. It has been omitted.

c. Curriculum Autonomy is constant when Expert = High. It has been omitted.

Tables 17 to 21 present the results on the comparison of general Autonomy and curriculum Autonomy scores across the categories of teaching styles. Evidently, the categories of Expert, Personal Model, and Delegator styles in terms of curriculum autonomy are significantly different from one another. In other words, there is a significant relationship between teachers' Expert, Personal Model, and Delegator styles and curriculum autonomy. A closer look at the descriptive statistics of these teaching styles reveals that the low category of the above teaching styles is of higher curriculum autonomy. This indicates that there is a negative relationship between teachers' Expert, Personal Model, and Delegator styles and curriculum autonomy while in terms of general autonomy, the hypothesis was retained.

Table 17: Comparing Autonomy across Categories of Expert

Hypothesis Test Summary				
	Null Hypothesis	Test	Sig.	Decision
1	The distribution of General Autonomy is the same across categories of Expert.	Independent-Samples Kruskal-Wallis Test	.300	Retain the null hypothesis.
2	The distribution of Curriculum Autonomy is the same across categories of Expert.	Independent-Samples Kruskal-Wallis Test	.022	Reject the null hypothesis.

Asymptotic significances are displayed. The significance level is .05.

Table 18: Comparing Autonomy across Categories of Formal Authority

Hypothesis Test Summary				
	Null Hypothesis	Test	Sig.	Decision
1	The distribution of General Autonomy is the same across categories of Formal authority.	Independent-Samples Mann-Whitney U Test	.116	Retain the null hypothesis.
2	The distribution of Curriculum Autonomy is the same across categories of Formal authority.	Independent-Samples Mann-Whitney U Test	.187	Retain the null hypothesis.

Asymptotic significances are displayed. The significance level is .05.

Table 19: Comparing Autonomy across Categories of Personal Model

Hypothesis Test Summary				
	Null Hypothesis	Test	Sig.	Decision
1	The distribution of General Autonomy is the same across categories of Personal model.	Independent-Samples Mann-Whitney U Test	.506	Retain the null hypothesis.
2	The distribution of Curriculum Autonomy is the same across categories of Personal model.	Independent-Samples Mann-Whitney U Test	.035	Reject the null hypothesis.

Asymptotic significances are displayed. The significance level is .05.

Table 20: Comparing Autonomy across Categories of Facilitator

Hypothesis Test Summary				
	Null Hypothesis	Test	Sig.	Decision
1	The distribution of General Autonomy is the same across categories of Facilitator.	Independent-Samples Mann-Whitney U Test	.064	Retain the null hypothesis.

Asymptotic significances are displayed. The significance level is .05.

Table 21: Comparing Autonomy across Categories of Delegator

Hypothesis Test Summary				
	Null Hypothesis	Test	Sig.	Decision
1	The distribution of General Autonomy is the same across categories of Delegator.	Independent-Samples Mann-Whitney U Test	.432	Retain the null hypothesis.
2	The distribution of Curriculum Autonomy is the same across categories of Delegator.	Independent-Samples Mann-Whitney U Test	.000	Reject the null hypothesis.

Asymptotic significances are displayed. The significance level is .05.

Discussion

In its broadest term, this study was an attempt to broaden the scope of research on EFL teacher education. Among multiple variables related to English language teachers, researcher chose to remain focused to inspect whether or not there was any significant relationship between teachers' teaching styles and their autonomy (general and curriculum). To this end, after examining 129 questionnaires which were thoroughly filled out, data analysis was run. After this stage, the researcher was able to reject the null hypothesis; that is to say, the categories of Expert, Personal Model, and Delegator styles in terms of curriculum autonomy are significantly different from one another. In other words, there is a significant relationship between teachers' Expert, Personal Model, and Delegator styles and curriculum autonomy. A closer look at the descriptive statistics of these teaching styles reveals that the low category of the above teaching styles is of higher curriculum autonomy. This indicates that there is a negative relationship between teachers' Expert, Personal Model, and Delegator styles and curriculum autonomy while in terms of general autonomy, the hypothesis was retained.

The findings of this study regarding teachers' autonomy are to some extent in line with the results of the study done by L Carolyn Pearson and William Moomaw (2005) in which teachers' autonomy was found correlated with on-the-job stress, professionalism and empowerment; in that as the curriculum autonomy increased, on-the-job stress decreased, but only little correlation was found between job satisfaction and curriculum autonomy; the study, as well, released that as general autonomy increased, so did empowerment and professionalism, but no relationship was detected between autonomy and teaching level (elementary, middle and high school).

Moreover, in terms of the second variable of this study, i.e, teachers' teaching styles, pursuant to Hossein Nowrouzi (2012), it was proved that teachers' teaching styles and self efficacy were significantly related; on the one hand, high self-efficacy was found to be related to particular teaching styles including Delegator and Personal Model, on the other hand, low self-efficacy was correlated to Expert and Formal Authority teaching styles.

CONCLUSION

The present study was an effort to contribute towards the betterment of the field of teacher education. The findings of this survey revealed that the categories of Expert, Personal Model, and Delegator styles in terms of curriculum autonomy are significantly different from one another. Simply put, there is a significant relationship between teachers' Expert, Personal Model, and Delegator styles and curriculum autonomy. A closer look at the descriptive statistics of these teaching styles proves that the low category of the above teaching styles is of higher curriculum autonomy.

The current study sustained the following limitations which are expected to be removed in the future studies.

First, the researcher based his selection of the participants on available sampling. The replication of the study is recommended in case procedures that allow a higher degree of randomization and ultimately more generalizability are employed.

Second, on account of the corresponding nationality of all the participants – Iranian — the results cannot be generalized to teachers of other countries.

Pedagogical implications

This study was particularly performed so as to lay the major emphasis on teachers and their main attributes, the dearth of which has always been distinct throughout the academic research. By considering the main variables of this study, English language instruction could be facilitated and done more fruitfully. Teachers, by selecting an appropriate teaching style can make a great contribution towards the amelioration of students' learning.

Pursuant to ETUCE (2008), it is the teacher who knows the classroom reality best and is able to make the best and most sound decisions with respect to the pupils. Accordingly, English language owners and directors ought to allow teachers more autonomy which may consequently enhance the quality of instruction.

The Authors:

Dr Abdollah Baradaran is the Assistant Professor of TEFL and the chairman of the foreign languages faculty at Central Tehran Branch, Islamic Azad University, Tehran, Iran. As for his professional background, he has taught many different courses in teaching English language to graduate students. He has published several papers in national and international journals and presented in numerous seminars.

Ehsan Hosseinzadeh (Corresponding Author) graduated with Masters degree in TEFL from Islamic Azad University, Central Tehran Branch, Tehran, Iran. Regarding his professional background, in addition to being the entrepreneur and principal manager of an English language centre in Tehran, Iran, he has designed, developed and taught wide-ranging courses to a multitude of candidates for several years. His main research interests have been instructional management, cooperative supervision, Neuro-Linguistic Programming, teacher training, teachers' various teaching styles and their autonomy.

INCIDENTAL L2 VOCABULARY LEARNING AND RETENTION; TYPES OF GLOSSING: MARGINAL GLOSSES VS. ENDNOTES

Mohammad Hossein Yousefi (mhh.yousefi@gmail.com)

Reza Biria (r_biria@yahoo.com)

Department of English, Khorasgan (Isfahan) branch, Islamic Azad University, Isfahan, Iran

ABSTRACT

A surge of research interest has been targeted as to find the most effective types of glossing in second language (L2) incidental reading and L2 vocabulary learning. Capitalizing on Involvement Load Hypothesis (Laufer & Hulstijn, 2001), the present study aims to compare the efficacy of two different types of glosses; marginal vs. endnotes in L2 vocabulary learning and retention. For the purpose of the data collection, two intact groups at Azad University of Bonab, Iran were randomly assigned to two groups. These two groups had more or less similar English proficiency knowledge. The participants (total=63) have been studying English at school and university for six years and all of them were majoring in accounting, genetics, electrical engineering, and microbiology. Students in first class were provided with marginal glosses and the latter group received glosses as endnotes. A pre-test was conducted to ensure that the target words were unfamiliar to the students. Both groups performed the given reading tasks under the similar conditions and allotted time. Finally, immediate posttest, embedding the same target words in it, was conducted. Two weeks a delayed posttest was conducted to investigate the retention of L2 vocabulary items. The results highlighted the beneficial effects for endnote glossing in both immediate and delayed posttest. It is argued that students in endnote group outperformed those in marginal gloss group (both in immediate and delayed posttest) highlight the fact that participants in endnote group involved in a wide range of mental tasks, e.g, making inferences, selective attention, establishing links between the meaning of the target words in the text and examples provided at the end of the reading comprehension task.

KEYWORDS: L2 vocabulary acquisition; L2 vocabulary retention; glossing

INTRODUCTION

There is little doubt that lexical development is an essential step in second language acquisition (Tight, 2010). Moreover, learning vocabulary is an essential part of mastering a second language, and the first or initial step in the process of acquiring vocabulary is to establish a form-meaning link (Schmitt, 2008). A number of studies (e.g., Schmidt, 2001; Watanabe, 1997) suggest that attention is crucial to learning. In all gloss conditions, the gloss drew attention to the word and encouraged learners to view the word as something to be learned and not just as part of the text (Watanabe, 1997). Gloss in L2 reading refers to providing a short definition or explanation of

important words in a text (Bowles, 2004; Nation, 2001). Traditionally, a 'gloss' refers to short definitions or explanations of the meanings of words at the bottom or sides of a text in order to support learners' reading comprehension (Pak, 1986; Lomicka, 1998). Roby (1999) pointed out that "glosses are many kinds of attempts to supply what is perceived to be deficient in a reader's procedural or declarative knowledge." (p, 96). As an aid to learning new L2 vocabulary items and reading comprehension, 'glossing' has been the focus of much research interest in the field. Investigating the efficacy of different glossing types can have pedagogical implications for SLA theory and language teachers. The present study is an attempt to compare the effectiveness of two different glossing types on L2 vocabulary learning and retention.

LITERATURE REVIEW

It has been argued that glossing help vocabulary learning and assist reading comprehension (Ko, 2012). A number of studies have provided evidence that glosses are effective in helping learners learn new lexical items in a second language (Bowles, 2004; Cheng & Good, 2009).

Zhang (2007) showed that in terms of vocabulary gains, the provision of marginal glosses was the more beneficial than the availability of dictionary and non-dictionary use. By providing additional information such as definitions or synonyms, glossing helps students cope with insufficient contextual cues in learning new words while reading (Ko, 2012). Hulstijn, Hollander, and Greidanus (1996) examined Incidental vocabulary learning using marginal glosses and dictionaries. They also tested the effects of word frequency, either once or three times in the text. Researchers (Hulstijn, 1992; Hulstijn et al., 1996; Watanabe, 1997) have also found that glosses facilitate second-language learners' vocabulary growth. Research has further indicated that language learners with access to marginal vocabulary glosses demonstrate greater vocabulary growth than those without glosses (Hulstijn, 1992; Hulstijn, et al., 1996; Watanabe, 1997). Additionally, Huang and Lin (2014) believe that glossing can increase the possibility of learning correct word meanings in context, but leaving words unglossed for learners to infer or retrieve their word meanings may increase the involvement load and mental effort, thus contributing to better retention (p.128).

Nation (2001) enumerated four advantages for glossing: First, learners can read difficult texts without simplification or adaptation. Second, providing accurate meanings prevents learners from guessing incorrectly, which should facilitate vocabulary learning and comprehension. Third, glossing does not seriously interrupt the reading process and it is less time-consuming than dictionary use. Fourth, learners may focus on glossed words, which may encourage learning. For example, the results of (Ko, 2012) indicated that glossing had a positive effect on L2 vocabulary learning.

More recently, (Ko, 2012) conducted a study to investigate the effect of different types of glosses as well as no- gloss and glossed texts on L2 vocabulary learning. The participants were randomly assigned to three groups: no gloss, L1 gloss, and L2 gloss. The participants were asked to read a text and after reading the materials, an unexpected vocabulary test was administered and a delayed vocabulary test was administered four weeks later. The findings showed that, on the

immediate vocabulary test, there was a significant difference between no-gloss and glossed conditions. However, participants showed no significant differences between texts with L1 glosses and L2 glosses.

Turk and Ercetin (2014) investigated the effects of interactive versus simultaneous display of visual and verbal multimedia information on incidental vocabulary learning and reading comprehension of learners of English with lower proficiency levels. The study involved two conditions: interactive display condition and the simultaneous display condition. In the former condition, learners were permitted to choose the type of multimedia information while the simultaneous display condition presented the verbal (definitions) and visual (associated pictures) information in a single gloss. The results of (Turk & Ercetin, 2014) indicated that the participants utilized glosses less frequently when they were given the control over access to the type of multimedia information. Furthermore, simultaneous display of multimedia information led to better performance on reading and vocabulary tests.

Moreover, Nation (2001) is of the belief that unsimplified and unadapted texts can be used with L2 learners if glosses are incorporated. He adds that glossing leads to minimal interruption of the reading process by providing accurate meanings for words that might not be guessed correctly by learners. The results of (Ko, 2012) demonstrated that there would be a significant difference between gloss and no-gloss groups with respect to gaining word meaning. Huang's meta-analysis on the effects of glosses on L2 incidental vocabulary learning (2010) revealed that language learners who were provided with textual glosses gained more vocabulary than those who had no access to glosses.

According to Nation (2001), textual glosses help language learners consolidate knowledge of unknown words. Hulstijn (1992) proposed the use of multiple-choice glosses, which combine the advantages of inference with single glosses because they reduce the challenges imposed by insufficient context and the possibility of inaccurate inferences.

In addition, Hulstijn (1992) found that language learners who have to infer the meaning of unknown words in text by themselves (high mental effort) are more likely to remember the form and meaning of an unfamiliar word compared to those who are given the meaning of unknown words. In another study, Yanguas (2009) examined the effect of multimedia glosses on L2 incidental vocabulary learning. Two weeks prior to the research, a vocabulary pre-test administered to the participants. They were randomly assigned to one of four groups: control, textual, pictorial, and textual+ pictorial glosses. Results indicated that all groups exposed to glosses outperformed the control group in the immediate vocabulary recognition posttest. Furthermore, participants who were provided with textual +pictorial glosses performed the best, followed by the pictorial glosses, textual glosses, and control groups.

In an experiment, Yoshii (2006) found a significant difference between the L1 and L2 textual gloss groups and between the picture and no-picture groups. Among these four groups, the L1-plus-picture group performed the best. However, no significant difference was found on the

recognition vocabulary test between the L1 and L2 textual groups and between the picture and no-picture groups.

RESEARCH QUESTIONS

This study addressed the following research questions :

1. Do glossing provided through marginal ones and glossing provided as endnotes affect L2 vocabulary learning differently?
2. Do glossing provided through marginal ones and glossing provided as endnotes affect L2 vocabulary retention differently

METHODOLOGY

Participants

The participants of the present study were 74 intermediate learners studying (EFL). They were 73 learners (male = 41, female= 32). But 9 of them were eliminated from the statistical analyses. Because 4 of them had the knowledge of some target words and five of them did not take delayed posttest. Two intact groups (group one = 31, group two = 32) at Azad University of Bonab, Iran were randomly assigned to two groups. These two groups had more or less similar English proficiency knowledge. The participants (total=63) have been studying English at school and university for six years and all of them were majoring in accounting, genetics, electrical engineering, and microbiology. The participants age ranged between 19 to 39 (mean=27).

Target words and materials

A reading text, a passage on philosophy, was adapted to the participants' level. Effort was made to ensure that participants were not familiar with the topic and therefore not have prior knowledge about it. We chose 12 target words and all of these lexical were bolded and appeared once in the text. Target words included: **inquiry, privileged, legitimacy, revelation, speculative, epistemology, rational, extraction, insight, aesthetics, tacit, and obscurity**. The text was adopted into two formats; one had marginal glosses and the latter had glosses appeared at the end of the reading task (as endnotes, as well as other information to trigger more mental processing). The reading task had 800 words and its reading difficulty index was determined through pilot study. Moreover, pilot study was conducted to determine the allotted time for task performance and ensure that the target words were unfamiliar to the participants. In this study, learning L2 vocabulary was operationalized as the ability to recognize vocabulary (receptive knowledge); because participants would be learning vocabulary as a result of reading.

Procedures

A total number of 63 students participated in this study. Prior to the main experiment, a cloze test was given to the students to check the equivalence of the two groups. The results of the independent T-test revealed that there were no significant differences between the two groups. Students in first class were provided with glosses in the form of marginal glosses and the latter group received glosses as endnotes. The participants in the marginal group received only English definitions of the target words on the margins of each page. Whereas, the participants in the

endnote group were provided with the definitions of the target words as well as examples to clarify their style, formal features, collocations, and other parts of speech of the target words in an attempt to trigger deeper processing level compared with the first group. A pre-test (recognition multiple-choice test) was conducted to ensure that the target words were unfamiliar to the students. Both groups performed the given reading tasks under the similar conditions and allotted time (40 minutes). The participants read the text and returned their materials. After finishing the reading comprehension test, they were given vocabulary test (11 minutes to take the L2 vocabulary test). Immediate posttest also had the format of recognition multiple-choice test. Two weeks later, the participants were given an unexpected delayed vocabulary posttest so that to investigate their retention of L2 vocabulary items. All tests were developed by the first researcher and through pilot study on a group of five students at the same level of L2 proficiency; some changes were made in their items and sequences. Both immediate and delayed posttest had the similar format and included 12 items. Following Ko (2012), every correct response on the part of the participants assigned 2 score. Hence the maximum score every participant could gain was 24.

RESULTS AND DISCUSSION

Data were analyzed using SPSS version 18 and assuming the independence of the two groups, the independent samples t-test was used. Table1 provides the standard deviations, means, and for both marginal glosses and endnote groups (immediate and delayed posttest). The mean of marginal gloss group in immediate posttest was 9.29 and the mean of endnote group was 15.40. The mean of marginal gloss group in delayed posttest was 6.70, while the mean of endnote group was 11.31.

Table 1: Descriptive Statistics for Immediate and Delayed Posttest

group1		N	Mean	Std. Deviation
delayed	marginal	31	6.7097	2.06871
	endnote	32	11.3125	3.33542
immediate	Marginal	31	9.2903	2.43849
	endnote	32	15.4063	2.94968

According to the Table 2 t-observed of immediate posttest is 8.94 at ($P < .05$) and greater than t critical (1.67). Happily, the null hypothesis (H_0) stating that "there is no significant difference between the two groups in L2 vocabulary learning" is rejected. And the alternative hypothesis (H_1) stating that "participants receiving glosses at the end of the reading comprehension text with extra information about the target words outperformed those students that received the definitions of the target words as marginal glosses.

As far as delayed posttest is concerned, t observed for delayed posttest is 6.55 at ($P < .05$) and greater than t critical (1.67). The results verified the fact that retention rate of L2 vocabulary items is significantly different.

Table 2: Independent Samples T-Test for Comparing Uptake in Simple vs. Complex Task Group

	t-test for Equality of Means		Sig. (2-tailed)
	t	df	
Delayed Posttest	-6.557	61	.000
Immediate Posttest	-8.954	61	.000

The findings of this study are in line with the predictions of Involvement Load Hypothesis (Laufer & Hulstijn, 2001) in that learning new vocabulary items is contingent on the degree of processing them. The results also gave support to (Ko, 2012; Roby, 1999) in that “glosses are many kinds of attempts to supply what is perceived to be deficient in a reader’s procedural or declarative knowledge.

It has been argued that glossing help vocabulary learning and assist reading comprehension (Ko, 2012). However, a number of studies have found beneficial effects for marginal glosses (Hulstijn, Hollander, Greidanus, 1996; Zhang, 2007). Some of them examined Incidental vocabulary learning using marginal glosses and dictionaries. The results of the study also support Zhang (2007) that in terms of vocabulary gains, the provision of marginal glosses was the more beneficial than the availability of dictionary and non-dictionary use.

The results of the present study are in line with the (Hulstijn, 1992; Hulstijn et al., 1996; Watanabe, 1997) in that glosses facilitate second-language learners’ vocabulary growth. A number of studies, however, highlighted the role of glosses in L2 vocabulary learning (Hulstijn, 1992; Hulstijn, et al., 1996; Watanabe, 1997). Those language learners with access to marginal vocabulary glosses demonstrate greater vocabulary growth than those without glosses. The present study, nonetheless, did not include control group to account for the differences between gloss and non-gloss groups.

The results of the present study also sit well with the argument of Huang and Lin (2014) in that leaving words unglossed for learners to infer or retrieve their word meanings may increase the involvement load and mental effort, thus contributing to better retention. We hypothesize that the more mental effort is consumed learning L2 vocabulary items, the longer and more stable would be the learning and retention of the target words. We also believe that providing L2 learners with different types of glosses should not be interpreted as not allowing them to involve in the task of L2 vocabulary learning and process incoming information. Rather, providing language learners with different types of glosses can be assumed as aiding reading task and proceed in it.

The fact that students in endnote group outperformed those in marginal gloss group (both in immediate and delayed posttest) highlight the fact that participants in endnote group involved in a wide range of mental tasks, e.g. making inferences, comparing and contrasting words, selective attention, returning back to the target sentences in the text, establishing links between the

meaning of the target words in the text and examples provided at the end of the reading comprehension task. All in all, these mental tasks and deeper levels of involvement in learning L2 vocabulary, we believe that, enhance the likelihood of coming L2 vocabulary items into memory.

CONCLUSION

Taken together, this study indicates that the more involvement triggered by the reading task, the better and higher the rate of L2 vocabulary learning and retention. We also call for modification of glosses in a way that trigger mental processing as well as aiding reading task. The results of this study should be taken as tentative and suggestive for future studies; different genre types, L2 reading proficiency, types of L2 words (emotion words, abstract words, and concrete words), L1 and L2 distance, age of the participants might have some moderating effects on the findings. Other studies should look at different types and times of delivery of the glosses. The timing of glosses may be a much more important factor in enhancing mental processing and deeper level of involvement in L2 vocabulary learning. This study has a number of pedagogical implications for syllabus designers, and language teachers as to involve students more deeply in the process of L2 vocabulary learning tasks. Language teachers should design classroom tasks in a way that trigger independent learning and allow mental processing. Language teachers should train students in a way that they would be able to employ different reading strategies as well as vocabulary learning techniques. Syllabus designers and curriculum planners should select and sequence learning tasks in a way moving from less mental demanding tasks towards the classroom tasks that require deeper mental processing on the part of the language learners. Other lines of inquiry can compare the sequencing of different glossing types in more longitudinal studies. Since L2 vocabulary and reading comprehension are regarded as incremental and long-term task. This study has a number of limitations; first, the duration of the treatment sessions was not long enough to generalize the findings to other contexts. Second, Iranian EFL learners' repertoire of L2 reading would not allow them to be good readers. They rarely taught reading strategies at schools and universities as well. Third, the reading task type and format and testing types might have confounding effects on the L2 vocabulary learning and retention. Fourth, all the target words in this study were "abstract words". Word type such as this may affect the findings.

ABSTRACT

The present study is an attempt to investigate the effect of the interactionist model of dynamic assessment on the learners' grammatical knowledge of English relative pronouns through a sandwich format. To this end, 60 learners from Navid Language Institute in Shiraz, Iran were randomly selected; and also were assigned into two homogeneous groups. In this study, 30 learners were from the teenager department and the rest were from the adult department. Then, the three aspects of a sandwich format through the interactionist model of dynamic assessment (DA) were conducted in both departments. The independent sample t-test was used to analyze the results obtained from both the teenagers and adults' groups. The findings of this study illustrated a significant difference between the pre-test and post-test scores of the grammatical English relative pronouns tests in both groups which shows the improvement of scores after mediation. Consequently, it is shown that the teenagers would benefit from the interactionist DA based on a sandwich format more than the adult learners. The results obtained from this study can have useful implications for English as a foreign language (EFL) learners and teachers. To this end, the results can be of crucial significance for EFL students in order to diagnose their weaknesses and strengths; and also mitigate their weaknesses in subsequent evaluations. In classroom setting, teachers can also make use of DA as a kind of strategic assessment which provides them useful information so that they can evaluate their students precisely.

KEYWORDS: Dynamic Assessment, Interactionist DA, Sandwich Format, Relative Pronouns

INTRODUCTION

The first decade of the twenty first century is marked with the changes in educational settings including language assessment and instruction. One of the most important reconsiderations came about in reaction to traditional psychometric views which support a disintegrated view of instruction and assessment. The novel approach known as dynamic assessment (DA) has established a profound integration between language testing and language instruction. Poehner (2008, p.2) posits that "active collaboration with individuals simultaneously reveals the full range of their abilities and promotes their development. In educational contexts, this means that assessment – understanding learners' abilities – and instruction – supporting learner development – are a dialectically integrated activity". This approach has come to be known as dynamic assessment. Dynamic assessment is primarily rooted in Vygotsky's zone of proximal development (ZPD). Vygotsky (1978, p.86) clearly defines ZPD as " the distance between the actual development level as determined through problem solving under adult guidance or in collaboration with more capable peers". As such, learners with a large ZPD are more responsive to the assistance, while the learners with a small ZPD are less responsive (Poehner, 2008). Dynamic assessment suggests a wealth of development in educational settings. It contends that mental abilities are socially mediated through interaction with others (Lantolf & Poehner, 2004).

While several studies have been devised (eg, Ableeva, 2008; Lantolf & Poehner; 2004; Sternberg & Grigorenko, 2002) to evaluate dynamic assessment in foreign language learning, no study has been carried out thus far to examine the effect of DA on learners' grammatical knowledge of English relative pronouns. However, the main objective of this study was to investigate the effects of the interactionist model of DA on the learners' grammatical English relative pronouns through a sandwich format.

Dynamic Assessment vs. Non-dynamic Assessment

According to Poehner (2008) dynamic testing and non-dynamic testing are not referred to as assessment instruments but to administration procedures. In dynamic assessment the learners are taught on how to perform certain tasks through mediated assistance (Kirschenbaum, 1998). Also, in dynamic assessment procedures, the emphasis is on the process rather than the products of learning. In other words, the dynamic nature of this theory is highly and primarily rooted in Vygotsky's observation that a body can envisage what it is only in movement (Lidz & Gindis, 2003). According to Lidz (1987, p. 4) DA is "an interaction between an examiner-as-intervener and a learner-as-active participant, which seeks to estimate the degree of modifiability of the learner and the means by which positive changes in cognitive functioning can be induced and maintained".

Non dynamic assessment is to make decision on static, one time scores exclusively (Wiedl, Guthke & Wingefeld, 1995). According to Sternberg and Grigorenko (2002), in non-dynamic testing the questions are administered to test takers who are supposed to answer successively, without taking any kind of assistance. In contrast, dynamic assessment intends to provide learners with sufficient support in order to make amend their learning deficits and also assist them to reach their potential development.

Interactionist vs. Interventionist Dynamic Assessment

In this section attempt has been made to elaborate on the differences between the two significant approaches to DA – interventionist and interactionist. In the interventionist model, different types of mediations are systematized and standardized, thereby underscoring the psychometric and statistical properties of the assessment procedure (Poehner, 2008). In the interactionist model, "assistance emerges from the interaction between the examiner and the learner, and is therefore highly sensitive to the learner's ZPD" (Lantolf, 2007, p. 54). Interventionist DA "is concerned with quantifying, as an index of speed of learning" (Brown & Ferrara, 1985, p.300). In other words, Interventionist DA emphasizes on the amount of assistance or mediation indispensable for a learner to quickly reach a pre-determined end point. Interactionist DA, on the other hand, focuses on the development of an individual learner or even a group of learners, irrespective of the effort required and without concern for a pre-specified end point (Lantolf, 2007). Antón (2003) and Gibbons (2003) conducted empirical studies with respect to the interactionist model of DA. Antón (2003) supports an interactionist DA procedure used for placement purposes in a university advanced L2 Spanish program and demonstrates that the interactionist DA procedure indicated significant differences among candidates that may have otherwise remained hidden. Gibbons (2003) also demonstrates the importance of interactionist DA in an L2 content-based school setting.

Sandwich and Cake Formats of DA

DA procedures can be designed in accordance with what Sternberg and Grigorenko (2002) have described as sandwich and cake formats. The sandwich format is much more consistent with traditional experimental research designs in which mediation is administered following a pretest and a post-test (used to investigate the effectiveness of the mediation) (Sternberg & Grigorenko, 2002). In the sandwich format to DA, "a mediation phase is similarly sandwiched between pretest and posttest that are administered in a non-dynamic manner (Poehner, 2008, p.19)". The performance on the posttest can then be compared to that of pretest so as to determine how much promotion an individual made as a result of assistance (Poehner, 2008). Sternberg and Grigorenko (2002) also posit that these procedures can be administered in either an individual or group setting, and that in individualized procedures the assistance may also be individualized, while in group procedures the assistance tends to be equal for everyone. In the latter format namely the cake format assistance or mediation is offered during the administration of the assessment, whenever problems emerge. According to Poehner (2008) in interventionist approaches to DA, the assistance offered might be in the form of a set of graded standardized hints ranging from implicit to explicit. Then the mediator calculates the number of hints indispensable for the learner in order to respond appropriately to the particular item. Also, in an interactionist approaches to DA, any evaluation of variation in learners over time would have to include both the quality and quantity of assistance (Poehner, 2008). In the present study attempt was made to investigate the effect of the interactionist model of DA on the learners' grammatical English relative pronouns through a sandwich format.

Mediated Learning Experience (MLE)

Feuerstein et al. (1988) describe the mediated learning experience (MLE) as a procedure through which external stimuli do not influence directly on the organism but are adjusted through usually

an adult mediator, who frames order on the stimuli to make assure that the relations between specific stimuli will be experienced in a specific way. Sternberg and Grigorenko (2002) express that the mediator not only refines the stimuli or task but also influences the learner by provoking him or her to a higher level of curiosity and to a level at which structural cognitive changes can occur. While differences are apparent between Vygotsky's and Feuerstein's theories both researchers understand mediation and assistance as the psychological part of cultural transmission (Poehner, 2008). As Lantolf (2007) posit, the MLE comprises from several significant components, including feelings of competence, ability to self-regulate, and the internalization of general learning principles that guide the individual in 'learning how to learn. Furthermore, the mediator must carefully select culturally determined stimuli for presentation to the individual. This enables the learner to easily inculcate the cultural practice one is taking part in with the mediator. In order to further extend current abilities to prospective performances, the individual must extend what has been internalized by expecting outcomes which are probable to result from certain actions (Sternberg & Grigorenko, 2002).

Empirical Studies in Dynamic Assessment on the EFL Context

On the EFL context in Iran the following researchers have conducted their studies to assess the effect of DA on the Iranian EFL learners. Jafary et al. (2012) investigated the effect of dynamic assessment on learners' syntactic knowledge. The results showed that at a 0.05 level of significance the mean of experimental group was more than the mean of control group for different scores. Also, Pishghadam et al. (2011) investigated the effectiveness of using a computerized dynamic reading comprehension test (CDRT) on the Iranian EFL students. The results illustrated that providing mediation in the form of hints contributed significantly to the increase of students' scores, and consequently to the improvement of text comprehension. In another study conducted by Zoghi and Malmeer (2013) attempt was made to explore the effect of an interactionist model of DA on the Iranian EFL adult learners' intrinsic motivation. The results indicated a significant difference between the two groups namely experimental and control group in terms of their amount of intrinsic motivation. The experimental group showed a high intrinsic motivation due to the interactionist model of DA.

RESEARCH QUESTIONS

This study was designed to investigate the possible effect of interactionist dynamic assessment on students' grammatical English relative pronouns and the degree of the effect that DA can have with respect to the learners' age. Thus, the following research questions were proposed:

Q1: Is there any significant difference between teenagers and adults performance in grammatical English relative pronouns when a DA procedure is used?

Q2: Does the interactionist dynamic assessment based on a sandwich format promote the learners' grammatical English relative pronouns?

METHODOLOGY

Participants

In this study the three aspects of the sandwich format of dynamic assessment were used with 60 EFL students in Navid Language Institute in Shiraz, Iran. To this end, 30 learners were randomly selected from the adult department and the rest were from the teenager department. All the participants were basically studying the Top Notch series books for the purpose of learning English better and achieving higher degrees in their education.

Design of the Study

The design of the study was based on an experimental design accompanied with pre-test and post-test comparison groups. Also the three aspects of a sandwich format namely, pre-test, mediation, and post-test were used. As poehner (2008) clearly states, in sandwich format a mediation phase is sandwiched between pre-testing and post-testing. As such, in this study the researchers attempted to help the students in order to see the effect of the interactionist model of dynamic assessment. Also, attempt was made not to disclose the answers explicitly but to provide them with hints implicitly. Consequently, the performance on the post-test was compared to that of pre-test so as to see how much improvement in English relative pronouns emerged.

Corpus

For the purpose of data collection on the students' ability in relative pronouns the researchers used the exercises in Navid Language Institute students' books.

Instruments

In this study, 40 multiple choice items of relative pronouns were extracted from the standardized TOEFL® test to be implemented as the questions of the study. The researchers administered two different but equivalent grammatical English relative pronouns tests in the pre-testing and post-testing stage. To this end, 20 items were administered in the pre-testing stage and the rest were administered in the post-testing stage.

Procedures

Six classes in Navid Language Institute in Shiraz, Iran (three from the teenager's department and three from the adult's department) were randomly selected and attempt was made to equate the number of students in each class for the purpose of having an equal sample size in each department in order to be able to compare the mean scores of the groups. To this end, in each department 30 students were randomly selected as participants of the study. The researchers scheduled to implement the three stages of sandwich format through the interactionist DA. To this end, two tests on grammatical English relative pronouns were prepared to be implemented in pre-test and post-test stage. The three stages are as follow.

In the pre-test stage as the first stage the students in both groups were given some question in terms of grammatical English relative pronouns and were asked to answer them. The questions were all in multiple choice formats. Then the researchers carefully corrected learners' papers obtained from the students and tried to provide individual comments and explanations to the students for their errors of grammatical English relative pronouns.

In the second stage, the researchers, who adopt a mediator role gave feedback, explanation through interaction and provided hints to them from implicit to explicit.

Finally in the last stage a post-test was administered. In this stage the questions were equivalent but different to that of the pre-test stage so as to compare the learners' improvement in grammatical English relative pronouns in both teenagers and adults' group. Then, the data were submitted to Spss for two independent samples of t-test between the groups.

RESULTS AND DISSCUSSION

In order to delve into the research questions the three aspects of the sandwich format through interactionist DA was administered to the students in both groups. Then the descriptive statistic was used on both groups. The results of descriptive analysis are illustrated in Table 1. As can be seen from the result, in the pre-testing stage both groups were nearly homogeneous with respect to their knowledge of grammatical English relative pronouns. In addition, there was no significant difference between teenagers and adults in the pre-testing stage with regard to their mean scores. Moreover, as can be seen from Table 1, in the post-test stage the teenagers showed improvement in their grammatical knowledge of English relative pronouns in comparison to adults.

Table 1: Descriptive statistics: Results of pre-test post-test scores in both groups

Group	N	Mean	Std. Deviation	Std. Error Mean
Pre-Test Teens	30	14.317	2.78456	.45432
Pre- Test Adults	30	14.325	3.42567	.32156
Post-Test Teens	30	17.750	2.65461	.45432
Post-Test Adults	30	16.525	3.31165	.37654

Table 2 illustrates the result of the pre-testing stage. Regarding the pre-testing stage the independent t-test between teenagers and adults was conducted. As can be seen from the results, both groups are nearly equal before mediation. Then, another t-test was conducted on both groups in the post-test stage in order to reveal the amount of improvement in learners' grammatical English relative pronouns. To this end, Table 3 indicates the results of independent sample t-test pertained to the post-test scores in both groups. Independent sample t-test illustrates a significant difference of .108, $t(60) = 1.575$, $p > .05$. Also, the eta square is .02 which is small.

Table 2: Inferential statistics (Results of independent-sample t-test for pre-test)

	Levene's Test For Equality of Variances								
	F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Equal variances assumed	.423	.506	.000	60	1.000	.0006	.7776	- .12306	1.2306
Equal variances not assumed			.000	66.875	1.000	.0006	.7770	- .12339	1.2339

Table 3: Inferential statistics (Results of independent-sample t-test for post-test)

	Levene's Test For Equality of Variances								
	F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Equal variances assumed	2.423	.108	1.575	60	.107	1.024	.630567	- .23065	2.23065
Equal variances not assumed			1.575	54.575	.108	1.024	.630567	- .23239	2.23239

The findings of this study would be discussed with respect to two main objectives of the study that the researchers intended to investigate. At first, the effect of DA on learners' grammatical knowledge of English relative pronouns then the effect of DA on learners' age would be discussed. The results obtained from the comparison of the pre-testing and post-testing stage in terms of their mean scores revealed that both adults and teenagers improved their performances through the use of an interactionist model of DA based on a sandwich format. The results obtained from the present study are consistent with the other studies indicating the positive effect of DA on the EFL learners (eg. Ableeva, 2008; Jafary et al., 2012; Lantolf & Poehner, 2004; Pishghadam et al., 2011; Zoghi & Malmeer, 2013).

The current study also illustrated that learners in different age groups were not influenced by DA to the same degree. In this study, it was obvious that the teenagers would benefit more than the

adults when an interactionist model of dynamic assessment based on a sandwich format was conducted in order to evaluate learners' grammatical English relative pronouns. A very lucrative interaction which happened between the teenagers and the researchers led the teens to gain more from this procedure. One possible explanation might be regarded as the behavior that the teens have in the process of interacting with the examiners because they are more lenient in accepting their mistakes in comparison to the adults. In contrast, adults seem to benefit from the controlled standardized teaching hints and techniques. Furthermore, the findings could be explained from Piaget's view of intellectual learning. For Piaget, language development is the result of gradual promotion of general intellectual skills. As adults have more developed intellectual system it is probable that they would benefit cognitive processes including standardized strategies more when they are learning a language than teenagers that their intellectual capacity is not as developed as adults and are more susceptible to interact with others.

CONCLUSION

This study attempted to investigate the effect of an interactionist model of dynamic assessment on the EFL learners' grammatical English tenses. The study revealed that an interactionist dynamic assessment based on a sandwich format plays a major role on the improvement of learners' grammatical knowledge of English relative pronouns. In other words the findings of this study propose practical usages for classroom learning. The learners in the current study had positive attitudes toward learning English relative pronouns through the interactionist model of dynamic assessment as was clearly shown in their posttest scores. To this end, the use of dynamic assessment in classrooms can set the ground for better instruction and assessment which consequently promotes the quality of education. The current study is also implicated that through the incessant interaction of teachers and students, students can be informed of their own weaknesses and their strengths. Teachers can also help them for their breakdowns in the course of teaching. The results also revealed that the adult learners will not benefit DA to the extent that the teens do. The results gained from this study can be of paramount importance for both EFL teachers and students. EFL teachers should have access to the finding of this study to provide an appropriate and useful way of integrating teaching and testing; and also EFL learners required to be informed that instruction through assessment help them to become aware of their weaknesses and strengths. As such, learners have this opportunity to mitigate their weaknesses in subsequent evaluations.

Not surprisingly, DA even with all its practical restrictions has been regarded as relative solution to the drawbacks of traditional static tests. The results of this study suggest that further research on the effects of mediations in dynamic assessment whether interactionist or interventionist are warranted.

Conducting needs analysis during a course and having classes with a few number of learners help teachers implement the features of dynamic assessment and reach the potential development of their students as much as possible.

Limitations of the study

Although this study informed EFL teachers regarding the integration of instruction and assessment in the course of education, it suffers from some limitations. First, variables such as gender and personal variables were not taken into account so as to have a good picture of the obtained results. Second, the number of the participants in this study was comparatively small for the results to be generalized to the population of EFL learners in Iran. Third, this study was mainly focused on the interactionist model of DA and the interventionist model was not emphasized. Therefore, other researchers interested in DA can benefit from these issues to fill the gap emerged in the literature.

ABSTRACT

This study was designated to investigate the effects of two mnemonic non-verbal vocabulary learning strategies (Key Word Method and Semantic Mapping Strategy Instruction) to learning new lexical items. 63 students majoring English as a foreign language at Islamic Azad University in Maragheh, Iran, were participated in this study. According to Nelson proficiency test scores, the subjects were divided into three groups. One control group who learnt the target words in a conventional way, and two experimental groups with two vocabulary leaning approaches, KWM and SMSI. Before treatment, the subjects participated in pretest to assess their levels of vocabulary knowledge, then they took a posttest to measure the amount of vocabulary learning and retention. The obtained data were analyzed through SPSS software for windows. The results revealed that the subjects in KWM performed better than the other two groups and those who were in SMSI group outperformed than those in control group. The outcomes of the present study would open a new way for presenting different vocabulary learning strategies and improving EFL learners' better understanding and retaining of new presented target words.

KEYWORDS: vocabulary learning, Key Word Method, Semantic Mapping Instruction, vocabulary retention, mnemonics, non-verbal strategies

INTRODUCTION

Nowadays, vocabulary is considered as an essential segment o second language learning and acquisition. It provides many advantage second language learners (Hippner-Page, 2000). Lynch (1996) believed that acquiring vocabulary is assumed as a vital process in learning a second of foreign language because it enhances learners' comprehension and serves as an influential step in making progress in language learning. Regarding the importance of vocabulary learning, a great number of different approaches to language learning, each with a different outlook on vocabulary, was proposed (Richards & Rodgers, 2001; Jesa, 2008). On vocabulary (Richards & Rodgers, 2001; Jesa, 2008). Once in a while, language teaching methodologies have received great weight to vocabulary learning, and sometimes it has been neglected (Schmitt, 2000). In practice, grammar and pronunciation are at the core of language learning, while vocabulary is neglected in most foreign language classes (Fernández, Prahlad, Rubtsova, &

Sabitov, 2009; Farghal & Obiedat, 1995). Nowadays it's widely accepted that vocabulary learning is one of the essential elements both of acquisition of one's native language and of learning a foreign language (Morra & Camba, 2009). Learning vocabulary is seen as a key element to achieve a high level of proficiency in the target language by a large number of theoreticians (Boers & Lindstromberg, 2008). Also researchers, teachers and others involved in foreign language learning are paying special attention to foreign language vocabulary acquisition (Zu, 2009). It is believed that having a large and varied vocabulary is the indicator of communicative competence and it is one of the important aspects of language learning (McCrostie, 2007).

Insights gained from the vocabulary learning processes have now highlighted the fact that second and foreign language learners should concentrate their efforts on developing vocabulary learning strategies. Regardless of this importance, for many years, there was little or no emphasis on vocabulary teaching. It was proposed that students should be able to learn the new target words they need without the aid of their teachers. Recently, researchers paid more attention to a number of strategies and techniques for teaching vocabulary (e.g. Rott, Williams & Cameron, 2002; Boers, PiquerPiriz, Free, & Eyckmans, 2009; Mizumoto, & Kansai, 2009; Shen, 2010). Research findings suggested that lexical problems frequently interfere with communication; communication breaks down when people do not use the right words in expressing intended meaning (Allen, 1983). Studies in vocabulary learning are considered as a "promising area of inquiry" (Ellis, 1990: 214).

Now that there is general agreement among vocabulary specialists on the point that lexical competence is at the very heart of communicative competence, there is a need for expanding the body of experimental studies to address several key questions about the effectiveness of different strategies and techniques of L2 vocabulary instruction on learning and retention. Considering the significance of vocabulary in language learning domain and to address the above problems, the current study was designed to determine the effectiveness of two mnemonic non-verbal approaches, Keyword Word Method (KWM) and Semantic Mapping Strategy Instruction (SMSI) in enhancing learning and retention of vocabulary items.

Theoretical Background

The first years of first language (L1) acquisition are often characterized as focusing on language at the lexical level (Piennemann, Johnston, & Brindley, 1988). Likewise, many second language acquisition (SLA) researchers believe that sufficient lexical knowledge is the essential component in developing second language proficiency (Grabe & Stoller, 1997; Kim, 2011). Researchers of SLA (Gass, 1989; Olshtain, 1987; Richards, 1976; Tekmen & Daloglu, 2006) have identified lexical knowledge as including seven major components: (1) knowing various denotations of a word, (2) knowing appropriate uses of a word, (3) knowing its syntactic properties, (4) knowing its underlying forms and derivations, (5) knowing the associations the word has with other words (collocations), (6) knowing the connotations of a word and (7) knowing its frequency of occurrence.

Accordingly, language teachers and researchers have recently been cognizant of the fact that vocabulary is a vital aspect of language, which is worth investigating. However, learners usually confess that they experience substantial complexity with learning new words and many of them spot the acquisition of vocabulary as their utmost foundation of problems. The problem is to discover which ways or skills will best help learners better learn, retain and retrieve vocabulary. Consequently, it is essential for language teachers to be aware of the effectiveness of different methods of vocabulary teaching to choose the ones that are the most effective to their students; this is what we follow in this experimental study. A number of researchers have recently examined the fruitfulness of different techniques of vocabulary instruction (Rott, Williams, & Cameron, 2002; Singleton, 2008; Min, 2008; Mizumoto, & Kansai, 2009; File & Adams, 2010). Among these techniques are two non-verbal strategies, as mentioned before KWM and SMSI.

Key Word Method

Numerous attempts have been made in the last few decades to optimize the teaching of foreign language vocabulary. Some researchers claim that optimization allows for far more effective vocabulary learning than having learners resort to his own instructional decisions. It was claimed that learners need to be given explicit instruction of vocabulary strategy in order to facilitate their awareness of vocabulary learning strategies that they can use to learn their own outside the classroom (Atay & Ozbulgan, 2007). Among the vocabulary learning methods, vocabulary memorization strategies involving deeper processing may result in better retention of words than strategies for shallow processing (Sagarra & Alba, 2006). Thus, one of the most popular and the most extensively researched foreign language vocabulary teaching methods has been the keyword method (Rodriguez & Sadoski, 2000; Pressley, Levin and Delaney, 1982) for that the theoretical framework for the encouragement of using keyword method (KWM) in vocabulary learning lies in its strength of verbal linkage and visual imagery in the memory process.

Djignovic (2000) illustrates that the KWM represents one attempt to optimize learning foreign language vocabulary. The idea emerged in an experimental psychologist's laboratory and divides vocabulary learning into two stages. First, the learner associates the spoken foreign language word with the keyword, which is an L1 word that sounds like some part of the foreign word, that is, it is similar in sound but has no other relationship to the foreign word. In the second stage, the learner forms a mental image of the keyword interacting with the L1 translation. Thus, the keyword method consists in forming a chain of two links connecting a foreign word to its translation.

The KWM may trace back to the empirical support of Paivio's (1997) Dual-Coding Theory (Rodriguez & Sadoski, 2000; Shapiro & Waters, 2005). As Shapiro and Waters (2005) pointed out, memories are stored in two different coding systems in Dual-Coding Theory with different levels of processing ranging from shallow to deep. Shallow processing emphasizes surface features of words to be remembered such as sounds, orthography, or physical features such as the number of vertical lines in a word, while deep processing focuses on meaning. The richer the meaning of an item to be remembered, the deeper the processing and the more it will be recalled (Craik & Lockhart, 1972, as cited in Shapiro & Waters, 2005). Such strategy associates the

meaning, sound, and image of the L1 and L2 has been found to improve retention (Hulstijn, 1997; Pressley, Level, & Miller, 1982, as cited in Fan, 2003).

Different definitions in the literature (Holden, 1999; Hustiljn, 1997; Paivio, 1983; Thompson, 1987) have been proposed for this mnemonic technique. The most comprehensive of which is the definition provided by Hulstijn (1997) who characterizes the KWM in terms of three categories : 1) an L1 or L2 word which refers to a concrete entity and is selected according to acoustic or orthographic similarity with the L2 target word; 2) a strong association between the target word and the keyword must be constructed, so that the learner, when seeing or hearing the word is immediately reminded of the keyword; 3) a visual image must be constructed combining the referents of the keyword and the target word, preferably in a salient, odd, or bizarre fashion in order to increase its memorability. (P. 204)

Recent studies examined the facilitation of the keyword strategy on foreign language learning and enhancement of vocabulary recall. Rodriguez and Sadoski (2000) conducted a study to explore the effectiveness of training in the use of the keyword method for vocabulary acquisition by students who are experienced in learning a foreign language. It was found that the keyword-trained students maintained a significant and substantial advantage in recall of word definitions over control students. Similarly, Shapiro and Waters (2005) indicated that the keyword method of vocabulary learning is a mnemonic method to help students learn foreign vocabulary. The keyword method was effective for that it provided a meaningful visual image upon which to base memory for a new word's meaning. In Taiwan, researchers also found positive effect of the keyword method on elementary school and senior high school students' vocabulary retention (Chen, 2006; Hsu, 2007; Lin, 2004) and on elementary school students' learning of word meaning (Lin, 2009) as well.

McDaniel and Pressley (1989) compared the keyword technique, in which students learn words through the combination of an auditory and imagery link, with the context method and found the former to be significantly more facilitative to learning than the latter. However, for longer term retention, findings related to the effect of use of the keyword method are more mixed, with some research demonstrating growth in recall after an immediate decline (Lawson & Hogben, 1998) and other research showing decline in levels of recall (e.g., Avila & Sadowski, 1996; Wang & Thomas, 1995). To our knowledge and experience, we suppose that the mixed results seem to be associated with use of different experimental procedures and testing protocols applied in these studies. Another study by Pressley, Levin, and Miller (1981) carried out an experiment with elementary school students in which keyword training facilitated the recall of Spanish words with both concrete and abstract referents. For materializing the keyword method, Olshtain and Barzilay (1991) used English-language vocabulary items of a rare and rather technical kind. They found keyword superiority for concrete but not for abstract words on immediate post-testing.

Wyra, Lawson, and Hungi (2007) examined the effects on recall of word-meaning pairs of the training in the use of keyword procedure. The researchers used six Spanish words as instruction and 22 Spanish-English pairs used as target words in the learning and testing part and found that

the training was a significant predictor of both backward and forward recall performance. Chen (2006) investigated the effect of the keyword method on elementary school students' long-term vocabulary learning in EFL setting in Taiwan and found that the elementary school students in the keyword-given and keyword-generated groups indicated that the keyword method was not only an interesting tool for learning English vocabulary, but also a skill helping them in acquiring the English words in a faster and easier way which can also increase the level of retention. The lack of the research on the keyword strategy training effect in learners' vocabulary learning process motivated the researchers to conduct further study.

Semantic Mapping Strategy Instruction

In spite of the importance of direct vocabulary instruction and vocabulary acquisition strategies, little research has been carried out with special attention to the teaching of specific vocabulary strategy (Brown & Perry, 1991). Johnson and Gu (1996) proposed different vocabulary learning strategies in general and paid special attention to Semantic Mapping Strategy Instruction (SMSI). SMSI involves drawing a diagram of the relationship between words according to their use in a particular text and is defined as a collaborative effort between the teacher and the class (Stahl & Vancil, 1986). Other memory strategies such as elaborating, associating and using imagery are contributed in this strategy (Oxford, 1990).

In SMSI, usually, the teacher presents a particular topic or situation to the students (e.g., food, professions, vacations, and so on) and the students are presented with a list of words and pictures that are most commonly related to the particular topic or situation. The vocabulary is then semantically related. This method of presentation is also viewed as an effective tool for vocabulary acquisition and retention by researchers such as Gairns and Redman (1986), Nattinger (1988), Stahl and Nagy (2006), and Graves (2006), who believe that presenting two words that are semantically related not only helps a learner to become aware of the similarities in meaning but also to determine and remember the differences between them.

Semantic mapping has been utilized in a wide variety of ways, including the following: as a means of enhancing the teaching of study skills (Hanf, 1971; Heimlich & Pittleman, 1986), as a framework for identifying the structural organization of texts (Clewett & Haidemos, 1986), as a strategy for promoting disabled students' reading comprehension skill (Sinatra et al., 1948), as an assessment technique (Fleener & Marek, 1992), etc. this strategy is as well effective for enhancing vocabulary knowledge of the learners' instructional level (Huynh et al., 2002).

A number of studies have been carried out regarding the effect of semantic mapping strategy (Bos & Andres, 1990; Brown & Perry, 1991; Zaid, 1995; Morin & Goebel, 2001). Crow and Quigley (1985) investigated the semantic field approach that there was a formal association between five related words and a keyword that could be mentally substituted in context. In a study with 61 high school students as subjects, Bos and Andres (1990) compared the effect of three knowledge-based interactive vocabulary instruction techniques, in which students were assigned to one of the three groups with three different treatments: semantic mapping group, semantic feature analysis group, and concepts' relations analysis. According to their research

outcomes, students who received treatment with knowledge-based interactive vocabulary technique scored higher than other students.

Nilforoushan (2012) examined the effect of teaching vocabulary through semantic mapping on the awareness of two affective dimensions, evaluation and potency dimensions of deep vocabulary knowledge as well as the general vocabulary knowledge of EFL students. Sixty intermediate EFL female adult learners participated in this study; they were chosen among 90 students through Preliminary English test and a general vocabulary knowledge test. They were thus randomly divided into two groups, experimental and control, each consisting of 30 students. At the end, students took a vocabulary achievement test and a test of awareness of evaluation and potency dimensions of deep vocabulary knowledge. Results showed that teaching vocabularies through semantic mapping significantly improved learners' awareness of the two dimensions.

Abdollahzadeh and Amiri (2009) investigated the effectiveness of vocabulary instruction via semantic mapping against the established traditional vocabulary teaching techniques in Iran. The sample of the study consisted of two hundred and sixty four intermediate adult Iranian EFL learners from different language institutes in Orumieh took part in the study. They were divided into two equal groups consisting of 9 classes in the control group, and 8 classes in the experimental group. They found out that the experimental group demonstrated significant superiority over the control group with regard to the scores obtained in the post-test. In other words, employing semantic maps to teach vocabulary items was demonstrated to have a positive effect on the vocabulary learning of adult Iranian EFL learners.

Simpson (1994) conducted a study to determine the effectiveness of semantic mapping as an independent note-taking skill especially in the content area of 11th grade English. The subjects consisted of 49 students. Results did not indicate a significant difference resulting from the use of semantic mapping although students' attitude and assessment indicated an interest in and a willingness to use the method. The researcher recommended considering semantic mapping as an alternative to traditional linear note-taking because it is equally useful to promote achievement and may be more appealing to students.

Tinkham (1993) determined that L2 learners were able to learn words that were not semantically related faster than those that were. In his study, 20 English speakers were asked to learn and orally recall sets of three semantically related and unrelated non-words (paired with their English counterparts) and two sets of six semantically related and unrelated non-words (also accompanied by an English translation). In both experiments, the participants were able to learn and recall the semantically unrelated set faster than the semantically related set, and they also reported having greatest difficulty remembering the related words. The results of this study were replicated by Waring (1997), but with 20 Japanese speakers. The conditions and materials for the study were the same as Tinkham's (except that the non-words were phonologically adapted to reflect Japanese phonology and their translations were words in that language). The results of this study mirrored those reported by Tinkham, as the Japanese speakers had less difficulty learning

the unrelated non-words than the related ones. In addition, they also described the semantically related sets as being the most difficult to learn.

The review of related literature on two non-verbal mnemonic strategies, key word method and semantic mapping strategy, has been conducted on different samples whereas the current study has been conducted on college EFL students. Moreover, there seems to be no experimental studies at all (to the best knowledge of the researcher) on the usage and comparing these two vocabulary learning strategies together as tools conducted among EFL classrooms in Iran. Therefore, this study aimed at filling this gap.

RESEARCH QUESTIONS

One of the most formidable tasks that face EFL teachers is teaching lexical items. Most Iranian EFL learners usually learn and retain the new target words in a conventional way, that is learning and memorizing a long list of the new words with their equivalences in their mother tongue. Hence, there appears a need for students to be presented with some non-verbal techniques for effective teaching vocabulary. Regarding the importance of vocabulary in language learning and in communicating with others and different effective vocabulary learning strategies, the present study aimed to investigate the effect of two mnemonic methods of teaching vocabulary, namely KWM and SMSI, and compare them with the conventional verbal method. Accordingly, the following research questions were proposed in this study:

1. Does Key Word Method as a non-verbal vocabulary learning strategy affect Iranian EFL learners' vocabulary development?
2. Does Semantic Mapping Strategy Instruction as a non-verbal vocabulary learning strategy affect Iranian EFL learners' vocabulary development?
3. Do the two non-verbal techniques of vocabulary teaching differ significantly in terms of permanency of the acquired items?

METHODOLOGY

With the aim of investigating the effect of two non-verbal vocabulary learning strategies, a quasi experimental design study was conducted. The subjects in the current study were assigned into one control group and two experimental groups according to their homogeneity level. The dependent variable of this study is learners' achievement of new target vocabularies. The independent variables are two experimental groups who study using KWM and SMSI, and one control group who learn target words in a conventional way.

Subjects

The sample of this study comprised 63 male and female subjects selected from among 85 students according to their scores (one standard deviation above and below the mean of the test) in Nelson proficiency test. They were pre-intermediate university students who were studying English as a foreign language at Islamic Azad University in Maragheh. Based on their proficiency test scores, the students were assigned into three groups, one control group and two experimental groups. The age range of the subjects was 18-25.

Instruments

For the purpose of data collection, the following instruments were prepared:

1. The Nelson test (adopted from Nelson English Tests, by Fowler and Coe (1976), series 200 B) was employed to ascertain the homogeneity of the subjects in terms of language proficiency.
2. In order to measure that whether students are familiar with the new target words or not, they were supposed to take a vocabulary test used prior to the experiment. In this test, the 80 new words were presented in a table with three columns. The students were asked to write “yes” in the first column if they have seen the words before, “no” in the second column if they have not seen, and the meaning of the target word in the third column if they know. From among these 80 target words, 38 words were selected to study during treatment sessions.
3. A pre-test with 38 items in the multiple-choice question type to measure the vocabulary knowledge of the students. The results of pre-test were submitted to Pearson correlation to measure the reliability of the test. The results confirmed that the test was reliable ($r=0.78$).
4. Twelve reading comprehension passages presenting the new target words that were chosen from some reading comprehension books.
5. As like as the pretest, a vocabulary posttest was designated in the multiple-choice question type to assess the amount of students learning and retention of new target words.

Procedure

First, a forty-five Nelson test of language proficiency was presented to 85 students to estimate their homogeneity level. The results of this test were used to select those students who were supposed to be the final participants of the study. As a result, 63 students whose scores occur one standard deviation above and below the mean of test score were selected as the final participants of the study. Then, the subjects were given 80 new target words in a table with three columns and were required to write “yes” in the first column if they have seen the words before, “no” in the second column if they have not seen the words and in the third column they were asked to write the meaning of the words if they know. Thirty-eight items were selected from among those eighty words to be studied during treatment. Before treatment, the students were supposed to take a pretest to evaluate their knowledge of vocabulary. This test comprised of 38 multiple-choice items in which the students were asked to choose the correct answer among four given choices. Next, the students were assigned into three groups: one control group who learnt the new target words in a conventional way (learning and memorizing a long list of words with their translations in their mother tongue), two experimental groups with two different vocabulary learning strategies. In experimental group 1, the students were supposed to make use of Key Word Method to learn the new words. That is, students were first taught keywords for the two practice examples from the preselected passages, then shown the new vocabulary word first, followed by a mnemonic picture and keyword linkage for this new word. Then, the Persian meaning of this new word was demonstrated). The semantic mapping, which was used for the treatment in the experimental group 2, were thematic maps, spider maps, problem and solution maps, and fishbone maps. The maps for the two first reading passages were filled by the learners with the teachers’ assistance. For the remaining passages, however, they were assigned to the learners

to fill in groups of four or five people. The teachers only observed and provided help if needed in this phase. The resulting maps which were checked to ascertain whether they had accommodated all the target lexical items were finally approved by the teachers. In the final step, the students were required to take a vocabulary posttest to measure whether the students have learned the new target words or not. In this test, like the pretest, the students were asked to choose the correct answer out of given choices. The data from both the pretest and the posttest were collected and submitted to SPSS for windows to be analyzed.

RESULTS AND ANALYSIS

In this study, data collected through pretest and posttest was analyzed using Statistical Package for Social Sciences 17.0 version for windows. After administrating the Nelson test, the subjects were divided into three groups (one control and two experimental groups). Then, the students' performances in each group were analyzed and compared with each other. In order to discover the homogeneity of the three groups, descriptive statistical analysis was done on the collected data and a one-way ANOVA was run. The results are shown in table 1 and 2.

Table 1: Descriptive Statistics for the Proficiency Test

Group	N	Mean	Std. Deviation	Minimum	Maximum
1	28	23.87	4.2859	43	86
2	29	24.57	4.465	41	83
3	28	23.68	3.3302	41	85
Total	85	24.08	4.0233	41	86

Table 2: One-Way ANOVA for the Proficiency Test

	Sum of Squares	Df	Mean squares	F	Sig
Between groups	6.083	3	2.028	0.130	2.70
Within groups	1807.917	116	15.585		
Total	1814.000	119			

As demonstrated in table one, in Nelson proficiency test, the mean scores of the three groups are approximately at the same level. Therefore, the students in proficiency test were homogenous ($G1= 23.87$; $G2= 24.57$; $G3=23.68$). The results of table 2, as well, confirm the consequences of table 1. Since the Sig. value is 2.70 which is much higher than the criterion Sig. ratio ($p= 2.70>.05$). In order to investigate the first research question which is an attempt to survey the effectiveness of KWM in improving EFL learners' vocabulary knowledge, the obtained data from both pre and post tests of the experimental group 1 who were supposed to study the new

target words through KWM were analyzed via utilizing paired-sample T-Test . The outcomes are presented in tables 3 and 4.

Table 3: Paired Sample Statistics of pre test and post test in KWM group

	Mean	N	Std. Deviation	Std. Error Mean
Pair 1 KWM. Pretest	18.2600	21	3.41862	.67608
KWM posttest	23.9850	21	3.86450	.69031

Table 4: Paired Samples Test for both Pre-Test and Post-Test of KWM Experimental Group

	Paired Differences					T	Df	Sig.
	Mean	Std. Deviation	Std. Error Mean	95% Interval of the Difference	Confidence of the			
				Lower	Upper			
Pair1 KWM pre KWM post	-4.4978	2.34279	.43784	-5.98540	- 4.16537	-10.983	24	.000

The results of table 3 demonstrate a significant difference between the mean scores of the subjects in KWM experimental group in pre test and posttest. As it is shown the posttest's mean score is 23.98 which is higher than the pretest's mean score which equals to 18.26. Hence, it would be possible to come to conclusion that the participants in KWM experimental group performed better in posttest than in the pretest. This conclusion has been authenticated in table 4, that explains the effectiveness of KWM on improving learners' vocabulary learning and retention ($p = .000$). The second research question addressed the value of teaching new target words via SMSI. To do so, the obtained data from both pretest and posttest of the subjects in SMSI experimental group were submitted to paired sample t-test to be discussed. Tables 5 and 6 are developed to illustrate the outcomes.

Table 5: Paired Sample Statistics of pre test and post test in SMSI group

	Mean	N	Std. Deviation	Std. Error Mean
Pair 1 SMSI. Pretest	19.6832	21	3.57116	.68426
SMSI. posttest	21.9830	21	3.60345	.70468

Table 6: Paired Samples Test for both Pre-Test and Post-Test of SMSI Experimental Group

	Paired Differences					T	Df	Sig.
	Mean	Std. Deviation	Std. Error Mean	95% Interval Difference	Confidence of the			
				Lower	Upper			
Pair1 SMSI pre SMSI post	-3.00031	2.17942	.39053	-3.84307	- 2.71586	-5.996	24	.003

As like as the subjects in KWM, those who learnt the new target words through SMSI outperformed in posttest comparing to pretest, since the mean scores differ with each other ($21.98 > 19.68$). To determine whether this difference is significant, the collected scores run on paired sample t-test. The results showed that there is a significant difference between the performance of the subjects in SMSI experimental group in posttest than in pretest ($p = .003 < .05$). Finally to answer the third research question which aimed to compare the effect of these two non-verbal vocabulary learning strategies, the scores were analyzed through ANOVA test analysis. The following tables show the results:

Table 7: Descriptive Statistics for each Group's Performance on the Posttest

	N	Min	Max	Mean	Std. Deviation
Control	21	23	34	19.05	3.13452
KWM	21	25	39	23.98	3.86450
SMSI	21	23	39	21.98	3.60345

As is clearly depicted in table 7, the mean scores show the KWM experimental group did much better than the other two on the posttest. In addition, the second experimental group (SMSI) performed better on the test than the control group, which scored the lowest on the test ($KWM = 23.98 > SMSI = 21.98 > control = 19.05$). In order to make these descriptive findings more meaningful, inferential statistics like ANOVA was required. Therefore, a one-way analysis of variance was run regarding the results of posttests, and the groups were compared so as to locate the point of significance between and among the groups in study. Table 8 presents the results.

Table 8: One-Way Analysis of Variance on the Posttest Scores of the Three Groups

	Sum Squares	Df	Mean squares	F	Sig.
Between groups	3175.482	2	1573.397	6.893	.002
Within groups	11937.83	57	217.930		
Total	15114.58	59			

This table gives both between-groups and within-groups sums of squares, degrees of freedom, F value etc. The sig value is .002. Since .002 is smaller than .05, (.002<.05), there is a significant difference somewhere among the mean squares on the independent variable (posttest scores) for the three groups. As is observed in Table 8, these results coincide with what is illustrated in the means table further above (Table 7), where the mean tended to change with each group in the case of the posttest.

Discussion

This study was an attempt to investigate the effect of two non-verbal vocabulary learning strategies, the KWM and the SMSI, on learning and retaining of vocabulary items among freshman pre-intermediate university students of English as a foreign language. To this end, the collected data were analyzed through two different statistical methods, one-way ANOVA and paired-sample t-test analysis, and the results demonstrated that the students in both experimental groups outperformed than those in the control group. But, the subjects in KWM experimental group showed higher improvement in learning and retaining the new target words than those in SMSI experimental group. For investigating the first research question regarding the efficiency of KWM, the paired-sample t-test analysis method was used and the t-test table showed great significant results for the first experimental group. Yet, according to the results of paired-sample t-test analysis for the second research question, the second experimental group, who received SMSI, showed little significant advantage over the control group in vocabulary development. The results of ANOVA test analysis, which compared these two non-verbal methods, validated the success of KWM over SMSI.

The outcomes of this study strongly corresponds to Hatch and Brown's point of view (1995) that mnemonics, or memory-aiding techniques, are basic kinds of associations used by learners to increase recall and these techniques are used for consolidation of form-meaning connections in memory. The results are also in line with Riazi and Alvari (2004) who concluded that students who use more vocabulary strategies learn better and have longer retention compared to those who just memorize the words.

The positive attitudes toward the keyword method in the present study echoes the findings of Chen's (2006) assertions that such method is an interesting tool for acquiring English vocabulary and most of the students believed that such skill can help them acquiring English words in a faster and easier way, and thus increase the level of retention. Nevertheless, the limitations of the keyword method which were reported by some the students in the present study corroborates the

assertions that the keyword method is most helpful for the beginners (Atkinson & Raugh, 1975) and was designed for use with concrete words (Rodriguez & Sadoski, 2000). Such limitations may be one of the factors interfering students with the application of the keyword method in new vocabulary learning tasks, and thus need to be taken into further consideration.

Keywords help individuals learn faster and recall better because they aid the integration of new material into existing cognitive units and because they provide retrieval cues (Thompson, 1987). Thompson's findings actually provide empirical evidence in support of what we found in this study. The studies conducted by Atkinson and Raugh (1975), Levin and Pressley (1985), Shapiro and Waters (2005), Sagarra and Alba (2006), and Atay and Ozbulgan (2007) to name a few, further support the outcome of this study as in their studies the keyword method has been shown to be an effective procedure for the acquisition and retention of vocabulary in foreign language learning. This method is one of a number of procedures that have proved useful for the task of acquiring definitions of new foreign-language words (Ellis & Beaton, 1993; Mc Daniel & Pressley, 1989), particularly for immediate recall. The findings obtained in this study is also in line with the results Carlson, Kincaid, Lance and Hodgson (1976) achieved, since they found a better recall in subjects who received a mnemonic device compared to a control group.

Furthermore, a second key finding of this study, which can make it different from similar ones, is that results of analysis made clear that the difference between the second experimental group (using SMSI) and the control group (using conventional way) in terms of vocabulary development was not more significant than the first experimental group. This is against Gains and Redman's (1986) assertion that non-verbal techniques, of any kind, lead to a better retention than verbal methods and that "there is little doubt that objects and semantic maps can facilitate memory" (p. 92), since EG2 did not perform better than CG in this study. Maybe because semantic maps just have a facilitating effect and are not sufficient for learning if they are used alone.

This positive impact of semantic mapping strategy can be attributed to the fact that in semantic mapping the relationships between words are explored, and thus, more ties among them are made in the lexical knowledge network of the learner. Establishing such a semantic network in the cognitive repertoire of the learner can lead to stronger comprehension of texts that use the target words (Bravo & Cervetti, 2008).

CONCLUSION

As mentioned before, this study aimed to investigate the efficiency of two non-verbal vocabulary learning instructions over conventional verbal strategy. Along with the acquired research outcomes and previous related literature, it can be stated that mnemonic devices used in this study were demonstrated to be more effective in L2 vocabulary instruction than verbal strategies. However, among these non-verbal mnemonic strategies, the KWM was corroborated to be more influential than SMSI in improving vocabulary knowledge of the learners. Consequently,

vocabulary instruction should be given higher priority in teaching English as a foreign language since it is the cornerstone of communication.

Vocabulary instruction is a complicated process which requires careful planning by teachers and active participation by students. Thornbury (2002) asserts, “learners need tasks and strategies to help them organize their mental lexicon by building networks of associations-the more the better” (p. 30). The findings obtained in this study may lead to a number of implications which could possibly be beneficial for language practitioners, teachers and students in an EFL context. First, this research is probably a call for language teachers, practitioners and researchers in language teaching and learning to pay more attention to L2 vocabulary teaching techniques. The findings may encourage teachers who still use the traditional verbal method of translation in their teaching to change their viewpoint in favor of a nonverbal method of teaching vocabulary. The result may especially be of great value to high-school teachers in an EFL context who are usually faced with the students’ request for information about effective techniques of vocabulary learning.

Second, the findings of this study are also useful for teacher trainers to incorporate appropriate and practical techniques for instruction of vocabulary in their existing training courses. This way, teachers themselves would be informed of different vocabulary teaching techniques and will develop positive attitudes toward the incorporation of the best techniques into their conventional teaching programs. In the long run, syllabus designers and textbook writers will also benefit from the results of this study; different mnemonics can be introduced within the graded vocabulary books and other materials in accordance to the level of the students for whom the material is designed. The major limitations of the present study was the number of the students. Since this study was carried out at the university context, due to administrative limitations, limited number of the students were participated in this study, therefore, generalizing of the results of the study to a large number of the students would not be reliable.

THE IRANIAN JUNIOR HIGH SCHOOL ENGLISH TEXTBOOK “PROSPECT 2” FROM THE TEACHERS’ POINT OF VIEW

Parisa Arabloo

M.A. in TEFL

Islamic Azad University, Central Tehran Branch
parisa.arabloo@gmail.com

ABSTRACT

This study was an attempt to evaluate and analyze the teachers’ points of view toward the newly developed Iranian junior high school English textbook “Prospect 2”. For this purpose, eighteen male and female teachers teaching junior high school (grade eight) from some cities in Iran, namely, Tehran, Urmia, Chaldoran, Khoy, Sanandaj and Tabriz were asked one interview question. The researcher recorded their voices while talking by a voice recorder and then listened and summarized the answers and perceptions toward the book. The teachers mentioned both positive and negative points about the book, but finally the findings of the study revealed that most teachers have positive attitudes toward Prospect 2. Some practical implications are presented which are on the basis of the results of this study and might be of use to the teachers, teacher trainers and materials developers. For example, teachers should incorporate appropriate and practical techniques for the instruction of CLT which the book is based this method.

KEYWORDS: Textbook Evaluation; Teacher's points of view; Prospect2

INTRODUCTION

Textbooks are of great value and effect in the process of teaching and learning. As stated by Zohrabi, Sabouri, and Kheradmand (2014), "textbooks are one of the elements that may promote or discourage learners depending on their materials. They are a kind of support for both teachers and learners. Textbooks provide students a kind of consistency"(p.95). They have an important influence in the instructional process. ELT textbooks have major function in the current discussion. Sheldon (1988, p. 237) states that “textbooks represent the visible heart of any ELT program”. Textbooks are an almost universal component of English language teaching.

According to Cortazzi and Jin (1999), ELT (English Language Teaching) textbooks play the role of a teacher, a map, a resource, a restrictor, and as an ideology. Further, as Cunningsworth (1995) contends, a textbook can be a source of activities, a syllabus for pushing the teaching/learning process toward systematization, and as a scaffold for novice teachers. Still others refer to textbooks in tandem with innovation, students’ needs, issues related to money and time (Hutchinson & Torres, 1994; O’Niel, 1982).

Textbooks hold a paramount status as an indispensable ingredient of language teaching profession; therefore, appraising and evaluating them seems to be imperative to assure their efficiency and consistency with the objectives defined and expected of the course. Constant evaluation of textbooks to see if they are appropriate is of great importance. This process enables us to make informed decisions through which student achievement will increase and educational programs will be more successful (Zohrabi, Sabouri & Behroozian, 2012)

It is good to mention here that Prospect 2 is the newly developed junior high school English textbook which is taught in schools now. It is based on the communicative language teaching approach (CLT). School teachers from all over the country have different perceptions and viewpoints toward its content. But there is no research to analyze and discuss it. The current study was an attempt to evaluate the strength and weaknesses of the junior high school English textbook "Prospect 2" from the teachers' point of view.

REVIEW OF THE RELATED LITERATURE

As Zohrabi (2011, p. 216) argues, "Materials, especially coursebooks, need to be evaluated at every stage of the course in order to find their weaknesses and improve them." As Tomlinson (2006) states, no textbook is perfect, since it can be used by different students in different circumstances. In evaluating a textbook, we need to know how it meets learners' needs. Evaluation might vary from one context to another based on the aims, wants, and abilities of the evaluators. Assessment of textbooks is a profitable way of teacher development and gives beneficial perception to the teachers. Teachers' perceptions and experiences play indispensable roles in the process of book evaluation. (Ahmadi & Derakhshan, 2014)

There is conclusive body of researches in the field of book evaluation. The next paragraphs report some of the works done in Iran and other countries. The study by Zohrabi, et al (2012) evaluated the merits and demerits of English for high school freshmen in Iran from the viewpoints of teachers and students. They focused on seven sections of layout, vocabulary, topics and content, exercises, skills, pronunciation, function, and social and cultural activities. The results of the investigation pointed out that the book was grammar-oriented and more emphasis was placed on reading more than three other skills; insufficient practice was provided for pronunciation; with respect to target culture, no social and cultural activities were included; and the layout of the book was believed to lack beauty (Jamalvandi, 2014)

In other studies, Yarmohammadi (2002) and Abdollahi- Guilani, et al (2011) concluded that there is not authenticity in Iranian ELT books. They also added that there is not correspondence between the students' needs and the content of the materials. In a study done by Litz (1997) , ELT textbooks in South Korea were proved to be successful in reaching their desired goal. In his case study on ELT textbooks not only did he take into account skills, content, tasks, but he appraised cost, availability, authors and publisher' credentials, layout and design and packages and websites related to the book evaluated. The textbook was shown to enjoy far more positive characteristics and it was able to suit the needs of the Korean learners. Multi-skills syllabus, clear

and logical organization of the book, inclusion of teaching strategies, and vocabulary skills were among the positive traits of the book.

RESEARCH QUESTION

What are the strengths and weaknesses of newly developed book “Prospect2” From the Teachers’ Point of View?

METHODOLOGY

Participants

The participants of this study were 18 male and female teachers teaching junior high school (grade eight) which were supposed to answer the research question (interviewees). The teachers were from different cities of Iran, namely Tehran, Urmia, Chaldoran, Khoy, Sanandaj and Tabriz. Their teaching experience was from 6 to 30 28 years. Some of them which were the researcher’s colleague in school discussed the subject face to face and the others responded by telephone or Email. They were free to speak in Farsi or English. The teachers were selected according to their accessibility by the researcher.

Instrumentation and Material

The material for this study is the English language textbook taught in Iranian junior high school (grade eight). "Prospect2"(Alavi, ForozandehShahraki, Nikoopoor, KhadirSharabian & Kheirabadi, 2014) includes work book, student book, audio CD and teacher's guide. The instrument used in this study was an open-ended interview question which the teachers were supposed to talk or write about it about 15-20 minutes. A voice recorder was used to record the teachers’ voices while interviewing in order to be able to listen later and take notes.

Procedure

This study began with an interview question. The researcher interviewed 18 teachers teaching junior high school (grade eight). Eight of the teachers expressed their ideas face to face with the researcher. Three of them talked on the phone and seven send their ideas by Email. The teachers expressed their ideas about the textbooks in accordance with the objectives of the textbook. The interviews lasted between 15to 20 minutes. The researcher recorded their voices via a voice recorder and then listened again and took notes to be able to summarize them.

RESULTS AND DISCUSSION

Eighteen teachers were interviewed and their opinions were asked about “Prospect 2” book. They talked about the virtues and weaknesses of the book. The researcher took notes and she tried to summarize the gathered data.

The teachers had both positive and negative perceptions toward “Prospect 2” but the positive attitudes were stronger than the negative ones. They all were agreed that the new book is according to communicative language teaching method (CLT) and satisfies the students’ needs.

They believed that the book is developed after a deep needs analysis and is exactly what students and teachers and the educational system in Iran needed from many years ago.

The researcher summarized and categorized all the advantages and disadvantages mentioned by the participants. The positive points are as follows:

1. The book is according to CLT which is one of the latest methods and focuses on interaction and communication.
2. The book is finely continuing the goals of “Prospect 1” which was developed the year before “Prospect 2” for the seventh grade students.
3. The vocabularies of the book are the necessary words which are needed in a daily conversation.
4. The book uses the vocabularies of the “Prospect 1”.
5. The activities are group or pair instead of individual ones.
6. The activities are higher order and there is no drill and memorization and they allow students to use their own features, favorites and information in responding the questions.
7. The book creates a friendly atmosphere in class.
8. The book (like Prospect 1) concentrates on speaking and listening and prepares students for communications in the society.
9. Topics are update and attractive and related to the everydaylife(like health, abilities,hobbies,...)
10. The lessons are from easy to hard.
11. To have a photo dictionary at the end of the book was a great idea.
12. Work book is a good practice. It’s questions are not limited to one-answer questions. There are lots of questions that demand student thinking and wants student’s own idea.
13. Teachers’ guide is good for teachers to be familiar with the right ways of teaching the book and knowing the goal of the book.
14. It is a finely-developed book for strengthening students in oral abilities.
15. Like Prospect 1, new words are taught in context not isolated.
16. The CD which distributed with the book helps students in listening which the previous series of the English books lack.
17. The book and its activities in it, creates a challenging atmosphere in class and make the students to participate. For example, the cards at the end of the book, the tables in the book like page 46, 52, 57 and etc. so, students are motivated to response the questions like what the city they live in it is like. Or what are their own hobbies and etc.
18. The teachers are satisfied and glad to teach the new book and they contend that they get energy from teaching it and it is not boring.

The negative points are listed below:

1. The time allocated to the book is limited and not enough to practice perfectly.
2. There is absolutely no grammar in it. It is better to put some grammar points, not complicated ones, to make them aware of the structures. When the students

- memorize the sentences, they learn in Audio-lingual method, but the aim of the book is to teach in CLT. Some grammar can help solve this problem.
3. There is more than one subject (material) in one lesson. For example, lesson 5 introduces several structures like “ where is it_ what’s Isfahan like/famous for_Are there/Is there”
 4. The accompanying CD is audio cd instead of video one. In this stage of life, students need video graphics and listening to audio CDs get them bored.
 5. The earlier studied vocabularies are not repeated in the later lessons.
 6. The teacher has to speak in Persian; otherwise, students will not understand the content well.
 7. There are too much new words in some lessons like lesson 6 and 7 and few ones in lesson 1.
 8. The same as Prospect 1, Reading and writing is somehow neglected and the focus is on speaking and listening.
 9. There should be some activities for teaching prepositions (to-on-in-at ...) in either student or workbook.
 10. The teachers who did not take the classes and enough trainings to teach in CLT, have problems teaching this book. They must take the required classes to be familiar with the goals of the book.
 11. Review parts in the student book are confusing and students cannot do them without the help of the teacher.
 12. The book puts a great pressure on teachers’ shoulders and teaching it, needs knowledgeable and experienced teachers.
 13. Teaching this book needs help and collaboration from school, because the projector, computer, audio system are required and there are some cities and villages in Iran without any facilities.

According to the teachers’ points of view about Prospect 2, it seems that the book is finely accepted and proved by them. They mentioned some positive and some negative points about the book but the positive ones exceeded and they mentioned at the end that the new book is much better than the previous book and they are glad to teach this book. They asserted that the book is successful in teaching communicative aspect of the language. According to Alemi and Hesami (2013), the previous junior high school textbooks were not on the basis of students’ needs and expectations. The new book is developed to solve students’ problems in oral skills and communicative needs. Ghorbani (2011), in his study, analyzed and evaluated the previous textbook being taught in Iranian senior high schools. Findings of the study showed that the book is not successful in teaching four skills. It is structural-based and does not pay attention to communicative skills. There are no CDs and teacher guides or workbooks.

Previous textbooks being taught in junior high schools of Iran entailed teachers to teach in grammar-translation method and also entailed the students not to be active in communicative skills. There were just transferring data not negotiating or other higher order activities. the newly

developed series of Prospect, (in this study, Prospect 2), covered all the deficiencies of the previous books. According to the teachers' points of view, Prospect 2 paid attention to students' needs in its content and tried to teach four skills, especially oral skills which are very important in society and modern era. Prospect 2 demanded experience teachers and active students.

CONCLUSIONS AND IMPLICATIONS

This study examined and analyzed the Iranian junior high school English textbook "Prospect 2" from the teachers' point of view. It was on the basis of an interview question which was asked from 18 teachers in some cities of Iran. The results of the interview showed that the book is successful in teaching communicative skills and the teachers are satisfied with it and have positive perceptions toward the book. In other words, the newly developed book had tried to cover all the deficiencies of the last series of junior high school books. Prospect series pay attention to all four skills specially listening and speaking skill. The method of teaching is CLT which is suits the content and also demands experienced teachers. Teachers' book, workbook and accompanying CD are all the merits of Prospect 2 and help students to learn communicative skills in much better ways. Activities are higher order and requires students to think critically. The teachers said they are eager to teach such books because these kinds of books are motivating, fresh, update and gives energy to them. The findings of this study are useful for teacher trainers and teachers to incorporate appropriate and practical techniques for the instruction of CLT. Teachers should be trained in an appropriate way. Materials developers also can use the results of the present study to recover the deficiencies in the introduced book or the later books.

