Trey Songz states the journey of his life and he also wants to confirm to fans and media about his career path from the beginning until now as an American black singer. Furthermore, it represents ethnicity.

*B. NASIR JONES*

1. 9<sup>th</sup> September, 2012: Life Is Good / Black Rage Tour!!! Tickets on sale 9/21

Themes: Declarative Statement, Photoshare, Music, and World News

Nasir Jones brings "black rage" as the racial reality of America into the court by presenting "social context" or "social framework" evidence for his tour name. Haris (1999) has also described the black rage to judges as "social reality" or "racial reality" evidence. It describes a lawyer's gestalt, a theory of the case, an all-encompassing strategy that uses racial reality evidence to establish self-defense, diminished capacity, insanity, mistake of fact, duress, or other state-of-mind defenses allowed by the criminal law. Moreover, this tweet represents racism.

2. 26<sup>th</sup> September, 2012: Check this out! The kids of @ATLmusicproject performing I Can!  
<http://youtu.be/9CmSwEAkqvc> **#LifeIsGood #amplifyATL #ATL**

Themes: Declarative Statement, Family and Friends, Humanitarian, Music, and World News

Nasir Jones posts a Video of the Atlanta Music Project's activity. He delivers his care and love for children who have passion for music. He also shares his concern to children from black ethnic group. It represents ethnicity.

3. 2<sup>nd</sup> October, 2012: Hey young world!! Go get my lil bro @MiguelUnlimite new album, out now!!  
<http://smarturl.it/KD?iqID=t>

Themes: Declarative Statement, Family and Friends, and World News

Nasir Jones aims to give support to one of American black singers who have the same ethnic with him. In addition, it represents ethnicity.

4. 7<sup>th</sup> November, 2012: Me & Pops for The Gap. #LifeIsGood

Themes: Declarative Statement, Expressing Excitement, Family and Friends, and Photoshare

Nasir Jones posts a picture of him and friends. They are from black ethnic group. In addition, they express their happiness after the show. This tweet represents racism and ethnicity.

5. 26<sup>th</sup> November, 2012: Happy Born Day Gov!!! @Jungle\_QB

Themes: Declarative Statement, Expressing Excitement, Family and Friends, Salutation and Photoshare

Nasir Jones aims to a birthday greeting to his friend who is also from black ethnic group. In addition, he shows off a picture of him and friends of black ethnicity to fans and media. In addition, it represents ethnicity.

6. 30<sup>th</sup> November, 2012: If you missed it, here's me and @hamiltonanthony performing "World's An Addiction" on **#CONAN**: <http://bit.ly/UeHzmE>

Themes: Declarative Statement, Event Attendance, Family and Friends, Music, and Expressing Excitement

Nasir Jones delivers his happiness about his performance with one of American black singers. This tweet represents ethnicity. Nasir Jones also shows off his performance to his fans by posting a video.

7. 28<sup>th</sup> February, 2013: Proof that Michael Jackson is the Greatest Musician Ever..Just Listen 2 Baby Be Mine. Period.

Themes: Declarative Statement, Expressing Excitement, and Family and Friends

Nasir Jones expresses his pride to Michael Jackson. He is a legend in the entertainment world as a singer who is also from black ethnic group. In addition, this tweet represents ethnicity.

8. 27<sup>th</sup> March, 2013: Shout out to the legendary Arsenio Hall !!! HE'S HISTORIC

Themes: Declarative Statement, Expressing Excitement, and World News

Nasir Jones states his expression of gratitude to one of the American black actors "Arsenio Hall". He is a legend in the entertainment world. This tweet represents ethnicity.

9. 28<sup>th</sup> March, 2013: Bring Back @ArsenioHall!! Check out how I inspired him to bring his show back!! <http://nasirjones.com/news/140191> #Arsenio Much love brotha!!

Themes: Declarative Statement, Expressing Excitement, and World News

Nasir Jones expresses his happiness and love to Arsenio Hall after he inspired him. As people know that Arsenio Hall is a legend in the entertainment world as an actor who is also from black ethnic group. In addition, this tweet represents ethnicity.

10. 6<sup>th</sup> April, 2013. Alkebulan. So I've herd. I don't not kno if America had another name first. America sounds Fly tho. Africa to. I'm used to it.

Themes: Declarative Statement, Introspection, and World News

Nasir Jones writes information about America and Africa and their other names actually. He is also sharing his thoughts and entering into conversation with his fans who are from black ethnic. It represents racism and ethnicity.

11. 6<sup>th</sup> April, 2013: Africa's original name was .....

Themes: Declarative Statement, Introspection, and World News

Nasir Jones tries to communicate with his fans who are from black ethnic group. He shares the ethnicity topic such as an African history in his tweets in order to get along with them. It represents ethnicity.

12. 6<sup>th</sup> April, 2013: Knowledge & Power

Themes: Declarative Statement and Introspection

Nasir Jones describes his point of view about knowledge and power. He tries to convey that being knowledgeable is not just one quality, but is many and a process of learning, experiencing, knowing and understanding. When people have knowledge, they have to understand the truly of powerful itself. It also represents racism and ethnicity in this world, especially for black ethnic.

13. 8<sup>th</sup> May, 2013: Happy G'day to @GabeHeight !!!!! My nig G code!!

Themes: Declarative Statement, Expressing Excitement, Family and Friends, Salutation

Nasir Jones aims to a birthday greeting to his friend who is also from black ethnic group. In addition, he shows off his care and love in order to give the online identity construction. In addition, it represents ethnicity.

14. 14<sup>th</sup> May, Let's hang backstage at @GovBallNYC! <http://bit.ly/17KxhCa> Enter now at @omaze & help me support kids worldwide thru @unicefusa

Themes: Declarative Statement, Expressing Excitement, Music, and World News

Nasir Jones invites his fans especially from black ethnic group to join with his event at Governor's ball NYC. Moreover, it represents ethnicity.

15. 26<sup>th</sup> May, 2013: S/O the good homie @quietAZmoney!

Themes: Declarative Statement, Family and Friends, and Expressing Excitement

Nasir Jones states his love to AZ. He is an American black rapper. This tweet also contains the online identity construction and represents ethnicity.

### C. ANTHONY HAMILTON

1. 2<sup>nd</sup> November, 2012: Set your DVRs Sunday 11/4 to see my @[BlackGirlsRock](#) performance. Honored to be one of their 1st male performers!

Themes: Declarative Statement, Expressing Excitement, Music, Promotion, and World News

Anthony Hamilton shares information about black girls' activity as dynamic young women with leadership potential to participate in the program, which offers lectures and workshops lead by world-class professors and other professionals across sectors. It represents racism and ethnicity.

2. 2<sup>nd</sup> November, 2012: Early VOTER?? I'm following YOU! Send me a pic (hide your address). [#VoteEarly #Obama2012](#)

Themes: Declarative Statement, Expressing Excitement, and World News

Anthony Hamilton expresses his support to President Obama for the president election in the USA. He also shows off his special vote to President Obama. In addition, he supports Mr. President because of the same ethnic with him as the black people. Moreover, this tweet represents racism and ethnicity. Through his tweet, he points out his stereotype about the power and existence of President Obama as the Black people who is a great leader for the United States of America.

3. 2<sup>nd</sup> November, 2012: NF these [#EarlyVoters](#)---> RT @[NursePooka](#): @[HamiltonAnthony](#) me and my boo voted early! [Obama2012 #Forward @BarackObama pic.twitter.com/heoCYUKK](#)

Themes: Declarative Statement, Expressing Excitement, Request, and World News

Anthony Hamilton writes about his vote to President Obama.. Moreover, he points out his stereotype about the power and existence of Obama as the Black people who is a great leader for the United States of America. Moreover, this tweet represents racism and ethnicity.

4. 2<sup>nd</sup> November, 2012: RT @[JESS3389](#): My daughter just said between voting @[BarackObama](#) & getting a follow from @[HamiltonAnthony](#) this is the BEST time of her life

Themes: Declarative Statement, Expressing Excitement, and Request

Anthony Hamilton retweets his fan's tweet about President Obama. His fan also states about her daughter who was voting for President Obama and getting a follow from him. Moreover, President Obama and Anthony Hamilton are American black public figures in the world. This tweet represents racism and ethnicity.

5. 4<sup>th</sup> November, 2012: Thanks to everybody who tuned in tonight to celebrate our women! Women of many shades, personalities (cont) <http://tl.gd/jt3e98>

Themes: Declarative Statement, Expressing Excitement, Humanitarian, Music, and World News

Anthony Hamilton expresses his gratitude to his fans who were attending in the black girls' event. This tweet represents ethnicity.

6. 4<sup>th</sup> November, 2012: Thank you Beverly Bond for giving us a platform to showcase our love you our sisters and our love (cont) <http://tl.gd/jt3f0g>

Themes: Declarative Statement, Expressing Excitement, Family and Friends, and Humanitarian

Anthony Hamilton expresses his gratitude to his friend “Beverly Bond” who supports the black girls in the world. He also tries to give the online identity construction in his tweet. In addition, this tweet represents ethnicity.

7. 4<sup>th</sup> November , 2012: And to all those who give kind words from the heart to me. I love you all sincerely! Thanks for (cont) <http://tl.gd/jt3fk2>

Themes: Declarative Statement, Expressing Excitement, Humanitarian, and Salutation

Anthony Hamilton writes about his gratitude to his fans always give kind words to him and support President Obama. He also expresses his special love to his fans who are black. This tweet represents racism and ethnicity.

8. 5<sup>th</sup> November, 2012: My friend our country need your vote. More than ever before we need to vote and get our family (cont) <http://tl.gd/jtaq0l>

Themes: Declarative Statement, Introspection and World News

Anthony Hamilton expresses his support to President Obama for the president election in the United States. Moreover, he supports Mr. President because of the same ethnic with him as the black people. This tweet represents ethnicity.

9. 5<sup>th</sup> November, 2012: RT @BarackObama: The choice in this election is clear. Make your voice heard. Confirm where you (cont) <http://tl.gd/jtarib>

Themes: Declarative Statement, Expressing Excitement, Request, and World News

Anthony Hamilton shows his support to President Obama by retweeting President Obama’s tweet. In addition, this tweet represents racism and ethnicity. Through his tweet, he points out his stereotype about the power and existence of Obama as the Black people who is a great leader for the United States of America. He is also sharing his thoughts and entering into conversation with his fans about the president election.

10. 6<sup>th</sup> November, 2012: Use your Twitter influence to help turn out the vote. Follow/retweet @Obama2012 and join the Twitter Team: <http://my.barackobama.com/twteam>

Themes: Declarative Statement, Expressing Excitement, Promotion, Request, and World News

Anthony Hamilton announces President Obama’s twitter team. He tries to persuade his fans to vote and join the Twitter team. It represents ethnicity as well.

11. 6<sup>th</sup> November, 2012: A beautiful family RT @thecrimsoncouch: @HamiltonAnthony Excited to share this vote with parents! #obamabiden2012 [pic.twitter.com/ZIO1bFCs](http://pic.twitter.com/ZIO1bFCs)

Themes: Declarative Statement, Expressing Excitement, Request, and Photoshare

Anthony Hamilton retweets his fan’s tweet about her vote with family for President Obama. In addition, this tweet represents ethnicity.

12. 29<sup>th</sup> November, 2012: Don't miss my performance of "World's an Addiction" w/ @Nas tonight on Conan. TBS at 11PM!

Themes: Declarative Statement, Expressing Excitement, Music, Promotion, and World News

Anthony Hamilton gives information about his performance through Twitter, he asks his fans to attend the event. In addition, he would perform with Nas who is also an American black singer. This tweet represents ethnicity.

13. 23<sup>rd</sup> March, 2013: Me and Chuck Harmony! Mad talent!!  
Themes: Declarative Statement, Family and Friends, Expressing Excitement, and Photoshare  
Anthony Hamilton declares his friendship with one of American black public figures. This tweet bears the online identity and counter the media stereotypes about black people. Moreover, it represents racism and ethnicity.
14. 30<sup>th</sup> March, 2013: Austin it's you & me tonight. @urbanmusicfest <http://lockerz.com/s/288558967>  
Themes: Declarative Statement, Expressing Excitement, Music, Promotion, World News, and Photoshare  
Anthony Hamilton shares his picture for an event of Austin festival. This show would be performed by American black singers. Furthermore, it represents racism and ethnicity.
15. 25<sup>th</sup> April, 2013: Thanks in advance to every 1 who supports me my wife our family and the greater cause for us all. (cont) <http://tl.gd/lll9en>  
Themes: Declarative Statement, Expressing Excitement, Humanitarian, and World News  
Anthony Hamilton expresses his gratitude to his fans who always support him and family. His special thanks go to his fans who are black. This tweet represents racism and ethnicity

Table 2: Themes in Trey Songz, Nasir Jones, and Anthony Hamilton's Tweets

Themes	Trey Songz	Nasir Jones	Anthony Hamilton	Totals

Expressing Excitement				
Family and Friends				
Humanitarian				
Inspection				
Music				
Photoshare				
Promotion				
Question				
Request				
Flattery				
Spirituality				
Sports				
Travel				
World News				

The most common theme among three American black singers was “Declarative Statement,” which makes a common sense of power. Twitter was created on the basis of sharing thoughts and entering into conversation (McMillan, 2011). “Declarative Statement” occurred in forty-five tweets; the second most frequent theme was “Expressing Excitement.” It occurred in only twenty-eight tweets. In addition, “World News” theme was found in twenty-one tweets; “Event Attendance” was only one tweet and none of coded themes, occurring in “Question, Spirituality, and Sports.”

## DISCUSSION

The research question asks themes of discourses that represent racism and ethnicity in the three American black singers' tweets, the representation of racism and ethnicity in American black singers' tweets, and the meaning and values of American black singers' tweet. They perform the concept of power to reflect the interests of the power elite, online identity constructions, and the media stereotypes, as they relate to racism and ethnicity. Literature suggests that mainstream media idealizes the racism and ethnicity as a characteristic of American black singers (Billings, et al., 2002; Hardin, et al., 2009; Trujillo, 1991). A Critical Discourse Analysis was used to detect themes present in the tweets of three American black singers. As the results of this study show, each singer in the sample uses Twitter to make declarative statements in a unique way. The 'talk' of the three American black singers shows racism and ethnicity as an overarching theme.

Using Twitter as a "front stage" for identity presentation, Trey Songz performs a personality showing declarative statement, active lifestyle, expressing excitement, family and friends, introspection and photoshare with his everyday life (Goffman, 1959). He also tweets about music and travel with his followers such as fans and media, expecting genuine care about his whereabouts and well-being. Nasir Jones presents declarative statement, expressing excitement, family and friends, introspection, photoshare with his followers to create the stereotypes of American black singers. He also shares his event attendance, humanitarian, music, salutation, and world news.

In addition, Anthony Hamilton performs his identity as a good singer. He always interacts on a personal level with his followers. He presents declarative statement, expressing excitement, family and friends, humanitarian, introspection, music, photoshare, promotion request, salutation, and world news. In addition, the most personal tweets pertain to "Expressing Excitement," and "Word News".

Moreover, the results of this study show that these three American black singers' tweets represent the maintenance of an existing group, and raising black people from the dominant of white class and the positions of power and stature in American society. These tweets also have meaning and values as the concept of power to reflect the interests of the strength elite, online identity construction, and a place to counter the media stereotypes. (Van Dijk, 1998).

## CONCLUSIONS

The findings indicate a vigorous conversation surrounding the rebellion of a dominant media ideology of American black singers as racism and ethnicity; however, they show the American black singers presenting the concept of power to reflect the interests of the strength elite, online identity construction, and a venue to counter the media stereotypes (Enck-Wanzer, 2009). Moreover, a deep analysis was conducted on the fifteen tweets from each singer to present an answer to the question regarding racism and ethnicity of American black singers and the most common theme among three American black singers' tweets was "Declarative Statement," which makes a common sense of power.

Furthermore, Critical Discourse Analysis is an effective method for deconstructing the identity of Twitter users, if the researcher is prepared to make argues on the themes exposed during coding. Twitter is a moderately new phenomenon, and until more research is present. This particular study presents future researchers an opportunity to see what has, and has not worked, in regards to the online identity presentation related to Critical Discourse Analysis through a social networking service.

## LIMITATION OF THE STUDY

There are no American white singers included in the sample, and only the American black singers are presented. Because the parameters surrounding Critical Discourse Analysis are not firmly distinct, it was essential to pay attention to what is considered non-analysis. Moreover, the researchers must be careful not to summarize or be partial during coding, and cannot conduct under analysis by simply discovering themes (Eriksson & Kovalainen, 2008:238). Consistent, deep analysis was the only way to correctly tribute the formulation of the study. If the researchers took a position on the content of these tweets, be it personal, political, or otherwise, the study would misplace validity. It was very important that when analyzing data of this type, the focus was on presenting the most accurate representation of the data possible. Taking a side in this study, making hypothesizes specifically to support the formulation of the study would have invalid all value of the study. Regardless of outcome, this research has rate in regards to understanding the social presentation of American black singers (Eriksson & Kovalainen, 2008:238).

### ABSTRACT

Despite stepping the world into the era of creating the e-learning content for educational system, e-assessment plays an important role in e-learning justice. The purpose of this qualitative study is to consider viability and practicality of e-assessment from multi-dimensional perspectives such as Strengths, Weaknesses, Opportunities and Threats (SWOT), based on the learners, teachers and administrators attitudes toward designing an ideal agenda for performing e-assessment in an actual e-learning environment, and in line with the constructivists' approach and Richard's maxims. To this end, three questionnaires, a five-point Likert scale one- for three levels of respondents- ranging from 1(strongly agree) to 5 (no idea), are developed for data elicitation from participants, working in e-learning centers of some Iranian universities. Statistically, participants showed their interest in the strengths and opportunities as well as the operational values of e-assessment. But, the study has a deep challenge in its design; another challenging problem is the low IT literacy of the teachers and administrators and the final one refers to the misconception noble savage of the learners. Finally, this study predicts the future stance of development and expansion of e-assessment in the educational context with more collaboration among learners, teachers and administrators in educational settings.

**KEY WORDS:** E-assessment; SWOT analysis; Practicality, Viability

### INTRODUCTION

Assessment is central to the practice of education. For learners, good performance on 'high-stakes' assessment gives access to further educational opportunities and employment. For teachers and administrators, it provides evidence of success as individuals and organizations.

Assessment systems are used to measure individual and organizational success, and so can have a profound driving influence on systems they were designed to serve.

Hersh (2004) advocates the position that assessment of student learning should be considered an integral part of the teaching and learning processes as well as part of the feedback loops that serves to enhance institutional effectiveness. On the other hand, the high price of paper around the globe has already made official administrators both in the ministry of education and in the ministry of Sciences; Research and Technology use e-assessment in educational environments instead of traditional paper and pencil tests. It should be emphasized that there is a significant relationship between how to perform e-assessment and what the outcomes are in education because use of lonely technology will not lead to effectively teaching-learning outcomes.

Based on literature studies, a number of studies have been conducted on the use of e-assessment in education but few studies have been conducted on the how to measure viability of e-assessment in education. In other words, Smart Assessment in Cyber Environment has not been practically studied in educational system of Iran. Therefore, there are particular gaps about advantage and disadvantage use of smart assessment and how smart assessment in cyber environment should be materialized for better implementation.

Thus, this study, by considering that paperless exams have become a need and a must in educational settings and learner orientation and autonomy through e-assessment, intends to shed some light on the strengths, weaknesses, opportunities and threats of Smart assessments in higher Iranian educational system for performing viable and practical e-assessment within an actual e-learning environment via describe achievable agenda.

The focus of this study is still largely on creating the virtual e-assessment content for educational system based on application of constructivists learning theory and Richard's maxims. By considering that the individual and dependent factors such as attitude and belief of students, teachers and administrators, engaging in e-assessment, play as an important role in the development and implementation of e-assessment, this study uses SWOT analysis in order to enable higher ministry of Iran education to use of viable e-assessment environments in the teaching-learning process instead of traditional paper and pencil tests.

Consequently, this study will depict the road map of Smart Assessment in Cyber Environment and how the system can be improved and expanded in the educational system. Lastly, Conclusion and recommendations are drawn for further researches on the use of E-assessment model in E-learning environments that adds to the practical objectified value of this research.

## **RESEARCH QUESTIONS**

R.Q1: To what extent do learners, teachers and administrators supportive of smart assessments?

R.Q2: To what extent are the findings of such assessments generalizable and global or just local?

## **RESEARCH HYPOTHESIS**

1-Neither learners, nor teachers and administrators have methodical and methodological conscious awareness of e-learning & e-assessment foundations.

2- Generalizability of this study is not possible.

## **THEORETICAL AND METHODOLOGICAL ISSUES**

Assessment is not new to academia, with the roots of the current movement dating back over two decades (Martell & Calderon, 2005). In higher education, the first attempts to measure educational outcomes emerged around 1900 with the movement to develop a mechanism for accrediting institutions of higher education (Urciuoli, 2005). E-Assessment is a new online pedagogy that uses ICT to deliver education effectively and not about technology for technology's sake. E-Assessment is one of the domains of e-learning. It refers to assessment which is electronically delivered.

There are claims (Richardson, Baird, Ridgway, Ripley, Shorrocks-Taylor & Swan 2002; Ripley, 2004) that students prefer e-assessment to paper-based assessment, because the users feel more in control; interfaces are judged to be friendly; and because some tests use games and simulations, which resemble both learning environments and recreational activities. According to Hamilton & Shoen (2005), web-based testing has significant advantages in the areas of cost, ease of use, reliability, replicability, scoring, aggregating results, and data management. They explain that digital assessment measures can score themselves with great reliability and no subjectivity while making data available with immediacy. According to Page, project based learning can support critical thinking, multi layered decision making, goal setting, problem solving, and collaboration. As a result, many institutions are anchoring their assessment activities into meaningful scenarios so that students are being assessed on their abilities to apply learning into realistic situations (Page, 2006).

The existence of maladministration examination at any educational level has the greatest threat to the validity and reliability of any examination and consequently to the authenticity and recognition of diploma issued. McAlpine Mhairi's paper (2002) entitled: " Principles of Assessment" (CAA Centre, 2002) breaks assessment down into five main points or criteria that ensure this dialogue is worthwhile: clarity of purpose; validity/reliability; referencing (establishing a common measure across all candidates); the quality of assessment items/instruments; and grading, a process that relates directly to referencing.

The idea of having our assessments computerized is obviously attractive and e-assessment is emerging as a major driver for e-learning for both learners and staff. E-Assessment (sometimes known as Online Assessment, Computer-based Assessment or Computer Assisted Assessment –CAA) certainly has advantages. However, it also has some disadvantages and associated problems.

Research by Clariana and Wallace (2002) has shown that the use of CAA has a positive impact on the test scores of high attaining pupils, when compared to those from paper-based tests, because they assert that higher-attaining students more quickly adapt to new assessment approaches. Noyes, et al. (2004) suggests that lower-performing individuals will be disadvantaged when CAA is used because they assert that a greater work load and additional effort is required to complete a computer-based test. There is also the issue of defining requisite technical skills for students undertaking CAA such as, who should be involved in that training, and when should it take place, especially in the context of overloaded curricula, (Weller, 2002).

Plagiarism is a concern for many thinking of using CAA, (Weller, 2002); but Rovai, (2000) and Carroll, (2002) suggest that assessment design is the key to deterring plagiarism. O'Hare & Mackenzie, (2004) assert that there is a level of imagination and rigor required for the design of assessment online compared to that for more traditional forms of assessment.

Bull and McKenna, (2004: page 3) suggest a number of reasons that academics may wish to use CAA:

1. To increase the frequency of assessment, thereby, motivating students to learn, encouraging students to practice skills.
2. To broaden the range of knowledge assessed.
3. To increase feedback to students and lecturers.
4. To extend the range of assessment methods.
5. To increase objectivity and consistency.
6. To decrease marking loads.
7. To aid administrative efficiency.

Nichol and Milligan (2006) have taken this further to show how e-assessment can support these seven principles by providing:

Timely feedback, opportunities for re-assessment and continuous formative assessment to encourage students' self-esteem, statistics to help tutors evaluate the effectiveness of the assessment— questions answered very poorly can be re-examined in case poorly specified, timely information for tutors to be able to help shape teaching.

Research agrees that constructivism learning theory, which focuses on knowledge construction based on learner's previous experience, is a good fit for e-learning because it ensures learning among learners (Harman & Koohang, 2005; Hung, 2001; Hung & Nichani, 2001).

Honebein (1996) advanced a set of goals that aid the design of constructivism in learning settings. The goals are to:

- Provide experience with the knowledge construction process;
- Provide experience in and appreciation for multiple perspectives;
- Embed learning in realistic and relevant contexts;
- Encourage ownership and voice in the learning process;
- Embed learning in social experience;
- Encourage the use of multiple modes of representation;
- Encourage self-awareness in the knowledge construction process.” (Honebein, 1996 p. 11)

E-assessment has not been limited to certain methods but rather has been an eclectic mix of various approaches and techniques such as “Richard Maxims” that are developed from a good teaching system (1996):

- 1.The maxim of involvement (follow students' interest to maintain involvement)
- 2.The maxim of planning (plan and try to follow your plan)
- 3.The maxim of order (maintain discipline)
- 4.The maxim of encouragement (seek ways to encourage student learning)
- 5.The maxim of accuracy (work for accurate student output)
- 6.The maxim of efficiency (make most of the efficient use of class time)

7. The maxim of conformity (make sure your teaching follows the prescribed method)
8. The maxim of Empowerment (give the learner's control)

A major problem of learning and education policy in educational system is the separation of 'academic' and 'practical' subjects. Regrettably, learning and education policy is separated from 'practical' subjects. E-assessment has undoubtedly to play a major role in defining and implementing curriculum change in education. Governments have strong commitment to implementation of high quality e-assessment by good initial progress has been made in education system; therefore, there is a need to be vigilant that the design of e-assessment systems is driven by considerations.

## **METHODOLOGY**

### ***Introduction***

The world stepped into the era of online information and technologies that virtually have impact on all sides of human life including economics, education, social and cultural sides. Undoubtedly, the progresses made advances in World Wide Web and Open Source software have led to many changes in the areas of teaching, way of education and learning, triggering to the formation of a new teaching and learning agenda, termed as "E-learning". Expansion of virtual E-assessment is one of the most appropriate approaches for making higher education for students by easily and conveniently accessing to self-assessment.

### ***Method***

This qualitative study, for evaluating the E-assessment effects on improving learning quality, favors descriptive/correlational method for survey because variables are non-experimental. Therefore, the correlation of independent variables such as, Strengths, Weaknesses, Opportunities and Threats are considered with dependent variables which are the attitude of administrators, teachers and learners towards E-assessment. The qualitative data are gathered from learners, teachers and educational administrators through five likert-point questionnaires along with face-to-face interviews. Interviews are done at each selected E-learning center in order to obtain the participants' perceptions towards the effectiveness of E-courses. The qualitative approach was preferred as it would help the researcher to capture accurately the standpoints of participants in more facets. The whole process involved collecting information through the interview, asking questions about the data collected, decoding the meaning through a combination of techniques, analyzing and evaluating the conclusions and disseminating the findings.

### ***Participants***

As the aim of this qualitative study is to identify factors that affect the effectiveness of e-assessment in Iran's universities, statistical population (N=110) consists of three groups, including 10 educational administrators; 30 teachers and 60 learners from three Universities which offered their General English in e-assessment-based instructions format. It should be noted that unfortunately, they do not have enough IT literacy about e-assessment especially learners who are noble savage. The participants were invited to respond to items, receiving information in a face-to-face oral interview.

### ***Instrument***

On the basis of literature review, three questionnaires were developed to collect the necessary data from administrators, teachers and learners. The questionnaires covered four areas: 1) Strengths features; 2)Weaknesses features; 3) Opportunities features; 4) Threats features; main components of e-learning in higher e-assessment extension and educational system, which were measured on a five-point Likert scale which ranged from 1(strongly agree) to 5 (No idea). Content and face validity of research instrument was done by committee members and some experts in this field. Questionnaire reliability was separately calculated by Alpha Cronbach coefficient for each question of three questionnaire templates. Based on the results of this test and the correlation coefficient, some questions were eliminated and some others were modified. In general, the reliability for the each questionnaire as research instrument was estimated respectively students' questionnaire=0.80, teachers' questionnaire=0.89 and administrators' questionnaire=0.76. The compiled data from completed questionnaires, saving at data bank, were analyzed by SPSS version 18 for description and inference.

### ***Data Analysis***

Participants 'opinions were evaluated using a self-administered 40-item, likert scale questionnaire (items regarding Strengths, Weaknesses, Opportunities and Threats of E-assessment method). Administrators, teachers and students ranked these choices in an order of completely agree (score: 5) to no idea (score: 1) in a manner which best described their opinions. In addition, open- ended questionnaires as a research instrument inviting administrators, teachers and learners to reflect their viewpoints about implementation of educational programs through E-assessment:

I) Strengths: If the method attracts the administrators, teachers and students to fallow the E-assessment eagerly (10 items: e. g. "E-assessment enables administrators, teachers and students to use a wide range of sources for discussing teaching subjects in an easier way than in traditional ways of teaching"; "Online assessments can provide increased instruction time for administrators and teachers for students").

II) Weaknesses: How do the administrators, teachers and students feel defenselessly in learning within e-assessment (5 items: e. g. "One of the noted barriers to use e-assessment is related to growing up professional candidates for planning and using online tests for evaluation processes"; "Lack of good experience in e- assessment history hinders new administrators, teachers and students from getting interested in its possibilities").

III) Opportunities: How do the administrators, teachers and students think about the effectiveness use of the e-assessment on learning outcome (12 items: e.g. "E- assessment can create co-operation in teaching among administrators, teachers and students"; " Using e-assessment make an opportunity for administrators, teachers and students to use new teaching methods in cyber teaching environments")

IV) Threats of using E-assessment: How do the administrators, teachers and students feel not enough ability to provide and use electronic educational materials in the e-assessment (8 items: e.g. " E- assessment courses can result in an overload of work that administrators, teachers and students find hard to cope with"; " the administrators, teachers and students specializing involved in e-assessment may see their work undervalued and downgraded by colleagues because it be considered more as a hobby than as rigorous academic teaching expertise").

## RESULTS

In order to determine the factors and effective fields for E-assessment application development in educational system, the determined variables from administrators, teachers and students were entered in to factor analysis.

**Descriptive Statistics of the students 'questionnaire**

	N	Minimum	Maximum	Mean	Std. Deviation
Threats	40	8	20	14.70	2.356
Weaknesses	40	12	23	18.22	2.778
Strengths	40	20	47	36.25	6.134
Opportunities	40	20	53	38.90	6.961
Sum	40	70	138	108.08	14.759
Valid N	40				

The above descriptive statistics in the table seems to lend support to the fact that based on the completed students' questionnaire the students prefer items, related to the strengths and opportunities rather than the weaknesses and threats for implementing and improving e-assessment model in Iranian educational system.

### Strengths. Statistics, related to the students' SWOT analysis

		Opportunities	Strengths	Weakness	Threats	Sum
Opportunities	Pearson	1	.63 *	.32 *	.44 **	.86 *
	Sig. (2-	.	.00	.04	.00	.00
	N	4	4	4	4	4
Strengths	Pearson	.63 *	1	.03	.32 *	.31 *
	Sig. (2-	.00	.	.62	.03	.03
	N	4	4	4	4	4
Weaknesses	Pearson	.32 *	.03	1	.35 *	.59 *
	Sig. (2-	.04	.62	.	.02	.00
	N	4	4	4	4	4
Threats	Pearson	.44 *	. *	.35 *	1	.67 *
	Sig. (2-	.00	.03	.02	.	.00
	N	4	4	4	4	4
Sum	Pearson Correlation	.86 *	.31 *	.59 *	.67 **	1
	Sig. (2-tailed)	.00	.03	.00	.00	.
	N	4	4	4	4	4

\*\* . Correlation is significant at the 0.01 level (2-tailed).

\* . Correlation is significant at the 0.05 level (2-tailed).

Correlation among independent variables in the table including: Strengths, Opportunities, Weaknesses and Threats indicates that there is strong correlation at 0.01 probabilities between strengths and opportunities variables in the filled out questionnaire by the students.

**Descriptive Statistics of the teachers 'questionnaire**

	N	Minimum	Maximum	Mean	Std. Deviation
Weaknesses	40	15	29	23.25	3.678
Threats	40	17	30	25.60	4.075
Opportunities	40	25	40	34.15	4.715
Strengths	40	28	50	40.90	5.683
Sum	40	97	147	123.90	15.293
Valid N	40				

The above descriptive statistics in the table seems to lend support to the fact that based on the completed teachers' questionnaire the teachers prefer items, related to the strengths and opportunities rather than the weaknesses and threats for implementing and improving e-assessment model in Iranian educational system.

**Statistics, related to the teachers' SWOT analysis**

		Strengths	Opportunities	Weaknesses	Threats
Strengths	Pearson Correlation	1	.749**	.497**	.744**
	Sig. (2-tailed)	.	.000	.001	.000
	N	40	40	40	40
Opportunities	Pearson Correlation	.749**	1	.443**	.645**
	Sig. (2-tailed)	.000	.	.004	.000
	N	40	40	40	40
Weaknesses	Pearson Correlation	.497**	.443**	1	.457**
	Sig. (2-tailed)	.001	.004	.	.003
	N	40	40	40	40
Threats	Pearson Correlation	.744**	.645**	.457**	1
	Sig. (2-tailed)	.000	.000	.003	.
	N	40	40	40	40

\*\* . Correlation is significant at the 0.01 level (2-tailed).

The correlation table among independent variables of Strengths, Opportunities, Weaknesses and Threats, based on Pearson product correlation coefficient indicates that there is strong correlation at 0.01 probabilities among four independent variables in the filled out questionnaire by the teachers.

**Descriptive statistics of administrators' questionnaire**

	N	Minimum	Maximum	Mean	Std. Deviation
Strengths	10	25	40	32.60	4.949
Opportunities	10	22	45	35.10	7.156
Weaknesses	10	16	24	20.30	2.830
Threats	10	13	23	18.70	3.057
Sum	10	80	121	106.70	13.695
Valid N	10				

Considering the mean score of independent variables in the above descriptive statistics table, and based on the questionnaire from, filled out by the administrators, it seems that administrators' viewpoints about E-assessment application development in Iranian educational system at first

focuses on strengths variable and then on opportunities variable than weaknesses and threats variables.

#### Statistics, related to the administrators' SWOT analysis

		Strengths	Opportunities	Weaknesses	Threats
Strengths	Pearson Correlation	1	.646*	-.006	.542
	Sig. (2-tailed)	.	.044	.986	.106
	N	10	10	10	10
Opportunities	Pearson Correlation	.646*	1	.227	.586
	Sig. (2-tailed)	.044	.	.528	.075
	N	10	10	10	10
Weaknesses	Pearson Correlation	-.006	.227	1	.602
	Sig. (2-tailed)	.986	.528	.	.065
	N	10	10	10	10
Threats	Pearson Correlation	.542	.586	.602	1
	Sig. (2-tailed)	.106	.075	.065	.
	N	10	10	10	10

\*. Correlation is significant at the 0.05 level (2-tailed).

The correlation table among independent variables of Strengths, Opportunities, Weaknesses and Threats, based on Pearson Product Correlation Coefficient indicates that there is strong correlation at 0.05 probabilities between strengths and opportunities variables in the filled out questionnaire by the administrators.

Samples seem to be normal in our three groups; hence, analysis of variance can be favored to evaluate interrelatedness of the four basic factors in those three questionnaires.

Since, each group of participants is consisted a normal statistics society in this study, the researcher uses ANOVA, analysis of variances for evaluation of simultaneous effect of four independent variables on the E-assessment application development in educational system. By comparing means of strengths, Weaknesses, Opportunities and Threats variables of the three questionnaires (administrative, teachers and students) with P-value more than 0.05 by means of ANOVA, analysis of variances it is easily indicative that they do not have any effect on each other.

Comparing means of strengths variable of the three questionnaires by ANOVA analysis (S=Students, T=Teachers and A=Administrators)

		Sum of Squares	df	Mean Square	F	Sig.
weakS	Between Groups	43.600	8	5.450	2.725	.439
	Within Groups	2.000	1	2.000		
	Total	45.600	9			
weakT	Between Groups	68.400	8	8.550	.267	.911
	Within Groups	32.000	1	32.000		
	Total	100.400	9			
weakA	Between Groups	70.100	8	8.763	4.381	.354
	Within Groups	2.000	1	2.000		
	Total	72.100	9			

Comparing means of Opportunities variable of the three questionnaires by ANOVA analysis (S=Students, T=Teachers and A=Administrators)

		Sum of Squares	df	Mean Square	F	Sig.
operationS	Between Groups	454.400	8	56.800	4.544	.348
	Within Groups	12.500	1	12.500		
	Total	466.900	9			
operationT	Between Groups	113.600	8	14.200	.580	.775
	Within Groups	24.500	1	24.500		
	Total	138.100	9			
operationA	Between Groups	448.400	8	56.050	4.484	.351
	Within Groups	12.500	1	12.500		
	Total	460.900	9			

Comparing means of Threats variable of the three questionnaires by ANOVA analysis (S=Students, T=Teachers and A=Administrators)

		Sum of Squares	df	Mean Square	F	Sig.
threatS	Between Groups	51.100	8	6.388	12.775	.213

	Total	51.600	9			
threatT	Between Groups	128.900	8	16.113	2.014	.499
	Within Groups	8.000	1	8.000		
	Total	136.900	9			
threatA	Between Groups	82.100	8	10.263	5.131	.329
	Within Groups	2.000	1	2.000		
	Total	84.100	9			

## DISCUSSION

This study develops information about successfully application of E-assessment in education context based on social studies research. However, the current study reveals that the usability of E-assessment is questionable and it cannot be relied upon, specifically in social science research.

This major drawback supports that questionnaire is not a reliable technique for data collection, especially when there is a discrepancy between what goes on in the mind of the researcher and what happens in the cognition of the respondents.

Therefore, the following suggestions receive priority:

- 1) ***Correct virtual communities selected for questionnaire distribution:*** The researcher should attempt to select communities, familiar with the subject of the research. As a matter of fact, they were interested in the use of E-assessment in educational system but they have not enough information about merit and demerit in use of such concepts.
- 2) ***Information overload:*** Possibly, the message in each item about E-assessment in the questionnaire was not attended to and just reacted to by the potential respondents. On the other hand, all of respondents do not have enough discretionary time to ask more information about meaning of ambiguous items.
- 3) ***Ease of refusing to participate in the survey:*** Questionnaire surveys rely greatly on respondents' initiative power to participate in. But the questionnaire mode of survey makes it easy to refuse by the participants. A potential respondent could simply delete the message received, either clicking or not clicking on the question with no explanation needed. Omitted responses decrease the validity of subsequent statistical analysis. The absolute number of incomplete items is not of great importance as is the percentage of the total number of returned questionnaires not fully completed.
- 4) ***Mistrust/fear of breach of anonymity:*** Perhaps some people mistrust questionnaire surveys or fear that their identity may be revealed.
- 5) ***Geographically diverse:*** The researcher has to travel to certain locations to find people who belong to certain organizations as participants. Assistance from professional organizations will definitely help to obtain valid and reliable results. Questionnaire surveys definitely cannot research much more geographically diverse regions that online surveys can. There are more expenses required for either participants or academics.
- 6) ***Great effort:*** On the other hand, to increase the response rate and obtain reliable and valid results from questionnaire surveys, great effort is required for designing a questionnaire. On one hand, it is important to include all the necessary items in order to collect the information needed and to control the length of the questionnaire as longer surveys may yield a lower response rate.
- 7) ***Limitations of the surveys:*** This survey is not reliable because the researcher collects data at a single point in time and not considers improvements in the educational system at different points in time. As matter of fact, frequent periodic surveys, often impractical, are expensive and time-consuming, but they add to the consistency of the findings.
- 8) ***Authenticity Question:*** This survey has not real authenticity because generally it cannot reflect potential pitfalls application of e-assessment in nowadays educational system. However, a single cross-sectional survey cannot unravel the different effects of each of SWOT factors on each other; in fact it is very difficult on the base of result of this survey to prove that exactly which factors actually cause impediment to the viability improvement of this application.

## CONCLUSION

This study supports that survey is not reliable enough, especially in certain social contexts, when there is a discrepancy between issues, derived from related literature and low literacy of respondents in some such issues. Hence, it is neither reliable and viable, nor generalizable.

Restrictions to this survey refer to gather data: 1) limiting access to large population of concern 2) lacking time and funding to carry out survey in different point of time 3) lower priority for carrying out a survey because of low IT literacy of participants to provide accurate, authentic responses 4) this self-constructed questionnaire with closed-ended questions may have a lower validity rate than other survey types 5) collecting data cannot reflect the individual respondent circumstances or the local culture that may be the root cause of respondent behavior.

The researcher confronted with real problems in collecting information from respondents because they were not willing to answer the questions since they believe they will not benefit from responding. Generally, respondents cannot imagine the full context of situation therefore they may read differently into each question and reply based on their own interpretation of the item – i.e. what is ‘agree’ to someone may be ‘disagree’ to someone else lead to subjectivity of responds. As a result, this study gets much more information about the educational system statues, what new and beneficial teaching techniques should be used, and how much progress has been made toward reform.

For better implementation of the flexible e-assessment system in educational system, a diagnostic assessment should be designed in the databases in order to identify preferred students’ learning styles.

# **NATIVIZATION IN THE SPOKEN MODE OF COMMUNICATION: A STUDY OF THE INNOVATIONS IN THE PRONUNCIATION OF ENGLISH WORDS IN GHANA**

**Richard T. Torto**

*Department of Communication Studies, University of Cape Coast, Ghana*

## **ABSTRACT**

The state of English today is that it bears the marks of all the languages and cultures with which it has come into contact. The socio-cultural conditions under which English is used in countries where it is a second language make it inevitable that its forms will depart from that of the native varieties. Research has shown that some innovations in English pronunciation may be due to the contact with languages with which it co-exists. The influence of indigenous languages on English occurs at all levels of linguistic analysis (lexical, morphological, phonological, semantic, syntactic and so on); however, pronunciation deviations are probably the ones most readily attributed to mother-tongue interference. The present paper is on nativization of the English language at the phonological level. The nature of the nativization is the influence of the indigenous Ghanaian languages on the pronunciation of English words by educated Ghanaians. The findings of the current study reveal that in Educated Ghanaian English (EGE) most words are articulated on the basis of their spellings.

**KEYWORDS:** Nativization, Spelling pronunciation, Received Pronunciation, Educated Ghanaian English, Communication, Non-native varieties of English

## **INTRODUCTION**

The growth and spread of English across the globe has given rise to many new varieties of English outside its native domains. The new Englishes have evolved into varieties which serve a wide range of communicative purposes and have developed their own character (Jenkins, 2003). With regard to the new varieties of English, Kachru (1997) establishes that the localized norms have distinctive linguistic, literary and cultural identity. Non-native varieties of English have developed through the imposition of English on populations that predominantly speak other languages. Speakers of non-native varieties are bilingual, having acquired English through the educational system (Bamgbose, 1997). With non-native varieties of English, the linguistic resources are creatively exploited by users to fashion out new forms of expression. Prator's (1968: 464) view on non-native varieties of English is worth stating here: "A second-language variety of English is a tongue caught up in a process that tends to transform it swiftly and quite predictably into an utterly dissimilar tongue." In Prator's opinion, a non-native variety of English should be regarded as a new type of English. More linguistic scholars have come to accept that non-native varieties of English exist in their own right and that they are suitable models for speakers in those nations for whom they are intended. Language is dynamic, and it is an aspect of growth and adaptation to cultural and linguistic settings that varieties of language develop.

The influence of local languages has left a permanent mark on non-native varieties of English in terms of code-mixing, code-switching, nativization, register-shift, loan translations and so forth.

What is needed is a concept of innovation which is a dynamic and systematic process involving not only language form but culturally determined as well as creative uses of English (Bamgbose, 1997). The process of nativization, by which non-native varieties of English emerge, consists in innovations in language form and language use. Linguistic scholars perceive nativization in varied ways. . For instance, Richard (1978) uses the concept in the sense of acquisition of native-like features by a learner in a second or foreign language context. This perception implies a process by which learners become like native speakers in their use of a second language. On the other hand, Owusu-Ansah (1997) views nativization as a process of linguistic change in which a foreign language becomes an integral part of the culture of a society which employs it as an additional language while it still maintains many features of the language as it is used by the native speakers. With this process, the foreign language in question loses some of its native-like characteristics. It acquires some features of the languages in the community in which it has been introduced.

Peter (1994) also supports the latter view on nativization. According to him, before a foreign language is integrated into a non-native culture, it loses some of its linguistic features. Kachru (1992) also perceives nativization in his own unique fashion. According to him, once English was adopted in a region, whether for science, technology, literature, prestige, elitism or modernization, it went through various reincarnations that were partly linguistic and partly cultural. The reincarnations were essentially caused by the new bilingual or multilingual settings, and by the new contexts in which English had to function. Gyening's (1997) position on nativization is also worth noting. In his view, as English spreads to all parts of the world, it has become necessary for its non-native speakers to fashion out for themselves words for concepts which are in their indigenous languages and cultures but which are absent from the English language and culture. Achebe (1972) also talks about nativization in his statement on the English Language. Achebe feels that the English language will be able to carry the weight of his African experience. But for him, it will have to be a new kind of English which is still in communion with its ancestral home, yet altered to suit its new African surroundings. Achebe regards nativized varieties of English as new Englishes.

The present study focuses on nativization as a process by which a language, foreign to a community, acquires certain characteristics which were not originally present in the language as it is used by its native speakers. This nativization process, which affects the foreign language, takes place at all levels of linguistic analysis such as pronunciation, meaning, grammar (morphology and syntax) and discourse and may help to distinguish the new variety so created from both native-speaker varieties and other non-native varieties. Nativization inevitably involves breaking native-speaker norms which define standard varieties. However, Bamgbose (1982) advocates the need to guide the process of nativization along the path of a national standard that is both internationally and locally acceptable. The present paper was inspired by the observation made by Sey (1973: 143): "The pronunciation of Educated Ghanaian English (EGE) is markedly different from Received Pronunciation (RP) although the latter is supposed to be the model aimed at in schools". The current study is an investigation of the innovations in the pronunciation of English words by educated Ghanaians.

#### **RECEIVED PRONUNCIATION (RP)**

Received Pronunciation (RP) is basically educated Southern British English. It has become more widely known and acceptable through the advent of radio. The British Broadcasting Corporation (BBC) adopted this form of pronunciation for its transmission; thus, RP is often identified with BBC English. This special function of RP in broadcasting, has led to its being the form of pronunciation most commonly presented in books on the phonetics of British English and traditionally taught to foreigners. The BBC is constantly bringing the RP accent to the whole of Britain. The more marked characteristics of regional speech, and in the London Region, the popular forms of pronunciation, are tending to be modified in the direction of RP, which is equated with the correct pronunciation of English. In the United Kingdom (UK) certain types of regional pronunciations are well established. For instance, Scottish English speech is universally acceptable while the popular forms of pronunciation used in large towns such as London, Liverpool, or Birmingham are generally characterized as sub-standard or ugly by those who do not use them. Features of regional pronunciation, without RP influence will be found in highly educated and less educated speech. There is however a modified version of the regional pronunciation which has adopted certain RP characteristics. Three main types of RP can be distinguished: the conservative RP forms used by the older generation and, traditionally, by certain professions or social groups; the general RP forms most commonly in use and typified by the pronunciation adopted by the BBC; and the advanced RP forms mainly used by young people of exclusive social groups—mostly of the upper classes, but also, for prestige value in certain professional circles. It can be said that if improved communications and radio have spread RP extensively, these same channels have rendered other forms of pronunciation less remote and strange. In fact, RP itself will not yield the requisite result if used in inappropriate social situations, as it may be construed as a mark of affectation or a desire to emphasize social superiority.

At this point, one can infer that RP is not spoken by everybody in the UK. Gimson (1962) has observed that speakers of RP are becoming increasingly aware of the fact that their type of pronunciation is one which is used by only a very small part of the English-speaking world. It is worth quoting, also, what Sey (1973: 144) says about RP “It must be remembered that native English-speaking teachers, preachers, administrators and traders who have from the earliest times come into contact with Ghanaians have not always been Received Pronunciation speakers.” Abercrombie (cited in Kachru, 1992) is of the opinion that RP does not reflect the social reality of England. He thinks RP does not necessarily represent the English of educated people. His reason is that while those who speak RP consider themselves educated, they are out-numbered by the educated people who do not speak RP.

There has always existed a great diversity in the spoken realizations of English in terms of the sounds used in different parts of the UK and other places of the world where English is spoken. Today, the English are particularly sensitive to variations in the pronunciation of their language. However, great prestige is still attached to RP—an implicitly accepted social standard of pronunciation.

## **THE SOUND SYSTEM OF LANGUAGE**

Given that human beings have different physical features, in a sense, every individual has a physically different vocal tract. Consequently, in purely physical terms, every individual will pronounce sounds differently. There are then, potentially numerous physically different ways of pronouncing a word. Furthermore, each individual will not pronounce a word in a physically identical way on every occasion. Obvious distinctions occur when the individual is crying, is

asking for additional bottle of beer, or is suffering from a cold. There is a vast range of potential differences in the actual physical production of a speech sound and this phenomenon falls within the framework of phonology which is defined as the description of the systems and patterns of speech sounds in a language.

Phonology is based on a theory of what every speaker of a language unconsciously knows about the sound patterns of that language. Due to its theoretical nature, phonology is concerned with the abstract or mental aspect of the sounds in language rather than with the actual physical articulation of speech sounds. Phonology is about the underlying design of the sound type that serves as the constant basis of all the variations in different physical articulation of that sound type in different contexts (Yule, 1996). Phonology is also concerned with the abstract set of sounds in a language which allows us to distinguish meaning in the actual physical sounds we say and hear. The sounds /f/, /v/, /w/, /d/, and /p/ are abstract sound units which make the words *fine*, *vine*, *wine*, *dine* and *pine* meaningfully distinct. In fact, there are meaningful consequences related to the use of one sound segment rather than the others. Each one of these meaning – distinguishing sounds in a language is referred to as a phoneme.

The phoneme is a single sound type and it is represented by a single symbol. It is worth noting that slash marks are conventionally used to indicate a phoneme, /k/, an abstract sound segment, as opposed to the square brackets, as in [k], used for each phonetic or physically produced segment. An essential feature of a phoneme is that it functions contrastively. For instance, the two sound segments /h/ and /p/ are phonemes in English because they are the only basis of the contrast in meaning between the words *hot* and *pot*. This contrastive attribute is the basic test for determining the phonemes which exist in a language (Yule, 1996). From another perspective, if the sound /f/ is substituted for /d/, as in *five* and *dive*, there will be a change of meaning: the two sounds /f/ and /d/ will represent different phonemes.

While the phoneme is the abstract sound unit, there are several varied versions of that abstract sound segment regularly produced in actual speech. The different versions of the phoneme are referred to as phones. Phones are phonetic sound units and they are presented in square brackets. A set of phones which are variants of one phoneme are referred to as allophones of that phoneme. For instance, the [t] sound of the word *tie* is normally articulated with a stronger puff of air (aspiration) than is present in the [t] sound of the word *stair*. This aspirated version is represented as [t<sup>h</sup>]. The [t] sound between vowels in a word like *waiter* is often realized as a flap which is represented as [D]. In the pronunciation of the word *eighth*, the influence of the final dental sound [θ] causes a dental articulation of the [t] sound. This is represented as [t̪]. Since these variations - [t<sup>h</sup>], [D] and [t̪] - of the phoneme [t] form a set of phones, they would be referred to as allophones.

There are definite patterns to the types of sound combinations permitted in a language. Obviously, forms such as [vxrk] or [wcsg] do not exist in English. They have been formed without regard to some constraints on the sequence or position of English phonemes. Such constraints are called the phonotactics of a language and they are part of every speaker's phonological knowledge.

## THE RELATIONSHIP BETWEEN LETTER AND SOUND IN ENGLISH AND GHANAIAIAN LANGUAGES

Generally, each letter of the alphabet represents a particular sound segment of a language. Many early orthographic systems were based on a correspondence between the graphic representation and the phonology (Crane et al, 1981). However, as the pronunciation of many languages underwent significant transformations over the years, the orthography did not always keep pace with the pronunciation. For instance, in English, there is inconsistent relationship between the orthography and phonology. Hence, for the vast majority of words in English, their pronunciations are different from their spellings. One letter of the English alphabet can often be pronounced in different ways. For example, the letter *a* is pronounced differently in the following words: *hand*, *fast*, *cane*, *water*, *dare* and *about*. There are a few selected words below to further illustrate this assertion:

<i>Come</i>	/kʌm/
<i>Bus</i>	/bʌs/
<i>Doubt</i>	/daʊt/
<i>Colonel</i>	/'kɜ:nəl/
<i>Sword</i>	/sɔ:d/
<i>Circle</i>	/'sɜ:kl/
<i>Computer</i>	/kəm'pjʊ:tə/
<i>Journal</i>	/'dʒɜ:nəl/
<i>Goal</i>	/dʒeɪl/
<i>Clerk</i>	/kla:k/

The examples above show lack of one-to-one correspondence between the graphic representation of the word and the pronunciation. Giegerich (1992) also observes that a sound segment in English may be represented by different letters in different words. For instance, the sound /ʃ/ has varied graphic representations in different words: *shine*, *mansion*, *mission*, *duration*, *ocean*. Similarly, in words like *farm*, *doff*, *cough*, *philosophy* and *lieutenant*, different letters represent the same phoneme /f/. It is also worth noting that the letter *g* is pronounced differently in words like: *girdle* [gɜ:dl], *gist* [dʒɪst] and *genre* [ʒa:n]. A group of letters, for example, *ch* is pronounced differently in different words: *church* [tʃɜ:tʃ], *christmas* ['krɪsməs] and *charade* [ʃə'ra:d]. All these illustrations substantiate the lack of correlation between the spelling and the pronunciation of many English words. This inconsistent relationship between the sounds of words and their spelling in English has immense influence on the pronunciation of English words in non-native varieties of English like Educated Ghanaian English.

In contrast to the inconsistency in the correlation between English orthography and phonology is the display of correspondence between the graphic representation and pronunciation in some indigenous Ghanaian languages. For instance, most words in Ga (a Ghanaian language) are pronounced on the basis of their spelling. The Ga people are the ethnic or traditional group in Accra, the capital of Ghana. The Ga language is one of the minority languages of Ghana but because Accra is the centre of governance and economic activities, many Ghanaians actually speak Ga as a second language or at least demonstrate a considerable degree of communicative competence in it (Guerini, 2007). The one-to-one correspondence between the orthography and the phonology of the Ga language is illustrated below:

<b>Ga</b>	<b>English</b>
-----------	----------------

<i>Ba</i>	Come
<i>Yaa</i>	Go
<i>La</i>	Sing
<i>Nu</i>	Water
<i>jara</i>	Market
<i>Kaa</i>	Crab
<i>Yaa wɔ</i>	Go to bed
<i>Baa ye niŋ</i>	Come and let's eat
<i>Ta shi</i>	Sit
<i>Yaa fo nu</i>	Go and fetch water

A similar correspondence between spelling and pronunciation exist in Fante; a Ghanaian language spoken in the Central and Western Regions of Ghana. In Fante, words are pronounced based on their spelling. The following are examples:

<b>Fante</b>	<b>English</b>
<i>Edziban</i>	Food
<i>Gyaadze</i>	Kitchen
<i>Buukuu</i>	Book
<i>nsu</i>	Water
<i>kɔ</i>	Go
<i>Bra</i>	Come
<i>Dzi</i>	Eat
<i>Miridzidzi</i>	I'm eating
<i>Merekyere adze</i>	I'm teaching
<i>Merekyerew</i>	I'm writing

There are many other Ghanaian languages like Ewe in the south, Konkomba in the north and so forth, in which lexical items are articulated on the basis of their spelling. This one-to-one correspondence between the orthography and the phonology of some indigenous Ghanaian languages has influenced the pronunciation of English words. The fact is that the indigenous languages in Ghana are acquired by the majority of Ghanaians at the early childhood stages and spoken in the home environment before they come into contact with the English language (Ngula, 2011). By the time they begin learning English, they would have already acquired the rules, structures and phonology of their first language (L1). It therefore becomes very easy for the acquired rules, structures and phonology of the L1 to be transferred into English. Bamgbose (1971:47) also supports this assertion: According to him, the influence of the local languages on English (as a second language) is immense because certain features of the local languages – phonological, grammatical and lexical – tend to be transferred into English. In Ghana, L1 influence plays a significant role in the spelling pronunciation encountered in the variety of English spoken. L1, indeed, serves as background or preexisting knowledge upon which inferences and predictions can be made to facilitate transfer. Hakuta (1990) also talks about transfer of linguistics features. According to him, native language proficiency is a strong indicator of second language development.

## METHODOLOGY

### ***Research Design and Instrument***

Sociologists and social psychologists are likely to depend on data gathered by the aid of questionnaire or the observation of the behavior of people under controlled experimental situations. The results are realized as numerical corpus analyzed statistically. Anthropologists collect data from uncontrolled human behavior; they employ the research technique of participant observation. Gal (1979) stayed for a year in Oberwart in Eastern Austria living with a local family for the purpose of collecting data for research on language choice and shift. Blom and Gumperz (1972), Gillian Sankoff (1980), Rubin (1968) and Dorian (1981) spent similar long periods staying in the communities in which they were conducting their investigations.

The present study adopted the ethnographic research design. This research design is based on the anthropological research technique of participant observation. According to Fasold (1984), although the subjects of the research may be interviewed and questionnaire data collected, these data are considered strictly supplementary; the main core of data consists of the observation of people's behavior as they carry on their everyday lives. Observation was the main research instrument used in the present study. It provided an empirical basis for capturing language used in its social context. The method of observation used was participant and non-participant. By means of the observation tool, the current researcher gathered data that reflected the way some educated Ghanaians pronounce English words.

### ***Data Collection Procedure***

The current study was based on observation of the pronunciation of English words by a cross-section of educated Ghanaians over a period of four years. The researcher observed that many English words were pronounced based on their spelling. This phonetic characteristic was due to the influence of the Ghanaian languages on English.

During the four year period of the study the researcher made an inventory of words that were pronounced based on their spelling. The investigator first noted the words that were articulated in a manner that is different from Received Pronunciation. He then did a phonetic transcription of the words based on their actual articulation. In fact, the researcher captured in his note pad only words whose pronunciations were based on their orthography. The words in focus were identified by means of auditory perception. The researcher was able to make a distinction between Received Pronunciation and spelling pronunciation due to his English background. He has his first and second degrees in English and he is currently pursuing his PhD in English at the University of Cape Coast, Ghana.

As a university teacher, the researcher recorded examples of spelling pronunciation from students' conversations and speeches. The researcher also recorded innovative pronunciations that were different from Received Pronunciation at such functions like presentation of manifestoes at the students' halls of residence and during Student Representative Council (SRC) executive elections. As the current investigator interacted with university administrators and colleague lecturers in informal conversations, at formal meetings and other discourse situations, he recorded the nativized versions in the pronunciations of English words. Spelling pronunciations were also recorded from both local and national radio and television networks. Innovative pronunciations different from Received Pronunciation were also recorded from sermons of clergymen presented during church services.

## **DATA ANALYSIS AND DISCUSSION**

This segment of the paper analyses the corpus of the research and discusses the findings of the study. The table below shows the RP versions of the words in focus and also displays the nativized versions for comparative analysis of the data.

Word	Received Pronunciation	Nativised Version
Staunch	/stɔːntʃ/	[stantʃ]
Launch	/lɔːntʃ/	[lantʃ]
Method	/ˈmeθəd/	[metəd]
Govern	/ˈgʌvən/	[gəvən]
Discover	/dɪsˈkʌvə/	[dɪskəvə]
None	/nʌn/	[nən]
Colour	/ˈkʌlə/	[kələ]
Thwart	/θwɔːt/	[θwat]
Other	/ˈʌðə/	[ɔdə]
Quality	/ˈkwɒlətɪ/	[kwalitɪ]
Quantity	/ˈkwɒntətɪ/	/kwantitɪ/
Honest	/ˈɒnɪst/	[honest]
Honey	/ˈhʌni/	[həni]
Alumni	/əˈlʌmnaɪ/	[alumnai]
Young	/jʌŋ/	[jəŋ]
Deposit	/dɪˈpɒzɪt/	[depəsɪt]
Wrong	/rɒŋ/	[rəŋ]
Plumber	/ˈplʌmə/	[pləmbə]
Ladle	/ˈleɪdl/	[ladl]
Worry	/ˈwʌrɪ/	[wəri]
Monday	/ˈmʌndɪ/	[məndəɪ]
Wednesday	/ˈwenzdɪ/	[wenesderɪ]
Adjourn	/əˈdʒɜːn/	[ajən]
Attorney	/əˈtɜːnɪ/	[atənɪ]
Dove	/dʌv/	[dov]
Love	/lʌv/	[ləv]
Glove	/ɡlʌv/	[ɡlov]
Monkey	/ˈmʌŋki /	[mənki]
Oven	/ˈʌvən/	[ovɪn]
Comfort	/ˈkʌmfət/	[kəmfət]
Tongue	/tʌŋ/	[təŋ]
Among	/əˈmʌŋ/	[aməŋ]
Company	/ˈkʌmpəni/	[kəmpenɪ]
Blood	/blʌd/	[bləd]
Flood	/flʌd/	[fləd]
Brother	/ˈbrʌðə/	[brəda]
Mother	/ˈmʌðə/	[məda]
Gesture	/ˈdʒestʃə/	[gestʃə]
Gear	/ɡɪə/	[dʒɪə]
Wander	/ˈwɒndə/	[wanda]
Wonder	/ˈwʌndə/	[wənda]
Enjoy	/ɪnˈdʒɔɪ/	[endʒɔɪ]

Incumbent	/ɪnˈkʌmbənt/	[ɪnˈkʌmbənt]
Trouble	/ˈtrʌbl/	[trɒbl]
Courage	/ˈkʌrɪdʒ/	[kɔreɪdʒ]
Castle	/ˈkɑːsl/	[kɑstɪl]
Won	/wʌn/	[wɒn]
Thorough	/θʌrə/	[tɔrɔ]
Tomb	/tuːm/	[tʊmb]
Onion	/ˈʌnɪən/	[ɒnɪɔn]
Tough	/tʌf/	[tɒf]
Double	/ˈdʌbl/	[dɒbl]
Modest	/ˈmɒdɪst/	[mɔdest]
Country	/ˈkʌntri/	[kaʊntri]
Whistle	/ˈwɪsl/	[wɪstɪl]
Category	/ˈkætəgəri/	[katɪgəri]
Motor	/ˈməʊtə/	[moto]
Principal	/ˈprɪnsəpl/	[prɪnsɪpəl]
Culture	/ˈkʌltʃə/	[kɔltʃə]
Vulture	/ˈvʌltʃə/	[vɔltʃə]
Voucher	/ˈvaʊtʃə/	[vatʃə]
Squad	/skwɒd/	[skwad]
Squat	/skwɒt/	[skwat]
Effort	/ˈefət/	[efɔt]
Oval	/əʊvl/	[oval]
Festival	/festəvl/	[festɪvəl]
Animal	/ænɪml/	[animal]
Approval	/əˈpruːvl/	[apruvəl]
Formal	/ˈfɔːml/	[fɔmal]
Carnival	/ˈkɑːnɪvl/	[kanɪvəl]
Failure	/ˈfeɪljə/	[feɪluə]
Front	/frʌnt/	[frɒnt]

The data above reflect a trend that suggests that spelling pronunciation is dominant among educated Ghanaian users of English. This innovative way of pronouncing English words resulted in the replacement of RP [ɒ] with [a] in EGE, as in the pronunciation of *quality* and *quantity*. From the data RP /ɔ:/ was also realized as [a] in EGE, in words like *staunch* and *launch*. Similarly, in many words in the corpus, the RP /ʌ/ was articulated as [ɔ] in EGE, in the following words: *govern*, *discover*, *none*, *colour*, *other*, *honey*, *young*, *worry*, *Monday*, *love*, *monkey*, *comfort*, *tongue*, *among*, *company*, *blood*, *flood*, *brother*, *mother wonder*, *trouble*, *courage*, *won*, *thorough*, *tough*, *double* and *front*. In standard pronunciation, the *o*, *oo* and *ou* spellings in the words above are articulated as RP /ʌ/ but in Educated Ghanaian English they were articulated as [ɔ]. There were, however, some exceptional cases in the corpus with regard to the realization of RP /ʌ/. In words like *dove*, *glove*, *oven* and *onion*, the graphic symbol *o* is realized as /ʌ/ in standard British English but from the data it was pronounced as [ɔ]. In the current research, mother tongue influence played a significant role in the spelling pronunciations encountered. The letter *u* in words like *plumber*, *alumni* and *incumbent* is pronounced as RP /ʌ/ but it was articulated as [ɔ] and [u] respectively. Again, the graphic symbol *u* in words such as *culture* and *vulture* is realized as RP /ʌ/ but in the present study it was pronounced as [ɔ]. Ngula (2011) describes the phenomenon of spelling pronunciation in the English of educated Ghanaians as innovative feature of pronunciation that is giving Ghanaian English its own character. From the

corpus, the RP /ə/ was realized as [a] in the following words: *discover*, *colour*, *other*, *plumber*, *brother*, *mother*, *wander* and *wonder*.

It is worth noting that the vowel /ə/ is not unknown in the L1. In fact, in some Ghanaian languages /ə/ may be heard for [a] in rapid speech or in weakly stressed syllables (Sey, 1973). The vowels /ə/ and /a/ are not contrastive either in L1 or RP. They are sufficiently alike to be treated as free variants by EGE speakers. Other different realizations of the RP /ə/ in EGE are in the words: *company*, *thorough*, *category*, *motor*, *principal*, *comfort* and *effort*. The RP /ə/ was replaced with the following phones: [e], [ɔ], [ɪ], [o], [i], [ɔ] and [ə] respectively.

With EGE, the spelling of words largely influenced their pronunciation. In the present study, the initial vowel sound in the words *alumni*, *adjourn*, *attorney*, *among* and *approval* was pronounced [a] instead of RP /ə/. The speakers were influenced by the initial letter *a*.

The phenomenon of spelling pronunciation was also manifested in the articulation of the following words: *oval*, *festival*, *animal*, *approval*, *formal* and *carnival*. With RP, the penultimate letter *a* is not pronounced. This confirms the earlier description of the phonology of English made in this paper (the inconsistent relationship between spelling and pronunciation). However, the *a* spelling in the words cited were pronounced as [a] by the EGE speakers. Spelling pronunciation showed itself widely among educated Ghanaian users of English. The difference between RP and EGE pronunciation was established.

There were other English words that were nativised in the present study. The pronunciations of *castle*, *whistle*, *modest*, *honest*, *squad*, *squat*, *wander*, *thwart* and *deposit* were based on their spelling. However, with RP, the spelling is different from the pronunciation. For instance, the standard pronunciation of the *a* spelling in words like *squad*, *squat*, and *wander* is RP /ɒ/ but the nativised version in the corpus is [a]. Similarly, the RP version of words like *castle* and *whistle* is characterized by the deletion of the sound [t] in the pronunciation but the EGE version in the data has the [t] sound in it. Furthermore, the standard pronunciation of the *ar* spelling in *thwart* is RP /ɔ:/ but it was realized as [a] in the data.

From the data, certain diphthongs were articulated as if they were monophthongs. This innovation can be attributed to the phenomenon of spelling pronunciation. The diphthong /eɪ/ in *ladle* was articulated as [a] a monophthong. Similarly, the diphthongs in words like *motor*, *voucher* and *oval* were replaced with pure vowels. The pronunciation of the word *country* was influenced by the word *count*. The fact is that the *ou* spelling in *country* is not a diphthong. It is rather a monophthong /ʌ/ but it was articulated as [aʊ] a diphthong.

Another spelling pronunciation feature noticed in the study is the articulation of the words *young*, *wrong* and *among*. The *ng* spelling at the end of the words is the consonant sound /ŋ/ but it was pronounced as [ng] based on the orthography.

The findings of the current study are in tune with Sey's (1973) assertion that the pronunciation of EGE is distinct from RP. Stevens (1953) also remarks that the English spoken in Ghana is to a large extent unacceptable outside the country. He observed that there has been a deterioration of the standard of pronunciation from the past to the present. He added that if spoken English in

Ghana is not guided in the standard way, it might follow the pattern of spoken English in some parts of India, where the pronunciation is quite unintelligible to non-Indians. However, according to Bamgbose (1998) the phenomenon of spelling pronunciation in EGE satisfies two important criteria non-native varieties of English ought to meet: it maintains international intelligibility and retains local and cultural identities. Ngula (2011) is also of the view that spelling pronunciation has become the normal and most convenient way of pronouncing many English words in EGE. He added that spelling pronunciation is one of the innovative features of pronunciation that are conferring a mark of identity on EGE. Wells (1982) has observed that there are many words that have undergone this process of spelling pronunciation.

## CONCLUSION

The current study has tried to depict the way educated Ghanaians pronounce English words. The standard pronunciation that is expected is RP which is equated with the correct pronunciation of English words. Using evidence obtained from educated Ghanaian speakers of English, the present paper discovered that, in Ghana, the vast majority of English words are pronounced based on their spelling. As a nativized version of RP, spelling pronunciation has become an innovative feature in Educated Ghanaian English. Spelling pronunciation has become the most convenient and comfortable way of pronouncing English words. It is worth noting that some of the indigenous Ghanaian languages exert an influence on the way some educated Ghanaians pronounce certain English words. The present paper views the phenomenon of spelling pronunciation as innovation. The paper suggests that rather than condemning spelling pronunciation outright, it should be guided towards standardization. This is because spelling pronunciation, as an innovative feature of EGE pronunciation, maintains international intelligibility and retains local and cultural identities.

## LIMITATIONS OF THE STUDY

The current study was limited to educated Ghanaian speakers of English (students, teachers and non-academic employees). This approach was to enable the researcher to investigate the extent to which educated Ghanaians are able to articulate words in the standard RP way since the latter is the model taught in schools. The study incorporated students of the University of Cape Coast as they represent a cross-section of educated Ghanaians. The student population is a heterogeneous entity. The students are selected from the different regions of Ghana. Thus, the student population of the corpus represents the entire country. The present study also captured pronunciations of words based on their spelling from the media. This helped the researcher since the pronunciations from the television and the radio are reflections of the phonetic innovations in Ghana.

### ABSTRACT

Rhetoric has been a very interesting phenomenon in the use of daily language, but then it is getting much more attractive linguistically with the employment of metaphor in an impressive way. Metaphorical expression, strictly speaking, has the capacity to decorate and beautify the content of speech in its own way. It brings about such an empowerment to the transfer of message and information. It, then, prominently bridges the smoother flow of rhetorical transference in a speech. With regard to the basic notion of systemic functional grammar, the term lexical metaphor has been part of ideational realization of metaphorical modes of expression. In such a reason, it is quite interesting to further investigate the nature of lexical metaphor from the perspective of systemic functional grammar. The basic instrumental device of the analysis is done through the transitivity analysis. This type of analysis has the potential to reveal the nature rhetorical transference within which the lexical metaphor adhered in a speech, the findings of the research show that there is one of the clause elements in the metaphor functioning as the nucleus of the metaphor. This phenomenon together with the other elements of the clause constitute the nature of the lexical metaphor.

**KEYWORDS:** lexical metaphor, transitivity, rhetorical transference

### INTRODUCTION

Metaphor comes up as one of people's options since it has its own uniqueness in carrying communicative messages more powerfully. Such a choice arises as there is an expectation that such a linguistic creativity can produce particular effect towards the audiences. In such a case, Orthony (in Orthony.ed; 1993:23) highlights that metaphor is basically a manifestation of language creativity to produce a non-standard effect with a not inferable meaning of the standard lexicon. This means that speakers of any languages have a tendency of using a language not in a conventional way as they want to get a more impressive effect of their speech.

In systemic functional grammar, the term 'metaphor' covers a sense of definition on the basis of interstratal relationship between semantics and lexicogrammar. It is simply defined as a realization of meanings through non-typical selections of grammatical features. Or in a more terminological paraphrase, it may be defined as variations of grammatical forms through which a semantic choice is typically realized in the lexicogrammar. In this respect, Thomson (1996:165) proposes a definition of grammatical metaphor as the expression of a different meaning through a lexicons-grammatical form which originally evolved to express a different kind of meaning. In relation to such definition, by which grammatical metaphor is used in rhetorical discourse, Downing and Locke (2006:165) state that grammatical metaphor is a very powerful in the presenting of information to influence the way the information is perceived by the

reconceptualization of an event as a participant, with the consequent restructuring of the rest of the clause.

Further discussing, Halliday (1985:321) makes a distinction between two main types of grammatical metaphor: interpersonal metaphors (or metaphors of mood), and ideational metaphors (or metaphors of transitivity). Mathiesen et.al (2010:111) further clarify the distinction that interpersonal metaphor is basically a resource for enacting a wider range of social roles and relationships in relation to tenor, allowing interactants to calibrate their interpersonal relations with respect to power and contact, while ideational metaphor is a resource for construing a wider range of phenomena in relation to field. The tendency in interpersonal metaphor is to “upgrade” the domain of realization from clause to clause nexus, making the realization more explicit, in a sense; this is used to give an explicitly subjective orientation to speech functions

The latter type, ideational grammatical metaphor, is chosen as the subject of this study regarding some basic features of ideational grammatical metaphor that may correspond to the basic nature of political speeches. In this respect, transitivity system that happens to be the rhetorical choice of metaphorical expression in political speeches is employed as the basis of the analysis. One common interpretation of ideational grammatical metaphor is that it is seen as relating to the way a particular word is used. Lipson (2004:78) further clarifies that ideational grammatical metaphor can be looked at two ways of its creation:

- (a) by using Processes metaphorically (metaphorical wording) and
- (b) by using NG to represent Processes (nominalization),

As Halliday (1994:342) describes the expression “a flood of protests”, the congruent meaning (i.e., the one with less variation in the expression of the meaning) for “They received a flood of protests” would be that “They received a large quantity of protests”. In the same respect, in the following sentences:

- (1) *We walked in the evening along the river to Henley.*
  - (2) *Our evening walk along the river took us to Henley.*
- (taken from Downing 1991: 110-11)

It's quite observable that the two expressions above share the same situation. However, the realization of the process constituents in (1) is congruent in fashion or is closer to the state of affairs in the external world, whereas example (2) shows metaphorical/incongruent mode of expressions by way of nominalization (walked => walk). Halliday (1994: 342) suggests that example (2) is called a grammatical metaphor. This is to say that, examples (1) and (2) share a degree of similarities and at the same time these examples evidence that one is more “basic” than the other. In the same respect, Halliday (1994:342) further argues that both the metaphorical and congruent forms are lexico-grammatical forms arrived at by a pass through the system network: they are independent realizations, but share a certain core of meaning.

As formulated above, this study is aimed at making an analysis of ideational grammatical metaphor which is made under the framework of systemic functional grammar. A great chance to further describe the metaphor is employed to a collection of political speeches delivered by Obama during his presidential election. Obama is considered by the writer as one prominent figure that has the capacity of producing impressive speech by way of using metaphorical expressions in line with its basic features of rhetorical speech in politic.

In this study, in a large part, the basic conceptualizations of grammatical metaphor and transitivity system are taken from Halliday (1985,1994), Halliday and Matthiessen (2004), Thomson (1996). However, there are also some other linguistic theories used to give more conceptual insight to the types of ideational grammatical metaphor which are taken from Lipson (2004), Downing and Locke (2006), Miller (2004), Eggins (2004), Freddi (2004), Morley (2000), Lock (1996), Butt et.al (1995). Some key terms concerning metaphor in general and other related issues are also taken by referring to Mathieson et.al (2010), Brown et.al, Charteris-Black (2004, 2005).

## **METHODS OF RESEARCH**

A number of speeches of Barack Obama during the American presidential campaign of 2010 were studied as he as running his campaigns for one of the world's most powerful positions. Disregarding the reasons why they strove for power, this study looked at how the choice of ideational grammatical metaphor is realized linguistically. The method of analysis is to locate grammatical metaphors where it appeared as linguistic choices which are made to depict ideas and concepts in certain ways. The method of analysis steps from the categories of grammatical metaphor comprising the subtype's ideational grammatical metaphor, metaphorical wording and nominalization. The speeches were analysed separately as well as comparatively.

The methodology used in this study is adapted from Charteris-Black (2004: 34-38) that in metaphor analysis three stages are involved, metaphor identification, metaphor analysis, and metaphor interpretation:

- (i) Selection of process type: material, mental, relational, with their various intermediate and secondary types.
- (ii) Configuration of transitivity functions: Actor, Goal, Senser, Manner etc. representing the process, its participant, and any circumstantial elements;
- (iii) Sequence of group-phrase classes: verbal group, nominal group, adverbial group, prepositional phrase, and their various sub-classes.

In this study, the collection of Barack Obama Speeches are downloaded from [www.barackobamaspeeches.com](http://www.barackobamaspeeches.com) where it compiles a comprehensive collection of Obama's speeches since the preliminary session of the campaign till the inaugural address of his presidential oath, that is in the period 2002 till 2009.

## **RESULT AND DISCUSSION**

This chapter presents an analysis of ideational metaphor on the perspective of functional grammar. Three steps of analysis will be done consecutively. First, the data will be analyzed to describe its transitivity configuration showing its semantic functions and its syntactic realization. Second, the data will be analyzed on the basis of its grammatical transfer showing the relevant

grammatical status towards its transitivity configuration. The last steps of analysis will be a combination of analysis showing congruent and incongruent analysis involving its basic and metaphorical meaning. However, this chapter is divided into two sections, Data Analysis and Discussion of the findings

The analysis of Metaphorical Wording focuses on the various transitivity configuration realized by the lexicogrammar. This will see on how the choice of word in different syntactic function creates metaphorical meaning. Some findings range from its classification on the basis of its process types. In this respect, mental process is realized in material process, or material process realized in mental process. This situation is also applicable for other types of processes as well. It also means that the presentation of the analysis will be categorized from its process type. Some sub-sections of the analysis are under the headings of material process, mental process, relational process, behavioral process, and verbal process. This is then to show that the Metaphorical Wording occurred on the basis of its process type. The stage of the analysis is carried out in three steps, namely, analysis of transitivity configuration, analysis of its grammatical transfer (initiated by congruence analysis), and analysis of its metaphorical meaning. And for the purpose of interpreting the meaning of the metaphors, the writer consults their lexical meaning to the Collins Cobuild Dictionary (CDROM:2006) and also Webster Collegiate Dictionary (CDROM:2003).

### 1. Metaphorical Wording on the basis of Material process

In this unit of analysis, all the Metaphorical Wordings are found to have the properties of material process. The data are found in various semantic classes of syntax (verb group, noun group, verb group) and for the purpose of bringing about a more comprehensible semantic analysis; the data are presented in the structure of a clause or clause complex.

*(1)Homes have been lost; jobs shed; businesses shuttered. Our health care is too costly; our schools fail too many; and each day brings further evidence that the ways we use energy strengthen our adversaries and threaten our planet (OB1-1)*

The sentence above comprises three metaphors with almost similar transitivity configuration:

a.	<i>Job</i>	<i>Shed</i>	
	<i>Business</i>	<i>Shuttered</i>	
	<i>Each day</i>	<i>Brings</i>	<i>Further evidence</i>
	Participant : Actor	Process : material	Participant: Goal

In terms of their transitivity configurations, the sentences above have one participant by which it carries a 'doing' meaning. In this case, the verb 'shed', 'shuttered', and 'brings' designates a

material process expressing an ‘action’ meaning. Those verbs designate a noun group semantically function as the actor of their action-meaning exemplified by the participants.

However, the process they represent depict different pattern from the perspective of their transitivity configuration. There is an incongruent realization of the process and their participants. The actor doesn’t fit to the logical function of the ‘doing’ thing in the process as ‘*job*’ cannot *set apart* or *fall into* something physically. In the following congruence analysis, there is an evidence that the speaker undergo a lexical choice that tend to be metaphorical, as in:

<i>Job</i>	<i>Shed</i>
Actor	Process
<i>Job</i> (‘s number)	<i>fell/decreased</i>
Actor	Process

From the congruence analysis above, there is no grammatical transfer since the incongruent and its congruent forms of expression are from the same type of transitivity configuration, which is all in the form of material process (*shed* → *decreases*). However, it is also quite clear that speaker intends to employ the word ‘*shed*’ metaphorically to make an analogy of job availability with something like a ‘*leaf*’ that can ‘*set apart*’ or ‘*fall*’ from ‘*its tree*’. As it may also mean that the job has somewhat getting more difficult to be obtained since there is not linear supply of job’s number for the outgrowing population of jobseekers.

<i>b.</i>	<i>Business</i>	<i>Shuttered</i>
	Participant: Actor	Process: Material

The transitivity configuration of the sentence above has one participant and one process. In this case, the verb ‘*shuttered*’ designates a material process, since it carries a ‘doing’ meaning (‘*to shutter*’ means ‘*to close by*; Meriam Webster dictionary’). While ‘*shuttered*’ designates a noun group semantically function as the actor of the action ‘*shuttered*’. This transitivity configuration shows that the actor doesn’t fit to the logical function of the ‘doing’ meaning in its process as the actor ‘*business*’ is not animate being or human like figure that can *close* by itself. In the following congruence analysis, there is evidence that the speaker employs a lexical choice that tends to be metaphorical, as in:

<i>Business</i>	<i>Shuttered</i>
<i>Participant : Actor</i>	Process : material
<i>Business</i>	<i>Shut down</i>
<i>Actor</i>	Process

From the congruence analysis above, it is quite clear that speaker intends to employ the word ‘*shuttered*’ metaphorically to show that the business has stopped because of particular reason. However, the metaphorical wording in 1a, 1b, 1c, occurred in the position of process.

## 2). *Our campaign was not hatched in the halls of Washington*

<i>Our campaign</i>	<i>was not hatched</i>	<i>in the halls of Washington</i>
Participant: Actor	Process : Material	Circumstance: place

The transitivity configuration of the sentence above depicts a material process. The verb '*hatched*' indicate a material activity by which the Actor '*our campaign*' expresses doing meaning. The transitivity configuration employs one participant, one circumstance and one process as the sample of the clause nexus.

Further discussing, there is an incongruent expression of the use of the process by which the Actor '*our campaign*' doesn't have the capacity of a thing that can '*hatch*'. In this case, it is very clear that the sentence can be said to be metaphorical since the process '*hatch*' is incongruently used by the participant '*our campaign*'. Consider the following congruence analysis:

<i>Our campaign</i>	<i>was not hatched</i>	<i>in the halls of Washington</i>
Participant: Actor	Process : Material	Circumstance: place
<i>Our campaign</i>	<i>originated</i>	<i>In the halls of Washington</i>
Participant : Actor	Process: Material	Circumstance

In such a case, there is a personification sample where the verb '*hatch*' is incongruently used to represent the idea of '*our campaign*' that basically comes from the people working in the halls of Washington.

### 3) *She's stealing my thunder*

<i>She</i>	<i>'s stealing</i>	<i>my thunder</i>
Participant: Actor	Process : material	Goal

The transitivity configuration of the sentence above depicts a material process. The verb '*is stealing*' indicate a material activity by which the Actor '*she*' expresses doing meaning. The transitivity configuration employs one participant, one Goal and one process as the root of the clause nexus.

Further discussing, there is an incongruent expression of the use of the participant by which the Actor '*she*' intend to do something (*stealing*) that is literally in appropriate and impossible to be done since '*my thunder*' is *almost invincible and untouchable*'. Then, the sentence can be said to be metaphorical since the process '*is stealing*' is incongruently used by the actor '*she*'. Consider the following congruence analysis:

<i>She</i>	<i>'s stealing</i>	<i>my thunder</i>
Participant: Actor	Process : material	Goal
<i>She</i>	<i>'s stealing</i>	<i>my precious thing</i>
Participant: Actor	Process : material	Goal

From the above congruent analysis, there is evidence, that the nucleus of the metaphor occurred in the participant (Goal) '*my thunder*' as an attempt to empower the Goal of the action metaphorically.

### 4) *Virginia, your voice can change the world tomorrow*

<i>Virginia, your voice</i>	<i>can change</i>	<i>the world</i>	<i>Tomorrow</i>
Participant: Actor	Process : material	Goal	Circumstance

The transitivity configuration of the sentence above depicts a material process. The verb ‘*change*’ indicate a material activity by which the Actor ‘*Virginia*’ expresses a doing meaning. The transitivity configuration employs one participant (Actor), one circumstance (time) and one process (Material).

Further discussing, there is an incongruent expression of the use of the participant by which the Actor ‘*Virginia*’ doesn’t have the capacity of a *human like* thing that can change ‘*something*’ or anything. The sentence can be said to be metaphorical since the process ‘*change*’ is incongruently used by the participant ‘*Virginia*’. Consider the following congruence analysis:

<i>Virginia, your voice</i>	<i>can change</i>	<i>the world</i>	<i>Tomorrow</i>
Participant: Actor	Process : material	Goal	Circumstance
<i>Your power</i>	<i>can change</i>	<i>the world</i>	<i>Tomorrow</i>
Participant: Actor	Process : material	Goal	Circumstance

As it is illustrated above, there is no grammatical shift in its syntactic categories and functions. The same semantic functions are shared both in its congruent or incongruent form. It also means that the choice of non-literal meaning is not because of grammatical shift or grammatical transfer among the participants and processes.

#### 5) *Change comes to Washington*

<i>Change</i>	<i>comes</i>	<i>to Washington</i>
Participant: Actor	Process : material	Circumstance

The transitivity configuration of the sentence above depicts a material process. The verb ‘*comes*’ indicate a material activity by which the Actor ‘*change*’ expresses doing meaning. The transitivity configuration employs one participant, one circumstance and one process.

Further discussing, there is an incongruent expression of the use of the process by which the Actor ‘*change*’ doesn’t have the capacity of a *human like* thing that can ‘*come*’ or make a moving like a living creature. The sentence can be said to be metaphorical since the process ‘*comes*’ is incongruently used by the participant ‘*our campaign*’. Consider the following congruence analysis:

<i>Change</i>	<i>comes</i>	<i>to Washington</i>
Participant: Actor	Process : material	Circumstance
<i>Change</i>	<i>Happens</i>	<i>to Washington</i>
Participant: Actor	Process : material	Circumstance

The above analysis has shown that the metaphorical nucleus occurs to the process ‘comes’ with its possible literal counterpart ‘happens’. This means that the Process with its lexical choice ‘comes’ has made the expression becomes wording-ly metaphorical.

6. *What North Carolina decided is that the only game that needs changing is the one in Washington, DC*

<i>what North Carolina decided</i>	<i>Is</i>	<i>that the only game that needs changing is the one in Washington, DC</i>
Participant: Identified	Process : relational	Participant: Identifier

Basically the transitivity configuration of the sentence above depicts a relational process. The verb ‘is’ indicate a relational status between the two participants ‘*what North Carolina decided*’ (identified) and ‘*that the only game that needs changing is the one in Washington, DC*’ (identifier) by which the participants are semantically connected with the ‘is’. However, to go into detail, more precise transitivity analysis is applied in the more detail description below:

What North Carolina	Decided
Participant: Senser	Process: Mental

Simply speaking, the clause above illustrate a personified character in the Participant ‘North California’. this has made the expression metaphorical in particular way. This phenomenon is strongly indicated by the illogical semantic relationship between the Senser ‘*North California*’ and the Process ‘*decided*’. A mental process of ‘*deciding something*’ must be done, by nature, by a human being. This character has successfully metaphorized the above clause to be metaphorical.

7) *Washington didn't give us much of a chance*

<i>Washington</i>	<i>didn't give</i>	<i>Us</i>	<i>much of a chance</i>
Participant: Actor	Process : material	Participant: Recipient	Participant: Beneficiary

The transitivity configuration of the sentence above depicts a material process. The verb ‘give’ indicate a material activity by which the Actor ‘*Washington*’ expresses doing meaning. The transitivity configuration employs three participants (Actor, Recipient, and Beneficiary), and one process as the nucleus of the clause.

Further discussing, there is an incongruent expression of the use of the process by which the Actor ‘*Washington*’ doesn’t have the capacity of a *human or human like* thing that can ‘give’. the sentence can be said to be metaphorical since the Actor ‘*Washington*’ is incongruently used with the process of ‘*giving*’. Consider the following congruence analysis:

<i>Washington</i>	<i>didn't give</i>	<i>Us</i>	<i>much of a chance</i>
Participant: Actor	Process : material	Participant: Recipient	Participant: Beneficiary
<i>(People in Washington)</i>	<i>didn't give</i>	<i>Us</i>	<i>much of a chance</i>
Participant: Actor	Process : material	Participant: Recipient	Participant: Beneficiary

The above analysis has shown that the Actor 'Washington' is the nucleus of the metaphor in that clause. The actor which is not human being has been personified like human figure that can give something.

## 2. Metaphorical Wording on the basis of Mental process

All data presented in this section of analysis are all categorized into mental process. The properties of being 'a mental process' clauses are determined mainly by the use of the verbs. In relation to the metaphorical use of the process, the clause is analyzed based on its transitivity configuration and then it's further analyzed to see the possible grammatical transfer within the process. The congruence analysis is conducted consecutively to figure out the possible meaning of the grammatical metaphor.

### 8) *The schools suffer*

<i>The schools</i>	<i>Suffer</i>
Participant: Actor	Process : mental

The sentence above has one participant and is in the form of mental process. Since it employs the verb 'suffer' which has a sense of affection, the sentence designates a mental process. The Actor 'school' which is inanimate and is not human like does not semantically correspond to the verb 'suffer'. Consider the following congruence analysis.

<i>The schools</i>	<i>Suffer</i>
Participant: Actor	Process : mental
<i>The schools</i>	<i>Undergo a bad situation</i>
Participant: Actor	Process: Material

The mode of its metaphorical expression is clearly understood by the use the verb 'suffer' to indicate the school condition that is not in well condition. The writer intends to make extra effect to the message by creating an analogy as if the 'school' is an animate being or human-like thing that can perceive a sense of feeling like 'suffer'. It is also quite clear that there is a grammatical transfer from material to mental process by which the expression is being metaphorical.

### 9) *In numbers (that) this nation has never seen*

<i>In numbers</i>	<i>this nation</i>	<i>has never seen</i>
Circumstance	Participant: Senser	Process : mental

Basically the transitivity configuration of the sentence above depicts a mental process. The verb 'seen' indicate a mental activity by which the Senser 'this nation' has perceived something.

However, there is an incongruent expression of the use of the process by which the Senser '*this nation*' doesn't have the capacity of *human-like* thing that can '*see*' or perceive something physically. In this case, the sentence can be said to be metaphorical since the participant '*this nation*' is incongruently used with the process '*seen*'. Consider the following congruence analysis:

<i>In numbers</i>	<i>this nation</i>	<i>has never seen</i>
Circumstance	Participant: Senser	Process : mental
<i>In numbers</i>	<i>(people of ) this nation</i>	<i>has never seen</i>
Circumstance	Participant: Senser	Process : mental

Based on the above analysis, it is quite clear the metaphorical nucleus of the clause. The Senser '*this nation*' has been made personified by referring it to the people of the nation. It also means that the changing character has made contribution to the meaning to be more metaphorical.

### 3. Metaphorical Wording on the basis of Relational process

This section of analysis compiles some relevant data to the use of metaphorical mode of Relational Process lexically by which the process is incongruently used. The same procedure of analysis has been previously done in the earlier sections. Hence, figuring out transitivity configuration of the metaphor is the first step before the analysis of the grammatical transfer within the clause. The last activity will be the interpretation of the metaphorical meaning based on its transitivity configuration.

10) *It Is the answer told by lines that stretched around schools and churches in numbers this nation has never seen*

<i>It</i>	<i>Is</i>	<i>the answer</i>
Participant : Identified	Process: Relational	Participant : Identifier

Basically the transitivity configuration of the sentence above depicts a relational process. The verb '*is*' indicate a relational status by which the participants is linked semantically.

### 4. Metaphorical Wording on the basis of verbal process

In this unit of analysis, all the Metaphorical Wordings are found to have the properties of material process. The data are found in various semantic classes of syntax (verb group, noun group, verb group) and for the purpose of bringing about a more comprehensible semantic analysis; the data are presented in the structure of a clause or clause complex. Verbal process identification is indicated by the use of the verb group in the process.

11) *(the answer/that is) told by the lines*

<i>(the answer/that)</i>	<i>is told</i>	<i>by the lines</i>
Verbiage	Process : verbal	Sayer

Basically the transitivity configuration of the sentence above depicts a verbal process. The verb ‘told’ indicate a verbal activity by which the Sayer ‘*the lines*’ expresses an utterance with ‘*the answer*’ as its verbiage.

However, there is an incongruent expression of the use of the process by which the Sayer ‘*the lines*’ doesn’t have the capacity of *human-like* thing that can ‘tell’ or produce oral communication ability. In this case, it is very clear that the sentence can be said to be metaphorical since the process ‘told’ is incongruently used by the participant ‘*lines*’. Consider the following congruence analysis:

<i>(the answer/that)</i>	<i>is told</i>	<i>by the lines</i>
Participant: Verbiage	Process : verbal	Participant : Sayer
<i>The lines</i>	<i>Contains</i>	<i>Some information (the answer)</i>
Participant : token	Process: Relational	Participant: value

Based on the congruent analysis above, it is quite clear that the Participant ‘*the lines*’ is instrumented to be more personified and carries metaphorical meaning by the process ‘told’. However, there is no grammatical shift among the clause elements.

12) *We pledge to work alongside you - to make your farms flourish and let clean waters flow; to nourish starved bodies and- (to) feed hungry minds*

<i>We</i>	<i>pledge to work</i>	<i>alongside you</i>	<i>(to) feed</i>	<i>hungry minds</i>
Participant: Actor	Process : material	Circumstance : Place	Process: material Process	Participant : Goal

Basically the transitivity configuration of the sentence above depicts a material process. The verb ‘pledge to work’ and ‘feed hungry mind’ indicate an external world activity by which the Actor ‘we’ makes up an event or a ‘happening’ of ‘work’ and also an action or a ‘doing’ activity of ‘feed’ with ‘*the hungry mind*’ as its Goal.

However, there is an incongruent expression of the process by which the Actor ‘we’ incongruently employs the verb ‘feed’ with the personified Goal of ‘mind’ which shows human-like capacity of feeling hungry. In this case, it is very clear that the sentence can be said to be metaphorical since the process ‘feed’ is incongruently used by the participant ‘we’ and ‘*hungry minds*’. Consider the following congruence analysis:

<i>We</i>	<i>pledge to work</i>	<i>alongside you</i>	<i>(to) feed</i>	<i>hungry minds</i>
Participant: Actor	Process : material	Circumstance : Place	Process: material Process	Participant : Goal
<i>We</i>	<i>pledge to work</i>	<i>alongside you</i>	<i>give support (to)</i>	<i>hungry minds</i>
Participant: Actor	Process : material	Circumstance : Place	Process: material Process	Participant : Goal

Based on the above analysis, it is clear that nucleus of the metaphor is applied to the Process ‘feed’ that does not literally correspond to the potential meaning of the Goal ‘*hungry minds*’. Literally the verb ‘feed’ means to give someone or something food to eat. This of course does not

match with Goal, 'hungry minds' that has the character of something inanimate that cannot eat anything.

## CONCLUSION AND SUGGESTION

The formation of transitivity configuration that features the metaphor nucleus and its syntactic realization. The discussion of metaphor nucleus is very essential to determine the pattern of metaphor. The transitivity analysis is instrumented to reveal such phenomenon. However, the configuration of the transitivity metaphor would be like the following:

### *She's stealing the thunder (MW3\_mp)*

It is quite possible that the nucleus of the metaphor can be either the participant (she: Actor, and my thunder: goal), process, or even the circumstance. In this instance, the participant 'she' is doing something rather impossible, 'steal the thunder'. An action that never be accomplished by any ordinary human being. Hence, from this point of view, there is a logical semantic relation between the whole elements of the clause that show this incongruent relation. Thunder must be the central of the in congruency in meaning that has the potential to make the clause metaphorical. The second way of figuring out the transitivity configuration is by applying congruence analysis, as in:

<i>She</i>	<i>'s stealing</i>	<i>my thunder</i>
Participant: Actor	Process : material	Goal
<i>She</i>	<i>'s stealing</i>	<i>my precious thing</i>
Participant: Actor	Process : material	Goal

Based on the above analysis, the syntactic and semantic position of 'my thunder' can be replaced by 'my precious thing' with almost equal meaning. This is to show that it is almost impossible to replace the process with any similar verbs included in material process. Hence, there two important phenomenon to be considered:

1. The transitivity configuration of ideational metaphor cover almost all types of processes, including material, mental, relational, and behavioural process. In this research, the most types existed in the speeches are material process with little occurrence of the other types. However, the grammatical transfer found in the data of the research shows that there are four types of nominalization are process as entity, attribute as entity, and circumstance as entity.
2. The discussion of metaphor nucleus is very essential to determine the pattern of metaphor. The transitivity analysis is instrumented to reveal such phenomenon. The nucleus of the metaphor can be either the participant, process, or even the circumstance

Since the study focuses on the nature of ideational metaphor in political speech, it is quite possible to further study in the other fields of discourse like business, economics, and the likes. In rhetorical speech, grammatical metaphor play an important role in shaping the message and information of the speech. However, since this study focuses on the ideational metaphor, there is a great change and challenge to further investigate the nature of the other types of grammatical

metaphor (interpersonal grammatical metaphor) under the objective of finding out its prominent linguistic features.

### ABSTRACT

This study investigates the advantages of applying Cognitive Linguistics to the instruction of conceptual meaning of phrasal verbs in an Iranian EFL context. Sixty intermediate learners were randomly assigned to two equal control and experimental groups. Thirty two phrasal verbs with the particles *up*, *down*, *in* and *out* were instructed to experimental groups using the insights gleaned from Cognitive Linguistics framework. The control group received the same phrasal verbs in terms of dictionary definitions and single verb equivalents. Results of t-test analysis of pre/posttest scores for both groups confirmed the superiority of the Cognitive Linguistics based approach and revealed a strategy transfer to unrehearsed phrasal verbs as well. The findings imply the potential usefulness of applying Cognitive Linguistics to teaching phrasal verbs.

**KEYWORDS:** Phrasal verbs, Cognitive Linguistics, particles, conceptualization, spatial scene, vantage point, strategy transfer.

### INTRODUCTION

A quick glance at television programs, movies, interviews, pop music, internet exchanges and many other conversational settings reveals that phrasal verbs (hereafter PVs) are abundant in today's colloquial English. Although there is usually a single verb equivalent, native speakers opt for the PV alternative. This dominance of PVs in everyday language of English speakers has made them a crucially important part of English lexicon for EFL learners. Even mastery of PVs is assumed to be a true evidence of language proficiency (Cornell, 1985). However, PVs have a reputation of being tough and troublesome for EFL learners; witness the publication of numerous self-study textbooks (e.g., Gairns & Redman, 2011; Hart, 2009; McCarthy & O'Dell, 2007; Rudzka-Ostyn, 2003) and PV-specific dictionaries (e.g., McIntoch, 2006; Rundell, 2005).

One reason that makes learning PVs a daunting task is that there are innumerable PVs in English and EFL learners are intimidated and confounded by this diversity (Bolinger, 1971; Side, 1990). Yet, that is a secondary source of problem compared to the issue of idiomacity (i.e., unpredictability of meaning of the construction from its components) For example, in '*I'm just worn out!*' *wear* does not refer to wearing clothes in literal sense of the verb and nobody is going *out*; rather, *wear out* is an idiomatic PV which means 'to exhaust or tire'. The problems are reinforced by the way through which PVs have been traditionally presented in course books or taught by teachers (Side, 1990; Tyler & Evans, 2004). In the traditional approach PVs are given in

long lists of learn-by-heart vocabulary and memorization is suggested as the only strategy; thereby, it has been implied that PVs are unsystematic, arbitrary, and random.

The thriving field of Cognitive Linguistics (hereafter CL) challenges the assumed arbitrariness of PVs in traditional view and argues that lexicon, at least in the case of particles, is systematically motivated, or simply put; principled and rule-governed (Evans & Tyler, 2004, 2005). A CL-based approach, thus, gives the leading semantic role of the PV to the particle component and provides a promising approach to the pedagogy of PVs based on cognitive meaningful learning. According to the *embodiment principle* of CL, cognition is the conceptual representation of bodily experience in spatio-physical environment (Lakoff & Johnson, 1980, 1999). From early infancy sensory perceptions are recorded in human mind in the form of reactivations of brain (Mandler, 2004). These reactivations are technically referred to as *image-schemas* (Johnson, 1987), *simulations* (Barsalou, 1999), and *redescriptions* (Evans, 2010). CL argues that such conceptual representations of motion, space and physical relations shape and motivate the foundation of cognition and thought. In the English language, such representations are linguistically encoded in particles; hence, CL-based analysis of underlying mechanisms that stimulate such conceptualizations provides a significant way of understanding the complex behavior of particles in general and PVs in particular.

For example, regarding the particles *up* and *down*, the fact that humans have their head at the top and legs at the bottom of their bodies gives rise to top-down interpretations of entities with no real physical body. This enables English speakers to talk about 'Manchester United *climbing up* the Premier league table'. Furthermore, given that the upright posture of the body entails health and good psychological conditions and a crouched and stooped body posture implies the opposite, *up* and *down* connote positive-negative values. Thus, without even knowing the meaning of the PVs '*run down*' or '*cut down*', one can predict they convey a negative sense.