This study was done with some limitations. The number of the interviewees were eighteen which is not that much enough for a research study. Another limitation was the interviewees' cities. The researcher had access to the mentioned cities and not other areas of the country. The third limitation was experiences of teaching. the researcher tried to interview the teachers with different years of experience but as a limitation, the teacher did not have access to such teachers. Some other limitations also exist. These limitations might affect the results of the study.

ABSTRACT

The present study aimed at identifying native English speakers', native Persian speakers', and Iranian English as a foreign language (EFL) learners' persuasion strategies and any possible pragmatic transfer from the EFL learners' mother tongue (Persian) to their L2. The participants of the study included 10 native English speakers, 30 learners of English, and 30 native Persian speakers, all of whom were university students. The classification of persuasion strategies utilized in this study was based on Hardin's classification of lexical and pragmatic realization of persuading speech act. The data were collected by means of a discourse completion task. The Chi-square test was used to compare frequencies of use of persuasion strategies by all the participants. Results indicated that although all the three groups used recommendation strategy most frequently and consolation and condolence strategies least frequently, the learners of English group and native Persian group made use of opinion-proving, request, advice, and suggestion strategies more frequently than the native English group. Iranian EFL learners were apt to express persuasion with care and/or caution represented by the mentioned strategies. Additionally, they were reluctant to use direct speech act, and they avoided imposition on the hearer. Avoidance and substitution strategies were among the more frequent pragmatic strategies which were transferred from Persian to English. The findings could be of importance for material developers and teachers in their development of instructional strategies as they interact with students during teaching English as a foreign language.

KEYWORDS: Interlanguage pragmatics, Pragmatic transfer, Persuasion strategies, EFL learners

INTRODUCTION

Pragmatics can be defined as the study of the relationship between language, its communication, and its contextualized use (Koike, 1996). Interlanguage is referred to as the learners' language system that is not consistent with the native speakers' language system (Selinker, 1972). Kasper (1998) combines the study of the two areas of pragmatics and interlanguage, and defines interlanguage pragmatics as the study of nonnative speaker's comprehension, production, and

acquisition of linguistic action when they do things with words. Pragmatic transfer is a research branch of interlanguage pragmatics. Pragmatic transfer refers to the influence exerted by learners' pragmatic knowledge of languages and cultures other than second language on their comprehension, production and learning of second language pragmatic knowledge (Kasper, 1992). Here pragmatic knowledge can be understood as a particular component of language users' general communicative knowledge, that is, the knowledge of how verbal acts are understood and performed in accordance with a speaker's intention under contextual and discoursal constraints (Faerch & Kasper, 1984). When people from different cultures communicate with each other without perceiving their different pragmatic knowledge, miscommunication may happen. Such phenomenon is due to transfer of native pragmatic knowledge in situations of intercultural communication (Zegarac & Pennington, 2000).

As noted by Leech (1983), there are two perspectives on pragmatic transfer. One is sociopragmatic transfer, and the other is pragmalinguistic transfer. According to Kasper (1992), sociopragmatic transfer operates when the social perceptions underlying language users' interpretation and performance of linguistic action in a second language are influenced by their assessment of their subjectively equivalent first language context. On the other hand, pragmalinguistic transfer designates the process whereby illocutionary force or politeness value assigned to particular linguistic materials in first language influences learners' perception and performance of form-function mappings in second language (Kasper, 1992).

For language use, pragmatic rules, as a matter of fact, are mostly subconscious and are not noticed by L2 learners until they are broken, i.e. feelings get hurt and offence takes place (Hanlig & Taylor, 2003). Accordingly L2 learners must realize that what is accepted in their NL at a given context may not necessarily be the case in another language when they contact with its native speakers (NSs). One area of pragmatic transfer which can possibly occur in Iranian learners of English language production is the speech act of persuasion. Persuasion is defined by Lakoff (1982) as the nonreciprocal attempt or intention of one party to change the behavior, feelings, intentions, or viewpoint of another by communicative means. Advertising, propaganda, political rhetoric, court language and religious sermons are obvious examples of persuasive discourse; however, persuasion may also occur in conversation. Persuasion is recognized as a directive speech act which, according to Searle (1969, as cited in Pishghadam & Rasouli, 2011) is that in which the speaker's purpose is to get the hearer to commit him/herself to some course of action. In other words, persuasion is an attempt to make the world match the words.

Despite large number of research done in pragmatic issues in general and speech acts in particular, they are still among the most popular topics that researchers try to investigate because of their dynamic features especially in the realm of teaching. The concept of this issue is reported by Delen (2010): "speech acts are not a new topic for researchers; on the contrary, they have been very popular since their emergence in the late 1960s" (p. 692). Finally, although a relatively large number of studies done on issues related to different types of speech acts and based on the fact that "research concerning L2 pragmatic competence often focuses on learners' speech act behavior, primarily by contrasting nonnative with native performance" (Yu, 2011, p. 1128), little research has been done especially in the context of Iran to investigate the speech act of

persuasion among non-native speakers, and more importantly to find any sign of pragmatic transfer.

Since Persian and English speakers have different perceptions of how persuading speech act should be conducted, it is more likely that pragmatic transfer of Persian will occur in intercultural communication between Persian nonnative speakers of English and native English speakers. Utilizing a prior study by Bu (2010) as the framework, the present study aimed to compare similarities and differences in the production of speech act of persuasion in English and Persian languages. The focus, moreover, was on determining any signs of pragmatic transfer from the first language to the second language. To this end, the researcher attempted to analyze the types of persuasive strategies used in English and Persian. As the next step, it was tried to locate any possible pragmatic transfers in persuasion strategies by Iranian learners of English.

REVIEW OF THE LITERATURE

As Hymes (1971) pointed out, communicative competence must include not only the linguistic forms of the language but also knowledge of when, how, and to whom it is appropriate to use these forms. Speech act has been one of the main aspects of pragmatic for a long time. Speech act theory refers to functions and uses of the language or in other words. It includes all the acts we do while as invitations, refusal, apologies, congratulation, persuasion and so on. According to Halliday (1972) such activities do not only by themselves give us enough information while the reveal much about social purposes in which people use language for (as cited in Schmidt & Richards, 1980).

In this regard, pragmatic competence helps students to come up with the problems of miscommunication in different cultures, and for effective communication in second language it is necessary to make students familiar with the appropriate selection and production of different speech acts in different contexts. Usually language teachers take communicative competence the same as the knowledge of linguistic forms or the ability to carry out the linguistic interaction in the target language, but efficient communication is beyond that. Therefore, a great deal of studies have been conducted across different languages and cultures to address universalities and variations in regard to speech acts such as request (Tatton, 2008), apology (Clyne, 1994), complaint (Salmani Nodoushan, 2007), compliment (Grossi, 2009), and refusal (Al-kahtani, 2005). However, the speech act of persuasion has received little attention.

Robin Lakoff (1982) defined persuasion as the "attempt or intention of one party to change behavior, feelings, intentions or view point of another by communicative means" (as cited in Hardin, 2010, p. 155). Therefore, advertising, propaganda, political oratory, court language and religious sermons are example of persuasive discourse; however, persuasion can also used in daily interactions. Persuasion according to Searle (1969) is regarded as the directive speech act in which the speaker's intention is to make the hearer to commit him or herself to perform some form of actions; in other words, persuasion is an attempt of speaker to match the world with his or her words (as cited in Bu, 2010). Persuasion according to Brown and Levinson's (1987) is categorized as a face threatening act, and according to Lakoff (1982) is considered as a kind of

imposition from the speaker upon the hearer; or as Searle (1969) pointed out, persuasion is a kind of commitment or urge for accomplishments of some actions from speaker to hearer. Therefore, having enough knowledge to infer the meaning and the ability to apply appropriate strategies for conducting persuasion seem crucial to hinder breakdown in intercultural communication.

Previous pragmatic research on persuasion has been conducted in different fields. One of these fields is pragmatic analysis of persuasion strategies. Rank (1988, as cited in Hardin, 2010) suggests a basic persuasive formula for advertisements. His five components are attention-getting, confidence-building, desire-stimulating, urgency-stressing, and response-seeking. Combining both Rank's (1988) and Leech's (1966) findings, Hardin (2001) examines persuasive discourse in Spanish language advertising and finds that memorability (making the audience remember the message), force (emotional and logical appeals and the strength of a message), and participation (the desire for a response or audience/hearer involvement) are primary persuasive goals.

Barkley and Anderson (2008) studied persuasion techniques in the courtroom and found that the persuasive effect of arguments is related not only to what is said, but also to how they are said and when they are said. In other words, the more reputable the source of the arguments, the more persuasive the arguments will be. The arguments delivered with confidence, persistence and clarity will be more persuasive.

One of the most recent researchers on the topic under question is Bu (2010), who investigated pragmatic transfer in persuasion strategies by Chinese learners of English. The subjects of the study included 10 native English speakers, 10 Chinese learners of English, and 10 native Chinese speakers, all of whom were university students. The classification of persuasion strategies was mainly based on Hardin's classification of lexical and pragmatic realization of persuading speech act. The data was collected by means of a discourse complete test questionnaire. The Chi-square test was used to compare frequencies of use of persuasion strategies by the Chinese learner of English group, the native English group, and the native Chinese group. Results indicated that although all three groups used complaint strategy most frequently and opting out strategy least frequently, the Chinese learner of English group displayed advice/suggestion/recommendation strategy more frequently than the native English group. The Chinese learner of English group also used opinion-proving strategy less frequently than the native English group and never used consolation/condolence strategies.

Several pragmatic research studies have also been done on the use of directives in persuasive discourse. In his study, Hardin finds that directives are commonly used in Spanish persuasive discourse and directives may be either direct or indirect in force (Hardin, 2001). The illocutionary force of a directive may be softened through mitigation and pragmatic strategies that delocalize the speaker from his/her deictic center (Haverkate 1984; Koike 1992). Indirectness requires the addressee to infer meaning and rely on shared knowledge between the speaker and him/herself. Moreover, since persuasion may involve face threatening acts (Brown & Levinson, 1987), the speaker must use appropriate politeness strategies to achieve the desired message. Certain forms

or constructions are conventionalized; that is, they are customarily used to perform specific speech acts.

In the Chinese context, Tang Xia (2009) analyzed persuading speech act from the perspective of the theory of Chinese face and indicated that Chinese persuasion strategies are human relation-based strategies. In addition, Zhai Lingzhi (2010) investigated persuasion strategies commonly used by Chinese from the perspective of pragmatics. These strategies included the combination of reason and emotion, analogy, encouragement, irony, praise and metaphor.

More recently, in another comparative study by Pishghadam and Rasouli (2011), the researchers investigated the general application of persuasive strategies among Iranian learners of English as a foreign language. To this end, 150 Iranian English learners took part in this study. The data were collected by means of a discourse completion test, consisting of 6 questions similar to real life persuasive situations. The Chi-square test was applied to compare the frequencies of persuasion strategies' application among Iranian EFL learners. The frequent use of query preparatory by nonnative English speakers was consistent with previous studies' results (Blum-Kalka & Olshtain, 1984; Hong, 2009; Tatton, 2008) which mentioned that mostly all languages prefer the application of conventionally indirect strategies.

RESEARCH QUESTIONS

The following questions were the center of focus in the present study:

1. Are there significant differences in the kinds of persuasion strategies used by native English speakers, native Persian speakers, and Iranian EFL learners?
2. What types of persuasion strategies are more likely to be transferred pragmatically from L1 to L2 by Iranian EFL learners?

METHODOLOGY

Participants

The study took place in Iran and the participants consisted of three groups: the Iranian learners of English group, the native English group, and the native Persian group. Each group of Iranians consisted of 30 participants, and there were 10 participants in the native English speakers group. They were university students ranging in age from 19 to 26 years old. So they showed homogeneity in terms of age and education. The participants in this study were accessed through convenient sampling procedure.

Instruments

The data were collected from participants by means of a discourse completion task (DCT). The DCT consisted of 6 items in different contexts close to real life persuasive situations, three of which were adapted from the aforementioned study by Bu (2010). Modifications were made in the other situations to make them more appropriate in both Iranian culture and English culture since in interlanguage pragmatics studies it is necessary to make sure that the situations in the DCT are equivalent cross-culturally. Through the modification process, three experts in the field

of ELT were asked to examine the DCT to make certain it was as valid and reliable as possible. In order to avoid native Persian speakers' misunderstanding of what they were required to do in the DCT, a translated version was given to them. As far as the scoring of the DCT was concerned, the data were first coded according to their classification based on the Bu (2010) framework. For the analysis of persuasion strategies utilized, descriptive statistics were employed to count the frequency and percentage of each strategy for each group, and Chi-square test was then used to compare the frequencies of persuasion strategies use by the Iranian nonnative English speaker group, the native English speaker group, and the native Persian group.

Procedure

To achieve the objectives of the study, the DCT was adapted and modified to fit the Iranian and American culture. Subsequently, three groups of participants (i.e. native English speakers, native Persian speakers, and Iranian EFL learners) were selected through convenience sampling and asked to take part in this study. They were 'persuaded' to fill out the DCTs and return them to the researchers. Once the completed DCTs were received, the data were subjected to statistical analysis.

RESULTS AND DISCUSSION

As the total number of collected data comprised 30 DCTs in English by the Iranian learners of English Group (G1), 30 DCTs in Persian by the native Persian group (G2), and 10 DCTs in English by the native English group (G3), and there were six different persuasive situations in these DCTs, the whole number of responses by G1, G2, and G3 amounted to 180, 180, and 60 answers for each DCT, respectively. First, the answers of the three groups to all six persuasive situations were analyzed and tabulated in Table 1.

Table 1: Frequencies and Percentages of Each Strategy by Three Groups

Strategy / Groups	Native Group	English Iranian Group	Learner of English	Native Group	Persian
Complaint	5 (8.33%)		14 (7.77%)		11 (6.11%)
Reaction	2 (3.33%)		8 (4.44%)		7 (3.88%)
Request	7 (11.66%)		27 (15.00%)		30 (16.66%)
Ultimatum	6 (10.00%)		4 (2.22%)		3 (1.66%)
Order	7 (11.66%)		8 (4.44%)		5 (2.77%)
Opinion-proving	6 (10.00%)		31 (17.22%)		38 (21.11%)
Advice	8 (13.33%)		23 (12.77%)		19 (10.55%)
Suggestion	5 (8.33%)		22 (12.22%)		19 (10.55%)
Recommendation	8 (13.33%)		35 (19.44%)		41 (22.77%)
Consolation	0 (0.00%)		0 (0.00%)		0 (0.00%)
Condolence	0 (0.00%)		0 (0.00%)		0 (0.00%)
Opting out	4 (6.66%)		8 (4.44%)		7 (3.88%)
Total	60 (100%)		180 (100%)		180 (100%)

Pearson Chi-Square value = 28.133, df = 4, Asymp. Sig. (2-tailed) = 0.009

The percentage of each strategy in the performance of persuading speech act is provided in parentheses after the frequency. The percentage numbers are rounded to two decimal, so the sum of the percentages may be more or less than 100%.

The descriptive data shown in Table 1 indicates that the frequency and percentage of the selection of the strategies among these three groups was not equally distributed. In order to be more specific, regarding the claim of difference between these three groups, the Chi-square test was run to detect the differences. The Chi-Square result is written beneath Table 1.

Based on these results, the answer to the first question was positive. That means that there was a significant difference in the number of persuasion strategies used by native English speakers, native Persian speakers, and Iranian nonnative English speakers since the groups showed discrepancy in the use of the strategies.

The research findings can be summarized as below: According to Table 1, all the three groups used recommendation strategy most frequently and consolation and condolence strategies least frequently. This phenomenon can be explained by the facts that in most situations the respondents tried to persuade the interlocutor in the same manner. All the participants of the three groups used different statements for recommendation and then tried to persuade the hearer. The second frequently used strategy by the native English group was advice when they performed their persuading act. Thus, advice and recommendation strategies were used equally by this group (13.33%).

By contrast, the second frequently used strategy by the learners of English group and native Persian group was opinion-proving (17.22%). Here the participants of both groups started the persuasion with what they would do to convince the person to do the favor for them. An example of the way they persuaded using opinion-proving regarding situation number six follows:

Situation 6:

You are the owner of a big bookstore. It is the beginning of the semester, and you are very busy. Today you want to extend business hours by an hour. So, you decide to persuade your clerk, whom you know quite well, to stay an extra hour more.

The learners of English, under the influence of their first language (Persian), tried to use expressions like *'If only you could stay a little longer, I promise to pay you more'* and other similar expressions showing their awareness of the situation for the clerk which in some senses were exaggerated to show their understanding. This is due to their use of substitution strategy which results from Persian speakers as well as learners of English highly frequent employment of recommendation to persuade the hearer to comply with the situations.

The third prominent strategy utilized by the learners of English group and native Persian group was that of request ($G2 = 15.00\%$, $G3 = 16.66\%$). The English group used it as their fourth strategy. Here, using request strategy frequently, the learners showed lack of knowledge and insecurity about the proper strategy to apply in assigned situations which resulted in substitution of more polite strategy (e.g. request).

Strategy of order ranked fifth in the category of persuasive strategies for native English group (11.66%), but the other two groups seemed to be reluctant in using this strategy. Strategy of order was used with the same rate as the reaction strategy (4.44%) in the learners of English group and it even ranked after opting-out for the native Persian group (3.88%). Ultimatum was used occasionally after the order strategy for native English group (10.00%); however, the other groups used this strategy less frequently. The strategy of ultimatum was used after opting out in the learners of English group (2.22%) and even less by native Persian group (1.66%). The least frequently used strategy by the three groups was consolation/condolence.

When the participants were asked about the use of recommendation/opinion proving/request/advice/suggestion, 21 out of 30 Iranian learners of English participants said that it was a duty for the speaker to give useful recommendations, prove their opinions, and ask for a favor through request strategy to change the hearer's behavior or to make the person do something for them. When interviewed why they used a certain formula, 18 out of 30 Iranian learners of English participants admitted that they used substitution strategy. For example, some of them said:

'When I needed help and I knew that this favor might bring about some difficulty for the hearer, I wanted to comfort him by giving a recommendation or asking to do the favor in the form of request. I would say: I promised to increase your salary to lessen the difficulty I might impose to them.'

Here, recommending was mostly used instead of other direct and explicit strategies in English. When they were asked about substitution strategy, they said the reason for substituting specific strategies was that they were not willing to impose themselves on the interlocutor through ordering or using ultimatum strategies. They also said that they were not fully familiar with these strategies and did not know how to utilize them properly in the required situations so they tried to avoid the strategies and substitute the ones which were known because of their use in their first language. Thus, these learners used two different pragmatic strategies: the first was avoidance strategy which was defined as "omission of speech acts whose formulas are unfamiliar" (Bu, 2010, p. 100), and the second strategy was substitution which was utilized to compensate for the students' lack of knowledge about the principles and rules of using these strategies pragmatically in a foreign language context. Here, under the impact of Persian, besides their inadequate knowledge, the learners of English group tried to select a strategy with 'less illocutionary force', again to avoid possible imposition on the hearer. From these findings, the second question of the study could be answered: The persuasion strategies

which were more likely to be transferred pragmatically from L1 to L2 by Iranian nonnative English speakers were avoidance and substitution.

Addressing the first research question

In this research, it was found that the frequency of use of persuasion strategies by Iranian EFL learners was significantly different from that of native English speakers, though they did share some similarities ($\chi^2 = 28.133$, $p = 0.009 < 0.05$). Iranian EFL learners were apt to express persuasion with care and/or caution represented by strategies of recommendation, opinion proving, request, advice, and suggestion and avoiding other strategies like ultimatum, ordering, complaint, reaction, consolation, and condolence.

They did this using statement of reason/explanation, statements of sympathy, as well as promise of compensation in the future more than native English speakers. Native English speakers were more sensitive to their interlocutors' higher and lower status, whereas Iranian EFL learners acted similarly to interlocutors with different social status. Additionally, they were reluctant to use direct speech act and they avoided imposition on the hearer. Thus, through analysis of the responses, the researcher came to the conclusion that the most commonly strategies used by Iranian EFL learners were indirect strategies.

The quantitative analysis showed that the Persian learner of English group used opinion-proving/ request/ advice/ suggestion more frequently than the native English group, which means that participants in the Persian learner of English group had a tendency of expressing their sympathetic feeling about their hearers' situation and they preferred to use recommendation/opinion-proving/request/advice to improve their hearer's situation and to comfort their hearers by being more polite and changing every situation to a request one. On the contrary, the participants in the native English group preferred to use recommendation/advice/suggestion to make the hearer comply with these situations. Such differences may result from their different perceptions of these situations. In the Iranian culture, making recommendation, opinion-proving, request, and advice is regarded as rapport-building. Although opinion-proving, request, and advice are also available in English culture for these situations, they were rarely used by native English speakers for the same situations compared to the answers given by Iranian groups. This is not surprising because English society is one of typical instances of individualist societies (Gudykunst, Ting-Toomey & Chua, 1988; Hofstede, 1991). Extending business hours by an hour, or persuading a person's little brother to pay the bill on her/his behalf are different matters for native English speakers as they behaved totally differently to these situations. They preferred to use ordering strategy more than the other two groups did, indicating their choice towards a more direct way for persuasion in these situations

Table 1 indicated that frequency of strategy use by the Iranian learner of English group and the native Persian group was similar in the use of recommendation, opinion-proving, request, advice, and suggestion. This phenomenon was due to the fact that in our society,

harmonious social relationship is highly valued. Advice-making, opinion-proving, and request-making are not only a method of keeping harmonious relations among people, but also a duty of benefiting the society. This positive culture orientation of such strategy results in the tendency that Iranian EFL learners of English group display similar frequencies to the native Persian group and more frequencies than the native English group in the use of recommendation, opinion-proving, request, advice, and suggestion. The similarity between the Iranian learners of English group and the native Persian group in the use of recommendation, opinion-proving, and request can explain the difference in the use of these strategies between the Iranian learner of English group and the native English group.

As far as opinion-proving strategy is concerned, the EFL learners of English group used this strategy more frequently than the native English group, which could be due to the fact that they were still influenced by Persian thinking pattern when they persuaded their hearers. Strategy of order, as another example, was used rarely in the learners of English group and it even ranked after opting out for native Persian group. This could be attributed to the fact that EFL learners, under their mother tongue influence, were not willing to use this strategy even when they were dealing with people from lower social level or when they were speaking to their family members. Instead of embarking on the utilization of the required strategies, EFL learners tried to show their politeness and understanding of the situation of the interlocutors, exaggerating their feeling in some situations, which in most of the cases were the reasons for which their utterances were colored and halfway between Persian and English.

In all situations, native Persian speakers and EFL learners of English similarly tried to show their understanding of the situation and difficulty they may bring for the interlocutors upon helping them with their problem; thus, opinion-proving, request, advice, and suggestion are encouraged to use when such situations are dealt with according to Iranian culture. It has also previously been confirmed that indirect speech act usually denoted politeness in the Iranian context as well. According to Allami and Naeimi (2010), in a high-context culture such as Iran, people tend to use indirect, symbolic, vague, and implicit style of communication whereas a low-context culture is generally represented by direct, lucid, accurate, and explicit communication approach. This result is not consistent with Hardin's (2010) finding that, nonnative speakers use explicit speech act verbs in persuasive discourse, and the use of these verbs may be less dominant among native speakers.

Addressing the second research question

From the above-mentioned findings, the researchers deduced that there were a number of factors that partake in the weakness of the Iranian EFL learners in English language selection of correct persuasion strategy; influence from Persian and lack of pragmatic knowledge of English language stood ahead of them. Thus, based on these findings, the second hypothesis stating "there is no pragmatic transfer in persuasion strategies by Iranian EFL learners in their intercultural communication" could safely be rejected.

However, more salient pragmatic transfer of Iranian learners of English was one to one principle strategy, while based on the findings of the present study, avoidance and substitution were among the most frequent strategies which were pragmatically transferred from Persian into English by Iranian EFL learners.

CONCLUSION

The above-mentioned results demonstrated that there were some differences in persuasion strategies between the learners of English group and the native English group, while there were some similarities in persuasion strategy use between the learner of English group and the native Persian group. These research results provided an affirmative answer to the first question: there is a significant difference in the kind of persuasion strategies used by native English speakers and Iranian nonnative English speakers.

It is worth reminding again that the use of rules of speaking from one's speech act community when interacting or when speaking in a second or a foreign language is known as pragmatic transfer. There was also pragmatic transfer in the use of persuasion strategies by Iranian learners of English as a foreign language. However, it was impossible to provide evidence of pragmatic transfer without simultaneously describing what was transferred.

As discussed above, the persuasion strategies that were mostly used by Iranian learner of English group and Persian native speakers were: recommendation, opinion proving, request, advice, and suggestion. The Iranian learners of English group also displayed some features of their pragmatic transfer of strategies of avoidance and substitution when they conducted a certain type of speech act. Avoidance and substitution of particular speech act were due to the learners' lack of skill or explicit training, for example, in the way to form appropriate advice, or indirect commands. Moreover, learners tended to avoid or substitute for the level of directness appropriate for each context, either because they were unaware or because they lacked the necessary skills to do so (Koike 1994).

Finally, based on the findings of the study, it could be realized that English and Persian languages demonstrated parallel strategy in application of recommendation formula as the most preferred strategy while they revealed different patterns in application of order and ultimatum strategies as English people utilized them frequently; Persian speakers used these strategies quite rarely. As a result, Iranian learners of English transferred these habits to English not only because of the influence from their mother tongue but also as their lack of knowledge in pragmatic utilization of these strategies in English contexts. Moreover, evidence proved the existence of significant difference between English native speakers and Iranian EFL males and females in application of persuasion strategy. The results obtained from this study should be approached with caution since this study suffers from limitations, one of which is the limited number of native English speakers who served as the participants of the study. Future studies might be able to

make up for this limitation. It could also be suggested that future research in this area take gender differences into consideration and explore whether males and female use different persuasion strategies in the two speech communities under investigation or not.

ABSTRACT

Regarding the crucial role of vocabulary learning and retention in pedagogical context and the presence of Computer Assisted Language Learning (CALL) as new and powerful technology in the domain of foreign and second language learning, this study aims to reports on the design and results of an experiment with an objective of assessing the different effects of utilizing two vocabulary development strategies, namely an online dictionary and flash cards, on improving learners' vocabulary knowledge in ESP classes. To do so, 50 freshman learners, majoring information technology (IT), with an age range of 19-20 were randomly assigned into two comparison groups who learnt new technical Information Technology words by making use of an online dictionary and flash cards. The outcomes of the present study indicate that the comparison group 1 who utilized an online dictionary outperformed the comparison group 2 who made use of flash cards. The obtained results of the current study would be more beneficial to the students in order to enhance their capability in remembering and retaining new technical words. As well, it has some advantages for teachers and materials writers to present new vocabulary learning strategies.

KEYWORDS: vocabulary learning, ESP, flash cards, online dictionaries, CALL.

INTRODUCTION

The effectiveness of vocabulary learning methods and instructional techniques has been recognized as an important element in both first and second language pedagogy. During the 1990s, interest in vocabulary learning and teaching increased. Paul Nation's (1990) "teaching and learning vocabulary" appeared at the beginning of the decade and proved influential in its inclusive review of research on vocabulary while providing pedagogical guidance through interpreting the research in terms of classroom applications.

Second language acquisition depends crucially on the development of a strong vocabulary (Nation, 2001). Without an extensive amount of vocabulary and strategies for acquiring new

target words, learners may be unable to make use of some language learning opportunities around them such as watching TV, reading newspaper, listening to radio, etc. (Renandya & Richard, 2002).

According to Laufer (1997), vocabulary learning is considered as the heart of any language learning and language use. Metaphorically, Zhan-Xiang (2004) illustrates that words of a language are just like bricks of a high building: despite quite small pieces, they are vital to the great structure. If we spend most of our time studying grammar, our English will not improve enormously, much improvement is attained if we learn more words and expressions, little can be said with grammar but almost anything with words (Thornbury, 2002). Researchers now view vocabulary as an important language component upon which effective communication relies (Oxford & Scarella, 1994).

Learning vocabulary is seen as a key element to achieve a high level of proficiency in the target language by a large number of theoreticians (Boers & Lindstromberg, 2008). Also researchers, teachers, and authors in foreign language learning are paying special attention to foreign language vocabulary acquisition (Zu, 2009). It is believed that having a large and varied vocabulary is the indicator of communicative competence and it is one of the important aspects of language learning (McCrostie, 2007).

Considering the significance of vocabulary learning in the domain of language pedagogy, and with regard to the development of specific English courses such as English for technology, management, accounting, engineering, etc., most of the students encounter difficulties in learning and retaining technical English words relating to their specific course of instruction (ESP). Certainly, a great deal about the origins of ESP could be written. According to Hutchinson and Waters, (1987) there are two reasons common to the emergence of all ESP: the demands of a Brave New World, a revolution in linguistics, and focus on the learner.

Hutchinson and Waters (1987) point to the second world war as an " ... age of enormous and unprecedented expansion in scientific, technical and economic activity on an international scale · for various reasons, most notably the economic power of the United States in the post-war world, the role [of international language] fell to English" (p. 6).

The second key reason cited as having a tremendous impact on the emergence of ESP was a revolution in linguistics. Whereas traditional linguists set out to describe the features of language, revolutionary pioneers in linguistics began to focus on the ways in which language is used in real communication. Hutchinson and Waters (1987) point out that one significant discovery was in the ways that spoken and written English vary. In other words, given the particular context in which English is used, the variant of English will change. This idea was taken one step farther. If language in different situations varies, then tailoring language instruction to meet the needs of learners in specific contexts is also possible. Hence, in the late 1960s and the early 1970s there were many attempts to describe English for Science and Technology (EST). Hutchinson and Waters (1987) identify Ewer and Latorre, Swales, Selinker and Trimble as a few of the prominent descriptive EST pioneers.

David Carver (1983) identifies three types of ESP First, English as a restricted language such as the language used by air traffic controllers or by waiters. Second, English for academic and occupational purposes in which according to the 'Tree of ELT' (Hutchinson & Waters, 1987), ESP is broken down into three branches: a) English for Science and Technology (EST), b) English for Business and Economics (EBE), and c) English for Social Studies (ESS). And third, English with specific topics that emphasis shifts from purpose to topic.

The main focus of ESP in pedagogical domain is on the second type of ESP, i.e. English for academic and occupational purposes. According to Akbari&Tahririan (2009), students in an ESP context come across unfamiliar target words in text materials and need to adopt some deliberate strategies to facilitate learning and retention of those words in their memories. Considering the crucial role attributed to vocabulary learning and teaching in second and foreign language teaching, recently, there has been a revived interest in the vocabulary nature and its role in learning and teaching in general and in learning technical English words in ESP classes in specific (Richard & Renandya, 2002).

According to Al-Seghayer (2001), advances and increased availability of computers have altered and expanded the field of second/foreign language education. The concern has been narrowed to the investigation of the efficiency of presenting information using multiple modalities such as text, audio, still pictures, and dynamic videos in the field of SLA (Robin, 2008; Belmonte & Verdugo, 2007). According to Lomicka (1998), with the advance of multimedia application in second language teaching and learning the investigation of annotation has been taken a step further. The computer is able to take a role as an interlocutor in language learning tasks. As well, it provides additional lexical information in the form of enhanced input for the user or language learner (Groot, 2009)

In today's language classrooms, vocabulary teaching and learning is increasingly supplemented by software products. The most important reason for this is the possibility of integrating different modalities, i.e. pictures, animations, videos, and sounds in the program and consequently creating interactivity with that (al-Seghayer, 2001; Jones & Plass, 2002). Along with the use of computer in order to improve the students' vocabulary knowledge, flash cards are, as well, considered as an educational tool to help people to memorize information. These constructive instruments are considered as a practical tool for stimulating English learners vocabulary in English classes because in addition being handy and useful in the English language learning classrooms, they are highly effective, versatile and fun, too. They're also cheap to acquire or produce and, in fact, could even be made by the learners themselves. These cards are supposed to be imperative elements in teaching vocabulary and developing communicative skills. The learners would be able to improve their language learning ability via utilizing different kinds of flash cards, because these cards concentrate on repeating, memorizing, reading or listening, besides other skills. The teacher must plan this activity with a very specific objective according to the students' level (Lynch, 2010). Flash cards can also help learners to drill in the English alphabet, increase their concentration on games and also helps them to memorize vocabulary elements, images, phrases or even grammar aspects.

Many Iranian EFL learners tend to memorize new words in a conventional way, which is memorizing a long list of words with their translations in their mother tongue. However, this strategy would not be efficient in learning and retaining the words for a long period of time. Therefore, with the birth of new technology and new learning strategies in the field of second and foreign language learning, most EFL learners, teachers, and material writers prefer to utilize these strategies in order to enhance their vocabulary knowledge. Because of the importance of vocabulary learning in general and vocabulary development in ESP courses in specific, the present study aimed to investigate the effectiveness of two vocabulary learning strategies, online dictionary and flash cards, in ESP vocabulary instruction. To fulfill the present study, the following research questions were addressed in this paper:

RESEARCH QUESTIONS

1. What is the effect of using online dictionaries in improving EFL learners' vocabulary knowledge in ESP courses?
2. What is the effect of using flash cards in improving EFL learners' vocabulary knowledge in ESP courses?
3. What is the difference between using flash cards and online dictionaries in promoting EFL learners' vocabulary knowledge in ESP courses? Which one is more beneficial?

METHODOLOGY

This quasi-experimental study reports on the comparison between two vocabulary learning strategies, namely using an online dictionary versus flash cards, on improving Iranian EFL learners' acquisition of ESP words in Information Technology (IT) classes. The dependent variable of this study is learners' achievement of technical Information Technology (IT) vocabularies. The independent variables are two experimental groups who study using flash cards and an online dictionary.

Participants

Initially, 74 male and female students at Islamic Azad University in Bonab, Iran, aged 19-26, majoring Information Technology (IT), took the Michigan Test of English Language Proficiency (MTELP). Based on their scores, 50 were selected to participate in the study. In the next stage the participants were given a test of new target words which were presented in a table with four columns. The aim of this test was to measure whether the new vocabularies are familiar to the students or not. In the final stage the participants were randomly assigned into two comparison groups.

Materials

To fulfill the objectives of this study the following instruments were utilized:

- To ascertain the homogeneity of the subjects in terms of language proficiency, the Michigan Test of English Language Proficiency (MTELP) was employed.
- The new target words were presented in a four-column table to quantify whether the words are new to the students or not. This test was designed by the researcher and piloted

for its reliability and validity. The words were included in the first column. In the second column the participants were supposed to mark “yes” if they know the meaning of the new word, and mark “no” if they have not seen that word before in column three. Finally in column four they were required to write the meaning of the target word if it is familiar to them.

- Eight reading comprehension passages which were adopted from “Special English for the Students of Computer” written by ManoochehrHaghani (1386). The titles of the passages were: 1. *The Information Society*, 2. *Personal Computers*, 3. *Popular Productivity Software: Word Processing*, 4. *Putting Word Processing to Work*, 5. *Popular Productivity Software: Desktop Publishing*, 6. *Spreadsheet: The Magic Matrix*, 7. *The PC System Unit: Looking in the Box*, 8. *Processor Design*, 9.
- A thirty items vocabulary pre-test, with the reliability index of 0.82, measured by Pearson Correlation method, was designed in multiple-choice format.
- Flash cards which consisted of new technical Information Technology (IT) vocabularies on one side and their pronunciations, meanings, and examples on the other side.
- An online Information Technology (IT) dictionary which is a talking IT dictionary and helps users to learn and identify the meaning and pronunciation of technical key vocabularies. This dictionary is available in www.Englisg4IT.com
- And finally, a multiple-choice post-test which was developed for the purpose of this study with thirty items. This test was also measured in terms of its reliability through conducting the scores to Pearson correlation method. The results confirmed its reliability ($r=0.79$)

Procedure

At the beginning of the study, a standardized general English proficiency test, MTELP, was administered to 74 participants who were divided into two groups in order to assess the participants' proficiency level. Based on the outcomes, of this test 50 subjects were selected from among 98 learners. Then, these participants were randomly divided into two comparison groups. In order to measure the familiarity of the participants with the new target vocabularies, these words were presented in a four-column table. As well, the participants were supposed to take a thirty-item pre-test that was in multiple-choice form.

Before treatment the researcher provided a brief introduction about how to use online dictionary and how to use flash cards to learn the meaning of the new words. Afterward, eight reading comprehension passages which were adopted from “Special English for the Students of Computer”, written by ManoghehrHaghani, were presented to the students. The subjects in comparison group 1, were required to learn the new words in each passage by using flash cards. These flash cards included the new vocabulary, its meaning, its pronunciation, and an example. The subjects in comparison group 2 were supposed to learn each new word by using talking online dictionary designed for the students of Information Technology. After treatment, the students were provided with a post-test which comprised of thirty multiple-choice question items with one correct answer and three distracters. At the final stage, the data were collected and submitted to the Statistical Package for Social Sciences (SPSS version 17.0) to analyze the results.

RESULTS AND DISCUSSION

This study was an attempt to survey the relative effects of using an online dictionary and flash cards as two influential vocabulary learning strategies. To bring about the objectives of the present study and to answer the research questions, the collected data were conducted via submitting to SPSS for windows and the outcomes were reported as follows:

First, the scores obtained from general language proficiency tests were analyzed through paired-sample t-test. The results of this analysis are demonstrated in tables 1 and 2.

Table 1: Paired Samples Statistics in Language Proficiency Test

		Mean	N	Std. Deviation	Std. Error Mean
Pair 1	proficiency.G.1	80.6531	37	10.09239	1.44177
	proficiency.G.2	79.9388	37	12.45895	1.77985

Table 2: Paired Samples Test in Language Proficiency Test

	Paired Differences					t	df	Sig. (2-tailed)
	Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
				Lower	Upper			
Pair proficiency.G.1 - proficiency.G.2	.71429	14.10526	2.01504	-3.33722	4.76579	.354	48	.725

The results in table 1 Shows that the mean score of the subjects in group 1 of proficiency test is 80.65 and the mean score for group 2 is 79.93. Accordingly, the mean scores are approximately at the same level and there is no significant difference in terms of general proficiency level between the participants. ($p=.725$). To answer the first research question, which addresses the effectiveness of utilizing vocabulary online dictionaries on improving EFL learners' vocabulary knowledge, the scores of the both pre and post tests for experimental group 1, those who learnt the target words through an online dictionary, were submitted to paired-sample T-test. The results of this analysis are presented in tables 3 and 4.

Table 3: Paired Samples Statistics for both Pre-Test and Post-Test of Comparison Group 1

		Mean	N	Std. Deviation	Std. Error Mean
Pair 1	online.dic.pretest	19.1600	25	3.59026	.71805
	online.dic.posttest	24.2800	25	3.70270	.74054

Table 4: Paired Samples Test for both Pre-Test and Post-Test of Comparison Group 1

		Paired Differences					t	df	Sig. (2-tailed)
			Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
					Lower	Upper			
Pair	Online dictionary pre-test Online dictionary post-test	-5.12000	2.22336	.44467	-6.03776	-4.20224	-11.541	24	.000

According to the results of table 3, the mean score for the participants in the comparison group 1, who utilized an online dictionary, in post-test is 24.28 which is higher than the mean score of the same subjects in the pre-test (19.16). These outcomes, as confirmed by the results of table 4, demonstrates that there is a significant difference between the performances of the subjects in group 1 in both pre and post tests and using an online dictionary as a vocabulary learning strategy in ESP classes has an influential effect on enhancing EFL learners vocabulary learning and retention. With regard to the second research question, the collected data from both pre and post test of the subjects in experimental group 2 who learn ESP vocabularies via flash cards were analyzed through utilizing paired-sample t-test and the results are revealed in tables 5 and 6:

Table 5: Paired Samples Statistics for both Pre-Test and Post-Test of Comparison Group 2

	Mean	N	Std. Deviation	Std. Error Mean
Pair 1 flashcard.pre	19.8000	25	3.47611	.69522
flashcard.post	22.2800	25	3.60000	.72000

Table 6: Paired Samples Test for both Pre-Test and Post-Test of Comparison Group 2

		Paired Differences				t	df	Sig. (2-tailed)	
		Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
					Lower				Upper
Pair	Flash cards pre-test Flash cards post-test	-2.48000	1.85113	.37023	-3.24411	-1.71589	-6.699	24	.000

The results in table 5 illustrates that the participants in comparison group 2 outperformed in post-test than in pre-test. Since the mean score for post-test is 22.28 which is higher than the mean score for pre-test (19.80). As well, the results of table 6 shows that the difference between performances of the subjects in group 2 in pre and post tests is dominant, since the Sig. ratio is

($p=.000$). Consequently it can be concluded that using flash cards has a positive effect on improving learners' ESP vocabularies. In order to answer the third research question which deals with the comparison between the effectiveness of both aforementioned vocabulary development strategies, the scores of the post-tests of both groups were conducted by the use of paired-sample t-test. The following tables illustrate the obtained results:

Table 7: Paired Samples Statistics for both Comparison Groups in Post-Tests

		Mean	N	Std. Deviation	Std. Error Mean
Pair 1	online.dic post-test	24.2800	25	3.70270	.74054
	Flashcard post-test	22.2800	25	3.60000	.72000

Table 8: Paired Samples Test for both Comparison Group in Post-Tests

		Paired Differences					t	df	Sig. (2-tailed)
		Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
					Lower	Upper			
Pair	Online dictionary post-test Flash cards post-test	2.00000	1.93649	.38730	1.20066	2.79934	5.164	24	.000

As it is demonstrated in table 7, the mean score for the subjects who learnt ESP vocabularies through an online dictionary is higher than the mean scores of those who made use of flash cards ($m=24.28 > m=22.28$). in accordance with the end result s of table 7, there is significant difference between the performances of subjects in both comparison groups in post-test and the participants in group 1 outperformed those in group 2 ($p=.000$).

Discussion

The present study was designed to shed light on the effects of using online dictionaries and flash cards on improving Iranian learners' vocabulary knowledge in ESP classes. The first and the second research questions addressed the effectiveness of using different vocabulary development strategies and the third research question compared these two strategies. The outcomes obtained through data analysis confirmed that the comparison group 1 who learnt new words via an online dictionary surpassed than those in group 2 who used flash cards. Furthermore, comparing and measuring the mean scores and standard deviations in tables 7 and 8 indicated that the students are more likely to use multimedia technology than the other paper-based methods. The findings of the present study is in line with the findings of Tick (2009), who have posited online dictionary technology may lead to positive effects in learning environments because of its widespread use and being as a kind of new technology .

As well, the outcomes echo those of the study conducted by Davies (2002), showing that vocabulary learning via flash cards can be more effective than massed vocabulary learning

through paper medium. He believes that this success may be due to students' easy access to flash cards, which results in their repeated exposures to and frequent practice of the vocabulary items on a daily basis.

Le (2010) also studied the effect of multimedia and traditional approach to the identification of English vocabularies. The result of his study was strongly in favor of multimedia technology. Emphasizing the importance of vocabulary learning, Brown (1973) stated that more attention can be placed on new target words by using new strategies to highlight new words for L2 learners.

CONCLUSION

The main purpose of the current study was investigating two different vocabulary learning strategies, namely using online dictionaries vs. flash cards, in remembering and retaining newly presented technical words. According to the obtained outcomes, it was observed that presenting new words through online dictionaries was more beneficial than presenting those words by the use of flash cards. Since, the mean scores of the students in group 1 (online dictionary group) was higher than those in group 2 (flash card group). The needs of struggling readers highlight the importance of teachers making correct pedagogical decisions in identifying target vocabulary and choosing appropriate materials. Working with a limited range of genres at any one time is also a valid idea to enable students to engage in learning new target words before moving on. These findings highlight the demands on teachers not just to be able to plan effective tasks, but also manage them in a way which will lead to students acquiring vocabulary effectively. Accordingly, this paper shows that making use of multimedia technology in general, and online dictionaries in this study in particular, would provide a wider path to the Iranian learners to enhance the amount of their vocabulary learning and retention. Therefore, in addition to utilizing paper-based methods such as flash cards, it would be very influential to provide learners, especially those in ESP classes with opportunities to be aware of the merits of employing technology in their vocabulary learning and retention. The major limitation of this study was imposed by administrative restrictions. Since this study was done at the university, the number of the students who participated in the study was limited. As well, in this study, only two vocabulary learning strategies were investigated, while it is possible to survey more vocabulary learning strategies.

ABSTRACT

English language has been an important medium of instruction throughout the world and has been utilized in both spoken and written form for conveying intended meanings. This paper aims to exploit Halliday and Hassan's framework of cohesion (1976) to analyze Ayatollah Khamenei and Rouhani's viewpoints about the nuclear negotiations derived from Reuters(2015) . A qualitative research methodology was utilized to analyze the writing of two news articles, named as "Iran's Khamenei hints ready to accept fair nuclear deal as talks proceed" which was retrieved on February, 2015 and has been translated by Balali and Nasralla(2015), and as "Iran's Rouhani says goal of nuclear negotiation is win-win outcome" translated by Dehghanpisheh and pressed in Reuters on February, 2015. The results confirmed the use of cohesive devices in these papers. Among cohesive devices, references particularly personal references and lexical cohesion were the most cohesive devices which were utilized in these papers.

KEYWORDS: cohesion, cohesive devices, discourse, texture, text

INTRODUCTION

The term "discourse" is used in day-to-day language interchangeably with discussion or dialogue. The story of a discussion or dialogue is the object of discourse analysis. Such analysis aims to expose patterns and hidden rules of how language is used and narratives are created. Thus, discourse analysis is a research method which involves examining communication in order to gain new insights. People in a variety of academic departments use the term discourse and discourse analysis for what they do, how they do it, or both. Many of these people have some training in general linguistics, and some identify themselves as linguists. Others, however, would identify themselves with other fields of study, such as communication, anthropology, psychology, education, and so on (Johnstone, 2008).

The study and analysis of actual language in use is the goal of text and discourse analysis. In talking about texture the most important concept is that of TIE. The term itself implies a relation: you cannot have a tie without two members, and the members cannot appear in a tie unless there is a relation between them. The nature of this link is semantic: the two terms of any tie are tied together through some meaning relation. Such meaning relation form the basis for cohesion between the messages of a text (Halliday & Hassan, 1976). Cohesion is in the level of semantic, which refers to relations of meaning that exist within the text, and that define it as a text (Halliday & Hasan, 1976). Cohesion occurs when the interpretation of some element in the discourse is dependent on that of another. Once people are involved in writing two or more interconnected sentences, they have to use cohesive devices and coherence as a means of linking sentences together.

Theoretical background

Blommaert (2005) states that to discourse analysts, discourse refers to real instances of communicative actions in the medium of language, although some defined the term more broadly as a meaningful symbolic behavior in any mode. There are various methods of discourse analyses which are emerged from different interpretations of the meaning of discourse (Mills, 1997; Torfing, 2005). Linguistic traditions define discourse solely as the units of written and spoken communication under study and focus on the content of texts and conversations. Other social science traditions define discourse as being derived from and dependent on social practices –the complex mix of cultural norms, disciplines and rituals– which govern discursive formations (Hajer, 1995). Social practices form sets of rules which work together to construct discourses. A definition of discourse which encompasses social practices draws attention to how discourses are formed and shaped, and to the possibility of contrasting set of influences producing divergent discourses.

Although discourse analysis has been a busy field of activity for many years, there is a good deal of uncertainty about what it actually is. The generally accepted view is that it has something to do with looking at language above or beyond the sentence, but this is hardly an exact formulation. Stubbs (1983) strongly stated that discourse analysis refers to attempts to study the organization of language above the sentence, or above the clause, and therefore to study larger linguistic units, such as conversational exchanges or written texts. However, this definition has been criticized because it didn't specify whether the terms clause or sentence refer to the same thing or not and whether the linguistic organization to be analyzed is above a clause or above a sentence.

According to Halliday (1994) a text, in the simplest way, is language that is functional. By functional, he means language that is doing some job in some context as opposed to isolated words or sentences that might be put on the blackboard. So, any instance of living language that is playing some part in a context of situation is called a text. He, further, believes that a text is both product and a process. The text is a product in the sense that it is an output, something that can be recorded and studied, and it is a process in the sense of a continuous process of semantic choice and a movement through the network of meaning potential. Ruqaiya Hasan (1984) proposed that the structure of a text is closely related to the context of situation, so much so that the specific values of field, tenor and mode, which together make up a contextual configuration,

can be used to make certain predictions about the structure of the text, just as the unfolding structure of the text itself can be used as a pointer to the very nature of the contextual configuration. Thus, there is a two-way relationship between text structure and contextual configuration: the on-going structure of the text defines and confirms the nature of the contextual configuration, while the latter acts as a point of reference for deciding what kind of elements can appropriately appear when, where, and how often which refers to texture, the main objective of this study. Texture is the basis for unity and semantic interdependence within text and a text without texture would just be a group of isolated sentences with no relationship to one another.

Eggs (1994: 85) refers to the term texture put forth by Schegloff and Sacks (1973: 74) “sequential implicativeness” which proposes that language follows a linear sequence where one line of text follows another with each line being linked or related to the previous line. This linear progression of text creates a context for meaning. Contextual meaning, at the paragraph level is referred to as “coherence” while the internal properties of meaning are referred to as “cohesion”. Since Systemic Functional Linguistics considers function and semantics as the basis of human language and communicative activity, Halliday and Hasan’s (1976) model of cohesion was adopted as the most suitable method for analyzing the legal text. This is because they (Halliday & Hasan, 1976) gave a detailed insight into the study of cohesion.

According to Van Dijk (1985), cohesion is a concept that is associated with the surface making of coherence which signals the ties between sentences and the points being made. He points out that cohesion is only part of the convention of coherence for the elements of a text to be seen as “connected”, with or without overt linguistic connections between these elements. Woods (2006) defines cohesion in terms of the distinction that is made between the illocutionary act and the proposition. In his view, prepositions, when linked together, form a text, whereas illocutionary acts, when related to each other, create different kinds of “discourse”.

Coherence has both “situational” coherence when field, tenor, and mode can be identified for a certain group of clauses and “generic” coherence when the text can be recognized as belonging to a certain genre. As mentioned before, cohesion relates to the “semantic ties” within text whereby a tie is made when there is some dependent link between items that combine to create meaning. Therefore, texture is created within text when there are properties of coherence and cohesion, outside of the apparent grammatical structure of the text.

Cox, Shanahan, and Sulzby (1990) supported the idea that cohesion is important for the reader in constructing meaning from a text and for the writer in creating a text that can be easily comprehended. Connor (1984) defined cohesion as the use of explicit cohesive devices that signal relations among sentences and parts of a text. This means that the appropriate use of cohesive devices enables readers and listeners to capture the connectedness between what precedes and what follows.

Like all the components of the semantic system, cohesion is realized through grammar and vocabulary (Tanskanen, 2006). Cohesion can therefore be divided into grammatical and lexical cohesion. Grammatical cohesion includes devices such as reference, substitution, ellipsis and

conjunction, while lexical cohesion is divided into reiteration (repetition, synonymy etc.) and collocation (co-occurrence of lexical items).

Grammatical cohesion is constructed by the grammatical structures each component tie each other. Halliday and Hasan (1976) classify grammatical cohesion into 4 major classes: Reference, Substitution/ Ellipsis, Conjunction, and lexical cohesion.

Referencing

Referencing functions as a means for retrieving presupposed information in text and must be identifiable for it to be considered as cohesive. According to Eggins (1994), in written text, referencing is illustrated for determining of how the writer introduces participants and keeps track of them throughout the text. There are three general types of referencing: homophoric referencing, which refers to shared information through the context of culture, exophoric referencing, which refers to information from the immediate context of situation, and endophoric referencing, which refers to information that can be “retrieved” from within the text. It is this endophoric referencing which is the focus of cohesion theory. Endophoric referencing can be divided into three areas: anaphoric, cataphoric, and esphoric. Anaphoric refers to any reference that “points backwards” to previously mentioned information in text. Cataphoric refers to any reference that “points forward” to information that will be presented later in the text. Esphoric refers to any reference within the same nominal group or phrase which follows the presupposed item. For cohesion purposes, anaphoric referencing is the most relevant as it “provides a link with a preceding portion of the text” (Halliday & Hasan, 1976: 51). Functionally speaking, there are three main types of cohesive references: personal, demonstrative, and comparative. Personal reference keeps track of function through the speech situation using noun pronouns like “he, him, she, her”, etc. and possessive determiners like “mine, yours, his, hers”, etc. Demonstrative reference keeps track of information through location using proximity references like “this, these, that, those, here, there, then, and the”. Comparative reference keeps track of identity and similarity through indirect references using adjectives like “same, equal, similar, and different, else, better, more”, etc. and adverbs like “so, such, similarly, otherwise, so, more”, etc.

Substitution and ellipsis

Substitution and ellipsis operate as a linguistic link at the lexico-grammatical level. In Bloor and Bloor (1995: 96), substitution and ellipsis is used when “a speaker or writer wishes to avoid the repetition of a lexical item and is able to draw on one of the grammatical resources of the language to replace the item”. The three types of classification for substitution and ellipsis: nominal, verbal and clausal, reflect its grammatical function. When something in text is being substituted, it follows that the substituted item maintains the same structural function as the presupposed item. In nominal substitution, the most typical substitution words are “one and ones” and they substitute nouns. In verbal substitution, the most common substitute is the verb “do” and is sometimes used in conjunction with “so” as in “do so” and substitute verbs. Halliday and Hasan (1976: 125–126) point out that “do” often operates with the reference items “it” and “that” but still have the main function as a verbal substitute because of its grammatical role. In clausal substitution, an entire clause is substituted and though it may seem to be similar to either nominal or verbal substitution, the difference is the presupposed anaphoric reference. Though substitution

and ellipsis are similar in their function as the linguistic link for cohesion, ellipsis differs in that it is “substitution by zero” (ibid: 142). Ellipsis refers to a presupposed anaphoric item although the reference is not through a “place-marker” like in substitution. The presupposed item is understood through its structural link. As it is a structural link, ellipsis operates through nominal, verbal and clausal levels. Halliday and Hasan further classify ellipsis in systemic linguistic terminology as deictic, enumerative, epithet, classifier, and qualifier.

Conjunction

Conjunction, as described by Bloor and Bloor (1995: 98) acts as a “cohesive tie between clauses or sections of text in such a way as to demonstrate a meaningful pattern between them”, though Halliday and Hasan (1976: 227) indicate that “conjunctive relations are not tied to any particular sequence in the expression”. Therefore, amongst the cohesion forming devices within text, conjunction is the least directly identifiable relation. Conjunction acts as a semantic cohesive tie within text in four categories: additive, adversative, causal and temporal. Additive conjunction acts to structurally coordinate or link by adding to the presupposed item and are signaled through “and, also, too, furthermore, additionally”, etc. Additive conjunction may also act to negate the presupposed item and is signaled by “nor, and...not, either, neither”, etc. Adversative conjunctions act to indicate “contrary to expectation” (ibid: 250) and are signaled by “yet, though, only, but, in fact, rather”, etc. Causal conjunction expresses “result, reason and purpose” and is signaled by “so, then, for, because, for this reason, as a result, in this respect, etc.”. The last conjunctive category is temporal and links by signaling sequence or time. Some sample temporal conjunctive signals are “then, next, after that, next day, until then, at the same time, at this point”, etc.

Lexical cohesion

Lexical cohesion differs from the other cohesive elements in text in that it is non-grammatical. Lexical cohesion refers to the “cohesive effect achieved by the selection of vocabulary” (ibid: 274). The two basic categories of lexical cohesion are reiteration and collocation. Reiteration pertains to the repetition of a lexical item, either directly or through the use of a synonym, a super ordinate or a generally related word. Collocation pertains to lexical items that are likely to be found together within the same text. Collocation occurs when a pair of words is not necessarily dependent upon the same semantic relationship but rather they tend to occur within the same lexical environment (ibid: 286). The closer lexical items are to each other between sentences, the stronger the cohesive effect.

Empirical background

Many researchers have conducted various researches focusing on cohesive devices and applying these devices in written and spoken languages in EFL and ESL contexts. In a study which was conducted by Liu and Braine (2005) investigating cohesive features in argumentative writing produced by 96 chines undergraduate students, it was confirmed that students were incapable of using cohesive devices proficiently in their writing.

Xuefan (2007) investigated the use of lexical cohesive devices by 15 each of 1st-and 3rd-year English majors in china. The outcomes revealed that proficiency levels were not influential on the

students' implementation of cohesive devices in their writing. Additionally, it was stated that repetition was more significantly used than other types of lexical cohesion. Ahmed (2010) investigated students' cohesion problems in EFL essay writing. The participants in the study were Egyptian student-teachers. The researcher concluded that the low English proficiency of the students caused their non-cohesive writing.

Crossley and McNamara (2012) examined the possibility of predicting second language (L2) writing proficiency through the use of different linguistic features. The study's corpus comprised of 514 essays that were collected from graduating Hong Kong high-school students at seven different grade levels. The study's analysis stressed the notion that proficiency did not produce texts that were more cohesive, though they constructed texts that were more linguistically sophisticated.

Al-Jarf (2001) investigated the use of cohesive devices by 59 Arab EFL students from King Saud University. Substitution was deemed to be the most problematic form of cohesion for the students followed by reference and ellipsis. Furthermore, the outcome of the study also indicated that "cohesion anomalies were caused by poor linguistic competence, especially poor syntactic and semantic awareness, and poor or inaccurate knowledge of the cohesion rules" (Al-Jarf, 2001: 141).

RESEARCH QUESTIONS

Considering the vital role of coherence and cohesive devices in interpreting the spoken and written discourse, and despite many researchers who have identified several types of cohesion (Brown & Yule, 1983; Cook, 1989; McCarthy, 1991; Renkema, 1993), the current study was designated to interpret the viewpoints of Iran's supreme leader, Ayatollah Khameneie, and Iran's president, Hassan Rouhani, based on Halliday and Hasan's (1976) cohesion framework due to the comprehensiveness of its well-developed taxonomy. To do so, the following research questions were proposed in the study:

1. What types of cohesive devices are used by Iranian diplomats in their spoken discourse?
2. How frequently do those diplomats use these cohesive devices in their speaking?

METHODOLOGY

Sifting through all the available approaches and facing with the enormous range of suggested ways, on may doubt which one to choose, however, the present study refers to Halliday and Hassan's (1976) four dimensional framework to analyze two news articles. The paper aimed to unveil the cohesion of the texts produced by Iranian leaders through exploiting cohesive devices of news interviews.

The corpus of the study

The corpus for this study on the use of cohesive devices came from two online reports. The first one is about Iran's paramount leader's viewpoints about nuclear power entitled as "Iran's Khamenei hints ready to accept fair nuclear deal as talks proceed" presented in "REUTERS" by

Mehrdad Balali and Shadia Nasralla on February 8, 2015. The second report illustrates Iran's president approach towards nuclear power negotiation which was pressed in "REUTERS" by Babak Dehghanpisheh on February 11, 2015. The title of this report is "Iran's Rouhani says goals of nuclear negotiation are win-win outcome."

The data analysis procedure

Based on the taxonomy of cohesive theory provided by Halliday and Hassan (1976), the four elements of this theory, referencing, substitution and ellipses, conjunction, and lexical cohesion, built the categories for analysis. Each device and its functions are explained below accompanied by examples obtained from the corpus.

Referencing

Referencing functions as a means for retrieving presupposed information in text and must be identifiable for it to be considered as cohesive. *Example: he in line 15 refers to Ayatollah Khameneie; those deadlines in line 94 refers to end of March and a June 30.*

Substitution and ellipsis

Substitution and ellipsis operate as a linguistic link at the lexico-grammatical level. It is used when to avoid the repetition of a lexical item. *Example: in line 44, if they can refers to taking the weapon of sanctions away from the enemy by Iran's nuclear negotiators.*

Conjunction

Conjunction acts as a cohesive tie between clauses or sections of text in such a way as to demonstrate a meaningful pattern between them. *Example: neither, for, however, and, until, etc.*

Lexical cohesion

Lexical cohesion refers to the "cohesive effect achieved by the selection of vocabulary. *Example: date and time.... Sunday, second time, November, in 2013, in 1986, June 30, March, Wednesday, 36th anniversary of Iran's Islamic Revolution, Monday*

To provide detailed portrait of cohesion in writing and speaking, the following results are presented and discussed from cohesive theory with four major cohesive devices (referencing, substitution and ellipsis, conjunction, and lexical cohesion) proposed by Halliday and Hassan (1976).

RESULTS AND TEXT ANALYSIS

According to the purpose of the study and abovementioned research questions, the papers were analyzed regarding cohesive devices as follows:

Referencing

As mentioned in previous paragraphs, referencing refers to retrieving presupposed information in text. Generally, there are three main types of cohesive references: personal, demonstrative, and

comparative. This research paper aims to analyze the passages in terms of incidences of personal, demonstrative and comparative references. Table 1 shows the results:

Table 1: Incidences of Personal References

<i>Personal References</i>			
<i>Line</i>	<i>Reference</i>	<i>Line Reference</i>	<i>Referenced Item</i>
1	He	1	Iran's paramount leader
2	It	1-2	A fair nuclear accord
5	I	5-7	Clerical supreme leader Ayatolla AliKhameneie
7	His	7	Clerical supreme leader Ayatolla AliKhameneie
10	His	9-10	President Hassan Rouhani
12	Its	12	The other party
14	It	14	On side
15	His	14	Khamenei
15	He	15	Khamenei
28	He	28	Khamenei
31	His	28	Khamenei
36	Its	35-36	Tehran
37	Themselves	37	Negotiators
38	They	36-36	Negotiators
43	Our	43	Iran
44	They	43-44	Iran's negotiators
44	Our	43-44	Iran
47	He	46-47	Khamenei
55	He	54-55	Zarif
57	They	57	Sanctions
59	You	59-60	Munich gathering
59	Them	57-58	Khamenei and Zsrif
59	He	57	Zarif
61	Its	61	Israel
65	Itself	64-65	Iran
66	His	66	Netanyahu
68	Its	67-68	Iran
70	Its	69-70	Iran
73	He	69	Rouhani
77	He	76	Khamenei
77	It	77	Each side of negotiation
77	His	76	Khamenei
84	His	82	Rouhani
86	His	85-86	Khamenei
87	We	----	Iran's government
88	Our	----	Iran
90	We	----	Iran's government
97	Its	95	Iran
103	You	102	Criticism
105	He	102	Rouhani
106	you	102	Criticism

In this paper, there were forty-one incidences of personal references whichact to track of participants throughout the text. Most of these references are anaphoric. For example, in line 5, the "I" refers back to "Clerical supreme leader Ayatolla AliKhameneie" in lines 5-7. The second

type of references is the demonstrative references which are utilized as verbal pointing to indicate a scale of proximity to presupposed reference. The most common kind of demonstrative reference is a definite article “the” that acts to identify. For instance in line 9, “the conciliatory approach” refers to the approach of President Hassan Rouhani in the same line. “the clerical” in line 82 refers back to Ayatollah Khamenei in lines 80-81. Table 2 reveals the demonstrative reference incidences.

Table 2: Incidences of Demonstrative References

Demonstrative References			
Line	Reference	Line Reference	Referenced Item
9	The conciliatory approach	9-10	President Hassan Rouhani
11	The president	10	Rouhani
12	The other party	3-4	The West
16	The long-running nuclear dispute	3-11	Nuclear negotiation
22	The major oil producer	21	Iran
24	The risk	22-25	Of a wider Middle East War
30	The powers	2	World powers
33	The annual conference	33	Munich Security conference
43	The weapon	42-43	Of sanctions
43	The enemy	General	The other party
46	The highest office	7	The supreme leader
46	The Islamic republic	41	Iran
47	The nuclear talk	43-46	Negotiation
49	The Shi'ite clergy	46	Ayatollah Khameneie
49	The powerful Revolutionary Guard	48-49	Hardliners in parliament
59	The Munich gathering	31-34	The annual high-profile Munich Security conference
82	The clerical	80-81	Ayatollah Khameneie
89	The official news agency	89	IRNA
94	Those deadlines	91-93	End of March and a June 30
95	The march deadline	91-93	End of march
110	The region	109-111	Islamic State

In addition to personal and demonstrative incidences of reference, this paper is comprised of several comparative incidences of referencing. The major contribution of these kinds of references is to show similarity or likeness as well as demonstrating the comparison between or among referenced items. For example in line 6, “no agreement is better than” compares the no agreement with an agreement which runs contrary to our nation’s interests. Or in line 46, “the highest office” shows the most important person (Ayatollah Khamenei) in Iran. The whole analysis of the texts in terms of showing comparative reference incidences are presented in table 3.

Table 3: incidences of comparative references

Comparative references

Line	Reference	Line Reference	Referenced Item
6	No agreement is Better than bad one	5-6	Agreement
12	The other party	10	Western powers
22	The major oil producer	21	Iran
24	The risk of wider war	24-25	Middle East war
40	Major sticking points	35-39	Points in nuclear negotiation
46	The highest office	46	Ayatollah Khameneie
76	Iran's highest authority	76	Ayatollah Khameneie

Substitution and ellipsis

As aforementioned, Halliday (1994) introduced substitution and ellipsis as the crucial characteristics of spoken text. These are utilized to represent grammatically cohesive relations. In substitution, one item is replaced with another and in ellipsis an item is omitted. In this article, there were just three notations of substitution. For example, in lines 43-44, "if they can" is interpreted to be a substitution of "taking the weapon of sanctions away from the enemy by Iran's nuclear negotiators. The other instances of substitutions are presented in table 4. Regarding ellipsis, something is left unsaid in the passage and it's the responsibility of the reader to supply the missing information. In line 14, "one side" refers to line 9-12 in which the elliptical reference to the negotiators in nuclear dispute that are the world powers and Iran. Table 5 represents the elliptical references in the article.

Table 4: Substitution Summary

Substitution			
Line	Reference	Line Reference	Substituted Information
44	If they can	43	taking the weapon of sanctions away from the enemy by Iran's nuclear negotiators
44	If they fail	43	not taking the weapon of sanctions away from the enemy by Iran's nuclear negotiators
81	Than a bad one	80	having an argument with the powers

Table 5: Ellipsis Summary

Ellipsis			
Line	Reference	Line Reference	Elliptical Reference
14	One side	9-12	Parties in nuclear negotiation
29	A single-stage	28	Negotiation
30	As the powers want	29	To lift the weapons of sanctions
37	A seven month extension	35-36	Extension of negotiation
44	They can	43-44	Taking the weapon of sanction away...
44	They fail	43-44	Not taking the weapon of sanction ...
45	This weapon	43	Weapon of sanctions
45	Khameneie	General	Supreme Leader Ayatollah Ali Khameneie
46	Islamic Republic	General	Of Iran
50	Tehran and Washington	35	Nuclear negotiators
54	Zarif	General	Iranian Foreign Minister, Mohammad JavadZarif
77	Neither side	69-72	Of nuclear negotiations
87	The battle field	87-89	Of negotiation table
102	Rouhani	General	Iran's President Hassan Rouhani
104	No path	103	Of having peace and well-being to be ...
111	The region	103-105	Middle East

Conjunction

Conjunction contributes to textual cohesion by linking successive sentences that are not structurally related. Halliday defines conjunction as “ a clause or clause complex, or some longer stretch of text, which may be related to what follows it by one or other of a specific set of semantic relations” (1994: 310). Under broad category of conjunction, four subcategories capture different relations: additive (and, in addition to, also, etc), adversative (however, instead, but, etc), causal (for this reason, because, since, for, etc), and temporal (next, after that, until, previously, etc). All four types of conjunctions represented in the current article are demonstrated in table 6.

Table 6: Conjunction Summary

Conjunctions			
Additive	Adversative	Causal	Temporal
Neither And Also	But However Rather Yet Than	Since For	After Until Last November

Lexical cohesion

Lexical cohesion differ from the other cohesive elements in that it is non grammatical. Lexical cohesion refers to the “cohesive effect achieved by the selection of vocabulary” (Halliday and Hassan, 1976:274). The two basic categories of lexical cohesion are reiteration and collocation. Reiteration pertains to the repetition of a lexical item, either directly or through the use of a synonym, a super-ordinate or a generally related word. Collocation pertains to lexical items that are likely to be found together within the same text. Collocation occurs when a pair of words is not necessarily dependent upon the same semantic relationship but rather they tend to occur within the same lexical environment. Whether it is through the different forms of reiteration or through collocation, a clearly identifiable choice of lexical pattern is very apparent. In table 7, a general word list is utilized to generalize the overall pattern of lexical cohesion from the article. It is necessary to mention that repetition of lexis is due to repetition in the text.

Table 7: Lexical Cohesion Summary

Lexical Cohesion	
Categories	Lexis
Power	Paramount, power, supreme, clerical, leader, president, clergy, senior, senator, prime minister, authority, elite.
Date and time	Sunday, second time, November, in 2013, in 1986, June 30, March, Wednesday, 36 th anniversary of Iran's Islamic Revolution, Monday
Improvement	Boosting, landslide, enrichment, ambitious, extension, raise, develop, continue.
negotiators	Officials, negotiators
Disagreement	Oppose, contrary, illogical, rejection, against, suspected, deny, conflict, stand-off, preventing, enemy, overrule, skeptical, criticism, severed, blasted, conservative, critics
Agreement	Go along, accept, back up, sanction, coincide, agree, endorse, assuring, agreement, rapprochement, fair accord, interest, conciliatory, détente, diplomatic relation, compromise, final accord, reach a common point.
Negotiation	Deal, statement, message, negotiation, dispute, remark, talk, comment, discussion, sticking point, consultation, speech.
Nations	Iran, world, nations, West, international world, Middle East, Syria, Iraq, Tehran, US, Russia, China, Britain, France, Munich, Islamic Republic of Iran, Washington, Afghanistan, Israel, Germany, Lebanon, Yemen, Islamic State
News Agencies	ISNA, RUTERS, IRNA, FARS.
Output	Demand, behavior, capability, consensus, output.
Nuclear	Nuclear weapon, uranium, nuclear arm agenda, nuclear program, civilian energy, nuclear fuel production capacity, oil production, nuclear bomb, nuclear talk/negotiation.
Amount	Major, excessive, alternative, crucial, wider, deeply, firmly, high profile, more time, technical, size, length, so much, highest, bilateral, underlying, further, strongest, high stake, mutual, broad.
End	End up, finals, limit, end, deadline, removed, take away, crippling, scrap, get rid of s.th, defuse, undermining, quite, change, ravage, uprooted, drive s.th out.
Meeting	Conference, parliament, meeting, office, gathering, cabinet,
Nationalities	Shi'ite, Sunni Muslims, Islamic State, Al-Qaeda.
Dangers	Dull, unidentified, mortal, thread, bad, dangerous, imperil, warn, fear, suspicious, wrong, inhuman, illegal, covert, war, battlefield, independence.
People	Ayatollah Ali Khameneie, Zarif, Benjamin Netanyahu, Rouhani, John Mclain, Barak Obama.
Idea	Approach, point of view
Peace	Peace, well-being, peaceful, win-win, security, ceremony, independence, liability.
Groups	Government, terrorism, world powers, arms, negotiators, terrorist groups, people, militants, hardliners, officials, diplomats, western officials.

CONCLUSION

Discourse analysis challenges researchers to question policy making process, how dialogue takes place, and how power relations produce dominant discourses and marginalizes others. Such questions require researchers to be reflective, querying the research material in ways that they may not otherwise consider (Richardson, 2001). This study contributes to literature on pragmatic analysis of metadiscourse in lectures of clerical Supreme Leader Ayatollah Khamenei and President Hassan Rouhani about Iran's nuclear negotiations with world powers. The relevance theory was adapted from Halliday and Hassan's cohesive theory (1974). This theory is constructed to theoretically explore the occurrence and the role of cohesive devices in lectures by Iranian diplomats. In order to meet the requirements of the current study, two lectures by Ayatollah Khamenei and Hassan Rouhani were selected from Reuters and was analyzed based on

cohesive theory considering the occurrences of four major cohesive devices (reference, substitution and ellipsis, conjunction, and lexical cohesion).

Cohesion analysis has shown what principles exist that creates semantic links within text between sentence and paragraph boundaries. The data of the study was qualitatively analyzed through identifying the numbers and the types of aforementioned cohesive devices. According to the discussion of results presented hereinbefore, two cohesive types, namely reference and lexical cohesion are the major forms of cohesion used to hang sentences together in editorials analyzed. Of these ties, it was demonstrated that the occurrence of lexical cohesion in terms of frequency was slightly higher than reference cohesion. But among different types of references, it was observed that personal reference items were the most of the reference cohesions utilized in the texts. The results, as well, illustrated that the lectures are highly coherent texts as they tend to make use of all cohesive devices in hanging sentences together, albeit at varying degrees or frequencies of occurrence. In this study, only two article papers were analyzed by the use of cohesive theory. The corpus of two articles is not small considering the qualitative and quantitative nature of the study. However, the corpus does not provide sufficient findings to allow generalization about the rhetorical structures of all the news articles. One way to verify the results is to undertake investigations using larger sample sizes from various journals.

Farhad Fahandezh Saadi Ph.D.

ABSTRACT

In the modern world, mobile phone as a new addition to information and communication technologies have provided new ways to help learners in the process of language learning. Given the importance of vocabulary, this study thus investigated the learners' attitudes toward vocabulary learning by mobile applications. To this end, One hundred higher-intermediate university students in Sirjan, Iran, participated in this study. After administered a pretest, the next phase started. During the experiment which lasted for four weeks, the participants in the experimental group were expected to use 504 Software installed on their mobile phone to do all vocabulary learning activities. Meanwhile, the control group worked with the 504 printed Book. At the end of the experiment, they were given a vocabulary test to see the effect of mobile application on their vocabulary learning and then attitudes' questionnaire was given to the experimental group. Then, their pre- test and post- test scores were compared using an independent t-test. Results of t-tests run revealed that the experimental group students significantly outperformed their control group in EFL vocabulary learning. Moreover, the students exhibited their positive attitudes to use mobile applications in vocabulary learning. The finding of the study underscored the vital role mobile phones play in extending learning out of the classroom anywhere anytime. Also, This study has some implications for syllabus designers to incorporate technological and mobile-based learning into the pedagogical language courses.

KEYWORDS: students' attitude, mobile application, vocabulary learning

INTRODUCTION

Vocabulary learning is a basic component of foreign language acquisition. According to Wilkins 1972 "without grammar very little can be conveyed, without vocabulary nothing at all can be conveyed". Also (Laufer, 1998) stated that learners should know at least 5000 lexical items in order to understand non-technical English text. Therefore enlarging English vocabulary is of great significance in English acquisition. However, the best means of achieving good vocabulary is still unclear, partly because it depends on a wide variety of factors. EFL learners in Iran face the challenge of lacking exposure to English vocabulary since for the majority of them the English class is only time to use English. Because of the inadequate class time, students do not

have the opportunity to speak and use all of the words in class (Motallebzadeh & Ganji, 2011). In such conditions, there are some problems for language teachers and learners. The problem faced a language teacher is difficult choices about how to use this limited time to teach this large number of vocabulary. Here, there seems an urgent need to find an effective self-study approach for students to enlarge their vocabulary size outside classroom hours (Alemi & Lari, 2013).

Teachers should make them responsible for their own learning outside the classroom. Furthermore, some Iranian students are bored to learn vocabulary through papers, books, and dictionaries. One of the ways that can help teachers and learners in teaching and learning of This large number of vocabulary is using different technologies available to students (Alemi & Lari, 2013). An abundance of evidence from some researchers suggested that one of the technologies that can be used to help learners in learning a foreign language is mobile phone. This technology has brought a new type of language learning called Mobile Assisted Language Learning (Thrnton & Houser, 2005; Chinnery, 2006). With the inevitable integration of mobile technology into our lives, to justify learners' needs in learning English vocabulary, it seems that mobile applications play an important role (Grace, 1998). Mobile learning is effective method; it can overcome restrictions of time and space, enabling learners to learn vocabulary at any time and any place. Besides, for students mobile applications offer a wide range of learning tools they can be download to their mobile devices and help language learners to manage their time of studying more efficiently. And of course, the exposure can be happened better and more frequent by mobile applications. Therefore, this study, aims to implement a complementary learning aid to solve the learners' vocabulary learning problems. In spite of the fact that the use of mobile applications has been on the rise during the last few years, however, so far to the best knowledge of the researcher, very limited research has been undertaken to evaluate the students' attitudes toward mobile learning. Few studies investigated " students' personal use of mobile applications for learning and learning benefits" (Steel, 2012, p. 1).

Moreover, there is a serious lack of research on the issue of mobile applications in the Iranian language teaching and learning context (Dashtestani, 2013). In an attempt to fill in some the gaps that currently exist in the literature, the researcher aimed to examine Iranian EFL learners' attitudes toward mobile applications for vocabulary learning, thereby the researcher tried to show some ways of implementing and integrating mobile phones into the language classroom. Many features of mobile phones, which have been mainly used in language learning, include Short Message Service (SMS), recording voice services, email services and java dictionaries. However, some applications and their role in language learning have been neglected. One such type of applications is, 504 Software. The current study is significant because it can shed more light on the students' attitudes on effectiveness of mobile assisted language learning (MALL), in general, and mobile applications in particular on speeding up foreign language vocabulary learning.

Also, this study explores the gender differences in acceptance of mobile learning. Moreover, the findings of this study help EFL teachers, EFL learners, syllabus designers, educational managers, English institutes, colleges and other places working on the English language teaching and learning to facilitate the process of vocabulary teaching and learning through supplementing books with mobile Applications in language classrooms.

LITERATURE REVIEW

Mobile learning can be defined as the acquisition of any knowledge and skill through using mobile device, anywhere and anytime (Geddes, 2004). According to O'Malley, Sharples and Lefrer (2003), any kind of learning that happens when the learner is not at a fixed state and takes advantage of the learning opportunities offered by mobile technologies.

Squire and Dikkers (2012) described the following affordances of mobile phones as basic contributors to their enhanced popularity: a) Portability: such devices can be taken to different sites and move around within a location due to small size. b) Social interactivity: can exchange data and collaborate with other learners face to face. c) Context sensitivity: the data can be gathered uniquely to the current location and time including both real and simulated data. d) Connectivity: mobile devices can connect handhelds to other devices, data collection devices or a common network that creates a true- shared network. e) Individuality: activities platform that is customized to the individuals' path of investigation. Mobile phones are effective devices for language learning, (e.g. Rosell & Aguilar, 2007; FallahKhair, 2012; Pemberton & Griffiths, 2007), have positive effect on the development of language skills (e.g., Chen & Chung, 2011) and enhance learners' language learning attitudes and motivation (e.g., Hang & Lin, 2012). In the study conducted by Steel (2012), the researcher investigated how 134 language learners used mobile apps to profit from their available learning time outside of class. It provides insights into student perspectives on the benefits of using mobile apps for foreign language learning. Mobile technologies provide EFL learners with additional exposure to target content anytime, anywhere. Mobile devices have numerous advantages for vocabulary learning. Recently, a few studies have investigated the pedagogical use of mobile phones for vocabulary learning. The projects (Thornton & Houser, 2005; Ghorbandordinejad et al. Baleghizadeh & Oladrostam, 2010; Lu, 2008; Zhang et al., 2011) integrating text message and vocabulary learning were generally well received. Students learn more effectively when exposed to spaced-repetition of vocabulary than massed repetition.

Similar to mobile phones PDAs Which also offer features such as personalization, localization, and mobility can be used for language learning. Song and Fox (2008), for instance, investigated undergraduate students' dictionary use of PDAs to increase their vocabulary learning in English. The results revealed that the students produced positive attitudes towards the use of mobile devices in learning. One of the most used features of mobile phones in language learning is short message service-SMS and has been used to help learners in different aspects of language learning Especially vocabulary learning.

In a study conducted in Iran, Derakhshan and Kaivanpanah (2011) provided evidence for the effectiveness of SMS on university students' vocabulary learning. During the experiment, which lasted for seven weeks, the participants were taught fifteen to twenty words each session and were asked to work in groups to talk about the words. Then the experimental groups were told to send a sentence for each word taught in class to researcher and to three of their classmates. The participants of the control group were asked to write sentences on paper and bring it to the class. The result of the posttest showed that the experimental group had higher scores than the control group; that is they outperformed the control group in vocabulary retention. In another study

conducted in Iran, Amirian and Zare (2013) investigated the effect of Java mobile dictionaries on EFL students' vocabulary learning. To this end, the researchers divided forty intermediate Iranian EFL learners into experimental and control group. Both groups, initially, took the pretest designed based on the vocabulary in the course book, Touchstone 3. While the experimental group received three java mobile dictionaries and installed them on their mobile phones, the control group attended conventional classes without any additional tool. Experimental group took the advantage of their mobile dictionaries throughout the course looking up the meaning of unknown words. After the treatment both groups firstly filled out questionnaire, which would elicit the learners' attitude toward java mobile dictionaries. Then, they took the posttest. Findings showed that the experimental group students significantly outperformed their control group in EFL vocabulary learning. Moreover, participants demonstrate positive attitudes toward MALL that more technology-based tasks and activities will definitely contribute to Better vocabulary learning.

In a study, Shih-hsieh Yang (2012) investigated the attitudes and self-efficacy of using mobile learning devices for college students in a language class by employing task-based instruction. The participants of the study comprised 58 second-year students at a technical university in central Taiwan who used mobile devices for M-learning in an English class to complete assigned tasks under the guidance of the instructor. Results showed that most students agreed that their motivation for English learning was enhanced and most of them had positive attitudes towards M-learning. The results related to research on students' attitudes toward the use of mobile devices for Language learning suggested that there is a general consensus among the majority of students over the suitability of mobile use for language learning in Asia and other parts of the world. As the literature clearly depicted, although many studies related to mobile phones use in Language learning were carried out, there are still steps to take probing areas which have not received as much attention as they observe. One of such areas is the mobile Applications in vocabulary learning. In this respect, the current study was designed to determine students' attitudes toward the mobile applications in vocabulary learning.

RESEARCH QUESTIONS

To this end, the following research questions were addressed in this study:

1. What are the attitudes of Iranian EFL university students towards the Mobile Applications for vocabulary Learning (MAELL)?
2. Do attitudes of the male and female students toward the mobile learning differ significantly?
3. Does mobile application affect the vocabulary learning of Iranian EFL university students?
4. What are the advantages and disadvantages of vocabulary learning via mobile applications?

METHODOLOGY

Participants

An original population of 140 EFL students from Paiaame noor University in Sirjan, Iran, voluntary were selected to participate in this study. A TOEFL test was administered to homogenize the students. Having administered a test of homogeneity, the researcher could finally

select one hundred students for the purpose of this study. The participants were divided into experimental (25 male and 25 female) and control groups (25 male and 25 female) based on their choice to work with a mobile application or a printed book for their vocabulary learning. The sample was comprised of fifty female and fifty male students, identical in number. The participants in this research, with an age range of 19 to 22, were in the higher-intermediate level based on their performance of the placement test.

Instruments

To fulfill the current study, the following instruments were applied:

Placement test

A Language proficiency test, a TOEFL test consisting of 75 questions, was administered to screen the students and homogenize them based on their level of proficiency before experiments were launched. The time limited for answering the test was 75 minutes. After administering the TOEFL test, those students who scores fell one standard deviation below and above the mean were chosen as valid sample of this study and divided into experimental and control groups.

Questionnaire

The design of the questionnaire came from previous research on mobile assisted language learning (e.g., Kukulska-Hulme & Shield, 2008; Stockwell, 2007). The 30 items questionnaire consisted of two parts based on five points Likert-scale format with strongly agree; agree; neutral; disagree; and strongly disagree, was used. The time considered to complete the questionnaire was 35 minutes.

To ensure the validity of the questionnaire, content of the questionnaire was validated by a team of three experts who were EFL and educational technology university professors. The evaluation session was held and they passed their comments. On the basis of the review panel feedback the content and the layout of the questionnaire were improved. The reliability of the questionnaire was calculated through Cronbach's Alpha was 0/82, which is acceptable value.

Pre- test and post-test

In order to assess the participants' level of achievement throughout the research, a vocabulary test was developed by the researcher. The participants took the test before and after the treatment as the pretest and posttest. The researcher randomly selected 8 units of 504 Book for this study. The words (N=96) were extracted from 8 units from the 504 absolutely essential words book and the students were expected to learn.

Both groups were pretested on their vocabulary knowledge prior to the study and after finishing the treatment were post tested to see the effect of mobile applications on their vocabulary learning. Due to the long interval between the pre-test and post-test, the same test was used as post-test at the end of treatment but in order to minimize the effect of memorization the order of the items were changed for the posttest. The best time to the participants based on the pilot test was determined to be twenty minutes. Before any instruction 30 vocabulary items were administered to 30 students for the purposes of the pilot study. Based on the performance of the

participants, the item analysis was performed and 10 items were omitted. The reliability of the test was calculated using Cronbach's Alpha 0/85 after item analysis.

The item facility and item discrimination indexes were 0.48 and 0.52 respectively, which are acceptable values. To determine the validity of the test, the researcher asked the supervisor and 3 experts to pass their comments on the content of the test. Therefore, some items were deleted and some items were revised.

504 Software and 504 Book

The 504 Software is a mobile application, which can be installed in diverse mobile phones. The distinguished feature of the 504 is that it is not only an application but also has some aids for vocabulary memorizing. The 504 Software provides the text and meanings of the words to assist word memorizing.

The screen was divided into three main sections. When a word is displayed on the screen, the learner can read the word by his/her self from phonetic symbol or can click the button on the right top of the screen to listen to the pronunciation of the word. In the second section, Persian explanation was given to help learners understand the word. In the third section three sentences was given to provide a context that the word can be used. The experimental group used the 504 Software, mobile version. The control group used the 504 Book.

Interview

In order to gather data about the advantages and disadvantages of mobile application for vocabulary learning fifteen interviews were conducted with randomly selected participants from the experimental group and they were recorded using the digital voice recorder. The interview was conducted with the students individually and face to face. It lasted between fifteen to twenty minutes. Each interview was recorded and transcribed. The participants' names are not real; the researcher used pseudo names for the participants.

Procedures

In order to accomplish its goals, this study used two groups each consisting of fifty participants. Before the application, participants met with the researcher. They were given a brief introduction to the program, its objectives, and its methods. The researcher explained the instruction of the program to participants how to move from one section to another and how to use 504 Software in their smart phones. All these procedures were also conducted in the control group with the only absence of mobile application outside and inside the classroom.

Before the start of the experiment and in order to assess participant's vocabulary knowledge, they were administered by pretest and then next stage of the study started. During the experiment which lasted for four weeks, the participants in the experimental group were expected to use 504 Software installed on their mobile phone to do all vocabulary -learning activities. Meanwhile, the control group worked with the 504 Book and they were expected to use the traditional vocabulary learning techniques. Moreover, the researcher made sure that the control group participants did not have access to this application in their smart phones during the treatment phase. At the end of treatment post-test was given to both groups to see the effects of mobile application on their

vocabulary learning and then attitudes' questionnaire was given to the experimental group. After the quantitative part of the study, qualitative data were collected using semi-structured interview questions. The interview took place in the Paiam-Noor University. The interview lasted between fifteen to twenty minutes and all audio –taped and then transcribed. It was semi-structured with the following open-ended questions:

What are the advantages of use of mobile applications for vocabulary learning?

What are disadvantages of use of mobile applications for vocabulary learning?

Data analysis

The mean and standard deviation were used to analysis of the questionnaires' study, SPSS (version 19.0) was used to calculate the required statistical analysis.

RESULTS AND DISCUSSION

Two instruments that were used in this study, Vocabulary Test and Attitude Questionnaire, were piloted to estimate their reliability. The piloting results as appeared in Table 1 indicated that these two tests were piloted with 30 intermediate EFL learners who had almost the same characteristics with the final sample of this study. The reliability of attitude questionnaire, containing 30 items, was estimated .82 through Cronbach Alpha, and the reliability of vocabulary test, consisting of 20 items, was estimated .85, and which are good indicators of internal consistency.

Table 1: Reliability Statistics of Vocabulary Test and Attitude Questionnaire

Test	No. Of Students	No. of Items	Reliability Index	Reliability Method
Attitude Questionnaire	30	30	.82	Cronbach Alpha
Vocabulary Test	30	20	.85	Cronbach Alpha

Investigation of the First Research Question

The results of One Sample Test that was performed to examine the attitudes of Iranian EFL university students towards the mobile application for vocabulary learning are set forth in Table 2 below. As can be seen in the table, the One Sample Test was significant, $t = 4.94$, $p = .000$, $p < .05$, in fact the t observed, 4.94 was above the t critical, 2.00, and also the p value was below the selected significant level for this study, .05, with 95% Confidence Interval ranging from .349 to .828; accordingly it was concluded that the EFL university students in the target group showed positive attitude towards the mobile application for vocabulary learning.

Table 2: One Sample Test for the Attitudes towards Mobile Application for Vocabulary Learning

Test Value = 3					
T	df	Sig. (2-tailed)	Mean Difference	95% Confidence Interval	
				Lower	Upper
4.946	49	.000	.591	.349	.828

Investigation of the second Research Question

Table 3: Independent Samples Test to Compare Male and Female Students' Attitude Scores

Levene's Test for Variances			T-test for Means			
Equal variance	<i>F</i>	<i>Sig.</i>	<i>T</i>	<i>DF</i>	<i>Sig. (2-tailed)</i>	Mean Diff.
Assumed	5.925	.019	1.053	48	.298	.250
Not assumed	5.925	.019	1.053	43.72	.298	.250

Independent Samples Test results as shown in Table 3 showed that there was no statistically significant difference in attitude scores between the two female and male groups, $t_{(43.72)} = 1.053$, $p = .29$, $p > .05$, in which the t value, 1.053 was below the t critical, 2.02, and the p value, .29 was more than the selected significant level for this study, .05; in consequence, the second null hypothesis as "Attitudes of the male and female students towards the mobile learning do not differ significantly" was retained.

Investigation of the third Research Question

The third research question of this study inquired if mobile application affects the vocabulary learning of Iranian EFL university students. Independent Sample Test was carried out to answer this research question. The table indicates that the mean and standard deviation of the two target ($M = 7.54$, $SD = 3.54$) and control ($M = 7.36$, $SD = 3.86$) groups are not far from each other on pre-test of vocabulary. But the results revealed that the students in the target group ($M = 14.84$, $SD = 3.19$) surpassed those in the control group ($M = 13.02$, $SD = 3.06$) on post-test of vocabulary.

Table 4: Descriptive Statistics of Two Group's Scores on the Pre-test and Post-test of Vocabulary

Source	Group	N	Mean	Std. Deviation
Pre-test	Target	50	7.54	3.54
	Control	50	7.36	3.86
Post-test	Target	50	14.84	3.19
	Control	50	13.02	3.06

Table 5: Independent Samples Test to Compare Two Groups' Scores on the Pre-test of Vocabulary

Levene's Test for Variances			T-test for Means			
	<i>F</i>	<i>Sig.</i>	<i>T</i>	<i>df</i>	<i>Sig. (2-tailed)</i>	Mean Diff.
Equal variance assumed	.237	.627	.242	98	.809	.180

Independent Samples Test results as appeared in Table 5 showed that there was no statistically significant difference in means between the two groups on the pre-test of vocabulary, $t_{(98)} = .24$,

$p = .80$, $p > .05$, in which the t -observed, .24 was less the t critical, 2.00, and the p value, .80 was more the selected significant level for this study, .05; consequently we could conclude that the two groups were homogeneous considering vocabulary knowledge before experiencing any treatment.

Additionally, the researcher performed another analysis of Independent Samples Test to compare two groups' vocabulary scores on the post-test of vocabulary, and the related results are laid out in Table 6. The table shows that the Sig., .64 in Levene's Test was larger than .05 and therefore the assumption of equal of variances was met.

Table 6: Independent Samples Test to Compare Two Groups' Scores on the Post-test of Vocabulary

Levene's Test for Variances			T-test for Means			
	<i>F</i>	<i>Sig.</i>	<i>t</i>	<i>df</i>	<i>Sig. (2-tailed)</i>	Mean Diff.
Equal variance assumed	.219	.641	2.911	98	.004	1.820

Table 6 manifests that Independent Samples Test detected a statistically significant difference in vocabulary scores between the two target and control groups, ($t_{(58)} = 2.91$, $p = .004$, $p < .05$, in which the t value, 2.91 exceeded the t critical, 2.00, and the p value, .004 was lower than the selected significant level for this study, .05; as a result, the second null hypothesis as "Mobile application does not affect the vocabulary learning of Iranian EFL university students" was rejected. So it can be claimed that application of mobile influences .

Data from the interview

The data was gathered from fifteen participants then reported and interpreted in the following way:

The first question: what are the advantages of mobile applications for vocabulary learning?

The results of interview showed that the majority of participants believed that learning vocabulary through mobile applications is convenient and efficient. It encourages them to make full use of fragmented time. Also, they can learn at anytime and anywhere. It seemed that the convenience of mobile phones was provided to be one major affordances of the use of mobile applications for vocabulary learning.

Marjan

Sometimes, when travelling in the bus or subway, I can read the vocabulary in my phone and to remember them. In a word, it can help me to make use of leisure time to learn vocabulary."

The results also showed that some of interviewees thought that portability is another advantage of mobile applications for vocabulary learning. They referred to the fact that mobile phones are light and small and they require little space to be kept and easy to be carried that increased their access to their applications.

Negar

"Mobile phones are small and can be carried very easily just unlike heavy books and dictionaries. So, I can benefit from this advantage of mobile phones to vocabulary learning."

In addition, the results showed that the majority of the participants believed that the possibility of connectivity to the Internet is one of affordance of the use of mobile phones. In fact the Internet can facilitate the process of language learning. The use of Internet will improve interaction, communication and problem solving.

Mahbobe

"When EFL learners use mobile phones for vocabulary learning, they have access to thousands of online EFL resources and this Internet is facilitative and very useful for learners' learning."

The second question: what are the disadvantages of mobile applications for vocabulary learning?

The findings showed that the majority of the participants believed that physical aspects of mobile phones may prevent an optimal learning and experience and some limitations. These limitations include: small screen size, limited battery life and limited memory size. For instance:

Danial

"Mobile devices have limited storage capabilities so, if you have large or many files your device may not be able to store everything"

Discussion

Regarding to the first research question, the results showed that experimental group showed positive attitudes toward Vocabulary learning using mobile applications. The findings might suggest that Iranian EFL students are aware of possible benefits and affordance of mobile implementation for vocabulary learning. Also, it seemed that participants found learning English vocabulary on mobile phones effective and entertaining. As Chang and Hsu (2011) argued students' attitude toward the use of mobile phones would play a pivotal role in determining the efficacy of this technology for education purposes.

The findings of this study are in line with Song and Fox (2008) who found out students produced positive attitudes toward the use of mobile devices in learning. Regarding to the second research question, based on the results of the questionnaire there was no significant differences in students' attitudes between male and female students. Therefore, it can be concluded that gender was not a fundamental factor which influenced attitudes toward mobile learning. The results are compatible with the Shih-hsien Yang (2012) who demonstrated that there were no major differences in students' attitudes between male and female students. Regarding to the third research question, the results showed that students of experimental group out-performed control group in terms of vocabulary acquisition and there was a difference between the two groups. It appeared that this may be due to the students' easy access to the mobile devices which results in their repeated exposure to and frequent practice of the vocabulary. The findings are supported by

the study conducted by Zare and Amirian (2013) which revealed that the experimental group students significantly outperformed their control group counterparts in EFL vocabulary learning. Regarding to the fourth research question, the findings revealed that learning vocabulary through mobile applications is convenient and efficient. Also, they can be easily accessed everywhere and anytime. It appeared that due to the convenience facilitated by the portability and accessibility of the mobile phones, students use them as an English Vocabulary learning device in their leisure time. Therefore, in line with the points suggested at the literature section by Klopfer et al (2002) like portability, accessibility and ubiquity. The findings are supported by the study conducted by Steel (2012) which showed that Students appreciated the flexibility and convenience of using their apps to meet their personal learning needs at times and in places that suited their lifestyles.

CONCLUSION

This paper was generally an attempt to assess the students' attitudes toward using mobile phones for promoting students' vocabulary learning. It can be concluded that using mobile applications has affected the students' performance in experimental group. Therefore, the method used in this study can be more effective in English vocabulary learning. As the findings of this study demonstrated, mobile applications could be an effective pedagogical tool for self-learning English vocabulary. Thus, these results highlight the importance of MALL and its features as an attractive path through which success of learning process can be enhanced. Besides, in this study students have shown their desire to use mobile applications for language learning due to convenience facilitated by the portability and accessibility of the mobile phones.

Their positive attitudes toward mobile applications showed that more technology based activities will contribute to better language learning. Therefore, the success of mobile learning depends largely on whether mobile technologies are accepted by students. Also, according to the interview, all participants expressed that they liked the experiences of using their own mobile phones to learn vocabulary and enjoyed very much the convenience and flexibility that mobile phones bring to them for vocabulary building.

The findings can be useful for language teachers, administrators and language institutes. It informs them in making decision about a readily available tool to help improving students' vocabulary knowledge. Teachers can change their methods and move toward learner oriented methods. Students also have more opportunity to improve their vocabulary rather than only using mobile devices for ever-day life.

Although being successful in confirming the effect of mobile applications on vocabulary learning, this study faced a number of limitations that could not be avoided. First of all, the study lasted for four weeks, which was not an enough time to measure all aspects of students' knowledge of language vocabulary.

Second, the population of the research was small. It was not appropriate to generalize the researches' results to other groups. Only 100 students might not sufficiently represent the majority of students at this level. Also, a more comprehensive questionnaire could be designed to

assess more precisely the learners' attitudes toward the mobile applications for vocabulary learning.

ABSTRACT

The purpose of this study was to compare frequency, forms and functions of hedging devices in news stories selected from native English, non-native English and Persian newspapers. The news stories were selected from four sections: arts & culture, business & economy, politics, and sports. The analysis was based on a corpora of 300 news stories; 100 from native English newspapers (The New York Times and Washington post), 100 from nonnative English newspapers (Tehran Times and Iran daily), and 100 from Persian newspapers (Jaamejaam and Iran). After identifying and categorizing the frequency and forms of hedges based on Yuryevna's (2012) taxonomy and also determining the functions of identified hedges based on an adapted taxonomy of Yu's (2009) classification of hedging strategies and Hyland's (1998) polypragmatic model, chi-square tests were utilized to clarify the probable differences. As the results of this study showed, regardless of epistemic nouns, implicit pragmatic markers, and reader-oriented hedges that were not employed in the news stories, there is a statistically significant difference between the native, non-native English and Persian news stories in terms of the frequency, forms (except epistemic adverbs) and functions of identified hedging devices. The findings have implications for ESP students and instructors, material developers, and also Persian and nonnative English journalists. In other words, this study may to some degree familiarize ESP students and also Persian and nonnative English journalists attempting to publish their news articles in international journals and English newspapers with the selection of acceptable language to have their voice. The findings of the present are also expected to be beneficial for ESP instructors in instructing their learners and increasing their understanding regarding the importance of the hedging phenomenon in news stories. Furthermore, the findings have also implications for material developers to design some authentic materials which reflect the natural frequency, forms and functions of hedges.

KEYWORDS: News Stories; Form; Function; Hedging

INTRODUCTION

The ability to write English texts correctly and professionally has a significant role in all fields because it helps one to communicate more effectively and be fully accepted as a member and participant in his/her particular or international community. Hedging can be considered as an important characteristic of professional writing (Noorian & Biria, 2010, 72). The growing interest in hedges is apparent in the majority of articles and researches mainly dealt with hedging in academic/scientific discourse. According to Hyland (1998), hedging is “an inherent aspect of language use” (p. 261). Although the literature gives special attention to the significance of hedging, we know little about its use, distribution, frequency of forms and functions in different genres. Despite its noticeable role in news genre, there have not been many studies that attempted to shed light on hedging in the news stories. It is commonly acknowledged that the language used in the news reports is required to be accurate, brief, and objective. However, these requirements do not deny the existence of hedges in news reports (Yuryevna, 2012, p. 3). Furthermore, mistakes in the employment of hedges can make indeterminacy, ambiguity, misunderstanding and uncertainty. Lack of awareness of the hedge structures and forms can cause serious problem for those who attempt to write, translate and read English journalistic texts. Thus, comparative analyses of hedging devices in news genre present better understanding and realization regarding hedging devices. The purpose of this study was to shed more light on comparing the frequency, forms and functions of linguistic devices which act as hedges in the news stories selected from four sections (arts & culture, business & economy, politics, and sports) of native English newspapers written by American news story journalists as native speakers of English, non-native English newspapers written by Iranian news story journalists who write in English as nonnative speakers of English, and Persian newspapers written by Iranian news story journalists who write in Persian as native speakers of Persian (that is, between two languages - English and Persian).

REVIEW OF THE RELATED LITERATURE

Definition of Hedges

Although the terms hedge and hedging have been part of the linguistic vocabulary for some thirty years now, no unified description of the concepts is to be found in literature (varttala, 2001, p.4). As Hyland (1998) mentions straightforward definitions of the *hedging* and *hedge* concepts are rather scarce and the available characterizations soon show that the terms are applied in various directions by authors. In spite of efforts to bring order into the large number of definitions (e.g. Crompton 1997), it seems that investigators follow to approach the notions of *hedge* and *hedging* in a diversity of ways. As a result, there is still little agreement and clearness as to what regards as a hedge and no usual explanation exists about hedge and hedging in the literature. In various researchers hedges are determined differently, that shows the difficulty of specifying what precisely the hedge is. The notion of hedge dates back to the work of Lakoff. Lakoff (1972) employed the term hedge as “words whose job is to make things fuzzier or less fuzzy” (p. 471). According to Poveda Cabanes (2007), “This definition became the starting point for several studies on this phenomenon, which was demonstrated to have multiple facets and therefore has been approached in many different ways by each author”(p. 140). Zuck and Zuck (1986) defined hedges as “the process whereby the author reduces the strength of what he is writing” in case the reported news turn out not to be true (p. 172). Falahaty (2004) denoted that “they try to extend

the scope of hedging in a way that it draws on pragmatic uses of the term in language” (p. 12). Brown and Levinson (1987), suggested hedges as “a particle, word or phrase that modifies the degree of membership of a predicate or a noun phrase in a set; it says of that membership that it is partial or true only in certain respects, or that it is more true and complete than perhaps might be expected” (p. 145). Skelton (1997) defined that “the term “hedge” is best used, when narrowly, only for mitigations of responsibility and/or certainty to the truth value of a proposition” (p. 45). According to other definition, that was suggested by Crompton (1997) hedges can be defined as “items of language which a speaker uses to explicitly qualify his/her lack of commitment to the truth of a proposition he/she utters” (p. 281). According to Carter and McCarthy (1997), hedges are defined as means that “allow speakers to personalize or otherwise soften the force of what they say, all in different ways, either because they have no wish to sound definite and authoritative, or because they believe the speaker not to be fully acquainted with their propositions or, very simply, because they do not know or are searching for the right word or expression” (p. 16). Hyland (1998) defined hedges as “linguistic means used to indicate either a) lack of complete commitment to the truth of the proposition, and b) a desire not to express the commitment categorically” (p. 1). This definition is the basis of our study, because according to Yuryevna (2012), “the overview of the related literature showed that the most commonly adopted definition of hedge is that proposed by Hyland” (p. 15). Hyland (1998) defines hedges as “the means by which writers can present a proposition as an opinion rather than a fact: items are only hedges in their epistemic sense, and only when they mark uncertainty” (p. 5).

Types of Hedges

Markkanen and Schroder (1997) have noted that “there is no limit to the linguistic expressions that can be considered as hedges” and “almost any linguistic item or expression can be interpreted as hedge” (p. 6). Due to the fact that hedging is primarily viewed as a pragmatic phenomenon, there is also little agreement among linguists about what linguistic devices should and should not be considered as hedges (Martin-Martin, 2008, p.136). Clemen (1997) asserted that “taking into account that hedging typically depends on context and situation and is not determined by individual lexical units and phrases, it does not seem possible to establish “list of hedges” (p. 236). Therefore, this can be regarded as the reason of lacking a complete explanation of hedging devices in reference works. Although establishing hedging devices taxonomy is difficult and there is a little certainty on the notion of hedge, a number of investigators attempted to propose more or less general list of linguistic devices which are more likely to act as hedges.

Crompton (1997) regarding Skelton (1988), Myers (1989), Salager-Meyer (1994) and Hyland’s works (1994) attempted to prepare an overview of the forms commonly took into account to be hedges, that contain *copulas other than be, lexical verbs, modal verbs, probability adverbs and probability adjectives*. The extent of what is regarded to be a hedge differs significantly. Moreover, as Yuryevna (2012) mentioned in her study, hedging has also been supposed to appear in, for example, lexis stating personal involvement, emotionally charged intensifiers, approximators (Salager-Meyer, 1994), agentless constructions, parenthetical expressions (Namsaraev, 1997), personal attribution, hypotheticals, direct questions (Hyland, 1998), pragmatic markers (Yu, 2009), concessive conjuncts, conditional subordinators, metalinguistic comments (Fraser, 2010). Yu

(2009) described hedges and their linguistic realization clearly. As concerns the complex analysis of semantic, grammatical and pragmatic characteristics of hedges, he asserted that “it can be predicted that certain linguistic areas are more likely to be the source of hedges than others” (p. 77). He presented hedges in six categories and they are modal auxiliaries, approximators, epistemic verbs, epistemic adverbs, adjectives and nouns as categories that are more presumably to be hedge candidates, “because all of them possess a meaning of ‘modifiability’” (Yu, 2009, p. 77).

RESEARCH QUESTIONS

The major issues that were addressed in the present study included the following research questions:

1. Is there any significant difference between native, nonnative English and Persian news stories in terms of the frequency of identified hedging devices?
2. Is there any significant difference between native, nonnative English and Persian news stories in terms of the forms of identified hedging devices?
3. Is there any significant difference between native, nonnative English and Persian news stories in terms of the functions of identified hedging devices?

METHODOLOGY

Corpora of the Study

The corpora of this study were based on a set of English and Persian data composed of 300 news stories; 100 native English news stories (comprising a total of 44,277) written by American news story journalists, 100 nonnative English news stories (containing 39,861) written by Iranian news story journalists who write in English, and 100 Persian news stories (comprising 39,856) written by Iranian news story journalists who write in Persian. 11 native English news stories were excluded in order to balance the total number of words for all three corpora. Therefore, the total numbers of words in the native English news stories decreased from 44,277 to 39,855 words. The news stories were chosen from six elite newspapers in Iran (*Tehran Times*, *Iran daily*, *Jaamejaam* and *Iran*) and United States of America (*The New York Times* and *Washington post*). These newspapers have major readers and include different sections. The news stories were selected randomly from each newspaper and found in the following four sections dealing with: arts & culture, business & economy, politics and sports. The researchers did their best to select the news stories from the four different sections to increase the external validity of the results. The corpora of the study were restricted to a short period of time because writers’ styles may change through longer period of time. Table 1 presented below show general information about the corpora.

Table1: General Information about the Corpora

Section Corpus	Arts & Culture	Business & Economy	Politics	Sports	No. of NS	No. of words	Publication Date
NENS	22	23	21	23	89	39855	August, September & October 2014
NNENS	25	25	25	25	100	39861	
PNS	25	25	25	25	100	39856	

Note. Native English News Stories (NENS), Non-Native English News Stories (NNENS), Persian News Stories (PNS)

Instrumentation

Although establishing a comprehensive taxonomy of hedging devices is difficult, different classifications of hedges that are more or less exhaustive have been introduced in the literature.

Based on these different classifications, Yuryevna's (2012) compiled taxonomy of hedging devices was applied in the research paper in order to compare and analyze probable differences between the native, nonnative English and Persian news stories regarding the frequency and forms of hedging devices (see appendix A). As for analyzing hedging functions, it was decided to employ the adapted classification which is based on the combination of Yu's (2009) classification of hedging strategies and Hyland's (1998) polypragmatic model (see appendix B). The researchers who are familiar with hedge analysis suggested Persian equivalents for the taxonomy and theoretical model in order to examine hedges in the Persian news stories.

Procedure

After selecting the news stories from the leading newspapers, they were read word by word and carefully to determine the frequency and forms of hedging devices based on the Yuryevna's (2012) taxonomy. All hedges were written down and counted. All the forms of hedges were located in their proper categories based on the taxonomy. Afterwards, the frequency of each category of hedging forms and also overall frequency were recorded in the native, nonnative English and Persian news stories separately.

In order to become certain regarding the reliability of the results, the corpora were double-checked by the researchers who are familiar with hedge analysis and all cases were considered in text to become sure they are hedging devices. According to Tahririan and Shahzamani (2009) "needless to say that due to the tentative, indeterminate and complex nature of the hedging phenomenon, no study can claims to be absolutely valid and reliable and provide objective interpretations with respect to the analysis of hedging" (p. 204). After determining the frequency and forms of hedging devices, chi-square tests were employed to show whether there is a statistically significant difference between all three corpora in terms of the frequency and also forms of identified hedges. Then, functions of all identified hedging forms were also determined in the native, non-native English and Persian news stories separately based on the adapted classification that combined two models, namely Yu's (2009) classification of hedging strategies and Hyland's (1998) polypragmatic model. Finally, chi-square tests were used to indicate whether

or not there is a statistically significant difference between all three corpora in terms of the functions of identified hedging devices.

RESULTS AND DISCUSSION

Comparison of Frequency of Hedging Devices in Native, Nonnative English and Persian News Stories

The frequency of hedges was counted separately for all three corpora (Table 2). As can be seen in Table 2, the hedging devices were classified into ten categories.

Table 2: Frequency of Hedges in the Native, Nonnative English and Persian News Stories

Category	F ¹	F ²	F ³
Modal verbs	80	55	17
Epistemic adverbs	7	8	2
Epistemic adjectives	27	10	4
Epistemic nouns	0	0	0
Epistemic lexical verbs	27	16	4
Approximators	99	53	34
Impersonal passives	17	19	3
Passive constructions	121	52	59
Attribution to the source	38	21	16
Implicit pragmatic markers	0	0	0
Total	416	234	139

Note. F¹ - Raw Frequency in the Native English News Stories, F² - Raw Frequency in the Nonnative English News Stories, F³ - Raw Frequency in the Persian News Stories

According to the Table, the native English news stories with total of 416 items employed a higher number of hedges than the nonnative English and Persian ones which had 234 and 139 hedging items in total, respectively. To examine the differences between all three corpora in the frequency of utilized hedging devices, chi-square test was used. Table 3 presents the summary of the results of this chi-square.

Table 3: Chi-square for the Frequency of Hedges in the Native, Nonnative English and Persian News Stories

Chi-square Test		
X ²	df	p
150.66	2	0.001**

**Level of Significance at 0.01 *Level of Significance at 0.05

As shown in the Table, the value of observed chi-square ($\chi^2=150.66$) is significant at α level ($\alpha=0.001$) with degrees of freedom of 2 ($df=2$) indicating that there is a significant difference between all three corpora in the frequency of employed hedges. Therefore, the native English news stories present a higher number of hedging devices than the nonnative English and Persian ones, respectively. It shows that the native English news story journalists tend to show their lack of complete commitment, tentativeness, uncertainty and doubt towards the proposition more than the nonnative English, followed by the Persian news story journalists. Results were examined in more details for each category of hedging forms in the following section.

Comparison of Hedging Forms in Native, Nonnative English and Persian News Stories

The findings of the present study for each category of hedging forms were supported by the chi-square tests in Table 4 in order to see whether or not native, nonnative English and Persian news stories are different in the distribution of each category.

Table 4: Results of Chi-square Tests for the Frequency of each Category of Hedging Forms in the Native, Nonnative English and Persian News Stories

Chi-square Test			
Categories	χ^2	df	p
Modal verbs	39.72	2	0.001**
Epistemic adverbs	3.64	2	0.161
Epistemic adjectives	20.82	2	0.001**
Epistemic nouns	-	-	-
Epistemic lexical verbs	16.89	2	0.001**
Approximators	36.03	2	0.001**
Impersonal passives	11.69	2	0.003**
Passive constructions	37.30	2	0.001**
Attribution to the source	10.64	2	0.005**
Implicit pragmatic markers	-	-	-

**Level of Significance at 0.01 *Level of Significance at 0.05

It can be noticed that according to the Table 4 presented above, the results showed that the value of observed chi-square ($\chi^2=39.72$) is significant at α level ($\alpha=0.001$) with degrees of freedom of 2 ($df=2$) indicating that there is a significant difference between all three corpora in the use of modal auxiliary verbs. Therefore, the native English news stories favor more number of this category of hedging forms than the nonnative English, followed by the Persian ones. It implies that the native English news story journalists tend to express prediction, possibility and tentative assumption by employing modal auxiliary verbs to a greater extent than the nonnative English and Persian news story journalists, respectively.

As seen in the Table 4, the chi-square results revealed that there is no significant difference between all three corpora in the use of epistemic adverbs. It means that the news stories are not different from each other in the use of this kind of hedging forms. It shows that the native, nonnative English and Persian news story journalists show a certain degree of ambiguity to the information they convey and also indicate a not clearly understood representation of reality almost equally.

As shown in the Table 4, the results revealed that the value of observed chi square ($\chi^2=20.82$) is significant at α level ($\alpha=0.001$) with degrees of freedom of 2 ($df=2$) showing that there is a significant difference between all three corpora in the use of epistemic adjectives. Therefore, epistemic adjectives are more frequent in the native English news stories than the nonnative English, followed by the Persian ones. It implies that the native English news story journalists show uncertainty, lack of exactness to the information and also present tentative statements more frequently than the nonnative English and Persian news story journalists, respectively.

As the findings of the present study showed, epistemic nouns weren't present and available in the news stories. It shows that the journalists don't employ this category of hedging forms that convey uncertain and indefinite meaning in their news stories. The reason for the absence of epistemic nouns in this study can be related to the functions of news stories. The main function of news stories is to objectively inform the readers, to provide them with hard facts (Buitkiene, 2008, p. 12). According to Table 4, the value of observed chi-square ($\chi^2=16.89$) is significant at α level ($\alpha=0.001$) with degrees of freedom of 2 ($df=2$) showing that there is a significant difference between the news stories of native, nonnative English and Persian newspapers in the use of lexical verbs with epistemic meaning. Therefore, the native English news stories favor more number of this kind of hedges than the nonnative English, followed by the Persian ones. Based on this, it shows that the native English news story journalists tend to hedge their commitments, and code the subjectivity of the epistemic source and also establish non-factual status of a proposition by means of various types of epistemic lexical verbs more than the nonnative English and Persian news story journalists, respectively.

To summarize the results regarding approximators of quantity, frequency and degree, it can be said that as Table 4 presented, the value of observed chi-square ($\chi^2=36.03$) is significant at α level ($\alpha=0.001$) with degrees of freedom of 2 ($df=2$) demonstrating that there is a significant difference between all three corpora in the use of approximators as one category of hedging forms. On a general level, the native English news stories employ a higher number of approximators than the non-native English news stories, followed by the Persian ones. It implies that the native English news story journalists work locally on the meaning of a phrase or a word within the proposition in order to seem inaccurate, uncertain, unclear and fuzzy by using this category of hedging forms to a greater extent than the nonnative English and Persian ones, respectively.

As seen earlier in the Table 4, the results showed that the value of observed chi-square ($\chi^2=11.69$) is significant at α level ($\alpha=0.003$) with degrees of freedom of 2 ($df=2$) indicating that there is a difference between the native, nonnative English and Persian news stories in the use of impersonal passive constructions. Therefore, it indicates that impersonal passive constructions are more frequent in the nonnative English news stories than the native English, followed by the Persian ones. As

shown in the Table 4, the results indicated that the value of observed chi-square ($\chi^2=37.30$) is significant at α level ($\alpha=0.001$) with degrees of freedom of 2 ($df=2$) showing that there is a significant difference between all three corpora in the use of agentless passive constructions. The native English news stories present a higher number of agentless passive constructions than the Persian and nonnative English ones, respectively. It shows that the native English news story journalists tend to prevent accepting responsibility for what they are asserting about in order to exhibit the news stories as objectively as possible by means of employing passive constructions to a greater extent than the Persian and nonnative English news story journalists, respectively.

It can be noticed that according to the Table 4, the results showed that the value of observed chi-square ($\chi^2=10.64$) is significant at α level ($\alpha=0.005$) with degrees of freedom of 2 ($df=2$) indicating that there is a significant difference between the native, nonnative English and Persian news stories in the use of attribution to the source. Therefore, the native English news stories favor more number of this category of hedging forms than the nonnative English, followed by the Persian ones. It implies that the native English news story journalists tend to prevent misunderstanding of the issues, facts or realities and support themselves from the probability being negatively judged by the readers more frequently than the nonnative English and Persian news story journalists, respectively. The implicit pragmatic markers include some devices such as hypothetical conditionals, direct questions, parenthetical constructions, etc. As the findings of this study indicated, implicit pragmatic markers weren't employed in the native, nonnative English and Persian news stories. According to Yu (2009), "pragmatic markers with interpersonal and interactive functions may bring a sense of cooperation, sharing, intimacy or solidarity between the interlocutors, expressed by humble and modest attitude, in a reduced or weakened tone" (p. 98). Therefore, the reason for the absence of implicit pragmatic markers with epistemic meaning as hedging devices in the present study can also be related to the nature of news stories. News stories are used in news genre to inform the readers as objectively as possible and provide them with hard information, facts and evidences.

Comparison of Hedging Functions in Native, Nonnative English and Persian News Stories

The frequency of hedging functions was counted separately for the native, nonnative English and Persian news stories (Table 5). As can be seen in Table 5, the hedging functions were divided into three main categories.

Table 5: Frequency of each Category of Hedging Functions in the Native, Nonnative English and Persian News Stories

Function of Hedge	NENS F ¹	NNENS F ²	PNS F ³
Writer-oriented	317	181	105
Accuracy-oriented	99	53	34
Reader-oriented	0	0	0

Key to Table: Native English News Stories (NENS), Non-Native English News Stories (NNENS), Persian News Stories (PNS), F¹- Raw Frequency in NENS, F²- Raw Frequency in NNENS, F³- Raw Frequency in PNS

To examine the differences between all three corpora in the frequency of each category of hedging functions, chi-square tests were run. The results of the analyses for each category were described in turn in Table 6 presented below.

Table 6: Results of Chi-square Tests for the Frequency of each Category of Hedging Functions in the Native, Nonnative English and Persian News Stories

Chi- Square Test			
Categories	X^2	df	p
Writer-oriented hedges	114.78	2	0.001**
Accuracy-oriented hedges	36.03	2	0.001**

**Level of Significance at 0.01 *Level of Significance at 0.05

As shown in the Table 6, the results indicated that the value of observed chi-square ($x^2=114.78$) is significant at α level ($\alpha=0.001$) with degrees of freedom of 2 ($df=2$) indicating that there is a significant difference between the native, nonnative English and Persian news stories in the use of writer-oriented hedges. Therefore, the native English news stories present a higher number of this category of hedging functions than the nonnative English and Persian ones, respectively. It implies that the native English news story journalists tend to keep some distance from statements in order to decrease the possibility of refutation and support themselves against any possible results of error by reducing their personal commitment to a greater extent than the nonnative English, followed by the Persian ones.

To summarize the results regarding accuracy-oriented hedges, it can be said that as Table 6 showed, the value of observed chi-square ($x^2=36.03$) is significant at α level ($\alpha=0.001$) with degrees of freedom of 2 ($df=2$) demonstrating that there is a significant difference between all three corpora in the use of this category. On a general level, the native English news stories favor more number of this category of hedging functions than the nonnative English, followed by the Persian ones. Based on this, it shows that the native English news story journalists tend to present information with greater objectivity, accuracy and exactness according to realities than the nonnative English and Persian news story journalists, respectively.

According to the findings, reader-oriented hedges weren't present in all three corpora. As Falahaty (2004) mentioned, this category of hedging functions "makes the readers involved in a dialog and addresses them as a thoughtful individual to respond and judge the truth value of the proposition" (p. 38). The reason for the absence of reader-oriented hedges in the present study can be related to the function of news stories. Journalists use news stories in order to present information, realities and truths to the readers as objectively as possible.

Discussion

As the findings of the present study showed, regardless of epistemic nouns and implicit pragmatic markers as two categories of the hedging forms and also reader-oriented hedges as one category of the hedging functions that were not present in the news stories, there is a statistically

significant difference between all three corpora in terms of the frequency, forms (except epistemic adverbs) and functions of identified hedging devices. As the results showed, there is not any significant difference between the native, nonnative English and Persian news stories in the use of epistemic adverbs as one category of the hedging forms. The findings of the present study seemed to confirm Yuryevna's (2012) findings that showed epistemic nouns, implicit pragmatic markers and reader-oriented hedges aren't present in the news stories. In addition, the findings also supported the results of Buitkiene's (2008) research which showed that news articles utilize different types of passive constructions in order to present information as objectively as possible and "to avoid taking responsibility for what they are claiming about" (p.14).

The findings of this study indicated that there are differences in the understandings of members of different cultures about applying appropriate discourses for stating their purposes. Differences in cultural background can give an explanation for the variation of such linguistic features. Culturally defined frameworks and paradigms may affect journalists' choices. Furthermore, Dahl (2004) claims that national culture is the main reason for variations in texts across languages and can influence the written discourse conventions. Therefore, in the present study, culture can be regarded as a reason for differences between all three corpora in terms of the frequency, forms and functions of identified hedging devices. Moreover, content of the sections and their argumentations can lead to some differences. According to this view, some sections favor more hedging devices and employ different forms and functions of hedges in comparison to other sections. This means that some sections like political section in the Persian newspapers may include some materials that are not the norms and convention of other sections. Therefore, content of the sections and their argumentations can be regarded as other reasons for the observed differences.

CONCLUSION

The purpose of this study was to compare the frequency, forms and functions of hedging devices in the news stories selected from the native, non-native English and Persian newspapers. The news stories were selected from four sections: arts & culture, business & economy, politics, and sports. As the results of this study showed, regardless of epistemic nouns, implicit pragmatic markers, and reader-oriented hedges that were not employed in the news stories, there is a statistically significant difference between all three corpora in terms of the frequency, forms (except epistemic adverbs) and functions of identified hedging devices. This study includes some limitations. First, there is still little agreement and clearness as to what regards as a hedge. In other words, no usual explanation exists about hedge and hedging in the literature. Second, Yuryevna's (2012) taxonomy of hedging devices and adapted classification which is based on the combination of Yu's (2009) classification of hedging strategies and Hyland's (1998) polypragmatic model were used in this research paper. Although these are by no means comprehensive, the main reason for selecting them is due to their most common examples found across the literature. There are a number of delimitations in the present study that should be taken into consideration. First, the size of given corpora is small (300 news stories). This can cause a problem for extending the research results to other contexts. Second, access to the printed form of *the New York Times* and *Washington post* was really difficult in Iran, so online editions of the

news stories were used in this study. Future researches are needed to employ different theoretical models of hedging in order to investigate their applicability to this special discourse. By conducting such researches, we would probably get wider insights on the presence of hedging phenomenon in news genre. It is also suggested that future researches concentrate on other genres of news. The findings have implications for ESP students and instructors, material developers, and also Persian and nonnative English journalists. In other words, this study may to some degree familiarize ESP students and also Persian and nonnative English journalists attempting to publish their news articles in international journals and English newspapers with the selection of acceptable language to have their voice and convey the latest news and events in order to inform English readers in all around the world as precisely, clearly and fully expressed as possible. Moreover, the findings of the present are expected to be beneficial for ESP instructors in instructing their learners and increasing and enriching their understanding and comprehension regarding the importance and usage of the hedging phenomenon in one specific genre of news writing, namely news stories. Furthermore, the findings have also implications for material developers to design some authentic materials which reflect the natural frequency, forms and functions of hedges.

Appendix A

Taxonomy of Hedging Devices (Yuryevna, 2012, p. 97)

Common Lexical Items Expressing Hedging

1. Modal Verbs

Can, could, may, might, should, would

2. Epistemic Lexical Verbs

Seem, appear, believe, think, guess, suggest, suppose, propose, predict, assume, speculate, suspect, attempt, seek

3. Epistemic Adverbs

Probably, perhaps, maybe, possibly, apparently

4. Epistemic Adjectives

Likely, unlikely, possible, probable

5. Epistemic Nouns

Possibility, probability, chance

6. Approximators

Some, about, nearly, almost, quite, somewhat, kind of, sort of, somehow, to some extent, approximately, around

Syntactic Items Expressing Hedging

1. Impersonal Passive Constructions

It is believed/assumed/said that...; X is believed/though/supposed to...

2. Agentless Passive Constructions (Passive Construction without By-Agent)

3. Attribution to the Source

According to X,...; As x stated,...

4. Parenthetical Constructions Expressing Personal Reference and Attribution

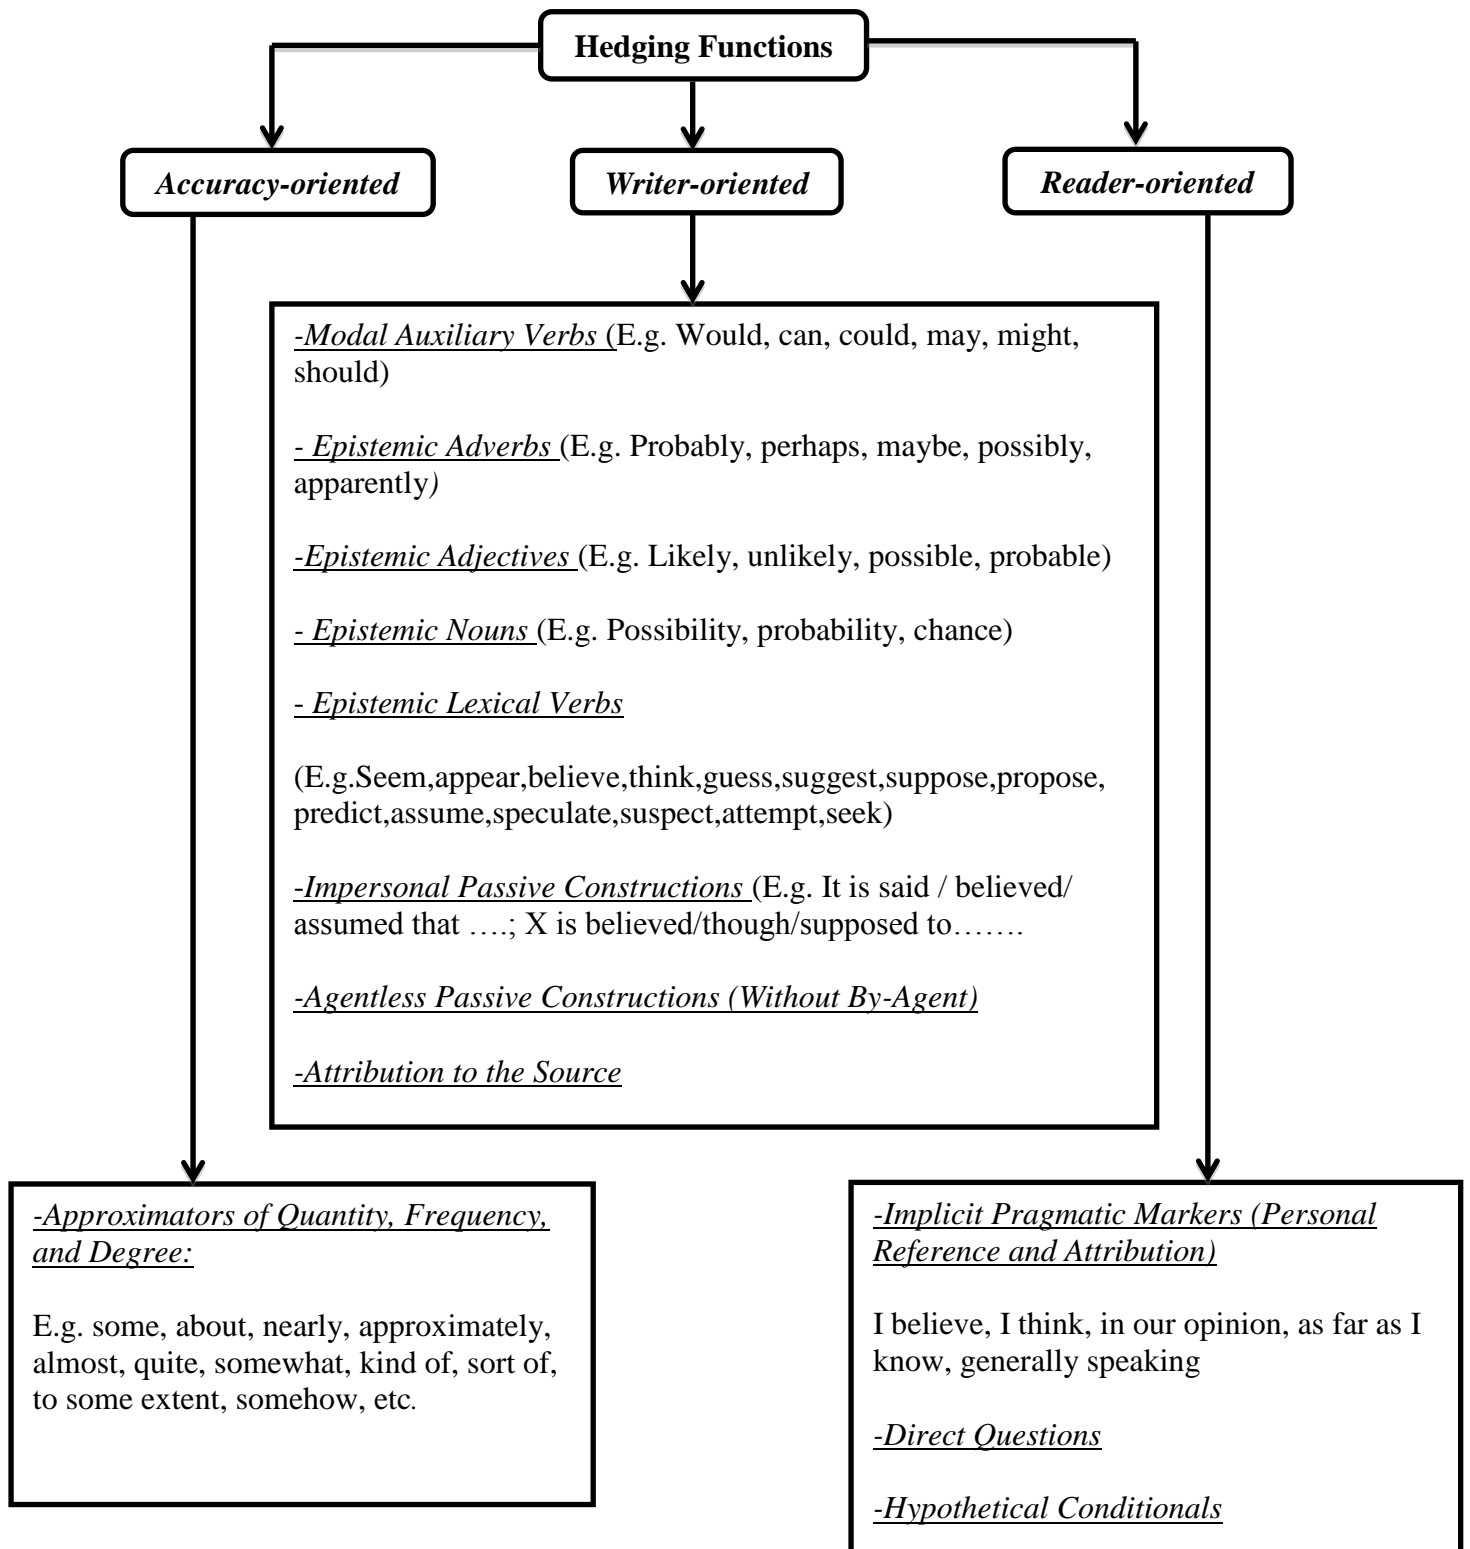

I believe, I think, as far as I know, in my/our opinion

5. Direct Questions

6. Hypothetical Conditionals

Appendix B

Theoretical Model for Analyzing Functions of Hedges (Adapted From Hyland, 1998, p.186; Yu, 2009, p.106)

ACTION RESEARCH TO HONE ORAL COMMUNICATION SKILLS OF ENGINEERING STUDENTS

ABSTRACT

Given to the context of globalization, and the importance of learning English for academic and professional lineage, the Technical English syllabus of Dr. M.G.R. Educational and Research Institute University has the objective of developing the oral communication skills of students in English. So an action research was designed to hone the oral communication skills of first year engineering students. As part of the program, a pilot study was conducted on the first year engineering students. It was a small scale survey study; it made use of a customized questionnaire to investigate the participants' personal factors such as age, mother tongue, nativity, and parental support that usually influence second language learning at the early stages and academic details like, medium of instruction and method of English learning in schools, the level of learners' English proficiency and the reason for the lack of it, in the learners' own view. Then the details were inferred to find the influence of socio environmental and socio political factors on English as second language learning in the Indian context. The descriptive survey method was adopted to scrutinize the responses and explain them. Lack of parental and societal support and probably the conventional methods of teaching English in schools might be the reasons for the students' lack of English fluency; reflecting on the observations, it was decided that the next action was to administer a diagnostic test to decide upon the learners' language skills to cope with the present venture and remedial measures for the deficiencies. The study was not final and conclusive; it has shown only the tip of the iceberg.

KEYWORDS: Globalization, action research, oral communication, pilot study, small scale survey study, questionnaire, descriptive survey method

INTRODUCTION

It is known that language is primarily speech. Spoken English enables us to express our views, ideas and our needs with others for obtaining information and for solving many problems. Today we live in a world that is highly developed technically and scientifically, that we need to keep pace with new innovations and developments happening around the world. The world communities are tied up with each other in one way or the other for the purpose of education, employment and business. The matrix of interdependence is so strong and fascinating that communication in English is the dire need of the hour. It is evident that all those pass the engineering courses cannot be employed within India because of the mismatch between the industries and the number of engineering candidates seeking for employment. Hence, obvious choice could be employment in the developed countries which look for skilled professionals who could manage the multilingual employees in different industries. Without adequate English proficiency they cannot hope to comprehend the subjects which are taught in English and aspire for a global career. A recent survey suggests at least 50% of the engineering graduates fail to fit into the category of employable candidates because of their inability to communicate fluently in English. The interviewers expect the candidates to be fluent if not accurate.

Globalization has transformed English into a language of opportunity. Given to the context of globalization, and the importance of learning English for academic and professional lineage, the Technical English syllabus of Dr. M.G.R. Educational and Research Institute University has the objective of developing the oral communication skills of students in English. To realise this objective, an action research was planned. Any teaching learning process must include, “planning (including needs analysis, goal and objective setting), implementation (including methods and materials development) and evaluation” (Nunan, D.1991, p.3). As part of the program, a small scale pilot study was conducted to find the factors, which could have influenced first year engineering students’ learning of English in schools. The course of the action research and the findings of the study are deliberated in this paper.

LITERATURE REVIEW

In the field of education, action research is about teachers identifying and posing problems as well as addressing issues and concerns related to the problem. It is about working toward understanding and possibly resolving these problems by setting goals and creating and initiating a plan of action as well as reflecting on the degree to which the plan works. It is a small scale intervention in the functioning of the real world and a close examination of the effects of such intervention (Cohen & Manion 1985, p.174)

Many researchers have framed their action researches to explore the academic performance of university students, particularly focusing on individual factors and their psychological implications in second language acquisition. The relationship between age and second language acquisition has often been discussed in language forums. Johnson & Newport, 1989; Lenneberg, 1967; Schachter, 1989 have recorded their investigation results as generalised sweeping comments. For them, in general, younger learners seem to be better at language learning in the long term than older learners are.

The sociocultural contexts in second language learning are also considered equally important because language learning is psychological at the individual level and sociological at the broader societal context. It is the present researcher's wish that the need for contextualised, detailed research designs and the significance of sociocultural and socio political approaches in understanding the university students' ability to speak and write in English have to be defined in the Indian context, at least, for the research reported here in.

The theoretical perspective of language socialization (Ochs, 1988; Schieffelin & Ochs, 1986) and its link between English as second language learning and sociocultural contexts (Duff, 1995; Willet, 1995) cannot be ignored in the present research. The present research perceives our students as striving to achieve their goal of communicative competence through the sociocultural and socio political interactive factors (Clement, 1980) which are found in various contexts. Skehan (1986) found a strong relationship between second language learning in a school situation and a set of measures relating to family background, parental education and parental literacy. Thus in addition to native ability in processing language, family influences inculcate in a child the ability to deal with language in a formal and decontextualized context. Barry McLaughlin (1990) believes that family variables influence the child's ability to use the kinds of language learning strategies that Oxford (1986) lists: asking questions to gather information, and initiating and sustaining conversations to say a few.

Naoka Morita (2000) says language socialization is a much desired phenomenon in an academic life because the less competent directly learn from the more knowledgeable peers while the competent members also learn from novices; this kind of learning process is known as guided participation whereas Lave and Wenger (1991) described it 'legitimate peripheral participation'. In her hypothesis Morita finds parents as experts and children as novices. This perception is on line with Skehan's family influence on children's L2 acquisition. As parents modify their children's oral communication, language socialization is usually applied to first language acquisition of children. In the L2 acquisition context, educated parents interact with their children in English and modify their output in order that they acquire the language. Thus parental influence also decides children's second language proficiency.

The purpose of the present study was to understand the English language proficiency of the first year engineering students in the theoretical perspectives deliberated earlier. The implications of socio political and cultural aversions have by and large been an impact on the social and political milieu of the sub-continent. The investigation should also help to ascertain the pattern of weaknesses in learning English in the tertiary level, and to earmark the specific area for improvisation in the ESL performance of the students to cope up with the demands of university education. The individual revelations observed should give scope for reflections and remedial teaching there on.

RESEARCH QUESTIONS

The research questions addressed were as follows:

1. What are the individual variables that interacted in the overall proficiency of the participants in the research?
2. What is their present proficiency in English as second language?
3. How can the students be facilitated to hone the required oral communication skills to seek global opportunity?

METHODOLOGY

The first step in a teaching process, is the collection of information about learners in order to diagnose the objective needs of the students (Richterich,1972); and it is more so with the action research. Action research is not exploratory in nature rather it is the process of posing the problem and identifying a solution which will give scope for exploring our teaching beliefs. “It is a cyclical process that follows a series of repeated steps like setting a goal, planning an action, to reach this goal, acting on this plan, observing the action, reflecting on the observation and setting the next goal”(Gebhard,1999 p.63) . As such the research methodology has included a questionnaire to investigate the interrelationship between the various components of L1 and L2 language proficiency. The pilot study made use of a customised questionnaire to investigate the participants’ personal factors such as age, and parental factors that usually influence language learning at the early stages and which act as affective filters in SLA. The next step was to investigate the pattern of learning in the schools (medium of instruction and method of English learning), and then infer the socio political and cultural factors that might have influenced the students. The importance of English in the learner’s perspective was to be ascertained. The entire process was carried as survey; it was a survey research because it was conducted by using questionnaires to collect the data, thoughts and feelings of participants. The descriptive survey method was adopted to scrutinise the responses and explain them. The appropriate objective inferences and findings make the entire action research process reliable and valid.

Participants

The research was conducted in the undergraduate engineering programme of Dr. M.G.R. Educational and Research Institute University in Chennai. The participants were sixty five in number. They were from the different states of India and hence heterogeneous by virtue of their mother tongue, culture and tradition. They got admitted to the university after passing public examinations in science, mathematics, and English as second language on completion of the plus2 course.

Research instrument 1 – questionnaire

Printed copies of the questionnaire were distributed to all the participants. The questionnaire focused on their age, family background such as literate and educated family, mother tongue and medium of instruction, length of exposure to English language learning (LOE), language proficiency and their interest in language learning programme.

RESULTS AND DISCUSSION

Age factor

The purpose of this study was to measure the relationship between their age and their second language acquisition. The study found that the students were in the age group of 17 - 20 years. They were young adults by virtue of their age.

Mother tongue

The study showed that twenty seven students had Tamil as their mother tongue; twenty five were Telugu students; nine were speaking Hindi and three students were speaking Urdu, while only one had Malayalam as mother tongue.

Medium of Instruction

Fifty six students had studied through the medium of English in schools invariably from LKG or first standard to plus2 (12/14 years). Nine students studied in regional medium schools, but they had also learnt English from third standard as second language – for not less than a period of nine years.

Location of Schools

Thirteen students had studied in rural schools; forty two students had studied in urban schools; only ten students had studied in semi urban schools.

Mother tongue	No. of students	Medium of instruction		Location of school			Graduate parents	Non-graduate parents	To speak English	
		Regional	English	Rural	S.urban	Urban			Yes	No.
Hindi	9	6	3	4	4	1	3	6	3	6
Urudu	3	-	3	-	3	-	3	0	0	3
Tamil	27	2	25	5	18	4	15	12	9	18
Telugu	25	1	24	3	17	5	16	9	7	18
Malayalam	1	-	1	1	-	-	1	-	0	1
TOTAL	65	9	56	13	42	10	38	27	19	46

Parental influence

The study showed that fifteen Tamil parents were graduates; the remaining twelve parents were non- graduates. Sixteen Telugu parents were graduates; nine parents had not even done school education. The sole Malayalam participant's parents were graduates. Only three of the Hindi speaking parents were graduates and the rest were just tenth standard passed. Regarding Urudu speaking parents, all the three of them were graduates.

English language proficiency

The questionnaire also inquired into the students' proficiency level in ESL. It was revealed that only three of the nine Hindi speaking students could speak in English; none of the Urudu speaking students could speak in English; only nine Tamil speaking students could speak in English; only seven Telugu speaking students could speak in English and the only one Malayalam student also could not speak in English. To sum up, nineteen students from different linguistic background could speak in English. Forty six students could not speak in English.

Teaching methodology at schools

The participants' response to the question on the way they had been taught English at schools showed it was mostly, teacher centred language pedagogy- (grammar- translation method, comprehension exercises, reading poems and prose aloud) and there were little opportunities for group discussions, role play, games and puzzles in the English classes. The students had learnt English as any other subject. Only the students who studied in central schools knew oral language activities like role plays, quizzes and puzzles.

Reason for their inability to speak in English

The students were honest in expressing their inability to speak in English. Forty nine students said they felt shy and were afraid of speaking in English amidst their teachers and peers because they were not sure of their vocabulary and the structure for the purpose. Despite having been educated in English medium, even those who said they could speak in English agreed that they experienced shyness and fear to speak in public. Six of the nineteen students, who said they could speak in English, felt sad that they are not competent enough to interact in English because of shyness and fear. The analysis showed fifty two students could not speak in English because of shyness, fear, lack of vocabulary and weak in grammar while only thirteen out of sixty five participants of the action research, could speak in English.

Socio environmental factor

Native speaker environment is obviously absent and so as children, the learners were not exposed to what it was to speak with native speakers of English. However, the information regarding their linguistic identity finds correlation in the people's socio-political milieu of the states to which they belong.

Discussion

The students were young adults in the age group of 17- 20. The age factor was not a disadvantage for the students to interact among themselves. The age could not be considered to be detrimental to learn English, in fact, they were better poised for learning English as second language. Ehrman and Oxford (1995) state that older learners have an advantage in understanding the grammatical system and in bringing greater 'world knowledge' to the target language learning context (p. 69). To conclude we may accept, David Singleton (2008) is correct when he says age effects are exclusively neurologically based and associating them with language learning is not credit worthy. The investigation has a positive note that the participants of this research are young adults and hence "they bring a great deal of life experience and cognitive maturity to the classroom" (Hills & Sutton, 2001: p.386).

The data obtained by the questionnaire proved that the students came from different states and their mother tongues were also varied. So the participants were heterogeneous. The researcher's observation showed they were good in speaking in their mother tongues. The Telugu and Malayalam students could pick up words in Tamil and could converse with Tamil students with

certain difficulty. At those times they tried to use English vocabulary and gestures to avoid conversation break ups. Students from North India, who spoke either Hindi or Urdu were hesitant to get into conversation because their languages could not be understood by the south Indians and they were not proficient in English to converse with the other classmates. Hence they were reticent most of the time.

The behaviourists believe that language is environmentally determined, controlled from the outside of the stimuli learners are exposed to and the reinforcement they receive. However, an early start and length of exposure to English language did not necessarily lead the participants to higher linguistic proficiency. Their percentage of marks in English in plus2 examination did not assure their oral fluency because in India, the language exams are written with no oral components assessment.

As per the students' declaration, it was found that English was taught in schools by direct method and they had little opportunity to speak in English for basic interpersonal communications, leave alone for academic purposes. Their lack of language proficiency in English can be attributed to the school teachers' indifference or ignorance towards the demands of the students as ESL learners. Practically speaking, there was no difference between the English medium students and regional medium students in speaking English; there was no difference in the students' oral performance in terms of their having studied in rural, urban and semi urban schools. However one significant fact evolved by this survey was that the students who had studied in central schools could speak better in English because of their exposure to oral activities. To sum up, the study observed that the students had not sharpened their listening and speaking skills at the tertiary level.

This research found further, the following observation: apart from not finding the expert-novice relationship between the parents and the children for language acquisition, which is considered primary strategy, the family support, which is considered support strategy in language acquisition was lacking for the present participants during their critical period of learning. Support strategies are recognised as instrumental to enhance or support learning indirectly by creating a good attitude in the learner, establishing learner goals and reducing learner frustration, tension and anxiety. The learners as young children under the control of their parents did not know the necessity to speak English anywhere; the teachers also did not throw the required opportunities to interact in English. In the absence of zone of proximal development, and so away from native speakers of English, there was no need for English in everyday communication outside the home and schools. So, the participants lacked the practice of speaking in English. Moreover, they were taught the language but were not taught to use the language for communication.

The linguistic divisions which were instrumental in the formation of linguistic states in India were also one of the reasons for the regional political parties to thrive in India. Their divide and function attitude has in fact, made language a pawn to achieve their selfish desires. In such a context, the status of English is purely a constitutional assurance but the people do not experience the crunch to speak the language in different inter personal and official situations inside and outside their homes. Furthermore, the regional language fanatics in the southern states even today do not allow the state governments to take stringent policy decisions on English language

teaching and their insistence on government's responsibility to make the university education in the mother tongue medium and the jobs for sons of the soil deter the language learners' and more particularly the society's attitude to accept the importance of English as an empowerment tool in the changed global context. This kind of societal and parental attitude has been detrimental in developing the language attitude of the students and finally has left them least motivated to learn the language (Skehan, 1986; Clement, 1980). The study takes an interesting new direction towards the L2 proficiency as Cummins (1984) points out that with appropriate help the students will learn to use L2 language in their oral communication. The simple fact that they have come from different states of India, to join a professional course assures one that they are focused on enhancing their career prospects. The engineering students are extrinsically motivated to learn the language which is the language of opportunity for global placement. Although there is ample evidence to show the lack of social and parental motivation have been a demotivating factor in the participants' language learning, from a practicing teacher's point of view the pressing question now is how the students can be motivated to realise their goal of oral communication.

CONCLUSION

The pilot study – the questionnaire has only helped to make an overall assessment of participants as individuals and members of a language group and learners. Having arrived at this point, the researcher needs to be focused to customise a test that could tell the students' past learning and its bearing on their present proficiency in terms of their strength and weakness and also give directions for further proceedings. The test, we are talking about, is the diagnostic test, to decide upon the learners' language skills and their ability to cope with the present venture and also the material and methodology to support the researcher's objective of honing the engineering students' oral communication skills, by showing them proper language learning strategies and engaging them in activities appropriate to their age.

Scope and limitations of the study

In view of the findings and their usefulness in planning and designing further course of action, the researcher feels such studies may be conducted for the benefit of student community. However, it is true that the pilot study was limited to a limited number of I B.Tech. students of Dr. M.G.R. Educational and Research Institute University, Chennai – 95.

QUESTIONNAIRE - 1

PERSONAL PROFILE

(SECTION – I)

1. Name : _____
2. Course : _____ Year : _____

Dr. M.G.R. Educational and Research Institute University, Chennai - 95

3. Date of Birth _____ Age: _____ yr.
4. Mother Tongue _____ State _____
5. Parents' education: (Put a tick mark in the relevant box)

PARENTS	EDUCATION				
FATHER	School	Intermediate	Graduation	Post-Graduation	Nil
MOTHER	School	Intermediate	Graduation	Post-Graduation	Nil

6. Do your parents speak English at home? Tick: YES / NO

ACADEMIC PROFILE (SECTION – II)

7. Name of the school last studied:
(Put a tick mark in the relevant box)

SCHOOL	BOARD				LOCATION			Medium of Instruction	
	SB	CBSC	Matric		rural	urban	semi-	R.M	Eng.
	Others				urban			Medium	
Primary									
Secondary									
Hr. Secondary									
LENGTH OF EXPOSURE TO ENGLISH (years)									
Marks obtained in English in 12 th std. public exam:								%	

SB: State Board / CBSC: Central Board of Secondary Education / Matric: Matriculation
R.M.: Regional medium/ Eng. Medium: English medium

ENGLISH PROFICIENCY SECTION – III

8. Tick the activities through which you were taught English in schools:

Translation	comprehension	Grammar exercises	reading poems & prose	Group Discussion	role play	games	puzzles
-------------	---------------	-------------------	-----------------------	------------------	-----------	-------	---------

9. Tick your proficiency level in English:

Understand only	write only	Speak and write
-----------------	------------	-----------------

10. If you cannot speak, give reason:

Shyness	Fear	lack of vocabulary	weak in grammar
---------	------	--------------------	-----------------

THE EFFECT OF CONCEPT MAPPING AND INFORMATION GAP TASK ON IRANIAN POSTGRADUATE EFL LEARNERS' WRITING

ABSTRACT

This study was conducted to investigate the effect of concept mapping and information gap task on Iranian Postgraduates English as a foreign language (EFL) learners' writing. The participants were forty-two Iranian postgraduate students majoring in TEFL (Teaching English as a Foreign Language) at Islamic Azad University, Karaj Branch, Tehran, Iran. They were assigned into two twenty one experimental groups of concept mapping and information gap task. Then, both groups sat for the pre-test, which was a TOFEL writing test. The purpose of this test was to measure the learners' initial writing ability. Afterwards, participants in one experimental group received concept mapping instruction and used it in their writings; while, participants in another experimental group were asked to complete writing information gap tasks. The treatment period took six weeks. Finally, both groups sat for the post-test which was another TOFEL writing test parallel to the pretest. After keying in the data into SPSS, the Mixed Within-Between Groups ANOVA statistical test was used to compare mean scores of both groups. It can be concluded that although both groups' performance improved significantly on their writing post-tests in comparison to their pretests, the comparison of post-tests of two groups showed that the concept mapping group outperformed the information gap task group. The results revealed that the application of concept mapping and information gap task improved learners' writing. The findings of this study could have a number of important implications for teaching writing to EFL learners effectively.

KEYWORDS: Concept Mapping, Information Gap Task, Writing

INTRODUCTION

The major purpose of all languages is communication. People all around the world with different native languages use English as their means of communication. English language consists of four skills. According to Chastain (1988), "writing is a basic communication skill and a unique asset

in the process of learning a second language” (p.244). Richard and Renandya (2002) states that comparing to other skills, writing is considered the major one and the most difficult skill for learners to master. Richards (1990) asserts that “The nature and significant of writing have traditionally been underestimated in language Teaching” (p.106). But in the recent decades, writing pedagogy has undergone remarkable changes. In the past, product approach was the most popular teaching methodology. Based on Brown (2001), writing teachers were only concerned with the final product of writing. In the mid 1960s, a number of changes happened which led to the emergence of process-centered approach. According to Keh (1990), process-centered approach assists learners in understanding their own composition process and building their body of strategies for pre-writing (gathering, exploring, and organizing raw materials), drafting (structuring ideas into a piece of linear discourse), and re-writing (revising, editing, and proofreading).

Concept mapping is a kind of pre-writing task which makes ideas visual. Concept maps help learners in generating and organizing their ideas, ordering, and establishing the relationship between them. According to Buzan (1995), “using mapping technique, students were able to complete essays in one third of the previous time, while receiving higher marks” (p.102).

Information-gap tasks make students actively participate in the process of learning (Ur, 1996). They encourage students to increase their target language practice.

Regardless of all the recent improvements in writing instruction, traditional methods of teaching are still used in most of Iranian academic settings and most EFL learners with good command of language have difficulty with learning writing. This study aims to examine the effect of concept mapping and information gap task on Iranian postgraduate EFL learners’ writing.

LITERATURE REVIEW

Task-Based Language Teaching (TBLT)

During the recent decades Task-based Language Teaching (TBLT) became one of the most leading teaching methodologies. Tasks play crucial role in Task-based Language Teaching (TBLT). Nunan (2004, p.1) asserts that “task is an important element in syllabus design, classroom teaching, and learners assessment”. Richards and Rodgers argue that “task-based language teaching refers to an approach based on the use of tasks as the core units of planning and instruction in language teaching” (2001, p.223). Based on Prabhu (1987) task is an activity which requires students to reach an outcome by the use of given information. Using task as a kind of class activity makes classes more student-centered. In addition, it encourages students to interact in target language and focus their attention on meaning instead of form.

Information Gap Task

In recent years there has been an interest in using Information gap task. In such kind of activity learners are required to use the language in order to exchange information while their attention is on meaning rather than structure of the language. Ellis (2004) defines information gap task as “A task where one participant holds information that the other participant(s) do(es) not have and that

must be exchanged in order to complete the task”(p. 213). According to (Prabhu, 1987), information gap task is a kind of task in which there is a missing piece of information that students need to complete. Also, Ur (1996) asserts that information gap task is “A particularly interesting type of task which is based on the need to understand or transmit information finding out what is in a partner’s picture, for example” (p.54).

Concept Mapping

In 1970s, concept mapping was first developed by Novak in a research program where he sought to follow and understand changes in children’s knowledge of science (Novak & Canas, 2006). Concept mapping is based on the David Ausubel’s learning psychology, which believes that learning takes place by assimilation of new concepts and propositions into existing concept propositional frameworks held by the learner (Novak, 2001). Based on Ausubel 1963, there are two kinds of learning; one of them is rote learning and the other one is meaningful learning. He defines meaningful learning as a kind of learning in which the learner consciously tries to make a connection between new knowledge and the knowledge already knows. According to (Novak and Canas, 2006), concept is “a perceived regularity in events or objects, or records of events or objects, designated by a label”. Nesbit and Adescope (2006) defines concept map as “a visual representation of individual’s knowledge structure on a particular topic as constructed by the learner” (p.414). Concept maps are a kind of brain storming tools which help us in generating and organizing ideas. They are composed of concepts, enclosed in circles and boxes, and connecting lines indicating the relationships between concepts and propositions. Concepts usually arrange hierarchically, from the most inclusive and general at the top to the least inclusive and the most specific at the bottom.

Writing

It is an undeniable fact that writing is the most challenging language skill for most of ESL/EFL learners and mastering it requires a considerable amount of time and effort. Writing is an extremely complex cognitive ability in which the writer is required to control a number of variables simultaneously. At micro level, these include control of content, format, sentence structure, vocabulary, punctuation, and spelling. At macro level, the writer needs to integrate information into cohesive and coherent text (Bell & Burnaby, 1984). To become a skillful writer is the main goal of many language learners, especially those who want to continue their education in academic settings. White and Arndt (1991) states that “through writing, we are able to share ideas, arouse feeling, persuade and convince other people, we are able to discover and articulate ideas in a way that only writing makes them possible” (p.1).

Empirical Studies on Concept Mapping and Information Gap Task

In a study Fahim and Karimi (2011) investigated the effect of concept mapping strategy on the writing performance of EFL learners. Learners in experimental group received instruction about how to use concept mapping as pre-writing strategy. The findings of the study showed that writing performance of students in experimental group significantly improved in comparison to students of control group. In another study, Nobahar, Nemat Tabrizi, and Shaghaghi (2013) examined the impact of concept mapping on Iranian intermediate EFL learners' self-efficacy and expository writing accuracy. Experimental group received concept mapping instruction as their

treatment while control group received no treatment. Results revealed that concept mapping instruction had positive effect on learners' self-efficacy and expository writing accuracy. Also, Soleimani, Zare, and Abbasi (2014) investigated the effect of pre-task planning through information gap on speaking skill of foreign language learners. The result of the study indicated that pre-task planning through split information activities significantly improved students speaking skill.

RESEARCH QUESTIONS AND HYPOTHESES

Based on the objectives of this study, the following research questions are formulated:

RQ1: Does concept mapping have any significant effect on Iranian postgraduate EFL learners' writing?

RQ2: Does information gap task have any significant effect on Iranian postgraduate EFL learners' writing?

Based on the above research questions and in order to investigate them empirically, the following null hypotheses are formulated:

HO1: Concept mapping does not have any significant effect on Iranian postgraduate EFL learners' writing.

HO2: Information gap task does not have any significant effect on Iranian postgraduate EFL learners' writing.

METHODOLOGY

Participants

The present study was conducted among 42 Iranian postgraduate TEFL students, 36 females (81%), and 8 males (19%) at Islamic Azad University, Karaj Branch, Tehran, Iran. The participants had enrolled Essay Writing classes. Participants ranged in age mostly from 23 to 30 years old and with a few exceptions over the age of 30. They were assigned into two intact groups. It should be mentioned that all participants in two groups were informed that they were part of a research project. In each class, the researcher explained that their writings would be used in her research anonymously. In addition to the student participants, there were also two raters who were experienced English teachers with an MA degree in TEFL (Teaching English as a Foreign Language).

Instruments

To fulfill the objectives of this study, the researcher administered the following instruments:

Pre-test

In the first stage, as a pre-test a TOFEL writing exam was administered. The participants were given 30 minutes to write a five-paragraph essay containing minimum of 300 words. This test was used before starting the treatment. The writing test was chosen from the book "185 TOEFL

Writing (TWE) Topics and Model Essays". The topic of the writing test was "People attend to college or universities for many different reasons (for example, new experiences, career preparation, and increased knowledge), why do you think people attend college or university?"

Materials

The treatment of this study was conducted for eight weeks. The researcher developed some concept mapping instructional materials which contained definition and examples of concept mapping, and also some writing information gap tasks. During treatment period, participants in one experimental group completed their writing tasks based on concept mapping instruction. On the other hand, participants in another experimental group were asked to complete writing information gap tasks.

Post-test

At the end of the study, another TOEFL writing exam parallel to genre and topic of pre-test was given to recognize any changes in the participants' writing ability in different groups. The participants were given 30 minutes to write a five-paragraph essay containing minimum of 300 words. Writing test was chosen from the book "185 TOEFL Writing (TWE) Topics and Model Essays". The topic of the final writing test was "Some participants like classes where teachers lecture (do all of the talking) in class. Other participants prefer classes where participants do some of the talking. Which type of class do you prefer?"

Writing Rating scale

Jacob, et al., (1981, cited in Weigle, 2002) analytic scale was used in rating essays. It is a weighted analytic scoring scale developed for rating second language learners' writing tasks. Scripts were rated on five aspects of writing including: content, language use, organization, vocabulary, and mechanics.

Procedure

The present study was conducted *for eight weeks* among 42 Iranian postgraduate TEFL students at Islamic Azad University, Karaj Branch, *Tehran, Iran*. Two TOEFL writing exams were used in the pre-test and post-test. The first test was taken as the pre-test before starting the treatment. The participants were given 30 minutes to write a five- paragraph essay containing minimum of 300 words. They were divided into two experimental groups. Based on the schedule, the participants of one experimental group received concept mapping instruction and used it before writing their compositions. In contrast, participants in another experimental group were asked to complete writing information gap tasks. At the end of the study, both groups took part in another test that was the post-test. They were given 30 minutes to write a five-paragraph essay containing minimum of 300 words. Finally, two raters who were experienced English teachers rated the papers on the basis of the analytical method of scoring. Inter-rater reliability was calculated. Next, the average of the scores given by the two raters was determined.

Design

The design of the present study was quasi-experimental pre-test post-test design. The participants were non-randomly assigned into two experimental groups. The independent variables of this study were concept mapping and information gap task, while the dependent variable was writing.

Data Analysis

In order to test the null hypotheses of this study, the following statistical analyses were carried out: First, the Spearman rho value was used to estimate the inter-rater reliability between the two raters for the writing sections. Second, descriptive statistics including mean and standard deviation were computed for both experimental groups. Third, Mixed Within-Between Group Analysis of Variance ANOVA was used in order to compare mean scores of both experimental groups in both pre-test and post-test. These data were calculated by using 21st version of Statistical Package for the Social Sciences (SPSS).

RESULTS AND DISCUSSION

Learners' Performance on the Pre-test

First of all, the participants of the study were divided into two experimental groups. Half of them were in the Concept mapping group and the others were in the information gap task group. The participants of both groups took part in TOFEL Writing exam as a pre-test in order to show their initial writing ability. The pre-tests were scored by two raters. In order to demonstrate the inter-rater reliability between the raters, the Spearman's rho value was calculated. The results are shown in the following tables.

Table 1: Inter-rater Reliability of Raters in Pretest of Concept Mapping Group

Pre-test CM-R2			
Pre-test CM-R1	Spearman's rho	Correlation Coefficient	.536**
	Sig. (2-tailed)		.004
	N		21

Table 2: Inter-rater Reliability of Raters in Pretest of Information Gap Task Group

Pre-test IG-R2			
Pre-test IG-R1	Spearman's rho	Correlation Coefficient	.690**
	Sig. (2-tailed)		.001
	N		21

Table 1 reveals that Spearman's rho value is equal .536 and sig level is equal .004 which is less than 0.01, so there is an inter-rater reliability between the raters in this test. In addition, as the

Table 2 presents, Spearman's rho value is equal .690 and sig level is equal .001 that is less than 0.01, thus there is an inter-rater reliability between the raters in this test.

Learners' Performance on the Post-test

After the treatment, participants took part in another test which is called post-test. In order to estimate learners' writing ability after the treatment, participants of both groups took part in another TOFEL Writing exam as a post-test. The same as the pre-test, this post-test was scored by two raters. In order to indicate the inter-rater reliability between the raters, the Spearman's rho value was calculated. The results are shown in the following tables.

Table 3: Inter-rater Reliability of Raters in Post-test of the Concept Mapping Group

Post-test CM-R2			
Pos-test CM-R1	Spearman's rho	Correlation Coefficient	.631**
	Sig. (2-tailed)		.001
	N		21

Table 4: Inter-rater Reliability of Raters in Post-test of the Information Gap Task Group

Post-test IG-R2			
Post-test IG-R1	Spearman's rho	Correlation Coefficient	.825**
	Sig. (2-tailed)		.000
	N		21

Based on Table 3, Spearman's rho value equals .631 and sig level is .001 which is less than 0.01. Therefore, there is an inter-rater reliability between the raters in the post-tests of concept mapping group. Moreover, Table 4 indicates that Spearman's rho value equals .852 and sig level is equal .000 that is less than 0.01. So, there is also an inter-rater reliability between the raters in the post-test of information gap task group, too.

Null Hypotheses

HO1: Concept mapping does not have any significant effect on Iranian postgraduate EFL learners' writing.

HO2: Information gap task does not have any significant effect on Iranian postgraduate EFL learners' writing.

In order to show whether there is any significant difference between the writing ability of participants in both concept mapping and information gap task groups, Mixed Between-Within Groups ANOVA was employed as the data analysis technique. Therefore, pre-test and post-test results for both groups were compared by this test. The results are shown in the following tables.

Table 5: Descriptive Statistics of Pre-test and Post-test of writing

Group	Variables	Mean	Std. Deviation	N
CM	pre-test	74.64	6.172	21
	Post-test	86.14	4.108	21
IG	pre-test	74.02	5.090	21
	Post-test	78.04	4.795	21

Table 6: Multivariate Tests of Pretest and Post-test of Writing

Effect	Value	F	Hypothesis df	Error df	Sig.	Partial Eta Squared
CM Wilks' Lambda	.777	11.511 ^b	1.000	40.000	.002	.223
IG Wilks' Lambda	.825	8.472 ^b	1.000	40.000	.006	.175

Table 5 indicates that the concept mapping group averaged 74.64 on the pre-test and 86.14 on the post-test. The mean difference of concept mapping group is 11.5. The result shows that this group's improvement is statistically significant. In addition, the value for Wilks' Lambda for time is .002 which is less than .05. Thus, the conclusion is that there is a statistically significant effect for time. Table 6 also shows that information gap task group averaged 74.02 on the pre-test and 78.04 on the post-test. The mean difference of this group is 4.02 which is not as significant as the difference of the concept mapping group. Moreover, the values for Wilks' Lambda for time is .006 which is less than .05. Therefore, the conclusion is that there is a statistically significant difference for time. Figure 1 presents the post-test differences in both groups.