Another conceptual representation of physical experience is the notion of *containment* which is linguistically encoded by the particle *in*. Human body is bounded with its skin and all of the concrete objects the infant observes and manipulates have limited bounded shapes. Such observation gives rise to a mental representation of bounded entities in terms of containment (Lakoff & Johnson, 1980, 1999). Containment at first is a simple spatial relation for a child and reflects in expressions such as: *The toy in the box*. Gradually however, the notion of containment evolves into numerous complex abstract concepts. For example, drawing on the containment schema, a child develops the ability to make sense of sentences such as: *He is in trouble/ love/ debt*. Hence, the particle *in* entails being inside or entering a container-like entity ranging from observable things such as cars, buildings, gardens, countries to invisible abstract entities such as activities, movements, situations, relations and so forth. In the same vein, the particle *out* is conceptualized as the notion of non-containment or exteriority; analogously, many of the senses associated with *out* involve opposing inferences from those arising with *in*.

In 1980, Lakoff and Johnson proposed *the conceptual metaphor theory* suggesting that human cognition is metaphoric in nature. Later on, Johnson (1987) introduced *image-schemas* as the building block of metaphors. Many CL researchers found these insights relevant to the study of PVs and set out to investigate whether presenting the underlying image-schemas and metaphors of particles to English learners has positive effects on pedagogy of PVs (e.g., Boers, 2000;

Condon, 2008; Condon & Kelly, 2002; Dirven, 1993; Kövecses & Szabó, 1996; Kurtyka, 2001 to name but a few).

On the whole, these studies confirmed the usefulness of making the students aware of underlying image-schematic motivation of particles in PVs; however, they also revealed some areas of weakness and doubt. For example, Boers (2000) observed that “Knowledge of the conventional metaphoric themes of a given language does not guarantee mastery of its conventional linguistic instantiations” (p. 569). The most remarkable shortcoming of previous accounts of systemacity of PVs was brought to light by Condon (2008). She admitted that in her study and other existing studies by that time “a vital piece of information is missing, namely, the location of the ‘viewer’” (p.152; emphasis in original). She noted that many confounding behaviors of particles; especially the fact that contrasting pairs such as *up/down* or *in/out* appear to be synonyms in some PVs, could only be explained by taking the viewer’s vantage point into account.

The above-mentioned issue is addressed by the recent developments of CL and mostly by the work of Leonard Talmy (2000) and Vyvyan Evans and Andrea Tyler (Evans & Tyler, 2004, 2005; Tyler & Evans, 2003, 2004).

According to the findings of Gestalt psychology, human’s species-specific perceptual mechanisms change, structure, and add further complexity and details to the raw input received from sensory experience. One of the ways in which perceptual apparatus constrains and structures human’s experience of space is *figure-ground segregation* (Evans & Green, 2006). Human perception tends to automatically segregate any given scene into figure-ground organization (*figure* is highlighted or focused element of the scene, and *ground* is the background or reference object). Talmy (2000) tailored the figure-ground segregation to language suggesting that the representation of space in language encodes *spatial scenes*. Any given language provides a means of viewing the same state, situation, or event from the range of perspectives that are conventionally available to the language user. In other words, a language provides the language user with resources for viewing the same scene in multiple, and hence alternative ways or in CL-specific terms, *construals*. Shifts in construal give rise to new interpretations of the scene.

Native speakers of a language are subconsciously aware of the conceptual and construal bases of spatial scenes; however, non-native language learners who are accustomed to see the relations and events in physical world through the lens of their mother tongue are clueless about that fundamental knowledge. This leads to a *cross-linguistic mismatch*: the particles do not match up well between languages; therefore, language learners have to cope with anomalies (Celce-Murcia & Larsen-Freeman, 1999). The critical issue of cross-linguistic mismatch is addressed by Evans and Tyler (2005) who submit: “rather than viewing particles from different languages as presenting different *meanings*, it is more insightful to take the view that different languages emphasize different aspects of the same (or similar) scene” (p.14).

In sum, these grounds lead to the logical assumption that giving instructions to and making EFL learners aware of the underlying principles of particles would help them learn PVs more efficiently. The present study takes this hypothesis as its point of departure and building on Evans and Tyler’s insights, examines whether presenting the conceptual bases of the particles *up*, *down*, *in* and *out* enhances a host of Iranian students’ learning of PVs. It also aims to find out if such an approach would help them develop an ability to transfer and apply their acquired knowledge to unfamiliar novel PVs.

## RESEARCH QUESTIONS

To put the above-discussed hypothesis into practice, the following research questions were formulated:

- (i) To what extent does a CL-based approach to teaching phrasal verbs by presenting underlying motivations of particles yield different results from a traditional approach such as the use of dictionary definitions/ examples/ simple statements of meanings?
- (ii) To what extent do CL-instructed students and the students who received their treatment by dictionary definition and single verb equivalents differ in developing a transfer strategy to unrehearsed novel phrasal verbs?

## METHODOLOGY

### *Participants*

The participants who took part in this study were 60 young female students (aged 17-23) of a private language school in Isfahan, Iran. They all shared Persian as their mother tongue. The participants were selected from among a large population of students who had enrolled in summer program of the private language. Upon enrollment, each student was asked to take part in a placement test (OPT, 2010). Based on the results of this test, a number of students were ranked as intermediate and 60 of these students were randomly selected as the participants of the study. The study was conducted during the summer English courses of the institute and before starting the course participants were informed that they were going to receive instruction concerning a number of PVs incorporated into their regular program.

### *Materials*

The data collection procedure of the study was performed through a pretest-posttest assessment. At the beginning of the course, the participants were asked to take a written pretest. Before administering the pretest, participants were briefed about PVs; highlighting that PVs consist of a verb plus a smaller word (such as up, down, in, and out) and giving examples they had already been practically familiar with, such as get up, stand up, sit down, come in, and go out. The participants were assured that their scores on the experimental tests would have no negative effect on their end-of-term results, and then the test was distributed. The pretest was later used as the posttest at the end of the experiment. The test was designed to address the two posed research questions of the study; thus it was split up into two parts. The first part examined the taught 32 target PVs with particles *up*, *down*, *in*, and *out*. The second part took focus on 12 novel unrehearsed PVs with the same four particles.

The first part of the test had a force-choice, fill-in-the-blank format. It consisted of cloze passages in the form of short dialogs or paragraphs, each of which was missing several PVs. For each cloze passage, the participants were asked to select the most appropriate PV from a given word bank. The second part of the test consisted of 12 paraphrase items; which required replacing the italicized parts of the sentence with one of the given PVs in a word bank. The participants were

told not to worry about tenses, and that they could, if they had difficulties with tense changes, insert the PVs in the infinitive form for both parts of the test.

The criteria for choosing the target PVs of the study were two-fold: firstly, they were chosen from classifications of most frequent and useful PVs for pedagogical purposes provided by Gardner and Davies (2007). Secondly, only PVs with idiomatic meanings were selected and literal ones were excluded. The reason was that literal PVs are rather catchy and simple for EFL students but idiomatic PVs are proven to be extremely problematic for EFL learners (Celce-Murcia & Larsen-Freeman, 1999; Rudzka-Ostyn, 2003).

Regarding the scoring procedure, a correct answer on each test item would count as *one score* and an incorrect/no response would otherwise count as *zero*. Therefore, a total of 32 and 12 would be a complete score a participant could gain on part one and part two of the test respectively.

It is worth pointing out that in order to ensure the reliability of pre/posttest, the Cronbach's alpha coefficient was computed using SPSS (version 20.0). The obtained alpha score for pre/posttest was high ( $\alpha > .92$ ) which indicated that the testing instrument of the study had high internal consistency and was adequately reliable.

### ***Procedure***

Using tables of random numbers, the 60 intermediate participants of the study were divided into two equal control and experimental groups. The experimental groups received their instruction of 32 target PVs through the model proposed by Tyler and Evans (2003) within the CL framework. The control group received the same PVs following a traditional approach, with no cognitive motivation and only relying on dictionary definitions and synonyms of PVs and using them in some example sentences.

The instruction of PVs was integrated into an extended general EFL program lasting over 1.5 summer months in 3 one-and-a-half-hour sessions per week (a total of 24 sessions). Owing to the bulk of content students had to cover in their program, a limited amount of time (ten minutes per session for both groups) was devoted to the instructional treatment. The course lasted for 8 weeks; each particle was allotted two weeks of instruction. Due to an odd/even schedule, both groups attended the same class at the same hour of the day and were instructed by the same teacher.

The teacher-fronted instruction for experimental group began by giving a brief explanation of particles having a related network of meanings and the notion that the central meaning for each particle designates a spatial relation between a *figure* and a *ground* element. However, to avoid the risk of overwhelming the students with technical terminologies, the dominant employed terms were (F) element or the focus of attention, and (G) or the background. The students were instructed that our understanding of space and the phenomena in our surrounding environment is organized by our brain. The brain does not perceive the world in a flat array; rather, it organizes our perception in terms of (F) and (G) elements. In an imaginary scene, (F) tends to be the smaller, more moveable element which is the focus of attention; the (G) is the larger, less moveable, locating element. The instruction was accompanied with schematic drawings (e.g., stick figures, cubes, arrows, dots, etc.) that the teacher draw on the board to illuminate the spatial scene related to each particle.

Gradually and over the 8 weeks of the experiment, the primary meaning of each particle as well as the additional senses it holds were presented to students emphasizing the roots of these meanings in everyday activities and bodily characteristics. These guidelines were adapted from Tyler and Evans' (2003) book. A noteworthy point is that Tyler and Evans model concentrates on prepositions and not PVs; therefore, some of the senses of *in/out* that only relate to their prepositional function were excluded. Table1 and Table2 summarize the basic and additional meanings of each particle accompanied with some instances of PVs.

Table1: Motivations for *up* and *down* based on Tyler and Evans' (2003) model

Particle	Basic Meaning	Additional Senses	Example
UP	Moving upwards toward the top	More	These exercises are good for <i>building up</i> leg strength.
		Better	They decided to get <i>dressed up</i> and go to a nice pub.
		Complete	The mayor has a plan for <i>cleaning up</i> waste sites.
Down	Moving downwards toward the bottom	Less	Don't offer me cigarettes; I'm trying to <i>cut down</i> .
		inferior	He is so modest; he always <i>talks</i> his success <i>down</i> .
		Complete	Pleas <i>wipe down</i> the stove after cooking!

Table 2: Motivations for *In* and *Out* based on Tyler and Evans'(2003) model

Particle	Basic Meaning	Vantage Point	Additional Meanings	Example
IN	Inside container (containment)	a inside	Enter	He <i>put</i> a lot of time <i>in</i> his research.
			Kept inside (blockage)	Never <i>hold in</i> your bed feelings.
		outside	Disappear	He finally <i>gave in</i> and admitted that his wife was right.
OUT	Outside container (exteriority)	a inside	Leave	After a three-day rest, the travellers <i>set out</i> again.
			No More	Their money <i>ran out</i> quickly.
			Complete	The research was <i>carried out</i> by students.
		outside	Prevent (exclusion) visible	Yuga will help you <i>block out</i> pain and stress.
			Known	His unique personality makes him <i>stand out</i> from the crowd.
				The birthday party <i>turned out</i> to be a disaster.

For *in* and *out*, the students were familiarized with the notion of *vantage point* and how a shift of interior/exterior vantage point gives rise to different interpretations. The students were highly recommended not to memorize the instructions but to conjure up the spatial scene relevant to each particle and try to infer the meaning from contextual clues. Another instructed point was the cases where contrasting pairs of *up/down* and *in/out* appear to be synonyms (See Appendix A for details).

As for the control group, the 32 target PVs of the study were taught under the same time schedule but through a traditional approach. The teacher wrote a target PV on the board and asked students to look it up in the dictionary. Single verb equivalent of the PV was also introduced, if any existed. Finally, the students were asked to memorize the PV and learn it by heart.

## RESULTS

The collected data from the pretest/posttest assessment were fed to SPSS (version 20.0) and were statistically analyzed by comparison of mean scores and their corresponding *p*-values through T-Test analysis.

### *Investigating the first research question*

In order to investigate whether the two instructional procedures yielded different results independent samples T-Test was performed. As Table 3 depicts, the groups' performances on pretest (part1) show a Sig. (2-tailed) value of 0.394. Put statistically, there is no meaningful difference between the groups at the beginning of the experiment. ( $p > .5$ ) However, at the end of the experiment, the groups' performances on the posttest (part1) display a statistically significant difference ( $p < .005$ ). This indicates the better learning gain of experimental students in comparison with their control peers. Figure 1 portrays the outperformance of experimental groups on posttest in terms of mean scores.

Table 3: Independent samples T-Test for equality of means (pre/posttest-part1)

	t	df	Sig. (2-tailed)
Pretest	.859	58	.394
Posttest	-13.699	58	.000

Figure 1: Graphic representation of the means (posttest-part1)

### ***Investigating the second research question***

In order to investigate whether the participants could transfer their acquired knowledge to novel PVs the scores of pretest/posttest (part2) were compared in terms of equality of means through independent samples T-Test. As illustrated in Table4, the control and experimental participants performed relatively equal on pretest ( $p > .5$ ) but after the treatment participant group significantly outperformed the control group on the posttest. ( $p < .005$ ) This superiority in strategy transfer is also evident in Figure2.

Table 4: Independent samples T-Test for equality of means (pre/posttest-part2)

	t	df	Sig. (2-tailed)
Pretest	1.138	58	.260
Posttest	-11.086	58	.000

Figure 2: Graphic representation of the means (posttest-part2)

## DISCUSSION

Regarding the first research question, analysis and comparison of the results demonstrate that experimental learners significantly outperformed their control peers on the first part of the pretest/posttest, and this lends strong support to the postulation that applying CL to teaching and learning PVs is beneficial and yields better results than a traditional approach that promotes memorization. In general, these findings confirm the outcomes of previous research approving a CL-based approach to the pedagogy of PVs (e.g., Condon, 2008; Condon & Kelly, 2002; Dirven, 1993; Kövecses & Szabó, 1996; Kurtyka, 2001). But meanwhile, these results contribute novel evidence that the shortcomings of previous studies could indeed be overcome by taking a more sophisticated and detailed account of CL motivations. The previous studies showed poor results for efficiency of CL-instruction for idiomatic PVs compared to literal ones. Condon (2008) suggested that this issue roots in the fact that the metaphor awareness-raising approach underscores the embodied experiential basis of particles and is too simplified because it does not account for many details of spatial scenes such as viewer's vantage point. To address the shortcomings of previous research, the current study deliberately concentrated on idiomatic PVs and took advantage of Tyler and Evans' (2003) model where particles are presented with respect to full-fledge and sophisticated details of construal such as figure-ground profiles and vantage points. The advantage and usefulness of this CL-based approach to learning idiomatic PVs is clearly supported by the current findings.

The reason of such superiority lies in the fundamental idea behind CL motivation that was applied to this study. CL puts up that language and linguistic behavior is an integral part of cognition as a whole, and not a separate and unique faculty (Langacker, 1987), it follows that relatively general theories of cognitive processing will pertain to learning a foreign language, in particular, theories which concern memory. Two are particularly relevant: dual coding theory and levels of processing theory. In *dual coding theory* (Paivio, 1971; as cited in Sternberg, 2006) it is held that there are two ways a person could expand on learned material: verbal associations and visual imagery. Visual and verbal information are processed differently and along distinct

channels in the human mind, creating separate representations for information processed in each channel. Thus, both visual and verbal codes can be used when recalling information. Since the treatment of experimental group was a combination of teacher-fronted verbal explanations and representative drawings of spatial scenes encoded by particles from different vantage points, it can be concluded that these two distinct codes might have provided the experimental learners with a dually enhanced processing. Control participants who received neither explicit explanations nor schematic drawings did not benefit from such enhancement and not strangely showed a lower learning gain.

Another relevant theory is *levels-of-processing theory*. The key claim of this theory is that the deeper the level at which information is mentally processed, the more likely the information is to be committed to long-term memory. (Craik & Lockhart, 1972) In other words, the duration and strength of the memory trace can be promoted by (mentally) connecting a new item with ones already known, embedding the item in a meaningful scenario, and/or associating the item with a mental image. There are two levels of processing: deep processing which entails durable semantic associations in memory and meaningful learning, and shallow processing based on no traceable scenario or associative clues leading to fragile memory record which is susceptible to rapid forgetting. This theory sheds light on the results of this study and provides a plausible explanation for the lower performance of the control group: in the absence of prompts to link PVs with mental images or previous knowledge and with relying merely on memorization the instruction on PVs could only be processed at a shallow level resulting in less effective learning and recall. In contrast, CL motivations about the conceptual bases of spatial scenes and meaning extensions of particles enabled the experimental students to process the received instruction on PVs at a deeper level and in a more active manner.

These explanations bear the answer to the second posed question of the study as well. Returning to this question that addressed the knowledge transfer to unfamiliar PVs, the findings indicate a successful transfer of knowledge for the experimental group. As noted by Nation (1990) inferring the meaning of a new item on the basis of existing knowledge is an important strategy in learning a second language and this strategy directly relates to the existence of some background reference. Dealing with new unfamiliar PVs involves drawing on contextual clues to infer the meaning. In general, inference is generated from a retrieval cue which would first have to access information from the relevant knowledge in memory. The strength of an inference is a function of the strength with which the cues are encoded. Accordingly, recorded information at deeper levels of processing and coded dually by verbal explanations and imagery representation would stimulate stronger inference abilities in comparison with the information without such support at memory. That is why the CL-instructed students exhibited better inference ability and could relate their acquired knowledge to unrehearsed PVs. Previous research (Boers, 2000; Condon, 2008) reported no evidence of developing such ability in their experimental participants. Thus, satisfactorily results of the current study bear further witness to the value and advantage of the applied approach.

## CONCLUSION

The present study was an attempt to examine whether a recent CL-based approach, namely *Principled Polysemy Theory* (Tyler & Evans, 2003), could have any advantageous contribution to teaching and learning PVs in comparison with an approach in which PVs are instructed through dictionary definitions and single verb equivalents. The findings of the study lend strong support to the superiority of the CL-based approach in yielding better learning gain of PVs as well as knowledge transfer to unfamiliar PVs. This ascendancy may originate from the basic thesis of CL that particles are not arbitrary but motivated by language users' experience of their physical, social and cultural surroundings. The findings imply that such motivated systemacity offers pathways for EFL learners to attain the following benefits:

1. A more profound understanding of conceptual bases of spatial scenes of particles and becoming familiar with the ways particles are conceptualized in native speakers' mindset; a kind of knowledge that does not automatically emerge in a foreign context.
2. Learning and remembering PVs meaningfully and efficiently (owing to greater depth of processing in general and to dual coding in particular)
3. Becoming more confident and less intimidated by PVs; once the students realize that PVs are not entirely arbitrary, they opt for alternatives to blind memorization, such as relying on conjuring up the spatial scenes of particles and inferencing the meaning from available cues. This changes their previous negative attitude toward PVs and encourages them to use them more frequently.

Another implication of the study relates to pedagogues and material designers; they could benefit from these findings in designing and performing actual practices to present PVs using their underlying CL-inspired motivations that may merit explicit teaching and save considerable class time.

Finally, there are a number of limitations to the study that should be acknowledged. The most noticeable limitation is that the study took focus on only four particles; this number is too limited to broad generalizations and further research is needed to determine the transferability of findings to other particles. Another shortcoming refers to the small sample size and the short period of the experiment. With a large and varied sample and by conducting a long-term experiment, the research would have yielded more precise and transferable results. Considering these limitations, it is hoped that further investigations establish a greater degree of accuracy and deeper understanding of the subject matter of the study.

### Appendix A

#### *The importance of construal in interpretation of particle meaning*

According to Table1, the particles *up* and *down* share a common meaning: the complete sense. However, it is important to note that this shared meaning refers to two different ways of viewing the same spatial scene. An example is the following sentences:

- (3)a. The house burned up.
- b. The house burned down.

Both the sentences in (3) describe the same event or spatial scene of ‘a burning house’ seen from two different vantage points which are depicted in Figure 3 and Figure4.

Figure 3: The house burned up.

Figure 4: The house burned down.

In figure 3, the fire is the profiled (F) element and the scene highlights the activity of burning until it is complete and accomplished. Figure 4, on the other hand, highlights a depletion and destruction activity and the (F) element is the house which continues burning until it is completely destroyed. In fact, both scenes convey a *completion* meaning; however, the completion of an activity carries a positive sense and hence is encoded in *up* and the completion/depletion which has a negative sense to it is described by *down*.

Another example of importance of vantage point and figure-ground profile is the case of *out* in these sentences:

- (4)a. The sun came out.
- b. The lights went out.

These scenes are demonstrated in Figure 5 and Figure 6.

Figure 5: The sun came out.

Figure 6: The lights went out.

The particle *out* in the sentences (4.a) and (4.b) exhibits two seemingly opposite meanings; when the sun is out it becomes visible while when the lights are out they become invisible. Evidently, this controversy becomes clear once the interior/exterior vantage point is taken into account. In fact, the perceptual accessibility shifts according to the shift of vantage point giving rise to different interpretations.

# IMPLEMENTATION OF TEAM TEACHING IN AN ESP PROGRAM AND THE INVESTIGATION OF ITS EFFECTIVENESS ON STUDENTS OF COMPUTER SCIENCE ESP VOCABULARY ACHIEVEMENT

## ABSTRACT

This paper presents an experiment concerning the contribution of team teaching to the better understanding of English as a specific purpose (ESP) terminologies. Accordingly, 40 learners majoring in computer science were selected as the participants of this study. Randomly, they were divided into two experimental and control groups. While the instructional material was the same for both groups, control group was taught through team teaching. At the end of the experiment, the findings were compared through t-test. Results after the analysis of the data indicated that who were taught through team teaching gained more ESP vocabulary than those who were taught conventionally.

**KEY WORDS:** team teaching, ESP, computer science, vocabulary achievement

## INTRODUCTION

Team teaching as a form of teacher collaboration has long been implemented in education at all levels. Sometimes synonymous with co-teaching or collaborative teaching, it features teachers' collective efforts that aim to improve teaching quality as well as students' performances. Many researchers have offered various definitions of team teaching: for example, Davis (1995) regarded team teaching as "all arrangements that include two or more faculty in some level of collaboration in the planning and delivery of a course". Not surprisingly, being amenable to different interpretations, the label of team teaching has been custom-tailored to suit diverse instructional purposes, functions, subjects, and educational settings.

The logistics of team teaching seem as simple as bringing two teachers together to work in the same classroom; yet, collaboration between two teachers is indeed a complicated phenomenon. In fact, a main focus of investigation by researchers in education has been the exploration of team teachers' interactions inside and outside the classroom. Researchers have attempted to disentangle issues that pose an impediment to team teaching so as to overcome obstacles that can damage teachers' collaborative relationships. Although a myriad of definitions of team teaching may create some confusion, which Anderson and Speck (1998) called "a cacophony of voices", the literature on team teaching has confirmed the positive effect of team teaching on student learning (Anderson & Speck, 1998) and teachers' ongoing development (Bailey, Curtis, &

Nunan, 2001; Eisen, 2000; Murata, 2002). Students taught collaboratively by two teachers have more access to teachers' assistance through a variety of teaching methods and materials, and opportunities for class participation (Anderson & Speck, 1998). Various forms of teacher collaboration can serve as an important catalyst for teachers' ongoing development and school change (Welch, 1998) because teachers engage in ongoing dialogues and interactions involved in the intense collaborative work. The social constructivist view of learning provides an explanation for the development of knowledge; rather than occurring in isolation, learning takes place in social environments and situated in social activities. Learning from colleagues is therefore one strategic approach for teachers who pursue continuous development in their careers. An effective ESP teacher must possess a relevant background in the subject field, especially on some subjects totally different from English such as science and technology, so as to offer learners a successful and beneficial course. Despite the scarcity of experts with such a cross-disciplinary training, an ESP class can be conducted alternatively by team teaching. In this study, researcher elects to collaborate in ESP teaching between an experienced English teacher trained in language teaching and an instructor specializing in computer science.

## **LITERATURE REVIEW**

Many researchers support the positive advantages of team teaching approach and its effects on learning. Johns and Dudley-Evans (1980) were two of the EAP teachers and researchers who found team teaching extremely useful in their study. Roth et al. (2002) considered co-teaching as an effective means of achieving deep learning of science concepts while learning alternative ways to teach the same subject-matter. Co-teaching also provides opportunities for new teachers to obtain greater opportunities of learning to teach. Eisen (2000) classified team teaching into eight team types based on central purposes of team formation as interdisciplinary or multicultural education, collaborative learning, community action and co-learning, action learning, specialized delivery, professional development, research, and writing. In the context of language education, teaching teams are most often constituted by teachers from different disciplines or different linguistic and cultural backgrounds.

ESP teachers are almost always teachers of English for General Purposes, and their switch into this field is sudden (Strevens, 1988). As Donna (2000) explicitly mentions, they get by with some basic guidelines and with a little help which ultimately proves inappropriate. Their task is to analyze students' needs, outline objectives, select and adapt teaching materials, design lessons, create an adult-oriented learning environment, and assess students' progress (Schleppegrell, 1991). Based on Little's (1990) typology, team teaching is at the end of the teacher collaboration continuum due to its closest interdependence among teachers, as teachers work together in the same classroom, sharing responsibilities of students' performance and implementing teaching activities together. This instructional practice is usually organized by policy makers or school leaders with different purposes. According to Eisen (2000), "no two teams are exactly alike because they operate along a continuum representing countless variations in goals, team membership, and members' relationships". Sometimes team teaching is implemented to utilize teachers' diverse expertise to complement each other in order to achieve better quality of instruction; at others, it is implemented for training purposes to improve new teachers' growth. As close interactions between team teachers in the classroom provide teachers with opportunities

to get exposed to different views and ways of teaching, team teaching is often associated with teachers' professional development in the workplace. Eisen (2000) classified team teaching into eight team types based on central purposes of team formation as interdisciplinary or multicultural education, collaborative learning, community action and co-learning, action learning, specialized delivery, professional development, research, and writing. In the context of language education, teaching teams are most often constituted by teachers from different disciplines or different linguistic and cultural backgrounds. In a similar attempt to Calderón's (1995), Rueda and Monzó (2002) investigated the collaborative relationship between classroom teachers and paraeducators, who shared the same ethnicity and native language with students mostly from low-income Latino communities and who were hired to assist teachers. The study took place in two large public elementary schools located in southern California, with thirty-two bilingual, Latino paraeducators involved in the study divided into three groups according to the range of years of work experience. They were observed in eight to ten occasions when working with students, and were interviewed by the researchers. Different from those teachers in Calderón's (1995) study who were offered opportunities to improve their teaching through team teaching practice, the paraeducators in this study, as the researchers concluded, generally played three roles in the classroom: clerical support, directed teaching, and apprentice. Most of the responsibilities for the paraeducators included doing some trivial work for the teachers or providing students with lessons that had already been designed by the teachers. There were few opportunities for the paraeducators to learn teaching practice from the teachers as apprentice, and interactions between the teachers and the paraeducators were scarce. Translations from Spanish to English were the most common source of input that the paraeducators were asked to provide. The paraeducators' suggestions about teaching practice and input of students' culture were not positively valued by the teachers. Limited interactions with the teachers and unequal power relationship prevented the paraeducators from learning how to teach and pursuing teaching careers.

The researchers stressed that teachers' acknowledgement of paraeducators' cultural and community knowledge is critical to helping paraeducators make a better contribution to student learning. They also asserted that in order to promote paraeducators' professional development, schools need to encourage collaboration between paraeducators and teachers in the ways of allowing interactions and time for planning lessons by both groups. Besides, since power differences negatively affect the collaborative relationship, teachers and paraeducators should be accountable to each other with regard to their respective roles. To implement team teaching with a different purpose from those of the two studies just described, Roth, Masciotra, and Boyd's (1999) studied the collaborative practice used to facilitate teacher learning of novice teachers, in which a novice teacher's development through co-teaching with an experienced teacher in a 7th-grade science class was investigated. Grounded in hermeneutic phenomenology which is concerned with understanding lived situations of being-in-the-world, the researchers argued that co-teaching is an approach to helping the novice teacher acquire tacit dimensions of teaching. In contrast to the gap between discourse about teaching learned at universities and the experience of actually teaching a classroom which the novice teacher experienced in a teaching alone situation, Roth et al. (1999) suggested that co-teaching provided the beginning teacher with abundant opportunities to "briefly step back, take time out from the responsibilities of developing the classroom conversation, and reflect-on – but with little delay relative to the action – the questions and interactions of the master teacher". In other words, they found co-teaching to be a more preferable teaching practice than sending pre-service teachers into a classroom where the resident teachers let them work on their own.

## RESEARCH QUESTION

The following question is addressed in the present study:

1. Does team teaching, collaborative, enhance computer students' English achievement in an ESP program?

## RESEARCH HYPOTHESES

From the research question the following hypotheses were found:

1. There is a positive difference in English achievement between the control group and the experimental group under the treatment through team teaching in ESP program
2. There is negative difference in English achievement between the control group and the experimental group under the treatment through team teaching in ESP program
3. There is no significant difference in English achievement between the control group and the experimental group under the treatment through team teaching in ESP program

## METHODOLOGY

### *Participants*

In this study, the addressed community was 40 undergraduate male and female students enrolled in the ESP course as a part of their major in computer science department at SAMA vocational and technical training school, Mahshahr branch. The department itself divided them into two intact classes. Randomly, one class was selected as an experimental group which included 20 students and the other as a control group which included 20 students. The data collected from the subjects' performance on the post-test and pretest are described in terms of mean (X), standard error of measurement (SEM), standard deviation (SD), and Levene's t-test, using the Statistical Package of Social Science (SPSS) program.

### *Instruments*

The main instruments used in the present study were the following: The textbook which was *English for the students of computer* published in Iran. It was developed by Barani, and Rezaei and the publisher is the Rahnama Press (Barani, Gh., & Rezaei. S. H, 2011). The textbook contains twenty lessons which due to the shortage of time ten lessons were covered. The pretest worked as a proficiency test which determined the homogeneity of the students regarding the English language proficiency and an achievement test played the role of posttest to point out the would-be impact of co-teaching on the experimental group.

### *Design and Procedure*

A quasi-experimental design was exploited for the present study. Accordingly, Two intact English classes in the ESP context were used in the study. The first class comprised 20 students and was held on Tuesdays. It was the experimental class co-taught by a pair of teachers group in which an ESP teacher who taught the technical terms and an EFL teacher who instructed the general terms. The other class, considered as control group, included 20 students who came to the class on Saturdays. An EFL teacher only conducted the instruction. The language proficiency of the

control and experimental groups was assessed by a proficiency test. In the control group ESP lessons were instructed by just one teacher, EFL teacher. While in the experimental, the participants were taught by two instructors, both EFL and ESP teacher. These two teachers cooperatively co-taught the ESP lessons based on team teaching model which made the study distinguishable from the traditional view of teaching. Collaboration and consensus between co-teachers determined every issues of the teaching process. In short, these groups were worked with for 10 sessions; each session taking almost one hour and quarter.

### **Data Analysis**

The data collected from the subjects' performance on the post-test and pretest are described in terms of mean (X), standard error of measurement (SEM), standard deviation (SD), and Levene's t-test, using the Statistical Package of Social Science (SPSS) program.

## **RESULTS AND DISCUSSION**

The aim of this chapter is to present the results of the quantitative analysis. Therefore, The preliminary descriptive statistics for the ESP vocabulary knowledge test (posttest) appears in the following Tables.

*Table 1: Descriptive statistics of posttest for the experimental and control groups*

Group	Test	N	Mean	SD
Experimental	posttest	20	50.8	2.37
Control	posttest	20	47.85	4.55

As displayed in Table 1, experimental group's performance in the posttest was better than those in the control group. It was also revealed that after the instructional treatment, the mean of the posttest scores for experimental group was 50.8, while for the control group it was 47.85. In the case of SD, for the experimental group, it was 2.37, whereas that of the control group was 4.55. So, the findings suggest that there was a difference between experimental and control groups after the treatment, collaborative teaching.

*Table 2: Results of t-test between Experimental groups and Control groups in Posttest*

Group	N	Mean	SD	t- value	Df	P
Experimental	20	50.8	2.37	2.56	38	0.014
Control	20	46.85	4.52			

*\*Significant at .05*

In order to compare the effectiveness of the collaborative teaching on ESP vocabulary learning , Levene's t-test demonstrated in Table 2 indicated that the mean difference between the experimental and control groups' scores measured at the time of posttest was significant ( $t = 2.56$ ,  $p < .05$ ). The mean difference between the experimental group ( $M=50.8$ ) and control group ( $M=46.85$ ) was 3.95. This indicates that the experimental group who were under the treatment at the collaborative teaching gained more ESP vocabulary than the control group. Therefore, it can be claimed that this difference is due to the kind of instructional environment where the experimental group was taught there and this gives further evidence for accepting the first hypothesis and rejecting the other two hypotheses.

1. There is a positive difference in English achievement between the control group and the experimental group under the treatment through team teaching in ESP program ( accepted)

2. There is negative difference in English achievement between the control group and the experimental group under the treatment through team teaching in ESP program (rejected)
3. There is no significant difference in English achievement between the control group and the experimental group under the treatment through team teaching in ESP program (rejected)

## **CONCLUSION**

This study aimed at investigating the effect of collaborative teaching on ESP terminologies promotion in the field of computer. To this end, the following question was under consideration: Does team teaching, collaborative, enhance computer students' English achievement in an ESP program?

To perform this research, subjects were randomly put in one control group and one experimental group and were assigned to one of the two following instructional conditions:

The experimental group was taught through the collaborative or team teaching, while Control group was taught traditionally. For data analysis, Levene's t-test was used. The calculated t-test proved that ESP vocabulary can be learnt better via collaborative teaching. The experimental group gained considerable amount of vocabulary than the control group. So, the computation and analysis of the t-test provided researcher with the judgment to reject the negative and null hypotheses of this study which stated that collaborative or team teaching would not significantly promote learners' ESP vocabulary knowledge. Results of this study indicated that teaching ESP courses through collaborative or team teaching at the university or instructional institutions might become a useful way for students to improve and facilitate their learning of ESP words. Based on the findings, one concludes that team teaching has much influence on the learning of computer ESP terminology.

In terms of the limitations of the study, the point should be highlighted that due to the shortage of the time, the researchers did not verify the pre-post tests in terms of reliability.

## **PEDAGOGICAL IMPLICATION**

The current study may provide some support for the idea that collaborative teaching can have powerful effects on the learning of computer ESP terminology. Findings of this research paved the way for the acceptance of this belief. The major implication to be drawn from this research is that students need to learn technical words through the collaboration between EFL and specialized teachers.

## **SUGGESTION FOR FURTHER RESEARCH**

This study aimed to answer just one question: Does teaching ESP course via team teaching , collaborative teaching, enhance computer learners' ESP terminology?  
However, another question may be raised as the follow:

1. In this study, only computer students were involved. It is suggested that learners of other majors participate in further studies.

### ABSTRACT

Communication provides an opportunity for persons of different cultures to learn from each other. It is important to build skills that enhance communication. In Communication process, creating means not only using the language and dialect of the people you are serving, but also using communication vehicles that are proven to have significant value and use by the target audience. Literary communication is the contact between the author and the reader. Like other forms of art, poetry has performed the function of a communication medium. When a poet describes an object it is separated from its context in the natural world and therefore looks different to the reader. A literary text, at least in our period and culture, may be about anything. Of course, literary narrative must satisfy the basic principles of narratives, such as description of (human or anthropomorphic) action, and a schematic structure with at least a complication and a resolution. The key element in visual poetry is the visual nature as opposed to the sound the words make. Performance poetry also relies on visual and oral communication. The difference being that aspects of the poem must be seen in the poet rather than on other forms of published material.

**KEYWORDS:** communication, literary communication, pragmatic context, maxims

### INTRODUCTION

Although literary communication is a relatively new concept, yet this form of language communication has come to be characterized by so many individual traits that can be studied as a self-contained phenomenon. Sociologists claim that all culture is communication. We may state that all literature is also communication. Although literature clearly meets the specifications of language communication, it nevertheless introduces unique elements, or perhaps a different system of hierarchy, into the rules governing vernacular speech. Speech act is not only an act of communication in the narrow sense. Equally important is expression and the effect it exercises on the interlocutor. These facts also have a bearing on a literary work even though literature possesses the unique feature of placing the message in the forefront of attention. However, since the message is never transparent and since its function is not restricted to denotation, it may therefore be said that a literary work communicates itself.

This formula does not contain a tautology. In a literary communication the message does not get lost as a text and it is not transparent. That is to say, the message that is communicated in that act contains what is essentially the Work, what constitutes its structure. Its reference functions emerge on a more distant plane.

One other important consideration supports the validity of the formula which states that a literary work communicates itself. Within the sphere of the literary culture in which we live, literary communication is perceived and felt as an act of a separate, distinct and unique character. Thus conceived, it represents a specific value which is not reducible to a different value. Communication does not therefore obviate the communiqué; it loses none of its reasons for existence even when it is recognized that it has fulfilled its current communication purpose. By communicating itself, a literary work remains in constant communicative readiness.

Literary communication may be distinguished from language communication, defined in its strictest sense, in one other aspect. Knowledge of a language code, though it is a necessary condition of literary communication, however, cannot fill that purpose satisfactorily. One may understand the language of a given work perfectly but be unable to establish communication with it. In order to do this, one must be familiar with what we call literary styles. The term is used here in its broadest sense to include both period styles and the styles of particular types of discourse, and most particularly literary genres. Literary styles also cover a system of images, symbols and stereotypes which form the world the author and the reader share. It is this that makes communication between them possible.

The purpose of literature like other forms of art is to communicate and not to exhibit. The exhibitory poetry aims at pleasing the senses and is thus purely emotional in nature. It becomes subjective and it is the poet rather than the poetry that then matters. The pleasure is solely derived from the form, a composition of sounds of words. Such poetry rarely attempts to convey the unexpressed knowledge; the essential idea behind the order of the form. A poem should rather communicate effectively. It does so by using forms with right analogies and balanced ornamentation eventually to establish a harmony between the spiritual and the intellectual self and the universal truth.

Communication provides an opportunity for persons of different cultures to learn from each other. It is important to build skills that enhance communication. Be open, honest, respectful, non judgmental, and willing to listen and learn. According to Fujishin (2009, 134) In process of communication, listening and observational skills are essential. Letting people know that you are interested in what they have to say is vital to building trust. Communication strategies have to capture the attention of the audience.

## **CREATING COMMUNICATION**

In Communication process, creating means not only using the language and dialect of the people you are serving, but also using communication vehicles that are proven to have significant value and use by the target audience. Literary communication is the contact between the author and the reader. The writer sends a message through his text and the audience receives it. The text comes to life and serves its purpose only when it communicates with the reader (Dijk, 1985).

The message can take any form, from a book to a script or a poem. What is important is the constant movement between producing and receiving stays alive, and that the author and the

reader speak the same language, and thus, communicate even though it is true that the majority of literary studies focus on the analysis of the actual text and not on the literary communication between author and reader, (Beaugrande, 1997). It has also been accepted that a comprehensive literary theory needs to include both the analysis of the text and the examination of its contexts (Rahim, 2011).

Because, as important as the studying of the text might be, the text's functions and the conditions of its production and reception are equally important as they connect it to its reader, without whom the text would not achieve its purpose.

The importance of literary communication lies also in the fact that no structures are ever solely literary. Rather, it is the historical and cultural context that determines whether a text could be considered literary. Metric structures, for example, are used in poetry, song writing and advertising without, however, these types of writing are considered as literature (Wolfreys, Robbins & Womack, 2006).

With this said, the structures and the context of a text are closely connected and one cannot exist without the other. Therefore, a theory of literature can only be a theory of literary communication. (Sell, 2000)

## PSYCHOLOGY OF THE READER

The examination of the text in relation to the psychology of the reader is another important aspect of literary communication. Literary communication is achieved only through the study of the cognitive and emotive structures of literature (Ibsch, 2001).

When one considers the perceived qualities of poetry, one cannot escape facing a rather disconcerting issue. Words designate "compact" concepts; even such words as "emotion" or "sadness" are tags used to identify the mental processes; they do not convey the stream of information and its diffuse structure. Notwithstanding, some poetry at least is said to display diffuse emotion, vague moods, or varieties of mystic experiences.

## COGNITIVE STYLISTICS

According to Semino (2002), brain-research of the last few decades seems to suggest, language is a predominantly *sequential* activity, of a conspicuously *logical* character, typically associated with the left cerebral hemisphere; whereas diffuse emotional processes are typically associated with the right cerebral hemisphere.

Thus, while we can *name* emotions, language does not appear to be well suited to convey their unique *diffuse* character. Accordingly, emotional poetry, or *mystic poetry* ought to be a contradiction in terms. We know that this is not the case. But this presentation of the problem emphasizes that we have all too easily accepted what ought not to be taken for granted (Johansson, 2005).

## **SOCIAL CONTEXT**

The term social context refers to the psychological position that people react to things differently depending on their immediate environment. Literary communication is also important for the fact that it relies on the social context of the text. (Grant, 1995) Apart from the text itself and its literary structures, apart from its historical and cultural background and apart from its psychological properties, a text needs to also be examined from a sociological perspective. The text's organization, production and interpretation in a specific society, as well as the rules, the values and norms that define it, are taken into consideration when evaluating a text's ability to communicate with its audience.

## **CORRESPONDENCE BETWEEN THE SPACES OF IMAGES AND MEANINGS**

The process of correspondence between the spaces of images and meanings may be multiple-faceted (Arana, 2008). It involves the sequence including perceptions, fragmented or primitive images, forms of images or sophisticated images, and constructing new images through restructuring perceived images. And corresponding to this sequence of image construction and reconstruction, there is the sequence of meanings: primitive or basic element of meanings, sophisticated or basic system of meanings, grand system of meanings and system complex of meanings. Logically, there is a cross-boundary feedback effect in this correspondence, and it is possible that any form or state of the construction-reconstruction of images could be mapped to multiple phases of meaning formation and correspondence.

## **POETRY AS A COMMUNICATION MEDIUM**

Like other forms of art, poetry has performed the function of a communication medium. Especially before the development of printing, verse rather than prose served as the dominant medium of literary communication, since it was easier to follow and learn by heart and readier to be combined with other genres such as song and dance (Steinberg, 2007)

In the modern society, however, the importance of verse has largely diminished, as the novel emerged as the most popular channel of communication and many subjects previously treated in verse moved over to the realm of prose. Now, the development of new spaces of communication like electronic visual media is producing yet another change. With the novel requiring to be read alone and taking much time, shorter verse which can be recited for and together with a mass audience and more easily combined with other media has regained a relatively high status. On the other hand, it is yet to be seen whether such retrieval could prevail over a larger trend of the decline of literature in general. There have also been a number of instances arguing that communication is not one of the many functions of art, but the very essence of it (Feldman, 1967).

It is well-known that the majority of literary studies, both traditional and modern, focus on the analysis of the literary text and not on the processes of literary communication.

Those views which hold that literary theory should be concerned with the "literary text" alone are unwarranted and ideological: not only the structures of the literary text are important, but also its functions, as well as the conditions of production, processing, reception, etc., as they are accounted for in psychological, sociological, anthropological, and historical studies. A pragmatic account of literature has its natural place in such a theory.

People communicate not just to convey information for businesslike practical reasons; they also convey feelings and attitudes. Pieces:

Telling a joke, passing the time in conversation and greeting old friends are some examples, and poetry is another (Thayer, 1997).

Some propositions including many involving values, emotions, feelings, attitudes and judgments can't be conveyed through communicating practical information or with scientific precision. Like science, literature (and especially poetry) uses a specialized language for the purposes of precision in matters different from science (Buddenbaum & Novak, 2001).

In ordinary life, people must deal with forms of communication that use some of the methods of poetry, including editorials, sermons, political speeches, advertisements and magazine articles. Yet when approaching poems, many people confuse practical or "scientific" kinds of communication with poetic communication, sometimes as a way of justifying their interest in poetry, and so fall into certain mistakes (Shafieyan, 2011).

One mistake is "message-hunting" looking only for a profitable statement or idea in a poem. A short prose statement can work better than a poem for communicating advice. Something else is at work in poetry.

Another mistake is thinking that poetry deals only with emotion or sensation, or even thinking that poetry can express an emotion such as grief the way tears would express it, or bring up the emotion in the reader (Vickers, 1973).

But poetry can never do that as well as real experience, the authors say, and a poem, such as Keats' Ode to a Nightingale, used as an example here, may really convey the poet's interpretation of an experience.

A third common mistake is an attempt to mechanically combine the first two, defining poetry as the "beautiful statement of some high truth", or "truth" with "decorations". This mistake can lead to thinking of poems as collections of pretty language pleasing for its associations with pleasant things. But even Shakespeare and Milton wrote fine passages bringing up unpleasant and disagreeable associations. The things represented don't themselves shape the poetic effect, which depends on the "kind of use the poet makes of them."

These mistakes look at poems in a mechanical way rather than in an organic way in which the elements (such as meter, rhyme, figurative language, along with attitude and emotion) need to be understood to be acting in a fundamental, intimate, organic way with each other.

The introduction also states (but doesn't develop the thought) that poems are inherently dramatic, with an implied speaker who reacts to a situation, scene or idea.

## **NARRATIVE POEMS**

In a "Foreword" introducing discussions of individual poems, the authors say that poetry takes the general human interest that people have in other people (expressed at other times in news articles about such things as outlaws, lovers killing lovers or other tragedies, to cite some examples) and put into a form "that preserves it" even after initial curiosity wanes (Brooks, 1976).

Poems that tell a story use the reader's natural curiosity about how a story will turn out (the most obvious way we become interested in literature), although readers or listeners who know the ending still enjoy the poems. The story element can be prominent. Narrative is a way for the poet to provoke certain emotional reactions and ideas in readers.

Using the ballad "Johnie Armstrong" as an example, the authors show how a narrative poem, far more than a novel or even a short story, will use bare "facts" in a dramatic way that gives them an emotional and intellectual meaning, whether or not the reader or listener has analyzed those or other elements. Poems are more concentrated or "closely" organized than prose in that they tend to present concentrated, sharper selected details in a concentrated, carefully arranged way, giving them more "intensity." By presenting concrete, explicit statements (as in "The Wife of Usher's Well"), the poet can convey an emotional impact as well as information, which more abstract language can't do. The reader can also be drawn into a more immediate appreciation of a poem by drawing out ideas from suggestions rather than the poet making explicit statements. Yet not every implication of a poem needs to be understood consciously for a reader to enjoy the work.

The theme of a poem can be properly described (to give a fuller understanding of the poem) without the process becoming "message hunting" if the reader understands that "the poem gives the theme its force", not the other way around (Winchell, 1996).

## **DESCRIPTIVE POEMS**

The poems in this section give readers an impression of some scene or object showing the impression they gave the poet either through his senses or imagination. Conveying fresh, vivid impressions of things is fundamental to good poetry, the authors assert. Descriptions in poetry are linked closely to our lives and our values just as narratives are (Huxley, 2002).

When a poet describes an object it is separated from its context in the natural world and therefore looks different to the reader. We feel it carries associations, emotional or intellectual or both, that the natural object doesn't. If nothing else, we know that the poet has chosen the object to describe and we wonder why.

## **EXPLORATION OF IMAGE**

The exploration of image triggering and message transition as an artistic form of communication can cause a blurring of the boundaries between poetry and art, if we can say that they in fact do have boundaries. We have created words to say this such as word art, concrete poetry, visual poetry, pattern poetry, visual riddles and puzzle poetry.

The concept of concrete poetry and word art has been around a long time although the words to define it as an art form may not. It is believed that the word "concrete poetry" began to spread as a new term in the 1950's helped by an exhibition of concrete poetry and a manifesto that was published in Brazil.

If we looked closely at some of the ancient forms of writing we might see that many have relied on the visual aspects of the written language to communicate, but more recently beginnings have been attributed to Apollinaire, who created calligrammes in 1914. In visual poetry, the juxtaposition of letters, sound and shapes may be played with (Dymoke, 2003).

The synergy of these words, letters and shapes trigger images, sounds and messages that can be called the art of the poet....making more from the sum of the parts in a visual communication. The key element in visual poetry is the visual nature as apposed to the sound the words make. Performance poetry also relies on visual and oral communication. The difference being that aspects of the poem must be seen in the poet rather than on other forms of published material (Anderson, 2009).

With the development of communication technologies, we can embed aural and visual stimuli into unique still or animated artistic expressions....what shall we call these new art forms? We already have words such as digital art and new media to talk about some art forms but do the words digital poems really communicate all that they can be? We have the technology to bring more senses into the poetry equation, touch for instance.

### **IMPRESSIVE SPEECH ACT**

There are reasons to introduce a kind of illocutionary act which involves the intention to change the attitude of the hearer with respect to the context (text, speaker, etc), especially the evaluative attitudes of the hearer (Dervin, 1984).

We might call this kind of act an "impressive" or "ritual" speech act. This provisional conclusion still leaves open the problem whether there is a specific speech act of literature. Probably this question should be answered in the negative: we should realize what the original forms and functions of "literature" were in order to understand its specific pragmatic function. It is well known that the specific notion of "literature," as such, is not very old. Indeed, our novels have their roots in everyday stories, myths, and folktales, and our poems in songs, hymns, etc. Functionally, then, our literature still belongs in the class where we also have our jokes, wise-cracks, dirty stories, etc. The differences with these kinds of communication, then, are not so much pragmatic as rather social: literature has been, we already suggested, institutionalized; it is published, authors assume a specific status, it is reviewed in specific papers and journals, it is taken up in text books, discussed, analyzed, etc. The institution also is defined by norms and values; it will be the case that there are also conditions pertaining to the structure of the utterance itself (as in any speech act). The attempt made above to sketch the problem about the pragmatic status of literature in terms of intended attitude change at the level of cognitive and/or emotive "liking" should not be seen as a reformulation of the classic principle which takes literature's function to be exclusively "esthetic." First of all, as we have already suggested, esthetic functions are based on communicative effects, and based on institutionalized norm and value systems which are socially, culturally, and historically variable. This allows for the well-known fact that some kinds of discourse, although clearly having "non-ritual" pragmatic function.

## IMPORTANCE OF LITERARY AUTHOR

Although the institution of literature is cultural rather than juridical or political, there is some sense in saying that "literary" texts are only appropriate when written by a "literary author." (Forastieri, et al, 1980).

Of course, this may seem circular, and problematic for "first" literary products, but it points to the cultural fact that there is an instance which "recognizes" the text and its author as "literary." As is also the case for a conviction by a judge, other contextual (and textual) conditions must in that case be satisfied: not everything an author says is thereby "literary," only those texts written in his "function" of a writer; the text should be made public, published in an appropriate message book, journal but usually not on the front page of a news paper), etc. All these conditions play of course a crucial role in the definition of literature in the usual sense of the term, but we do not count them among the pragmatic appropriateness conditions in a more limited sense, because they are culturally different. Of course, there are few, except theoretical, grounds to reject a broader conception of pragmatics, in which the full social, institutional and even cognitive/emotive, properties of communication are made explicit. Another aspect of the literary context is the knowledge, in both speaker and hearer, of overlapping, and ideally identical, rule systems, conventions or "codes" besides those of natural language.

Literary texts in the strict sense are such only due to other, institutional aspects of the socio-cultural context, e.g. originality with respect to the system which is a culturally and historically dependent value (Poyatos, 1988). In each communicative situation the speaker will have a certain "position" and certain attitudes with respect to denoted events, persons or the hearer in particular. That is, he will not only provide explicit evaluative statements, but also implicitly selects, describes and combines objects and events from his point of view. The same holds in literary communication, but the system of perspectives may be more complicated because besides his own point of view, the author may represent the point of view of a narrator and/or those of represented persons possibly through the point of view of the narrator. As soon as representation is involved, we no longer are at the pragmatic, but at the semantic level, although the specific aspect is that communication contexts are represented. The pragmatics of literature, then, only pertains to the perspective of the author himself, and to his relations with the readers (Teun, 1981).

That pragmatics should also specify how pragmatic function and context is systematically related to the text. In fact when we mentioned specific literary rules and conventions, being used and interpreted parallel to those of the natural language system. In which respect are these pragmatically relevant? First textual manifestations of "underlying" pragmatic structures are all kinds of announcements and titles. Much in the same way as performative verbs may denote the locutionary force of an utterance. In linguistics, a locutionary force is the performance of an utterance, and hence of a speech act. The term equally refers to the surface meaning of an utterance because, according to J. L. Austin's posthumous "How To Do Things With Words", a speech act should be analyzed as a locutionary act (i.e. the actual utterance and its ostensible meaning, comprising phonetic, phatic and rhetic acts corresponding to the verbal, syntactic and semantic aspects of any meaningful utterance), as well as an illocutionary act (the semantic 'illocutionary force' of the utterance, thus its real, intended meaning), and in certain cases a further perlocutionary act.

For example, my saying to you "Don't go into the water" (a locutionary act with distinct phonetic, syntactic and semantic features) counts as warning you not to go into the water (an illocutionary

act), and if you heed my warning I have thereby succeeded in persuading you not to go into the water (a perlocutionary act). This taxonomy of speech acts was inherited by John R. Searle, Austin's pupil at Oxford and subsequently an influential exponent of speech act theory. Cognitively these function as preparation for the adequate pragmatic interpretation of the text.

### **DEICTIC EXPRESSIONS**

A typical manifestation of semantic-pragmatic features of a context are deictic expressions (Forastieri, et al, 1980). Other pragmatic "indicators" are those of surface structure: graphical structure, and morpho-syntactic structures, even if there are other discourse types (e.g. advertisements) and similar specific rules.

At the semantic level we first of all have the condition already discussed for the pragmatic level: the text need not be true. More specifically, it need not denote properties or actions of speaker and hearer, as is often the case in other speech acts. We here obviously have the main source for the pragmatic nature of ritual illocutionary acts: as soon as the underlying proposition is (known to be) false the corresponding speech act will also assume a "spurious" character, at least at the micro-level: we have quasi-assertions and quasi-complaints. Whereas other speech acts often require a specific semantic content, e.g. an action of speaker or hearer, no such requirement seems to hold for literary communication (Forastieri, et al, 1980).

A literary text, at least in our period and culture, may be about anything. Of course, literary narrative must satisfy the basic principles of narratives, such as description of (human or anthropomorphic) action, and a schematic structure with at least a complication and a resolution. Both the semantic and the narrative structures may however show specific operations of deletion, permutation, repetition and substitution which are conventionalized for literary communication, and which need not be spelled out here. Although, as we said, the semantics of literary texts is in principle not restricted, especially in modern literature, such restrictions may well occur in specific types of literature or in different historical or cultural contexts. Whereas in other descriptions of psychical or social events, the account may have a more or less general character, or general conclusions added (as in a psychological or social report, a theoretical study, etc.), a novel may describe particular details which would not occur in other kinds of discourse, e.g. because they are irrelevant or inaccessible. On the other hand, much classical literature requires a specific "lexicon" in which the possible "themes" of a text are given.

Only recently, then, a poem could also be about a table or an egg, and only in the modern novel specific trivia of everyday life could be described in detail, whereas in classic literature "important" themes, such as life, death, nature, love and hate, power, war or pride, etc. would be preferred. This is not the place to enumerate the basic properties of literary texts. It should only be stressed that the specific ritual illocutionary force of literature may be indicated by typical textual conventions at the graphical/phonological, syntactic, stylistic, semantic and narrative levels. Maybe none of these typical structures are exclusively literary, taken in isolation, but together and given certain properties of the context already mentioned above (presentation, reading situation, etc.) they may be sufficient indications for the appropriate pragmatic interpretation of the text. Clearly, there is an interaction between text and pragmatic context: as soon as the structural properties of the text are marked (with respect to some rule, norm, expectation) the reader will also remark them, whereby the specific pragmatic nature of ritual discourse can be

brought about; and conversely: if the specific attention is not on some intention of the speaker with respect to specific beliefs, or actions of the reader, the reader is able to pay focused attention to the specific structures themselves.

### IMPORTANCE OF MAXIMS

The idea of applying Gricean Maxims to the analysis of literary texts has been developed most fully in van Dijk's *Pragmatics and Poetics* and Pratt's *Toward a Speech Act Theory of Literary Discourse*. Van Dijk states that all Gricean maxims change in literary communication, that the speaker 'opts out' from the principles of ordinary conversation and that the 'Cooperative Principle' does not hold. He proposes the so-called Cooperative Principle from which the four literary counterparts of the Gricean principle are derived. Pratt (1977) also notes the conspicuous difference in communication on the levels of author-reader and hero-hero. She shares Ohmann's (1974) view on speech acts of the latter level as 'mimetic' or 'imitation speech acts' and states that what counts as a lie, a clash, an opting out, or an unintentional failure on the part of a fictional speaker (or writer) counts as flouting on the part of the real-world author. The implicature involved as the result of flouting is that the non fulfillment is in accord with the purpose of the exchange in which the reader and author are engaged.

### CONCLUSION

Communication is the exchange and flow of information and ideas from one person to another; it involves a sender transmitting an idea, information, or feeling to a receiver. Effective communication occurs only if the receiver understands the exact information or idea that the sender intended to transmit. Communication provides an opportunity for persons of different cultures to learn from each other. It is important to build skills that enhance communication. Literary communication is the interaction between the author and the reader is just one in a variety of communicative acts. Literary communication is fundamentally different from oral communication in that the addresser and the addressee in literary communication are temporally, locally and possibly culturally distanced. As a result literary communication is a one sided process with no feedback on the part of the addressee. In literary communication, there exists a strong tendency to observe the Maxims. They prove to hold good for literary as well as for oral communication. They cannot be said to be totally violated or flouted nor is there any necessity to introduce special Maxims for literary communication. The non-fulfillment of Maxims can be accounted for in terms of the goal oriented approach by the presence of a predominant goal supra ordinate to that of communicating something to the reader.

## ABSTRACT

E-learning efforts and experiments currently receive much attention across the globe. The availability of electronic and web-enabling technologies also dramatically influences the way we view the learning strategies of the future (Kramer, 2000; Hitz, 1995). This is a practical, non-experimental study in which questionnaire was used to collect data. The results show that the main important infrastructures are lack or shortage of designed equipment and facilities to accommodate new technologies, lack of students' access to computer and proper telecommunications, specific problems of Iran telecommunications infrastructures. The major administrative-educational barriers of e-learning development are: lack or shortage of incentives to study in an electronic way, lack of laboratory sessions through e-learning and lack of education for students in the field of instructional technology. Also, the findings show that the major human barriers are: inadequate specialized faculty members in new educational technologies,

unfamiliarity of planners and administrative officers with e-learning applications, lack of commitment of faculty members to spend time for learning via technologies. Among financial barriers in developing e-learning, the following items can be mentioned: lack of investment and funds, high cost of educational technology equipment, high cost of updating the required content.

**KEY TERMS:** Electronic learning (E-learning), higher education, IT and ICT, teaching and learning

## **INTRODUCTION**

The introduction of distance and Electronic Learning Technology (hereafter, e-learning) in teaching institutions is often complex and educators do not always accept the Information and Communication Technologies (hereafter, ICT) as expected. Removing trade/political barriers facilitates e-learning around the world, but there are significant cultural barriers to the use of Internet-based resources and computer technologies (Collins, 1999). The Internet may be a global technology but users work in local/national contexts (Li & Kirkup, 2007). In this regard, Galanouli, Murphy, and Gardner (2004) comment that resisting change is a state of mind for many educators and one of the most difficult barriers for effective ICT integration (see also Barak (2007)).

Arbaugh (2002) defined e-learning as the use of the Internet by users to learn specific content. Other researchers define e-learning as using modern Information and Communications Technology (ICT) and computers to deliver instruction, information, and learning content (Selim, 2007). The stakeholders of e-learning are learners, faculty, administrative and technical staff, and employers (Ozkan & Koseler, 2009).

The growth of information and communication technologies (ICT) has dramatically reshaped the teaching and learning processes in higher education (Pulkkinen, 2007; Wood, 1995). ICT for education is more critical today than ever before since its growing power and capabilities are triggering a change in the delivery means of education (Pajo & Wallace, 2001). The higher education institutions around the globe have increasingly adopted ICT as tools for teaching, curriculum development, staff development, and student learning (Kumpulainen, 2007; Usuel et al., 2008).

With the ongoing development of ICT and the diverse fields it affects, various theoretical models have been proposed for a better understanding concerning its diffusion, adoption, acceptance, and usage (Davis, 1989; Rogers, 2003; Scurry et al., 2005; Taylor & Todd, 1995; Venkatesh & Davis, 2000; Venkatesh et al., 2003; Yi et al., 2006). Although ICT has the potential of improving educational methods and the quality of teaching and learning, the advantages of ICT are often under-realized (Surry & Farquhar, 1997). The adoption of ICT at universities is often poorly implemented and is based on unfounded optimism (Taylor, 1998). A large numbers of faculty members are still hesitant or reluctant to adopt technology for teaching tasks (Jacobson, 1998). Research has found serious obstacles to fully integrating technology into the teaching and learning processes in higher education (Becta, 2004). In addition, there are no universal solutions to the problems as the ICT adoption is not merely a technical issue. Instead, the rate of adoption

is affected by factors such as innovation characteristics and various economic, sociological, organizational, and psychological variables (Straub, Keil, & Brenner, 1997). Straub et al. (1997) used the Technology Acceptance Model (TAM) in a cross-cultural study with participants from Japan, Switzerland, and the United States. They discovered that TAM exhibited fidelity for the US and Switzerland, but not in Japan, which suggested that the model may not predict technology use across all cultures Straub et al. (1997). In another intercultural study, Pelgrum (2001) reported that there was a substantial variation regarding the most significant barriers to ICT between teachers in different countries.

The existing face-to-face learning paradigm is no longer the only educational paradigm due to the advent of e-learning that makes it possible to receive education without being restricted by time and space (Hyeoncheol & Injin, 2007). Inoue (2007) indicates that “isolation and disconnectedness in the online environment may be to blame for student dropout, as well as the feeling of isolation that may lead to loss of motivation to learn” (cited from Doris, Supawan, & Christine, 2010).

The higher education centers are the applicants of the utilization of electronic education, because these educations are not limited to a special time and place. Thus, the higher education centers consider this fact as a prominent advantage (Garrison, 1999). Generally, virtual education means making the best use of electronic systems such as computers, internet, multimedia discs, electronic journals, virtual newsletters, etc. The virtual education aims are to make the learning easier, and more effective, and it can save time, cost and energy (Anderson and Elloumi, 2004). When examining the literature at the intersection of teaching and learning with information and communication technology (ICTs), one is struck by the relative lack of focus upon the potential problems and drawbacks of the incorporation of technology into educational work-life (i.e. Granger, Morbey, Lotherington, Owston, & Wideman, 2002; Hassini, 2006; Liaw, Huang, & Chen, 2007; Marbach-Ad & Sokolove, 2001; Marbach-Ad & Sokolove, 2002; Mazzolini & Maddison, 2007; Ruthven, Hennessy, & Deaney, 2005).

The present time that is considered as ‘Information Age and Information Revolution’ that has made major changes in human lifestyle and has created a new concept which is called ‘information society’. Information society is a symbol of all conventional and traditional social processes such as business, education and the like which is located in a new format by using information and communication technology (ICT). Miladi and Malek Mohamadi (2010), based on Yaghoubi’s quotation (2008), believe that broader approach towards E-learning indicates that the education and E-learning system have unique benefits and advantages for organizations and educational institutions.

Chahill (2008), based on Duderstat (2001), in this regard, stated that the higher education must meet these changes and they should invest in capacities which make the new types of learning, independent of time and place limitation, possible, in order to create a persuasive view in their future in the next millennium.

Increasingly, organizations are adopting online learning as the main delivery method to train employees (Simmons, 2002). Internet, which is located among the top ten inventions of the twentieth century, has achieved the concept of long-life learning; and, it also has driven learning out from the limitation of time and place. At the same time, educational institutions are moving toward the use of the Internet for delivery, both on campus and at a distance. Many adult education and training providers are running to get on the online learning bandwagon. Several

global groups of institutions are collaborating to promote distance education (Alley, 2001; Woudstra & Adria, 2003).

Lynch (2004), in a study entitled 'investigation of effective variables for students participation in an electronic evaluation', that was conducted by regression analysis, showed that 'computer', 'gender' and 'the experience of participating in Electronic evaluation' are of the predictor variables of the variability of the dependent variables. There is a significant relationship between the variables 'attitude toward computers and CBT' and 'psychological readiness of the learners to participate in electronic evaluation.

Oliver (2002) in a study entitled 'quality assurance of E-learning in Australian higher education' discusses the factors leading to successful adaptation and sustainable use of virtual learning in higher education in Australia.

Today, with the advent of network-based information technologies and the Internet, a new revolution has created in the teaching and learning process; and, the other traditional practices of knowledge transfer through the text, paper, exercises, etc. are less able to attract the attention of young people who are living in media-saturated world. New communications technologies (especially the Internet) have exciting capabilities to overcome learning barriers and geographical access; many higher education institutions seeks to use these capabilities and features learning, acquisition, teaching and research.

Frazeen (2004), in his final dissertation, entitled 'effective factors in quality of web-supported learning' considers the relationship and impact of several basic factors. He divided these elements in following six groups: organizational and educational factors, instructor, students, technology and educational designing.

Panitz (2008) in his study, about the advantages of electronic and participatory learning about motivating the learners, stated that working students had less interest in face to face education. Chahill (2008) in his paper entitled 'motivating factors of faculty members to participate in E-learning' refers to a significant relationship between 'vocational factors' (time, credit, career development, rewarding and high responsibility at work) and 'structural factors' (access to training materials over the course of learning, presenting different learning styles) with the implementation of E-learning courses. Gamble (2009) in his research entitled 'The learning effects in a multicultural environment' compared and investigated the impacts of an E-learning course that was held in China and the US.

The use of new technologies is very important, because, on one hand technologies related to higher education are being developed constantly and rapidly; and on the other hand, the poor quality of educational professionals and specialists is recognized as a part of global education problem. Unfortunately, in most countries, training of human resources in development projects were not the main priority; as a result, training and teaching programs was not tailored to the educational issues (Rabb, Ellis & Abdon 2002).

E-learning, which is considered as both internet use and digital technologies in teaching and learning, has always been identified as either an alternative solution or a new procedure to boost traditional approaches of education. Educational institutions apply e-learning in teaching process for the following reasons:

- IT promotion: E-learning is becoming an ideal tool for teaching and learning.
- Rich information: E-learning provides the accessibility of rich information resources every time and everywhere for both learners and teachers.
- Alternative learning approach: E-learning can give the possibility and opportunity of learning process to those who were marginalized as disable students.
- Blended learning: E-learning can complete traditional classes by releasing valuable resources and developing training of a greater number of traditional students (Spender, 2001).

Information technology has created new opportunities for education. More than 1000 institutions in 50 countries provide e-learning options (Sharma & Kitchens, 2004). E-learning is a useful tool for enhancing the quality of teaching and learning. E-learning is an “innovative approach to education delivery via electronic forms of information that enhance the learner’s knowledge, skills, or other performance” (Siritongthaworn, Krairit, Dimmitt, & Paul, 2006, p. 139).

Although e-learning in developing countries had been increasingly adopted to achieve by traditional and non-traditional students, in developing countries it is still unknown and it is not used as a training approach (Abdon, Ninomiya & Rabb 2007). However, the e-learning has great facilities for solving many of the problems of education systems including education system such as limited financial resources, lack of attention to developing learners’ creativity and innovative ability, little use of distance learning technologies and the Internet, little relationship of students with the international scientific community, little relationship of education sector with the private sector, mismatch between education system and global changes, use of inappropriate teaching methods, lack of a learner-centered approach in education and lack of cross-organizational relationships (Zare & Zolali, 2006). At an institutional level there are concepts such as Christensen’s (2007) disruptive technologies, and Anderson’s (2006) long tail economy, but few frameworks as reliably and widely used in higher education as Boyer’s (1990) work. Thus, according to numerous features and capabilities of e-learning for agricultural education, the fundamental question of the present research would be “what are the obstacles of electronic learning deployment and development in Iran Higher Education?”

## REVIEW OF LITERATURE

For the past few years, there has been a growing understanding of the important role of information and communication technologies (ICT) in higher education. Various new models of education are evolving in response to the new opportunities that are becoming available by integrating Web-based technologies (Barak & Rafaeli, 2004; Light, Nesbitt, Light, & White, 2000; Ward & Newlands, 1998). Though Web-based technologies are considered to be commonly used for educational purposes, the transition from traditional teaching to ICT-enhanced environments is not obvious and ought to be further investigated.

ICT can serve as a tools for designing new learning environments (Donovan & Nakhleh, 2001),

integrating virtual models (Dori, Barak, & Adir, 2003), and creating learning communities (Gordin, Gomez, Pea, & Fishman, 1997; Rafaeli, Barak, Dan-Gur, & Toch, 2004). However, not all teachers are convinced that ICT should be an integral part of their teaching strategies (Galanouli, Murphy, & Gardner, 2004). Galanouli et al. (2004) declared that resisting change is a state of mind for many teachers and one of the most difficult barriers for effective ICT integration.

With the advent of information technology in education, many researchers have focused on various aspects of this research. In many of these studies, organizational factors, infrastructures, facilities, planning and policy making for e-learning is considered. In other research, the necessary competences and skills for e-learning development in education systems is addressed. Some researchers have noted the following items: the cost of internet access, lack the proper hardware and software facilities, bandwidth limitations, low speed of internet and the delay in responding (Shea et al. 2005; Nordheim & Connars 1997; Zhang et al. 2002; Anstead et al. 2004; Murphy & Dooley 2000; Grant 2004; Liyan Song et al. 2004; Gulati 2008; Partides 2002; Wilson & Moore 2004).

The Internet information technology offered tools for developing collaboration and cooperation activities in distance learning (Jara et al., 2009; Macdonald, 2003), facilitating student interactions in a constructivist perspective linked to Vygotsky's theory (1978). Cooperation implies an engagement to peers through social interaction (Amhag & Jakobsson, 2009; Hew & Cheung, 2008) and collaboration activities delivered in the virtual social environment offered the student the possibility to develop understanding through their own constructs, becoming active learners. Chao, Saj, and Hamilton (2010) believe that collaborative course implementation is the best way to design high quality online courses.

In some studies, lack of social participation and social interaction between students and professors have been considered and their results suggested that students, in e-learning, do not possess the possibility of interacting with friends and classmates and getting help when they are faced with problems and then, probably images and texts may not be satisfying for them (the students). So, the students are deprived of the sense of community in e-learning; and, the students' sense of resentment and despair in e-learning courses is more in comparison to traditional courses (Kurtus 2000; Beneke 2001; Vonderweel 2003; Woods 2002; Lieblein 2000; Liyan Song et al. 2004).

The expansion of e-learning products is one of the fastest growing areas of education since it allows cutting down the costs and it improves the cost-effectiveness of education (Gilbert, Morton, & Rowley, 2007). Despite the proliferation of papers into distance learning in the last past decade, most research has considered technical, financial and administrative aspects and less research was focused on didactic issues. More recently, methodological issues were addressed by researchers, considering various approaches for delivering online courses (EL-Deghaidy & Nouby, 2008). The model of a training based on self-instructional materials and independent study was deeply revised and the focus of distance learning research enlarged to the application of innovative didactic methods such as cooperative learning, having the constructivist learning

theory as a reference (Amhag & Jakobsson, 2009; So & Brush, 2008; Wheeler, Yeomans, & Wheeler, 2008).

In other studies, the obstacles of e-learning development have been investigated regarding educational aspect. In these studies, the following items are addressed: the interval between faculty members and students, motivating procedure of students to begin or continue electronic courses, students' inability in understanding the goals of online courses due to lack of teachers participation, lack of computer literacy or low level of computer literacy among teachers and students, inexperience of faculty members using of technology in teaching, credit of online tutorials and the quality of its graduates, and finally lack of training for teachers in the field of educational technology (Anstead et al. 2004; Dillon & Walsh 1992; McPherson & Nunes 2000; Miller & Miller 2000; Miller 1997; Murphy & Terry 1998; Nordheim & Connars 1997; Kelsey et al. 2002; Gulati 2008).

Some researchers have referred to management issues such as student recruitment strategies, lack of standardization in the field of e-learning, inadequate salary for faculty members, shortage of teaching spaces which are equipped with new technologies, assessing methods of students, copy right and intellectual property issues of the content and course (Arabasz et al. 2003; Shea et al. 2005; Wilson 2003).

In this article, the authors try to respond to the following research question. What are the issues to adapting web-based training deployment in Iran higher education? Then, some alternative solution will be discussed regarding web-based training deployment. And, some recommendations are released at the end in order to pave the road of those who are interested in this field.

## **METHODOLOGY**

### ***Participants***

This is a practical and non-experimental research. The population of this study consists of graduate students of Iranian University which were selected using purposeful sampling. In this sampling, the samples are selected in such a way that they represent a population which is expected to meet the research objectives (Churchill, 1991). In this study, the students were selected that continually used the mail and at least they had used an electronic registration system two times in the college.

### ***Research Instrument***

Thus, 130 students were selected as the sample. The research tool was a questionnaire consisting of two parts: "individual characteristics of the students" and "a measurement Scale for E-learning adapting Barriers" with 30 items which was measured based on five-scaled Likert range, from very low to very high. Cronbach's alpha for the barriers of web-based training was 0.89, indicating the high reliability of the research instrument.

### ***Data Analysis***

Content validity of the questionnaire was obtained through a few revision stages for education and e-learning experts. The obtained data of the questionnaire were analyzed by making the best use SPSS software.

### **Research Procedure**

To assess the reliability of the questionnaire, it was preliminarily completed using 25 students out of the sample. Descriptive and inferential statistical analysis was conducted in two parts.

## **RESEARCH FINDINGS**

### **Individual characteristics**

Research findings showed that students' average age is 24 years. 55.5% of the students were male and 45.5 percent were female. The average score of 54.1 percent of the students (highest frequency) was more than 17. The average score of 37 percent of the students was between 15 and 17. And, the average score of 8.9 percent of them was less than 15. The lowest average score of the students was 12.5 and the highest was 19.25 while their computer literacy was upper intermediate.

### **Web-based training barriers**

Table 1, shows the infrastructural obstacles to the development of e-learning in higher education.

*Table 1: Infrastructure and Equipment Barriers for web-based training*

Barrier	mean	SD	Priority
Lack or shortage of designed equipment and facilities to accommodate new technologies	3.84	0.90	1
lack of Students' access to the computers and proper communication	3.80	1.22	2
Specific problems of Iran telecommunications infrastructures	3.79	1.21	3
Technical problems and the need to time spending to learn solutions	3.75	1.18	4
Old computer systems	3.71	1.17	5
Lack of administrative and technical support for e-learning equipment	3.69	1.14	6
Lack of a proper plan to prevent theft and vandalism	3.55	1.11	7
The use of computers as a means of luxury	3.43	1.18	8

According to presented mean in Table 1, the mean of all the barriers is more than 3 and it is evaluated as moderate and upper than moderate in the students, perspective. In other words, the role of infrastructure and equipment problems, which hinders the development of e-learning in higher education, is considerable. Here, lack or inadequate facilities and equipment for the use of new technologies in higher education is the most important barrier (mean = 3.80).

Table 2: Administrative – educational barriers for web-based training

Barrier	mean	SD	Priority
Lack of laboratory sessions through e-learning	3.89	1.18	1
Lack of education for students in the field of instructional technology	3.78	1.14	2
Lack or shortage of incentives to study in an electronic way	3.77	1.05	3
The nature of e-learning and lack of students' access to real people to solve their problems within their fields	3.70	1.04	4
Lack of transition of the academic culture through e-learning	3.43	1.25	5
Requiring much time to prepare students	3.40	1.09	6

In Table 2, administrative and educational challenges of e-learning development in higher education is presented. The mean of the presented items and components show that 67.5 percent of the administrative and educational issues, to a large extent, and 32.5 percent, to a moderate extent, hinder e-learning development in higher education. The main barrier is considered lack of laboratory sessions via e-learning. Regarding higher education fields and the dominant practical academic activities which is done in farms and laboratories, and also regarding the students' attendance in the farms, which is one of the requirements of academic courses, the possibility of holding sessions via e-learning is so far-fetched. The second and third barrier in the development of e-learning are: 'lack of training courses for students to learn new technologies' and 'absence or lack of incentives for them to study via e-learning'.

Another important factor in the adoption of e-learning in an organization or institution is skilled and committed workforce (Broadbent, 2001). In Table 3, the shortage or lack of skillful manpower for the e-learning development and problems of human resources are mentioned. Regarding the mean of the human resources, 64 percent of these barriers hinder e-learning development in higher education in moderate and higher level. 36 percent of these barriers hinder e-learning development in higher education in low and very low level. The most important barrier for human resources for the development of e-learning is lack of qualified faculty to use modern instructional technologies. The difference between the traditional classroom teaching and electronic learning is similar to the difference between driving a car and flying a helicopter. While some of the skills that come with cars driving may be applicable to the flight, but these skills are not sufficient by themselves. Thus, the transition from one to the other requires more skills. Also, the transition from traditional classroom learning to electronic learning involves acquiring new skills that are typical of this type of teaching and learning (Turgeon, Biase & Miller, 2000).

*Table 3: Human barriers for web-based training*

Barrier	mean	SD	Priority
Inadequate specialized faculty members in new educational technologies	3.92	1.17	1
Unfamiliarity of planners and administrative officers with e-learning applications	3.80	0.92	2
Lack of commitment of faculty members to spend time for learning via technologies	3.77	1.27	3
Stakeholders oppose to e-learning methods	3.78	1.22	4
Students' unfamiliarity with the ways of interacting with instructors	3.45	1.25	5
Lack of interest in students for e learning	3.33	1.44	6
Excessive dependency of students to computer-based teaching and neglecting the teachers' instructions	2.72	1.31	7
resistance of faculty members against changes and their fear of technologies	2.52	1.35	8
Lack of any experience of the students about e-learning and their fear of enrolling in e-learning units	2.44	1.29	9

Some think that the implementation of electronic learning facilitates the teachers' work, but this idea is not always true. Development and deployment of new types of training requires further work and attention. Planners and administrators unfamiliarity with electronic learning applications is the second human issue for the development of electronic learning domain. Lack of commitment of faculty members to spend time learning the technology is the third priority. Electronic learning development requires huge investments both in the financial and in the workforce sectors. The main issues in the e-learning costs are for buying an e-learning content, tools and related systems. The most important issue for the development of electronic learning in higher education is shortage of funds for investment and credit for electronic learning development. This issue accounts for the highest average compared with all 26 barriers are listed in Tables 1 to 4.

*Table 4: Financial barriers for web-based training*

Barrier	mean	SD	Priority
Lack of investment and funds	3.91	0.90	1
High cost of educational technology equipment	3.66	1.16	2
High cost of updating the required content	3.34	1.14	3

The high cost of purchasing equipment for college to use electronic learning and the high cost of updating the content are the second and third priorities. According to in Table 4, and regarding the average of the three credit barriers, financial problem is one of the most important concerns in the development of electronic learning in higher education.

***Factorial Analysis of E-learning Development Barriers***

To categorize the barriers of e-learning development, the exploratory factorial analysis approach was used for data summarization. The suitability of the collected data for factorial analysis was determined by making the best use of KMO (Kaiser-Meyer-Olkin) and Bartlett's tests. KMO value equals to 0.816 which shows that the data for factorial analysis are appropriate. Also, Bartlett test statistic equals to 46.22 that indicates that it is significant in 0.01 level.

*Table 5: The number of extracted factors with eigenvalues, percentage of variance and cumulative percentage of variance*

factors	eigenvalues	percentage of variance of eigenvalues	cumulative percentage of variance
First	5.60	17.35	17.35
Second	4.65	14.69	32.04
Third	3.61	11.63	43.67
Fourth	3.48	10.71	54.38

In Table 5, the number of extracted factors with eigenvalues of each of them, percentage of variance and cumulative percentage of variance of each factor is observed after rotating with varimax method. As it is shown, eigenvalue of the first element is 5.6 and it has the highest influence in determining the barriers. Eigenvalue of the fourth factor is less than other factors and it would account for a smaller percentage when compared to other factors. Totally, these four factors determine 51.40 percent of total variance of e-learning development barriers; and, the other 49.60 percent of variance were the factors that had not been identified by factorial analysis. After considering the associated variables with each factor and their factor loadings, which can be seen in Table 6, barriers to the development of e-learning were named in this way: The first factor includes four barriers referring to the process of learning implementation. Thus, the first factor is named "administrative barriers" that explained 18.35% of the total variance of all obstacles. The variables in the second factor discuss more on the problems of manpower and human resources development in e-learning development.

*Table 6: Variables associated with each factor and the coefficients obtained from the matrix*

Factor s	variables	Load factor of variables
Administrative barriers	The nature of e-learning and lack of students' access to real people to solve their problems within their fields	0.738
	Specific problems of Iran telecommunications infrastructures	0.577
	Lack or shortage of incentives to study in an electronic way	0.559
	Lack or shortage of designed equipment and facilities to accommodate new technologies	0.544
	Lack of laboratory sessions through e-learning	0.541
Human barriers	Lack of interest in students for e learning	0.782
	resistance of faculty members against changes and their fear of technologies	0.725
	Excessive dependency of students to computer-based teaching and neglecting the teachers' instructions	0.719
	Inadequate specialized faculty members in new educational technologies	0.717
	Stakeholders oppose to e-learning methods	0.547
	Lack of any experience of the students about e-learning and their fear of enrolling in e-learning units	0.536
Technical	Lack of administrative and technical support for e-learning equipment	0.775
	Lack of education for students in the field of instructional technology	0.680
	The use of computers as a means of luxury	0.632
	Lack of a proper plan to prevent theft and vandalism	0.624
Financial	High cost of updating the required content	0.745
	Lack of investment and funds	0.653
	High cost of educational technology equipment	0.628

Hence, this factor is named as "human barriers" that accounts for 15.20 percent of the total variance. Administrative and human barriers account for 30.34 percent of the total variance of barriers of e-learning development. The third factor deals with technical problems and educational issues involved in the development of e-learning. Thus, the factor refers to the "Technical- educational Barriers" to the development of e-learning which 15.73% of the explained variance is dedicated to this factor. The variables of the fourth factor assets the credit and financial problems of developing e-learning; hence, this factor is named "financial barriers" in the development of e-learning in higher education that, on the whole, explains 11.91 percent of the total variance.

## **CONCLUSION**

Recent studies have shown that "the successful implementation of educational technologies depends largely on the attitudes of educators, who eventually determine how they are used" (Albarini, 2006). Indeed, understanding the intrinsic and extrinsic dimensions, and including moderating factors (specifically, the cultural dimensions) that influence educators' attitudes towards ICT and adoption in higher education is, therefore, a focal point of interest but is under-researched in recent educational studies of information-accessing behavior (see for instance, Chang and Lim (2002)). As Li and Kirkup (2007) propose, "how far culture influences people's perception of the Internet and their use of it (. . .) needs further research". As Venkatesh (2000) notes, there is a significant and growing body of research regarding the importance of the role of intrinsic motives in technology use (see for instance, Davis, Bagozzi, & Warshaw, 1992; Finneran & Zhang, 2005; Sanchez-Franco & Roldan; 2005 for a review).

New information technologies are opening extraordinary abilities to change or reshape teaching and learning activities in all institutions of higher education. They also provide tools to design modern scientific environments that have never been possible before. For this reason, many universities want to establish electronic courses using the capabilities of information technology in the form of e-learning or online learning. However, the study several research of illustrates that the development of e-learning in education systems are faced with many problems. That unfamiliarity of policymakers and educational planners with them can impose heavy costs on educational institutions. This paper aims to familiarize planners, policy makers, students and faculty members with the issues facing the use of e-learning in higher education. It was found that the important steps in the development of e-learning are 'the strengthening and developing of telecommunications infrastructure in educational institutions' and 'providing access to the networks of institutions' since the effectiveness of e-learning depends on the availability and reliability of hardware and software, and lack of adequate telecommunications infrastructure severely affects the communication between the learner and the educational system. Therefore, funding for facilities and learning tools is a serious need for universities. Many researchers cited lack of the hardware and software as one of the major challenges of development of e-learning (Anstead et al., 2004, 28; Shea et al., 2005; Zhang et al., 2002; Usun, 2006).

Investment in training workforce and training of skilled manpower is another important issue in the development of e-learning. Without specialist and competent manpower the development of e-learning will fail and the resistance of the traditional system will be increased and then,

entering to higher education and information technology will be harder. Moreover, consideration of the nature of several educational courses in planning for the use of e-learning is very important. E-learning will not be replaced by traditional education and it should be focused on the fields and subjects that traditional education system is not able to respond to such problems. The use of modern technology will solve problems and lead to higher education success. Finally, we can say that universities and educational institutions cannot overcome obstacles of the e-learning development without adopting a holistic and integrated approach. And, their policies for directing and providing the necessary resources to facilitate the development of e-learning should be a long process.

The researches do not believe that web-based training is and will be the only possible way to reach such an efficient training and education. Web-based training will be best coming if it is mixed with some other types of media and training. This process leads to a better, cheaper and more effective education that entitled *blended learning*. Although some traditional teachers avoid adopting new methods and techniques web-based training and blended learning, which limits the general tendency toward applying these technologies in education, there is a growing trend for this new training types and hopefully it would be more manifest and apparent day by day.

## THE EFFECT OF USING LEARNING LOGS AS A SELF-ASSESSMENT TOOL ON THE SYNTACTIC DEVELOPMENT AMONG IRANIAN PRE-INTERMEDIATE EFL LEARNERS

Sara Mahdavian  
Dr. Masoud Yazdani Moghaddam  
Dr. Parviz Behruzi

*Islamic Azad University at Garmsar, Faculty of Humanities, English Language Department*

### ABSTRACT

Recently, there has been focus on self-assessment and its effect on students' Learning. Many techniques have been cited for self-assessment. This research attempts to find out, if learning logs as a self-assessment tool has any significant effect on syntactic development. To this end, a standardized proficiency test was conducted on 90 pre-intermediate learners at Amin and Parsa language Institutes in Shahrood. Among them 60 learners who scored one standard deviation above and one standard deviation below the mean were selected. Then they were randomly divided into two groups of 30. Before this research was conducted, a pretest was given to the participants and the treatment followed afterwards. After the treatment, the posttest was conducted. Finally the analysis of t-test was used to find the statistical answer for the above mentioned question and this research indicated that, the experimental group has better results and such kind of activity should be used within a curriculum during the course of study.

**KEY WORDS:** Learning log, self-assessment, syntax.

### INTRODUCTION

In recent years a debate has developed over which techniques to teaching and learning is more effective. Teacher can use these techniques and methods for measuring and understanding their students' weaknesses and strengths. One of these methods is assessment. Assessment, in broad sense, means "any method used to better understanding the current knowledge that a student possesses" (Collins & O'Brien, 2003, p.29).

Also the notion of assessment may have complicated aspects. Assessment is often divided into the following distinctions:

- 1) Formative and summative.
- 2) Objective and subjective.
- 3) Referencing (criterion-referenced, norm-referenced).
- 4) Informal and formal.

Summative assessment, or assessment of learning, and assessment for learning is formative assessment (Stiggins, 2001). In fact, summative assessment is related to assessing students' learning at a particular time, whereas formative assessment is related to further improvement of learning students, assessment of learning versus assessment for learning (Crooks, 2001).

The purpose of formative assessment is to reflect the concepts and skills the teacher emphasized in the class for judging students' performance (Guskey, 2003). The information collected through formative assessment is used to detect the strengths and weaknesses of the learners for the purpose of improving proficiency (Collins & O'Brien, 2003; Shaaban, 2005). According to Black and Wiliam (1998b) the assessment process includes all activities in the class, either by teachers to assess their students or by students to assess themselves, and according to this definition, "assessment includes teacher observation, classroom discussion, marking tests and collecting information from students themselves about their own learning; namely students' self-assessment" (Davis, 1998). Students' self-assessment can be considered as one of the most important formative assessment techniques and it can improve the quality of student's learning and it modifies teaching strategies. Therefore, if students have enough time to assess themselves in the class, they will be more confident and they can improve themselves better, (Angelo & Cross, 1993).

#### **STATEMENT OF THE PROBLEM AND PURPOSE OF THE STUDY**

One of the major goals of linguistics is to identify the syntactic rules of a language; syntax is a major component of the grammar of a language. Syntax is referred the ways that words combine to form sentences and the rules which govern the formation of sentences, making some sentences possible and others not possible within a particular language (Richards & Schmidt, 2002). To communicate students must develop their syntactic ability. Yet after these many years of exclusive methods for teaching grammar, our students have not reached an acceptable level of mastery and they have many problems. Also the teachers assess their students' syntactic ability on the basis of the traditional assessment methods such as, written tests. These tests bring anxiety, fear, or disappointment to students which might negatively affect their language learning. For this reason, this research attempts to examine the effect of using learning logs as a self-assessment tool on syntactic development. So the major concern of the research is to provide appropriate techniques to expand students' attention to the self-assessment that is necessary for their learning. Nowadays teachers mainly try to prepare students for assessing themselves through different techniques. These techniques can be replaced by teachers' test, which can make anxiety for students. One of these practical techniques can be making logs by students in the class, in which they can also use grammatical structures in their logs, besides assessing themselves. Therefore, the purpose of this study is to investigate the effect of learning log as self-assessment tools on syntactic development (conditional and passive structures) among Iranian EFL learners.

#### **SIGNIFICANCE OF THIS STUDY**

When this research is conducted, it is expected that a number of fruitful results would be achieved. Firstly, it will make an effective method to develop some aspects of grammar (conditional and passive forms), since it can provide an opportunity for learners to assess themselves in the class. Secondly, it will introduce a way of self assessing through learning logs. Thirdly, it will involve students' attention and increase their motivation on their own learning. In

this way, Iranian pre-intermediate EFL learners can benefit the result of this study and develop their syntactic ability by employing learning log as a self-assessment tool in their process of learning.

## **REVIEW OF RELATED LITERATURE**

According to Collins (2009), syntax is related to the following means:

- 1- The branch of linguistics that refer to the grammatical arrangement of words and morphemes in the sentences of a language.
- 2- It is facts about grammatical arrangement of words in a language.
- 3- It is a systematic statement of rules governing for the grammatical arrangement of words and morphemes in a language.

According to these definitions about syntax it is important to know about it especially for EFL learners. In this research the researcher wants to study the effect of using learning logs as a self-assessment tool on syntactic development.

Self-assessment or self-evaluation

According to Richards and Schmidt (2002), self-assessment also self-evaluation is referred to check one's own performance on a language learning task after it has been completed or checking one's own success in using and learning language. They also have cited, self-evaluation or self-assessment is an example of a meta cognitive strategy in language learning.

### ***Other meanings of assessment***

In literature, the terms assessment and evaluation are sometimes used interchangeably (Collins & O'Brien, 2003). But sometimes they are used in differently. Assessment, in broad sense, means "any method used to better understand the current knowledge that a student process" (Collins & O'Brien, 2003, p.29). On the other hands assessment of students includes using a well organized system, namely tests, to make judgments about the student's achievement (Gronlund & linn, 2000). Tests may create anxiety, fear, or disappointment for students, and may have negative effect on language learning of learners. Students might suffer from spending long hours of study and preparation for tests and they might be disappointed at the fact that what they concentrate differs from what the teacher emphasizes on his/her question (Guskey, 2003).

Self-assessment is a kind of assessment that students can be involved in the teaching-learning process and it helps improve their performance (Brantmeier, 2005; Falchikov & goldfinch, 2000; Shaaban, 2005). Self-assessment does not mean that students are allowed to assess themselves in the form of grades; instead they continue feedback on their progress to help both students and teacher.

Students' self-assessment is referred to be one of the most important formative classroom assessment techniques, and one of the purposes of this technique is to improve the quality of students' learning, it can also lead to modify teaching strategies that have not met the required learning outcomes.

Students can increase their awareness of what is happening in class by assessing their own learning (Gipps, 1994). Definitely the most important factor of a successful teaching-learning process is active student's involvement (Stiggins, 2001). This needs teachers to provide their students with feedback for using it effectively for learning and consequently, students can learn how to assess themselves so that they can learn what they need to do In order to achieve success (Black & Wiliam 1998b).

### ***Assessment without test***

The following are devoted to so call alternative assessment methods, including:

- Observation
- Portfolio
- Conferences
- Dialogue
- Journals
- Journal

Journals are written conversations between students and teachers (Hold away, 1979). Dialogue journal is a written conversation between a teacher and an individual student, which is quite confidential and is an on-going thought a whole semester or school year (Froese, 1991). Dialogue journal writing supports the writing process by providing an authentic two-way written interaction between writing partners, which are usually the teacher and the student (Edelsky, 1986; Peyton & Reed, 1990; Peyton & Staton, 1993; Silva, 1990; Staton, 1988a; Urzua, 1987).

Students trust and get closed acquaintance with the reader/responder of dialogue journal writing, so they attend to specifics more and explain their ideas in more detail to meet their reader/responder needs (Alexander, 2001). Also Richards (1992) has defined number important benefits of dialogue journals that provide useful information for individualizing instruction such as:

- writing skills.
- writing strategies.
- Their interests, expectations, goals.
- Students' experience in and outside of the class.
- Learning process.
- Attitudes and feeling about themselves, their teachers.

### ***Learning log***

According to Brown (1941), a journal is a log or account of person's thought, feelings, reactions, assessments, or ideas, that usually written with little attention to structure, form, or correctness. Learners can involve their thoughts without fearing of those thoughts being judged later by teacher, and sometimes journals are represented a stream of a consciousness with no particular point, purpose, or audience (Brown,2010).According to Staton, Shuy, Peyton, and Reed (1987,cited by Brown,2010), there are some categories or purposes in journal writing such as the following:

- Language-learning logs
- self-assessment reflection
- grammar journals

- responses to reading
- acculturation logs
- diaries of attitudes, feelings, and other affective factors
- Strategies-based learning logs

### ***What is difference between journal, log and diaries?***

Learning logs, journals and diaries are terms often used interchangeably. However, the purpose of them may differ slightly (Moon, 2003). Diary is a record of the day's events, what happened, who was met with and what may have been discussed and what was decided at that time. It is general but also can be very specific and detailed but it may also refer to other source of information (Moon, 2003). Journals are free-flowing, often un-structured pieces of writing that relate to opinion and personal experience (Froes, 1991). Whereas, learning log is valuable tools that will help students make sense of their learning at school, also it is an opportunity for reflection on what you are learning, how you learned, and what you still need to learn (Moon, 2003). Learning logs are clear response to specific questions focused on the learning process, and they are objective, and factual (Richards, 2002 ).

## **METHODOLOGY**

### ***Introduction***

As mentioned before the purpose of this study is to investigate whether using logs as a self-assessment tool have any significant effect on syntactic development or not. Also the present chapter describes the following parts: the participants, instrumentation, materials, procedure, data collection and design. The participants section details the population from which the researcher plans to select the sample. The instrumentation section deals with the instrument or data gathering devices that used in this study. The procedure section outlines the research plan. It describes what researcher did and what data was needed.

### ***Participants***

To test this null hypothesis, all the pre-intermediate level male and female EFL learners in Amin and Parsa Institutes in Shahrood aged between 15 and 20 participated in this study and they enrolled in the new course at the pre-intermediate level. In order to have two homogeneous classes, the researcher administered a proficiency test among 90 students of two institutes. Among them 60 learners who scored one standard deviation above and one standard deviation below the mean were selected. Then she ranked students based on their performance on the test. The researcher randomly assigned one subject to the control group and another to the experimental group, to ensure the homogeneity of the control and experimental groups. Experimental group received treatment which was focusing on the learning logs as a self-assessment tool during their treatment and the control group did not receive any treatment.

### ***Instrumentations***

The researcher intended to use CELT as the proficiency test and the teacher-made test for the pre-and post-test. The comprehensive English Language Test (CELT) as a proficiency test was piloted on students who were at the same level of pre-intermediate, and acceptable Cronbach index (0.832) was obtained and so it was proven reliable and all the items were multiple-choice

items. The tests were scored by help of some scales and the results were evaluated with SPSS and EXCEL software. CELT was used as a proficiency test in order to ensure the homogeneity of the participants in terms of linguistic knowledge. The researcher with the help of SPSS and MS EXCEL 2007 software evaluated scores on proficiency tests. The teacher-made test was used for the pre-and post-test which included total structures of grammar and the researcher wanted to investigate the students' improvement in conditional and passive forms. First of all, the pre-test was piloted on 10 students who were at the same level of the experimental and control groups for standardization. Both the pre-and post-test were based on multiple choice and the participants had to answer the items on an answer sheet.

### *Procedure*

After administration of the proficiency test, 60 participants whose scores were between one standard deviation above and one standard deviation below the mean score were selected. Then the scores were ranked and the participants were randomly assigned into two groups. It had been tried that each group contain participants of all ranks. Both of control and experimental groups after being homogenized with respect to their result of proficiency test had a four-week-course, and eighty minutes for each session. Before administration of the pre-test for the researcher to make sure of the reliability of the test, the test was administered to a group of 10 students who were at the same level of the target groups. Then the data gathered from the administration was analyzed to ensure the reliability and validity of the test.

### *Treatment*

First of all, all the pre-intermediate students in Parsa and Amin institutes were asked to change the Persian sentences in to the English sentences which were included conditional and passive forms. According to this teacher research, because of several models of these structures, students had lots of problems at theses institutes and for this reason the researcher made decision to teach these structure on the basis of the self-assessment technique instead of traditional assessment.

During 20 sessions (four weeks) of treatment, the researcher taught conditional and passive forms from Interchange and Headway books. At the beginning of treatment students were asked to make logs in the class. It was explained how students had to make logs and how to write about their feelings and thoughts in their logs. Therefore they could write about the difficulties they had in conditional and passive forms and what they could do with this structure after each unit. The students made log after each unit and they also wrote about their learning and practicing plans.

### *Experimental group*

The experimental group consisted of 30 students. The students in this group were taught by one of the researchers, using the technique of the students' self-assessment and at the beginning of the course the researcher explained about making logs. After teaching of every unit students were asked to make logs. Then at the end of each unit, they should write their thoughts, beliefs, and the difficulties they had in the forms of conditional and passive as far as possible. It was certain method to measure how well students have learned the taught material was used. All of the students in the experimental group should do this activity in the class and the researcher gave their students time to respond. The purpose of this activity was to provide both the teacher and the students with true information about the students' learning outcomes and their needs. It also gave the teacher immediate feedback about the students' learning. Therefore, after analyzing the students' feedback, if the researcher felt that the class had failed to understand a certain point; she could try to modify teaching strategy for the next class to teach that particular point again. To achieve this goal, the researcher collected the students' feedback and sorted it in order to have a clear idea of what to discuss in the next class.

This information was exchanged between the students and the teacher by logs; therefore the researcher could utilize it to improve activities and methods in the class. The Students wrote about themselves and about what they should do for improving more in their logs. According to (Richards, 2003), the students can express themselves in these following forms:

- After this unit I studied.....
- After this unit I learned.....
- My difficulties were.....
- My learning and practicing plans were.....

#### *Control group*

The control group also consisted of 30 students. The students in that group were also taught by the same researcher. In this group, students were not asked to make logs and they did not have to make log for assessing themselves. Teacher utilized only the traditional techniques of classroom assessment.

#### *Design*

According to Mackey and Gass (2005) the design of this research was a comparison group design, a subcategory of quasi-experimental design, and sampling design was intact group design. The dependant variable is syntactic development; the independent variable is the effect of learning log as a self-assessment tool, and the language proficiency level is considered as control variable.

The diagram of such a design is as follow:

G1 (control)	T1		T3
G2 (experimental)	T3	X	T4

In this research T1 and T3 refer to the pre-test before applying the treatment and T2and T4 refer to the post-test. The Post-test was administered at the end of the course.

#### *Data analysis*

For testing hypothesis, there was a t-test which was a quantitative procedure. Computer based statistical program such as SPSS (Statistical Package for Social Science) was conducted. According to Hatch and Farhady (1981) t-test is an excellent statistical procedure to use in comparing two means, in order to get relationship between two sets of scores and final logical answer to the research question.

## **RESULTS AND DISCUSSION**

### *Descriptive Analysis of CELT proficiency test score*

The researcher administered the proficiency test among students who were in 6 classes of 15 members. All of them were at the pre-intermediate level. Table 1 illustrates the descriptive statistics of CELT proficiency test.

*Table 1: Descriptive statistics of CELT proficiency test.*

		Statistic	Std. Error
scores	Mean	77.1667	2.23988
	95% Confidence Interval for Mean		
	Lower Bound	72.7161	
	Upper Bound	81.6173	
	Median	83.0000	
	Variance	451.534	
	Std. Deviation	21.24932	
	Minimum	28.00	
	Maximum	100.00	

In this table the Standard deviation, mean score, and variance are 21.24, 77.16, and 451.53. Before administration of the pre-test for the researcher to make sure of the reliability of the test, the teacher-made test that was given to the both groups was administered to a group of 10 students who were at the same level of the target group. According to the Table 2 the researcher used Cronbach Alpha to investigate item facilities and difficulties. Table 2 illustrates the reliability of teacher-made test.

*Table 2: Reliability of teacher made test*

Cronbach's Alpha	N of Items
.734	40

As can be seen in this table, the teacher-made test was administered and acceptable Cronbach Alpha index (0.734) was obtained and so it was proven reliable and the researcher could use it as the pre-and post-test between the experimental and control groups.