Figure1: The Post-tests' Differences in the Concept Mapping and Information Gap Task groups

According to the above figure, although both groups' performance improved in the post-test, the concept mapping group outperformed the information gap task group. Therefore, both null hypotheses can be rejected, and it can be said that both concept mapping and information gap task positively affected the writing ability of Iranian Postgraduate EFL learners. Great amount of studies have been done on the impact of concept mapping on EFL learners' writing ability. The results of the present study are in line with the results of other studies (Fahim & Karimi, 2011; Nobahar, Nemati Tabriz, & Shaghaghi, 2013; Ojima, 2006; Pishghadam & Ghanizadeh, 2006; Roa, 2007; Talebinezhad, & Negari, 2009). All above mentioned studies approved the fact that, concept mapping instruction significantly improves learners' writing ability. Also, the findings of current study are consistent with previous studies that showed the positive effect of information gap task on second or foreign language learning (Defrioka, 2009; Jondeya, 2011; Soleimani, Zare, & Abbasi 2014).

CONCLUSION

This research was designed to investigate whether the application of concept mapping and information gap task have any significant effect on improving learners' writing performance or not. Therefore, the following research questions were developed. The first question was, "does concept mapping have any significant effect on Iranian Postgraduate EFL learners' writing?" And the second question was, "does information gap task have any significant effect on Iranian Postgraduate EFL learners' writing?" In order to answer the above mentioned questions, the following statistical analyses were carried out. Descriptive statistics including mean and standard deviation were computed for both experimental groups. Also, Mixed Within-Between Group Analysis of Variance ANOVA was used in order to compare mean scores of two experimental groups in both pre-test and post-test. Based on the findings of this research, since there were significant differences between the pre-tests and the post-tests of two groups, both null-hypotheses were rejected and it could be concluded that application of concept mapping and information gap task improved learners' writing. The findings of the present study can be beneficial for both students and instructors. Concept maps can be used by students as a brainstorming tool which could help them in generating and organizing their thoughts and ideas. It also can be used by instructors as a tool in assessing learners' understanding of the materials. Instructors can use information gap tasks as small group class activities to encourage students to increase their target language practice.

Limitations of the Study

The current study was limited in several ways. The first limitation was related to the inability of the researcher in controlling the gender variable, participants were both males and females. Another limitation was about the participants of the study who were not randomly selected. They were selected based on convenience sampling. Finally, due to the time restriction on university courses, the researcher was allowed to use only 30 minutes of every session for writing treatments.

ABSTRACT

This study was an attempt to investigate the comparative impact of lexical inferencing and concept mapping on English as a foreign language (EFL) learners' lexical collocation learning. Accordingly, 60 female EFL learners were selected from a group of 90 learners based on their performance on a sample piloted PET in Zabansara Institute, Tehran. They were randomly assigned into two experimental groups. They were given a teacher made lexical collocation test to ensure that the participants had no knowledge of the target lexical collocations prior to the treatment. The ten session treatment which followed included teaching lexical collocations using lexical inferencing in one experimental group and concept mapping in the other. Everything in both groups such as materials, the amount of instruction was the same except the treatment. At the end of the instructional period, a piloted teacher-made lexical collocation test was administered to both groups to see if there is any significance difference between two groups in terms of their performance on the posttest. The analysis of the test scores using an independent samples t-test indicated that Concept mapping techniques was as effective as lexical inferencing in learning lexical collocations. As a result of the study, the lexical collocation knowledge of EFL students may be developed by familiarizing them with the perception underlying the lexical inferencing and concept mapping techniques.

KEYWORDS: Concept mapping- Lexical inferencing - Intermediate Learners- Lexical collocations

INTRODUCTION

The importance of vocabulary in learning a language as a key element in language classes can hardly be denied. Wilkins (1972) said, "Without grammar little can be conveyed; but without vocabulary nothing can be transferred" (p. 111). Vocabulary knowledge is important as a result learning vocabulary is considered as a key factor in achieving a high level of proficiency in the target language (Boers & Lindstromberg, 2008). That is to say, even an adequate knowledge of vocabulary alone could be enough to go on a communication (Wallace, 1982). Furthermore, Celce-Murcia and Rosensweig (1989) approve that vocabulary should be considered as a central element in language teaching from the beginning stages. According to Sinclair (1987), using

language is selecting more than one word at a time, and blending them together. McCarten (2007) states, “the way in which some words are usually used is generally called collocation” (p. 5). In addition, Stubbs (2002) defines collocation as “the habitual co-occurrence of two unordered content words or a content word and a lexical set” (p. 215). Since much of natural language consists of prefabricated chunks, learning words in isolation does not help L2 learners to be successful in communications. Learners also have to obtain a large number of fixed sequences in order to be able to produce and comprehend ideas accurately and fluently (Wray, 2002). In addition, collocations especially the lexical collocations are the most important part of second language acquisition and they are also essential to non-native speakers in order to speak or write fluently and accurately (Jaén, 2007). Lewis (2000) also believes that “lexical collocations are combinations of two equal lexical components” (p. 133). Teaching vocabulary and collocation to students is a complex process, so Genç (2004) states that in order to stimulate interest and awareness in students about vocabulary improvement and make the vocabulary learning process more meaningful, there is a plenty of vocabulary teaching techniques. Vocabulary learning strategies include concept mapping, organizing, note taking, identifying important information, lexical inferencing and summarizing (Pressley, 1982; Weinstein, 1988). Moreover, Spencer and Guillaume (2006) said “words must be presented to students through several different contexts and situations in order to develop their knowledge (p. 208). Also, Quain (1996) states, “most researchers believe vocabulary is best taught in context rather than isolated lists” (p.120). As a result guessing from context is certainly the most significant vocabulary learning strategy that is called Lexical inferencing, and has been defined as the connections that people begin when they try to understand texts. Lexical inferencing allows the learners to learn vocabulary without the teacher’s help and they can understand their reading without stopping to check each word in the dictionary. Nation (2001) mentions that, “Incidental learning via guessing and inferencing from context is the most important of all sources of vocabulary learning” (p.232). Also, Beers (2003) states that “An inference is the ability to connect what is in the text with what is in the mind to create an educated guess” (p. 62). Its aim for learners is being able to make a well-formed guess of the meaning of an unknown word in a context without interrupting the reading too much.

Another useful strategy is concept mapping which has been described as “metacognitive strategies” (Mintzes, Wandersee & Novak, 1997) that encourage students to think reflectively, and used as a learning technique in different fields and they are suitable for presenting and organizing knowledge. The researcher as a teacher noticed that it is very fundamental to find a suitable way to overcome the learners’ problems with collocations because collocation is very important for a person who is learning a second language, also understanding collocations is crucial for both language production and comprehension (McIntosh et al., 2009). Finally, according to Hill (1999), most learners with good vocabulary knowledge have problems with fluency and the researcher as a teacher has witnessed the lack of learners’ collocational competence as a source of error, which hinders their fluency. Therefore, the researcher decided to look for the useful strategies in teaching collocation in order to help students develop collocational competence, but in the present study, she decided to focus just on lexical collocations. According to Williams and Burden (1997), one of the areas that can shed light on the issue of collocational knowledge is a study of language learning strategies. It would be useful to present the techniques and activities that affect the ways of teaching collocation, and help

learners develop collocational capability. Hence, the researcher tried to focus on some classroom strategies, which remind the importance of collocations to learners. Among the strategies graphic organizers are recommended (Chularut & De Backer, 2003) because they provide visual scaffolds that encourage students to extract and represent the meaning of words from texts. Concept mapping is a metacognitive strategy, which may be helpful for students to develop their vocabulary competence (Chularut & De Backer, 2003). On the other hand, the context is one of the most significant factors in learning vocabulary, and according to Nagy (1997), L2 learners may have a greater need to use context in vocabulary development. In addition, L2 learners learn new words considerably as they encounter them in context through reading and listening activities, similar to the way native speakers of a language expand their vocabulary knowledge (Read, 2000). Although these learning strategies have been studied in Iran, few studies have considered the use of strategies for learning collocations among Iranian EFL learners. Among these strategies, lexical inferencing as a cognitive strategy and concept mapping as one of the metacognitive strategies were chosen because based on what Chularut and De Backer (2003) argues these strategies help students to develop the vocabulary knowledge.

The present study is considered to be significant for some reasons. First, the results can help teachers have a better view on using the lexical inferencing and concept mapping technique in teaching lexical collocation. In addition, the use of these two strategies seems to be helpful for the teacher in constructing and using them to improve lexical collocations. Secondly, the results can help students have a better view on using vocabulary-learning techniques. Third, gaining a better understanding of these kinds of strategies help educators develop more effective interventions to enhance lexical collocation, too. However, collocations are important and Howarth (1998) believes that learning collocations helps ESL/EFL learners to become more native-like because English native speakers tell EFL learners that a sentence is good in English, but as the native speakers, they never use it. Thus, if EFL learners apply chunks of language they will be able to become more native-like.

RESEARCH QUESTION AND NULL HYPOTHESIS

To fulfill the purpose of this study, the following research question was formulated:

Is there any statistically significant difference between the impact of using lexical inferencing and concept mapping on EFL learners' lexical collocations learning?

H₀: There is no significant difference between the impact of using lexical inferencing and concept mapping on EFL learners' lexical collocations learning.

METHODOLOGY

A thorough description of the participants, procedure, and instrumentation carried out for this study are presented in this section.

Participants

The participants, compromising the population of the present study, were 60 female intermediate EFL students. They were females whose age ranged from 15 to 22. Their language proficiency

was intermediate level according to the criteria set by the language school. The participants were selected from among 90 students via the administration of a PET (Preliminary English Test), (2004). In addition, 30 participants with almost similar characteristics to that of the target sample took part in the piloting of the present study's instruments.

Instrumentation

In order to come up with a homogeneous sample, a proficiency test was administered in this study. To minimize the individual differences among the participants and to ensure homogeneity of them, a version of the PET (Preliminary English Test) proficiency test was employed as a reliable and standard criterion to help the researcher choose the sample. The second instrument was a researcher made lexical collocation test (a pretest and a post-test) each containing 50 multiple-choice items on the lexical collocation and it took 60 minutes. These two parallel 50-item multiple choice tests were made based on their course book (Top Notch intermediate) one for pretest and one for post-test.

Procedure

To complete the course of study, four stages were followed: First the PET was piloted on 30 participants demonstrating almost similar characteristics as the target sample before the actual administration in order to make sure that the test had appropriate reliability (0.93) and item characteristics (no items were modified or removed) and thus suitable for the target sample. The administration of the whole test took 1 hour and 20 minutes. The second stage consisted of administering the piloted PET to help the researcher make sure about the homogeneity of the participants regarding their language proficiency. Having administered the test used for homogenization, out of 90 students the eligible ones -those 60 whose scores ranged from one standard deviation above and below the mean on the test were selected as the participants of the study. The participants were then randomly assigned to two experimental groups. Two experimental groups were administered the researcher- made lexical collocation pretest at the beginning of the instruction session. Before the test was administered, participants were provided with an explanation of the study being conducted and were assured that the results would have no influence on the course outcomes. The pretest was conducted to assess the lexical collocation knowledge of the two groups before the course of instruction and to check their homogeneity in not knowing the lexical collocations prior to the treatment. In the lexical inferencing group, lexical inferencing instruction was introduced in a way that the students got some contextual cues to use while they were trying to infer the meaning of unknown lexical items. The other experimental group was instructed through concept mapping strategy. In this group, the students first read the passage of their book and then the teacher presented the new vocabulary items. She presented suitable multiple collocates for each word. In this way, students learned a new word through its collocations. Then, the teacher drew a circle in the center of the board and wrote the verb on it such as "make". Then, the students should say different words that could be collocated with that verb, such as "choice". "A mistake". "An excuse". The teacher drew lines from the circle for each of the words involved. After that, she drew a circle at the end of each of the lines, and wrote each word in one circle. After that, the teacher chose one of the words associated with that verb (such as make a mistake), explained the meaning of it, and wrote it in the other circle in the same line. After coming up with the correct meaning of lexical items through contexts and the

provision of the necessary feedback, the researcher asked the students to make new sentences with the taught lexical collocations. The teachers gave feedback on the sentences made by the students. Then, the students were asked to make more sentences with them as their homework. After the end of the instruction, a piloted researcher-made post-test consisted of 50 multiple-choice items based on those lexical collocations covered during the instruction was administered to compare the participants' learning of lexical collocations in both groups.

Design

The participants of this study were selected based on nonrandom sampling method but randomly were assigned into two experimental groups to receive two different kinds of treatment; therefore, this study is a quasi-experimental. The study enjoyed a posttest only design with two concept mapping and lexical inferencing strategies as the two values of the independent variable and lexical collocations learning as the dependent variable. Furthermore, all participants were female intermediate EFL learners, so language proficiency and gender were considered as the control variables of the study.

Statistical Analysis

Several statistical analyses were conducted to answer the research question in this study. After scoring PET, pretest, and posttest, the researcher calculated mean, standard deviation of the scores (descriptive statistic). The inter rater reliability of the two raters in the writing section of PET was calculated by the use of Cronbach alpha. The means of two groups' scores at posttest were compared using an independent samples *t*-test to test the null hypothesis.

RESULTS AND DISCUSSION

Descriptive Statistics of the PET Piloting

Prior to the actual administration, the PET was piloted to ensure that it could be used confidently for participant selection. The section below describes the details of the piloting administration of PET. The data collected from piloting PET were examined with regard to the normality of their distribution. All items of the PET went through an item analysis procedure and no items were discarded thanks to their non-malfunctioning characteristics. Furthermore, the mean and standard deviation of the scores and the reliability were calculated. The mean of the test was 53.26 and the standard deviation of the test was found to be 10.185. Table 1 shows the descriptive statistics of the PET Piloting.

Table 1: The Descriptive Statistics of the PET Piloting.

	N	Minimum	Maximum	Mean	Std. Deviation	Skewness	
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error
Total	30	35.50	71.00	53.2667	10.18513	-.261	.427
Valid N (listwise)	30						

The reliability of PET was calculated through the Cronbach alpha formula. The reliability of .826 was achieved which was satisfactory. Table 2 shows the reliability of the piloting PET.

Table 2 : Reliability of the PET in the Pilot Phase

Cronbach's Alpha	N of Items
.826	67

The writing section of the test was rated by two raters, the researcher and one of her colleagues using the predetermined PET rating scale. The rating was done based on the Cambridge General Mark Schemes including the range of scores from zero to five. The Pearson correlation coefficient was used in order to calculate the inter-rater reliability between the raters. The inter-rater reliability of the two raters scoring the writing papers proved significant ($r = 0.89$, $p < 0.01$). The reliability showed that there was a significant correlation between the two raters. Therefore, this ensured the researcher that the same raters could be used for the actual administration of the test (Table 3).

Table 3: Inter-rater Reliability of the Two Raters in writing section of the Piloting Correlations

			Rater1	Rater2
Spearman's rho	Rater1	Correlation Coefficient	1.000	.894**
		Sig. (2-tailed)	.	.000
		N	60	60
	Rater2	Correlation Coefficient	.894**	1.000
		Sig. (2-tailed)	.000	.
		N	60	60

** . Correlation is significant at the 0.01 level (2-tailed).

Descriptive Statistics of the PET Main Administration

After piloting the PET, the researcher used it as an instrument to homogenize the students in this study. Generally, 90 students participated in the test and after the administration of the test; the researcher selected 60 students whose scores fell between one standard deviation above and below the mean. Similar to the piloting phase, descriptive statistics were conducted after the administration of the test. Table 4 shows these statistics with the mean of 56.08 and the standard deviation of 7.11.

Table 4: Descriptive Statistics of the PET Main Administration

	N	Minimum	Maximum	Mean	Std. Deviation	Skewness	
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error
scores	90	35.50	69.50	56.0889	7.11091	-1.024	.254
Valid N (listwise)	90						

Out of the 90 participants, 60 whose scores fell between one standard deviation above and below the mean were chosen. In addition, the reliability of the PET for the homogenization of the participants was calculated (Table 5). An index of .701 reassured the researcher of the reliability of this test.

Table 5: Reliability of the PET Main Administration

Cronbach's Alpha	Cronbach's Alpha Based on Standardized Items	No. of items
.701	.720	67

Descriptive Statistics of the Lexical Collocation Piloting test

The lexical collocation posttest was piloted with a group of 30 participants in Zabansara institute with almost the same characteristics (the same language proficiency level and age) as the group of the main study. The results of the piloting revealed that there were not any malfunctioning items to be discarded. (Table 6). It has to be indicated also that the posttest was parallel to the pre-treatment test of lexical collocations. And as for the content, those items that were not known to the learners, hence taught to them during the instructions, were included in the posttest.

Table 6: Descriptive Statistics of Piloting Lexical Collocations posttest

	N	Minimum	Maximum	Mean	Std. Deviation	Skewness	
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error
Lexical collocation posttest	30	14.0	22.0	17.300	1.8411	.448	.427
Valid N (listwise)	30						

The reliability of each of the test was calculated using K-R 21 formula. The reliability of the lexical collocation posttest came out to be 0.75 which was satisfactory.

Table 7: Reliability of the Lexical Collocation posttest Piloting

	K-R 21 formula	No. of items
Lexical collocation Posttest pilot	.75	50

Descriptive Statistics of Lexical Collocation Pretest and Posttest Main Administration

Before the treatment, a Lexical collocation pre-test was administered in order to make sure the participants in both groups had no background knowledge of the Lexical collocations, which were taught during treatment sessions. As displayed in Table 8 the mean scores for lexical inferencing and concept-mapping groups on the pretest of Lexical collocation are 15.87 and 16.20. However, only those items which were not known by any of the participants were selected to be taught and included in the posttest. At the end of the treatment, in order to test the achievement of the Lexical collocation, a posttest was run to both groups. As displayed in Tables 4.8 the mean scores of lexical inferencing and concept mapping groups on posttest of lexical collocation turned out to be 34.51 and 35.17 respectively.

Table 8: Descriptive Statistics of Lexical Collocation Pretest and Posttest scores (main administration)

	N	Mean	Std. Deviation	Skewness		Skewness ratios
	Statistic	Statistic	Statistic	Statistic	Std. Error	
Lexical Inferencing pretest	30	15.8710	2.83716	.542	.421	1.28
Lexical Inferencing posttest	30	34.5161	3.13976	.778	.421	1.84
Concept Mapping pretest	30	16.2000	3.25259	-.140	.427	-.32
Concept Mapping posttest	28	35.1786	4.52199	-.255	.441	-.57
Valid N (listwise)	28					

As shown in table 8 all the skewness ratios fell within the normality range of ± 1.96 .

In order to examine the comparative effect of lexical inferencing and concept mapping as teaching techniques in improving the knowledge of students in learning lexical collocations, the scores on the lexical collocation posttest of the lexical inferencing group, and the scores obtained from the concept mapping group lexical collocation posttest were compared through applying an independent samples *t*-test. The results were to show whether or not there was any significant difference in the performance of the two groups in the post-test of lexical collocation. The following table shows the result:

Table 10: Independent Samples *t*-test of the Posttest Scores

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
posttest	Equal variances assumed	3.329	.073	.659	57	.513	.662	1.00551	-1.351	2.675
	Equal variances not assumed			.647	47.5	.521	.662	1.02387	-1.396	2.721

With the equality of variances assumed ($F=3.32$, $p=.07>.05$), the first row was used for the result of the *t* -test. As displayed there, the difference between the posttest mean scores turned out to be non-significant ($t=.659$, $p=.513>.05$). Therefore, the null hypothesis fails to be rejected. This study compared the impact of lexical inferencing and concept mapping as teaching techniques in improving the ability of students in learning lexical collocations. The scores on the lexical collocations post-test of the lexical inferencing group, and the scores obtained from the concept mapping group were compared through applying an independent samples *t*-test. The results showed that there was not any significant difference between the two groups in terms of their post treatment learning of the collocations. The null hypothesis of the study fails to be rejected according to the results of the data analysis. In fact, the results of the lexical collocation post-tests strongly indicated that learning lexical collocation through the lexical inferencing strategy was as effective as the concept mapping strategy. In other words, the participants who were exposed to these two strategies demonstrated enhanced learning of the lexical collocation as they did not know them before the intervention. Furthermore, based on the statistical analysis which has been done, there was no significant difference between the impacts of these two strategies on learning lexical collocations. This outcome is in line with the findings of Nosratinia (2012). She studied the effects of the "concept mapping" and the "Lexical Inferencing" strategies on EFL learners'

retention of phrasal verbs. Similarly, regarding the results of statistical analysis, it was concluded that there was no significant difference between two groups on retention of the phrasal verbs. This result also supports the findings of Cooper (1999) in which he found out the learners are successful in using lexical inferencing strategies to learn idioms. Theoretically, perhaps there is a claim that there is a stronger relationship between learning vocabulary through inferencing and higher levels of achievements than learning the words through memorizing. One probable explanation is that inferencing techniques involve deeper mental processing. In addition, students who used more inferencing strategies considered guessing as a problem solving strategy and it made them enjoy their reading and comprehend the text better. The construction of concept maps may have helped students to build more complex structures in regard to information in the texts than they were able to construct on the basis of individual study and in-class discussions. By the use of concept mapping, students may have been ready to understand not only the ideas in the text, but also the relationships among the concepts and notions, which lead to a better understanding of the texts. It appears that the act of concept mapping helps ESL students to tie information from the text at hand to prior knowledge, to organize and summarize their thoughts during reading, and to organize recall of specific text details and difficult vocabulary which are likewise involved in inferencing process. This may explain why the two techniques were similarly effective on the learning of the collocations. The students in concept mapping group talked about the concept and their relations among these concepts and it is exactly in line with Stice and Alvarez's findings (1987) that drawing concept maps helped students understand relationships between concepts such as compare, contrast, cause and effect.

CONCLUSION

The purpose of this study was to investigate the comparative impact of using lexical inferencing and concept mapping on EFL learners' lexical collocations learning. The results indicated that there was no significant difference between the effect of these two instructions in learning lexical collocations. Before starting the instruction, a prepiloted sample PET was administered to 90 female students through which 60 of them whose scores fell within one standard deviation above and below the mean were selected. Ultimately, 60 students selected as the main sample of this study were randomly divided into two experimental groups referred to concept mapping and lexical inferencing groups. To make further sure that the two groups manifested no significant difference in terms of the dependent variable of the study, independent samples *t*-tests were run separately at the outset on the mean scores of both groups on a lexical collocation test at the outset. Following the instruction, both groups took a post test of lexical collocation with the mean and standard deviation in the concept-mapping group being 35.17 and 4.52, respectively. In the lexical inferencing, the mean was 34.51 while the standard deviation came out to be 3.13. Comparison of the means of two groups through an independent samples *t*-test was calculated to test the null hypothesis of the study which showed that there was no significant difference between the performances of the two groups on the posttest. In other words the two teaching techniques were equally effective.

Suggestion for Further Research

Drawing on the theoretical concepts and practical procedures followed throughout this study, some other related studies can be carried out:

Only female students participated in this research; it would be interesting to see whether gender is also a factor or not. Moreover, the focus of the present study was exclusively on the effect of concept mapping and lexical inferencing strategies on lexical collocation learning. Therefore, further research can be conducted with the result of teaching other skills or sub skills through these two strategies. This research was carried out among teenagers; the same experiment could be implemented among other age groups to see whether age is a factor in comparing the impact of concept mapping and lexical inferencing strategies on lexical collocation learning. While this study focused on lexical collocations as one of its outcomes, other studies within the same design could seek other types of collocations including learning of grammatical collocations, technical and academic collocations, weak and strong collocations, and open and restricted collocations. Other kinds of learning strategies could be investigated to find out if there is a better learning strategy suited for teaching and learning collocations.

Limitations

The limitations imposed to the present study were as follows:

1. The researcher could not control the students' age as there were in a class based on their proficiency level not their age; therefore the result of this study may not be generalizable to other age groups.
2. This research was conducted only in two classes in a language school; consequently, generalizability of the results was limited by the small sample of the study.

ABSTRACT

*The process of oral communication involves two integral parts: listening and speaking. It is not possible to develop listening skill just through hearing what is spoken. Active listening yields in understanding of what is spoken. Listening is not a single process; series of processes are included in it. In most of the cases we are not fully aware of the processes through which we perceive our first languages, but when it comes to second or foreign language learning we notice this complexity of the processes (Lynch & Mendelsohn, 1995, as cited in Schmidt, 1990). Consequently this study aimed at investigating the role of title familiarity on improving listening comprehension. For this reason the researcher worked on 60 language learners from one of the institutes of Ghazvin. For the purposes of this study, 60 young EFL learners were divided into two groups. At the beginning of the program the researcher conducted a language proficiency test (**Cambridge Mover Tests**) in order to assure the comparability of both groups. Before the treatment, both groups were administered a listening pretest. The experimental group (n=30) were taught the listening materials through some information about the materials while control group learnt the same ones through traditional instruction, that is they just listened to the materials then they were to answer the relevant questions. After the program, the post-test and delayed post-test were administered to the groups. The data analyzed through t-test. Results indicated that providing learners with additional information on listening tasks had a significantly positive effect on listening comprehension of young EFL learners. So teachers may be able to consider the results actively in relation to improve the learners' listening comprehension on a daily basis.*

KEYWORDS: Listening comprehension, Title Familiarity, Traditional Listening Instruction

INTRODUCTION

In spite of the fact that the role of listening in English as Foreign Language and English as Second Language environments has been clarified, neither learners and nor teachers are of an exact knowledge of how to develop this important skill (Wolrin and coakley, 1996). It can be said that listening received less attention in comparison with other skills in research area. It can be said that less attention has been given to listening while comparing with other skills in research area, based on recent research on listening comprehension the significant role of the non-linguistic knowledge on listening comprehension has been emphasized. It was reported that learners perceive the meaning of a text through making use of background information or “schema”. According to different types of knowledge of which is used in comprehension (linguistic/non-linguistic) there would be top-down or bottom-up processing during listening comprehension (Buck, 2001). Generally speaking listening skills are important parts of literacy. As children get older, they learn through listening. Vocabulary is of great role in listening comprehension. Oral language skills develop as children listen to those around them and these skills are the basis of reading and other literacy skills. Most part of a child’s vocabulary develops while children listen to adults and other children around them. Children learn as many as 13,000 words by the time they are six, long before they are competent readers just through listening (Bonk, 2000). Research indicates that we spend 80% of our daily workings communicating, and based on research 45% of that time is spent listening. Although, listening is the most important and primary skill in all areas of language use, most of people are poor listeners. It is found that immediately after listening to ten-minute material the average understand half of what was said, and within 48 hours that drops off another 50% to a final 25% level of effectiveness. It can be said that people comprehend only one-quarter of what was said. It should be found that why we are such inefficient listeners? Firstly, actually we have never been taught how to listen. In schools people are taught speaking, reading and writing skills. Secondly most of us are busy talking and thinking about what to say next that actually we miss out on many important points to learn about new ideas, points..., It is evident that the major part of listening process is asking questions and really listening to answers (Lawson, 2007).

There are supports that can be provided by parents to enhance listening comprehension as follows:

- “Talk with children. Conversation is a great teacher. To converse, it’s necessary to listen to what the other person says. Conversation also teaches the pleasure of being social, which supports successful learning later.
- Read to children. When children listen to stories they practice listening carefully. Adults can ask questions about the book like, “Where did they plant the seed?” or “What happened first?” to evaluate children’s listening skills.
- Play listening games. Games like “Grandma’s Trunk” and “Simon Says” are great for boosting listening skills.
- Listen. When you listen to children you teach them that listening is important and that helps them want to learn to listen well.

- Encourage children to ask questions when they don't understand something that's said or read to them. Listen carefully to their questions and try to make the information clearer" (Higgins, 1995, p.41).

Listening strategies are those procedures, techniques or activities that are directly act on the comprehension and recall of listening material. Listening strategies can be recognized by how the listener processes the input. *Top-down strategies* are listener oriented. The listener makes use of background knowledge of the topic, the situation or context, the type of text, and the language. This background knowledge activates a set of imaginations that help the listener to inference what is heard and guess what will come next. Top-down strategies include

- listening for the main idea
- predicting
- drawing inferences
- summarizing

Bottom-up strategies are text oriented the listener relies on the language in the message, that is, the combination of sounds, words, and grammar that creates meaning. Bottom-up strategies include

- listening for specific details
- recognizing cognates
- recognizing word-order patterns

Strategic listeners also use *meta- cognitive strategies* to plan, monitor, and evaluate their listening. They make planning by deciding which listening strategies would serve best results in a particular situation. They monitor the process of listening comprehension and the effectiveness of the selected strategies. They evaluate through determining whether they gain their listening comprehension goals and that whether the combination of listening strategies selected was an effective one(Hayati,2009).

Listening for Meaning

To extract meaning from a listening material, students must go through four basic steps:

1-Firstly understand the aim of listening. Activate background information of the topic in order to predict or anticipate content and identify appropriate listening strategies.

2-Paying attention to the points of listening input that are more relevant to the identified aim and ignore the rest. This selectivity helps students to focus on specific items in the input and reduces the amount of information they have to hold in short-term memory in order to recognize it.

3-Select top-down and bottom-up strategies that are appropriate to the listening task and use them flexibly and interactively. Students' comprehension improves and their confidence increases when they use top-down and bottom-up strategies simultaneously to construct meaning.

4-Checking comprehension during listening and when the listening task is over. Monitoring comprehension aids students detect inconsistencies and comprehension failures, directing them to use alternate strategies (Tsui & Fullilove, 1998: 432).

What is included in listening?

“Speech perception (e.g., sound discrimination, recognize stress patterns, intonation, pauses, etc.)

Word recognition (e.g., recognizes the sound pattern as a word, locate the word in the lexicon, retrieve lexical, grammatical and semantic information about the word, etc.)

Sentence processing (parsing; e.g., detect sentence constituents, building a structure frame, etc.)

construct the literal meaning of the sentence (select the relevant meaning in case of ambiguous word)

hold the information in short-term memory

recognize cohesive devices in discourse

infer the implied meaning and intention (speech act)

predict what is to be said

Decide how to respond” (Morley, 1991, p.82).

Undoubtedly there are factors of which affect the process of learning as follows:

Bottom-up

Top-down

A: Listener Factors

General

1 Experience/practice in listening to the target language: use of the media (cinema, TV, radio, etc.)

2 General intelligence

3 General background knowledge of the world

More specific

4 Physical and educational

4.1 age/sex

4.2 home background, size of family

4.3 educational background and type of school

4.4 physical health and alertness

5 Intellectual

5.1 knowledge of the target language in its various aspects: phonology, lexis, syntax, and cohesion

5.2 powers of analysis and selection: ability to distinguish between main and supporting points

5.3 knowledge of the specific topic or subject

5.4 memories (short term and long term)

6 Psychological

6.1 motivation and sense of purpose while listening

6.2 attitude of the listener to the speaker

6.3 attitude of the listener to the message: level of interest

6.4 listener's powers of attention and concentration

B: Speaker Factors

1. Language ability of the speaker: native speaker - beginner-level non-native Speaker
- 2 Speaker's production: pronunciation, accent, variation, voice, etc.
- 3 Speed of delivery
- 4 Prestige and personality of the speaker

C: Factors in the Material and Medium

- 1 The language used to convey the message: phonological features, including Stress, intonation, weak forms (especially in conversation), lexis, syntax, Cohesion, etc.
- 2 Difficulty of content and concepts, especially if the material is abstract, abstruse, highly specialized or technical, esoteric, lengthy, or poorly organized.
- 3 Acoustic environments: noise and interference.
- 4 Amount of support provided by gestures, visuals, etc.

Teachers' Selections Factor

Practice/exposure/experience/opportunity Speaker's clarity, pronunciation, accent, etc.
Acoustic environment: noise, interference Motivation to understand Knowledge of target language further specified as : phonology, stress, intonation vocabulary syntax (especially when complex) ability to interpret cues Familiarity with topic/subject matter Interference from mother tongue Speed of delivery Interest in the subject Attitude to the speaker Classroom conditions/alertness Knowledge of speaker and intentions.

Students' Selections Factor

Practice opportunities Educational level and background General ability in English/difficulty of the English used Vocabulary/idiom Ability to attend and concentrate Speaker's production: voice, clarity, etc. Speed of delivery Motivation and attitude Content of text/familiarity TV viewing habits Environment, noise, etc. Family background Radio listening habits Interest Reading habits Note-taking ability
Sex of the listener Memory General intelligence (Boyle, 1984).

LITERATURE REVIEW

Among the factors affecting listening comprehension there are various factors within which there is also dialect familiarity as reported by Major et al. (2005), English as a second language (ESL) listeners scored lower on listening comprehension tests when hearing ethnic and international dialects of English than when hearing standard American English. According to Eisenstein & Berkowitz (1981) Standard English was more intelligible for advanced beginners and high intermediate-level learners than working-class New Yorkese or foreign-accented English. According to Tauroza and Luk (1997), some learners perform more successfully in comprehending standard varieties while others achieve greater comprehension of L1-accented varieties is explained by the influence of dialect familiarity. Learners understand the language of which they are exposed as fully as possible are of standard varieties. Recently so much attention

has been given to foreign language listening comprehension, although (Celce-Murcia, 2001, Rost, 2002). Tsou (2005) studied the effects of cultural familiarity on foreign language learning. Tsou administered an anthropology process together with task-oriented approach to administer the cultural lesson. It was proved that when culture-familiar lessons were used in EFL instruction, language proficiency enhanced significantly. During listening or reading people focus on the most essential words that is they skim the unrelated and unimportant ones. Ervin (1992) also has administered a study to see that whether or not listeners would understand the materials of which are culturally familiar to them better than those are not. There were two classes, one of which was Scottish and the other one was Texan, all have listened to a same culture passage and answered to a set of questions. This was repeated twice based on their cultures. As it was reported through T-test, there was no significant difference between same and other culture for the Texan group, while the Scottish group scored significantly high in same culture than the other culture. Genc and Bada (2005) also conducted a study on the effect of culture in language learning and teaching. Students of Cukurava University in Turkey were participants of this study. The results of this study have indicated that cultural awareness is very important and when can be raised; the listening comprehension also would increase significantly. Tehrani & Dastjerdi (2012) also studied the relationship between prior knowledge and EFL learners' listening comprehension. They found that it will be useful to help learners to build a mental framework to facilitate their comprehension, and that pre-listening supports including cultural information would be an essential part of listening comprehension. They also have found that since listening is a multidirectional process, there are many factors which affect it. Thus students would understand that for comprehending successfully, they must consider the text as a whole and as a result they are to activate their background information, rather than focusing on every single word in discourse. Basavand and Sadeghi (2014) studied on the effect of cultural knowledge on listening comprehension. Generally the results proved that having cultural information is of significant role in comprehending listening materials. All of these findings are supported by Ausubel's (1968) statement: learning would be effective when it is gained with meaningful materials of which connect the new comings to what learners already know. This must be in a manner of which the new knowledge is fixed into the prior ones. The new information is to be matched with its cognitive structure. Undoubtedly in listening and reading background knowledge is of an important role in comprehending a spoken or written text.

According to Stevens (1982), mental background is one of the widely accepted parameters in listening comprehension. Listening like reading not only involves decoding the materials but also constructing them. It means that we will be able to understand what we hear and what we listen only if the relevant information was activated. Most of the language learners don't perceive what they listen, because of not having the shared knowledge (not being able to activate relevant information) and sometimes and sometimes because of not being able to notice the words correctly. Hensen and Jensen (1995) also worked on the effect of prior study of lecture topics on listening comprehension. They found that the role of background knowledge is more evident in technical lectures than in non-technical ones. Keshavarz and Babaei (2001), also studied the role of background information in listening comprehension and have found no significant difference on the effect of giving information and activating the schema on listening comprehension of the participants. Mueller (1980) conducted a study on the role of prior knowledge in listening

comprehension. This study was performed at different levels of German students. It was found that the participants who received information before listening scored higher than those didn't receive any information. Long (1990) also studied the effect of background knowledge on L2 listening comprehension of ESL students of Spanish. Participants were given two passages-one familiar and other one unfamiliar. Although the English summaries had more correct idea units for the familiar topics, no significant differences have been reported between the familiar and unfamiliar passages for the recognition measure. Othman and Vanatha (2010), also conducted a study on the role of topic familiarity in listening comprehension. They worked on 34 intermediate students who were majors was business studies at a private institution. Based on the findings of their studies topics familiarity has an influence in listening comprehension. The scores of post-test were significantly higher than that of pre-test. Gabhard (2000) states there is close relationship between the background knowledge and real world experiences and the kind of the expectations we have. This knowledge is of great importance when we consider the language processing problems of learners. So listening doesn't mean just identifying the linguistic features of the text but also pairing speech to what the listener already knows about the subject. He then adds that the process of listening comprehension would occur only if the listener can place what she/he listens in a context. When the listener knows something about the listening material thus comprehension is more likely to occur. Sadighi and Zare (2006), investigated the impact of background knowledge on listening comprehension. They reported meaningful difference in participants' post-test scores. Their post-test scores were very higher than pre-test. Salahshuri (2011), also worked on the role of background knowledge in foreign language listening comprehension. He reported that the participants regardless of their levels scored higher on the familiar passages. Cultural schema when involves familiarity, helps readers to reform the reading materials. This resulted from the fact that there is encoding decoding process during reading. The readers based on their background reconstruct the reading materials (Erten and Razz, 2009).

RESEARCH QUESTIONS AND HYPOTHESES

- 1- Does Title familiarity have any effect on Iranian EFL learners listening comprehension?
- 2- Does Title familiarity result in improving the listening comprehension?

Null hypothesis1: There are no significant differences in the effect of Title familiarity on Iranian EFL learners listening comprehension.

Alternative hypothesis1: There are significant differences in the effect of Title familiarity on Iranian EFL learners' listening comprehension.

Null hypothesis2: There are no significant differences in the effect of Title familiarity on Iranian EFL learners' listening comprehension.

Alternative hypothesis2: There are significant differences in the effect of Title familiarity on Iranian EFL learners' listening comprehension.

METHODOLOGY

Design of the study

The design of the study is quasi-experimental, that is there was not random assignment. The Independent variable of the study was providing title relevant information and the dependent variable was EFL listening comprehension.

Participants

A total of 60 language learners with an age range of 15-18 participated in this program of which lasted for one academic semester. All the participants were from Persian background. They were selected from 7 classes. The participants were students of the one of the high institutes of Ghazvin Iran.

Instruments

In this study the researcher made use of following materials:

Pre-test of which was administered on participants listening skill was listening test which its material was Jack C, Richards' book called Tactics for Listening which were chosen from the source book of the institute. The test consisted of 4 listening passages that included 5 short listening comprehension texts followed by 5 multiple- choice questions for each of them in order to evaluate the participants' performance.

The post test of which was conducted at the end of the program was 20 multiple- choice test which were followed 4 new listening passage included 5 short listening comprehension texts from the same source book and delayed posttest was given after one month after the first posttest.

Procedures

Before starting the program one language proficiency test was conducted on learners' skills of Listening, Speaking, Reading, and Writing, for assuring their proficiency level. After that one pre-test was administered for proving the comparability of both groups. Then the researcher started the program. The researcher taught listening materials in Experimental group through providing them with information about title and for instance about the jobs of the speakers and their names as generally as possible, the researcher tried to made use of standard dialects of English in order to control the possible effect of variation of dialects on comprehension. Since the researcher herself is not a native speaker of English she provided learners with culturally related information when it was possible, but because the researcher didn't experience the target culture it can be said that cultural information can be considered as more general information. But in control group learners just listened to the same materials by themselves and then answered the relevant questions. After 18 sessions, one post-test was administered to both groups. The collected data was analyzed via Statistical Package for the Social Sciences (SPSS).

RESULTS AND DISCUSSION

In this study there was just one research question, because the first one was that of loading but the answer is: Yes familiarity affects the process of listening comprehension. As a result the

researcher aimed at finding answer to the second question, as it evident in the following figure both groups were approximately at same level at the beginning of the study:

After administering the program the researcher conducted a post-test of which there were meaningful changes in experimental group as given in the following figure:

The mean of control group in pre-test was 12.9 while in post-test was 13.2 as it is evident there was no meaningful improvement, it is also given in the following figure:

In experimental group mean of pre-test was 12.13 while in post-test was 17.93, thus there was meaningful changes in post-test scores in this group. The gathered data was analyzed by SPSS as is given in the following table:

Independent Samples Test

		Levene's Test Equality of Variances							95% Confidence Interval of the Difference	
		F	Sig.	t	df	Sig.(2- tailed)	Mean Differences	Std. Error Differences	Lower	Upper
Pretest	Equal variances Assumed	0.608	.439	-1.35	58	.891	-.08000	.59245	-1.2711	1.1113
	Equal variances not Assumed			-1.35	57.085	.891	-.08000	.59245	-1.2711	1.1119
Posttest	Equal variances Assumed	1.116	.296	-7.613	58	.000	-4.76000	.62545	-6.0171	-3.50286
	Equal variances not Assumed			-7.613	51.907	.000	-4.76000	.62545	-6.0171	-3.49812

Based on Leven test for equality of variances in this table, Sig. (2-tailed) for both groups is 0.891. It means, there is no significant difference in means of both groups in pretests and confidence interval of the difference proved the results. According to the Leven test, there is a significant difference in means of both groups in the posttests since the p value is ($P > 0.05$) (means of experimental group improved so much and the difference of post tests is meaningful) consequently the positive effect of familiarity on listening comprehension has been proved. Also the group statistics are as follows:

Group Statistics

Groups		N	Mean	Std. Deviation	Std. Error Mean
Pre test	control	30	12.9999	1.94446	.38867
	Experi.	30	12.1333	2.23677	.44721
Post test	control	30	13.2400	1.74877	.34775
	Experi.	30	17.9333	2.57808	.51962

The findings of this study have indicated that providing learners with relevant and important information is of key role in listening comprehension. Anderson & Lynch (2000), has reported that when learners are given essential information, the process of learning would be facilitated. The results of this study are in agreement with those of which found positive supports for the effects of providing information in listening comprehension, for example that of Anderson & Lynch (2000), Markham and Latham (1987), Ockey (2007) Schmidt-Rinehart, (1995), Jonsen and Hasen (1995), Sadighi and Zare (2006) and Salahshuri (2011) Babaei (2001) and Aidinlou *et al.*, (2012).

CONCLUSION

The aim of this study was to investigate the role of the title familiarity on improving listening comprehension in order to develop listening skill through hearing what is spoken and listening activities by providing additional information on listening tasks. The results of this study indicated that listening comprehension can be enhanced by preparing appropriate instructions. So when learners are given information on listening activities there is no such a burden on memory in the process of understanding what is spoken, that is, it might be concluded that cognitive load was lowered significantly. Teachers have to re-check their methods and techniques. The educators are to know that they must put emphasis on the listening processes rather than the listening test results. The other point that should be taken in to account is that background information that students bring with them to classrooms helps them to perform the listening task more successfully, thus when is not in active form, educators are to activate it, & when there is no enough information, should be provided by teachers. Teachers' responsibilities are more than just providing learners with linguistic knowledge. Learners will be able to use target language as effectively as possible in required situations. Title familiarity is an essential factor in the comprehension of unfamiliar texts.

Implication and Limitation of Study

The most important implication of the current study for the language classes specifically foreign language classes in schools has to do with the type of activities which are related to participants'

knowledge about what they heard to support learners' performance in listening comprehension. The key point is that the learner's knowledge and information toward key units and words in texts should be enhanced. Another point pertains to the type of listening texts and instructions used in classrooms. The other factor contributing to the cycle of study is selection of materials according to the learners' proficiency level, their background, activities and instructions during session's processes that should be related to the aim of study. In addition to all these, language teachers and syllabus writers are supposed to incorporate a range of information related activities and change the weight of listening lessons from testing listening into teaching listening so that they could support language learners to enhance their listening performance and listening comprehension. To put the same point in a different way, the data and results clarify fundamental concepts specifically for the teachers who may be able to consider the results actively in relation to what they do in the classroom on a daily basis. Like all studies, the present study suffered from some shortcomings. To start with, the time span in this study was not sufficient for learners to concentrate well enough on the listening comprehension instruction by regarding title familiarity to help them transfer processed information responding the questions. Additionally, the study didn't take the various ages of learners into account, and learners with a limited age range took part in this study.

ABSTRACT

*In spite of the big strides in the field of granting black people in the United States of America their rights since the abolition of slavery, race-and gender-based discriminatory practices are still prevalent. The paper aims at exploring the gender-based discrimination against a homeless black mother who is oppressed and exploited by the very institutions that are originally established to help her. It is divided into three sections. Section one deals with the questions of race and gender in contemporary America. Section two deals with the various forms of gender-based discrimination in Suzan-Lori Parks's *In the Blood* while section three states the main conclusions of the study. It is concluded that unlike black men, black women are oppressed not only because of their race and class, but also because of their gender. Also, Parks wants to emphasize that unlike in the past, forms of discrimination in contemporary America are less clear and direct.*

KEYWORDS: Parks, racial discrimination, gender, *In the Blood*.

SUZAN-LORI PARKS: THE QUESTION OF RACE AND GENDER IN CONTEMPORARY AMERICA

'I dont think the world likes women much'
(Suzan-Lori Parks,4-68)

Suzan-Lori Parks (1963-) was twenty one years old when she began writing for the theater. Her first two attempts of writing, *The Sinner Place* (1984) and *Betting on the Dust Commander* (1987) failed, but the third play she wrote, *Imperceptible Mutabilities in the Third Kingdom* (1989), won the Obie Award for best new off-Broadway play, followed by another Obie Award for *Venus* in 1996. This means that Parks "comes to the [American] stage when the discourse on race appears most vulnerable to change"(Goto,2007.p.107). Historically speaking, Civil Rights Movement in the United States of America has made big strides from its inception in the late 1950s until the mid-1980s in its fight for equality. However, "Does that mean racism no longer exists?" asks Goto in his thought provoking article "Digging Out of the Pigeonhole: African-American Representation in the Plays of Suzan-Lori Parks." The answer to this question, Parks

seems to concur with Goto, is 'absolutely not.' For both of them, this only means that Black people

must look harder and longer into [their] language, history, and movements to extract that mold of racism harming [America's] democratic potential. The extraction requires new tools – new ways of seeing, acting, and speaking that may seem unconventional, if not outright strange.(Ibid)

This is what Parks is bent on doing in her plays. Using the stage as her medium, Parks creates new ways for African-Americans to express and represent an identity that goes beyond the idea of essential blackness and oppression. This new kind of representation challenges the oversimplified discourse on difference, which critics and audiences seem to expect and demand from African-American playwrights. In fact, Parks often disagrees with the critics who repeatedly read her African-American characters as unilaterally oppressed. This kind of reading, in Parks's viewpoint, is outrageously simplified and conventional. Meticulously surveying the representation of the black people on the American stage, Parks thoughtfully wonders: "Can a Black person be onstage and be other than oppressed? For the Black writer, are there Dramas other than race dramas? Does Black life consist of issues other than race issues?"(Parks, 1995, p.21). In the light of these questions, it is crystal clear that race and racial oppression constitute the common denominator in the historical as well as the daily experience of the black people. In other words, race is inescapable and inevitable factor in the formation of the black experience.

This experience acquires new dimensions when race joins forces with gender in the case of black women. In her seminal essay, "Elements of Style" (2008,p.8), Parks explains "I am an African American Woman-this is the form I take, my content predicates this form, and this form is inseparable from my content. No way could I be me otherwise." This sheds light on the centrality of these two elements, i.e., being black and woman to Parks's theatrical enterprise. These two elements, Parks contends, contribute to doubly 'otherized', 'inferiorized' and 'marginalized' the black women not only within the white-dominated society, but also within black communities. This makes the use of a black feminist approach that "embodies the realization that the politics of sex as well as the politics of race and class are crucially interlocking factors in the works" of Parks an "absolute necessity" if a full understanding of her plays is to be achieved (Lewis, 2012, p.119).

Parks's plays, in fact, reveal a deep interest in discussing the roles gender and race play in a black woman's life. In relation to this, Dixon(2001, p.219) points out Parks's tendency to "treat her characters' racegender, like other characteristics, as emblematic." Her main concern is not the discussion of racegender-based ideas per se. Rather; she is more interested in showing the role these elements play in deepening the already existing gap(s) between the Afro-American women and the representatives of the dominant white society.

At the center of this racegender discourse in relation to the representation of black women is the question of the status of the female body which occupies a central place in "so many [contemporary] social and political controversies"(Sanchez-Palencia & Cuder, 2012, 142-143). Sanchez-Palencia and Cuder remark the complexities involved in the representation of women's

bodies on stage mainly because they constitute a "part of a complicated system of patriarchal referents"(Ibid) that tend to either objectify or mystify them.

Parks usually criticizes the stereotypical representations of the female body in her plays. However, in none this criticism is as clear and strong as in *Venus* (1996) which "can be regarded as the master narrative through which black women continue to be constructed"(Lewis, Looking Forward, 2012, p.161). Parks dramatizes the sensational story of Saartjie Baartman, *The Venus Hottentot*, a 19th century South African woman whose aberrant anatomy (the abnormal protuberance of her buttocks and genitalia scientifically termed as *steatopygia*) made her the object of sexualized glory, ethnographic documentation, imperialist practices and market commodification as she was exhibited naked in the freak shows of London and Paris inspiring both horror and fascination(Sanchez-Palencia & Cuder, 2012,p.143).

Parks, however, is not interested in digging into the history of Baartman's journey from the colonized and exoticized Africa to the colonizing Europe. Rather, she tends in *Venus* to focus on her own contemporary culture "evidencing that the former modes of physical and psychic colonization persist under different forms"(Ibid, 144). Keizer illustrates this phenomenon with instances of the hyper-exploitation of black female bodies in American consumer culture, like the proliferation of buttock-enhancing jeans, pants and surgery, or the fascination with the backsides of Beyoncé, J.Lo, Rihanna and other black divas, which bespeak a utilization of black body stereotypes to signify a hot, wild, appealing female sexuality. This means that the image of the black woman is equated to her sexual parts and is exploited within popular culture(Qtd in Ibid, pp.143-144). This image, more often than not, conforms to "a racialized and gendered system of representation and signification"(Martin, 2014, p.54).

In another essay entitled "An Equation for Black People Onstage,"(1995) Parks discusses the nature of the Black-White relationship on the American stage. She laments that "The bulk of relationships Black people are engaged in onstage is the relationship between the black and the White Other." Since the "use of the White in the dramatic equation is ...too often seen as the only way of exploring ... Blackness," this equation reduces Blackness, Parks contends, "to merely a state of 'non-whiteness'." This means that the lives of black people consist of nothing save "a series of reactions and responses to the White ruling class"(p.19) Parks firmly rejects these widely spread negative attitudes and misconceptions about the black and suggestively talks about the existence of "many ways of defining Blackness and ...of presenting Blackness onstage"(Ibid).

In her plays, Parks makes serious attempts at "construct[ing] a new African-American identity in which individuals are no longer solely defined as victims of oppression and racism, instead they are portrayed as real humans with their own virtues and vices"(Vanmarsnille,2009,pp.7-8). To construct this new African-American identity, Parks employs a number of dramatic strategies. The first strategy is to probe beneath the apparently glittering crust of the history of the United States of America. In his article, "Digging the Fo'-fathers: Suzan- Lori Parks's Histories," Thompson (2007,167) confirms that the phrase "Digging the Fo'- fathers "gets "at the primary activity of Parks's plays." He further adds that "the resurrection and remembering of histories...are both the form and content of Parks's operating theatre"(Ibid.). The aim of writing

these 'histories' is not to present the life of stately or heroic figures, but to "locate the ancestral burial ground, dig for bones, find the bones, hear the bones sing, write it down"(Parks qtd in Geis, 2008,19). This process of digging and excavating the past aims at filling the empty 'spaces,' 'holes' and 'absences' of history as Parks calls them (Qtd in Thompson, 2007, p.167) In looking for these 'absences', Parks is intent on discussing some of the contemporary gendered and racial discourses relevant to the treatment of Afro-American women.

The second strategy Parks uses is related to the language. In fact, Parks distinguishes herself from her contemporaries when she invents her own approach to using language and pauses, which becomes a signature quality to her work. She becomes well known for her formula of 'rep and rev' repetition and revision. Do it again; do it differently. This term is first coined by Gates, he calls it "repetition and revision, or repetition with a signal difference" which Parks then further paces down to 'rep and rev'(1988, p.xxiv).

In her play *In the Blood*, Parks uses language with different denotations and connotations for most characters. Characters that are poorly educated use less complex words and syntax. While the more educated characters use a more formal language. In his article *In the Blood*, Krasner (2000, pp.565-566) reports that Hester uses "language symbolizing her life beneath, below, and beyond the gaze of society." In the same vein, Berkman comments on the special use of language in the play. He points out that

Throughout *In the Blood*, four-letter 'S' words, each with sharp emotional impact, proliferate like babies: Soda and slut fast link to slow, to sack, soup, shoe, soap, sell and – most devastating of all, yet with Hester able to spot only the 'A' in it – spay. (2007, p.63)

Parks also uses a certain type of punctuation such as altering the ordinary punctuation with using intervals of silence which she refers to as "dramatic pause" by repeating the characters' names for emphasis. She is not telling her tales through words only but with sounds. As a result of using such technique of doubling characters, naming her characters with words that bear meanings of their traits, and uses a series of soliloquy-like "confessions", the play has reaped tremendous success. Parks's writings are always imbued with posing and answering questions regarding race and gender problems.

As the following section will reveal, *In The Blood* tackles many themes relevant to the status of Afro-American women in contemporary America like gender discrimination, society's oppression, violence, and sexual harassment. In a satirical style, Parks explains how society blames and punishes those who are mainly created by the neglect of its own institutions and organizations.

Gender-based Institutional Discrimination in Parks's In The Blood

In 1999, the year in which *In the Blood* premiered at the Joseph Papp Public Theatre's New York Shakespeare Festival, the United States Census Bureau reported that 39% of single black mothers (nearly 1.5 million families) were living below the federally established poverty line. The Bureau also reported that while the poverty rate for African Americans as a group dropped to a record low that year, "the poverty rate for Blacks in 1999 [23.6%] was still about three times

the poverty rate for White non-Hispanics (7.7 percent)"(Qtd in Larson, 2008, p.91). Besides being poverty-stricken, Hester la Negritta, the protagonist of the play, is a homeless mother of five fatherless children. In a 1987 national study, Martha Burt found that 9 percent of the homeless people were single women, and another 9 percent were women accompanied by their children. The single black women form 47 percent of the total number of homeless women (Glasser & Bridgman,1999,p.20). Glasser believes that the number of homeless single black women might be greater because unlike homeless men "a characteristic survival strategy of homeless women [in general] is to keep hidden from view"(Qtd in Ibid) So, black women suffer invisibility not only in the theatre, but also in many public spheres. No doubt, living on the streets or under the bridges, as in the case of Hester, involves great dangers for the homeless women for "once on the streets they are... at great risk of violence"(Ibid., p.57) Those women might seek help and protection from individuals, institutions and governmental bodies whose duty is to help them and alleviate their suffering. Unfortunately, these same institutions sometimes become an essential factor in exploiting, harassing, and aggravating the already critical living conditions of those women. Hester is an example of a homeless black woman who is abused, brow beaten and oppressed by the very persons who are supposed to redress her problems.

To explore the impact of poverty and homelessness and their implications for the various systems at work in contemporary America, Parks blends the bleak story of Hester with Nathaniel Hawthorne's dark romance *The Scarlet Letter* (1850), in her first "Red Letter Play," *In the Blood*(For more information about Parks's other Red Letter Play, *Fucking A*, see Jefferson, 1999).

In the Blood tells the story of Hester and her five children—all of whom are doubled with an adult character in the play. Each of these adult characters, male and female, confesses to a sexual fascination for Hester as well as to sexually exploiting her in some ways. The Doctor (the middle son, Trouble) and the welfare lady (aka "Welfare" and the oldest daughter Bully) are also trying to sterilize Hester, while her white "friend" Amiga Gringa (the youngest daughter, Beauty) steals from her. Reverend D (the youngest son, Baby), her most recent lover, refuses to acknowledge her out of fear that it will damage his ministry and his status in the community, and her first lover Chili (doubled with the oldest son Jabber) finally returns after years of absence only to reject Hester when he discovers the children she conceived with others during their separation. Throughout the play, Hester's health deteriorates, and she eventually has visions of Armageddon. Her circumstances, coupled with the trauma of hearing Jabber call her a "slut," drive her to beat Jabber to death, and she uses the blood of her murdered son to write an "A"—scarlet by nature—on the ground next to his body (Larson,2008, p.91).

As she did in *Venus* (1996), Parks presents us with a woman "who has been famously romanticized and mystified" and asks us to "consider her again through the lens of our cruel and continuing histories of oppression"(Geis, 2004, p.140). Yet, Parks's substantial revision of Hester Prynne and *The Scarlet Letter* also shows that time, and thus history, have only become more malignant for America's present-day Hesters, especially if they are black and poor. Indeed, time and history have only complicated Hester's plight. New oppressions compound the old and

ultimately leave Hester without hope or escape and make her like Hawthorne's Hester a social outcast(Ibid).

In addition to that, Hester La Negrita is marked by the letter 'A'. It is the only letter she knows of the English alphabet. However, the mark is also symbolic; it speaks to Hester's social and possibly political illiteracy, her lack of critical knowledge which helps to keep her in her position at the periphery of society. This can be seen in the ways in which the various people and institutions in her life exploit and oppress her. In this way Parks's play considers the social and cultural, and economic environment and the various influences which shape Hester's lived experiences (Keene, 2012,p.10).

Similar to Greek classic tragedy, Parks begins her play with prologue and ends it with epilogue ; the actors become a kind of chorus that circles Hester like vultures. In the prologue, Parks sets the tone for the play that is to follow, a severe assault on the political, medical, capitalistic, and religious systems that define the American ideal. Besides all the action of the play occurs out-of-doors, because Hester is never allowed inside literally or symbolically, and that indicates the unity of place. Parks designates the place for the play as " Here" and the time as "Now", which refers to the poverty of the whole atmosphere of Hester's life. Significantly Hester's home is under a bridge, a place that alienates her from civilized society.

Hester is victimized by her race, gender, her naïveté, intense longing to be a good mother, and economic status. Her allegedly best friend, Amiga Gringa, is friendly only as long as Hester has something for her to take. The medical profession wants only to stop her from procreating, even as it takes advantage of her and her dire conditions. The government, through the Welfare Lady, has little time for Hester and offers her work for which she is unprepared. Formalized religion represents for her only another form of oppression and subjugation. Her true love and the father of her eldest son, Jabber, cannot abide the burden that loving her brings(Williams, 2009, 799).

As a result, Hester falls outside the realm of the accepted social parameters. The guidelines which police and protect the lives of those who fit into the dictates of the social order, do not apply to her . Consequently, women, similar to Hester, whose livelihood is dependent upon assistance from the government, often, are monitored around issues which most people would consider personal, and thus not subject to public ridicule. These women are scrutinized harshly around practices deemed as overly sexual or irresponsible; practices, which according to society, are a burden to their pockets and a detriment to the social morale(Keene, 2012, p.52). In the Prologue to the play, this message is conveyed by words spewed from the collective voices of the people who represent society at large and are named by Parks as ALL: "SHE KNOWS SHES A NO COUNT/SHIFTLESS/HOPELESS/BAD NEWS/BURDEN TO SOCIETY...WOMAN GOT 5 BASTARDS/AND NOT A PENNY TO HER NAME/SOMETHINGS GOTTA BE DONE TO STOP THIS SORT OF THING"(Parks, 2000,p.31) These informative statements said by All explain, in clear-cut terms to what extent Hester is cornered and oppressed by people around her.

Society not only alienates Hester, but also rudely invades and intrudes in whatever small personal spaces she owns. On her "practice place" the word "SLUT" is scribbled by some bad boys; an action that makes the seed of anger against society gradually grows inside Hester, although she doesn't exactly know the meaning of the word but she prefers her "place clean". Jabber, her eldest son, tries to remove this word. Although he teaches his mother how to read and write, she is very slow. She asks him about the meaning of the word because the letters of the word 'Slut' are "mysterious" to her. The only letter she knows is "A". Jabber refuses to read the insulting word in order not to hurt his mother's feelings. Hester with bitterness predicts the bad meaning of this word but she knows that she is obliged to live with it:

HESTER: We know who writ it up there. It was them bad boys writing on my home. And in my practice place. Do they write on they own homes? I dont think so. They come under the bridge and write things they dont write nowhere else. A mean ugly word, I'll bet. A word to hurt our feelings. And because we aint lucky we gotta live with it.(1, 35)

Thus in this cruel society that only perceives Hester as "SLUT," "HUSSY", and a "BURDEN TO SOCIETY", and shows no mercy or sympathy for her, Hester struggles to find help for herself and for her five children by any means available. She is a model for motherhood. She starves herself so her children can eat, she goes without sleep in her attempt to provide them with their needs. She calls them "treasures" and "joys" that give meaning to her life. She helps her Children to enjoy their meals by telling them that the soup has everything they love in it. Also she helps them to sleep by telling them stories. This is the 'black mother figure' who is always presented historically in literature as someone who, "at all costs, nurtures, protects, self-sacrifices" and cares for her children. In contrast to the mainstream culture that stigmatizes Afro-American woman as mindless, crude and expendable (Kolin, 2010, p.11).

Since the contents of *In the Blood* hinge upon matters that affect the social realities of women, specifically, Afro-American women: reproductive rights, hyper-sexuality, gender roles, and single motherhood which are shaped by race, class and gender among other things (Keene,2012, p.56), Parks chooses to discuss these issues through a series of dramatic confrontations between Hester and the representatives of the American society. Each of those representatives makes a confession that exposes the hypocrisy and duplicity of his declared claims and declarations.

Hester's first confrontation with the System that oppresses her takes place in her meeting with Amiga Gringa who is supposed to be her 'white' friend. Amiga claims to share in Hester's oppression, but actually she participates in it. She always steals from Hester every chance she gets. She steals food and money from poor Hester. When Hester gives her a watch and asks her to sell it, she cheats her and never gives her all the money back. Amiga wants Hester to make use of her reproductive ability. She dishonestly wants to make Hester sell her own babies in return for money. In this way, she contributes to commodifying and dehumanizing the motherhood experience. The 'womb' as the most essential part in the woman's reproductive system is thus turned into a factory machine subject to the economic principle of supply and demand.

Larson (2008, p.97) argues that Parks introduces Amiga to "reinforce the growing modern separation between black and white women." Amiga's whiteness, Larson adds, allows her the privilege to reject unjust labor demands. Having sold her white children, Amiga does not have the stigma of being a begging unwed mother like Hester, who admits: "no one gonna give money to me with me carrying Baby around"(1-46) As such, Amiga will either find legitimate work with a living wage or will make more money from her illegal/illicit activities than Hester, allowing for at least the possibility that Amiga's poverty is not permanent or systematic (Ibid).

In her confession ,Gringa states that she is better than Hester, thanks to her "white womb" that makes her more valuable. People desire her white children, she can sell them without feeling guilty. On the contrary, Hester's black womb lacks value and proves itself a threat to society. Gringa's main concern is to get the cash by selling "the fruit of [her]white womb"(5, 77). Moreover, she criticizes Hester for accepting the sewing job offered by the Welfare lady, which she considers beneath her. She calls it "chump work" that leads to nothing and enslaves the worker. Instead of helping Hester, Gringa makes things harder and dimmer for her.

As a result of poor nutrition, poverty, and the weight of societal ridicule, Hester feels ill. She has a stomach ache and she ought to see a doctor. The doctor who is supposed to hold a human job, should take care of his patients, and looks after them, plays a very different role with Hester. He joins forces with Gringa in treating Hester in an inhuman manner by examining her in the street , like a mechanic, and looking up into "her privates". The Doctor claims that the "Higher Up" – the federal Medicare system- is pressuring him to 'spay' her to end her fertility. The Doctor wants to remove her womanly parts in order to prevent her from begetting more children. He exploits Hester sexually and manipulates her body to satisfy his desires. In so doing, he contributes to subverting her womanhood, motherhood, and humanism just to keep his own position high.

This scenario mimics the historical truth of the sterilization of Afro- American women. Jennifer Nelson notes that while white middle class feminists were fighting for the right to abortion, Afro-American women and women of color were fighting for reproductive freedom, "the freedom to have as well as not to have children"(Qtd in Keene, 2012,p.58). Feminist organizations such as the Committee for Abortion Rights and Against Sterilization Abuse (CARASA) argue "that a woman's income and economic assets determined [her] ability to control [her] reproduction in a capitalist society"(Ibid). Consequently, because women of color are disproportionately low income or working class and because women are the bearers of children, the intersections of race, class and gender are elements which work together to repress them.

Through The Doctor's confession, Parks manages to criticize the stereotypical images of black female "bodies as possessions, as objects of desire, and as bloody biological battlefields"(Thompson,2007,p.181). In his confession, the Doctor narrates his sexual encounter with Hester. However, he blames not himself but Hester who, he claims, tries to seduce him and not the other way around. He perceives himself a victim to her seduction because "She gave herself to me in a way that I had never experienced, even with women I've paid,...What could I do? I couldn't help it" (2, 58-59) .Combined with Reverend D's description of illegitimate babies who are born out of wedlock as "The ultimate disaster of modern times,"(3-60) these lines

contain a clear reference to the prevalence of prostitution in modern American society. The play itself bears witness to the prevalence of this problem as most of the characters engage in various forms of illicit, unlawful and extramarital relationships.

In a gender-stratified society, in which sex, sexuality and the body are socially constructed, J. Lowman notes: "prostitution represents the pole of a system of sexual stratification and must be resisted as the quintessential form of men's exploitation of women... Prostitution is the raw end [sic] of patriarchy"(Qtd in Hatty, 2014, p.71). According to V. Jenness, prostitutes are often viewed as "social misfits, sexual slaves, victims of pimps and drug addiction, and tools of organized crime". Moreover, harassment, abuse and violence are integral to prostitution. In fact, the evidence indicates that prostitute women are subjected to frequent acts of verbal abuse and physical violence, including sexual assault, and are stigmatised as 'whores' or 'hookers'(See *ibid*, 72-75).

In accordance with this, N. J. Davis holds the view that prostitution is a type of gender victimisation or a paradigmatic case of sexism according to Hatty. Carole Pateman maintains that prostitution is inherent in the 'sexual contract' that exists in patriarchal society. In prostitution, men buy the sexual body of the woman, a far more significant purchase than that which occurs between employer and employee in capitalist society (*Ibid.*, p.73).

Research conducted on women who work as prostitutes indicates that poverty plays a major role in drawing women into prostitution. The structural inequalities associated with a highly stratified labor market, in which women earn only a fraction of men's wages, render prostitution an attractive alternative to impoverishment. However, it is possible to argue that women who are disadvantaged through their membership of marginal groups or disadvantaged backgrounds are candidates for prostitution (See *Ibid*).

Unquestionably, the various points raised in the above argument concerning prostitution are very well reflected in the case of Hester. Because of the vicious cycles of poverty, ignorance, and discrimination, Hester is compelled to offer sexual services to male partners who exploit her. She is stigmatized as a 'slut' and 'hussy' and is subject to various forms of verbal abuse and sexual harassment. Like many other poor and disempowered black women, Hester prostitutes herself to earn living. Hester's sexuality, indeed, seems to be her only significant source of earning income, but unfortunately, theater critic Sarah Wilkinson explains, her "sexual acts are paradoxically both Hester's saving grace and her downfall, her only way to acquire money and the reason why she has none"(Qtd in Larson,2008,p.105). Moreover, Hester sexual activities, Keene (2012,p.63) observes, help only to reinforce the stereotypical image of Afro-American women as hyper-sexualized and sensual.

Hester's next confrontation comes through the political system in the form of the Welfare Lady, who, like all others before her, views Hester as a resource, taking advantage of her dire situation to find profit. Welfare does, however, offer Hester a way to secure financial assistance asking her to name the deadbeat fathers of her treasures, giving the government an opportunity to access their salaries and gain income for both herself and her children. Hester is unwilling to take this

step, mainly because she does not wish to bring harm to Chilli, her soul mate, her first and only love, who is the father of her eldest child, Jabber.

Like the Doctor who represents the medical system that takes much and gives less to Hester, the Welfare Lady, who represents the Welfare system in society does the same. Although the Welfare Lady maintains that "I walk the line between us and them between our kind and their kind," (4,69) she and her husband exploit Hester and use her as "little puppet" for their pleasure. As a matter of fact, the Welfare Lady cares for Hester just because it is her job to care: "I care because it is my job to care. I am paid to stretch out these hands, Hester. Stretch out these hands. To you"(4,65).

The problem with the Welfare Lady is that she is only interested in showing off, even when she offers Hester the sewing job; she gives her the fabric without teaching her how to sew it. She does it not for the sake of offering a real honest help, but to do her job only. She never lets Hester speak; she just obliges her to do the work:

WELFARE: Needles, thread and the pattern, in this bag. Take the cloth. Sew it. If you do a good job therell be more work. Have it sewn by tomorrow morning, yll get a bonus.(4, 68)

Moreover the Welfare Lady blames Hester for running from the shelter she argues:

We at Welfare are at the end of our rope with you, Hester. We put you in a job and you quit. We put you in a shelter and you walk. We put you in school and you drop out ...We build bridges you burn them. We sew safety nets, harder, good strong safety nets and you slip through the weave.(4,64)

But Hester claims that she has been harassed by all people there. Instead of helping her and her children the social helping agenesis are interfering in her life through their representative who systematically exploits her. She reports "The shelter hassles me. Always prying in my business. Stealing my shit. Touching my kids"(4,65).

As a result , Hester loses trust in such deceptive system that claims deep concern for those who are in need, but in fact it does not. In fact, instead of encouraging Hester and her children to be good members of society, the Welfare Lady blames them for being poor people and she scorns them , in her confession, she criticizes Hester and claims such type of woman inferior to her because of the sins she commits.

The Welfare Lady's confession utilizes language that invokes historical discourses around race and racism. When she states 'I walk the line,' W.E.B. Du Bois's claim of the problem of the color line for the twentieth century emerges (Qtd in Keene, 2012, p.63). The reference to 'our kind' and 'their kind' mimics the dialogue of racial divisions. This difference in kind, in spite of The Welfare Lady herself being a black woman is sufficient in expressing racial ideas of separation. It also speaks to the divisions which can exist within racial groups, as influenced by social

ideologies and class distinctions. This can be seen in the dissimilarities that The Welfare Lady notes, between herself and Hester:

It was my first threesome
And it wont happen again.
I should emphasize that
She is a low-class person.
What I mean by that is that we have absolutely nothing uncommon.
As her caseworker I realize that maintenance of the system depends on a well-
drawn boundary line
and all parties respecting that boundary.
And I am, after all,
I am a married woman. (4-71)

The Welfare Lady's treatment of Hester, the welfare mother, translates the public attitudes towards these mothers and helps to perpetuate the stereotypical images of women on welfare "lazy, hyper-sexual, irresponsible and social leeches." Consequently, it is quite natural, David Zucchino argues in "Myth of the Welfare Queen: A Pulitzer Prize Winning Journalist's Portrait of Women on the Line", that women on welfare (particularly black women) become "a class of women ... despised by mainstream America"(Ibid,p.48).

The religious institution that is represented by Reverend D. also participates in Hester's oppression. He makes adultery with her and is a father to her newly-born Baby, but he displaces his shame onto her and expresses his hatred for what she has done. In turn, Hester prepares a strategy to secure him; she never gives his name to the Welfare Lady who insists on knowing the baby's father's name although she has already given names of her other four children's fathers.

Hester takes Amiga's advice to take Baby's picture and go to his father to ask help. Hester goes to Reverend D. who is "On his soap-box preaching to no one in particular "(3,59), she covers her face by the baby's photo, he sees her but doesn't recognize her:

REVEREND D.: Do you know the father?
HESTER: Yes.
REVEREND D.: You must go to him and say "Mister, here is your child!"
HESTER: Mister here is your child!
REVEREND D.: "You are wrong to deny what God has made!"
HESTER: You are wrong to deny what God has, made!
REVEREND D.: "He has nothing but love for you and reaches out his hands every
day crying wheres daddy?"
HESTER: Wheres daddy?
REVEREND D.: "Wont you answer those cries?"
HESTER: Wont you answer those cries? (3,60)

Reverend D. seems to make his own trap. As he speaks, Hester repeats all his words back to him. Hester who owns all his tapes and armed by his immediate words "Go, to him. Plead with him. Show him this sweet face and yours. He cannot deny you "lowers the picture of her baby to show him her face, only to have all words flee. When the words resume, the Reverend denies Hester and claims that he has never seen her before: "Me, someone you've never even met", he rushes to call a taxi for her, he stays explosive with hollow promises of help:

HESTER: He's talking now. Not much but some. He's a good boy.

REVEREND D.: I am going to send one of my people over to your home tomorrow. They're marvelous, the people who work with me. They'll put you in touch with all sorts of agencies that can help you. Get some food in that stomach of yours. Get you some sleep. (3,61-62)

By using such confrontational dialogue between Hester and Reverend D., Parks clearly presents a poignant satire directed at the doubled-faced representatives of religion as an institution. She satirizes their hypocrisy and meanness. Reverend D. says something but does another. In his preaching he gives a powerful speech about how to help those who are in need. But in reality, he does nothing to improve Hester's life. In his confession, he bares himself to the audience:

In all my days in the gutter I never hurt anyone.
I never held hate for anyone.
And now the hate I have for her
and her hunger
and the hate I have for her hunger.
God pulled me up.
Now God, though her, wants to drag me down
and sit me at the table
at the head of the table of her fatherless house.(6, 85)

Reverend D. joins forces with the other influential figures in Hester's life; i.e., the Doctor, Amiga Gringa, and the Welfare Lady, to marginalize, oppress and forsake Hester and her children. Thus, he is as liable as them in aggravating her plight that leads to her tragic fate. Reverend D's treatment of Hester does not only mark the systems of race, class or gender as inherent issues, his character functions more as an institution or a system, similar to Capitalism, which promises a reward, but often fails to deliver (Keene,2012,p.64).

Hester's long journey of suffering and desperation culminates in the fatal blow she receives from Chilli, Jabber's father. In a form of nostalgic feeling, he returns to Hester after 13 years of absence. He justifies his own irresponsibility towards Hester and his son in his confession "We was Young" by claiming:

We was young
and we didn't think
we didn't think that nothing we could do would hurt us

nothing we did would come back to haunt us

.....

we were Death Defying

we were Hot Lunatics

careless as all get out (7-98)

This points at the dangers involved in the practice of unguarded sex. Chilli's irresponsible decision to leave Hester to pursue his life elsewhere sheds light on the inequality in man-woman sexual relation as she is to bear the consequences of rearing socially unacceptable fruit of this relation; i.e., illegitimate children and of being stigmatized as 'unmarried' and 'single welfare mother.'

Through Hester's contact with Chilli, the questions of gender roles and gendered stratification of society are vividly presented and intensely debated. Chilli maintains the same traditional and patriarchal position that views women as secondary and subordinate to men and confines them to the private sphere of housekeeping and child rearing. He is ready to return to her on condition that he

would still retain [his] rights to [his] manhood... I would rule the roost. I would call the shots. The whole roost and every single shot. I've proven myself as a success. You've not done that. It only makes sense that I would be in charge. (7-95)

At this point in the play Chilli does not know that Hester has four other children. When he finds out, the circumstances of Hester's new engagement instantly switches. Chilli recoils from his marriage proposal and tells Hester that they cannot be together. He takes back his wedding gifts: the ring, veil, and dress and leaves. The image of a single mother with five children, four of which are not his own is a deterrent for Chilli and his dream of marriage; Hester herself understands how this could be a barrier, as exemplified by her reaction to Chilli's question of who are the other four children. Hester's response is "*the neighbors kids*" (Italics mine) (7-96). Though only a momentary denial of her children, it exemplifies the disparaging connotations associated with an unmarried woman with multiple children. The notion of having too many children has had a negative impact on Hester's life. However, not necessarily due to her condition, but more so, by what the people around her perceive that to mean. The men in Hester's life, past and present, are as culpable for the situation in which Hester finds herself as she is (Keene, 2012, p.57).

Hester's desperation and hopelessness make her see a vision, which personifies a bad omen. The vision as she describes it is like an eclipse: "It was a big dark thing. Blocking the sun out. Like the hand of fate. The hand of fate with its five fingers coming down on me" (6,82). Toward the end of the play this vision becomes true.

In her last confrontation with the Reverend D., he calls Hester "slut" and threatens to crush her under foot. By doing so Reverend D. shows himself as a priest without any religious ethics. Jabber who wakes up, overhears Reverend D. and recalls that this label –slut– was written in his

mother's practice place. He asks his mother to define the appellation for him, but she refuses, he says that he has lied to her when he pretended that he could not know how to read that word at that time. But in fact he knows how to read it and knows what it means as well. Jabber repeats this word one time too many. Hester, in a desperate effort to refuse this identification, takes up the club Trouble brought earlier in the play and brutally beats her son to death:

HESTER /JABBER /HESTER/ JABBER

She quickly raises her club and hits him once. Brutally. He cries out and falls down dead. His cry wakes Bully, Trouble and Beauty. They look on. Hester beats Jabber's body again and again and again. Trouble and Bully back away. Beauty stands there watching. Jabber is dead and bloody. Hester looks up from her deed to see Beauty who runs off. Hester stands there alone. Wet with her sons blood. Grief stricken, she cradles his body. Her hands wet with blood, she writes an A on the ground.(8,103-104)

With her son's blood, Hester shaping her last 'A'. Her farewell to her son is a sorrowful boast: "Looks good, Jabber, don't it? Dont it, huh?" Schafer (2001, p.193)maintains "It is Hester final attempt to write her own story and claim her own identity rather than accept that offered by a society that will condemn her."

Hester can do nothing to stand against her fate represented symbolically by the hand that blocks out the sun with its five fingers. In the last confession, Hester focuses not on the killing but on what she has done. She calls her children "mistakes" rather than "treasures". She states that she should have had "a whole army full" of those "Bad mannered Bad mouthed Bad Bad Bastards!" (8-106)

In the final scene of the play which Parks calls 'The Prison Door', the same title of the opening scene in Hawthorn's *Scarlet Letter*, the chorus appears. They frame Hester's tragic downfall. All her accusers close in on her, blaming her for her lack of education, for her sexuality, for her lack of husband, and her poverty. She is accused of failing to get further than the first letter of the alphabet, and forced sterilization awaits her to put an end to her mistakes. The choice of the scene's title is very suggestive and apt as Hester is trapped and imprisoned in various forms of psychological and emotional deprivation, social alienation, and financial insecurity.

Parks manages to present her protagonist as a victim of society that seeks to exploit the black female body. She explains through her protagonist how systemic racism , ongoing racial stereotypes, mapped across the black female body ; and societal complicity create the unfortunate life of her protagonist. Harry J. Elam Jr. suggests that Hester La Negrita is a victim , but also tragically complicit in her own oppression. He argues: "Hester's tale offers a poignant, contradictory conjunction of suffering and survival, institutional neglect, and individual abuse"(Qtd in Larson,2008,p.105). Although the hypocritical society institutions are all responsible for what she is suffering from, she herself is to blame, in part for her own catastrophe and her social exclusion.

In an interview, Parks claims, "I just write tragedy and devastation. It's like bleeding, like when they used to bleed folks. The play creates a wound that is actually the first stage in the healing process"(Spring Theater,2001). This wound is what Parks hopes to heal by reconfiguring the literary canon. In the apt words of Jefferson(1999,p.2), we will "Leave 'In The Blood' feeling pity and terror . And because it is a work of art, you will leave thrilled, even comforted by its mastery".

CONCLUSION

Parks addresses the audience at the end of the twentieth century. In *In the Blood*, she manages to present an image of a black woman who is brutally victimized by the social system in a society that has no sympathy for those who are socially outcast. Hester La Negrita, the protagonist, is oppressed by Reverend D. and the Welfare Lady, who are Afro- Americans, as well as by the Doctor and Amiga Gringa, who are whites. So the issue is not who is black and who is white, but it is who is responsible for what she suffers from. Till she reaches a convention that " I dont think the world likes women much" (4,68),she believes that all bad things happen to her because of her race and gender which force her to resort to violent acts of destroying herself and her own family. Parks focuses on the important role race and gender play in making large number of young black women illiterate and unemployed; a fact that leads to their marginalization and impoverishment.

This situation makes Hester more like Euripides's *Medea* (431 BCE), killing out of spite and vengeance against a world that has unfairly branded her a slut. They are neglected and maltreated by the same social institutions created to provide care and compassion to the poor.

In The Blood, Parks seems to suggest that whereas seventy years ago acts of discrimination were overt and widespread, persistent racial inequality in employment, housing, and a wide range of other social domains has renewed interest in the possible role of discrimination. In fact, unlike in the pre-Civil Rights era, when racial prejudice and discrimination were overt and widespread, today discrimination is less readily identifiable and clear.

ABSTRACT

This study aimed to comparatively investigate the effect of recast, task complexity and recast plus task complexity on the Iranian advanced English as a foreign language (EFL) learners' Oral accuracy. To that aim, three groups of learners, a total of 90 female EFL learners, were assigned to three experimental groups to receive the treatments each: task complexity, recasts, and task complexity plus recasts. The homogeneity of the three groups of learners in terms of general proficiency as well as their oral accuracy was checked at the outset, and finally the learners were interviewed to compare their oral accuracy with a posttest. The data obtained from TOEFL were analyzed and one way ANOVA was employed to assure homogeneity of learners regarding language proficiency and oral accuracy scores on the pre-test. The research came to the conclusion that both recast and task complexity led to the enhancement of learners' oral accuracy while the combination of recasts and task complexity seems to have contributed to less positive impact. Based on the findings of the present study, the following implications could be arrived at: 1. teachers may decide to employ recasts and task complexity in their classes more than before 2. Teachers may start reflecting and investigating different underlying constructs for the concept of recasts and task complexity in their classroom 3. Material developers may consider the inclusion of task types which foster the use of recasts in the classroom more than before.

KEYWORDS: task complexity, recast, oral accuracy

INTRODUCTION

Researchers (Long, 1985, Dulay, & Burt, 1973) in second language learning and teaching have been searching for the ways for dealing with errors. For example, when the focus is on meaning, the emphasis is placed on fluency rather than accuracy (Long, 1985). Thus, this results in a compromise on accuracy, which may be fossilized in the learner's interlanguage. In the same context, the language classrooms have used corrective feedbacks with the aim of focusing on form and meaning techniques. As Chastain (1998, cited in Gholizade, 2013) States: "Learning requires feedback. Otherwise, the learners have no means of judging the extent and

appropriateness of their learning. Consequently, many studies in second language acquisition have focused on the effect of corrective feedback on the quality of learning". (p. 418). Even today, in spite of the plethora of research that has been conducted on the subject, the question of what constitutes the most effective instructional approach remains controversial. One of the fundamental issues underlying the debate has been and continues to be what should serve as the starting point in determining the content of second language teaching. In line with the argument SLA researchers have shown an increased interest in exploring analytic approaches to syllabus design for the past decade and one type of analytic syllabus employing task as a unit of analysis has received particular attention (Long, 1985; Long & Crookers, 1992; Skehan, 1998; Skehan & Foster, 2001). Meanwhile research suggests that, in order to achieve native-like proficiency, output needs to be supplemented by consistent corrective feedback. According to Doughty (2001): "Implicit strategies of corrective feedback are receiving increasing attention from SLA researchers, and this is due to their possibility of directing learners' peripheral attention to form without diverting their focal attention from meaning"(Doughty, 2001, cited in Leeman, 2003, p.19).

Of all the implicit corrective strategies, such as clarification requests, comprehension check, and repetition seek, recasts seem to hold special promise. Recasts are generally described as the teacher's or more advanced speaker's reformulation of "all or part of a learner's utterance, thus providing relevant morph syntactic information that was obligatory but was either missing or wrongly supplied, in the learner's rendition, while retaining its central meaning"(Long, Inagaki, & Ortega, 1998, p.358). Recasts involve the teacher's reformulation of all or part of the student's utterance, minus the error, as shown in example (Lyster & Ranta, 1997). To recast an error, an interlocutor will repeat the error back to the learner in a corrected form. Recasts are used both by teachers in formal educational settings and by interlocutors in naturalistic language acquisition.

Research to date suggests that recasts can facilitate L2 development, but their efficacy is a function of several internal and external variables one of them being task variables. For example, Robinson (2001) suggests that, "task complexity increases the cognitive demands of tasks"(p.287), and it may influence the efficacy of recasts. According to Robinson (2001, 2003), some tasks, depending on their attentional demands, may be more effective in inducing learners to notice recasts than others. Along the same lines, a study conducted by Lyster and Ranta (1997) is an important research project on corrective feedback, culminating in the identification of seven types of corrective feedback, one of which is recast. In the same context, the following study seeks to find out the effect of recasts, task complexity and task complexity plus recasts on the Iranian EFL learners oral accuracy.

RESEARCH QUESTIONS

This study seeks to answer the following questions:

Is there any significant difference between the impact of recast and task complexity plus recast on EFL learners' oral accuracy?

Is there any significant difference between the impact of task complexity and task complexity plus recast on EFL learners' oral accuracy?

Is there any significant difference between the impact of task complexity and recast on EFL learners' oral accuracy?

METHODOLOGY

This study was conducted in Iran. A thorough description of the participants, procedure, and instrumentation carried out for this study are presented in this section.

Participants

The participants were 90 female EFL learners at upper-intermediate level who were assigned to three experimental groups. They were studying in Safir language institute. They were homogenized using a TOEFL. Initially 120 students took the test, students standing at one standard deviation above and below the mean were selected as the participants. After the administration of the test participants were selected and they were divided into three groups of 30 members.

Instruments

The following instruments were applied in this study:

TOEFL Test

The TOEFL test included reading, structure and speaking sections. It was taken from sources including Baron's TOEFL (10th edition, 2008). There were two sections (reading-50 items, and structure-40 items) on this test which took a total of about ninety minutes to complete. There was also a speaking section which comprised 6 tasks which involve expressing an opinion on a familiar topic. This test was piloted on a group of 10 students having the same level of proficiency as those who took part in the study. The test was applied in order to have a homogenized group at general level of English and also scores achieved at speaking section were analyzed in terms of the participant's oral accuracy prior to treatments.

Course book

The course book which was utilized for the purpose of instruction in this study was "Total English" (by Will Moreton, 2011) comprising 12 units, 3 of which is taught per-term (42 hours). This book consists of the following:

- Extensive speaking, pronunciation and vocabulary sections
- Thorough grammar sections with clear examples and practice
- Comprehensive listening activities with scripts
- Contemporary, engaging reading materials taken from authentic sources
- Writing Banks with the chance to practice different writing styles
- And finally, the Review and Practice pages after each unit bring all the learning activities together.

It was used the institute's routine and was the main course of attention during the whole 21 sessions of the term. There was a focus on the speaking section of this book.

Procedure

In order to meet the criterion of the study the following procedure was followed:

Treatments

Initially, TOEFL was piloted on a 10-member group to make sure it was appropriate for the group in question. After the administration of TOEFL to the subjects of the study out of 120 ninety participants were chosen based on the normal histogram of the TOEFL. That is to say participants with scores lying between one standard deviation above and below the mean were chosen for the purposes of the study. The participants were divided to three groups. Then an oral interview test was conducted to assure the homogeneity of the participants regarding oral accuracy. One way ANOVA was employed to probe any significant differences between the means of the groups with regard to oral accuracy. The participants in our three groups started to receive one of the three treatments each. In experimental group I, students received recasts with a special focus on certain lexicon and structures. That is, the participants in this group consistently received recasts from the researcher when they produced erroneous sentences. The recasts were typically of the simple isolated declarative type; that is, they targeted a single error and were provided with falling intonation, without added emphasis on the targeted feature (Kim & Han, 2007; Lyster, 1998). A small number of recasts were also provided, albeit randomly, in response to other ill-formed structure and lexicon. The two conditions namely "watch-and-tell" and "watch-then-tell" were used for classifying the complex tasks. The rationale for these conditions was based on the research finding conducted by Skehan and Foster (1999). "Comparing the learners' performance under these two conditions, Skehan and Foster observed that the watch-then-tell condition led to greater complexity than watch- and-tell" (Skehan and Foster, 1999, cited in Révész, 2009, p.18).

The tasks in this group were of simple ones which had a watch-and tell condition. That is, the learners had to watch the films and to simultaneously narrate what they saw in the film. They also could resort to note-taking to retrieve the information. The films included the following themes: a trip to Europe, history of Iran, whale in the sea. These topics were selected due to the structural elements these films covered. In addition, the language of the films was suitable for upper-intermediate level. Initially, the learners in all three groups were introduced to the task. To this end, they were given warm-up activities on the topics of the films. Subjects were encouraged to elaborate on what they knew about these topics and share them with their classmates. After each task, the learners reviewed the task and once again referred to the film to check how they had performed on the task. Experimental group 2 received no recasts and had to perform a complex task. This group was required to perform with a watch-and-then-tell and – contextual support conditions. That is, the learners watched some videos and then had to narrate the story shown in the video while having no access to the videos or notes. Experimental group 3 was exposed to both complex tasks and recasts which were the same as those used in groups 1 and group 2. Overall, 10 sessions were held and in each session forty five minutes was devoted to the administration of the treatment.

Oral Interview Tasks

Oral interview tasks were used both as the pretest of oral accuracy and also as the post test of oral accuracy. The pretest and posttest employed oral production tasks: the three experimental groups were asked to take part in an interview in which each student was asked the same set of questions. The topics included: motivation for learning English, the job they will select in the future, the favorite sport, and five advantages of internet. All interviews were tape-recorded and two raters rated the oral accuracy of the interviewees. Inter-rater measurement was applied in order to insure reliability of scores. Accuracy was measured in terms of error-free T-units as follows:

All the main clauses plus subordinate clauses attached to or embedded in them were counted as T-units. Only those T-units that contained no grammatical, syntactic, lexical, and errors were counted as error-free T-units (Arent, 2003; Storch, 2009). (E.g. in the following text there are two error-free T-units)

1-Since young children tend to connect short main clauses with 'and,' they tend to use relatively few words/**T-unit**. But as they mature, they begin to use a range of appositives, prepositional phrases, and dependent clauses that increase the number of words/**T-unit**.

2-I walked west and I come to a house. (An error-free T-unite and a T-unit with error).

To measure accuracy, the number of error free T-units is divided by the total number of t-units (Arent, 2003; Storch, 2009). The result is multiplied by 100 to obtain the percentage.

RESULTS AND DISCUSSION

Testing the hypotheses

Three hypotheses were put forward for the following study as follows:

There is not any significant difference between the impact of recast and task complexity plus recast on EFL learners' oral accuracy.

There is not any significant difference between the impact of task complexity and task complexity plus recast on EFL learners' oral accuracy.

There is not any significant difference between the impact of task complexity and recast on EFL learners' oral accuracy.

A one-way analysis of variances was run to compare the three groups' means on the posttest of oral accuracy in order to investigate our three research questions. Before discussing the results it should be mentioned that the assumption of homogeneity of variances was met (Levene's $F(2, 87) = 2.28, P > .05$) (Table 1).

Table 1: Levene's Test of Equality of Error Variances

F	df1	df2	Sig.
2.288	2	87	.111

As displayed in Table 2, the recast ($M = 35.35$, $SD = 5.06$) had the highest mean on the posttest of oral accuracy. This was followed by task complexity ($M = 33.75$, $SD = 6.64$) and recast plus task complexity ($M = 27.15$, $SD = 4.25$) groups.

Table 2: Descriptive Statistics, Posttest of oral accuracy by Groups

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean		Minimum	Maximum
					Lower Bound	Upper Bound		
Recast	30	35.35	5.060	1.132	32.98	37.72	25	40
Task complexity	30	33.75	6.640	1.485	30.64	36.86	20	40
Recast plus task complexity	30	27.15	4.258	.952	25.16	29.14	19	35

Based on the results displayed in Table 3 ($F(2, 87) = 12.90$, $P < .05$, $\omega^2 = .28$ representing a large effect size) it can be concluded that there were significant differences between the means of the three groups on the posttest of oral accuracy.

Table 3: One-Way ANOVA, Posttest of oral accuracy by Groups

	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	755.733	2	377.867	12.906	.000
Within Groups	1668.850	87	29.278		
Total	2424.583	89			

The F-value of 12.90 indicated significant difference between the three groups' means on the posttest of oral accuracy; however, the post-hoc Scheffe's tests should be run to compare the groups two by two in order to investigate the research questions. Based on the results displayed in Table 4, it can be concluded that;

A: The recast group ($M = 33.75$) significantly outperformed the recast plus task complexity ($M = 27.15$) group on the posttest of oral accuracy ($MD = 6.60$, $p < .05$). Thus the first null-hypothesis as there is not any significant difference between the impact of recast and task complexity plus recast on EFL learners' oral accuracy **was rejected**.

Table 4: Multiple Comparisons; Post-Hoc Scheffe's Tests

Dependent Variable	(I) Group	(J) Group	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
						Lower Bound	Upper Bound
Posttest Oral accuracy	recast	Task complexity	1.600	1.711	.648	-2.70	5.90
		Recast plus task complexity	8.200*	1.711	.000	3.90	12.50
	Task complexity	Recast plus task complexity	6.600*	1.711	.001	2.30	10.90

*. The mean difference is significant at the 0.05 level.

B: The task complexity group ($M = 35.35$) significantly outperformed the recast plus task complexity ($M = 27.15$) group on the posttest of oral accuracy ($MD = 8.20$, $p < .05$). Thus the second null-hypothesis as there is not any significant difference between the impact of task complexity and task complexity plus recast on EFL learners' oral accuracy **was rejected**.

C: There was not any significant difference between the task complexity ($M = 33.75$) and recast ($M = 35.35$) groups means on the posttest of oral accuracy ($MD = 1.60$, $p > .05$). Thus the third null-hypothesis as there is not any significant difference between the impact of task complexity and recast on EFL learners' oral accuracy **was supported**.

Discussion

The aim of the current study was to investigate the comparative effect of recast, task complexity and recast plus task complexity on Iranian advanced EFL learners' oral accuracy. The results of one way ANOVA indicated that both the recast group and task complexity group outperformed the recast plus task complexity group on the post test of oral accuracy.

As pointed out earlier recasts according to Long et al. (1998) refer to a speaker's reformulations of "all or part of a learner's utterance, thus providing relevant morph syntactic information that was obligatory but was either missing or wrongly supplied, in a learner's rendition, while retaining its central meaning" and task complexity as Robinson (2001) maintains refers to the "attentional, memory, reasoning, and other information processing demands imposed by the structure of the task on the language learner" (p.29). On the other hand, the study revealed that there was not any significant difference between the effect of task complexity and recast on the learner's oral accuracy.

In a nutshell, the study came to the conclusion that both recast and task complexity led to the enhancement of learners' oral accuracy while the combination of recasts and task complexity seems to have caused less positive impact. The fact that recasts have contributed to the enhancement of oral accuracy in this study corroborates the results of many studies conducted in which recasts have been used (Egi, 2010; Ammar, 2008; Long, 2007; Robinson, 2005a, 2003a 2001a, Braid, 2002; Havranek, 2002; Ayoun, 2001).

Regarding the finding that task complexity has also led to the betterment of oral accuracy in this study, this result confirms the findings and views of many scholars who are in favor of task complexity (Nelson, 2011; Michel, M. Kuiken, F. & Vedder, I. 2007; Larsen-Freeman, D. 1997; Fotos, S.S., 1994; Long, M. H. & Crookes, G. 1992).

Respecting the finding that recasts and task complexity have approximately led to an equal degree of improvement in terms of oral accuracy it could be concluded that both types of treatments have possibly activated the same constructs which underpin the cognitive ability of the learners with respect to oral accuracy. In other words both types of treatment although different on the surface may have not a striking disparity when it has come to the acquisition of grammar hence the improvements in both groups.

With respect to the fact that a combination of recasts and task complexity has led to a lesser degree of positive effect on learners oral accuracy could probably have its roots in the amount of demand it has placed on the shoulders of the learners. That is to say both task complexity and recasts may have contributed to a sort of confusion on the parts of the learners.

CONCLUSION

In this study the researcher attempted to investigate the impact of recasts, task complexity and recast plus task complexity on the oral accuracy of Iranian advanced learners. The study came to the following conclusions: both recast and task complexity led to the enhancement of learners' oral accuracy while the combination of recasts and task complexity seems to have caused less positive impact.

Firstly the results of the study revealed that both the recast group and task complexity group outperformed the recast plus task complexity group on the post test of oral accuracy. Moreover it was found out that there was not any significant difference between the effect of task complexity and recast on the learner's oral accuracy. These findings remind us of the nature of recasts and task complexity. That is to say the results help shed more light on the impact of task complexity and recast. The fact recasts and task complexity have approximately led to an equal degree of improvement in terms of oral accuracy, it could be concluded that both types of treatment although different on the surface may have not been very different when it has come to the acquisition of grammar hence the improvements in both groups.

Pedagogical Implications

Based on the findings of the present study, the following implications regarding the impact of recasts, task complexity and recasts plus task complexity on learners' oral accuracy could be arrived at:

- Overall, by employment of recasts and task complexity teachers can help enhance the oral accuracy of their learners. That is to say based on the results of the present study teachers may decide to employ recasts and task complexity in their classes more than before.
- Awareness of teachers might be developed regarding the question that why task complexity and recasts led to an enhancement regarding the oral accuracy but a combination of these two was not very fruitful. In this respect, as pointed out earlier, it could be concluded that both types of treatments may have possibly activated the same constructs which underpin the cognitive ability of the learners with respect to oral accuracy. As a consequence teachers may start reflecting and investigating different underlying constructs for the concept of recasts and task complexity in their classroom. This may, in turn, lead to the enhancement of and could be considered as one of the components of the reflective repertoire that teachers hold.
- Material developers may consider the inclusion of task types which foster the use of recasts in the classroom more than before especially when it comes to the requirements and objectives of the courses and may likewise decide to consider more factors while constructing the syllabus.

- Last but not least, teacher educators may draw upon the results of the study while discussing the impact of recasts and task complexity or a combination of these two on oral accuracy.

Limitations

- The subjects of this study were all female learners aging between 19 to 30.
- The present study focused on the skill of speaking, only.
- The participants of the study were advanced learners of English.

ABSTRACT

In the present day, translation and translation studies have expanded in most countries and there are professional translators all around the world. However, some parts of languages and thoughts cannot be translated easily due to the diversity of parts of speech in different countries. (Na Pham, 2005; Yarmohammadi, 2010; Dodd, 1999). This study aims to shed light on the problems which students face in translating from Persian to English. An error analysis approach to identify linguistic translation errors was used to discover students' main problems. Thirty English Language Translation students were selected through purposive sampling. A Persian - English translation task was administered to collect the corpus for analysis. All the students' translations were analyzed to identify linguistic problems. Three lecturers were interviewed for their understanding of the causes of students' errors in translation. It was found that mainly syntactic errors occurred in their translations. Considering the students' errors and categorizing errors devise appropriate translation teaching techniques. Moreover, being aware of students' causes of errors is suitable for the translation teachers to improve their tasks.

KEYWORDS: Translation; errors in translation; error analysis; linguistic errors; syntactic errors

INTRODUCTION

The need for effective and efficient use of information and knowledge in developing countries such as Iran is obvious as access to the latest information is only possible with a good command of English or with good translations. English is the most important foreign language in Iran's education system (Chalak & Kassaian, 2010). In recent years, the B.A programmes in Iranian universities have introduced English translation courses that teach translation strategies, theories of translation, interpretation, translation of simple prose texts and translation of different types of texts (literary, news, political). English Language Translation students must undergo 4 years of study in language proficiency, linguistics, and all the theories of translation and strategies of translation of texts in various fields such as literature, economics, politics and religion.

Translation training is often run by language departments and is spread over two and a half years, starting from the second semester of year 3 and ending in year 4. The problem is that very few of these graduates qualify as good translators. According to Rahimy (2003), many studies find that most of the graduates are just incapable of presenting a meaningful translation of different text types. Hence, much of the translated work in Iran, such as translation of Persian literary texts into English, is poor and quite unintelligible. Specifically, in some cases, the sense of the main message in the second language (SL) is actually omitted. Khanmohammad's (2012) study suggests that most students have basic problems in comprehending the original text. She points out that if translation students have problems understanding the second language or target language (TL) culture, they would be unable to transfer the culture-specific items accurately. She also notes that students transfer pragmatic sense through literal translation, thus failing to convey an accurate translation. The main purpose of this study is to understand students' errors in translation from Persian to English, and to seek explanations for these errors.

Many researchers all over the world have tried to understand translation errors through error analysis such as Stewart (2008); Na Pham (2005) from Vietnamese to English; Dodds (1999) from Italian to English (Coskun, 1997; Seguinot, 1990). However, none have focused only on syntactic errors in detail. Iranian researchers have also studied students' errors in translation but not in detail (Golestany, 2010; Jamalimanesh, 2009; Khodabandeh, 2007; Riazi and Razmjoo, 2004). As Kiraly (1995) indicated: "Error analysis should help translation teachers understand the problems (linguistic, cultural, textual, production) that occur during the process of a translator's training". The findings of this study may contribute to research in translation studies on other language pairs or combinations, and may also help translators and TEFL students majoring in translation studies to improve in their translation.

PREVIOUS STUDIES

In the Iranian context, Riazi (2004) found that errors occurred when there are simple substitutions of one syntactically correct structure for another which is equally syntactically correct, even if semantically incorrect. Coskun (1997) explored another dimension of translation problems. The result of his study showed that students made errors both in comprehension and production due to miscomprehension of the source text. Besides that, the students only translated the surface structure.

In another study on error analysis in translation, Khodabandeh (2007) revealed that the students' difficulties were mainly with grammar, as well as with discourse and vocabulary. Another study analysing linguistic errors showed that Iranian students attempting English translation sometimes find foreign journalistic text-types harder than domestic ones to translate (Rahimy, 2003). The study reported in this paper aims to explore the category of errors among Iranian English Language Translation students in order to discover the causes of their errors. It also aims to find out the most common errors found in these students' translation.

Errors and Error Analysis in Translation

Errors occur when the learner's knowledge of the rules of the target language is incomplete. Errors are considered to be systematic, governed by rules and also regarded as rule-governed when they follow the rules of the learner's interlanguage (Keshavarz, 2011). According to Abbasi and Karimnia (2011) it is essential that teachers be able to adjust their teaching plan to work more effectively by identifying learners' errors. Moreover, recognizing errors can provide valuable information for teachers about how much the learner has learned and what kinds of problems s/he has in the study of language.

According to Pym (2010), translation errors may be attributed to different causes and located at different levels (language, pragmatics, culture). He defines three kinds of errors in translation: slips, systematic errors and skill-related errors. Slips occur when the students can repair the errors when they are pointed out to them. Systematic errors are the surface sentence-grammar errors, and the third type involves the skill or ability to use the language, rather than the knowledge of language. The possible reason for making these errors is that the language learner has not mastered those aspects of grammar yet, or the use of idioms is not culturally appropriate.

According to Richards et al. (1993: 96), "EA may be carried out in order to: a) find out how well someone knows the language, b) find out how a person learns a language, and c) obtain information on common difficulties in language learning". EA is used to analyse the actual errors produced by foreign language learners and an attempt is made to explain the causes of the errors. Various techniques are available for identifying, classifying and systematically interpreting language learners' errors (Khodabandeh, 2007). According to Seguinot (1990), errors indicate the quality of a translation and are also windows into the translation process itself. Translation errors provide two kinds of information: an indication of how information about language might be organized in the brain and an insight into the developmental process that takes place in translator training (Na Pham, 2005).

Error analysis models for translation in previous studies focused on language competence, grammatical rules, spelling and phrases which are the subcategories of linguistics, and rarely focus on text meaning (Golestany, 2009; Jamalimanesh, 2009; Khodabandeh, 2007; Stewart, 2008; Na Pham, 2005; Riazi and Razmjoo, 2004; Dodds, 1999; Coskun, 1997 and Seguinot, 1990). This study adapted Na Pham's (2005) Error Analysis Model (figure 1) to explore linguistic translation errors. Linguistic translation errors based on Na Pham's framework are categorized as morphological errors, grammatical errors, syntactic errors, collocational errors and inappropriate word form errors. By analysing linguistic translation errors using Na Pham's error

analysis model, this study seeks to gain a better understanding of students' linguistic errors in translation.

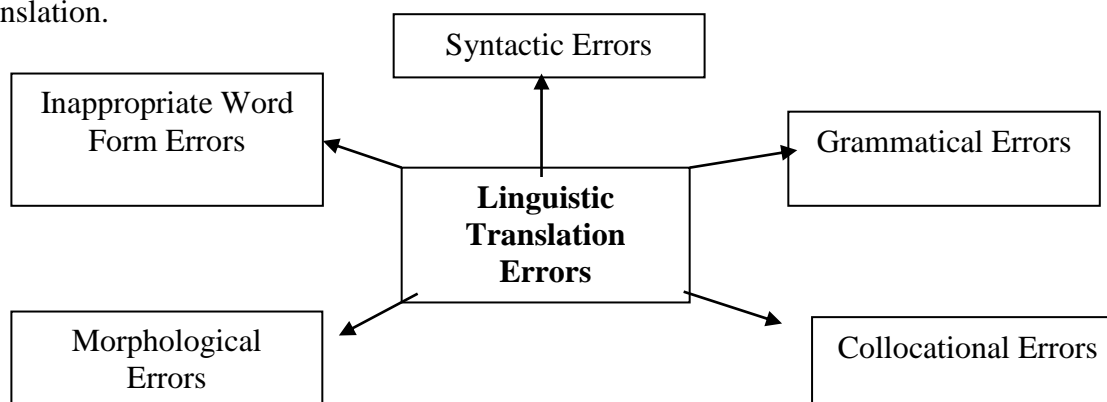

Figure 1: Na Pham (2005) model for linguistic translation errors

RESEARCH QUESTIONS

- 1) What are the most common types of error found in the students' translation pieces from Persian to English?
- 2) What are the plausible explanations for students making these errors in their translation from Persian to English?

METHODOLOGY

A qualitative research design was employed to find out the English language translation students' errors in translation. Using purposeful sampling, 30 final year English Language Translation students who had completed 3 years of academic instruction and had attended the entire translation studies programme from the Department of English Language Translation of Shiraz Islamic Azad University of Iran were selected. The criteria for selection were that the subjects: 1) should have a similar educational background and 2) must be easily accessible. In addition, three lecturers, two male and one female, each with more than 10 years of experience in teaching English as a foreign language as well as translation studies, were interviewed for their explanations of the causes of students' errors.

Translation Task

Subjects were asked to translate one text from Persian to English. The source text was selected by the 3 professors of translation courses in Iran. The selected text of 167 words was extracted from "Translation Skills from Experts and Professional Points of View in Translation" by Janzadeh (2008:162) which was introduced by the professors of translation in Iran universities and which is also taught in universities. It contains several literary texts and short stories translated from Persian to English and vice versa. The text, translated by a translation expert with more than 20 years of experience, has been used for more than 5 years in English language translation courses in Iran universities. Thus the content of the book was deemed appropriate for the students who are familiar with it.

While asking the lecturers for help with selecting an appropriate text from the book, the author explained the purpose of the study, the statement of the problem and the framework of the study.

They had taught the book for more than five years and they were asked to make sure that the students had not worked on this text before. The text was a short story about a man who wants to sell his old horse.

A checklist was designed to ensure that the task would enable the elicitation of useful information to answer the research questions of this qualitative study. The checklist, adapted from Zailin Shah's (2004) criteria for selection of literary texts for the literature classroom, consisted of criteria for ensuring the validity of the literary text. Zailin Shah (2004) advised taking into account some factors related to the text and the readers, such as: the difficulty level of the language, the complexity of vocabulary, the length of the text, the subject matter, the prior knowledge of learners, and their interest level. The checklist used a Likert scale from 1 to 4: 1 (poor), 2 (fair), 3 (average), 4 (good). Lecturers were asked to indicate their preference for the text by ticking any number from 1 to 4. An additional space was provided below the checklist for lecturers to offer other suggestions. The checklist was approved by the same three lecturers who were asked to assess the validity of the text.

Data Collection Procedure

Prior to the interview sessions with the teachers, the researcher arranged a meeting with each of the three lecturers to explain to them the topic, the statement of the problem and the aim of the research. The interview sessions with the lecturers were conducted in their respective rooms. They were asked to answer 3 core questions about the students' most frequent errors and also students' causes of errors in translation. One week after interviewing the lecturers, the translation task was administered to the students in the form of a class activity. All 30 students in the three translation classes (10 students from each class) performed the task in the regular class time. In order that the students took the task seriously, the researcher asked the lecturers to consider using the translation task score to count towards their final score. Subjects were free to use any dictionaries they liked. In a regular translation exam, the students would require 110 minutes to translate this text. In this study, participants were given 120 minutes to translate the text from Persian to English to ensure that they could complete the task and that the pressure of time would not cause them to make more errors. After they translated the text, the students were interviewed about the causes of their errors. Interviews with students were conducted to collect data about the insights or perspectives of research participants.

Data Analysis

The translations of the 30 students in the sample were collected and analysed. Errors were underlined and classified in terms of their sources, using Na Pham's taxonomy. Based on Na Pham's (2005) translation error analysis, a table was designed to count the number of errors identified in each category. Following Creswell's (2008) suggestion, the frequency and percentage of errors were calculated manually. Students' translations were compared to the published translation of the source text and analysed by the researcher. Errors were coded and classified. All the errors were categorized and noted down directly on the students' translations. Students' translations were compared with the original source text and the published translation of the ST. The researcher underlined and coded each student's translation piece based on the

category and subcategory of errors. The codes were classified and the results presented in a table. The percentages of each category of errors were displayed in separate tables.

For the purpose of analysis, the researcher first transcribed and translated the lecturers' and students' interviews from Persian to English. To ensure the accuracy of the translation, a Persian-English bilingual colleague checked the transcribed texts. Secondly, the transcriptions of the lecturers' and students' interviews were carefully read for the purpose of coding the data which was done with the assistance of an expert with more than 5 years of experience in analysing qualitative research and data analysis in the English Department of Islamic Azad University of Shiraz, Iran. Thirdly, the researcher made a list of all the code words and also grouped together similar codes, removing redundant codes to reduce the list of codes. The themes were identified by examining the codes that the participants discussed more frequently. In other words, the constant comparative method (Glaser & Strauss 1967) formed the foundation for data analysis in this study. The researcher began the process with open coding, by examining the interview transcripts, looking for categories of errors and causes of errors, and highlighting the category of errors, followed by naming and coding the categories based on the conceptual framework of the study. In the next step the researcher compared the categories for similarities and differences. Similar categories were then combined into new categories. A category would be considered saturated when no new codes could be added. Eventually, some categories emerged as more significant than others. The codes were classified and categorized in a table and each category of errors was presented in a separate table. Finally, by quantifying the codes and displaying the results by percentage in separate tables for each category, the themes emerged more clearly.

FINDINGS AND DISCUSSIONS

This study is concerned with examining the most common linguistic errors in students' translation using Na Pham's (2005) framework for analysing errors. The data was analysed during the interviews with the lecturers and students and with reference to the standard translation of the text in the book. As mentioned earlier, linguistic translation errors occur when the focus is on the language structure (Nord, 1997). Occasionally, the translator's low proficiency in either the SL or TL could be the source of linguistic translation errors (Nord 1997). In text analysis, linguistic translation errors are divided into five subcategories: morphological errors, grammatical errors, syntactic errors, inappropriate word form errors and collocational errors. Table 1 shows the distribution of linguistic translation errors.

Table 1: Distribution of linguistic translation errors

Linguistic translation errors	Frequency	Percentage
Morphological errors	140	23.89 %
Grammatical errors	67	11.43%
Syntactic errors	252	42.66 %
Collocational errors	70	11.94 %
Inappropriate word form	73	12.45%
Total	586	100 %

As shown in table 1, syntactic errors accounted for 252 errors in students' translation. Therefore, syntactic errors were the most frequent errors (42%) of all the linguistic translation errors. Morphological errors (140) were the next most frequent type of errors comprising 23% of the total number of linguistic translation errors identified. These were followed by inappropriate word form errors (12%), collocational errors (11.94 %), and finally grammatical errors (11.43%). This paper will focus on syntactic errors, the most common type of linguistic errors found in the students' translations. The following sections will present the results and findings of each subcategory of syntactic errors.

Syntactic Errors

Syntactic errors are made at three levels: phrase, clause and sentence. In this study, the definitions of phrase, clause and sentence are taken from Merriam Webster's Online Dictionary, [http:// www.m-w.com](http://www.m-w.com). Table 2 presents the frequencies and percentages of the subcategories of syntactic errors.

Table 2: Frequency and percentage of subcategories of syntactic errors

Type of syntactic errors	Frequency	Percentage
Phrase structure	84	33.33 %
Clause structure	122	48.41 %
Sentence structure	46	18.25 %
Total	252	100 %

As depicted in table 2, errors at clause structure level were the most frequent type of errors in students' translations. Altogether, 122 errors were found at the level of clause structure, comprising 48% of all the syntactic errors. Errors at the level of Phrase structure were the next most frequent type of errors; 84 errors accounting for 33% of the syntactic errors. Students made far fewer errors in sentence structure, about 18%. The following sections discuss each of these subcategories of syntactic errors.

Phrase Structure

Some examples from the data are:

1. Addition of unnecessary words, or of an unnecessary phrase:

Example: *He gave the remainder price credit.*

Proposed translation of the source text: He promised to pay me in full when we met again.

Example: the word 'price' is not considered a wrong insertion. It is redundant and unnecessary, and may cause ambiguity.

2. Inappropriate noun phrase construction or inappropriate verb phrase construction

Example: *He paid the half of price in cash and he accepted to give old donkey for other half of price.*

Proposed translation of the source text: He paid me down one half of the money, and then offered me a half-starved ass in payment of the remainder

Example: *He said, it () exhausted and fagged.*

Proposed translation of the source text: He said that it was old.

3. Inappropriate phrase construction.

Example: *I accepted the prices with no bargaining.*

Proposed translation of the source text: I threw him the bridle and saddle into the bargain.

Example: *I sold my horse with inclination.*

Proposed translation of the source text: I immediately exhibited my horse for sale at the market

4. Incomplete phrase. Students cannot complete the phrase or leave it unfinished.

Example: *In my opinion it has many faulty.*

Proposed translation of the source text: a horse dealer, to whom I showed it, made out so clearly that it was full of defects.

5. Non parallel combination refers to two phrases within a sentence not being parallel.

Example: *He was more confused than me.*

Proposed translation of the source text: and he seemed as surprised

Clause Structure

1. Addition of unnecessary word. This error occurs when the students add one extra word to the phrase. In the following example, the students wrote the extra word 'account',

Example: *He agreed that the other half would be paid on credit account.*

Proposed translation of the source text: he promised to pay me in full when we met again.

2. Addition of a verb to the clause (not the sentence), which repeats the meaning of another verb.

Example: *It seemed that my horse didn't have had any good points.*

Proposed translation of the source text: it seemed to have every quality that a horse ought not to have.

3. Inappropriate clause construction: a construction that is not constructed according to the standard syntax of clauses in English. There are two types:

a. The student may choose a structure which does not match the intended meaning of the original (although the word order of the structure is correct). Example (3a) shows this error.

Example 3a: *I would win the deal even if I'd sold it for free.*

Proposed translation of the source text: I thought myself in luck if I got anything at all for it.

b. The student decides to use the correct structure, but apply the wrong word order within the sentence. Example (3b) shows this error.

Example 3b: *Anything which is bad that a horse shouldn't my horse have.*

Proposed translation of the source text: it seemed to have every quality that a horse ought not to have.

4. Incomplete clause. A clause is considered to be incomplete when the subject or main verb is missing.

Example 4: *I was give to understand on the way that (it) is so fast.*

Proposed translation of the source text: I had proved it to be a good beast, from the rate at which I had travelled.

5. Omission of the relative pronoun linking one clause to another.

Example: *It was me () would make a good deal.*

Proposed translation of the source text: I thought myself in luck if I got anything at all for it.

Sentence Structure

Incomplete sentence. If the main verb and other parts of speech in the sentence are deleted, but the subject is not, the result is an incomplete sentence. Sometimes an omitted verb causes a sentence to be incomplete.

Example: *Anything which is bad that a horse shouldn't have my horse ().*

Proposed translation of the source text: it seemed to have every quality that a horse ought not to have.

Factors Contributing to Students' Errors

In the first stage of the study, students' errors in translation were identified according to Na Pham's (2005) taxonomy. In the second stage, the author sought explanations for these errors. Three lecturers were interviewed for their views on the reasons for students' errors in translation. The following reasons were given by the lecturers and students:

(a) Students had poor reading comprehension skills. Even after four years of instruction, they had difficulty grasping the main idea of a text. They also had problems comprehending Persian literary texts, making it even more difficult to translate literary texts accurately.

(b) Students were unable to translate compound sentences. More often than not, they confused the relative clause with the main clause, thus altering the focus of attention in the sentence.

(c) Students did not have enough practice, as they only learned English in the class without continuing to practice it at home.

(d) The many grammatical errors in their translation affected the communication of the main ideas of the source text.”

(c) Students were also careless about conveying the author’s main message.

(e) Students relied solely on the dictionary to translate, but they had poor dictionary skills.

(f) The main cause of students’ errors in their translation was that they did not read of the entire text first. Right from the beginning of the translation task, they tried to translate it sentence by sentence without considering the global meaning of the text.

(g) Another cause of students’ errors was that they did not revise their translation.

(h) The students did not consider the structure of the target text and most of the time they translated the source text literally.

(i) The most important reason was that the lecturers in Iran universities are trained in Teaching English as a Second Language, Literature or Linguistics, and rarely have any expertise in translation studies.

j) Lack of practice with certain linguistic structures prevented students from writing grammatically correct English sentences, although they may have known the rules very well.

k) Students seemed unable to apply their knowledge of English acquired in grammar or syntax classes to the translation process.

l) There was interference of the Persian language (of the source text).

m) Students’ generally had a low level of linguistic competence, and were unable to distinguish between similar words or structures in English.

The findings of the analysis of the students’ translation reveal a low level of skills in translation despite 4 years of instruction. The analysis of the translation texts reveals that syntactic errors comprised 42% of the errors among all categories of errors. (table 2). This result is similar to Na Pham’s (2005) findings in his analysis of students’ errors from Vietnamese to English. The results of the text analysis and interviews with lecturers showed poor awareness of grammar among ELT students. The students’ errors in the frequency list (table 2) for each sub-category of errors show that these were fossilized errors. This became especially clear from the results of the error analysis. This could be due to several reasons. Firstly, the students might lack practice in using certain linguistic structures. Two of the lecturers interviewed said that the students had poor linguistic competence and were unable to distinguish between similar words or structures in English. The students also seemed to be unaware that different situations called for different structures. Secondly, it was quite possible that the students were just not considering the wide choice of the strategies they had been taught in the translation programme. Two of the lecturers pointed out that students had been taught how to translate different types of texts from different fields such as politics, religion, economics, and literature.

CONCLUSION

Generally, the findings revealed that English Language Translation students may have problems comprehending the source language texts in Persian because of the complexity of the sentences and the differences between Persian structure and English structure. A similar observation was made by Na Pham (2005), Khodabandeh (2009) and Kussmual (1995) in their error analysis of students' translation.

Considering the differences between the structures of the source text and the target text, the lecturers' knowledge in both languages is important in improving students' translation by providing them with more input and strategies in translation. For that reason, lecturers who are not experts in translation studies should practice on translation and work on improving themselves before they can teach the translation courses in Iran. According to Bell (1994), a good translation teacher is the one who can comprehend what translation is and how it occurs. He added that a translation lecturer should be good in translation theory, transfer procedure and translation methodology. Adding Persian reading courses, English and Persian grammar courses in translation programme may increase students' ability in translation. Finally, students should be screened in proficiency both in English and Persian language before they are accepted in translation programme. The findings of this study is limited to the translated texts from Persian to English. Moreover, no generalization is possible due to the nature of the subjects under study.

ABSTRACT

The present study aimed at exploring teachers' and learners' beliefs about grammar teaching and learning in language institutes in Isfahan. To this end, two questionnaires were adapted and used to elicit teachers' and learners' beliefs about grammar teaching and learning. Thirty-five English language teachers and 200 learners of English who were randomly selected from different institutes in Iran, were asked to fill out teachers' belief questionnaire and learners' belief questionnaire respectively. Such descriptive statistics as frequency and percentage were utilized to perform data analysis and make comparisons. The results revealed that there were some differences between teachers' and learners' beliefs regarding error-correction and testing procedures in the classroom. However, their beliefs about the other factors under investigation, e.g., definition of grammar, and the importance of teaching/learning grammar, were not dissimilar. The results of this study would be beneficial to both teachers and learners who are engaged in the process of teaching and learning grammar.

KEYWORDS: Teachers' beliefs, Learners' beliefs, Grammar teaching, Grammar learning

INTRODUCTION

Language teacher cognition, defined by Borg (2003a, p. 81) as “what teachers know, believe, and think,” has come into focus for over three decades varying into different areas such as teacher education, grammar teaching, and classroom research. Influenced by advances in research, teaching has been recognized as a thoughtful profession and teachers' thinking came to be viewed as a major factor in educational settings. As Borg suggests, “teachers are active, thinking decision-makers who make instructional choices by drawing on complex, practically-oriented, personalized and context-sensitive networks of knowledge, thoughts, and beliefs” (p. 81). Studies have indicated that teachers' belief systems—the information, attitude, values, theories, and assumptions about teaching and learning—have a great impact on their instructional practices, all of which have provided the fact that teachers' comments and actions in the class are derived from their beliefs (Borg, 2003b; Ng & Farrell, 2003). In fact, it has been revealed that teachers have complicated beliefs about learners and classroom activities which form an organized set of rules (Berliner, 1987; Borg, 1998; Burns, 1992; Shavelson & Stern, 1981). Teachers and scholars have also studied ESL and EFL teachers' knowledge and beliefs in second and foreign language teaching (Freeman & Richards, 1996; Li & Walsh, 2011; Sanchez, 2010).

The studies of second language acquisition had been the main source of knowledge about grammar teaching for over 30 years. Grammar instruction has remained in demand in the field of second and foreign language teaching and learning and the degree of attention to grammar has increased in the history of language teaching. Thus, in the light of teacher cognition research in the field of second language and foreign language, the teaching of grammar has attracted substantial attention. There have been a number of studies in the area of teacher beliefs and teaching grammar in second/foreign language (Hinkel & Fotos, 2008; Kaçar & Zengin, 2013; Wach, 2013). Farrell (1999) examined the pre-service teachers' beliefs and proposed that these beliefs may not change. By the same token, in-service teachers' beliefs were investigated by Richards, Gallo, and Renandya (2001). The findings revealed that communicative approach was preferred by many of teachers in language learning, while some of them were interested in direct grammar teaching.

Whereas different teachers have different beliefs and can create various theoretical belief systems, some controversial issues including the proper lesson plans, methods, techniques and materials for teaching and the effect of these on teachers and learners' belief systems are raised here. As a result, different beliefs of teachers and learners in the field of language teaching can negatively impact on the effectiveness of classroom programs and instructional practices. In spite of the fact that there is a considerable care in the area of language teachers' and learners' beliefs, there have not been many studies focusing on the beliefs of language teachers and learners about teaching and learning grammar especially in English language institutes of Iranian. Therefore, it would be beneficial to uncover layers of teachers' belief systems and find out whether there is a mismatch between the teachers' and learners' beliefs.

LITERATURE REVIEW

The role of grammar teaching has been open to debate in teaching foreign and second languages (Burgess & Etherington, 2002). Teaching of formal grammar in language programs has always had the mixture of good and bad experiences based on various theories and thinking. For instance, grammar teaching was once discouraged and most people disapproved of teaching it (see Ball, Kenny, & Gardiner, 1990). Before that time, it was disputed that teaching explicit grammar was not a useful way of developing practical communication skills. Most methods and approaches were against grammar teaching during the 1970s and 1980s. The centrality of grammar was challenged and its role as a part of teaching plans and curricula was ignored. Once again in the 1990s, grammar played a leading part in language teaching classes and people became interested in grammar instruction.

Views on grammar instruction lie between two extremes: At one extreme there are those who support explicit or formal grammar instruction; at the opposite extreme, there are those who ignore grammar teaching. According to Stern (1991), those teachers who are against grammar teaching have explained that grammar instruction is not useful for L2 learners' competence. Terrell's (1991) view about the role of grammar instruction is that if learners are able to use

grammatical structures on a discrete-point grammar exam, it does not mean that they are capable of using this knowledge in daily conversation.

However, a number of studies have positive views about grammar teaching. Baleghizadeh and Farshchi (2009) claim that grammar is one of the most important aspects of language by which learners expect to communicate well. Wu (2007) affirms that grammar is the main part of L2 instruction and stated that grammar improves learners' writing, reading, and listening skills altogether.

One of the dimensions of teacher cognition which has recently come into favor in ELT is teacher beliefs. Research on teachers' beliefs within the field of language teacher education has been admitted as a central issue in the early 1990s and recent years much work has been devoted to the development of teachers' beliefs. Johnson (1994) has proposed that teachers' beliefs cannot be defined easily since they are not something to be observed. What is obvious is that teacher beliefs comprise assumptions that influence their teaching. Research on teachers' beliefs and practices has examined a number of issues, e.g. the nature of grammar teaching or thinking and actions of experienced teachers (see Breen, Hird, Milton, Oliver, & Thwaite, 2001), which may affect the beliefs and practices of EFL teachers (Allen, 2002). Nazari and Allahyar (2012) remarked that teachers' practical and pedagogical knowledge exert an influence on their teaching techniques and move them towards adopting certain grammar teaching procedures.

Researchers in the field of teaching and learning have viewed teaching as a linear process which relates teachers' behavior to learners' achievement (Cochran, Smith, & Lytle, 1990). To have effective teaching practices, a good decision making is needed to improve students' learning. Teachers make many decisions for the improvement of learners' learning. Some decisions are made, say, for preparing lesson plans and some of them are made during the activities and interactions with learners.

Concerning language learners' beliefs, many research studies have been conducted within SLL/FLL contexts (Alanen, 2003; Barcelos, 2003; Dufva, 2003; Gardner, Masgoret, Tennant, & Mihic, 2004; Kalaja, 2003). With regard to language learners' beliefs, some studies have been carried out firstly by Gardner (for an overview see Gardner, 1979; Gardner et al, 2004). Since the 1980s, such cognitive variables as language learners' beliefs have come into focus.

The concept of learners' beliefs has been the focus of many research studies and a great interest for many scholars. Teachers can gain better understanding of learners' expectations and satisfaction with their language classes by having the knowledge of learners' beliefs (Horwitz, 1988). Riley (1996) claims that learners' language learning fall under the influence of learners' beliefs. Growing evidence also suggests that learners' beliefs not only influence their approaches to language learning, but also affect the way they respond to teaching activities. Learners may show dissatisfaction if they are encountered with the situations in which teaching methods differ from their thinking about the way of teaching. Thus, the knowledge of language learners' beliefs is vital in order to take appropriate approaches and to improve language instruction (Horwitz, 1999; Sakui & Gaies, 1999; Yang, 1999; Zarate, Gohard-Radenkovic, Lussier, & Pens, 2004).

There are many factors including learner wants and syllabus expectations to which teachers refer for shaping their views within the process of teaching and learning. However, learners' and teachers' experiences have a powerful impact on their views about grammar teaching. Considering the need for congruence between teachers' and learners' belief, Berry (1997) conducted a research in which there were 372 undergraduate learners and 10 teachers in Hong Kong. The researcher used a 50-item questionnaire to measure the knowledge of grammatical terminology, and found "wide discrepancies between the learners in terms of their knowledge of metalinguistic terminology and between this and the teachers' estimation of it" which can cause problems in the classroom (p. 143). In the same vein, researchers like Kumaravadivelu (1991) stated that a similarity between teachers' and learners' beliefs result in effective teaching and learning. In contrast, a disagreement between teachers' and learners' ideas affects learning negatively.

RESEARCH QUESTIONS

Here in this study, teachers' and learners' beliefs and the process of grammar teaching and learning were examined. Thus, an attempt was made to answer the following questions:

- 1) What are teachers' beliefs about teaching grammar in language institutes?
- 2) What are learners' beliefs about learning grammar in language institutes?
- 3) What are the differences between teachers' beliefs and learners' beliefs about presenting grammar in language institutes?

METHODOLOGY

Participants

Two groups of participants took part in this research: EFL teachers and learners. Both teachers and learners were randomly selected from different English language institutes in Isfahan, namely Nikan, Paya, Naazh, Setak, Sanato Madan, Safir, Kaaj, Daneshjou, Roshd, Azadeh, and Fardaye Behtar. The teachers who participated in the study had Masters and Bachelor degrees in different branches of English language. Out of 35 language teachers who were asked to complete the questionnaire, 30 teachers (13 males and 17 females) returned their questionnaires. Moreover, 200 students who participated in this study were randomly selected from all the above-mentioned English language institutes. However, 187 student questionnaires were returned.

Instruments

Two different questionnaires were adapted from different sources including Horwitz (1987), Farrell (2005), Borg (1999), and Burgess and Etherington (2002): one of them sought English language institute teachers' beliefs about grammar teaching and learning and the other elicited language institute learners' beliefs (see Appendix A & B). Each questionnaire used in this study consisted of two parts. The first part was about teachers' and learners' bio-data and their background, while the second part concerned with their beliefs about grammar and its teaching and learning in English language institute courses. It should be mentioned that learners' questionnaires were carefully and precisely translated into Persian, so that the participants could

fully understand the questions and answer them easily. The validity of the questionnaires was confirmed by three experts and their reliability was computed by cronbach's alpha. The reliability of teachers' questionnaire and learners' questionnaire were .80 and .88, respectively.

Procedures

The questionnaires were distributed among English language teachers, a few of whom answered the questionnaire after or between their class times. Other teachers were assigned a time for returning it during one week. So the questionnaires were collected during the spring and the summer semesters of 2014. Out of 35 distributed questionnaires, 30 were returned. Learners' questionnaires were also gathered after being distributed among the students of English language classes with the time limit of 20 minutes for each class. Out of 200 distributed questionnaires, 187 were completely answered and returned.

RESULTS AND DISCUSSION

The data obtained through the questionnaires answered by the teachers and learners were interpreted to assess their beliefs. The following accounts, which are based on the tables supplemented in the Appendixes, present the results of teachers' and learners' beliefs about grammar teaching and learning in language institute classes.

Teachers' Beliefs about the Grammar Teaching

Item 7 which demonstrated the importance of teaching grammar in language institute courses, had the highest percentage (7.0%) of the alternative 5. However, item 25, concerning the teaching approach category, and items 40 and 42 of the teaching techniques category had the least percentage (.5%) in this choice. In alternative 4, item 9, which related to the importance of grammar, and item 12, which related to reasons for teaching grammar, were the most frequently selected items by teachers with the percentage of 10.2, and the least percentage belonged to item 41 of the teaching techniques category (1.1%). Items 7, 8, and 9, referring to the importance of grammar, and item 11, which indicated practical reasons, with the percentage of .5, were among the least selected items of alternative 3; however, item 17, referring to the future occupation reason, had the highest percentage (6.4%).

The highest percentage of the alternative 2 belonged to item 42 of the teaching techniques category (8.6%). Item 19, which related to the learners' proficiency level, item 22, which referred to the decontextualized approach, item 23, which indicated the contextualized approach, item 29, which belonged to the student correction, and item 34, which demonstrated testing grammar at discourse level, had the lowest percentage (.5%) of this choice.

In the last alternative, the highest percentage belonged to item 8, referring to the importance of teaching grammar (7.5%), and the lowest one belonged to item 10, relating again to the importance of grammar, item 17, concerning future occupation, item 21, which presented implicit grammar teaching, item 22, which represented decontextualized teaching approach, item 28 and 31, which related to teacher-correction, and finally item 29, concerning student correction (.5%).

Learners' Beliefs about the Grammar Learning

Item 24, which was related to the correction category, had the highest percentage (59.4%) of alternative 5. On the other hand, item 26, which related to the same category, had the lowest percentage (2.1%) of this choice. Concerning alternative 4, item 2, concerning the definition of grammar, with the percentage of 51.3, and item 8, relating to the importance of grammar, with the percentage of 8.0 were the most and the least frequently selected items, respectively. The lowest percentage of alternative 3 belonged to item 24, which indicated teacher-correction (4.3%), and the highest one belonged to item 13, which presented reading skill as a reason for learning grammar (32.7%). In case of alternative 2, item 8, which showed the importance of grammar, with the percentage of 43.9 was the most preferred one, and item 1, which referred to the structural definition of grammar, with the percentage of 1.6 was the least frequently chosen item. It is clear from alternative 1 that item 37, which indicated use of learning aid techniques, had the highest percentage (57.8%). Items 3, and 5, which referred to the definition of grammar, items 10 and 14, which respectively related to writing and language development as the reasons for learning grammar, items 22, and 23 of learning approach category, item 28, which related to the teacher-correction, and finally item 29, which referred to the teacher-feedback, were among the least frequently selected items. Regarding the third research question of the study, the following descriptions are presented.

The Difference between Teachers' and Learners' Beliefs about Grammar Teaching and Learning

The similar items of teachers' questionnaire and learners' questionnaire consisted of 35 items including all 7 categories. The table in appendix F indicated that the highest mean (4.47) belonged to teacher-correction of learner group. It should also be mentioned that there were only 5 categories in which the means were above 4. These categories were definition of grammar in which the highest mean belonged to the learner group (item 1) and showed the learners' preference for structural definition of grammar (4.42); importance of grammar with the highest mean of 4.40 of teacher group (item 7); reasons for teaching/learning grammar with the highest mean of 4.33 of the teacher group (item 10) indicating practical reasons; teaching/learning approach with the mean of 4.19 of the learner group (item 15) relating to decontextualized approach; and correction with the mean of 4.47 of the learner group (item 19) which indicated teacher-correction. The table also represented that the two lowest means belonged to item 29, relating to using teaching/learning aids (1.84) for the learner group, and item 8, referring to the importance of teaching/learning grammar (1.56) for the teacher group.

Discussion

The items in the survey aimed to elicit teachers' and learners' beliefs about the grammar role in language teaching and learning. The items of the first category were asked for reaction to different views about the definition of grammar indicating that teachers and learners had structural view towards the definition of grammar. Regarding the structural view as crucial to the area of teaching and learning, it could be inferred that this kind of view made educators feel important about the structures and forms of the sentences rather than other aspects of a language as having a pragmatic role or a communicative one. This finding was in line with Swan's (2005)

view towards the grammar definition who perceived grammar as a set of rules in which the words can help learners with what to say in order to speak a language.

In this study, both teachers and learners had strong beliefs about the importance of grammar in language institutes. The reason might be that grammar has been conceived of as one of the most important concepts in human communication by which people express their thoughts and ideas they want to share. Thus, some researchers reported positive attitudes towards the importance of teaching grammar and its central role in language teaching (Batstone, 1994; Debata, 2013). On the contrary, in a study conducted by Loewen, et al. (2009), learners reacted negatively to studying grammar. They commented that spending time on grammar was a tedious job because numerous rules had to be memorized and learnt. Their finding is not congruent with the findings of the current study concerning the importance of teaching/learning grammar. The reason for this discrepancy could probably be attributed to the lack of usefulness of English outside the classroom and the way teachers teach grammar to the learners in their context.

Concerning the reason for teaching and learning grammar in language institutes, both teachers and learners believed that it was writing which could be considered as a compelling reason for teaching and learning grammar. Learners also felt an urgent need to improve their communication ability, self-confidence, and language development, which made it essential to learn grammar. They believed that if they did not know grammar well, they would not be able to speak and communicate appropriately. The explanation for this idea could be that without the help of grammar instruction, learners cannot use English accurately. Hence, focusing on grammatical concepts is essential for meaningful communication and assists learners in writing intelligibly. The findings supported the view of Tajzadeh, Khodabandehlou, and Jahandar (2013) who considered writing as a significant factor in learning grammar, and declared that learning the grammatical rules was required to write a foreign language accurately.

In the case of teaching/learning approach, teachers believed that learners' proficiency level in English language influenced teachers' decisions to provide learners with specific presentation of the grammatical rules. The reason may probably be the importance of instructional support provided by teachers at different proficiency levels, i.e. specific grammatical rules would be presented based on the language learners' proficiency level. Liu (2013) in his study revealed that in order to have a full understanding of the concepts of specific grammatical points, it would be a good idea to change the method of introducing the grammatical items as the proficiency level of the learners increases. On the contrary, learners valued learning the grammatical items at the sentence-level. The basis for this belief might be the variety of structures, vocabularies, and lack of explicitness within a text which make it incomprehensible for learners. This finding is in line with the survey carried out by Baleghizadeh and Farshchi (2009) who found that learning grammar within the texts was too difficult for their learners because its presentation in the texts was time-consuming and difficult.

As for the error correction, teachers preferred self-correction and peer-correction, while learners had strong beliefs in teacher-correction. The root of this type of belief could be that learners considered their teachers as knowledgeable authorities who can provide them with the best

possible type of feedback. In addition, the reason could be attributed to the assumption that most learners believed that teacher correction facilitates their learning and makes them improve and develop language awareness. Kavaliauskiene and Anusienė (2012) reported that learners' positive view on teacher-correction was connected with the importance of learning to speak English correctly. Likewise, some researchers had negative attitudes towards error-correction and believed that classroom time should not be devoted to such matters (Krashen, 1999; Semke, 1984; Terrell, 1977).

Another issue surveyed in this study was how to test grammar in language institutes. Results showed a degree of significant difference between teachers' and learners' beliefs regarding testing grammar in language institutes. They indicated that teachers strongly believed to have grammar test items at discourse-level, while learners preferred to have them at sentence-level. With regard to learners' point of view towards testing grammar at sentence-level, it could be noted that the texts may make comprehension and responding to test items hard for learners as a result of various structures and complicated grammatical features appearing in a text, while grammar structures practice out of context is not functional from teachers' viewpoint. The idea of decontextualized testing is in contradiction to Freeman's (2009) view who holds that testing grammar at sentence-level does not assess whether test takers can use grammar correctly in real-life situations.

In applying teaching/learning techniques, teachers and learners rarely used pictures, teaching devices, tables, figures, charts, songs, music, and games for their grammar teaching and learning. They agreed with contextualized and real life activities more frequently and used form-focused practice techniques more often than not. The justification might be that using student-centered activities provide a chance for learners to express themselves and enjoy learning. The finding supported Bowen's (2005) idea suggesting that contextualized task such as authentic reading texts would be challenging for learners to practice the grammatical points within a text, and fully comprehend the structures.

CONCLUSION

This study was an attempt to explore teachers' and learners' beliefs about grammar teaching/learning in language institute courses. Moreover, it dealt with a comparison of teachers' and learners' beliefs about teaching/learning grammar. To this end, two questionnaires were adapted to elicit teachers' and learners' beliefs towards grammar teaching/learning. The participants of the study were initially 35 English language teachers and 200 learners, who were randomly selected from different English language institutes in Isfahan. The findings of this study indicated that teachers' and learners' beliefs were, to a large extent, similar towards teaching and learning grammar in language institute courses. It further revealed that from among 7 categories of beliefs about grammar teaching in English language institute courses, teachers and learners differ in their beliefs about error-correction and testing procedures.

It is concluded that the match between teachers' and learners' beliefs in different aspects of grammar teaching/learning can lead to the effective language teaching/learning strategies. This congruence further encourages them to take a balanced approach in order to fulfil their

requirements. Conversely, the divergence between teachers' and learners' attitudes make them fail to progress and achieve their goals. Thus, the mismatches should be identified for a better communication between teachers and learners in order for their expectations to be met. This research tried to extract teachers' and learners' beliefs without keeping factors of age, gender, and proficiency level under control, which could have influenced the result of the study.

Appendix A Teachers' Belief Questionnaire

Dear colleagues,

Our goal in this research is to study teachers' beliefs about teaching grammar in language institutes courses and your participation will definitely help us achieve the purpose. Please kindly spare a few minutes of your time to fill out this questionnaire. Thank you for your cooperation.

1. Gender: ☐ male ☐ female
2. Age:
3. Academic major:
4. Highest academic qualifications:
☐ Master's degree ☐ doctorate ☐ other; please specify
5. Teaching Experience:
6. Please indicate to what extent you agree with the following statements:

A : Definition of grammar :	Strongly agree	Agree	No opinion	Disagree	Strongly disagree
1. Grammar is a set of structures and rules of a language.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Grammar is concerned with using the correct tenses.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Grammar means to produce language structures accurately.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Grammar helps better understand different meanings.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Grammar means the appropriate use of language in different situations.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Grammar facilitates communication.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
B : The importance of teaching grammar in language institute courses :	Strongly agree	Agree	No opinion	Disagree	Strongly disagree
7. Grammar is important and has to be taught in language institute courses.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
8. It is not needed to teach grammar to learners because they've already had it in high school.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
9. It is good to dedicate some time to teaching grammar in language institute classes.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
10. Grammar should be the main part of	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

language institute syllabus.					
C : Reasons to teach grammar in language institute courses :	Strongly agree	Agree	No opinion	Disagree	Strongly disagree
11. Learners need to know the grammar rules for writing.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
12. Grammar is important to improve learners' communication ability.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
13. Without a good knowledge of grammar, learners' language development will be severely constrained.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
14. Grammar looks tidy, teachable and easily testable so it's desirable to be taught in language institute courses.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
15. Teaching grammar gives power to teachers by showing that they know more than the learners do.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
16. Learners generally need to understand the grammatical rules of English in order to improve their reading skill.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
17. Learners need grammar for future occupation.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
D : How to teach grammar in language institute courses :	Strongly agree	Agree	No opinion	Disagree	Strongly disagree
18. Grammatical structures taught depend on learners' needs.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
19. The approaches to grammar teaching depend largely on the learners' proficiency level in the English language.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
20. Grammar should be taught explicitly.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
21. Grammar should be taught implicitly.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
22. Teacher should present grammatical rules at sentence level.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
23. Teachers should teach grammatical structures not only in discrete sentences but also in texts.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
24. Both inductive and deductive approaches should be used.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
25. There is an essential need to provide a large number of complex exercises for learners to master the grammatical structures.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
E : Error correction and feedback in language institute classes :	Strongly agree	Agree	No opinion	Disagree	Strongly disagree

26. When learners make errors, I correct them and later I explain it to them.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
27. When learners make errors, I ignore them.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
28. I only correct learners' errors if it interferes with communication.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
29. I provide learners with an opportunity to think about their performance.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
30. I encourage learners to correct each other.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
31. I correct local errors.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
32. I correct global errors.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
F: How to test grammar in language institute courses.	Strongly agree	Agree	No opinion	Disagree	Strongly disagree
33. I test grammar at sentence level.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
34. I test grammar in context(text or at discourse level)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
35. Grammar is one of the most important parts of language institute exam.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Answer these questions using “always”, “often”, “usually”, “sometimes”, “never”:

G: How much do you use these techniques to teach grammar in language institute classes?	Always	Often	Usually	Sometimes	Never
Using story-telling	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Using role-play	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Using pictures and images	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Using teaching devices and aids (balls, boxes, dolls and so on)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Using tables, figures, charts and diagrams (such as tense tables)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Using music, songs and poems	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Playing games	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Making learners participate in real life tasks in order to develop their grammatical knowledge	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Using contextualized practice	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Using form-focused practice (such as substitution drills)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Appendix B

Learners' Belief Questionnaire

Dear learners,

Our goal in this research is to study learners' beliefs about learning grammar in language institute courses and your participation will definitely help us achieve the purpose. Please kindly spare a few minutes of your time to fill out this questionnaire. Thank you for your cooperation.

1. Gender: ☐ male ☐ female
2. Age:
3. Academic major:
4. Highest academic qualifications:
☐ Associate degree ☐ Bachelor's degree
5. Please indicate how far you agree with the following statements:

A : Definition of grammar :	Strongly agree	Agree	No opinion	Disagree	Strongly disagree
1. Grammar is a set of structures and rules of a language.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Grammar is concerned with using the correct tenses.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Grammar means to produce language structures accurately.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Grammar helps better understand different meanings.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Grammar means the appropriate use of language in different situations.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Grammar facilitates communication.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

16. Grammar should be clearly and explicitly presented in language institute classes.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
17. Learners should be presented with grammatical rules at sentence level.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
18. Learning grammar should be in reading context in language institute courses.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
19. Learners should learn grammatical structures not only in discrete sentences but also in texts.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
20. Learners learn grammar better when they start with examples and then identifying the rules.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
21. Learners learn grammar better when they work on rules in first place and then have some examples.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
22. Frequent practice is a key for learners to improve their grammatical accuracy.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
23. Learning reading skills in language courses develops learners' grammatical knowledge.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
E : Error correction and feedback in language institute classes :	Strongly agree	Agree	No opinion	Disagree	Strongly disagree
24. When I make errors, I expect teacher to correct me and later explain it to me.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
25. I expect to have an opportunity to look and evaluate my learning.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
26. I like my classmates to correct my errors.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
27. I expect teacher to correct the errors which are important (global errors).	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
28. I expect teacher to correct all my errors.(local errors)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
29. Teacher should check if I have understood and learnt the grammar rules under study.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
30. Learners should work together and help	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

each other to evaluate their learning.					
F: How to test grammar in language institute courses.	Strongly agree	Agree	No opinion	Disagree	Strongly disagree
31. Grammar items should be at sentence level.	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
32. Grammar items should be in context(text or at discourse level)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

Answer these questions using “always”, “often”, “usually”, “sometimes”, “never”:

G: How much do you use these techniques to learn grammar in language institute classes?	Always	Often	Usually	Sometimes	Never
Memorizing the grammatical rules	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Learning the rules in “story”	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Learning the rules in “role-play”	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Using pictures and images	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Using balls, boxes, dolls and other learning devices	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Using tables, figures, charts and diagrams (such as tense tables)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Using music, songs and poems	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Learning the rules by playing games	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Learning by participating in real life tasks in order to develop my grammatical knowledge	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Learning by extracting the rules from the passages in the course book and working on them. (contextualized practice)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
Form-focused practice (such as substitution drills)	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

A CRITICAL APPRAISAL OF ESP STATUS IN IRAN

ABSTRACT

Teaching ESP (English for specific purpose) courses is widespread in many countries in the world, and also in Iran. During forty years of ESP courses, numerous studies have been conducted addressing and questioning the effectiveness of such courses and now this is one of the most controversial issues among academics, teachers, textbook writers, and students. Most ESP teachers and content area specialists express their deep dissatisfaction with their performance in ESP courses and such courses are considered as a huge burden on the shoulder of students and teachers. As such, the output is not satisfactory. The present paper is a critical reflection and appraisal of the current ESP (English for specific purposes) status in Iran from both retrospective and introspective perspectives. To do so, the researchers primarily focused on the English background of ESP learners entering universities to highlight the mismatch between ESP goals and language proficiency of the ESP learners (retrospection). Then, they shifted their focus on factors arising out of ESP status itself (introspection). This study indicates that we must consider both background of the ESP learners (language proficiency) and the impact of determining factors on teaching ESP courses in Iran if we want to find a solution to this long-lasting problem. At the end some practical educational implications are proposed for ESP material designers, teachers, and policy makers in ministry of science, research, and technology.

KEYWORDS: ESP, EAP, need analysis, EGP, ESP teacher, content area specialist, teacher education

INTRODUCTION

What is ESP?

The study of language for specific purposes (ESP) has a long and interesting history going back, some would say, as far as Roman and Greek Empires. Since the 1960s, ESP has become a vital and innovative activity within the teaching of English as a foreign or second language movement (Howatt, 1984).

Johnson and Johnson (1998) write the following definition for ESP:

English for specific purpose (ESP) is a broad and diverse field of language teaching. In its earlier manifestations in 1960's, it was particularly associated with the notion of a special language or

register (EAP). Later developments have included a communicative view of language as applied to ESP, recognition of the importance of need analysis procedures, and an increasing focus on appropriate perspectives on language learning and language skills (p-105).

According to Hutchinson and Waters (1987), ESP must be seen as an approach. ESP is not a particular type of teaching material. Understood properly, it is an approach to language learning, which is based on learner need. The foundation of all ESP is the simple question: why does this learner need to learn a foreign language? From this question will follow a whole host of further questions, some of which will relate to the learners themselves, some to the nature of the language the learners will need to operate, some to the given learning content. However, this whole analysis drives from an initial identified need on the part of the learner to learn a language. ESP then is an approach to language teaching in which all decisions as to content and method are based on the learner's reason for learning.

Dudley-Evans, Co-editor of the ESP Journal defines ESP in terms of 'absolute' and 'variable' characteristics.

Definition of ESP (Dudley-Evans, 1998):

Absolute Characteristics

1. ESP is defined to meet specific needs of the learners
2. ESP makes use of underlying methodology and activities of the discipline it serves
3. ESP is centered on the language appropriate to these activities in terms of grammar, lexis, register, study skills, discourse and genre.

Variable Characteristics

1. ESP may be related to or designed for specific disciplines
2. ESP may use, in specific teaching situations, a different methodology from that of General English
3. ESP is likely to be designed for adult learners, either at a tertiary level institution or in a professional work situation. It could, however, be for learners at secondary school level
4. ESP is generally designed for intermediate or advanced students
5. Most ESP courses assume some basic knowledge of the language systems

Critical Features of ESP

1. It is goal directed, i.e. a means rather than an end in itself. This perspective is fundamental to a view that sees language as a "service" rather than a subject studied for its own sake, and has been a powerful influence on most areas of ESP research and practice.
2. It is based on an analysis of learner's needs.

Engaging with Disciplines

Tony Dudley-Evans and Maggie Joe St. John (1998) proposed three levels of cooperation in order to teach subject-specific works:

- *Cooperation*

Cooperation is the first stage and involves the language teacher taking the initiative in asking questions and gathering information about the student subject course, how English fits into their

course and what the department and students see as priorities. In fact, this is part of the target situation analysis required for needs analysis.

- *Collaboration*

If cooperation largely involves the language teacher taking the initiative and finding out what happens in the subject department, collaboration involves the more direct working together of the two sides, language and subject, to prepare students for particular tasks or courses. In collaboration the language and subject teacher work together outside the classroom.

- *Team-teaching*

The final level of subject-language interaction is the actual working together in the classroom of the subject and language specialists, usually referred to as team – teaching.

Classification of ESP

Historically, such abbreviations as EAP, EOP, EST, and EBT have been used in describing ESP. Robinson (1991) has classified ESP as either English for academic purposes (EAP) or English for occupational purposes (EOP). This classification was based on the experience of the learners and time and age were considered as the most important factors.

Presently, another professional based classification of ESP has been proposed by Tony Dudley-Evans and Maggie Joe St. John (1998). Here, ESP is divided to EAP and EOP according to discipline or professional area. Based on this model, in EAP, English for science and technology has been the main area, but English for medical purposes and English for legal purposes have always had their places. Recently, the academic study of business, finance, banking, economics, accounting, and numerous other EAP courses especially in master in business administration (MBA) have become established.

English for occupational purposes (EOP) refers to English that is not for academic purposes; it includes professional purposes in administration, medicine, law, and business, and vocational purposes for non-professionals in work or pre-work situations. Therefore, we may distinguish between studying the language and discourse of, for example, medicine for academic purposes, which is designed for medical students, and studying for occupational purposes, which is designed for practicing doctors.

In this introductory section, we focused on English as it is related to academic purposes (EAP). First, we distinguish between English for academic purposes and general English. Then, EAP situations are introduced and subsequently, its situation in Iran is determined. Finally, the prominent skill used in EAP i.e. Reading is elaborated in detail.

English for academic purposes is an educational approach. It is unlike general English courses. It begins with the learners and the situation whereas General English begins with the language. General English tends to teach learners conversational and social genres of the language while EAP courses tend to teach formal, academic genres.

The key determinant of what an EAP course should contain is whether the subject course is taught in English. In this regard there are four types of EAP situation, exemplified here using tertiary level institutions. Some features may also apply to the teaching of English at secondary school level, where, particularly in the senior, immediately pre-university classes, English courses will have EAP component. These four situations are as follows:

Situation 1

EAP in English speaking countries such as UK, USA, Australia where students come from another country in foreign system; for them both general and academic culture may be different; everything around them operates in English.

Situation 2

EAP in ESL situations such as Zimbabwe where education at all levels have been mainly in English; the civil service uses English, but people mostly use their first language in everyday life.

Situation 3

EAP situations where subject courses are taught in the national language e.g. Jordan are among third situation EAP types. In tertiary education, some subjects are taught in L1, but others, such as medicine, engineering, and science, are taught in English.

Situation 4

EAP situations where subject courses are taught in the national language in countries like Brazil are called fourth EAP situation type. In these situation all tertiary level education is taught in the L1; English is the auxiliary language (Tony- Evans & Maggie Jo St John, 1998, p. 34-41).

In this situation, the materials focus on key micro-skills related to overall to overall macro-skill of reading, but also teach certain lexical and grammatical items relevant to the comprehension of undergraduate academic reading texts (Tony- Evans & Maggie Jo St John, 1998, p. 40).

The actual methodology is also fascinating: the classes are taught in national language and this enables the teacher to lead some very detailed discussions about the linguistic structure of the text and the techniques of deducing meaning of the text in a foreign language. In some respects the classes resemble a problem-solving class in applied discourse analysis in detail in workings of an English text (Alderson & Scott, 1992; Scott, 1981a, 1981b). In the study that follows, the focus will be on the fourth situation which exemplifies the current EAP situation in Iran. In our country, EAP has often been referred to as technical English and the courses have focused almost exclusively on reading.

Significance of reading in EAP

To catch up with the changing world, students are supposed to be lifelong learners. Reading is in charge at that point. Supposing that most of the learning processes occur in terms of reading, students should have a meaningful and critical reading process. Without supportive skills of reading comprehension, desired level of learning may not be reached (Yalcin & Sengul, 2004).

At college, reading activities are made to comprehend the academic materials and to learn the conceptual framework. These materials are complex ones with lots of concepts and information. Students are supposed to read and understand the assigned texts before coming to classes on their own. Such a reading process means to read beyond the lines and to think critically (Shelton, 2006).

The role of reading is much more striking in comprehension of EAP texts where a reader is actively involved in using available content knowledge (content schemata) and knowledge of the text structure (formal schemata) to construct the meaning of the text (Anderson & Pearson, 1984; Carrel, Devine, & Eskey, 1988; Rumelhart, 1980; Swaffar, 1988).

One of the most important contributions to the approach to reading in EAP was the shift from text as linguistic object (TALO) to text as a vehicle of information (TAVI) (Johns and Davis, 1983). They encapsulated the key principles, that for EAP learners, extracting information accurately and quickly is more significant than language details; that understanding the macrostructures comes before language study; and that application of the information in the text is of paramount importance. Therefore, language knowledge is the medium of comprehension of content knowledge, which is of prime importance.

Tony Dudley-Evans and Maggie Jo. St. John (1998) proposed three key stages in designing and teaching a reading course: selection of texts, extracting and recording information, and the use of information that has been gathered.

Selecting texts:

Traditionally, texts have mainly been chosen by institutions and teachers: by institutions through the textbooks available on the market; by the teacher through the textbooks in their resource center and any supplementary material they provide. However, learners and subject specialists also have an important role to play in selecting texts for reading. The texts they supply can become part of a regular course.

The criteria used for selecting texts will relate to key features of both carrier and real content. Key features of carrier content include conceptual level, novelty, value, and interest. The key features of content include significance, relation to objectives, exploitability, clarity, and accessibility.

Once good texts have been selected, activities can be written. These will relate to the overall purpose of reading the text and, so the process begins from using the information gathered.

Using the information that has been gathered:

It is one from which the design of activities begins. Knowing what students would really do with a text, and why is necessary for setting the task that will guide the reading process and determine all the other activities.

The first stage for the EAP teacher is to know what kind of tasks and processing would be associated with particular texts or information.

Extracting and recording information:

With a short document, highlighting the relevant information on the actual text may be an appropriate strategy. With longer or more complex documents, extracting the information and recognizing it and fitting it in with existing knowledge is necessary. Visual representation can be very helpful for this especially for right hemisphere learners. Key graphic representations include lists, columns, tables, matrices, tree diagrams, flow charts, bubble diagrams, and mind maps. Then, there are other two dimensional representations such as concept maps, plans, pictures, and different kinds of graphs. Which type is appropriate depends in part on the type of information.

A RETROSPECTIVE REFLECTION ON ESP IN IRAN

English as an international language and as the international means of general and scientific communication has an EFL status in Iran depriving the learners from a very precious wealth of incidental and semi natural context of learning.

With this background at hand, this language enters the educational system from the second year of junior high school in Iran utilizing mostly a grammar-translation method that, according to Richards and Rodgers (2002), requires quantitative repetitions and substitutions to master grammatical structures that are taught deductively. Vocabulary is pre taught, reading passages are translated on a word-by-word basis, and no attention is paid to the oral form of the language. The EFL Learners have mechanical roles in such a system and are not actively engaged in the process of learning. Moreover, in the absence of enough and proper input and exposure, they are expected to demonstrate a satisfying output. Therefore, these courses are not effective enough and the students who leave the public school system in Iran suffer poor English language proficiency.

Although there has recently been a shift of focus from GTM (grammar translation method) to CLT (communicative language teaching) in our educational system, we cannot expect dramatic changes in short run specially bearing in mind some generations of teachers who have been trained (not educated) in teacher training centers according to GTM. Bearing those historical pitfalls in mind, one must immediately recognize the wide gap between ESP learners' English proficiency level and the academic purpose of ESP. English is a required course for the university students in Iran which emphasizes reading literature.

As mentioned above, in the academic level, there has been a shift of focus with regard to the purpose of ESP from text as linguistic object (TALO) to language as vehicle of information (TAVI). These courses and the related textbooks are designed and developed with this presupposition that learners do not have a difficult time going through the linguistic structures and getting to the content information through reading strategies.

But, as soon as it starts working, it stops working since learners have a hard time handling the linguistic difficulties, let alone content information. This language proficiency level will

automatically lead the ESP teachers toward teaching such courses on a word-by-word translation basis.

This is all but a synopsis of historical accounts of the current EGP (English for general purposes) status in Iran. Therefore, it can be concluded that EGP courses beginning from high school and leading to pre-university do not leave a valuable heritage behind for ESP learners now in the tertiary level.

AN INTROSPECTIVE REFLECTION ON ESP IN IRAN

As teachers, academics, textbook writers, course designers and even students, we cannot sit back and hope that the educational system and policy makers will change the status in near future and it should not be an excuse for us so as not to reflect on ourselves. Therefore, in this section we turn to an introspective reflection of ESP in the academic level.

Need analysis

Belcher (2006) states that ESP specialists assume that there are problems that education can improve and that these problems being unique to specific learners in specific contexts should be addressed carefully with tailored-to-fit instructions. Therefore, first the ESP specialists usually assess the learners' needs and then design and implement specialized curricula in response to the identified needs. It is due to this emphasis on the concept of needs that there are striking differences among curriculum designers, material developers and teachers.

Dudley-Evans and John (1998) believed that needs analysis is the cornerstone of ESP and makes the course purposeful. There are many classifications of needs, objective and subjective, perceived and felt and process oriented and product oriented, to name a few. Dudley-Evans and John (1998) accept that needs analysis is the first step before a course, but at the same time they admit that different situations may alter the way in which needs analysis is actually conducted.

Jordan (1997) states that there are other terms, such as necessities, demands, lacks, likes and deficiencies also proposed for the concept of "needs". According to him, for an EAP needs analysis factors such as the subject of the study, necessary language, study situation and the related study skills, should be considered.

After the Islamic Revolution of Iran in 1979, the then Ministry of Higher Education began to establish uniform discipline-based EAP programs for universities that have led to designing several ESP textbooks for students of medicine, engineering, science, social sciences, humanities and other academic fields (Mohammad, Hashemi, Lamir, Farideh, & Namju, 2011).

As Eslami-Rasekh (2010) mentions the purpose of these programs is to enhance the students' motivation and interest through providing EAP courses that are more related to the learners' needs in special fields of study. However, as Eslami-Rasekh (2010) claims these courses were not designed based on any systematic needs analysis so the program designer's goals do not seem to have been fulfilled.

For ESP, if narrowed down to an Iranian context, the cornerstone of the needs analysis is to understand the wide gap between the ESP goals and the ESP learners' language proficiency. Such understanding will dramatically influence the process of needs analysis. However, the absence of such a perception has led to the present status in which both ESP teachers and ESP learners are the slaves of textbooks. Level adaptation is not met and even in this system the best educated teachers cannot go beyond translation on a word by word basis and students have mechanical roles in a cold, de-motivating context.

EGP or ESP?

EAP courses could generally be divided into two main sections: EGP (English for general purposes or general English) and ESP (English for specific purposes).

Entering universities with that poor language proficiency, students are supposed to study EAP courses (i.e. EGP and ESP). In designing such courses, we must consider students' proficiency level, needs, interests, course and institution level, and availability of recourses.

Zohrabi (2010) states that based on the experience of teaching in EFL situation, students largely need general English rather than specific English. Every year many students enter schools and universities and study the EAP courses (i.e. EGP and ESP) in EFL situations. A great amount of money, resources, time and energy are spent on these courses. However, the end results of such programs are less than satisfactory. Hyland (2002) believes that it is “probably because of gaps in school curricula or the insufficient application of learners themselves” (p. 386). The most important barriers students face in an EFL context like that of Iran are language components (vocabulary and grammar), the four language skills, and appropriate use of language. The ESP students in EFL situations mostly need to acquire general English and harness language in order to deal effectively with the requirements of their subject-specific courses.

Unfortunately, some students, teachers, and administrators assume that General English is not important and cannot develop students' linguistic and communicative competence. They assume that EGP is a general course which can barely teach useful things to the students. However, as Widdowson(1998) emphasizes “simplicity of language is not to be equated with accessibility of meaning” (p. 5). Mainly, EGP should assist students to function effectively in their specific field of study. This branch of ELT is a means to help learners to fulfill their academic requirements (Dudley-Evans & St John, 2000).

Teacher education

The prerequisite to investigating teacher education is to define the role of ESP teachers. Dudley-Evans and St John (1998) use the term “practitioner” rather than “teacher” to emphasize that ESP work involves much more than teaching. According to them, ESP practitioner can have several roles: *The ESP practitioner as a teacher, The ESP practitioner as course designer and material provider, The ESP practitioner as researcher, the ESP practitioner as collaborator, and The ESP practitioner as evaluator.*

What reality reveals in an Iranian context is that teacher education is not provided for both ESP teachers and content area specialists and there is no cooperation between these two groups of teachers. In addition to the poor language proficiency of the ESP learners, ESP teachers are not motivated enough to deal with the scientific content information of an academic field of study other than their own field. On the other hand, content area specialists do not have an acceptable command over language and their only choice is translation. As such the output is not satisfactory. One other problem is that ESP teachers barely evaluate and reflect on their own teaching in such a de-motivating context. They (ESP teachers and content area specialists) cannot bridge the gap among ESP learners, ESP textbook designers/writers, and policy makers.

Strategic teaching and the use of reading strategies has no place in such classes. Therefore, we cannot direct students, especially considering their background, to the content information through mere translation of ESP texts.

ESP Materials

The most prominent debate on ESP is concerned with the selection and use of authentic vs. non-authentic, general vs. subject-specific and simple vs. simplified materials. One major problem as posed on an Iranian context is again the lack of need analysis in the process of designing, developing, and writing ESP materials. One other problem is that in the real world teachers barely save any time to research and develop appropriate and useful materials.

Therefore, it is believed that many teachers have become slaves of the published course books available. Gatehouse (2001) notes that “no one ESP text can live up to its name” (p. 10). Clapham (2001) states that finding appropriate materials is indeed difficult and the appropriateness of these materials cannot be determined in advance.

Last but not the least, as Azizfar, Koosha, and Lotfi(2010) state, it is disappointing that researchers have not provided more guidance to enable teachers and administrators to make wiser decisions.

EFL teachers or content area specialists?

Who must teach ESP, EFL teachers or content area specialists? As Maleki (2011) has rightfully stated teaching English for Specific Purposes was and is a controversial issue among EFL teachers and others. The result of his study indicates that EFL teachers are more qualified to teach ESP courses. Our experience as ESP teachers in different universities in Iran shows that in most universities, content area specialists teach the ESP courses and EGP courses are assigned to EFL teachers.

Unfortunately, the only resort of content area specialist is the translation of ESP texts on a word by word basis. They do not have much command over the language, strategic reading, pronunciation, and other critical linguistic features of the text. The historical background of ESP learners makes the situation much more difficult. Here we need a veteran EFL teacher to pave the way for students in the process of reading and comprehension of such texts. An EFL teacher can better disentangle the students from the linguistic difficulties of the text and lead them to the

content information by employing a variety of reading strategies that simplifies the difficulties of the text.