### ***Descriptive Analysis of the pre-and post-test scores***

As it was discussed previously, after piloting the pre-test, the subjects were given a pre-test. Before investigating the results on the scores of the pre-test, the descriptive statistics were presented in order to summarize the available data and describe the main features of the data. Table 3 shows the results of the pre-test scores in the control and experimental groups.

*Table 3: Results of the pre-test in the control and experimental groups.*

		exp group in pre test	control group in pre test
N	Valid	30	30
	Missing	0	0
Mean		78.4667	79.3667
Std. Error of Mean		1.54751	1.21909

Median	77.0000	78.5000
Mode	77.00	78.00
Std. Deviation	8.47607	6.23302
Variance	71.844	44.585
Minimum	64.00	68.00
Maximum	96.00	93.00
Sum	2354.00	2381.00

As it is observable, the mean score of control group in the pre-test is equal to 79.36 and that of the experimental group is 78.46. They are close to each other and it seems that there is not remarkably significant difference between them. Table 4 shows independent t-test comparing the control and experimental groups at the beginning of the research.

Table 4: Independent t-test comparing the control and experimental groups in the pre-test.

	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
g Equal variances assumed	2.384	.128	-.457	58	.649	-.90000	1.97001	-4.84341	3.04341
o Equal variances not assumed			-.457	54.986	.650	-.90000	1.97001	-4.84802	3.04802

As the table shows the level of significance and the t-value of this test are .128 and -.457 respectively. As you can see, the significance value is far above the .05 level of significance, and the difference between the two means is not significant. In other words, there was no significant difference between the scores at the outset of the research. Therefore, it comes to be known the two groups were homogenous.

Table 5: Dependent t-test comparing the pre and post-test of the experimental group.

	Paired Differences					t	df	Sig. (2-tailed)
	Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
				Lower	Upper			
Pair 1 exp group in post test - exp group in pre test	3.53333	2.56949	.46912	2.57387	4.49280	7.532	29	.000

It can be seen in the table that the significance level was below 0.05 and the degree of freedom, mean, standard deviation and standard error of measurement were 29, 3.53, 2.56, and 0.46 respectively.

The sharp difference between the two means indicated that the students improved substantially. Consequently the significance value is below 0.05. Table 6 shows the pre and post-test of the control group.

*Table 6: Dependent t-test comparing the pre and post-test of the control group.*

	Paired Differences					t	df	Sig. (2- tailed)
	Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
				Lower	Upper			
Pair 1 control group in the post test - control group in the pre test	.40000	1.88643	.34441	-.30440	1.10440	1.161	29	.255

The difference between the means of the pre- and post-test is insignificant, which indicates the students did not improve significantly during the course. As can be seen the significance value is above 0.05 and null hypotheses has not been rejected. Thus, the results came to be insignificant. Whereas, in table 6 the significance value is below 0.05 which indicates there is sharp difference between the means of the pre-and post-test in the experimental group during the course and this improvement can be related to the treatment of the experimental group.

## CONCLUSION AND DISCUSSION

According to the result of t-test which was used to indicate the statistical significance of the difference between the means on two sets of scores, it could be concluded that the mean score of the experimental group is (82) with a standard deviation of (7.26), while the mean score of the control group is (79.76) with a standard deviation of (6.34). The results show that there is a significant difference between post-test scores of the students of the experimental group over the students of the control group after treatment due to the method of self-assessment. This indicates that the implementation of logs as a self-assessment had a positive effect on the students' performance in syntax (conditional and passive forms).

### ***Pedagogical implication***

In the section below, by making use of results obtained in the previous chapter, the research question posed in the first chapter is addressed then the researcher summarizes the findings in support the claim that due to the implementation of the self-assessment technique there was a statistically significant differences between the mean scores of the performance of the subjects of the experimental group over the period of the study compared to the mean scores of the subjects of the control group. Regarding to the research results, there is a significant relationship between use of log as a tool for detecting students' feeling and attitudes and syntactical development. As results in tables and show, the participants in experimental group who were exposed to making logs improved more significantly from pre-test to post-test in syntax than control group who were not exposed to this technique. It took students about three weeks from the first introduction of learning logs and self-assessment techniques to learn how to use them effectively to assess them.

At the beginning, many students were reluctant to express themselves through short sentences which was included their attitudes in the form of different examples of what they had taught. They wrote very few and vague comments. Sometimes they wrote that they understood when they really did not. The researcher had to spend some time with those students to explain to them that the technique aimed at helping the teacher to determine the students' problems so that she can handle them properly and to be aware of the students' strengths in order to reinforce them and to be aware of students' weakness in order to solve their problems.

The second point was that, the researcher noticed that the use of log was very useful, especially for students who were shy and reluctant to cite what they did not understand. Therefore students could express themselves, their feelings, attitudes, thoughts and their performance by writing different examples of related structures in the logs for assessing themselves and by this technique they could be aware of their strengths and weaknesses better than before. Also students' self-assessment had effect on the teacher strategies, it also gave the teacher immediate feedback about the students' learning after each units. Therefore, after analyzing the students' feedback, if the researcher felt that the class had failed to understand a certain point; she could try another teaching strategy for the next class to teach that particular point again. Because of being close relationship between teacher and students, students' self-assessment had effect on teacher's strategies and researcher could modified her strategies to teach certain point on the basis of students' needs, strengths, and weaknesses. Also, this technique of self-assessment encouraged students to participate more openly which was clear from the researcher. It directed students to write more accurate and honest answers, especially when they felt that they would not be judged

by marks. It also helped the students to direct their own effort more effectively which was clear in the paper work which they had submitted, especially towards the end of the study.

### ***Suggestion for further research***

It is believed that, this study covered a narrow scope of language learning strategies, and other researchers and interested students are recommended to carry out related studies to achieve more knowledge in this regard. It since the study was narrowed down in terms of its participants, and self-assessment technique, it seems necessary to point out some further research to done in this regard. Many factors, such as the subjects' genders and individual differences, social background were not taken in to consideration. Thus, in interpretation the results, we should consider that those factors might have affected students' ability in syntax. Also this research focused on some aspects of grammar (conditional and passive forms), while further research can be done over the other aspects of grammar. The need is felt to carry out similar experiments to investigate the long term effects of self-assessment techniques for other skills such as, writing, reading, listening, and even speaking. This research could be replicated with learners at higher and lower levels of language proficiency rather than pre-intermediate levelers were considered in the present study.

## ABSTRACT

This study was an attempt to investigate the effect of teaching two cognitive strategies i.e. Contextualization versus Inferencing on the Iranian intermediate English as a foreign language (EFL) students vocabulary development. In this study, the researchers have employed two Contextualization and Inferencing strategies taken from Brown (2000) to teach forty intermediate words to 77 participants. The participants were intermediate students of Golestan Language Institute who were divided into two experimental and one control groups. One of the groups benefited from Contextualization, the other one received Inferencing strategies, and no specific treatment was applied for control group. Based on the definition of cognitive strategies and the two selected strategies, the researchers tried to manipulate the teaching materials in a way that the words were placed in a meaningful sequence for Contextualization, and provided some information and clues that helped participants to guess the meaning of the new words for Inferencing. The results of this study gained through t-test and Oneway ANOVA analysis, indicated that the Contextualization strategy was more helpful in development of the intended vocabulary, since the related group's results outweighed the findings of the other two groups, in other words the difference between the mean scores of Contextualization and Inferencing strategies was statistically significant. The findings of this study suggest that the teachers should take advantage of the cognitive strategies more effectively in their classes while teaching vocabulary.

**KEYWORDS:** Vocabulary development, Strategies, Contextualization, Inferencing.

## INTRODUCTION

Lexis plays a crucial role in the area of second and foreign language learning which has widely been acknowledged in vocabulary research. It is quite vital for L2 and foreign language learners to acquire an impressive command of vocabulary of that language to become successful learners. Singleton (2007) states that “the major challenge of learning and using a language –whether as L1 or L2- lies not in the area of broad syntactic principles, but in the ‘nitty-gritty’ of the lexicon.” (Singleton, as cited in Murcia 2007.) Hunt and Beglar (2005) also argue that “the heart of language comprehension and use is the lexicon.” Besides these important issues of vocabulary that has even been considered as to be the Cinderella of the field of second language acquisition research during much of the twentieth century (Levenston, 1979;

Richards, 1976), it has been neglected and undervalued throughout its varying stages and up to the present day.

Undoubtedly, all language teachers and learners believe that learning a second language requires learning a large value of vocabulary of the target language, but their most important concern is how to accomplish this task. It is important to know how vocabulary is best acquired, and what the instructor can do to develop the process of lexicon acquisition. For sure, dictionaries are the first and most reliable sources for this aim, but they are not enough since the new vocabulary is internalized well when the words are learnt in effective ways rather than just checking them in the dictionaries, and also through its later use. On the other hand, English L2 and FL learners are often criticized for using unhelpful ways when learning vocabulary. Therefore, it seems a pivotal problem which needs specific strategies to deal with.

According to Rasekh (2003) and Oxford (1994) successful learners unconsciously develop their own special traits including some behaviors and techniques which help them to boost their process of L2 acquisition. Whenden (1991) also claims that these actions, behaviors and steps that learners apply are learning strategies that would facilitate the obtaining, storage, retrieval and use of the input information.

Based on H. Douglas Brown (2000), learning strategies are divided into three main categories. a) Metacognitive strategies that involve planning for learning and thinking about the learning process as it is taking place. b) Cognitive strategies that are more limited to specific learning tasks and involve more direct manipulation of the learning material itself. c) Socioaffective strategies that have to do with social mediating activity which interact with others. In this study, the researchers have chosen two cognitive strategies "Contextualization" and "Inferencing", the former refers to placing a word or phrase in a meaningful language sequence while the latter refers to using available information to guess the meaning of new items, predict outcomes, or fill in missing information.

The purpose of the study has been to implement these two strategies in teaching Iranian intermediate EFL students, and at the same time make a comparison between their effectiveness.

## **REVIEW OF LITERATURE**

It is generally accepted that a considerable percentage of L2 vocabulary acquisition on the part of learners occurs incidentally, in other words to make the new words learned and retained a variety of textual enhancement techniques could be applied (Robinson, 1994).

According to Arani (2005) there are a great number of researches on vocabulary and its different aspects, but the most focus is on how learners process the newly taught information and what strategies they use to comprehend and restore them. Therefore, it is worth studying the present strategies and take advantage of the best ones which suit our purpose.

Oxford (1990) is one of those who tried to present a very comprehensive taxonomy of language learning strategies. The main distinction in his classification is between direct strategies and indirect strategies. Oxford divided the direct strategies into three: memory strategies (used for storing and retrieving aspects of the target language), cognitive strategies (used for using the language and for understanding how it works), and compensation strategies (used for using the language despite gaps in knowledge). On the other hand, indirect strategies cover metacognitive strategies (used for planning, organizing, and evaluating

learning), affective strategies (used for approaching the task positively), and social strategies (used for collaborating with others for assistance).

Considering the importance of strategies, this study is based on two metacognitive strategies, Contextualization and Inferencing which were defined in chapter one. Theoretically, Contextualized vocabulary acquisition (CVA) is primarily a vocabulary learning method used in learning a second language or foreign language through the use of contextual tools. It involves inferring the meaning of words in a given context, most often a text. As opposed to de-contextualized learning, this type of vocabulary learning is incidental and depends on the context the learner is exposed to. Vocabulary here is not systematically learned for a specific purpose, even if its understanding and acquisition will become purposeful in the long run. This strategy is not suitable for beginners as it implies that the student has already acquired a certain level in L2 in order to be able to read a second language and infer meaning of particular words from the main context. It also implies more complex cognitive processes by the learner who is actively seeking meaning as opposed to mere memorization of a list of words, which conforms to its "opposite" strategy of de-contextualized vocabulary learning. CVA requires students to make more efforts to find out the meaning of words. Concentration, perseverance and reasoning are the types of skills students are bound to develop by using contextualized vocabulary acquisition extensively (Ghanbari, Kassaian & Duppenhaler, 2011).

Inferencing on the other hand, has been defined as the connections that people establish when they try to interpret texts (Brown & Yule, 1983). It is appropriately related to global understanding of longer pieces of discourse in which context may exercise an influence in enabling comprehension. Therefore, inferencing and meaning-guessing are the products of contextualization. As such, EFL learners can possibly derive the meaning of unknown words using the context in which they appear, that is, a sentence in which the word to be learned appears (Clarke & Nation, 1980; Chern, 1993; Huckin & Bloch, 1993; Rott, 1999). Lexical inferencing from information available has been recognized in recent years as an important strategy for dealing with unknown words (Buikema & Graves, 1993; Fraser, 1999; Nazmia, 2004; Parel, 2004). It involves using a variety of linguistic and nonlinguistic clues to guess meanings when the learner does not know all the words (Oxford, 1990a,b).

Inferences involve information that is not explicit in the text, but that the reader adds on the basis of the congruence between the explicit text content and his or her prior knowledge. Two main types of knowledge-based inferences in reading have been distinguished: connective inferences and elaborative inferences (Singer, 1994). The former are necessary to establish a coherent propositional representation of the successive parts of the text, thus integrating explicit information in a message. The latter serve to extend or refine the explicit content and thus help to construct a mental model of the situation described by the message. The examination of lexical inferencing also often needs to consider the following two aspects. One is using linguistic and other knowledge to infer the unknown words; the other is using the cognitive processes to infer the meaning of new words. Actually, it is difficult to separate the knowledge and process in that "although serial hypothesizing, guessing and decision-making processes seem to be governed by conscious decision making and can be followed in a think-aloud protocol, many generation and recognition activities are relatively unanalyzable, because they are unconscious and possibly parallel processes and therefore readers are not able to report them" (Roskams, 2005:71).

## RESEARCH QUESTION

Implementation of this study tries to answer the following research questions:

1. Does implementation of Contextualization and Inferencing strategies significantly affects student's vocabulary knowledge?
2. What are the statistically significant differences between the effects of these two strategies in learning and internalizing the new vocabulary?

### **SIGNIFICANCE OF THE STUDY**

In learning a second language, vocabulary has a crucial role and in order to communicate well in the real context, an adequate number of words and the knowledge of using them is required. Additionally, many scholars acknowledge the intimate relationship between the vocabulary and the four skills. Rhoder and Huerster (2002) confirm the need for language learners to have extensive vocabulary knowledge in reading and listening. Ultimately, the understanding of the student's problems in vocabulary learning and the ways we can foster this process seems to play an important role not only for teachers and material developers, but also for students themselves. If students develop their own strategies and become more independent learners as a result it can enable them to provide and design materials and activities that will enhance their lexical competence. On the other hand, awareness of strategies through strategy teaching will lead to autonomy. According to Weden (1985), the autonomy of students and learners should be aligned with teacher's goal of facilitating self-directed learning by introducing and recommending strategies to encourage the learners to discover which strategy suits them better. In this study, two cognitive strategies have been put into practice to come to a conclusion that which strategy helps students to improve and internalize the new vocabulary better.

### **METHODOLOGY**

#### ***Participants and Setting***

This study was carried out at Golestan Language Institute, the official branch of Simin Language Institute on Golestan Street, Mashhad, Iran. The participants of this study were 77 students from six intermediate classes at the Golestan Language Institute in the summer of 2012. Each of these classes consisted of eleven to fourteen male and female students with the average age of 20. One of the researchers was the teacher of these classes and by applying some changes in the syllabus that have been approved by the supervisor; he could provide adequate time to carry out the treatment.

#### ***Instrumentation***

In order to collect the required information the researchers took advantage of a Nelson proficiency test i.e. 200 A by Fowler and Coe (1976), this intermediate test contained 50 items including 36 structural single items and 14 structural continuous prose. The test was run to select homogenous groups of intermediate students based on their proficiency. And a pre-test prepared by the researchers which was used as the post-test too. It should be noted that the test was developed by the researchers since there was no valid and reliable test in the market meeting the needs of the researchers. The validity of the test was also reviewed and revised by two experts in the field. In order to check the reliability, the test was piloted on twenty similar intermediate students of Golestan Language Institute. The data was used to estimate the Cronbach's Alpha value which proved to be .816.

The pre-test contained forty vocabulary test items based on the prepared and selected vocabulary that were supposed to be taught to the participants through the use of the two contextualization and inferencing strategies.

### ***Design***

The design of the study was quasi-experimental with three groups. In this study, there were one control group and two experimental groups. The participants were from six classes. A pre-test-treatment-post-test design was employed to verify the effect of Inferencing vs. Contextualization strategies.

### ***Procedure***

This study was conducted at Golestan Language Institute in Mashhad in the summer of 2012; three intact groups from six classes of this institute who were taught by one of the researchers were selected as the participants. The researcher omitted the snapshot and perspective parts of the New Interchange book 2 that seemed easier for the students which have been approved by the supervisor, and could save fifteen minutes each session for the teaching of the intended vocabulary items. Most of the students were hard working and cooperated well with the researcher. Although based on the institute placement test all the students were at the intermediate level, the Nelson test also showed that the participants were homogeneous. After the Nelson test, the pre-test was conducted.

After analyzing the average of the obtained scores it was concluded that all the participants did not have a prior knowledge of the 78.85% of the prepared intermediate words. In the next session of the class, the researcher let the students know that they would be presented with forty additional and useful words. They were told that every other week, they would be given four words each session, and after twenty sessions a test would be conducted in order to verify how well they have learned and memorized the words. At the beginning of each session, the researcher dedicated fifteen minutes to teaching the new words and the rest of the session was spent on the normal teaching procedure of the New Interchange book 2. As mentioned above, each session four words were taught to the groups, and it took ten sessions in two months to complete the teaching process. In the control group, the method of teaching new words was similar with the method used in their own book to teach vocabulary. The words were listed on the board, and then pronounced by the teacher. The students were supposed to use their dictionaries, and when they had any problems, they asked the researcher.

In the other two groups i.e. Inferencing and Contextualization, new vocabulary were taught based on the inferencing and contextualization strategies already prepared by the researcher according to the definitions and guidelines acquired during the thesis preparation. First of all, the new words were written on the board and then the teacher asked participants to listen to the pronunciation of the words carefully. The students listened to the teacher pronunciation four or five times, and then the teacher wrote the sentences he already prepared on the board for each word. In the inferencing strategy group, each word was followed by an example that contained some clues that helped the participants to infer the meaning of the word, while in the contextualization strategy group, each word was followed by a short contextualized dialog that helped participants to guess the meaning of the new word. After the participants read the given sentences on the board they were asked to guess the meaning of the new words individually. Then, in order to make sure that the participants guessed and inferred the correct meaning, the teacher used the spot check technique. Most of the students had correct guesses and those who were not sure about the exact meaning, got the correct meaning after the spot checking. Finally, after all the students found out the meaning of the new words, the words were pronounced again by the teacher and this time the participants were asked to repeat the words after the teacher. Students were also asked to write down the words and the given Contextualization and Inferencing examples at the end of the teaching process.

## **DATA ANALYSIS AND RESULTS**

Analysis of the data is a multi-level process in which the whole gathered information would be summarized, classified in order to provide a chance to verify and analyze the different relationships between the data to investigate the research questions. In this process the data would be analyzed both experimentally and conceptually and various statistical techniques have a vital role in conclusion and generalization. In this section, the obtained data through pre-test and post-test are analyzed by statistical techniques, and the results would answer the research questions.

In order to make sure that changes in the scores of the groups are only affected by the treatments, the participants are supposed to be as homogenous as possible. While investigating the research hypotheses it is important to determine the methods that we use to make the comparison between the control group and the experimental groups, in other words if we want to apply the classical tests we should verify the different dimensions of normality hypothesis. The normality hypothesis has been tested through One-Sample Kolmogorov-Smirnov Test and its results for each group are presented below. Based on the following hypothesis, One-Sample Kolmogorov-Smirnov Test shows that the observations are normally distributed.

$H_0$ : Observations distribution is normal

$H_1$ : Observations distribution is not normal

When the P-value exceeds the standard normal value i.e. 0.05 the zero hypothesis is rejected proving the fact that the observations are normally distributed. The normality hypothesis has been tested through One-Sample Kolmogorov-Smirnov Test and its results for each group are presented in (Table 1).

Table 1: Results of Kolmogorov-Smirnov test

	Pre-test A (control)	Post-test A (control)	Pre-test B	Post-test B	Pre-test C	Post-test C
N	26	26	25	25	26	26
Normal Mean	8.4231	20.4231	8.6000	21.6800	8.3846	20.1154
Paramete Std.	3.16447	5.20133	3.8297	6.64404	4.04056	5.13285
rs <sup>a,b</sup> Deviation			1			
Most Absolute	.245	.128	.115	.102	.147	.163
Extreme Positive	.245	.118	.111	.080	.147	.163
Differenc Negative	-.173	-.128	-.115	-.102	-.100	-.080
es						
Kolmogorov-Smirnov Z	1.252	.654	.574	.511	.750	.831
Asymp. Sig. (2-tailed)	.087	.785	.897	.956	.628	.495

a. Test distribution is Normal.

b. Calculated from data.

Results of (Table1) indicate that the obtained scores of the participants in the three groups of the study are definitely distributed normally. Therefore, the normality hypothesis of the observations would not be rejected. According to the gathered information, zero hypothesis and accepting the normality hypothesis for the observations we are allowed to employ classical tests to compare the results of the control and experimental groups. In order to compare the two samples using classical tests it is important to employ t-

student test since the variance of the society is not determined. This test is different for dependent and independent samples, in this research the samples are independent hence we employ the t-student distribution with an n-2 degree of freedom.

In order to investigate the first question after analysis of the groups and determining the unity of them we need to compare the post-test scores of group A (control) and group B (contextualization) and also the post-test scores of group A (control) and group C (inferencing) that the results of this evaluation are presented in (Table 2) and (Table 3).

*Table 2: Groups A and B Post-test Comparisons*

		Levene's Test for Equality of Variances		t-test for Equality of Means				
		F	Sig.	T	Df	Sig. (2-tailed)	95% Confidence Interval of the Difference	Upper
							Lower	
Post-test A_B	Equal variances assumed	3.90	.347	-2.194	49	.033	-6.62385	-.28999
	Equal variances not assumed			-2.187	47.337	.034	-6.63606	-.27778

The estimated absolute value of the statistics is ( $t = -2.194$ ) which exceeds the same value in t-student table which is ( $t = 1.701$ ). Considering the mentioned facts, by 95 percent confidence we conclude that the difference between the post-test scores of group A (control) and group B is significant therefore the hypothesis is accepted.

*Table 3: Groups A and C Post-test Comparisons*

		Levene's Test for Equality of Variances		t-test for Equality of Means				
		F	Sig.	T	df	Sig. (2-tailed)	95% Confidence Interval of the Difference	Upper
							Lower	
Post-test A_C	Equal variances assumed	01.4	.529	0.679	49	.500	-1.76953	3.57568
	Equal variances not assumed			0.682	47.687	.499	-1.76043	3.56659

The estimated absolute value of the statistics is ( $t = 0.679$ ) which is less than the same value in t-student table which is ( $t = 1.701$ ). The Significance (2-tailed) value is 0.500 which is more than the significance level (0.05). Consequently, by 95 percent confidence we conclude that there is no significant difference between the post-test scores of group C and group A (control), and as the zero hypothesis is not significant the hypothesis is rejected.

Based on the above information and the obtained scores the researchers conclude that implementation of Contextualization strategy improves students' vocabulary development. On the other hand, teaching Inferencing strategy was also helpful but not as much as Contextualization and even the routine procedure of teaching in the control group.

In order to investigate the second question after analysis of the groups and determining the unity of them we need to compare the pre-test and post-test scores of group B with group C that the results of this evaluation are presented in (Table 4) and (Table 5).

Table 4: Groups B and C Pre-test Comparisons

	Levene's Test for Equality of Variances		t-test for Equality of Means					
	F	Sig.	T	Df	Sig. (2-tailed)	95% Confidence Interval of the Difference		
						Lower	Upper	
Equal variances assumed	1.668	.203	.845	48	.402	-1.76953	2.70392	
Equal variances not assumed			.845	43.827	.403	-1.10861	2.70861	

The estimated absolute value of the statistics is ( $t = 0.845$ ) which is less than the same value in t-student table which is ( $t = 1.701$ ). The Significance (2-tailed) value is 0.402 which is less than the significance level (0.05). Therefore, by 95 percent confidence we come to this conclusion that the difference between the variables of the study is not significant. As the zero hypothesis is not significant, we conclude that the difference between the pre-test scores of group B and group C is not significant. This shows the unity of the groups before the beginning of the research.

Table 5: Groups B and C Post-test Comparisons

	Levene's Test for Equality of Variances		t-test for Equality of Means					
	F	Sig.	T	Df	Sig. (2-tailed)	95% Confidence Interval of the Difference		
						Lower	Upper	
Equal variances assumed	2.809	.100	2.959	48	.005	1.39715	7.32285	
Equal variances not assumed			2.959	42.957	.005	1.38814	7.33186	

The estimated absolute value of the statistics is ( $t = 2.959$ ) which exceeds the same value in t-student table which is ( $t = 1.701$ ). The Significance (2-tailed) value is 0.005 which is less than the significance level (0.05). Therefore, by 95 percent confidence we conclude that the difference between the post-test scores of group B and group C is significant.

According to the above information the researchers conclude that teaching Contextualization strategy is more effective than teaching Inferencing strategy in learning and internalizing the new vocabulary.

On the other hand, by employing another test which is called Tukey test and based on ANOVA the researchers concluded that Contextualization is the most effective strategy in comparison with Inferencing strategy and the routine procedure of teaching in control group. The results of this ANOVA test are presented in (Table 6).

Table 6: Oneway ANOVA for QuestionTwo Post-test A\_B\_C

	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	221.347	2	110.674	3.706	.029
Within Groups	2209.640	74	29.860		
Total	2430.987	76			

The results of this table suggest that the statistics F of research strategies calculated as  $F = (3.706)$  with a freedom degree of (2, 74) exceeds the standard F statistics that is  $F_{0.95, 1, 120} = (3.11)$ . We can see that the significance level is 0.029 ( $p = .029$ ), which is below 0.05. Therefore, the zero hypothesis is rejected and by 95 percent confidence we conclude that the difference between the means of the groups is significant. Consequently, we can state that there is a statistically significant difference in the mean of three groups using different kind of strategies to learn vocabulary.

## DISCUSSION AND CONCLUSION

Based on the gathered and analyzed data the researchers can conclude that, first: employing Contextualization strategy in teaching the new vocabularies was effective; second, employing Inferencing strategy in teaching the new vocabularies was not as effective as Contextualization.

At the beginning of the research, the researchers decided to take advantage of two cognitive strategies i.e. Contextualization and Inferencing in teaching forty new and unfamiliar intermediate words to the three groups of homogenous participants. In this study, group A was the control group and groups B and C were the experimental groups of the study. Group B benefited from contextualization treatment and group C received the inferencing strategy as treatment. The researchers believed that implementation of these strategies would help participants to improve their vocabulary development, so first of all a pre-test was hold to determine that the participants did not have a prior knowledge of the prepared new vocabularies. The results of the pre-test indicated that the new words were unfamiliar to the participants. In the second stage, the words were taught regarding the above mentioned strategies for the experimental groups and the control group through the routine procedure of teaching. The treatment process took four weeks, and in the final stage the post-test was conducted. The results of the post-test indicated that only the overall scores of group B which received Contextualization strategy outweighed the results of the control group. Based on the results of the analysis done through classical tests such as T-test and ANOVA the researchers concluded that teaching the Contextualization strategy was more effective in learning the unfamiliar words in comparison with the Inferencing strategy. On the other hand, although teaching the Inferencing strategy helped participants to learn the intended vocabulary, it did not result in a more effective change in

comparison with the development of the participants in control group who received no specific treatment but gained higher scores. The researchers can claim that based on the obtained post-test scores the participants in group B who were exposed to Contextualization strategy have learned and retained the vocabularies more effectively in comparison with group C and control group, but those in group C who received the Inferencing strategy did not show as much improvement in vocabulary development as the other two groups.

The results of the current study can be compared and contrasted with the related studies mentioned in the review of the literature. In the first study that was held in the Philippine (2009), on five groups with different branches of studying, the use of fifty three common vocabulary strategies was used. Correlation analysis of the study showed positive association between these vocabulary strategies and the results indicated improvement in the student's vocabulary learning. In the second study that was carried out in King Khalid University (2009), inferencing of new lexicon in context versus non-context vocabulary presentation was verified. The results showed that both direct teaching and teaching through context approaches were effective. Another issue suggested that training on contextualized meaning-guessing could help EFL students to learn the vocabularies without exact equivalents in their first language.

The third study which was done in the W. State University of New York at Buffalo (2008) on fourteen adolescents. The researcher tried to employ contextual vocabulary acquisition through authentic passages. The results of the study showed that the inferencing process was very effective and helped students to determine specific parts of the text. These findings suggest that researchers may use broader range of context in teaching vocabulary.

The results of the current study as discussed so far also showed a positive and effective influence on students' vocabulary learning while Contextualization and Inferencing strategies were employed. However, the comparison findings revealed a significant difference between Contextualization and Inferencing strategies in which Contextualization strategy was seen more effective and more helpful. Taking into account the above results from other studies and the results obtained in this study, the researchers conclude that employing vocabulary cognitive strategies is most of the time beneficial and students can take advantage of them in vocabulary acquisition.

### **PEDAGOGICAL IMPLICATIONS**

There are some pedagogical implications which can suggest and provide fruitful guidelines related to different ELT issues. Teachers can provide their students rich contexts to help them learn new words. Also, the strategies utilized in the present study can be introduced to language teachers as well as learners as effective ways to learn vocabulary. The materials designers and developers should concern more on materials with rich contexts to present words.

### **SUGGESTIONS FOR FURTHER RESEARCH**

Based on the findings of the current study, the following suggestions may seem beneficial and merit attention. If we consider the unsuccessful process of learning the lexicon that usually does not last long then based on H. Douglas Brown (2000) we need to take advantage of some strategies which are said to be specific attacks that we make on a given problem. The interested researchers can first of all try other cognitive strategies and compare them with the two strategies (contextualization and inferencing) or with any strategy that they think might result in more improvement, and then they can try the other two categories of Brown strategies i.e. metacognitive and socioaffective strategies.

The employment of these strategies in other areas of language acquisition e.g. different parts of grammar like interlanguage pragmatics development (e.g. Koike & Pearson, 2005) and collocations (e.g. Richard Xiao & Tony Mcenery, 2006) is another line for interested researchers. This study investigated the effect of teaching Contextualization and Inferencing strategies on Iranian intermediate EFL learners vocabulary development, the interested researchers can investigate the existence of any effect on advanced learners too, whereas the employment of these strategies is not recommended for beginners and elementary learners since Ghanbari, Kassaian,&Duppenhaler(2011) state that Contextualization strategy is not suitable for beginners as it implies that the students have already acquired a certain level in L2 in order to be able to read a second language and infer meaning of particular words from the main context.

## AIMS AND SCOPE

The international journal of language learning and applied linguistics world performs as a platform for the new scholars to share their insights with other scholars in the form of original papers.

The international journal of language learning and applied linguistics world is a double-blind peer-reviewed international journal dedicated to promoting scholarly exchange among teachers and researchers in the field of language teaching and applied linguistics. Papers submitted to the journal will immediately be sent to two related reviewers who are responsible to provide feedback on the content and the language use.

The journal is published monthly in online and print versions. The scope of the journal includes, but not limited to, the following fields:

*Theory and practice in English*  
*Language teaching & learning*  
*Teaching English as a second or foreign language*  
*Applied linguistics*  
*Discourse studies*  
*Syllabus design*  
*Language learning problems*  
*Computer assisted language learning*  
*English for specific purpose*  
*English for academic purpose*  
*Language teaching & testing*  
*Translation studies*

*Note: This article is based on partial findings from the author's doctoral dissertation under the guidance of Prof. R. Subbakrishna at the University of Mysore, Mysore, India.*

### ABSTRACT

There is a common belief that learners who learn a language in its native context are more sociolinguistically and pragmatically competent than those who learn it in a traditional classroom curriculum in their home country. This longitudinal study was to assess this assumption in study abroad program that “the more is better”. Specifically, this study focused to measure the impact of duration of sojourn on the learners’ pragmatic development in request and apology speech acts. To this end, 72 Iranian study abroaders who enrolled in a six month program were selected as participants in this study. These students were already placed in the intermediate level by conducting a proficiency test and an interview by the language institutes in India (Mysore). A Discourse Completion Task (DCT) including request and apology scenarios were administered to these students in three phases. At the beginning of the course as *pre-test*, after three months as *post-test 1* and after six months as *post-test 2*. Comparing the learners’ gains in post-test 1 and post-test 2 reveals that longer duration results in more progress in these two most frequent speech acts. Consequently, this study adds support to the belief that longer study abroad programs are more beneficial to have more fluent and pragmatically proficient language learners.

**KEYWORDS:** study abroad, length of stay, pragmatics, interlanguage pragmatics, request, apology

### INTRODUCTION

There is a popular assumption that second language context is a perfect setting for learning a new language. The abundant direct exposure to the language made SL learning context conspicuously better-quality than FL context. FL setting uses formal and usually regular classes with a good deal of linguistic knowledge *about* language while little is done to present the language itself. On the other hand, SL context yields a remarkable amount of cultural and pragmatic input through a great deal of interaction with native speakers. Therefore, a combination of a sojourn (for acquiring cultural and pragmatic knowledge) with a classroom support (for acquiring linguistic knowledge) in a form of study abroad program may bring the best condition for maximizing language learning process because it enjoys both the advantages of FL and SL learning environments. Kinginger (2011) claimed that study abroad is endowed with development in different domains of language competence and social interaction abilities. Khorshidi (2013) suggested that “While regular language classes are good sources for providing linguistic knowledge, context which is study abroad program

equipped with, seems to be a flourishing source for providing cultural and pragmatic knowledge through interaction with L2 natives” (p. 62). This popular belief has become so popular that a great number of students leave their home to spend a period abroad and expect to return with a good level of proficiency in target language skills.

Research supports that study abroad provides learners with gains in all four language skills especially in oral proficiency skill (e.g., DeKeyser, 2007; DuFon & Churchill, 2006; Segalowitz & Freed, 2004) which is not manifested as much in FL context. As a matter of fact, among the language proficiency skills, learners’ pragmatic ability makes them different from FL learners because it is generally observed that even advanced FL learners with a good repertoire of linguistic knowledge, are not successful to communicate appropriately in social contexts.

### ***Pragmatics or Inter-language Pragmatics?***

Pragmatics is nothing but the study of language in context. In other words, pragmatics is “the study of those relations between language and context that are *grammaticalized*, or encoded in the structure of a language” (Levinson, 1983, p. 9). As a part of linguistics, syntax studies sentences, semantics studies propositions but pragmatics is the study of linguistic acts and the contexts in which they are performed (Stalnaker, 1998). Huang (2007) states that “syntax is the most and pragmatics is the least abstract, with semantics lying somewhere in between” (p. 5). Consequently, as Recanati (2004) asserts syntax provides input to semantics and semantics provides input to pragmatics.

As a domain within L2 studies, pragmatics is usually referred to as inter-language pragmatics. Inter-language pragmatics (ILP) studies the *inter-language*, which is related to the second language acquisition research and *pragmatics* which is the study of language in context. ILP applies pragmatic theories, principles and frameworks to study how L2 or foreign language learners encode and decode meaning in their L2 or foreign language (Schauer, 2009). In simple words, ILP studies the second language acquisition in its context.

Kasper and Rose (1999) define ILP as the study of second language use, and assert that inter-language pragmatics is the study of non-native speakers’ comprehension, production and acquisition of linguistic action in L2, or put briefly, ILP investigates how to do things with words in a second language. Kasper and Rose (2002) introduce inter-language pragmatics as interdisciplinary or hybrid because inter-language pragmatics belongs to both pragmatics and SLA. Schauer (2009) holds that ILP utilizes pragmatic theories, frameworks and principles to examine how foreign/second language learners encode and decode meaning in their L2. In second language acquisition and inter-language pragmatics, pragmatic competence has been an area of immense concern over the last three decades. Pragmatics research, in applied linguistics, mostly focuses on the relationship between language use and the social and interpersonal context of interaction (Roever, 2010).

### ***Context of Learning in Study Abroad***

Context is the cornerstone of success in study abroad. If the learners are supported to make the most of it, they may acquire different aspects of linguistic and cultural features of the target language. Lafford (2006) states that the term context refers not only to the environment in which the learner is situated, but it also refers to the learner’s relationship with the environment. Using the context varies in different learners due to

their individual differences” (Khorshidi, 2013, p. 63). For instance, different personality traits behave differently in different contextual conditions. As an example extrovert learners may involve themselves in interactions more than introvert ones.

Unlike FL, whatever the SL learners receive as input in their classes, they have the chance to testify those language elements in the context to check its applicability. Previous studies support this assumption that a combination of formal classes and immersion in the native context can serve as a facilitator in L2 learning (Brecht, Davison & Ginsberg, 1993; Carrol, 1967; Freed, 1995; Huebner, 1995; Lennon, 1995; Spada, 1986). Lafford (1995, as cited in Freed, 1998) argued that study abroaders “have a far broad repertoire of communicative strategies for initiating, maintaining, expanding, and terminating a communicative situation than do those [at-home learners] whose learning has been limited to the formal language classroom” (p. 44).

Studies highlight that language acquisition is influenced by social and contextual factors (Douglas, 2004; Kramsh, 2000; Lantolf, 2000; Swain, 2000; Tarone, 2000). Studies by Carsello and Creaser (1976), Kuh (1995), and Limburg-Weber, (2000) show that study abroad affects language learning and personal development. All the above studies suggest that study abroad learners’ linguistic, sociological and pragmatic competence is bolstered during their sustained sojourn.

#### ***What Learners Acquire in Study Abroad?***

Study abroad is often considered as an ideal way for learners to be inundated with the target language skills and culture. Previous research (Felix-Brasdefer, 2004; Matsumura, 2003) supports that because of the direct exposure, learners acquire pragmatic knowledge through interaction with native speakers. Other studies (Collentine, 2004; Kinginger, 2011) also hold that study abroad learners demonstrate great gains in language skills and pragmatic competence.

Hassall (2012) presented a list of items learners acquire in study abroad (SA) context:

- ***Routines:*** pragmatic routines or formulaic expressions that are used in different speech acts (e.g., “Would you like a ...?”, “Sorry about that,” etc. ). Studies indicate that study abroad learners get a good repertoire of greeting formulaic expressions in different speech acts ((Barron, 2003; DuFon, 2000; Hoffman-Hicks, 2002; Lafford, 1995; Marriott, 1995).
- ***Informal Style:*** the informal language or colloquial words and phrases that learners pick up to use during their sojourn. This is corroborated by studies by Marriott (1995) and Kinginger (2008) in which their learners developed a plain style of language and improved to understand colloquial expressions and words.
- ***Sociopragmatics:*** according to Hassall (2012) sociopragmatics refers to the development in social “end” of pragmatics. In other words, it is the learners’ capability to assess the contextual condition based on which they decide to make an appropriate request or apology (see Barron, 2003; Felix-Brasdefer, 2004; Kasper & Rose, 2002; Kinginger, 2008; Matsumura, 2003). This kind of pragmatic competence is often achieved in the context of the target language than FL context.
- ***Modifiers:*** ‘modifiers’ are the linguistics elements that are employed to decrease or increase the illocutionary force of a request. For instance, study abroaders may learn to use downtoners like “*possibly*” to mitigate or employ intensifiers such as “*really*” to increase the impact of a request. Previous studies namely

Cohen and Shively (2007), Warga and Scholmberger (2007) and Schauer (2009) proved that context in study abroad greatly enhances learners' repertoire regarding request and apology strategies.

- **Global Sensitivity:** this refers to the learners' pragmatic awareness which enables the learners to detect pragmatic errors. Previous research studies also support that learners' pragmatic awareness increases with a long-term stay in second language context (Bardovi-Harlig & Dornyei, 1998; Schauer, 2009).

### ***Factors affecting study abroad***

The advantage of study abroad over study at-home has been well attested by previous research studies. However it is often the case that, success in the language achievement depends on various variables such as individual differences in learning styles, personality dimensions, motivation and aptitude, attitude, and the amount of submersion in the L2 community. Kinginger (2011) holds that individual differences play a key role in the amount of achievement during study abroad. According to Martinsen (2010) there are factors such as *interaction*, *cultural sensitivity*, *living arrangements*, *length of stay*, and *motivation* which affect the amount of gain in study abroad. Hassall (2012) added two more items to this list namely *input* and *identity*. Among all these factors, length of stay seems to be the most important one as others can be subordinated by the duration of sojourn. Longer stay does certainly bring more interaction, input, progress in cultural sensitivity, etc. and may result in both linguistic and cultural proficiency (Medina-Lopez-Portillo, 2004; Dwyer, 2004).

Several studies have been investigated to test the benefit of longer period of stay in L2 community with adequate exposure and sufficient input. Results demonstrate that learners made a good deal of progress in pragmatic ability in conversational routines (House, 1996), employment of request strategies (Olshtain & Blum-Kulka, 1985), and use of fewer external modifiers (Blum-Kulka & Olshtain, 1986).

Taken as a whole, research has suggested that a second language learning setting provides both quantitatively and qualitatively richer input than a foreign language learning setting and that learners tend to show gradual convergence to native speakers' pragmatic behavior as their length of residence is prolonged.

### ***Request and Apology speech Acts***

Request and apology are the most frequent speech acts in communication. While request utterances are made to ask someone for a favor, apologies are often employed to express one's regret about what happened or said. Because of their face-threatening culture specific nature, these two speech acts are very important to get mastery over by speakers. In other words, if for any reason the interlocutor rejects a request or an apology, the speaker may lose face. Therefore, mastery of making requests and apologies may be beneficial to settle a positive atmosphere for an ideal communication.

Whenever a request is made, the requester is showing power by requesting; therefore the requestee's negative face (i.e. the wish to be unimpeded) may be threatened. If the hearer refuses to carry out the required act, the speaker is eminent to lose face. The difference between a request and other speech acts such as suggestions, warnings, or pieces of advice, is the fact that this speech act totally lies in the interest of the speaker and is at the cost of the hearer (Trosborg, 1994). On the other hand, apology means an

acknowledgment expressing regret or asking pardon for a fault or offense. Therefore, it is needed for language learners to be equipped with apology strategies and also to know the appropriate strategies to use for a specific context or situation otherwise, there will be a misunderstanding which may lead to unpleasant outcomes. The speech act of apologizing is rather different from that of requesting, since apologies are generally post-event acts, while requests are always pre-event acts.

## METHODOLOGY

In this study, the investigator tested a group of 72 Iranian English language learners who enrolled to study English two in Indian language institutes as a study abroad program. The researcher investigated to see if the amount of duration affects learner's pragmatic competence in request and apology speech acts.

### *Participants*

The participants in this study were the Iranian students who enrolled in a six month study abroad program in India (Mysore). These 72 language learners were already administered a placement test and an interview and placed in intermediate level.

### *Instruments*

A Discourse Completion Task including 16 request scenarios developed by Schauer (2009) and 10 apology situations originally developed by (Blum-Kulka & Olshtain, 1984) in Cross-Cultural Speech Act Realization Project (CCSARP) was used to measure the amount of gains in the three phases of the learners' stay in L2 context.

### *Procedure*

The data for this study were collected by conducting the DCT in three phases:

- **Phase 1:** at the beginning of the program as pre-test in order to have a criterion for comparing the gains in post-test 1 and post-test 2.
- **Phase 2:** after three months as post-test 1 to measure the amount of gain for the first three months.
- **Phase 3:** after six months as post-test 2 to measure the total amount of gain during the study abroad program.

**Final step:** three native speaker English language teachers scored the papers based on the Speech Act Measure Rating Criteria prepared by Cohen et al. (2005). (see Appendix A)

## RESULTS AND DISCUSSION

To measure the participants' performance and the amount of their gains in the three phases the scores were submitted to SPSS to be analyzed. The output for the participants' scores is presented below.

Table 1: ANOVA

Scores	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	115.750	2	57.875	275.213	.000
Within Groups	44.792	213	.210		
Total	160.542	215			

The ANOVA test as illustrated in table 1 presented a Sig of .000 at the level of  $p = .05$ . Consequently, it demonstrates that there is a significant difference between the scores in the tests.

Table 2: Descriptive Statistics of the scores in the tests and gains

	N	Minimum	Maximum	Mean	Std. Deviation
Pre_test	72	1.38	3.77	2.4771	.45162
Post_test1	72	2.13	4.72	3.4575	.52653
Post_test2	72	3.27	4.85	4.2675	.38689
Gain 1	72	.16	2.07	0.9767	.38332
Gain 2	72	.18	2.93	1.7694	.53640

Table 2 depicts the descriptive statistics regarding the amount of gains in three phases of measurement. The learners' achievement in post-test 1 (after three months) and post-test 2 (after six months) and a comparison between the amount of gain 1 and gain 2 show that the learners' pragmatic knowledge repertoire regarding request and apology speech acts increased along with lengthening their length of stay. As the data in the table above reveals, the average gain in post-test 1 was 0.97 (after three months) which increased to 1.76 in post-test 2 after six months of stay. A comparison in the means related to pre-test, post-test 1, and post-test 2 confirms a linear development in learners' request and apology pragmatic competence. This finding supports the findings by House (1996) and Olshtain and Blum-Kulka, (1985), and Schauer, (2009) in which their participants made a good progress in conversational routines and employment of request strategies.

Table 3: Paired Sample Test

	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference		t	Df	Sig. (two-tailed)
			Lower	Upper			
<b>Pre-test – Post-test 1</b>	.36651	.4319	-1.06654	-.89429	-22.698	71	.000
<b>Pre-test – Post-test 2</b>	.0522616	.6201	-1.91404	-1.66678	-28.874	71	.000
<b>Pre-test 1 – Post-test 2</b>	.55389	.06583	-.94016	-.67984	-12.409	71	.000
<b>Gain1-- Gain 2</b>	0.59015	.06955	-.93146	-.65410	-11.339	71	.000

Table 3 illustrates if the differences among the tests and gains are significant. As the table demonstrates, the differences among the tests in three phases and gains are

significant at the level of  $p = .05$ . In table 3, a One-way ANOVA also supports this significance.

The results of this research through quantitative analysis suggest that learners' overall performance on the requests and apologies has been higher in the group with longer stay i.e. those who have been abroad for longer period appear to access more on inter-language pragmatics in using request and apology strategies. The results in this quantitative study suggest that the learners' overall performance in request and apology speech acts has definitely improved with longer period of sojourn.

## **CONCLUSION**

This empirical study adds support to the common belief that because of the linguistic and pragmatic competence it provides, study abroad language learning is beneficial. Among factors introduced by Martinsen (2010) and Hassall (2012) affecting study abroad success such as the amount of interaction, cultural sensitivity, living arrangements, length of stay, motivation, input, and identity, length of stay seems to be one of the most dominant ones because duration period can influence others. What differentiates study abroad from study at-home is not the amount of linguistic input. As a matter fact, exposure with native speakers gives the chance to the learners to apply what they have learned in classes and get to know the pragmatic aspects of the language as well. Through study abroad, learners also learn how to behave in different contextual conditions which are often very difficult to acquire through study at-home language learning. Therefore, getting pragmatically and communicatively competent is the most outstanding feature of language learning through study abroad. This study is in line with previous studies (House, 1996; Olshtain and Blum-Kulka, 1985; Dwyer, 2004; Roever, 2010; Schauer, 2009 ) emphasizing the effectiveness of longer stay in L2 context. Longer duration in study abroad with a classroom support means being more proficient in linguistic and pragmatic aspects of language. The amount of gains in post-test 1 and post-test 2 show that longer residency results in more proficiency in request and apology speech acts.

## **LIMITATIONS OF THE STUDY**

This study investigated the development of two frequent speech acts in study abroad context without a study at-home group as a control group. The researcher couldn't include a study at-home group due to some contradictory educational regulations for PhD studies in the two countries. Other research studies can investigate the impact of length of stay in study abroad with a study at-home support.

## **ACKNOWLEDGMENT**

This article is based on partial findings in my PhD dissertation under the guidance of Dr. R. Subbakrishna, professor-cum-deputy director at the Central Institute of Indian Languages (CIIL), Mysore, India. I would like to take this opportunity to express my deep sense of gratitude to my guide for his thought provoking suggestions during this research. My special thanks are to the native speaker teachers Madam Nila, Madam Samantha, and Madam Sabrina for their great kindness in evaluating and scoring the questionnaires. I also owe my special thanks to all the respondents for filling the questionnaire with an immense level of spirit. The last but not the least, I would also like to thank the unanimous reviewer(s) for the insightful comments and suggestions provided.

#### Appendix A

##### Speech Act Measure Rating Criteria (by Cohen et al. 2005)

##### Notes:

- “Respondent” refers to the research subject who completed the *Speech Act Measure* (i.e., the “You” on the instrument). “Hearer” refers to the person rating the measure, imagining that they are in the position of the interlocutor talking to the research subject.
- Do not give the respondent a lower score for grammatical errors, UNLESS those grammar errors inhibit the ability of the hearer to understand what the speaker is trying to communicate. But if you cannot understand what the speaker is trying to communicate because of grammar errors, you can give him/her a lower score.
- Do not give the respondent a lower score for spelling errors. The instrument is meant to reflect oral speech, in which case spelling errors would not be important.

#### 1. Speech Act Measure Rating Criteria: Request

##### Overall Success of the Request Item:

Please judge the overall success of the request made by the respondent. Think about whether you would want to comply with the request if you were in the position of the hearer. Please rate each answer with **1-5** based on the speaker’s responses using the criteria listed below, if you were the hearer...

5 = I would happily comply with the speaker’s request

4 = I would comply with the speaker’s request, but somewhat reluctantly

3 = I would comply with the speaker’s request, but reluctantly

2 = I would comply with the speaker’s request, but only very reluctantly

1 = I would absolutely not want to comply with the speaker’s request

**Note:** The same measure rating criteria was used for apology as well.

## AN OVERVIEW ON READING COMPREHENSION AND READING SPEED

**Parastoo Babashamsi**

*Faculty of Education, University Putra Malaysia*

### ABSTRACT

Reading comprehension may be one of the most important skills which is usually investigated by language specialists in the field of second and foreign language acquisition. It is also becoming more and more significant in the new knowledge economy, and remains the most useful human activity for converting information into knowledge, be it reading on paper or from the screen. The importance of reading as a key skill and of its sub-skills is well confirmed. In the same line, the present paper is an overview over different types of reading such as extensive and intensive reading as well as the relationship between reading speed and reading comprehension.

**KEY WORDS:** reading comprehension, extensive reading, intensive reading, reading speed

### DEFINITION OF READING COMPREHENSION

Reading is the most significant one of the four fundamental skills (Carrell, 1989). Reading can also be defined as the efficiency “to draw meaning from the printed page and interpret this information appropriately” (Grabe & Stoller, 2002, p.09). Or it may further be defined as understanding written material that is read to us, or as the process of ‘constructing meaning’ from written material.

Miller (n. d.) defined comprehension as a crucial tool for reading in our modern age through which we: obtain meaning from the words constructed by others, gain knowledge of something new, and understand another person’s opinion.

As Alyousef (2005) proposed, reading can be considered as an “interactive” process between a reader and a passage that leads to fluent reading. In this process, the reader interacts dynamically with the text as he/she tries to extract the meaning.

Gough and Tunmer (1986) suggest a much simpler view of reading, in which reading comprehension is considered as the product of decoding. It can be considered as a useful technique for improving students’ success in receiving valuable knowledge from the text (Mayer, 2003, p. 34).

Coady (1979) mentioned that reading is mainly a ‘psycholinguistic guessing game’ (cf. Goodman, 1967). Aebbersold and Field (1997, p. 15) wrote that reading is what happens when people take a look at a text and allocate meaning to the written signs in that text. The text and the reader are two physical units essential for the reading process to commence. It is, however, the communication between the text and the reader that forms actual reading.

Therefore, we can say that reading is often considered as a hierarchy of skills, from processing of individual letters and their related sounds to word identification to text-processing competencies. Complete comprehension entails fluid communication of all these processes, beginning with the sounding out and identification of individual words to the perception of sentences in paragraphs as part of much longer texts (Pressley, 2000).

With regard to various purposes of reading, Rivers and Temperley (1978, p. 187) note that L2 learners may require or want to read: to acquire information for some purpose or because we are interested in some subject, to get instructions on how to do some task for our work or daily life, to keep in touch with friends or companies by letters, emails, or messages, to know when or where something will occur or what is accessible, to recognize what is happening or what has happened, to enjoy or be excited.

These definitions of reading comprehension can shed light on reading and reading comprehension altogether. In the following part, we turn to take a glance at various kinds of reading comprehension among EFL learners.

### **TYPES OF READING**

Most of the scholars suggest that generally we have two kinds of reading: extensive reading (ER) and intensive reading (IR). The former involves fast reading of great amount of materials or longer readings for overall understanding with the focus mainly on the meaning of what is being read than on the language (Carrell & Carson, 1997), whereas the latter is concerned with short texts with close supervision from the teacher, which helps students to gain thorough meaning from the text to develop reading skills and to improve vocabulary and grammar knowledge (Carrell & Carson, 1997; Nuttall, 1996).

Richards, et al. (1992, p.133) defined extensive reading as “reading in quantity ... in order to gain a general understanding of what is read. It is intended to develop good reading habits, to build up knowledge of vocabulary and structure, and to encourage a liking for reading.” Hafiz and Tudor (1989) state that the pedagogical value attributed to extensive reading is based on the assumption that exposing learners to large quantities of meaningful and interesting L2 material will, in the long run, produce a beneficial effect on the learners’ command of the L2.

Inspired by Krashen’s Input Hypothesis, researchers have shown new interest in extensive reading in current years. This is seen most obviously in various styles adopted by ELT Institutions. Krashen (1982, p. 164) calls ER as pleasure reading and states that pleasure reading is a significant source of comprehensible input for acquisition. Thus, students are forced to read alone by using the resources within their access (Hedge, 2003, p. 200-201). ER, with its emphasis on motivating learners to read autonomous, large quantities of meaningful language, fits well with recent principles for good second and foreign language pedagogy (Day & Bamford, 1998).

### THE READING SPEED

A broadly known problem encountered by learners throughout the ESL/EFL world is that of slow reading (Hamp-Lyons 1983; Cooper 1984). Records from Segalowitz, Poulsen, and Komoda (1991, p. 15) specified that the second language (L2) reading rate of bilingual readers is “30% (or more) slower than L1 reading rates.” These data are also held by Weber (1991), who indicates that highly skilled bilinguals naturally have a slower reading speed in a second language. Jensen (1986, p. 106) pointed out that “at the end of a reading course, even advanced ESL students may read only 100 words or less per minute.” This has often been related to classroom approach in reading lessons, mostly where such lessons concentrate on language development rather than reading *per se*.

A number of specialists have remarked on a regular practice in intensive reading lessons (Nuttall 1982; Alderson & Urquhart 1984; Bartram & Parry 1989; Hyland 1990; Susser & Robb 1990). Text comprehension research shows that readers regulate reading speed based on the difficulty or contradictions which they encounter (Haberlandt & Graesser, 1985).

Slow reading as a difficulty for learners has been described by Brown & Hirst (1983, p.140) as a “weakness independent of the purpose of reading”, concerning the processing of information at such a slow pace that the reader is not capable of holding enough detail in short-term memory to allow interpretation of the general message of the text. In this context, it should be noted that diverse reading purposes need different reading speeds, and though the development of sufficient reading speed should be given a high priority in our learning programs, we should also remember, as Nuttall (1982) does that reading speed without comprehension is useless.

It was in the 1960s that interest in reading speed got impetus from the writings of Fry (1963) and De Leeuw (1965). Fry claimed that good readers reach a speed of 350 words per minute, fair readers 250 words, and slow readers attain 150 words per minute. De Leeuw mentions 230-250 words per minute as an average primary speed.

The earliest studies conducted on native English speakers showed that fast reading was only a skimming strategy used to cover the entire reading material (Brown, Inouye, Barrus, & Hansen 1981). However, later studies indicated that readers attained not only rapid reading skills but also better comprehension when they were purposely taught rapid reading techniques (Cranney, Brown, Hansen, & Inouye 1982). Fast reading is often encouraged as a good way to understand the main ideas of a text (Haynes, 1993).

These contradictory views made the researchers to examine the relationship between reading speed and reading comprehension. While it is usually disputed that the two are closely linked (Broughton et al 1978; Berkoff 1979; Champeau de Lopez 1993), the exact nature of the relation between them has been the center of a continuing debate lasting more than half a century. What is thought clear is that a very slow reader is more apt to read with little understanding. Before he/she arrives at the end of a page, or even of a sentence, he has forgotten the beginning.

Champeau de Lopez (1993) made the helpful difference between ‘timed readings’, in which learners read at their own speed, and ‘paced readings’ where the teacher manages the time permitted. In her study, she found that students improved their reading speeds

on average from 120 to 170 words per minute (a 50% increase), after pursuing a course based on a mixture of timed and paced readings. However, she also observed a negligible drop in comprehension over the same period, from 78% to 67%. Coady's advice (1979, p. 12) on this point appears valuable "..... comprehension is achieved by reading neither too fast nor too slow".

In a study by Bell (2001) on reading speeds and comprehension in two groups of learners defined as intensive and extensive groups respectively, it was revealed that subjects exposed to extensive reading gained both significantly faster reading speeds and significantly higher scores on reading comprehension tests. The extensive group was exposed to a system of graded readers whereas the intensive group learned short texts followed by comprehension questions.

The question of how comprehension is influenced by altering the pace of reading was also considered by Poulton (1958). This study established that the amount of remembering a criterion of comprehension increased considerably when the pace of reading decreased from around 300 words/min to about 150 words/min. However, one of the conclusions of conventional studies on reading like those done by Tinker in the 1930s and 1940s (summarized in Tinker, 1963) was that the fast reader tends to grasp better. Reasons for the apparent inconsistency have been recognized and explained by Carver (1990). Both negative and positive correlations between reading speed and comprehension have been reported as these are two different types of correlations: between-individual and within-individual. When an individual raises his or her reading rate, his or her comprehension reduces (e.g. Poulton, 1958), which is a within-individual negative correlation. However, people who naturally read fast also tend to display a high level of comprehension (e.g. Jackson & McClelland, 1979), which is a between-individual positive correlation.

In view of the above, many factors such as limited perceptual duration (word-by-word reading), slow perceptual reaction time (slow recognition and response to the material), vocalization (reading aloud), faulty eye movements, regression (needless or unconscious re-reading), faulty habits of attention and concentration, lack of practice in reading, fear of losing comprehension, causing the person to intentionally read more slowly, habitual slow reading, poor evaluation of which parts are important and which are unimportant, and the attempt to remember everything rather than to remember selectively should be considered.

In the same line, one of the factors that may affect the speed of reading and reading comprehension is the difficulties which readers have in word identification or recognition (Lyon, 1995; Torgeson, Rashotte, and Alexander, 2001; Hook & Jones, 2002). Many students who try to learn to read are able to make up for primary reading problems by becoming perfect decoders, but are unsuccessful in reaching a level of adequate fluency to turn into fast and proficient readers (Hook & Jones, 2002).

Another important factor to consider in studies of reading rate is word length. There is a common finding in reading research that in skilled readers, length does not affect the reading speed for high frequent words, whereas longer pseudo words do take more time to recognize than short pseudo words (Carbonnel & Valdois, 2004; Weekes, 1997 as cited in Martens & de Jong, 2006). Field (2004, p. 12) proposed that "longer words often take the same time to read as short ones ... without loss of comprehension."

However, the converse body of research is also robust. For example, reading speed is said to slow down when words are read via the non-lexical route. In other words, “reading speed decreases with each additional letters. The larger the length of a word, the more readers rely on sub-lexical decoding strategies” (Martens & de Jong, 2006, p. 141).

Contradictory data also exist concerning the best or adequate reading rate. Some authorities propose that 180 words per minute “may be a threshold between immature and mature reading and that a speed below this is too slow for efficient comprehension or for the enjoyment of text” (Higgins & Wallace, 1989, p. 392). Dubin and Bycina (1991, p. 198) claimed that “a rate of 200 words per minute would appear to be the absolute minimum in order to read with full comprehension.” Jensen (1986, p. 106) suggested that second language readers seek to “approximate native speaker reading rates and comprehension levels in order to keep up with classmates” and recommends that 300 words per minute is the best rate. This pace is supported by Nuttall (1996, p. 56), who stated that “for an L1 speaker of English of about average education and intelligence... the reading rate is about 300 words per minute.”

However Pakhare (2007) believed that reading at the pace of 200 to 220 words per minute is measured as a normal speed of reading. For normal reading rates 75% is a satisfactory level of comprehension. This means if a child can recognize the meaning of at least 75% of the whole text, then he/she has reached suitable levels for reading comprehension.

In his article on how to increase reading speed and comprehension, Lee (2009) proposed that we have three ways to increase our reading speed: know the vocabulary in the text, read a lot of books, relate the text to your personal experience.

In the same line, Feldman (2006) introduced 9 important ways to improve reading speed, which are presented below: skimming before reading, categorizing reading materials from the most important parts to the least ones, selecting the proper environment, reading early in the day, turning headings into questions, avoiding using highlighter, previewing before reading, being flexible with your reading speed, and reading correspondence only once.

## CONCLUSION

The present paper was an attempt to highlight the importance of reading comprehension as one of the important language skills to be developed by language learners in both EFL and ESL contexts. In the same line, some of the previous studies were reviewed to highlight some of the problems that language learners encounter while trying to comprehend a text were considered. As the speed of reading is affected by many factors, language learners particularly at the low level are encouraged to skim the passage before reading, categorize reading materials from the most important parts to the least ones, turn headings into questions, and preview before reading.

**ABSTRACT**

This study, by considering the importance of e-learning in higher education system, has the aim to identify and explore alternative solutions of the development and application of e-learning. This research has been conducted using an exploratory qualitative research methodology with two groups of respondents including both faculty members and PhD candidates in six different higher education institutions in Hamedan and Kurdistan provinces that selected randomly. Data were gathered through interviews technique. The data collection process was conducted to obtain complete and comprehensive data, and saturation was attained by 30 respondents. The results revealed that influencing factors of e-learning development and application in these provinces were: promoting cultural environment for both faculty members and the students,

supporting technical infrastructure, removing technological and economical barriers and also conducting continuous training courses and workshops.

**KEYWORDS:** E-Learning, Higher Education, Internet, Vensim's Software, Hamedan and Kurdistan Provinces, Iran

## **INTRODUCTION**

A quick review of the changes of the previous periods shows that the educational systems of each period relates to the changes of that period. In the present time, the internet network has transformed the classical and traditional educational system; and, the new educational methods and practices are extending so quickly. With the advent of internet, traditional roles in society have changed and each of these current traditional roles present a new manifestation both electronically and virtually which added new terms into the nations' culture and language (Ahmadi & Virjiniyari, 2003). The development of virtual education is one of the facilities that have created in the light of development of computers and, in the broad sense, information technology. Internet, which is located among the top ten inventions of the twentieth century, has achieved the concept of long-life learning and driven learning out from the limitation of time and place. Currently, educational institutions, research centers, government agencies, business centers and many other people are looking for the access to the internet so fast. It is clear that internet and World Wide Web have profoundly affected the society, especially universities and faculties. Thus, ICT (information and communication technology) has a major role in the guarantee the quality of higher education and this would be considered as a competitive advantage for universities. However, the development and use of communication technologies in the educational system is an infrastructure for applying changes in education which this can facilitate the presenting and receiving the training programs in different places. New technologies can alter the type of people and organization needs. Advances in technology such as computers and robots have opened new ways to create and enhance innovative teaching methods for instructors. This technological change has had a significant impact on the education, especially teaching methods. Wonderful development of electronic communication has given Distance Learning a new position and the development of these types of education has changes it to such an educational approach that employees and the people whom are not able to attend physically in classes can continue their education. In response to these demands, the distance learning organizations are trying to provide a comprehensive training system, from registration to examination, for learners. These organizations make attempt to enhance the quality, quantity and presentation methods of education and to equate these elements to developed countries (Murphy and Terry, 1998).

The higher education centers are the applicants of the utilization of electronic education, because, these educations are not limited to a special time and place. Thus, the higher education centers consider this fact as a prominent advantage (Garrison, 1999). Generally, virtual education means making the best use of electronic systems such as computers, internet, multimedia discs, electronic journals, virtual newsletters, etc. The virtual education aims are to make the learning easier, and more effective, and it can save time, cost and energy (Anderson & Elloumi, 2004).

The present time that is considered as 'Information Age and Information Revolution' has created major changes in human lifestyle and it provided a new concept which is

called 'information society'. Information society is a symbol of all conventional and traditional social processes such as business, education and the like which is located in a new format by using information and communication technology (ICT).

E-learning, which is considered as both internet use and digital technologies in teaching and learning, has always been identified as either an alternative solution or a new procedure to boost traditional approaches of education. Educational institutions apply e-learning in teaching process for the following reasons:

*IT promotion:* E-learning is becoming an ideal tool for teaching and learning.

*Rich information:* E-learning provides the accessibility of rich information resources every time and everywhere for both learners and teachers.

*Alternative learning approach:* E-learning can give the possibility and opportunity of learning process to those who were marginalized as disable students.

## **LITERATURE REVIEW**

Miladi and Malek Mohamadi (2010), based on Yaghoubi's quotation (2008), believe that broader approach towards E-learning indicates that the education and e-learning system have unique benefits and advantages for organizations and educational institutions.

Chahill (2008), based on Duderstat (2001), in this regard, stated that the higher education must meet these changes and they should invest in capacities which make the new types of learning, independent of time and place limitation, possible, in order to create a persuasive view in their future in the next millennium (Chahill, 2008). Soltani (2004) in a study entitled 'A Survey of Affecting Factors of the Use of Information Technology in Teaching and Research Activities of Faculty Members' considered the familiarity of faculty members with the information technology, and the use and attitudes of them toward it and its relationship with the individual characteristics of the faculty members. Moreover, it was found that there is a positive and significant relationship between positive attitudes of faculty members and their proficiency in computer knowledge (Soltani, 2004). Naghavi (2007), in his study, discussed about 'the Attitudes of Faculty and Graduate Students of Agricultural Extension and Education toward Distance Learning via the Internet'. Additionally, he considered the proficiency level of Information Technology of faculty and graduate students as a necessary element of e-learning development; moreover, he investigated the barriers of the expansion of this type of education (Naghavi, 2007).

Yaghoubi (2008), in his study, entitled 'the design of E-learning systems in the field of agricultural extension and education' refers to 'educational and technical factors affecting the E-learning system' and 'E-learning program restrictions' as stimulants and inhibitors of E-courses (Yaghoubi, 2008). He also refers to the following elements as important factors affecting students' attitudes toward e-learning: the evaluation of e-learning capabilities in solving the problems, the access to the internet, the use of internet, students' overall assessment of the problems of the present system (Yaghoubi, 2008).

Mohamadi (2009) in his paper entitled 'Determination and analysis of the components of E-learning system in agricultural scientific-applied educations of Iran' investigated the following elements in e-learning system in agricultural scientific-applied educations:

incentives and the driving factors, the necessities and urgencies, the educators attitudes, the barriers and disincentives, the availability of e-learning technologies and organizational strategies of e-learning. Sadri Arhami et al. (2003), in a study entitled 'e-learning in Iran: challenges and alternative solutions in higher education' refers to the concept of e-learning and web-based studies, and he considers the issues and obstacles of its implementation.

A study entitled "Evaluation of ICT development strategies in the education system in Australia, the U.S. and India, and comparing them with Iran" have been conducted by Ghaedi (2007) and he compares 'the facilities', 'equipments', 'development methods' and 'barriers' of the mentioned countries. Jokar (2007) in an article entitled 'information resources as one of the support systems in E-learning courses' studied the students of virtual courses of Shiraz University, and he considers lack of information resources and E-learning content as the barriers of such educations.

Some, like Nasiri (2005), has studied about easier and better implementation of these educations in a virtual interactive environment. In other studies, including Farahani (2001), it has been shown that implementing e-learning would be merely successful when the courses are theoretical. In a study conducted by Salajeghe (2011), the factors that facilitate virtual education are discussed. Finally, the research by Salim Abadi (2006), and Jafari (2002), the obstacles and challenges of implementing e-learning have been investigated. There are also some researches indicating that e-learning is improper due to the following reasons: technical limitations like, lack of accessibility to telecommunications infrastructure, and the limited interaction between teacher and learner; therefore, the traditional face to face educational method is emphasized. The researches of Chizari (2010), and Ghaedi et al (2007), based on Brown's research are included in this study. There are some other researches in the field of E-learning that each of which have a particular look at it. The most important of these researches are: Salajeghe (2011), Musa Khani (2005), Martinez (1997) etc.

Lynch (1999), in a study entitled 'investigation of effective variables for students participation in an electronic evaluation', that was conducted by regression analysis, showed that 'computer', 'gender' and 'the experience of participating in Electronic evaluation' are of the predictor variables of the variability of the dependent variables. There is a significant relationship between the variables 'attitude toward computers and CBT' and 'psychological readiness of the learners to participate in electronic evaluation (Lynch, 2004).

Oliver (2002) in a study entitled 'quality assurance of E-learning in Australian higher education' discusses the factors leading to successful adaptation and sustainable use of virtual learning in higher education in Australia.

Mohamadi (2009) in his study entitled 'investigation of ICT infrastructure and human resource capacity in Liberia' concluded that the development of ICT in this country is depended on the improvement of the following factors: telecommunication infrastructure, human resources, economic, social and information-technology-based curriculum planning.

Naghavi (2007) in his researches, about Development, establishment and application of e-learning, stated that in the e-learning readiness of human resources, these items are

essential and effective: physical, cognitive, emotional, social and cultural factors. A glance at the recent changes in educational system shows that most of these changes in the phase of educational technology utilization have focused on acquiring early technology skills. This can clarify the importance of the application of technology for basic skills (Rosenberg, 2001). Frazeen (2006), in his final dissertation, entitled 'effective factors in quality of web-supported learning' stated the relationship and impact of several basic factors. He divided these elements in following six groups: organizational and educational factors, instructor, students, technology and educational designing (Frazeen, 2005).

Panitz (2008) in his study, about the advantages of electronic and participatory learning about motivating the learners, stated that working students, had less interest in face to face education (Panitz, 2008). Chahill (2008) in his paper entitled 'motivating factors of faculty members to participate in e-learning' refers to a significant relationship between 'vocational factors' (time, credit, career development, rewarding and high responsibility at work) and 'structural factors' (access to training materials over the course of learning, presenting different learning styles) with the implementation of e-learning courses (Chahill, 2008). Gamble (2009) in his research entitled 'The learning effects in a multicultural environment' compared and investigated the impacts of an E-learning course that was held in China and the US (Gamble, 2009).

In table 1, the effective factors of e-learning promotion such as infrastructure facilities, motivation factors, knowledge and skills of learners and etc. and with the other researches in this field have been briefly discussed.

*Table 1: Summary of studies in the field of e-learning in Iran and other countries*

Nr.	Effective factors in E-learning promotion	Author/ organization and date
1	infrastructure facilities: (infrastructure, designing and preparation of learning system components)	Sadri Arhami (2003), Miladi and Malak Mohamadi (2001), Chizari (2010), Ghaedi et al (2007), Chahill (2008)
2	importance and advantages	Miladi and Malek Mohamadi (2010), Farahani (2010), Panitz (2008)
3	motivational factors	Gamble (2009), Chahill (2008), Frazeen (2006), Oliver (2002)
4	technical skills and knowledge of teachers and learners	Soltani (2004), Naghavi (2007), Yaghoubi (2008), Mohamadi (2009), Murphy and Terry (1998)
5	barriers and Challenges	Salim Abadi (2006), Jafari (2007), Jokar (2007), Lynch (1999)

The main research questions, regarding the research purpose, would be:

- What are the requirements and necessary infrastructures of e-learning development?
- What are the advantages of e-learning in comparison to traditional learning?
- What are proper guidelines for the establishment and development of e-learning?

## **METHODOLOGY**

### **RESEARCH METHOD**

In order to answer these research questions, a qualitative approach was used; and, in order to collect the necessary data, the meaningful and snowball sampling method were used.

### **PARTICIPANTS**

Statistical population of this study was the following groups: 1) faculty members of agricultural higher education of Hamedan and Kurdistan provinces; 2) faculty members and PhD students of electronics, telecommunications, Hamedan Jahad Daneshgahi (JD).

### **DATA COLLECTION PROCEDURE**

It must be mentioned that, in the qualitative researches, the sample size does not matter; since, the crucial aspects are the procedure of sample selection and the quality of research process. As soon as the theoretical saturation is obtained, sampling and data collection would be finished. Totally, there were 25 respondents in this study and the interviews ended as soon as the data were saturated.

### **DATA COLLECTION INSTRUMENTS**

The main approach of data collection in this study is semi-structured interviews. Since, the main purpose was, as much as possible, to collect the data from the respondents, it was tried to use the open questions.

### **DATA ANALYSIS**

The data analysis was performed by using open coding. The reason for coding is to convert the data into concepts. Therefore, at the beginning, the data were separated from each other and the phrases are categorized based on the semantic units in order to attach the codes to the data. Then, these codes were classified based on the discovered phenomena of the data, which these data are directly relevant to the research questions, and these codes were conveyed to the abstract codes and finally these codes were reported jointly and commonly. The literature review was profoundly investigated to ensure the data validity and reliability. This deep investigation was conducted for both a better understanding of the subject and an appropriate formation of the interview questions. The professors and faculty members' point of view were used in this study.

This is a dynamic study, therefore the system dynamics methodology is a suitable method for this study. The present research was analyzed conceptually by Vensim software. Using the system dynamics makes the investigation of different behaviors and their feedbacks in various times possible and it helps with the management development and appropriate policies in the case of this study. The systemic thinking is considered as a framework, procedure, rule and a rationale for recognizing the problem and it includes analytic and synthetic aspects. Table 2 indicates the faculty members' view point of the above universities.

Table 2: the respondents' view about e-learning development approaches

Topics in terms of repetition	Common topics	Conclusions/recommendations
economic infrastructures technological infrastructures human infrastructures culturalization	material and immaterial infrastructure  culturalization	The required investment for updating technical knowledge and skills as well as telecommunications infrastructure and the required equipment should be provided. Logic and proper culture of using this type of education must be institutionalized among the users.
computer and internet knowledge computer use english proficiency technical-vocational courses workshops	technical knowledge and skills of the users  presenting preliminary training	Familiarity with the English and how to use the Computer software, networks and the Internet and etc. will increase their participants' ability in this field. The learners must have passed International Computer Driving License (ICDL) and should have participated in relevant workshop

## RESULTS

In table 2, respondents view and comments, stated issues, common topics, the conclusions and recommendations were briefly discussed. As it can be seen in the table, the approaches of e-learning development includes material and immaterial appropriate infrastructure (economic, technological and human), culturalization, development and skill training and technical knowledge of the users and providing fundamental educations to the teachers and students. Generally, the content analysis of respondents' views of their questions was presented in four general areas and the investment in the mentioned sectors is considered as a development approach. For example, the following elements were taken into account in the sector of 'skill and technical knowledge of the users' which familiarity with English and proficiency of different tutorial and computer software are of those elements.

In table 3, frequency and the percentage of each of the e-learning elements, based on table 2 conclusions, were presented both individually and in association with the other elements.

Here, some comments are quoted directly:

One of the respondents commented on the advantages and barriers of e-learning in comparison to traditional teaching "the main advantages in establishment of e-learning are: flexibility, the elimination of unnecessary and costly traffic of learners, lack of limitation to a particular time and place; and, lack of access to high-speed and inexpensive internet and lack of understanding of responsible men and the audience from e-learning are the main barriers of this era".

Table 3: Infrastructures and requirements of e-learning development

Priority	Common topics	Frequency	Percentage of each element individually	Percentage of each element in association with the other elements
1	material and immaterial infrastructure (economic, technological, human infrastructures)	22	88	18.2
2	Culturalization	21	84	17.4
3	technical knowledge and skills of the users (Computer and internet knowledge, computer use, English proficiency )	19	76	15.7
4	presenting preliminary training (technical-vocational courses, workshops)	17	68	14

Another respondent said: “e-learning is not limited by time and place and the management of e-learning plans can be practicable for a large group of students.”

Regarding necessary facilities and resources, another respondent stated that: “information, knowledge and ability of learners to use computers and E-learning tools and hardware facilities, such as: computer, webcam, headset, tablet and etc. are of utmost importance.”

Regarding the skills of e-learning learners, another respondent stated that: “the learners of this system should be familiar with computer, web, network and hardware and software”; another interviewee said that “the learners of this system must attend in tutorial courses of authoritative organizations like technical-vocational organization, and they should participate in seminars and workshops in order to acquire the essential skills.”

In table 4, frequency and percentage of each of the effective elements in describing the benefits of e-learning in comparison to traditional education are discussed both individually and in association with the other elements.

As it is inferred from table 4, the four major advantages of e-learning in comparison to traditional education are: saving the costs, diversity in training (flexibility, the number of admissions), updating the data (data access, effectiveness and efficiency of training), lack of need to the physical presence of the master. Since, in the present time, the increasing pace of human life and their different roles and responsibilities in communities has caused time shortage and economic problems, therefore, e-learning utilization seems to be so essential and cost-benefit.

In table 5, frequency and the percentage of each of the elements (both individually and in association with the other elements) and necessary facilities to establish E-learning system is discussed.

Table 4: e-learning advantages in comparison to traditional education

Priority	Common topics	Frequency	Percentage of each element individually	Percentage of each element in association with the other elements
1	saving the costs	24	96	28.9
2	diversity in training (flexibility, the number of admissions)	22	88	26.5
3	updating the data (data access, effectiveness and efficiency of training)	19	76	22.9
4	lack of need to the physical presence of the master	18	72	21.7

In table 5, the essential facilities and equipments to establish e-learning system are presented in the above six major factors. The most important factor is essential and appropriate hardware and software equipments for starting up and holding e-learning courses.

Regarding the mentioned results we can conclude that the main advantages of e-learning are: Saving time and cost, expanding communication domain, expanding courses, up to dating information, having a flexible method of study, increasing interaction and increasing curiosity and initiative.

Also the main e-learning barriers would be: high costs of infrastructure creation, reduction of face to face interaction, the high initial cost of preparing materials, and lack of appropriate hardware and software, and unfamiliarity with the technology of e-learning for both teachers and learners. Of course, e-learning for different groups (e.g., teachers, students, planners, managers and executives) have different advantages and disadvantages.

Table 5: proper guidelines for the establishment and development of e-learning

Priority	Common topics	Frequency	Percentage of each element individually	Percentage of each element in association with the other elements
1	Essential hardware and software equipments	23	92	19.5
2	High-speed and inexpensive internet	22	88	27.1
3	Professional human resources (professors, managers, experts)	19	76	16.1
4	Learners' knowledge and skills	17	68	14.4
5	Holding tutorial courses for the learners	14	56	11.9
6	culturalization	13	52	11

In figure 1, dynamic relationships of essential material and immaterial infrastructure for the operation and development of e-learning system were investigated by Vensim Software.

As it is inferred from figure 1, economic, technological and human infrastructure has positive effects on necessary infrastructure for e-learning development and they are considered as approaches of e-learning development. For example, 'material and immaterial infrastructures' and 'technology infrastructures' develop 'human

infrastructures'; and, 'material and immaterial infrastructures' and 'technology and human infrastructures' promote 'economic infrastructures'. And yet, 'material and immaterial infrastructures' enhance 'economic, human and technological infrastructures'.

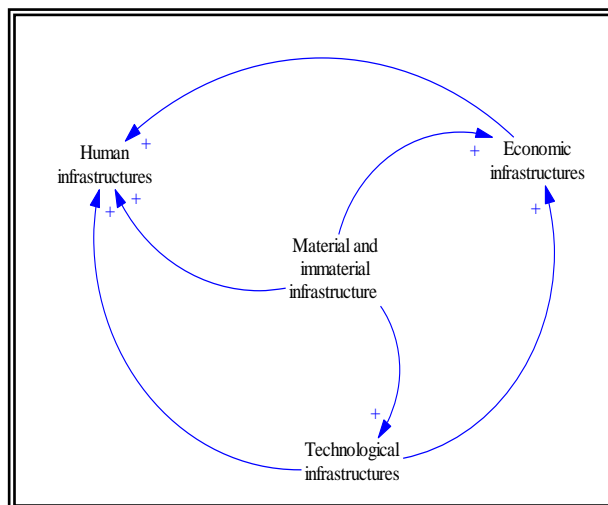

Figure 1: dynamic relationships of essential material and immaterial infrastructure

In figure 2, the dynamic relationships of the learners' skills and knowledge were considered.

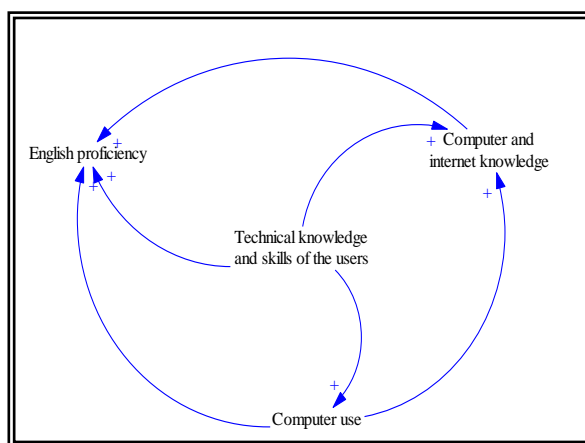

Figure 2: the dynamic relationships of the learners' skills and knowledge

In figure 2, it is shown that, the learners' skills and knowledge which includes internet and computer knowledge, English proficiency are considered as the factors that affect positively on e-learning development.

As figure 2 shows, increasing the learners' skill and knowledge enhances internet and computer knowledge, English proficiency and computer user. And, increasing level of computer user enhances computer and internet knowledge and also English proficiency. And, finally, increasing computer and internet knowledge develop English proficiency. In figure 3, the approaches of e-learning promotion is presented.

In figure 3, the approaches of e-learning development is presented with all its subcategories. As the figure clearly shows, each of the four branches of presenting preliminary training, material and immaterial infrastructure, culturalization and the

learners' skills and knowledge along with its subparts have positively and directly affected on e-learning development. Deficiency and shortage in each of the above parameters are considered as the barriers of e-learning development.

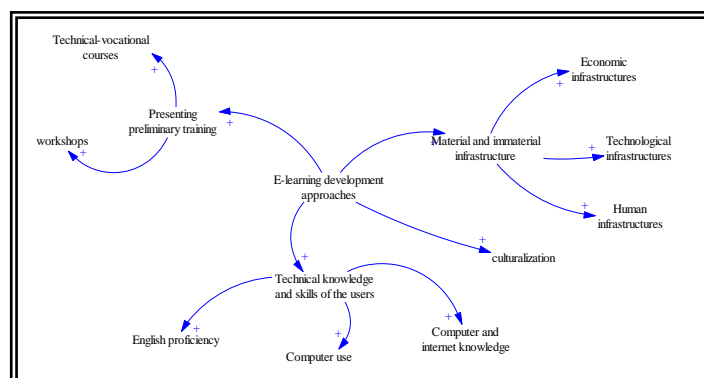

Figure 3: the approaches of e-learning development

Figure 4 represents the flowchart of the findings and conclusions of effective factors of e-learning development especially in Iranian higher education system.

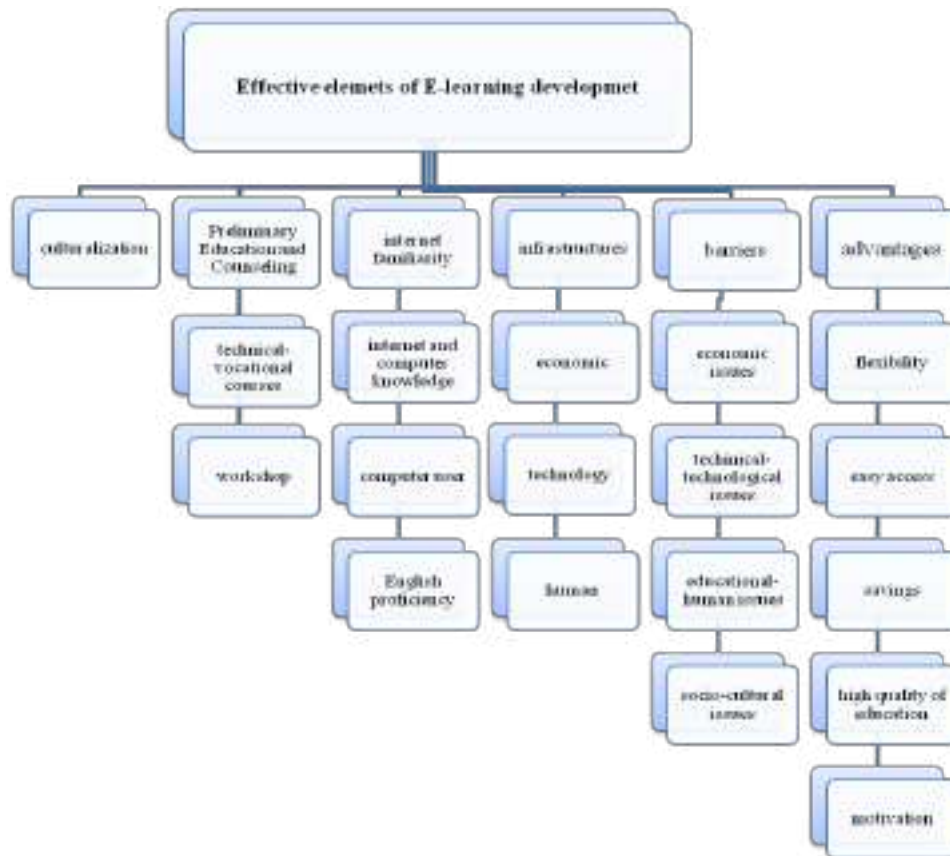

Figure 4: Effective elements of e-learning development

## DISCUSSION

New information technologies are opening extraordinary abilities to change or reshape teaching and learning activities in all institutions of higher education. They also provide tools to design modern scientific environments that have never been possible before. For this reason, many universities want to establish electronic courses using the capabilities of information technology in the form of e-learning or online learning. However, the study several research of illustrates that the development of e-learning in education systems are faced with many problems. That unfamiliarity of policymakers and educational planners with them can impose heavy costs on educational institutions.

If the government and the responsible authors invest properly in e-learning, the development and extension of economic, technological, telecommunication, electronic infrastructures and human resources would be achieved. This finding matches to Howard (2008) study in Liberia that states: “the development of ICT would be possible by reinforcement of telecommunication, human resources, economic, social infrastructures and IT-based curriculum planning.” Creating the appropriate cultural context and establishing reasonable and proper use of education cybernetic and electronic environments is a part of development and extension requirements of e-learning.

The most important skills of e-learning learners are ‘technical skill and knowledge of learners in English proficiency’, ‘software, hardware and network proficiency’ and other required potentials in e-learning. This finding accord to Yaghoubi (2008) study which asserts that: “internet and computer knowledge and the students’ interest in e-learning must be taken into account.”

It is necessary for the virtual course students to be familiar with internet skills and English proficiency. Also, they should participate in tutorial workshops.

Massive spending and investment plans in developing appropriate and essential infrastructures have a significant effect on 'the scientific growth and development of the country' and 'increasing the scientific potential of Iran universities in comparison to foreign universities.'

It seems that if it is invested on the development of infrastructures and proper physical and technical contexts of e-learning, then it will be more efficient than a situation in which huge budgets are spent for creation of educational environment.

## **CONCLUSIONS**

The educational system of the country must present more comprehensive services in English education and computer skills for students.

The government and responsible people of cultural and social affairs should provide proper social and cultural contexts for developing and establishing of public use of e-learning.

Training interested and knowledgeable E-learning professors and also producing electronic content in educational syllabus is of utmost importance while lack of such a thing is felt.

Regarding that no exact and documented study in the field of 'the payment of teaching per hour' has not been done either in a traditional or electronic way, it seems that, if an exact and proper research is done in the field of investigating the technical and economic justification, then, responsible men will be convinced to invest in e-learning development.

## **ACKNOWLEDGEMENT**

The researchers are grateful to Leila Avatefi and Seyede Sara Barzegar for their insightful feedback on this work. This work was totally supported by them; and, the researchers would like to thank them for many useful ideas, comments and suggestions

## MOTIVATION AMONG IRANIAN LEARNERS

**Mahbube Keihaniyan**

*Young Researchers and Elite Club, Najafabad Branch, Islamic Azad*

*University, Najafabad, Isfahan, Iran*

*Email: m\_keihaniyan@yahoo.com*

### ABSTRACT

This study investigated 50 state high school and private institute learners in Najafabad, 25 each, to see if there was any difference between their motivation. These students were selected to answer a motivation questionnaire and the analysis of the results gained through this questionnaire. Although there was no significant difference between these two groups with regard to proficiency. The analysis of the learner's responses to the motivation questionnaire showed that the private language institute learners were more motivated to learn English than the high school learners. The findings of this study are useful for teachers to apply motivated methods to improve learners' motivation. Also, students who take responsibility for their learning enjoy freedom and power to make decisions in their learning. Knowing that learning is a product of one's own activities, a student feels more rewarded and enhances his courage to get involved in an active learning process.

**KEYWORDS:** Motivation, Private institute, Motivation questionnaire

### INTRODUCTION

Students should be active agents of their learning, not merely passive receivers of information. Learning is a product of learners' own actions and is based not only on the learners' prior skills and knowledge but also on their experience and interest. If learners have role in defining and choosing the goals, the course content, and methodology, learning will be more relevant to them (Decorte, 1993). Although many teachers admit that learners differ in terms of needs and preferences, they may not consult learners in conducting language activities. The basis for such reluctance to cooperate may be that learners are not capable to express what they need to learn and how they want to learn it.

Recent research on motivation has demonstrated that students' goals and expectancies are referred as motivational variables can have considerable influence on their academic performance, and achievement (e.g., Barker, Dowson, & McInerney, 2002; Dowson, 2001, 2003). McInerney (1992) proposed that individuals' internal motivations (such as their goals and expectancies) may promote positive academic behavior and achievement, external (or at least externally referenced) forces in students' social environments may facilitate or inhibit the translation of these internal motivations into actual behavior. There is a large body of research concerned with the impact of attitudes and motivation on second language acquisition, and much of it has demonstrated a relationship between attitudinal and motivational variables on the one

hand and proficiency in a second language on the other (Clément, 1978, 1980; Dörnyei, 1994; Gardner & Lambert, 1959; Gardner et al., 1983; Gardner et al., 1976; Tremblay & Gardner, 1995).

Furthermore, it is often suggested in the literature that L2 learning motivation is affected by specific L2 learning contexts to which L2 learners are exposed (Clément & Kruidenier, 1983; Dörnyei, 1990; Oxford, 1996; Oxford & Shearin, 1994; Schmidt, Boraie, & Kassabgy, 1996). For instance, in an ESL (English as a Second Language) situation, where direct contact with native speakers of English is possible, English is mastered through direct exposure to it. In an EFL (English as a Foreign Language) context, however, English learning mostly takes place in academic or formal classroom settings without regularly interacting with the English language community, thereby limiting generalization of the studies based on an ESL sample. Motivation is commonly defined as the “energization” and “direction” of behavior (Cofer & Appley, 1964; Heckhausen, 1991), that is, motivated behavior involves both the activation of motives, values, or interests by internal or external cues and the guiding of these activated motives, values, or interests toward potentially satisfying objects, outcomes, or end states.

### **STATEMENT OF THE PROBLEM**

Motivation plays a significant role in the EFL learning process, and most learners may feel disappointed if the method of teaching is not appropriate for them. Regarding language teaching in Iran, Bakhshi (1997) notes: “One of the problems is an old belief that just knowing about the language and its grammatical patterns suffice teaching English, so there are no rooms left for advancement through insight of linguistics, psycholinguistics, sociolinguistics, and motivation” (p.14). Teachers do not use classroom activities that increase students’ commitment for learning English. This makes students feel reluctant to the task of learning. This study attempts to investigate this issue in an Iranian context. In this study, the researcher wants to compare motivation in the high school and the private language institute. In the high school teacher has the central role but in the private language institute learners have central role and in the private language institute learning English is an optional course but an obligatory one in the high school then the researcher wants to find motivation in these two settings.

### **OBJECTIVES OF THE STUDY**

The importance of motivation in educational setting necessitates the investigation of this factor involved in the process of teaching. Therefore, the present study was designed to show the difference between motivation experienced by learners. With regard to what has been presented above, the present research will address two major questions:

- 1) Is the motivation in high school different from the motivation in the private language institute?
- 2) Is the type of motivation (instrumental motivation, integrative motivation, attitude toward learning English, attitude towards English textbooks, Coercion Index, and overall achievement) different in high school and the private language institute?

### **METHODOLOGY**

#### ***Participants***

The participants of this study ranged from 15 to 17 year-old students selected randomly from 50 high school female students and 50 female students studying English as a foreign language (EFL) in a private language institute in Najafabad. Learners in these two settings enrolled in the second grade and their major was computer. Then, a Nelson test was administered to the students to select and homogenize the intended number of students for the study. Next, 50 students, 25 from Mahjub high school and 25 from Parto private institute, whose scores on the Nelson were between one standard deviation above and one standard deviation below the mean, were selected to take part in the study; to answer questions of a motivation questionnaire.

### *Instruments*

Data in this study were collected through using instruments as follows:

1) A Nelson test (1999). It consisted of 40 multiple-choice items on grammar and vocabulary to estimate the proficiency level of the learners. The validity of the test was established by consulting with three experts. **The validity of the test was established by consulting with my supervisor and advisor. It' reliability was measured via cronbach's alpha that was 0.72.**

2) A motivation test. It was developed by Celce Murcia (1991) and consisted of 41 questions. This questionnaire was translated into Farsi to avoid participants' confusion. According to Seliger and Shohamy (1989), one of the main problems with questionnaires in a foreign language (FL) is that participants often have problems in providing answers in FL and there is no assurance that the questions are properly understood and answered correctly. The participants were asked to rate their attitudes on a 5-point Likert scale. The researcher measured its reliability via Cronbach's alpha ( $r=0.81$ ).

### *Data Collection and Procedure*

Data were collected through the following stages: At first 100 students from the high school and the private institute, 50 each, were selected randomly. Then, via the administration of the Nelson test, 50 students (25 from the high school and 25 from the private institute) were selected as the participants of the study. Then the motivation questionnaire was distributed among the participants. They were asked to read the questions carefully and express their feeling by choosing one of the alternatives written in front of each statement.

## **THE ANALYSIS OF THE LEARNERS' RESPONSES TO THE MOTIVATION QUESTIONNAIRE**

Table 1 gives a summary of the findings for both groups, that is, the high school and the private institute learners, on the motivation questionnaire, and Figure 1 presents the graphical representation of the same results.

Table 1: Descriptive Statistics of the Two Groups on the Motivation Questionnaire

High School					Language Institute				
Min	Max	Mean	SD	Variance	Min	Max	Mean	SD	variance
99	205	183.08	20.845	434.493	153	230	195.24	18.622	346.773

Figure 1: The graphical representation of the results for the motivation questionnaire

As Table 1 shows, the mean and the standard deviation scores of the high school students on the motivation test are respectively 183.08 and 20.84. For the language institute students the mean and the standard deviation scores are 195.24 and 18.62 respectively. In the high school group, the highest score and the lowest score are 205 and 99, but in the private language institute the highest score is 230 and the lowest score is 153. The above table shows that the mean score for the motivation obtained by the language institute students is higher than that obtained by the high school learners.

In order to find out whether or not this difference is statistically significant, a *t*-test was run. Table 2 shows the results of this *t*-test.

Table 2: The Results of the *t*-test for the Motivation Questionnaire

Group	No.	Mean	SD	SEM	df	t	P
High School	25	183.08	20.845	4.169	48	-2.229	.031
Institute	25	195.24	18.622	3.724			

Table 2 reveals that the amount of *t*-observed ( $t = -2.229$ ) is significant at the probability level of  $p = .031$ , which is smaller than .05. In other words, motivation is significantly higher for the language institute students than for the high school students.

# THE RESULTS OF THE ANALYSIS OF THE LEARNERS' RESPONSES TO DIFFERENT PARTS OF THE MOTIVATION QUESTIONNAIRE

The motivation questionnaire is divided into six parts. The researcher compared the learners' responses to 4 parts in the high school and the private institute because these 4 parts are more related to this research.

Table 3 shows the descriptive statistics of different parts of the motivation questionnaire for each group and Figure 2 presents the graphical representation of the same results.

Table 3: Descriptive Statistics of Different Parts of Motivation Questionnaire for Both Groups

Group	Parts of motivation	No.	Mean	SD
School	Instrumental	25	15.498	1.5831
	Integrative	25	16.212	4.0901
	Coercion index	25	14.280	4.7734
	Attitude	25	14.347	3.1979
	Textbooks	25	14.808	1.6036
	Achievement	25	14.784	4.5559
Institute	Instrumental	25	17.046	1.6848
	Integrative	25	18.480	2.2683
	Coercion index	25	10.920	3.0911
	Attitude	25	17.270	3.1531
	Textbooks	25	15.480	2.9189
	Achievement	25	17.976	4.1151

As this table shows the mean scores of the private institute in instrumental motivation, integrative motivation, attitude toward learning English, attitude towards English textbooks, and overall achievement are higher than the high school learners. The mean score of the high school learners in the coercion index is higher than the private institute.

Figure 2: Graphical representation of the means in different parts of the motivation questionnaire for both groups

As figure 2 shows the mean score in each part of the motivation questionnaire for the private institute learners is higher than the high school learners except in the coercion index.

## THE RESULTS OF THE ANALYSIS OF THE LEARNERS' RESPONSES TO THE FIRST PART OF THE MOTIVATION QUESTIONNAIRE

The first part of this questionnaire deals with the learners' reasons for learning English. It consisted of 8 questions: 4 items ask instrumental motivation, 2 items are about integrative motivation and 2 questions are about coercion index.

### *The Analysis of the Learners' Responses to the Instrumental Motivation Questions*

These questions of the questionnaire deal with the instrumental motivation:

1. *I think it will some day help me get a good job.*
2. *Proficiency in English is a sign of good education.*
3. *I study English to go to the university.*
4. *English is the language of progress and modernization.*

As Table 3 shows, the mean and the standard deviation of the private institute students on the instrumental motivation questions are respectively 17.04 and 1.68. The mean and the standard deviation of the high school students on the instrumental motivation questions are respectively 15.49 and 1.58. By comparing the means of the two groups shown in the table 3 it can be said that the amount of instrumental motivation is higher for the private institute learners. A *t*-test was

applied to find out if there is a significant difference between these two groups. Table 4 reveals the results of this *t*-test.

*Table 4: The Results of the t-test for the Instrumental Motivation*

Group	N	Mean	SD	df	t	p
High School	25	15.49	1.58	48	-3.348	.002
Institute	25	17.04	1.68			

It can be seen in Table 4 that the amount of *t*-observed ( $t=-3.348$ ) is significant at the probability level of  $p=.002$  which is smaller than .05. In other words, instrumental motivation in these two settings is different. The amount of instrumental motivation is higher for the private institute learners.

In order to find a correlation between test anxiety and instrumental motivation, a Pearson Correlation Test was employed.

*Table 5: The Results of the Correlation Analysis for Instrumental Motivation*

		Test Anxiety	Instrumental motivation
Test Anxiety	Pearson Correlation	1	-.446(**)
	Significance(2-tailed)	.	.000
	N	25	80
Instrumental motivation	Pearson Correlation	-.446(**)	1
	Significance(2-tailed)	.000	.
	N	25	120

\*\* Correlation at 0.01(2-tailed):...

This table depicts a significant negative correlation between the test anxiety and the instrumental motivation ( $r=-.446$ ). In other words, it can be said that the higher the test anxiety, the lower the instrumental motivation, and vice versa.

### ***The Analysis of the Learners' Responses to the Integrative Motivation Questions***

These questions of the questionnaire deal with the integrative motivation:

1. *I think it will help me to better understand English- speaking people.*
2. *I like English.*

As Table 3 shows, the mean and the standard deviation of the private institute students on the integrative motivation questions are respectively 18.48 and 2.26. The mean and the standard deviation of the high school students on the integrative motivation questions are respectively 16.21 and 4.09. By comparing the means of the two groups shown in the above table it can be said that the amount of integrative motivation is higher for the private institute learners. A *t*-test was applied to find out if there is a significant difference between these two groups. Table 6 reveals the results of this *t*-test.

Table 6: The Results of the *t*-test for the Integrative Motivation

Group	N	Mean	SD	df	t	p
High School	25	16.21	4.09	48	-2.425	.019
Institute	25	18.48	2.26			

It can clearly be seen in Table 6 that the amount of *t*-observed ( $t=-2.425$ ) is significant at the probability level of  $p=.019$  which is smaller than .05. In other words, the amount of the integrative motivation is significantly higher for the private institute students than the high school students.

### ***The Analysis of the Learners' Responses to the Coercion Index Questions***

These questions deal with the Coercion Index:

1. *It is a part of the school curriculum.*
2. *My parents want me to learn it.*

As Table 3 shows, the mean and the standard deviation of the private institute students on the coercion index questions are respectively 10.92 and 3.09. The mean and the standard deviation of the high school students on the coercion index questions are respectively 14.28 and 4.77. By comparing the means of the two groups shown in the above table it can be said that the amount of coercion index is higher for the high school learners. In other words, high school learners attend the English classes only because it is a part of the school curriculum not because of their motivation. A *t*-test was applied to find out if there is a significant difference between these two groups. Table 7 reveals the results of this *t*-test.

Table 7: The Results of the *t*-test for the Coercion Index Questions

Group	N	Mean	SD	df	t	p
High School	25	14.28	4.77	48	2.954	.005
Institute	25	10.92	3.09			

As Table 7 shows the amount of *t*-observed ( $t=2.954$ ) is significant at the probability level of  $p=.005$  which is smaller than .05. In other words, the amount of the coercion index is significantly higher for the high school students than the private institute students.

### **THE ANALYSIS OF THE LEARNERS' RESPONSES TO THE SECOND PART OF THE MOTIVATION QUESTIONNAIRE**

The second part of this questionnaire deals with the learners' attitude toward learning English and consisted of 5 questions:

1. *Studying English is an enjoyable experience.*
2. *I would study English in school even if it were not required.*
3. *I do not like to spend my time on subjects other than English.*
4. *I think learning English is the best experience in my life.*

5. *Learning subjects other than English is a waste of time.*

As Table 3 shows, the mean and the standard deviation of the private institute students on questions about learners' attitude are respectively 17.27 and 3.15. The mean and the standard deviation of the high school students on these questions are respectively 14.34 and 3.19. By comparing the means of the two groups shown in the above table it is clear that the private institute learners have positive attitude toward learning English. It can be said that learners' motivation cause positive attitude to learning English and vice versa. A *t*-test was applied to find out if there is a significant difference between these two groups. Table 8 reveals the results of this *t*-test.

Table 8: The Results of the *t*-test for Learners' Attitude toward Learning English

Group	N	Mean	SD	df	t	p
High School	25	14.34	3.19	48	-3.255	.002
Institute	25	17.27	3.15			

It can clearly be seen that the amount of *t*-observed ( $t=-3.255$ ) is significant at the probability level of  $p=.002$  which is smaller than .05. In other words, the amount of the positive attitudes toward learning English is significantly higher for the private institute students than the high school students.

### THE RESULTS OF THE LEARNERS' RESPONSES TO THE THIRD PART OF THE MOTIVATION QUESTIONNAIRE

The third part of this questionnaire deals with the learners' attitudes toward their English textbooks and consisted of 7 questions:

1. *The topics and reading texts in our English textbooks are enjoyable.*
2. *The materials and activities in our book are interesting.*
3. *Reading texts and topics encourage me to read more English.*
4. *The pictures of the book help me to understand English better.*
5. *Reading passages present an up-to-date picture of the target language people.*
6. *Reading texts and topics are in harmony with the students own needs and interests.*
7. *The reading texts are interesting.*

As Table 3 shows, the mean and the standard deviation of the private institute students on questions about the learners' attitude toward English textbooks are respectively 15.48 and 2.91. The mean and the standard deviation of the high school students on these questions are respectively 14.80 and 1.60. By comparing the means of the two groups shown in the above table it can be said that the private institute learners have positive attitude toward their English textbooks and this attitude can increase their motivation. A *t*-test was applied to find out if there is a significant difference between these two groups. Table 9 reveals the results of this *t*-test.

Table 9: Results of the *t*-test for Learners' Attitude toward English Textbooks

Group	N	Mean	SD	df	t	p
High School	25	14.80	1.60	48	-3.176	.003
Institute	25	15.48	2.91			

As Table 9 shows the amount of *t*-observed ( $t = -3.176$ ) is significant at the probability level of  $p = .003$  which is smaller than .05. In other words, the amount of the positive attitudes toward English textbooks is significantly higher for the private institute students than the high school students.

### THE RESULTS OF THE LEARNERS' RESPONSES TO THE FOURTH PART OF THE MOTIVATION QUESTIONNAIRE

This part, consisted of one question, asks learners' satisfaction with their achievement in English:

1. *I am satisfied with my achievement in English.*

As Table 3 shows, the mean and the standard deviation of the private institute students on overall achievement are respectively 17.97 and 4.11. The mean and the standard deviation of the high school students on this question are respectively 14.78 and 4.55. By comparing the means of the two groups shown in the above table, the private institute learners are more satisfied with their achievement in English. It can be said, there is a positive relationship between motivation and overall achievement. In other words, the higher the motivation, the higher the overall achievement, and vice versa. A *t*-test was applied to find out if there is a significant difference between these two groups. Table 10 reveals the results of this *t*-test.

Table 10: The Results of the *t*-test for the Satisfaction with Overall Achievement in English

Group	N	Mean	SD	df	t	p
High School	25	17.04	4.55	48	2.600	.012
Institute	25	17.97	4.11			

It can be seen in Table 10 that the amount of *t*-observed ( $t = 2.600$ ) is significant at the probability level of  $p = .012$  which is smaller than .05. In other words, satisfaction with overall achievement in English in these two settings is different. Satisfaction is higher in the private institute learners.

### DISCUSSION

***The First Research Question: Is there any difference between learners' motivation in the high school and the Private language institute?***

To answer this research question, a *t*-test was used and the results show that motivation is higher in the private language institute learners than the high school learners. Also, Boggiano *et al* (1992) found that if teachers be as facilitators in the class, use interesting materials (photographs, objects,...) and give learners an active role that learners can decide what to teach and how to teach, learners' motivation will increase.

***The Second Research Question: Is the type of motivation (instrumental motivation, integrative motivation, attitude toward learning English, attitude towards English text books, Coercion Index, and overall achievement) different in high school and the private language institute?***

To answer this research question a series of *t*-tests were used to analyze the learners' answers to the motivation questionnaire. It was clear that instrumental and integrative motivations are higher in the private institute learners. They want to learn English because they want to find a good job and learning English help them to have a better understanding of English-speaking people. Private institute learners have positive attitude toward learning English and their textbooks. Also, they were satisfied with their achievement in English. But, in the high school, learners attended the English class because it was a part of their school curriculum. They have negative attitude toward learning English because they think learning English is a dull activity and waste of time. Learners in the high school were not satisfied with their progress in English because they just want to pass their course.

A previous study by Giles and Coupland (1991) found that integrative and instrumental motivations are very useful factors to engage learners in learning process. Integrative motivation comes from the learner and it has a very strong power to move learners toward learning. Also, if learners want to have a good position and a good job in their society they are engaged in learning process. The result of Giles and Coupland's research is similar to the results of the present study.

## CONCLUSION

According to this study if learners have an active role in learning process, their motivation will increase. Then, students should take responsibility for their learning. They should ask for freedom and power to make decisions in their learning. It is also necessary for students to know that learning is a product of their own activities and it is based on their prior skill, knowledge, and interest. Therefore, it seems that the effective language learning occurs when students collaborate with teachers and textbook writers in designing useful materials by expressing their attitudes and opinions.

## LIMITATION OF THE STUDY AND SUGGESTIONS FOR FURTHER RESEARCH

No study is complete by itself and cannot take every detail into consideration. Therefore, there are always aspects which are not accounted for. This research is no exception. There are some issues which were not controlled in this study and can be topics for further research by other researchers.

- 1) This study was done only in one city with a limited number of students. It is suggested that another study be performed with large numbers of students from more cities.
- 2) In this study data collection was done through questionnaires; some other studies can be carried out to incorporate interviews with students as well.
- 3) In this study only female students were questioned. Some other studies can be performed on both genders and see if they differ in motivation and test anxiety.
- 4) In this study, the participants were adolescents; in other studies adult language learners can be the focus of attention to see whether the same results will be obtained.

**ABSTRACT**

The purpose of this study is to examine a deconstructive concept of theatre as it specifically relates to the theatre of post-structuralism by investigating the works and ideas of Tom Stoppard. Accusing Western philosophy of being obsessed with binary oppositions, Jacques Derrida's deconstructive approach represents language as an instable and delogocentric system by means of which no fixed meaning can be created. Together with conceptualism and rejection of modern doctrines, Derrida's theory of post-structuralism is utilized to analyze the inner dynamics of Stoppard's two selected plays: *Rosencrantz and Guildenstern Are Dead* and *Arcadia*.

**KEY WORDS:** Post-structuralism, Postmodernism, Deconstruction, Binary oppositions, Différance, Dissemination, Delogocentrism.

**INTRODUCTION**

The primary aim of this study was to trace deconstructionist features in Tom Stoppard's two selected plays: *Rosencrantz and Guildenstern Are Dead* and *Arcadia*. After a very brief introduction to a post-structuralist school of criticism by Jacques Derrida called deconstruction, Tom Stoppard's dramaturgy is given a close deconstructionist reading in the selected plays.

***Deconstruction***

Deconstruction is a school of philosophy and literary criticism associated closely with French philosopher, Jacques Derrida, one of the most influential thinkers of the latter part of the twentieth century, and also the Belgian/North American literary critic Paul de Man. Derrida's deconstruction theory, basically, refers to the re-reading or breaking down of a text to show the multiple meanings at work which tries to subvert the logic of opposition within language. As Butler (2002) asserts:

The central argument for deconstruction depends on relativism, by which I mean the view that truth itself is always relative to the differing standpoints and predisposing intellectual frameworks of the judging subject. It is difficult to say, then, that deconstructors are

committed to anything as definite as a philosophical thesis. Indeed, to attempt to define deconstruction is to defy another of its main principles – which is to deny that final or true definitions are possible, because even the most plausible candidates will always invite a further defining move, or 'play', with language. For the deconstructor, the relationship of language to reality is not given, or even reliable, since all language systems are inherently unreliable cultural constructs. (16)

According to Derrida, this demands a close analysis of the basic "distinctions" and "conceptual orderings" which have been formulated by the predominant tradition of Western philosophy. In a series of discussions on philosophers as Plato, Hegel, Rousseau, Kant, Husserl, Austin, and Lévi-Strauss, Derrida embraces a strategy or reading which throws doubt on the presumptions and limitations of textual meaning by uncovering how the uncertainties and certainties a text has presented have indeed been formed through a chain of "preferences" and "repressions" which own advantaged special ideas, values and arguments above others. As Derrida (1978) puts it:

the movement of signification is possible only if each so called 'present' element, each element appearing on the scene of presence, is related to something other than itself, thereby keeping within itself the mark of the past element, and already letting itself be vitiated by the mark of its relation to the future element, this trace being related no less to what is called the future than to what is called the past, and constituting what is called the present by means of this very relation to what it is not. (32)

Derrida's idea, here, is that what has been put forward as a dichotomy (binary oppositions) in Western philosophy, such as masculine/feminine, is only a difference which has been influenced by a hierarchy. Reshaping Saussure's notion of binary oppositions, Derrida argues that, in each pair, one term is "suppressed" and one "privileged". Derrida aimed to demonstrate how the privileged term relied on the suppressed one for its meaning. Derrida's idea does not seek the information of analytic distinctions altogether, nor does he deal with a simple reversal of hierarchical oppositions. As Derrida and some of his more keen followers well known, "positing difference against identity succeeds only in falling back within the very logic of binary opposition their deconstructive enterprise tries to resist". (Payne and Barbera, 2010:79)

As an alternative, Derrida tries to substitute and recast concepts into larger and inclusive contexts. His procedure simply embodies use of the meaning and potentiality of a concept against the limits within which it has been formulated. Therefore, his doubt on the "structurality of structure", the cause of the cause, or the context of the context attempts to uncover the metaphysical termination or the limits of Western philosophy. Derridean deconstruction reveals the logic, assumption and, structure which construct the predominant tradition of Western Philosophy. Deconstructive criticism does not assert that it can clear up textual conflicts and contradictions. On the contrary, it argues that, there is something inherent to the structure of language which perplexes any attempted textual unity. Derrida's terms "différance" and

"dissemination" point out to both the possibility and the impossibility of defining a certain meaning of a text.

Différance is a pun in French, combining the meanings of "differing" (as in any set of items lined up in space differ from one another) and "deferring" (as in putting off, delaying). Since all texts contain ambiguities and can be read in different ways (la différence), exhaustive interpretation must be forever deferred (la différance).

Suspended between its two senses of differing and deferring, this neologism represents the non-originary origins of a generalized system of language that encompasses both speech and writing; where meaning is never located within the sign as a self-sufficient entity but is, rather, constituted through the differential play between an infinite number of signifiers and signified. As a result, meaning is always deferred. Thus, the 'concept' of différance represents a powerful critique of *presence* and its associated values. (Childs and Fowler, 2006:55)

Dissemination, however, suggests the process by which, in language, the meaning of any term or set of terms is distributed and diffused throughout the language system without ever coming to a final end.

Dissemination designates the idea that meaning is never stable, or fixed, but is, rather, dispersed or scattered throughout the language system. Thus, like the notion of *undecidability* (to which it is related), dissemination calls into question the possibility of definition itself. For this reason, it is best conceived of as an effect of writing. (Childs and Fowler, 2006:61)

Derrida's recognized notion of writing plays the role of a metaphor for the "absence" of both a "unified subject" and a "constant referent" in any text- it is not important if spoken or written. For him, such absences are the inescapable aftermath of using "signs" which produce and communicate meaning.

The involvement of the linguistic sign separates the "subject" and the "referent" from themselves, and it is such separations and absences which creates the possibility of textual "misinterpretations" and "misunderstandings". The desire for these systematic incoherence and unmanageable ambiguities in meaning can be regarded as the best characteristic of deconstructive criticism.

In relation to literary analysis, when beginning the interpretive process, by means of what has been defined as Différance and Dissemination, deconstructors seek to overrule their own logocentric ways of viewing a text, moving towards delogocentrism.

A deconstructive reading strategy, as Bressler (1999) represents a linear procedure in his text analysis, would follow the following steps as a simple representation, having a clearly delineated beginning, middle and end:

1. Discover the binary operations that govern the text.
2. Comment on the values, concepts and ideas behind these operations.
3. Reverse these present binary operations.
4. Dismantle previously held worldview.
5. Accept the possibility of various levels of a text based on new binary inversions.
6. Allow the meaning of the text to be undecidable (81-82)

In sum,

Derrida's philosophical enterprise claims to deconstruct pervasive shibboleths as these occur in both academic work and in the language of everyday life. Everyday language is not neutral; it bears within it the presuppositions and cultural assumptions of a whole tradition. At the same time, the critical reworking of the philosophical basis of the tradition in question results, perhaps unexpectedly, in a new emphasis on the individual autonomy and creativeness of the researcher/philosopher/reader. Maybe this anti-populist yet anti-Platonic element in grammatology is Derrida's most important contribution to the thought of the post-war era. (Lechte, 1994:124)

### ***Rosencrantz and Guildenstern Are Dead***

Beginning with his early writing career as a playwright, his writing strategy and career, Tom Stoppard, himself, believed that:

The reason why *that* idea appealed to me rather than another one is that it does have this under-structure to it. . . . The important thing about a successful work of art is not that it should communicate X to everybody but that it should run through the absolute alphabet for each 26 people. (Taylor, 2001:28)

Most embodied to the mentioned idea, one that in a metaphoric situation represents a system of meaning, all at once possible, is his most famous play: *Rosencrantz and Guildenstern Are Dead* (1967). The play is not a mere 'Shakespearean pastiche'. For,

While retaining the broad context given by Shakespeare, Stoppard develops his 'borrowed' characters into his own creations speculating philosophically upon the 'reality' of a dramatic situation – the plot of *Hamlet* – which they cannot understand. This obliges Stoppard to adopt a critical view of the way in which his 'heroes' are handled by Shakespeare. (Brassell, 1985:37)

Rosencrantz and Guildenstern, two dead characters from the Shakespeare's well-known play *Hamlet*, enter a new context designed by Stoppard with the writer's tendency toward lots of doubt and irony. The text's complexity encounters the reader with lack of coherency, and as a result, the existence of binary oppositions within the play.

In the course of the play, Stoppard divides all three acts of the play into two forms of the 'borrowed characters', which is the characters' "on-stage" and "off-stage" selves. While the

Shakespearean style is evident in the "on-stage" sections where passages of *Hamlet* enter directly into the play, Stoppard's art craft delivers the much longer "off-stage" sections where Rosencrantz and Guildenstern – as frightened strangers in a world somebody else seems to have made – are left on their own to make sense of the "on-stage" sections and their own relationship to these two parts. Brassell (1985) elaborates on the same idea:

In creating these "off-stage" realities, however, Stoppard does nothing to make Shakespeare's minor characters major, refusing them the complex and lavish attention that 'heroes' traditionally receive. Instead, his objective is to explore the undeveloped nature of the perpetual minion, the man constantly relegated to the furthest recesses of the stage, without the faintest understanding of the action unfolding around him. (ibid)

There are sections in the play that reflect the same ideas, where the suspended characters are in search of the "off-stage" realities, created by not Shakespeare but Stoppard, the lines that represent the characters confusion on the notions of their reality or fictionality:

**GUIL:** Why is he mad?!

**ROS:** I don't know!

*Beat.*

**PLAYER:** The old man thinks he's in love with his daughter.

**ROS** (*appalled*): Good God! We're out of our depth here.

**PLAYER:** No, no, no---he hasn't got a daughter---the old man thinks he's in love with his daughter.

**ROS:** The old man is?

**PLAYER:** Hamlet, in love with the old man's daughter, the old man thinks.

**ROS:** Ha! It's beginning to make sense!

(Rosencrantz and Guildenstern Are Dead: 49)

They never get significantly further than the chaotic affairs around them. Unable to remember their instructions or how they have arrived, they are never aware of the fact that they are participants of a perplexing drama.

**GUIL:** ... What's the first thing you remember?

**ROS:** Oh, let's see... The first thing that comes into my head, you mean?

**GUIL:** No---the first thing you remember.

**ROS:** Ah. (*Pause.*) No, it's no good, it's gone. It was a long time ago.

**GUIL** (patient but edged): You don't get my meaning. What is the first thing after all the things you've forgotten?

**ROS:** Oh I see. (*Pause.*) I've forgotten the question.

**GUIL** leaps up and paces.

**GUIL:** Are you happy?

**ROS:** What?

**GUIL:** Content? At ease?

**ROS:** I suppose so.

**GUIL:** What are you going to do now?

**ROS:** I don't know. What do You want to do?

(Rosencrantz and Guildenstern Are Dead: 11)

Although they are two dead characters in Shakespear's text, now they are present in Stoppard's one, alive, bewildered with their existence, and not sure about their perception of reality, completely aware that, with their engagement in Stoppard's new game, their fate cannot be changed and this new game cannot save them from their previously-held death.

**PLAYER:** Lying down. (*He laughs briefly and in a second has never laughed in his life.*) There's a design at work in all art surely you know that? Events must play themselves out aesthetic, moral and logical conclusion.

**GUIL:** And what' that, in this case?

**PLAYER:** It never varies---we aim at the point where everyone who is marked for death dies.

**GUIL:** Marked?

**PLAYER:** Between "just desserts" and "tragic irony" we are given quite a lot of scope for our particular talent. Generally speaking, things have gone about as far as they can possibly go when things have got about as bad as they reasonably get. (*He switches on a smile.*)

**GUIL:** Who decides?

**PLAYER** (*switching off his smile*): Decides? It is written.

*He turns away. GUIL grabs him and spins him back violently.*

(*Unflustered.*) Now if you're going to be subtle, we'll miss each other in the dark. I'm referring to oral tradition. So to speak.

**GUIL** *releases him.*

We're tragedians, you see. We follow directions---there is no choice involved. The bad end unhappily, the good unluckily. That is what tragedy means. (Rosencrantz and Guildenstern Are Dead: 80)

By eliminating the characters binary opposition of presence/absence and the condition made for the audience to experience Rosencrantz and Guildenstern "live" on the stage and at the same time "dead" off stage, Stoppards deconstructs the binaray of illusion/reality as well, suggesting that levels of reality and fictionality are not separable. The same idea is exactly mentioned in the play by The Player, who does not differentiate between the two worlds of reality and fiction when Rosencrantz is irritated by being called a "fellow artist", objecting that, "I thought we were Gentlemen" (Rosencrantz and Guildenstern Are Dead: 22). The player emphasizes that, "For some of us it is performance, for other patronage. They are two sides of the same coin" (ibid).

Not only has the existence of binary operations within the text, but also, the text's theme made the play's text delogocentric.

Tom Stoppard's play *Rosencrantz and Guildenstern Are Dead* ... is a very funny play about death. Very funny, very brilliant, very chilling; it has the dust of thought about it and the particles glitter excitingly in the theatrical air. (Barens, 2001:231)

In *Rosencrantz and Guildenstern Are Dead* the "Dead" of the title as a key word acknowledges the audience or the reader that the protagonists will die. Since title characters died in their off-stage deaths in Shakespeare's tragedy, as victims of a literary determinism, they must die here in Stoppard's world. This dramatic irony and their progression towards their death as they approach the end of the play provide a context for both Rosencrantz and Guildenstern's musings on the nature of death:

**ROS:** We might as well be dead. Do you think death could possibly be a boat?

**GUIL:** No, no, no . . - Death is . - - not. Death isn't. You take my meaning. Death is the ultimate negative. Not-being. You can't not-be on a boat.

**ROS:** I've frequently not been on boats.

**GUIL:** No, no, no-what you've been is not on boats.

**ROS:** I wish I was dead. (*Considers the drop.*) I could jump over the side. That would put a spoke in their wheel.

(*Rosencrantz and Guildenstern Are Dead*: 108)

Stoppard's theme is probably best explained in Act II, when Rosencrantz makes speech about lying in a coffin. He says to Guildenstern:

Do you ever think of yourself as actually dead, lying in a box with a lid on it?

**GUIL:** No.

**ROS:** Nor do I, really... It's silly to be depressed by it. I mean one thinks of it like being alive in a box, one keeps forgetting to take into account the fact that one is dead... which should make all the difference... shouldn't it? I mean, you'd never know you were in a box, would you? It would be just like being asleep in a box. Not that I'd like to sleep in a box, mind you, not without any air- --you'd wake up dead, for a start, and then where would you be? Apart from inside a box. That's the bit I don't like, frankly. That's why I don't think of it..

**GUIL** *stirs restlessly, pulling his cloak round him.*

Because you'd be helpless, wouldn't you? Stuffed in a box like that, I mean you'd be in there forever. Even taking into account the fact that you're dead, it isn't a pleasant thought. Especially if you're dead, really... ask yourself, if I asked you straight off--- I'm going to stuff you in this box now, would you rather be alive or dead? Naturally, you'd prefer to be alive. Life in a box is better than no life at all. I expect. You'd have a chance at least. You could lie there thinking well, at least I'm not dead! In a minute someone's going to bang on the lid and tell me to come out. (*Banging the floor with his fists.*) "Hey you, whatsyername! Come out of there

**GUIL** (*jumps up savagely*): You don't have to flog it to death!  
(Rosencrantz and Guildenstern Are Dead: 70-71)

In *Rosencrantz and Guildenstern Are Dead*, the idea of discovering the nature of death and representing it stands for the demand to represent the unrepresentable. Although the same idea re-emerges several times throughout the play as a reminder that the demand has not to be forgotten, and although Stoppard's play gives the final answer at the very end to the question rises at the very beginning, that title characters as the same title announces have to die, there remains another question: *how?* Finding answer for such a question requires speculations on the different perspectives the characters represent regarding the representation of "death". But the larger question is: *when did they die?* Based on the play itself, the possible answers to that question are many. According to Vos (1977):

(1) They die at the end of the play: "Now you see me, now you . . ." . . . and disappears (126); (2) They are already dead at the opening of the play: ". . . the fingernails grow after death . . ." as Rosencrantz cuts his nails (18); (3) They die at each performance of the play; (4) They never died; they exist only in Shakespeare's and Stoppard's imagination and thus they never lived.

Paradoxically, each of the four hypotheses is accurate. The idea of death, however, can be analyzed from other perspectives. The Player dies in one way:

*The **PLAYER** stands with huge, terrible eyes, clutches at the wound as the blade withdraws: he makes small weeping sounds and falls to his knees, and then right down.* (Rosencrantz and Guildenstern Are Dead: 90)

But this is what Guildenstern had previously named "the mechanics of cheap melodrama":

**GUIL** (*tear, derision*): Actors! The mechanics of cheap melodrama! That isn't death! (*More quietly.*) You scream and choke and sink to your knees, but it doesn't bring ~ home to anyone---it doesn't catch them unawares and start the whisper in their skulls that says---"One day you are going to die." (*He straightens up.*) You die so many times; how can you expect them to believe in your death? (Rosencrantz and Guildenstern Are Dead: 83)

However, Player comments that "it is what is expected":

**PLAYER:** On the contrary, it's the only kind they do believe. They're conditioned to it. I had an actor once who was condemned to hang for stealing a sheep--- -or a lamb, I forget which---so I got permission to have him hanged in the middle of a play---had to change the plot a bit but I thought it would be effective, you know---and you wouldn't believe it, he just wasn't convincing! It was impossible to suspend one's disbelief---and what with the audience jeering and throwing peanuts, the whole thing was a disaster!---he did nothing but cry all the time---right out of character---just stood there and cried... Never again.

For Guildenstern, however, this melodramatic dying of Player is not the genuine representation of death since it only represents, in a caricatural way, its external signs. For Guildenstern, on the other hand, representation of death is something else. It results to the death of representation:

**GUIL:** No, no, no... you've got it all wrong... you can't act death. The fact of it is nothing to do with seeing it happen ---it's not gasps and blood and falling about---that isn't what makes it death. It's just a man failing to reappear, that's all ---now you see him, now you don't, that the only thing that's real: here one minute and gone the next and never coming back---an exit, unobtrusive and unannounced, a disappearance gathering weight as it goes on, until, finally, it is heavy with death. (ibid)

After that it was the time for Rosencrantz and Guildenstern to die. They represent dying one's own death from the internal point of view because death is "nothingness", "the absence of presence". By disappearing from the stage they die without "the mechanics of cheap melodrama" and in this way they are no more. By the time they die they "disappear from view" and no presentation can be expected from them and Rosencrantz and Guildenstern's genuine representation of death results in their death of representation. By presenting the unrepresentable, then, the theme of the play acts as a coin with two sides with one side deconstructing the other one. By presenting "death of representation" and "representation of death" at the same time, the play never provides the text's reader and the spectator, as well, with not only a definite and logocentric text, but also a decidable meaning.

This lack of determinate meaning is made by the existence of difference rather than repetition within the play. In *Rosencrantz and Guildenstern Are Dead* the meaning is deferred – as in Stoppard's "death of representation" and "representation of death" – and the world and characters are also different – from that of Shakespear's *Hamlet*.

The characters represented are not claimed to be real or even a representation of real; they are made of words based on a text without any context. Real character is therefore an illusion; all characters are the products of the imagination of an author. Deconstructionist views of "the subject as text" could be properly applicable to the analysis of Stoppard's characters. As Kvale (1992) maintains:

The radical deconstructionist move is to constitute the subject as text (or the text as subject), making it impossible for that subject to refer to itself in any consistent way, independent of the world of signs it is enmeshed in. The text replaces the transcendental ego of Kant. In this scheme the subject is doomed to perpetual exile from itself. It is exposed to endless substitutions of meaning. "The absence of transcendental signifier ... extends the domain and the play of signification infinitely" (Derrida, 1981:278). By letting the subject be swallowed up in the text, the transformation of "essential" rational man into "relative" postmodern man is fulfilled. (124-125)

### *Arcadia*

First opened at the Royal National Theatre in London on 13 April 1993, Tom Stoppard's *Arcadia*, being reviewed by the *The Times* in "Ideas Meet their Comic Match", was praised for the "perfect marriage of ideas and high comedy". Vincent Canby of *The New York Times* described the play as "Tom Stoppard's richest, most ravishing comedy to date, a play of wit, intellect, language, brio and, new for him, emotion."

*Arcadia* is set in an airy room in a large, Derbyshire country house, in the years 1809-1812 and 1993, with the scenes alternating between the two time periods, juxtaposing the activities of two modern scholars – Hannah Jervis, the author of a popular best-seller on Byron's mistress Lady Caroline Lamb, and Bernard Nightingale, a don at a modern university – and the house's current residents – Valentine, 25-30, a postgraduate biologist and mathematician, who is also an expert at computers, Chlöe, who is 18 and, Gus, who is 15 and is the silent savant who stopped speaking at the age of five – with the lives of those who lived there 180 years earlier, major among them were Thomasina Coverly, the 13-year-old (later 16-year-old) daughter of Lord and Lady Croom, Septimus Hodge, Thomasina's tutor and the academic colleague and friend of Lord Byron (an unseen but important character in the play) and, Ezra Chater, an unsuccessful poet stayed at Sidley Park, who married to a promiscuous wife. In the final scene, however, characters from both periods share the stage.

In the 1800s, in the course of the play, Thomasina, a precocious young genius with understandings of chaos theory and the principles of thermodynamics, her tutor, Septimus, working on the young girl's scientific theories until his own death, the guests and other members of the Croom household engaged in discussions about math, science, art, sex and landscape gardening. Meanwhile, in the present-day scenes, Hannah, busy with the history of the family and Bernard, investigating the possibility of his theory that Byron killed the cuckolded Chater in a duel and then fled the country, are investigating the events of the past.

Stoppard's *Arcadia* is a play shaped within a series of binary operations. Concerning a delicate balance between the past and the present *Arcadia*, deals with the contrasting ideas of order and disorder and the certainty of knowledge. As Haney II (2008) remarks, these opposing concepts and ideas are suggesting certain significance within the play. According to him:

Stoppard's *Arcadia* juxtaposes the dimensions of time and timelessness, intuition and logic, heart and mind in a way that paradoxically induces in the characters and audience a transpersonal, transrational experience of freedom even from within the boundaries of time. (83)

Through Stoppard's discussion of Chaos Theory within the play, the most prominent of these opposing concepts is the idea of chaos versus order.

Simon Jenkins (1993) seems to suggest Stoppard's motivation in using chaos theory in the course of *Arcadia*. According to him, Stoppard has simply been attracted to the beauty of fractal surfaces when he states that *Arcadia* is "the authentic post-modern play, eclectic, picturesque, devoid of

morality, glittering with [the director] Trevor Nunn's surface dazzle", and that in it Stoppard 'brushes aside' the question of lost meanings (16). In a similar vein, Wardle's review in *The Independent* on Sunday (1993: 23) emphasises the play's form over its content in a series of expressions reminiscent of a firework display ('dazzlingly elaborate', 'irregular and unforeseen', 'strikes increasingly brilliant sparks'), and praises Stoppard for finally abandoning any attempt to write about social or ethical issues.

While such interpretations forge a connection between Stoppard's work and poststructuralist and postmodernist attitudes to epistemology and ethics by ignoring some of the major thematic elements in *Arcadia*, they do draw attention to the way chaos theory informs the structure of Stoppard's play. What must be added to them, however, is the way that chaos theory functions in *Arcadia* as not just a reflection of complex form and flashy style, but as justification for much more old-fashioned concepts, such as crafted and harmonious form and the value of literary meaning. Although everything disappears into the state of chaos and entropy – as it happens in the final scene – a sense of order can be found within this chaos. According to Valentine:

**Valentine:** Lend me a finger. (*He takes her finger and presses one of the computer keys several times.*) See? In an ocean of ashes, islands of order. Patterns making themselves out of nothing. I can't show you how deep it goes. Each picture is a detail of the previous one, blown up. And so on. For ever. Pretty nice, eh? (*Arcadia*: 76)

The table which collects props from both time periods throughout the play is a strong example of the chaos/order dichotomy. Edwards (2001) explains this representation:

At the end of the play, the table has accumulated a variety of objects that, if one saw them without having seen the play, would seem completely random and disordered. Entropy is high. But if one has seen the play, one has full information about the objects and the hidden 'order' of their arrangement, brought about by the performance itself. Entropy is low; this can be proved by reflecting that tomorrow night's performance of the play will finish with the table in a virtually identical 'disorder'—which therefore cannot really be disorder at all. (181)

By contrast, in *Arcadia* the presence of those windows of order, of form in life and art, is underlined. Stoppard's aim has been to give the play shape, and in accordance with chaos theory, that shape has symmetries and reflections which weave a complex, harmonious picture.

Lady Croom and Mr. Noaks arguments on the garden's style in different periods of time and discussing the before-and-after views of the place pictured by the architect exemplify the binary of Classicism versus Romanticism in the course of the play.

**Lady Croom:** Where there is the familiar pastoral refinement of an Englishman's garden, here is an eruption of gloomy forest and towering crag, of ruins where there was never a house, of water dashing against rocks where there was neither spring nor

a stone I could not throw the length of a cricket pitch. My hyacinth dell is become a haunt for hobgoblins, my Chinese bridge ... is usurped by a fallen obelisk overgrown with briars ... (Arcadia: 12)

Lady Croom's neo-classical way of looking at nature – her assumption that its orderliness conforms to an idea of perfection defined by God – is contrasted with the new architect Richard Noakes's romantic design, which strives to convey an impression of the drama of the individual's struggle against the overpowering forces of nature. Naturally, the new design follows not only a new vision of natural law, but also one of aesthetic value.

**Lady Croom:** The trees are companionably grouped at intervals that show them to advantage. The rill is a serpentine ribbon unwound from the lake peaceably contained by meadows on which the right amount of sheep are tastefully arranged – in short, it is nature as God intended ... (ibid)

In the past, Thomasina represents Romanticism in her scientific outlook and growing affection for her tutor Septimus. She challenges the traditional notion that Newton has sorted out the mystery of universe, by the time she asks "Is God Newtonian" (Arcadia: 6). Poking holes in Newtonian science, she discovers that once having stirred jam onto her pudding, "You cannot stir things apart" (ibid). According to Thomasina, the way Septimus teaches geometry limits it to simple forms which are predictable rather than something which like an apple leaf, "which alludes both to the Eros of Eden (Romanticism) and to Newton's discovery of gravity (Enlightenment)" (Haney II, 2008:85). Although Septimus provides her with some explanations and remarks that Newton "has mastery of equations which lead into infinities where we cannot follow" (Arcadia: 49), she does not agree with him.

**Thomasina:** What a faint-heart! We must work outward from the middle of the maze. We will start with something simple. (*She picks up the apple leaf.*) I will plot this leaf and deduce its equation. You will be famous for being my tutor when Lord Byron is dead and forgotten. (ibid)

Therefore, throughout the play:

Thomasina challenges the assumptions of the Enlightenment through Romanticism in her pursuit of nonrationality and the study of irregular landscapes of nature in the wild. (Haney II, 2008:85)

On the other hand, doing research on the Coverly estate in the present, Hannah represents a neoclassical attitude based on Newtonian physics and a denial of feelings. In the course of the play she attempts to deny emotions and rejects Romanticism.

**Hannah:** The whole Romantic sham, Bernard! It's what happened to the Enlightenment, isn't it? A century of intellectual rigour turned in on itself. A mind in chaos suspected of genius. In a setting of cheap thrills and false emotion ... The decline from thinking to feeling, you see. (Arcadia: 36-37)

The two scientific positions, Thomasina and Hannah, as the play progresses, lead other characters as well as the audience and the reader, suggested by Septimus, toward a condition of unity.

**Septimus:** When we have found all the mysteries and lost all the meaning, we will be alone, on an empty shore. (*Arcadia*: 126)

This overview of the debate between classicism and romanticism in the play reveals the extent to which the two world-views dominate the play. Thematically, the debate brings out the positive and negative qualities in both, and shows how elements combined from each attitude can form a view of the world which allows for both structure and individual freedom, for both reality and representation. The solution to the contrast between the determined and the truly free is not made in the play by replacing the classical garden with the romantic version, since both are shown to be equally determined. Instead, it is found in the freedom with which the mind of the daughter of the house moves in its strictly determined surroundings.

Fleming notes that Stoppard constructs *Arcadia* through a "nonlinear bouncing between time periods [that] suggests disorder, yet lurking underneath is a tightly ordered dramatic structure" (2001:195). He also notes that the term fractal means "self-similar," as in the "Self-similarity of dialogue, situations, characters, props, costumes, and musical accompaniment" across the scenes covering two historical periods (ibid). As one shall see, in *Arcadia*;

Stoppard dramatizes how the mind undergoes a transformation through which the discovery of the mystery of life does not lead to meaning or rationality, but rather toward the transcendence of meaning in the source of thought where we can taste the boundless unity of nonpluralistic consciousness. To be alone as Septimus says, therefore, suggests undergoing a transformation beyond the Romanticism vs. Enlightenment, reason vs. emotion duality toward the unified experience of pure consciousness as opposed to the multiplicity of the mind's conscious content—the qualia or qualities of phenomenal experience. (Haney II, 2008:86)

Stoppard's *Arcadia* is also shaped in a world trapped not only in present, but also in past. The opposing insights in the fields of art and science are also traceable within the play's text. In her book, *The Politics of Postmodernism* (1989), Hutcheon proposes that:

There are other kinds of border tension in the postmodern too: the ones created by the transgression of the boundaries between genres, between disciplines or discourses, between high and mass culture, most problematically, perhaps, between practice and theory. (18)

In fact, the binary of art/science is evident from the very beginning. In fact, *Arcadia* is characterized by its emphasis on the coexistence of literary theories and science notions, which seem to be contradictory and exclusive to each other. The following argument between Valentine and Bernard remarks their conflicting ideas on scientific progress and artistic personalities:

**Valentine:** The questions you're asking don't matter, you see. It's like arguing who got there first with the calculus. The English say Newton, the Germans say Leibnitz. But it doesn't matter. What matters is the calculus. Scientific progress. Knowledge.

**Bernard:** Really? Why? Why does scientific progress matter more than personalities?

Valentine: Is he serious?

**Hannah:** No, he's trivial. Bernard –

**Valentine:** (*Interrupting, to Bernard*) Do yourself a favour, you're on a loser.

**Bernard:** Oh, you're going to zap me with penicillin and pesticides. Spare me that and I'll spare you the bomb and aerosols. But don't confuse progress with perfectibility. A great poet is always timely. A great philosopher is an urgent need. There's no rush for Isaac Newton. We were quite happy with Aristotle's cosmos. Personally, I preferred it. Fifty-five crystal spheres geared to God's crankshaft is my idea of a satisfying universe. I can't think of anything more trivial than the speed of light. Quarks, Quasars – big bangs, black holes – who gives a shit? How did you people con us out of all that status? All that money? And why are you so pleased with yourselves? (*Arcadia: 61*)

This above discourse is an example of heated arguments between Enlightenment and Romanticism in the play. Valentine who embodies notions of enlightenment subscribes to the notion that progress and knowledge matter more than personalities. Yet Bernard, who attacks him in a Romanticist's violent reaction against the Enlightenment, refuses to be limited by Valentine's devotion to scientific progress. By depicting Bernard as cynical and radical in his attack on Valentine, Stoppard reveals his opinion that the Romantic objection to the Enlightenment may be too extreme. With the conversation between Valentine and Hannah, the dissolution between art and science is finally reached upon.

**Hannah:** Is it the grouse?

**Valentine:** Oh, the grouse. The damned grouse.

**Hannah:** You mustn't give up.

**Valentine:** Why? Didn't you agree with Bernard?

**Hannah:** Oh, that. It's *all* trivial--your grouse, my hermit, Bernard's Byron. Comparing what we're looking for misses the point. It's wanting to know that makes us matter. Otherwise we're going out the way we came in. That's why you can't believe in the afterlife, Valentine. Believe in the after, by all means, but not the life. Believe in God, the soul, the spirit, the infinite, believe in angels if you like, but not in the great celestial get-together for an exchange of views. If the answers are in the back of the book I can wait, but what a drag. Better to struggle on knowing that failure is final. Oh! but how beautiful! (*Arcadia: 75*)

It is apparent that, in the course of the play, there is a clash between emotion emphasized in the free will and rationality embodied in Newton's law of motion. In Newton's theory, a general, accurate and simple analysis and prediction is featured, as Septimus reveals "everything from the furthest planet to the smallest atom of our brain acts according to Newton's law of motion" (*Arcadia: 5*). However, Thomasina has started to intuit that the world-view projected in Newton's theory is incomplete as she tells Septimus: "When you stir your rice pudding, Septimus, the

spoonful of jam spreads itself round making red trails like the picture of a meteor in my astronomical atlas. But if you stir backward, the jam will not come together again. Indeed, the pudding does not notice and continues to turn pink just as before" (ibid). Septimus, indeed, inspired by his student, Thomasina's innovative discovery of the nature, seems to be informed of the incompleteness of Newton's law of motion.

**Septimus:** A prize essay of the Scientific Academy in Paris. The author deserves your indulgence, my lady, for you are his prophet.

**Thomasina:** I? What does he write about? The waltz?

**Septimus:** Yes. He demonstrates the equation of the propagation of heat in a solid body. But in doing so he has discovered heresy – a natural contradiction of Sir Issac Newton.

**Thomasina:** Oh! – he contradicts determinism?

**Septimus:** No! ... (Arcadia: 81)

As stated by John Fleming:

Since comprehending scientific concepts can sometimes be difficult, Stoppard aids his audience's understanding by paralleling the shift in the scientific paradigm to the analogous transition from classicism to romanticism – that is, classicism metaphorically corresponds to Newtonian science and Romanticism to deterministic chaos. (2001:197)

In the following monologue, it seems that Valentine has experienced both determinism and unpredictability, both fate and free will. As he explains to Hannah, "The unpredictable and predetermined unfold together to make everything the way it is. It's how nature creates itself, on every scale, the snowflake and the snowstorm." (Arcadia: 47).

**Valentine:** If you knew the algorithm and fed it back say ten thousand times, each time there'd be a dot somewhere on the screen. You'd never know where to expect the next dot. But gradually you'd start to see this shape, because every dot will be inside the shape of this leaf. It wouldn't be a leaf, it would be a mathematical object. But yes. The unpredictable and the predetermined unfold together to make everything the way it is. It's how nature creates itself, on every scale, the snowflake and the snowstorm. It makes me so happy. People were talking about the end of physics. Relativity and quantum looked as if they were going to clean out the whole problem between them. A theory of everything. But they only explained the very big and the very small. The universe, the elementary particles. The ordinary-sized stuff which is our lives, the things people write poetry about – clouds – daffodils – waterfalls – and what happens in a cup of coffee when the cream goes in – these things are full of mystery, as mysterious to us as the heavens were to the Greeks. (Arcadia: 48)

Indeed, *Arcadia* is a play full of different theories ranging from literature, mathematics, physics, chaos theory and, landscape gardening in its structure and the play's plot. In the end, however, Thomasina is burnt to her death and she can never be brought back due to the irreversibility

notion implied in the second law of thermodynamics. In this light "it is not nonsense" (Arcadia: 36), far from which the play is an exemplifier of the employment of science theory to restore, re-construct and re-present the past in a story-telling manner. Hence, the dichotomies between art and science, emotion and ration, heart and mind are eliminated, and a world of multiple disciplines can be reshaped through scraps of memory.

As Stoppard contrasts free will and determinism, science and humanism, romantic and classical, female intuition with male dogmatism, these kinds of oppositions become numerous in the course of the play; in the same way, the play takes on a number of different meanings when looked at from different perspectives. And the existence of all these dual operations leads the play's text towards both difference and deference and meaning uncertainty.

In *Arcadia*, since the action of the play goes nowhere, the reader/audience comes to a dead end or "aporia" in Derridian terms. There are indefinite contradictory meanings or significations in the play and the reader cannot decide which one to choose or refer to as the final signified. Consequently, it can be concluded that in *Arcadia*, there is not a sufficient ground for the reader to choose among the numerous signifier or signified. Thus, attaining an accurate and exact meaning is, approximately, impossible. (Hooti and Shooshtarian, 2010: 22)

## CONCLUSION

The exploration of Tom Stoppard's two selected plays: *Rosencrantz and Guildenstern Are Dead* and *Arcadia* in a post-structuralist framework with regard to the relevant deconstructive theories and concepts was the main concern of the study. In order to detect these elements, the definition of important key terms and the theoretical framework introduced by the school's prominent critic, Jacques Derrida, were presented first. The next step was to apply the related discussed elements to the context of Stoppard's selected plays and the present part wishes to bring the findings and conclusions of the study.

According to post-structuralism, the writer had no final authority over the text, a text was no longer thought to be a clear display of the writer's worldview, but was seen as a boundlessly perplexing subversion of the authors' prime intentions. It was a text that made a start by questioning the foundations on which texts themselves were constructed, a text which gave particular importance to the fact that it was written; and a text that did not end with a straight and definite conclusion. Therefore, while reading a text one must stop trying to discover the undiscoverable which is the absolute truth and openly affirm that what may be right for one person may not be right for another.

When such principles are applied to literary interpretation, the postmodernist realizes that no such a thing as the meaning of an aesthetic text exists. Therefore, since each reader's view of truth is different from that of other readers, for each text, then, there exist an almost infinite number of interpretations as there are readers, all possible and therefore, the final reality is undecidable – text's moves towards the notion called delogocentrism.

Regarding Stoppard's drama, the same situation that deconstruction declare about the text exists. Almost at the end of each play by Stoppard, readers become confused and perplexed. Since the text does not indicate its meaning and it is up to the reader to interpret it, the number of interpretations will not be limited and decidable.

In *Rosencrantz and Guildenstern Are Dead* Stoppard paints a picture of a real deconstructionist condition. The existence of binary oppositions in the play reflects the text's delogocentrism. Though they are present in Stoppard's text, Rosencrantz and Guildenstern are absent as a matter of their previous death in Shakespeare's text. The present/absent model of personal identity leads to their level of reality/fictionality that cannot be separated. The lack of final meaning, completely evident in the play leads to the lack of closure and which is another characteristic of deconstruction. Since there are numerous contradictory meanings or significations in the play, the responsibility of interpretation and getting the meaning depends on the reader, not on the writer who has, in fact, no authority over the text which leads to relativity of the play's text.

Consisting of two plots, one happens in the past and the other in the present, Stoppard's *Arcadia* moves around a theory on Lord Byron, however, Byron is not a major character in the play. Stoppard, then, repeats in *Arcadia* what he did in *Rosencrantz and Guildenstern Are Dead*, where he assigned minor roles to Hamlet, while moving Rosencrantz and Guildenstern to centre stage.

Stoppard's *Arcadia*, the second play which is discussed in the study, is composed of two plots, is not only a play of ideas but also a play about ideas. It resembles his *Rosencrantz and Guildenstern Are Dead* in a way he introduces Byron as a minor character as he assigned a minor role to Hamlet by bringing two previously dead characters, Rosencrantz and Guildenstern to stage.

Antor (1998) describes *Arcadia*'s thematic pattern:

We intend to show here that Stoppard presents various modes of approaching reality and making it meaningful, both from the arts and from the sciences, and that he depicts a general development from a pre-modern or, one might even say, a classical belief in regularity, order, finite linear teleology and the existence of well-structured patterns to a postmodern and post-structuralist scepticism about these things and an awareness of irregularity, chaos, non-linearity, infinity and unstructured patternlessness or complexity. The play, in order to discuss these concepts, uses the theory of gardening and the conflict between classicism and romanticism as well as recent developments in chaos theory and thermodynamics and thereby becomes an example of isomorphisms of thought in the two cultures. (326-354)

As post-structuralist theorists are highly doubtful about endeavors to either establish or comprehend the society on the basis of fixed and universal values, binary oppositions and their blurring distinctions are of significant importance in the deconstructive age. *Arcadia* is a play shaped in a series of such dichotomies such as distinctions between thinking and feeling (binary

of reason/emotion), order and disorder (binary of order/chaos), and the Classical and the Romantic (binary of Classicism/Romanticism).

In the closing scene of *Arcadia*, there are times when the past and present characters mingle on the stage. To cite an instance, Hannah, the present-day novelist, fills Septimus's glass from the same decanter and sips from it. This visual image creates a theatrical effect bringing together the past and present, and hence, blurring their boundaries. Likewise, the closing scene of *Arcadia* is fascinating in a way that the past and present characters: Septimus and Thomasina, Hannah and Gus, are dancing together simultaneously onstage. In a way, their co-existence and simultaneity may blur the boundary between present and the past.

Thus in "Romantic vs. Postmodern Reality: An Examination of Tom Stoppard's *Arcadia*", Guy Stern writes that:

In *Arcadia* Stoppard outdistances even all his previous deconstructions of reality [....]. [T]hree recondite researchers prove before our eyes that the past is unreconstructable, reading its records, intuiting its spirit, or trying to quantify it via modern mathematics inevitably leads to major distortions. (1996:155)

To solve the problems by the classical science, Stoppard introduces chaos theory. Chaos theory is only a tool to reflect the insufficiency of a single perception within the play. The abandonment of a single perspective is post-structuralism. Since deconstructivist thinkers reject the idea that there could exist an integrated world view and there are no basic principles or foundations on which to build an encompassing picture of the universe, abandoning the classical science as the basic principles and introducing chaos theory to destroy an integrated world view makes *Arcadia* as an exemplifier of post-structuralism.

In *Arcadia*, as in most of Stoppard's plays, there is no final meaning, no real authority and no transcendental signified. This feature leads to a sense of non-ending in the play. Everything is unreliable and ambiguous. The lack of final meaning results in lack of the closure force the text's meaning to be undecidable and moves the play towards an insight called delogocentrism.

### ABSTRACT

Various teaching materials are considered to be essential components in language learning/learning at all levels. In the same line, various textbooks accompanied with audiovisual materials which have been prepared for language learning serve as the basis for much of the language input learners receive and the language practice that occurs in the classroom. However, various sources of audiovisual programs from different technologies also have the potential to provide the necessary language input for language learning in-and-outside the classroom setting. Various audiovisual programs are considered as sources of authentic language input if they contain genuine instances of language use as opposed to exemplars devised specifically for language teaching purposes. In view of this, the present paper was set to shed more light on the concept of authenticity of language input by considering the potential sources of authentic language input currently available in English as a foreign language (EFL) context and English as a second language (ESL) context. Moreover, it underscores the benefits of utilizing authentic language input in language learning classrooms.

**KEY WORDS:** Authentic language input, Sources of authentic language input, Audiovisual programs

### SOURCES OF LANGUAGE INPUT IN EFL/ESL CONTEXTS

Various sources of language input particularly authentic language input are available in EFL and ESL contexts. However, before the discussion on the sources of language input is started, the concepts of EFL and ESL contexts need to be considered.

An EFL context refers to an environment where English language is not the primary or secondary language spoken. According to Freed (1995), English is considered as a foreign language rather than a second language. Moreover, English language has no major role in society and is learnt in the classroom setting (Ellis, 2008). In contrast, an ESL context is an environment where English language is spoken in society as the official language or the medium of communication among people from different countries. In fact, English language plays an institutional and social role in the community in ESL context (Ellis, 2008).

Considering the sources of language input in EFL/ESL contexts, it should be mentioned that in ESL contexts, people can have interaction with other people from different countries using the English language. English is then considered as a source of language input which can facilitate and pave the way for SLA (Gass, 1997). The social interaction in ESL contexts is one of the authentic sources of language input which can help language learners acquire the language in informal setting. In contrast, in an EFL context social interaction as a source of language input in an informal language learning setting is lacking. English is not used as a medium of communication or for other purposes in society in the EFL contexts. As a matter of fact, the use of English language is mainly limited to formal setting at universities, language institutes or language classrooms. However, various audiovisual technologies have proved effective in providing the language learners with authentic language input to learn the language in-and-outside the classroom.

### **AUTHENTIC LANGUAGE INPUT**

The employment of authentic language input through authentic materials in foreign/second language learning has a long history. Henry Sweet (1899, cited in Gilmore, 2007) was one of the pioneers who utilized authentic texts in his books because he was aware of their potential advantages over contrived materials.

In order to determine the definition of authentic language input as precisely as possible, the term authenticity should be considered first. In this regard, there are a variety of definitions of this concept which relate to the foreign/second language (Gilmore, 2007; Taylor, 1994; Nunan, 1999; just to name a few). These varieties of definitions originate from the debate as to whether authentic materials in the foreign/second language are in fact authentic or not.

Considering to the concept of authentic language input, Gilmore (2007) defined authentic language input as the language carrying a real message which is created by a real speaker or writer for a real audience. Taylor's (1994) also considered authentic language input as any material in English which has not been specifically produced for the purpose of language teaching. In fact, authentic language materials are spoken or written language materials that have been produced in the course of real communication and not specifically produced for the very purpose of language teaching (Nunan, 1999).

According to Nunan (1999), authentic language input can be drawn from various sources of audio-visual mass media technologies including TV. Linguistically, authentic language input refers to the use of authentic materials from the target culture which is presented in the target language such as different programs, for example, news, movies, songs, soap opera, and comedy as audio-visual mass media materials provided by various technologies. The important point to be considered is that these materials are not initially made for language teaching purposes.

### **SOURCES OF AUTHENTIC LANGUAGE INPUT**

There are varieties of authentic teaching sources and materials available to EFL/ESL teachers to employ for different needs for various teaching situations. While social interaction as a source of

authentic language input is not available in EFL context, many other sources of authentic language input are available in both EFL and ESL contexts through various audiovisual technologies. The sources of authentic language input which are available in both EFL and ESL contexts can originally be extracted from different desktop technologies such as computers and non-desktop technologies such as TV. Accordingly, various audiovisual mass media materials can include different print materials followed by related video and audio, audiotapes and CDs with accompanying textbooks, and videotapes with textbooks.

Considering the integration of various audiovisual programs that provide authentic language input into language learning, many studies have been conducted (Martinez, 2002; Gilmore, 2007; Nunan, 1999; Gebhard, 1996; Brinton, 1991; Miché, 2002; Schön et al., 2008; among others). These studies all underscore the point that audiovisual materials are pedagogically valuable to be utilized for language teaching. According to Gebhard (1996), there are unlimited sources for authentic language materials from TV programs such as TV that language teachers and learners can utilize for the very purpose of language learning.

### **BENEFITS OF UTILIZING AUTHENTIC MATERIALS**

There is an agreement among foreign/second language instructors that authentic language input can be utilized as an essential part of second language learning. According to many scholars (Martinez, 2002; Gilmore, 2007; Nunan, 1999; Gebhard, 1996; Brinton, 1991; just to name a few), there are many advantages associated to authentic language materials which make these materials pedagogically valuable to expose language learners to the target language. In this regard, Martinez (2002) provided a number of sound advantages for using authentic language materials for language teaching. An important advantage is that authentic language materials provide a wide range of language change of the target language. For example, by listening to songs and stories in the target language, language learner will be able to hear dialectal differences of various countries that speak the target language (Martinez, 2002). This can be used for a class discussion.

According to Brinton (1991), authentic materials and media can strengthen the direct relationship between the language classroom and the outside world for students. Gebhard (1996) considered authentic materials as a way to contextualize language learning. When lessons are focused on comprehending, language learners tend to concentrate more on content and meaning rather than the language itself. This offers the language learners a valuable source of authentic language input, so that they are not exposed only to the language presented by the text and the teacher.

In the same line, Brosnan et al. (1984) put forth that by simplifying the language or changing it for teaching purposes, the task may become more difficult. According to Brosnan et al. (1984), authentic language offers language learners the opportunity to deal with a small amount language input which contains complete and meaningful messages. Moreover, authentic language materials help language learners to notice the immediate relevance of what they do in the classroom to what they need to do in the real world communication. It is essential for language learners to listen to and read different kinds of authentic language material because it helps motivate the language learners by bringing the content and the subject matter to life for them, and enable them

make the important connections between the classroom world and the real world outside the classroom setting.

Another advantage of using authentic materials is the comfortable environment that these materials create for young children. Authentic language materials are more appealing to the language learners than non-authentic language materials because of their objective to communicate a message rather than emphasize particular aspects of the target language (Gilmore, 2007). Another advantage of using authentic language material is the focus on every feature of the language (Gilmore, 2007). In contrast, the artificial language materials tend to cause continual repetition of certain grammatical constructions, certain elements of the vocabulary, or certain combinations of words.

Regarding the use of authentic language materials, some researchers have focused on the use of songs as authentic language input and language learning (Miché, 2002 & Schön et al. 2007). According to Miché (2002), songs are multipurpose resources of authentic language material for different foreign language lessons. Both communication and entertainment are combined as songs provide communication skills entangled with hobby. In addition, pronunciation skills can be strengthened through listening to different songs. Pronunciation variations are provided through authentic language input from songs as well as various dialects of the target language (Miché, 2002). Accordingly, authentic language input from songs is a great way to make language learners aware of the dialectal variations from one target language speaking country to the next. Authentic language input from different songs can provide repetition in conjunction with rhythm which leads learners to remember not only the pronunciation, but also the vocabulary (Miché, 2002).

### **DRAWBACKS OF USING AUTHENTIC MATERIALS**

In relation to the drawbacks of utilizing authentic materials, Martinez (2002) underlined the problem associated with the use of authentic language materials in the classrooms with different language proficiency levels. According to Martinez (2002) authentic language materials which are used may be too culturally biased and the vocabulary may be irrelevant to the language learners' needs. More importantly, low level language proficiency or beginner level language learners may have a hard time interpreting what they hear or read because of the mixed structures that are used. Accordingly, much of the difficulty language learners experience is related to their lack of familiarity with authentic language input and the processing strategies required for comprehending it.

In short, the majority of researchers agree on the pedagogical value of authentic language materials and the integration of such materials in language learning.

### **WHAT TYPE OF AUTHENTIC MATERIALS TO SELECT?**

Access to a wide range of audiovisual mass media programs is getting very easy for all the people around the world with everlasting technological developments. In the same line, many researchers have highlighted the pedagogical values of various audiovisual mass media programs to be incorporated into language learning. Among various programs, films, cartoons, news, songs, and documentaries turn out to be effective teaching devices to develop the language

learners' language skills and stimulate their imagination simultaneously. Their capacity to arouse the learners' motivation and their potential to engage the learners in a variety of fruitful activities related to aural perception in the target language can scarcely be denied.

One of the essential factors to be considered in utilizing various audiovisual mass media programs as sources of authentic language input is the choice of the programs that should be based on some criteria that can serve the purposes of the teacher. Accordingly, some important criteria for selecting the appropriate segments of various programs can be:

1. The students' language proficiency should be considered.
2. Choose stories that are relevant to students' lives.
3. Ask the students about their preferences regarding different types of audiovisual programs.
4. Choose stories that motivate the students.
5. Use various broadcasts that provide exposure to various accents and cultures.
6. Choose stories that are proficiency-level appropriate; political and science related stories are often too difficult for many students to understand.
7. Use stories that lend themselves to many learning activities and the integration of the four skills.

### **HELPFUL TEACHING TIPS**

After outlining some of the criteria for selecting and preparing various audiovisual programs, the following several teaching tips that will help make teaching with various authentic materials easier and more enjoyable for both the teachers and the language learners should be taken into consideration:

1. Offer students a choice in the content of the materials you show in class. Take an inventory of their interest.
2. Prepare extension activities to fill the space between the first and last students' finishing an activity.
3. Get feedback from the students. It is important for teachers to get feedback from students regarding their comfort level on the various four skills assignments, processes, and procedures used in conjunction with the stories.
4. Ask your students regularly about their feelings about activities in class. You could give them a formal feedback form to fill out or ask them informally to give you a thumb up or a thumb down.
5. All four skills activities should include opportunities for students to play an active role in their own learning. When preparing for a task, help students become aware of any relevant strategy, from their own language, that might help them to perform the task successfully.

### **CONCLUSION**

Authentic materials refer to the use various materials including video and audio and other resources that are not specifically prepared for pedagogical purposes. Authentic materials may

have positive effect on learner motivation because they are intrinsically more interesting and motivating than created materials.

There are various reasons why authenticity may be regarded as important. One is that it presents learners with language exposure similar to that enjoyed by native speakers, including all the characteristics of natural language which may be necessary for the learner properly to interpret texts. In addition, there is motivational attraction for insisting on authentic texts, created as a means of communicating content and not for some pedagogic purposes.

### ABSTRACT

Following cognitive views towards language pedagogy, this preliminary report illustrates the beliefs of a community of non-English-major university students (N=139) about learning English as-a-foreign-language (EFL) in a dominantly bilingual Kurdish-Persian academic context in Ilam, in western Iran. To recognize the beliefs, BALLI (Horwitz, 1988) as a popular survey instrument was slightly modified and administered to the participants. Adopting a descriptive approach, the findings were generally classified and discussed in terms of five components: (a) language aptitude; (b) language learning difficulty; (c) nature of language learning; (d) learning and communication strategies; and, (e) motivation and expectations. The results also revealed these ethnic learners have a broad but consistent range of conceptions about EFL similar to and different from studies reported in the current literature. Finally, as a pedagogical implication, it was suggested that EFL teachers should consider the susceptibility of learners' beliefs to change during time and develop useful strategies to relieve clashing beliefs among language learners.

**KEYWORDS:** Bilingualism, Beliefs, EFL, ESP, Language learning, Language learners, Local

### INTRODUCTION

In the domain of cognitive views, beliefs are "dynamic and situated constructs" (Ellis, 2008) which have been generally characterized as "psychologically held understandings, premises, or propositions about the world that are felt to be true" (Richardson, 1999, p. 103). During the last two decades, research interest in second or foreign language learning has been inclined to the examination of student-centered learning and learners' individual characteristics (Bernat and Gvozdenko, 2005) and growing studies in this line have led to a particular focus on learners' beliefs (Altan, 2006; Bernat and Lloyd, 2007). Therefore, in the context of language pedagogy, beliefs as metacognitive knowledge (Oz, 2007) have been defined as common assumptions that learners hold about themselves as learners, about the nature of language learning, the learning process, and the variables influencing their learning (Wenden, 1999).

Evidence from a growing number of published research and scholarship in the last two decades in this stream from the learners' perspective demonstrates that the belief system of language learners plays a decisive role in their success and failure in language learning (Bernat,

& Gvozdenko, 2005; Bernat, 2008). As well, such studies reveal that learners' beliefs about own capacity and personal models of their own processes are much more important than universally accepted theories of learning, and some psychometric measures or individual difference factors such intelligence or aptitude (Ellis, 2008; Bernat, 2008) and it is argued that belief systems are influential because they raise learners' consciousness and shape their attitudes towards language learning, learning strategies and policies (Buyukyazi, 2010). Therefore, understanding learner beliefs is essential, since they can have a facilitative or detrimental effect on learning and the way learners feel about, approach, and act upon a language (Bernat and Gvozdenko, 2005).

For example, learners' beliefs about the importance of grammatical accuracy or native-like pronunciation, or even the amount of time it takes to learn a language might be as a hindrance or as an incentive. Therefore, it can be concluded that an awareness of learners' beliefs is central to language pedagogy because according to Ellis (2008), beliefs shape the way learners set about language and language learning process and product. In addition, knowledge of learners' multidimensional beliefs about language and language learning that are under the influence of many variables including past positive or negative learning experiences, cultural background and context, and numerous individual differences as well as personal factors (Bernat & Gvozdenko, 2005; Oz, 2007) may provide language teachers and educators as well as curriculum designers with a better understanding and awareness of differing types of learners, their strategies, orientations, and expectations that will have an impact on their learning practices (Horwitz, 1988, p.283). Consequently, it is argued that teachers can make more informed choices about teaching and learning processes (Bernat, & Gvozdenko, 2005), plan appropriate language instruction (Horwitz, 1999), and adopt the best approaches and techniques for teaching English based on the belief system of learners.

Over the past two decades, many researchers have explored language learning beliefs in various studies (e.g. Altan, 2006; Bernat, 2006; Buyukyazi, 2010; Oz, 2007; Man-fat, 2008; Tanaka and Ellis, 2003; Yazici and Tan, 2010), covering varying groups of learners in different learning settings (e.g. in Turkey, China, Hungary, Japan, Thailand, Malaysia, and ....). Iran, among other English-as-a-Foreign-Language (EFL) contexts, provides an interesting sociolinguistic setting for a study on language learning beliefs. There has still been scarcity of empirical research both internationally and locally that investigate foreign language learners' beliefs in unique contexts. Yet only a few of studies have explored Iranian non-English-major university students' beliefs (except a few recently published studies limited in scope to monolingual Persian-speaking EFL learners e.g. Abedinia, Rahimi, Zare-ee, 2011; Ghabanchi and Meidani, 2012; Ghavamnia, Kassaian and Dabaghi, 2011; Mohebi and Khodadady, Khonamri, 2009; Zare-ee, 2010).

Therefore, due to the paucity of studies on EFL learners belief system in Iran it would be interesting to explore the language learning beliefs of these Iranian students learning EFL and provide a preliminary description of commonly held learner beliefs in a predominantly ethnic bilingual region outside the circle of English world in order to complement the lines of research and studies in this regard. Accordingly, the current study is to address the following research question:

What beliefs do Iranian ethnic non-English-major university students hold about EFL in their bilingual academic context?

## METHODOLOGY

### *Participants*

To conduct this report, 139 non-English-major undergraduate university students, enrolled in various specific English courses at Bakhtar Institute of Higher Education in Ilam, were recruited on voluntary basis. The participants represented both genders with the mean age of 20.2. By ethnicity and linguistic background, all the respondents screened out for the history of bilingualism were early bilingual Kurdish-Persian speakers living in Ilam in western Iran.

### *Instrument*

The survey instrument employed was the modified version of Horwitz's (1988) BALLI (Beliefs About Language Learning Inventory), a popular self-administered 34-item Likert-type questionnaire translated for the ease of responding into Persian (the second but the formal academic language of bilingual learners in the present context) in order not to cause lack of understanding or misinterpretation. Before conducting the main study, a pilot test of the questionnaire was also administered among 10 ESP learners chosen from the same population in which the internal reliability of the Persian version of the questionnaire was found to have an alpha coefficient of 0.83.

### *Procedure*

Data were collected from participants during the last class of the second semester of the academic year. Before the inventory was passed out, the researcher guaranteed the anonymity of the participants and provided a brief overview of the nature and aim of the study. After completing the questions the students returned. As part of the procedure, data gathered were entered into the Statistical Package for Social Sciences (SPSS, Version 17). Descriptive analysis in the form of percentages was computed and the data were put into principal components and discussed in detail.

## RESULTS AND DISCUSSION

The results were discussed under Horwitz's (1988) themes (i.e. language learning aptitude, language learning difficulty, the nature of language learning, learning and communication strategies, and motivations and expectations) below.

### *(a) Language learning aptitude*

Table 1. Participants' beliefs about language learning aptitude

Items	BALLI Statements	SA/A* %	N %	SDA/DA %
1	It is easier for children than adults to learn a foreign language.	92	6	2
2	Some people have a special ability for learning foreign	73	18	9

6	languages. People from my country are good at learning foreign languages.	50	36	14
10	It is easier for someone who already speaks a foreign language to learn another one.	38	30	32
11	People who are good at mathematics or science are not good at learning foreign language.	9	22	69
16	I have a special ability for learning a foreign language.	52	29	19
19	Women are better than men at learning languages.	21	32	57
30	People who speak more than one language are very intelligent	72	17	11
33	Everyone can learn to speak a foreign language.	87	8	5

\*SA/A=Strongly Agree/Agree, N=Neutral, SDA/DA=Strongly Disagree/Disagree

The bilingual respondents endorsed the concepts of the positive effects of early language learning, the existence of special abilities for language learning, the belief that everyone can learn to speak a foreign language, the influence of intelligence on language learning; in contrast, they were in disagreement with the effect of gender on language learning, and they did not make a distinction between an aptitude for the sciences versus an aptitude for the humanities-type subjects such as language. Half the respondents also believed that people from their country are good at learning languages. All in all, the findings suggested the perceived existence of language aptitude by the bilingual respondents and the belief that while learning a language is not impossible for anyone, the ability to master more than one foreign language indicates intelligence.

(b) Language learning difficulty

Table 2: Participants' beliefs about language learning difficulty

Items	BALLI Statements	SA/A* %	N %	SDA/DA %
3	Some languages are easier to learn than others.	74	18	8
4	English is a language that is ...	26	50	24
15	If someone spent 1 hour a day learning a language, how long would it take then to speak the language very well?	75	15	10
25	It is easier to speak than understand a foreign language.	49	29	22
34	It is easier to read and write English than to speak and understand it.	77	15	8

\*SA/A=Strongly Agree/Agree, N=Neutral, SDA/DA=Strongly Disagree/Disagree

The bilingual students believed that some languages are easier than others; however, they regarded English as a language of medium difficulty which would optimistically take one to three years to learn. The respondents also believed that it is easier to speak than to understand a foreign language, and they agreed that it is easier to read than write in a foreign language. In all, the findings suggested that the population of respondents as a whole feel that their target language is of medium difficulty, and do not perceive a difference between the difficulties of various language skills.

(c) The nature of language learning

Table 3: Participants' beliefs about the nature of language learning

Items	BALLI Statements	SA/A* %	N %	SDA/DA %
8	It is necessary to know about English speaking cultures to speak English.	85	10	5
12	It is best to learn English in an English-speaking country	16	15	69
17	The most important part of learning a foreign language is learning new words.	83	13	4
23	The most important part of learning a foreign language is learning grammar.	55	27	18
27	Learning a foreign language is different than learning other academic subjects.	68	22	10
28	The most important part of learning English is learning how to translate from my own language.	74	19	7

The respondents believed that it is necessary to know the culture of the foreign language in order to speak the language but not in an English-speaking country. The respondents believed that learning new words, grammar and translation are the most important parts of language learning. They also agreed that people who are good at academic subjects are good at foreign languages. The elicited beliefs in this stream imply that respondents lean towards believing that there are certain approaches, such as focus on learning vocabulary or grammar and translation strategies that make language learning successful.

(d) *Learning and communication strategies*

Table 4: Participants' beliefs about learning and communication strategies

Items	BALLI Statements	SA/A* %	N %	SDA/DA %
7	It is important to speak English with an excellent pronunciation.	89	8	3
9	You should not say anything in English until you can say it correctly.	2	34	64
13	I enjoy practicing English with the foreigners I meet.	78	15	7
14	It is OK to guess if you don't know a word in English.	57	26	17
18	It is important to repeat and practice a lot.	96	2	2
21	I feel shy speaking English with other people.	19	12	69
22	If beginning students are allowed to make mistakes in English, it will be difficult for them to speak correctly later on	83	15	2
26	It's important to practice with cassettes/tapes or CD ROMs.	87	12	1

\*SA/A=Strongly Agree/Agree, N=Neutral, SDA/DA=Strongly Disagree/Disagree

The learners endorsed repetition and practice with cassettes/tapes or CD ROMs. They admitted that they will enjoy practicing English with an English-speaking individual they meet without any shyness. They favored having excellent pronunciation, guessing unknown words and saying anything grammatically incorrect just for the sake of communication, but not for beginning students. This reflects the fact that in foreign language learning contexts, the role of authentic materials is viewed as a crucial aspect of successful language learning, and learners adopt different strategies in various contexts.

(e) *Motivation and expectations*

Table 5: Participants' beliefs about motivation and expectations

Items	BALLI Statements	SA/A* %	N %	SDA/DA %
5	I believe I will learn to speak English very well.	74	20	6
20	People in my country feel that it is important to speak English.	76	14	10
24	I would like to learn English so that I can get to know the native speakers better.	78	15	7
29	If I learn English very well, I will have better job opportunities.	79	12	9
31	I want to learn to speak English well.	91	7	2
32	I would like to have foreigners as friends.	74	15	11

\*SA/A=Strongly Agree/Agree, N=Neutral, SDA/DA=Strongly Disagree/Disagree

The respondents agreed that they want to learn to speak English very well, and they believed they will eventually speak English very well to get better job opportunities and have better communications. They believed that their countrymen valued the ability to speak English highly. Respondents felt instrumentally motivated. In this category, the vast majority of responses seem to reflect the learners' desire for and optimism in achieving their language learning goals.

As a whole, the research findings elicited by BALLI in such a newly-explored bilingual context in Iran revealed that Horwitz's BALLI instrument can be considered as a suitable tool for conducting research on language learning beliefs in different sociolinguistic settings. The findings also revealed that Iranian university students in this ethnic region hold a range of beliefs, some of which would be an impediment to successful language learning and some can facilitate it.

## CONCLUSION

The present study aimed to examine Iranian ethnic non-English-major university students' overall belief system in an unexplored academic context in light of current literature in order to fill a gap in learner belief research. Analysis of the established principal belief themes shows that there are significant results that can be linked to the specificity of the participants' context. In addition, beliefs may vary based on individual learners' differences, learners' age, learning stage, language proficiency, professional status, cultural and educational background, context diversity, and several personal factors among others (Horwitz, 1999; Bernat & Gvozdenko, 2005). It is argued, that it is rather the individuals' complex metacognitive structure, as affected by a number of social, cultural, contextual, cognitive, affective, and personal factors that is responsible for the shaping nature and strength of these beliefs (Bernat, 2006). Investigating the relationship of

beliefs to other factors sheds light on their stability and malleability and thus bears consequences for possible instructional intervention methods in the classroom attempting to change those beliefs, which may hinder the learning process (Bernat, 2006) and upgrade those beliefs which may facilitate the learning process.

There were several limitations in conducting the present study including the small-scale sample size, the limited survey instrument (BALLI), the ethnicity bias (bilingual Kurdish-Persian non-English-major undergraduate students living and studying in Ilam in western Iran), and the imbalance of gender among respondents.

The findings of this study can have several important pedagogical implications for both learning and teaching. The analysis of the BALLI items revealed that different students had different beliefs towards learning English as a foreign language. Iranian bilingual students in this study showed their great eagerness to learn this internationally accepted language very well and this is surely a very helpful belief that can facilitate language learning. But, maybe these good and correct beliefs cannot guarantee their learning because of the other harmful beliefs that they hold such as placing a great deal of emphasis on grammar and excellent pronunciation and believing that less than two years for learning English is enough. In this case, the students are faced with mismatching beliefs clashing with the reality of language learning and consequently frustrations and disappointments might emerge. In such cases it is required to confront erroneous beliefs with new information (Horwitz, 1988). There are some strategies that might help reduce these misbeliefs. Sometimes the source of such wrong beliefs goes back to what is known as culture or background. Therefore, culture and background of the students should also be taken into account by teachers. It seems that there is a need for teachers to devote sessions to talk with students about the real and helpful beliefs about language learning. This will help both students to become familiar with correct and realistic beliefs and teachers to get most from their classes.

Finally, although it is stated that learners' beliefs might be context-bound, learners' beliefs are also susceptible to change during time and this change may decrease or increase the level of learning. Therefore, as it is pointed out by Horwitz (1988) "it is essential to determine how student beliefs change over the course of language instruction" (p. 291).

### ABSTRACT

This paper makes an attempt to review the book entitled “Curriculum Planning and Development”. The book was evaluated and scrutinized both internally and externally. In other words, the researchers investigated the book in two dimensions: *content and design*. To do this, 20 questionnaires were submitted to all specialized teachers and professors of Hamadan and Kermanshah universities in Iran. The research tool was questionnaire included both selecting and

open-ended questions, while most of the questions were based on a Likert Scale of questions with 5 choices. The reliability of the research tool was examined by making the best use of SPSS software and Cronbach's alpha test. Reliability Coefficient of the questionnaire was calculated 0.90 that indicated that the questionnaire for data analysis was ideal. Finally, the results were analyzed by making the best use of factorial analysis; and, the data were depicted in the form of tables and graphs in the rest of this study.

**KEY WORDS:** SP (English for Specific Purposes), evaluation, curriculum, textbook, book review

## **INTRODUCTION**

On a daily basis, the materials that we teach must be evaluated, but this type of evaluation is not enough. We must conduct and perform systematic evaluations if our purpose is to maximize learning (Brown, 1995; Ellis, 1997; Richards, 2001). There are large ranges of textbooks to choose from, but the process of selecting an appropriate textbook can be both time-consuming and expensive (McDonough & Shaw, 2001; Karimi, 2006). Evaluation is a 'matching process that matched the needs to available solutions' (Hutchinson & Waters, 1987 cited in Sheldon 1988: 237). SAMT organization aims at publishing ESP books in different fields and majors in Iran. This paper aims to evaluate one of the ESP books in the field of 'Curriculum Planning and Development'.

The emergence and spread and distribution of English as the language of international relationship, asserting of knowledge ideas, and culture is well attested. It is a fact that English language teaching is obviously subject to developmental trends, and of the main prominent trends of recent years has been that of English for Specific Purposes. English is by far the most important and acceptable language of scientific and scholarly conferences, workshops and debates. As a matter of fact, no one can deny the fact that for the past few decades there has been a growing need to use the English language for the expression of information within specific professional fields. In response to this need, the teaching of ESP has become a major concern mainly in the countries that English is taught as a foreign language (Gatehouse, 2001).

Definitions of ESP are numerous but they all reflect the emphasis on how ESP teaching develops appropriate procedures to learners whose main goal is learning English for a purpose other than just language learning. That purpose may be educational, or professional, and ESP seeks to justify how well it prepares learners to achieve the required goals.

In defining ESP, Hutchinson and Waters (1987, p.19) posit "ESP is an approach to language teaching in which all decisions as to content and method are based on the learner's reason for learning."

Accordingly, ESP can be defined as English instruction based on actual and immediate needs of learners who have to successfully perform real-life tasks unrelated to merely passing an English course or exam (Smoak, 1996). So, the issue of focusing on learners' needs becomes equally

paramount as the methods utilized to spread linguistic knowledge. Dudley-Evans and St. John (1998) believe that any language must be included as a defining feature of ESP but the main concerns of ESP are needs analysis, text analysis, and preparing learners to communicate in an effective way in any required situations.

Another thing which is of utmost importance is that the experts of curriculum design believe that the breaking down of curriculum into components and sub-processes is a vital issue, since it simplifies and organizes such a complex process as the curriculum design is (Hutchinson & Waters, 1984, Nunan, 1991).

The organization for researching and composing university textbooks in the humanities (SAMT), whose aim is Cultural Revolution, tries to develop a fundamental change in the procedure and content of university textbooks, particularly in humanities. So, the organization for researching and composing university textbooks in the humanities, SAMT, were established to consider the issue (Merhmohammadi, 2006).

SAMT has published a variety of ESP books in various scientific fields. The main objective of these publications is to teach English in a specialized familiar context in order to motivate the students to use specialized English sources and texts in target situation. Thus, it will help the students strengthen their ability to use particular sources and improve their exploitation skills. Since gaining such skills is necessary to develop one's own knowledge in a specialized field, it should be esteemed and appreciated as a key professional accomplishment (Merhmohammadi, 2006).

This organization tries to codify educational English textbooks relevant to the students' needs in public, semi-professional and professional situation (Koosha, 2002). The book has been compiled for the students Curriculum Development in B.A. level.

Although, curriculum development been around for a while, it is generating some problems due to the lack of a proper course book. Nowadays, the course "Curriculum Development" is concerned too much as an academic course than before.

Mahmud Mehrmohammadi, Gholam Reza Kiany and Maryam KhezriNejad (see Appendix C) have tried to fulfill the educational needs of the students of this course. Since the students' needs regarding this course must be satisfied, such an English course for the college students is of utmost importance. This opportunity opens new gates of modern "Curriculum Development and Planning" for the students to do more research in this field.

The authors of the book have also designed other English books associated with this one. Some of these books are: "English for the students of Tourism and Hotel Management", "Curriculum Theories", "Scientific Fundamentals for the Art of Teaching", "Curriculum: attitudes, outlooks and perspectives", "Rethinking of teaching - learning process and teacher training", "Research queries in education and training", "Comparative analysis of the fundamental aspects of the German education system and comparing it with the Islamic Republic of Iran", "Art education:

whatness, whyness and howness”, and the present book, and “10 effective principles”, and “Effectiveness Strategies” (See Appendix C).

The syllabus of this course, which has been published in Ministry of Culture and Higher education, has not mentioned the source that must make the learners familiar with the purpose of the students’ development in order to make the best use of specific and technical courses of this academic course. These educational goals would not have been come true just by introducing this specialized ESP book.

This course book, by itself, cannot cover the students’ needs for studying the English sources like papers, articles, e-books and etc. The syllabus of this course as translated in Appendix A shows that in order to obtain the amount of needed English knowledge for students to make them enough capable to read the English papers of these English and foreign sources, a stronger and heavier course book is required. Therefore, it can be concluded that, book size is not sufficient for this purpose.

To provide a comprehensive book review it is needed to answer the following questions about the book “English for the students of Curriculum Development” (See Appendix C).

#### **1. What is this book?**

This is an English book which is written for the students of ‘curriculum development’ focusing on their reading comprehension.

#### **2. For what purpose is this book designed?**

This book is designed for the students of ‘Curriculum Development’ to improve their reading ability for comprehending the English sources and textbooks, and also the texts which are written in foreign countries, in ‘Curriculum Development’ field of study. This book is useful for those who are interested in curriculum and the ways of developing and planning it.

This book tries to reflect the realities which are happening in the world concerning this field of study. This book aims, mainly, to increase the students’ knowledge in curriculum development course. And finally, the secondary purpose of this book is to train some curriculum developers.

#### **3. In what situation is this book compiled?**

This 1<sup>st</sup> edition of this book is compiled in the fall of 2004 / 1382; and, the 2<sup>nd</sup> edition was presented in 2006 / 1385. Since then, this book had never been published again.

#### **4. Who are the authors of this book? How are they qualified to write this book?**

- Mahmud Mehrmohammadi, Associate Professor in Curriculum Development, TarbiatModarres University, Tehran, Iran
- Gholam Reza Kiany, Assistant Professor in Applied Linguistics / TEFL, TarbiatModarres University, Tehran, Iran

- Maryam KhezriNejad, Lecturer in TEFL, Islamic Azad University, Islamshahr Branch

### **5. To what extent is this book implemented for certain and reliable scientific facts?**

Since 'Curriculum Development' is originally an American course, the passages which are used in this book are adopted from the U.S. authors. In order to judge about its scientific basis, a very brief overview of the origin of 'Curriculum Development' is needed.

Curriculum planning as a strategic educational process for the improvement of learning first appeared in the educational literature of the post-World War I era (Ornstein & Hunkins, 1988). Since that time, curriculum planners have utilized several different approaches in designing curricula to improve teaching and learning in light of changing societal factors (Hyman, 1973; Brandt, 2000).

Research conducted at Niagara University and Buffalo State College, New York, commencing in 1992, with a sample of two hundred and seventy- nine (279) educators, reconfirmed the significance of the five personal needs and the significance of the six professional needs (Polka, 1994). However, change in education is a process, not an event, and it is accomplished first by individuals (Hord, et al., 1987).

### **6. To what extent are writing principles and linguistic rules observed?**

The passages are chosen from the books of authentic sources. Therefore, I can consider these passages highly reliable; because, the authors are all native speakers of English. The writers and authors are the experts of 'Curriculum Development'. These experts are Kilebard, H. M. (1975), Klein, M. F. (1980), Eisner, E. W. (1983), Ackerman, D. B. (1989) and Postlewaite, N. and T. Husen (1999), whom are knowledgeable enough to present scientific opinions about the mentioned field.

### **7. How much is this book acceptable among students?**

Answer of this question is to some extent informal and optional. Students are not qualified enough to judge about the quality of the book. But, the feedback that I personally received from the students of Hamedan Jahad Daneshgahi University, Bu Ali University, Alvand University, shows that, in comparison to the other books, somehow acceptable.

### **8. Are novel and new features included in the book?**

Yes, this book has four novel features: **a)** all the vocabularies, at the beginning of each unit are explained by English definition, while some examples and sentences are included in each definition; **b)** the other novel feature is about grammar. In this book, at least, one exercise of grammar is mentioned in which word formations are included; while, word formations are an essential part of promoting reading comprehension; **c)** the other novel feature is the variety of the exercises. Many various exercises are in each unit that the other books of the same publication exclude such features. The book includes the following exercises: Comprehension Questions, Multiple Choice Items of Vocabulary, Oral Questions, Fill in the Blanks, Matching Items, Grammar, Word Order, and Sentence Writing. But this book lacks the translation exercises; and,

d) it has a phonetic guide at the beginning of the book; while most of the other books of the same publication lack such a feature. And all the new vocabularies are presented with the phonetic signs.

**9. To what extent are the book materials and contents compatible?**

It is a little difficult to judge about this question. The content and materials of the book are exactly copied from the following books: “Intellectual and Practical Criteria for Successful Curriculum Integration”, “The Kind of School We Need”, “Curriculum Design”, “Reappraisal: The Tyler Rationale”, and “The International Encyclopedia of Education” (see appendix C). This can be regarded both as a positive and negative point. It can be positive, because the authors are native speakers of English, and it can make the text to a reliable one. It can be negative, because the book writers fail to add anything to the texts and content as long as the texts are copied from the original books which are mentioned above.

**10. To what extent the book title and headlines are related to the content and material?**

The passages of the book are chosen from some parts and chapters of the book. So, the titles and headlines of each chapter and unit are highly interrelated with the content and materials of each chapter.

Before starting the technical book review, it must be mentioned that there are some very important criteria in the scope of criticism. Here, I decided to mention some of these criteria about criticism. The following criteria must be considered about this Book Review:

**The 1st Criteria:** The issues of the book:

The authors of this book compiled some materials that are not researchable. These materials are mostly theoretical and they cannot be discussed from practical point of view. The book mentioned some very general ideas about this course and the content usually is driven from personal ideas of the experts.

**The 2nd Criteria:** The chosen method of the authors:

Since this book is a reading comprehension one, it includes both passages and comprehension exercises. To me, the authors do not add anything by their knowledge to the book except the exercises. The authors just copied the exact sentences of the “Intellectual and Practical Criteria for Successful Curriculum Integration”, “The Kind of School We Need”, “Curriculum Design”, “Reappraisal: The Tyler Rationale”, and “The International Encyclopedia of Education” books in the present book, while they had just controlled the arrangement of the materials. And, the authors haven’t checked the transposition of the materials; because, in all units earlier units were started with lower pages and later units were started with higher units. For example, first passage was chosen from page 1163 till 1164; and, the next passage is chosen from 1164 till 1166; and, third passage is chosen from 1166 till 1167. So, transposition, or which passage comes first and which one comes next, is not observed; because the materials were used in a single file.

**The 3rd Criteria:** Writing Style

Since this is a native-speaker-written book, the expressions and words are clear. This book lacks any kind of vague idiom and expression. Punctuation, lack of unnecessary repetition, and rhetoric language are considered as some strong points of the book.

#### **The 4th Criteria:** Codification of Book Content

Since the materials and book content are copied from the source books, the logical relevance and its transposition is observed. But each unit lacks a proper introduction and appropriate conclusion. Moreover, the order of easiness of the units is not observed. 2<sup>nd</sup> unit of the book include more new vocabulary items than that of unit 6. Additionally, fifteen units do not support the students to become a fluent reader. Additionally, it seems that 20 units fail the students to be able to read the relevant passages comprehensively. In this case, I do believe that for such a purpose at least 20 units would be more appropriate.

#### **The 5th Criteria:** References

Hunter (2003) believes that citation is important because it is the basis of academics, that is, the pursuit of knowledge. In the academic endeavor, individuals look at evidence and reason about that evidence in their own individual ways. That is, taking what is already known, established, or thought, they use their reasoning power to create new knowledge. In assessing a book, considering its references is of utmost importance. The author mentioned the references at page 143 - at the end of the book. These references are primary sources and the authors used them directly. But, there are numerous secondary sources that the authors used them indirectly, while they are not included in the references of the book. It must be noted that the authors had applied reliable and valid sources, and the book references are interrelated with the materials and content and passages.

Variety of used reference in this book is rather low. It has five references written at the end of the book. Since, 'Curriculum Development' is a modern course in universities, and it needed to be updated evermore, the used references are already too old, and they must be updated right away. The newest reference of the book is for 13 years ago, while the others are for 23, 29, 31, and 36 years ago. Moreover, during this very long period of time, 'Curriculum Development' was affected by lots of considerable changes for sure.

#### **The 6th Criteria:** authors' understanding and interpretation of the facts and evidences

The authors don't follow a researchable principle which is based on a theory. They even don't state an issue based on logical and reasonable comments. These theoretical view points and judgments pictures the authors' intellectual power and work. Since, in this book there are no author-made theoretical points, it fails to reflect the authors' critical and theoretical points.

Formally, this technical book review is split into two different parts of, a) formal criticism and evaluation, and, b) content criticism and evaluation.

### A) Formal Criticism and Evaluation

Generally, the anatomy of all books is made of three parts:

#### 1- The Pretext

- The first element which must be taken into consideration in analyzing pretext is about the page title. It is made of two subparts of (I) publishing features, and (II) book profile. (I) The page title is totally standard and it has all the necessity information including: full name of the main author (Mahmud Mehr Mohammadi), his/her date of birth (1958), the English and Persian title of the book (English for the Students of the Curriculum Development), the address of the publication (SAMT Publication – Tehran – Iran), ISBN or the International Standard Book Number which is a unique numeric commercial book identifier based upon the 9-digit Standard Book Numbering (SBN) code (ISBN: 964-459-763), price (10500 Rials), the number of the pages (143), date of publications (first publication on 2004 and third publication on 2006), full name and date of birth of the other authors if any existed, and the title of the book.

- (II) the book profile includes the following factors:

The logo of SAMT publication, (see Appendix D), Authors, Edition team (The editorial Staff of SAMT), Print Run (5000 Rls.), Price (10500 Rls.), Typesetting and Lithography (SAMT), Text Printing (Printing and Publishing Organization, Ministry of Culture and Islamic Guidance), address and phone number.

In the case of interpretation of SAMT Publication logo, it must be noted that, based on an interview with Mohammad Reza Yaghoubi (see Appendix C), there is a logo at the top of the first page of the book which is the symbol of publication relating to book and publishing affairs. There are 12 tulips around the book for two reasons: first, tulip flower is the symbol of flourishing of science; second, they are 12, and it is a holy figure standing for 12 Imams whom are considered as religious beliefs in Islamic countries. The next point in this logo is that, there are tips of the pens between the tulips. These pen tips show that SAMT organization is doing cultural works.

- The other element in pretext analysis is table of content. This table is arranged base on FIPA (The Foundation for Intelligent Physical Agents). There are six parts in this book, and these 15 lessons and 4 extra texts are embedded inside these parts. Part one has four lessons; part two has 3 lessons; part three has 4 lessons; each of part four and part five have 2 lessons; and part six has 4 lessons, while the last part includes just 4 passages without any exercises in them.
- The next element is foreword and preface in which the authors have introduced the SAMT publication and the present book, and they mentioned their main aim of compiling such a book. But, this book lacks an introduction part.

#### 2- Main Text

a) The logic and method of book editing:

- Parts and subparts: There are 6 parts and 19 subparts.
- Subject unity: The passages were chosen from 5 books. These passages were presented one after another, and they follow one topic and it discusses about the curriculum field of study.
- Text paragraph: In this book the paragraphs of the passages were arranged standard.
- Punctuation of the main passages: Since the passages were copied from valid and reliable curriculum textbooks, the punctuation standards of the main passages were perfectly observed.

b) Correctness of prose and syntax:

- The passages were highly authentic and it lacks any sort of self-made and non-standard expressions and grammatical rules and vocabularies. As a matter of fact, these features make the passages more reliable.

### 3- Post main Text

a) Appendices and enclosures

- It seems that the book lacks such features.

b) Indexing

- None of the index types were used at the end of the book. Neither alphabetical nor numerical indices were applied.

The following factors are categorized in Formal Criticism and Evaluation:

a) Print accuracy:

- In some pages of the book there are some shadows behind and around the printed words.
- The quality of the printing is not the same. Some pages are pale, while some other is chromatic.
- The size of the letters match the book format and passage. There is no irrelevant font size in the book. The font size of the passages is 12. The font size of the titles is 14, and the font size for the title of the whole chapter is 22. They are all printed in black color.
- I hardly found any kind of printing mistakes.
- Totally, the paper quality is acceptable. But, it is a little thin.

b) Binding Problems:

- It sounds that the book headband was, already, in a good quality.
- No binding problems were found in binding of the book, and this feature among SAMT publication books is universal.
- There were no binding mistakes, and all the pages were ordered numerically from the first page to the last one.

c) Referral system and footnotes:

- It seems that there are no footnotes in the book.

- There is no extra information which is driven from translated books, especially complementary materials which is related to the present book.

d) Book format:

- Length and width of the book is  $160 \times 240$  millimeters.

•

### B) Content Criticism and Evaluation

It is aimed at a “systematic introduction” to the issues and practices dealing with “developing, managing, and evaluating” an effective program. The authors emphasize that curriculum development” as used in this book refers to “the range of planning and implementation processes involved in developing or renewing a curriculum. These processes focus on needs analysis, situational analysis, planning learning outcomes, course organization, selecting and preparing teaching materials, providing for effective teaching, and evaluation. Moreover, the book also concentrates on methodological issues that most likely to have a significant impact on language curriculum practices.

This book consists of 6 parts and 20 lessons, each of which provides essential elements of curriculum development that experts need to have a clear understanding. Nunan (1984) has justified a curriculum development as “a set of process and procedures which are both systematic and interrelated” (p.18). This set had been “professional-oriented” and comprises these elements: “need analysis, [materials], and objectives setting [to address the learners need], content, methodology and evaluation” (Nunan, 1984, p.18). **Part one** deals with the origin of curriculum development relating to historical background. The term ‘Curriculum Design’, ‘subject matter’ and some reforms are discussed in part one. The role of learners and teachers and, also, types of activities use in learning and the role of community and some curriculum approaches are discussed in part one. **Part two** considers a model of curriculum, and this part talks about curriculum improvement and the conception of curriculum in the experts’ point of view. **Part three** provides a basic assumption of curriculum development based on an analysis of Reappraisal of Tyler Rationale. In this part subject matter are considered as a source of objectives. And then, the learners’ needs and studies of contemporary life were introduced as the source of objectives. **Part four**, which seems the shortest part of the book, relates to intellectual criteria for curriculum interaction. Ackerman (1989) considers the role of validity within curriculum development as an essential element and states some requirements for the validity within and for the disciplines. **Part five** focuses on the procedures for using the information collected from previous stages for developing program that result in learning objectives. It considers the prerequisite knowledge in curriculum. **Part six** includes some sole units that concentrate on intellectual independence, problem formulation and critical thinking methods.

### Methodology

#### *Research Method*

This research is a functional one which is carried out by making the use of a survey method.

#### *Participants*

This research includes 20 participants who are all English experts. The researchers have chosen them among the university professors of Jahad Daneshgahi, Azad University of Hamedan, Azad university of Kermanshah, Bu Ali University and Non-governmental Educational Institution of Alvand. The research tool was the questionnaire including open and close questions, while most of the questions were based on a Likert Scale of questions with 5 choices.

#### ***Data Collection Instrument***

The questionnaire is presented at Appendix B. The data collection methods are library studies and standard questionnaire. The reliability of the research tool was examined by making the best use of SPSS software and Cronbach's alpha test. Regarding utilization of standardized questionnaire, the Reliability Coefficient of the questionnaire was calculated 0.90 that indicates the ideal situation of the questionnaire for data analysis.

#### ***Data Collection Method***

The data collection method was carried out by utilizing *semi-structured interviews*. This type of interview, first, investigates the conceptual background of the subject, and based on this, it defines some main points as research questions, and then, interview questions guide would be clarified. Data collection and face to face interviews with individual interviews was carried out after clarification of *interview questions guide*. At the beginning, the number of the participants was not clear; but, as soon as the interview started, the method of *Snow Ball Sampling* was used and the rest of the important samples were clarified; and the process of data collection continued until the *Theoretical Saturation* of the samples. Then, when 20 people were interviewed, the Theoretical Saturation was obtained and interview process stopped right here.

#### ***Data Analysis***

For data analysis, two statistical methods of descriptive and analytic were used. In this research, also, qualitative method was utilized as well which was carried out by case study approach. A criterion was considered in order to choose the participants: familiarity with the topic; and, the participants were all among the English experts of universities. Experience (Polkinghorne, 1989) and familiarity with the phenomenon (Wrets & van Zuuren, 1987) are considered the most important criteria in qualitative researches.

Analysis of qualitative data from interviews was conducted using content analysis. For this purpose, first, the data were written, then, the topics and subjects were coded individually in the form of concepts, then, they were summarized and finally, they were reported in the form of shared topics and subjects. The number of samples is 20, regarding this and according to research (DIIA, 2007), the shared topics and subjects can be expressed as frequency and percentage. Therefore, in this study, the shared topics and subjects were reported as frequency and percentage.

## **CONCLUSION**

### **I. Prioritizing the respondents' ideas on book review**

In Table 1, the status of each of the related items of respondents' ideas on book review is prioritized based on the coefficient of variation (CV).

According to table 1, the amount of book correspondence to the society needs and realities (average rate = 4.20, and SD = 0.69), the amount of book correspondence to the students mood (average rate = 3.35, and SD = 0.58), and the amount of book relatedness of examples with the content of the book (average rate = 4.00, and SD = 0.72), are the most important priorities. The above items, from the respondents' point of view, are the strengths of the book.

Some poor or weak points of the book, in respondents' pint of view are: non-understandability of book concepts (average rate = 2.85 and SD = 1.34), not having an updated content (average rate = 2.70 and SD = 1.34), and releasing low levels of opportunity for students to discover the facts (average rate = 2.80 and SD = 1.43).

*TABLE (1): Prioritizing the respondents' ideas on book review*

Priorit y	Index	Average rate	SD (Standard Deviation)	CV(Coeffici ent of variation)
1	The correspondence of the book content with the community needs and realities	4.20	0.69	0.16
2	The book correspondence with the students' mood	3.35	0.58	0.17
3	Relevance of the examples with the book content and concept	4.00	0.72	0.18
4	The quality of the book materials	4.00	0.72	0.18
5	The appropriateness of book language, editing method, and words difficulty regarded to students knowledge	3.35	0.74	0.22
6	The amount of book unity and coherence in book content	3.30	0.80	0.24
7	Agreement with universal changes in the book	3.45	0.99	0.28
8	Effectiveness of workbook in teaching process	3.10	1.16	0.37
9	The suitability of the material based on educational goals	2.90	1.11	0.38
10	Appropriateness of teaching time for covering the book content	3.30	1.34	0.40
11	Relatedness of the book tables, figures and charts to the book content	3.15	1.30	0.41
12	The attractiveness of the book content for the students	2.90	1.20	0.41
13	Tediousness of the book for the students	2.60	1.09	0.41
14	The variety of exercises and questions	2.60	1.09	0.41
15	Appropriateness of the book content for the students	2.65	1.13	0.42
16	The book effectiveness in increasing students' academic knowledge	2.95	1.31	0.44
17	The systematic nature of the book questions	3.05	1.39	0.45
18	Understandability of the book content	2.85	1.34	0.47
19	The up-datedness of the book content	2.70	1.34	0.49
20	Amount of opportunities for students to discover the facts by the book	2.80	1.43	0.51
—	Average	3.16	—	—

Scales: at all (1), little (2), somehow (3), very (4), extremely (5)

## **II. The open questions of the questionnaire**

The participants were asked to mention their ideas about 12 questions of the book review which were asked openly. The questions were generally analyzed through *content analysis*. Totally, various opinions were collected. During the analysis, some items were obtained which is shown in table 2. The respondents were asked to answer to the questions which are shown in the appendix B.

<b>Positive points</b>	<b>Negative Points</b>
<b>Knowledgeable authors</b>	Poor syllabus of the course
<b>Relevant texts</b>	Authentic texts
<b>Authentic texts</b>	Copy- paste content
<b>Vocabulary explanation</b>	Non-researchable issues
<b>Grammar exercises</b>	Low number of units
<b>Various exercises</b>	Low number of sources
<b>Phonetic guide</b>	Lack of incite references at the end
<b>Interrelated content</b>	Theoretical (not practical) views
<b>Native speaker authors</b>	Out of datedness
<b>Valid sources</b>	Unable to present new ideas
<b>Good price</b>	Unable to promote students' knowledge
<b>Unit organizations</b>	Non-understandability of the book questions
<b>Subject unity</b>	Lack of coordination between chapters
<b>Text paragraphs</b>	Unsystematic nature of questions
<b>Punctuation</b>	Boring content
<b>Paper quality</b>	Lack of book attractiveness
<b>Prose &amp; syntax correctness</b>	Lack of workbook
<b>Printing accuracy</b>	Lack of charts and graphs
<b>Binding quality</b>	
<b>Title appropriateness</b>	
<b>Standard letter size</b>	
<b>Book unity and coherence</b>	

As shown in table 2, appropriateness of the size of the book letters and suitability of the book price are the main priorities in the respondents' point of view; and, monetary incentives and promoting students' knowledge are the least important priorities. Chart 1 illustrates the respondents' opinion on the book review.

TABLE (2): Prioritizing the respondents' ideas on book review

Priority	Shared subjects and topics	Frequency	Percent of the each of the items separately	Percent of the each of the items related to the others
1	Appropriateness of the size of book letters	20	100	11.2
2	Appropriateness of the book price	20	100	11.2
3	Non-understandability of the book questions	19	95	10.7
4	Out of datedness of the content	19	95	10.7
5	The title appropriateness	19	95	10.7
6	Usability in new courses	18	90	10.1
7	Quick understanding of the content	17	85	9.6
8	Lack of coordination between the book chapters	14	70	7.9
9	Presenting new ideas and comments	12	60	6.7
10	Book price and monetary incentives	11	55	6.2
11	Promoting students' knowledge	9	45	5.1

CHART 1: Respondents' ideas and opinions on the book review

### Book Review in one Look

### SUGGESTIONS FOR FUTURE RESEARCH

More research and study on this book review is definitely needed. The researchers had tried to provide their critical ideas on this book review; but, this book review could be more comprehensive by the work of the other scholars as well.

*Appendix A*

*(The Syllabus of Curriculum Planning and Development in Ministry of Culture and Higher Education)*

The syllabus of “English in Curriculum Planning and Development” according to the Ministry of Culture and Higher Education is presented here.

Type of the course:           Theoretical

Number of Credits:           2

Prerequisite:                    –

Course Number:               58

This course aims to:

Present the vocabulary, expressions and texts which are driven from current sources of curriculum development and planning which aims to improve the students’ knowledge who want to study the English sources in their mentioned field.

The syllabus course:

It includes the expressions and vocabulary by making the use of the passages which are related to “Curriculum Development”.