EDUCATIONAL IMPLICATIONS

Following those retrospective and prospective reflection on ESP in Iran, some instructional implications are proposed here:

- As long as policy makers in our educational system are reluctant to make some dramatic changes in our educational system, the chronic disease of ESP cannot be cured in Iran. Therefore, the methodology must change. To do so, we must change the methodology of teacher education in teacher training centers focusing on the most recent trends of teaching, post method, and critical reflection. GTM must be eradicated from schools and new materials arising out of such changes must be introduced. All these require volition, investment, and support on the part of ministry of education and ministry of science, research, and technology. If we succeed in doing so, students will enter universities with a rich general English background making the connection between students' language proficiency and the goals of ESP.
- ESP emerged out of the concern with the needs of different groups of learners. English is the medium of communication and people from all walks of life need to learn it to fulfill such needs as exchanging ideas, communicating on the internet and social networks, performing educational and occupational tasks, and reading newspapers, magazines, writing for conference presentation. De-motivation of the learners and inefficiency of the ESP classes may stem from ignoring their needs and expectations by authorities and decision makers. In fact our educational system at tertiary level is suffering from the lack of systematic need analysis. Policy makers, universities, ESP teachers, and material writers must pay attention to the needs of the learners. Dehnad, et al. (2014) recommended that a team consisting of instructors from educational departments, including English language department and students come to some agreements about educational needs, wants, expectations and desires about ESP curriculum of post graduate students. Moreover, ESP teachers must engage in the process of exchanging their ideas about students' needs and expectations with content area specialists. As Benesch (1996, pp. 736) claims, needs analysis is a political and subjective process. Critical needs analysis assumes that institutions are hierarchical and those at the bottom are often entitled to more power than they have. Hashemi, et al. (2011) stipulated that learners, who are at the bottom of the hierarchy in top-down educational systems such as Iran, should be given more power and their voices should be heard in order to facilitate change. Faculty members need to become aware of what their students *need*, versus what the institutions think of as being necessary and take action accordingly.
- As Dora Chostelidou, et al.(2009) has stated the impact of teacher training on optimizing teaching and learning opportunities in the ESP classroom need hardly be argued as the distinct characteristics and the nature of English for Specific Purposes require awareness on the part of the ESP teachers as to the diversified roles and the modern instructional needs assumed of them. Using skills as a framework of ESP, ESP teachers must be provided with the necessary knowledge and tools to deal with their own students' specializations. Most of them are not

specialists in the field and they work with students who know the subject better than the teacher do. A professional teacher is someone who develops the essential skills in understanding, using, and presenting authentic information through various learning strategies and is able to switch from one professional field to another without being obliged to spend months on getting started. Wright et al. (1997) declared that “more can be done to improve education by improving the effectiveness of teachers than by any other single factor” (p. 63). Hence, studying and exploring teachers’ personalities, beliefs, and performances is arguably required to discover the efficient options for fostering the learning process. By providing teachers with teacher education programs, the educational system can help them continue their own educations, gain vital skills that they may not have been able to learn while taking college courses, and stay current with new techniques. It is critical for teachers not only to know their material but also to help students in order for them to truly succeed. The purpose of these programs must be educating teachers on the best ways to instruct and motivate students for the best possible outcomes.

- One more practical implication for ESP in an Iranian context is that because of the dearth of adequate exposure to general English, students need more EGP rather than ESP courses. As Zohrabi (2010) has stated, undergraduate students are not provided with general English language for adequate period of time at university, i.e. EGP is only offered during the first or second semester. The students need to be exposed to general English language throughout the whole period of their studies. That is, it is better that EGP course to be offered to the students each semester. When the students obtained enough language proficiency, they could tackle their subject-specific texts more easily.

*Who must teach ESP? EFL teachers or content area specialists? In Iran, most of the ESP courses are taught by content area specialists and the result of the studies conducted by Davoudi-Mobarakeh, et al. (2014) and the observations of the researchers in the present study show that

* Specialists are just vocally active but EFL teachers are ready for a variety of pedagogical movements in the class.

*Specialists have less encouraging students. EFL teachers make more autonomous learners by engaging them in the process of learning. EFL teachers provoke ESP learners background knowledge by frequent warm ups and various strategies and materials.

* Specialist classes are teacher oriented but EFL teacher classes are student centered.

*Specialists are not knowledgeable enough to tackle the linguistic problems posed on texts. ESP teachers just translate.

*As Duddly-Evans (1998) states the EFL teachers need not have a scientific command on the ESP texts.

*More student participation has been reported where EFL teachers run the classes.

* Translation is limited in EFL teacher class, but it is very common in specialist class.

* the use of different learning strategies by EFL teachers motivates and involve the students in the process of learning while a content area specialist can only teach on a word by word translation basis where learners have a mechanical role and are de-motivated.

- The evaluation of ESP materials is closely related to students' motivation and their needs, thus affecting the efficiency of the course. Materials provide a stimulus to learning. Good materials do not teach: they encourage learners to learn (Hutchinson and Waters, 1992, p. 107). Wallace (1992) specifies five determining criteria in order to evaluate the ESP materials:
 - * Adequacy — the materials should be of the appropriate language, age, level.
 - * Motivation — they should present content which is interesting and motivating for students' work. It aims at students' effectiveness, interest and pleasure of work.
 - * Sequence — it is important if there is some relation to previous texts, activities, topics not to miss the sense of a lesson.
 - * Diversity — they should lead to a range of classroom activities, be a vehicle for teaching specific language structure and vocabulary and promote reading strategies.
 - * Acceptability — they should accept different cultural customs or taboos.

To sum up, materials evaluation not only helps an ESP practitioner to adjust the teaching materials to the learners' needs and their level of proficiency, but also keep them motivated. ESP courses have started to be more prevalent particularly in our rapidly developing country in recent decades since Iran has undergone a lot of changes in her national and foreign policy, international trade and economy. Sometimes, it has been observed that students are not motivated to study English. As most of them do need English for their future studies and careers, it should be found out why they do not show enough motivation to learn English. One of the reasons would be that they have to study books which are not compiled for their specific needs.

CONCLUSION

In this study, a critical appraisal of ESP in Iran from both retrospective and prospective perspectives was presented. With regard to the retrospective side, we focused on the general English background of the ESP learners before entering the universities. We concluded that one striking problem students face while reading ESP courses at the academic level was their poor language proficiency they carry with themselves to the university which is not compatible with the goals of ESP. The introspective side of this reflective study focused on five determining yet ignored factors in ESP especially in an Iranian context (need analysis, teacher education, EGP or ESP?, ESP materials, EFL teacher or content area specialist?).

Finally, and based on those introspective and prospective reflections, some educational implications were proposed for policy makers (ministry of education and ministry of science, research, and technology), educational institutions (namely universities), teachers, students, and ESP textbook writers.

ABSTRACT

The present research study aimed to search the effect of electronic vs. non-electronic scaffolding on learners' structural ability. To conduct this, amongst the various computer tools, email was selected as the channel of communication between the teacher and the learners. The researcher adopted a quasi-experimental approach. The sample of the study consisted of 66 male intermediate English as a foreign language (EFL) learners from Metanat English Language Institute in Bardaskan, Khorasan Razavi, Iran. The scaffolding strategies were used in teaching English grammar for the e-scaffolding group via exchanging e-mails in the fall semester of the year 2014-2015. Also, the same strategies and techniques were taught in non-electronic scaffolding group. But the control group was not gone through these strategies. The standard grammar test was used as pre and post tests to measure any possible differences between the mean scores of the students in electronic, non-electronic scaffolding and control groups. The collected data were analyzed statistically using one-way ANOVA. The study results indicated that there were statistically significant differences between the e-scaffolding group's mean scores in the pre-and the posttest compared to the non-electronic scaffolding and control groups. In the light of those results, the study recommended the necessity of implementing strategies and techniques of scaffolding via e-mail exchanging in teaching English grammar.

KEYWORDS: E-scaffolding, non-electronic scaffolding, structural ability

INTRODUCTION

Accuracy along with fluency has always been significant in producing foreign languages, and it cannot be disregarded. To obtain it there exist several approaches and techniques such as inductive learning, deductive learning, implicit, explicit ones or problematizing, pushing, and scaffolding which to me the latter plays a fundamental role in conveying grammar knowledge in the process of teaching which is a necessary element for production skills (speaking and writing).

There should be sufficient support to provide the security to take risks with the language especially in the case of grammar in order to make learners autonomous, responsible and problem solvers. Successful learners are who take the responsibility of their own and have an active role in the process of learning. In fact, it's the very autonomous learning which involves the supporting and facilitating role of the teacher. McLoughlin and Marshall (2000) define scaffolding as a form of assistance provided to learner by a more capable teacher or peer that helps the learners perform a task that would normally not be possible to accomplish by working independently.

Grammar instruction is often regarded as the unattractive component of the language by the language learners. One of the best solutions to change the unattractiveness to attractiveness is creating attractive learning tool that acts as a stimuli for learning a foreign language (Taylor, 1980). The important issue is here that with the rise of the world of digital technologies, attractiveness has been created in various areas of language. That is, providing electronic supports that empower them to cope with more complicated and sophisticated content and skill demands than they could otherwise handle. Among the variety of forms of facilitating language teaching and learning via internet, e-mail has been so far the most popular and useful tool. In Iran, applying e-mail into English writing teaching is still a relatively new field due to the late access to the Internet.

The usage of computers for teaching grammar has not been seen as the same amount of communicative computer assisted language learning, while teaching grammar electronically owns several potential advantages. Computer tools such as e-mailing can provide rich input and explicit grammar explanation. In a study conducted by Ragan, Redwine, Savenye, and McMichael (1993) learning time lessens by 30 percent compared to the conventional instruction group. Furthermore, they revealed that learner interactivity and control over programs as the characteristics of computer instruction generate improved results in achievement.

The goal of this study was to determine whether or not students who are provided with e-scaffolding to practice grammar skills using e-mailing perform differently than students who are provided with traditional opportunities through scaffolding to practice grammar skills. The primary research question posed in this study was whether a difference is created in the acquisition of a specific grammar point for students taught in an electronic instruction versus chalk and talk class.

LITERATURE REVIEW

Theoretical and empirical support for the study and informing the research methodology is served through the literature review. Careful review of relevant literature has substantiated the need for the current study. Thornbury (2000) says: "Grammar is partly of what forms (or structures) are possible in a language. Traditionally, grammar has been concerned almost exclusively with analysis at the level of the sentence. Thus, the grammar is a description of the rules that govern how a language's sentences are formed" (p.1). Maugham (1938) adds, "It is necessary to know grammar, and it is better to write grammatically than not, but it is well to remember that grammar is common speech formulated. Usage is the only test."

The concept of scaffolding draws different meanings among different researchers. Some researchers like McLoughlin and Oliver (1998) think of it as any form of support that students receive. But Orrill and Galloway (2001) restrict it to particular processes, strategies, and techniques that support learners. In this study, scaffolding contains a process that enables a learner to attain an objective, solve a problem, or end with a task that the individual would not be able to do without support from other human beings or tools.

The roots of the term "scaffolding" are attributed to Vygotsky's (1978) socio-cultural theory, and, in particular, his concept of the zone of proximal development (ZPD). Zone of proximal development containing the concept of scaffolding was proposed for the first time by the Russian psychologist Lev Vygotsky (1978). He never used the exact terminology of scaffolding. In his view, ZPD is the distance between what a learner can do independently and what he or she can potentially achieve with individualized support from more capable others, such as a teacher, even a peer or someone who has greater expertise. The process and support by which a more knowledgeable other mediates a learner's attempts to take on new learning characterize scaffolding in instructional situations.

Grammar was associated with linear thought and "perceived as anathema to process because its teaching had always been identified with teacher-centered classrooms" (Devet, 2002, p. 10). Nowadays, with the entrance of digital technologies to the process of education especially in teaching and learning foreign languages, teachers' interest in resorting to computer tools for teaching grammar to get rid of traditional teaching has increased. In spite of the abundance of comparative research on electronic scaffolding in other academic fields such as reading and the growing body of research on methods of teaching grammar, as far as the literature review is concerned, a few research studies have investigated the use of electronic foreign language teaching. One area that has gained much from the computer tools in terms of data volume, easy access, interactive and immediate feedback and possible individualization of teaching is grammar drills. Generally, the results of the comparative studies have indicated that computer-based language instruction produced syntax development and created high motivation than traditional or conventional classroom instruction. However, a few studies have found that computer-based language instruction had non-significant or negative effects (Biesenbach-Lucas, Meloni & Weasenforth, 2000).

Abu Naba'h, Hussain, Al-Omari, and Shdeifat (2009) compared the computer assisted language learning (an instructional program) and the traditional method on the achievement of passive voice of secondary students in Jordan. The results of their study showed that there is an effect on students' achievement attributed to receiving the treatment through the instructional program. Ghorbani and Marzban (2013) investigated the effect of teaching grammar with Power Point Presentation on Iranian Beginner EFL learners over a four-week period. During these sessions grammar in CALL group was taught with Power Point software that were introduced to the class instead of the traditional method of grammar teaching. The grammar lessons with the inclusion of Power Point slides that was made up of colorful learning tips, inspiring pictures, bulleted patterns of highlighted examples, related sounds of the pictures, and their hyperlinks to refer to their original sites for further explanations. The researchers confirmed that the computers have been

considered a good fit for grammar instruction. In a study to investigate the difference of acquisition of specific grammar points (past tense (irregular and irregular), past continuous and present perfect (regular form) and conditional tense) for students taught in electronic teaching versus those in a chalk and talk class, Nutta (1998) administered a treatment of 60 minutes of teaching a day per one week. The results showed that computer-based grammar teaching was at least as effective as teacher-driven.

The purpose of scaffolding through e-mailing is to enable effective, efficient and engaging learning. It should contain cognitive and non-cognitive elements. Interest, motivation, emotions, beliefs, attitudes and efficacy constitute non-cognitive element. On the other hand, modeling, questioning, optimal guidance, information processing and recall constitute cognitive elements. By joining the two elements the teacher can reach a more effective, efficient, and engaging learning which via e-mail can reduce the learners' anxiety in learning grammar and boost their levels of their motivation.

RESEARCH QUESTIONS

For the purpose of the present study, the following research questions were formulated:

- Q1. Does electronic scaffolding have any significant effects on Iranian intermediate EFL learners' syntax?
- Q2. Does non-electronic scaffolding have any significant effects on Iranian intermediate EFL learners' syntax?

METHODOLOGY

Participants and setting

The population of this study included English learners at intermediate level studying at Metanat Foreign Languages Institute of Bardaskan, Khorasan Razavi, Iran. Their age ranged from 14-18. They were all native speakers of Farsi. All participants were studying English as a required subject for three to four years in secondary school.

Instrumentation

Language proficiency test

The language proficiency test named Nelson English language test, series 100, developed by Fowler and Coe (1976) was administered to determine the learners' level of proficiency and homogeneity in terms of English language proficiency. It consisted of two sections: structure and vocabulary in the form of multiple choice questions. It included 50 items and the time allotted was nearly 40 to 45 minutes.

The Nelson test is a standard test, however, in order to test the reliability of the test in this study for these students, a Kuder-Richardson was calculated to determine the degree of internal consistency. The analysis was done considering the data from the whole participants taking part in this study. The obtained value through the analysis was 0.602 which is regarded at an acceptable level of reliability.

ICT questionnaire

Since the treatment in e-scaffolding (ES) group was supposed to be done only through emails, the researcher had to determine learners' degree of familiarity with information and communication technology especially e-mail and Internet on which he could assign them to the ES group. To serve this purpose, the standard ICT questionnaire taken from Internet was administered to see whether the participants had the knowledge of using e-mail and Internet. This questionnaire includes two parts in Persian (Persian version, because of avoiding misunderstanding): the first part provided personal information about the participants, and the second part which is divided into four sub-parts consisting of 25 items in the Likert scale format from "little" to "very much". It is worth mentioning that in order to find more assurance on its reliability, Cronbach's Alpha was utilized to assign the degree of reliability (.72). In part A, the participants were required to mark the type and amount of using computer. In part B, they were to rank using computer software. Also, in parts C and D, they were asked to check the type and amount of using Internet and Internet services.

Grammar in Use Intermediate Third Edition Evaluation Test

As the aim of this study is to examine the effect of e-scaffolding on structural ability, a standard grammar test named Grammar in Use Intermediate Third Edition Evaluation Test (Cambridge University Press 2010) was administered as a pre-test. Since the time interval between the pre-test and post-test was long enough, the same pre-test was used as post-test too. This test is known as a standard test, however, in order to assure its reliability, Kuder-Richardson was administered to assign the degree of reliability. The value gained by that was 0.812 which is an accepted degree. It included 50 multiple choice items on different topics. The time allotted to answer it was 45 minutes.

Procedure

The researcher announced the course project to the institute principal. She reviewed the project and approved it. First, the Nelson English proficiency test, series 100, was administered to see whether they are homogeneous in terms of English language proficiency or not. At first, the test takers were 70 male students. The passing mark was at least 30 out of 50. Those who obtained at least 30 marks and more have been regarded having the same level of proficiency for this research. Two students failed the test. The rationale of administering this test was to assure their proficiency level. Second, the standard ICT questionnaire was set up to see whether they had information and communication technology literacy according to which 22 of the participants who were ICT literate were assigned as the electronic scaffolding (ES) group. The participants who obtained at least %75 of the choices could be regarded ICT literate. All the participants passed the questionnaire successfully except seven participants who did not possess computer systems at home. In order to find out the learners' level of structural ability before conducting the treatment, the researcher utilized the grammar in use intermediate test as a pretest on three groups. The control group and the non-electronic scaffolding group were supposed to attend their classes 90 minutes in the evening the first four days of the week for eight weeks. The researcher decided on certain rules for writing e-mails, otherwise he would become overloaded by e-mails from the learners. He agreed on the evenings when he answered the e-mails to avoid impatient learners sending him an e-mail requesting his answer twice a day. He said that he

usually uses group e-mailing which will save time and send certain answers or directions to all learners. Treatment was implemented in two months for sixteen sessions each with 90 minutes on control and NS groups in the afternoon the first four weekdays. All the weekdays from morning to night was allotted to e-mail exchanging with the ES group. The materials used in the present study also included the book contained grammatical points by Raymond Murphy (2012) titled "English grammar in use".

In the control group, the researcher taught the grammar points explicitly. A traditional grammar lecture followed by translation exercises. The structures were taught deductively. In the non-electronic scaffolding group grammar was taught inductively and in an implicit way by using scaffolding strategies. Also, these strategies such as modeling, templates, feedback, and questioning prompts which were approved and experienced by some researchers mentioned in the literature review are very effective in teaching grammar to foreign language learners. Thus, he tried to keep those strategies to teach grammatical points in both non-electronic scaffolding (NS) group and those possible in electronic scaffolding (ES) group.

But the ES group involved the learning process via e-mailing. The teaching and learning were done via e-mails. Through exchanging e-mails, the researcher established a trusted atmosphere and enhanced a "give and take" environment to learning by being a participant, a co-respondent, and a facilitator. He asked students to introduce themselves to one another through e-mailing. In the first e-mail for each unit containing a grammatical point, the teacher first introduced the grammar items learnt. Second, he gave explanations of forms and functions. Third, he followed the examples of usage in sentences and carbon copied to all members of the ES group. If there was no problem for them in understanding that point they sent an e-mail indicating all is OK. Feedback was given by the teacher as well as by the other respondents. If a student had a question on a certain grammatical point he received comments tailored to his level considering his current position by questions or statements. The teacher used different techniques such as template, modeling, question prompts, feedback appropriate to that particular structural point. To teach and scaffold, for example, "Relative Clauses" (who and which) the teacher, first, wrote what a clause and relative clauses are. Then he gave its forms and functions followed by the examples of usage in sentences. Since modeling as one of the scaffolding strategies was possible for most of the structural points, the teacher utilized that. He did this by chunking a compound sentence having who or which into simple sentences and highlighted that part having who or which clause in different colors, bolding and italicizing it. He used questions to draw the learners' attention to that particular point considering their previous knowledge related to that subject.

Study design

Because it was impossible for the researcher to set learners randomly to these three classes, the design of this study is quasi-experimental design. The participants of this research are intact.

RESULTS AND DISCUSSION

In order to sort and reveal data in a logical way, the researcher administered various statistical procedures. In order to ensure the normality of data, Kolmogorov-Smirnov test (table 1) besides

the one way ANOVA were conducted for all data in Nelson test, grammar pretest and grammar posttest in three groups of e-scaffolding, non-electronic scaffolding and control groups.

Table 1: Results of Kolmogorov-Smirnov Test

		Nelson	G.PR	G.PO
N		66	66	66
Normal Parametersa	Mean	44.60	33.63	36.72
	Std. Deviation	3.26	3.77	4.32
Most Extreme Differences	Absolute	.136	.159	.140
	Positive	.136	.121	.093
	Negative	-.108	-.159	-.140
Kolmogorov-Smirnov Z		1.107	1.290	1.135
Asymp. Sig. (2-tailed)		.172	.072	.152

a. Test distribution is Normal.

Note. G.PR stands for grammar pretest; G.PO stands for grammar posttest

In order to homogenize participants and select those students with similar level of language proficiency, Nelson test was administered. Table 2 displays results of relevant analysis.

Table 2: Results of Homogeneity of Variances for Nelson Test

Levene Statistic	df1	df2	Sig.
1.105	2	63	.338

As the table 2 shows, p-value is .338 which is greater than $\alpha = 0.05$, therefore, the null hypothesis of Levene test which is the equality of variances, is supported, and ANOVA can be used. To be sure about the homogeneity of the groups in terms of general proficiency, one-way ANOVA was used.

Table 3: Results of ANOVA for Nelson Test

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	1.576	2	.788	.072	.931
Within Groups	690.18	63	10.955		
Total	691.75	65			

As Table 3 shows, there is not any significant difference ($F=.072$, $p=.931 > 0.05$) among three groups in Nelson test before implementing the treatment. The results show that p-value is .931 which is greater than $\alpha = 0.05$.

To check and compare the homogeneity of the total participants of the three groups ($N=66$), the Nelson Test was administered. Also, to obtain more detailed information about the differences about the means and to compare the three groups, multiple comparisons were conducted. Table 4 illustrates the descriptive statistics of participants' scores.

Table 4: Results of Multiple Comparisons for Nelson Test

Dependent Variable: Nelson							
	(I) group	(J) group	Mean Difference (I- J)	Std. Error	Sig.	95% CI Lower Bound	Upper Bound
Scheffe	C	NS	.36364	.99796	.936	-2.13	2.86
		ES	.27273	.99796	.963	-2.22	2.77
	NS	C	-.36364	.99796	.936	-2.86	2.13
		ES	-.09091	.99796	.996	-2.59	2.41
	ES	C	-.27273	.99796	.963	-2.77	2.22
		NS	.09091	.99796	.996	-2.41	2.59

Note. NS stands for non-scaffolding group; ES stands for electronic scaffolding group; CI stands for confidence interval and C stands for control group.

As Table 4 shows, there is not any statistically significant difference among three groups since p-value is greater than 0.05 in every comparison. ($p=.936$ for comparison of control and non-scaffolding groups; $p=.963$ for comparison of control and e-scaffolding groups; $p=.996$ for comparison of non-scaffolding and e-scaffolding groups). Therefore, participants gained similar and close scores in Nelson test.

In order to assess the participants' performance at the outset of the study, one way ANOVA was again conducted. Results are shown in table 5.

Table 5: Results of Homogeneity of Variances for Grammar Pretest

Levene Statistic	df1	df2	Sig.
1.480	2	63	.235

According to Table 5 p-value is greater than 0.05 ($p=.235$), therefore, AONVA can be conducted.

To ensure the homogeneity of groups with respect to grammar in pretest, one-way ANOVA was used. The results are revealed in table 6.

Table 6: Results of ANOVA for Grammar Pretest

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	26.455	2	13.227	.927	.401
Within Groups	898.818	63	14.267		
Total	925.273	65			

As Table 6 shows, there is no significant difference ($F=.927$, $p=.401 > 0.05$) among three groups with respect to grammar ability.

To check and compare the homogeneity of the total participants of the three groups ($N=66$) in terms of grammar ability, the Grammar in use third edition evaluation test was administered. Also, to obtain more detailed information about the differences about the means and to compare the three groups, multiple comparisons were conducted. Table 7 illustrates the descriptive statistics of participants' scores and shows the results.

Table 7: Results of Multiple Comparisons for Grammar Pretest

Dependent Variable: grammar pretest	(I) group	(J) group	Mean Difference (I-J)	Std. Error	Sig.	95% CI Lower Bound	Upper Bound
Scheffe	C	NS	-1.50000	1.13886	.425	-4.3552	1.3552
		ES	-1.09091	1.13886	.634	-3.9462	1.7643
	NS	C	1.50000	1.13886	.425	-1.3552	4.3552
		ES	.40909	1.13886	.938	-2.4462	3.2643
	ES	C	1.09091	1.13886	.634	-1.7643	3.9462
		NS	-.40909	1.13886	.938	-3.2643	2.4462

As Table 7 displays, p-value is more than 0.05 indicating that there is not any statistically significant difference among means of three groups in grammar test administered as the pretest. As a consequence, participants' homogeneity was accepted prior to the treatments implemented in the study.

In order to see whether e-scaffolding treatment has significant effects on EFL students' syntax, independent sample t-test was employed. And the first null-hypothesis restated below was rejected.

H01: "Electronic Scaffolding has no significant effects on Iranian intermediate EFL learners' syntax".

To compare the performances of the e-scaffolding and control participants in the grammar posttest, independent sample t-test was utilized. Table 8 illustrates the descriptive statistics of participants' scores.

Table 8: Results of Independent Sample T-test for Grammar Posttest in E-scaffolding & Control Groups

Group	N	M	SD	df	t	p
ES	22	39.45	3.55	42	5.26	.000
C	22	33.81	3.54			

As Table 8 shows, participants in e-scaffolding group (N=22, M=39.45, SD=3.55) significantly (df=42, t=5.26, p=.000 < 0.05) performed better than those in control group (N=22, M=33.81, SD=3.54) in grammar posttest. The difference is significant at the 0.05 level of significant. The present finding confirms the significant effect of using e-scaffolding in improvement of EFL students' grammar. Therefore the first null-hypothesis was rejected.

In order to see whether scaffolding has significant effects on EFL students' syntax, independent sample t-test employed. Also, the second null-hypothesis restated below was tested.

H02: "Non-electronic scaffolding has no significant effects on Iranian intermediate EFL learners' syntax".

To compare the performances of the non-scaffolding and control participants in the grammar posttest, independent sample t-test was utilized. Table 9 shows the results.

Table 9: Results of Independent Sample T-test for Grammar Posttest in Non-electronic scaffolding & Control Groups

Group	N	M	SD	df	t	p
NS	22	36.90	4.01	42	2.71	.01
C	22	33.81	3.54			

As Table 12 shows, participants in non-electronic scaffolding group (N=22, M=36.90, SD=4.01) significantly ($df=42$, $t=2.71$, $p=.01 < 0.05$) performed better than those in control group (N=22, M=33.81, SD=3.54) in grammar posttest. The difference is significant at the .05 level. The present finding confirms the significant effects of using non-electronic scaffolding in improvement of EFL students' grammar. Therefore the second null-hypothesis was rejected.

CONCLUSION

It is concluded that the electronic scaffolding strategies and techniques initiated a meaningful change in the mean score of the ES group. In other words, providing learners with scaffolding via exchanging e-mails can positively affect Iranian intermediate EFL learners' performance in grammar tests. Besides, the results indicate that the participants in the e-scaffolding group developed more self-monitoring and regulation by producing more positive results at the end of the study. The results of this study contrastively show that receiving feedback, support and guidance from the instructor via e-mailing to the extent that it's not felt to be essential can develop a more interactive context in web-enhanced language learning modes, while lack of interaction has been claimed as a major drawback in internet-based L2 classroom activities. This study has established valuable insights into the use of emails in fostering the learning of grammar. The respondents of the study were observed to yield high interesting learning grammar through email exchanges.

Similar to any other study, some inevitable limitations, which may raise new questions for further researches in the same field in the future, are imposed on. In addition to the small sample size and its short duration, among so many channels and applications that are possible such as blogging, chatting, video chatting or e-mailing, the treatment was driven through only e-mailing by the researcher. Another is that this study was carried out in Metanat Language Institute of Bardaskan, Khorasan Razavi, Iran with intermediate students of English language, more research is needed to be conducted in order to see whether similar results will be attained in other settings. Also since the participants' gender is male, the relationship between learners' success in structural ability due to the effect of electronic scaffolding could be investigated in terms of gender, in other words, the research could be carried out with equal numbers of participants from each sex. In addition, because these classes already existed in this site, random sampling of the participants was impossible.

SUICIDE IN ANCIENT TIMES: A NEW-HISTORICIST APPROACH

Hussein Zamani

Dr. Pyeaam Abbasi

University of Isfahan, Iran

ABSTRACT

While human's right to live has always been an unquestionable doctrine through the ages, his right to die has remained a matter of controversy thus far. Suicide through centuries has been a fact of life and humans' ideological pendulum has been swinging from the most antithetical extremes to the most agreeable extremes with regard to this phenomenon. Surprisingly, the adoption of fierce and inimical stances against suicide by church authorities in the Middle Ages, had no precedent in the ancient times as suicide was in many cases celebrated or at least tolerated by the ancients and was regarded as an honorable choice in the face of humiliation and capitulation. While humans' later toleration of suicide in the wake of modernism was to a great extent the fallout of the emergence of skeptical secular philosophies of life and more a backlash against the previous religious monopoly of the church, the ancients maintained a rigid adherence to their mundane life and reckoned suicide as an active means of attaining their worldly aspirations. The present paper aims to delineate the ancients' affirmative outlook towards suicide in different social, historical, political and literary contexts and to discuss the underlying reasons behind their approach. The findings from the research illustrates how conspicuously the ancients were obsessed with courage, nobility and honor that they sought to find an alternative for attaining these values even in the face of failure. Suicide was the means for measuring their courage against the workings of the fate.

KEYWORDS: Suicide; Ancients; Celebration; Toleration; Right to die

INTRODUCTION

Owing to the fact that Christianity materialized in a world in which dignity and chastity were the integral social fabrics, any Christian stance against suicide in favor of these basic precepts was naturally uncalled for. If the truth be known, many figures of authority such as the early bishop of Hippo, Augustine and the later theologian Thomas Aquinas have postulated that Jesus was a suicide as well. Akin to Socrates, he never adduces reasons to acquit himself and even seems to have incensed his judges. In the book of John we find Jesus saying: "No man taketh [my life] from me, but I lay it down of myself" (John 10:18). Our earliest records verify that Christians did not take issue with suicide and even extolled the virtues of suicide. To illustrate, around the year 300 the scholar Eusebius, soon to be a bishop, set his pen to paper for a compilation of Christian martyrs. He recounts how a Christian woman and her two virgin daughters took their lives out of deference to faith.

However, the most astringent remarks on suicide come from Saint Augustine in his book *City of God* around the year 400. He seems to have signed off on the presupposition that Jesus took his life voluntarily, writing, “His soul did not leave his body constrained, but because he would and where he would and how he would.” Yet he deprecated other suicides and clashes with Eusebius over his judgment on the story of virgin girls killing themselves. For Augustine, the girls would be exonerated of any possible rape. Augustine’s remarks provide us with corroborative evidence that individual intention supplants the outward appearance of an action as a gauge for any moral judgment. With that reversal we leave behind the classically inflected sense that honor—or even virtue, or purity, or the absence of sin—ought to decide the matter of guilt. We have arrived at a morality dependent on individual intention. He dubs suicide as a “detestable crime and a damnable sin” and squarely assails it:

This we affirm, this we maintain . . . that no man ought to inflict on himself voluntary death . . . that no man ought to do so on account of another man’s sins, for this were to escape a guilt which could not pollute him, by incurring great guilt of his own; that no man ought to do so on account of his own past sins, for he has all the more need of this life that these sins may be healed by repentance. . . . Those who die by their own hand have no better life after death (Augustine, 2009, p.29).

As mentioned, medieval retribution for suicide had been severely gruesome, and it became even more atrocious in the wake of the Protestants. In the late Renaissance, those who committed suicide continued to suffer ghastly violence, but these practices began to be drastically opposed by philosophical and literary investigation of suicide. As a matter of fact, many writers and intellectuals of the Renaissance and the early modern period that followed it were engrossed in suicide and viewed it from different facets. Still, the philosophy was to large extent against suicide, but now the pillars of reasoning were founded less on ecclesiastical orthodoxy and more on personal evaluation of the situation. The Renaissance was also an era of showing initiative in diplomacy, economics, and social relations, so we are not taken aback to witness changes in all the dimensions of culture, and adoption of new outlooks towards suicide was part of the vast cultural and political breakthrough. Petrarch excelled in philosophy and literature: his hero Cicero, as mentioned, was at least tolerant and at times booster of certain ancient suicides.

In the Enlightenment, the outlooks Berkeley delineated came to be voiced overtly by philosophers. Enlightenment philosophers launched a full-scale onslaught against a variety of religious taboos and purported that many ecclesiastical rules—such as the religious prohibition of self-murder—were utterly superstition and convention. The loudest champions of the right to suicide were two of the greatest upstarts against Christianity, the Enlightenment philosophers David Hume and Baron d’Holbach. When we survey their philosophical arguments, we come to know that they were concerned more with rejecting religious authority than in particular with adopting a more liberal attitude towards suicide for individuals and community. It is a significant distinction, since it appears that some people were convinced by these philosophers and acted on their convictions. According to contemporaries there was a noticeable rise in suicides in this age, and many pinned the blame on philosophical arguments siding with the right to suicide. When we read those arguments and find them to be acrimonious and smart onslaughts on the religious

injunction against suicide, not exacting, sympathetic reflections on the meaning of life, it is fair to wonder whether this philosophical mobilization against the churches did in fact inspire more negative fallouts than its arguments merited.

The present paper, however, aims to delineate how ancients viewed suicide. There is no shadow of a doubt that the agitation for human's right for suicide which emerged after the middle Ages in the rise of secularization, was more an intentional move for defying religious authorities and reckoned suicide as the last resort and more as an escape from the ignominy of life. For the ancients, however, the mundane world was replete with excitement and was the only context where human beings could attain their aspiration. However, suicide was highly celebrated for them in many cases and this viewpoint was not adopted as a reaction to previous eras.

DISCUSSION

Owing to coequality of the dead with the living and regarding suicide merely as bidding farewell to unbearable quandary offered by the mundane world and simply a means of entry into another existence, suicide is reckoned as a neutral phenomenon in ancient Egyptian perspective and bears no resemblance to what we see in the upcoming religious discourses.

An anonymous Egyptian papyrus entitled *A Dispute over Suicide* written in Egypt's First Intermediate Period proposes a tense dialogue between the soul and self in which a man, fed up with exhausting vicissitudes of life endeavors to coax his soul to escort him into death. Whether an individual is condoned to get away with himself takes center stage in the dispute as individual freedom calls social responsibility into question. While the soul asseverates that committing self-slaughter ruins any chance of enjoying a blissful afterlife, the self is adamant that death signifies a healing to him to attain tranquility and to triumph over mortality.

For a person sentenced to death, execution by suicide was excusable and the Romans, later on, followed the same route as well. Further evidence of the Egyptian embrace of suicide is manifest in what is dubbed Declaration of Innocence which comprised of forty two questions concerning sinful acts asked of a dead person ritualistically. While we can see questions as regards violence and bloodshed, no question is posed among them to denote a proscription for suicide.

No condemnatory or condonable attitude is adopted with respect to suicide in the Old Testament. One can itemize seven instances of self-destructive conduct therein: shunning the ignominy of being killed by a woman, Abimelech had one of his warriors put him to the sword. As Samson's hair grew long again, he regained his legendary robustness and tore down the philistine temple, putting to death he, himself and the multitude assembled there to rejoice at their victory over him. Ahitophel who forecasts a debacle in his rebellion against King David hanged himself. Saul, who had lost his three offspring in the battle against Philistines on Mount Gilboa, resolved to kill himself. Saul's armor bearer too, modeled after his lord. Following the fall of the city of Tizrah, Zimri who had abandoned all hope set the king's house on fire while he was there. Razis, a patriotic elder of Jerusalem, settled upon killing himself rather than be slaughtered by his foes. Jonah is recognized as a figure who considered suicide several times while being caught in the fish's stomach.

As a prominent case of someone engineering his own death we could refer to the tale of Samson, in the book of Judges. Samson's mother was visited by an angel during her pregnancy and was told that as long as his infant abided by Nazirite vows, God would grant him outstanding strength. He, therefore, had to abstain from alcohol and never cut his hair. He soon exerted his power on Israel over Philistines through his legendary strength demonstrated by such feats as killing a thousand of armed soldiers using only the jawbone of an ass and killing a lion bare handed.

On the way to his engagement party he comes across a dead lion and comes to know that swarm of bees has made its hive in the lion's ribcage. Taking some of the honey, he shares it with others and provides his in-laws-to-be with a riddle: "Out of the eater something to eat, out of the strong something sweet" which leads to a massacre. His tragic flaw is when he falls in love with another Philistine woman, Delilah, who overthrows him consequently.

As soon as she makes him expose the chink in his armor, she treacherously shaves his head while sleeping. Philistines soon apprehend him in his feeble state just to blind him. He is then enslaved and yoked like an ox to push a grindstone. While Philistines are rejoicing in their temple at their dominance, Samson whose hair has grown a bit, devastates the whole building killing himself and as many philistines as possible. The story is not voiced tragically and no moral assessment of the incident is made.

Just like the Old Testament, Hebrew Bible adopts a neutral stance against suicide. There are minor exceptions however. Job, whose life is a picture of sheer misery, wished he had never come into being. Despite his wife's provocations, he resists suicide. He says, "My Soul Chooseth strangling and death rather than my life". Suicidal as his words may appear, he does not give away. Hence, Job has always served as an anti-suicide biblical symbol. However, scripture sometimes guards against suicidal thought. In the apocryphal book of Ecclesiasticus we read:

Give not over thy mind to heaviness, and afflict not thyself in thine own counsel. . . . Love thine own soul, and comfort thy heart, remove sorrow far from thee: for sorrow hath killed many, and there is no profit therein. Envy and wrath shorten the life, and carefulness bringeth age before the time. . . . For of heaviness cometh death, and the heaviness of the heart breaketh strength. In affliction also sorrow remaineth: and the life of the poor is the curse of the heart. Take no heaviness to heart: drive it away, and member the last end. (Ecclesiasticus 30:21, 22-24; 38:18-20) "Love thine own soul, and comfort thy heart." We are given a clear directive there: "Sorrow hath killed many, and there is no profit therein." Scripture is thus not as neutral as it might have seemed.

The New Testament from a neutral standpoint acquaints us with suicidal figures such as Judas Iscariot and Paul's jailer. Also, the Torah, neither condemns nor condones self-destruction and only in the body of rabbinical literature are we able to trace an opposing posture. Saul's self-destructive move is quite understandable when interpreted as an avoidance of profanity. Permission is granted to suicide whenever, it is a deterrence against disgrace to God.

Due to Hebrew's maintaining a tight attachment to life, suicidal inclination is less frequently observed among them. They boasted of being the God's selected nation and bore a positive attitude towards life. Insanity was known to be the trigger point for developing suicidal tendencies and they, thus, recognized major funeral rights for the victims and never desecrated the corpses.

In Judaism however, suicide was conspicuously a taboo as it put accent on the sacredness of life as well as humane intrinsic values. Giving up the ghost voluntarily was deemed as an affront to God. Life was to be preserved and suicide, even under the direst conditions, meant giving up hope in the Almighty. Suicide was however, justified in defense of goodness, morality and God. Exceptions to the ban on suicide were made only in extreme cases where the principles of divinity were jeopardized. Anyway, funeral rights were usually granted to the victims of suicide and the public participated in funeral rites out of reverence for the living, however with no rending of clothes and no eulogy. Suicide in the midst of war was permissible though as in the case of Josephus, the priest and general in the army of Jews. He was arrested by the Romans and lived the rest of his life in Rome when the lives of Jewish people had undergone major transmutations. He wrote the history of time in four books, *The Jewish War*, *Antiquities of the Jews*, *His Life* and *Against Apion*.

Josephus reports to us on his involvement in a mass suicide when he decreed the detachment of Jewish troops at Jotopata in A.D. 68. Hemmed in by Vespasian's army, his warriors came to the conclusion that demise takes precedence over capitulation and adjudicated to commit suicide. Josephus adopts an opposing stance primarily, contending that "for those who have laid mad hands upon themselves, the darker regions of the netherworld receives their souls, and God, their father, visits upon their posterity the outrageous acts of the parents. That is why this crime, so hateful to God, is punished also by the sagest of legislators. With us it is ordained that the body of a suicide should be exposed, unburied until sunset. . . ." He is soon censured for his pusillanimity and threatened to death. Ultimately, he desists from his urge and concedes that suicide was reasonable in such a situation where defending Torah and the holy name is the prime concern and indeed came up with the solution—"that they commit mutual slaughter by lot"—and they unanimously concurred. However, he and one soldier could survive the bloodbath "by chance or by the providence of God" and Josephus could successfully convince his fellow to show the white flag to the Romans.

He recounts even a more awe-inspiring mass suicide which took place in 74 A.D. Zealots, pursued by Romans, took refuge on altitudes of Masada under Eleazar Ben Jair's leadership. Roman enclosure lasts for three years and they lose any hope for further resistance. Eleazar assembles his comrades and reminds them of their vow not to live under the yoke of Romans and emboldens them to die by their own hand. He proclaims that "death affords our souls their liberty and sends them to their own place of purity where they are to be insensible to all sorts of miseries." The warriors engaged in a vast bloodshed which took a heavy toll, killing a total of 960 people. They primarily killed their families and then themselves. Reportedly, ruthless Romans were all awe-stricken in the face of honor and contempt for life demonstrated by the people. The only survivors were two women and five children who had gone into hiding.

Brutus, the most famous of Julius Caesar's assassins, took his own life when his brigade was defeated following the second battle of Philippi. Many instances of individual suicide could be seen in Josephus's books, some of which are concerned with Herod and his family members. Phasaël, Herod's younger brother, kills himself while in King Antigones's custody, in the belief that Herod is dead. Shackled in chains and awaiting capital punishment, he hits his head against a large rock. A year later, Herod gets even with Antigones by killing him. He also recounts two suicide attempts by Herod, one in 41 B.C. by sword and the second in 4 B.C. by knife.

In this part I will introduce the major figures of ancient suicide. We will move from mythical to historical contexts and present the reader with a range of motives for self-murder. In mythical realm motives mostly fall into one of the following categories:

suicide because of great loss
altruistic suicide,
suicide because of shame,
and suicide because of love gone wrong

There is a strong case for celebration of suicide in ancient Jewish, Greek and Roman worldview. There is, nevertheless, little evidence to buttress the frequency of suicide among them until at least the first century B.C.E.

Quite interestingly, ancient suicidal figures, whether real or fictional, are scarcely diagnosed with depression which is lucidly in stark contrast with our era's despair suicides. As a matter of fact, despair suicide is mostly reckoned as reprehensible. Plato, for instance, pays obeisance to suicide for the sake of community and launches an acrimonious onslaught against those who end their lives on the grounds of disillusionment. Today, killing oneself under coercion is not beheld as suicide through our eyes. For ancients, however, it was quite the reverse and Socrates served as a suicidal figure thus.

We should bear in mind that familial honor was of paramount significance among the ancients and suicides were less customarily perpetrated against the family than for it. In other words, ancient suicides were social apparatus to insulate family reputation from being tarnished. It was a means by which a good family name could be rehabilitated in the wake of an ignominious event.

Our discussion on ancient suicide centers upon archaic myths from Homer and Hesiod and later Greco-Roman mythology of Sophocles, Ovid and others. As a case in point, when Erechtheus sacrificed his youngest daughter to win victory for Athens against Eleusis, his other daughters kept their vows to die together and killed themselves as the incident was so hard for them to stomach.

Icarius who had been well versed by Dionysus in viticulture and Oenology, was oblivious to enlighten his fellows about the aftermath of drinking. Inebriated, they thought they had been poisoned. They killed Icarius out of fear and interred his corpse under a tree. His daughter, Erigone, unable to stay the course brought death on herself by hanging from the very tree beneath which her father was entombed. According to another source, "sorrowful Erigone wept her fill

for her slain sire, and already was untying the fatal girdle, and bent on death was fastening it to the sturdy boughs”(Hyginus, 1960, p.186). Erigone’s dog Maera led her to her father’s burial site and then threw itself into a well.

When Oedipus could get away with death by solving Sphinx’s unfathomable riddle, the fact heaped too much insult on Sphinx so that she leaped from acropolis to her death. By the same token, when Oedipus could successfully shun the sirens, they killed themselves: “Ulysses proved fatal to them, for when by his cleverness he passed by the rocks where they dwelt, they threw themselves into the sea” (1960, p.117). Supernatural beings had transparently no conception of being overpowered.

Iphigenia is an exemplar of death for the sake of community as Agamemnon sacrifices her for Artemis so that he allows the winds to shift and launch the Greek fleet toward Troy. Yet, in some other versions of the tale, the death is embraced voluntarily by her: “I have chosen death: it is my own free choice. I have put cowardice away from me. Honor is mine now” (Euripides 1375-78). No doubt, honor of community forcefully prevailed upon the ancients to sacrifice themselves. However, sacrificial death, in this particular case, occasions mortal repercussions, namely, the death of Agamemnon and later Clytemnestra. Also, Orestes’ is driven insane by divine spirits for murdering her mother.

Orion’s three Daughters, Coronides, Menippe and Metioche clearly exemplify ancients’ unceasing tribute to their communities. When the only way to deliver Ionians from the fatal plague was to sacrifice two young women willingly, Orion’s daughters had no hesitation to accept death in behalf of their fellow citizens. As one ancient chronicler tells us, “they cried out . . . that they were willing sacrifices. They thrust their bodkins into themselves at their shoulders and gashed open their throats” (Liberalis, 1992, p.84). The prominent Roman poet Ovid (43 B.C.E. to 18 C.E.), too, directs our attention to an artist’s depiction of the scene where Orion’s daughters are portrayed in the streets of Thebes, stoutheartedly “cutting their throats, piercing their brave hearts with swords,” and dying “for the sake of their people” (Ovid, 2010, p.372). It is Crystal clear that there is no attempt made to disguise their extolment for their suicide.

It is beyond doubt that suicide was reckoned as a guardian of one’s honor in the period of Homer. When Charondas indeliberately breached one of his formulated laws by entering the town assembly without removing his dagger, he killed himself with the same dagger thereupon. In the same vein, Greeks and Romans were accredited to take their own lives to avoid apprehension and humiliation in the battlefield. In this regard, we could instance Demosthenes who took poison on the verge of being incarcerated by the Macedonians. Likewise, Vulteius and his troops opted for suicide rather than servility to Pompey. Upon hearing the news of their lord’s suicide, Otho’s soldiers had no ambivalence to follow suit.

P. Decius Mus, 337 B.C., is also noted as he, in compliance with the ritual of *devotio*, sacrificed himself in the Battle of Vesuvius to decimate the foes. Decius the Younger, son of Mus, also went for killing himself in a fight against the Gauls in 295 B.C. Cato the Younger of Utica is also remarkable as he favored inviting his own death over subjection to Caesar. As a case in

point, Regulus welcomed death with open arms when he abode by his pledge to return to Carthage considering that he had propelled Rome into war against Carthaginians upon his release. Moreover, Greek history transmits two incidents of heroic mass suicide which transpired at Corcyra one in 425 B.C and the other two years later in 427 B.C. Positive that their execution is imminent, large numbers of prisoners engaged in a mass suicide to dodge their mortifying destiny.

When Odysseus bequeathed Achilles' armor, Ajax, who looked upon himself as the true heir, took umbrage at the incident and committed himself to get back at his former comrades. Deluded by Athena, he slaughters a herd of sheep in the belief that they are Greek combatants. When he rose from the torpor into which he had sunk, he ends his life forthwith to extricate himself from such a fiasco. There is a sensible irony to note here. While he was struggling to latch on to Achilles armor, he was totally ignorant of how defenseless he could be against his own mortal jealousy. Ajax's case intelligibly epitomizes suicide of shame in the ancient world. In like manner, Jocasta, Oedipus's mother, hangs herself in the knowledge that she had married her own son and Oedipus blinds himself with a pin from her cloak.

The myth of Thisbe and Pyramus which later provided a template for Shakespeare's Romeo and Juliet stands as one of the great myths of suicide for love. Both plays present star-crossed lovers who absurdly put an end to their lives. Narcissus, however, typifies self-love. In the earlier versions of the story, Narcissus, immensely tantalized by his own image, plunges into the water and drowns himself willfully. In Canon's version, nonetheless, he slew himself and narcissus flower blossoms in the ground drenched with his blood.

Hercules's lover, who craves his attention, is duped by the demigod's foe and soaks Hercules' robe in what she conceives to be the love elixir so as to rejuvenate his love for her. But when he puts the robe on, it sears his flesh and when he tries to take it off, it pulls out his organs. He asks his friend to make a pyre and throws himself on it. Hercules engages in a sort of self-immolation which plainly precipitates an impending and otherwise agonizing death. In this sense, we may call this type of suicide Herculean.

Euripides (480 to 406 B.C.E.) as the most modern of the three ancient Greek playwrights has a different slant on the matter since he bluntly values life over death. In his play *Iphigeneia in Aulis* he writes: "Ill life o'er passeth gracious death". Elsewhere in *The Madness of Hercules*, Euripides' hero says: "Yet, thus I have mused—how deep soe'er in ills—shall I quit life and haply prove me craven? Or, . . . I will be strong to await death."

While ancient mythical and literary suicides feature sizeable amount of passion, historical records of self-murder are less marked by emotional fervor than by philosophical composure. Though historical figures are in most cases coerced into committing suicide, they do so with a glorious display of courage and nonchalance for death. The fact has its roots in the philosophical worldview of the epoch undoubtedly. We will not hem and haw, then, to make mention of historical instances of forced self-murder. In discussing suicide in ancient Greek and Roman

world, we ought to take notice of the fact that they envisaged no eternal afterlife for the man. Death consequently was the end.

Pythagoras (570 and 495 B.C.E.) is known as one of the earliest proposers of anti-suicide argument. Pythagorean schools vocally ran counter to volitional end to life because, life is hallowed there. Man is dispatched at a guard post and is duty-bound not to leave it until he is retired. Plato, later on, borrowed the idea, which remained a well-known allegory for years.

Cleomenes I, the king of Sparta personifies one of the few instances of suicide which is induced by madness. He is no doubt a figure of substance because his example later appealed to Renaissance philosopher Michel Montaigne and the Enlightenment philosopher David Hume as two major voices in defense of suicide. According to Plutarch, he had nothing to lose when his plot to dethrone Demaratus foiled. However, he resisted Therycion's enticement to commit suicide and determined to stay alive as long as he could for the others, "For it is an ungenerous thing either to live or die for ourselves" (Plutarch, 1918). Ultimately, in prison he went insane and knifed himself to death. Initial resistance to a splendid suicide culminated eventually in a wretched self-slaughter. That is why the story never escaped Montaigne and Hume's attention.

Plutarch also draws our attentions to what is defined as suicide cluster nowadays:

Once upon a time a dire and strange trouble took possession of the young women in Miletus for some unknown cause. The most popular conjecture was that the air had acquired a distracting and infectious constitution, and that this operated to produce in them an alteration and derangement of mind. At any rate, a yearning for death and an insane impulse toward hanging suddenly fell upon all of them, and many managed to steal away and hang themselves. Arguments and tears of parents and comforting words of friends availed nothing, but they circumvented every device and cunning effort of their watchers in making away with themselves (Plutarch, 1931, 11:249).

To end the epidemic, a decree was issued pursuant to which women who took their lives were sentenced to be dragged naked through the marketplace. The women, supremely protective of their chastity, could not tough the disgrace out and did not hang themselves anymore.

Among historical records, Socrates' enforced suicide appears salient. By reason of his conviction that philosophy is best done through dialogue, no writing, ascribed to him, is handed down to us to be indicative of his worldview. His student, Plato, is the pre-eminent provenance on Socrates' ideas. It is beyond doubt, that he was resolute in censuring every aspects of life in his contemporary world of ancient Greece, particularly, humans' voracity for wealth and sovereignty. As Plato relates in his *Phaedo*, Socrates staged a spectacular exhibition of poise and resignation in his death. In both Plato and Xenophon's accounts of his death, Socrates would have been able to abscond from the lock-up but he has a deep yearning to eschew the humiliation of old age and proclaims himself "better of dead." In disregard of court's verdict, he never beseeches for life. Still, in Plato's account of his dying scene, Socrates expresses his disapproval of ending one's life prior to God's mandate: "Man is situated in this life as if he were on a post or station which he must not quit without leave; because the gods exert a providential care over us on which account we are a part (as it were) of their property and possessions; and because we

should think it unjust and punishable (if it were in our power to punish) for any slave of our own to kill himself without our permission.” There is a real prospect that Socrates fixed upon suicide as means to dispose of an afflictive death. Accordingly, convicts were granted clemency when they were provided with hemlock. Self-murderers could also avoid sequestration of their holdings which would have been otherwise denied for those who were executed for crime. They could also enjoy sepulchral rights. It was viewed as a goodwill gesture when Nero took kindly to let Seneca commit suicide when he suspected his former teacher’s machination against him. Seneca’s forlorn writing insinuates that his suicide was less out of honor than utter despair:

Hence the boredom, the disgust for oneself, the tumult of a soul fixed on nothing, the somber impatience that our own inaction causes, especially when we blush to admit the reasons . . . tightly contained in a prison with no exit. . . . As Lucretius says, “Thus all continually flee themselves.” . . . We follow ourselves; we cannot get rid of that intolerable company. . . . We lack the strength to bear anything: work, pleasure, ourselves, everything in the world is a burden to us. There are some whom this leads to suicide because their perpetual variations make them turn forever in the same circle and because they have made all novelty impossible for themselves, they lose their taste for life and the universe.

Roman law, nonetheless, manifestly vetoed suicide in the case of slaves and soldiers as it was not in the national interest. Prevalence of stoic army suicides shows under no uncertain terms that this legal ban was unavailing overall.

Plato (424 to 348 B.C.E.) is known for turning the spotlight on otherworldliness by pertaining to his theory of ideals. His well-known Allegory of the Cave pictures men in fetters, who face the far wall of a cave. Their only avenue towards understanding is gleaning shadows cast on the wall by representations of the objects in front of the fire. Once one throws off the shackles and turns back, he will be sightless first by the fire and then by the light outside. The gist of his argument is that what accounts for knowledge is no more than a shade. True knowledge is procured only in an excruciating and arduous course of understanding.

In his *Laws*, Plato dwells upon the theme of suicide first and foremost. He enumerates extenuating circumstances for suicide. Suicide is justified for one so dishonored as to be beyond expiation and correspondingly in cases of insufferable loss. Socrates too could not be rebuked as he was compelled by the state to do so. Notwithstanding his seemingly lenience for suicide, he launches into a draconian tirade against those who end their lives out of “weakness to the vicissitudes of life”.

As the originator of manifold scientific disciplines from marine biology to logic, ethics to psychology, Aristotle appears more down-to-earth than his counterparts. He dismisses suicide as an injustice to community and a type of social larceny. However, he does not waver in his rationalization of suicide for the sake of community. Taking your life is not only condonable but also commendable, provided you cede it to the republic.

Throughout history, medical sphere has always laid the groundwork for fierce disputes over toleration of suicide. As one of the pioneers of scientific medicine, Hippocrates' (460 to 377 B.C.E.) express rejection of assisted-suicide is manifest in his famous adage "First, do no harm." Hippocratic Oath patently gainsays euthanasia: "I will neither give a deadly drug to anybody if asked for it, nor will I make any suggestion to this effect." Only patients who were "overmastered by their disease" (Hippocrates, 1967, pp.185-217) were an exception to the rule. They were allowed to make a plea to practitioners to relieve them of pain forever.

The advent of stoicism late in the Greek period marks an epoch incontestably tolerant of suicide. At the heart of stoicism was the idea of accepting life as it is. Resignation and passivity are the pivots around which their whole ascetic philosophy revolves. Characteristically, they were completely impervious to death and embraced it with open arms. One should leave life as one leaves a room that has become too smoky. Given their skeptical outlook on life, this came to mean a penchant for death. The school was founded by Zeno of Citium and was in the ascendant until 529 C.E. when the Byzantine emperor Justinian closed all the philosophical schools in deference to Christianity.

Both Greeks and Romans feast their eyes on death naturalistically. The idea of an afterlife for ordinary people, distinct from gods, begins to emerge, vaguely, in the Judaism of the eighth and seventh centuries B.C.E., starting with the prophet Isaiah but it could never supersede pagan ideologies. Centuries later, the author of Ecclesiastes spells out the fact:

For that which befalleth the sons of men befalleth beasts; even one thing befalleth them: as the one dieth, so dieth the other; yea, they have all one breath; so that a man hath no preeminence above a beast: for all is vanity. All go unto one place; all are of the dust, and all turn to dust again. Who knoweth the spirit of man that goeth upward, and the spirit of the beast that goeth downward to the earth? (Ecclesiastes 3:19–21).

Elsewhere the eponymous Preacher writes:

For to him that is joined to all the living there is hope: for a living dog is better than a dead lion. For the living know that they shall die: but the dead know not anything, neither have they any more a reward; for the memory of them is forgotten. Also their love, and their hatred, and their envy, is now perished; neither have they any more a portion forever in anything that is done under the sun (Ecclesiastes 9:4–6).

In the Hellenistic age, dating from the death of Alexander the Great in 323 B.C.E. and spreading throughout the vast Roman Empire, a range of "mystery religions" came to prominence, namely, the cult of Isis, the Eleusinian Mysteries and the Mythraic Mysteries. In a completely rarefied atmosphere, their cosmopolitan luminaries passed on the occult and provided their initiates with insurance and a life after demise. The epidemic dissemination of mystic ideologies was to a large extent an insurrection against the frosty religion of the state. Pre-Christian Romans' worldview, after all, had been predicated principally upon mundane doctrines and for them adherence to the values and virtues of community was the chief avenue to safeguard purpose and inner peace.

Allegiance to such mores required them to keep cool in confrontation with death and even to sacrifice their lives for a sublime end.

Hellenistic period is also marked by Epicurean movement which was thought of as tolerant towards suicide. Epicurus (341 to 270 B.C.E.), based upon the little writing imparted to us, was steadfast in cleansing the man of the fear of death, fear of the gods and fear of death:

Whatsoever causes no annoyance when it is present causes only a groundless pain in the expectation. Death, therefore, the most awful of evils, is nothing to us, seeing that, when we are, death is not come, and when death is come, we are not. It is nothing then, either to the living or to the dead, for with the living it is not and the dead exist no longer (Epicurus, 1972, pp.649-50).

The Roman poet and philosopher Lucretius was the great bard of Epicureanism and is said to have taken his own life at age forty-five, in 55 B.C.E. Due to the fact that so little of Epicurus' own writing has survived thus far, he could come to our aid opportunely in order to elucidate Epicureans' approach towards death. In line with his shaman, in his book-length poem entitled *On the Nature of Things*, he outspokenly dispenses with the feeling of apprehension for death:

Death, then, is nothing to us, no concern,

Once we grant that the soul will also die.

Just as we felt no pain in ages past

When the Carthaginians swarmed to the attack,

So too, when we no longer are, when our

Union of body and soul is put asunder,

Hardly shall anything then, when we are not,

Happen to us at all and stir the senses,

Not if the earth were embroiled with the sea and
the sea with heaven!

Now if you happen to see someone resent

That after death he'll be put down to stink

Or be picked apart by beasts or burnt on the pyre,

You know that he doesn't ring true, that something hidden

Rankles his heart—no matter how often he says

He trusts that there's no feeling after death (Lucretius, 1995, pp. 26-27).

It should be noted, however, that Lucretius' writing, unlike Epicurus', strikes us as existential and nihilistic. While comradeship and elation constituted central tenets of Epicurus' mindset, Lucretius appears to have been a much more skeptical disciple. According to him, "each man tries to flee from himself, but to that self, from which of course he can never escape, he clings against his will, and hates it." The fact comes as no surprise as according to historians, cynicism had suffused the period between the seventh and fourth centuries B.C. Among the heavyweights of philosophy, Theognis of Megara, Sophocles, Euripides, Herodotus, and Democritus were great apostles of the right for suicide. Epictetus, the prominent stoic philosopher puts in his two cents'

worth: “live as long as it is agreeable; if the game does not please you, go; if you stay, do not complain.”

Cato was a Roman statesman and is recognized as an apotheosis of rectitude. He was also a Stoic. In 49 B.C.E. when Caesar could wrest the power from Senate, Cato preferred to end his life rather than witnessing the demise of the Republic and bowing down before a victorious Caesar. Based on valid documents he, in all likelihood, took his life twice. In one version, he first gashed his abdomen. He was found covered with blood and a doctor replaced his intestines and stitched up his wound but when left alone again, Cato ripped out the stitches, eviscerated himself again, and finally died.

Cicero (106 to 43 B.C.E.), the ingenious Roman rhetorician, philosopher and statesman, brings another arresting commentary on suicide. Cicero and Cato are poles apart as Cicero acclimatized himself to the political reversal following the investiture of Julius Caesar. He on the one hand finds Cato a model of liberty and on the other hand sees eye to eye with Plato that no man should exercise his right to die as we should attend our posts fully. In point of fact, he applauded self-sacrifice for the sake of state:

“But noble deaths, sought voluntarily, for the sake of country, are not only commonly reckoned glorious by rhetoricians but also happy. They go back to Erechtheus, whose daughters sought even with eagerness for death to save the lives of their fellow-citizens” (Cicero, 1950, pp. 116-17).

Women have been always viewed as the pillars of strength in reference to suicide. There is no shadow of a doubt that Lucretia should be reckoned as one of the greatest sources of inspiration for the ancients. Raped by Etruscan king's son Sextus Tarquinius, this semi-legendary figure in the history of the Roman Republic took her own life clamoring for justice. The incident is said to have kindled the revolution that overthrew the monarchy and established the Roman Republic. Arria, is another Roman figure who was recognized as the embodiment of self-sacrifice and the quintessence of philosophical spirit. In the year 42 C.E. when his husband Caecina Paetus was convicted of treason by the emperor Claudius and dictated to kill himself, he found himself too pusillanimous to undertake the task. Finding her mate shamefully effete, Arria valiantly stabbed the dagger into her chest, famously saying, “Nondoleat, Paete!”—It doesn't hurt, Paetus!—and handed the dagger back to him for his turn (Pliny the Younger, 2006, pp. 152-53). Pliny the Younger (61–c. 112 C.E.) held many contemporary suicides in high esteem most of which validate the great influence exerted by stoic movement. He recounts how a severely wounded soldier is emboldened by his wife to take both their lives. The fact overtly betokens the potent example that Arria served for Romans. Porcia Catonis is another salient female figure who is supposed to have wolfed down scorching coals upon hearing the death of his husband Brutus. To belabor the point, Cleopatra made a sharp retort to Augustus Caesar's inauguration by committing suicide, clutching two poisonous asps to her breast.

Quite interestingly, unrequited love provided compelling impetus for the ancients to end their lives. Virgil (70–19 B.C.E.) the illustrious Roman poet makes us conversant with absorbing

instances of suicide for love. In his *Aeneid* he relates how Dido, the queen of Carthage, killed herself when Aeneas, with whom she had fallen in love, left him. In another story, when Theseus forgot to hoist the white sail to denote his victory, his father Aegeus presumed his son to be dead and drowned himself in the sea, which from then on bore his name. Similar is the suicide of Hero who dolefully drowned herself when Leander's body washed ashore. Considering the following passage on the ancient queen, no apparent condemnation of suicide catches our eyes:

"Let me die, I go gladly to the dark.
May the heartless Trojan see my flaming pyre
from far out on the deep
and let it bring him evil omens." She spoke
and then her maidens saw her fall
upon her sword, the red blood spouting
and frothing over her sword
drenching her hands (Virgil, 2009, p. 89).

CONCLUSION

The ignominy and abhorrence attached to the act of suicide in the Middle Ages conspicuously had no precedence in the ancient times. Even from a religious point of view, the Old Testament and the New Testament not only adopted a tolerant stance against suicide but also paid tribute to the act in some cases. We may therefore conclude that it was in the writings of church authorities such as St. Augustine and St. Aquinas that suicide was later regarded as an obvious violation of God's rights and was bitterly repressed in the Middle Ages. For the ancients, suicide could be interpreted as a means of attaining honor and grace when capitulation or death in the hands of enemy was the last resort. Surprisingly, women, who later on were known to be the fair sex, were the paragons of courage and honor for the ancients and were in many cases among the most renowned suicides. It was also viewed as a means of expiation when a hero made a tragic flaw and merited retribution for that. Moreover, ancients pertaining to an existential philosophy of life, sometimes favored suicide over tolerating the backbreaking after-effects of a great loss, for instance, in the cases of unrequited love. The fact attests to the fact that ancients had no strong adherence to the blessings of an afterlife so when worldly life ceased to fulfill their aspirations they preferred to do themselves in.

ABSTRACT

Phonetic awareness is identified as a key early literacy skill which plays an important role in learners' academic success. The present study aims to investigate the relationship between Emotional Intelligence (EI) and Phonological Awareness (PA). This paper reports an experimental study. The present study was conducted on students who were selected based on the convenient sampling. 57 lower-intermediate English students were selected from four different private English institutes in Zanzan and Gazvin cities in Iran. From the total participants, 27 were males and 30 were females. Two types of instrument were employed to collect the necessary data, a test on phonological awareness and a questionnaire on emotional intelligence. The findings of the study indicated that there is no significant correlation between EI and PA. Further interpretations of the results revealed that some other extraneous factors might directly or indirectly shed some light on PA. The practitioners, active in teaching pronunciation, can benefit more from the current study. The most fundamental implication is that teachers are supposed to be aware that students with high or low EI will perform equally on PA.

KEYWORDS: emotional intelligence, phonological awareness, foreign/second language acquisition.

INTRODUCTION

Phonetic perception and production are known to be an essential part of human development. As children grow up, they begin to manifest the ability to discriminate between sounds and

consequently perceive them. The ability to distinguish sounds is the issue of PA (Erdos, Genesee, Haigh, & Savage 2011; Konza, 2011; Mathes & Torgesen, 1998). Due to the significance of PA, especially in early years of life, there have been various attempts to define it (Anthony & Francis, 2005; Griffith & Olson, 2004; Yopp & Yopp, 2009). Yopp and Yopp, for instance, define it as 'the ability to manipulate individual sounds (phonemes) in words, and rudimentary phonological skills, such as judging whether two words rhyme' (2009, p.1). In other words, children who can detect and manipulate sounds are phonologically aware. PA as an auditory skill which affects learners' academic success is a necessary step in understanding the relationship between the sounds and letters (Torgesen & Wagner, 1998). Owing to this fact, it plays a noticeable role in learning to read and spell (Bentin, 1992; Katzir, Kennedy, Kim, Lovett, Morris & Wolf, 2006). Although PA skills do not lead to independent and successful readers, they are crucial steps in the development of reading skills. Students who do not have sufficient awareness of how speech is divided into small sounds will have difficulty in learning to read a written system. In order to foster learners' PA, various strategies can be implemented. Some of these strategies that are related to emotions rather than cognition deal with emotional intelligence.

Emotional intelligence (EI) as a term that has long attracted the attention of scholars and researchers encounters with a plethora of definitions (Assanova & McGuire, 2009; Gardner, 1983; Goleman, 1995). Ardashiri and Zarafshan contend that 'EI is largely accepted as the ability to understand and apply the knowledge created from our emotions to aid effective functioning, reduce the impact of stress, and enhance relationships' (2012, p.106). Furthermore, EI plays a considerable role in students' educational success. Numerous studies have attempted to investigate the effect of EI on learners' academic achievement (Brackett & Salovey, 2006; Mohammadi, 2012; Williford, 2000). Studies indicate that students with high level of EI are more willing to take part in speaking and brain based-activities. They try to cooperate with other students because they have high level of social skills and self-esteem. In contrast, low level of EI leads to isolation from classroom environment, conversations as well as brain-based activities (Bora, 2012).

LITERATURE REVIEW

Phonological awareness (PA) is a term that should not be confused with other terms such as phonemic awareness and phonics which are the sub skills of PA (Yopp & Yopp, 2000). PA refers to the skill of analyzing the words at the level of independent sound units. These skills place on two ends of a continuum ranging from holistic, simple form of awareness to more complex forms (Cisero & Royer, 1995; Treiman & Zukowski, 1991; Yopp & Yopp, 2009). Less complex end of a continuum encompasses activities such as initial rhyming, rhyming songs, sentence segmentation and so forth. At the complex end of a continuum are activities such as breaking words into onsets and rimes as well as blending rime and onset into words. Finally, phoneme segmentation is an instance of more complex level of awareness which requires explicit instruction. Moreover, PA is a general perception of person about how spoken language can be divided in to its components. For instance, it can be a perception about how sentences are divided into words, syllables as well as rimes and onsets. When a syllable is broken down into the smallest units, the term phonemic awareness is applied (Ehri, Nunes, Schuster, Shanahan,

Willows, & Yaghoub-Zadeh, 2001; Burns, Griffin & Snow, 1998). Phonemic awareness refers to sound when words are divided in to their smallest units of sounds. Finally, Phonics refers to how speech sound and written letter correspond to each other (Burns, Griffin & Snow, 1998). The significance of phonemic awareness in fostering the learners' PA should not be overlooked. 'A child's phonemic awareness on entering school is widely held to be the strongest single determinant of the success that she or he will experience in learning or conversely, the likelihood that she or he will fail' (Stanovich, 1994, p.2).

Without sufficient awareness of how words can be broken down into discrete segments, identification and manipulation of sounds becomes difficult or even impossible. As the words are divided into the smallest units, phonemes, phonemic awareness manifest itself. Consequently, familiarity with phonics enables learners to comprehend the relationship between letters and sounds. To put in a nutshell, being a competent reader requires learners to pass through five steps including phonemic awareness, phonics, fluency, vocabulary and text comprehension in which the PA is the fundamental skill. PA is developed through certain activities. Most of these activities refer to preschool period (Mathes & Torgesen, 1998).

PA is practiced during kindergarten and the first grade at school with children (Ehri & Roberts, 2006; McGee & Ukrainetz, 2009). During this period, children have natural tendency to play with language and develop their PA. The major objective of PA is directing children's attention to the elements of the words, thus it demands certain mental processing including thinking, recognizing, distinguishing, exploring and realizing the sound of language. Through activities that stimulate phonetic awareness, children listen to each other while reading aloud, then recognize the sounds in words and repeat it for themselves and recognize familiar sounds. By practicing and engaging in different tasks during classroom activity, learners understand the patterns among words and apply this knowledge to reading and sentence processing. It is worth noting that PA is a skill that should be taught to children; it cannot develop on its own (Chard & Dickson, 1999; Christie, Richgelds & Roskos, 2003; Ege, 2006; Justice, Pullen, 2003; Lonigan, Menchetti & Phillips, 2008; Olofsson & Niedersoe, 1999; Rubba, 2004; Torgesen et al., 1992; Torgesen & Wagner, 1998). In this case, preschool teachers can help children extend their PA through activities such as reading aloud books that play with sounds, sharing poetry that plays with sounds, sharing songs that play with sounds as well as playing games that draw attention to sounds. In addition to these activities, according to National Association for the Education of Young Children (2009) PA instruction should be purposeful and child-appropriate. Moreover, similar to various domains of second/foreign language learning, phonetic acquisition deals with factors that are emotion based.

One of the areas concerning with emotion is Emotional Intelligence (EI) which has a long history. About 2000 years ago, Plato indicated that all learning has an emotional base (Della-Chiesa, Hinton & Miyamoto; 2008; Wharam, 2009). According to Matthews, Roberts and Zeidner (1997), in 1872 Charles Darwin found that it was not the fact that the strongest or the most intelligent species could survive but the species that are the most responsive to changes could survive more. In 1920, Edward Lee Thorndike introduced social intelligence which referred to the ability to understand and manage people in order to act and behave wisely. The

advent of social intelligence made the foundation for emergence of EI. In 1950s, Abraham Maslow introduced his hierarchy of needs in which the emotional need placed in higher order needs (Burden & Williams, 1997). In 1990, Peter Mayer and John Salovey found that some people are much better than others in recognizing their own emotion and other people's feeling and solving problem in relation to emotional matter. They perceived the non-cognitive aspect of intelligence in previous works and coined the term emotional intelligence in 1990. According to Salovey and Mayer (1990) EI is a form of social intelligence that involves the ability to monitor one's own and others' feelings and emotions, to discriminate among them, and to use this information to guide one's thinking and action

Mayer and Salovey introduced a four-skilled model of EI skills in which the four skills are inter-related in a way that mastery in one skill influences the other areas. The first skill is “perception of emotion” which refers to perception of emotion in oneself and others. The second skill is “the use of emotion to facilitate thinking” which refers to ability to use or generate emotions to focus on attention, communicate feelings, or engage in other cognitive processes such as reasoning, decision making and problem solving. The third skill is “understands of emotion” which refers to ability to understand emotional information and the causes of emotions. The fourth skill is “management of emotion” which concerns with the ability to be open to feelings and apply effective strategies to promote personal understanding and growth. In 1992, Daniel Goleman investigated about why EI is more important than IQ (Kagan, 1995). Goleman suggested that IQ by itself is not a predictor of human performance in activities and only about twenty five percepts of human performance deals with IQ. The most recent definition which made an attempt to put the most encompassing definition forward was as the capacity, ability, skill, or potential to feel, use, communicate, recognize, remember, describe, identify, learn from, manage, understand and explain emotions (Hein, 2007). In all of the definitions of the EI there are some common features: first, it relates to the person ability to be self-aware and understand his/her own emotions whenever experience them. Second, it relates to discover other people's emotion. Third, it refers to manipulating emotional information. Studies on emotional intelligence suggest that EI skills deals with knowing how and when to express emotion and how and when to control emotion which plays a crucial role in children's personal, social and academic lives. Bora (2012) pointed out that students with high level of EI were more engaged in classroom activities because their self-esteem and social skills were in a high level. Previous studies indicate that cognitive and non-cognitive abilities relate to each other highly. Emotional and social skills cause improvement in cognitive function. Ghanizadeh and Moafian (2011) suggested that there was a significant relationship between students' emotional intelligence and their critical thinking skills.

Regarding PA, most of the previous studies focus on the relationship between PA and reading. In the context of Iran, Dastjerdi, Jahani, Mehri, Saeedmanesh and Soleymani (2009) conducted a study in order to investigate the relationship between PA and reading in first grade students. They concluded that there is a direct relationship between PA and reading. In another study, Kazemi (2014) argued that teaching PA can improve students' reading achievement. It is worth mentioning that a number of these studies take into consideration kindergarten children's PA claiming that PA can facilitate reading comprehension (Kjeldsen, Niemi & Olofsson, 2003). Accordingly, Chein (2002) confirmed that among different PA tasks (e.g. syllable awareness,

onset-rime awareness, and phonemic awareness) phonemic awareness has the highest relationship with reading and speaking skills.

While the so-called studies focus on the PA of kindergarten children, the present study focuses on lower-intermediate EFL learners' PA. This study is an innovative one for this area, since the relationship between PA and EI is being investigated which is not the focus of the previous studies.

RESEARCH QUESTION

Study of emotional intelligence and investigation of its relationship with foreign/second language acquisition is a new phenomenon in educational contexts (Ardashiri & Zarafshan, 2012). Very limited numbers of studies have attempted to focus on the effect of EI on PA. In the present study, the relationship between emotional intelligence and phonological awareness was investigated. Therefore, the following research question was formulated for current study.

Is there any relationship between emotional intelligence and phonological awareness?

METHODOLOGY

Participants

57 Iranian students who studied English as a foreign language in private English institutes of Zanzan and Qazvin served as the participants of the present study. 30 of students were females and 27 of the students were males. The students were in lower-intermediate level of language proficiency based on the levels specified by institutes. They ranged in age from 12 to 15 and had already studied English.

Instruments

This study is conducted by a questionnaire and a test. The test was on phonological awareness naming Phonological Awareness Quick Screening Test (PAQST). Adams and Foorman (1998) developed PAQST which consisted of 66 items. PAQST was designed to measure respondents' perceptions of their ability in awareness of phonology. The reliability of the Phonological Awareness Quick Screening Test was computed through method of estimating reliability and reported to be 0.76.

The second instrument which was applied to measure emotional intelligence of the participants was Schutte Self-Report Emotional Intelligence Test (SSEIT). The SSEIT includes 33 items self-report, each of which used a five-point Likert scale ranging from 1 (strongly disagree) to 5 (strongly agree). Moreover, the reliability index of the test was calculated and reported to be 0.91.

Procedure

Permission for data collection was granted from the principals of four different language institutes in Zanzan and Qazvin. Administers distributed the PAQST papers test among the participants. Then, respondents were asked to provide details of their age, gender and educational level. Before administering the test, administrators explained about the test briefly and the

respondents were informed about the purpose of the study. Then, administrators of the test assisted the participants in replying the questions step by step in order to make them more capable in answering the questions properly.

After collecting the PAQST test papers, the SSEIT questionnaire papers were distributed among the same participants. Administrators explained the details of replying the questions. Furthermore, administrators translated every question of the questionnaire into participants' mother tongue in order to guarantee effective data gathering and avoid comprehension problems that participants might encounter when given the English one.

RESULTS AND DISCUSSION

In the present study the relationship between lower-intermediate language learners' emotional intelligence (EI) and phonological awareness (PA) was gone under investigation. Statistical procedures were established in order to answer the research question concerning if there is any probable relationship between learners' level of EI and their level of PA and to test hypothesis. It was hypothesized that a positive relationship exists between EI and PA.

Based on the students' scores obtained from SSEIT and PAQST test, two-tailed Pearson correlation was conducted in order to find the relationship between the two variables. Statistical package for the social science (SPSS) version 16.0 was used for analysis, and results were presented in Table 1.

Table 1: Two-Tailed Pearson Correlation between Scores of EI and PA

	E.I	P.A
E.I Pearson Correlation	1	-0.21
Sig. (2-tailed)		.875
N	57	57
P.A Pearson Correlation	-0.21	1
Sig. (2-tailed)	.875	
N	57	57

As the results indicate there is no significant relationship between PA and EI (correlation between two variables ($r = -.021$) is negative and the Sig. (2-Tailed) value is .875 which is more than .05 indicating that there is no statistically significant correlation between the variables of the study.). Therefore, increase or decrease in EI does not significantly relate to increase or decrease in PA.

CONCLUSION

This study was an attempt to investigate the possible relationship between emotional intelligence (EI) and phonological awareness (PA). Appropriate statistical procedures were followed to get required answers to the research question. The research question investigated if there is any probable relationship between language learners' level of EI and their level of PA. The hypothesis was that whether monitoring of one's emotions could be a strategy to develop phonological awareness which plays a crucial role in learners' reading skills. As it is presented in the above section, this study indicated that there is no positive and significant relationship between the two variables. The analysis demonstrated that students with high level of EI may or may not have high level of phonological awareness. In other words, EI has no impact on learners' PA. So the hypothesis of the study claiming that there is a positive relationship between EI and PA was rejected.

To the best knowledge of the so far researchers no other studies have yet attempted to assess the relationship between EI and PA. However, there are numerous studies focusing on either of the variables independently and their impact on learner skills. One of these studies conducted by Ghanizadeh and Moafian (2011) suggested that there was a significant relationship between students' EI and their critical thinking skills. While some other studies assessing the effect of EI on learners' academic achievement (Brackett & Salovey, 2006; Mohammadi, 2012; Williford, 2000), indicated that students with high level of EI are more willing to take part in speaking and brain based-activities. According to these and many other studies mentioned in the above sections it appeared that EI and PA have positive impacts on learners' achievements, though findings of this study revealed no statistically significant correlation between EI and PA.

However, the researchers do not claim that the results obtained from this study are absolutely conclusive. Furthermore, it is suggested that the findings of the present study should not be taken as definitive rather as indicative of some hypotheses to be tested in future studies.

Limitation of the Study

Like other studies, this study had some limitations. One of the major limitations of the present study was about sample size. Larger sample size could definitely lead to significant results. Since the focus of the present study was on the relationship between emotional intelligence and phonological awareness, the results cannot be applied to other areas such as vocabulary, grammar and so forth. What is more, gender issue was not exclusively controlled for current study; therefore, more studies are needed to ponder upon these kinds of relationships with a focus on gender.

THE EFFECT OF LEITNER'S BOX ON IMPROVEMENT OF VOCABULARY RETENTION

Mansoorreh Hosseinnia and Roghayeh Maghsoodi

ABSTRACT

The goal of this paper was to investigate the effect of using Leitner's learning box in studying inter-mediate to advanced vocabularies among the students of Saba English institution in Jajarm, North Khorasan, Iran. This research was carried out in two classes of male and female learners which were between the ages of 15 to 18.. Sixty learners were randomly chosen from among the students of Saba English institution, who were studying in 18th term. The test was performed in fall semester 2014. One class was considered the control group that received the conventional treatment while the other class that was considered as experimental group received the Leitner's learning box to use it for learning vocabulary. Before initiating the treatment, two similar tests were prepared as the pre-test and post-test to discover the vocabulary knowledge of the students at the initial and final stages of the study. The analysis of obtained results in the post-test manifested significant differences between the two groups such that the students in the experimental group outperformed the students in the control group in terms of their vocabulary knowledge. Thus, it was concluded that the use of Leitner's learning box in studying vocabulary for the 18th term students of saba English institution led to a higher level of vocabulary improvement.

KEYWORDS: vocabulary, vocabulary test, Leitner's box, active words, passive words.

INTRODUCTION

“Vocabulary is a core component of language proficiency and provides much of the basis for how well learners speak, listen, read, and write.” Without an extensive vocabulary and strategies for acquiring new vocabulary, “learners often achieve less than their potential” and may be discouraged from making use of language learning opportunities such as listening to the radio, listening to native speakers, using the language in different contexts, reading, or watching television”(Richards, 2002).

“If language structures make up the skeleton of language, then it is vocabulary that provides the vital organs and the flesh.” (Harmer 1993) . One of the most challenging parts of language learning is the acquisition of vocabulary. Vocabulary as a main component of English language learning has drawn many attentions in past years. Laufer (1997) indicates that learning the vocabulary is at the heart of language learning and its use. Indeed, vocabulary makes the essence of English language. Vocabulary is an intrinsic part of language teaching as well as learning. Vocabulary is essential for critical thinking, close reading, concise writing and other skills (Levines., 2005). Many researchers concur that there is very little research performed in the field of vocabulary learning and that the most effective means of vocabulary learning is still unclear (Folse, 2004; Hunt & Beglar, 2005; Annette & De Groot, 2006).

“Learning vocabulary is a very important part of learning a language. The more words you know, the more you will be able to understand what you hear and read; and the better you will be able to say what you want to when speaking or writing” (Shoebottom, 2012).

In the English language teaching and learning literature, a recurring theme has been always the neglect of vocabulary. It was often given little priority in language programs and was often left to be looked after itself and received only incidental attention in textbooks and language programs (Hedge, 2008; Richards & Renandya, 2002). Many authors remark that at one time it was widely assumed that lexical instruction is not essential as it can happen by itself; thus, the vocabulary teaching was not popular (Moir & Nation 2008). However, today, the importance of vocabulary and its significance in language learning have become more accepted. Griffiths (2006) indicates, for instance, that recently the significance of teaching vocabulary has been acknowledged. Learning vocabulary seems to be one of the easiest things about learning a language (after all, it's not difficult to remember a word, is it?). But it's also one of the hardest things to do, especially when you have reached a certain level.