*Appendix B*

*(Questionnaire of Book Review)*

Number	Questions	Extremely	Very	Somehow	Little	At all
1	Are the books effective in promoting the students knowledge?					
2	Is the book content up to date?					
3	To what extent are the book materials attractive for students?					
4	Are the curriculum hours enough for covering the book content?					
5	Are the graphs, tables, charts, if there are any, related to the book content?					
6	To what extent the examples are related to book concept?					
7	To what extent are the book concepts understandable for students?					
8	To what extent cohesion and unity is observed in book content?					
9	To what extent the book content meets the society needs and realities?					
10	To what extent high-quality materials are used for book printing?					
11	To what extent the book exercises meet the students’ mental circumstances?					
12	Do you agree with the universal changes in the present book?					
13	Is the order of the material based on the educational aims?					
14	Are the book language, editing procedure and the used words proper to					

4	basic understandings and the students' prior knowledge and experience?					
1	Are the book questions systematic and proper for students' technical					
5	needs?					
1	Does the book provide an opportunity for students to discover the facts?					
6						
1	Are there various kinds of questions included in the book?					
7						
1	To what extent workbook helps your teaching?					
8						
1	To what extent are the materials useful for the students?					
9						
2	To what extent are the materials boring for the students?					
0						

### **(Open Questions)**

1. What is your opinion about the letter size?
2. What is your opinion about the amount of content?
3. What is your opinion about the book price?
4. What is your opinion about the difficulty level of the book questions?
5. Do you use this book in the next courses? If no, what books you would introduce?
6. What are the problems of the book? If you were the author, how would you solve them?
7. What was the author's purpose or purposes in writing this book?
8. What did the title have to do with the book?
9. Did this book give you any new ideas about this course?
10. What do you think the author was trying to accomplish with this book?
11. Did you find this book a quick read? Why or why not?
12. What are your concerns about this book?

If there is any point that is excluded from the above questionnaire, you can mention it here. Thanks in advance.

## LOCAL EFL TEACHERS' BELIEFS: A PRELIMINARY REPORT IN IRAN

**Mohsen Akbari**

*English Language Teaching Department, Tarbiat Modares University, Tehran, Iran*  
Corresponding Author, Email: [mohsena719@yahoo.com](mailto:mohsena719@yahoo.com)

**Maryam Youran**

*English Department, Payam-e Noor University, Ilam, Iran*

### ABSTRACT

The study of teachers' beliefs is a contemporary inclination in language pedagogy and teacher education research with an outstanding outcome highlighting the influential role of teachers' beliefs in determining their professional behavior. Given the paucity of studies on language teachers' beliefs in unexplored EFL contexts particularly in Iran, this preliminary study examines the impacts of English and TEFL invoking the elicited real-life beliefs of 25 Kurdish EFL teachers of private language institutes in Ilam, in western Iran. A self-designed open-ended questionnaire along with an interview was administered to encourage teachers to spell out their beliefs and to obtain the required data. In light of qualitative-interpretative data analysis, the EFL teachers' beliefs boiled down to six main groupings including (1) "My ways of communication" (2) "My personality" (3) "My native language, culture and identity" (4) "My worldview beliefs" (5) "My lifestyle" and (6) "Other". These categories were illustrated and discussed to form a general agenda of Kurdish EFL teachers' belief system. There were also recommendations for further studies exclusively for the design and development of EFL teacher education programs and courses in the region, in Iran and in a globalized context.

**KEYWORDS:** beliefs; language teacher; EFL; TEFL; Iran; Kurdish

### BACKGROUND

Teaching a language is a multifaceted endeavor that involves educational, linguistic, personal, as well as social and cognitive dimensions (Moini, 2009). Due to a rise in the cognitive and social views towards teaching languages in recent years (Williams & Burden, 1997, p. 56; Moini, 2009) and the highlighted complex relationships between what teachers do and what they know and believe (Borg, 2009), Pajares (1992) among others proposes that "teachers' beliefs can and should become an important focus of educational inquiry" (p. 307). The main reason behind such a suggestion is that "teachers are highly influenced by their beliefs" (Williams & Burden, 1997, p. 56) and also teachers are no longer viewed as "mechanical implementers of external prescriptions, but as active, thinking decision-makers" (Borg, 2009, p. 2). The definition, operationalization, and study of teachers' beliefs are not easy to do (Moini, 2009); nevertheless, beliefs have been considered by many scholars, among them Borg (2001), as conscious or

unconscious, in other terms; implicit or explicit (Williams & Burden, 1997, p. 57) understandings and propositions held and endorsed by individuals to be true or false (Phipps & Borg, 2009).

Since the 1990s (Borg, 2003, 2009; Zheng, 2009), research on language pedagogy and language teacher education has put an emphasis on the significance of language teachers' beliefs. From this decade onwards, as Borg (2009) points out, there has been a rapid and steady increase in the volume of research examining various aspects of what language teachers know, believe and think and of the relationships of these constructs to what teachers do i.e. teachers' beliefs about the subject matter i.e. the language, teaching, learning, learners, role of teachers, various approaches and methods of teaching a language, and the impact they might have on teaching practices, activities, and learning outcomes, classroom behaviors and practices, relationship between language teachers' beliefs and teacher education programs or vice versa, relationship between language teachers' prior language learning experience and their beliefs, comparison of teachers' beliefs and their learners' beliefs; and the likely factors or sources leading to teachers' belief system (see e.g. Tercanlioglu, 2005; Zeng & Murphy, 2007; Al-Alawi, 2008; Cabaroglu & Denicolo, 2008; Song, 2009; Al-Musallam, 2009; Buyukyazi, 2010; Kuzborska, 2011).

There are several reasons why such studies on language teachers' theoretical and pedagogic beliefs, particularly here EFL (English-as-a-Foreign-Language) teachers, as the invisible dimensions of teaching (Borg, 2001; 2009) have been of paramount importance in local and global contexts. To elaborate, beliefs are of use in understanding language teachers' personal attitudes, thought processes, pedagogic concerns, professional development (Pajares, 1992; Williams & Burden, 1997, p. 62; Agnes, 2006), language teachers' definitions of the world and themselves as well as their instructional practices, choices, planning, decision-making and teaching behavior in the classroom (Williams & Burden, 1997, p. 63) and the language institute or school they work for, and more significantly addressing teaching objectives, designing lessons, selecting tasks and activities, and assessing language learners performance (Williams & Burden, 1997, p. 57; Borg, 2001; Zheng, 2009; Kuzborska, 2011). Moreover, due to the unobservable features of EFL teachers' beliefs (Williams & Burden, 1997, p. 57), teachers may not be aware of the dynamic nature of their ideas, behavior, and instructional practices (Borg, 2009; Farrell & Kun, 2007; Erkmene, 2010). In this case, it is important to make the dominant beliefs influencing their profession clear so as to give them awareness, to help them weigh up their ideas and their fellow teachers' stand, to think and practice better, to find answers to their questions and concerns, to assess their professional development, and to reconstruct some aspects if necessary (Freeman, 1991; Agnes, 2006; Zheng, 2009; Kuzborska, 2011).

Additionally, encouraging teachers to reflect on their existing beliefs and behaviors could help them become more receptive to alternative perspectives, reflect if their current beliefs and teaching practices are worth maintaining and be prepared to modify or adjust their knowledge and work in ways that are consistent with their developing views and research-based standards throughout the world (Kuzborska, 2011; Qbeita, 2011). In all, if teachers' beliefs can be elicited, there is a better chance for teacher education programs and courses to suit teachers' needs (Cheng, Yi & Tsai, 2009; Bigelow & Walker, 2003).

Although such studies are into favor in the line of research in many English and non-English-speaking countries, they are open to be conducted in more unexplored contexts especially EFL

ones. Despite such an emphasis on language teachers' beliefs, there are a few studies in pertinent research on EFL environments and nonnative-speaking EFL teachers, who teach in these unique and particular contexts. There are for example not many studies focusing on limited number of EFL teachers such as Greek, Chinese, Saudi Arabian, Hungarian, Turkish, Omani, as well as Taiwanese EFL teachers (see recent studies e.g. Mattheoudakis, 2007; Chan, 2008; Al-Alawi, 2008; Nishino, 2008; Cabaroglu & Denicolo, 2008; Al-Musallam, 2009; Song, 2009; Lihua, 2010; Caner, Subasi & Kara, 2010; Qbeita, 2011). In the same way, when the available literature was reviewed, it was observed that there was not sufficient number of empirical studies on this subject in Iran as well, with several recently published exceptions reduced to EFL teachers' beliefs in Farsi-speaking regions; for instance, studies on Iranian EFL teachers' beliefs about the role of a language teacher (Torghabeh, Elahi & Khanalipour, 2009); the role of grammar in TEFL (Baleghizadeh & Farshchi, 2009); grammar and teaching grammar (Moini, 2009); EFL methodologies and materials as well as instructional experience (Atai & Gheitanchian, 2009); relationship between teachers' beliefs and gender (Estalkhi, Mohammadi, Bashiri & Kamali, 2011), reading strategies and several practical teaching activities (Khonamri & Salimi, 2010); and language learning (Ganjabi, 2011). No reported study to date, to our best knowledge, has been focused and published on Kurdish-speaking EFL teachers' beliefs in the related literature across the world and in Iran and sources are nonexistent in this regard. Additionally, Kurdish EFL teachers in Iran who speak the Kurdish language as their mother tongue, Farsi as their second formal language and English as a foreign language are interesting cases to voice their beliefs on the English language and TEFL (Teaching English as a Foreign Language) in a particular context. Thus, this study complements other studies and adds to the body of knowledge of beliefs in general, but more specifically, beliefs of that particular ethnic group which to date have remained unexplored, i.e. Kurdish EFL teachers beliefs.

### **PURPOSE OF THE STUDY**

Bearing in mind what Williams and Burden (1997) propose as "beliefs tend to be culturally bound" (p. 56) and given the need for the improvement of teacher education programs, the importance of language teachers' beliefs in teacher education, and largely the growing increase of the globalization of English across the world and the role of teachers as the driving force of this international language, the purpose of conducting this preliminary case study, as the first tentative attempt in this area, is to explore the impacts of English and TEFL on a group of EFL teachers in Ilam, a dominantly Kurdish-speaking city, in western Iran in order to help to specify the mainstream belief system and the main themes emerging from these beliefs of these EFL teachers and the likely role of these beliefs in promoting EFL teacher education courses and programs in this region, in Iran, and even in a globalized context in the future.

Accordingly, the study was to address the following research question based on a qualitative-interpretative approach:

- What are Kurdish EFL teachers' beliefs about the English language and TEFL under their particular context?

## METHODOLOGY

### *The context of study*

The context of the present study is Ilam, a city located in western Iran, where the Kurdish language is predominantly spoken as the first language. Like all other non-Farsi cities in Iran, Ilam has a situation wherein two distinct codes which function separately are spoken, the official and national language is Farsi which is used in academic and formal interactions but the spoken first language is Kurdish, in better terms Southern Kurdish or Ilami Kurdish (viz. a Western Indo-Iranian language subgroup of the Proto-Indo-European language family) which is used in some local media and newspapers and also as a vernacular for interactions (Haig & Matras, 2002). In addition to the Kurdish-Farsi situation in Ilam, many Kurdish individuals like other Iranians are learning EFL at schools, universities and private language institutes. Aside from typical Kurdish EFL learners, there are Kurdish EFL teachers who do not get enough exposure to English like many other people around the world but at schools, private language institutes, media, or occasional tourists.

With their different cultural and trilingual background, Kurdish EFL teachers have to cope with more challenges in language learning and teaching as well as language use in a unique context. They tend to teach English to Kurdish English learners in Farsi or in little English or even in Kurdish. In this sense, Kurdish EFL teachers, influenced by their own culture and languages, bring to their local contexts; particular beliefs, norms and expectations concerning the English language and TEFL. As a result, given the need for the improvement of teacher education programs in the region and in Iran, the importance of language teachers' beliefs in teacher education programs and courses, and largely the growing increase of the globalization of English across the world and the role of teachers as the driving force of this international language (Williams & Burden, 1997, p. 56), in line with the aim of the present study, Kurdish EFL teachers' beliefs were an interesting case to study.

### *Participants*

To unravel the beliefs as the main concern of the present study, 25 Kurdish EFL teachers from private language institutes in Ilam, Iran, were randomly selected using convenience sampling (Bryman, 2004) and were asked to participate with their consent in the study. They were told that their participation was entirely voluntary and that their responses would remain anonymous and that confidentiality would be maintained. Versions of the questionnaire were handed out to 30 teachers; 25 were returned after one week, a response rate of about 84 percent. Of the 25 EFL teachers, 16 teachers (64 percent) were female and 9 teachers (36 percent) were male with the mean age of 25. All the teachers' second languages were Farsi. All the teachers had been teaching EFL to different levels and age groups of Kurdish learners for about three years at the time of the data collection ( 25<sup>th</sup> October, 2011) and they held Bachelor's in English language and literature. None of the teachers, however, possessed specific language teaching qualifications.

### *Instruments and Procedure*

Using a natural qualitative-interpretative inquiry, a self-designed open-ended questionnaire was administered to elicit data on Kurdish EFL teachers' beliefs about the English language and TEFL following Caner *et al.* (2010) and Kuzborska (2011) in an unexplored setting where

English is taught as the only foreign language. The questionnaire (see the Appendix) composed of two parts.

The first part focused on background personal information about teachers (such as gender, age, languages, educational background, major, and English teaching experience, teacher training programs or courses).

The second part was an open-ended question eliciting teachers' beliefs towards English and TEFL. The main reason behind using the type of question was giving opportunities to the participants to develop their responses and beliefs in ways which the researchers might not foresee (Phipps & Borg, 2009). The questionnaire was piloted with four randomly selected Kurdish EFL teachers from this region one week prior to its administration.

In addition to the questionnaire, one-on-one semi-structured interviews (Peacock, 1998) were conducted with each participant teacher because they were essential in facilitating validation, providing qualitative information about the Kurdish EFL teachers' beliefs, gaining more in-depth responses from the participants, and learning about the participants' underlying reasons for their beliefs they offered in written self-report questionnaires (Peacock, 1998; Erkmene, 2010). Audio-recorded interviews started with questions about biographical information and led to the main open-ended question of the study. This type of open-ended question and one-on-one interviews gave EFL teachers a different context in which to make their beliefs explicit and reconstruct them (Cheng *et al.*, 2009) about English and TEFL in a Kurdish context and also maintain their own personal voice. 25 Kurdish EFL teachers (84 percent) provided the required answers, returned the questionnaire, participated in the interviews and completed the study. 5 participants (16 percent) out of the randomly selected teachers left the study during the research process.

To probe into the collected data, EFL teachers' beliefs in light of their responses and reflections to the open-ended questions and the transcribed individual interviews were analyzed and organized qualitatively into categories in terms of their content i.e. the main themes and important shared concepts posed by Kurdish EFL teachers for further discussions. Analysis and review then involved focusing on each individual case using the sentence as the unit of analysis and coding (following Zeng & Murphy, 2007; Cheng *et al.*, 2009; Phipps & Borg, 2009).

### ***Elicited Teachers' Beliefs***

The findings presented a diversity of beliefs. In spite of the diversity, common concepts were evident both within each individual case as well as across cases. Based on the qualitative-interpretative content analysis of the data elicited by the open-ended questionnaire and individual interviews, several coherent themes were identified both across cases, despite their diversity, to illustrate the Kurdish EFL teachers' belief system under an untouched unique context.

In the following discussion of the categories, direct quotes were mainly from Kurdish EFL teachers, since we had their written text to work from and also their transcribed interviews. We attempted, as far as possible, to use the words of the participants in the discussion as well as to interpret underlying intentions. In other words, our aim was to let the Kurdish EFL teachers speak for themselves and have a voice. The six categories are presented in order of salience based on the number of mentions in the data or other indications of priority for the category as follows:

Table 1: A general agenda of Kurdish EFL teachers' beliefs system

## RESULTS AND PRELIMINARY DISCUSSION

“What are Kurdish EFL teachers' beliefs about the English language and TEFL under their particular context?” was the main research question that led to the present preliminary report. This case study in a newly explored setting, i.e. Ilam, as a dominantly Kurdish-speaking city in Iran, shed light on our understanding of a diversity of beliefs and

Categories	Beliefs	Number of teachers	Percentage
A	My ways of communication	18	72%
B	My personality	14	56%
C	My native language, culture and identity	10	40%
D	My worldview beliefs	7	28%
E	My lifestyle	4	16%
F	Other	2	8%

reflections by Kurdish EFL teachers in terms of the impact of English and TEFL on different aspects of their professional and personal lives. In spite of this diversity or even complexity, common concepts were evident across all the participants. Among the outstanding common concepts posed by Kurdish EFL teachers were the headings as follows:

### (A) “My ways of communication”

The first category of responses that was of pragmatic nature was “My ways of communication”. Of the 25 participant Kurdish EFL teachers, 18 teachers (72 percent) voiced their beliefs in this respect. These participant teachers unanimously confirmed in their beliefs that learning English as a valuable means of communication across the world beside TEFL gave them a hand to become directly aware of a great deal of information and knowledge and have access to up-to-date everyday data. For instance, a female Kurdish EFL teacher stated:

*English helped me to change the means of communication I used to stick to. I think more logically and I believe that my communication habits have improved thanks to the English language and TEFL. (Teacher No. 12)*

A similar response was by a male Kurdish EFL teacher who said:

*More and more communications with different individuals from different social classes and age groups in my hometown as well as in Iran and even throughout*

*the world were the main impacts of learning and teaching English. (Teacher No. 8)*

Of the key words highlighted in this category were “communication”, “interaction”, “familiar”, “awareness” and “knowledge”. These words point out that the EFL Kurdish teachers believed that the English language and TEFL have given a better chance to communicate and interact with different individuals and characters in local and global contexts. They felt their way of communicating in their first and second languages have become logical because of the fact that they have learned and taught English. It is argued that the position of English as the world's prestigious language seems to place demands on Kurdish EFL teachers to be able to communicate with people from different parts of the world. Explicitly stated in Kurdish EFL teachers' beliefs, it was argued that learning and teaching English helped them to meet people with different tastes and personality traits, increased their communication skills locally and globally, aided in mutual interactions with others not only in the outside English world, but also in their local closed settings. As a whole, English learning and teaching were taken into account as a positive factor which led to finding out some weaknesses in the ways of communication of Kurdish EFL teachers, and were valued as integral parts of interaction in the globalized world of today. This was according to Norton and Toohey (2002, p. 113) that learning and practicing a language is learning and practicing a diverse set of sociocultural practices including interaction-related ones.

#### (B) “My personality”

The second category out of the six categories derived was a psychology-related category entitled here “My personality” with 56 percent of the total participant beliefs (14 teachers). In this category, learning English and TEFL were considered as a personality enhancer, i.e. learning English and TEFL were considered helpful in positive changes in the personality-related aspects of Kurdish EFL teachers in this context. A comment made by a female Kurdish EFL teacher is typical of the responses elicited from participants:

*English as an international language and practicing TEFL helped me to be more and more talkative, positive, and outgoing. I feel happy now. (Teacher No. 11)*

Shyness, impatience, lack of confidence, lack of motivation and even concentration were described as the major personality traits of Kurdish EFL teachers which were set aside by learning English and TEFL. Another Kurdish EFL teacher recounted:

*Learning this language like leaning other skills made positive changes in me and it could help me to think better and have a prestigious social class. I am more self-confident, and I feel free and comfortable. (Teacher No. 3)*

The noticeable keywords in this category involved the words “positive”, “sociable”, “open-minded” and “self-confidence”. Many of the teachers have become less shy and much more positive thanks to English and particularly TEFL. Additionally, what some teachers described here was a case of a personality shift. Kurdish EFL teachers considered communication in English easier and more comfortable, because they could overcome their shyness and become more positive and self-confident in comparison to the time when they speak in Kurdish or Farsi. They approved the positive changes noticeable in their personality by highlighting the importance of learning English and TEFL in giving them positive personality traits such as flexibility, patience, broad-mindedness, punctuality and even commitment. This was in line with such

an idea that learning and knowing a foreign language leads to lots of positive changes and makes the person open-minded and tolerant (Caner et al., 2010). It should be mentioned that this category was somehow related to the first one “My ways of communication”. Because it is argued that those individuals who try to communicate with others have more positive personality traits. And this was in agreement with Gardner’s comment (2002, p. 160) that learning and practicing a language involves taking on patterns of behaviors, personality traits, personal conduct and so on.

**(C) “My native language, culture and identity”**

The next popular category ranking the third was “My native language, culture and identity” and included the responses that mentioned the relationships between English and TEFL and the native language, culture, and identity of Kurdish EFL teachers in this unexplored context. About 10 teachers (40 percent) of Kurdish EFL teachers recounted and believed that English and ELT did not have any effects on their mother tongues (Kurdish) and their second languages (Farsi). They confirmed that they have enjoyed positive impacts due to learning and teaching EFL. For example, a female Kurdish EFL teacher wrote:

*Learning English and practicing TEFL helped me to think better. They pushed me to evaluate my mother tongue, my second language, my culture and identity. Because of reading in English, I tried to have a weblog in English and explain my native language, my country and hometown, lots of customs and practices, all in English, to the world. I think English paved the way. (Teacher No. 18)*

In a similar fashion, a male Kurdish EFL teacher noted:

*English and TEFL gave me directions on comparing my own culture and all the things related with other cultures especially the Western or English culture. Not only I learned a lot about other cultures and tried to make others particularly EFL learners and many people worldwide aware of them, I found out lots of values and forgotten points in my own culture. (Teacher No. 5)*

The most important key words in this category were the words “positive”, “improve” and “explain”. It is argued that according to the themes under this category, learning English and TEFL were both positive factors which play important roles in forming Kurdish EFL teachers’ views towards their native languages, culture and even identity. This positive change triggered by the English language and TEFL that pushed Kurdish EFL teachers to looking at their own native languages, culture and identity in an objective or critical manner, to know them better by themselves and even explain them in English to the rest of the world or to convey and use them in teaching procedures and their lives.

It could be argued that this category of analytically interpreting native languages, culture and identity in English is the side effect of the first category. This might be due to the contact and interactions with others that usually leads to a reevaluation of ourselves and our possessions, here i.e. our languages, culture and identity. Additionally, several teachers pointed out the impact of English and TEFL on their literacy in their own native language or formal language. So, learning English and practicing TEFL provides opportunities for Kurdish EFL teachers to come into contact with native and non-native English speakers and often have great times explaining things Kurdish or Farsi to them in English. This might force Kurdish EFL teachers to view their culture and their own languages objectively. In addition, they not only do not

assume English and TEFL as threats to their languages, culture and identity, but also they usually know it as a facilitator or improver. In all, according to this category, languages, cultures and identities are inseparable and even they have lots of interrelationships particularly, in this study, positive ones. There might be other reasons behind looking at learning and practicing EFL very positively, in this regard a male Kurdish EFL teacher believed that:

*I think due to the traditional context of this region such an effect is not too predominant. However, sometimes I use English words instead of some words and combinations in my L1 or L2 just because they are more fashionable. (Teacher No. 12)*

As a whole, it is maintained that language learning and practicing engage many aspects of an individual's world such as their identity, culture and their possessions. This is because of the fact that language is a complex social practice (Norton & Toohey, 2002, p. 113).

#### **(D) "My worldview beliefs"**

Another category, "My worldview beliefs", included the Kurdish EFL teachers' beliefs about the effect of English and TEFL on their own worldviews, as well as the world they live in. They generally stated that the English language and TEFL have broadened their worldviews and that have led them to become more interested in the outside world. This was the category where 7 Kurdish EFL teachers (28 percent) pointed to the impact of the English language and TEFL on their worldviews. Considering the importance of communications nowadays, Kurdish EFL teachers in their limited context believed that learning and practicing English or any other languages opens a window to the outside world and surroundings, to more contacts with different cultures and thoughts, and more mutual understanding and acceptance and as a result a better life. To illustrate this category, a typical example is a comment by a female Kurdish EFL teacher. She wrote:

*Learning English and TEFL are helping me to broaden my knowledge, change my outlook and see the world better. It is just because I have learned a global language for communication. (Teacher No. 1)*

Similarly, to illustrate this change of outlook, a male Kurdish EFL teacher gave such an account:

*Through learning English as an international language, I could expand my worldview and become familiar with a wide variety of ideas, beliefs, and viewpoints. (Teacher No. 7)*

The outstanding key terms which were so apparent in this category of beliefs, were "world", "broaden", and "international" as well as the remark that "Learning and teaching the English language was like entering a new world with lots of benefits" which might represent the beliefs of the Kurdish EFL teachers classified in this category. This gives the impression somewhat related to some type of convergence among those who learn English. These beliefs that have been attributed to English and TEFL are probably a result of some images and terms which are of dimensions of global and cultural flows.

It should be noted that although a person who lives in a country or even a city far from the world of English such as an EFL context, here Ilam in Iran, would not be able to imagine such a change or have such a worldview, the “My worldview beliefs” category is of interest in this preliminary report. Therefore, the results are in agreement with such a comment that learning and knowing a foreign language, here the English language as an international language for communication, bring new insights into an individual’s worldview (Caner *et al.*, 2010). This category also proved Wardhaugh’s comment (1990, p. 214) that languages can control your worldviews.

#### (E) “My lifestyle”

The penultimate derived category of significance was entitled “My lifestyle”. Just 4 Kurdish EFL teachers (16 percent) were classified in this category. Several key words in this category such as “lifestyle”, “life”, “motivation”, and “change” were highlighted among a diversity of beliefs and reflections. One belief that fell into this category was a comment made by a female Kurdish EFL teacher:

*Learning and teaching English was of great help. I am more disciplined and I got used to planning for my life at present and in the future. I schedule my life routines better than the past. I act better and feel happy.* (Teacher No. 24)

In such beliefs, English and TEFL are considered as significant factors that have led to positive changes in the participant teachers’ lives. They are free from running a monotonous and dull life, they feel cheerful and energetic, they have gained the best motivating sources i.e. English and TEFL, and more importantly a trace of determinism and feeling of life destiny is highlighted in their beliefs. For example, a female Kurdish EFL teacher mentioned:

*Via English and TEFL, I became familiar with the lifestyle of many other individuals all over the world, and such a familiarity directed me to the best.* (Teacher No.20)

Additionally, a western lifestyle as the impact of English and TEFL is of importance. For example, a comment was made by a Kurdish EFL teacher as follows:

*I think, making some changes in the way of dressing, decorating the house, cooking some foods especially English desserts, and taking care of pets were the impacts of learning and teaching English.* (Teacher No. 11)

In general, it is argued that learning English and TEFL are the most significant encouragements for the Kurdish EFL teachers, and like other categories, they look up to English and TEFL. This category was in line with the belief that language is influential in predisposing speakers towards adopting a particular view to everything including their lives and get through the task of daily living (Wardhaugh, 1990, p. 212).

#### (F) “Other”

Among the other sparingly detected categories were “My benefits” which included responses related to some type of advantages such as job, money and ability as a result of learning and using English and TEFL. For example, a female Kurdish EFL teacher gave such a comment:

*I have gained more job opportunities just due to learning English and gaining experience in TEFL. I teach English in many language schools and I am bale to translate different articles and everything in English. (Teacher No.3)*

Similarly, a belief spelt out by a Kurdish EFL teacher was:

*English and TEFL have improved my performance generally and also my skills and abilities to tackle the problems, to earn money and to be known as a capable person.*

Such a category was in agreement with Caner *et al.* (2010) who believe that it is a global fact that learning and knowing a foreign language fulfill a person's personal and occupational needs.

Or "My interests in English" which was composed of the interests of Kurdish EFL teachers in English culture and media just because of learning English and TEFL or thanks to globalization. One comment from this category that represented this belief was aired by a male Kurdish EFL teacher:

*Watching English movies and series, listening to original clips and music tracks in English as well as reading novels and stories and all the stuff in English were my favorites which became more and more by improving my English. (Teacher No. 10)*

A key word in this category of responses was "enjoy", as demonstrated by a female Kurdish EFL teacher:

*Learning English has helped me to make the best use of English media and enjoy time better than those who are not familiar with this international language. Using a computer and some software is easy these days just due to learning English. I enjoy reading some masterpieces and literary works in English as well as watching some original movies. I enjoy surfing the Net. (Teacher No. 14)*

This inclination towards English culture and media that is music, movies, books, magazines, websites, blogs, chat rooms, an the like can be though as a result of images created by the media power and the capability to disseminate these images as well as the capabilities gained via learning the English language and TEFL.

There were also other categories which could not be classified into any of the categories described above.

In all, the consistent general agenda of Kurdish EFL teachers' beliefs reveals that their reflections and beliefs about the positive impacts of English and TEFL have much in common. Kurdish EFL teachers in this newly explored setting, i.e. Ilam, as a dominantly Kurdish-speaking city in Iran, helped us to shed light on our understanding of a diversity of beliefs and reflections by Kurdish

EFL teachers in terms of the impact of English and TEFL on different aspects of their professional and personal lives. In spite of this diversity or even complexity, common concepts were evident across all the participants. They have positive viewpoints towards English and TEFL as advantageous and valuable means in improving their ways of communications; personality traits; native languages, culture and identity; worldviews; lifestyles; and even their benefits and interests. However, given the paucity of studies on Kurdish EFL teachers' beliefs in Iran, there is a dire need to conduct such studies and know how much the elicited beliefs in this region are culturally bound. More studies will help language education programs and courses in the region and in Iran, because the limited present study was just a preliminary report and tried to open a window to the world of research on ethnic EFL teachers in one of the Unexplored contexts i.e. Ilam in Iran.

## **CONCLUSIONS**

Although the current study helped in presenting a particular image of Kurdish EFL teachers, further studies may provide better understandings by examining other aspects of teachers' beliefs in larger-scale studies from qualitative or even quantitative perspectives. All the findings of this study have to be understood within the limitations of participant size and the research context. For this reason, we cannot assume or infer that the experiences or beliefs of a limited group of Kurdish EFL teachers are typical of the beliefs of other EFL teachers in Kurdish regions in Iran. Additionally, the self-designed questionnaire and interviews did not generate as much data as we had expected. Consequently, the information we collected about Kurdish EFL teachers' beliefs was not detailed and could not give a complete picture of Kurdish EFL teachers. The study also does not account for the interplay of age, gender, educational background, university degree, life and professional experience, personality traits and socio-economic status and teachers' beliefs which are of paramount importance according to Tercanlioglu (2005). Although no generalizations could be made from this single case study as a preliminary report and there is a need to conduct longitudinal studies with well-designed elicitation procedures, it does reveal the variety of teachers' beliefs about the impacts of English and TEFL in a newly explored context. However, further studies are required to complement the present preliminary report as the first tentative attempt in the literature of EFL teachers' belief system in the region, in Iran and in a global setting.

The main clear implications of this study, like other studies on language teachers' belief system, concern EFL teachers and particularly here Kurdish EFL teachers as well as language pedagogy and teacher education (Phipps & Borg, 2009). It is concluded that EFL Kurdish teachers should be trained to acknowledge their beliefs and become familiar with some likely context-specific factors that contribute to their streams of beliefs according to Phipps and Borg (2009). In fact, perhaps by making Kurdish EFL teachers aware of their implicit or explicit beliefs, we can take a step towards helping them to address how to improve their practices and become more effective teachers. In addition to conducting studies on language teacher's beliefs, there are other ways to do to empower teachers in this regard such as allowing them to establish their own professional development agenda of beliefs by holding workshops at a regular basis wherein they voice their ideas and beliefs as well as setting teacher education courses and programs which are endowed with teachers' beliefs components, designing websites and blogs and communication groups

wherein they feel free to spell out and share their beliefs or establish a coherent system of beliefs, and the like (Zheng, 2009; Kuzborska, 2011). Of course, it should be mentioned here that these strategies might not result in developing more efficient teachers, but at least they may help reduce discrepancy and unawareness. By working with an awareness of their own beliefs, teachers have an effective means to help them gain insights into their own teaching, into how they give meaning to what they do and the reasons that underlie their practice. As a whole, these orientations, i.e. the belief system as presented here, can offer a useful tool in teacher education programs and courses in this region, Ilam, or even nationally in other parts of Iran, and positively all over the world.

However, it should be argued that it is not enough for studies on EFL teachers' beliefs to explore just a general agenda of beliefs; rather we need to consider the list of possible sources for teachers' beliefs like age, gender, educational background, university degree, life and professional experience, personality traits and socio-economic status and so on (Tercanlioglu, 2005); try out different elicitation strategies such as classroom observations and diaries beside open-ended questionnaires and interviews to identify the probable relationships between teachers' beliefs and their practices; to explore, acknowledge and understand the underlying reasons behind such beliefs (Phipps & Borg, 2009); to explore the stability of beliefs over time; as well as weigh up the matches between EFL teachers' beliefs and EFL learners' tendencies in the same context, in order to enable researchers, teacher educators and curriculum developers to better understand the process of teaching, recognize teachers' needs, identify problem areas, and design and develop one-of-the-kind teacher education courses and programs and publish guidelines for would-be and practicing EFL teachers on teaching sufficiently, effectively and systematically (Farrell & Kun, 2007; Erkmene, 2010; Al-Nofaei, 2010; Agnes, 2006). All things considered, we should take two pieces of advice in the stream of language teachers' belief system. Firstly, according to Borg (2009), there is uniqueness of different educational contexts and particularly the uniqueness of teachers and learners as human beings, therefore what teachers believe in is associated with the educational context they are involved in; and secondly, "beliefs tend to be culturally bound" (Williams & Burden, 1997, p. 56) although the influence of English as the global language of today is something tangible in any part of the world.

## APPENDIX

Dear Teacher,

This is a questionnaire for academic study about Kurdish-speaking English-as-a-Foreign-Language (EFL) teachers in Ilam, Iran. The purpose of this study is to understand your beliefs about the impacts of English and English Language Teaching (ELT). Your answers to this questionnaire are very valuable and important. They will be used exclusively for the academic study. The information you provide will be confidential and anonymous.

The questionnaire is composed of two parts. Part I requires appropriate answer based on your own personal situations. Part II is an open-ended question as the leading question of the present study. You are free to write your answer in this part without any limitations and cover all the topics and concepts you like.

Thank you for your cooperation and assistance

Mohsen Akbari

Bakhtar Institute of Higher Education

Ilam, Iran

### Part I. Background Information (Please mark your answer in the appropriate box.)

1. **Gender:** Male ☐ Female ☐

2. **Age:** .....years old

3. **Languages:** First language: ..... Second language: ..... Other languages: .....

4. **Educational background (Please indicate the highest education level completed)**

Junior college ☐ Undergraduate ☐ Master's degree ☐ Doctorate ☐

5. **Major:** .....

6. **English teaching experience:** less than 1 year ☐ 1–2 years ☐ 3–5 years ☐ 6–10 years ☐

7. **Have you ever taken a teacher training program or course?** Yes ☐ No ☐

### Part II. Your beliefs (An Open-ended Question) (Please write your responses on the blank sheets attached)

*What have been the impacts of learning English and Teaching English as a Foreign Language (TEFL) on you?*

## THE COMPREHENSIVE STUDY OF ACCOUNTABILITY STRATEGIES EMPLOYED BY IRANIAN EFL TEACHERS IN GILAN PROVINCE

### ABSTRACT

This study emphasized the value of teacher accountability as the means to help them to be aware of accountability standards in education and also it is conducted in an effort to investigate the role of gender, age, degree and teaching experience, average working hours, in teachers' perception of accountability in language teaching career in an Iranian English as a foreign language (EFL) context. In the process of empirical research, 71 male/female EFL teachers teaching in English language institutes and schools in Gilan province with different academic degrees and different experience were provided with questionnaires of teacher accountability designed and administered to tap their perception toward the mentioned constructs. The collected data was then fed into SPSS to find the relationship between accountability and teachers' gender, age, degree, experience, average working hours. It was revealed that there is no significant difference between teacher accountability and the variables under the study.

**KEYWORDS:** Accountability, teacher education.

### INTRODUCTION

Research on teacher education especially teacher accountability has become the most-recent watchword in education. The quality of teacher development practices has become a major concern in recent educational discourse, with a growing emphasis on a teacher accountability suggesting that quality should be assessed with reference to students' achievement. Whether and to what extent practices meet this goal is, however, often unclear. Although the quality of teacher development practices cannot be defined in absolute terms, provisional definitions are worth pursuing as long as both teachers and teacher educators acknowledge their usefulness in the regulation of professional empowerment processes. They should serve both to provide a direction to practices and to establish a framework for the assessment of those practices.

Accountability is an important dimension of professionalism. This dimension highlights that the teacher is morally responsive to the student's and parents' needs, as well as responsive to the

public through the mechanism of the state. In moral terms accountability can be seen as keeping to ethical standards held by teachers as a group and as individuals. There is no doubt that organizational commitment is an important characteristic of a good and effective teacher which results from very deep faith and loyalty to the institution. Moreover, it's also important for student academic achievement.

Teaching in general, includes teaching English as a foreign language (TEFL) or teaching English as a second language (TESOL) depending primarily on three major elements: the curriculum, the student, the teacher, and on many secondary issues.

It is believed that the learner is the most important element in the educational process. Celep (2001) stated that in any educational institution, a human being is the most important element because s/he participates in any position of the input-output process circle of the educational institutions.

According to Hoy, Tarter, and Kottkamp (1991), effective teachers need high level of organizational commitment. This suggests that high level of student's achievement requires dedicated teachers who contribute effectively. There is no doubt that high level of student's achievement is strongly related to high level of organizational commitment.

According to McNeil et al (1986), commitment has been defined as "The tendency to be involved in positive activities rather than feeling purposeless .In addition, those who are characterized as being committed usually have the ability to set goals for themselves and recognize their own personal value system.

Singh and Billinnsley (1989) stated that low level of teacher's commitment reduces students' achievement, increases teacher absenteeism and increases teacher turnover, too (move from teaching to another job).

The success of any organization depends primarily on the staff's level of commitment (Oberholster & Taylor, 1999). They added that teachers with low levels of commitment are less faithful to the organization, see themselves as outsiders, do only what enables them to get by, and seem to be more concerned with personal success than with the success of the organization as a whole. In contrast, teachers with high levels of commitment see themselves as an integral part of the organization, what threatens the organization endangers them as well, do their best to perform their duties better, and work for the organization as if it belonged to them. So, there is no doubt that students' level of achievement will be influenced by the teachers' level of commitment. "In order to achieve its goals, any organization needs knowledgeable and experienced people, facilities and financial instruments as well as other factor including trust, commitment and accountability" (Chalbi, 1996, P.147).

In educational institutions, a number of institutional factors have been found to correspond with faculty commitment. For example, Harshbarger (1989) concluded that the congruence of faculty university value was one of the principal factors affecting faculty commitment. Allen (1992), Armon (1995), Graham (1996), and Kawakubo (1988) stated that communication satisfaction,

sense of autonomy, and internal locus of control seem to take part in the organizational commitment, while external locus of control apparently plays a negative role. In other educational institutions, positive factors include reduced role ambiguity (Campisano, 1992; Cintavey, 1995), teacher empowerment (Homung, 1995; Wu, 1994), clear organizational mission Varona (1991), and encouragement of innovation, continual professional development, and shared decision making (Veitenheimer, 1993).

On the other hand, some personal factors have been found to influence negatively the organizational commitment of teachers. These include nonalignment of personal and organizational goals and values Menzies (1995), lack of communication and trust Varona (1991), high levels of interpersonal conflict Booker (1990), and imposing or withdrawing conflict resolution style on the part of principals (Hajzus, 1990). So the level of organizational commitment can be enhanced by maximizing the positive factors such as, administrative support, empowerment, collegiality, and a collaborative climate, and minimizing the negative factors such as nonalignment of personal and school goals and values, lack of communication and trust, high level of interpersonal conflict.

## **RESEARCH QUESTIONS**

This study seeks answers to these questions:

RQ: Are there any statistically significant relationships between the measures of teacher accountability and participants' age, university degree, work experience, average working hours and gender?

In order to investigate the above-mentioned research question empirically, the following null hypothesis was put forth:

N0: There are no statistically significant relationships between the measures of teacher accountability and participants' age, university degree, work experience, working hours and gender.

## **METHODOLOGY**

### ***Participants***

To accomplish the purpose of the study, the target population for this study consisted of 71 male and female EFL teachers with different work experience teaching in 11 English institutes and 3 high schools in Gilan province. 23 of the participants were male and the rest 48 were female with different age, working experience, working hours and employment type. According to the teachers' responses to the questionnaires, of the total subjects having participated in the research study, there were 21 MA holders, 27 MA student, and 23 BA holders.

### ***Instrumentation***

Considering the subjects of the study, the following instrumentation was developed: Teacher accountability measuring scale developed by researcher herself and was arranged according to

the specifications of related factors. This instrument has a six-point from 1 (agree) to 6 (completely don't agree) that has been devised based on eleven factors (elements): self-acceptance, self-actualization, self-transcendence, job performance, affective teacher commitment, continuance teacher commitment, normative teacher commitment, autonomy, fairness, organizational support and general questions.

This measure is the only instrument developed for measuring the construct of teacher accountability, and in order to examine the psychometric characteristics of teacher accountability questionnaire, the data gathered from the participants was analyzed using SPSS software. The analyses included first running corrected item-total correlation as a measure of item discrimination. Corrected item-total correlation is actually an equivalent measure of point-biserial correlation or classical item discrimination measures; however, corrected item-total correlation is specifically used for Likert-scale type items scored on several categories rather than dichotomously scored items.

The SPSS software provides the effect of removing items with particular discrimination values on the internal consistency of the scale. In the data analysis here, these values were checked, and those items with low discrimination index were removed. Following the removal of malfunctioning items, Pearson correlation coefficient was computed between the subscales of the questionnaire to see if there are any statistically significant relationships between eleven measures of teacher accountability as a measure of teacher quality. Since these subscales were added to the questionnaire by the researcher herself, high correlation between the subscales would be indicative of the fact that these subscales together are correctly chosen to be considered as different facets of the construct teacher accountability.

All the subscales of teacher accountability questionnaire were analyzed at the item level and scale level and some items were removed. The reliability of questionnaires was computed through Cronbach's Aalpha (= .79) which indicates a high reliability.

### ***Procedure***

To ensure full demographic and grade-level representation, 11 English institutes in different cities in Gilan province and 3 high schools were selected for data collection. Each teacher answered the questionnaire. There are a total of 5 variables in the research which are the independent variables of gender, age, teaching experience, degree and average working hours. The answers to the questionnaire provided by teachers were compared with each other with regards to the independent variables of gender, degree, average working hours, experience.

### ***Research Design***

In the present study, because of the nature and necessities of the work, 'survey method' was considered best to capture the proposed objectives. Based on the literature, a "survey" can be any kind of instrument from a short paper-and-pencil feedback form to a comprehensive and detailed one-on-one in depth interview (Seliger & Shohamy, 1989; Ary, Jacobs, & Rezavieh, 1996; Howitt & Cramer, 2000). In this paper, the survey used is a questionnaire.

## RESULTS

In order to investigate whether there is any statistically significant relationship between the measure of teacher accountability and participants' demographic information, some statistical analyses were employed as reported under the following headings.

### Age

Table 1 provides the descriptive statistics on participants' teacher accountability score, obtained by administering 11 measures of teacher accountability in the form of one questionnaire, across different age categories.

Table 1: Study population by age

	AGE		Statistic
Teacher accountability	20-30	Mean	284.0732
		N	41
		Std. Deviation	31.77530
		Minimum	229.00
		Maximum	383.00
		Range	154.00
		Skewness	1.019
	31-40	Mean	281.2105
		N	19
		Std. Deviation	20.02936
		Minimum	224.00
		Maximum	327.00
		Range	103.00
		Skewness	-.649
	41-50	Mean	3
		N	3
		Std. Deviation	39.52636
		Minimum	208.00
		Maximum	287.00
		Range	79.00
		Skewness	-.189

In order to see whether participants from different age categories have statistically different levels of teacher accountability, Kruskal Wallis test as a non-parametric mean comparison statistic was employed. The reason for choosing this statistic rather than one-way ANOVA was that not all the skewness values provided in Table 1 are within the acceptable range (i.e. between -1 and 1) to meet the normality assumption for parametric tests like one-way ANOVA.

Tables 2 and 3 present the mean ranks and the main Kruskal Wallis test results, respectively. Evidently, only two age categories (i.e. 20-30 and 31-40) have been compared since the other age category is too small in sample size to be included in the analysis. As Table 3 demonstrates,

there is no significant difference between the two age categories in terms of their mean teacher accountability scores; Chi-Square = .006,  $p = .936$

Table 2: Ranks

	AGE		Mean Rank
Teacher accountability	20-30	4	32.63
	31-40	0	32.23
	Total	4	

Table 3: Chi-square Test Statistics (a,b)

	Teacher accountability

Df	1
Asymp. Sig.	.936

a Kruskal Wallis Testb Grouping Variable: AGE

### University degree

Table 4 provides the descriptive statistics on participants' teacher accountability score, obtained by administering 11 measures of teacher accountability in the form of one questionnaire, across different education degree categories.

Table 4: Study population by university degree

	EDUCATION		Statistic
Teacher accountability	BA	Mean	271.6957
		N	23
		Std. Deviation	25.46376
		Minimum	208.00
		Maximum	327.00
		Range	119.00
		Skewness	-.704
	MA student	Mean	290.6250
		N	24
		Std. Deviation	35.74890
		Minimum	230.00
		Maximum	383.00
		Range	153.00
		Skewness	.956
	MA	Mean	281.4706
		N	17
		Std. Deviation	20.14670
		Minimum	247.00
		Maximum	320.00
		Range	73.00
		Skewness	-.274

In order to see whether participants from different age categories have statistically different levels of teacher accountability, one-way ANOVA test as a parametric mean comparison statistic was employed.

The reason for choosing this statistic rather than Kruskal-Wallis test was that all the skewness values provided in Table 4 are within the acceptable range (i.e. between -1 and 1) to meet the normality assumption for parametric tests like one-way ANOVA.

Table 5 presents the main ANOVA results. Evidently, there is no significant difference between the education degree categories in terms of their mean teacher accountability scores;  $F(3-65) = .541, p > .05$ .

*Table 5: ANOVA*

	Sum of Squares	f	Mean Square	F	Sig.
Between Groups	2562.899		854.300	541	656
Within Groups	102601.536	5	1578.485		
Total	105164.435	8			

### ***Gender***

Table 6 provides the descriptive statistics on participants' teacher accountability score, obtained by administering 11 measures of teacher accountability in the form of one questionnaire, across the two genders.

*Table 6: Study population by gender*

	GENDER		Statistic
Teacher accountability	Male	Mean	283.8696
		N	23
		Std. Deviation	34.95101
		Minimum	224.00
		Maximum	383.00
		Range	159.00
		Skewness	1.058
	Female	Mean	280.0000
		N	41
		Std. Deviation	26.10843
		Minimum	208.00
		Maximum	352.00
		Range	144.00
		Skewness	.090

In order to see whether participants from different age categories have statistically different levels of teacher accountability, Mann Whitney test as a non-parametric mean comparison statistic was employed. The reason for choosing this statistic rather than one-way ANOVA or independent samples t test was that not all the skewness values provided in Table 6 are within the acceptable range (i.e. between -1 and 1) to meet the normality assumption for parametric tests.

Tables 7 and 8 present the mean ranks and the main Mann Whitney test results, respectively. As Table 8 demonstrates, there is no significant difference between the two genders in terms of their mean teacher accountability scores; Mann Whitney = 491.00,  $p > .05$ .

Table 7: Ranks

	GENDER	N	Mean Rank	Sum of Ranks
Teacher accountability	Male	23	37.65	866.00
	Female	47	34.45	1619.00
	Total	70		

Table 8: Mann –whitney test Statistics (a)

Mann-Whitney U	491.000
Wilcoxon W	1619.000
Z	-.619
Asymp. Sig. (2-tailed)	.536

a Grouping Variable: GENDER

### Work experience

Table 9 provides the descriptive statistics on participants' teacher accountability score, obtained by administering 11 measures of teacher accountability in the form of one questionnaire, across different experience categories.

Table 9: Study population by work experience

	EXPERIENCE		Statistic
Teacher accountability	0-10	Mean	282.3148
		N	54
		Std. Deviation	31.41735
		Minimum	208.00
		Maximum	383.00
		Range	175.00
		Interquartile Range	32.5000
		Skewness	.598
	11-20	Mean	279.0000
		N	7
		Std. Deviation	12.17922
		Minimum	264.00
		Maximum	298.00
		Range	34.00
		Interquartile Range	21.0000
		Skewness	.143
	over 20	Mean	270.3333
		N	3
		Std. Deviation	18.77054
		Minimum	250.00
		Maximum	287.00
		Range	37.00
		Interquartile Range	.
		Skewness	.845

In order to see whether participants from different experience categories have statistically different levels of teacher accountability, one-way ANOVA test as a parametric mean comparison statistic was employed.

The reason for choosing this statistic rather than Kruskal-Wallis test was that all the skewness values provided in Table 9 are within the acceptable range (i.e. between -1 and 1) to meet the normality assumption for parametric tests like one-way ANOVA.

Table 10 presents the main ANOVA results. Evidently, there is no significant difference between the experience categories in terms of their mean teacher accountability scores;  $F(2-65) = .243$ ,  $p > .05$ .

Table 10: ANOVA

	Sum of Squares	f	Mean Square	F	Sig.
Between Groups	413.811	5	206.90	243	.785
Within Groups	2 55280.82	5	850.474		
Total	2 55694.63	7			

### Average working hours

Table 11 provides the descriptive statistics on participants' teacher accountability score, obtained by administering 11 measures of teacher accountability in the form of one questionnaire, across different work hour's categories.

Table 11: Study population by working hours

	HOURS		Statistic
Teacher accountability	0-10	Mean	284.8000
		N	20
		Std. Deviation	26.62725
		Minimum	229.00
		Maximum	351.00
		Range	122.00
		Skewness	.250
	11-20	Mean	287.1176
		N	17
		Std. Deviation	32.12064
		Minimum	224.00
		Maximum	352.00
		Range	128.00
		Skewness	.311
	21-30	Mean	272.6316
		N	19
		Std. Deviation	20.76378
		Minimum	208.00
		Maximum	297.00
		Range	89.00
		Skewness	-1.732
	over 30	Mean	281.5000
		N	8
		Std. Deviation	45.31477
		Minimum	230.00
		Maximum	383.00
		Range	153.00
		Skewness	1.771

In order to see whether participants from different work hour's categories have statistically different levels of teacher accountability, Kruskal Wallis test as a non-parametric mean comparison statistic was employed. The reason for choosing this statistic rather than one-way ANOVA was that not all the skewness values provided in Table 11 are within the acceptable range (i.e. between -1 and 1) to meet the normality assumption for parametric tests like one-way ANOVA.

Tables 12 and 13 present the mean ranks and the main Kruskal Wallis test results, respectively. As Table 13 demonstrates, there is no significant difference between the work hours categories in terms of their mean teacher accountability scores; Chi-Square = 2.580,  $p > .05$ .

Table 12: Ranks

	HOURS		Mean Rank
Teacher accountability	0-10	0	38.03
	11-20	8	36.00

## DISCUSSION

The findings of this study are in agreement with those previously mentioned in the review of literature. For example, as to first research questions involving the relationships between the measure of teacher accountability and participants' gender. The findings of this study contradicted those concluded by Spencer and others (1989); Reyes (1992); Pennington (1995). The later studies suggested that female teachers were more committed than male ones. They attributed their findings to the differences in teachers' motivation, efficacy and satisfaction. They argued that female teachers were more motivated, effective, and satisfied than male teachers. As to second research question involving the relationships between the measure of teacher accountability and participants' age, the trend of our result agreed with that of Oberholster and Taylor V (1999) who found a positive relationship between commitment and age in favor of those who were 50 years old and more. This may be explained by the fact that older teachers tend

to be stable in their jobs all over the world and to love their job, thus to commit themselves to it. As to third research question involving the relationships, this study agreed with Reyes (1992) who indicated that years of experience correlate negatively with organizational commitment. But it disagreed with those of Cheng (1990) and Oberholster and Taylor-V (1999) who found that the length of teaching experience relates to organizational commitment. As to forth research questions the relationships between the measure of teacher accountability and participants' university degree. These findings contradicted with those of Oberholster and TaylorV (1999) who reported that doctoral degree holders were more committed than lower degree holders (M.A, B.A, or less) because doctoral degree holders were more aware of their work and they felt more satisfied than lower degree holders.

### **CONCLUSION AND IMPLICATIONS**

Teaching is complex and demanding work and there is a daily need for teachers to fully engage in that work with not only their heads, but also their hearts (Day, 2004; Elliott & Crosswell, 2001; Fried, 1995; Nias, 1996). It appears to be a professional necessity for teachers to be emotionally committed to their work, for without this emotional connection teachers face the constant danger of burn-out in an increasingly intensified work environment (Nias, 1996).

In so doing, the present study was conducted to explore the likely effect of teachers' experience, gender, age, degree, average working hours, on the way they are disposed toward accountability.

Based on the findings of the study, the researcher concluded that teachers' commitment were not affected by the respondents' gender, age, degree, average working hours, experience. The findings show that EFL teachers' degree, teaching experience, gender, age, working hours, does not have any significant effect on their accountability. This implies that teachers' perception of accountability generalizes across degree and teaching experience, gender, age, degree, average working hours. As a result, the researcher believes that EFL institutions and schools authorities can implement their educational programs regardless of, teaching experience, gender, age, degree, average working hours, of their teachers as far as they are concerned with the teachers' accountability. Associated to this are immediate calls for the inclusion of this factor in any teacher preparation program. These programs should become more devoted to fostering this constructs in the academic contexts.

Because of profound differences in participants, context of the study, research design, and instructional methods, it is far from possible to strongly support any generalizations. As always, further research is needed to give more comprehensive answers to questions about teacher accountability in language teaching. The following suggestions may be provocative for interested readers and research

The first suggestion for further research calls for considering teachers with different English language backgrounds. The participants in this study were all except one EFL speakers while there is a possibility to conduct this study with ESL speakers as teachers of English and also with native speakers of English.

The present study was conducted in the private EFL institutes, and high school contexts. Future studies can focus on just one of the mentioned contexts or other academic contexts. It is also suggested that further study is conducted based on the relativity of teachers' majors to the EFL i.e. the independent variable of degree can be categorized based on English and non-English majors.

- 5 The problem comes, I get confused easily.
- 6 Comprehensive cover of my dreams has priority over everything.
- 7 Often do not recognize that I have a lot of choices in any situation.
- 8 I'm living in dull conditions.
- 9 There are many things I have to do it, which have been doing a bit of attention.
- 10 I do a lot of things that prefer do not them.

**Self-actualization**

- 1 I feel completely free .
- 2 I feel inner peace, even at busy time.
- 3 I do things that I have accepted it and I accept them.
- 4 I open myself to the unpleasant decisions without having to think about them too much.
- 5 I get distracted easily, even when I am doing something that I enjoy.
- 6 I have many good ways to deal with my own.
- 7 I'm not in any position to make the right decision./
- 8 I do most of the work that I have to do them.
- 9 I do not have to decide when to rely on feelings.
- 10 It is difficult to start anything because I do not know the consequences.
- 11 I have the feeling of freedom.
- 12 Feel free to have a problem when I have no choice.
- 13 Usually, I do not know what is important in various situations.

**Self-transcendence**

- 1 I believe that there is a reason to live.
- 2 Personally, I feel that I have benefited from the work that I do.
- 3 There is nothing good in my life.
- 4 There is nothing in my life that I really committed myself to it.
- 5 My life is a good life for no reason.
- 6 I can barely understand it, what are the things that concerns me is my life.
- 7 Always eager to know what the future will bring for me.
- 8 Life has betrayed me because of my desire not to be feasible.
- 9 It is very hard for me to imagine myself anywhere else.
- 10 I wish I did not exist.
- 11 I cannot establish connection with the things I need to do.
- 12 When I'm sick, I do not know what I do.
- 13 I think that my life has meaning premier of my personal interests.
- 14 I know there are things in the world that is beyond my understanding.

**Job Performance Questionnaire**

- 1 I accepted the job, responsibility, and I know the consequences for their.
- 2 Unsupervised superior (manager) would work honestly.
- 3 I would be respectful with students and try to fix their problems.
- 4 I've been working on for the achievement of results and confident I follow.
- 5 I am in earnest, it is worth keeping, and I try to work on problems.
- 6 I am sympathetic towards my job and I try to give it the desired quality.
- 7 Emergency arises, or when human issues are discussed, from the point of sacrifice.
- 8 I strive to increase my professional knowledge.
- 9 Accept my mistakes.
- 10 I respect my colleagues and to respect their rights and to have a sense of cooperation.
- 11 I'm trying to pass on information on my career.
- 12 I refrain useless waste of time and tasks in the classroom
- 13 Means of work and care in their use would save.
- 14 I follow orders, and administrative regulations.

**Affective Teacher Commitment**

- 1 I do not feel like part of a family at school.
- 2 I feel emotionally attached to school.
- 3 Working at school has a great deal of personal meaning for me.
- 4 I feel a strong sense of belonging to school.
- 5 School does not deserve my loyalty.
- 6 I am proud to tell others that I work at school.
- 7 I would be happy to work at school until I retire.
- 8 I really feel that any problems faced by school are also my problems.
- 9 I enjoy discussing school with people outside of it.

**Continuance Teacher Commitment**

- 1 I am not concerned about what might happen if I left (name of school) without having another position lined up.
- 2 It would be very hard for me to leave (name of school) right now, even if I wanted to.
- 3 Too much in my life would be disrupted if I decided I wanted to leave (name of school) now.
- 4 It wouldn't be too costly for me to leave (name of school) now.
- 5 Right now, staying with (name of school) is a matter of necessity as much as desire.
- 6 One of the few, serious consequences of leaving (name of school) would be the scarcity of available alternatives.
- 7 One of the reasons I continue to work for (name of school) is that leaving would require considerable sacrifice—another organization may not match the overall benefits I have here.

**Normative Teacher Commitment**

- 1 I do not feel any obligation to remain with (name of school).
- 2 Even if it were to my advantage, I do not feel it would be right to leave (name of school) now.
- 3 I would feel guilty if I left (name of school) now.
- 4 (Name of school) deserves my loyalty.
- 5 It would be wrong to leave (name of school) right now because of my obligation to the people in it.
- 6 I owe a great deal to (name of school).

**Autonomy**

- 1 Within the bounds of any applicable school board policy and applicable laws, I have freedom to act on student issues.
- 2 I have reasonable freedom to make decisions about instructional issues in the school in which I am employed.
- 3 I have reasonable freedom to manage the fiscal affairs of my school.
- 4 I have freedom to direct student activities in the school in which I am employed.

**Fairness**

- 1 I believe that rules and procedures are administered fairly by school district leaders.
- 2 District resources are allocated without favoritism.
- 3 I trust my school district to make decisions on my behalf.

**Organizational Support**

- 1 I receive support from my school district when I have to make tough, unpopular decisions.
- 2 My school district shows concern for the needs which I express regarding the school at which I work.
- 3 My school district appreciates any extra time and effort that I spend to do efficient and effective work
- 4 School / institution values my contributions to its well-being
- 5 School / institution really trying to improve my life.
- 6 School / Institute notice to my satisfaction in the work environment.
- 7 School / institution admire my achievements.

General question

- 1 Usually do not think too deeply about things.
- 2 I often don't feel satisfaction, even after a lot of work to do.
- 3 I always controlled by the expectations of others.
- 4 I do not have enough time for the things that are important.
- 5 Rarely do I have to do I prioritize.
- 6 I rarely think about the consequences before doing my job.
- 7 I haven't ever known my main tasks.
- 8 There are times when I feel completely helpless.
- 9 I do a lot of things without knowing enough about them.
- 10 Sense of fragmentation (pressure) because I'm getting a lot of work to do in that department.
- 11 Even when important work I do, I do not have the perseverance to finish it.
- 12 I do not want to do a lot of things actually.

**CLASSROOM OBSERVATION AND IRANIAN EFL TEACHERS' SKILLS AND STRATEGIES**

**ABSTRACT**

The paper describes the processes used to examine the effectiveness of less experienced teachers' participation in experienced teachers' classes on English as a foreign language (EFL) teachers' skills and strategies. For this purpose, 21 EFL teachers teaching Elementary and Pre-intermediate courses were selected according to available sampling in KISH Language School in Bojnurd, a city in the Northeast of Iran. Data analysis and statistical calculations through Wilcoxon Signed Ranks Test revealed that less-experienced teachers' participation in experienced teachers' classes had a significant effect on EFL teachers' skills and strategies used in their classroom and made them reflect on their own teaching.

**INTRODUCTION**

It is believed that teaching can be considered as the most rewarding profession there is – and it can be. We can all give examples of the pleasure of helping a child grow in knowledge and understanding, and achieve their potential, but what about the teacher? They shouldn't be excluded from the benefits of lifelong learning because of their workload and desire to give. Growth and change are part of all our personal and professional lives, and teachers need to embrace them; not just to do a better job, but to enjoy doing it. Supporting teachers in their development – trainees, newly or recently qualified, in their first three, ten or twenty years, and whether they're wonderful or struggling – is vital in improving the quality of teaching and learning in our schools (Bubb, 2005). Teachers need to have wider professional effectiveness to cross the threshold, taking 'responsibility for their professional development and use the outcomes to improve their teaching and pupils' learning, and make an active contribution to the policies and aspirations of the school' (DfES, 2004). In recent times there has been call for change in teacher education in ways that will promote teachers being much more reflective in their practice (Jones, 1998; Korthagen & Kessels, 1999; Ball, 2000; Wise & Leibbrand, 2001). Korthagen and Kessels (1999, p. 4) argue that teacher education programs need to link theory and practice and "to integrate the two in such a way that it leads to integration within the teacher". Similarly, Ball (2000, p. 244) maintains "We must understand better the work that teachers do and analyze the role played by content knowledge in that work" (Townsend, Raton & Bates, 2007). The best way for teachers to improve what they do is for them to reflect on their practice

and work with other teachers to help them understand what is needed for high achievement." (Townsend, Raton & Bates, 2007).

Pachier and Field (1997) suggest that being a successful foreign language teacher involves a commitment to stay beside the developments in the field and an enthusiasm to engage in constant professional development. Moreover, English language teachers should be able to gratify the expectations of regularly increasing number of students by using up-to-date teaching methodologies performed expertly with commitment and enthusiasm (Coskuner, 2001). The increasing awareness of the new approaches in teaching training has made the researchers interested in the notion of classroom observation which is one of the professional development activities as a tool which less-experienced teachers can use to develop as effective teachers. Therefore this study will investigate how observation can influence professional configuration and teacher development and whether it makes teachers rethink any of their own teaching methods and strategies.

## **REVIEW OF LITERATURE**

Generally in EFL, as in other areas of education, it is common to talk about training new teachers. According to Borg (2009), helping teachers become more successful, teacher education courses can be arranged and structured in certain ways. For instance, they can include awareness-raising activities and opportunities for the participating teachers to put ideas into practice, set their own goals, and assess their own development. Additionally, with adequate space and time, participating teachers may more easily develop their ideas. The research on training of teachers shows that it is an integrated activity in the process of which language teachers are taught to teach (Freeman, 1989; Kagan, 1992; Kennedy, 1993; Strevens, 1974; Swan, 1993; Wallace, 1991). This, of course, is not a new idea. The process has long been viewed as "*a highly complex activity which requires knowledge, understanding, practice and experience before it can be carried out in a fully professional and effective manner*" (Strevens, 1974, p.26). Teacher development has been differently termed and differentiated from teacher training, teacher education, and personal development in the ELT over the last three decades. Within ELT the term 'development' has been applied to a broad range of activities including skills training, curriculum development, materials development, classroom research, management training, job switching, and continuing professional development (CPD). It has also been applied to the kind of personal development viewpoints that follow from the view that the way you are and how you go about things influences your teaching as much as any training, embodied for example in the well-known saying 'You teach who you are' (Postman and Weingartner, 1969).

Throughout the past ten years several articles published in Teaching and Teacher Education have reported on research and involvements designed for teachers, with teachers and by teachers tried at their professional learning, with an eye on their impact on teacher and student changes. They cover different geographical districts and different research and development methods. Professional development is basically '*a solitary journey*'; but, almost all teachers need help and support during that journey from colleagues or supervisors to improve their own development, by which they can achieve an inside view on other teachers' experiences and increase their awareness by the use of reflecting on their own situation (As cited in Hargreaves & Fullan, 1992,

p.81). According to Edge (Cited in Bailey et.al., 2001) working alone doesn't help teachers to improve and subjective experience that is not shared with anyone cannot contribute to their progress, however ,through the quality collaboration, teachers have an opportunity to escape from subjectivity and draw some conclusions regarding their experiences and opinions. Bowman and McCormick (2000, p. 256) mentioned that collaboration among teachers is a valued and often necessary factor for effective schooling because it fosters expert instruction (As cited inVo and Nguyen 2011).

A professional development (PD) model is defined as a pattern or plan used to conduct the designing of a program (Joyce & Weil, 1972).

Drago-Severson (2002), Sparks and Loucks-Horsley (1989) and Marczely (1996) in their broad reviews of the research have found out that seven different PD models are used for teachers: (1) in-service training, (2) observation/assessment, (3) development/improvement process, (4) study groups, (5) inquiry/action research, (6) individually guided activities, and (7) mentoring and coaching.

People often only think of professional development as referring to courses, yet the range of on-the-job, off-the-job, and close-to-the-job professional development opportunities is huge. Fault at being away from the classroom, a lack of information about course quality and supporting shortages are stopping many teachers from updating their subject knowledge and skills in the job (Gray, 2005). More recently, Harris and Sass (2007) recognized what they call the "*lagged effect of professional development*" that is, the larger effect of teachers' professional development on student outcomes not becoming noticeable until three years after the teachers had completed their course.

Integral to the idea of teacher development is the process whereby teachers are encouraged to question and analyze their own practice. However, teacher development is not a concept that one comes across in the state sector of education. In-service training is largely based on the transmission model of education and consists of the diffusion of new teaching techniques. The same is true of the very large continuing education sector.

Observation/assessment is one of model of PD that involves colleagues who give feedback based on observations about the performance of colleague educators. It is a powerful tool for assessing and monitoring a teacher's progress. Used well, it can also be a way to support teachers, because observation gives such a detailed picture and enables very specific objectives to be set. Observing someone teach gives a really detailed picture and is an opportunity to stimulate some really useful reflection on teaching and learning.

Both the observers and the observed learn from the process of observation. The most common form of teacher evaluation is classroom observation and differs broadly in how they are performed and what they evaluate. They can be conducted by a school administrator or another assessor. They can evaluate general teaching practices or subject specific techniques. They can be formally planned or unannounced and can occur once or several times per year or term. The type of observation method adopted, its focus, and its frequency should depend on what the

administration would like to learn from the process (Little, Goe & Abaell, 2009). Observation is regarded as the process of capturing the events of the classroom. It is an essential part of any teacher training program, whether pre-service or in-service (Maingay, 1988; Sheal, 1989; Wajnryb, 1992; Williams, 1989). As it is crucial to make sure the least interference in the classroom, a fundamental issue of observation concerns the requirement of non-involvement (Gebhard, 1999).

Roberson (As cited in Garcia, 2011), found that, classroom observation is one of the first data collection methods available to those interested in teaching behavior. The use of classroom observation instruments in evaluating teacher performance is a widely accepted practice in teacher education for evaluating instructional effectiveness (Chism, 1999; Griffiee, 2005).

Additionally, according to a research done by Vo and Nguyen (2011), In addition to positive feelings about their experience they had for class observation, the participants held the same belief that through observation and discussion, they had learnt about and adopted some of the others' instructional techniques. The evidence also showed that they adjusted their own techniques to improve the teaching of a particular class.

When evaluating teacher success through classroom observations, valid and appropriate instruments are essential. If observations are used thoughtfully, they can offer important, useful, information about a teacher's practice but districts must take great care to control them in ways that decrease rater bias and other measurement concerns (Little, Goe & Abaell, 2009).

### **SIGNIFICANCE OF STUDY**

Generally speaking, teachers play a key role in changes to teaching methodology and contribute to improvements in the quality of education, especially EFL teachers who have to meet the needs and standards of English as an international language. The newest wave of education reform is the transformation of teacher education programs into professional partnerships, such as professional development schools (PDSs) (Hammond, 1994; Levine, 1992). One issue related to professionalism of the teaching force refers to the necessity to bridge the gap between knowledge acquired during formal pre-service studies and further developments accruing while teachers are employed (Nir & Bogler, 2007). On-the-job professional development programs effort to bridge this gap by allowing teachers to develop new idea that will improve their teaching experience (Mtetwa & Thompson, 2000), increase and renew their teaching skills and practices (Desimone, Porter, Garet, Yoon, & Birman, 2002), change their thoughts, beliefs and perceptions (Guskey, 2002) and bring about improvements in their teaching (Blandford, 2000).

The important point motivating a work in this area is the position of teachers observation in many countries like Iran where teachers' observation has not occupied the place it merits, whether in second language class, in school or in different EFL institutes (Akbari & Ghafar Samar and Tajik, 2007). Also, as far as observation during the period of teaching practice is concerned, it can be seen as a method for current training and learning (Wajnryb, 1992).

## STATEMENT OF THE PROBLEM

It is required to be recognized that teachers are at the heart of any improvement within national education systems and, hence, that they and the sources of contexts in which they work need to be studied to notify the innovation behavior process (Hayes, 2011). Teacher education is currently facing a number of tensions as pressures have come from many quarters in the last decade, with perhaps the most intense focus being on the issue of teacher quality. This call for an improvement in the quality of teachers is welcomed by many, but there are inherent dangers too. (hand book) . Teacher education is presently facing a number of anxieties as pressures have come from many parts in the last decades, with perhaps the most powerful focus being on the issue of teacher quality (Tony & Richard, 2001). Researches show constantly that teacher quality is the crucial factor in student learning, the frequent problem is to identify the important characteristics of teacher quality and help teachers to develop these characteristics, though (Hammond, 1999; Wenglinsky, 2000).

## RESEARCH QUESTIONS

The following two research questions are posed for the purpose of this study:

1. Does experienced teachers' classroom observation foster the development of teaching skills?
2. Does experienced teachers' classroom observation make teachers rethink any of their own teaching methods?

## METHODOLOGY

### *Participants*

The participants of the present research were 21 teachers including seven males and 14 females. To carry out the experiment, one group was selected as experienced teachers (5) teaching Elementary and Pre-intermediate levels in English having university education (Bachelor or Master degree) with minimum of 5 years of teaching. . Also a group of teachers was selected as less experienced, novice ones teaching at Elementary (8) and Pre intermediate (8) levels having educational degree in English, though.

### *Instruments*

To investigate the effect of classroom observation on teachers' skills, three instruments were employed by the researchers.

A sample of TOEFL test was used to assess the teachers' proficiency in English. It was selected from Longman Complete Course for the TOEFL test book published by Addison-Wesley Longman, Inc (2001). The number of questions were 60 multiple items, divided into grammar (30 items), vocabulary (20 items) and reading (10 items) sections. The TOEFL sample was piloted on (n=22) EFL teachers to determine the reliability of the test. Analyzing the result of the study using SPSS (Ver.18), the reliability was estimated through Cronbach's Alpha as 0.732.

The second instrument used in this study was a Peer Observation of Teaching questionnaire containing several sections. The questionnaire included focus on a particular issue, for example use of visual aids, question techniques, pace and timing, interaction patterns with / between students.

Before observation the questionnaire was administered to participants to assess their initial knowledge, attitudes and skills in teaching. A similar questionnaire was given to participants to evaluate the impact of the treatment. A sample of the questionnaire is provided in appendix 1, p. 11

Finally teachers were interviewed to find out more information on their responses about the process they were involved, which was not possible in observation questionnaire. A sample of the interview is provided in appendix 2, p. 15.

### ***Procedure***

Prior to the experiment, the participants were given a sample of TOEFL test to evaluate their language proficiency in English. Among teachers with higher scores some were considered as less-experienced and some were selected as experienced teachers based on the years they have taught English in language schools. A group of less-experienced EFL teachers who had targeted treatment (classroom observation) was chosen to determine the effect of treatment on less-experienced teachers' skills and methods. This study required at least 10 sessions with less-experienced teachers attendance in experienced teachers' classes. Teachers observed a class on an area particularly relevant to their own area of teaching. And they were supposed to fill the mentioned observation checklist at least twice during the observation sessions first before starting observation sessions and the second one after ending observation in order to choose the focused areas of observations according to teachers' needs and particular teaching situations. Also to check how effective classroom observation was teachers had to prepare a written report of whatever happened during the class. The participants discussed what they had learnt from experienced teachers' teaching performance, and what they thought should be improved, as well as how.

Data was collected through reports of each class observation. The purpose of this study was to help not only less-experienced and experienced teachers to improve their teaching methods and skills, but also students' performance as well.

### **RESULTS AND DISCUSSION**

In this study teachers were supposed to fill in a lesson observation criteria twice before and after treatment. The questionnaire includes different sections and each part includes various questions. The results estimated for lesson observation criteria 1 (before treatment) are observable in table 1.

Table 1: Descriptive Statics before Treatment

	N	Minimum	Maximum	Mean		Std. Deviation	variance
	statistic	statistic	statistic	statistic	Std.Error	statistic	statistic
Preparation and planning	16	1.00	1.80	1.3500	.06455	.25820	.067
Start of the session	16	1.00	1.75	1.2656	.06237	.24948	.062
Explanation of the	16	1.00	2.00	1.4167	.06804	.27217	.074
subject	16	1.00	1.50	1.2292	.04781	.19124	.037
Presentation of the	16	1.00	1.75	1.2969	.05337	.21348	.046
session	16	1.00	1.60	1.2000	.04830	.19322	.037
During the session	16	1.00	2.33	1.3542	.10305	.41220	.170
Finishing the session	16	1.00	2.40	1.4000	.09661	.38644	.149
Evaluating							
Learners' behavior							

According to this table sixteen teachers answered the questions that are related to different parts of questionnaire. According to this table Mean and Std Deviation for each part Preparation and planning, Start of the session, Explanation of the subject, Presentation of the session, During the session, Finishing the session and Evaluating Learners' behavior are (M: 1.3500/1.2656/1.4167/1.2292/1.2969/1.2000/1.3542/1.4000;SD:.06455/.06237/.06804/.04781/.05337/.04830/.10305/.09661) respectively which shows that teachers are not really satisfied with their performance during their classrooms. Table 2 illustrates the results estimated for lesson observation criteria 2 (after treatment).

Table 2: Descriptive statistics after Treatment

During the session	16	2.00	3.67	3.0417	.14554	.58214	.339
Finishing the session	16	2.00	3.40	3.0125	.09741	.38966	.152
Evaluating							
Learners' behavior							

The evidence shows that overall, teachers reported high satisfaction with the processes in which they were involved since, Mean and Std Deviation for each part including: Preparation and planning, Start of the session, Explanation of the subject, Presentation of the session, During the session, Finishing the session, Evaluating, Learners' behavior are (M:3.0625/2.9687/2.9896/2.9479/2.8984/2.9000/3.0417, SD:.28018/.49896/.41486/.30257/.34827/.45019/.58214/.38966/3.0125) respectively. These findings indicate that less-experienced teachers who participated in experienced teachers classes reported greater satisfaction with the programs compared to their colleagues who didn't receive treatment.

Table 3: Descriptive Statics of all Questions

	N	Minimum	Maximum	Mean		Std. Deviation	variance
	statistic	statistic	statistic	statistic	Std.Error	statistic	statistic
Lesson observation criterial	16	1.17	1.43	1.3125	.02161	.08645	.007
Lesson observation criteria2	16	2.62	3.31	2.9688	.04521	.18085	.033

The findings show that Mean and Std Deviation of lesson observation criteria 2 (M: 2.9688, SD: .04521) is higher than Mean and Std Deviation of lesson observation criteria 1 (M: 1.3125, SD: .02161) which shows the great impact of class observation on Iranian EFL teachers' skills and strategies.

## DISCUSSION

The main purpose of this study was to investigate the effect of observing experienced teachers' classes on less-experienced EFL teachers and how observing can help less experienced teachers to foster and develop their teaching skills and strategies. Data analysis through Wilcoxon Signed Ranks Test revealed that less-experienced teachers' participation in experienced teachers' classes had a significant effect on their skills and strategies and helped them to rethink their own teaching methods.

Following in the study, teachers were interviewed to reveal their specific ideas regarding the effect of experienced teachers' class observation on their professional development. All teachers reported high satisfaction with their participation in experienced teachers' classes and processes in which they were involved. They had become more creative in enlarging their teaching in order to make their lessons more interesting. The participants said that they have become more motivated in teaching as a result of observation. The fact of observing teachers in many different settings will likely suggest variations they can try to improve their strategy. In other words, as they observe teachers implementing a strategy in different ways, they, too, can gain the ability to see and act more flexibly in their own teaching. The interview with experienced teachers showed that less experienced teachers' participation in their classes was beneficial for them too. They mentioned that it offered them an opportunity to exchange their ideas, learn from each other, and help each other to professionally develop, all in a relaxed manner. It also helped them to build up good work relationships and a sense of professional community. In response to the question whether they will want to participate in more professional activities in future, almost all participants gave a firm yes because they believe that it could lead to the improvement of teacher performance and students' outcomes as well as a good sense of professional community.

## CONCLUSION

Professional development processes are aimed towards developing teachers' proficiency. On-the-job training processes are intended to bridge the constantly expanding gap between teachers' previous studies and the developments taking place in the educational realm. For many teachers, these processes provide a major channel that enables them to keep their professional knowledge

and teaching techniques updated. Therefore, the greater teachers' willingness to participate in professional development activities and their satisfaction with these processes the, more likely they will acquire new knowledge and skills that will improve their professional. Based on the findings of the present study and studies that have already been done, we can conclude, experienced teachers' class observation is acceptable for EFL less experienced teachers and its introduction is beneficial for both teachers and students.

### LIMITATIONS OF THE STUDY

In addition to the small sample size and its short duration, several limitations were presented in this study. Variables such as gender, age and personal variables were not taken into account due to the limited number of the available participants. Another restriction in this study was related to experienced teachers since some did not have a positive attitude toward their classroom being observed by their colleagues. Also the number of the years teaching may not be a good measurement to recognize experienced from non-experienced teachers.

6. Make good use of audio-visual materials?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

### Presentation of the session

Did the teacher.....	Entirely/ Always	Partly/ sometime	Rarely/ hardly ever	Not at all never
1. Show enthusiasm?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Control the pace of delivery?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Control the timing?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Speak clearly and concisely?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Maintain an appropriate level of class control and discipline?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Communicate at the level of all students in class?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

### During the session

Did the teacher.....	Entirely/ Always	Partly/ sometime	Rarely/ hardly ever	Not at all never
1. Use interactive and learning strategies?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Provide many concrete, real life, practical examples?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Effectively use teaching and learning activities in order to give all children access to the lesson?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Draw inferences from examples  models and use analogies?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Check students understanding regularly?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
6. Have effective use of praise, criticism and behavior management' strategies?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
7. Teach at an appropriately fast pace, stopping to check students' understanding and engagement?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
8. Use nonverbal behavior, such gestures, walking around, and eye contact to reinforce his  her comment?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

### Finishing the session

Did the teacher.....	Entirely/ Always	Partly/ sometime	Rarely/ hardly ever	Not at all never
1. Identify how well the learning outcomes had been achieved?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Reiterate and summarize key point?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Identify links with following session?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. End the session positively and clearly?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Provide clear, specific expectation for assignments?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

### Evaluating

Did the teacher.....	Entirely/ Always	Partly/ sometime	Rarely/ hardly ever	Not at all never
1. Make quick, accurate assessments of class progress?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Ask differentiated questions?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Provide frequent feedback to students on their performance, praise students answers and use probing questions to clarify answers?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

### Learners' behavior

1. Arrive on time?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
2. Pay proper attention?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
3. Respond to the teachers questions?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
4. Fully understand the task and were enthusiastic to complete?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>
5. Assess their own learning and tracking each group attainment during the lesson?	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>	<input type="checkbox"/>

### Sample of interview

*I believe that it is necessary for novice teachers to observe experienced teachers' classes. I personally have learned a lot from the observation and have applied them in my teaching. It provides opportunities for teachers to build their knowledge and skills. It also helps teachers to develop their expertise in planning, preparation and assessment. Experienced teachers' classroom observation helped me to improve my teaching practice including those on capability procedure.*

## THE EFFECT OF USING MODEL ESSAYS ON THE DEVELOPMENT OF WRITING PROFICIENCY OF IRANIAN PRE-INTERMEDIATE EFL LEARNERS

### ABSTRACT

The present study was conducted to investigate the effect of using model essays on the development of writing proficiency of Iranian Pre-Intermediate EFL learners. To fulfill the purpose of the study, 55 pre- intermediate learners of Parsa Language institute were chosen by means of administering proficiency test. Based on the results of the pretest, two matched groups, one as the experimental group and the other as the control group were formed. These learners were pre tested through a writing task. Each participant was asked to write about a topic. Then, participants in the experimental group studied a model essay about the writing task and they underlined or took notes about those aspects of language that they noticed in the model essay written about the same topic. It means that, model essays were accompanied by the teacher's explanations. After seven sessions of treatment, the two groups were post tested through a writing task, the same as pretest. The scores of the participants demonstrated that the experimental group outperformed the control group. After running a t-test for comparing the mean score of two groups, it was concluded that using model essays has a significant effect on the development of writing proficiency.

**KEY WORDS:** Output, Noticing, and Model essays

### INTRODUCTION

The necessity of linguistic communication has highlighted the importance of writing proficiency in today's ever more global community. Writing proficiency is considered as an important component of educational cycles, business endeavors and personal experiences. Writing is recognized as a key factor in students' academic development, and it is the primary means by which students transform from passive recipients of knowledge to active participants in their own education (Harvard's Expository Writing Program, 2003). Foreign language education has always been greatly dependent on English writing instruction as an important player in the learning process. Discussions in the realm of L2 writing research have been very much concerned with the role of output and noticing. Swain, in her output hypothesis, has discussed the role of output in second language learning (1985, 1993, 1995, 1998 & 2005). She claims that output has three

functions: noticing, hypothesis testing and metalinguistic awareness. According to Swain's hypothesis, the importance of noticing in writing can be investigated and underpinned (1985, 1993, 1995, 1998 & 2005). She firmly believes that through output procedures such as writing, L2 learners are familiarized with linguistic problems. Swain and Lapkin (1995) have used noticing coincidentally alongside the same notions used by Schmidt and Frota (1986), who state that by noticed; they all mean "the normal sense of the word, that is consciously" (p. 311). Swain (1995), while arguing the promotion of noticing via output, claims that "in producing the target language (TL), learners may encounter a linguistic problem leading them to notice what they do not know, or know only partially" (p. 129). This means that output provides L2 learners with the opportunity to notice a gap, prevalent between their inter-language (IL) and (TL), which will be helpful in learners' conscious recognition of their language problems.

Some more practical studies have proved that noticing is promoted by output. Within the framework of Noticing Hypothesis, model essays can be applied as one of the effective ways of improving learner's writing techniques. Qi and Lapkin (2002) conducted some studies in this regard and hence, suggested that 'the positive modeling of native-like writing may be more helpful to the learner than error correction' (p.286), even though the role of native speaker modeling has been investigated in a few other studies and has proven to be not contingent on learner output. Some L2 writing researchers argue that the implementation of model essays should be promoted among L2 learners for improvement of their writing skills in terms of the relationship between reading and writing. Echholz (1980) states that L2 learners reading experience directly affect their writing and thus, they can improve their L2 writing proficiency by reading. Furthermore, Smagorinsky (1992) argues that model essays would be the most effective tool provided that L2 writers possess adequate knowledge on the content. . In this research, the teacher's task is to comprehend how writing relates to the other language skills and how reading can be integrated with writing by using model essays. Model essays can provide enough input for EFL learners to improve their writing skill. Escholz (1980) points out, "what L2 learners write depends on what they read" (p.5). Some researchers emphasize the necessity of a model text illustrated in an academic writing textbook, which enables L2 writers to pay attention to the various aspects of TL (e.g., Hyland, 2003).

## **REVIEW OF THE RELATED LITERATURE**

According to Swain (1995), three functions of output have been proposed that relate more to accuracy than to fluency in second language learning. They are noticing, testing hypothesis and metalinguistic function. Swain states that under certain circumstances, output promotes noticing (Swain, 1995). One important aspect of noticing research has concerned the role of output in promoting noticing. Swain (1995, 1998, and 2005) has proposed four functions of output, one of which is noticing/triggering function. It is claimed that, through output activities such as speaking and writing, L2 learners become aware that they cannot say what they want to say in the target language. Swain and Lapkin (1995) reported that their students consciously recognized linguistic problems through the act of writing and modified their output. However, Lapkin et al. (2002) argues that more L2 noticing studies are needed to provide direct empirical evidence that noticing leads to learning. Shehadeh (2002) also points out that while past research has focused on the occurrence of modified output; more research is needed to investigate how producing output can

lead to acquisition. While some studies (e.g. Izumi, 2002; Morgan- Short and Bowden, 2006) have addressed this issue and shown the positive effects of output, relatively few studies have been conducted in the context of L2 writing. Qi and Lapkin suggested that the positive modeling of native- like writing may be more helpful to the learner than error correction (p.286). However, few studies have explored in this context the role of native speaker modeling which is not contingent on learner output. The role of noticing in effecting inter-language development has been a central issue in SLA for about two decades. It has been claimed that noticing plays a key role in triggering learners' inter-language change (e.g., Ellis, 1995; Robinson, 1995; Schmidt, 1990, 1992, 1993, 1995, 2001; Schmidt & Frota, 1986; Skehan, 1998). The significance of investigating learner noticing in writing can be argued for on the basis of the output hypothesis by Swain (1985, 1993, 1998, and 2005). She has identified at least four functions of output, one of which is the noticing/ triggering function. She argued that L2 learners become aware of linguistic problems through output activities including writing. Swain & Lapkin (1995), for instance, reported that their students, through the act of writing, consciously recognized that linguistic problems and modified their output. How much noticing affects the learners' subsequent processing of input or feedback remains an important question to be investigated (Shehadeh, 2002; Izumi, 2003, for theoretical arguments for the output hypothesis).

Models and reformulations may play qualitatively different roles in promoting learner's noticing. While, reformulation involves "having a native writer of the target language rewrite the learner's essay, preserving the entire learner's ideas, making it sound as native like as possible"(Cohen, 1983, P.4), the models used in this study are written by native speakers independently of learners' texts. One important advantage of reformulation may be that L2 writers can easily engage in a cognitive comparison of their text with reformulated writing because by definition reformulation is based on their texts. However, reformulation may fail to address some problematic elements that L2 writers wanted to include in their original texts, because of their limited linguistic resources. The role of output in second language learning has been discussed mainly by Swain (1985, 1993, 1995, 1998, and 2005) in her output hypothesis, which maintains that output has three major functions: Noticing, hypothesis\_ testing and metalinguistic awareness. One of these, also known as the 'noticing/ triggering function', has been claimed to play an important role for SLA. Swain (1995) claims that output promotes noticing and "in producing the target language (TL), learners may encounter a linguistic problem leading them to notice what they do not know or know only partially" (p. 129). In other words, output allows L2 learners to notice a gap existing between their inter-language (IL) and TL, which may lead to learner's conscious recognition of their language problems. Some empirical studies have demonstrated that output promotes noticing. Izumi (2002) study, for instance, demonstrates that visual input enhancement is not enough for acquiring the form of L2 learner's IL; and that output facilitates noticing formal elements in the TL. Testing Hypothesis, in other words, trying out how the TL works is also an important function of output. In the recent SLA researches, much emphasis has been placed on the role of attention, awareness, and noticing, which have been viewed as key issues in L2 learning by many researchers (e.g. Ellis, 1993; Robinson, 1995; Schmidt, 1990, 1995, 2001; Schmidt & Frota, 1986; Swain, 1985, 1995; Swain & Lapkin, 1995). In his noticing hypothesis Schmidt (1990) claims that noticing plays an essential role in SLA and that L2 learners must become 'aware' of certain aspects of language, mainly the meaning. Some L2 writing researchers argue that L2 learners should be encouraged to use a model essay for

improving their writing skills in term of the relationship between reading and writing. Ferries and Hedgcock (1998) argue that L2 writers have to be exposed to various types of reading material since it is difficult to acquire L2 writing skills by only writing. Eschholz (1980) point that what L2 learners write depends on what they read and they can improve their L2 writing skills by reading. He also argues that given the opportunities to learn rhetorical modes, L2 learners can eventually apply their knowledge about those modes; L2 learners can eventually apply their knowledge about those modes to their writing. Based on (Cumming's (1995) empirical study, which demonstrates the significance of rhetorical aspects of texts in model essays, Smagorinsky (1992) discusses that model essays are the most helpful tool if L2 writers have a sufficient amount of current knowledge. Thus, some researchers emphasizes the necessity of a model text illustrated in an academic writing textbook, which enables L2 writers to pay attention to the various aspects of TL (e.g. Hyland, 2003).

However there are also several objections to using model essays in an L2 writing context. Murray (1980) points out that the process of making meaning in L2 cannot be achieved by referring to written texts. In addition, Gobby (1997) asserted that model essays prevent L2 learners from having creativity, which she believes in one of the important aspects of writing skills. Writing instruction with model essays has also been criticized by other researchers (Collins & Genter, 1982; Judy, 1980) for lying emphasize not on content but on form. They insist that language form and the content of composition are inseparable. Even among researchers who claim that model essays is important but not totally sufficient (Ferries and Hedgcock, 1998; Hyland, 2003). However, there has been little empirical research to explore the role of model essays in l2 writing pedagogy. The field of second language (L2) writing has come of age. Research on L2 writing has grown exponentially over the last 40 years and, during the late 1980s, and the early 1990s, second language writing began to evolve into an interdisciplinary field of inquiry with its own disciplinary infrastructure- replete with a journal monographs. Researchers in recent years have stressed the need for ESL writing instruction to move to a process approach that would teach students not only how to edit but also to develop strategies to generate ideas, compose multiple drafts, deal with feedback, and revise their written work on all levels (Chenowith, 1987; Raimes, 1985, 1987). Improvement in writing has been linked to reading development (Saddler, 2004). Reading supports writing across all the levels of instruction and can be used throughout the writing process. For example, students might read a text to help them generate ideas for their writing. They might do research to provide background information of writing. During the revision process, students read and give feedback on a partner's writing to help them the writer revise, and they may also do peer editing. During the editing process, students might read a form or style guide or instructions for publishing to help themselves and their peers. Process writing emphasizes the role of the reader as audience and, through development of multiple drafts, often creates a context for communication. Improved reading and writing skills are complementary instructional goals within the process writing framework.

## **RESEARCH QUESTIONS**

Taking a look at the above - mentioned problems and requirements for writing instruction makes one ponder over the questions which probably arise as fallow:

1. Does using model essays have any significant effect on the development of writing proficiency of Iranian Pre-Intermediate EFL learners?
2. What aspects of language do EFL learners notice by comparing their own writing with the model essays (native speaker writing)?

## METHODOLOGY

### *Participants*

To test this null hypothesis, all pre-intermediate level male and female adult EFL learners in Parsa Language Institute in Shahrood participated in this study. The participants were 55 EFL learners consisting of, 15 males and 40 females, ranging from 18 to 30 years of age. All participants were enrolled in the Interchange Course at the pre-intermediate level. In order to have homogeneous classes the researcher administered a language proficiency test to 87 EFL learners. In the next stage, 55 out of 87 participants who scored one standard deviation above and below the mean were chosen.

### *Instruments*

In order to have reliable and valid results in this research, these instruments were used:

1. Comprehensive English Language Test, an objective placement test, was used in order to determine the learner's level of proficiency in grammar. It included 75 grammar questions. The subjects' scores were out of 100. The test takers were selected and placed into two nearly homogenous groups, experimental and control group.
2. Student's first paragraph writing assignment, as a pre- test.
3. Writing tasks and models essays were chosen for this research project from the book 'Paragraph Development'.
4. Student's final paragraph writing assignment, as a post- test.

### *Procedure*

In order to come up with reasonable answers to the research questions, the procedures below were followed:

The data collection was conducted in Parsa English Language Institute in Shahrood. The communication task developed for the purpose of this study was 'paragraph writing'. The selection of this task was motivated by the assumption that it encouraged learner output. The data collection procedure in both groups consisted of three stages. The researcher gave the "CELT" language proficiency test to 87 EFL learners. There were 75 multiple choice grammar tests with 60 minutes for the participants to complete the test. 55 out of 87 participants who scored one standard deviation above and below the mean were selected.

In the first stage, a pre- test, consisting of a writing task, was administrated to both control and experimental groups. Each participant was asked to write about a topic within approximately 45 minutes. As time on task was not controlled in this study, the participants were allowed to spend

more than 45 minutes, if necessary, to complete the task. The pretests were corrected by two raters. Treatment was done during three stages:

In the second stage, every session, participants in the experimental group studied a model essay about the writing task and they underlined or took notes about those aspects of language that they noticed in the model essay written about the same topic. It means that, model essays were accompanied by the teacher's explanations. To prevent the possibility of the researcher's bias, two other raters scored the students' papers. The two raters scored each paper independently. The raters were required to score each paper individually and blind to the scores given by the other rater. The control group did not receive any model essay and during one session, they just wrote about the predetermined topic. The following rating scale (J. B. HEATON) was considered by two raters:

*Content*

30- 27 EXCELLENT TO VERY GOOD: knowledgeable- substantive- etc.  
26- 22 GOOD TO AVERAGE: some knowledge of subject- adequate range.  
21- 17 FAIR TO POOR: limited knowledge of subject- little substance- etc.  
16-13 VERY POOR: does not show knowledge of subject- non- substantive.

*Organization*

20- 18 EXCELLENT TO VERY GOOD: fluent expression- ideas clearly stated.  
17- 14 GOOD TO AVERAGE: somewhat choppy- loosely organized but main ideas stand out- etc.  
13- 10 FAIR TO POOR: non- fluent- ideas confused or disconnected- etc.  
VERY POOR: does not communicate- no organization- etc.

*Vocabulary*

20- 18 EXCELLENT TO VERY POOR: sophisticated range- effective word/ idiom choice and usage- etc.  
17-14 GOOD TO AVERAGE: adequate range occasional errors of word/ idiom form, choice, usage but meaning not obscured.  
13- 10 FAIR TO POOR: limited range- frequent errors of word/ idiom form, choice, usage- etc.  
9-7 VERY POOR: essentially translation- little knowledge of English vocabulary.

*Language use*

25- 22 EXCELLENT TO VERY GOOD: effective complex constructions- etc.  
21-19 GOOD TO AVERAGE: effective but simple constructions- etc.  
17- 11 FAIR TO POOR: major problems in simple/ complex constructions- etc.  
10- 5 VERY POOR: virtually no mastery of sentence construction rules- etc.

*Mechanics*

EXCELLENT TO VERY GOOD: demonstrates mastery of conventions- etc.  
4 GOOD TO AVERAGE: occasional errors of spelling, punctuation- etc.  
3 FAIR TO POOR: major problems in simple/ complex constructions- etc.

2 VERY POOR: no mastery of conventions- dominated by errors of spelling, punctuation, capitalization, paragraphing- etc.

In the last stage, at the end of seven-week program, the participants in both groups were post tested. The post testing procedures were exactly the same as pretesting. However, the participants were not allowed to use dictionaries since one of the aims of the study was to investigate the effect of using model essay on learners' progress in writing proficiency, without any other aids.

## **RESULTS**

### **A. Results of the Proficiency Test**

To ensure the homogeneity of the participants, the CELT Placement Test was administered. The descriptive statistics of the participants' scores on this test are set forth in Table 1. As it is clear, 87 participants were selected as homogeneous participants for this study with the mean score of 63.61. The minimum score obtained by participants on CELT is 39 and the maximum score is 85. In order to figure out whether the data is normally distributed, we used Kolmlgrov-Smirnoff non-parametric test. The P-value is .181 based on the data, which indicates that the scores are normally distributed. Table 2 shows the results of the normality test.

*Table 1: Descriptive Statistics of CELT Placement Test*

	N	Range	Minimum	Maximum	Mean	Std. Deviation	Variance
Oxford Placement Test	87	46	39	85	63.61	10.647	113.357
Valid N (listwise)	87						

To test the normality of the groups Shapiro-Wilk was used. The null-hypothesis of the test of normality is that the distribution of the groups' scores is normal. Therefore, the distribution of the scores is not normal if the P-value (sig.) is less than .05. The results are depicted in the following table.

*Table 2: Test of Normality of CELT*

	Shapiro-Wilk		
	Statistic	df	Sig.
CELT	.979	87	.181

The distribution of the scores of the CELT is normal because P-value (sig.) which is .18, is higher than .05.

### Pretest-Content

The results of comparing pre-test content between control and experimental groups that are laid out in Table 3 reveals that P-value, which is .22, is more than .05. Therefore, it does not show a significant difference. Therefore, we can safely claim that there is no significant

Table 3: Descriptive data and Independent Sample Data for Pre-test Scores of Content in two Groups

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Pretest (Content)	Equal variances assumed	.870	.355	1.231	53	.224	.987	.802	-.622	2.597
	Equal variances not assumed			1.229	52.062	.225	.987	.804	-.625	2.600

### Post-test Content

The results of comparing post-test content between control and experimental groups that are laid out in Table 4 reveals that P-value, which is .020, is less than .05. It can be claimed that there is significant difference between the two mean content scores of two groups at post-test. Thus, the Null hypothesis of no significant effect of using model essays of the participants on the development of content of writing proficiency at posttest is rejected. In other words, model essays had a significant impact on the performance of the participants on the posttest. Therefore, we can claim that using model essays affects the development of content of writing proficiency of Iranian Pre- Intermediate EFL learners.

Table 4: Descriptive data and Independent Sample Data for Post-test Scores of Content in two Group

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Posttest (Content)	Equal variances assumed	1.043	.312	-2.398	53	.020	-1.634	.682	-3.001	-.267

Table 4: Descriptive data and Independent Sample Data for Post-test Scores of Content in two Group

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Posttest (Content)	Equal variances assumed	1.043	.312	-2.398	53	.020	-1.634	.682	-3.001	-.267
	Equal variances not assumed			-2.392	51.509	.020	-1.634	.683	-3.006	-.263

### Pre-test – Organization

The results of comparing pre-test organization between control and experimental groups that are laid out in Table 5 reveals that P-value which is .37, is more than .05. Therefore, we can safely claim that there is no significant difference between the means of the two groups' organization scores at pretest.

Table 5: Descriptive Data and Independent Sample Data for Pre-test Scores of Organization in two Groups

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Pretest (Organization)	Equal variances assumed	.196	.660	-.901	53	.372	-.431	.478	-1.389	.528
	Equal variances not assumed			-.899	51.912	.373	-.431	.479	-1.392	.531

### Post-test – Organization

The results of comparing post-test organization between control and experimental groups that are laid out in Table 6 reveals that P-value, which is .00, is less than .05. Thus, the Null hypothesis of no significant effect of using model essays on the development of organization of writing proficiency at posttest is rejected. In other words, model essays had a significant impact on the performance of the participants on the posttest. Therefore, we can claim that using model essays affects the development of organization of Iranian Pre-Intermediate EFL learners' writing.

Table 6: Descriptive Data and Independent Sample Data for Post-test Scores of Organization in two Groups

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Posttest (Organization)	Equal variances assumed	1.165	.285	-3.834	53	.000	-1.479	.386	-2.252	-.705
	Equal variances not assumed			-3.819	49.99	.000	-1.479	.387	-2.257	-.701

### Pre-test -Vocabulary

The results of the two groups' vocabulary pre-test results that are laid out in Table 7 reveals that P-value, which is .21, is more than .05. Therefore, it does not show a significant difference. Therefore, we can safely claim that there is no significant difference between the two mean vocabulary scores of two groups at pretest.

Table 7: Descriptive Data and Independent Sample Data for Pre-test Scores of Vocabulary in two Groups

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Pretest (Vocabulary)	Equal variances assumed	.334	.566	1.258	53	.214	.617	.490	-.367	1.601
	Equal variances not assumed			1.262	52.159	.213	.617	.489	-.364	1.598

### Post-test – Vocabulary

The results of comparing vocabulary post-test results between control and experimental that are laid out in Table 8 reveals that P-value, which is .01, is less than .05; therefore, it shows significant difference. Thus, the Null hypothesis of no significant effect of using model essays of the participants on the development of vocabulary of writing proficiency at posttest is rejected. Therefore, we can claim that using model essays affects the development of vocabulary of writing proficiency of Iranian Pre-Intermediate EFL learners.

Table 8: Descriptive Data and Independent Sample Data for Post-test Scores of Vocabulary in two Groups

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Posttest (Vocabulary)	Equal variances assumed	1.280	.263	-2.562	53	.013	-1.028	.401	-1.834	-.223
	Equal variances not assumed			-2.551	49.075	.014	-1.028	.403	-1.839	-.218

### Pre-test\_ Language Use

The results of comparing language use pre-test between control and experimental that are laid out in Table 9 reveals that P-value, which is .75, is more than .05. Therefore, it does not show any significant difference. Therefore, we can safely claim that there is no significant difference between the two mean language use scores of two groups at pretest.

Table 9: Descriptive data and Independent Sample Data for Pre-test Scores of Language Use in two Groups

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Pretest (Language use)	Equal variances assumed	.190	.664	-.310	53	.758	-.228	.734	-1.699	1.244
	Equal variances not assumed			-.309	50.361	.759	-.228	.736	-1.706	1.251

### Post-test – Language Use

The results of comparing post-test language use results between control and experimental that are laid out in Table 10 reveals that P-value, which is .02, is less than .05. Thus, the Null hypothesis of no significant effect of using model essays of the participants on the development of language use of writing proficiency at posttest is rejected. In other words, model essays had a significant impact on the performance of the participants on the posttest. Therefore, we can claim that using model essays affects the development of language use of writing proficiency of Iranian Pre-Intermediate EFL learners.

Table 10: Descriptive data and Independent Sample Data for Post-test Scores of Language Use in two Groups

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Posttest (Language use)	Equal variances assumed	.498	.484	-2.384	53	.021	-1.786	.749	-3.289	-.284
	Equal variances not assumed			-2.377	51.184	.021	-1.786	.751	-3.295	-.278

### Pre-test - Mechanics

The results of comparing pre-test mechanics between control and experimental that are laid out in Table 11 reveals that P-value, which is .60, is more than .05. Therefore, it does not show significant difference. Therefore, we can safely claim that there is no significant difference between the two mean mechanics scores of two groups at pre-test.

Table 11: Descriptive data and Independent Sample Data for Pre-test Scores of Mechanics in two Groups

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Pretest (Mechanics)	Equal variances assumed	.011	.918	-.518	53	.607	-.087	.167	-.422	.249
	Equal variances not assumed			-.518	52.972	.607	-.087	.167	-.422	.249

### Post-test – Mechanics

The results of comparing post-test mechanics results between control and experimental that are laid out in Table 12 reveals that P-value, which is .003, is less than .05. Thus, the Null hypothesis as no significant effect of using model essays of the participants on the development of mechanics of writing proficiency at post-test is rejected. In other words, model essays had a significant impact on the performance of the participants on the post-test. Therefore, we can claim that using model essays affects the development of mechanics of writing proficiency of Iranian Pre-Intermediate EFL learners.

Table 12: Descriptive data and Independent Sample Data for Post-test Scores of Mechanics in two Groups

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
Posttest (Mechanics)	Equal variances assumed	.000	.989	-3.139	53	.003	-.554	.177	-.908	-.200
	Equal variances not assumed			-3.139	52.888	.003	-.554	.177	-.908	-.200

### Total Writing- Pretest

As it is shown in table 13 the hypothesis of equal of variances is proved because the P-value (sig) is .87 which is higher than  $\alpha = 0.05$ . P-value which is .63, is more than .05. So it does not show significant difference. Therefore, we can safely claim that the control and experimental groups are not significantly different in pre-test.

Table 13: Descriptive Data and Independent Sample Data for Total Writing Scores in Pre-test in Two Groups

	Levene's Test for Equality of Variances		t-test for Equality of Means						
									95% Confidence Interval of the Difference
	F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Lower	Upper
Total Writing in Pretest	.027	.871	.479	53	.634	.85979	1.79358	-2.73768	4.45726

### Total Writing Post-test

As it is shown in table 14 the hypothesis of equal of variances is proved because the P-value is .52 which is higher than  $\alpha = 0.05$ . Table 4.24 provides enough criteria for the rejection of the first null hypothesis of this study, because P-value which is .00 is less than .05. So it shows a

significant difference. Therefore, we can safely claim that the control and experimental groups are significantly different in posttest (after the treatment).

*Table 14: Descriptive Data and Independent Sample Data for Total Writing in Post-test Scores in Two Groups*

	Levene's Test for Equality of Variances		t-test for Equality of Means						
								95% Confidence Interval of the Difference	
	F	Sig.	t	df	Sig. (2- tailed)	Mean Differenc e	Std. Error Differenc e	Lower	Upper
Total Writi ng in Postt est	.406	.527	-5.302	53	.000	-6.48214	1.22249	-8.93414	-4.03014

## DISCUSSION AND CONCLUSION

The main purpose of this study was to investigate the effect of using model essays on the development of writing proficiency of the Iranian pre-intermediate EFL learners and to explore if it is feasible to apply it in the teaching of writing in EFL educational settings in Iran. Considering the review of the literature and what happens in real language classes, contradictory findings and ideas were observed. In order to test the null hypothesis, the researcher gave the "CELT" language proficiency test to 87 EFL learners. Out of the 87 participants, 55 were selected.

In the first stage, a pre-test, consisting of a writing task, was administrated to both control and experimental groups.

In the second stage, every session, participants in the experimental group studied a model essay about the writing task and they underlined sections or took notes about those aspects of language that they noticed in the model essay written about the same topic. Model essays were accompanied by the teacher's explanations. To prevent the possibility of the researcher's bias, two other raters scored the students' papers. The control group did not receive any model essays and during a session, they just wrote about the predetermined topic. In the last stage, at the end of the seven-week program, the participants in both groups were post-tested. The post testing procedures were the same as pretesting.

The statistical analysis of written pre-test data showed that there were not any significant differences between the two groups in the pre-test. After the instruction, the post-test was administered to the participants and the results showed a significant difference between the two groups' mean scores. Finally, the descriptive statistics of students' noticing showed that model essays help students to notice content and vocabulary more than other categories. The results were satisfactory for the experimental group and it shows that model essays can draw learners'

attention to certain linguistic forms in the output and increase “noticing” and improve EFL writing. One major limitation of this study was that subjects could not be homogenized. Language institutes are usually the place where learners of different ages participate. Because of this, the ranges of their ages were different. The researcher could not control the variable “sex” and the groups had mixed gender. Participants were Iranian, so the results cannot be generalized to speakers of other languages. Only seven sessions were going to be spent on the treatment, so time allocated has been limited. Furthermore, as the design of the study was intact group, pre-test- post- test it was not possible to have random selection.

## AIMS AND SCOPE

The international journal of language learning and applied linguistics world performs as a platform for the new scholars to share their insights with other scholars in the form of original papers.

The international journal of language learning and applied linguistics world is a double-blind peer-reviewed international journal dedicated to promoting scholarly exchange among teachers and researchers in the field of language teaching and applied linguistics. Papers submitted to the journal will immediately be sent to two related reviewers who are responsible to provide feedback on the content and the language use.

The journal is published monthly in online and print versions. The scope of the journal includes, but not limited to, the following fields:

*Theory and practice in English*  
*Language teaching & learning*  
*Teaching English as a second or foreign language*  
*Applied linguistics*  
*Discourse studies*  
*Syllabus design*  
*Language learning problems*  
*Computer assisted language learning*  
*English for specific purpose*  
*English for academic purpose*  
*Language teaching & testing*  
*Translation studies*

### ABSTRACT

According to Harmer (2001:86) CLT is prejudiced in favor of native-speaker teachers by demanding a relatively uncontrolled range of language use on the part of the students, and thus expecting the teachers by demanding them to be able to respond to any and every language problem which may come up. In this paper thus, it was tended to find out whether Iranian EFL high school teachers are at ease when using CLT in their classes or not. That is, whether Iranian teachers are capable of utilizing comprehensive approach named CLT in their classes to achieve its ultimate goal, communication in real context. 50 participant teachers teaching English at high school were given a questionnaire to express their view points about the probable difficulties they might encounter when using CLT. In addition to the questionnaire, each teacher was interviewed for about 5 minutes so they might express their ideas live on the probable constraints in applying CLT in their genuine classes. Then the data collected by means of the interview and the questionnaires were analyzed. It was concluded that the main sources of problems in CLT implementation by the Iranian EFL teachers are: problems caused by the teachers, difficulties coming from the students, pitfalls created by the educational system, and hurdles caused by the CLT approach itself.

**KEY WORDS:** Communicative Language Teaching (CLT), English as a Foreign Language (EFL)

### INTRODUCTION

The history of language teaching has been characterized by a search for more effective ways of teaching second or foreign languages. For more than a hundred years, debate and discussion

within the teaching profession have often centered on issues such as roles of grammar in language curriculum, the development of accuracy and fluency in teaching, teaching productive or receptive skills, motivating learners and the role of materials and technology (to name only a few hotly debated issues). Based on many debates and discussions raised about the nature of language learning and teaching over the years one can obviously perceive the complex nature of language learning and teaching in turn.

One good indication of this is the emergence of different "isms" over nearly each one or two decades in the history of language learning and teaching. To cut it short so far researchers can not propose a method of language teaching as the mere panacea to solve all the problems in the field. However, the most comprehensive language teaching approach is Communicative Language Teaching (CLT). Based on Richards (2001:155) both American and British proponents now see it as the most comprehensive approach and a method that aims to (a) make communicative competence the goal of language teaching and (b) develop procedures for the teaching of the four language skills that acknowledge the interdependence of language and communication. Its comprehensiveness thus makes it different in scope and status from any of the other approaches or methods known so far.

Communicative Language Teaching (CLT), also known as the Communicative Approach, emerged in Europe and the USA in the 1970s. In the late twentieth century, it became the dominant paradigm within Western ELT and applied linguistics, so much so, in fact, that to admit to a disbelief in CLT would be regarded as 'heresy' (Brown, 2007). It has as most readers will be aware, been 'exported' and promoted around the world in a variety of cultural and educational contexts and with greater and lesser degrees of success.

The origins of CLT are generally traced to a changing view of language, away from language structures towards language functions and communication, philosophically, the focus on learners as individuals, which we have seen previously within the Direct Method and Humanistic language teaching (Crookes, 2009). CLT also emerged in a period when more people than ever were crossing international borders for work, and had immediate functional language needs.

CLT is in some ways problematic as the term means different things to different people and everyday classroom practices can appear to be quite different when CLT principles are applied in different social and educational contexts. Thus, CLT can be seen as an umbrella term that describes a change in thinking about the goals and processes of classroom language learning (Savignon, 2004) with a number of interpretations of how this might be realized in practice. Key to all strands of CLT, however, is the move from teaching language as individual linguistics structures to teaching people how to use language effectively when communicating, in effect a move from teaching linguistic competence to communicative competence.

Communicative competence essentially suggests that teaching learners to form grammatically correct sentences is not enough, Learners also need to be able to use language appropriately in a variety of contexts (Hymes, 1972). Hence, in essence, the goal of CLT is to teach 'real-life' language.

The communicative approach—or Communicative Language Teaching (CLT)—is the name which was given to a set of beliefs including not only an examination of what aspects of language to teach, but also a shift in emphasis in how to teach. The "how to teach aspect" of CLT approach

based on Harmer (2001:85) is closely related to the idea that language learning will take care of itself and that plentiful exposure to language in use and plenty of opportunities to use it are vitally important for a student's development of knowledge and skill. But this is always easier said than done. Since despite the fact that CLT have now become a generalized "umbrella" term to describe learning sequences which aim to improve the students' abilities to communicate, it has come under severe attack from many fronts.

As it was mentioned, CLT starts with a theory of language as communication, and its ultimate goal is to develop learners' communicative competence. Based on Hewings (2001:150) in CLT, meaning is paramount. According to Larsen- Freeman (2003:131) the most obvious characteristics of CLT is that, almost all that is done with a communicative intent. A number of reports in the literature deal with CLT innovations in EFL contexts. Many have proposed that most EFL teachers have found it difficult to use CLT. For instance, Burnaby and Sun (1989) reported that teachers in China found it difficult to deploy CLT. The constraints cited include the context of the wider curriculum, traditional teaching methods, class size and schedules, resources and equipment, the low status of teachers who teach communicative rather than analytical skills, and English teachers deficiencies in oral English and sociolinguistic and strategic competence. Many other studies and researches have shown that it is not that much easy for the teachers specially the EFL teachers to utilize CLT as an asset to reach the final goal of language teaching in their context with their students. Based on a study that assessed the attitudes of Hong Kong educators toward using CLT in the local context, Chau and Chung (1987) reported that teachers used CLT only sparingly because it required too much preparation time. Since the emergence of CLT the only group of people having difficulty using it are not the teachers. Students are also to be taken into account in this case. Sano et al (1984) point out that the Japanese students studied generally did not feel pressing need to use English, therefore the goal of communicative competence seemed too distant for them. A study conducted in Vietnam identified class size, grammar-based examinations, and lack of exposure to authentic language as constraints on using CLT (Ellis; 1994). As this brief review indicates because of many problems CLT as the most known comprehensive approach in language teaching has proved difficult to be implemented on the part of teachers of English as a Foreign Language.

It has been suggested that many communicative activities are not, in fact, any more 'genuine' than activities out forward by other methods. For example, asking someone to give directions while working in a classroom pair-work activity does not serve any authentic communicative and language are removed from their original context outside the classroom into a learning context, they may become inherently artificial (Widdowson, 1998). Similarly, an over-emphasis on the exchange of messages-any messages- within the classroom may lead to the entail for English language teachers' professional status (Pennycook, 1990: V. Cook, 2008). Last, but by no means least, it has been suggested that CLT is not appropriate for all cultures and contexts (Bax2006), for example where learner autonomy, pair and group-work and less obvious teacher intervention is not part of the educational tradition.

Despite this criticism, however, CLT seems to offer teachers significant alternatives for their everyday teaching practices. Undoubtedly, its conception of language as communicative

competence strikes a chord with many teachers and applied linguists, even if the process for achieving this is at time potentially problematic.

Based on the above mentioned facts about CLT, its scope and status CLT has proved difficult to implement in EFL classrooms. For this reason I undertook a case study of Iranian high school English teachers understanding of the uptake of CLT.

## **METHODOLOGY**

### ***Participants***

The participants in this study were 50 high school English teachers. 32 male and 18 female subjects ranged from 32 to 48 years in age. Their experience in English teaching varied from 6 to 22 years with an average of over 10 years. At the time of the study, 18 female participants were teaching the high school students in different high- schools in various grades. This was also the case for the male teachers. The group of teachers filling out the questionnaire were participating in an intact in-service program. So they were not randomly selected, but it was assumed that based on their experience in teaching English as an EFL, they could be representative sample of the EFL teachers teaching in the same context. Based on the researchers' familiarity with most of these teachers were mostly among the more successful teachers in their classes.

### ***Instruments***

In order to tap these teachers' personal view points about the probable problems they might have experienced using CLT in their real classes first a written questionnaire was used. This questionnaire (see the appendix 2) included both open-ended questions and questions with fixed alternatives. Each participant was required to give his personal ideas in the form of responses to the open-ended questions and choose either "yes" or "no" for the fixed response questions. The participants were also required to be interviewed on the part of the researcher. The questionnaire used in the study has been developed and pilot studied for issues of reliability and validity on the part of Defeng Li (2001). The interviews were conducted in a systematic and consistent order but letting researchers as the interviewers have sufficient freedom to digress and probe far beyond the answers to the prepared and standardized questions in the questionnaire.

### ***Data collection procedure***

To collect the empirical data necessary for this study a questionnaire was distributed among the 50 teachers participating in the research. They provided both open answers and alternative answers to the open ended and "yes", "no" questions respectively. Then, to hear their personal views the researcher asked each one to have a 5 minute interview with him.

The data obtained both from the written questionnaires and the oral interviews were carefully analyzed. Since data analysis is not a simple description of the data collected but a process by which the researcher can bring interpretation to the data, the themes and coding categories in this study emerged from an examination of the data rather than been determined before hand and imposed on the data.

## RESULTS AND DISCUSSION

The problems in using CLT reported by participant teachers in this study fall into four types: Some may be caused by the teacher. Some others may be created by the students. The third class may come on the part of the educational system. The last but not the least problems might probably be caused by CLT itself.

### *Problems on the part of CLT teacher*

#### *Lack of training in CLT.*

- Misconceptions about CLT.
- Deficiency in spoken English.
- Few chances for retraining in CLT.
- Deficiency in sociolinguistic and strategic competence.
- Lack of enough time for materials development for communicative class

Figure 1: The percentage of teachers' views on problems raised on the part of Iranian EFL Teachers in using CLT in their real classes mentioned above

### *Problems caused by the students*

- Low English proficiency.
- Resistance to class participation.
- Lack of motivation for communication.

Figure 2: The percentage of teachers' views on problems caused by the students when Iranian EFL Teachers tend to use CLT in their classes

### ***Educational problems***

- Lack of budget.
- Crowded classes.
- Insufficiency of support.
- Grammar-focused exams.

*Figure 3: The percentage of teachers' views on Educational problems when Iranian EFL Teachers tend to utilize CLT in their actual classes*

### ***Created problems by CLT***

- Lack of efficient assessment instruments.
- Inadequate account of EFL teaching in CLT.

*Figure 4: The percentage of teachers' views on created problems by CLT itself when Iranian EFL Teachers are going to apply CLT*

The number of times the research subjects reoffered to a theme in either the questionnaire or the interview as a limitation in CLT implementation in their own classes is to be taken into account. The maximum number of mentions possible for each of the themes involved in the four main types of problems is 48 out of 50 participants considered that their own deficiency in oral English constrained them in using CLT in their classes. Generally, it seems that one of the important requirements on the part of the teachers intending to use CLT is a good command of spoken

English. Although the teachers felt that they were highly proficient in English grammar, writing, and reading, almost all of them reported that their inadequate abilities in spoken English did not let them conduct the communicative classes essentially involved in CLT.

All participants reported that their insufficient strategic and sociolinguistic competence in using English for real communication to achieve genuine purposes in real context would inhibit their use of CLT. This is because of the fact that in CLT classes greater emphasis is given to strategic and sociolinguistic competence than in traditional grammar or structure focused classes. That is to say; being capable enough in application of these two communicative competences is a must to be able to communicate in real context for real purposes.

45 out of 50 subjects also reported that one of the main problems in utilizing CLT on the part of them is lack of enough training in CLT. Most of them told that they had heard only the name of CLT and few of them reported that they have studied some chapters on CLT but that is only in the books. It seems that this lack of systematic training in CLT led to a sketchy and fragmental understanding of CLT and made it unsafe for the instructors, to leave the security of the traditional methods and take the risk of trying a new unfamiliar method.

47 respondents referred to teacher's misconceptions about CLT as one of the principal roadblocks. A usual misunderstanding was that by focusing on appropriateness and fluency, CLT does not teach form at all and thus neglects accuracy. But based on many experts in the field of language teaching in CLT both fluency and accuracy receive emphasis. From among all these Larsen–freeman's conception worth mentioning as she points out that a CLT teacher evaluates not only the students' accuracy but also their fluency (Freeman; 2003:132). Many teachers probably think that CLT does not teach grammar and only teaches speaking. Such misunderstanding led teachers to believe that CLT contradicted their beliefs about language learning and did not allow them to prepare students for the various exams that are of crucial importance to their future careers.

Almost all English textbooks available (before the publication of the new series of text books accompanying publications of the communicative curricula) had been developed under the influence of the grammar-translation and audio-lingual methods. So teachers had to write their own materials and design their own activities if they wanted to use CLT. Iranian teachers and textbooks are not also exceptions. 44 out of 50 underpaid and over worked teachers as participants of this study complained about the lack of time and expertise in designing communicative activities.

All 50 teachers reported that one main problem preventing them from applying Communicative Language Teaching was their students' low proficiency in English. Iranian students do not start learning English until after the five years period of elementary school (Grade one junior high school), and they have only one or two 90 minute English classes per week and this makes progress slow. They usually suffer from their small English vocabulary and little command of English structures. Since Iranian students do not often have the necessary proficiency in English, all participant teachers found it difficult to do any oral communicative activities with them.

For this most participants expressed their view points as such; because the average secondary school students have a very small English vocabulary, and they know limited number of English structures, they have great difficulty expressing themselves in English when they are required to participate in genuine communicative exchanges. Gradually they lose interest in trying to speak English and become too discouraged to speak English any more.

Nineteen out of twenty teachers recognized the lack of motivation on the part of the students to work on their communicative competence as a great hindrance. Though a large number of people including students in our country have a great inclination to learn to express themselves in oral English, most of the participants reported that since their students' goal is to enter the university, they prefer to work on English grammar and vocabulary. This might be the case because in the national university Entrance Exam in Iran the part dealing with English is heavily based on grammar and lexis. "Because of the fact that grammar and lexis in isolation (in the form of discrete multiple choice test items) still play a decisive role in all English examinations in our country, teachers who teach communicative competence are not liked as well as those who teach grammar and lexis in isolation".(The idea was expressed by one of the participant teachers in this study).

47 out of 50 respondents believed that the students' resistance to class participation was one of the primary constraints in trying to use CLT. Believe it or not almost all of us are the product of traditional classroom structures; that is, we have mostly been brought up in teacher fronted classes. That is why; it proves a bit difficult to bring up our students while giving them ample opportunities to be active participants in real communicative activities. "Well, paragraphs, pages, chapters and even books have been written down on the importance of student centered classes but it seems that we teachers are still the class dictators" one of the respondents said. However; one main feature of CLT according to Richards (2001:168) is that it requires teachers to acquire less teacher-centered classroom management skills.

Communicative Language Teaching has proved to be more successful in small classes. That is why people like Richards (2001:168) also clearly state that there must at most be 12 students in a CLT class. This might be necessary to give every one in the class more time and opportunities to participate in real communication activities. Unfortunately, no one of the participant teachers claimed to have English classes with less than 25 students in. And this they believed makes the job even thornier.

As it was previously mentioned most of our English examinations are grammar and lexis based. The biggest of these life procedure determinant exams is the National University Exam given to the students each year. Based on this fact most of the subjects (48 out of 50) believed that, they are under the pressure to make their pupils do well on such tests, often devoting valuable class time to teaching test-taking skills and drilling students on multiple-choice items. Based on the above mentioned fact the reader can judge how our teachers are under sever constraints in CLT application.

Lack of enough funding was also mentioned as a great limitation in CLT utilization (44 out of 50 teachers reported this). Obviously CLT needs ideal classes with as less students as possible. It also needs some equipment including a TV set, a computer, and so many other things not to be mentioned here. Some of the teachers believed that it is always more difficult to apply CLT because of the lack of money which is not always there. So "it's much harder than you plan and imagine." one of the respondents said.

We teachers are not also supported by each other. 43 respondents also proposed the lack of support as an important limitation to the teachers in CLT application. Teachers generally found this lack of professional, administrative, and collegial support discouraging. That is why they mainly lose hope in dealing with the challenges of introducing CLT in their classes.

CLT does not give a sufficient account of EFL teaching though its initial growth in foreign language teaching accounted for that (Hewing; 2001:160). Obviously EFL is different from ESL. Yes, many people tend to confuse them and often ignore the special elements of EFL. One of the participants in this study rightly said that "because EFL and ESL teaching are different we often find Western language teaching methods difficult to use". The significant difference that almost all the teachers saw between EFL and ESL included the goal of learning English, contextual situation, teachers' command of English proficiency, and the availability of authentic English materials.

Another problem cited on the part of 49 participants in this study as a constraint in using CLT is its lack of effective assessment instruments. Larsen–Freeman (2003:132) when dealing with the evaluation of the CLT students points out that the student who has the most control of the structures and vocabulary is not always the best communicator. That is why she proposes that a teacher can informally evaluate his students' performance in his role as an advisor or co–communicator. She further explains that in order to assess students writing skill, for instance, a teacher might ask them to write a letter to a friend. However, it seems not to be easy to evaluate our students when we use CLT to teach by.

Based on the above mentioned facts one can see the difficulty and the lack of clear cut assessment procedures in CLT. Imagine you are teaching 6 (sometimes more) classes a week. Then you have to be busy enough during the week. If you are so optimistic there might be at least 200 students in your classes. If you are going to follow the procedures of CLT to evaluate your pupils efficiently, it seems hard job, right? One other major difficulty is the fact that most our standard tests emphasize the objectivity nature of our scoring and evaluation procedures. Something that does not seem to be very reasonable in CLT.

## **CONCLUSIONS AND PEDAGOGICAL IMPLICATIONS**

The aim of the present study was to see if EFL teachers in general and Iranian EFL teachers in particular can apply CLT procedures in their EFL teaching context successfully. Based on the findings of this study one can speculate about the perceived difficulties in utilizing CLT demands and what the EFL situation in many countries allows. This contradiction must be resolved before EFL teaching in these countries can benefit from CLT. One good way to do this is that the delivery of EFL methods courses in education programs should change. In this regard, Hewing (2001:161) obviously points out that CLT should not be lectured about but demonstrated. Novice nonnative teachers of English then should have opportunities to go hands–on experience with and gain confidence in using Communicative Language Teaching. In addition despite its initial claim to be appropriate an approach for EFL situation, CLT seems to be more suitable for ESL situations.

To indicate this fact Edge (1996:18) points out that it seems necessary that rather than relying on expertise, methodology, and materials controlled and dispensed by Western ESL countries, EFL countries should strive to establish their own research contingents and encourage method specialists and classroom teachers to develop language teaching methods that take into account the political, economic, social, and cultural factors' and most important of all, the EFL situations in their countries. They should also devise teaching methods, appropriate to their learners, their colleagues, and their societies. As it is the case with almost all studies done in the field of teaching English as a foreign language, this study is not free of limitations. That is to say, because of the eluding nature of CLT which is defined differently by different people one cannot claim to provide all inclusive criteria to list the problems with which EFL teachers wish to come to a conclusion in evaluating CLT as an approach in EFL contexts. Therefore, the authors of this paper have not intended to come to an absolute conclusion about the perceived problems with which EFL teachers might face in using CLT in their real classes. ALL in all, it is hoped that this survey be of use for all colleagues. All defects of this paper are of ours. That is, no fault is to the participant teachers in this study.

*Appendix 1*

**Table one:** A summary of the number and the percentage of the major perceived problems mentioned on the part of the participants in this study.

Sources of Perceived Problems in Using CLT	No. of Mentions Out of 50	Percentage
<b><i>1. Problems on the part of CLT teacher</i></b>		
1.1 lack of training in CLT	45	90%
1.2 misconceptions about CLT	47	94%
1.3 deficiency in spoken English	48	96%
1.4 few chances for retraining in CLT	49	98%
1.5 deficiency in sociolinguistic and strategic competence	50	100%
1.6 lack of enough time for materials development for communicative classes	44	88%
<b><i>2. Problems caused by the students</i></b>		
2.1 low English proficiency	50	100%
2.2 resistance to class participation	47	94%
2.3 lack of motivation for communication	49	98%
<b><i>3. Educational problems</i></b>		
3.1 lack of budget	44	88%
3.2 crowded classes	50	100%
3.3 insufficiency of support	43	86%
3.4 grammar-focused exams	48	96%
<b><i>4. Created problems by CLT</i></b>		
4.1 lack of efficient assessment instruments	49	98%
4.2 inadequate account of EFL teaching in CLT	50	100%

## Appendix 2

### *The questionnaire used in this study*

*Please complete the following questions as appropriate.*

1. Age.....
2. Sex.....
3. How many years have you been a teacher of English?
4. Are you teaching in a middle school or high school?  
Middle School                                  High School
5. Which grade(s) are you teaching? .....
6. Are you teaching in an urban or rural middle/high School?  
Urban    Rural
7. Are you concerned about the methods you use in teaching English?  
YES     NO
8. What methods are you using now?
9. Have you tried Communicative language Teaching (CLT)?  
YES     NO
10. Why did you or why didn't you try CLT?
11. How did you like using CLT in your classroom?

**The following are some difficulties that other EFL teachers had in adopting CLT.**

Did you come across these difficulties or do you think they might be difficulties for you in adopting CLT?

- |   |     |    |
|---|-----|----|
| 1. Teachers' deficiency in spoken English?                                      | YES | NO |
| 2. Teachers' deficiency in strategic and sociolinguistic competence in English? | YES | NO |
| 3. Teachers' having little time to write communicative materials?               | YES | NO |
| 4. Students' low English proficiency?   | YES | NO |
| 5. Students' passive style of learning?   | YES | NO |
| 6. Lack of authentic teaching materials?  | YES | NO |
| 7. Grammar-based examinations?  | YES | NO |
| 8. Large classes?   | YES | NO |
| 9. The differences between EFL and ESL?   | YES | NO |

## METAPHOR AND METONYMY IN INTERACTION: A COMPARATIVE STUDY OF BODY-PART EXPRESSIONS IN ENGLISH AND CHINESE

Cai Ying, Cao Jingxiang

*Dalian University of Technology/Foreign language Department, Dalian, China*

*Email: caiyingaaaa@163.com*

### ABSTRACT

Within the framework of Contemporary cognition, metaphor and metonymy are both viewed as a way of thinking rather than only a matter of language. In this paper, non-literal senses of “gut” in both Chinese and English are studied quantitatively and qualitatively with the aid of corpora under the guidance of cognitive theories. The findings show that non-literal uses of “gut” across two languages account for a substantial proportion of its corpus citations; the metonymic expressions of “gut” in both languages are more than metaphoric ones, and a number of non-literal notions of “gut” are generated by conceptual interplay between metonymy and metaphor; universal bodily experience can motivate equivalent expressions across two languages, but gut is hardly observed as an internal organ, and the cognitive process is complex, which will result in different expressions of gut for cultural and linguistic reasons.

**KEY WORDS:** Non-literal, corpus, conceptual interaction, metonymy, metaphor

### INTRODUCTION

The study of metaphor has attracted the attention of many scholars in cognitive linguistics. Metaphor is viewed as a way of thinking rather than only a matter of language by Lakoff and Johnson (1980). They proposed “conceptual metaphor theory” which underlies distinct semantic fields can share many of the same words and expressions. Conceptual metaphor theory also claims that most central metaphors are grounded in bodily experience which plays an important role in motivating features of language. Human is likely to cognize the world on the basis of body parts and organs as body seems to be the most familiar part to know and perceive. Compared to the lexes from the field of head and limbs, such as eye, mouth, hand, leg, etc., the conceptual process of viscera lexes is more complex and attracts less attention, and more comprehensive researches on the uses of viscera expressions (except for “heart”) are needed .

This paper intends to conduct a systematic and in-depth corpus study on “gut” expressions in English and Chinese under the guidance of cognitive linguistic theories and the metaphor–metonymy interaction. It discusses to answer the following questions:

- (1) What is the frequency of non-literal senses of “gut” expressions in corpora?
- (2) What is the conceptual process of “gut” expressions?
- (3) What are the similarities and differences of the uses of “gut” expressions motivated by universal bodily experience and cultural knowledge across the two languages?

## LITERATURE REVIEW

### *Metaphor , Metonymy and their conceptional interaction*

Metaphor and metonymy are both viewed as a way of thinking rather than only a matter of language from cognitive perspective. A great number of researchers have provided insightful observations on the conceptual processes of metonymy and metaphor. Lakoff (1987) regarded metonymy and metaphor both as the types of ICM (idealised cognitive models). “An ICM is a cognitive structure, which is idealised for the purpose of understanding and reasoning, and whose function is to represent reality from a certain perspective” (Ruiz de Mendoza, 1997). Furthermore, Lakoff & Johnson (1999) assumed that metaphor is the result of the combination of primary metaphors. The idea had also been studied by Grady (1997, 1998), who coined the term “primary metaphors” to refer to those mappings “which arise directly from correlations in our experience and which work together with other metaphors to give rise to compound metaphors.” Turner & Fauconnier (1995) have proposed the “blending theory” of metaphor and conceptual projection to refine Lakoff’s two-domain model, thus the interpretation of metaphor requires the activation of minimum four mental spaces: two input spaces, a source and a target, and two middle spaces, a generic space and a blended space or blend.

As to metonymy, the discussions have focused on “the demarcation of metonymy in its own right and in relation to metaphor”. (Marisol Velasco-Sacristán, 2010). From the view of cognitive semantics, there are two broad perspectives to demarcate metonymy: the domain-related approach (Kövecses and Radden, 1998; Barcelona, 2000, 2003; Croft, 2003; Kövecses, 2003) and the prototype-related approach (Riemer, 2003; Dirven, 2003), along with recent refinements to both approaches: the domain-refined approach (Ruiz de Mendoza, 2002; Dirven, 2002; Ruiz de Mendoza and Díez Velasco, 2003 ) and the contiguity-refined approach (Peirsman and Geeraerts, 2006). On the one hand, the scholars of the prototype-related approach considered metonymy as a prototypically structured concept, and the relations that lie at the basis of metonymic shifts of meaning are not just objectively given, but rely on a process of construal (Dirven, 2002); On the other hand, metonymy is usually regarded as a shift of meaning within a single conceptual domain in the domain-related approach. The notion of conceptual domain is crucial to defining and distinguishing metaphor and metonymy. Croft (2002) proposed replacing “domain” with “domain matrix”, a refined concept of domain to illustrate “more than one domain joining together in a given entity”, thus metonymy defined as “a metonymic mapping which occurs within a single domain matrix, not across domains (or domains matrices)” (Croft, 2002). Ruiz de Mendoza (2002, 2003) refined the domain-related approach, treating metonymy with three parameters: domain inclusion, domain expansion and reduction, and domain highlighting. Thus we have a whole domain, called matrix domain, which stands for one of its subdomains, and a subdomain stands for its corresponding matrix domain. The former is regarded as target-in-source metonymy, the latter source-in-target metonymy (Ruiz de Mendoza and Díez Velasco, 2000), which are diagrammed in Figure 1 and Figure 2. Domain and the prototype approaches can be complementary rather than incompatible. Therefore, Marisol Velasco-Sacristán (2010) claimed that the domain matrix, the conceptually associative relations within these domains and the pragmatic features of inference and relevance are equally important and necessary for demarcating metonymy. “In this sense, metonymy has to be considered as a fundamental type of cognitive model (i.e., an intra-domain mapping), based on a conceptually contiguous relationship between two referents that can be used for immediate pragmatic purposes.” Marisol Velasco-Sacristán (2010).

Figure 1: source-in-target metonymy

Figure 2: target-in-source metonymy

A number of linguists believe that there is no clear boundary between metonymy and metaphor with fuzzy cases between these categories. The interplay between metonymy and metaphor that may result from their combination is complex and interests many scholars. A metonymy-metaphor continuum by Taylor (1995) led Radden and Barcelona (2000, 2003) to the intermediate notion of metonymy-based metaphor. Goossens (2003) proposed “metaphonymy”, by studying several ways in which metaphor and metonymy interact. Ruiz de Mendoza and Díez Velasco (2000, 2003) stated several interactional patterns between metaphor and metonymy under the guidance of Turner and Fauconnier’s conceptual blending theory (2000). Ruiz de Mendoza argued against Goossens’s typology of interactional patterns (2003) that two distinct domains of a metaphor cannot be included within the single domain of a metonymy. He proposed that the typology of interactional patterns is based on two main criteria: the place where the metonymic mapping develops and the scope of the metonymy. Thus Ruiz de Mendoza and Díez Velasco came up with six kinds of interplay that may result from the combination of metonymy and metaphor: metonymic expansion of a metaphoric source, metonymic expansion of a metaphoric target, metonymic reduction of one of the correspondences of a metaphoric target, metonymic reduction of one of the correspondences of a metaphoric source, metonymic expansion of one of the correspondences of a metaphoric source, metonymic expansion of one of the correspondences of a metaphoric target. In their research, the interactional possibility is frequently exploited by body part metonymies that express feeling.

### *Cognitive linguistic studies on body-part term*

There have been a great number of mono-linguistics and cross-linguistics studies on the human body part terms. Some scholars noted the conceptual process of body-part terms, such as Lakoff (1993) and Kövecses (2000). Lakoff (1993) claimed that the most central metaphors are grounded in our human physical experience, thus different languages can have the same conceptual metaphors. Kövecses (2000) studied the semantics of emotion language, and brought up the idea that “emotions are largely understood metaphorically. Physiological reactions of emotion are metonymically related to these emotions”. Mono-linguistic researches on some body part terms were conducted to support certain cognitive linguistic theories. For example, Niemeier (2000) illustrated one certain body part, i.e. heart which is the site of emotions to argue that many metaphors have a metonymy basis. Comparative Researches on body-part terms in different languages were also done by many scholars. Deignan (2004) did a cross-linguistic research on a few body part lexes to argue that most central metaphors are grounded in universal bodily experience and thus are shared by different languages, and a large number of expressions are

generated by a combination of metaphor and metonymy. Qi (2007) studied “heart” expressions in English and Chinese, and forwarded a cognitive model of “heart” expressions from a cognitive perspective with six metonymic models and two metaphoric models. Bai (2009) studied the metaphoric behavior of viscera lexes in Chinese and English, especially from the perspective of cultural difference. Zhao (2010) offered a systematic and comprehensive study on meaning transference of body-part terms in English and Chinese from cognitive and comparative perspectives.

However, most studies on body part terms incorporated metonymy into metaphor and the conceptual interaction between metaphor and metonymy was neglected, thus the classification was ambiguous and rash; some body part terms, especially those of the head and limbs, are frequently addressed (Gao, 2006; Li, 2007; Qi, 2007; Luo, 2010; Liu, 2008; Niemeier, 2000), while others have received less attention from the scholars, such as viscera (with “heart” excluded); most studies are conducted qualitatively, while a quantitative study aided by corpus is needed as a complement.

## METHODOLOGY

The study is to offer an adequate description of observed features of language in use quantitatively and qualitatively based on corpora by investigating the language use of patterns for body part lexis, the prevalence of different words co-occurs with body part terms, and the percentages of cognitive model of the chosen body part expressions. The body part lexis “gut” is chosen for investigation for its extensive metaphorical uses in English and Chinese. All derived and inflected forms of the items are also studied. The Corpus of Contemporary American English (COCA) and Center for Chinese Linguistics PKU (CCL) are adopted for research of English and Chinese items respectively. COCA is the largest freely-available corpus of English which contains more than 450 million words of text from 1990 to 2012. CCL is a Chinese corpus for linguistic study which contains 447 million words of text updated until 2009. Thus the two language online corpora are with similar word capacity, and both contain written and spoken form of language, but the English corpus is better updated.

Corpus data are analyzed as follows: the words we study generate many thousands of citations, and the senses of citations of each item are identified aided by dictionaries of each language; in order to analyze the metaphoric meaning of “gut” expressions, the main collocates with high frequency of each lexeme are identified automatically for the English data, and manually for the Chinese; the meaning of each fixed expression is examined in terms of dictionaries and context of the citation; The metonymic and metaphoric uses of non-literal meaning are identified. The conceptual modes proposed by Ruiz de Mendoza and Díez Velasco (2000, 2003) are adopted to analyze the non-literal uses of “gut”.

## RESULTS

### *“Gut” expressions in the corpora: frequency and fixedness*

In this section, results of the data from the corpora are presented and processed. In English corpus, the foreign languages, acronym, name of a person are opted out, and the verb forms of “gut” are also beyond this research. Thus, the literal expressions include leaky gut, bacteria in the gut, fish guts and so on, meaning “the lower part of the alimentary canal”, “the entire

alimentary canal”, “the bowels or entrails, especially of an animal”. In Chinese corpus, the proper names like “香肠” and “火腿肠” (kinds of sausage) are excluded, and the literal expressions includes “肠癌”(intestinal cancer), “肠炎”(enteritis) and so on. Table 1 and Table 2 show the frequency of the literal and non-literal senses of “gut”. Non-literal senses of the word “gut” in both Chinese and English accounts for a substantial proportion of the corpus citations, which is consistent with Deignan’s corpus research on several body lexis and the conclusion she had drawn. (Deignan, 2004). About 87.1% of citations of gut in English and about 43.4% citations of gut in Chinese are non-literal.

TABLE 1: SUMMARY OF “GUT” IN ENGLISH CORPUS

Number of citations	Uses	Example
272	Proper Noun, foreign language, which is beyond our research	" Das ist gut ", sagte ich nach einem Weilchen, " es ist gut,
1243	gut as a verb, which is not discussed in our research	gut the fish
897	literal meaning	leaky gut
4746	non-literal meaning	gut feeling
Total	7158	

TABLE 2: SUMMARY OF “GUT” IN CHINESE CORPUS

Number of citations	Uses	Example
905	Proper Noun, name of a person, which is beyond our research	香肠,火腿肠,鱼肠剑等
3472	literal meaning	肠癌
3354	non-literal meaning	愁肠
Total	7731	

It is also observed from the data that a large proportion of “gut” expressions have some degree of fixedness, and particular senses exist with particular collocates. For example, disease and bacteria are associated with the literal meaning of “gut” in a large sense, and “feeling” with a non-literal sense. Moreover, a great number of metonymies and metaphors appear in the fixed and semi-fixed expressions, such as *gut feeling* or *to have the guts*. Table 3 and Table 4 show the number of citations of “gut” expressions with its frequent collocates, in descending order of number.

TABLE 3: SUMMARY OF COLLATIONS WITH "GUT" IN ENGLISH CORPUS (NON-LITERAL)

Number of citations	Collocation	Example
477	Freely combining	Most of the weight had gone to his gut, which hung over beltless Oshkosh jeans.
871	in (the/one's) gut(s)	...experience a feeling so strong, they might as well have been swatted in the gut by a 43- ounce, white-ash bat of baseball's
698	to have the/no guts to	...It's fundamentally time for somebody to have the guts to stand up and say enough lying about the Middle East.
452	gut feeling(s)	...to come back with solid evidence that rules them out, not just a gut feeling.
189	to take (a lot of) guts	...That had to take a lot of guts and I think that you have to realize that many of our Western Allies have...
174	gut instinct(s)	...To stick with your gut instinct...
171	the guts of	...sucking them into the guts of 55 Water Street...
158	gut tell(s)	...My gut tells me that our story probably rang true for most everybody...
147	to get the guts to do that...	...It took a long time for me to get the guts

146	to hate one's guts	...you're going to hate each other's guts by the time you get there....
136 call me...	gut reaction(s)	...whose gut reaction to everything is to
128	to spill the/one's guts	...And commercial stockyards and slaughterhou ses have learned better than to spill their bloody guts in public...
76 gut...	punch someone in the gut	...It hit him like a punch in the
74	blood and guts	...in Reza's mouth when she gave one of her windy laughs, blood and guts...
67	into one's/ the gut	...to move through it into the gut itself...
57	trust one's gut	...So you'll have to trust your gut, FAIL, which failed you here...
55	to go with one's gut	But where do Republicans go with their gut and their brains? If they see one guy is ready...
49 guts here...	to show one's guts	...People want someone to show some
48	gut check	... I don't have a gut check for this...
48	kick in the gut(s)	...Elvis held him back by the shoulders and kicked Conrad in the gut...
43 gut...	feeling in the gut	...a sinking feeling puddled in Marianna's
42	pain in the gut(s)	...Something in the prisoner's cry of pain struck deep into his gut....

## DICUSSION

### *Types of the “gut” expressions*

The different types of non-literal expressions in corpus citations are presented and analyzed. The non-literal expressions of “gut” are divided into metonymy, metaphor, and the interaction between metonymy and metaphor, under the guidance of Goossens (1990), Radden and Barcelona (2000), Ruiz de Mendoza and Díez Velasco (2000,2003)

#### *Metaphor*

As Lakoff and Johnson(1993, 1999) has postulated that metaphor is an ontological mapping from the source domain to the target domain. Metaphor is not only a matter of language but also a way of thinking, the way we conceptualize the world. “Gut” is a visceral organ inside human body which cannot be directly observed by people, so its morphology and function are rarely metaphorically exploited.

A few cases of metaphors are found in “gut” expressions. For instances, the metaphorical uses of “gut” in English are usually post-modified, such as the guts of the computer or the guts of the problem, in which the plural form “guts” means the essential components or inner working parts. In Chinese corpus, “羊肠小道” (a narrow winding trail) is a typical metaphoric expression, which characterizes the road in terms of our knowledge of the gut of the sheep.

#### *Metonymy*

The metonymy of “gut” expressions falls into two categories proposed by Ruiz de Mendoza (2002): target-in-source metonymy (a “domain reduction” metonymy) or source-in-target

metonymy (a “domain expansion” metonymy). On the one hand, as Kövecses (2000, 2002) has proposed, the physical reactions of the emotions and the emotional experience could be regarded as parts of the same domain. For example, when a person is becoming pale or shaking, we can infer that he or she is frightened. In English corpus “gut” can refer to innermost emotional or visceral response, such as “feeling in the gut” and courage in “to have the guts”. “Gut” as “intuition” is a special meaning and occupies a large proportion in English corpus, such as “gut feeling” and “gut instinct”. In Chinese cases, items like “柔肠” (the tender emotion) and “愁肠” (the upset emotion) are used to express a seat of emotion. “肠” also metonymically infers to human characters, such as “心肠”( heart; intention). “饥肠” (hunger) is part of a situation in which a person’s gut is rumbling due to the hunger. The type of all the above expressions is target-in-source metonymies, which can be diagrammed in Figure 2. Taken GUT FOR INTUITION as an example, the essentials of the conceptual process are as presented in Figure 3:

Figure 3: GUT FOR INTUITION

On the other hand, “Gut” metonymically refers to “the belly, abdomen” in “beer gut”, “suck in one’s gut” and “to kick someone in the gut”, which typically is a “domain expansion” metonymy (Ruiz de Mendoza, 2002). “Beer gut” means a fat belly because of too much beer drinking. In this expression, “gut” refers to the region of the body (i.e. a vertebrate between the thorax and the pelvis), instead of its literal meaning of the part of the alimentary canal between the stomach and the anus which is situated inside the body.

### Interaction

The typology of the conceptual interaction between metonymy and metaphor is under the guidance of Ruiz de Mendoza (2000) and Díez Velasco (2000). The expressions of gut examined in this paper fall into three categories of six types proposed by them.

Consider the expression “to have the guts”, a case of conceptual interplay between the metaphor QUALITIES ARE POSSESSIONS and metonymy GUTS FOR COURAGE. “Courage” is regarded as a physical entity with its associated properties, that is, it can be processed, and thus an abstract concept is characterized in terms of a physical entity. The metonymy GUTS FOR COURAGE is part of cultural knowledge that is experientially grounded in the sensations in human’s guts when facing danger or challenges. The conceptual process is shown in Figure 3. The conceptual interplay of metaphor and metonymy is also evidenced in expressions like to take (a lot of) guts, to get the guts, to lack guts, to show one’s guts, which are all consistent with the conceptual mode by Ruiz de Mendoza and Díez Velasco (2000, 2003): the metonymic reduction of one of the correspondences of a metaphoric target, as Figure 4 shows.

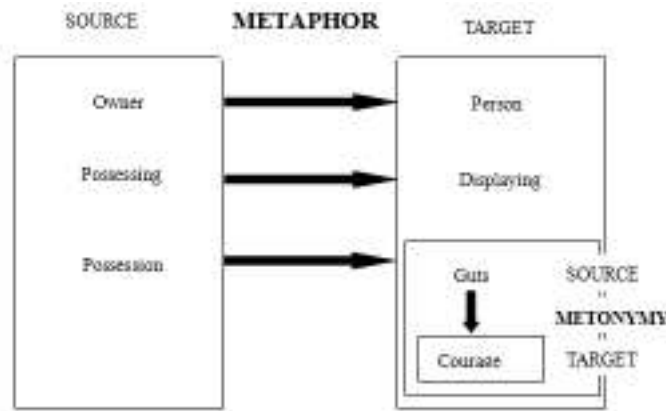

Figure 4: to have the guts

Figure 5: a metonymic reduction of one of the correspondences of a metaphoric target

In English corpus, there are a great number of verbs or the noun form of those verbs to express human feelings, such as gut churns, to churn in one's gut. Consider the expression "Anger churns in his gut", which is used to describe that people feel anger in their gut like fluid churns in a container. In this semantic construction, the metonymy is built into the target of the metaphor. Furthermore, the metonymy, whose source domain is a subdomain of its target, helps determine the interpretation of the metaphoric mapping: "Anger churns in his gut" is part of a situation in which human body reacts to anger. The essentials of this process are presented in Figure 5.

Figure 6: Anger churns in his gut.

Additionally, the complete understanding of this process requires the activation of our knowledge

of the logic of the CONTAINER schema. Therefore, the gut is understood as a three-dimensional entity that can hold things inside, that is, the gut is metaphorically understood as a container and emotions as its contents. The full interpretation of the expression “Anger churns in his gut” applies metaphoric, metonymic and image-schematic principles. Some other expressions such as “to twist in one’s gut”, “to clutch (at) one’s gut” also work in this mode, i.e. a metonymic expansion of a metaphoric target, as presented in Figure 6:

Figure 7: a metonymic expansion of a metaphoric source

As to another metaphorical expression “She feels like she gets punched in the gut”, this presents a different interaction between metonymy and metaphor to “Anger churns in his gut”. In order to analyze the way the interplay works, we select a context in corpus data, in which Jane feels sorrow every time when she reminds of her brother’s death. So she feels like she gets punched in the gut at the thought of his brother’s death. In the metaphor, the source domain is a person’s physical reaction to sorrow, and the target has a person that expresses such emotions (without actually being punched in the gut). The metonymy, which serves as the basis for the metaphoric mapping, is from a situation where a person gets punched in the gut to one in which a person shows sorrow. Thus, the source of the metonymy is built in its target. The essentials of the interaction process are shown in Figure 7. The conceptual process mode-a metonymic expansion of a metaphoric target- shown in Figure 8, can be applied to expressions like “to get kicked in the gut” and “肝肠寸断”(a Chinese phrase, literally meaning ‘liver and gut are cut into inches’, metaphorically meaning ‘overwhelmed by grief’)

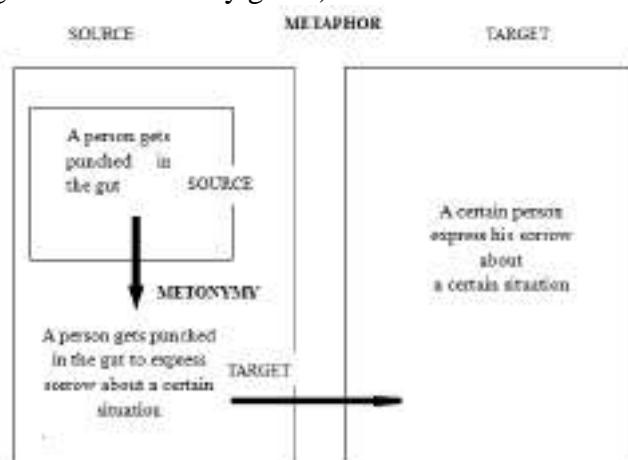

Figure 8: to get punched in the gut

Figure 9: a metonymic expansion of a metaphoric target

A new typology is found in this paper, which is exploited by Chinese expressions like “蛇蝎心肠”(to have a murderous heart, literally meaning ‘have a heart and gut as malicious as snakes and scorpions’), “铁石心肠” (heart of stone, literally meaning have a heart and gut as hard as steel and stone). The equation of the expressions is “modifier + gut”. Figure 10 shows the conceptual process of this type of expression:

Figure 10: 铁石心肠

The new conceptual process mode is “a metonymic reduction of a metaphoric target” as Table 11 shows:

Figure 11: a metonymic reduction of a metaphoric target

### Meaning of GUT expressions in English and Chinese

In this section, we compare the metaphorical uses of “gut” expressions in English and Chinese according to the corpus data we have analyzed above. Moreover, the non-literal meanings of “gut” expressions are also compared across two languages, to distinguish which are motivated by universal bodily experience, or shared metaphors from those cultural- specific.

*Cognitive operation of “gut” expressions by two languages*

According to our classification and analysis above, a substantial proportion of non-literal expressions of “gut” in both languages are metonymic rather than metaphoric. A few senses of “gut” and “肠” expressions are metaphoric. The metaphorical use of “gut” in English refers to the essential components or inner working parts of machines or some abstract word like problem. In Chinese corpus, “羊肠小道”(a narrow winding trail) is a typical metaphoric expression, which characterizes the road in terms of our knowledge of the gut of the sheep (i.e. narrow and winding).

There is a great number of “gut” and “肠” are metonymically used with two-fold role: on the one hand, it refers to the abstract concepts: a seat of emotions, such as “gut wrenching” for “extreme upset”, “愁肠” for depression and sadness, “柔肠” for “tender heart”, etc; personal qualities, such as, “guts” for “courage”, “gut feeling” for “instinct”, “直肠子” for “straightforwardness”, “花花肠子” for “cunning”. On the other hand, it refers to “the belly, abdomen”, such as “beer gut”, “suck in one’s gut”, “elbow into one’s gut”, “to punch someone in the gut”.

As it is analyzed above, a number of high-frequent collocations of “gut” conform with the interactional patterns between metonymy and metaphor proposed by Ruiz de Mendoza and Díez Velasco (2000,2003). They generally fall into three categories by Ruiz de Mendoza: A metonymic reduction of one of the correspondences of a metaphoric target, such as “to have guts”, “to take (a lot of) guts”, “to get the guts”, “to lack guts”, “to show one’s guts”; A metonymic expansion of a metaphoric target, such as “to churn in one’s gut” “to twist in one’s gut”, “to clutch (at) one’s gut”; A metonymic expansion of a metaphoric target, such as “to get punched in the gut”, “to get kicked in the gut”.

*Shared meanings grounded in bodily experience*

From the above classification, we have found that there are shared non-literal meanings by the two languages regardless of minor differences. In many cases, the shared meanings seem to be motivated by bodily experience. First, physiological reactions of emotion are metonymically related to these emotions. A substantial number of “gut” and “肠” with their collocates refer to various kind of human emotions, and generally speaking, those emotions are negative, such as anger, depression, worry, etc., as in the following citations:

“...But the strongest romances give the reader the emotional impact of gut-wrenching internal conflicts that make it look like these people can't possibly end up happy together.”

“。。。你去体会当父母看到儿子生病时那种忧心忡忡、愁肠百结的心境。” (You will have a gut-wrenching experience as parents seeing their son is ill.)

*Differences in non-literal meaning*

Differences in non-literal meaning across two languages are no less than their similarities. In English corpus, “Intuition” meaning of “gut” takes a relative large proportion, such as “gut feeling”, “gut instinct”, etc. The notion of “gut” as “intuition” is ancient, and probably explains expressions such as gut reaction, gut feeling, and so on. Some version of explanation can be

traced back to the transcripts of Hebrew Bible. The term “bowels” in the Hebrew Bible refers to the center of the body from which the “whole” of human emotions were believed to originate. The examples are as follows:

“My gut feeling is the fact that Conrad was present during his death, there's a lot of questions to be answered.”

“Her gut instinct proved right: Johnson's charged performance as Lennon has won raves from critics and...”

In English, “guts” can refer to “courage”, a human character, in citations such as the following:

“I want to say, Congresswoman, you are my new hero for having the guts to talk about this.”

“Mark had finally gotten the guts to ask, and he'd done so in a place where...”

Additionally, in Chinese, the notion of “肠” as human characters is relatively more frequent and various, such as “直肠子” for “straightforwardness”, “花花肠子” for “cunning”, “蛇蝎心肠” for “ruthless” and so on, and the word before “肠” identify the kind of personality to some extent. The examples are as follows:

“老杨是个直肠子, 心里存不住话。” (Mr. Yang is straightforward and outspoken.)

“...这就说明她是个蛇蝎心肠的女人, 难道不是吗?” (She has a murderous heart cruel, doesn't she?)

Moreover, many idioms with “gut” are frequently used, such as “to hate a person's guts” (to dislike a person very strongly), sweat or work one's guts out (to work very hard), “to spill one's guts” (to tell all; to confess), “to bust a gut” (to work very hard or to make a big effort to achieve something), “to bust a gut laughing” (to laugh a lot), “a gut course” (a course that is easily passed). Most of these idioms date back long ago, and we can hardly find their origin of the notion of “gut”.

In Chinese, two viscera lexes are usually combined to form the fixed items due to their closely connection to each other, and the concept of viewing the world as a whole. For example, the expressions like “心肠” (heart; intention) contains heart and gut, “肝肠寸断” (deep sorrow) liver and gut, “牵肠挂肚” (be very worried about; be deeply concerned) gut and belly. However, this situation rarely happens in English. “Gut” can metonymically stands for belly or stomach, such as “beer gut”, which can also be expressed as “beer belly” or “beer stomach” with the same meaning. But “gut” and “belly” won't appeared together in an expression. In Chinese, the morphology of gut is metaphorically used with the notion as “narrowness and winding”, such as “羊肠小道” (a narrow winding trail), “九曲回肠” (gut-wrenching; twists and turns of rivers).

## CONCLUSION

In the course of the quantitatively and qualitatively study of the “gut” expression across two languages, this paper brought out the following points: first, non-literal senses of “gut” expressions in two languages both accounts for the majority of the total uses; second, there are vastly more metonymic expressions than metaphoric ones. Some frequent “gut” collocations fall

into the categories of interactional patterns between metonymy and metaphor proposed by Ruiz de Mendoza and Díez Velasco (2000,2003), and an additional pattern- a metonymic reduction of a metaphoric target- is found in Chinese expressions of “gut”; third, the two languages share some similarities in conceptual interactions and non-literal senses motivated by universal bodily experience, but the differences are quite a few: the specific non-literal senses of each language and the combination of two Chinese viscera lexes to express emotions or human characters.

## **ABSTRACT**

Internet begging is a relatively new discourse genre. It is the online version of traditional begging, which is asking strangers for money to meet immediate and other needs such as money, food, and shelter. E-begging employs various discourse strategies which may appear vague or inexplicit. Correct interpretation of begging texts may evade the readers who do not understand the particular socio-cultural environment. The data for this study which comprised of sixty internet beggars' texts from two very popular internet begging websites were carefully selected. Thirty begging texts relating to financial incapability were selected from each of the websites. The texts were posted by the beggars between December, 2012 and February, 2013. This study adopted both the Pragma-Rhetorical theory and Critical Discourse Analysis approaches (see Watson and Hill (1993:146), Kennedy (1998) and Babatunde (2000:150)). Many internet beggars register on the sites with different socio-economic problems, different linguistic appealing modes etc. The words 'need' and 'help' signify a kind of logical use of language by beggars in distress or desperation to draw the attention of the audience to their situation through their language prowess. It was discovered that the proposition of five speech acts of the expressives, the commissives, the assertives or representatives, the directives and the declaratives by Searle (1969) was effectively employed by the e-beggars. Various discursive strategies of communicative strategies like persuasive strategies, politeness strategies and storytelling strategies were also employed in the e-begging texts. The internet beggars' used every available rhetorical strategy in the communicative process as well as to create intended effects. This paper recommends that e-beggars should try to avoid using the speech acts of the directives. Also, website owners should device means of educating prospective e-beggars on appropriate language skills and discursive strategies.

**KEY WORDS:** Discourse strategies, internet begging, financial incapacity

## **INTRODUCTION**

In linguistics, a relatively new discourse genre is Internet begging (see Freeman and Medway 1994:1). Internet begging, cyber-begging, or Internet panhandling according to Wikipedia (2013:1) is the online version of traditional begging, which is asking strangers for money to meet immediate and other needs such as money, food, and shelter. It has a notable advantage over street begging as it is practiced with relative anonymity, consequently eliminating or reducing the shame and disgrace associated with begging in public.

The internet is a global network of computer networks used for sending messages from one place to another. Several opportunities like websites development and management, e-mail, networking and programming activities e.t.c. are available on the internet.

### **DISCOURSE SPACES ON THE INTERNET**

There are several discourse spaces available on the internet. The following fields of research are the discourse spaces. They include: the virtual conference forums and seminars, listservs, the internet as an informal learning environment for English as a second language, then the internet as a discursive space where identities are formed and social relationships are negotiated, and as a space where the intermingling of the global and the local rise to hybrid language varieties, e.t.c. (See Davis & Brewer, 1997; Mitra & Watts, 2002, pp. 486-488).

### **THE CONCEPT OF E-BEGGING**

Internet begging is a new way of begging with a new generation of beggars who use the internet medium to beg for money, food, shelter, e.t.c. According to Wikipedia (2013,3-7), during the early days of the Internet, cyber-begging occurred in the form of personal advertisements for assistance on local bulletin board systems (BBS). As a result of the development of personal websites, certain persons began advertising their needs, using the features available through website authoring. Many Internet service providers (ISPs) later offered a free homepage along with the basic dial-up connection service to the Internet. Internet begging gained notoriety and momentum after June 2002 when Karyn Bosnak started SaveKaryn.com as an attempt to have the Internet public help pay her credit card debt.

E-begging, a computer mediated communication, as Atima (2012, pp 8-9) opines, has become a regular part of our internet experience where beggars beg online in order to get out of problems or debt either by necessity or choice. Beggars may publish their own sites where they ask for money or operate on community sites or forums and may place addresses on their sites called e-bay. They are people who are sick, jobless, or are experiencing home foreclosures and bank failures who turn to begging with their heart touching tales targeted at the internet audience to request for money.

### **NOTABLE CONTEXTUAL FEATURES OF E-BEGGING DISCOURSE**

Internet begging exhibits its own peculiar contextual features. E-begging texts bear titles or headings. They may have greetings followed by the introduction and then the requests or problems of the beggars in a polite manner (See Atima, 2012, p. 9). They employ the use of appeals to pity, an undisguised appeal to greed, trust, fallacies, e.t.c. as well as persuasion techniques which aim their target audience in a very logical way. The language of e-begging is uniquely different and resourceful. It is the background of the beggar that shapes his language, which is usually more on business tone, deliberately trying to manipulate or persuade his audience for his selfish goals. The internet medium, the background of the beggars, and the knowledge of the audience are the three notable contextual features of e-begging discourses.

## **DISCOURSE**

Discourse is viewed from different angles by different scholars. For example, Stubbs (1983:1) views discourse as language above the sentence or above the clause. Fairclough (1992:28) sees it is more than just language use but as a type of social practice.

In a nutshell, discourse occurs as one expressing oneself employing words. It is a common way of knowing, valuing and experiencing our world. It can be used for an assertion of power and knowledge, and also for resistance and critique (See Atima, 2012, p. 30). Basic features of discourse that can be found in texts are: repetitions, informative, additives, causative, adversatives and so on. Since, beggars' texts observe the features of discourse, just like every other speaker or writer whose texts are considered discourse, then begging discourse is uniquely distinct.

## **DISCOURSE STRATEGIES**

The techniques or approaches that manifest in a particular language use are called discourse strategies. They exist at both written and spoken language texts. It is to be noted that a given discourse or text may be analysed employing different theories of language as discourse strategies are ways by which a particular genre of discourse may be analysed by appreciating the language in use in different situations e.g. discourse in the media, business, politics, and education etc. Internet begging belongs to the class of internet discourse which is a kind of computer mediated communication.

Shi, Mishra, Bonk, Tan, and Zhao (2006, pp. 19-38) analyse discourse strategies and identifies the behaviour of multitasking. Hara, Bank and Angeli (2000, pp. 115-152) and Gerosa, Pimental, Fuks, and Lucena (2004, pp. 262-272), (2005, pp. 160-169) show for asynchronous discussion forums that the analysis of beggars discourse (strategies) structure provides important information that can be used to understand and support communicating participants.

## **METHODOLOGY**

The data for this study which comprised of sixty internet beggars' texts two internet begging websites were carefully selected. The choice of the two sites was predicated on the fact that they are very popular begging websites on the internet. The two currently very popular/host sites selected for this study are <https://begslist.org> and <http://www.ebeggars.com>. Many internet beggars register on these sites with different socio-economic problems, different linguistic appealing modes etc. Thirty begging texts relating to financial incapability were selected from each of the websites. The texts were posted by the beggars between December, 2012 and February, 2013.

To carry out this study, both the Pragma-Rhetorical theory and Critical Discourse Analysis approaches were adopted. According to Watson and Hill (1993:146) and Babatunde (2000:150), Pragma-Rhetorical theory investigates the totality of the speakers' use of every available rhetorical strategy in a communicative process and the intended effects on the participants in a given context.

For this study, the adoption of Pragma-Rhetoric theory is highly relevant as it allows for analysis texts are characterized by pragmatic tact and rhetoric like the language situation of internet beggars' texts. Watson and Hill (1993) notes that pragmatics studies language especially as it affects the user e.g. the choices she/he makes, the constraints she/he meets with in using language and the effects the use has on the communication system.

Also, Critical Discourse Analyses is capable of describing various issues present in the internet begging texts. Since internet beggars struggle to gain economic power and as such do this by their words, CDA framework will be able to succinctly capture the social and ideological forces that constrain their manipulative utterances (See van Dijk, 2006). In addition, insights from the method of three tenets or stages as presented by Fairclough (2000) would be applied. Both CDA and Pragma-Rhetorics relate the notion of discourse to micro and macro-discourse.

### ***Pragma-Rhetoric Model***

The pragma-rhetoric model as cited in Babatunde (2000, p. 150) and presented below is relevant to the study of the discourse of e-begging.

#### ***Resources of Pragma- Rhetoric Model***

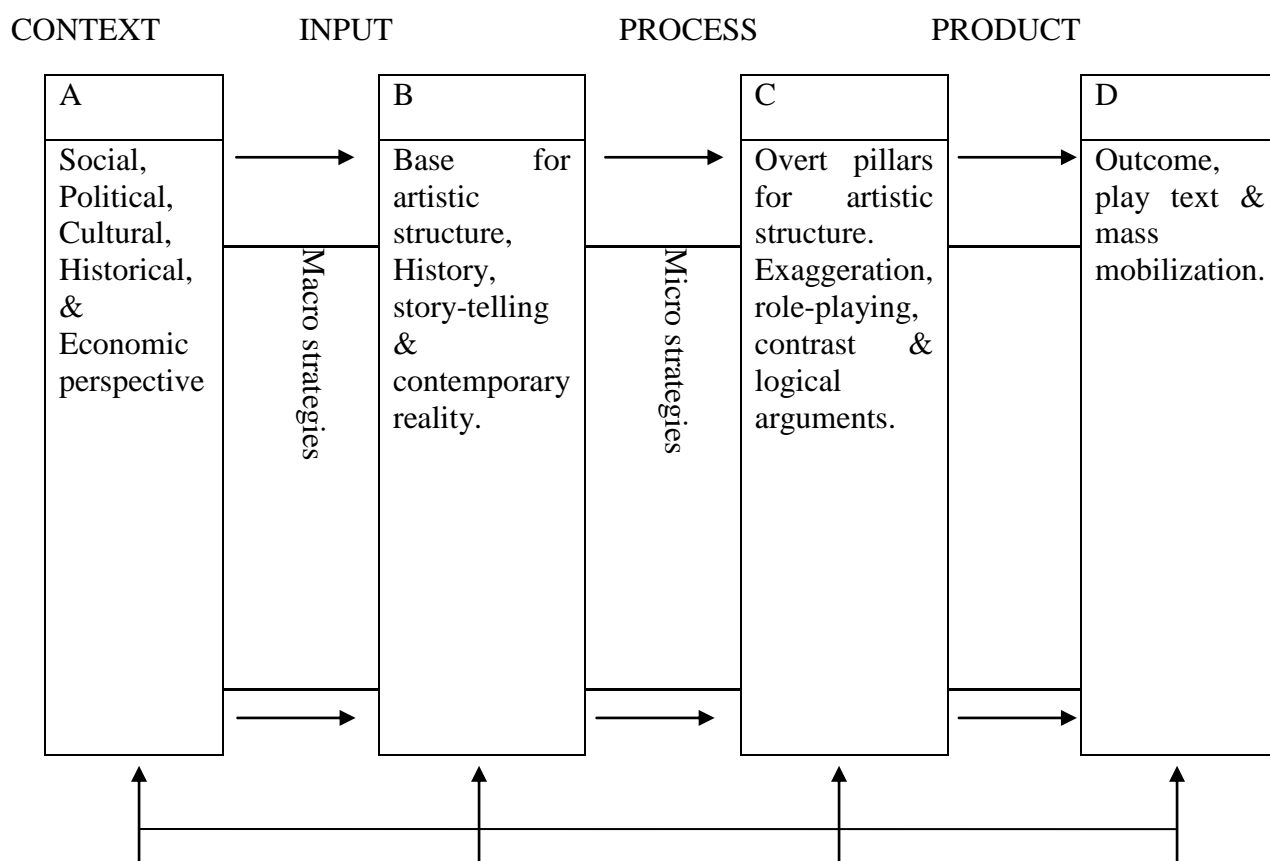

Fig 1: Framework of Rhetorical Analysis as presented in Babatunde (2000) based on the e-begging discourse genre by (Dasal and Gross, 1999).

The above model presents a four-stage model: context, input, process and product. It is applicable to pragmatics as well as e-begging discourse. In this connection, the various elements of Pragma-Rhetoric theory such as contexts, intention, world knowledge, speech acts, affective elements and structure of speech would be applied (See Austin, 1962; Searle, 1969; Grice, 1975).

### ***Critical Discourse Analysis***

Critical Discourse Analysis (CDA) originated from classical rhetoric, text linguistics and sociolinguistics, applied linguistics and pragmatics (See Wodak & Mayer, 2001; Fairclough, 2003; Fairclough & Wodak, 1997; Fowler, 1981).

CDA stresses a kind of interdisciplinary work in order to achieve a proper understanding of how language functions in constituting knowledge, in organizing social institution or in exercising power (Van Dijk, 2006). Atima (2012, p. 39) submits that CDA is useful in disclosing the discursive nature of much contemporary social and cultural changes. Particularly, the language of the mass media is scrutinised as a site of power, of struggle and also as a site where language is often apparently transparent.

### **INTERNET BEGGING DISCOURSE RELATING TO FINANCIAL INCAPABILITY**

Atima (2012) categorises internet begging texts into five distinct areas. They are: the physical disability group, the financial incapacity group, the people begging for educational needs, the sickness group and the homelessness group. This study, however, focuses on and analyses internet begging discourse relating to financial incapability group only.

A fundamental aspect of the internet discourse relating to financial incapacity centres on the financial constraints of the different internet beggars. Each beggar, therefore, adduces reasons for the e-begging experience. Notice must be accorded some of the titles of texts with the key words italicised.

#### ***Titles of Internet Begging Discourse Relating to Financial Incapability***

The following are examples presented in alpha-numeric order:

TL...1 *Hard Times*

TL ...2 *Money needed*

TL ...3 Please help *save* our home

TL ...4 Struggling to *clear debt*

TL ...5 *Need money* for *food* and *bills*

From texts TL...1 to TL...5, it is safe to conclude that the statements of the beggars reflect their basic constraints. The texts portray them as people in need. For example, text TL...1 tends to suggest someone who needs help consequent upon societal economic downturn. The beggar is possibly an adult male adversely affected by the economy. All the texts present needs for money to solve various financial problems like: food to eat, payment of bills, debts, e.t.c. Among other lexical features peculiar to e-begging for financial incapacity are: “fallen”, “hard times”, “need help”, “in debt”, “pay for some bills”, “in desperate need”, “financial help,” e.t.c. It must be noted that the words “need” and “help” make e-begging for financial incapacity distinct and selective for componential analyses as indicated below.

Need	help
+ assistance	+ distress
+ lack	+ poverty
+ scarcity	+ want
- plenty	- adequacy
-sufficiency	- sufficiency

The words analysed are embedded with meanings as they equally depict the subject matter of e-begging for financial incapacity. The words ‘need’ and ‘help’ signify a kind of logical use of language by beggars in distress or desperation to draw the attention of the audience to their situation through their language prowess. The word ‘need’ may not project the actual help required as in texts TL...1 TL...3 and TL ...4 while texts TL...2 and TL ...5 state specific needs for money and food.

### ***Analysis of the Pragmatic Acts and the Discursive Strategies in the Texts***

In order to analyse the pragmatics and the discourse strategies of the selected internet begging texts, J.R. Searle’s (1969, 1979) classification of speech acts shall be applied. Searle (1969) proposes five acts which are: the expressives, the commissives, the assertives or representatives, the directives and the declaratives. They are all employed in e-begging discourse and shall be adopted for the data analyses of this work.

#### ***Expressive Acts***

The expressive acts usually show the psychological state of the speaker with reference to the proposition. It is very important to note that e-beggars state their feelings and attitudes to situations and conditions via expressive acts (paradigm case: thanking, apologising, welcoming, congratulating, e.t.c.). Expressive acts express emotions, disguise, sympathy, e.t.c. Such acts are common in the selected internet begging texts, examples of which are presented in alpha-numeric order with specific lexical items revealing the acts italicised:

- EA...1 Any contribution would be greatly *appreciated*.  
EA...2 *Thank* you for taking the time to read and *God bless*.  
EA...3 Again, *thank* you so much for your time!  
EA...4 *Thank* you in advance for your kindness!  
EA...5 Any donations would be tremendously *appreciated*.

#### ***Commissive Acts***

The commissives tend to commit the speaker to some future course of action (paradigm cases: promising, threatening offering, vowing, challenging, swearing, e.t.c.) through the use of performative verbs like promise, swear, vow, e.t.c. Their examples are presented in alpha-numeric order as indicated below:

- CA...1 I *will return* the generosity as soon as I recover from surgery.  
CA...2 I *will* even take job offers that are legitimate and honest work.

CA...3 I *will give* every donator back -if he wishes a video that i will sing the Christmas carol and thank you personally

CA...4 As things improve, your donations *will be paid* forward to St. Jude Children's Research Hospital in Memphis, TN.

CA...5 I want some money as a loan which *i'll re-pay* within a span of 1 year.

Texts CA...1, CA...2 and CA...5 are promises while texts CA...3 and CA...4 are vows.

#### *Assertive/Representative Acts*

Assertives do commit the speaker to the truth of the expressed proposition (paradigm cases: asserts, conducts, claims, indications, reports, predictions, e.t.c.). Their examples are presented in alpha-numeric order as indicated below:

AR...1 We really *need* the bill paid

AR...2 I *need* my spirits brought back up

AR...3 I was *robbed* at gunpoint on my way to work at 6:30a.m.

AR...4 Recently, one of my metal caps *popped off* and splice right through the filling underneath.

AR...5 I was *laid off*, discovered my boyfriend had been cheating on me, *got very sick*, and now I'm being *threatened* with an eviction during the Holidays.

Performative verbs are always associated with assertive acts which are “claiming, saying, stating, asserting, e.t.c. In text AR...1 the speaker says “We really *need* the bill paid” while texts AR...3 and 4 are just reports. Text AR...5 claims “I was laid off” and then text AR...2 asserts that “I *need* my spirits brought back up.”

#### *Directive Acts*

Directive acts which may be questions, commands, requests, pleadings persuade the addressee to carry out some instructions or perform some physical actions. Examples of such acts presented in alphanumeric order as shown below:

DR...1 Please help me pay for the paperwork so my wife can be declared a permanent citizen and also be allowed to work

DR...2 I am making a request for help with paying for new tires and a four wheel alignment for my car, a 2010 Subaru Legacy sedan.

DR...3 Please help me pay my bills and get back up on my feet!

DR...4 Please help save our home

DR...5 Please help us!

Texts DR...1, 3, 4 and 5 employ “pleas” while text DR...2 uses a different mode of “request.”

#### *Declarative Acts*

Such acts affect immediate changes in the institutional state of affairs which tend to rely on elements of extra-linguistic institutions (paradigm cases: excommunicating, declaring war, christening etc.). Examples of such acts presented in alpha-numeric order below:

DL...1 I would like the money to *pay* for the test which is 40 dollars.

DL...2 Now I am trying to start over and raise some money to *get* a place and *pay* off all my bills.

DL...3 but this was *my last resort*.

DL...4 I'm the *only chance* this family has

DL...5 The *ONE thing* I want to give him this year *is* not going back to living in my car.

Declarative acts are not common features of e-begging as the verbs that characterise the acts are “decide and declare” Texts DL...1, 2 and 5 declare intentions of how he wants to use the money, while texts DL...2 and 3 presents decisions occasioning the begging acts.

### ***Discursive Strategies in the Texts***

Various discursive strategies are employed in the e-begging texts. They are: communicative strategies, persuasive strategies, politeness strategies and storytelling strategies.

#### ***Communicative Strategies***

If communicative strategies are conventional, they follow the normal natural order but if they are conversational they are actions and reactions. Observable at this juncture is Grice’s (1975:45) cooperative principles in conversation of quantity, quality, relevance and manner. Examples of communicative strategies are presented in alpha-numeric order below:

- CS...1 Just a determination to keep going and move forward.  
CS...2 No sob stories (I've already cried).  
CS...3 I am seeking help in order to place a down payment on a vehicle.  
CS...4 YES I AM CRYING OUT LOUD.  
CS...5 No money for us.

In the texts CS...1 to 5, it is clear that what is central to them is to pass across messages that the audience must understand, even though in different styles or strategies. Texts CS...1, 2 and 5 do not begin with normal sentence pattern. The encoder just tries to communicate and observes the cooperative principle due to the system, or medium of passing this message. Texts CS...3 and 4 are different but have been so that the addressee can understand the persons who are in need.

#### ***Persuasive Strategies***

These are strategies beggars employ to persuade, and appeal to the audience as they beg. Several of such texts begin with “please,” some begin with greetings, while others are mild tone to beg with the intention is to win addressee’s heart. The sentences that persuade may either be at the beginning, middle or end of the text. Some examples of persuasive strategies are presented in alpha-numeric order below:

- PS...1 Any help someone could spare would be amazing.  
PS...2 If there is anyone who would be willing to help even a little please let me know!!  
PS...3 If anyone can help me in anyway I would be most grateful.  
PS...4 If you can relate to my situation please make a donation today  
PS...5 If you are in a position to help us, even if it’s just a little, my family would be very grateful!

Texts PS...1 to 5 are persuasive in nature as they appeal to the audience in a mild tone.

Internet beggars appeal to the emotions of the audience as they use powerful and effective pathos to achieve their goals.

### *Politeness Strategies*

E-beggars always use polite words as they appeal to the internet public with the intention of receiving help. Some examples of politeness strategies are presented in alpha-numeric order as shown below:

PL...1 WE ALL ENCOUNTER DIFFICULTIES THROUGH SOME EDGES OF LIFE.

PL...2 I would greatly appreciate all the help I can get.

PL...3 We are having a rough time

PL...4 My wife and I have fallen on some hard times just recently

PL...5 Please help us!

Texts PL...1 to 5 employ a level of politeness as they woo people with the use of the exclusive “we” and the use of “please” also.

### *Story Telling Strategy*

Many e-beggars tell stories about themselves while others make reference to their experiences to attempt to convince their audience about their plight since they understand the socio-cultural concepts of their environment and exploit such to gain sympathy. Examples of storytelling strategies are presented in alpha-numeric order below:

ST...1 I'll just begin my story...here is how it all started....

ST...2 I don't know what to say.

ST...3 Hello, my name is Angelina. I would like to tell my situation.

ST...4 Once upon a time, there lived a group of young adults who came to find one another through catastrophic circumstances and a helping hand from their Creator.

ST...5 I know everyone has a story and I would truly appreciate a minute of your time to read mine.

Texts ST...1 to 5 tell their stories in order to win sympathy of the audience which is not just narration but includes aspects of description.

## **SUMMARY AND DISCUSSIONS**

This paper attempts to show the essence of pragmatics in rhetorical communication. It has investigated e-beggars begging spree on the internet via the use of pragma-rhetorical theory which has been quite relevant in analysing discourse. The selected texts analysed in this paper present several interesting features of discourse which ordinarily may not have been deemed to be a very serious academic adventure.

## **CONCLUSION**

The pragma-rhetorical theory studies the speaker's use of every available rhetorical strategy in the communicative process as well as the intended effects. In essence, this theory makes it possible to blend both pragmatics and rhetorics of the internet begging texts.

## **FINDINGS**

It was discovered that the words ‘need’ and ‘help’ signify a kind of logical use of language by beggars in distress or desperation to draw the attention of the audience to their situation through their language prowess. It was discovered that the proposition of five speech acts of the expressives, the commissives, the assertives or representatives, the directives and the declaratives

by Searle (1969) was effectively employed by the e-beggars. Various discursive strategies of communicative strategies like persuasive strategies, politeness strategies and storytelling strategies were also employed in the e-begging texts. The internet beggars' used every available rhetorical strategy in the communicative process as well as to create intended effects.

## RECOMMENDATIONS

This paper recommends as stated below:

E-beggars should try to avoid using the speech act of the directives. Also, website owners should device means of educating prospective e-beggars on appropriate language skills and discursive strategies.

### ABSTRACT

The present research examined the effect of word repetition prior to reading on skimming of Iranian EFL learners. Initially, a sample of 108 sophomore EFL learners majoring in English translation was selected based on systematic random sampling from Dorud Islamic Azad University. Then, based on an ECCE proficiency test, 62 participants were chosen and divided into two homogeneous groups of 31. One group had exposure to repetition practice and the other did not have any chance for repetition practice of reading materials. After thirteen academic sessions, the results of the paired t-test regarding the pre-tests and post-tests of the two group means showed that both differences (group one: -2.83 and group two: 1.22) were significant at 0.05 levels ( $P < 0.05$ ). These findings suggest that repetition practice prior to reading, could improve EFL learners reading comprehension; however, repetition practice could demonstrate greater improvements on skimming than EFL learners' reading comprehension.

**KEYWORDS:** Reading Comprehension, Skimming, Repetition practice, EFL

### INTRODUCTION

The term *repetition* reminds most educators and scholars of the era of Audio-lingualism in the 1950s when *behaviorism* and *structuralism* were the dominant notion of most language learning.

Years later a variation on Audio-lingualism in British-based teaching and elsewhere, introduces the procedure most often referred to as PPP, which stands for **P**resentation, **P**ractice, and **P**roduction. In this procedure the teacher introduces a situation which contextualizes the language to be taught. The language, too, is then presented. The students now practice the language using accurate reproduction techniques such as *choral repetition* (where the students repeat a word, phrase, or sentence all together with the teacher 'conducting'), *individual repetition* (where individual students repeat a word, phrase, or sentence at the teacher's urging), and cue-response drill (Harmer, 2001 p. 80). *Repetition* also reminds us of other interrelated concepts as rote learning, memorization and imitation. O'Malley *et al.* (1985b) in discussion of learning strategies introduce repetition as a cognitive strategy in imitating a language model, including overt practice and silent rehearsal.

For long *repetition* has been playing a very significant role not only in subject matter learning and learning in general but also in language learning in particular. Although *repetition* has been an obvious dominant feature of the 1950s and 1960s in audio-lingual and other methods, it has been under severe criticism by scholars in the 70s and 80s. Basically they believed that it is not *repetition* and rote learning that leads to language learning/acquisition but rather it is meaningful learning. This criticism has made a shift from *repetition* to meaningful learning in meaningful context. It means that repetition must be contextualized in a meaningful way (Richards & Rodgers, 2001). Nevertheless, nowadays many teachers still use *repetition* in language classes that only covers a small portion of their teaching plan.

The approach taken in this study toward *repetition* is different from that of rote learning and meaningful learning. This pre-reading technique is used in early stages of leaning elementary or intermediate level where students have a fuss over the meaning of new words that hinder them from general understanding. The merits of this technique are to prepare our students to deal with authentic reading materials not only in class but also out of class. It is believed that in the early stages of learning l2 there is too much fuss and anxiety over new words in reading. This technique is devised to help students pass this phase/stage and will not be useful for real reading in later stages. However, it can be employed wherever or whenever you feel students have the problem of dealing with new vocabulary.

Our perspective first deals with the psycholinguistic aspect of repetition in linguistics on native language acquisition then it goes on to argue how to devise an artificial technique to bridge the gap between the problem of new vocabularies and reading comprehension students have when they skim for gist or main idea. The argument of this technique draws on the morphological (eye-familiarity) and phonological (ear-familiarity) effect of repeating new words prior to reading where the focus is on skimming for gist and main idea. These two issues will be discussed further later in this paper. From Psycholinguistics point of view, O'Grady *et al.* (1996) have studied the way our mind processes the new and repeated words. They have also experimented the way our mind treats repeated words by what they call frequency effect, priming effect, garden path effect, and eye movement. The relationship and implication of each of these terms in EFL/ESL will be discussed further later throughout this paper.

A common paradox in reading lessons is that while teachers are encouraging students to read for general understanding, without worrying about the meaning of every single words, students, on the other hand, are desperate to know what each individual word means (Chastain, 1988; Brown, 2000; Richards & Rodgers, 2001; Harmer, 2001; Ellis 2004; Davidson, 2005). Given half a chance, many of them would rather tackle a reading passage with a dictionary (electronic or

otherwise) in one hand and a pen in the other to write translation all over the page (Harmer, 2001)! What we suggest in this paper is a technique that not only takes the students' attention away from new words that are believed to hinder students from reading for general understanding but also increases their speed of reading comprehension. When asked to skim a text for general understanding, most students worry about new words and their meaning. Some even stop when faced with a new word and try to find its meaning; they waste a lot of time on working out the meaning of every single word. Although students are likely to encounter new grammatical structures, idioms, or expression, and pronunciation problem in reading, we attempt to resolve their prime concern, that is, dealing with new vocabulary on the assumption that repetition of new words prior to skimming develops not only speed of reading comprehension but also pronunciation. When we read we pronounce the words on the text that meet our eyes either loudly or silently. So one tool to reading comprehension that speeds up our rate of reading is the pronunciation of new words. This objective is best achieved through this technique where students practice repetition of new words and phrases prior to skimming.

## **REVIEW OF LITERATURE**

We will now review the role of new vocabulary (words) and repetition on skimming in previous literature chronologically. The role of each one is either cited separately or together.

Chastain (1988) contends that students do not need to know all the *vocabulary* and grammar to comprehend a major portion of the text and to recreate the author's meaning. They can learn to read at a much higher level of proficiency than in the past when the preoccupation with the grammar deprived them of the opportunity to read for meaning. On skimming he advocates the idea that readers can comprehend without concentrating on every word, and that they can take the same approach in the second language that they do subconsciously in the native language.

Grellet (1981 cited in Chastain, 1988) also maintains that proficient readers do not concentrate on sentences and words. Instead they start with global understanding and then work toward comprehension of detailed aspects of the reading. Aspatore (1984 cited in Chastain, 1988) discusses the way we can help students overcome vocabulary problem, she suggest that teachers ask students to read and underline unknown words without looking up the meaning in the dictionary; to use contextual clues to guess the general meaning; to skip unknown words; and to focus on cognates, roots, prefixes, and suffixes. Krashen and Terrell (1983 cited in Chastain, 1988) outline the following communicative strategy: 1. Read for meaning. 2. Don't look up every word. 3. Predict meaning. 4. Use context.

Brown (2000) touches on the issue of vocabulary and repetition in first and second language learning from the perspective of imitation and frequency of occurrence in first language learning and rote learning as well as meaningful learning in second or foreign language learning. He goes on to argue that rote learning of vocabulary repetition is obsolete and is replaced by meaningful learning in meaningful context. Brown and Hanlon (1970 cited in Brown, 2000), for example, found that the frequency of occurrence of a linguistic item in the speech of mothers was an overwhelmingly strong predictor of the order of emergence of those items in their children's speech.

Harmer (2001) contends that where reading for general understanding is emphasized, good readers are able to take in a stream of discourse and understand the **gist** of it without worrying too much about the details. Reading for such 'general' comprehension means not stopping for every word, not analyzing everything that the writer or speaker includes in the text. Elsewhere he points out that because students are worried about new words in reading even when they are asked to skim he proposes that we pre-teach vocabulary that is in the reading text. This removes at least some of the barriers to understanding which they are likely to encounter. However, if we want to give students practice in what it is like to tackle authentic reading texts for general understanding then getting past words they do not understand is one of the skills they need to develop. By giving them some or all of those words we deny them that chance. We need a common-sense solution to this dilemma: where students are likely to be held back unnecessarily for three or four words, it makes sense to teach them first. Where they should be able to comprehend the text despite some unknown words, we can leave vocabulary work till later.

Ellis (2004) compares the role of repetition in stereotypical classroom processes in traditional form-focused pedagogy, echoing, i.e. the teacher repeats what a student has said for the benefit of the class; and task-based pedagogy, repetition, i.e. a student elects to repeat something another student or the teacher has said as private speech or to establish intersubjectivity. Elsewhere in his book Lantolf (1995 cited in Ellis, 2004) sees repetition as a form of language play that is important for language acquisition. His learners repeat items and structures that lay within their zone of proximal development.

Davidson (2005) deals with vocabulary issues under the title of lexical knowledge. He points out that it is clear that as the number of unknown lexical items in a reading passage increases, the more difficult it is for students to read it with comprehension. He argues that at the beginning stages and perhaps at the intermediate levels, it may be advisable to maintain a minimum of new vocabulary items. For more efficient readers, a higher percentage of new lexical items could be included in the reading passage, since efficient readers, by definition, have learned either to guess the meaning of unknown words or to ignore them. Finally, it might be difficult to find authentic texts in which the quantity of unknown lexical items is very small. Thus, the number of unknown vocabulary items in a reading passage is affected by the students reading ability, the goal of the reading course, and the objective of the particular lesson.

All the literature cited above tells us about the role of new words in reading and how they might hinder our readers from general understanding. Most of the body of this literature encourages the reader not to stop for new words when skimming. And the majority of the scholars believe that repetition and rote learning is obsolete and must be replaced by meaningful learning in context. Nothing is pointed out about the role of vocabulary repetition prior to skimming. What is lacking in the body of this literature is that where they believe that students should simply not worry about every new word when skimming, they do point out how we can remove this problem. Apparently when we tell our students to do so, we know that they are still worried about those new words and are desperately seeking their meaning. They will not stop until their need is satisfied. The pre-reading technique proposed here is thought to satisfy their needs.

## **CONCEPTUAL AND THEORETICAL FRAMEWORK**

To fully understand the merits of this pre-reading technique it is advisable to consider the way our mind processes new words and the way it is affected by repeated vocabulary. Psycholinguistics has a great contribution to the study of language processing in the mind. Thus

we heavily draw on psycholinguistics from linguistics point of view and skimming from teaching point of view. These two areas of study will be the main focus of this research.

O'Grady *et al.* (1996) have studied in their experiment the effect of lexical decision process on the mind. In the lexical decision paradigm, the experimental subject is seated in front of a computer screen. A word appears in the middle of the screen and the subject must judge as quickly as possible whether or not the word is a real English word by pressing a button labeled 'yes' or 'no'. They have found in many experiments, for example, that subjects take about half a second (500 milliseconds) to press the 'yes' button for frequently used words such as *free* but almost three-quarters of a second to press the 'yes' button for less common words such as *fret*. This finding has been called **frequency effect**. Assuming that longer response time reflect processing that is more difficult or complex, this finding suggest that our mental dictionaries are organized so that words we typically need more often (the frequent words) are more easily and quickly available to us. It also suggests that some aspects of phonology are automatically activated during word reading (although in the lexical decision task, the subject never has to pronounce the word). In other experiment on **priming paradigm** O'Grady *et al.* (1996) found that the response time to words that have been heard or seen before is faster than it otherwise would have been. This is called **priming effect**. On **eye movement** experiment their technique has revealed that fixation times are typically longer for less frequent words, and the point of fixation are typically centered on content words such as nouns and verbs rather than on function words such as determiners and conjunctions. Difficult sentence structures create longer fixation times as well as many more regressive (backwards) saccades. **Regressive saccades** are backward jumps in a sentence and are usually associated with mis-parsing or miscomprehension. On average, backward saccades make up 10 to 15 percent of the saccades in sentence reading, but syntactically complex sentences and semantically anomalous sentences (e.g., *The pizza was too hot to drink*) create many more regressive saccades. It has also been found that poor readers jump back and forth through sentences much more often than good readers do. In another part they introduce **garden path sentences** where readers have to reconstruct or back-track a sentence because of unknown words, ambiguity of the sentence or the structure. Consider the garden path in this sentence: *Since Keith always walks a mile seems like a short distance to him.*

The backtracking readers experience in their reading shows up significantly in eye-movement studies in which it is found that subjects show more regressive saccades sentences as well as longer fixation times (O'Grady *et al.*, 1996).

From linguistics point of view, Falk (1978) talks about native/first language acquisition where it is generally believed that children acquire those linguistic elements or items that are most frequently occurring around them or they most frequently encounter. It means the more exposure to the most frequent language item the more likely for that language item to be acquired. However, there are some language items with less frequency that are exposed to the child through adults/family talk, TV, or radio which are not addressed directly to the child but are presented around him. In this stage s/he does/can not use them but these items form his/her later passive repertoire though they are not used now. He is phonologically familiar with these terms but not semantically. Gradually every one of these phonological terms find their semantic counterparts in the right time and place. The point I am trying to make here is parents or adults underestimate the

ability children have about language acquisition. Although their language repertoire is not complete children can understand a large part of our language, much more than we think and surprisingly those parts they do not understand they save or store them for later analysis. Brown and Hanlon (1970), for example, found that the frequency of occurrence of a linguistic item in the speech of mothers was an overwhelmingly strong predictor of the order of emergence of those items in their children's speech. Though they are not familiar with the meaning of the new words they are familiar with its phonological structure. They are familiar to their ears, or in later stages, even to their eyes though no meaning is retrieved. In acquiring new items, those items that their phonological structures have occurred to the child before are believed to be learnt sooner or better than those he has not heard them before. This theory is also true about second language learners.

Now considering all the above findings from psycholinguistics to child first language acquisition in linguistics and relating them to reading for general understanding in ESL/EFL, we first attempt to find the connection between each of these terms and their implication in teaching skimming. As pointed out previously what *frequency effect*, *priming paradigm*, *priming effect*, *eye movement*, *regressive saccades*, and *garden path sentences* tell us in general suggest that readers spend more amount of time on unfamiliar words and less time on familiar words that are heard or seen before. And some of the regressive saccades or backtracking our eyes make during skimming are the result of those unknown words.

In acquiring new items, those items that their phonological structures have occurred to the child before are believed to be learnt sooner or better than those he has not heard them before. This theory is also true about second language learners. The implication of the phonological familiarity is well manifested in our pre-reading technique. *The theoretical framework suggested here is that when readers meet and hear the new words by choral repetition prior to their skimming, a network of eye and ear familiarity is established in their short term memory when they plunge into the text.* When we read we pronounce the words on the text that meet our eyes either loudly or silently. So one tool to reading comprehension that speeds up our rate of reading is the pronunciation of new words. This objective is best achieved through this technique where students practice repetition of new words and phrases prior to skimming. When readers are familiar with the morphological symbol and sing of the new words, that is, the superficial form of the new words (not their root, suffix, or prefix); as well as their phonological realization through our technique they are thought to have a faster eye movement, over new words and less regressive saccades or backtracking. Priming and frequency effect is also enhanced and garden path effect is thought to be reduced. The repetition technique activates the phonological and morphological representation of the new words in the students' short term memory while the new words will be introduced to their repertoire though no meaning is retrieved. The activation and effect of this short term retention facilitates the speed of skimming and eye movement students experience when they read those new words.

## STATEMENT OF THE PROBLEM

It is hoped that the current study, although sketchy, will shed some light on foreign language teaching/learning in general and skimming for general understanding in particular. The attempt made here is to dispel the fuss and anxiety both teachers and learners have over new words when the focus is on reading for general understanding. This study can also give the teachers an alternative toward handling the paradox in reading when students worry about new words. It has been observed that when teachers ask students to read a text and tell them about the main idea or gist of it their first complain and anxiety is about meaning of new words as well as time limit.

Remember that when we ask students to skim a time limit must be made so that students be encouraged to read for general understanding and not for detail.

## RESEARCH QUESTIONS

The main questions to be perused in this study are as follows:

- 1) To what extent does repetition of new words prior to skimming for general understanding have a positive effect on students' reading comprehension?
- 2) To what extent does repetition of new words prior to skimming for general understanding negative have a negative effect on students' reading comprehension?

## RESEARCH HYPOTHESES

**The H1 hypothesis** is that repetition of new words prior to skimming for general understanding will have a significant positive effect on students reading comprehension.

**The H2 hypothesis** is that repetition of new words prior to skimming for general understanding will have a negative effect on students reading comprehension.

## METHODOLOGY

### *Participants*

In the present research, the participants were chosen from BA students of Islamic Azad University of Abadan. They were studying English translation in their fourth semester. The population was 108 male and female students. The 62 homogeneous participants drawn from this sample were randomly divided into two experimental groups of 30. There were 27 females and 4 males in group one who had no chance of repetition practice; and there were 26 females and 5 males in group two who had a chance of repetition practice. In group one, the average age was 25.29 ranging from 19 to 46. There were 17 bilinguals with Arabic-Persian backgrounds, 1 Turkish- Persian bilingual, 3 Kurdish-Persian bilingual, and the rest were Persian monolinguals. In Group two, the average age was 24.61 ranging from 19 to 39. There were 12 bilinguals with Arabic-Persian backgrounds, 1 Kurdish-Persian bilingual, and the rest were Persian monolinguals. Note that learners' bilingualism, age, and gender were not considered as variables and are presented here only to describe the participants.

### *Instrumentation*

A proficiency *Michigan Examination for the Certificate of Competency in English* (ECCE) Mennen (2005), multiple-choice reading comprehension test of 60 items was first administered to 10 fourth semester EFL subjects. When the reliability was assured, this test was administered to 108 EFL populations in order to select the homogeneous subjects. The other instrument was a 20-item multiple-choice reading comprehension Examination for the Certificate of Competency in

English (ECCE) test that served as pre-test and post-test for both experimental groups. The reliability of the test before administration of the pretest was calculated by the correlation between the means of test and retest by two weeks interval between the test and retest. The reliability coefficients was calculated based on correlation coefficient and it was met as  $r = 0.87$ . It is worth noting that group one was not exposed to repetition practice; and group two had chance of repetition practice. Assignments given to both groups also included out of class activities alongside class activities. Participants were permitted to work in groups to check the correct pronunciation.

### ***Procedures***

A 60-item language proficiency test of ECCE Michigan, whose reliability coefficient was met, was prepared and administered to 108 EFL subjects from Islamic Azad University of Dorud, Lorestan Province and after an interval of two weeks the same test was administered to the same 10 subjects and the reliability of the test and the retest was calculated as  $r = 0.83$ . Then, for the purpose of selecting the homogeneous participants, those who scored one standard deviation below and above the mean which was 14.4586 were called for the next phase of the study. After that, they were randomly divided into two experimental groups of 31 participants. Their classes were held once a week for 90 minutes for thirteen sessions.

Before any treatment, a different reading test of ECCE was administered to measure the participants' reading comprehension; in fact, this reading test of 20 multiple choice items designed for pre-intermediate to intermediate EFL level functioned as both pre-test and post-test for both groups. It is a reading test. In order to make sure of the reliability of the pre-test, it was administered to 10 fourth semester EFL majoring BA translation students twice within two weeks intervals. The reliability of the pre-test obtained by the coefficient correlation between the test and retest was  $r = 0.87$ . After the reliability of the pretest was assured, it was administered to both experimental groups to measure their reading comprehension knowledge.

It is important to note that some in-class and out of-class reading activities were worked out in groups. Sometimes assignments included internet extracted texts of their own materials. However, in order to avoid taboos in these texts, the socio-cultural appropriateness of materials was checked with the subjects before they were brought into the classroom.

### ***Teaching:***

This pre-reading technique is used for early stages of learning, for example, an elementary or intermediate level where students have a fuss over the meaning of new words that hinder them from general understanding. The merits of this technique are to prepare our students to deal with authentic reading materials not only in class but also out of class. It is believed that in the early stages of learning there is too much fuss and anxiety over new words in reading. This technique is devised to help students pass this phase/stage and will not be useful for real reading in later stages. However, it can be employed wherever or whenever you feel students have the problem of dealing with new vocabulary.

Once the reading text has been specified the teacher is required to extract the new words and phrases out of it. Determining what words are new and must be listed out prior to a reading task is a difficult decision to make. For what might be new to one student might not be new to another. There are books which list their new vocabularies either at the beginning, throughout the lesson, or at the end of it. In case they're listed at the beginning you do not need to bother to determine the new words and can benefit from that. In cases where new vocabularies are not

specified and it is up to the reader to extract the new words, there seems to lie the hard decision of determining what words are new to our readers. Based on the English level of our students, experienced teachers know how to identify which words are to practice prior to a reading task. Therefore, for carrying out this technique teachers need to prepare a list of new vocabularies or phrases in case there isn't any. Once you have prepared the list of the new words and phrases, write them on the board or ask the students to write them on their notebook or a piece of paper (when we write the new words retention will be longer). Now ask your students to listen to you carefully and attentively; then read the list out loud with normal speed to the students. Next on the second round read every word or phrase slowly and separately. On the third round have students repeat every word or phrase after you for two or three times. The number of the word repetition depends on the students' difficulty with the words and the feedback the teacher gets from the students. Teachers must be careful that words be pronounced correctly. It does not matter if they do not know the meaning of the new words because the purpose of this activity is word recognition and eye (morphological) and ear (phonological) familiarity with the new words prior to extensive reading. Then you can give a time limit of, say, five minutes for skimming the text for general understanding or main idea. Students must be encouraged to read as fast as they can and not to stop for new words. Remember that the purpose is to teach the students to kick the habit of stopping or wasting time on new words.

#### ***Testing the hypothesis:***

Two groups of 31 intermediate students at the fourth semester from Dorud Islamic Azad University were selected. One group will be the control group where we gave them a reading text and ask them to read the text in 6 minutes and answer the questions at the end. This group received no repetition practice.

The experimental group, on the other hand, had the chance of receiving the repetition practice and are asked to skim the text in 5 minutes.

We hypothesize that our experimental group which has received repetition practice will score higher on general understanding test. A paired sample *t*-test (Hatch & Farhady, 1981) will best serve our purpose here to compare the mean score of these two groups.

## **RESULTS**

The performance of group one (no repetition practice) on the pretest and the posttest produced a difference between their scores. **Table 1** below shows the participants' performance on the 20 item multiple-choice reading comprehension Pre-post tests. This was followed by paired *t*-test as depicted in **Table 2**. The significance value for the *t* test indicates that there is a significant difference between the Pre- post tests. The difference was also significant even at 0.001 level. Performance of the participants in group two, who had exposure to repetition practice, on multiple-choice reading comprehension test also revealed that there existed a difference between the means of Pre-post tests (see **Table 3**). Once the raw scores were obtained, paired *t*-test was calculated. **Table 4** illustrates the comparison of these two means. Comparison of the pre-post tests means indicated a significant improvement over learners' reading comprehension.