Although vocabulary has been the subject of several studies, few researches have revealed the effective techniques of vocabulary teaching and learning. Thus, it is of great importance to find the most effective techniques for vocabulary teaching. Based on a research performed by Allen (1983), all experienced language teachers verify the important role of words and know that the lack of them leads to feeling of insecurity.

Vocabulary is an indispensable part of English language learning process. It would be impossible to learn a language without vocabulary. The important role of vocabulary has been emphasized in all different methods in language teaching and learning. Rivers (1981) states that vocabulary cannot be taught; it can be presented, explained, included in all kinds of activities, but it must be learned by the individual. “Have you ever wanted to increase your English vocabulary? As most learners agree, it's vital to know a lot of words if you want to make progress in a foreign language. Even if your grammar is excellent, you just won't be able to communicate your meaning without a wide vocabulary. But exactly how can you increase your vocabulary knowledge?” (Pemberton, 1997).

Statement of problem

The place of vocabulary in L2 teaching and learning has deservedly received great attention in recent years. Due to this fact, materials designers have been trying to provide L2 learners some ways or devices to increase our vocabulary knowledge.

Significance of the study

Vocabulary learning is central to language acquisition, whether the language is first, second, or foreign. Despite the fact that vocabulary has not always been recognized as a priority in language teaching, interest in its role in second language (L2) learning has grown rapidly in recent years and specialists now emphasize the need for a systematic and principles approach to vocabulary

by both teacher and the learner. The problem, “how can you increase your vocabulary knowledge?” is the significance of this study lies.

LITERATURE REVIEW

Vocabulary is considered as one of the important components of language knowledge. Horowitz (1988) found that a large number of ESL students completing her questionnaire either agreed or strongly agreed that “the most important part of learning a foreign language is learning its vocabulary”. Also research has shown that “lexical errors tend to impede comprehension more than grammatical errors and native-speaking judges tend to consider lexical errors as more serious than grammatical ones” (Ellis, 1994). Widdowson, 1993 (as cited in Lewis, 1993: 115) states that the more we consider the matter, the more reasonable it seems to suppose that it is the starting point, and that the syntax need to be put to the service of words and not the other way round. Interest in second language vocabulary acquisition (hereafter SLVA) has grown steadily in the last thirty years. It has given rise to the procedure of several excellent books (e.g., Huckin, Haynes, & Coady, 1993; Huckin & Coady, 1997; Nation, 1990; Schmitt & McCarthy, 1997; Singleton, 1999; Schmitt, 2000).

Some information about learning words

“The vocabulary you know can be divided into two groups - passive vocabulary and active vocabulary. Passive vocabulary contains all the words that you understand when you read or listen, but which you do not use (or cannot remember) in your own writing and speaking. Active vocabulary is all the words you understand, plus all the words that you can use yourself. Your active vocabulary, in English and your own language, is probably much smaller than your passive vocabulary.

The more you work on learning a word, as suggested above, the more likely it is that it will become part of your active vocabulary. Once you have chosen which words to learn, you next have to decide how you are going to learn them” (Shoebottom, 2012). Here we want to introduce a useful device for leaning vocabulary and investigate the effect of it for learning vocabulary.

Leitner’s box

“Our brains get bombarded with information provided by our senses. We are presented with too much to store and encode. The brain has developed sophisticated algorithms for throwing away information. The brain has developed algorithms for encoding information into Long Term MEMORY if it is important. We can use these methods of moving information from Sensory MEMORY into Working MEMORY and encoding it into Long Term MEMORY for easy recall later. Leitner’s Cardbox application is designed to lift things into the Long Term MEMORY through controlled repetition and spacing. The box system (also called “Leitner system”) was originally conceived by German psychologist Sebastian Leitner in the 1960s. Its purpose is to provide a structure for people to learn and retain vocabularies in short-term and long-term memory. The box system is comprised of a set of boxes (5 in the case of Leitner’s Cardbox application), each containing a certain number of flashcards. This amount rises proportionally with the box’s number. Also, the higher the box number, the nearer are the respective cards in the

long-term memory. Leitner's Cardbox application is based upon the algorithm as developed and tested by Sebastian Leitner a German psychologist" (ITNT, 2003- 2011).

Method

In this method flashcards are sorted into groups according to how well you know each one in the **Leitner's learning box**. This is how it works: you try to recall the solution written on a flashcard. If you succeed, you send the card to the next group. But if you fail, you send it back to the first group. Each succeeding group has a longer period of time before you are required to revisit the cards.

examples

Example 1. Suppose you have 3 groups called Group 1, Group 2 and Group 3. The cards in Group 1 are the ones that you often make mistakes with, and Group 3 contains the cards that you know very well. You might choose to study the Group 1 cards once a day, Group 2 every 3 days, and the Group 3 cards every 5 days. If you look at a Group 1 card and get the correct answer, you "promote" it to Group 2. A correct answer with a Group 2 card "promotes" that card to Group 3. If you make a mistake with a Group 2 or Group 3 card, it gets "demoted" to the first level, which forces you to study that card more often.

The advantage of this method is that you can focus on the most difficult flashcards, which remain in the first few groups. The result is, ideally, a reduction in the amount of study time needed.

Example 2. This example uses 5 proficiency levels and 12 decks of flash cards. Cards at Proficiency Level 1 are reviewed at every learning session; those at Level 5 are retired and no longer in use. Those at Levels 2, 3, and 4 are reviewed every 2nd, 3rd, and 4th session, respectively.

Learning sessions are numbered from 0 to 9, then the numbering starts over again (that is, 0, 1, 2, ... 8, 9, 0, 1, 2 ...). Cards at Level 1 are in Deck Current; those at Level 5 are in Deck Retired; all other cards are in 1 of these 10 "progress" decks, each of which begins with a title card sporting 4 digits:

0-2-5-9 • 1-3-6-0 • 2-4-7-1 • 3-5-8-2 • 4-6-9-3 • 5-7-0-4 • 6-8-1-5 • 7-9-2-6 • 8-0-3-7 • 9-1-4-8 If a learner is successful at a card from Deck Current, it gets transferred into the progress deck that begins with that session's number. (For example, success at a card during Session 6 transfers it from Deck Current to Deck 6-8-1-5.) Cards from that deck are reviewed whenever a number from the deck title matches the session number. (For example, cards from Deck 6-8-1-5 will be reviewed again at Sessions 8, 1, and 5.) If a learner has difficulty with a card during a subsequent review, the card is returned to Deck Current; otherwise it stays in its progress deck. When a learner is successful at a card during a session that matches the last number on the deck (for example, Session 5 for Deck 6-8-1-5), that card goes into Deck Retired, and the title card for that progress deck is freed up for use at the following session (Wikipedia, the free encyclopedia)".

Figure 1.

benefits

- **Selective Learning:** Prioritize your studying by focusing on the proper compartment—each compartment represents a degree of knowledge. This allows you to learn what you need to learn, when you want to learn it.
- **Staggered Learning:** Using the review scheduling system allows you to maintain properly spaced review sessions. Staggered learning minimizes the amount of time required to complete a cardfile and maximizes information retention.
- **Automation:** Flashcards are moved between the compartments without effort. Review frequency is determined automatically using established intervals and an e-mail will show up each day indicating what cardfiles you need to study.
- **Assessment:** By examining the distribution of flashcards within the various compartments you can easily gauge your mastery of the subject.
- **Community:** Cardfiles can be made up of any of the hundreds of thousands of flashcards in our system. Add these flashcards to your own cardfiles to leverage the time spent by your peers to create these flashcards”(Tuolumne Technology Group, 2001, 2012).

“Leitner Learning Strategy

” (Granule User's Manual)

RESEARCH QUESTIONS

Based on the mentioned problems and the study purpose, the following questions were posed:

Q1: Is there any noticeable difference between the impact of traditional teaching method and the Leitner's learning box (LLB method) on vocabulary knowledge of the students of Saba English institution?

Q2: Does using LLB have a positive effect on students' vocabulary knowledge and learning?

RESEARCH HYPOTHESIS

According to a review of literature and the aforementioned lines of reasoning the following alternative hypothesis was formulated.

H1: There is no significant difference between the mean scores of the students in the experimental group who use LLB and the mean scores of those students in the control group who do not use LLB.

H2: Using LLB does not have a positive effect on vocabulary knowledge of students of one class in the experimental group at the end of the study and treatment.

H3: Traditional teaching treatment does not have a positive effect on vocabulary knowledge of first year students in the control group at the end of the study.

METHODOLOGY

Study Design

A quantitative study was selected because of the nature of this research and the research questions. In addition, the proper design for this study was experimental. Two groups were selected. One group served as the experimental group and received treatment (LLB) while the other group served as the control group and received only the routine instruction. To verify the homogeneity of the two groups a language proficiency test was carried out for this purpose. It should be mentioned that the control and the experimental groups were matched for every items except for the treatment. Both groups were the students of 18th term of Saba English institution in two different classes. In order to measure the effectiveness of the treatment, the pre-test / post-test design was selected. In this case, the words in this study were chosen of *Interchange* (Jack c. Richards) that was taught in 18th term of Saba institution. Before starting the treatment, the authors made a one hundred item multiple-choice test and did a pilot study on a smaller group. The one hundred item multiple-choice test was split into two equal halves based on odd and even numbers as the pre-test and post-test.

Participants

Sixty learners were randomly chosen from among the students of Saba English institution, who were studying in 18th term. The participants were both male and female learners and they were between the ages of 15 to 18. The cluster sampling was used to select and specify the number of students required to carry out the experiment, that is, the procedure of selection of participants started with randomizing the larger groups and moved toward smaller ones. Therefore the unit of selection was not an individual but a group of individuals. They were divided into two groups of thirty learners. One group used leitner's box for learning the vocabulary of 18th term's book, the other group not.

Instruments

The first instrument which was used by the Institute to measure the language proficiency level of the students was the Vocabulary English Language Test. The test aimed to measure the vocabulary level of the students in 18th term which was chosen of the Interchange book, Intro. The second instrument was SPSS software used for the analysis of data.

Procedure

After selecting and dividing students in two groups (one group were used Leitner's box for retention of words, another group weren't used Leitner's box for retention of words), the researcher gave them a vocabulary test to examine their vocabulary English language proficiency level. Then she analyzed the data by SPSS software.

The obtained data

The data gathered on variables were analyzed by the following methods through SPSS software. 1) Descriptive Statistics was used to determine the mean and standard deviation of each group on the pre-tests and post-tests. 2) Independent *T*-test was used to find the difference between the levels of the students of both groups on post-tests. 3) Matched *T*-test was used to compare the two mean scores of the students of both groups in pre-test and post-test on vocabulary tests.

RESULTS AND DISCUSSION

Pre-test data

After students took the vocabulary pre-test and post-test, the mean scores, the medians, the standard deviations, the variances, the minimum and the maximum of the vocabulary pre-test and post-test scores of the control and the experimental groups were calculated respectively. The related results are given in Tables 1 and 2.

Table 1: The Results Obtained for Control Group in Pre-test and post-test

Variables	Pre-test	Post-test
Mean	13.85	14.45
Median	14.20	15.50
Standard Deviation	0.785	0.949
Variance	0.597	0.847
Minimum	12.5	13.75
Maximum	17	17

Table 2: The Results Obtained for Experimental Group in Pre-test and post-test

Variables	Pre-test	Post-test
Mean	14.35	17.05
Median	14.20	17.25
Standard Deviation	0.850	0.895
Variance	0.724	0.794
Minimum	13	15
Maximum	16	18

As Table 2 shows, like the control group, the mean of experimental group's post-test scores (17.05) is larger than the mean of pre-test scores (14.35). Therefore, from these numbers can conclude on the average the way of teaching has caused the improvement of students' scores in both relevant groups, but it is important to know that such a conclusion is only a descriptive conclusion. As Table 1 and 2 show the mean of the two groups is similar in pre-test, but the mean of the two groups was different in post-test. The result of pre-test showed that the two groups were almost at the same level of vocabulary knowledge and the mean of two groups were not of great difference.

Post-test data

After giving treatment (LLB) to the experimental group, the research questions of the study were to be answered "Is there any significant difference between the impact of traditional teaching method and using LLB on vocabulary knowledge of first year students in the university? Does using LLB have a positive effect on students' vocabulary knowledge?" to answer these questions the researcher used two comparisons. First the performances of the two groups compared and second the performances of the two groups in the pre-test and post-test compared to investigate their progress and the influence of using LLB. Table 1 and 2 show the results. The posttest results show that there is a significant difference between the control and the experimental group regarding their vocabulary knowledge. The T observed is 9.612 and T critical at the selected significance level of 0.05 for degree of freedom 24 is 2.056. In other words, the T observed exceeds the T -critical implying that the experimental group performed significantly better in the post-test. As Table shows the post-test results reject the first null hypothesis and it was concluded that there is a significant difference between the experimental and the control group in terms of their vocabulary knowledge at the end of the study. Overall, the experimental group represented a greater increase than the control group. Then based on the results the second null hypothesis was rejected and it was concluded that using LLB has a positive effect on the experimental groups' progress in their vocabulary knowledge at the end of the study.

Discussions

The results of the study indicated that though both traditional and LLB methods enhanced vocabulary development of the students from the pre-test to the post-test, the experimental group seemed to be better than the control group. That is, the experimental group students had

significantly better vocabulary gain scores than the control group students at the end of the study. During the 16-week study, both groups followed the same course book which provided the students with a number of the new vocabularies (words). While the control group students learned vocabulary only through traditional method, the experimental group students learned vocabulary only through LLB as a new method. The experimental group students in the present study were shown explicitly the LLB strategy which they could try to achieve better vocabulary learning. The students discussed this strategy was more effective than other strategies, and received help and feedback from the teacher. When they failed to only memorize a new word, they tried to use LLB strategy, as they were aware of the existence of another strategy which they could fall back on. Thus, the instruction seemed to help them to learn better new words their performance. The vocabulary instruction through LLB empowered students in learning the relevant vocabulary. During the instruction period, students themselves found that they benefited from this strategy. It seemed that after a certain amount of practice and use, they knew how and when to use this strategy for remembering new words and for retrieving it when needed.

CONCLUSION

This study examined the influence of LLB on the vocabulary knowledge of two groups of 18 term students of Saba English institution of Jajarm, North Khorasan, Iran. Through the analysis of the findings from the students' vocabulary pre-tests and post-tests, it was concluded that the contribution of LLB in teaching vocabulary to students led to a higher level of vocabulary improvement. Using LLB facilitates their involvement in the class work by sharing answers, trying to participate, paying attention, giving the examples, encouraging themselves to take part in the lesson, participating as volunteers, interacting with each other in a low-risk, warm-up activity, and utilizing the new words in the example. The findings revealed that participants in the experimental group, who had received the treatments on LLB, significantly enhanced better performance in a vocabulary test. Therefore, accordingly, through rejecting the first and second null hypotheses, the researchers can claim that LLB is a useful way of enhancing vocabulary learning and can play an important role in teaching and learning vocabulary to first year students. The result of this study indicated that there was significant difference in the efficiency of LLB compared to traditional teaching method. It was confirmed that learning vocabulary through LLB would lead to better learning than traditional method. The results of present study have several important achievements:

- 1) since vocabulary is a very important part of the language, a teacher must equip himself/herself with up-to-date techniques and methods of teaching them. The results of this research can be valuable for language teachers at the inter-mediate to advanced levels.
- 2) the present study showed a new technique in vocabulary learning and teaching such as four-step vocabulary flash card in order to facilitate vocabulary learning for students and also provide an opportunity for them to use or review their vocabulary in every situation.
- 3) LLB is very practical and useful for those who prepare themselves for international exams such as TOEFL, IELTS and GRE.
- 4) the results of this study proved that LLB is an effective way of enhancing vocabulary learning for students.

5) this study introduced a strategy (LLB) that make vocabulary learning interesting and easy for students.

Limitations of the study

Every study has own limitations. One of the limitations of the present study is the time limitation. The time period of the institution was three months and I had to investigate in that time period. Another limitation of my study was limited participants because of limitation of student in the institution classes. The other limitation is related to the Leitner's box. The access of it was difficult to all of the students. And the writing of words in the flash cards was time-consuming.

ABSTRACT

This study was directed at probing hedging phenomenon in the field of written news discourse, more specifically, in one specific genre of news writing, namely news stories. Underlying purpose of the present research was to analyze frequency and forms of hedging devices and their functions in news stories selected from four sections (arts & culture, business & economy, politics, and sports) of English and Persian newspapers. To investigate hedging phenomenon, Yuryevna (2012)'s taxonomy of hedging devices and adapted classification that combined two models, namely Yu's (2009) model of hedging strategies and Hyland's (1998) polypragmatic model of hedging functions were used. Data for this study contained a corpus composed of a total of 79,711 words collected from the news stories of four famous and highly-circulated newspapers in Iran (Jaamejaam and Iran) and United States of America (The New York Times and Washington post). The results of the present study showed that there is a statistically significant difference between the English and Persian news stories in the frequency of hedges, specific types and forms of hedges (except epistemic adverbs) and also functions of these devices. The English and Persian news stories were not different from each other in the use of epistemic adverbs. Epistemic nouns and implicit pragmatic markers as two types of the hedging forms had no frequency in the data. Although there were some shortcomings, limitations, problems and complexities in this study, the present research provided certain implications regarding the presence and importance of hedging phenomenon in news genre. The ESP instructors may find the comparative results of this study as a source for designing writing tasks for the learners that help them master this metadiscourse feature in writing Persian or English news stories.

KEYWORDS: Form; Function; Genre; Hedge

INTRODUCTION

Writing is one of the most important skills with a crucial role and fundamental basis in learning a second or foreign language. Writing is important because of its power of communication. It can involve a close relationship with author and reader. Hedging plays a major role in the effectiveness of a writing piece both from the reader and the writer perspective. Hedge is the main center and has a crucial importance in this study. Hedging as a member of linguistic category has different definitions. Concerning the current different definitions of hedges in the literature, the most commonly adopted definition of hedge that is the basis of this study is presented by Hyland (1998), “hedges are linguistic means used to indicate either a) a lack of complete commitment to the truth value of an accompanying proposition, or b) a desire not to express that commitment categorically” (p. 1).

The research on hedging has only just initiated and is quite new concept in discourse researches. Although hedge is a quite new concept, it has received great attention and numerous studies have been done that are dealing with academic/scientific or spoken discourse and mostly between one or different languages in terms of using hedging devices (e.g. Salvager-Meyer, 1994; Hyland, 2000; Falahaty, 2007). Although various investigations have documented the presence and functional role of hedges in these genres, little attention has been given to other genres like newspaper. Newspaper is a vital genre because it is one of the forms of written discourse that is issued daily or weekly. It has more readers than other kinds of written texts and help the public know everything that is happening around the world. Newspaper discourse like academic discourse which follows constraints or conventions of a discipline, governs certain conventions in order to be accepted by their corresponding discourse community and meet their expectations. Yuryevna (2012) in his study stated that “news writing is not simply a language work done by the journalist to record and report to the recent occurrences and developments, but it is an invisible interaction between the journalist and the audience” (p. 3). According to Buitkiene (2008), “newspapers carry articles of an extremely diverse character; consequently, linguistic means employed, hedging included, to achieve specific purposes are also divergent” (p.11). Although there are different articles in newspapers (E.g. news stories or ‘straight news’, opinion, editorial articles), this study focuses on news stories. Likewise, he has also stated that “the main function of news stories is to objectively inform the reader, and provide him/her with hard facts” (p.12).

Hedge words can pose serious problems for ESP students and Persian journalists in translating, writing and reading in English language in general and journalistic texts in particular because they have lack of exposure to English as a foreign language and are unaware of the functions of these linguistic features. They have not also received enough instruction on how to use them in order to produce appropriate texts in the foreign language. So the ability to hedge effectively in English for them may be difficult. Therefore, this study aimed to compare the frequency, forms and functions of linguistic devices which act as hedges in the news stories selected from the following four sections: arts & culture, business & economy, politics and sports of English and Persian newspapers published by two groups of journalists: American news story journalists (as educated native speakers of English) and Iranian news story journalists who write in Persian (as educated native speakers of Persian).

This study attempts to familiarize ESP students and Persian news story journalists attempting to publish their English news stories in international journals or English newspapers with appropriate use of hedging devices in order to avoid vagueness and misunderstanding, communicate closely with the readers, enrich the understanding of hedging phenomenon in this genre and increase their awareness of the way educated native speakers of English in the field of journalism organize their writings. It is hoped that this study could be applied not only to the field of language teaching and teaching writing for the students and journalists of this second or foreign language, but also to teaching some ESP courses (e.g. English articles and news writing course). This research also fills the gap of previous researches and the literature related to hedging phenomenon in news genre.

BACKGROUND

In 1972, Lakoff presented the term hedging. It has commonly been distinguished as “words whose job is to make things fuzzier or less fuzzy” (Lakoff, 1972, p. 471). Later, Hyland (1998) considered hedging devices as “linguistic means used to indicate either a) a lack of commitment to the truth value of an accompanying proposition, or b) a desire not to express that commitment categorically” (Hyland, 1998, p. 1). For many years, hedges have achieved a special consideration in linguistic researchers, particularly in spoken and written scientific/academic discourse. Considering that “hedging is a central to academic writing where the need to present unproven propositions with caution and precision is essential” (Hyland, 1996, p. 433), many researchers (Salager-Meyer, 1994; Hyland, 1996; 1998; Clemen, 1997; Vold, 2006; Yu, 2009; Pisanski-Peterlin, 2010 and others) have been performed to consider this hedging phenomenon. Moreover, Iranian researchers have also investigated on hedges, for example: Davoodifard (2006) studied the incidence of hedging devices in English and Persian academic research articles and she concluded that English academic research articles employ more hedging devices than Persian ones. All the research studies have revealed that hedging is a usual and one of the most prominent characteristics of academic connection. Buitkiene (2008) considered that the reasons given in support of such studies are really firm, because “English has become the lingua franca of academic discourse, young researchers as well as renowned ones, despite their nationality, have to express themselves in this language if they want to be fully accepted members of the international academic community” (Buitkiene, 2008, p. 11). Thus, “the issue of hedging, alongside with other linguistic, cultural, rhetorical aspects, became strongly accentuated and researched cross-linguistically and cross-disciplinarily in written and spoken academic discourse” (Buitkiene, 2008, p. 11). However, other genres as well as different registers within these genres also employ hedging strategies (Buitkiene, 2008, p.11).

Newspaper discourse among those genres can be investigated as Noorian & Biria, (2010) has reasonably found out “the most remarkable genre since it is undeniably one of the most popular public media which has a wide range of audience” (p. 67). News writing is not actually a language task performed by the journalist to note and give an account of the new incidences and improvements, but it is a hidden action and reaction between the audience and the journalist. Although it is generally received that the language employed in news reports is necessitated to be

correct, concise, and real, these necessities do not refuse the essence of hedging devices in news reports. Fomina (2010) in her investigation mentioned that “hedging frequently occurs in newspaper articles since it is an efficient strategy to persuade somebody in such a way that readers don’t feel that the ideas are being imposed on them” (p. 206). Hedged expressions are neither true nor false they are somewhere in between and that is exactly the quality that makes them so popular with many writers and speakers (Fomina, 2010, p. 206). Unfortunately, the study of hedging phenomenon in news texts has not received much attention and is a relatively new concept in discourse studies. In the past decades; researchers have been concerned about the use of hedges in written and spoken academic or scientific discourse. Numerous studies have investigated and paid great attention in hedging phenomenon (Salager- Meyer, 1994; Clemen, 1997; Markkanen& Schroder, 1997; Hyland, 1998; 1999; Yu, 2009). Researchers have documented the significance use and role of hedges in academic or scientific writing. Other genres (E.g. newspaper genre) also use hedging devices but they have not received the attentions and investigations they deserve. In the other words, the total number of investigations on hedging phenomenon in newspaper discourse is not as many as the total number of investigations concerning scientific/academic discourse. Clemen (2002) investigated on hedging devices in journalism and demonstrated the attendance of hedging devices in this genre. Her study was the first investigation concerning specially on hedging in journalism. He educed a little number of economic texts from *The Economist* magazine and indicated what kind of hedging devices may be presented in them. Her study was scarcity of enough information, however, it still presented “an idea of the occurrence of hedges and kindred elements in a genre of economic text that deserves still wider coverage” (Clemen, 2002, p. 46). Buitkine (2008) studied on hedging devices in two types of newspaper articles (editorials and news stories) from four different newspapers: *The Times*, *The Guardian*, *The Independent*, and *Herald Tribune International*. The results of the study revealed that editorials employ more hedging devices than news stories because editorials attempt to persuade the readers but news stories attend to inform the reader. Buitkiene (2008) in her investigation mentioned that on the basis of newspaper article genre, hedging devices are distributed differently in newspaper discourse. Each newspaper genre educes them in a distinct way, since “each genre pursues different interests and policies” (Buitkiene, 2008, p.12). He also found out that “the main function of news stories is to objectively inform the reader, to provide him/her with hard facts, while editorials aim to form or influence, sometimes even to manipulate, public opinion” (Buitkiene, 2008, p.12). Fomina (2010) investigated certain discourse functions of English hedging devices in the British English magazine *The Guardian*. He achieved that “hedging frequently occurs in newspaper articles since it is an efficient strategy to persuade somebody in such a way that readers do not feel that the ideas are being imposed on them” (p. 206). Yuryevna (2012) investigated hedging phenomenon in two particular genres of online news writing (news articles and opinion articles). The result indicated that opinion articles employ more hedging devices than news articles and attend to use more lexical hedging devices, whereas news articles prefer to employ non- lexical type of hedging devices. This study differs from other studies in compensating some shortcomings of the previous researches by comparing frequency, forms and functions of hedging devices only in the news stories selected from the four mentioned sections of English and Persian newspapers.

RESEARCH QUESTIONS

Regarding what were mentioned above and based on the purposes, the present study sought to answer the following research questions:

1. Is there any significant difference regarding the frequency of hedging devices employed between news stories of English and Persian newspapers?
2. Is there any significant difference regarding the forms of hedging devices employed between news stories of English and Persian newspapers?
3. Is there any significant difference regarding the functions of identified hedging devices between news stories of English and Persian newspapers?

METHODOLOGY

Corpora of the Study

The corpora of this study included a total number of 200 news stories. Therefore, the corpora of the study were divided into two subsections including English and Persian news stories.

English News Stories

The corpus was composed of 100 English news stories written by American journalists who specialize in writing news stories. *The New York Times* and *Washington post* were chosen for this study, since they are the most prominent and elite newspapers in USA due to the information they contain. The news stories, though randomly selected, were chosen from the four mentioned sections of both newspapers (25 English news stories from each section).

Persian News Stories

A total number of 100 Persian news stories from two elite and highly-circulated newspapers in Iran namely, *Jaamejaam* and *Iran* written by Iranian journalists, was chosen. These 100 Persian news stories were selected randomly from the four sections of the newspapers (25 Persian news stories from each section).

The researcher tried to select the news stories which are approximately in the same length in order to get to a reliable result, so the news stories that are too short or too long were discarded. Having a wide variety of sections can increase the external validity of the results. The reason why news stories were chosen in this analysis is closely related to the importance of broadcasting the news, information exchange, mass communication in present day societies, and the findings of the previous studies (Dafouz-Milne, 2008; Noorian & Biria, 2010; Buitkiene, 2008) that confirmed the key role of hedges in newspaper discourse as an efficient strategy in attaining effective persuasion. The main motivations for focusing on the news stories of arts & cultural, business & economic, political and sports sections are their nature and information they contain. Moreover these sections have approximately the most readers in comparison to other sections.

Instrumentation

Yuryevna (2012) compiled taxonomy of hedging devices to guide the process of identifying and categorizing hedging devices in the sample texts (see appendix A). This taxonomy was used in

this study in order to identify and categorize hedging devices. Wordsmith Tools' Concordance program was used in this study in order to identify English hedges. This program allows seeing a particular word or phrase in the contexts. Adapted classification that combined two models, namely Yu's (2009) model of hedging strategies and Hyland's (1998) polypragmatic model of hedging functions was used as theoretical model for analyzing hedging functions (see appendix B). The reason for choosing this classification is an adaptation of Hyland's classification with some modifications concerning linguistic devices and their correspondence the hedging functions. To examine hedging devices in the Persian news stories, Persian equivalents for the taxonomy and theoretical model were suggested by the researchers who are familiar with hedge analysis (see appendix A).

Data Collection

As concerns hedging devices across languages, the research data for the present study comprised 200 news stories (100 English and 100 Persian news stories). 100 English news stories derived from the four mentioned sections of the English newspapers contained a total of 44,277 words ranging from 302 to 589 words whose average length amounted to 443. 100 Persian news stories extracted from the four mentioned sections of the Persian newspapers comprised 39,856 words. The lexical range of the Persian news stories was between 300 and 493 with an average length of 399 words. All the news stories were published between August, September, and October 2014. Time can affect the style of the writers. With this time limitation, this factor can be restrained. News stories must be chosen carefully because some of the news stories derived from *The New York Times* and *Washington post* were not written by native American English journalists and in the same way, there are some news stories collected from *Jaamejaam* and *Iran* that were not produced by Iranian news story journalists who write in Persian as native speakers of Persian. Although the news stories that are too short or too long were discarded, the total number of words in the selected news stories of the mentioned newspapers and their sections wasn't the same.

Therefore, in order to balance the total number of words across the English and Persian news stories in general and across the sections in particular, 3 arts & cultural, 2 business & economic, 4 political and 2 sports news stories derived from the English newspapers were excluded. As a result, the total number of words in the English news stories reduced from 44,277 to 39,855 words. Table 1 provides details about the number of words and news stories selected from the English and Persian newspapers and their four sections.

Table 1: The Number of Words and News Stories for Data Analysis

Section Category	Arts & Culture	Business & Economy	Politics	Sports	Total number of news stories	Total number of words
English news stories	22 9,969	23 9,963	21 9,961	23 9,962	89	39855
Persian news stories	25 9,967	25 9,963	25 9,962	25 9,964	100	39856

Once the materials of the research study were selected, they were analyzed in terms of the hedging frequency, forms and functions they perform. Procedures used for analyzing the data are discussed below.

Procedure

After collecting the data, the first task is to organize and present them in an understandable way. The English news stories were analyzed by employing Wordsmith Tools 5.0. Wordsmith Tools' Concordance program was employed in the present study in order to identify English hedging forms. For the purpose of electronic search, the list of common hedging devices that was compiled by Yueyevna (2012) was used in the study. Then, due to the highly contextual nature of hedges, the electronic search was followed by a manual examination of the identified items. All identified English items were scrutinized in their context in order to determine and locate hedging devices in their proper categories.

As concerns the analysis of the Persian data, the selected news stories were also read precisely word by word in order to identify hedging items and locate them in their proper categories. The researchers who are familiar with hedge analysis judged about determination of those English and Persian linguistic items that express mitigation. Then, the overall frequency and percentage of hedging devices and also the frequency and percentage of each category of hedging forms were identified in the news stories of English and Persian newspapers. Since all the selected news stories did not have exactly the same length and were varied, the raw figures were converted to a common basis (marker per 1000 words), that is calculating the frequency of hedging per 1000 words. It can provide a basis for comparing the frequency of occurrence. In order to ensure the reliability of the analysis and avoid probable errors of identification, the frequency of hedging devices counted two times.

Then a closer examination of the frequency and percentage of different types of each category was conducted. Besides, chi-square tests were used in order to determine whether there is a significant difference regarding the frequency of hedging devices and also forms of employed hedges between the news stories of English and Persian newspapers. Moreover, the researchers were determined the frequency and percentage of each category of hedging functions in the news stories of English and Persian newspapers. At this point, the analysis was based on the adapted classification that combined two approaches, namely Hyland's (1998) polypragmatic model of hedging functions and Yu's model of hedging strategies. Chi-square tests were also employed in order to identify whether there is a significant difference between the English and Persian news stories in terms of the functions of identified hedging devices.

RESULTS AND DISCUSSION

Overall Distribution of Hedging Forms

The overall distribution of hedging forms by categories was counted separately for the English and Persian news stories. Tables 2 and 3 show it.

Table 2: Distribution of Hedging Forms in the News Stories of English Newspapers

Categories	F ¹	F ²	%
Modal verbs	80	2.00	19.2
Approximators	99	2.48	23.8
Epistemic lexical verbs	27	0.67	6.5
Epistemic adverbs	7	0.17	1.7
Epistemic adjectives	27	0.67	6.5
Epistemic nouns	0	0	0
Passive constructions	121	3.03	29.1
Impersonal passives	17	0.42	4.1
Attribution to the source	38	0.95	9.1
Implicit pragmatic markers	0	0	0
Total	416	10.43	100

Note. F¹ - raw frequency, F²-frequency per 1,000 words, %-percentage of the individual categories

Table 3: Distribution of Hedging Forms in the News Stories of Persian Newspapers

Categories	F ¹	F ²	%
Modal verbs	17	0.42	12.2
Approximators	34	0.85	24.5
Epistemic lexical verbs	4	0.10	2.9
Epistemic adverbs	2	0.05	1.4
Epistemic adjectives	4	0.10	2.9
Epistemic nouns	0	0	0
Passive constructions	59	1.48	42.4
Impersonal passives	3	0.07	2.2
Attribution to the source	16	0.40	11.5
Implicit pragmatic markers	0	0	0
Total	139	3.48	100

Note. F¹ - raw frequency, F²-frequency per 1,000 words, %-percentage of the individual categories

Concerning the frequency of occurrence of hedging devices in the English and Persian news stories, Tables 2 and 3 shows that the frequency of hedging devices per thousand words in the news stories of English newspapers was 10.43 (n=416) which meant that 1.04% of words in this corpus were hedges, whereas the frequency of hedging devices per thousand words in the Persian ones was 3.48 (n=139) which indicated that 0.35% of words in this corpus were hedges.

Table 4: Chi-Square for the Frequency of Employed Hedges in the English and Persian News Stories

Chi-square Test		
X^2	df	p
138.25	1	0.001**

**Level of Significance at 0.01 *Level of Significance at 0.05

According to the Table 4, there is a statistically significant difference between the news stories of English and Persian newspapers in the frequency of employed hedges ($X^2=138.25$, $p=0.001$, $df=1$). Therefore, the English news stories show a statistically significant higher inclusion of hedging devices than the Persian ones. Based on this, it implies that the English news story writers show their uncertainty, tentativeness and lack of complete commitment towards the proposition by means of using hedging devices more frequently than the Persian news story writers. The findings said little about the use of specific hedging categories. Therefore, the results of the analysis were examined in more details in the following section in order to provide closer analysis of the each hedging category.

Categories of Hedges

Modal Auxiliary Verbs

While modal verbs can be readily identified in the sample corpus, the actual meaning expressed by modals is less clear (Hyland, 1998, p. 105). Coates (1983, 1992) regards epistemic modality as the “speaker’s assumptions or assessment of possibilities” (p. 55). It demonstrates lack of confidence or the speaker’s confidence in the truth of the statement stated. The study showed that there are six modal auxiliary verbs with epistemic meaning that were used as hedges in the English news stories, whereas there are two modal auxiliary verbs with epistemic meaning that were used as hedges in the Persian ones. Among them an auxiliary verb *could* (/tæva:nestæn/ توانستن) was found to be the most common in the English news stories, accounting for almost 7.45% (n=31) and in the Persian ones, accounting for about 10.07% (n=14). A modal auxiliary *may* (n=18) was appeared to be the second most common hedging device, amounting for 4.32% of all identified hedging device in the English news stories, whereas an auxiliary verb *should* (/ba:jestæn/ بایستن) is the second most common hedging device in the Persian ones, accounting for about 2.15% (n=3). The third most frequent auxiliary verb in the English news stories was a modal verb *would* (n=13), accounting for about 3.12%. In the data analyzed for this study, a modal auxiliary *might* was appeared to be the fourth most common hedging device, amounting for 1.92% (n=8) of all identified hedging device in the English news stories. The fifth most frequent auxiliary verb in the English news stories was the modal verbs *can* (n=5) and *should* (n=5), accounting for about 1.20% (for each one).

To summarize the results regarding modal auxiliary verbs, it can be said that as it is presented in Table 5 below, there is a statistically significant difference between the news stories of English and Persian newspapers in the use of modal auxiliary verbs as hedging devices ($X^2=40.91$, $p=0.001$, $df=1$).

Table 5: Results of Chi-Square Tests for the Distribution of Hedging Forms by Categories in the English and Persian News Stories

Chi- square Test			
Categories	X^2	df	p
Modal verbs	40.91	1	0.001**
Approximators	31.76	1	0.001**
Epistemic lexical verbs	17.06	1	0.001**
Epistemic adverbs	2.77	1	0.096
Epistemic adjectives	17.06	1	0.001**
Epistemic nouns	-	-	-
Passive constructions	21.35	1	0.001**

Attribution to the source	7.14	1	0.008**
Implicit pragmatic markers	-	-	-

**Level of Significance at 0.01 *Level of Significance at 0.05

On a general level, the news stories of English newspapers with total of 80 items employ a higher number of modal auxiliary verbs than the Persian ones which have only 17 hedging items in total. It shows that the English news story journalists express more prediction, possibility, tentative assumption, and assessment of probability by using epistemic meaning of modal auxiliary verbs than the Persian ones.

Approximators of Quantity, Frequency and Degree

Approximators of quantity, frequency and degree are those hedging devices that “work locally on a word or a phrase within the proposition, making its meaning sound vague, fuzzy, and imprecise” (Yu, 2009, p. 105). The data analyzed for the present study showed that 99 approximators, accounting for 23.8% were identified in the news stories of English newspapers and 34 items, accounting for 24.5% were identified in the news stories of Persian newspapers. In

the English news stories, there are seven types of approximators that were used to express hedging. As concerns the Persian news stories, there are four different types of approximators to express hedging. Among them *about* (n=37, 8.89%), *almost* (n=3, 0.72%), *approximately* (n=1, 0.24%), *around* (n=4, 0.96%), *at least* (n=9, 2.16%), *nearly* (n=13, 3.12%) and *some* (n=32, 7.69%) were present in the English news stories, while the Persian ones included *about* (/hodu:de/ حدود) (n=11, 7.91%), *at least* (/hæde ?æqæl/ حداقل) (n=1, 0.71%), *nearly* (/næzdi:k be/ نزدیک به) (n=3, 2.15%) and *some* (/bærxi:/ برخی) (n=19, 13.66%). According to the Table 5 presented earlier, it can be noticed that the chi-square test results showed that there is a statistically significant difference between the news stories of English and Persian newspapers in the use of approximators as hedging devices ($X^2=31.76$, $p=0.001$, $df=1$). The English news stories show a statistically significant higher inclusion of approximators than the Persian ones. It suggests that the English news story journalists work locally on the meaning of a word or a phrase within the proposition in order to sound imprecise, fuzzy and vague by means of approximators more frequently than the Persian ones.

Epistemic Lexical Verbs

According to Varttala (2001), “while auxiliaries are commonly viewed as a central way of producing modal meanings, they are by no means the only devices with such potential” (p. 118). Hyland (1998) considers epistemic verbs as “the most transparent means of coding the subjectivity of the epistemic source” (p. 119), and they are usually employed to hedge either assertiveness or commitment. Five different lexical verbs with epistemic meaning were identified in the English and Persian news stories with 31 items in total. Total number of this type of hedges was 27 (6.5%) in the English news stories, whereas the incidence was noticeably lower in the Persian news stories with 4 items (2.9%). The English news stories included five epistemic lexical verbs, namely *appear* (n=9, accounting for about 2.16%), *believe* (n=3, 0.72%), *seek* (n=6, 1.44%), *seem* (n=6, 1.44%) and *suggest* (n=3, 0.72%), while only two of them, namely *seem* (/be næzær resi:dæn/ به نظر رسیدن) (n=3, 2.15%) and *believe* (/mo?taqed bu:dæn/ معتقد بودن) (n=1, 0.71%) were used in the Persian news stories. As shown in the Table 5, the chi-square test results revealed that there is a significant difference between the news stories of English and Persian newspapers in the use of epistemic lexical verbs ($X^2=17.06$, $p=0.001$, $df=1$). Therefore, epistemic lexical verbs are more frequent in the English news stories than the Persian ones. It implies that the English news story journalists code the subjectivity of the epistemic source, hedge their commitment or assertiveness and provide non-factual status of a proposition more frequently than the Persian news story journalists.

Epistemic Adverbs

Apart from modal auxiliaries, epistemic lexical verbs and approximators, there are many other ways of stating epistemic modality. A type of epistemic meaning associated with hedging is also frequently presented by epistemic adverbs “which can introduce a certain degree of indefiniteness or lack of precision to the information” (Yueyevna, 2012, p. 61), “either to provide a more accurate representation of reality or simply because vagueness is more appropriate for this specific communicative situation, in which a higher degree of precision is not considered necessary” (Poveda Cabanes, 2007). Two different forms of epistemic adverbs as hedging

devices were identified in the English and Persian news stories with 9 items in total. Total number of this type of hedges was 7 (1.7%) in the English news stories, whereas the incidence was lower in the Persian news stories with 2 items (1.4%). The English news stories included two epistemic adverbs as hedging devices, namely *possibly* (n=2, accounting for about 0.48%) and *probably* (n=5, 1.20%), while only one of them, namely *probably* (/ehtema:læn/ احتمالاً) (n=2, 1.43%) was available in the news stories of Persian newspapers. It can be noticed that according to the Table 5 presented earlier, the results of chi-square test showed that there is no statistically significant difference between the news stories of English and Persian newspapers in the use of epistemic adverbs ($\chi^2=2.77$, $p=0.096$, $df=1$). Therefore, the English and Persian news stories are not different from each other in the use of epistemic adverbs. It shows that the English and Persian news story journalists use the same number of epistemic adverbs to provide a vague representation of reality and also represent not quite precise and a certain degree of ambiguity to the information.

Epistemic Adjectives

A number of adjectives were present in the research data that involve the kind of meaning that may be taken to constitute hedging. According to Varttala (2001), these adjectives with epistemic meaning mark the information presented as tentative, uncertain, doubtful, or not completely precise in many situations entirely similar to that of the adverbs. Three different adjectives with epistemic meaning were identified in the English and Persian news stories with 31 items in total. Total number of this type of hedges was 27 (6.5%) in the English news stories, whereas the incidence was noticeably lower in the Persian news stories with 4 items (2.9%). The English news stories included all three epistemic adjectives, namely *likely* (n=15, 3.60%), *possible* (n=10, 2.40%) and *unlikely* (n=2, 0.48%), while only one of them, namely *possible* (/ehtema:li:/ احتمالی) (n=4, 2.87%) was found in the Persian ones. As seen earlier in the Table 5, the results of chi-square test revealed that there is a considerable difference between the news stories of English and Persian newspapers in the use of epistemic adjectives ($\chi^2=17.06$, $p=0.001$, $df=1$). As mentioned before, the English news stories present a higher number of epistemic adjectives than the Persian ones. It shows that the English news story journalists tend to mark the information presented as tentative, uncertain, doubtful, or not completely precise more than the Persian news story journalists.

Epistemic Nouns

The findings of the present study demonstrated that noun hedges weren't present in the English and Persian news stories. It implies that the journalists don't use noun hedges in their news stories. The absence of this type of hedging devices in the news stories could be again explained by the functions they perform in news discourse. The main function of news stories is to objectively inform the readers, to provide them with hard facts (Buitkiene, 2008, p. 12). Therefore, it is reasonable to expect such findings.

Passive Constructions

The findings of the present study indicated that agentless passive constructions as one of the hedging forms were found in the news stories of English newspapers with total of 121 items, accounting for almost 29.1% and also Persian newspapers which had 59 items, amounting for about 42.4%. The chi-square test results revealed that there is a statistically significant difference between the news

stories of English and Persian newspapers in the use of agentless passive constructions ($X^2=21.35$, $p=0.001$, $df=1$). Therefore, the English news stories show a statistically significant higher inclusion of agentless passive constructions than the Persian ones. Based on this, it implies that the English news story journalists attempt to prevent taking responsibility for what they are stating about in order to present the news stories objective by means of various types of passive constructions more frequently than the Persian news story journalists.

Impersonal Passive Constructions

While passive constructions are not always used to express hedging, impersonal passive constructions in this sense are easier to identify and to define their hedging meaning (Yueyevna, 2012, p. 68). The findings of the present study revealed that impersonal passive constructions that are used as hedging devices were present in the news stories of English newspapers with total of 17 items, accounting for about 4.1% and the Persian news stories which had only 3 items, amounting for almost 2.2%. To summarize the results, it can be said that as it was presented earlier in the Table 5, there is a statistically significant difference between the news stories of English and Persian newspapers in the use of impersonal passive constructions as hedges ($X^2=9.80$, $p=0.002$, $df=1$). Therefore, it shows that the English news stories present a higher number of impersonal passive constructions than the Persian ones.

Attribution to the Source

According to Yuryevna (2012) “this category of hedging devices can be regarded as a particular characteristic of the news writing” (p. 68). Since the journalist are supposed to be as objective and accurate as possible, reference to the source of the information can be one way to avoid misinterpretation of the facts or events and to protect themselves from the possibility being negatively judged by the readers (Yuryevna, 2012, p. 68). The findings of the present study revealed that this category of hedging devices was found in the news stories of English newspapers with total of 38 items, accounting for almost 9.1% and also Persian newspapers which had 16 items, accounting for almost 11.5%. According to the Table 5 presented earlier, it can be noticed that the chi-square test results revealed that there is a statistically significant difference between the news stories of English and Persian newspapers in the use of attribution to the source hedges ($X^2=7.14$, $p=0.008$, $df=1$). Therefore, the English news stories show a statistically significant higher inclusion of attribution to the source than the Persian ones. It suggests that the English news story journalists prevent misinterpretation of the events or truths and keep safe themselves from the possibility being negatively judged by the readers in order to be accurate and objective to a greater extent than the Persian news story journalists.

Implicit Pragmatic Markers

This category of hedges wasn't present and constituted no percent of all hedging devices identified in the English and Persian news stories. Pragmatic markers with interpersonal and interactive functions may bring a sense of cooperation, sharing, intimacy or solidarity between the interlocutors, expressed by humble and modest attitude, in a reduced or weakened tone (Yu, 2009, p. 98). News stories in comparison to other genres such as opinion articles perform different functions and follow different interests.

The main function of news stories is to objectively inform the readers, to provide them with hard facts, while opinion articles aim to persuade the reader and form public opinion (Buitkiene, 2008, p. 12). Therefore, as the findings of the present study showed, the journalists do not employ these different expressions and senses in their news stories. This category consists of some devices, for example, direct questions, parenthetical constructions, hypothetical conditionals, etc.

Functions of Hedges

Hyland (1998) in her polypragmatic model of hedges divided hedging functions into three main categories: accuracy-oriented, writer-oriented and reader-oriented hedges. Table 6 below presents the overall distribution of writer, accuracy and reader-oriented hedges in the English and Persian news stories.

Table 6: *Distribution of Hedging Functions in the News Stories of English and Persian Newspapers*

Function of Hedge	ENS			PNS		
	F ¹	F ²	%	F ¹	F ²	%
Writer-oriented	317	7.95	76.20	105	2.63	75.54
Accuracy-oriented	99	2.48	23.80	34	0.85	24.46
Reader-oriented	0	0	0	0	0	0

Key to Table: F¹-raw frequency, F²-frequency per 1,000 words, % percentage of the individual categories, English news stories (ENS), Persian news stories (PNS)

This Table shows that apart from reader-oriented hedges which had no frequency in the data, the English news stories contained more writer-oriented and accuracy-oriented hedges compared to the Persian ones. Furthermore, the frequency of writer-oriented hedges in the English and Persian news stories was higher than accuracy-oriented hedges. A more closed examination of each hedging function will be presented further in the following subsections.

Writer-oriented Hedges

As Table 6 presented earlier demonstrated, the first prominent functional category of hedges in the news stories of English and Persian newspapers was writer-oriented hedges. Journalists employ this type of hedging devices in the news writing in order to support themselves from the possible results of error by restricting their personal responsibility. Table 6 showed that the frequency of writer-oriented hedges per thousand words in the English news stories was 7.95 (n=317), accounting for about 76.20% of the overall number of hedges which was more than that of the Persian ones (2.63, n=105, amounting for 75.54%). As shown in the Table 7, the chi-square test results revealed that there is a significant difference between the news stories of English and Persian newspapers in the use of writer-oriented hedges ($\chi^2=138.25$, $p=0.001$, $df=1$).

Table 7: Results of Chi-Square Tests for the Distribution of Hedging Functions by Categories in the English and Persian News Stories

Chi-square Test			
Categories	X^2	df	P
Writer-oriented hedges	138.25	1	0.001**
Accuracy-oriented hedges	31.76	1	0.001**

**Level of Significance at 0.01 *Level of Significance at 0.05

Therefore, the English news stories favor more number of this type of hedging functions than the Persian ones. It implies that the English news story journalists tend to maintain some distance from propositions in order to reduce the probability of refutation and make a shield for themselves against the possible consequences of error by limiting their personal responsibility more frequently than the Persian news story journalists.

Accuracy-oriented Hedges

According to the Table 6 presented earlier, the second important functional category of hedges in the news stories of English and Persian newspapers was this category of hedging functions. The prominent function of this category is to express statements with higher exactness. The writers in order to present information more precise and objective employ a diversity of degree of precision adverbs that present an “acceptable degree of imprecision to specify the accuracy” (Hyland, 1998, p. 140). Table 6 showed that the frequency of accuracy-oriented hedges per thousand words in the English news stories was 2.48 (n=99), accounting for about 23.80% of the overall number of hedges which was more than that of the Persian ones (0.85, n=34, amounting for 24.46%). As seen earlier in the Table 7, the results of chi-square test revealed that there is a considerable difference between the news stories of English and Persian newspapers in the use of accuracy-oriented hedges ($X^2=31.76$, $p=0.001$, $df=1$). As mentioned before, the English news stories present a higher number of this type of hedging functions than the Persian ones. It indicates that the English news story journalists attempt to express information with more accuracy and precision according to reality than the Persian news story journalists.

Reader-oriented Hedges

Reader-oriented hedges mainly are about the interpersonal interaction between writers and readers, in other words, reader-oriented hedges are as devices that help to lessen the statements in a way that “bring a sense of cooperation, sharing, or solidarity between the interlocutors” (Yu, 2009, p. 97) and make easy and effective communication between the writers and readers. According to the Table 6 presented before, the results of the present study indicated that because of the nature of news stories that informs the readers and presents truths and realities objectively, reader-oriented category of hedging functions wasn’t employed and found in the news stories of English and Persian newspapers. It implies that the journalists do not concern the readers in exchanging of opinions or direct them as an attentive individual to answer and judge regarding the truth value of the proposition in their news stories. They also do not provide and express a

sense of cooperation, intimacy and sharing in the statements between the readers and themselves in their news stories.

Discussion

The purpose of this study was to compare the frequency, forms of linguistic devices which act as hedges and determine the functions of identified hedges and see whether the incidence of the hedging frequency, forms and functions varies in the news stories selected from four sections (arts & culture, business & economy, politics, and sports) of English and Persian newspapers. In respect to the first research question, the findings of this study showed that there is a statistically significant difference between the news stories of English and Persian newspapers in the frequency of employed hedges. Therefore, the English news stories show a statistically significant higher inclusion of hedging devices than the Persian ones. Finally, it is concluded that this study rejects the first null hypothesis. As concerns the second question which deals with specific types and categories of hedging devices, regardless epistemic nouns and implicit pragmatic markers which had no frequency in the data, the present study revealed that there is a statistically significant difference between the English and Persian news stories in the use of each hedging form except epistemic adverbs. In other words, apart from epistemic nouns and implicit pragmatic markers that were not present in the data, this study rejects the second null hypothesis regarding all the forms of hedging devices except epistemic adverbs employed between the news stories of English and Persian newspapers. With regards to the third research question, the findings of the present study showed that regardless reader-oriented hedges which had no frequency in the data, there is a statistically significant difference between the news stories of English and Persian newspapers in the use of each hedging function (writer-oriented hedges & accuracy-oriented hedges). In other words, regardless reader-oriented hedges that were not present in the data, this study rejects the third null hypothesis regarding the functions of identified hedging devices between the English and Persian news stories. The findings of this study supported Yuryevna's (2012) study on hedging in news writing that indicated implicit pragmatic markers, epistemic nouns and reader-oriented hedges aren't present in the news stories. The present study also confirmed his study that showed writer-oriented hedges are the first prominent functional category of hedges and accuracy-oriented hedges are the second important category of hedging functions.

The results of this study showed that hedges play a prominent role in the news genre. Although considerable differences were found in the use of hedging devices, their forms and functions in the news stories of each language, the most significant issue was the language differences that, following Hyland (1997), are believed to be the result of the cultures of English and Persian communities. The notion of culture-specificity as developed by Hyland (1997) refers to the ideological schema that controls each community's knowledge, purposes, self-identification and conduct. The use of language by community members can express signs of their community-specific culture. So, writings of journalists of news stories to be specified by their discourse community norms, values and native language. The English news story journalists are involved in the effective nature of their discourse. It seems that this can be affected by the way they connect themselves with other members of the society and their awareness of cultural factors.

English and Persian writers mitigate their statements when they try to hide a matter against a thrust. This can be affected by the matter that as a result of impreciseness of an unhedged proposition, all the essential information cannot be presented (Varrttala, 2001). Although the Persian news story journalists employ fewer hedges and somehow are more open and honest than their English counterparts, this could not mean that they are impolite or want to indicate more authority. It seems that their understanding of cultural factors is completely different from their English counterparts. Thus, it is indicated that understanding cultural issues can lead to proper interpretation of hedges.

Besides cultural issues and differences between communities, these types of comparisons will hold true if we pay special attention to the nature of the sections. In other words, the nature of the sections can be regarded as one of the factors influencing the observed differences in the amount of using hedging devices, hedging forms that are employed and also functions they perform in the news stories of English and Persian newspapers. The different bases of argumentation in various sections can be considered as another reason for the observed differences. The amount of information that should be presented in the news stories can differ from one language to another and also from one section to another. The different emphasis given to the news stories of various sections of English and Persian newspapers can partially protect this idea.

CONCLUSION

The results of the present study indicated that hedging as mitigating device was widely employed and present in the English and Persian news stories. It suggests its importance in newspaper genre. These findings proved that hedge is an essential feature of professional writing. There are a number of limitations that may influence the findings of the study. First, establishing a clear definition of hedge is extremely difficult because researchers of various studies have proposed definition of hedges in different ways. Second, providing a comprehensive taxonomy and classification of all hedges using in a language is a very controversial task, because researchers have little agreement on the functions and forms of hedge. As concerns delimitation, this study is based on relatively small corpora (200 news stories). In order to complement the findings of the present study, some further researches can be suggested:

1. Future researches can be carried out expanding the corpora size to see if the same results are obtained.
2. Future researches are needed to examine other sections for in-depth analysis and reliability of the results in order to find out whether the results will be the same as or different from the results of the present study.
3. It is suggested that future researches concentrate on other genres of news, because only a single genre of news, that is, news story was examined in this study.

The results of the present study may be useful and have implications for ESP students and instructors, material developers and also Persian news story journalists attempting to publish their news stories in English in international journals or English newspapers. They are provided with a better understanding of hedges and can also be used for the development of teaching and studying writing in English. In other words, the findings of this study can have remarkable advantages for the students and journalists to examine and consider their extent of foreign language experience, the awareness of conventional rules and norms of English language, and the differences that might exist between the use of hedges in English and Persian news stories. It helps them make judgment accurately about employing one form rather than another. Moreover, the results of this study can also be used by ESP instructors, in order to inform the learners of the differences that may occur in hedging devices use between English and Persian news writing. ESP instructors when teaching writing skills should emphasize the ability to make a difference between observed facts and interpretations, make the learners aware regarding the way that English journalists use hedging and modify their claims and statements appropriately, and also aware them concerning the different degrees of emphasis that the English journalists may use in their news. The ESP instructors may find the comparative results of this study as a source for designing writing tasks for the learners that help them master this metadiscourse feature in writing Persian or English news stories. Furthermore, the findings of the present study suggest the necessity for developing and designing some authentic materials by material developers in order to manifest the natural frequency, forms and functions of hedging devices in their work. Information conveyed by authentic data is undoubtedly of great value for educational purposes.

Appendix A

Taxonomy of Hedging Devices (Yuryevna, 2012, p. 97)

Common Lexical Items Expressing Hedging

1. Modal Verbs

Can, could, may, might, should, would

توانستن، ممکن بودن، بایستن، خواستن

2. Epistemic Lexical Verbs

Seem, appear, believe, think, guess, suggest, suppose, propose, predict, assume, speculate, suspect, attempt, seek

به نظر آمدن/رسیدن، معتقد بودن، تصور کردن، احتمال دادن، حاکی بودن (نشانه چیزی بودن)، قرار بودن، در نظر داشتن، پیش بینی کردن، فرض کردن، گمان کردن، حدس زدن، قصد کردن، خواستن

3. Epistemic Adverbs

Probably, perhaps, maybe, possibly, apparently

احتمالا (احتمال دارد/احتمال می رود که)، شاید، ممکن است، در حد امکان، ظاهراً (گویا)

4. Epistemic Adjectives

Likely, unlikely, possible, probable

ممکن، بعید، احتمالی، امکان پذیر (شدنی)

5. Epistemic Nouns

Possibility, probability, chance

احتمال، امکان، شانس

6. Approximators

Some, about, nearly, almost, quite, somewhat, kind of, sort of, somehow, to some extent, approximately, around

برخی (بعضی)، حدود، نزدیک به، تقریباً، نسبتاً، تا اندازه ای (قدری)، تا حدی، کم و بیش، به نحوی، حدوداً، در حدود

Syntactic Items Expressing Hedging

1. Impersonal Passive Constructions

It is believed/assumed/said that...; X is believed/though/supposed to...

اعتقاد بر این است/فرض بر این است/گفته می شود که...; ... بر این باور است/تصور می شود/قرار است که...

2. Agentless Passive Constructions (Passive Construction without By-Agent)

3. *Attribution to the Source*

According to X,...; As x stated,...

بنا بر (بر اساس، به گفته ی، بر طبق، به عقیده ی، مطابق، بر حسب) ...،...؛ همانطور که... بیان کرد (اظهار داشت)،...

4. *Parenthetical Constructions Expressing Personal Reference and Attribution*

I believe, I think, as far as I know, in my/our opinion

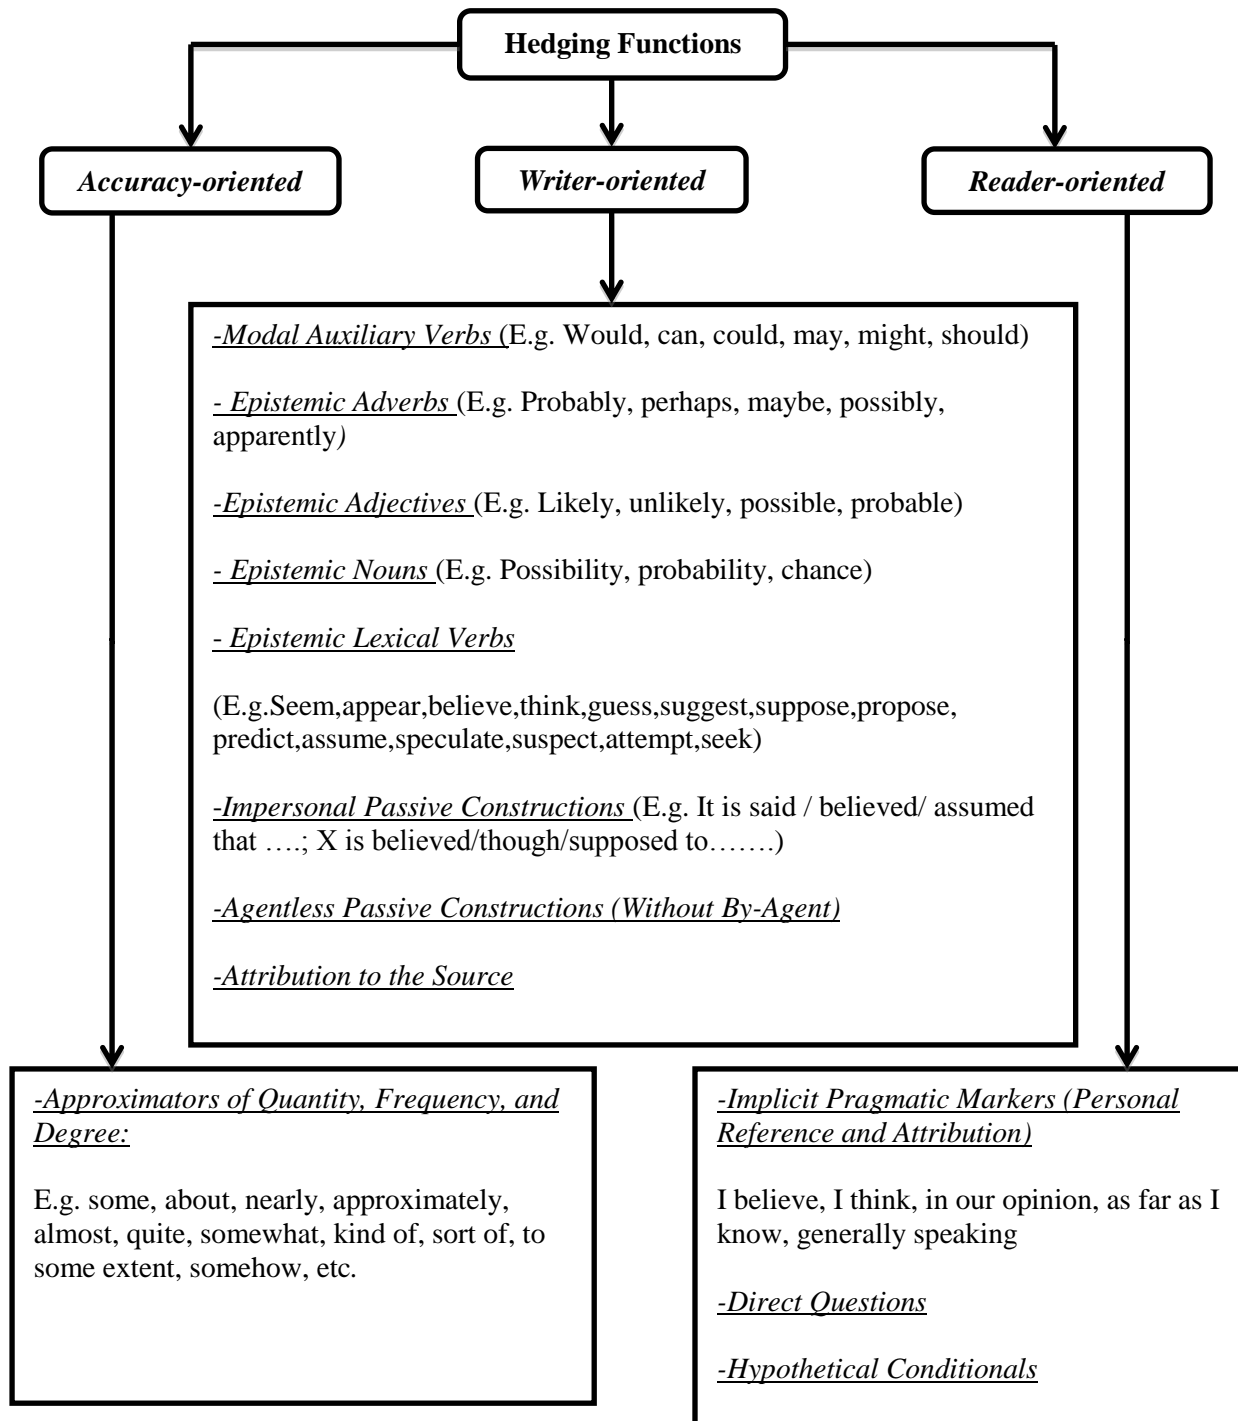

من معتقدم (باور دارم)، من تصور میکنم (فکر میکنم)، تا آنجایی (چنان) که می دانم، به عقیده ی من/ما

5. *Direct Questions*

6. *Hypothetical Conditionals*

ABSTRACT

The present study was an attempt to investigate the Effect of Self-Correction on Extroverted and Introverted Intermediate EFL(English as a Foreign Language) Learners' Writing Improvements. To carry out the study, 128 intermediate Iranian male EFL learners were selected through administration of Preliminary English Test (PET) and employing the Eysenck Personality Questionnaire (EPQ). The participants were assigned to four main groups: (1) extroverts who corrected their own writings; (2) extroverts whose writings were corrected by the teacher; (3) introverts who corrected their own writings; (4) introverts whose writings were corrected by the teacher. The experimental groups (Group 1 & 3) received a seven-week period of treatment. The obtained results showed that personality type had no significant effect on learners' improvement in writing. However, correction method proved to be significantly effective, with self-correction method showing greater effect on writing improvement. The results indicated that self-correction method has a greater effect on learners' improvement in writing than the traditional teacher-correction method. The first null-hypothesis was rejected, implying that there is a significant difference between the two correction techniques; self-correction is more effective in writing improvement than the teacher-correction. The second null-hypothesis was supported. This implies that extroverts and introverts can improve equally in their writing and being extroverted or introverted will have no significant effect on learners' rate of improvement.

KEYWORDS: *extroversion, introversion, self-correction, teacher-correction, EFL writing development, writing feedback.*

INTRODUCTION

Teaching of ESL writing has undergone great changes in the twentieth century, particularly since 1945, from viewing language as an end product to viewing it as an interactive process in which learners play a determining role. Consequently, responding to learners' errors has undergone great changes. However, teachers need to inform the learners of the quality of their pieces of

writing. (Chastain, 1988; Magnan, 1990; Hyde *et al.*1997). Apart from different approaches of teaching writing and different writing correction methods, personality traits such as Extroversion and Introversion are believed to have an impact on learners' learning in that learners with different personality types view language and language learning differently (Fillmore, 1979; Stern, 1991; Brown, 2006; Shepherd, 2002; Hajimohammadi, 2010).

During the recent decades most of the language-teaching specialists have changed their attitudes and have tried to put the learners in the focal point of the attention through providing them with some tasks. Consequently, many methods and strategies emerged and each of them has assigned a different role to learners. As far as writing improvement is concerned, some teachers have recommended that a part of the responsibility for learning is put on the learners themselves. For instance, the learners can be taught to read their own pieces of compositions and check for the errors. That means self-correction instead of the traditional teacher-correction (Fathman - Whalley, 1990). Moreover, focusing on the learners many instructors have put forward the idea of considering the learner factors such as personality type, motivation, attitudes and other personal factors. Thus, these factors have gained prominence. One of these factors is the personality trait of Extroversion /Introversion. Considering a student as extrovert or introvert would likely affect many teachers' attitudes toward him due to the erroneous stereotype that some teachers have against introverted learners. (Borg, Shapiro, 1996). The present study intended to investigate the effect of these two personality factors as well as correction methods in writing improvement of learners.

An Overlook on Teaching Writing

There's no doubt that developments in teaching of ESL composition have been influenced by and, to a certain extent, are parallel to the developments in the teaching of writing to the native speakers of English (Silva 1990). Since 1945- the beginning of the modern era of second language teaching in the United States- many particular approaches or orientations to L2 writing have achieved dominance and then faded but never disappeared. Each approach, at least as it emerges in the literature, has the distinctive focus, highlighting in one case the rhetorical and linguistic form of the text itself; in another the writer and the cognitive processes used in act of writing, in another the content for writing, and in the last the demands made by the reader (Raimes 1991, p. 448)

According to Silva (1990), the four most influential approaches to this period are:

1) Controlled Composition(*focus on form*): Silva (1990) describes this phase of composition teaching by remarking that controlled composition that sometimes is referred to as guided composition has its roots in Charles Fries's (1945) 'oral approach', the precursor of the Audio-lingual Method of second language teaching. The basic notions of controlled composition are that language is speech (from structural linguistics) and learning is habit formation (from behaviorist psychology). From this perspective writing was regarded as a secondary concern, essentially as reinforcement of oral habits.

2) Current-Traditional Rhetoric: In the mid-sixties there appeared an increasing awareness of producing extended written discourse. This awareness led to suggestion that controlled composition was not enough; that writing was more than building grammatical sentences; and that there was a need for a bridge between controlled and free writing. This approach combined the principles of current-traditional paradigm from native speaker composition instruction with Kaplan's theory of 'constructive rhetoric' (Silva 1990, p. 13).

Kaplan (2006, p. 13) defined rhetoric as "the method of organizing syntactic units into larger patterns". He suggested that ESL writers "employ rhetoric and a sequence of thought, which violates the expectations of the native reader". From the perspective of this version of current-traditional rhetoric, writing is basically a matter of arrangement, of fitting sentences and paragraphs into prescribed patterns. Learning to write, then, involves becoming skilled in identifying, internalizing, and executing these patterns. The writer fills in a preexisting form with provided or self-generated content. The reader is easily confused and perhaps vexed by unfamiliar patterns of expressions. The text is the collection of increasingly complex discourse structures (Silva 1990, p. 14).

3) the Process Approach(*focus on writer*): This is an approach in teaching composition writing which emphasizes the composing processes that writers make use of in writing (such as planning, drafting, and revising) and seeks to improve learners' writing skills through developing their use of effective composition processes. This approach is sometimes compared with a product approach or a prose model approach, that is, one which focuses on producing different kinds of writing products and which emphasizes the imitation of different model paragraphs or essays (Richards *et al.* 1992). In this approach, content, ideas and the need to communicate determine the form. In essence, "composing means expressing ideas, and conveying meaning. Composition means thinking" (Raimes 1983 a, p. 261). In the classroom context, this approach calls for providing a positive, encouraging, and collaborative workshop environment within which learners, with ample time and minimal interference, can work through their composing processes. The teacher's role is to help learners develop viable strategies for getting started (finding topics, generating ideas and information, focusing, and planning structure and procedure), for drafting (encouraging multiple drafts), for revising (adding, deleting, modifying and rearranging ideas), and for editing (attending to vocabulary, sentence structure, grammar and mechanics). From the process perspective, writing is a complex, recursive, and creative process similar in L1 and L2. Writer is the center of attention. The reader, focusing on the content, ideas, and the negotiation of the meaning, is not preoccupied with form. The text is a product –a secondary, derivative concern, whose form is a function of its content and purpose. It is the responsibility of the individual writers to identify and appropriately address the particular task, situation, discourse community, and socio-cultural setting in which they are involved.

4) English for Academic Purpose(*focus on content*): There have been a lot of criticisms against process approach. One major criticism is that the process approach does not adequately address some central issues in ESL writing. Reid (1984 a, b) has suggested that the approach neglects to seriously consider variations in writing processes due to differences in individuals, writing tasks,

and situations. Critics also question whether the process approach realistically prepares learners for academic work. According to Horowitz (1986, p. 144), this approach “creates a classroom situation that bears little resemblance to the situation in which learners’ writing will be exercised”. He suggests that process orientation ignores certain types of academic writing tasks. He also believes that the two basic tenets of process approach –“content determines form” and “good writing involves writing”– do not necessarily hold true in many academic contexts. He further asserts that the process approach overemphasizes the individual’s psychological functioning and neglects the socio-cultural context.

English for academic purpose, as an alternative instructional methodology, aims at recreating the conditions under which actual university writing tasks are done and involves the close examination and analysis of academic discourse format and writing task specification. In brief, from English for academic purpose orientation, writing is the production of the prose that will be acceptable at an American academic institution, and learning to write is a part of becoming socialized to the academic community (Silva 1990 p. 17). According to Silva (1990), an adequate and appropriate theory of writing is one that regards writing as an interactive activity, is reasonably comprehensive and internally consistent, reflects an understanding of historical developments in the field, is informed by current work in relevant disciplines, and is sensitive to the cultural, linguistic, and experimental differences of individuals and societies. Unfortunately, it seems that these approaches are not sufficiently grounded in appropriate and adequate theory and credible research and each of them is privileging and limiting its attention to a single element of writing. Controlled composition focuses on lexical and syntactic features of the text, whereas ESL current-traditional rhetoric focuses on discourse-level text structure. The process approach attends to writers’ composing behaviors, while English for academic purpose approach focuses on the reader, in the form of the academic discourse community. Therefore, it seems that there are no comprehensive theories of L2 writing, and also it does not seem prudent to assume that theories of first-language writing alone suffice (Silva 1990).

When and How to Correct the Errors (correction as feedback)

Undoubtedly, the final purpose of any writing course is to improve learners’ writing. However, Tsang (1996) found that frequent writing practice with little or no teacher feedback only led to limited improvement in L2 writing. The importance of feedback has also been pointed out by Swain and Lapkin (1995, p. 384) who posit that “relevant feedback could play a crucial role in advancing their [the learners’] language learning.”

Terrell (1985) remarks three reasons for not correcting learners’ errors directly: (1) it does not lead to more language usage in future, (2) it may result in independent effect and learners that interfere with learning and (3) it will probably cause learners to focus their attention on language rather than meaning. The written work must be viewed by teachers not as the final product but as the raw language material that the learners are in the process of shaping. According to Power (2002), the positive correction strategy firstly depends on the approach or, approaches, which underlie the planning of the program. He believes that considering the programs, teachers must decide whether to adopt a behaviorist approach (steering round errors -simplicity, minimal steps,

and reinforcement of correct utterances) or whether to draw the learners into the danger areas of correction. He goes on asserting that “neither behaviorist nor cognitive strategies of correction will succeed unless something tells the learners that a mistake has been made.”

Similar to the teaching of the other skills, teaching writing should involve learners with their own learning. The self access approach, with a better defined focus on the learners’ learning experience, needs, realistic learning objective and personalized learning program, is seen as an alternative of the uniformed conventional teacher-oriented approach. The attempt to experiment with this approach is to explore the learners’ potential and existing knowledge of English in his learning experience and maximize such experience to help him learn and use English effectively and efficiently. Teachers must coach and guide meta-cognition for it develops learners’ self-monitoring and self-correction skills. If teachers want their learners to think, the learners must know that the teacher will test their thinking and problem solving skills as explicit elements that go into determining their grades. Critical ability on the learners’ part is probably better developed through self-correction. Self-correction, which is welcomed by many teachers, certainly makes the learners more aware of the kind of mistakes they are making and will consequently result in something being learned. Yet, in practice it does not solve all the problems.

Personality Factors and Teaching Writing

Since different learners view the language learning from different points of view, it is the responsibility of course designers to design a syllabus appropriate for any given class of learners. The tasks should be in line with the learners’ needs and personality types. During the recent years most of the teaching approaches changed their attitude toward learners’ needs and emotion. This, in its turn, may lead to individualized learning in which allowance is made in the design of a curriculum for individual differences in what learners wish to learn, how they learn, and the rate at which they learn. Individualized instruction attempts to give learners more control over what they learn and how they learn it (Richards *et al.* 1992).

According to Ellis (1985), in an individual approach, learners’ factors that can influence the course of development are considered to be infinite and very difficult to classify in a reliable manner. Five general factors that can contribute to individual learners differences are ‘age’, ‘aptitude’, ‘cognitive style’, ‘motivation’, and ‘personality’. As Fillmore (1979) points out, on one hand individual differences are seen as an all-important factor, while on the other hand they are treated as relatively insignificant. One of these individual differences is the personal factor that is difficult to observe by a third person (Schumann, 1975). Fortunately, in recent years there has been increasing awareness of these psychological characteristics, which have bearing on language learning and can influence the learning outcome (Stern 1991). This increasing awareness that sensitizes teachers to variations in their reactions to different learners has been achieved through different psychological methods such as Eysenck Personality Questionnaire (EPQ), Pinker Personality Profile and Meyers-Briggs Type Indicator (MBTI).

RESEARCH QUESTIONS

To investigate the performance of the extroverts and introverts with regard to their improvement in writing the following questions were proposed.

1. *Is self-correction more effective than teacher correction in Iranian Intermediate EFL learners' writing improvement?*
2. *Is there any relationship between personality traits of Extroversion and introversion and learners writing improvement?*

METHODOLOGY

The purpose of the present study was to investigate the effect of self-correction on extroverted and introverted learners' writing improvement. Accordingly, 128 male EFL learners were selected as the participants of the study. They were assigned to four different groups – two groups included extroverts and two groups included introverts. Afterwards, they were given seven topics to write about in a seven- week period. While two groups –one extroverted and one introverted– enjoy self- correction, the teacher corrected the writings of the other two groups.

Participants

The participants of this study were selected from an English language institute, which is located in Tehran, Iran, named Iran mehr English Language Institute. The participants of this study were 128 male learners ranging between 14 and 20 years old, who (according to the chart of the institute) were intermediate learners. These 128 learners were selected from among 156 intermediate learners according to their scores in Preliminary English Test (PET) and also on the basis of the responses to Eysenck Personality Questionnaire.

Instrumentation

Preliminary English Test (PET)

The Preliminary English Test (PET) is an international examination sanctioning a certain level of mastery of the English language. A preliminary exam consists of three main points: the focus, the ideas, and explanations. The exam consists of 3 papers: Reading and Writing, Listening and an oral examination. A total of 70% across the 3 papers is needed to pass the exam. All items in each test have carefully been pre-tested by the constructors of the tests. These tests are widely used by EFL teachers as one of the most accurate means of measuring the general knowledge of Standard English. On the basis of the proficiency level of the available population, the P.E.T test was adopted and administered at the beginning of the study to select homogeneous participants. The allotted time to answer the test was one hour and half. The total score of the test was 60. The mean score was 32.58 and the standard deviation was 5.237.

Personality Questionnaire

The EPQ measures up to 21 scales of personality that are consistent with the giant three dimensions of personality traits (Extroversion, Neuroticism, and Psychoticism) as defined by Professor Hans Eysenck (Jackson *et al.* 2000). Therefore, EPQ provides a particularly accurate and comprehensive assessment of personality. The EPQ version that was employed in the

present study aimed to distinguish between *extroverts* and *introverts*. It included 57 YES/NO items, according to which the degree of the learners' extroversion could be measured. According to the EPQ key, in a given learners responses 'YES' to items 1, 3, 8, 10, 13, 17, 22, 25, 27, 39, 41, 44, 46, 49, 53 and 56 and 'NO' to items 5, 15, 20, 29, 32, 34, 37, and 51, he or she would be a total extrovert.

Therefore, if the number of corrected YES and NO, responses is 5, for example, a given learners would tend to have 4% extroversion tendencies and consequently 96% introversion tendencies. If the number of a student's total correct YES and NO responses to these 24 items is 18, he or she would have 95% extroverted tendencies and 5% introverted tendencies. One separate key is also provided to secure the reliability of the responses. According to this key, responding YES to selected items such as 6 and 24 and responding NO to items 12, 18, 30, 36, 42, 48, and 54 would be considered as lies. Therefore, the more lies are included in a student's responses, the less reliable his or her responses to the total 57 items would be. EPQ supposes that if there are more than 3 lies in a student's responses, that student must be excluded from the study. It is essential to note that being introverted or extroverted is not binary. In other words, no one is exclusively extroverted or introverted. Rather, everyone shows a range of extroverted and introverted behaviors and, thus, falls somewhere in the continuum with total extroverted behaviors at one far end and total introverted behaviors at the other far end.

Correction Code Sheet

This sheet included some symbols and alphabet letters that were representatives of the error types the learners would have in their pieces of writing. It has to be mentioned here that the symbols are quite conventional and each teacher can develop his or her version of the correction codes. The symbols and alphabet letters were chosen mostly in a way that best could symbolize the error types. The error types and responding symbols were the follows:

Code	Use	Example
WW	Wrong word	As our plane flew <u>on</u> the mountains we saw snow
WT	Wrong time	As our plane flew over the mountains we <u>see</u> snow.
WF	Wrong form	As our plane flew over the mountains we <u>was seeing</u> snow
WO	Wrong order	As our plane over the mountain <u>flew</u> we saw snow.
SP	Spelling	As our plane <u>flue</u> over the mountains we saw snow.
P	Punctuation	As our plane flew over the mountains; we saw snow.
X	Extra word	As our plane flew over <u>to</u> the mountains we saw snow.
M	Missing word	As our plane flew over the mountains - saw snow.
R	Register	As our plane flew over the mountains we <u>observed</u> snow.
?	Not clear	As our plane flew over the mountains we saw snow.
!	Silly mistake!	As our plane flew over the mountains we <u>seed</u> snow.
RW	Try re-writing	<u>O</u> ur vehicle flies, we snow find, over mountains you saw it.

Composition Rating Scale

This scale was developed according to the 'Error Count Method'. The errors that were considered in this study were '*semantic errors*', '*grammatical errors*', and '*punctuation errors*'. The minus

mark was assigned to each error. Two raters (the researcher and one of his colleagues) rated each piece of writing.

RESULTS AND DISCUSSION

To select the participants Preliminary English Test (PET) was administered at the beginning of the study. Table 1 shows the descriptive statistics for the PET

Table 1: Descriptive statistics for Preliminary English Test (PET)

Number of Items	Number of Participants	Mean	Standard Deviation
50	156	32.58	5.273

After the 128 participants were assigned to the four groups, a one-way ANOVA was carried out to ensure the homogeneity of the four groups regarding their general English proficiency. The general descriptive statistics related to the distribution of the participants in the four groups according to their performances in PET are presented in Table 2 below.

Table 2: General statistics related to the distribution of the participants in the four groups

	Group A	Group B	Group C	Group D
Number of Learners	32	32	32	32
Mean	33.312	33.290	32.281	33.515
Standard Deviation	3.897	3.625	3.665	3.759

As it may be clear from the mean scores and the standard deviations of the four groups, the participants have been assigned to the four groups homogeneously. This is further confirmed by the result of one-way ANOVA (Table 3) as follows:

Table 3: Statistics related to the homogeneity of the four groups

Source of Variation	SS	d.f	MS	F observed	F critical
Between Groups	29.7064	3	9.9021	0.7081	2.70
Within Groups	1733.9732	124	13.9836		

Compared with the critical F value of 2.70, the low observed value of 0.7081 depicts that there is no significant difference between the four groups as far as the learners' performances in P.E.T are concern. This implies that the participants have been assigned to the four groups homogeneously. Two questions were posed earlier in chapter one:

- 1) Is self-correction method more effective than teacher-correction method in the learners writing improvement?
- 2) Is there any relationship between learners' personality traits of extroversion/introversion and their writing improvement?

To find the answers to these questions, the researcher obtained the main data from the final compositions of the four groups. To analyze the data, a two-way analysis of variances (Two-way ANOVA) was employed to investigate the relationship between (1) Extraversion/Introversion as

personality traits, (2) self-correction versus teacher-correction as correction method, and (3) the learners' scores based on a written composition at the end of a seven-week period. Thus the following results were obtained.