*The Effect of Speech Rate on Listening Comprehension of EFL learners***Table 1: Descriptive statistics of group one's pretest and posttest**

	N	Mean	Std. Deviation
Group 1 pre-test	31	10.74194	3.306234
Group 1 post-test	31	13.58065	2.486955

**Table 2: Group 1 paired t-test**

Paired differences							
	Mean	Std. Deviation	Std. error mean	95% confidence interval of the difference		t	df
Sig				Lower	upper		(2-
tailed)							
Pair 1 pre-posttest :	-2.838710	2.517893	0.452227	-3.762280	-1.915139	-6.277	30

0.000  
Level of significance = 0.05 Sig = 0.000 t observed = - 6.277 t critical = 2.000

**Table 3: Descriptive statistics: pre-test and post-test results of group two**

	N	Mean	Std. Deviation
Group2 pre-test	31	11.35484	2.763432
Group 2 post-test	31	12.58065	2.202638

**Table 4: Group 1 paired t-test**

Paired differences							
	Mean	Std. Deviation	Std. error mean	95% confidence interval of the difference		t	df
Sig				Lower	upper		(2-
tailed)							
Pair 2 pre-posttest :	-1.22581	3.007875	0.540230	-2.32910	-1.22509	-2.269	30

0.031  
t observed = -2.269 level of significance = 0.031 at 0.05

**Table 5: Paired t-test of G1 & G2 pre-and posttests**

Paired differences							
	Mean	Std. Deviation	Std. error mean	95% confidence interval of the difference		t	df
Sig				Lower	upper		(2-
tailed)							
Pair 1 pre-posttest :	-2.838710	2.517893	0.452227	-3.762280	-1.915139	-6.277	30
0.000							
Pair 2 pre-posttest :	-1.22581	3.007875	0.540230	-2.32910	-1.22509	-2.269	30
0.031							

Pre-post tests of group one was higher compared to that of group two. Statistically, differences found in group one are simply more significant than those of group two (See **Table 5**). As indicated in **Table 5**, there is enough significant difference in t-observed and t-critical as well as level of significance of group one to reject H01 not only at 0.05 level but also at 0.001 level. It is worth mentioning that the level of significance for rejecting the null hypothesis was set at the 0.05 level of significance for both hypotheses (H01 and H02).

**DISCUSSION**

In the following, the research questions are respectively discussed and answered.

1) *To what extent does repetition of new words prior to skimming for general understanding have a positive effect on students' reading comprehension?*

Table 5 shows that participants' performance on the pretest is much different from their performance on the posttest. Results suggest that participants' exposure to repetition practice had a significant effect on the improvement of their reading comprehension. The results related to the first hypothesis are in agreement with Rivers (1981), Chastain (1988). In the same line, Rivers (1981) believes that learners should be exposed to speech repetition and when speech is mechanically repeated it is not desirable; and learners can understand natural speech even in the early stages of language learning.

2) *To what extent does repetition of new words prior to skimming for general understanding negative have a negative effect on students' reading comprehension?*

A comparison between the means of pretest (11.35) and posttest (12.58) of group two showed a difference. Group two performances on the reading comprehension posttest showed that although they had only exposure to repetition practice, their performance had an improvement which was not comparable to that of group one. However, the difference (0.031) was large enough at 0.05 level of significance to reject the null hypothesis. It implies that listening comprehension is affected by fast or slow speech but exposure to slow speech rate is constructive and formative as well. Although the degree of its formativeness and construction is not obviously so clear, it demonstrated a degree of improvement.

There are a lot of intervening factors that might change the results of research or the results one gains might not be because of the treatment. Repetition practice in reading comprehension cannot be easily studied if other factors are not taken into account. Repetition practice whether slow or fast is strongly affected by other factors such as formality and informality of the speech, the situation type, the relationship between speaker and listener, level of technicality of that speech or its jargon, learners background and world knowledge and many other factors Rivers (1981). However, this research could somehow imply that participants' exposure to repetition practice made a better improvement over those who did not expose to repetition practice. What is important to note is that this research can partially imply that in designing any reading material, imposing repetition practice exercises do make a difference but what makes the biggest difference is the *naturalness* of both material and exercise. Therefore, mechanical repetition speech practice is not a long term objective in teaching and learning reading comprehension. On the other hand, repetition practice might be used for the same purpose but in EFL / ESL reading comprehension in general and speech repetition in particular that may suggest a different sense.

Researchers have to guard against the idea that comprehending of skimming not an end but rather a short path practice to comprehend natural texts. EFL / ESL listeners do not usually go around asking their interlocutors to repeat their speech; rather repetition in speech may happen rarely when the global features of communication are broken down. It means, in real life experience in L1 as well as L2, naturalness is more marked or prominent than unnaturalness. It might also be true about EFL / ESL skimming in reading comprehension. Students had better practice to deal with skimming, although they might have started with slow speech repetition.

## CONCLUSIONS AND IMPLICATIONS

The results of the two experiments presented in this research focused on the effect of word repetition on Iranian EFL learners' skimming and reading comprehension. The assumption to use word repetition practice was motivated by the fact that reading comprehension constitutes a large input in academic language comprehension, and on the other hand, there are limitations for learners to comprehend this natural input in EFL / ESL context; therefore, word repetition practice before skimming has been another compensation for the learners' limitations to be investigated. The results of the two experiments conducted in the present study provided positive answers to our hypotheses and research questions. That is, skimming or exposure to repetition practice made a significant improvement in learners' reading comprehension. This improvement was manifested in their post test compared to their pretest. On the other hand, learners' exposure repetition practice also demonstrated an improvement. However, the significance of the improvement in exposure word repetition practice was greater than those who did not have any chance to word repetition practice. What is clear in this research is that word repetition practice before reading has some features that can be beneficial to the readers.

Although others might have come to different conclusions on the issue of word repetition prior to reading on skimming and reading comprehension, the word repetition practice counted better in this research. In teaching and learning reading comprehension, word repetition cannot be overlooked. But the decision to use what materials is vital to the whole concept of teaching and learning reading comprehension. Although the results of this research implied that word repetition prior to reading made improvement in skimming and reading comprehension. Teachers and learners should take into account features of word repetition practice has some advantages and disadvantages. But if comprehending the passages and texts is the optimal objective, therefore, the attention and focus should be given to word repetition practice before reading. However, the researchers do not claim the results obtained from this study are absolutely conclusive. Put it another way, as people come to learn a new language in a foreign context, not only their skills practice influence their performance in general and their reading comprehension in particular but also many other factors including sub skills practices for the language proficiency they are going to obtain, the context in which they are going to master the new language are extremely influential in this regard. Of course, the researchers believe that to know more about the role of word repetition prior to reading on skimming in EFL contexts more studies are needed. It is suggested that further more future studies take the limitations of this study into consideration and investigate the characteristics of other pre-reading exercises, and their influences on the reading comprehension in academic and non-academic situations.

## ON THE NATURE OF L2 PRAGMATIC COMPETENCE

Ren Hulin

Department of Foreign Languages, North China Electric Power University, Beijing, China

### ABSTRACT

The paper is to explore the nature of pragmatic competence in a second language (L2). In this context, “pragmatic competence” refers to a speaker-hearer’s tacit knowledge of the conditions governing the appropriate use of language (Botha 1995:123). The paper begins by Thomas’s (1983) two division of pragmalinguistic and sociopragmatic components of pragmatic competence in an L2. Then, the two types of pragmatic failure in communication and their differences by Blum-Kulka (1982) and Thomas (1983) are discussed. Following this, Blum-Kulka’s (2002) argument that certain aspects of pragmatic competence in an L2 are universal is discussed. Finally, the paper summarizes components of pragmatic competence in an L2.

**KEY WORDS:** Pragmatic, Competence, Second language

### INTRODUCTION

It is widely accepted that second language (L2) learners differ in their pragmatic competence. According to Thomas (1983), a speaker’s pragmatic competence in an L2 would be made up of pragmalinguistic competence and sociopragmatic competence. Thomas claims that a speaker, in order to be pragmalinguistically competent in an L2, should have grammatical knowledge about that language, i.e. abstract or decontextualized knowledge of intonation, phonology, syntax, semantics, etc. Lack of such knowledge may result in multiply ambiguous sentences such as in (1), where the ambiguity is caused by lack of semantic knowledge, since the verb *miss* in (1) has at least three senses, i.e. *fail to catch*, *discover loss* and *avoid from*. *She* and *it* are an indefinite number of possible referents.

(1) She missed it. (Thomas 1983:92)

In addition to this, Thomas argues that a speaker should also have social pragmatic principles in order to be sociopragmatically competent in an L2. According to Thomas, the social pragmatic principles include knowledge about cross-cultural beliefs of using language effectively in order to achieve a specific purpose and to understand language in context. One example of this is as in (2), where the social determined pragmatic principles allow English first language (L1) speakers to determine that *she* refers to *Elsie*, *it* refers to *the earlier train*; and *missed* has the sense *failed to catch*. Lack of the knowledge may result in L2 pragmatic failure in communication to be discussed as follows.

(2) A: Why didn’t Elsie come on the earlier train?

B: She missed it.

(Thomas 1983:93)

## PRAGMALINGUISTIC AND SOCIOPRAGMATIC FAILURE IN L2

There are two types of pragmatic failure argued by Thomas (1983), i.e. pragmalinguistic failure and sociopragmatic failure in an L2. Pragmalinguistic failure occurs when the pragmatic force mapped by speakers onto a given utterance is systematically different from the force most frequently assigned to it by native speakers of the target language (Thomas 1983:99). Pragmalinguistic failure may be caused by differences in the linguistic encoding of illocutionary force. Illocutionary force, according to Finegan and Besnier (1989:329), is concerned with a speaker's intention in making an utterance in a given context. For example, the illocutionary force of an utterance such as *Do you have the time?* may be a request for information about the time of the day or a yes/no question (*Do you have the time [to help me]?*). In the utterance, should a difference in the linguistic encoding of illocutionary force exists, such as the conventionalized understanding of the word *time*, pragmalinguistic failure may occur, as in (2), where the native speaker requests for information about the time of the day, the non-native speaker misunderstands the native speaker's intended meaning of *time* as a yes/no question (*Do you have the time [to help me]?*).

(2) Native: Do you have the time?

Non-native: I have to go home.

(Flowerdew 1988:69)

Sociopragmatic failure in L2 is related to "the social conditions placed on language in use" (Thomas 1983:99). Sociopragmatic failure may take place when there are cross-cultural differences in what constitutes appropriate linguistic behavior (Thomas 1983:99). Appropriate linguistic behavior, according to Bachman (1990), involves knowledge of the sociolinguistic conventions for performing language functions appropriately in a given context. For example, the phrase *I'm asking you to ...* might in a suitable situation be taken by a native English speaker to be command, as when a teacher says to a student *I'm asking you to stop talking*. In Russian, the literal equivalent *proshu vas* is not considered as a command, but merely a device for *going on record*. Thus, if a Russian student of English says something to his or her teacher like *I'm asking you to look at my work*, which in an appropriate situation might well be perceived by the native English speakers as face-threatening and domineering. In such a case, sociopragmatic failure is caused by different social beliefs of the appropriate linguistic behavior in request between English and Russian.

As can be seen from the above illustration, one of the differences between pragmalinguistic and sociopragmatic failure in an L2 is that pragmalinguistic failure concerns one's linguistic knowledge or grammatical conventionalized rules of an L2, while sociopragmatic failure involves one's sociolinguistic knowledge or social conventionalized beliefs of language usage in an L2 (Thomas 1983). Another difference is that pragmalinguistic failure may be caused by differences in the linguistic encoding of pragmatic force in an L2, while sociopragmatic failure stems from cross-culturally different perceptions of what constitutes appropriate linguistic behavior in an L2 (Thomas 1983).

## THE ROLE OF INDIRECT SPEECH ACTS

Essentially in agreement with Thomas, Blum-Kulka (1982) claims that pragmatic competence involves realizing indirect speech acts necessarily in an L2. Indirect speech acts involve cases in which the speaker says one thing and means that, but also means something else. One example of indirect speech acts is as the utterance *It is cold in here*, a speaker may mean that the physical atmosphere in a room, as a warning not to bring the baby in, he or she may also mean a request to turn on the heater.

Blum-Kulka claims that learning to realize indirect speech acts in an L2 necessarily involves learning new strategies for realizing indirect acts, as well as new social attitudes about the appropriate and effective use of these and other strategies in context.

An evidence to support Blum-Kulka's claim comes from the different strategies of indirect speech acts performed in different languages. Take the conventional strategies of making indirect requests as example, say, in Hebrew and English. A conventional standard for making indirect requests in Hebrew, as in (4), is by questioning whether there is a possibility in the future for the act to be performed. While the same case in English is represented in (5), where *can you do (such and such)* is a standard way of indirectly making a request.

(4) Ulay telex lišon? (Perhaps you'll go to bed?)

(5) Can you go to bed?

(Blum-Kulka 1982:34)

Another evidence in favor of Blum-Kulka's claim is from different social attitudes about the appropriate and effective use of the same strategies in a given context. One example is the strategy used for asking for the salt at a dinner table in Israel. The speaker of Hebrew who wants the salt passed can use an expression which is a literal translation of an English as *can you pass me the salt?*. However, the most appropriate and effective expression of the social attitudes used at dinner tables in Israel is *Elšar leqable at hamelax? (Is it possible to get the salt?)*.

From the evidences provided above, one can see the different strategies of making indirect requests between languages such as Hebrew and English. Consider that a native English L2 learner of Hebrew, if he/she does not learn the new strategies of making indirect request in Hebrew, i.e. by questioning whether there is a possibility in the future for the act to be performed as *Ulay telex lišon? (Perhaps you'll go to bed?)*, he/she may fail to realize the indirect speech acts in Hebrew. Hence, for native English L2 learners of Hebrew, they might have to learn new strategies of making indirect requests in Hebrew which are different from his/her native strategies. Likewise, the speakers of Hebrew in Israel also need to learn the new social attitudes about appropriate and effective use of some strategies in context, which might be quite different from that of their native norms such as *Elšar leqable at hamelax? (Is it possible to get the salt?)* etc.

## THE ROLE OF UNIVERSAL PRAGMATIC KNOWLEDGE

In spite of the fact that there are new strategies and appropriate social attitudes of indirect speech acts that L2 learners have to learn, certain features of indirect speech acts may be shared by L1 and L2, and can be transferred from L1 to L2, as such, these shared features will play its basic role in the acquisition of pragmatic competence in an L2 (Blum-Kulka 1982, 2002). According to Blum-Kulka, certain aspects of pragmatic knowledge of L2 are based on universal

principles, and these universal principle based knowledge will help L2 learners in acquiring the basic ability to interpret and realize indirect speech acts in an L2.

One evidence supporting Blum-Kulka's claim can be found from learners of different linguistic and cultural backgrounds, mainly from their interlanguage production or comprehension of requests, suggestions, invitations, refusals, corrections, complaints, apologies, compliments and indirect answers (Ellis 2002). For example, in Hebrew, the general question about direction of driving is a request for a lift, as in (6), where the question of the Hebrew may be different from that of the native English speakers'. However, the native English speaker can understand the meaning of the Hebrew and make an answer to it, i.e. *No, we are unable to go with you.*

- (6) A (the Hebrew) Are you going our way?  
B (native English speaker) Yes, but I'm afraid the car is full.  
(Kasper 1992: 212)

Another evidence is from the cross-culturally shared conversational rules, as in (7), the non-native speaker begins his answer to the question *Is he not very nice?* by another question *Not nice? I think he's great.* According to the survey of Blum-Kulka's (1982:44), 90% of native speakers agree with the answer *Not nice? I think he's great*, which is compatible with the answer of the L2 learners with 85% agreement.

- (7) Non-native: What do you think of our new boss?  
Native: Not very nice.  
Non-native: Not nice? I think he's great.  
(Blum-Kulka 2002:57)

In the example of (6), albeit not always in the same way as native English speakers make a request, the Hebrew manages to get the information that is needed from the native English speakers. In such a case, one can see that there is universal principle pragmatic knowledge shared by English and Hebrew, which operates in the specific sets of realizing different strategies in the context. Likewise, from the answer agreement in (7) between the native speakers and the L2 learners, one can see that the ability to draw conversational implications may come from the universal pragmatic knowledge shared by L1 and L2. Hence, it may be the transfer of the universal principle pragmatic knowledge from L1 to L2 that enables L2 learners to acquire the basic ability to interpret and realize indirect speech acts in an L2. Recently researchers tried to explain L2 learners' performance in terms of universal processing mechanism or its relationship with the grammar (e.g. Felser and Roberts 2007), although the results are still in debate (Shin and Christianson 2012).

## CONCLUSION

In sum, L2 pragmatic competence consists of pragmalinguistic and sociopragmatic knowledge. Pragmalinguistic knowledge entails grammatical rules about an L2, lack of such knowledge may result in pragmalinguistic failure. Sociopragmatic knowledge involves sociolinguistic perceptions of an appropriate linguistic behavior in an L2, lack of this knowledge may cause sociopragmatic

failure. The nature of pragmatic competence in an L2 involves learning new strategies for realizing indirect acts, as well as new social attitudes about the appropriate and effective use of these and other strategies in context. The basic ability to interpret and realize indirect speech acts in an L2 is acquired from the universal knowledge of indirect speech acts shared by both L1 and L2.

### ABSTRACT

The Innovated Writing Process (IWP) approach was designed as a program for teaching writing, and was implemented in the classroom settings, to investigate the impact of Revising and Redrafting on improving Arab Learners of English written accuracy (Mourssi, 2013a). The IWP approach focuses on the role of both the teacher and the learner and gives detailed guidelines for instructors to follow. It is an attempt to apply Sociocultural Theory in the classroom settings (Lantolf & Thorne, 2006), and how the input can be well reprocessed which, in turn, develops the Second language learners' internalized grammatical system. In other words, based on the shortcomings found in previous methods of teaching writing - product writing/ process writing - and following recent works in applied linguistics and second language acquisition on form-focused instruction, ex-implicit teaching and learning (Mourssi, 2013b), and types of feedback, the Innovated Writing Process approach was designed. Finally, implementing the IWP approach indicates that corrective feedback does help L2 learners in the SLA, and also indicates the metalinguistic feedback may be one of the most suitable feedback types which help L2 learners acquiring second language linguistic items.

**KEY WORDS:** *Form-focused instruction, interaction, metalinguistic feedback, revising, redrafting and SLA.*

### INTRODUCTION

In designing the IWP, a variety of teaching methods were integrated bearing in mind the L2 learners' level and the types of error/mistake which emerge as they prepare their written work. Corrective feedback is provided to the learners by analyzing their errors/mistakes and explaining the nature of the errors/mistakes produced during writing, and how L2 learners managed to produce the target-like forms themselves after receiving metalinguistic feedback (Mourssi, 2012b).

The reader should be reminded that the Innovated Writing Process approach (IWP) is one of the findings of an empirical study in the context of Arab learners of English (Mourssi, 2013a). This paper consists of six main parts which are: introduction, literature review, theories of language and language learning in the IWP approach, the design, the procedures, conclusion and the references. In the following is the literature review.

## LITERATURE REVIEW

### *Research on Process Writing (1980s-1990s)*

There is an assumption suggesting that, when teachers teach students how to write target-like forms, the process helps the latter to learn the underlying structures of the language as well. Raimes (1983, p.3) posits that the use of writing as a medium for communication reinforces grammatical structures, idioms, and vocabulary. Thus, teaching writing provides a unique way to reinforce learning.

According to Reid (1993, p. 21), in the 1970s, many ESL composition teachers in intensive language programs used writing mainly as a support skill in language learning. Some of the activities in writing included: doing grammar exercises, answering reading comprehension questions, and writing dictation. Furthermore, writing was viewed as one technique used to add interest to a lesson or even perhaps, as a testing device to diagnose grammar or comprehension errors. In the 1980s, linguists and teachers of EFL/ESL observed that traditional writing exercises were “product” orientated, meaning that they were more concerned with the final result than with the process of learning which can occur through the writing activity.

Richards et al. (1999, p. 290) defined process writing as an approach that puts emphasis on the composing process, wherein the writer makes use of tools such as planning, drafting and revising. These tools are used to help students improve their writing skills and possibly achieve target-like procedures in composing. Sometimes, process writing is comparable with the product approach or the prose model approach that focuses on producing different kinds of written products by imitating model paragraphs or essays.

Pennington et al. (1996) conducted a study on the introduction of process writing among secondary school students in Hong Kong. The outcome of the survey suggests the presence of a complex pattern of cause and effect relationships between students' attitudes and teachers' behaviours. The results also revealed that the student group that had positive experiences with process writing are those who demonstrated positive attitudes at the beginning of the project. This group was supervised by a teacher who integrated elements of process writing into his/her teaching routine. On the other hand, the group that evaluated the experience negatively was taught by a teacher who focused on traditional language exercises and grammatical accuracy, and did so with very little integration of elements of process writing. These findings underline the importance of the role of the teacher in teaching writing processes inside the classroom.

Fulcher (1997, p. 17) maintains that the process approach often emphasizes the development of thinking skills along with the writing process. Raimes (1983, p. 3) also underscored the strong relationship between writing and thinking that makes writing a valuable part of any language course. Therefore, it can be surmised that writing holds an important role in the development of language skills. The stages of process writing will be presented in the following section.

### *Stages of Process Writing*

A number of recent works support the use of process approaches in teaching writing and these are reviewed below:

Hedge (1997, p. 21) explains that the process of writing contains a number of stages as represented in the following Table.

Table 1: Stages of Process Writing

being motivated ► to write	getting ideas ► Together	Planning and ► Outlining	making notes ►	Making a first ► Draft	revising Re-planning ► redrafting	editing and getting ready ► for publication
-------------------------------	-----------------------------	-----------------------------	----------------	------------------------------	--	--

To emphasize clearly the importance of the teacher's role during the writing class, Nunan (1989, p. 13) asserts that English as Second Language (ESL) courses must be carefully planned for each class is a single piece of a complex design. Likewise, teachers should determine the materials in order to arrive at a specific performance level by setting some goals that a teacher aspires to achieve (2012d).

Reid (1993, p. 73) argues if the ESL writing class is one of the areas in a writing program, it is necessary to know not only the performance objectives of a single course but also the overall goals of a writing program involving other classes. Teachers may also experience difficulties in teaching speaking, listening and reading. But more often, it is more difficult to teach writing because it requires greater effort and a larger amount of time from both teachers and students (Hedge, 2005).

Pressley and Yokoi (1997) examined certain instructional practices and procedures in teaching writing developed by fifth-grade teachers, nominated as outstanding teachers in the U.S. An analysis of the survey returns shows that these teachers have prioritized the development of word-level comprehension, and critical thinking skills. As they believed that the development of background knowledge is essential to the process, students were consistently reminded about the importance of planning, drafting, and revising. In the following, I will talk about research on writing processes in the 21st century.

### ***Research on Writing Processes in the 21st Century***

Due to the dramatic changes in the process of teaching writing in the 1990s, there has been an increasing awareness amongst L2 writing researchers and teachers that classroom-based instruction plays a significant role in helping L2 learners improve the accuracy of their written texts (Bitchener, 2005; Ferris, 2002, 2004). To ensure improvements in writing skills, additional exercises now include discussions and exercises in marking strategies encompassing further activities such as revision in the planning and drafting stages (Hedge, 2005, p. 5). These exercises are expected to increase teachers' interest to find intervening measures using feedback in a variety of ways. That is what the author seeks to achieve with Arab learners and teachers of English.

Concerning difficulties and challenges in the teaching process of writing, Hedge (2005, p. 7) argues that compared to speech, effective writing requires a number of things, such as: (1) a high degree of organization in the development of information; (2) ideas or arguments; (3) a high degree of accuracy; (4) the use of complex grammatical devices for focus and emphasis; and (5) a careful choice of vocabulary, grammatical patterns and sentence structures. These five items may explain why writing can be a difficult task for most ESL/L2 students. From this point of view, the author is trying to activate the writing sub-processes which are drafting, revising and

redrafting and increasing the role of the teacher inside the classroom in teaching writing skills. The approach integrates noticing, active interaction, feedback and error analysis aiming at improving foreign learners' writing as well as speaking. The framework of the IWP is presented in Figure 1.

Hedge (2005, p. 10-15) developed several assumptions which could motivate students and teachers. Four of these assumptions are as follows: (1) students need opportunities to practise various forms and functions of writing, and from within these develop different skills; (2) the need to encourage students to go through the processes of planning, organizing, composing, and revising; (3) the process of marking needs constant review and modification, and (4) giving students more time in the classroom to generate discussions and activities that encourage effective writing processes.

Shin (2008, p. 3) made a critical review of the usefulness of grammar correction in second language writing. The author concluded with a discussion on the necessity and importance of proper grammar correction for L2 writers. Similarly, Rahimi (2009) has investigated the impact of feedback which includes reference to the students' L1. Both indirect feedback and no feedback approaches were studied. He concluded that feedback is effective.

O'Brien (2000, p. 40) sets out four principles which presumably govern the teaching of writing. These are: (a) teachers should be aware of the difficulties involved in writing and should take into account the assessment methods they use; (b) teachers should expose students to a variety of models of effective writing; (c) teachers should be careful in selecting topics; and (d) teachers should bear in mind that the production of the whole text must be encouraged otherwise the teacher will lose the opportunity to proceed with the teaching of the sub-processes. Students in most of the Arab countries in many cases are asked to write a final draft of their work from the beginning not only in secondary schools, but in the foundation course provided to Higher Education Students in many different universities. Qatar University EFL Students are typical of university students from the Gulf countries which are considered as the richest countries in the Arab world. These students need to use modern technology and methods in teaching as well as in the business and banking fields. In order to examine the effects of this practice, Al-Buainain, (2006) conducted survey of language instructors at the Department of Foreign Languages in the University of Qatar. The majority were in agreement that most EFL students were weak in three writing courses namely: writing 1, writing 2 and advanced writing. With this finding, Al-Buainain (2006) recommended further research that will investigate this problem and develop remedial procedures that will help students overcome their weakness and therefore lessen the number of them failing every semester.

Al-Buainian (2006) enquired whether it was possible to acquire syntax through writing. In a similar vein, Weissberg (1998) tested the hypothesis that SL learners may acquire syntax in part by writing in class and the result indicates that classroom writing has a positive effect in Second Language Acquisition (SLA). On the other hand, Liu (2000, p. 33) argues that "insufficient use of lexical cohesive ties by ESL students contributes to the lack of cohesion in their writing". In Iran, Kiany and Khazrineshed (2001) carried out a study to explore the relationship between English proficiency, writing ability and the use of conjunctions. Part of the conclusion the authors were able to draw suggests the creation of innovative materials since these can insert particular types of conjunctions for every level.

Due to the need to improve high school students' writing, De la Paz, et al. (2002) made a study on the writing instruction used in middle school classrooms and developed an experiment requiring the development of a variety of cognitive resources. De la Paz et al. (2002) concluded that the students in the experimental group wrote longer essays containing more mature vocabulary and were qualitatively better than those in the non-target groups.

The literature on process writing has guided the researcher to concentrate on group work, noticing, interaction, feedback, error analysis and motivating teachers as well as learners to be involved in writing processes and consider writing as a starting point to improve their other language skills. In other words, there are a number of potentially conflicting issues; students need grammar rules in order to be accurate, but traditional grammar teaching has proved to be demotivating for them. Each method and approach has its own theory of language and theory of language learning. In what follows the theory of language on which the IWP approach is based.

## **THEORIES OF LANGUAGE AND LANGUAGE LEARNING IN THE IWP APPROACH**

### ***Theory of Language in the IWP Approach***

The IWP approach is based on integrating three different theoretical views of language. The first one is the *structural view* where language is considered as a system of structurally related elements for the coding of meaning. The mastery of these elements in this system is the target of language learning. The elements of this system are defined as: phonological units, grammatical units, grammatical operations and lexical items.

The second view is the *functional view* where language is viewed as a vehicle for the expression of functional meaning, and where the emphasis is on semantic and communicative dimension rather than on grammatical characteristics of language teaching content by categories of meaning and function rather than elements of grammar and structure.

The third view is the *interactional view* where language is seen as a tool for the creation and maintenance of social relations. This view has been added since "interaction" has been central to theories of second/foreign language learning and pedagogy for more than thirty years, when Rivers (1987) defines the interactive perspective in language education:

"Students achieve facility in using a language when their attention is focused on conveying and receiving authentic messages that contain information of interest to both speaker and listener in a situation of importance to both" (p.4). In other words, the IWP approach can represent implications of the Sociocultural Theory in SLA (2012d).

### ***Theory of Language Learning in the IWP Approach***

In general, the IWP approach is derived from adapting three common and well known theories in the field of SLA, aiming at changing the theoretical frameworks of these theories into a pedagogical framework to be implemented and activated inside the classroom context. In particular, the IWP approach is based on integrating three well known theoretical approaches in

explaining second language learning namely: Behaviourism, Innatism, and Interactionism, which reflect the theory of language of the IWP approach. In detail, *Behaviourism* states that language learning is the result of imitation, practice and feedback, while Innatism gives priority to learners' innate characteristics (which Chomsky calls "Innatism Position"), and Interactionism focuses on the role the linguistic environment in interaction with the learner's innate capacities.

To be more specific, theory of language learning in the IWP approach matches with the Behaviourism theory which believes that learners receive linguistic input from speakers in their environment and which also outlines that language learners start off with the habits formed in L1 as they linked the second language learning with Contrastive Analysis Hypothesis (CAH). CAH claims that when there are similarities between L1 and L2, the learners will acquire the Target Language with ease, but when there are differences, the learners will have more difficulties (Cook, 2001). This is what happens with Arab Learners of English due to significant differences between Arabic and English, and the crosslinguistic influence of L1 in the acquisition of L2 is indicated in the current empirical study. From this point, one part of the teacher's and of the learners' role is formed in the IWP approach.

The second theory on which the IWP approach is based is *Innatism*, which states that language learning is based on L1 acquisition not L2 acquisition, and that the Universal Grammar (UG) is based on language competence in the target language. According to the IWP approach the UG should be available to second/foreign language learners and at the same time language competence should not be practical without language performance in which foreign/second language learners transform their knowledge of the language into use of the language. Other linguists termed these changes as changing the declarative knowledge *that* into procedural knowledge *how* through practice (Anderson, 1995; De Keyser, 1998, 2003). In other words, the IWP approach is basically associated with the kind of learning which takes place in the classroom environment, where rules learning must be followed by practice, and when practice is not enough to get reasonable output, input should be reprocessed to be more understandable and more comprehensible until such time when the learners become able to use the target rules. From this point, another part of the teacher's and of the learners' role in the IWP approach is formed. Pica (2008) concludes that the more time is spent in treating the form, the more form is retained in learners' mind.

The third theory on which the IWP approach is based is the *Interactionism*. This theory is based on the first two theories mentioned above where the first one states that learning is based on receiving the linguistic input from the speakers in the learners' environment, while the second one states that learning is based on increasing the comprehensive input. The researcher thinks that these two theories cannot be performed or implemented without interaction. The interaction comes in the form of negotiation which will not concentrate on one aspect only whilst ignoring the other, but it will be negotiation of both *form* and *meaning* in the form of metalinguistic feedback following the processes of error analysis and contrastive analysis based on the type of learners' errors/mistakes.

Gass and Selinker (2008) claim that the interaction approach accounts through input *exposure to language*, production of language *output*, and *feedback* that comes as a result of interaction. They add that negotiation, recasts and feedback are items that involve in interaction. They also add that negotiation serves as catalyst for change because of its focus on non-target-like forms, by providing learners with information about non-target-like forms; negotiation enables learners to

search for additional confirmatory evidence (p.331). The negotiation is termed in the current method as metalinguistic feedback.

In conclusion, the theory of language learning in the IWP approach includes both *process-oriented theories* which are built on learning process, and *condition-oriented theories* which emphasizes the nature of learners and the environment where language learning takes place. We as researchers, have to have in mind the principle that to predict or to analyze the learners' errors may provide the teacher and the learners with many opportunities to interact, negotiate, and with valuable information in the areas of difficulties that learners may encounter. This might help learners develop their interlanguage grammar and, in turn, help them develop their internalized grammatical system. What links theory with practice or approach/method with procedures is what is called "Design". In what follows the design of the IWP method is discussed.

## **THE DESIGN OF THE IWP APPROACH**

The design of the IWP approach includes: the objectives of the method, the content of the method, the syllabus, followed by the role of the teacher and the learners, and finally the role of the instructional materials.

### ***The Objectives of the IWP Approach***

As the IWP approach is based on process-oriented theories and condition-oriented theories, the objectives of the IWP approach are linguistically oriented, having in consideration the nature of the ALEs and the educational environment where language learning takes place. The objectives of the IWP approach are as follows:

- to improve learners' accuracy and fluency reflected in improving their speaking as well as writing;
- to present explicit grammar in a stimulating and motivating way using suitable teaching materials which attract the learners attention, e.g. picture-story writing;
- to increase awareness of contrastive aspects between L1 and L2 and to internalize these features as part of their L2 grammar;
- to transfer the explicit knowledge to learners' speaking abilities as well as their written work;
- to teach students how to notice their mistakes by interacting while speaking as well as writing.

Sets of picture-story writing can be selected as the basis on which the students are asked to write an essay; these writing tasks should be related to the learners' environment. These tasks could be designated as the teaching materials.

### ***The Content of the IWP Approach***

The IWP approach consists of seven main stages which involve the speaking process as well as the writing process. In what follows the stages of the suggested framework of the innovated writing process are described Figure 1.

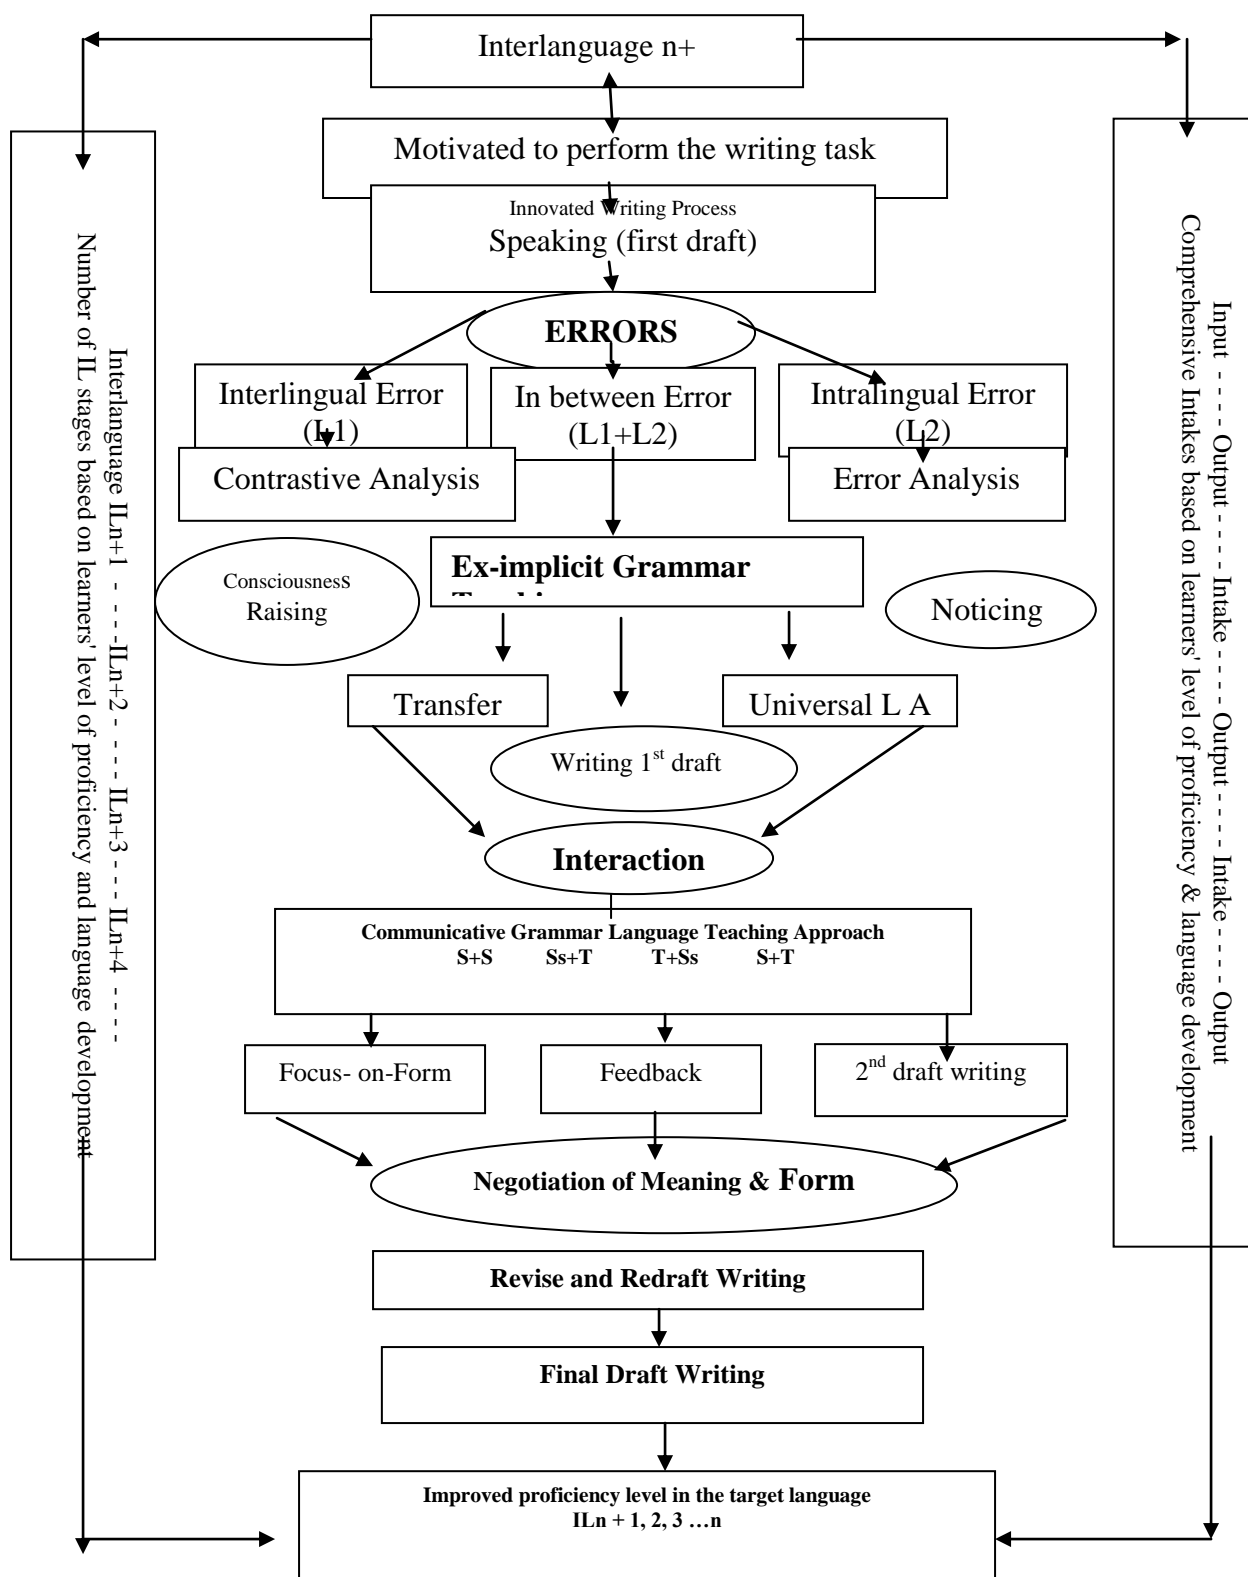

Figure 1: Framework of the Innovated Writing Process

*The Main Seven Stages in the IWP Approach*

*Stage One (Discussion)*

This stage includes open discussion inside the classroom; it can be in the form of small groups of four students or in pairs. The discussion is followed by brainstorming and making notes in addition to asking questions and suggesting ideas and sequences related to the target topic. The most important factor here is that the teacher should motivate all the students to participate in the activity/task; however, he/she should organize/control the discussion in order to avoid the drawbacks of the communicative approach (one of the drawbacks of Communicative approach is giving the opportunity to the learners to talk without control or correcting their mistakes).

*Stage Two (Oral Feedback on Discussion and Analyzing Spoken Mistakes)*

The teacher's role here is to render oral feedback on the speaking abilities of the students, explaining the mistakes that students made while speaking. The teacher starts analyzing the mistakes on the board following the Grammar Translation Method. The students are then asked to speak again about the same topic paying attention to the mistakes they had made previously. The teacher can interrupt students if they make the same mistakes in order to give his/her metalinguistic feedback on the non-target-like forms following the procedures of Communicative Language Teaching method (CLT) and Task-Based approach (TB). Although CLT and TB do not generally focus on mistakes, they might suggest ways in which mistakes can be highlighted and corrected through repetition and correction.

*Stage Three (Planning)*

Students are to select ideas individually, arrange the information and structure the text, followed by self-evaluation and participation in group-evaluation while planning the initial draft. The teacher's role is to give his/her oral/written feedback on planning for each group depending on the learners' output.

*Stage Four (First Draft)*

Following the first three stages, students are asked to write the first draft asking the teacher for help when it is required. If they are not able to finish the first draft during class time, they are allowed to complete it when after school. The teacher should ask students not to get help from others in performing this task: the first draft must be written by students themselves in order to find out what the gaps are.

*Stage Five (Oral/Written Feedback on the First Draft)*

The teacher asks students to have group/peer evaluation. The role of the teacher at this point is to give his/her general written feedback, based on the students' writing following the procedures and carrying out the role of the teacher and the role of the learners while performing the Task-Based approach in explaining and correcting the mistakes (Nunan, 2009, p. 66-67). It is suggested that oral feedback may be better in which the teacher presents the metalinguistic

feedback for all the students, however, some students prefer to get written feedback. It is the role of the teacher to keep the individual differences in mind.

#### *Stage Six (Analyzing Written Mistakes and Writing up Second Draft)*

After providing the feedback on the first draft, the teacher presents and explains the written mistakes on the board to all the students. The students are then asked to write their second draft based on the previous input they have already gained from the previous stages. This stage is an attempt to re-process the input for low/high level learners.

#### *Stage Seven (Final Written and Spoken Draft)*

If the students still make mistakes in their writing, the teacher should hold individual discussions during which he/she explains the mistakes to weaker student/s individually. After all students finish their final draft, they are asked to read their writing to all students. The teacher should ask students to comment on each piece of writing in a communicative and confident way. The researcher thinks that including the audience who are to listen to the speaker student in evaluation might motivate the ALEs to get more interest in interacting with the teacher and in turn to revise and redraft their writing whenever they feel they need to. Here they become aware of what they do and feel that they have to spend more time revising and redrafting their writing in order to produce a good piece of writing.

In what follows the learners' different settings in the IWP approach, the theories of SLA and proposals used in implementing the IWP approach and finally the integrated ELT methods and approaches followed in the IWP approach are discussed.

#### *Learners' Settings in the IWP Approach*

To discuss the learners' settings in the IWP approach, first it needs to be agreed that learning foreign/second language naturally is different from instructionally learned languages. In other words, learning from natural situations is different from learning in a classroom; and therefore, acquiring is different from learning with respect to Krashen's (1982) classification. Based on the drawbacks of different situations and different learning settings, the IWP approach exemplifies the advantages of the three different settings inside the classroom, aiming at creating a variety of settings to cover the different attitudes and the individual differences of the students inside the classroom. These settings are: natural setting, instructional setting and finally the communicative setting. In what follows the characteristics of each setting are described.

##### *Natural Setting*

This is the first setting followed in the IWP approach, where learners have their freedom to interact as if they were outside of the classroom. They should feel free to interact with each other. Following this setting, they will be exposed to a variety of vocabulary and structures. Each learner should interact using the foreign language to their best ability. The main goal of this setting is to improve learners' fluency and get rid of any anxiety.

*Structure – Based Instructional Setting*

In this setting, learners learn linguistic items one by one. The teacher presents the simple ones followed by more difficult ones. The learners' errors must be analyzed in order to improve their accuracy. To be more practical, the teacher asks questions which students answer, the teacher then evaluates the learners' answers – this is called Initiation/ Response/ Evaluations (IRE) exchange (Lightbown & Spada, 2006, p. 112). This setting is essential in terms of the teacher's analysis of learners' errors following ex-implicit grammar teaching and giving the corrective feedback in the form of recast feedback, metalinguistic feedback and finally elicitation feedback. The weaker learners get the opportunity to participate actively in the writing task.

*Communicative Instructional Setting*

The third setting is a result of the first two settings, which both aim at improving learners' fluency and accuracy. The third setting aims at re-processing the input to be more comprehensive and understandable. It is considered to be the most important for learners in order to get the chance to interact effectively, correct their errors, arrange their ideas and produce appropriate piece of writing based on the outcome of the previous two settings. In this setting, the teacher focuses on meaning negotiation having ensured that learners have learnt the target structures related to the task in the previous settings.

*Theories of SLA and Proposals Implemented in the IWP Approach*

The four proposals in the IWP approach see Figure 2, have been suggested in order to develop and implement SLA theories inside the classroom. These four proposals match with the learners' settings mentioned previously and with the ELT methods and approaches which will be discussed later on. The four proposals are:

*Let's Talk*

This proposal emphasises the importance of access to both comprehensible input and conversational interactions between the teacher and the learners (Lightbown & Spada, 2006, p. 150).

*Get It Right from the Beginning*

This proposal is selected because of the nature of the ALEs whose previous language learning experience was in grammar translation classes. Lightbown and Spada (2006) claim that teachers avoid giving opportunities for learners to speak freely because this would allow them to make errors (p.139). It is therefore better to give feedback directly and give the chance for learners to produce target-like language from the beginning. This will help learners to make fewer errors while using the language.

### *Teach What is Teachable*

This proposal is the practical interpretation of Pienemann's (2005) developmental features and process ability theory explaining that some things can be taught successfully whereas other things seem to remain un-acquired. In other words, teachers should realize the stages through which learners may pass in learning linguistic items. It will be useless to try to teach a forward stage before a previous one, so in the IWP approach teachers should start with what is teachable and what is learnable first.

### *Get It Right in the End*

This proposal is suggested in order to practically interpret both theories of SLA, namely: Form-Focused Instruction (FFI) and Meaning-Focused Instruction (MFI) as well as their importance in the IWP approach. It is also proposed in order to ensure and agree with the previous proposal "Teach what is teachable" which states that if teaching fails to take the learners' readiness into account, some things cannot be taught. This proposal also emphasizes that some aspects of language must be taught explicitly (Lightbown & Spada, 2006, p.166).

### *The ELT Methods and Approaches Followed in the IWP Approach*

In general, the IWP approach is designed to be followed and implemented in teaching writing; it aims at improving learners' fluency and accuracy. The IWP approach is the main outcome and the basic finding concluded from my own empirical study (Mourssi, 2012a). Therefore, the IWP approach is based on a systematic integration of four well known and common ELT approaches.

### *Audio-Lingual Approach*

In the Audio-Lingual approach, following the opportunity for the learners to interact in the form of dialogues, specific grammatical patterns in the dialogues are selected based on the pictures provided and become the focus of various kinds of drill and pattern-practice exercises (Richards & Rodgers, 2006, p. 59). This supports Lightbown and Spada's (2006) theory which states that in Audio-Lingual approach there is little use of the first language, and learners are expected to learn mainly through repetition and habit formation: Audiolingualism is based on communicative approach where implicit learning is used (p.112).

### *Grammar-Translation Method (GTM)*

The second method is the Grammar Translation Method (GTM). It integrates performing certain stages in the IWP method in explaining learners' errors. The main principle of the GTM is that the sentence is the basic unit of teaching and language practice. Richards & Rodgers (2006) mention that GTM is still widely practised; it has no advocates although it is a method for which there is no theory (p.7). While implementing the IWP method with ALEs, it is concluded that ALEs become highly motivated and participate effectively while following the GTM in analyzing and correcting their errors as GTM is based on grammar rules where explicit grammar learning is used.

### *Communicative Language Teaching Approach (CLT)*

The third approach is communicative Language Teaching approach (CLT). It is integrated with the previous approaches based on the characteristics of communicative view of language which

has theoretical base: where language is thought as a system for the expression of meaning, the basic and primary function of language is to allow interaction and communication, and finally the structure of language reflects its functional and communicative uses (Richards & Rodgers, 2006, p. 161). These concepts are implemented and performed in the IWP approach following the suggested stages one by one shifting between the different methods mentioned above. Having in consideration communicative approach, it is proposed that learning a language can be through implicit and explicit learning.

#### *Task-Based Approach*

The last approach which comes at the end of the IWP approach is Task-Based Language Teaching (TBLT). The TBLT is selected to be integrated in performing the IWP approach, based on its assumptions assumed by Feez (1998, p. 17). Some of the assumptions are: the focus of the TBLT is on the process rather than product; the activities and tasks can be either those which learners might need to achieve in real life or those which have a specific pedagogical purpose, and finally the taught activities are sequenced according to the degree of difficulty and the previous experience of the learners, beside the complexity of the task, and finally the language required to undertake the task.

#### *The Syllabus of the IWP Approach*

The IWP method has no specific syllabus since it is a process-based method. Richards & Rodgers (2006) mention that term syllabus is less frequently used in process-based methods, in which consideration of language content are often secondary (p.26). However, the teacher's activities and the learners' activities can be formed as follows:

#### *The Teacher's Activities*

The teacher motivates, presents, evaluates, explains, and analyzes the errors, giving oral, written, direct feedback (giving the target-like form), indirect feedback (using recasting for example), and metalinguistic feedback in which the teacher explains the nature of the mistakes without providing the target-like forms for the learners.

#### *The Learners' Tasks*

Students revise and redraft their speaking in a speaking process (having space from the teacher to prepare and reformulate their speech before answering the target task) as well as writing in a writing process, notice their mistakes and interact with the teacher to fill in the gaps in their knowledge of L2.

#### *The Roles of the Teacher and the Roles of the Learners in the IWP Approach*

The role of the teacher and the role of the learners in the IW P approach are presented in Appendix 1.

### *The Role of Instructional Materials*

Picture-story is one of the main forms of teaching materials in the IWP approach for the following reasons:

- pictures can motivate the students to pay attention;
- pictures can motivate the students to take part in the story;
- pictures can contribute to the context in which the language is being used;
- pictures can bring the outside world into the classroom;
- pictures can be used in many different ways;
- pictures can cue responses to questions;
- pictures can cue substitutions through controlled practice;
- pictures can provide information to be referred to in conversation and discussion (which serve improving speaking as well as writing).

Where the teacher is a stimulator/ pictures will be stimulating/ learners will be stimulated / teaching writing will be a kind of stimulation which tame and persuade learners to participate efficiently. However, the teacher can apply the IWP approach to other types of writing, e.g. general/academic writing.

## **PROCEDURES OF THE IWP APPROACH**

The Procedures Focus on Presenting, Practice and Feedback (PPF)

### *Presenting*

The teacher presents the target linguistic data through the task, e.g. the simple past tense forms is better presented by the picture-story writing.

### *Practice*

Students practise speaking process and writing process following revising and redrafting in performing the task.

### *Feedback*

Teacher follows the process of error analysis as well as contrastive analysis process by implementing the different types of feedback based on the type of the non-target-like forms produced and the level of the learners. The researcher can declare that implementing the IWP participates analyzing and investigates how how ALEs acquire the simple past tense, (Mourssi, 2012a, 2012c).

## **CONCLUSION**

The interactional process, whether it is negotiated interaction, interactional feedback, noticing gaps in knowledge by learners as well as by the teacher, while speaking or while writing, can direct the learners' attention to many things which might have been stored in their memory (implicit knowledge) but that they have temporarily forgotten. The teacher's role is to activate this knowledge which can relate to lexical items, grammatical constructions, phrasal verbs,

prepositions, collocations, and so on. Different types of interaction promote development and lead to an actual improvement in learners' knowledge in the long term.

The IWP was presented (including ex-implicit grammar learning/teaching, feedback, negotiation, and interaction) as a form of Form-focused-Instruction which integrates a strong interactional component. This provides a rationale for the IWP and the Communicative Grammar Language Teaching Approach and how they can help improve the ALEs' written accuracy and fluency as well.

*Appendix A: The Roles of the Teacher and the Roles of the Learners in the IWP Approach*

Teacher's Role in the IWP approach	Students' Role in the IWP approach
Getting the SS motivated to the task	SS get ready for the picture-story writing task, receive the question paper and think individually about how to perform the task, listen to the teacher's instructions, brainstorm and get ready to participate effectively in performing the task and ask questions based on the pictures
Teacher answers all students' questions related to the story in turn	SS write one or two verbs under each picture to be used expressing the events of the story, (in the simple past form) and define the subject
Teacher elicits and writes down students' mistakes while talking about the picture-story	SS ask questions related to the verbs used and the new vocabulary used in their writing
Teacher explains the students' mistakes following Grammar Translation Method, showing the differences between English and Arabic sentences (as an oral feedback on students' mistakes while speaking about the picture-story)	SS take notes about the unclear points; arrange their ideas and the sequence of the story events
Teacher asks students to revise and redraft their speaking based on target-like forms of the simple past tense and on the target-like forms of the English sentence which is different from the Arabic form	SS notice their mistakes related to the simple past form and the target-like structure of the English sentences
Teacher asks students to speak about the picture-story, revise and redraft their speaking together in pairs or in groups	SS revise and redraft their speaking after correcting their mistakes based on feedback received, and speak about the story
Teacher asks students to write the first written draft and gives his/her written feedback for each student	SS speak about their story after revising and drafting their story
Teacher analyses the students' errors following the intensive interaction with the students following communicative approach (after marking the first draft)	SS receive the teacher's written feedback and rewrite after revising and correcting
Teacher holds individual discussions with weaker students (whenever it is possible)	SS interact with the teacher and ask for clarification if they do not understand the feedback given
Teacher asks students to write the final draft individually and read their writing in front of the class; then other students are asked to give their feedback in a communicative way	Students write the final draft
Teacher gives the final grade for each student and asks them to write down their weak points to be considered in the following writing lesson	SS read the final draft loudly at the front of the class

## CRITICAL DISCOURSE ANALYSIS: THE REPRESENTATION OF SOCIAL ACTORS IN *SUMMIT* SERIES

Javad Shirvani

*M.A. of Linguistics, Isfahan University, Iran*

*E-mail: javad.shirvani86@gmail.com*

### ABSTRACT

This study investigates the representation of social actors in *Summit* series from critical discourse analysis point of view. In order to do the analysis, van Leeuwen's (1996, 2008) framework is used and the textbooks in question are textually analyzed with an emphasis on *deletion*, *role allocation*, and *substitution*. The findings of this study indicate that the social actors are represented differently with respect to some discursive features. Males are portrayed as more included, prominent, active, and independent social actors than females. Considering jobs, however, both genders are represented as having high-status and ordinary ones. All in all, a female subordination can be implicitly understood from the textbooks.

**KEYWORDS:** Critical Discourse Analysis, Ideology, Representation, Social Actors, Discursive Features.

### INTRODUCTION

Critical Discourse Analysis (CDA) is an interdisciplinary approach to the study of discourse that views language as a form of social practice and focuses on the ways social and political domination are reproduced in text and talk (Fairclough, 1989: 20). Also, Fairclough and Wodak (1997: 275) state that one of the central objectives of CDA is to consider the linguistic choices a text producer makes as a potential medium through which the ideological import of a particular discourse situation can be reproduced.

According to van Dijk (1998a), CDA is a field that is concerned with studying and analyzing written and spoken texts to reveal the discursive sources of power, dominance, inequality and bias. It examines how these discursive sources are maintained and reproduced within specific social, political and historical contexts. In the same line, Fairclough (1992: 35) simply states that "CDA aims at making transparent the connections between discourse practices, social practices, and social structures, connections that might be opaque to the layperson."

The main assumption of CDA that makes the approach different from other approaches to text analysis is that it stresses not only the decoding of propositional meaning of a text, but also its ideological assumptions. Advocates of CDA are interested in how a text may influence and manipulate its readers by the use of presuppositions that stem from the author's own, particular view of the world and circumstances of a text production. Thus, the text interpretation should include a close analysis of context which is not represented only by: "the immediate environment in which a text is produced and interpreted, but also the larger societal context including its relevant cultural, political, social and other facets" (Huckin, 1997:79).

Regarding language learning, as Karimaghahi and Kasmani (2013: 27) mention, this ideological assumption is not directly imposed by curriculum to the learners; rather it is carried out through

the underlying “hidden agenda” which resides within the text. In other words, the dominant cultural group controls, classifies, produces, and transmits what kind of knowledge is to be learnt and what values and attitudes are acceptable in that society. This results in accepting a particular attitude and value as something normal and natural by learners.

In the context of learning a language, here English, as a foreign language (EFL) the norms of conduct, ideology, etc. are usually disseminated without the learner even being aware of being exposed to such norms. That is, s/he is exposed to a hidden curriculum (Skelton, 1997). Evans and Davis (2000) assert that though researchers and publishers have agreed upon using positive characteristics of different genders in their textbooks, the achievements have not been so significant. CDA takes language as a means of addressing problems of social change. In other words, without any exception, the language used in any text including EFL textbooks can be ideologically loaded although at first glance they may seem innocent. For instance, as Davatgarzadeh and Sahragard (2010: 69) state, studies of the portrayal of women in most EFL textbooks have shown that the stereotypical role of women as mothers and homemakers is still being perpetuated in many current language textbooks.

With regard to the effects of textbooks on learner’s attitudes and ideologies, the present study examines the ways in which social actors are represented in *Summit* series (2006) to uncover the hidden discursive structures. Hence, attempts are made to clarify the ways male and female social actors are represented in the *Summit* series (2006). The study draws on the work of van Leeuwen (1996, 2008) to formulate a framework which utilizes a socio-semantic inventory, in a systematic way. Specifically, the study seeks the answers to the following research questions:

1. Are social actors (men and women) represented differently in the textbooks and, if so, how is this achieved linguistically?
2. What ideological assumptions account for the differences?

## **METHODOLOGY**

### ***Data Collection***

The data selected for this study came from four English textbooks used in many English language institutes in Iran for intermediate levels. The *Summit* series includes four books, 1A, 1B, 2A, and 2B, written by Joan Saslow and Allen Ascher and were published in the United States of America by Pearson Longman Incorporation in 2006. Each book includes five units and each unit includes two conversations and one reading comprehension passage. In the present study, all the sentences in conversations and texts were extracted and analyzed through CDA, or more specifically, van Leeuwen’s (1996, 2008) framework.

### ***Procedures***

In this study, all the sentences in reading passages and conversations have been critically analyzed, focusing on each phrase, clause, and sentence separately and in conjunction with the neighboring phrases, clauses, and sentences. Van Leeuwen’s (1996, 2008) framework is used as

basis for the analysis of the textbooks under investigation to identify whether the features found in the abovementioned data follow an ideologically charged pattern and if so, what the nature of this ideological move can be. Also, to investigate the data statistically, chi-square tests have been used to determine whether the differences are significant.

Van Leeuwen's (1996, 2008) social actors are influenced by the policies and decisions of powerful organizations which either include or exclude them from the centers of power. He explains the principal ways in which social actors can be represented in discourse. In his view, CDA is the impact of power structures on the production of knowledge and the effect of this produced knowledge on identity and subjectivity of the members of the community. His (1996, 2008) framework consists of the following sections presented schematically in Figure 1 below:

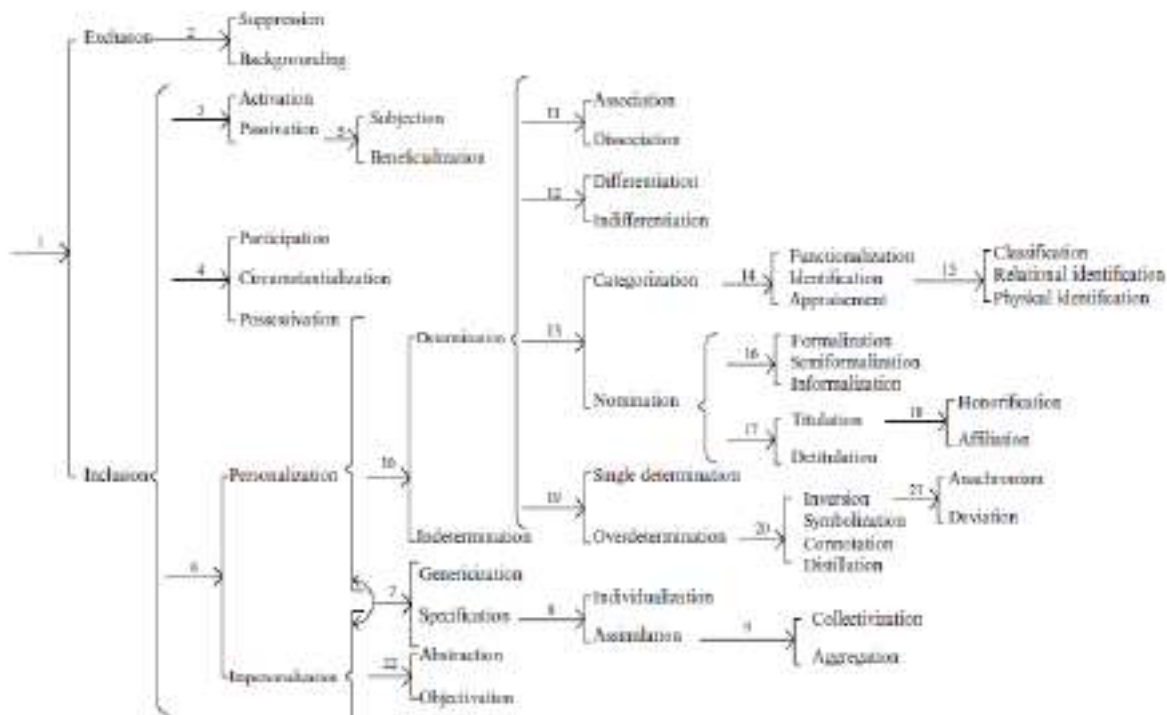

Figure 1: Social Actor Network

As can be seen in the “network”, van Leeuwen (1996, 2008) proposes three main types of transformation; deletion, rearrangement, and substitution. As Karimagahei and Kasmani (2013: 29) explain, “the ‘network’ shows whether the social actors were excluded or included; whether through rearrangements different roles were assigned to different social actors; and whether any substitutions were used in their representation.”

As one type of discourse (here an EFL textbook) does not include all the categories and modes of representation, for practical purposes, the following elements of van Leeuwen's framework (1996, 2008) are considered to function as the criterion for the analysis: *Exclusion*, *Inclusion*, *Activation*, *Subjection*, *Beneficialization*, *Functionalization*, *Classification*, *Relational Identification*, *Formalization*, *Semiformalization*, *Informalization*, *Indetermination*, *Abstraction*, *Objectivation*, *Genericization*, *Individualization*, *Collectivization*, and *Aggregation*. Van Leeuwen (1996: 32-69) and (2008: 23-54) define these elements as the following:

**EXCLUSION/INCLUSION:** Social actors are sometimes omitted or backgrounded to serve certain purposes.

**ACTIVATION/PASSIVATION:** Social actors can be activated, i.e. represented as the active, dynamic forces in an activity, or passivated, i.e. represented as undergoing an activity or as being the recipient. Passivation necessitates a further distinction: the passivated social actor can be *subjected* or *beneficialized*. Subjected social actors are treated as objects in the representation. Beneficialized social actors form a third party which, positively or negatively, benefits from the action.

**FUNCTIONALIZATION:** Functionalization occurs when social actors are referred to in terms of an activity, in terms of something they do, for instance, an occupation or role.

**Classification:** In the case of classification, social actors are referred to in terms of the major categories by means of which a given society or institution differentiates between classes of people.

**RELATIONAL IDENTIFICATION:** Relational identification represents social actors in terms of their personal, kinship, or work relations to each other, and it is realized by a closed set of nouns denoting such relations: “friend,” “aunt,” “colleague,” etc.

**NOMINATION:** Nomination is typically realized by proper nouns, which can be *formalization* (surname only, with or without honorifics), *semi-formalization* (given name and surname), or *informalization* (given name only).

**INDETERMINATION:** Indetermination occurs when social actors are represented as unspecified, anonymous individuals or groups.

**ABSTRACTION AND OBJECTIVATION:** The former occurs when social actors are represented by means of a quality assigned to them. The latter occurs when social actors are represented by means of reference to a place or thing closely associated either with their person or with the activity they are represented as being engaged in.

**GENERICIZATION:** Genericization occurs when social actors are represented as classes.

**Individualization:** Individualization occurs when social actors are referred to as individuals.

**Collectivization:** Collectivization occurs when social actors are referred to as groups which are realized by plurality, by a mass noun or a noun denoting a group of people but not treated as statistics.

**AGGREGATION:** It quantifies groups of participants by treating them as statistics. These elements will be dealt with in the next section.

## RESULTS AND DISCUSSION

### Deletion

The process of exclusion/inclusion, categorized under deletion, is a central concern for CDA. According to van Leeuwen (2008: 28) “representations include or exclude social actors to suit their interests and purposes in relation to the readers for whom they are intended.” Some exclusion may be “innocent”, details which readers assume to know already or which are deemed irrelevant to them; others tie in closely to certain ideologies which should be considered. Table 1, below, summarizes the inclusion and exclusion of males and females in *Summit* series:

*Table 1: Inclusion and Exclusion of Male and Female Social Actors*

Inclusion / Exclusion	Male (No. =393)	Female (No. =211)	X <sup>2</sup>	Significancy
Inclusion	387 (98.47%)	203 (96.20%)	34.082	.000
Exclusion	6 (1.53%)	8 (3.80%)	.061	0.704

As Table 1 shows, male social actors are included with considerably more frequency than female ones and, on the other hand, female social actors are excluded more frequently. In the case of inclusion, as the statistics reveal, the difference is significant ( $p < 0.05$ ). However, this difference is not statistically significant regarding exclusion ( $p > 0.05$ ).

Out of 20 units analyzed, only 4 texts have been allocated to successful and famous women including Helen Keller, Jane Goodall, Dr. Janice Perlman, and Donna Paxton while more texts have been considered to introduce successful and famous men such as Paul Newman, Beethoven, Freud, Dr. Robert Ballard, etc. Furthermore, the series mostly reflect positive attitude toward males and negative toward females. In a conversation in Book 2A page 39 a female social actor is included as a grumbler:

*Example 1. Meg: Oh, Carla's always ticked off about something or other.*

In another conversation in the same book, on page 40, the authors have provided female characters to describe their *shortcomings*. But, in another conversation in Book 2B page 75 a male social actor is introduced as someone who turned his life around successfully:

*Example 2. Olivia: That's the one. Well, he's apparently turned his life around. I just heard he's the CEO of MegaStar Foods.*

With regard to the exclusion as an important factor of CDA, *Summit* excluded male and female actors in some texts:

*Example 3. Newman was told that the salad dressing would sell only if his face were on the label. (Book 1A: 34)*

*Example 4. B: Well, everyone says she's bad news. (Book 1A: 6)*

In most cases of exclusion, however, both male and female actors have been excluded. It is a common phenomenon in newspaper texts and political speech. In this way, both social actors and their activities are excluded. The following examples make the point clear:

*Example 5. Maintaining a hopeful, positive, yet realistic perspective in the face of hard times can be a real challenge. (Book 1A: 8)*

Example 6. It is estimated that as few as 1600 giant pandas remain in the wild today. (Book 1B: 70)

### Role Allocation

In this section, the roles that social actors are given to play in representations are considered. In van Leeuwen's words (2008: 32-33), "representations can relocate roles or rearrange the social relations between the participants." He further points out that representations can endow social actors with either active or passive roles. As van Leeuwen puts it:

"Activation occurs when social actors are represented as the active, dynamic forces in an activity, passivation when they are represented as 'undergoing' the activity, or as being 'at the receiving end of it'." (2008: 33)

In this respect, the current study examines the representation of the two social actors with regard to their actions since they are inextricably related, especially considering the nature of actions in relation to which social actors are activated or passivated. The findings of the analysis are displayed in Table 2.

Table 2: Role Allocation of Male and Female Social Actors

Role Allocation	Activation	Passivation		Total
		Subjected	Beneficialized	
Male	314 (96.02%)	9 (2.75%)	4 (1.23%)	327
Female	184 (95.33%)	6 (3.10%)	3 (1.57%)	193

As Table 2 indicates in the textbooks both male and female social actors are mostly activated in activities (96.02% and 95.33% respectively) and in a few cases passivated (3.98% and 4.67% respectively). This much more activation of both social actors rather than passivation in *Summit* series may be due to the fact that the books are prepared for EFL learners whose knowledge of English is not supposed to be high.

Table 3: Chi-square Results for Male and Female Role Allocation

Role Allocation	Male	Female	X <sup>2</sup>	Significancy
Activation (Total = 498)	314 (63.05%)	184 (36.95%)	22.434	.000
Subjection (Total = 15)	9 (60%)	6 (40%)	4.895	.018
Beneficialization (Total = 7)	4 (57.15%)	3 (42.85%)	1.857	.154

As can be seen in Table 3, the activation of male social actors is greater than that of females (63.05% and 36.95% respectively) and, also, the difference is statistically significant ( $p < 0.05$ ). Therefore, it can be concluded that *Summit* series represent males as active and dynamic actors in their social context. The following examples show male and female activation in the textbooks:

Example 7. Max: I want to get out and see the world. (Male Activation; Book 2A: 3)

Example 8. Olga: I think you're wrong. (Female Activation; Book 2B: 99)

In regards with passivation, i.e. subjection and beneficialization, both male and female social actors are passivated only in a few cases and as can be seen in Table 3, the difference between

male and female actors is not significant ( $p>0.05$ ). As stated before, this might be due to the fact that these textbooks are compiled for intermediate EFL students.

### ***Substitution***

Social actors are represented through different discursive features under substitution. They are personalization (*functionalization, classification, relational identification, formalization, semiformalization, informalization, and indetermination*), impersonalization (*abstraction and objectivation*), genericization, and specification (*individualization, collectivization and aggregation*).

Social actors can be either represented as personalized actors or impersonalized ones. In the former, they are represented as human beings but not in the latter. Table 4, below, indicates male and female actors personalization and impersonalization in *Summit* series.

*Table 4: Personalization and Impersonalization of Male and Female Social Actors*

Personalization/ Impersonalization		Male (Total= 396)	Female (Total=340)	X <sup>2</sup>	Sig.
Personalization	Functionalization	41 (10.35%)	34 (10%)	0.652	0.398
	Classification	45 (11.38%)	30 (8.82%)	2.01	0.076
	Relational Identification	36 (9.09%)	14 (4.12%)	9.431	0.001
	Formalization	38 (9.59%)	25 (7.37%)	2.667	0.102
	Semiformalization	124 (31.31%)	113 (33.23%)	0.018	0.805
	Informalization	83 (20.97%)	91 (26.77%)	5.470	0.008
	Indetermination	25 (6.31%)	27 (7.94%)	0.059	0.689
Impersonalization	Abstraction	3 (0.75%)	4 (1.17%)	0.00	1.000
	Objectivation	1 (0.25%)	2 (0.58%)	7.691	0.006

As can be seen in the table, in the texts under analysis male and female social actors are almost always personalized. Only in 10 cases males and females are impersonalized, i.e. abstracted or objectivated:

*Example 9. Studies of time spent on instant messaging services would probably show staggering use. (Book 1B: 116)*

*Example 10. New Surveys suggest that the technological tools we use to make our lives easier are killing our leisure time. (Book 1B: 116)*

Moreover, both social actors are frequently determined through functionalization, classification, relational identification, formalization, semiformalization, and informalization, males 92.69% and females 90.31%. Also, as Table 4 indicates, personalization is mostly realized by semiformalization (males 31.31% and females 33.23%) followed by informalization (males 20.97% and females 26.77%).

Concerning functionalization and classification as two types of categorization, males and females are almost equally functionalized (10.35% and 10% respectively) and classified (11.38% and 8.82% respectively). Also, qualitative analysis indicates that in *Summit* series both male and female actors are represented by both high-status and ordinary jobs. Moreover, they both are mostly classified in terms of their age and provenance. Chi-square test results, also, indicate that the difference between male and female social actors regarding functionalization and

classification is not statistically significant ( $0.398 > 0.05$  and  $0.076 > 0.05$  respectively). Here are some examples:

*Example 11. Irish writer James Joyce spoke thirteen languages. (Book 2B: 76)*

*Example 12. Isabel Carter is a talented portrait painter. (Book 2A: 12)*

*Example 13. Rachel Kelsey, 34, and Jeremy Colenso, 33, both experienced climbers, had checked the weather forecast for a week before they set out. (Book 2A: 28)*

*Example 14. The lines above are from the song "Not Pretty Enough", written and performed by Kasey Chambers, an Australian folk-rock singer and song writer. (Book 1A: 46)*

Considering relational identification in terms of their kinship and personal relations, male social actors are more identified in terms of their relations to other human beings than female ones. Also, Chi-square test results show that this difference is statistically significant ( $p < 0.05$ ). Furthermore, in 11 cases females are identified in terms of their relations (kinship or personal) to a male, while in only 4 cases males are introduced in terms of their relations with females. Thus, the textbooks under analysis tend to represent males as more independent actors.

*Example 15. He and his wife both work overtime, putting in long hours in order to make ends meet. (Book 1B: 95)*

*Example 16. Paxton realized that she would have to make a choice between having more money and having more time- time to spend with her two daughters, to contribute to her community, and to relax.*

Nomination is one of the important factors employed to represent social actors. As Table 4 indicates, out of 463 instances of nomination, 245 cases (including 38 formal, 124 semiformal, and 83 informal) refer to males and 218 cases (including 25 formal, 113 semiformal, and 91 informal) refer to females. Considering the three instances of nomination, i.e. formalization, semiformalization, and informalization, female social actors are more frequently referred to informally than male ones. In fact, out of 174 cases of informalization, 47.70% of the total refers to males and 52.30% of the total refers to females. Chi-square test results, also, show that the difference is statistically significant ( $p < 0.05$ ). This shows that the textbooks may tend to represent male actors as more important people and show more respect toward them by using more formalization and semiformalization.

Genericization and specification are two other factors used to represent social actors. Genericization is achieved by representing social actors as classes; however, specification is achieved by representing them as specific, identifiable individuals. Regarding specification, the social actors are either individualized or assimilated (collectivized or aggregated).

Table 5: Genericization and Specification of Male and Female Social Actors

Genericization / Specification		Male (Total=464)	Female (Total=316)	X <sup>2</sup>	Sig.
Genericization		10 (2.15%)	15 (4.75%)	1.333	0.284
Specification	Individualization	431 (92.89%)	285 (90.18%)	43.364	0.000
	Collectivization	15 (3.23%)	10 (3.17%)	3.232	0.134
	Aggregation	8 (1.73%)	6 (1.90%)	2.341	0.148

As Table 5 indicates, both male and female social actors are most frequently represented through specification and are mostly individualized (males 92.89% and females 90.18%). Also, male social actors are individualized more than female ones and this distinction is statistically significant ( $p < 0.05$ ). According to van Leeuwen (2008: 35) individualization is of primary significance in CDA. In *Summit* series male actors are more frequently represented as specific, identifiable individuals than female actors. In other words, individuality of males has been emphasized and it can be concluded that males are depicted as more independent individuals than females.

Concerning assimilation, finally, both social actors are represented by collectivization and aggregation. The latter treats social actors as statistics, but the former does not. Here are some examples of collectivization and aggregation:

*Example 17. According to Chinese tradition, the elderly have always been honored and respected by the young.*  
(Book 1B: 94)

*Example 18. But today an increasing number of single young adults face the difficult situation of caring for both their parents and their grandparents.* (Book 1B: 94)

## CONCLUSION

One of the important issues contributing to gender-role differentiation and gender inequality is the ways social actors are represented in the media including textbooks. Textbooks as a crucial tool in constructing social members' identities are used apparently to convey certain types of knowledge to the learners. However, in addition to transferring knowledge they may be used as influential tools to impose certain normative outlooks and identities on the members. Since at first sight the norms and values which underlie texts cannot be understood, it is the aim of Critical Discourse Analysis (CDA) to make these ideological systems and representations clear and display their relations to the broader social order.

Among different approaches to CDA, van Leeuwen's framework (1996, 2008) was utilized to analyze *Summit 1A*, *1B*, *2A*, and *2B* textbooks. The employed model consists of various discursive features to analyze and determine the ways social actors are represented through the texts. Based on the analysis, the discursive structures such as deletion, role allocation, and substitution provided a distinct representation and depiction of social actors in the textbooks. Concerning "deletion", the books used 'inclusion' extensively for both genders. However, male social actors were more frequently included than female ones and the difference was also statistically significant. On the other hand, females were more 'excluded' than males. This may

reveal a male oriented ideology present throughout the textbooks. With regard to “role allocation”, the texts mostly tended to use ‘activation’ rather than ‘passivation’. Also, male social actors were more frequently activated than female actors and the difference was statistically significant. This use of activation might be due to the fact that the textbooks are designed for intermediate EFL students whose knowledge of English may not be high. In regards with “substitution”, both male and female actors were almost always ‘personalized’ and rarely ‘impersonalized’. Concerning ‘functionalization’ and ‘classification’, both actors were represented by high-status and ordinary jobs; hence, depicting a rather neutral attitude toward both genders. However, under both ‘relational identification’ and ‘individualization’ category, males were represented as more independent actors and in both cases the difference between males and females was statistically significant. Regarding ‘nomination’, finally, female actors were represented more frequently through ‘informalization’ while male actors were mostly depicted by ‘formalization’ and ‘semiformalization’. This shows that the textbooks show more respect males and considers them more important.

All in all, the present study tried to depict the power relations and its inherent ideology regarding the representation of male and female social actors in *Summit* series. Such analyses can provide a wealth of additional information, including insights into both the curriculum developer and the teachers to interpret and respond to the propositional content of discourse. As Karimaghaei and Kasmani (2013: 36) put it, in this way learners find out how to read critically and understand the underlying ideological structures of the texts and comprehend better.

### ABSTRACT

A critical discourse analysis was applied to a short interview to reveal the hidden goals behinds these simple questions and replies. Both Opera and Obama were successful in including direct and indirect strategies in their turns. Van Valin's model was used as a model for finding out these ideologies used. Blackness, whiteness, racism, race discrimination, and racialization were focused on whether Clinton or Obama is regarded black enough than the other since 'black' is usually used out of the context of colour reference. The ideology of change evidently focused on his two subsequent campaigns, Obama covered both changes local and international, with their different senses and domains.

**KEYWORDS:** *Critical discourse analysis, Obama, the ideology of change, blackness, race discrimination*

### INTRODUCTION

The US racial or ethnic classification 'black' refers to people with all possible kinds of skin pigmentation from the darkest through to the very lightest skin colors, including albinos, if they are believed by others to have African ancestry, or to exhibit cultural traits associated with being "African American". As a result, in the United States the term "black people" is not an indicator of skin color but of socially based racial classification. Relatively dark-skinned people can be classified as white if they fulfill other social criteria of "whiteness" and relatively light-skinned people can be classified as black if they fulfill the social criteria for "blackness" in a particular setting.

The notion of blackness can also be extended to non-black people. Hansen (2012) states clearly that Toni Morrison once described Bill Clinton as the first black president, because of his warm relations with African Americans, his poor upbringing and also because he is a jazz musician. Christopher Hitchens was offended by the notion of Clinton as the first black president, noting, "we can still define blackness by the following symptoms: alcoholic mothers, under-the-bridge

habits...the tendency to sexual predation and shameless perjury about the same". Some black activists were also offended, claiming Clinton used his knowledge of black culture to exploit black people for political gain as no other president had before, while not serving black interests. They note his lack of action during the Rwanda genocide and his welfare reform, which Larry Roberts said had led to the worst child poverty since the 1960s. Others noted that the number of black people in jail increased during his administration. The question of blackness also arose in the Democrat Barack Obama's 2008 presidential campaign. Commentators have questioned whether Obama, who was elected the first black President of the United States, is black enough, contending that his background is not typical, as his mother was white American, and his father was a black Kenyan immigrant. Obama chose to identify as black and African-American (ibid.).

The present paper is a critical discourse analysis of a short interview of Barak Obama, the first black American President. Racism and race discrimination, the Black and the White in USA are examined as the ethnic basis for this study. Shedding light on CDA and its tenets, and Van Dijk's approach is in the second section. A brief CDA is done in the third section.

### **RACISM AND RACE DISCRIMINATION**

"Racism", as stated by Wodak and Reisigl (2001:372) is a stigmatizing headword and political "fighting word" that seems to be on almost everyone's lips today. Perhaps this is because the meaning of "racism" has become extraordinarily expanded and evasive. There is talk of a "genetic," "biological," "cultural," "ethnopluralist", "institutional," and "everyday racism," of a "racism at the top," of an "elite racism," of a "racism in the midst," of an "old" and a "new" or "neo-racism," of a "positive racism," and of an "inegalitarian" and a "differentialist racism." Racism involves the use of essentialist and biological understandings of people under the banner of race to limit, 'other,' or disenfranchise them. The power of 'science' in its attempts to explain and categorize human variation has continued to allow such biologically and physiologically essentialized understandings to endure in discourses of race (Henry & Tator, 2002:119f). He explains that this occurs because science provides a cultural and social "guarantee" of measurable and absolute difference among people that carry the same amount of authority as other systems of knowledge do. Further, though overt assertions of biological hierarchy in relation to race are now considered 'racist' in the Western world, *"the genetic, biological, and physiological definitions of race are alive and well in the common-sense discourse is for us all. The biological, physiological, or genetic definition, having been shown out the front door, tends to slide around the veranda and climb in the back through the window"* (ibid.). Consequently, common-sense continually relies on these biological and physiological understandings of race as 'science' even if these understandings have been largely assumed to be absent in everyday discourse, continuing the assumptions as race being related to essentialized understandings of bodies.

Democratic racism as racist discourse begins in the families that nurture people; in the communities that help socialize them; in the schools and universities that educate them; in the media that communicate ideas and images to them; and in the popular culture that entertains them. People learn this discourse at the very sites where every other form of learning is provided. Racisms also involve varying registers and have developed from overt forms of racial oppression to more subtle ones. Parker and Roberts (2005:75) argue, *"while classical racism has subsided, everyday racism has remained alive. This type of racism can be characterized as those mundane practices and events that are infused with varying degrees of racism"*. Racism is therefore not as outwardly prevalent in contemporary culture, but has developed to become more within the everyday practices, understandings, and the knowledge people use towards others, which are

contextually based. Furthermore, Henry and Tator (2002:121) explain that racist discourses in contemporary Western culture operate in a coexistence with democratic beliefs in justice and fairness, while simultaneously exhibiting negative beliefs and feelings about "*minority groups and discrimination against them*" which they term "*democratic racism*" (p.23f). These conflicting and coexisting discourses of democracy and discrimination are produced and reproduced in different sites of learning, considered 'official sites' and 'casual sites':

Racisms are therefore not simply personal, involving personal prejudices, as has been assumed in the past (see Hill, 2008), but are structural and contextual in nature. They rely on large social structures of domination and subordination and are continually enacted by all people, particularly the dominant (Leonardo, 2004). It is therefore vital to understand how such discourses of democratic racism are activated, favoured and perpetuated in all sites of learning, not simply those sites considered traditional or formal sites like institutions. The power of 'unofficial' sites of learning to influence and evolve these discourses must not be ignored. They are important sites of analysis for understanding how racisms continue to be enacted in contemporary culture. It is within these sites and structures of domination that essentialist discourses get enacted onto bodies, making them racialized. This process of becoming raced is known as *racialization*.

The process of racialization relies on ideologies and essentialism to position people and categorize them into particular groups related to assumed common traits (whether they be physical or social) that are considered concrete and distinguishable from other groups (Murji & Solomos, 2005). As Murji and Solomos state in their book on the theories and practices of racialization, racialization acts as a means of understanding as well as ideological and cultural or political practices and process through which race is given significance. Culture and political practices, they assert, have "*become the basis for the broader conception of racialization as expressing the ways in which social structures and ideologies become imbued with 'racial' meanings, so that social and political issues are conceived along racial lines*" (ibid.:11). However, how such practices actually engage race is not always clear as they can refer to processes of enacting 'race' in varying levels, degrees, and registers, whether it be very specific biological distinctions, processes of cultural differentiation or "*a code in which the idea or language of race*" is enacted (Murji & Solomos, 2005: 4). Further, as explained above between race and ethnicity, racialization is able to enact many different social and cultural divisions and 'classifications' to work on its behalf, these include "culture, ethnicity, language, sexual orientation, ability, religion and, of course, race and skin colour as ways of distinguishing groups for differential and unequal treatment. This process of racialization allows dominant bodies to suppress and dominate others" (ibid.). What is clear is the power infused within processes of racialization as they involve a practice of classification that is largely enacted by the dominant upon the dominated.

Therefore in reality, the social categories of race are complex, interrelated and changing social constructions. Race is not a single, fixed and deterministic category of identity and representation, but rather something that is enacted, placed upon bodies, and used to ensure social and political divisions through a process of racialization. Consequently scholarly analysis working with notions of race and racialization needs to pay particular attention to the social construction of race and its underlying power relations within subjugated knowledge as well as

the way race works discursively, as a language of understanding people (Rashidi, 2012:4ff). As racialization works within systems of domination and oppression to describe peoples within racial understandings, there is also a hierarchy within racialized understandings that provides some racialized groups more power than others. In the Western World, racialized whites are often afforded this dominant position (see also Schäffner & Wenden, 1995 56).

### **THE BLACK AND THE WHITE IN USA**

Discrimination in the USA is by gradation. Whites discriminate against blacks and people of color. Men discriminate against women irrespective of color. Latinos (people from Latin America who see their near white pigmentation as a sign of superiority over blacks) discriminate against blacks. Black Americans, who are direct descendants of black slaves in America, discriminate against blacks from other parts of the world - especially those from Africa. And they discriminate against so called black people who are black by circumstance that they look every inch, white, but have a little black blood running through their veins. At the height of discrimination in America, blacks were openly stoned to death on flimsy reasons. At the peak of it, a black man could be lynched just for making a pass at a white lady, proven or not. How does a lynched dead, prove he did not have eye contact with a sacred white lady, you may wonder. He could also be shown the way out of an eatery simply because he strolled past an area reserved for people of superior color (see Rashidi, 2012).

Within definitions of race, and processes of racialization, a particularly interesting and elusive category is that of the white race. "White" was not initially considered a race, as it was the norm from which all 'other races' were understood. Whiteness consequently came to define itself largely through the negative of what it is not – it is *not the Other*. This definition is from a legacy of colonialism, where racial classification and understanding is rooted; where the colonizers, understood to be 'white,' were the sign post from which race was defined, therefore creating the discourse of white as *not* race, *not* Other (Johnson & Enomoto, 2007:78ff). Because of this 'non-race' beginning, whiteness has developed as a position of power, as the norm and at times invisible in relation to 'other races' as it is the center from which 'other' races are measured and defined (Frankenberg, 1993b). White does remain a race and therefore comes to have its own particular as well as common attributes of definitions of race (Frankenberg, 2004).

Whiteness is therefore particular because it is defined through its advantages and its privileges (ibid.), not through its disadvantages or lack of norms, as whiteness does not only incur disadvantage to racialized others by being the 'norm' it also allows those defined as white to have and gain advantages because of their racialization. Furthermore, whiteness has developed in conjunction with concepts of race, especially since the civil rights movements of the 1960s, to see itself within a conflicted ideology. Johnson and Enomoto (2007:5) explain that "*from the late 1960s on, white identity has been reinterpreted, rearticulated in a dualistic fashion: on the one hand egalitarian, on the other hand privileged; on the one hand individualistic and 'color-blind,' on the other hand 'normalized' and white*". Their characterization of white identity is an important one to understand how whiteness functions and is perpetuated as a racialized identity in popular culture. These dualistic characteristics of whiteness are important points of questioning and contention within the discourses of racialized popular culture.

The project of whiteness as a racial category in the North American context is therefore particularly interested in continuing to define itself through ideologies of fairness, egalitarian ideals and democratic understandings, but in order to do so, it engages in intricate policing of its

definitions and relations of power in relation to racialized others. How these dualistic characteristics play out reveal important registers of whiteness that enact differing levels of dominance, privilege, and democratic ideologies.

As Rashidi (2012) explains whiteness as a category is also measured in its comparison to blackness: Whiteness “*in the United States is measured not just of the melanin content in one’s skin but of one’s social distance from black-ness*”. What this means is that performances of whiteness by some people who can ‘pass’ as white allows them ‘white’ status, where the abstract (though understood as fixed and obvious) borders of ‘white’ and ‘black’ remain intact and racialized ‘in-betweens’ are required to perform their identities within these borders in a sort of third space of racial ambivalence and in-betweenness. This uncertainty is felt largely by Latinos (ibid.) but also by Jews (as the blog discussions make clear), which will be explained below. Performances of ‘race’ through representation occur through a variety of means and at a variety of degrees.

### **CRITICAL DISCOURSE ANALYSIS**

Critical discourse analysis (CDA) as its names suggests first, is critical device. Although it is not attached to any special theory and philosophy, it calls itself merely as a method of analyzing the text. It mainly deals with the questions of inequality and power, power institutes and the relation of language and power so it is natural to conclude that it has a political attitude (Stubbe et al, 2003). Fairclough defines it as:

*...relationships of causality and determination between (a) discursive practices, events and texts, and (b) wider social and cultural structures, relations and processes; to investigate how such practices, events and texts arise out of and are ideologically shaped by relations of power and struggles over power; and to explore how the opacity of these relationships between discourse and society is itself a factor securing power and hegemony (1993:135).*

Wodak (2006) describes it as an interdisciplinary knowledge and heterogeneous mass that cannot be put in one category. It is called interdisciplinary because it is located somewhere between sociology and linguistics and some linguists believe that a correct understanding of the relations between society and discourse is impossible unless linguistics and sociology approaches are totally combined. Van Dijk (2001:352) states that “*Critical discourse analysis (CDA) is a type of discourse analytical research that primarily studies the way social power abuse, dominance, and inequality are enacted, reproduced, and resisted by text and talk in the social and political context.*”

Using the word of discourse in the title of this method means that there are many ways for discussing the social inequalities but the way that CDA proposes is based on the role of discourse in producing power, abusing it, and finally creating the inequality. Power which is produced by the elites, institutes or groups results in dominance and discourses reproduce this dominance or challenge it; in this condition an analyst examines the structures, strategies and other properties of the text or discourse to see how they work and (re)produce this dominance (Van Dijk, 1993b).

## THE TENETS OF CDA

Fairclough and Wodak (1997: 271-280) summarize the main tenets of CDA as follows:

1. CDA addresses social problems
2. Power relations are discursive
3. Discourse constitutes society and culture
4. Discourse does ideological work
5. Discourse is historical
6. The link between text and society is mediated
7. Discourse analysis is interpretative and explanatory
8. Discourse is a form of social action.

Furthermore, McKenna (2004:10-14) generally mentions eight characteristics for CDA as they follow:

### ***Teleology***

According to this feature, CDA has a teleological view to the questions of power, dominance, justice, fairness, etc. McKenna believes that “CDA claims, sometimes implicitly, sometimes explicitly, that its practice provides demystifying and emancipator effects” (2004:12). Although she asserts the quotation as a criticism about CDA, but it reflect the truth about the teleological aspect of CDA that tends to correct the affairs to turn onto the fair way. In this way, it is different from the other discourse analysis methods like conversational analysis, which mostly pays attention to the communication and dialogue in real situations. Through unifying theory and practice, it tries to bring about real social changes in the frame of that teleological attitude to the positive notion of society.

### ***Theory of discourse***

Marxian theories have placed a lot of concentration on the notion of discourse. The Marxian and neo-Marxian critical discourse approaches have been challenged by the Foucaultian poststructuralist ideas even to a point that they seemed to meet their end (ibid.: 11). CDA is a proper field for both of them to appear and simultaneously help each other to construct a better vision of the discourse and distinct it from other similar methods.

### ***Materialism***

The perception of the discourse, which is largely presented by CDA, is based on materialist conception even to that extent that “social context relates to textual production”. As a notion which is taken from a Marxian theory, Bakhtinian language theory, and Foucaultian discourse theories, Foucault – one the main figures who have had a great influence on the theoretical frame of the CDA (Van Dijk, 2001) – believes that language and context are interwoven concepts. In other words, language acquires life in real and concrete communicational environment not in an abstract linguistic system of language or in the speakers’ mentality. The main specialty of discourse which separates it from a simple speech act is that as Van Dijk says it takes place within a more extended frame of social practice. It is something which takes place “*within a framework of understanding, communication and interaction which is in turn part of broader sociocultural structures and processes*” (1997:21).

### ***Historicity***

Spatio-temporality of any textual production is provided by the historicity of the discourse. A discourse is not something that merely happens in the present time but it contains many ideas and

memories from the past and the groups, which have been involved in that discourse, too. Overall, it can be said that CDA looks at discourse as a diachronic process as much as it deals with the synchronic aspect of it. This idea finds its climax in discourse historical method of Wodak (2006) and intertextuality notion of Fairclough et al. (2006:87).

### ***Constructionism and constructivism***

The constructionism of discourse means that like what Wittgenstein means by the idea of “meaning is use”; there are different possible meanings for a word depending on the context in which the word is used. Although, sometimes, it has wrongly been understood as McKenna pointing to such misunderstandings writes, sometimes the conclusion has been drawn like that, “*we are free to construct any meaning we like.*” By the other side, constructivism means that, at the same time that language can reflect the reality it can produce reality. CDA believes that language can represents different layers of meaning dependent on the discourse in which it is acting and beside that one of the most important characteristics of language which appears in a discourse is the ability of it to represent and create realities ( 2004: 13).

### ***Theories of subject***

Because of the relation between subject as a concept with agency and constructedness, this notion is very important in CDA. McKenna believes that individuals should be counted as the agents of ideology by constructing of their subjectivities. Despite the Marxian who only daresay to the external subject, Foucault believed that there are two internal and external subjects (ibid.). The conclusion of that discussion would be this fact that the process of power as political technology is accomplished through making subjective and productive bodies. Because some of the main issues that CDA is going to investigate are the questions of power and ideology, the usage of power and its mutual relation with ideology, the speaker production of text or other interaction forms will be very important because through this production, they can be the agent of ideology.

### ***Ideology***

As already mentioned, individuals through construction of their subjectivity are the agents of ideology. According to that, social practices, during which individuals construct their subjectivity, represent the ideology that is constructed discursively. In this relation, many definitions and explanations have been given; for example, a definition of ideology by Bourdieu and Eagleton who believe that it is a “*spontaneous belief or opinion [that] . . . would seem unquestionable and natural*”( 1992 :112) or “*things people accept without knowing*”(p.114) . By other side, Hodge and Kress define it as “*systemic body of ideas, organized from a particular point of view. Ideology so is subsuming category which includes science and metaphysics*” (1993: 6). All of these cases can be the reflex of this fact that how much the question of ideology is important for CDA. Generally, we can say that the ideology governing a discourse is responsible for a major part of the circumstances taking place in that discourse. It determines the attitude of participants and adjusts the nature of the relation, which is between them. It is also responsible for other involving factors within the discourse that have an unconscious impact on the participants. It is obvious that one of the main elements that every discursive analysis should pay attention to is the ideology behind the discourse. Just because of these, Rahimi and Sahragard (2007:12) believe that “*any theory of language which is serious about social functions must take it into consideration*”

### **Power**

There is a tight link between discourse and power and in the same way between power and knowledge. Foucault rejects the structuralist Marxian ideas about power and their notion of state apparatus and ideological state apparatus while he cannot present a clear theory about power; despite this fact there are three points, which CDA has borrowed from his discussion about power: Discourse has the same capability to produce positive or negative outcomes. Power and power relations are produced in a system of social networks. There are certain criteria for any entity, which want to enter and influence the discourse (McKenna,14).

Fairclough categorizes the relation of power and discourse in two classes of *power in discourse* and *power behind discourse* which alludes to the power of institutes or groups which are apparent within the text as the power in discourse and those which exist but their presence is not touchable and it is hidden (1993). Power is one of the basic notions of CDA and originally the very reason that justifies the existence of CDA is its tend to survey the power relationship and the dominance, which can result in inequality, injustice and abuse.

### **THE SELECTED APPROACH: VAN DIJK AND SOCIO-COGNITIVE MODEL**

Van Dijk is one of the most recognized figures of CDA and his ideas seem to be very important to this discipline since if not in all but in most of the resources used for preparing this study there are some references to his works and probably elaborating on his works will define the features of the socio-cognitive direction of CDA. He has done remarkable works regarding the racism in the news, representation of minorities and defining the notion of *Us* and *Other* or *ingroups* and *outgroups* when he explains the models in ideologies which will be elaborated below. The most signalized characteristic of his works is that he has elevated the analysis of discourse to something more than the mere analysis of structures and determining the possible interpretations of the text – by the structural analysis of text, we mean the analysis of the grammatical component of the text. Rather he has dealt with the production and reception process of the news (Boyd-Barrett, 1994). Production process deals with the elements, which mostly are influential in the process of producing news like the financial or economic and social practices. Van Dijk believes that “Discourse is not simply an isolated textual or dialogic structure. Rather it is a complex communicative event that also embodies a social context, featuring participants (and their properties) as well as production and reception processes.”(1988a: 2).

These practices are taken-for-granted to be not only influential on the process of making news but also determinative for the major policies of the institute, which produces news. Reception process refers to the way that news is comprehended and understood by the addressee. As the result of what has been said, we can say that Van Dijk has proposed three levels of analysis, structure, production and reception and comprehension. He tries to tie these levels together and make smooth criteria for analyzing the text. These relationships according to him take place in two levels of microstructure and macrostructure levels. The earlier relates to the semantic relations of grammatical components of text which make it coherent and the other one deals with rhetoric elements such quotation, direct and indirect reporting, which make it to seem factual. However, macrostructure is the only level that Van Dijk pays more attention to it because it is relevant to the thematic/topic structure of news stories and their overall schemata. Van Dijk defines schemata as a pattern that contains a headline, story and consequences. This last one is the final comment and conclusions that exists within the news and regarding this part he thinks that headlines and lead paragraphs more or less contain the most general information and addressee memorizes them better (1988b:14ff).

The other major notion that Van Dijk has investigated so much is the notion of ideology and analyzing the discourse analysis as ideology analysis. As Van Dijk says ideologies are produced and reproduced in discourses and communications and even the non-verbal semiotic texts like pictures and so on can have an impact in this (re)production (1995: 17). Consequently, he proposes three levels of analysis for analyzing the ideologies within the text. Two of these analytical levels, including the social analysis and discourse analysis are the same with the traditional system of interpreting the text, in the sense that the social analysis is adopted to context analysis and discourse analysis is adopted to the text analysis in the traditional method (1995:18; 2006b:161; 2006c:115). However, the new gift of Van Dijk to CDA is the third level of analysis, the cognitive analysis. The sociocognition, which by itself is divided into social and individual cognition, is something between other two levels. He defines cognition as “the system of mental representations and processes of group members” (1995:18) following his definition of cognition, he defines ideologies as “systems” (Van Dijk, 2006c:166) that “indirectly influence the personal cognition of group members” (1995: 19).

The notions of ideology and context bring about the notion of *model*. Mental representation of individuals within a social action or interaction is called model. Defining the meaning of cognitive model he writes “*The meaning or 'contera' of discourse is controlled by subjective interpretations of language users of the situation or events the discourse is about, that is by their mental models*” (2006c:121). These models are so important in analyzing the role of ideologies within the society. They determine the norms within the society and the way that individuals think, behave and move. One of immediate results caused by recognition of individuals’ mental representation within the society is the possibility that helps to categorize the two major groups of Us versus Them where the participant or speaker generally tends to present oneself or one’s group in the positive terms and other groups in negative terms (Van Dijk, 1995: 22).

The way that CDA works is a top-down method that despite the fact that power relations are bilateral, it only pays attention to those aspects of power abusing and dominance which are imposed from top to down e.g. from institutes or elites to the society or from majority to minority, etc. Besides, CDA is macro-level discourse analysis methods, which means that instead of paying attention to the grammatical aspect of the text within the text, as a separated unit, it deals with those aspects of text, which are in relation with the discursive definition of it. Although more modern version of CDA try to decrease the distance between these two features of the text and make a kind of combination and unity between them in a way that they act as complementary instruments to give to hand a better vision of the discourse and what is going on there. In other words as Van Dijk believes these micro- level notions can direct the text to macro-level implications that helps to gain wider vision of the circumstance of power (re)production and other related subjects. Van Dijk states:

*...it is theoretically essential to understand that there is no other way to relate macro-level notions such as group dominance and inequality with micro-level notions as text, talk, meaning and understanding. Indeed, the crucial notion of reproduction, needed to explain how discourse plays a role in the reproduction of dominance, presupposes an account that relates discourse structures to social cognitions, and social cognitions to social structures (1993, p.280).*

It is obvious that text analysis can take place in two distinct levels of macro or micro. Micro level deals with the participants of the text or the conditions, issues or people that directly are related to the text within the context while macro level deals with more prominent and major issues that can be related to context in higher level and beyond the actual condition of the text. For example, in normal social behavior, the analysis devoted to the people involved in the behavior, the place and time of the behavior and physical description of that behaviour consists the micro level of the analysis while in a higher level describing and investigating the power relations among the people and groups or studying the possible ideology which exists behind the text is related to macro level of the analysis (Van Dijk, 2006c; Van Dijk, 2007).