Table 4: Two-Way ANOVA. The effect of Self-correction method and Personality traits on writing improvement

Source of Variation	SS	d.f	MS	F observed	F critical
Personality Trait (factor A)	150.8804	1	150.8804	0.67033	2.70
Correction Method (factor B)	698.4453	1	698.4453	3.10308*	2.70
(Factor A) × (Factor B)	57.5392	1	57.5392	0.2556	2.70
Within Groups	27910.06	124	255.081		
Total	28816.92	127			

As Table 4 reveals, the F observed value of 0.67033 related to the personality traits (factor A) is much lower than the critical value of 2.70 at 1 and 124 degree of freedom. This depicts that being extroverted or introverted alone, that is personality trait regardless of the correction method, has no significant effect on learners' improvement in writing. However, as Table 4 illustrates, the F observed value of 3.10308 related to correction method (factor B) is greater than the F critical value of 2.70. In other words, the correction method (*self-correction*) has proved to be significantly effective on learners' improvement in writing.

Moreover, the other observed F value of 0.2556 related to the interaction between the two factors of personality trait and correction method is much lower than the F critical value 2.70. This implies that there is no significant interaction between personality trait and correction method because the corresponding F observed value is much lower than the F critical value.

CONCLUSION

As AbiSamra (2003) asserts teacher's attitude toward correction, the way in which he offers it to learners, and learners' own feelings about the teacher in general are significant factors in the effectiveness of correction strategies. She recommends that teachers focus more on process in their comments and use multi-draft assignments; they should teach learners how to use feedback to enhance their writing skills (Self-correction has proven to be very effective; being aware of one's errors and rewriting those using problem-solving techniques is significantly beneficial for developing writing skills). As self-correction has proved to be superior to the traditional teacher-correction with regard to the writing improvement, it can be suggested to teachers to apply this method as an alternative to the traditional teacher-correction method in order to involve the learners in the whole process of writing, in general, and in the correction of errors, in particular. The followings would also justify the merits of self-correction.

According to Harris (1995), learners often perceive feedback (teacher-correction) as criticism rather than as constructive and well-meaning suggestion. Therefore, giving a part of the correction responsibility to the learners themselves will mean to them that the issue of criticism is

not as sensitive as it might have been if correction was done by the teacher himself. Furthermore, Boughey (1997, p. 128) asserts, the correction carried out by the learners is a process approach. She believes that in order for this process of writing, revising, and rewriting to be developmental, “some form of constructive feedback to the successive piece of writing is desirable and often necessary”. She goes on to say that in large mainstream classes peer reviews may suggest itself as an obvious means of alleviation of the workload of the teacher. At any rates, the learners must first be trained in taking this responsibility. Self-correction can serve as a preliminary practice for this responsibility.

According to Zeny (2003), the benefit of using correction codes to carry out the self-correction is that learners tend to pay closer attention to their work, considering different possibilities for choice of lexis, for instance. So, in fact, there is awareness raising and more willingness to assume responsibility for their production, even though it may happen merely at a linguistic level. As Porto (2001) says, each writer writes for specific readers and readers would read the written piece critically. Therefore, if the reader and the writer is the same person, some consciousness-raising would occur. According to Ferris (2007), self-correction follows the principles of problem solving and discovery learning, according to which learners themselves, guided by the teacher, find their problems in a relaxing atmosphere. Therefore, the solution can be better fitted into the cognitive structure which already exists in their minds. The other finding of the present study suggests that there is no significant difference in extroverts and introverts regarding their improvement in writing. Therefore, it can be suggested to the teachers that they consider the existing differences between the learners’ different potentials due to their different personality types. Teachers should bear in mind that introverted learners, who are sometimes erroneously believed to be shy, quiet, easygoing, and even not talented, can show improvement in the tasks required for them by just using strategies different from those of their extroverted counterparts to approach the goals (Hajimohammadi, 2010).

Therefore, it can be concluded that all learners, regardless of their personality traits, have the aptitude to learn in an efficient way just if the teachers discover the appropriate channel through which they would improve. These findings indicate that educators need to be aware of these temperament factors in order to address individual educational needs of learners. If educational setting is incompatible with the learners’ personal orientations towards learning, they may be unable to engage in educational activities and will be left at a disadvantage. More importantly, learners may disengage from the learning process which can further hamper their educational success.

Limitations of the study

The findings of the present study account for male intermediate teenagers. The instruction method is based on extensive reading and writing. Moreover, only two personality factors have been considered in the study, namely extroversion and introversion. The study also account for the effect of self-correction method on the learners’ improvement in writing. Therefore, two variables are considered in this study.

The Authors

Dr. Abdollah Baradaran is the Assistant Professor of TEFL and the chairman of the foreign languages faculty at Central Tehran Branch, Islamic Azad University, Tehran, Iran. As for his professional background, he has taught many courses in teaching language at the graduate level. He has published several papers in national and international journals and presented in numerous seminars.

Mohammad Reza Alavi (Corresponding Author) has got his M.A from Islamic Azad University, Central Tehran Branch, Tehran, Iran. He has worked as an interpreter for many years. His main areas of research interest comprise Teacher Education, Psychological Issues of ELT, Cooperative Learning, Bilingual and Multilingual Teaching and Teacher Training.

A CONTRASTIVE STUDY OF CODE GLOSSES IN INTERNATIONAL AND IRANIAN NEWSPAPERS

ABSTRACT

This study aimed to identify how code glosses are distributed according to cross-cultural or cross-linguistic preferences and explore the role they play in the construction and attainment of persuasion. For this reason, 240 opinion columns of three Persian newspapers (IRAN, Hamshahri and Ettelaat) and two English ones (NewYork Times and Independent) were selected. Then code glosses were highlighted in the texts and classified based on the Dafouz-Milne' (2008) taxonomy of meta-discourse markers. Findings revealed that code glosses are present in English and Persian newspapers' opinion columns, but there are variations as to the distribution. In addition, two groups of informants were used in order to discover how these markers operate as a persuasive mechanism in English and Persian texts. For the Iranian informants, the text with a high number of these markers and for the English informants, the text with a balanced number of these markers was considered as the most persuasive texts. Results showed that English and Persian informants chose the most persuasive texts according to their cultural preferences. The results are useful for columnists because in order to convince their audience, they should present the propositional material in a way that the audience find more convincing.

KEYWORDS: Code glosses; persuasion; cross-cultural; cross-linguistic

INTRODUCTION

In each written genre, writers try to guide and direct readers through the text. Some genres have a wide audience, and among them are newspapers especially the opinion column. So columnists try to present their writings in such a way that they persuade readers to share the writer's views and reflect the particular conventions that are followed in a given culture by certain features. These features are called metadiscourse markers. Code glosses - a kind of metadiscourse marker - help readers to comprehend the text better. Code glosses explain, rephrase, expand, or exemplify propositional content. Overall, they reflect the writer's expectations about the audience. They include parentheses, punctuation devices, reformulators, and exemplifiers (Hyland, 2007, p.3). Although the presence and function of metadiscourse markers have been examined in a number

of different contexts, little attention has been given to news discourse.

Columns, especially opinion columns, can be considered some of the most adequate examples of persuasive writing (Connor, 1996, as cited in Dafouz-Milne, 2008). By taking the importance of code glosses in newspaper genre especially the opinion column, this study attempts to contrast across English and Persian newspapers opinion columns in order to investigate their role in persuasion of their audiences.

Writers include code glosses to help decode the message, share the writer's views, and reflect the particular conventions that are followed in a given culture. They have a crucial role in the construction and attainment of persuasion (Dafouz-Milne, 2008). Dafouz-Milne (2008) studied how metadiscourse markers, both textual and interpersonal, contribute toward the overall persuasiveness of a text. Dafouz-Milne's study suffered from a number of limitations: a) the small-scale nature of the research and, b) the dynamicity and extra-textual dimension of the notion of persuasion itself. There are various extra-textual reasons that play a decisive role in the judgment of persuasion (the topic, the type of newspaper or the columnist) which were ignored by her. Also, the number of the participants who completed the questionnaire to judge on newspaper's opinion columns was too small. Further, there is no study on code glosses in Persian newspapers, and no study has ever focused on Iranian readers' evaluation of texts which are published in newspapers. Furthermore, Persian students of English who study at university have to pass courses on journalistic texts and it is necessary for them to know the different kinds of metadiscourse markers, it seems that awareness of such devices would be of optimal importance to them.

LITERATURE REVIEW

Newspaper

Mass media is a term used to denote a section of the media specifically designed to reach a very large audience such as the population of a nation. "The mass media, which is usually understood to refer to the press, radio and television broadcasting, have become one of the most pervasive phenomenon in our culture" (Thomas & Wareing, 1999, p. 50). The mass media provide the means of access to much information and represent a potentially powerful force in a society (Thomas & Wareing, 1999).

Newspaper is a kind of mass media. Richardson (2008, p. 64) states that "journalism is best approached as an argumentative discourse genre." Newspaper discourse, and opinion column in particular, can be considered as "some of the most persuasive writing in all countries, setting standards for written persuasion" (Connor, 1996, as cited in Dafouz-Milne, 2008, p. 96). The newspaper serves many purposes in the modern society: It informs by supplying facts, figures, scores, prices, charts, maps, photos and illustrations; it educates by going beyond basic facts in the in-depth analysis of columns, commentaries and editorials; and it provides a print marketplace for advertisers and prospective customers.

The online and print editions of the newspaper share some defining features. First, the newspaper is made of diverse content. In addition, they feature editorials, letters to the editor, movie listing, horoscopes, comics, sports, film, interview, recipes, advice column, opinion column, classified advertisement, and a host of other material. Second, newspapers are conventionally packaged. Both the print and online versions are organized according to the content. Third, newspapers are local. Fourth, more than any other medium, the newspaper serves as a historical record, and fifth, newspapers are timely (Dominick, 2009).

Newspapers are divided into two types: Broadsheet newspapers are large-sized newspapers. Broadsheets are considered to be informative and objective, keeping news and opinion or comment firmly apart. They present the reader with serious news, which is supported with detailed and informed analysis and comment on economic, political, social, and world events. Tabloids or the popular newspapers are newspapers whose pages are about half the size of broadsheet newspapers. Typically, they have colorful front pages with many photographs and often very big headlines (Shams, 2007).

Opinion Column

Newspapers give their staff-members as well as their readers an opportunity to express their opinions on current events. That is, besides editorials, there are other opinion articles in newspapers. One such article is the column, which refers to a series of articles by the same person appearing on a regular basis in a newspaper and giving the person's personal opinion on different issues. Columns can be regarded as personal editorials, the purpose of which is to advise, criticize, entertain, analyze, interpret, or comment. They are views behind the news written by people who take an interest in explaining behind-the-scene events. Columns use singular voice (they use the personal "I"). The writers of columns are called columnists, who are either staff members of the newspaper or syndicated columnists, who write for different newspapers. Columnists are sometimes famous and influential, so their columns are often headed by their pictures. Each columnist has his own style. Some try to be funny; others are very serious and use a very formal style (Shams, 2007).

Opinion columns are a main type of analytical writing in newspapers. Franklin (2008, p. 70) states that "the editorial and op-ed (opposite editorial) pages are central to a newspaper's identity". Most of today's British newspapers whether quality, mid-market or tabloid, national, regional or local value and mark out as distinctive forms of opinion journalism. Comment articles are public, mass communicated types of opinion discourse which play a definitive role in the formation and alerting of public opinion, promote social interaction among journalists, readers, and the rest of participants in the language event, and influence social debate (Van Dijk, 1996). All the papers have in common the commitment to designate spaces for opinion expression (Franklin, 2008).

Opinion columns are often found on the page opposite the editorial page. The page is usually labeled *Opinion* or *comment*. Opinion columns may be found elsewhere in the newspaper as well,

especially on the page preceding the editorial page. Opinion columns might be written by columnists who are employed by the newspaper, or by guest writers who have some expertise to share or a specific argument to make (Petroce, 2008, p.1). While op-ed articles are subjective accounts, they are often perceived to carry an objective-like status; that is, they are generally, associated with the opinions of the newspaper as an elite institution, since the author is normally a recognized and regular contributor (Greenberg, 2000).

When evaluating opinion columns, readers are expected to pay attention to whether the arguments made are supported by evidence. A good writer will back up his or her arguments with examples. If there are obvious counter-arguments, these should also be addressed and dealt with (Petroce, 2008, p. 2). Opinion columns, like editorials, express an opinion; but the opinion expressed belongs solely to the column's author, not to the newspaper or to the editorial board. In fact, it is quite common for an opinion column to argue against an opinion expressed in an editorial in the same newspaper (Francis, 2007).

In order to persuade, columnists have to present the propositional material in a form that the potential audience will find most convincing and attractive; furthermore, to succeed, writers need to create a credible textual persona or ethos and develop an appropriate attitude towards their readers and the claims they present. In the construction of this textual persona, metadiscourse plays a vital role (Dafouz-Milne, 2008, p. 96).

Audience

In media studies audience is mostly used as a way of talking about people, either as groups or as individuals (Nightingale & Ross, 2003). All writers need to consider who they are writing for and adjust their prose to meet the needs of readers. They know that readers can always challenge arguments and reject claims and so they must present their ideas in ways that will be seen as both credible and persuasive, using the conventions of the genre to adequately engage their readers (Hyland, 2005). Essentially, writers must both present themselves as competent individuals, expressing a textual voice or community recognized personality, and engage with readers in accepted ways.

Metadiscourse markers

Coherence in discourse can be achieved by different means. Coherence relations that hold together different parts of the discourse are partly responsible for the perceived coherence of a text. More specifically, the recognition of coherence relations by the hearer or reader enables them to assign coherence to a text. Discourse markers guide the text receiver in the recognition of those relations (Taboada, 2006, p.507). In order to be successful, the writer needs to operate at two levels: the level of text (discourse) and the level of metatext (metadiscourse): On one level, the writer supplies information about the subject of the text. On this level he expands propositional content. On the other level, the level of metadiscourse, he does not add propositional material but helps readers organize, classify, interpret, evaluate, and react to such material. Metadiscourse marker is a kind of cohesive devices that help to establish relationships

between different sentences or between different parts of a sentence (Halliday & Hasan, 1976). Metadiscourse markers help writers shape their arguments to needs and expectations of their target readers. Metadiscourse helps organize, engage the audience, and signal the writer's attitude. It is the author's overt or covert presence into the discourse to inform and to shape the reader's thoughts (Crismore, 1984, p. 280).

A variety of metadiscourse taxonomies have been proposed (Dafouz-Milne, 2008; Hyland & Tse, 2004; Dafouz, 2003; Hyland, 1998 a; Vande Kopple, 1997) which propose different metadiscourse categories. Most of these classifications generally organize the linguistic units under the functional headings of textual and interpersonal metadiscourse. Textual metadiscourse refers to the organization of discourse, while interpersonal metadiscourse reflects the writer's stance towards both the content in the text and the potential reader.

Textual metadiscourse consists of seven Macro-categories including: a) Logical markers express semantic and structural relationships between discourse stretches, and help readers interpret pragmatic connections by explicitly signaling additive, adversative, and conclusive relationships in the text, b) Sequencers mark particular positions in a series and serve to guide the reader in the presentation of different arguments in a particular order, c) Reminders refer back to previous sections in the text in order to retake an argument, amplify it or summarize some of the previous argumentation, d) Topicalisers explicitly indicate some type of topic shift to the reader so that the argumentation can be easily followed, e) Code glosses explain, rephrase, expand, or exemplify propositional content, f) Illocutionary markers explicitly name the act the writer perform, and g) Announcements refer forward to future sections in the text in order to persuade the reader for prospective argumentation. Interpersonal metadiscourse consists of five Macro-categories: a) Hedges refer to markers that withhold full commitment to the statements displayed in the text, b) Certainty markers express full commitment to the statements presented by the writer, c) Attributors perform a double function in the text, d) Attitude markers express the writer's affective values towards the reader and the content presented in the text, and e) Commentaries help to establish and maintain rapport with the audience by means of rhetorical questions, direct appeals, personalization, and asides.

Recently, Hyland and Tse (2004) have put forth a stronger interpersonal view on metadiscourse, claiming that all metadiscourse categories are essentially interpersonal since they need to take into account the readers' knowledge, textual experiences, and processing needs. Thus, they proposed a change in the terminology adopting Thompson's (2001) label of interactive (instead of textual) and interactional (instead of interpersonal) metadiscourse (as cited in Dafouz-Milne, 2008).

Code glosses

Code glosses help grasp functions of ideational material (Hyland, 1999; Hyland & Tse, 2004; Rahman, 2004; Vande Kopple, 1997). Code gloss signals are a crucial element of a text's meaning as they relate a text to its context by taking readers' needs, understandings, existing

knowledge, intertextual experiences, and relative status into account (Hyland, 2004, p. 17). They help "explain, rephrase, or exemplify textual material" (Dafouz-Milne, 2008) and are divided into four subcategories: a) Parentheses are words or phrases that are enclosed parenthetically; b) Punctuation devices refer to comma, semicolon, and colon. c) Reformulators are a discourse function whereby the second unit is a restatement or elaboration of the first in different words, to present it from a different point of view and to reinforce the message, and d) exemplifier is a communication process through which meaning is clarified or supported by a second unit which illustrates the first by citing an example (p. 98). Kumpf (2000) classified colons and parentheses as visual metadiscourse. Reformulation is a discourse function whereby the second unit is a restatement or elaboration of the first in different words, to represent it from a different point of view and to reinforce the message. Reformulation is a "process of textual reinterpretation: the speaker or writer re-elaborates a previous fragment of discourse presenting its contents in a different way" (Cuenca & Bach, 2007, p.149). On other hand, reformulation ensures textual cohesion and at the same time facilitates discursive progression because it helps in reducing the possible communicative defects of a text, and it also makes it possible to re-elaborate the conceptual content of some statements previously presented in order to accomplish different functions (Cuenca & Bach, 2007).

Cuenca and Bach (2007) analyzed contrastively the form and use of reformulation markers in research papers written in English, Spanish, and Catalan. The corpus consisted of 395 utterances including periphrastic reformulators. The study showed interesting differences in the form and use of these markers cross-linguistically. In terms of the form and frequency of the markers, English papers used simple fixed markers and had fewer reformulators than Spanish and Catalan. On the contrary, Spanish and Catalan papers included more markers some of which were complex. The study showed that English authors usually reformulate to add more information to the concept (expansion), whereas Catalan and Spanish authors reduce the contents of the implicatures of the previous reformulation. Another finding was that some of specific and typical reformulators in Spanish and Catalan express two or even three moves in Spanish, so they tend to be more ambiguous; on the contrary, English reformulators express one move.

Exemplification is a communication process through which meaning is clarified or supported by a second unit which illustrates the first by citing an example. Lischinsky (2008) states that classical logic and rhetoric have considered examples useful for pedagogic or public debates. It is a current feature of academic writing and a central aspect of exposition, a part of the routine ways in which writers in all fields seek to make their ideas accessible and persuasive. Essentially, it is an appeal to understanding that the writer's beliefs are recoverable from the example: presenting an element of the writer's data or experience to make the abstract more concrete. Focusing on exemplifying and reformulating in academic discourse, Hyland (2007) explored how

professional academic writers monitor their texts for readers to restate information or provide examples as they construct their arguments. The disciplines were selected to allow comparisons across a range of academic knowledge and rhetorical practice, comprising mechanical engineering, electrical engineering, marketing, philosophy, sociology, applied linguistics, physics, and microbiology. The main claim of this paper was that elaboration is a complex and important rhetorical function in academic writing, and that its use varies according to discipline. The analysis showed disciplinary variations in the ways which reformulation and exemplification were expressed and the functions they served.

Persuasion and metadiscourse

In persuasive writing, a writer takes a position for or against an issue and writes to convince the reader to believe or do something. It is also used in essays and other types of writing to get the reader to accept a point of view. In order to convince the reader, the writer needs more than opinion; he or she needs facts or examples to back his or her opinion. The concept of persuasion has often been linked to hedging, emphatics, and metadiscourse in general. Signed or opinion articles are a subclass of persuasive texts.

According to Hyland (1998 b), metadiscourse plays an important part in displaying the writer's communicative intentions and is therefore integral to persuasive writing. He argued that metadiscourse is closely linked to the rules and expectations of a given discipline's discourse community. For example, if a researcher wants his or her arguments to appear persuasive to the readers within given academic community, the linguistic devices he or she chooses need to conform to the conventions of the discipline. Hyland points out metadiscourse in such different communities would also vary. On the basis of his findings, he argued that metadiscourse cannot be separated from its rhetorical context, and the relationship between them is indispensable for the success of academic writing. In another study focusing on expressions of evaluation and standpoint in academic writing, Silver (2003) analyzed the use of the adverbial *evidently* in American research articles published in academic journals of economics and history. He chose the genre due to its persuasive nature. According to him, academic writing essentially involves the making of arguments, or knowledge claims, targeted at the discipline's discourse community, and they need to be made convincingly if the author wants his or her claims to gain the readers' support and attention. Silver's analysis of this epistemic adverbial in the context of history and economics research articles revealed that it can function both as a hedge and a booster. According to Silver, the adverbial *evidently* not only shows the writer's epistemic stance regarding propositions in the text studied, but it also gives an evaluation of what the discipline's value system considers as evidence.

Dafouz-Milne (2008) studied how metadiscourse markers contribute toward the overall persuasiveness of a text. The corpus in her study comprised opinion columns from two newspapers of The Times (English) and the other El País (Spanish). Within the category of interpersonal metadiscourse markers, Dafouz-Milne included the following macro-categories:

hedges, certainty markers, attributors, attitude markers, and commentaries. The results showed that hedges were the most common category of interpersonal metadiscourse markers in both British and Spanish texts. Certainty markers followed as the third most frequent type, right after attitudinal markers and before commentaries. As for the persuasive effect of the texts, the informants' answers indicated that the most persuasive texts were those that had a balanced number of both interpersonal and textual metadiscourse markers. In terms of overall intercultural differences, the Spanish texts were found to contain more textual metadiscourse markers than the English, whereas the situation was the opposite in the case of interpersonal metadiscourse, which was more abundant in the English texts. Dafouz-Milne concluded that the critical factor in producing a successfully persuasive text is to skillfully combine both expressions that weaken the argument (i.e; hedges) and those that strengthen it (i.e; attitudinal markers or certainty markers).

RESEARCH QUESTION

The current study attempts to answer the following questions:

- 1) To what extent are code glosses used in Persian and English opinion columns?
- 2) Is there any significant difference in using code glosses in Persian and English opinion columns?
- 3) Is the English text as well as Persian text with high degree of code glosses more persuasive than ones with medium or low degree of respective markers?

METHODOLOGY

The present study cast a contrastive look on code glosses in opinion columns of English and Persian newspapers in order to explore how these markers are distributed according to cross-cultural or cross-linguistic preferences and their role in the construction and attainment of persuasion.

Participants

The study was carried out with 60 participants of whom 30 were native speakers of English (British and Irish backgrounds) aged between 25 to 42 and the other 30 were native speakers of Persian aged between 27 to 35. The native speakers of English were accessed via e-mail, and the Persian native speakers were contacted in person. A questionnaire was originally distributed among 45 Persian native speakers and 30 were returned. The same questionnaire was sent to 50 English native speakers, but only 30 of them were returned.

Dataset

The corpus in this study consisted of five newspapers, three Persian newspapers (*Ettelaat*, *Hamshahri*, and *IRAN*) and two English ones (*New York Times* and *Independent*) all of which were chosen because of their status and the political and rhetorical influence they exert in their respective national cultures. The opinion columns of these newspapers were the only sections that were investigated. The columns covered such topics as social and cultural, economics, and politics. Generally 240 columns were analyzed: One hundred-twenty opinion columns of the

Persian newspapers which were published during January and February 2009 and 120 opinion columns of the English newspapers published during January and February 2009 were selected. This quantity was assumed to be adequate to allow the researcher to make valid generalizations.

Instrumentation

This study explored the role of code glosses in the construction and attainment of persuasion and made a contrastive analysis of opinion columns in the use of code glosses as pragmatic devices in Persian and English newspapers. Dafouz-Milne taxonomy (2008) was used as the theoretical framework for the selection of these two metadiscourse devices which covers the functional division of textual and interpersonal metadiscourse. This division has offered a variety of subcategories covering both the pragmatic functions of metadiscourse markers and the linguistic devices used to carry out such functions. The taxonomy is shown in the following Tables. As mentioned before, opinion columns are a subgenre of persuasive texts (Van Dijk, 1988, as cited in Dafouz-Milne, 2008) and their final aim is to convince the audience by means of textual and interpersonal metadiscourse markers. These texts are constant in our daily lives and their mastery is necessary for literate individuals.

Table 1: Textual Metadiscourse Categories

Macro-category	subcategory	Example
Logical markers	Additive	and/in addition/moreover...
Express semantic	Adversative	or/however/but...
Relationships between discourse stretches.	Consecutive	so/therefore/as a consequence...
	Conclusive	finally, in any case
Sequencers		
Make particular positions in a series		first, second/on the one hand... on the other...
Reminders		
Refer back to previous sections in the text		<u>Let us turn to</u> / as was <u>mentioned before</u>
Topicalisers		
Indicate topic shifts		<u>in political terms</u> / <u>in the case of</u> NHS
Code glosses	Parentheses	
Explain, rephrase or Exemplify textual material	Punctuation devices	Tax evasion: it deplored in others but not in oneself.
	Reformulators	in other words/that is
	Exemplifiers	for example/for instance...
Illocutionary markers		
Explicitly name the act the writer performs		I <u>propose</u> / I <u>hope</u> to persuade...
Announcements		
Refer forwards to future sections in the texts		There are many <u>good reasons</u>

A questionnaire was also used and demanded readers to read the selected texts, and then explain their decisions by writing open comments on evaluating the selected English or Persian texts. From each dataset, three texts were selected to be evaluated by the participants. The questionnaire was loosely adapted from Connor (1987 as cited in Dafouz-Milne, 2008) and Connor and Lauer's (1988, p.146) model (as cited in Dafouz-Milne, 2008, p. 101) for persuasive writing and contained three basic criteria for evaluating persuasive effect: rational appeals, credibility appeals and affective appeals. Consequently, the number of texts for persuasion comprised three texts in Persian and three texts in English (three opinion columns of each newspapers) with different indices of code glosses.

Table 2: Interpersonal Metadiscourse Categories

Macro-category	subcategory	Example
Hedges		
Express partial commitment	Epistemic verbs	May/ might
To the truth-value of the text	Probability adverbs	Probably/ perhaps
Epistemic expressions	It is likely	
Certainty markers		
Express total commitment		Undoubtedly/clearly
to the truth-value of the text		
Attributors		
Refer to the source of the information		'x' claims that...
Attitude markers		
Express writers' affective values	Deontic verbs	Have to / needs to
towards text and readers	Attitudinal adverbs	Unfortunately/remarkably
Cognitive verbs	Attitudinal adjectives	It is absurd /it is surprising
	I feel / I think /I believe	
Commentaries		
Help to establish writer rapport the text	Rhetorical questions	What is the future of Europe, reader-integration or disintegration? through
Direct address to reader		<u>Dear reader</u>
Inclusive expressions		<u>We all</u> believe
Personalizations		<u>I</u> do not want Diana (<u>ironically</u> for a Spencer) was not of the
Asides		
Establishment.		

Procedure

This study was based on a sample of 240 opinion columns which were selected from five English and Persian newspapers. *Ettelaat*, *IRAN*, and *Hamshahri* represented the Persian newspapers and *New York Times* and *Independent* represented the English press. From each English newspaper, 60 texts were selected during two months. But, for the Persian counterparts, the first twenty

issues of each newspaper during two months were selected for the analysis. Initially the opinion columns, either obtained directly from the electronic versions of the relevant newspapers or manually, were scanned and converted into Rich Text format. Then, word count was run on the corpus to have a rough estimate of the quantity of the data. Since the columns in Persian could not be converted into Rich Text, they were counted twice manually. Next, the texts were carefully read three or four times in order to identify the linguistic signals in focus and key signals that characterize code glosses. To analyze the data quantitatively, the frequency of the code glosses was calculated. About 20 percent of the data was analyzed for the inter-rater reliability and agreement was reached accordingly. Also, for the sake of intra-rater reliability, the data was analyzed two times within about one month interval. Having analyzed the data and presenting the frequencies, in order to see if the possible differences are statistically significant, *chi-square* analysis was administrated.

Table 3: English Texts for Persuasive Effect

Text 3	28	5

Table 4: Persian Texts for persuasive effect

Persian texts	Total meta discourse	code glosses
Text 1	25	6
Text 2	52	6
Text 3	69	4

In the second phase of the study, a questionnaire was used in order to attain persuasion on the selected informants. Since, the total corpus consisted of 240 opinion columns with various lengths, 60 texts (30 Persian texts and 30 English ones) of almost the same length were selected as original in order to select three Persian texts and three English ones from among them, and then they were arranged based on the frequency of respective metadiscourse markers. Three texts in English and three texts in Persian were selected for subsequent judgment. One text in English and one in Persian included a high proportion of metadiscourse markers; also, one with a medium proportion, and one with a low proportion from each group of texts were selected. An additional reason for reducing the original corpus was found in the principles of feasibility and availability, since informants could only analyze a limited number of texts without the task becoming too demanding.

To avoid aprioristic influences on the informants, the texts were edited, omitting the names of the authors and newspapers and the titles of the columns. The readers were given a questionnaire in order to rank the texts from 1 to 5, 1 representing the least persuasive text and 5 the most persuasive. They were also invited to explain their decisions by writing open comments. The Persian texts were sent to Iranian informants. English native speakers received the texts through three of my friends who live in America, England, and Holland. After gathering the

questionnaires, the scores given to the questionnaires by the informants' responses were analyzed and then the raw scores of the informants were computed through the SPSS program (version 13) for data analysis. Next, to see if the possible differences are statistically significant, a *t*-test analysis was administrated. Moreover, the responses of the informants to the questions in the questionnaire were qualitatively analyzed. The possible quantitative differences between the opinion columns were also qualitatively investigated.

RESULTS AND DISCUSSION

On a general level, the quantitative analysis reveals that English texts used more code glosses than did Persian texts (English, $n=842$, Persian, $n=749$), but their difference was statistically significant. On the whole, the statistical analysis showed that the differences between two languages were statistically significant (see Table 5).

Table 5: Code Glosses in English and Persian Newspapers

Total textual markers	Word Count	Code Glosses (%)
English	92,214	842 (0.004)
Persian	81,152	749 (0.9)
Chi-square		5.436

Critical value= 3.8415

Code glosses in Persian and English newspapers

Regarding code glosses, Results display statistically significant differences with English writers using these explanatory devices much more frequently than do their Persian counterparts. A closer examination in the subcategories of code glosses discloses that punctuation devices were the most frequently used category in both sets of groups: English ($n=354$) and Persian ($n=225$). In fact, punctuation devices were given priority by newspaper columnists in both corpora and the statistically significant difference existed here. Other categories, though not significant, exhibited some differences across the two languages. After punctuation devices, exemplifier markers ranked second with both corpora showing a very similar number. On close examination, the study reveals that expressions like *for example* (*be onvane mesal*) and *for instance* (*baraye mesal*) are the most frequent resource in both corpora. The other exemplifier markers found are *such as* (*Az ghabile*) and *i.e* (*Yani*). Parenthesis markers occupy the third place in terms of frequency of occurrence with Persian texts and the fourth place with English counterpart: (Persian, $n=162$; English, $n=143$). Regarding reformulator markers, Persian and English writers used an almost identical number of tokens (Persian, $n=151$; English, $n=150$). Within the linguistic preferences, English columnists opt for the expression *in other words*, closely followed by *namely* and *that is* while in the Persian data, the constructions *Yani* (namely), *be ebarat digar* (in other words) dominate with 125 instances.

Table 6: Code Glosses in English and Persian Newspapers

Total logical devices markers	parentheses (%)	punctuation (%)	exemplifiers (%)	reformulators(%)
English	143 (16.98)	354 (42.04)	195 (23.15)	150 (17.81)
Persian	162 (21.62)	225 (30.04)	211 (28.17)	151 (20.16)
Chi-square	1.184	28.741	0.631	0.003
Differences	p>0.05	p=0	p>0.05	p=0

Critical value= 3.8415

On a general level, the quantitative analysis reveals that the texts written in *Hamshahri* and *IRAN* columns used a lower number of code glosses than *Ettelaat*. Chi-square analysis revealed that the differences were statistically meaningful. (*Ettelaat*, n=477, *IRAN*, n=162, *Hamshahri*, n=110). Within the English corpus, again, code glosses appeared to be only marginally different. Table 8 exhibits the related figures.

Table 7: Code Glosses in Persian Newspapers

Total Textual Markers	Word Count	Code Glosses (%)
Hamshahri	18,316	110 (0.6)
IRAN	25,403	162 (0.63)

Chi-square		0.304

Critical value= 3.841

Persuasion in English and Persian newspapers

Comparison of the English texts on persuasive effect

Table 9 provides the information about the informants' scores on persuasion for English text one (text with high index of code glosses) and text two (text with medium index of respective markers), and text three (text with low index of respective markers). The comparison of the means of text one and text two showed text two to be more persuasive.

As it is shown in Table 9 *t*-observed was calculated as (-7.300) and *t*-critical was (1.645) at the (df = 58). Therefore *t*-observed was much higher than the *t*-critical of 1.645 at the 0.05 level of significance. So, there was a meaningful difference between the two mean scores, and the *t*-value confirmed that text two was more persuasive than text one. Comparison of text one and text three revealed the latter to be more persuasive. A statistical *t*-test was also administered. The *t*-value of -6.467 observed for a degree of freedom 58 was greater than the *t* critical value of 1.645 at the

0.05 level of significant. Therefore, there was a meaningful difference between the two mean scores, and the t value confirmed that text three was more persuasive than text one.

Comparison of the texts continued for text two and text three. As it is shown in the following Table, t -observed was calculated as (-3.013) and t -critical was (1.645) at the ($df = 58$). Therefore t -observed was higher than the t -critical of 1.645 at the 0.05 level of significance. Therefore, there was a meaningful difference between the two mean scores, and the t -value confirmed that text two was more persuasive than the text three

Table 9: Results of t -test of English texts on persuasive effect

Texts	N	Mean	SD	t-test
Text 1	30	3.2333	0.62606	-7.300
Text 2	30	4.4667	0.68145	
Text 1	30	3.2333	0.62606	-6.757
Text 3	30	4.0667	0.25371	
Text 2	30	4.4667	0.68145	-3.013
Text 3	30	4.0667	0.25371	

Comparison of the Persian texts on persuasive effect

The comparison of the means of Persian text one (with low proportion of the markers) and Persian text two (medium index of the markers) revealed text two to be more persuasive. The t -value of -6.467 observed for a degree of freedom 58 was significantly above the t critical value of 1.645 at the 0.05 level of significant. Therefore, there was a meaningful difference between the two mean scores, and the t value confirmed that text two was more persuasive than text one.

Comparing the mean score of text one (text with low density of the markers) to text three (one with high density of the markers) revealed the text three was more persuasive than the text one. A statistical t -test was administered. The t -observed was calculated as (-7.603) and t -critical was (1.645) at the ($df = 58$). Therefore t -observed was more than the t -critical of 1.645 at the 0.05 level of significance. Therefore, there was a meaningful difference between the two mean scores, and the t -value confirmed that text three was more persuasive than text one.

Comparing the mean score of text two (with medium index of the markers) to mean score of text three (with high index of the respective markers) showed that text three was more persuasive than text two. The t -value of 3.008 observed for a degree of freedom 58 was significantly above the t critical value of 1.645 at the 0.05 level of significance. Therefore, there was a meaningful difference between the two mean scores, and the t value confirmed that text three was more persuasive than text two. Table 10 reveals the data related to the result of the persuasion effect of Persian texts on informants.

Table 10: Results of t-test for Persian texts on persuasive effect

Texts	N	Mean	SD	t-test
Text 1	30	2.7000	0.70221	-6.467
Text 2	30	3.7667	0.56832	
Text 1	30	2.7000	0.70221	-7.603
Text 3	30	4.4000	1.00344	
Text 2	30	3.7667	0.56832	3.008
Text 3	30	4.4000	1.00344	

The qualitative analysis of the questionnaire on persuasive effect

The informants' comments on the persuasive effect were also analyzed qualitatively. The English native speakers agreed on text with medium index of examples, facts, and comparison as the most persuasive text. In addition, they remarked the use of example, facts, and comparison can be an important way to convince people better. However, Persian native speakers chose the text with high proportion of these markers as the most persuasive text. They did not write any comments on the texts, they exactly wrote the descriptions which were given for each number in the questionnaire.

In general, there was a meaningful difference among English texts with different proportions of code glosses. The English native speakers chose the text with moderate index of discourse markers as more persuasive, followed by text with a high number of these markers. Text with a low index of discourse markers was considered as less persuasive by the English informants. These findings show that the English and Persian texts with high degree of code glosses are not more persuasive than the ones with medium or low degree of code glosses. These findings were in line with Dafouz-Milne's (2008) study. On the contrary, the Iranian informants chose the text with high density of code glosses as the most persuasive text, leaving texts with medium and low proportions of these markers in second and third places of persuasiveness. As a result, for Iranian readers, the higher degree of code glosses, the more persuasive the text will be. These findings contradict Dafouz-Milne's (2008) study in which the Spanish and English informants of her study chose the texts with a medium proportion of metadiscourse markers as more persuasive texts.

It can be concluded that circumlocution is a current figure of speech in Persian literature and one part of the circumlocution is redundancy, which seems it uses much more in Persian literature. In fact, redundancy is part of the aremonial feature of Persian. It seems Iranian people use redundancy in their speech and extend it to their writing. They used to talk much more around a topic and think by more explanation, they can convince the others better. In addition, the use of redundancy has become a habit in their daily life. In the following paragraph which is extracted from the data, the author used redundant phrases whose omissions may not cause any problem in comprehending the text. On the other hand, it seems English native speakers use conciseness in their writing.

CONCLUSION

This study has presented quantitative and qualitative research on the presence and persuasive function of code glosses in a corpus of Persian and English opinion columns. Regarding similarities, the study reveals that code glosses are present in the English and Persian texts. As Dafouz-Milne (2008) states that these similarities can be attributed to the newspaper-genre characteristics of opinion columns that seem to contribute to the national culture and exhibit certain uniformity across languages. Concerning differences, this study suggests that there is some variation across languages in the construction of opinion columns. For instance, the findings show that English authors use more code glosses than Persian writers. It is worth to note that English writers know that these texts address fairly broad audiences and also they are aware that these texts should include some explicit reading cues and examples in order to help audience to comprehend as intended.

As regards the analysis of persuasion, the findings suggested that texts with a balanced number of code glosses items were considered as the most persuasive by our informants, followed by texts with a high number of these markers. The texts considered to be less persuasive of all by our English informants were those with a low index of metadiscourse markers. On the contrary, Persian informants chose the text with high degree of respective markers as the most persuasive one. Texts with medium and low degrees of these markers occupied the second and third places of persuasiveness. In other words, it seems that our readers highly value texts that guide and show consideration towards the audience, by establishing a dialogic tenor without resulting too assertive or patronising.

The results gained from the present study are useful for columnists. In order to convince their audience, columnists should present the propositional material in a way that the audience find more convincing. Metadiscourse markers, especially code glosses can be useful in this way. Also, they should consider the following things when they write an opinion column: 1) Think about their audience. If they are trying to engage the public with new or interesting ideas, make sure they are connecting with the appropriate readers. 2) Do not assume everyone thinks like them. If you assume “everyone knows” something, then you are marginalizing people who may not know. This is your opinion. Stating it as fact limits your credibility. 3) Do not be formulaic. Read, listen and watch to make sure your opinion is relevant. There are many common topics that are staples to the opinion page, and it can be difficult not to regurgitate other people’s opinions. What is their angle? What makes their opinion more interesting than those we have heard before? 4) Be (a little bit) humble. Be willing to be corrected with an argument as equally substantiated as your own. The opinion page creates a dialog with an extensive and sometimes unexpected audience. If your writing employs grandiose statements, generalizations and crass language, you can respect the same attitude in return. 5) Don't be too humble. This is your opinion, and you chose to share it for a reason. If you seem halfhearted or unsure, it will be immediately obvious to the reader and you will have a hard time persuading them, Francis (2007).

The results of the study are useful for newspaper editors, because it makes them devote more

spaces to opinion columns to convince the audiences better. There are some important limitations in this study: a) the number of English and Persian newspapers was not equal, initially, three English newspapers (Independent, New York Times, and Washington Post) and three Persian newspapers (Iran. Hamshahri, and Ettelaat) were chosen, but because of the presidential elections, the link of Washington Post was cut, and I had to compare two English newspapers with three Persian ones. b). The second limitation was the difficult access to the English native speaker. The other limitation was the dynamicity of dimension of the notion of persuasion itself (Dafouz- Milne, 2008).

There are various textual reasons which were not analyzed in this study that play a decisive role in the judgment of persuasion (the topic, the type of newspaper, the number of newspaper, and the columnist). Thus, further studies could offer more insights into persuasion by using a larger corpus, focusing on different disciplines and genres and this may be involve other subjects. For example it would be interesting to contrast English teachers' and students' evaluations with that of Persian teachers' and students' evaluations in order to understand whether their view of persuasive text turns to be the same. There were some important limitations in this study: a) the number of English and Persian newspapers was not equal, initially, three English newspapers (Independent, New York Times, and Washington Post) and three Persian newspapers (Iran. Hamshahri, and Ettelaat) were chosen, but because of the presidential elections, access to the link of Washington Post was not possible, two English newspapers were compared with three Persian ones. b) The other limitation was the dynamicity of the notion of persuasion itself (Dafouz- Milne, 2008).

THE GENERALIZATION OF RELATIVE CLAUSE INSTRUCTION IN THE ACQUISITION OF ENGLISH AS A FOREIGN LANGUAGE

Farideh Ataelifar

Department of English, Shiraz Branch, Islamic Azad University, Shiraz, Iran.

Faridehataelifar@gmail.com

ABSTRACT

The experimental study intended to test the generalization of instruction of one form of relative clause to others in learning English as a foreign language. 150 students were given a pre-test of combining eighteen pairs of sentences, attaching the second sentence as a relative clause to the first one. After scoring the pre-test, chosen from Eckman's paper(1988) consisted of a sentence combining task which was to be performed on eighteen pairs of sentences and the eighteen questions on the pre-test contain three pairs of sentences which are to be combined into resultant sentences containing a relativized subject, three into sentences with a relativized indirect object, and so on, 60 students who were found to have no knowledge of relative clauses in English were randomly assigned to four equal groups, three of which served as experimental groups and one as the control group. Each experimental group was given instruction on a particular type of relative clauses. The subjects were then given a post-test(chosen from Eckman's paper(1988). The task in the post-test was the same as in the pre-test but sentences were different to reduce the effect of the pre-test performance on the post-test performance. From the results of the experiment, it is argued that maximal generalization of learning takes place from structures which are typologically more marked to those structures which are typologically less marked, and not the reverse. Some implications of this interpretation are discussed.

KEYWORDS: Accessibility Hierarchy; Markedness Differential Hypothesis; Generalization Strategy

INTRODUCTION

The theory of language universals maintains that certain linguistic features are present in all world's languages. Universal grammar consists of a highly structured and restrictive system of principles. Associated with some of these principles are certain possibilities of variations, called parameters. As these parameters are fixed, a grammar is determined (core grammar), so that it can tell what languages have in common. These common features are known as statistical universal since they are established statistically by looking at as many languages as possible. An example is relative clauses (RC), one type of dependent clauses introduced by a relative pronoun referring to the main noun the clause depends upon. Keenan and Comrie (1977) found out interesting similarities in how languages combine main and relative clauses together. These

similarities depended on the kind of word in the RC that was used as a link to the main clause. This concept was called the Accessibility Hierarchy (AH). Six types of RCs make up the AH. They can be thought of simply as types 1 to 6:

Type 1. Subjects Clause: "The man who left was John."

Type 2. Object clause: "The car that he crashed was John's."

Type 3. Indirect object clause: "The person that he gave the cheque was John."

Type 4. Object of preposition clause: "The person to whom he gave the cheque was John."

Type 5. Possessive clause: "The man whose book I borrowed was John."

Type 6. Object of comparison clause: "The man than whom I am taller is John."

Complex structures in general and RCs in particular have been the target of several studies. These structures are revealing in the sense that they open new horizons to psycholinguistic research.

From their study of RC construction in a wide range of languages, about fifty of grammatical relations out of which relativization could take place. The proposed universal order which was labeled the AH was as follows:

SU > DO > IO > OBL > GEN > OCOMP

Subject direct object indirect object oblique genitive object of complement

According to this hierarchy it is easier to relativize subjects than relativizing other positions. By the same token direct objects are easier to relativize than indirect objects and the pattern continues in the same way.

Eckman (1977) believed that different strategies used in the acquisition and comprehension of RCs may be due to some other factors such as the degree of difficulty of the aspects of the target language. Considering the assumption that human beings will learn to do things which are less difficult before they learn to do related things which are more difficult, he proposed the idea of markedness differential hypothesis (MDH). More importantly, however, the MDH suggests that it is the most marked aspects of a target language from which it should be possible for a learner to gain maximal generalization of his/her learning.

The Significance of the Study

Considering the grammatical and semantic functions of the RCs, the understanding of the relationship between words and the semantically defining or describing role of RCs for their antecedent nouns helps the students to interpret a text meaningfully. Naturally this will promote both the productive and receptive skills of the learners. So the acquisition of English grammar and RCs as one of its major components can be taken as a requirement for the development of all four skills in those students learning English as a second/foreign language.

For the successful teaching of RCs to students of English as a foreign language, teachers should come to an understanding of the processes involved in acquiring them. Generalization hypothesis proposed by Gass (1981,1982) which is a strategy applied by EFL and ESL students in the

acquisition of RCs can reduce the amount of time required to teach 6 types of RCs. Considering time as an important factor in the acquisition of English, teachers can take advantages of the process.

LITERATURE REVIEW

The question whether there is a natural route to language development or whether syntactic structures are acquired in a fixed sequence by children and adults has occupied the minds of many researchers (Krashen 1981, Cook 1985, Comrie 1981, Brown 2007). This question has arisen as a result of such a theory as nativism which is based on the assumption that in the languages of the world the possible grammars are limited by an innately determined set of schemata that result from the biological composition of the human mind. Burns and Richards (2012) argues that certain linguistic forms are more accessible or more salient to the child than others. Thus some structures are learnt sooner than others in a predictable way. This very predictability has provoked a lot of research in the area of first and second language acquisition.

Gass (1979) found that the difficulty for the EFL learners indeed seemed to follow the hierarchy with type 1 as the easiest type and type 6 as the most difficult, regardless of the learners first language. There were one major exception: type 5 (possessive clauses) was much easier than expected, coming between types 1 and 2 in term of difficulty, rather than after type 4. Data on English RC's were gathered from 17 high intermediate and advanced about L₂ learners enrolled in an English language training program at Indian University. The nine native languages of these learners were: Arabic, Chinese, French, Italian, Korean, Persian, Portuguese, Japanese and Thai. Her study also suggested that the areas of difficulty for these groups could be predicted on the basis of universal properties of RC's rather than the basis of language specific properties.

Eckman and his colleagues (1988) divided thirty-six EFL students who were enrolled in English as a second language intensive program at the University of Wisconsin-Milwaukee into four groups. All the students were from intermediate or low-intermediate proficiency levels. Each of the subjects was given a written pre-test consisting of a sentence combining task which was to be preformed on twenty-one pairs of sentences. Following the pre-test and the grouping, each group of students received instruction on relative clauses for one class hour. The first group received instruction on only subject relatives, the second on only direct object relatives, and the third group on only object of preposition relatives. The fourth group, the control group, received instruction on sentence combining techniques not related to relative clauses.

Two days after the instruction, the subjects were given the post-test The results of the analysis of the post-test scores indicate that the group which scored the best was the one trained on the object of a preposition, with the object group next, subject group next, and control group last.

Nicholas (1995) pointed out that terrestrial languages follow the pattern of generalization presented by Eckman (1988) for the heads of RCs, first subjects, then direct objects, followed in order by indirect objects, possessors, and comparatives.

Cheung (2002) investigated the development of relative clauses in the interlanguage of native Cantonese learners of English within the framework of Keenan and Comrie's Noun Phrase Accessibility Hierarchy (1977, 1979). He also distinguished the features of Cantonese-English interlanguage which may be attributed to language transfer from those which may be considered as universal to second language acquisition.

As observed by Keenan and Hawkins (1987) on English newspaper texts, subject relative pronouns are much more common than direct object ones, themselves being more common than indirect object ones (which confirms Keenan and Comrie's Accessibility Hierarchy). For French relatives, Abeille et al (2002) presented the following results:

Relative pronouns: subject (qui without prep): 6291 (61%); direct object (que, qu'): 1565 (1, 2%); genitive (dont): 1076 (10, 4%); locative (ou'): 782 (7, 6%); indirect object (prep + qui, quoi, lequell): 539 (5, 2%); others (0, 3%). Works on eye movement and understanding rates by Holmes and O'Regan (1981) have shown that que relative clauses are more difficult to process than qui relative ones. Their relative frequencies offer confirmation of this result and call for new experiments involving genitive relative clauses. They have presented that, contrary to English, French relative clauses tend to be attached high (on the first N in a N1 prep (det) N2 sequences), but that the preference is reverse for short relative clauses. Searching their corpus (where relative clauses, like all clauses, tend to be long, with an average of 11 words), they have found a similar preference: 52% relative clauses attach on the first N, in contexts where another N is a structural candidate, and the proportion is reverse for short relative clauses (length less than 6 words): 43%.

Herrman (2005) compared RCs occurring in different dialects of Britain, including the Celtic varieties of Scottish and Irish English. After checking cognitive hierarchies and theories such as Keenan and Comrie's AH (1977, 1979), he gave an overview of RCs in different regions of Britain without making any attempt at drawing another dialect map. Finally, he concluded that all the compared British dialects follow the AH.

RESEARCH QUESTIONS

It has been argued that in the application of the generalization strategy, learners generalize the structure to other related structures when they are taught only some particular ones. This study determines whether Iranian students who are taught some types of RCs can generalize them to the others which they are not taught and whether such generalization, if any, follows a predictable pattern.

Methodology

Participants

The participants in this study comprise 60 Iranian adolescents who were selected from among 150 females attending a foreign language center called Iran Language Institute. To feel firmly confident that the Ss had not received any instruction on the RCs before the study, the researcher gave them a written pre- test consisting of a sentence combining task. The Ss were asked to

combine eighteen pairs of sentences, attaching the second sentence as a RC to the first one. After scoring the pre- test sixty Ss who were found to have no knowledge of RCs in English were sampled as the Ss of the present study.

Instrumentation

Pre-test

The pre- test (Eckman 1988) given to the Ss consisted of a sentence combining task which was to be preformed on eighteen pairs of sentences. The eighteen questions on the pre- test contain three pairs of sentences which are to be combined into resultant sentences containing a relativized subject, three into sentences with a relativized indirect object, and so on. Therefore, for each type of relative into sentences with a relativized direct object, three clauses (6 types), three pairs of sentences were used. The different pairs of sentences were randomly ordered in the test booklet.

Post-test

Five days after the second session of the instruction, the subjects were given the post-test under exactly the same conditions as the pre-test (Eckman 1988). The task in the post-test was the same as in the pre-test but sentences were different to reduce the effect of the pre-test performance on the post-test performance . Because the time interval couldn't make the researcher feel fairly confident that pre-test would have little or no effect, two different but parallel tests were administered as pre- and post-tests.

In order to find out whether the two tests are parallel, a pilot study was conducted with 20 Ss learning English in Shiraz Language Institute. Both tests were administered at the same time then each of them was scored. The mean of each set of scores was computed and a matched (paired) *t*-test was used to compare the means. The observed value of *t* was -0.24 which was not statistically significant at $p < .0001$. The results of the *t*-test was shown in Table 1.

Table 1: the *t*-test for equality of means.

	N	Mean	Std.Deviation
Pre-test	20	13.40	3.88
Post-test	20	13.45	3.95
P<.0001			

Table 2: Levene's test for equality of variance

Levene's test for equality of variances, <i>F</i> , which is the ratio of the variances of the two exams was shown in Table 2. The ratio of .98 was not statistically significant at $P < .0001$.		Sig
Total Equal Variances assumed Equall Variances not assumed	.98	.02
P<.0001		

The reliability of the tests was calculated by using the Kuder-Richardson formula 20, also referred to as Cronbach's Alpha. A measure of .94 was obtained for the reliability which was

significant at $P < .0001$. The tests were considered to be content valid by the advisor because the content of them was selected appropriately to correspond to the content of the materials to be tested and they were aimed at measuring the appropriate level of the Ss' learning.

Scoring

Each of the pre and post-tests was scored on the basis of whether or not the students produced the correct target sentence. Only errors relevant to the formation of the target relative clause were counted. In fact, most of the errors did not involve miscombinations; rather, the majority of errors involved the structure of the relative clause itself. Since multiple errors on one sentence weren't counted, the maximum number of errors that any subject could make on either the pre- or post- test was 18.

Procedure

After the pre-test was administered, the sixty subjects were randomly assigned to four groups (three experimental groups and one control group). Each group consisted of fifteen subjects. After grouping, each group received some instruction for two sessions as follows: the first group received instruction on subject and direct object relatives, types 1 and 2, the second on indirect object and object of preposition relatives, types 3 and 4, the third group on possessive and object of comparison clauses, types 5 and 6. The fourth group, the control group, was given a placebo lesson on sentence combining techniques that was not relevant to relative clauses.. Each group was given a brief explanation on modifiers and told that they were going to be shown a technique for combining sentences or ideas using one sentence to modify or further describe another. The students in each of the three groups were told that for the purpose of that lesson they would be using the second idea (sentence) to modify the first, and that it would have to be slightly changed in order to become part of the first sentence. Part of the change would be to add a marker, *that* (for people and things), *which* (for things), *who/whom* (for people). Then, in each of the classes, the teacher proceeded to write out quickly on the board pairs of short sentences and a simple sketch illustrating each. These pairs were interrelated and told a short story. These pairs of sentences were controlled so that those used with the first group of students were appropriate for subject and direct object relativization, those used with the second group were appropriate for indirect object and object of preposition relativization, and those with the third group for possessive and object of comparison relativization. Thus for each of the groups, all instruction and examples centered around only two relative clauses types. The students were then instructed to find the phrases in each sentence pair that referred to the same person or thing. They were shown how to substitute a marker for the second co-referential element and move the now-changed second sentence to the correct position in the first.

At this point in each class the students then did an oral exercise in which they listened to seven or eight pairs of sentences, again telling a story (a new story). They were instructed to repeat each sentence pair, first mentally combining them with a relative clause structure as they had just done with the sentences on the board. Again the sentences were controlled so that the students were working only with the relative clause types that were the focus of their group.

The third activity for each class was a written exercise. The students were again given pairs of sentences—another story—and instructed to rewrite each pair, putting the second sentence inside the first as a modifier. This was done individually, with the teacher walking around checking for problems and re-instructing when necessary. The sentences used in all three groups centered around the same stories, ensuring that the lexical content for the groups was nearly identical. The time interval, the teacher, and the method of the instruction for all groups were completely the same. They differed only according to whether the relative clauses that were to be formed involved the specific types of relative clauses which were instructed.

The time interval, the teacher, and the method of the instruction for all groups were completely the same. They differed only according to whether the relative clauses that were to be formed involved the specific types of relative clauses which were instructed.

The subjects were given the post-test under exactly the same conditions as the pre-test five days after the second session of instruction. The task in the post-test was the same as in the pre-test but sentences were different to reduce the effect of the pre-test performance on the post-test performance.

RESULTS AND DISCUSSION

After scoring, a one - way analysis of variance (ANOVA) was performed on the differences between the pre and the post- tests (Table 3).

Table 3: Tests of between- subjects effects

Dependent variable: Post

Source	Type III sum of square	Df	Mean square	F	Sig
Corrected model	1868.387	4	467.097	140.798	0.000
Intercept	2165.491	1	2165.491	652.748	0.000
PRE	41.537	1	41.537	12.521	0.000
Group	1827.194	3	609.065	183.591	0.000
Error	182.463	55	3.318		
Total	6437.000	60			
Corrected total	2050.850				
P < .05					

Table 3, the ANOVA table, summarized the estimates of populations σ^2 such as S^2_{within} and $S^2_{between}$. Then a common-sense understanding of ANOVA, the comparison of the two estimates was presented as F value. As shown in the table, pre-test was a source of variance in the study and the difference between the pre-test and the post- test was significant at the 0.05 level because the F value was high enough that the null hypothesis can be rejected safely ($12.521 > 2.78$). The four groups were considered as another source of variance. Referring to table 7 and F - distribution table, the difference between the groups in the post-test, the dependent variable, was

statistically significant too ($183.591 > 2.78$). Table 4 displays the results of the ANOVA conducted on the information of table 3. The MS (mean square) column gave the researcher the two variance figures, the MSB and the MSW, which made up the F -ratio. The degrees of freedom were given. The SS (sum of squares) column is the variability found between groups and within groups before they were divided by their respective degrees of freedom. The observed value of F was compared with its critical value in the F -ratio table and it was concluded that the two estimates, S^2_{within} and $S^2_{between}$, were not the same so there was treatment effect in the study ($172.006 > 2.78$).

Table 4: The analysis of variance on pre-and post- test differences

	Sum of squares	Df	Mean square	F	sig
Between Groups	1828.183	3	609.394	172.006	0.000
Within Groups	198.400	56	3.543		
Total	2026.583	59			
P< .05					

After analyzing the answers for each of the areas searched for in the study, the final results were recorded in tables 5 and 6.

Table 5: Test of Between-Subject Effect

Source	Type III sum of square	DF	Mean Square	F	Sig.

P<.05					
	Paired Differences			T	Sig. (2- tailed)
	Mean	Std. Deviation	Std. Error Mean		
Pair 1 Pre-Post	-6.1333	2.69568	.69602	-8.812	.000
P<.05					

Table 6: The Analysis of Variance on Pre and Post-test Differences

	sum of square	DF	Mean Square	F	Sig.
Between Groups	1828.183	3	606.394	172.006	0.000
Within Groups	198.400	56	3.543		
Total	2026.583	59			
P.<.05					

As shown in the tables ,pre-test was a source of variance in the study and the difference between the pre and post- tests were significant at the 0.05 level because the F value was high enough that the null hypothesis can be rejected safely ($12.521 > 2.78$). As the results of the study of Eckman

and his colleagues (1998), Cheung (2002), and Herrman (2005) indicated, the present study also found out that the difficulty for EFL learners indeed followed the AH proposed by Keenan and Comrie (1977) regardless of the learners' first language. But the exception of Grass's study (1979), type 5 coming between types 1 and 2 rather than after 4, was not observed in the present study.

The 4 groups were considered as another source of variance. Referring to table 3 and *F*-distribution table, the difference between the groups in the post- test, the dependent variable, was statistically significant too ($183.591 > 2.78$). The *MS* (mean square) column gave the researcher the 2 variance figures, the *MSB* and the *MSW*, which made the *F*-ratio. The observed value of *F* was compared with its critical value in the *F*-ratio table and it was concluded that there was treatment effect in the study ($127.006 > 2.78$). The results of the present paper support the idea of Burns and Richard (2012) that some structures are learnt sooner and easier than the others in a predictable way (Table 6). Also, the difficulty for the EFL learners to learn six types of relative clauses seems to follow a predictable pattern found by Gass (1979). He proved that there was a major exception in the hierarchy of learning relative clauses: type 5 (possessive clause) came between type 1 and 2 in terms of difficulty; however, the results of the current study indicated that Iranian students followed the exact accessibility hierarchy found by Eckman and his colleagues (1988).

CONCLUSION

The result of the study supported the hypothesis that the structure from which one will obtain maximal generalization is the relatively more marked structure than the less marked structure. Thus if one were forced to choose only one RC structure to teach, the structure must be the most marked one, type 6. But it would be incorrect to conclude, on the basis of the results of the present study alone, that the best way to teach RCs is to give instruction of only the most marked structure, that is object of comparison clause.

Moreover, structures should be graded in accordance with the Accessibility Hierarchy of Keenan and Comrie (1979) by authors when they are writing a textbook. The difficulty orders found in this piece of research, confirm the hierarchy found by the above- mentioned authors: subjects are more accessible than objects. Regarding this fact, textbook writers and teachers should provide students, particularly, at the lowest level, with more exercises on complex structures, if any to be used, whose head NPs stand at the lowest level of the Accessibility Hierarchy. Gaining this amount of knowledge from this study, teachers may design their courses and present their material in a more effective way.

Limitations of the Study

The results and findings of the study have methodological implications for further research examining L2 learning. To replicate the current paper, one may add other independent variables such as gender or age which were two limitations of the study. And then test for significance of each factor. Also the interaction of independent variables may be looked to find out which factor has the main effects and consequently is the most important one.

The COMPARATIVE EFFECT OF USING LABEL EXTENDING, SUMMARIZING, AND STRIP STORY ARRANGEMENT TASKS ON EFL LEARNERS' VOCABULARY RETENTION

Elham Fallah

Islamic Azad university of Central Tehran Branch

Elham fallah 1984 @ gmail.com

ABSTRACT

The purpose of the present study was to examine the impact of three different story making tasks (label Extending, summarizing, and strip story arrangement) on elementary English as a foreign language (EFL) Learners' vocabulary retention. The participants of this study were 120 EFL learners who were selected from among 12 classes in a branch of Kish language school in Chalous based on their performances on Nelson. The participants were then divided into three experimental groups. One experimental group known as label extending was supposed to make a story based on a picture and a prompt sentence, another experimental group known as summarizing group was supposed to summarize a given story and finally the third experimental group known as strip story arrangement group was supposed to arrange a strip story. All the three experimental groups had to use the newly taught words in their final written drafts. All the participants took part in vocabulary retention post test after the treatment. The three groups' performances on the post test were compared by one-way ANOVA and the results confirmed that there was not any significant difference among the effects of using label extending, summarizing, and strip story arrangement tasks on EFL learners' vocabulary retention. This study is of educational value to the teachers in terms of focusing on students' collaboration and creativity in the classroom and shifting the attention from teacher- centered activities to learner- centered ones.

KEYWORDS

Label extending task, strip story task, summarizing task, vocabulary retention

INTRODUCTION

Candlin (1988) viewed vocabulary as an important component in language teaching in terms of organization of syllabuses, the evaluation of learner performance, and the provision of acquisition resources. Furthermore, vocabulary acquisition is crucial to students' traditional language skills. Without enough vocabulary, listening, reading comprehension, and writing are inefficient. As Wilson (1986) mentioned, without grammar very little can be conveyed; however, nothing can be conveyed without vocabulary.

According to Ellis (1997), Knowing the words in a piece of discourse facilitates understanding which in turn allows the grammatical patterning to become more transparent. Ellis (1994) has

noted that lexical errors impede comprehension more than grammatical errors and that native-speaker judges lexical errors as more serious. Reading stories is a way of teaching EFL vocabulary. Garvie (1990) refers to the eloquent witness to the importance accorded to stories. Wodinsky and Nation (1988) investigated the potential contribution that graded readers could make to vocabulary learning and suggest that future research should be done to test to see if such learning and coping actually occurs and what factors influence learning. Different studies have been done on the effects of different types of story making on vocabulary retention; however, the comparative effect of using label extending, summarizing, and strip story arrangement tasks on EFL learners' vocabulary retention (in a written form) seems not to have been investigated before.

The usual approach to vocabulary learning is to present students with a list of words to be mastered, then present them in the context of a text, and then provide exercises to "reinforce" the vocabulary. Research, however, tells us that a great deal of vocabulary acquisition can take place through story hearing, read- alouds, and pleasure reading (Cho & Choi, 2008; Elley, 1991; Krashen, 2004; Mason & Krashen, 2004; Vivas, 1996; Wang & Lee, 2007). The goal of the previous related studies is to determine whether and how much vocabulary can be gained without presenting students with a list of words, and without supplementary exercises, using a method in which target words are presented in the context of a story.

In the present study, using label extending, summarizing, and strip story arrangement tasks may enable new information to be more processed and then retained for a longer time than any other activities designed to achieve the same objective. It also requires all students to use their creativity in label extending, summarizing, and strip story arrangement tasks by catering for their self-esteem (e.g. by indicating that their participation is worthy).

Moreover, incorporating different story making tasks in the classroom in a cooperative form can shift the focus from teacher-centered activities to learner-centered ones. Besides, making stories encourages students to use their imaginations. Developing the imagination can empower the students to consider new and inventive ideas. It can also contribute to self-confidence and personal motivation as students envision themselves competent and able to accomplish their hopes and dreams. The results of this study may verify whether Iranian EFL learners are able to retain new vocabularies more efficiently by making stories.

The vocabulary of any language is huge, and its acquisition takes time, even for native speakers. From one point of view, vocabulary learning is quite simple. Teachers have to ensure that learners know the basics of the target language, its grammar, phonetics, spelling and vocabulary. Once this threshold is reached, learners are sufficiently autonomous to expand their vocabulary by wide reading, as the learner can take a new text and find it comprehensible and interesting. In this chapter, the review of the issues related to the topic is given under two main sections: the theoretical review of the concepts and definitions, and the practical review of some studies related to the topic of the present study.

What Does It Mean to Know a Word?

According to Simpson and Nist (1997) knowing a word means understanding a word upon recognition and providing appropriate and precise definition that fits the context. They likened knowing a word to an iceberg and believed that memorized definition is often located on the tip of the iceberg. Beneath the surface of the water is a much larger mass of ice which is more important and constructs the underlying proficiency.

Over the years lexical researchers have developed various criteria for understanding what is involved in knowing a word. An early definition divided vocabulary knowledge into two main categories: knowledge of word meaning (generalization, breadth of meaning, precision of meaning) and levels of accessibility to this knowledge (availability and application).

The Historical View Toward Vocabulary

One of the first aspects of the oral approach to receive attention was the role of vocabulary. Several large- scale investigations of foreign language vocabulary were undertaken In the 1920s and 1930s. This has led to the development of principles of vocabulary control, which were very influential in the teaching of English in following decades.

According to Celce-Murcia (2001), in past years vocabulary teaching received less attention because it was thought that vocabulary could simply be left to take care of itself. In the late 1970s and early 1980s and by the late 1980s and early 1990s, vocabulary studies were developing exponentially and vocabulary teaching was coming into its own.

Categorization

Most models of lexical knowledge distinguish between passive/receptive and active/productive vocabularies. Laufer and Nation (2001) proposed the first version of a measure of passive vocabulary fluency, the VORST (vocabulary recognition speed test). Using the VORST, they examined the relationship between fluency and vocabulary knowledge reflected in the passive vocabulary size score, and also the relationship between fluency and frequency of words being accessed.

Implicit and Explicit Learning in Incidental Vocabulary Acquisition

If vocabulary learning requires a precise and effortful coordination of form and meaning, it may not optimally occur with an activity like extensive reading that allows the reader to bypass such precision and effort. Learner attention is another crucial variable. In incidental vocabulary acquisition, the learner's attention is focused primarily on communicative meaning, not on form. Krashen's input hypothesis strongly claims that acquisition occurs only when the learner's attention is focused on meaning. According to Ellis (1995) Vocabulary learning requires attention to both meaning and form.

Story Telling

In order to provide successful language learning, Pesola (1991, p. 340) suggested that storytelling is "one of the most powerful tools for surrounding the young learner with language". Including storytelling in the curriculum can improve the level of learning in these four language skills

(Wilson, 1997). In addition, storytelling is a creative art form that has entertained and informed across centuries and cultures, and its instructional potential continues to serve teachers.

A

According to Isbell (2002), many stories that work well with children include repetitive phrases, unique words, and enticing description. As Morrow (2001) has pointed out, story recall allows children to revisit the tale and refine their understanding. It helps children develop concepts about words, print, and books as well as assessing students' current language levels. According to McGee and Richgels (2000), story recall provides children with the opportunity to reorganize the sequence of events, to use the vocabulary of the story and to expand children's comprehension of the world as well.

Application of Stories in Teaching Methodologies

The use of literature to teach second/foreign languages can be traced back to over one century ago. In the nineteenth century, second/foreign languages were taught with the help of the Grammar Translation Method. However, in the seventies, methods such as the Community Language Learning, Suggestopedia, the Silent Way, Total Physical Response, and the Natural Approach did not utilize literature to teach second/foreign languages, and neither did the Notional-Functional Syllabus.

Instructors have realized that literature can be used to reinforce the skills and complement language teaching. Moreover, students can gain insight into literature by gaining entrance to a world familiar or unfamiliar to them due to the cultural aspects of stories, and taking a voyage from the literary text to their own minds to find meanings for ideas, leading to critical thinking.

Benefits of Short Stories

Researchers who advocate the use of short stories to teach ESL/EFL list several benefits of short stories. These include motivational, literary, cultural and higher-order thinking benefits.

Practical Review

In this section, some related studies conducted by different scholars are stated.

Yang, Chi Cheung Ruby (2009) conducted a case study of the use of short stories in a junior secondary ESL classroom in Hong Kong in a small class of 20 junior secondary school students in order to investigate if they become more interested and more confident in English by using short stories. The findings showed that using short stories can make students interested in learning English if interesting stories are selected and if the language used meets the level of the students.

In another study, Ramirez and Belmonte (2007) examined the effects of using digital stories to improve listening comprehension with 220 six- year- old Spanish learners of English. Findings of the study were in favor of the experimental group. The result of the study raised interesting issues related to the use of technology in the context of foreign language learning.

RESEARCH QUESTION

To fulfill the purpose of the present study which was to see whether there were any significant differences between using label extending, summarizing, and strip story arrangement tasks on EFL learners' vocabulary retention. The following question was raised:

Is there any significant difference among the effects of label extending, summarizing, and strip story arrangement tasks on EFL learners' vocabulary retention?

METHODOLOGY

In this section, the participants, instrumentation, procedure, design, and statistical analyses will be described.

Participants

In this research, 91 out of 120 elementary students from Kish language center located in Chalous were randomly selected through a homogenizing test of Nelson 050D after being piloted with 43 subjects with the same characteristics. The main participants' scores fell one standard deviation above and below the mean. They were almost equally divided into three experimental groups in the form of three intact classes.

The participants' age range was between 18 to 22, and all of them had already covered the basic levels of the book series "Total English". The participants' English learning experience was at least one year. They had English classes for six hours per week.

Instrumentation

The instruments used in this study are sequenced as follows:

1. A homogenizing test of Nelson
2. Vocabulary retention post test (Achievement test)
3. Instructional materials (both in written and pictorial forms)
4. Written tasks

Procedure

The procedure of the study is sequenced as follows:

1. The homogenization test of Nelson 050D was piloted with 43 subjects who had the same characteristics as the other subjects of the study (all of them were elementary female). This test was given to the subjects in order to measure its reliability and have a ruler to choose the participants of the main study. It involved 50 multiple choice grammar items and the time allocated to it was 35 minutes. Each item was weighed by a single credit with no negative points for wrong answers. The reliability of the nelson was 0.895. No items were discarded. The mean and standard deviation of the pilot group was calculated (mean= 27.3953; SD=9.2147).
2. After piloting the Nelson test, it was given to 120 participants at the beginning of the course in order to choose the participants of the main study. The time allocated to this test was 35 minutes and was in the form of 50 multiple- choice grammar questions. Each item was weighed

by a single credit with no negative points for wrong answers. The reliability of the Nelson test was 0.718. Besides the mean and standard deviation were calculated (mean= 28.1750, SD=6.9749). Those students who fell one SD below and above the mean and who turned out to be 91 were considered as the main participants of the study. Then a teacher- made vocabulary test involving 70 items on the new words from the books “ Steps to Understanding English” and “ Anecdotes in American English” written by L.A. Hill which were used as the materials for treatment was given to the 91 participants who fell one standard deviation above and below the mean based on the Nelson test in order to establish that the 70 new vocabularies were unknown to the students . When a participant wrote the exact synonym or definition for each vocabulary, that item would be omitted from the test. The time allocated to this test was 35 minutes and it was administered to the participants two days after the administration of Nelson test. Each item was weighed by a single credit with no negative point for wrong answers. The researcher omitted 10 items from the test. The 91 participants were then divided into three experimental groups.

3. In the treatment stage, three different story making tasks including label extending, summarizing, and strip story arrangement were practiced in the three experimental groups. In all experimental groups, each session started as follows:

First of all the students were taught 60 new words in twelve sessions and in one semester. The teacher used to write some new words on the board for each session. She had to teach some aspects of the words including parts of speech, pronunciation, and synonyms. She also had to elicit some sentences which contained the new vocabularies from the students to make sure that all the subjects had grasped the required information related to the vocabularies. Then she moved to the second stage which was in fact the dividing point of the three experimental groups. In one experimental group namely, strip story arrangement group, the teacher used to split some sequenced sentences of a story which involved the new vocabularies already taught to the participants and wrote them on the board then asked the subjects to rearrange them in their personal drafts.

In another experimental group namely label extending group, instead of providing a split story, the teacher used to stick a picture illustrating a scene of funny characters on the board and provided a prompting sentence of a story then asked the participants to continue the story based on the new words they were taught some minutes before. Finally in the third experimental group namely summarizing group, the teacher asked the participants to summarize a short story including the same new vocabularies. In all three groups, the students were allowed to work collaboratively during the process of doing the tasks for the sake of removing the boredom, but they had to do the final job individually. They also received feedback on their final drafts by the teacher.

4. Finally, a vocabulary retention post test was given to the students one week after the end of the course.

The post test included 60 items on the new words covered during the course. This test was exactly the same teacher made vocabulary test minus the 10 known vocabularies. The means of

the post tests of the three experimental groups were compared together to reject or maintain the null hypothesis.

Design

The design of this study is Quasi experimental. Besides, label extending, summarizing, and strip story arrangement tasks are the independent variables of this study. The dependent variable is the vocabulary retention. The participants of this study were elementary females; therefore, the subjects' proficiency level, age and gender are the control variables of this study.

Descriptive Statistics of the Proficiency Test Piloting

As the first step, Nelson was piloted. The test included 50 questions on grammar. The test had a total score of 50 and the administration of the test took 35 minutes. This test was administered to a group of 43 elementary EFL learners at Chalous branch of Kish Air language school bearing almost the same characteristics as the target sample. No items were discarded from the test.

Following the piloting of the test, the mean and standard deviation of the raw scores and the reliability were calculated. The mean and the standard deviation of this administration were found to be 27.3953 and 9.2147, respectively. Figure 1 below shows the histogram of the participants' scores on the pilot study of Nelson.

Figure 1: Histogram of the Scores Obtained on Nelson – Pilot Study

Table 1 shows the descriptive statistics of the Nelson in the pilot phase.

Table 1: Descriptive Statistics of the Nelson– Pilot Study

	N	Minimum	maximum	Mean	Std. Deviation
Score	43				
Valid N (listwise)	43	10	43	27.3953	9.2147

Table 2 shows the reliability of the test scores gained by the participants in the Nelson piloting phase. The Cronbach alpha came out to be .895.

Table 2: Reliability of the Nelson – Pilot Study

N of Items	Cronbach's Alpha (α)
50	.895

Descriptive Statistics of the Proficiency Test (Homogenization)

The researcher used the piloted test as an instrument for homogenizing the participants of the study. The standard general proficiency test (Nelson) was administered among 120 elementary learners. These participants were already placed at the mentioned level according to the placement test of the language school. However, to ensure the homogeneity of the subjects, only 91 participants of the study from among 120 candidates whose scores fell within the range of one standard deviation above and below the mean on this proficiency test were chosen. The descriptive data (Table 3) of this standard test for those 120 candidates are demonstrated below.

Table 3: Descriptive Statistics for the Total Scores on the Nelson – Main Administration

	N	Minimum	Maximum	Mean	Std. Deviation
TOTAL	120	9.00	48.00	28.1750	6.9749
Valid N (listwise)	120				

Considering the results, the mean of the scores for the 120 subjects came out to be 28.1750 and the standard deviation came out to be 6.9749. Therefore, those participants whose score fell one standard deviation above and below the mean, were those who participated in the main study. This resulted in 91 participants who were randomly divided into the three experimental groups. The reliability of Nelson in this actual administration for homogenization of the participants was estimated as well (Table 4). An index of .718 reassured the researcher of the reliability of this test.

Table 4: Reliability of the Nelson – Main Administration

N of Items	Cronbach's Alpha (α)
50	.718

Dividing the Participants into the Experimental Groups

From among the 120 students who took the test, the researcher selected the 91 who scored between 21.20 and 35.14 on the test and then randomly divided them into three experimental groups.

Post-test (Vocabulary Achievement Test)

Once the treatment was completed, the researcher administered a vocabulary achievement test serving as a post-test among the three groups of experimental. The test included 60 items on the new words covered during the course. This test was exactly the same teacher made vocabulary test minus the 10 known vocabularies.

Descriptive Statistics of the Vocabulary Post Test

The test was administered at the end of the treatment to the 91 participants of the study in the three experimental groups. Table 5 below displays the descriptive statistics for this administration in all groups with the means being 31.50, 28.03, 25.64 for the three experimental groups, respectively.

Table 5: Descriptive Statistics of the Experimental Groups' Total Scores on the Post-test

	Group	N	Mean	Std. Deviation	Std. Error Mean	Skewness	
						Statistic	Std. Error
Total	Label extending	30	31.5000	12.26082	2.23851	0.393	0.427
	Summarizing	30	28.0333	10.83889	1.97890	0.302	0.427
	Arrangement	31	25.6452	7.46346	1.34048	0.347	0.421

Figures 2, 3 and 4 display the distribution of scores for each of the three experimental groups, respectively.

Figure 2: Histogram of the label extending Group's Scores on the Post-test

Figure 3: Histogram of the summarization Group's Scores on the Post-test

Figure 4: Histogram of the strip story arrangement Group's Scores on the Post-test

Testing Hypothesis 1 of the Study

The first null hypothesis of the study stated that:

H₀₁: There is not any significant difference among the effects of using label extending, summarizing, and strip story arrangement tasks on EFL learners' vocabulary retention.

To test this hypothesis, an ANOVA was run to compare the mean scores of the three experimental groups.

Note has to be taken that in order to be able to run ANOVA, the normality of the distribution of scores on post-test within each group had been checked (Table 7) and since the three values .920 (.393/.427) for the narration group and .707 (.302 / .427) for the summarizing group and .824 (.347/.421) for the arrangement group fell between -1.96 and 1.96, running ANOVA was legitimized.

As the other condition for running ANOVA, homogeneity of variance was also checked by Levene's test (Table 8) and the p value did not become significant ($p = .089 > .05$), and thus, homogeneity of variance was assumed. The descriptive statistics are presented in Table 6 and the results of ANOVA are demonstrated in Table 10.

Table 6: Test of Homogeneity of Variance

Sig.	df2	df1	Levene Statistic
.089	88	2	2.484

Table 7: Descriptive Statistics for Comparing Means of Experimental Groups on Post-test (Vocabulary Retention)

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for mean	
					Lower bound	Upper bound
Label extending	30	31.5000	12.26082	2.23851	-2.9079	9.8412
Summarizing	30	28.0333	10.83889	1.97890	-9.8412	2.9079
arrangement	31	25.6452	7.46346	1.34048	-12.1778	.4681
total	91	28.3626	10.52248	1.10306		

As Table 7 demonstrates, the highest mean score was obtained by the label extending group, then the summarizing group. The lowest mean score was obtained by the arrangement group. However, to check whether the differences were significant or not ANOVA was run.

Table 8: ANOVA Results on Post Test (Vocabulary Retention)

	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	527.470	2	263.735	2.459	.091
Within Groups	9437.563	88	107.245		
Total	9965.033	90			

As Table 8 indicates, the ANOVA results showed that not enough evidence was observed to reject the null hypothesis ($F_{(2,88)} = 2.459$, $p = .091 > .05$) meaning that there is not any significant difference among the effects of using label extending, summarizing, and strip story arrangement tasks on EFL learners' vocabulary retention.

Discussion

Interpretation of the findings of the study with regard to the related literature is given in this part. The effects of story making on vocabulary retention are first addressed.

Based on the statistical analyses, not enough evidence was observed to reject the null hypothesis yielding that there is not any significant difference among the effects of using label extending, summarizing, and strip story arrangement tasks on EFL learners' vocabulary retention. However, the findings do not imply that the three different story making tasks did not have any influence on EFL learners' vocabulary retention since the participants of the study performed well on the vocabulary achievement test compared to the beginning of the course.

The findings of the study are in line with Lao and Krashen (2000) who presented the results of a comparison between a group of students that read literary texts and a second group that read non literary texts at a university in Hong Kong. The group who read literary texts showed improvement in vocabulary and reading comprehension. In the present study, elementary students also benefitted from story making tasks as a kind of literary activity.

Young (1996) points out to the use of children's stories to introduce critical thinking to college students. In order to provide successful language learning, Pesola (1991) views storytelling as one of the most powerful tools for surrounding the young learner with language. Wilson (1997) believes that the curriculum can improve the level of learning in the four language skills.

CONCLUSION

As it was stated in the previous sections, not enough evidence was observed to reject the null hypothesis claiming that there is not any significant difference among the effects of using label extending, summarizing, and strip story arrangement tasks on EFL learners' vocabulary retention. It means that the three different story making tasks had almost the same effects on the vocabulary retention of the three experimental groups.

Pedagogical implications

Findings related to the present study may have some implications for teachers in that incorporating label extending, summarizing, and strip story arrangement tasks in the classroom can shift the focus from teacher- centered activities to learner- centered ones. It also requires collaborative work and creativity among students.

The findings have also some implications for syllabus designers. Murdoch (2002) believes that if stories are selected and exploited appropriately, they will provide quality text content which will greatly enhance ELT courses for learners at different levels of proficiency.

Suggestions for further study

Regarding the limitations of this study and the importance of some issues discussed fully throughout the study, some gaps and new ideas are found which can give good insights and pave the way for future studies:

1. This study investigated the impact of story making conditions on vocabulary retention of elementary EFL learners. Other language proficiency levels can be studied.
2. Other studies can compare other story making tasks, e.g. finding the main plot of the story, personalizing the stories and so on.
3. Other studies can investigate or compare the impact of story conditions in an oral mode.
4. The present study was confined to female students. Other studies can be carried out in coeducational or male settings.
5. The present study was confined to a private language school. Other studies can be carried out in public schools.
6. Other studies can focus on collecting qualitative data as well as quantitative one.
7. Other studies can investigate the impact of the three story conditions using a control group.

Limitations of the study

Like many other studies, the present study suffered from some limitations.

The present study was confined to a private language school in Chalous. Therefore, the findings cannot be generalized to EFL students in public schools. The researcher had to work just with

female students which will probably decrease the generalizability of the study to the males or coeducational situations.