In another view, maybe it is possible to say that macro level of analysis mostly is in relation with the groups, societies and the thinking and ideological bases that provide the groups and societies with intellectual resources and to a large extent it deals with the power relationships in these groups. At least, at one place, macro level analysis has been categorized to models of traditional and new macro analysis, which the first one is more based on the power relations, overall, seems to be more theoretical, and so farther than the micro level but, the later one is more in relation with the micro level and its components. In this sort of new macro analysis, the main emphasis is on the notion of interaction, which implies a stress on the relations between people within the context and their performances within the context. At the same time, from the viewpoint of the power relationships between the people as the participants of the context, the new macro method can determine which performances should be chosen for a specific situation. Regarding this point, Van Dijk writes,

*Obviously, this formulation is in terms of traditional macro-level categories, such as the power of groups, organizations and institutions. Especially relevant for discourse analysis [,] is of course also the more local, situated micro-level of social structure, that of interaction (2006a:364).*

## THE CDA OF THE INTERVIEW

### *The Interview*

The interview is held with Barack Obama:

The president-elect (then Illinois state senator), who first brought the house down back in 2004 at the Democratic National Convention, takes a rare break from his 16-hour workday to tell Oprah about his multicultural upbringing, political plans and priorities, and loving family.

Note: This interview appeared in the November 2004 issue of O, The Oprah Magazine. It's a speech I'll never forget: Barack Obama, the Illinois state senator from Chicago, addressing the nation at the 2004 Democratic National Convention. "I stand here knowing that my story is part of the larger American story, that I owe a debt to all of those who came before me, and that in no other country on earth is my story even possible," he said with a fervor that could be felt through the airwaves. "Tonight we gather to affirm the greatness of our nation, not because of the height of our skyscrapers or the power of our military or the size of our economy," he continued. "***Our pride is based on a very simple premise, summed up in a declaration made over 200 years ago: 'We hold these truths to be self-evident, that all men are created equal.'***"

Oprah: There's a line in *The Autobiography of Miss Jane Pittman* [a 1974 TV movie based on Ernest J. Gaines's novel] when Jane is holding a baby and asking, "***Will you be the One?***" While

you were speaking, I was alone in my sitting room cheering and saying, "*I think this is the One.*"

Barack: That's so nice. I think *I'm one of the ones. I fight against the notion that blacks can have only one leader at a time. We're caught in that messiah mentality.* As a consequence, a competition is set up. Who's the leader of the Korean-American community or the Irish-American community? The reason we don't know the answer is that they've got a collective leadership—people contributing in business, culture, politics. *That's the model I want to encourage. I want to be part of many voices that help the entire country rise up.*

Oprah: How do you define yourself as a leader?

Barack: Though *I'm clearly a political leader now, I didn't start as one.* I was skeptical of electoral politics. *I thought it was corrupting, and that real change would happen in the grass roots.* I came to Chicago [after college graduation] *to work with churches organizing job-training programs. I thought the way to have an impact was through changing people's hearts and minds, not through some government program. So I did that for three and a half years, went to law school to become a civil rights attorney, and then wrote a book.*

Oprah: You were so young when you wrote *Dreams from My Father*. Why did you decide to write a memoir at 33?

Barack: I had the opportunity. When I was elected president of the Harvard Law Review, people were willing to give me money to write. That's a huge luxury. *I thought I had something interesting to say about how our cultures collide as the world shrinks. My family's story captures some of the tensions and evolution and crosscurrents of race, both in this country and around the globe. One of the contributions I thought I could make was to show how I came to terms with these divergent cultures—and that would speak to how we all can live together, finding shared values and common stories.* Writing the book was a great exercise for me because *it solidified where I'd been and set the stage for where I was going.*

Oprah: *When did you first realize that you were a little black kid? Was it the incident you wrote about, in the seventh grade, when someone called you "coon"?*

Barack: Because I grew up in Hawaii and then lived in Indonesia for a while, *I understood my affiliation to Africa and black people from an early age, but only in positive terms.* I became aware of the cesspool of stereotypes when I was 8 or 9. *I saw a story in Life magazine about people who were using skin bleach to make themselves white. I was really disturbed by that.* Why would somebody want to do that? *My mother had always complimented me: "You have such pretty brown skin."* (bold and italic are mine for the purpose of analysis).

### ***Structure of the Interview***

This interview is divided into the following parts:

*Preliminaries:* Opera mentioned some previous events related to electing Obama as Illinois state senate .Opera presented her expected ambitions in this senate. Setting was specified. Both, Opera

and Obama shared their dreams in the greatest of their nation , neither in the height of skyscrapers, nor the power of military , nor the size of economy; but in 200-years ago declaration

*Opera:* presented her old dream: finding out **The One! The One** who will save Jane Pittman, Opera, and many other blacks from racism and discrimination.

*Barak:* accepted these thanking statements of Opera, declaring the shared responsibility of the whole America to fight black discrimination.

*Opera:* certain questions related to the political and social life of Obama.

*Barak:* certain examples that prove his vitality and personality as both a writer and a leader.

### ANALYSIS OF THE INTERVIEW

Since CDA deals with power, domination and social inequality, it tends to focus on groups, organizations and institutions, and thus requires an analysis of the social cognition – or the social representations – shared by these collectivities. Most important, according to Van Dijk, are knowledge (personal, group and cultural), attitudes (socially shared opinions) and ideologies (basic social representations of social groups) (Van Dijk 2001: 113f). To find out how language users exercise power in or by their discourse, one needs to examine those properties that can vary as a function of social power. Hence, Van Dijk suggests one should concentrate upon the following linguistic markers: stress and intonation; word order; lexical style; coherence; local semantic moves such as disclaimers (local meaning, lexical meaning, meaning of words, as well as the structures of propositions, coherence, implications, presuppositions, allusions and vagueness); topic choice (global meaning of the discourse, semantic macrostructures); speech acts; schematic organization; rhetorical figures; syntactic structures; propositional structures; turn takings; repairs; and hesitation (Van Dijk 2001: 99). According to Meyer (2001: 26), Van Dijk puts forth a six step-strategy on how to conduct the actual analysis (see also Van Dijk 2001: 101-08 for an example of how he uses this analysis). At any rate, Meyer's (2001: 26) summary is found below:

1. Analysis of semantic macrostructures: topics and macropropositions
2. Analysis of local meanings, where the many forms of implicit or indirect meanings, such as implications, presuppositions, allusions, vagueness, omissions and polarizations are especially interesting
3. Analysis of 'subtle' formal structures: here most of the linguistic markers mentioned are analyzed
4. Analysis of global and local discourse forms or formats
5. Analysis of specific linguistic realizations, for example, hyperbolas, litotes
6. Analysis of context

### VAN DIJK'S SIX STEPS OF ANALYSIS

To be practical, these six steps are reflected in this interview as follows:

#### ***1. Macrosemantic structures: Topics and Macropropositions***

- Memories (Opera's first four lines before the interview)
- America is the greatest nation (5<sup>th</sup> and 6<sup>th</sup> lines before the interview,
- Opera quoting Obama at the 2004 Democratic National Convention.

- American Dependence Declaration, 200 years ago, and Obama's pride of it ( 7<sup>th</sup> and 8<sup>th</sup> lines before the interview)
- Opera is quoting a very famous 1974 TV movie, based on a novel by Gaines: "*Will you be the One?*"
- Obama's Fighting black discrimination and racism
- A question by Opera concerning his leading personality
- Obama's considerations of America's election system
- Opera's question concerning his political status as a leader
- Opera's questioning about his decision to write a memoir
- Obama's response with details concerning major and minor themes like race
- Obama's concluding about his nation and family.

## 2- Microsemantic structures

**Setting:** after 16 hour-workday at the Democratic Convention

**Interaction time:** a rare break from a long day

**Location:** no clear mentioning, even two cities are mentioned: Illinois and Chicago.

**Participants:** two people Opera and Barak Obama

**Identities:** two very famous blacks: Opera and Obama

**Roles:** question –answer procedure to clarify Obama's concepts

**Relations:** personal powers, US President and famous TV presenter

**Aims:** to thank, praise, and then understand his ideology of Change (social and political)

**Personal knowledge:** both are highly educated, having charisma to influence others

**Actions:** both cited authentic resources like US Human Rights Declaration, a novel, and an autobiography to convince others

## 3- Formal structure

Simple sentences, complex sentences, Anaphora especially *One*, Definiteness, Passive structures

## 4- Local and Global discourse

The local discourse is related to themes of personal change to nation's and definiteness.

Global is related to themes like change, and fighting black discrimination

## 5- Specific linguistic realization

As in affirming, definiteness and the metaphor of Change and its multiple references and meanings.

## 6- Context

It is plausibly supplied by highly literary works, even with personal, as Obama's book *Dreams of My Father : A Story of Race Inheritance* (published in July 1995) and *The Autobiography of Miss Jane Pittman* (1971). Both heroes of these two stories are calling for change of their society as a whole

## THE INTERVIEW BASIC CHARACTERISTICS

**1-Action:** This discourse (interview) is observed is to clarify, and then identify the ideology of change, from the self to the whole society. This is the 'inner' form of change. Obama, as perceived by the researcher, aims to move the society to be more flourished, economically, health, education, salaries, etc. It is a change from Bush's eight years of bad America to a nation full of prosperity and control. This is represented in the first decisions taken by Obama and his team.

**2-Context:** Even short, but this interview reflected clearly the dream of the other side of America; The Black who have old dreams to be represented in the whole aspects of the American society. Only some had farther dreams, like Obama's father, Opera, and Obama. Thus, the background, situation, conditions, and all actual and other participants (his father as a source of realistic potentials, and social-changing atmosphere as represented by his white mother) were existent positively.

**3-History:** this is very clear in all the active and other participants. Opera's dreams and ambitions, Obama's family and its history are actual records of the Black in America.

**4-5-Power and ideology:** The ideology of power is so evident in Obama's words: *change* and *fight*, encourage, want to be the model and *one of the ones*. This power is also reflected in his book, since moved from being an observer to an active critic and then a reformer.

## THE IDEOLOGY OF SOCIAL CHANGE

Does this interview reflect Obama's ideology of change, as reflected in his slogans: "Change we believe in" or "We believe in Change"? This interview clearly reflects this policy or ideology by his first reply: *I think I'm one of the ones. I fight against the notion that blacks can have only one leader at a time. We're caught in that messiah mentality.* This ideology of change, in Obama's concept, is the responsibility of the society "I'm the one of the ones". This responsibility needs fighting these old notions in both behavior and mind. In other words, Obama declared his strategy of social reform, before being with political reference. The basic points to be inferred concerning this ideology from doing CDA for this interview are the following:

- i- Obama's first reply also has that sense of urgency in doing the action now.
- ii- Being aware that he was a black from the early years helped him positively to be determinant and productive.
- iii- Early instances lead him to be positive to his own personality, family, siblings, and then his nation.
- iv- His policy of change is inherent; to be the first American black president is a unique representation of his presidency slogan.
- v- This confidence was early postulated; his continuous encouragement from his mother led him to reject those attempts of his peers to be white.
- vi- Till now, his mother is a source of support and encouragement.

- vii- The title of the book reflects the unity of his family especially in being in direct touch with his father and then being a direct observer.
- viii- Opera was biased in her interview especially when she focused on those points that can reflect the developed mentality of that black one, moved to her confidence in being the one, her support of his slogan 'change'. Furthermore, she moved the interview to be a propaganda for the president's only positive sides.
- ix- Particular emphasis was on 'the one'. Even 'one' is a marker of indefiniteness, but being preceded by the definite article it is used as if Opera, and other blacks were really waiting that one. We notice the capitalization of 'O' in one for doubling its emphasis.
- x- It is so clear that Africa and Indonesia are more familiar with the other one, unlike America. Therefore, Obama wanted that one concept in Africa and Indonesia to be in America.
- xi- He criticized the routine of elections.

#### **VAN DIJK'S SEQUENCE MODEL**

Overall, Opera and Obama follow the sequence of situation – problem – solution scheme in this interview, which is presumably culturally and morally inspired Opera herself. Using this scheme, this is how this interview moves:

**Situationx:** Opera and Obama express their greetings and desire to find out possible solutions to their everlasting problem: black racism.

**Problem:** Opera and Obama carry similar heritage of racism, discrimination.

**Solution:** Dependency and Human Rights Declaration ,Obama's book ,Gaines's novel ,and then being elected as the first Black American President ,all present a local ideology of change and influence. Obama develops this ideology to have other forms like power, equality and dominance, to actualize his ideology of change. In his book, for example, in this lyrical, unsentimental, and compelling memoir, the son of a black African father and a white American mother searches for a workable meaning to his life as a black American. It begins in New York, where Barack Obama learns that his father -- a figure he knows more as a myth than as a man -- has been killed in a car accident. This sudden death inspires an emotional odyssey -- first to a small town in Kansas, from which he retraces the migration of his mother's family to Hawaii, and then to Kenya, where he meets the African side of his family, confronts the bitter truth of his father's life, and at last reconciles his divided inheritance. Opera cited the story of Jane Pittman as an example of those black ladies carrying from their early days the dream of change; a change that gives them some aspect of humanity. Opera herself was one of those, especially her early years were very dramatic since being raped before completing her eleventh. Thus, Opera found her and all her black nation's everlasting dream comes true, and finally her GODOT arrived, and

no more waiting. Moreover, Obama was very successful in this especially in his lexical selection. The best example is the choice of “I fight the notion”; a phrase repeated many times on the tongue of both Jane Pittman and Opera herself. The interesting thing here is that both Opera and Obama himself are under the influence of this novel and its adopted film (1974) which nominated to BAFTA AWARD and got nine EMMY Awards. Moreover, after Obama’s elect, this novel was reprinted in 2009, and about 3 million copies were sold.

### **INSTANCE OF BLACK DISCRIMINATION**

The instances of black discrimination in this interview are the following:

- i- Opera who herself carries sad and dramatic discriminative reflections from early childhood.
- ii- Obama’s book which is memories of race and inheritance.
- iii- Obama’s personal experience
- iv- The incident mentioned by Obama concerning those peers looking for changing their skins; the famous pop singer Michael Jackson is one of them , for reasons related of employment , girls, and away-from discrimination.
- v- The novel mentioned by Opera concerning Jane Pittmon, who really suffered from both her black husband and white neighbours.

### ***The Ideology of Political Change***

As different as the notion of the founding documents are the concepts of *freedom* and *justice*. *Freedom* is a principle the American liberalism built on the *classical liberalism*, where it meant individualism and the notion of choice the individual has that is not restrained by tradition (Micklewait, 2005: 343). According to Taylor, the liberal *freedom* is defined largely in terms of the social and political rights of individuals as “immunity from interference by others in his life, either by state or church or by other individuals”. *Justice*, on the other hand, is “understood in terms of equality and the end of oppression in the social world – ‘fair play’.”

The American Revolution is seen as a fresh start for mankind to create a “better world”. The Democratic Party became the advocate for all the inequalities in the society, whether it is segregation and racial prejudice, women rights, gay rights or simply economic disparities stemming from unrestricted capitalism. The capitalism is, however, venerated in the liberal vision because it creates wealth, but it has to be regulated in order to serve the common good. “Progressive social change and an active role by the government are important, and initiatives such as the New Deal and the Civil Rights Movement are positive forces that improve society. Increasing wealth creates new opportunities to achieve fairness and justice.” (Morris 2004: 56) Therefore, the *American Dream* has also a different interpretation; in the view of liberalism it means equal opportunity for success for anyone.

According to Lakoff (2002: 108), the liberal model is a reflection of *the nurturant parent morality* model, where the government builds on mutual respect rather than on control, and where the “compassion” and “caring” are the keywords. In order to end the inequalities in the society, the government has to play a significant role in the lives of the people. Taxation is required for the common good of the society and in implication, a big governmental apparatus has to be

formed for a fair distribution of wealth. Schooling and welfare systems are the governmental responsibilities as well. The problem of liberal ideology is the concept *equality* that especially in the 20<sup>th</sup> century became linked with Marxist theories and their implementation after the Second World War. The Democratic Party therefore struggles to form a new narrative that would stress the differences with Marx, but at the same time, will be consistent with the Democratic Party's role of the correcting force in the course of American history (desegregation, civil rights, women rights, New Deal etc.).

## CONCLUSIONS

Even the interview was very short ,no more than ten or eleven turns for both , but the critical discourse analysis specified many interesting points like sharing personal experiences ,the mentalities and how are being represented , and procedures to be followed by the first black American President to fight this typical racism in the American society. As a political personality, Barak Obama tried to shed some light on these negative factors in his society, believing that these negative points can be easily recovered by keeping America to its Anti-Discrimination Declaration, or also called American Human Rights Declaration, 200 years ago. Opera herself shed light on two forms of black racism by citing Jane Pittman, a young black slave, who, like Opera herself, suffered from rape in her early years, and being discriminated by her black husband and white neighbours. Finally, CDA is again proved a very useful tool and then mechanism to understand what is hidden between lines.

## AIMS AND SCOPE

The international journal of language learning and applied linguistics world performs as a platform for the new scholars to share their insights with other scholars in the form of original papers.

The international journal of language learning and applied linguistics world is a double-blind peer-reviewed international journal dedicated to promoting scholarly exchange among teachers and researchers in the field of language teaching and applied linguistics. Papers submitted to the journal will immediately be sent to two related reviewers who are responsible to provide feedback on the content and the language use.

The journal is published monthly in online and print versions. The scope of the journal includes, but not limited to, the following fields:

*Theory and practice in English*  
*Language teaching & learning*

**ABSTRACT**

This study determined the effects of three types of comments on the content and organization of Iranian EFL learners' compositions. They were in the forms of Statement, Imperative, and Question. Totally, 250 changes were traced. The resulting 250 changes were analyzed based on the degree to which the students utilized each teacher's comment in the revision process. The results showed that Imperative comments were more influential on revisions than Statements or Questions and they helped students to have more substantial positive revisions. Moreover, it was observed that nearly 60 percent of all the three kind of comments led to positive changes in the final drafts and only 17 percent had negative effects on the revisions. These outcomes may imply that teachers should be more careful in selecting the type of the comments on the students' revision and try to use more imperative comments than questions or statements when giving comments.

**INTRODUCTION**

Providing feedback to students, whether in the form of written commentary, error correction, teacher student conference, or peer discussion, has come to be recognized as one of the ESL writing teacher's most important tasks, offering the kind of individualized attention that is otherwise rarely possible under normal classroom condition. Teachers are now very conscious of the potential feedback has for helping to create a supportive teaching environment, for conveying and modeling ideas about good writing, for developing the ways student talk about writing, and for mediating the relationship between students' wider cultural and social worlds and their growing familiarities with new literacy practices. However some other researches such as Truscott (1996) takes the strong position that error correction in L2 writing is useless and should be abundant. Because he believes that language acquisition is a gradual developmental process that is impossible to become errorless by any transfer of explicit suggestions, hence, he rejected error corrections. On the contrary to Truscott's strong belief against error correction, Ferris (1999) claimed that Truscott's arguments were premature and overly strong. In addition, Ferris maintained that there were equally strong reasons for teachers to continue giving feedback, not the least of which is the belief that students have regarding its value. Generally, evidence on support of Ferris is more than that of Truscott (Ashwell, 2000; Cradelle & Corno, 1981). Today most of the writing teachers believe that at least some kinds of feedback is needed on the student's paper if they want to have a better result in their teaching and also students feel satisfied that their works have been read. Commentary is one kind of feedback that is given on the mechanics, content, organization, and so on. As the literature about feedback is reviewed, rarely can you find enough evidence concerning giving feedback in the form of comments on the content of written materials. Ferris (1997) for example tried to probe the effects of different kinds of comments on the revision process of compositions. Moreover, most of the studies in the literature have spent their time on the mechanics of writing and error correction. Hence, this study seeks to investigate the effects of different kind of comments on the content of compositions and to see whether there is any difference between the efficiency of these comment on the revisions or not.

***Objectives and significance of the study***

In the present study, the focus is on different types of comments on the content and organization of ideas in EFL composition writing. In fact few studies have been previously done regarding comparing different types of comments with each other. Ferris (1997) studied the influence of teacher commentary on students' revisions. She made a model for teacher commentary in which comment length, comment types, use of hedges, and text specific comments were included and investigated on native speakers of English. The present study seeks to investigate and compare different types of text specific comments, in forms of statements, imperative, and questions on Iranian EFL learners.

## REVIEW OF LITERATURE

### *Error correction and teaching writing*

Error correction research has focused mostly on whether teachers should correct errors in student writing and how they should do it. The reason why teachers should correct errors and how they should do it is topic of constant debate, although there are researches that suggest error correction is ineffective as a means of imploring student writing (Cohen & Robbins, 1976; Robb, Rose & Shortreed, 1986). Writing teachers know well that students are not satisfied with not giving one feedback on their written errors. However, there is enough evidence to believe that students benefit from these feedbacks (Zamel, 1985; Ferris, 1997). The matter of the kind of feedback is still source of concern for many teachers. Teachers' commentary on the revision of the composition is one kind of feedback that EFL instructors can apply for giving feedback to the students' writer.

### *The process writing*

The process approach is an approach to teaching writing that places more emphasis on the stages of the writing process than on the final product. It is interpretational, learner-centered and not specifically related to examinations. Writing in process approaches is seen predominantly to do with linguistic skills, such as planning and drafting, and there is much less emphasis on linguistic knowledge, such as knowledge about grammar and text structure. In the approach, students are taught planning, drafting, revising, editing and publishing strategies at each stage of the writing process to help them to write freely and arrive at a product of good quality (Zamel, 1985:79). Moreover, since writers do not seem to know beforehand what it is they will say, writing is considered to be a process through which meaning is created. Hence, it implies that revision should become the main component of the instruction, which writing teachers should intervene throughout the process, and that students should learn to view their writing critically (Zamel, 1982:195). Revision is making any change at any time in the writing processes that involves identifying discrepancies between intended and instantiated text, deciding what could or should be changed in the text and how to make desired changes (Fitzgerald, 1987:484). He also maintained that changes may be made in the writer's mind before being instantiated in written text, at the time text is first written or after that.

### *Responding to students errors in writing*

The first thing that a teacher should realize about teacher response is that it is not something that happens at the end of a writing task, but that it is something that happens continuously throughout the teaching and writing processes. For many teachers, responding to student writing has become a mechanical activity, an activity that takes place in the natural course of events in a writing class (Vengadasamy, 2002:2). Moreover, there are some other points still to be mentioned about responding to students writing. For example the teacher can motivate students in the writing class through the type of feedback he or she provides to students written works and students feel better motivated to engage in writing activities when they perceive their teachers to be more interested in what they have to say than in their language accuracy. However, too many error corrections can be discouraging to the learner writer. It supports the notion that teacher response should focus mainly on content (Vengadasamy, 2002:5).

### *Commentary as a feedback*

With the exception of a few articles published in the mid to late 1980s, research on written commentary really did not get much attention until the 1990s. Thus, many issues inherent in commentary have yet to be addressed or adequately addressed in the research literature. Students need some form of feedback that helps them see how others are reading their writing and what revisions might strengthen their writing. Students need to learn that the words they inscribe on paper are not static and that meaning resides not only in these words but also in what the audience brings to the reading of these words. This can only be understood if students get feedback from readers, feedback that shows the writer where what they have intended has been achieved and where their texts may have fallen short of their intentions and goals (Goldstein, 2004:64-65).

Often, one of the first question teachers will ask is what form their commentary should take. Should they ask questions? Should they tell students exactly what to do? Should they show their students exactly how to make a particular revision? Coupled with this, teachers ask where they should put their commentary: in the margins next to what is being commented on, in the beginning of the students' papers, in an endnote, or perhaps some combination of approaches. There is no research that addresses the relative effectiveness of end versus marginal versus initial commentary. Ferris and Hedgcock (1998) suggested that marginal commentary has immediacy, appearing right next to the place where revision is needed; as well, marginal commentary leaves no doubt to what the comment applies and it is physically easier to read the text and the corresponding comment together. On the other hand, end

commentary can be summative, bringing together major themes to educate the writer about particular types of content or rhetorical issues and corresponding strategies for revision.

### ***The extent of error feedback***

Many error corrections advocates have advised against comprehensive error feedback because of the risk of exhausting teachers and overwhelming students (Ferris, 2002:50). Moreover, it is suggested that error correction may be most effective when it focuses on patterns of error, allowing teachers and students to attend to three major error types at a time, rather than dozens of disparate errors (Ferris, 2002:50). Also Zamel (1985) suggested that in error feedback, the teachers should prioritize what they want to correct and grade. They should not focus only on grammar because students may think that grammar is the only thing that counts in writing. Most teachers react primarily to surface errors, treating the composition as if it is a series of separate sentences or even clauses, rather than as a whole unit of discourse (Zamel, 1985:86). Writing teachers spend a great deal of time responding to their student's paper. It may take at least 20 minutes to comment on an individual paper (Zamel, 1985:80). Hence, one should be very careful in delivering any comment on the students' paper as Zamel (1985:94) mentioned that the teachers need to change their responding behavior so that students can better understand how to revise their writing. They must recognize that students may not be able to use comments and markings, for the teachers comments may represent very complex reactions that the students are incapable of applying to their text. Moreover, certain types of commentary may be more problematic for students than others. Ferris (1997:330) in her study of the influence of teacher commentary on student revision concluded that marginal requests for information, request (regardless of syntactic form) and summary comments on grammar appeared to lead to the most substantive revisions. Also Ferris (1995:43) when exploring the students opinion to describe their strategies for addressing their teachers feedback, found that on early drafts, many of the students reported going to an outside source (instructor, tutor, friends, grammar books, dictionaries) for help in understanding or responding to their teacher's comments. Thus, written comments on content should be consistent. Teachers must use a set of clear and direct comments and questions, and also should familiarize students with these comments. These comments must address the strategies required to improve the essay and not just indicate what the teacher found lacking or interesting.

## **RESEARCH QUESTIONS**

The study, therefore, seeks to answer the following questions:

1. Is there any difference between the effects of comments in forms of statements, imperatives, and questions on the students' revisions of compositions?
2. Do the feedbacks make positive or negative changes in the final drafts?

However, it is crucial to maintain that this research is aimed to seek the effect of different kinds of comments on the content of writing and is not concerned with the mechanics of writing

## **METHODOLOGY**

### ***Participants***

In the initial stage, 265 participants between the ages of 20 to 30 were selected from the male and female Iranian EFL students (sophomores and juniors) enrolled at Azad university of Dezful who were majoring in English translation in 2006/2007. All the participants had passed basic courses of grammar and writing in the previous semesters. To be sure of the homogeneity, a proficiency test from Longman Preparation Course for TOEFL (second edition) was given to them. A total of 265 students between the ages of 20 to 30 participated in the test. On the basis of the participants' scores on the test, that ranged from 25 to 86, nearly 90 students scored from 70 to 86. Hence, it became clear that these 90 participants were more proficient and suitable for this study.

### ***Design***

#### ***Samples***

To address the issue already outlined and to testify the amount of the efficiency of each type of the above mentioned comments i.e. questions, statements, and imperatives on the revision of the compositions of the EFL students, the participants were given a composition assignment; "Write your opinion about a social or environmental problem". They were required to write two drafts for the assignment. The participants had different activities such as brainstorming, organizing their ideas, writing the first draft, revising, and second drafting. At first the students were

required to write their first drafts in 45 minutes to 1 hour, and then their first drafts were collected. The week after, at the beginning of the class the students were instructed about the way they should treat the comments on their papers, the time allocated to the task and etc. Then the first drafts, while they had been treated with three kinds of comments were given back to the participants so that they could revise their first drafts according to the feedbacks supplied. The time allocated to the revision was 45 minutes to 1 hour. Finally, the first and the second drafts were collected while they were attached to each other, and considered to be the samples of the study.

#### *Feedback procedure*

In the present study, three types of teacher comments were used: statements, imperatives, and questions. This study, however, tried to apply all the three kinds of comments under study to each draft so as to assess the impact of comment types on the revisions. Moreover, the teacher's commentary was restricted to a fixed number of expressions according to their functions. In obtaining data, more objective evidence of the responses to the written comments was extracted. Students in this study were instructed to use a problem-solving pattern of organization in a way that they were required to follow the comments for that specific, underlined part in their compositions. For example one part of the compositions was underlined, and then the teacher provides a comment for that special subject. Next week, before the papers were given back, the teacher would instruct participants to revise just that specific part of their compositions and not to make substantial revision. In terms of the problem-solving, it was tried to address the function of content feedback:

- (1) Providing details to explain the problem or solution (Providing)
- (2) Describing why the problem is serious (Describing)
- (3) Adding new ideas or more specific support or examples (Adding)

The expressions used as teacher comments in this study are given below.

#### **1. Providing**

Statement: It's very confusing. / It's not clear.

Imperative: Explain it more clearly. / Explain that a bit.

Question: What does this mean? / What do you mean?

#### **2. Describing**

Statement: The reason is not clear.

Imperative: Give a reason for it.

Question: What is the problem, and why?

#### **3. Adding**

Statement: This part is too general. / It is difficult to understand.

Imperative: Give a specific example. / Make it easier to understand.

Question: Is it supported with specific details?

Having received these feedbacks on the compositions, the students were required to revise their first drafts according to the type of the feedback they received.

#### *Rating process*

At this point, the main part of the teacher, the evaluation of the papers, began. Ferris (1997) made a comprehensive research and examined the effects of different types of feedback on ESL compositions and designed a rating scale for revisions according to which the changes were traced in the student's revision of the compositions. The rating is as follows:

1. No change
2. Minimal change/ negative effects
3. Minimal change/ positive effects
4. Substantive change/ negative effects
5. Substantive change/ positive effects
6. Deletion

Taking the term *Content* to represent what a student writer is trying to generate or express, the researcher of the present study focused on meaning or development of idea and provided commentary for helping students explain, describe, or add details. Such a feedback procedure makes it possible to define the word "*minimal*" as partial or unchanged in original thought or meaning, whereas the word "*substantive*" is defined as total, or total change in original thought or meaning. The example of teacher comments and student revisions are shown in the Appendix.

#### Data collection procedure

The data for this study were collected over one semester at Azad university of Dezful. At first, the students were instructed to follow the comments on the content of the compositions when they received their first drafts to revise them. Then, they were required to write about a social, cultural or environmental problem so that the participants were free to choose one of the confirmed topics as their own option. In this way, the first drafts were collected. Then by the feedback procedure which was explained in section 3.2.2 above, the researcher implemented the comments on the first drafts. Each draft received at least 2 or 3 comments from all types of comments under observation. It means that every draft was treated with all kinds of comments. For instance, the researcher would underline a statement in the composition and would write an imperative or question comment beside the underlined part so that in each draft 2 or 3 types of comments from all the three kinds of the comments under observation were exerted. In all, 250 comments were implemented, 90 imperatives, 80 statements, and 80 questions.

## RESULTS AND DISCUSSION

### Results

In this part the results of statements, imperatives, and questions on the compositions are shown. Table 1, 2 and 3 presents the sums of frequency and percentages of the statements, imperative, and questions as the comments under observation.

Table 1: The frequency table and percentage

#### statements

	Frequency	Percent
no change	16	17.8
minimal change( negative effects)	7	7.8
minimal change( positive effects)	15	16.7
substantive change(negative effects)	7	7.8
substantive change(positive effects)	38	42.2
deletion	7	7.8
total	90	100.0

Table 2: The frequency table and percentage

#### imperatives

	Frequency	Percent
no change	4	5.0
minimal change( negative effects)	11	13.8
minimal change( positive effects)	18	22.5
substantive change(negative effects)	4	5.0
substantive change(positive effects)	40	50.0
deletion	3	3.8
total	80	100.0

Table 3: The frequency table and percentage  
questions

	Frequency	Percent
no change	17	21.3
minimal change( negative effects)	7	8.8
minimal change( positive effects)	17	21.3
substantive change(negative effects)	5	6.3
substantive change(positive effects)	19	23.8
deletion	15	18.8
total	80	100.0

### Discussion

The purpose of this study was to examine the influence of teachers' comment types on students' revisions and the students' drafts that had received teacher commentary and subsequent revisions of these drafts. The first question considered whether the teacher's comments types have an apparent influence on students' revisions. Based on the above tables, it is apparent that the teacher's imperative comments are the most effective. When the researcher provided the imperative comments, the substantive positive changes were clearly much more likely to occur in the students revisions (50 percent). When questions were used, such changes were unlikely to occur ( 23.8percent). Finally, when statements were analyzed, 42.2 percent of the comments led to substantive positive effects. In summary; then, these results show that the comment types have an apparent influence on students' revisions. It is also fair to say that the teachers' imperative comments are more influential than questions or statements on the degree to which changes are made. The second question of the research asked whether comments make positive or negative changes in the final drafts. By analyzing tables 1, 2, 3, it was observed that nearly 17 percent of the imperatives, questions, and statements led to negative changes and nearly 60 percent of the all the comments had positive effects on the revisions.

### *Do the student revisions influenced by teacher feedback lead to overall improvement in students' papers?*

Generally, the change (whether minimal or substantial) were overwhelmingly tended to improve the students' papers. Not so much of the changes, (17%), were rated as being negative. Students may either respond very effectively to teacher commentary or ignore it altogether. This awareness should both encourage teachers in their often burdensome role of providing written commentary on students' drafts and alert them that some students whether because of laziness or lack of understanding of the teachers' feedback or effective revision strategies may not utilize their feedback successfully for revision. The teachers should therefore be careful (a) in their own responding strategies , (b) in explaining those strategies to their students , and (c) in helping students learn to revise and holding them accountable for considering feedback they have received in doing so (Ferris , 1997).

### Cultural issues

All learning situations are unique and highly variable. The diversity of student population, the L2 proficiency of the students, their distinct cultural dispositions and instructional socialization, as well as their own beliefs about writing, may lead to different results (Hyland and Hyland, 2006:42). But culture, as one of the main issues in language learning has always been a source of concern in educational settings. Jin and Cortazzi (1998:749) have defined culture of learning as follow:

...socially transmitted expectations, beliefs, and values about what good learning is. This concept draws attention to the usually taken- for- granted cultural ideas about the roles and relations of teachers and learners, and about appropriate teaching and learning styles and methods, and I general, about what constitute good work in classrooms.

In the present study, however, considering the cultural background of Iranian EFL learners, it is realized that the students have been flourished in an educational setting that the teacher is the dominant power in the classroom and everyone should follow the teacher's instructions. The teacher presents the lesson, acts as a model, gives assignment,

asks questions, and in general, he is the authority in the class; therefore, the students expect the teacher to give them commands for the fulfillment of the tasks which are given to them about how to solve the problem. This assumption can be an affective factor in justifying the reason for occurrences of more substantive positive changes in implementing the imperative comments in Iranian EFL compositions. However, this issue in other cultures may have quite different regulation that needs further investigation.

#### ***Making comments helpful and meaningful***

Comments should not entail correcting a student's writing. In order to foster independent writers, you can provide summary comments that instruct students to look for problems and correct them on their own (Sokolik, cited in Nunan, 2003:93). If we write comments on students' paper, make sure they understand the vocabulary or symbols you use. Take time to discuss them in class. Be cautious about the tone of your comments when writing short comments, we tend to leave out the words that soften our message while you may think, "I'm not sure I understand your point here," the limited space may cause you to write simply, "nuclear" or just "?" students can see comments such as these unkind and unhelpful. Moreover, respond to grammar should not be as the primary concern in early drafts. When you do respond to grammar, highlight the categories of error you consider most serious (Flaxman, 2006:6).

### **CONCLUSION**

#### ***Summary***

This study was intended to investigate the efficiency of imperatives, statements, and questions, as comments, on the revisions of compositions of Iranian EFL learners. These feedbacks were implemented on the content of the compositions and aimed to develop and organize the compositions in a better way so that the students could progress more in the unity and coherence of their written products. In order to probe the resulting changes after implementing the feedbacks, the rating scale that was designed in 1997 by Danna Ferris was used. In this way, six kinds of changes in the second drafts of the students were traced. The changes were minimal positive, minimal negative, substantive positive, substantive negative, no change, and deletion. By this method, it was revealed that between the three types of comments, the imperatives had a better effect on the revisions and generally they had more substantive positive changes on the compositions. Besides, the data analyses showed that 50% of the imperatives, 42% statements, and 23.8% questions were rated to have positive substantive effects on the revisions. However, the overall results showed that 70% of the comments led to minimal and substantive positive changes. Also, according to the results of this study, the relationship between the comment type and revision type in all kinds of the comments were meaningful, the residuals were close to zero in all types of comments. This showed that a strong relationship between comment type and revision type was obtained that can lead us to think more about the use of commentary in our writing classes.

#### ***Implications for L2 writing instructions***

Writing is a productive skill that is very important for the process of learning a foreign language, however this skill has not been focused upon as it really deserves. Feedback, as one of the crucial facts in writing instruction, is of paramount importance and the usefulness of giving feedback to students' drafts was explained in the section 2 of the present study. In this study; however, the focus was on the clarification and comparison of the effects of three kinds of feedbacks on content development which are called comments and resulting changes that might have occurred during the revision process. The comments were imperatives, statements, and questions. Generally it was observed that over 70% of the three kinds of comments led to a positive change on the revisions, whether minimal or substantial, but imperatives had greater substantive positive changes on the revisions, comparing with the other two kinds of comments. Therefore, in applying different kind of comments a great attention is needed so as to guide students to have more positive changes in the subsequent drafts. In this study; however, the comments on content of the students' compositions, helped them to organize their ideas better and have a better unity and coherence in the process of writing. Moreover, it should be mentioned that, if we consider writing as a productive communicative activity, we should not hinder the conveying of the message by over-correction of the grammatical points. This is what the students are afraid of, and mostly the only thing that bring about for the students is the feeling of frustration and distress, and this feeling may cause students to avoid writing in general in subsequent sessions.

### **Implication for further research**

The present study surveyed statement, question, and imperative as teacher's comments on the Iranian EFL learners in spite of the fact that there are other kinds of comments in the form of request or exclamation that need to be studied as well. Moreover, some other factors can affect the revision process that in this study were not taken into consideration. First, because this study looked at over 250 comments and 180 papers, it did not examine the differences in student's ability and personality, nor did it look at individual progress across writing topics. Second, the analyses took only the teacher's comments into consideration not all possible sources of student's revision. The students most likely receive input from peers, tutors, and others outside the class. Clearly, further analyses examining variations across instructions would be helpful. Other important analyses would involve contrasting groups of L1 and L2 students in order to investigate the degree to which L2 students have cultural, rhetorical, and linguistic schemata that teachers need to consider when providing feedback.

### **LIMITATIONS AND DIFFICULTIES**

On one hand, implementing that large number of feedbacks was a huge and burdensome task. Besides, collecting all that students to participate in the proficiency test was extremely difficult in a way that the test was given to different groups of the students in their own classes so as not to be forced to administer the test at the same time and place. On the other hand, explanation and training of the students to make them familiar with that forms of specific feedback and how to react to that comments was also extremely difficult and the reaction of the students when they faced with that comments was so strange that their papers were not regarded as a sample either.

### *Appendix*

Examples of teacher comments and student revisions

#### **1. Statements**

**1. Student original:** Trash problem is important in our society.

**Teacher comment:** It's very confusing.

**Student revision:** Trash problem is important in our society.

(No change)

**2. Student original:** The reason is that many people think that it is troublesome.

**Teacher comment:** The reason is not clear.

**Student revision:** The reason is that many people think that it is troublesome job to put the cigarette end into the ashtray.

(Substantive positive change)

#### **2. Imperatives**

**1. Student original:** The third solution to this problem is the educational role by the government.

**Teacher comment:** Explain it more clearly.

**Student revision:** The third solution to this problem is that the government should take the educational role so that the students will be interested in global warming and start to think about it. As a result, many people will improve their life style and global warming will also improve.

(Substantive change)

**2. Student original:** It is obvious that developing countries have more problems than developed countries.

**Teacher comment:** Explain it more clearly.

**Student revision:** It is obvious that developing countries have more problems than developed countries.

(No change)

#### **3. Questions**

**1. Student original:** The second solution is that we recognize that it is dangerous.

**Teacher comment:** What does this mean?

**Student revision:** The second solution is that we recognize that smoking is dangerous.

(Minimal positive Change)

**2. Student original:** The first reason is that abnormal weather occurs all over the world.

**Teacher comment:** Is it supported with specific details?

**Student revision:** The first reason is that we have abnormal weather, such as concentrated heavy rains, tornadoes and drought conditions all over the world.

(Substantive positive change)

**A COMPARATIVE STUDY  
OF ADJECTIVE-NOUN COLLOCATIONS FROM ENGLISH INTO PERSIAN  
IN JANE EYRE BY CHARLOTTE BRONTE**

**ABSTRACT**

Translation both commercial and literary is an activity that is growing phenomenally in today's globalized world (Hatim & Munday, 2004). It provides the interaction between people who have different languages. One of the significant challenges of translation is rendering collocations. In transferring message from one language to another, the translator faces different problems and to make amends for these problems s/he uses different strategies. This study tried to study the translation of Adjective-Noun collocations from English into Persian. It investigated two different translations of collocations of the famous novel, *Jane Eyre*, from English into Persian to find the adopted strategies and differences that exist between English and Persian in translating them. For this purpose forty Adjective-Noun collocations were selected and compared with corresponding part in Persian. The results showed that Employed procedures in both translations are Equivalence, Literal Translation, Modulation, and Transposition. Equivalence emerged as the most conspicuous procedure in Afshar's translation and literal translation was the most frequent one in Bahrami's translation.

**KEY WORDS:** Collocations, Equivalence, Literal Translation, Modulation, and Transposition

**INTRODUCTION**

Translation has an effective and undeniable role in today's world. Raffle stated, "as long as the need to know (other culture) is great; the need for translation will be great" (as cited in Golestany, 2009). Many researchers have analyzed the act of translation based on different theories. They have taken into account different issues such as the cultural aspects of the source language and target language or linguistic-based criteria. "Translation is rendering the meaning of a text into another language in the way that the author intended the text" (Newmark, 1988). Translation has many challenges, one of which is the problem of translating collocations. Collocations play an important role in transferring the meaning from the ST to TT. Most of the time it is impossible to predict the meaning of a collocation from the meaning of its parts.

Munday (2009) defines collocations as "the phenomenon of co-occurrence of two lexical items. (e.g. *held our breath, human being, in winter wage war*); this is a major building block of lexical and syntactic structure" (p. 172). He also point out that "incorrect or unusual collocation often occurs in the speech of language learners and may be a feature of translationese" (p. 171).

The present study focused on the translation of the Adjective-Noun collocations. It intends to compare two different translations of collocations of *Jane Eyre* by Charlotte Bronte from English into Persian to find the differences that exist between English and Persian in translating collocations. This study tries to investigate different strategies applied in translating collocations according to Vinay and Darbelnet's model of translation.

**REVIEW OF THE RELATED LITERATURE**

***Collocation***

Studies on collocations started 2,300 years ago in Greece. The Greek Stoics related collocations to semantics and used the concept of collocation to study the meaning relationships between words. According to these ancient scholars, words "do not exist in isolation, and they may differ according to the collocation in which they are used" (Robins, 1967, p. 21). Traditionally, collocation was defined as: "a sequence of one or more consecutive words that

has characteristics of a syntactic and semantic unit, and whose exact and unambiguous meaning or connotation cannot be derived directly from the meaning or connotation of its components” (Christopher & Schütze, 2000). Baldwin et al. (2003) call collocations “simple decomposable multiword expressions”.

Widdowson (2007) stated that:

Certain items tend to keep company, or **collocate**, with others: there is, at it were, a kind of mutual attraction that draws them together. So the word *unforeseen* will attract the word *circumstances*, *foregone* will attract *conclusion*, *crying* will attract *shame* and *pious* will attract *hope*, and so on. But collocation goes beyond the relationship between two lexical items in a noun phrase to include many other recurring combinations in phrases like: *as a matter of fact*, *all things considered*... (pp. 79-80)

Hoey (2005) defines collocation as words apart and evidences by their occurrence together in corpora more often than is explicable in terms of random distribution (as cited in Munday, 2009). Based on Naixing’s (2002) definition, “a collocation is a conventional syntagmatic association of a string of lexical items, which co-occur, in a grammatical construct with mutual expectancy greater than chance as realization of non-idiomatic meaning in texts” (p. 100).

For Mitchell (1965) collocation is an association of roots or potential lexical meanings rather than actual words; further:

A linguistic item or class of items is meaningful not because of inherit properties of its own but because of the contrastive or differential relationships it develops with other items or classes. Meaning is much less in the name than in the network of relevant differential relationship. (as cited in Nofal, 2012).

Regarding collocation, Howarth (1996) pointed out the following characteristics:

- Collocation words are common examples occupying an important role in language production.
- One of the reasons for collocation is that these combinations are employed as lexical units.
- In general, lexical collocation is referred to as juxtaposition of two or more words, so that native speakers utilize them as commonly as other language components (as cited in Nosratzadeh & Jalilzadeh, 2011).

Smadja (1993) stated the characteristics of collocations as “arbitrary, language- (and dialect-) specific, recurrent in context, and common in technical language” (p. 3). He added “Arbitrariness refers to the fact that substituting a synonym for one of the words in a collocational word pair may result in an infelicitous lexical combination. Thus, for example, a phrase such as *make an effort* is acceptable, but *make an exertion* is not” (as cited in McKeown & Radev, 2000, p. 3-4).

### ***Classifications of Collocations***

Collocations have variety of forms. They come in a large variety of forms. The number of words involved as well as the way they are involved can vary a great deal. Some collocations are very rigid, whereas others are very flexible. For example, a collocation such as the one linking “to make” and “decision” can appear as “to make a decision”, “decisions to be made”, “made an important decision”, etc. In contrast, a collocation such as “The New York Stock Exchange” can only appear under one form; it is a very rigid collocation, a fixed expression (Smadja, 1993). Different classification of collocations will be proposed in this part.

#### ***Classification of Collocations based on the traditional perspective***

Based on the traditional perspective, collocations can be divided into two major groups:

1. Verbal: such as, breaching, cancel the appointment, eating.
2. Nonverbal: such as, flawless flower, last memories, Islam prophet, Islamic revolution, fast cooker.

Each of these two groups divided in to two subgroups: Open collocations and Free collocations (as cited in Nosratzadeh & Jalilzadeh, 2011). Howarth (1996) proposes three categories of free collocation:

- collocations used to satisfy an immediate requirement
- predictable collocations making language system
- entrenched idioms not restricted by semantic and collocation characteristics.

#### *Classification of Collocations by Cowie and Mackin*

Cowie and Mackin (1975) classified idioms and collocations into four categories based on idiomaticity from most to least fixed: pure idioms, figurative idioms, restricted collocations, and open collocations. Cowie (1981) has another important classification of collocations. In this classification, collocations divided into two parts: restricted and open collocations (as cited in Darvishi, 2011). Restricted collocations refer to clusters that are fixed or like idioms e.g. kick the bucket, rain cats and dogs, etc. Open collocations refer to nodes that can cluster with a wide range of other words e.g. a red car, a small car, an expensive car, etc. (Falahi & Moinsadeh, 2012).

#### *Classification of Collocations by Palmer*

Palmer (1981) classified collocations based on the restrictions on words and proposed three kinds of collocational restrictions as follows:

- 1) Some restrictions are fully based on the meaning of the item such as green cow
- 2) Some restrictions are based on range-a word may be used with a whole set of words that have some semantic features in common. This explains the unlikeliness of the pretty boy (pretty being used with words denoting females).
- 3) Some are collocational in the strictest sense, involving neither meaning nor range, as added with eggs and brains (p. 79).

#### *Translating Collocations*

While the previous sections deals with collocations, their definitions and types, this part focuses on their translation. As mentioned, collocations play a vital role in translation. Some problems may occur in the translation of English collocations into Persian. According to McKeown and Radev (2000), "a concept expressed by way of a collocation in one language will use a collocation in another language" (P. 12). The British scholar Firth (1957) who is the father of collocational studied in modern times stated, "You shall know a word by the company it keeps" (p. 12). Therefore, collocation is a mode of expressing meaning: Meaning by collocation is an abstraction at the syntagmatic level and is not directly concerned with the conceptual approach to the meaning of words. One of the meanings of night is its collocability with dark, and of dark, of course, collocates with night (Firth, 1975, p. 196). Based on Machali (2000) translators and learners of English should be aware of the fact that some collocations maybe register specific, for example while 'tolerable' and 'error' would normally not go together, they can be an acceptable collocation in Statistics. Failure to identify them in a text may cause a distortion of meaning.

Therefore, collocations play important role in translation and translators should find suitable collocations in the process of translation to have a proper translation, which is natural and familiar. In translation, the aim is to transfer a message from one language to another. Many experts propose some methods and techniques of translation or translation strategies. Translation strategy has been used by several scholars but each of them defined it differently. Loescher (1991) defines translation strategy as "a potentially conscious procedure for solving a problem faced in translating a text, or any segment of it" (p. 8). Based on Venuti (1998) translation strategies "involve the basic tasks of choosing the foreign text to be translated and developing a method to translate it" (p. 240).

#### *Vinay and Darbelnet's Model of Translation*

Scholars proposed different models of translation. One of these categories is Vinay and Darbelnet's model of translation. This model is a very popular and comprehensive classification among scholars. For this reason, it has chosen as the theoretical basis of this study. This model contains two methods covering seven procedures as follows:

##### **1. Direct translation,** which covers:

- 1.1. **Borrowing:** Borrowing is "a form of direct translation" which "involves the transference of the ST word into the TT, e.g. *tequila* or *tortilla* from Mexican Spanish or the case of DVD, CD-ROM, etc. in information technology internationally. This may either be to fill a lacuna or to exoticize the TT (Munday, 2009, p.170). The direct transfer of words like *computer*, *television*, *mobile*, etc. from English to Persian are some examples of borrowing.

- 1.2. **Calque:** Calque is “a special kind of borrowing whereby a language borrows an expression from another, but then translates literally each of its elements” (Vinay&Darbelnet, as cited in Munday, 2009, p.171). For example, English “*sky scraper*” to Persian “*سکراپتر*”.
- 1.3. **Literal translation:** literal translation is “a word-for-word rendering which uses the same number of TL words in the form of established equivalents as well as the same word order and word classes, e.g. English *my cat is hungry*→ German *meine Katze ist hungrig*” (Munday, 2009, p. 182), and English “*Slow down a bit*→ Persian “*آهسته تر برو*” (Eftekhari, 2008).
2. **Oblique translation**, which covers:
  - 2.1. **Transposition:** Transposition “concerns grammatical shift such as word class changes” (Munday, 2009, p. 212). For instance, English *made a gesture*→ Persian *آهسته تر برو*
  - 2.2. **Modulation:** This procedure entails a “variation of the form of the message, obtained by a change in the point of view” (Venuti, 2000, p. 89). “This change can be justified when, although a literal, or even transposed, translation results in a grammatically correct utterance, it is considered unsuitable, unidiomatic, or awkward in the TL” (Hatim & Munday, 2004, p. 150).
  - 2.3. **Equivalence:** “Equivalence refers to cases where languages describe the same situation by different stylistic or structural means” (Munday, 2001, p. 58). For example, French cry of pain would be transcribed as ‘Aie!’, but in English, this would be interpreted as ‘Ouch!’ (Hatim&Munday, 2004), and English *true to life*→ Persian *نزدیک به واقعیت*.
  - 2.4. **Adaptation:** Adaptation is “changing the cultural reference when a situation in the source culture does not exist in the target culture” (Munday, 2001, p. 58). For example, “the traditional turkey dinners served by British at Christmas are still largely unknown to most Germans” (Munday, 2009, p. 212) or *offering* → *پیشکش* (Eftekhari, 2008).

### Related empirical studies

Collocation has become one of the primary concerns in translation. In the world there have been some researches undertaken, that is related specifically to collocations.

Some of the researchers worked on methods for retrieving and identifying collocations. For example, Smadja (1993) described a set of techniques based on statistical methods for retrieving and identifying collocations from large textual corpora. These techniques produce a wide range of collocations and are based on some original filtering methods that allow the production of richer and higher-precision output. Wu and Zhou (2003) proposed a novel method to automatically extract synonymous collocations by using translation information. LÜ and ZHOU (2004) presented a new method for acquiring collocation translations by making use of monolingual corpora and linguistic knowledge.

Some of the studies have examined the importance of collocations in teaching and learning. For instance, Sadeghi (2009) compared Persian and English collocations with respect to lexis and grammar on 76 participants who sat a 60-item Persian-English test of collocations. The results of the study indicated that learners are most likely to face great obstacles in cases where they negatively transfer their linguistic knowledge of the L1 to an L2 context. The findings of this study had some immediate implications for both language learners and teachers of EFL/ESL, as well as for writers of materials. Gorgis and Al-Kharabsheh (2009) compared the output of two translation tasks to find out the extent to which students of translation can translate Arabic contextualized collocations into English properly. Webb and Kagimoto (2010) investigated the effects of three factors (the number of collocates per node word, the position of the node word, synonymy) on learning collocations. The results showed that more collocations were learned as the number of collocates per node word increased, the position of the node word did not affect learning, and synonymy had a negative effect on learning.

Some other investigations were allocated to translation of collocations. For example, Nofal (2012) analyzed collocation in both English and Arabic. He believed that collocation in both English and Arabic and its relation to lexicography, translation, and interpretation in addition to teaching/learning process gained little or even no attention from specialists and scholars. The paper concluded with some remarks and recommendations that could enhance the process of translation and interpretation as well as teaching/learning process. He stated that, these remarks, findings, and recommendation, if best employed, could enhance the quality of teaching, learning, and interpreting collocations. Maurer-Stroh (2004) endeavored to demonstrate the need for a bilingual collocation dictionary. This

study focused on the lexicographical treatment of the translation of adjective-noun collocations from English into German. The applicability of such a dictionary tested along with the hypothesis as to the expansion possibility of the adjective-noun dictionary to other collocational structures. Bzour (2006) had studied the use of collocations as a measure of translation quality and of the translator's competence. He concluded that the optimum translation is the one that uses more collocations that accurately reflect ST meanings and the remarkable character of the ST (elevated, rhetorical and expressive language).

## METHODOLOGY

The famous novel, *Jane Eyre* by Charlotte Brontë two Persian translations by Mohammad Taghi Bahrami Haran and Mehdi Afshar were selected for the current research. The beginning parts of the novel were selected for study and was analyzed for the collocations. To begin with, the text was carefully read in order to identify collocations of the chosen type with the help of software, Oxford Collocation Dictionary, to make sure that the selected part is certainly a collocation. Forty Adjective-Noun collocations were selected and compared with corresponding parts in Persian versions.

Vinay and Darbelnet's model of translation was utilized as the main theoretical model and as one of the most comprehensive one. This model was selected to produce quantifiable data, which could be processed statistically. All cases were examined to determine different strategies used in translating collocations based on the mentioned model. As mentioned, this model contains two methods and seven procedures.

### Data analysis

Some of the data obtained from the novel, *Jane Eyre*, by Charlotte Brontë and two Persian translations belong to Mohammad Taghi Bahrami Haran and Mehdi Afshar are presented in this part. The collocations and their translations were distinguished in bold face in the in the following table and the applied procedure for each collocation is also determined based on Vinay and Darbelnet's model of translation.

Table 1: Collocations of *Jane Eyre*

Source Text	Col Type	Bahrami's Translation	Applied Procedure	Afshar's Translation	Applied Procedure
yet there were certain <b>introductory pages</b> that, child as I was, I could not pass quite as a blank.	Adj+N	در عین حال، از صفحات مقدماتی آن، با اینکه بچه بودم و اطلاعات چندانی نداشتم نمی توانستم به سادگی بگذرم.	Literal	سرگرم ورق زدن صفحات نخستین کتاب شدم و با آن که کوچک بودم ولی خالی از ذهن نبودم.	Literal
added Bessie, in <b>no harsh voice</b>	Adj+N	بسی هم با لحنی که دیگر خشونت آمیز نبود.	Literal	بسی با صدای ملایمی اضافه کرد.	Modulation
To review the contents of a certain <b>secret drawer</b> in the wardrobe	Adj+N	تا محتویات یک کشوی مخفی در کمد لباسها را واری کند.	Literal	برای سرکشی به کشوی مخفی که در جالباسی جاسازی شده بود.	Literal
A miniature of her <b>deceased husband</b>	Adj+N	یک تصویر مینیاتور از "شوهر فقیدش"	Equivalence	مینیاتوری از شوهر فوت شده اش	Literal
but it was not yet her hour for <b>complete victory</b>	Adj+N	اما هنوز ساعت چیرگی کامل آنها برمن فرانسیده بود.	Literal	اما هنوز احساس پیروزی بر آن پسر وجودم را گرم می داشت.	Equivalence
a wretchedness which kept drawing from me <b>silent tears</b> ;	Adj+N	ضعفی که دائما باعث ریزش اشکهای بیصدای من می شد.	Literal	آن چنان افسردگی که مرا بی صدا به گریستن وامی داشت.	Transposition
Bessie had a <b>sweet voice</b>	Adj+N	بسی صدای خوبی داشت.	Literal	بسی صدایی شیرین و لطیف داشت.	Equivalence
Lee must, I think, have been a girl of good <b>natural capacity</b> ,	Adj+N	بسی لی، به گمانم، طبیعتا استعداد خوب بودن را داشت.	Transposition	بسی می بایست طبیعت خوبی داشته باشد.	Equivalence
my <b>ready</b> and orthodox <b>answer</b>	Adj+N	جواب قراردادی را که آماده داشتم.	Transposition	پاسخ آماده من به این سوال که از اعتقادات مذهبی ام ریشه می گرفت.	Literal

## RESULTS AND DISCUSSION

Employed procedures in this study include Equivalence, Literal Translation, Modulation, and Transposition. Equivalence emerged as the most conspicuous procedure in translating collocations in Afshar's translation and literal translation was the most frequent one in Bahrami's translation. Borrowing, adaptation and Calque had no place in translating Adjective-Noun collocations from English into Persian. In the table below, the frequency and the percentage of each adopted procedure by Persian translators are referred:

Table 2: The frequency and percentage of Translation Procedures

Collocation Type	Bahrami		Afshar	
	Frequency	Percent	Frequency	Percent
Equivalence	14	35	21	52.5
Transposition	5	12.5	3	7.5
Modulation	3	7.5	4	10
Literal translation	18	45	12	30

The following figures show the frequency of applied procedures in each translator's work:

Figure 1: The Percentage of Applied Procedures

This study tried to investigate the translation of Adjective-Noun collocations of the mentioned novel and two parallel Persian translations based on Vinay and Darbelnet's model. The purposes for current study were to compare the differences that exist between English Adjective-Noun collocations and their Persian translations and to find applied strategies in translating collocations of the novel in each translator's work and to investigate strategies in translating Adjective-Noun collocations that transfer the meaning properly from the original text to the target language and to see whether they could have the same effect on target audience.

Comparing and analyzing data revealed that there are many differences between English and Persian in translating Adjective-Noun collocations and this is because of different natures of the two language and differences that exist among them. As in the current study, Rabeh's (2009,2010) study that was based on two tasks of the test, concluded that students facing problems in translating different collocations from and into their mother tongue because of the specificity and the variability of the collocation in the two languages.

In addition, this study found that the translator forces to deviate from the source text and change the form or s/he compelled to translate a collocation of one type to a collocation of another type or it may be translated to a statement that is not a collocation. These observations support the findings of Al-Sughair's (2011) study that investigated collocations from English to Arabic. He found that "collocations are also modified in translation and therefore both marked and unmarked collocations have unmarked translations. In some cases, collocations end up as non-collocations in the target text" (P. iii). Similar to Heylen and Kerry's (1994) and Hwas and Shalbak's (2012) study that revealed Literal translation could cause some problems in translating Adjective-Noun collocations, contrasting Adjective-Noun collocations between English and Persian in this research showed that Direct (literal) translation is not suitable method in translating collocations and cannot create an acceptable, natural and familiar translation that could have the same effect as the original on target audience.

## CONCLUSION

Comparing and analyzing data revealed that there are many differences between English and Persian in translating collocations. Employed procedures in this study included Equivalence, Literal Translation, Modulation, and Transposition. Equivalence emerged as the most conspicuous procedure in translating collocations in Afshar's translation (52.5%) and literal translation was the most frequent one in Bahrami's translation (45%). Borrowing, adaptation and Calque had no place in translating Adjective-Noun collocations from English into Persian. The analysis of data and contrasting the two Persian versions revealed that Afshar's translation provides a more appropriate and natural translation in general that can produce the same effect as the original. Moreover, the results revealed that the procedure of Equivalence can be influential and be considered as an effective solution for the problem of collocation translation. This procedure could produce the same context as the original in target language if used properly. It further revealed that literal translation is not a proper procedure and cannot create a natural and familiar translation.

Finally, this study concludes that often, unavoidable changes occur in translating collocations from SL into TL. Changing the form of the original text in the translation of collocations is inevitable in some places during the translation process and this is because of different natures of languages and differences that exist among them. Therefore, the translator forces to deviate from the source text and change the form or he compelled to translate a collocation of one type to a collocation of another type or it can be translated to a statement that is not a collocation. It also revealed that translators faced difficulties with collocations and sometimes they do not distinguish them and thus translate them as usual sequences of words.

## CRITICAL THINKING AND LANGUAGE PROFICIENCY

**Mahbube Keihaniyan**

*(m\_keihaniyan@yahoo.com)*

*Young Researchers and Elite Club, Najafabad Branch, Islamic Azad  
University, Najafabad, Isfahan, Iran*

### ABSTRACT

This study investigated 100 university students expected to think critically. So they can keep up with the new technological innovations. Since language is used for acquiring knowledge, it is important to gain points into the nature of the critical thinking ability of learners and its connection to their language proficiency. This study examined the critical thinking ability of Iranian undergraduates and its relationship to language proficiency. The Cornell Critical Thinking Test (CCTT) was administered to 100 undergraduates. The findings showed that the critical thinking ability of the undergraduates was low. However, significant relationships were found between their critical thinking ability and English language proficiency.

**KEYWORDS:** Critical thinking, language proficiency, Cornell Critical Thinking Test

### INTRODUCTION

Critical thinking and critical analysis are terms which are consistently used by academics in explanations of what is required by students in their university work as well as in feedback about what is lacking in student assignments. But what is critical thinking/critical analysis? It's very hard to define. It can be thought of as better, more rigorous thinking. It has also been described as "the intellectually disciplined process of actively and skillfully conceptualizing, applying, analyzing, synthesizing and/or evaluating information gathered from, or generalized by, observation, experience, reflection, reasoning or communication, as a guide to belief or action (Norton & Toohey, 2009, p.12). The difficulty in defining it is partly because what critical thinking/analysis is differs in relation to the context, the situation and the material to which it is applied.

The technical age has created great demands for workers and graduates. However, complaints have been made by employers in many parts of the world such as America (Curry, 2003), United Kingdom and Europe (Joldersma., 2006) regarding their confusion in the school, college or university systems of being able to prepare future workers who could meet the demands of the global job market. It seems that there is a mismatch between the skills required by the employers and those acquired by the graduates. Included in this mismatch is critical thinking, a skill which has been claimed to be lacking among the graduates.

### LITERATURE REVIEW

Critical thinking is a way of deciding whether a claim is true, partially true, or false. Critical thinking is a process that leads to skills that can be learned, mastered and used. Critical thinking is a tool by which one can come about reasoned conclusions based on a reasoned process. This process incorporates passion and creativity, but guides it with discipline, practicality and common sense. While critical thinking is something we all engage in to manage our day to day lives, the word 'critical' is commonly thought to have a quite negative meaning, for example finding fault with someone or something. At university, however, 'critical' has a broader meaning: being critical involves making judgments and evaluations. Making judgments can involve distinguishing between fact and opinion or evaluating the validity of information sources or the validity of particular theories and/ or their application to particular situations. These judgments need to be well grounded in research, wide reading, and include consideration of all possible viewpoints. Critical thinking in this sense is based on a synthesis of a number of factors, and is not just uninformed personal opinion. Critical thinking is integral to academia generally because this is the main way that knowledge is added to a field. While academics in a particular field may agree with the conclusions of a particular piece of research, these conclusions may open up other questions which need to be answered.

Critical thinking is the intellectually disciplined process of actively and skillfully conceptualizing, applying, analyzing, synthesizing, and/or evaluating information gathered from, or generated by, observation, experience, reflection, reasoning, or communication, as a guide to belief and action. In its exemplary form, it is based on universal intellectual values that transcend subject matter divisions: clarity, accuracy, precision, consistency, relevance, sound evidence, good reasons, depth, breadth, and fairness.

Critical thinking ability has been identified as one of the constructs which has been proven to be a good predictor of academic performance (Tsui, 1998; Elias., 2005; Freire, 2007). Hence, it is important for relevant university authorities to be informed of the critical thinking ability level of their undergraduates. Relevant information on the matter will, beyond doubt, help the university authority to both improve the academic performance of the students and better prepare them for future work. Critical thinking is also claimed to be important in the acquisition of language skills particularly writing and reading (Krunzel, 2005; Kabilan, 2004; Okazaki, 2002; Stapleton, 2001; Freire, 2007), two indispensable language skills that can help undergraduates secure their academic success. However, studies on the relationship between critical thinking and these two language skills, especially those which use second language learners as the sample are still not sufficient. Similarly, there are not many studies conducted on the relationship of the aforementioned construct with general language proficiency.

### **OBJECTIVE OF THE STUDY**

The present correlational study was conducted to ascertain the critical thinking level of Iranian undergraduates and determine whether the students' prior ability in English language influences their scores on a test which measures their general critical thinking ability.

### **METHODOLOGY**

#### ***Participants***

The participants of this study ranged from 20 to 25 year-old students selected randomly from Azad University of Najafabad. This group was chosen based on the assumption that they had undergone at least three semesters of university education which was deemed as an adequate period to have had the students exposed to the kind of learning at the tertiary level which promotes the development of critical thinking. The participants of the present study were 100 undergraduates of four different English proficiency levels: Excellent (N=10), Good (N=25), Fair (N=30) and Poor (N=35). A Nelson test was administered to the students to select them based on their grades. The rather small number of undergraduates in the Excellent group compared to that in the Poor proficiency group reflects that majority of the undergraduates at the university were not highly proficient in English.

#### ***Instruments***

1) *A Nelson test Dadkhah (2002)*: It consisted of 40 multiple-choice items on grammar and vocabulary to estimate the proficiency level of the learners. The validity of the test was established by consulting with three experts. Its reliability was measured via cronbach's alpha that was 0.75.

2) *Cornell Critical Thinking Skills Test (CCTST)*: This test has 71 multiple choice items that must be completed within 50 minutes. Each test item has three alternative response choices, A, B, and C, respectively. The test is divided into four parts: Induction (23 items), Credibility (24 items), Deduction (14 items) and Assumption Identification (10 items). Each of the test items that are correctly answered is given a score of 1. In this study, the individual undergraduate's total score obtained on the CCTT was used as a measure of his or her general critical thinking ability; that is, a higher score on the test indicates a better critical thinking ability. It is a standardized test developed by Ennis, Millman, and Tomko (2002) and is based on the developers' conceptual definition of critical thinking. It is claimed by its developers to be a general critical thinking test which attempts to measure critical thinking skills as a whole (1985, p.1). So, it was used as an instrument to measure the critical thinking ability of the undergraduates involved in the present study. Cronbach's alpha coefficient was used to examine internal consistency reliability for the items within each of the CCTT parts that was .80. According to Atkinson (2003), one of the main problems with tests in a foreign language (FL) is that participants often have problems in providing answers in FL and there is no assurance that the questions are properly understood and answered correctly. Therefore, this questionnaire was used in Farsi, the native language of the participants.

## PROCEDURE AND DATA ANALYSIS

The Farsi version of the CCTT was administered to 100 undergraduates. The students took not more than 50 minutes to complete the test. They were told nothing about the aim of the study to avoid halo effect. Also, it was optional for the students to write their names at the top of the papers. The selected students were tested in terms of the relationship between critical thinking ability and language proficiency. Correlational and structural equation modelling (SEM) analyses were performed on the data to find this relationship. One-way analysis of variance (ANOVA) was employed to determine if significant differences in the mean of the CCTT scores exist between the four proficiency groups.

## RESULTS

The results of the Nelson test indicate that the majority of the sample were from the two low proficiency groups. Reliability for the items was measured by Cronbach's alpha coefficient that was about .80.

This alpha coefficient is within the range of reliability estimates reported in the CCTT test manual (i.e., .67-.90).

Table 1: Reliability coefficients for the CCTT

Scale	No. of items	<u>M</u>	SD	$\alpha$
Induction	23	12.67	3.24	.56
Credibility	24	12.33	3.08	.57
Note: N=100				
Deduction	14	9.12	2.50	.58
Assumption	10	4.07	1.71	.34
Identification				
CCTT				

The computed mean (M) for the total score on the CCTT obtained was 30.17 (SD= 6.05).

Table 2 shows correlations between the variables. The high scores on the CCTT are correlated with the score of language proficiency. So, the CCTT was significantly correlated to all measures of language proficiency. This indicated that high scores on the CCTT were associated with high scores on proficiency. Nevertheless, the computed coefficients were within the small range (suggesting that the relationships between the variables studied were not that strong).

Table 2: Pearson Product-Moment Correlations Between CCTT and Measures of Language Proficiency

	1	2	3
(1) MUET	1.000		
(2) SPM English	.623	1.000	
(3) CCTT	.238	.288	1.000

A structural equation modelling (SEM) analysis was also performed on data of the study through the employment of AMOS 7.0 (Moore & Parker, 2007) to test the fit of the hypothesized structural model for the entire sample. The scores on each of the four sub-scales of the CCTT were used as the indicators which were regarded as measured variables of the critical thinking construct since the use of the total scale on the CCTT together with scores on the Nelson test, as measured variables of language proficiency, could not generate the text output of model fitness

for any interpretation to be made. The results of this analysis are to be interpreted with care since the researcher has stated earlier that the four sub-scales of the CCTT would not be taken as distinct dimensions of the CCTT.

A one-way analysis of variance (ANOVA) was conducted on the CCTT scores obtained by the four different English language proficiency groups to determine whether there were significant differences in the mean scores across the groups. Levene's test was not significant,  $F(1,27) = .974$ ,  $p > .05$  indicating that the assumption of homogeneity of variances had not been violated. The results showed a statistically significant difference in the mean scores for the four groups,  $F(1,271) = 8.156$ ,  $p < .05$ . The effect size, which was computed by using eta square, was .8. A post-hoc test performed on the data yielded results which indicated that the mean score for the Excellent group ( $M = 40.80$ ,  $SD = 5.32$ ) was significantly different from the other three groups, Good ( $M = 30.62$ ,  $SD = 7.17$ ), Fair ( $M = 30.92$ ,  $SD = 6.53$ ) and Poor ( $M = 30.65$ ,  $SD = 6.05$ ). Nevertheless, the mean scores of the three lower proficiency groups were not found to differ significantly from each other.

## DISCUSSION

Results of the CCTT measure the general critical thinking ability of learners. The test developers of the CCTT have stated in the test manual that many of the test items can be assigned to more than one of the four proposed aspects of critical thinking. This is argued because critical thinking is a complex construct. Since measuring a specific aspect of critical thinking is difficult, the test developers recommend that the CCTT be used as a general critical thinking ability test. This provides explanation for the use of the CCTT total score instead of the four sub-scale scores in the analysis of the data gathered in the present study. The present researcher relies on the test developers' claim that the CCTT is construct valid based on its content validity and correlations with other cognitive tests as presented in the test manual. The present study provides valuable information about critical thinking. As the results show learners by different level of proficiency use critical thinking. A previous study by Giles and Coupland (1991) found similar findings. They studied the development of critical thinking skills in writing classes and they found that learners by different level of language ability use critical thinking in different levels. When the means were added by the researchers, a mean for the total score on the CCTT was obtained for both the experimental (25.02 before the intervention and 30.15 after the intervention) and control group (16.84 prior to treatment and 19.90 after the treatment). These means were found to be much lower than those presented in this study. Another study by Canagarajah, (2005) revealed the similar results as the present study.

The present study also provides evidence for improving the undergraduates' English language proficiency. As showed by the results, proficiency in English is positively related to critical thinking ability implying that if the undergraduates are proficient in English, their critical thinking ability will also be heightened. Furthermore, the two different competencies can be acquired independently of each other; that is, there are undergraduates who are proficient in English but poor in their ability to exercise critical thinking skills. The rather weak correlations between language proficiency and critical thinking established in this study lend support to the weaker interpretation of Whorf's theory of linguistic relativity (1941) argued by Burbules and Berk (2006), which proposes that language is not solely responsible for determining one's thought but functions instead as one of the elements that helps to shape one's thought. Thus, the small correlation coefficients computed in this study indicated that proficiency in English partly contributed to undergraduates' ability to think critically. The valuable contribution that language proficiency may make to the undergraduates' critical thinking ability is further reinforced by the results produced through the one-way analysis of variance (ANOVA) procedure which showed that students of the highest English proficiency level also obtained high scores on the CCTT. The actual difference in the mean scores of the four proficiency groups (i.e., eta square = .10) was approaching Robertson (2000) large effect size coefficient (eta square = .14) indicating a rather substantial practical importance of the difference between the most proficient group and the other three less proficient ones.

## CONCLUSION

The findings of the present study imply that more work needs to be done towards upgrading the standard of English language and critical thinking ability among undergraduates. The observed facts that the undergraduates did

not have critical thinking ability level equivalent to that of their western counterparts and that the majority of them were not highly proficient in English are consistent with the findings of a study done by Jones et al., (1999). The study revealed that students had problems not only because they had poor critical thinking skills but also due to the fact that their English language skills were poor and that they relied heavily on rote-learning. So, the university must dare take the challenges of bringing about real changes that will eventually improve the standard of English among the undergraduates and enhance their critical thinking ability and more serious attempts should be made towards creating an educational system that promotes life-long learning.

#### **LIMITATION OF THE STUDY AND SUGGESTIONS FOR FURTHER RESEARCH**

No study is complete by itself and cannot take every detail into consideration. Therefore, there are always aspects which are not accounted for. This research is no exception. There are some issues which were not controlled in this study and can be topics for further research by other researchers.

- 1) This study was done only in one city with a limited number of students. It is suggested that another study be performed with large numbers of students from more cities.
- 2) In this study, the participants were adults; in other studies other language learners can be the focus of attention to see whether the same results will be obtained.

**ABSTRACT**

This study determined the exclusion strategies used by one of English language newspapers in Indonesia, The Jakarta Post Newspaper, in representing the social actors in the case of FPI's rejection to Lady Gaga's performance in Indonesia. Exclusion strategies which are strategies of discourse used by mass media are the process of omitting social actors from the news. These strategies are a part of Critical Discourse Analysis (CDA) tools in analyzing representation of social actors which is a theory put forward by Theo van Leeuwen. According to Theo van Leeuwen (2008:29) there are two kinds of exclusion, suppression and backgrounding. Suppression is the exclusion that leaves no traces in the representation, excluding both the social actors and their activities, whereas backgrounding is the exclusion that leaves traces in the representation. Suppression might be linguistically realized by passive agent deletion, nominalization and process of nouns, and non-finite clauses. Backgrounding might be realized by simple ellipses in nonfinite clauses with *-ing* and *-ed* participles, in infinitival clauses with *to*, and in paratactic clauses. The results of the study show that the exclusion strategies mostly used are suppressions; there are 95% of suppressions. The suppressions are linguistically realized by passive agent deletion which is 10%, 80% by nominalization and process Nouns, and 5% by non-finite clauses. The Jakarta Post Newspaper only used 5% of backgrounding in the news. Almost 90% of exclusion strategies go to the pro social actors of this case. The Pro group is excluded because The Jakarta Post Newspaper wants to drive the readers' attention to the other actor (the victim) which here is Lady Gaga and her supporters as the Con group.

**KEYWORDS:** Exclusion, representation, actors, suppression, backgrounding

**INTRODUCTION**

Mass media is media used as a means of communication; it is specifically designed to reach a very wide public; it is made for people as the audiences who need the information brought. In another word, mass media is a tool used for delivering messages or information from the source (the newsmaker and the media producer) to the audience (public) by using mechanical means of communication, such as newspapers, magazines, films, radio, television, and Internet.

One of the mass media types that is static and prioritizes in visual-written messages is printed media. The examples of this type of media are such as newspaper, magazine, tabloid, and newsletter. However, in this study, we choose newspaper as the media to analyze; the only reason is because newspaper is considered as the most popular printed media in the world. Also, newspaper is considered more up-to-date in presenting the news to be delivered to the audience than the other media. Newspaper is published in the form of sheets containing news, essays and advertisements printed, published, and sold regularly and periodically to the public. Newspaper can be read again and again, and reach a wide audience because the price is relatively cheap.

As one of the mass media types, newspaper also has function to give people information about daily phenomena. The phenomena that always occur every day can be the phenomena of social, cultural, economic, and many other things including the phenomena related to politics and government. In presenting the phenomena, a newspaper

must have some important parts that are always issued in every edition; the parts are: headlines, editorial, news article, feature article, and news in specific section (such as: sports, business, national, and international sections).

Headlines become the data source of this study. The reason why to choose headlines is because headlines are the most important part of a newspaper. Headlines are the words printed in large type across the top of a newspaper article. Headlines are printed so because headlines have function to catch the reader's attention; it means headlines must be the first thing to see by the reader who wants to buy a newspaper. Besides, headlines are printed on the front page because the information issued is considered important by the owner and the people behind the newspaper. Headlines are also called the essence of news. Therefore, their function is not only to attract readers to read the news but also to cause a certain effect on the readers. Thus, headings strategy (News title making) becomes very important to achieve all of that. Headings strategy used in headlines has function to choose the theme both news issued and the newspaper on that edition. Perspective is also built through the making of headlines. Here, headlines serve as a thematization effort. The effort becomes the starting point of the development of the information which is relevant to the news, and also becomes the starting point of limiting meaning interpretation of the information developed in the news content. In another word, by only reading headlines, it will instantly build readers' perspectives and thoughts about the important news on that edition.

In addition, we used headlines as the data source since they are issued in the form of text. Of course, there is a tight relation between text and discourse; therefore, in analyzing it, it cannot be separated to discourse. McCarthy states as follows:

"Discourse analysts study language in use: written texts of all kinds, and spoken data, from conversation to highly institutionalized forms of talk." (2000:5)

Besides the quotation above, Fairclough (1995:74) also states that discourse is as a complex of three elements: social practice, discursive practice (text production, distribution, and consumption), and text, and the analysis of a specific discourse calls for analysis in each of these three dimensions and their interrelations. Both of the quotations show a tight relation between text and discourse. Since text is a written language, it becomes a part of discourse, and of course text can be analyzed by discourse analysis.

Fairclough (1995:97) defines a discourse analysis as an analysis method which includes linguistic description of the language text, interpretation of the relationship between the (productive and interpretative) discursive processes and the text, and explanation of the relationship between the discursive processes and the social processes. In addition, Mc Carthy (2000:5) states that discourse analysis is concerned with the study of the relationship between language and the contexts in which it is used. In other words, the focus of discourse analysis is not only on the pattern of language but it is also considering the context of text. Paltridge (2006, in Mahritta 2012:9) states that the terminology of context of text can be related to the social and political situation where the text is produced or the particular goal tried to reach by the text producers. Moreover, the context influences the text producer when producing text. It can affect the producer's way in using the grammar, the words choice, and even the intention in performing particular way of language use in the discourse; those things are called as the discourse strategies.

Related to this study, as the analysis will focus on how discourse strategies are used in terms of critical or what we have already known as Critical Discourse Analysis (CDA), it is really important to explain in short about CDA itself. According to Wodak and Meyer, CDA regards language as social practise, and takes consideration of the context of language use to be crucial. CDA takes a particular interest in the relation between language and power (2001:1). In addition, Wodak and Meyer also states as follows:

CDA may be defined as fundamentally concerned with analyzing opaque as well as transparent structural relationships of dominance, discrimination, power and control as manifested in language. In other words, CDA aims to investigate critically social inequality as it is expressed, signaled, constituted, legitimized, and so on by language use (or in discourse) (2001:2).

Furthermore, as this study attempted by using CDA approach, it is absolutely right to analyze the discourse strategies used by media in presenting and publishing their news (articles). The way of media presents the news

about one, group, opinion, and perception is called representation. Thus, as stated before, the theory of CDA that relates to the representation in discourse asserted by van Leeuwen (2008) is chosen as an appropriate theory to be applied in this study. The theory involving an analysis model is used since it will analyze how the social actors are presented in the news, especially in headlines articles. In addition, the van Leeuwen's model is used in this study since it tries to disclose the use of language and critically analyze the relation of language use and the power held by the discourse producer in making particular action.

All the background above really encourages us to conduct a study and to do the analysis by using van Leeuwen's theory (2008) on discourse strategies of representation of social actor on The Jakarta Post Newspaper headlines. Since headlines become the data source of this study, we also limit the topic of the headlines. We choose the case of FPI's rejection to Lady Gaga's performance in Indonesia as the topic. The description about the headlines topic will be explained in the next section below.

### ***Problems identification***

The problem chosen as the topic of this study is about the case of FPI's rejection to Lady Gaga's performance in Indonesia. This case has ever blown up in Indonesia and even in the world around the year of 2012; in addition, this case still gives impact to Indonesian until now. There are so many parties and people in Indonesia still questioning why the concert is cancelled and what factual reasons behind the police's decision is. Moreover, the question also rises along with an issue of the decision making because there is a rejection of the concert from the hardline Islamic Defenders Front (FPI) at that time. The questions raise big question: 'Is the police fear of the power of FPI?' The big question still remains in people's memory even though the concert has been cancelled so far from today.

The case was begun from the plan of Lady Gaga to hold a concert in Indonesia on June 2012. Indonesia was a country among the first stops on Lady Gaga's "Born This Way Ball" world tour. Since the plan first arose in January 2012, there was a wave of rejection from the hardline Islamic Defenders Front (FPI). However, the promoter of the concert still gave effort to prepare the concert; more than 50,000 tickets had been sold since selling opened on March 10, 2012. Seeing this, the FPI's rejection rose into a threat; FPI threatened violence if the concert went ahead. According to FPI, they rejected Lady Gaga because Lady Gaga's song was considered no moral values and her outlandish clothes and provocative dance moves would corrupt Indonesia's youth. FPI told that Lady Gaga is bringing the faith of Satan to Indonesian and thus will destroy the nation's morals.

The peak point of this case was when finally the national police did not issue the permit of the concert. Many people and parties in Indonesia considered that the decision was affected by the FPI's action; the fact still becomes a big question that cannot be answered briefly by the police until now. Also, many parties considered the show's cancellation would be a backward step in efforts to develop a more open Indonesia and bad news for business. All the fact of the description above really encourages us to raise this topic in this study. Thus, the analysis of exclusion strategies involving the social actors in this case on the headlines of The Jakarta Post Newspaper is attempted; in addition, The Jakarta Post Newspaper is chosen as the mass media to be analyzed since it appears in English language. It also can be read by people all over the world since it is also published in online version.

## **REVIEW OF LITERATURE**

### ***Critical Discourse Analysis (CDA)***

According to Fairclough, CDA is a critical approach of Discourse Analysis. Here, discourse analysis can be defined as an analysis on language used; it means the analysis cannot be limited to the description of language form without any bonding with aim and function designed in human's business. Therefore, we can simply define CDA as an analysis of how language is used through critical perspective.

Van Dijk (1995:253) in Post (2009:14) also states that Critical Discourse Analysis (CDA) is a multidisciplinary approach to language that strives to highlight the nature of social power and dominance by substantiating the intricate relationship between text, talk, social cognition, power, society, and culture. Here, multidiscipline can consist of many discipline studies, such as: history, anthropology, social, politics, communication, and also the language itself. In addition, van Dijk also defines CDA as follows:

“Critical Discourse Analysis is a type of discourse analytical study that primarily studies the way social power abuses, dominance and inequality are enacted, reproduced and resisted by text and talk in the social and political context.” (van Dijk, 2008: 85)

In the quotation above, van Dijk points that the focus of CDA is actually to criticize how power is abused; he also highlights dominance and inequality that can be meant as to elevate someone or group that have the power (a dominant group), and the other side to position someone or group that have no power in an inappropriate position.

#### ***Theo Van Leeuwen CDA Model***

According to van Leeuwen in Suganda (2007:13), language is a reflection of an ideology. By studying language reflected in a text or a discourse, the ideology can be dismantled. Van Leeuwen’s model can be used in detecting and investigating how someone’s or a group’s position is marginalized in a text or a discourse.

In his book *Discourse and Practice*, van Leeuwen (2008) introduces two CDA analysis models. He names his model by Representing Social Actors and Representing Social Action. The term ‘representing’ can also be meant as ‘representation’. Related to this term, he states that “the term of representation itself is directed to how one, a group, perception, or opinion is presented in the news.” (2008: 4).

The explanation above shows that the main problem in representation is how the reality is presented in the news reported. If we talk in terms of media that must involve author (media producer) and the reader, the use of words, sentences, and grammatical aspects have the certain meaning when they are received by the reader. Those things in the media producer’s perspective are commonly called as discourse strategies. Therefore, in this study, we will try to analyze the discourse strategies used by media in terms of van Leeuwen’s representing of social actor.

#### ***Representing of Social Actors***

As having explained that representing of social actors is associated with how actors (one or group) are represented in the news. In addition, this model is concerned with how a side is positioned in an inappropriate position and the other side in higher position. For that reason, there will be two strategies appeared in the framework of the theories point; they are exclusion and inclusion. Van Leeuwen (2008:28) states that representations include or exclude social actors to suit their interests and purposes in relation to the readers for whom they are intended. Exclusion means omitting actors of a social action by some linguistic mechanisms; inclusion means putting the actors in the center of attention and being presented in the text clearly.

As this study focuses on exclusion, at the next section we will only explain about exclusion and the strategies how to use it. The only reason to choose only exclusion in this study is because as van Leeuwen states that exclusion has rightly been an important aspect of critical discourse analysis (2008:28). Thus, to analyze exclusion is more interesting.

#### ***Exclusion Strategies***

Exclusion is the process of omitting actors by some linguistic mechanisms. It has two main subdivisions: suppression and backgrounding. The main difference between suppression and backgrounding is the point that they leave trace or not within representation (van Leeuwen, 2008:29). The description about both subdivisions will be explained below.

#### ***Suppression***

Suppression is the exclusion that leaves no traces in the representation, excluding both the social actors and their activities. Van Leeuwen calls this kind of exclusion as radical exclusion (2008:29). The linguistic realization of suppression can be realized in some ways as follows:

- a. Passive agent deletion. Some CDA analysts call this linguistic realization as passivization. This realization is used to exclude social actor(s) from the representation/news discourse. The function of this realization is to omit or delete the real actor(s). By omitting the actor(s), the sentence producer tries to drive the readers’ attention into the other one (victim). Below is the example: ‘The robber was shot yesterday.’

The focus in this sentence is the victim, 'the robber'. The sentence producer uses passivization instead of active sentence, for example: 'A police shot the robber.' If we compare both examples above, by presenting the active sentence, the actor "a police" is clearly existed. Otherwise, by using passivization, the actor "a police" is deleted. The only function of this realization is to drive the reader's attention to be concerned with the victim "the robber" and to pay no attention to the actor "A police".

- b. Non-finite clauses (e. g., infinitival clauses). According to van Leeuwen, suppression also can be realized through non-finite clauses that function as a grammatical participant. Below is the example: 'To maintain the policy is hard'.

The clause 'to maintain the policy' allows the social actor(s) who are responsible for maintaining the policy to be excluded.

- c. Nominalizations and process nouns. Rashidi and Rasti (2012:2) gives example as follows: 'Financial support came to us'.

From the example above, the noun 'support' is nominalised from excluding the doer of the activity.

### **Backgrounding**

Backgrounding is the exclusion that leaves traces in the representation. Here, the excluded social actors in a specific activity pop up later in another part of the clause, sentence or text. According to van Leeuwen (2008:30-31) the linguistic realization of backgrounding can be existed from simple ellipses in nonfinite clauses with *-ing* and *-ed* participles, in infinitival clauses with *to*, and in paratactic clauses. In all of these cases, the excluded social actor is *included* elsewhere in the same clause or clause complex. It can also be realized in the same way as suppression, but with respect to social actors who *are* included elsewhere in the text. The two realizations background social actors to different degrees, but both play a part in reducing the number of times specific social actors are explicitly referred to. The examples of backgrounding are as follows:

- a) Clearing the case, police set up the evidence. (*using infinite clause -ing*)
- b) To maintain the policy, government has invited some experts. (*Infinitival clause with to-*)
- c) John invited them to the party, but the wilsons didn't show up. (*Paratactic clauses*)

The first example uses infinite clause with *-ing* and the second uses infinitival clause with *to*. The social actors 'police' and 'government' are backgrounded or found at the rest of the sentence. The third example uses paratactic clauses. Here, the reader will know exactly the specific actor 'the wilsons' in the second clause.

## **RESEARCH QUESTIONS**

In this study, we try to analyze and describe the exclusion strategies represented in the headlines of The Jakarta Post Newspaper in the case of of *FPI*'s rejection to Lady Gaga's performance in Indonesia from Critical Discourse Analysis point of view. Considering that, there are three issues discussed in this study: (1) What exclusion strategies are used by The Jakarta Post in representing the actors that involve in the texts?; (2) What linguistic realizations are used as the tools in revealing the exclusion strategies?; and (3)What are the functions of using those strategies?

## **THE OBJECTIVES OF THE STUDY**

This study seeks to investigate the exclusion strategies used by one of English language newspapers in Indonesia, The Jakarta Post Newspaper, in representing the social actors in the case of *FPI*'s rejection to Lady Gaga's performance in Indonesia. In this study, the focus is on determining the type of exclusion strategies used by The Jakarta Post Newspaper, the linguistic realizations of the exclusion types, and the function of using those. This study gives a comprehensive analysis on how the social actors are excluded in the representation of the case in the news by the Jakarta Post Newspaper.

## **METHODOLOGY**

### **The Method**

The method applied in this research is qualitative. Bogdan and Biklin (1992:29) state that qualitative research at least has five features as follows: (a) Qualitative research takes place in a natural setting; (b) Qualitative research is descriptive. The data collected is in the form of words rather than numbers; (c) Qualitative researchers are concerned

with process rather than with products; (d) Qualitative researchers analyse their data logically; (e) Meaning is an essential concern to the qualitative approach.

Since the features show how a qualitative method is used in a research, we give some attempts to implement them in this research. One of the attempts is by deciding the conceptual model or the object of this research. As this research will raise the representation of social actors, the object of this research is the actors involved in the case of FPI's Rejection to Lady Gaga's Performance in Indonesia. Since the actors are represented in The Jakarta Post headlines, the object of this research can be seen through words, phrases, clauses, and sentences which present or describe the actors.

Related to the object of this research above, another attempt that we must do is to conduct specific strategies in implementing the formulation of study and also the objectives of study. The strategies are stated below.

First, in implementing the first objective which is to analyze the discourse strategies used to represent the actors in the text, we use specific discourse strategies of representation of social actors put forward by van Leeuwen (2008). The process will be as follows: (1) understanding the clauses meaning comprehensively, and then, (2) choosing the data by categorizing them into specific discourse strategies (inclusion or exclusion). Second, in implementing the second objective which is to describe the linguistic realizations used as the tools in revealing the discourse strategies, we also use specific linguistic realization on discourse strategies of representation of social actors put forward by van Leeuwen (2008:23-54). Van Leeuwen states (2008:23) that every discourse strategy has its own linguistic realization, such as: transitivity, paratactic analysis, nominalization, passivation, and many other elses. Last, in implementing the third objective which is to formulate the functions of using those strategies, we use van Leeuwen's theory (2008) as well. In the theory, van Leeuwen has given some detail examples of his analysis on representation of social actors. Thus, the van Leeuwen's analysis will be our guidance in conducting the analysis.

### ***The Technique of Data Collecting***

Data collecting is an underlying thing that is necessarily attempted to conduct a research. The aim of the data collecting is to get valid and accurate data. In collecting the data, there are several applicable methods, i.e. library research, field research, and laboratory research. In this research, we only conduct library research since this research needs many references. Library research is the most appropriate method for this kind of research. In collecting the data, I implement several procedures as follows:

1. Choosing the data source  
In conducting this research, data source is needed to get accurately valid data. Eventually, a newspaper is chosen as the data source. Here, we collect the headlines about the case of FPI's rejection of Lady Gaga's performance in Indonesia from The Jakarta Post newspaper.
2. Reading the whole articles carefully and thoroughly  
The whole headlines articles about the case from The Jakarta Post newspaper are read carefully and thoroughly to comprehend the content of the articles.
3. Choosing the data  
In this process, the data chosen are the clauses and sentences related to the representation of social actors as the topic of this research. They consist both of discourse strategies: exclusions and inclusions, however, in this study we only focus on the exclusions.
4. Analyzing the data  
After choosing the data, we will analyze them based on the strategies used to represent the actors in the text, and then, we will analyze the linguistic realizations used as tools in revealing those strategies. Finally, we will describe the functions of using those strategies.

### ***Data Source***

The data source of this research are taken from 6 (six) headlines articles from The Jakarta Post Newspaper. The articles are: (1) 'Little Monsters' growl over threats to Gaga (*May 09, 2012*), (2) No Permit for Gaga: Jakarta Cops (*May 15, 2012*), (3) Gag is Not The End To Gaga Concert (*May 16, 2012*) (4) Gaga Concert – To Be or Not To be (*May 23, 2012*), (5) Extremists Win The Lady Gaga Saga (*May 28, 2012*), (6) Fans Mourn The Concert That Never Was (*June 04, 2012*).

### *Theoretical Outline*

In this research, there are several applied theories used in analyzing the data. To find the exclusion strategies represented by the media in this research, we will use Theo Van Leeuwen's theory (2008). In addition, in order to accommodate the analysis of this research, we use not only Theo van Leeuwen's theory of linguistic realization (2008) but also Systemic Functional Grammar (SFG) put forward by Halliday & Matthiessen (2004) and Gerot & Wignell (1995) as the tools of analysis.

## **RESULTS AND DISCUSSION**

### *Results*

As this research will focus on the representation of social actors, the first thing to do is to classify the actors who are involved in the case. The case that we raise in this research is about FPI's Rejection to Lady Gaga's Performance in Indonesia. It is simply classified that the main actors involved in the case is Lady Gaga and FPI. However, we also have to consider the other actors involved; therefore, we will divide two main groups as the pros of the case and the cons. We name the pros as **the pro-rejection actors** and the cons as **the anti-rejection actors**.

The pro-rejection actors in this case are as follows:

1. FPI (*Front Pembela Islam*), or in the articles it is named by Islam Defender Front.
2. The National Police.
3. The rejection supporters. Those are people (public) who support the rejection, but are not FPI members.

The anti-rejection actors in this case are as follows:

1. Lady Gaga herself.
2. Big Daddy Entertainment as the Promoter of the concert
3. Lady Gaga fans who are known as Little Monsters.
4. The anti-rejection supporters. Those are people who are not Lady Gaga fans.

The results of the study can be seen in the table below:

*Table 1: The frequency of the exclusion strategies found in the headlines*

<b>Actors</b>	<b>Suppression Frequency</b>	<b>Backgrounding Frequency</b>
<b>Pro-Rejection</b>	19	-
<b>Anti-Rejection</b>	1	1

*Figure 1: The percentage of exclusion strategies found in the headlines*

As stated before, there are three linguistic realizations in suppressions, the results are shown in the table below:

*Table 2: The frequency of the linguistic realizations in suppressions*

Actors	Passive Agent Deletion	Nominalization and process Nouns	Non-finite Clause
Pro-Rejection	2	16	1
Anti-Rejection	-	1	-

Figure 2: The percentage of the linguistic realizations in suppressions

All of the detail results can be seen in the table below:

Table 2: The analysis results of exclusion strategies

No.	Data	Headlines	Excluded Actors	Types of Exclusion
1.	'Little Monsters' growl over <u>threats</u> to Gaga.	'Little Monsters' growl over threats to Gaga ( <i>May 09, 2012</i> )	FPI	Suppression
2.	<u>preventing</u> the singer from performing in Indonesia "will not make gay people turn straight"		FPI	Suppression
3.	there's a very slim chance <u>the permit</u> will be issued	No Permit for Gaga: Jakarta Cops ( <i>May 15, 2012</i> )	Police	Suppression
4.	<u>the decision</u> was based on input received from groups who said Lady Gaga, famous for her hit singles "Poker Face" and "Bad Romance", was not suitable for local audiences.		Police	Suppression
5.	<u>after clearing</u> those bureaucratic hurdles, promoters in Jakarta had to submit several additional permit requests to the National Police		promoters	Backgrounding
6.	<u>The battle</u> to hold a concert for American pop diva Lady Gaga in Jakarta reached new heights Tuesday	Gag is Not The End To Gaga Concert ( <i>May 16, 2012</i> )	FPI	Suppression
7.	<u>This decision</u> is an obvious reflection of the police's inability to control the FPI.		Police	Suppression

8.	The show's cancellation would be a backward step in efforts to develop a more open Indonesia and bad news for business.		Police	Suppression
9.	She has finally broken her silence on the prolonged drama over her planned Jakarta concert	Gaga Concert – To Be or Not To be (May 23, 2012)	FPI,	Suppression
10.	making notes of censorship concerns and <u>threats of violence</u> against her on Twitter		Police	
11.	There will be no concert if the <u>permit is not issued</u>		FPI	Suppression
12.	The Lady Gaga concert in Jakarta was <u>canceled</u>		Police	Suppression
13.	The law can only be applied to those who used <u>violence</u> to reject Lady Gaga, and the police have not done anything	Extremists Win The Lady Gaga Saga (May 28, 2012)	FPI	Suppression
14.	<u>the gig's cancellation</u> reflected a <u>government that was weak in the face of intolerant political groups</u>		Police	Suppression
15.	Big Daddy Entertainment said that the 26-year-old singer's management decided to cancel the planned concert due to " <u>security concerns</u> "		FPI,	Suppression
16.	all 52,000 tickets that <u>had been purchased</u> for the show <u>would be refunded</u>		Police	
17.	that <u>the show's cancellation</u> would not prompt other foreign performers to have second thoughts about performing here		Promoter	Suppression
18.	Alhamdulillah [praise the Lord] that <u>the concert was canceled</u>		Police	Suppression
19.	the bitter end of weeks of <u>controversy</u> over the gig was a huge loss not only for Gaga fans but also for every citizen who believed in freedom.		Police	Suppression
20.	They also stamped their handprints with colorful paint on a large poster of Gaga, which stated "Little Monsters' tribute to diversity"		FPI,	Suppression
			Police	

21.	Their fears were unfounded as around 3,000 members of the FPI prayed together at their headquarters on Jl. Petamburan III, Central Jakarta, to celebrate <u>the concert cancellation</u>		Police	Suppression
-----	--	--	--------	-------------

### Discussion

Some of representative data will be analyzed as follows:

**Datum 1:** The Lady Gaga concert in Jakarta was canceled (*TJP: Extremists Win The Lady Gaga Saga: May 28, 2012*)

The datum above consists of exclusion strategy since there is actor excluded in the datum.

To get the detail analysis, the Functional Grammar tool is used as follows:

The Lady Gaga concert in Jakarta	was canceled
Theme	Rheme

In addition, to complete the analysis, we also use the transitivity analysis as follows:

The Lady Gaga concert in Jakarta	was canceled
Goal	Process: Material

Here, the datum is a passive clause. By using theme and rheme analysis, it shows that the focus of message is the Subject of the clause 'the Lady Gaga concert in Jakarta'. In addition, since the transitivity analysis shows that there is no actor in the clause, the process becomes the same important as the Goal. Thus, the analysis will be more interesting to analyze since there is actor deleted.

The strategy of passive without existing the actor is called passive agent deletion. This strategy is categorized as suppression strategy. By using this strategy, the text producer tries to drive the readers' attention to the goal. Thus, the producer wants to show that the goal is more important than the actor who executes the action (cancellation). Here, as we know the actor is 'the police'. 'The police' has been hidden; the only reason the producer does it is to protect 'the police' from the case. Then, the readers who read this article has unconsciously been driven to be concerned with the goal that is "the Lady Gaga concert" and to pay no attention to the actor "the police".

**Datum 2:** She regretted the cancellation (*TJP: Fans Mourn The Concert That Never Was: June 04, 2012*)

The datum above consists of exclusion strategy since there is actor excluded in the datum. To get the detail analysis, the Functional Grammar tool is used as follows:

She	regretted	the cancellation
Senser	Process: Mental	Phenomenon

Here, the datum is an active clause involving mental process. By using the transitivity analysis, it shows that the focus of message is the Subject of the clause or as the senser of the process 'she (Lady Gaga)' and the Object or the phenomenon of the process 'the cancellation'. Here, the social actor, Lady Gaga, is included; however, there is

another actor who is excluded. This is realized by the presence of the Noun ‘cancellation’. The Noun has proposition ‘someone cancels something (the concert)’. Thus, it is definitely there is actor excluded from the clause.

The strategy above is categorized as the process Nouns which is a type of suppressions. By using this strategy, the text producer tries to hide the other actor and to drive the readers’ attention to the sener (subject of the clause). Thus, the producer wants to show that the sener is more important than the actor who executes the action (cancellation). Here, as we know the actor is ‘the police’. ‘The police’ has been hidden; the only reason the producer does it is to protect ‘the police’ from the case. Then, the readers who read this article has unconsciously been driven to be concerned with the sener that is ‘she (Lady Gaga)’ and to pay no attention to the other actor “the police”.

**Datum 3:** Preventing the singer from performing in Indonesia will not make gay people turn straight. (*TJP: ‘Little Monster’ growl over threats to Gaga: May 09, 2012*)

The datum above consists of exclusion strategy since there is actor excluded in the datum. To get the detail analysis, the Functional Grammar tool is used as follows:

<u>Preventing</u> the singer from performing in Indonesia	will not make gay people turn straight
Theme	Rheme

Here, the datum is an active clause. By using theme and rheme analysis, it shows that the focus of message is the Subject of the clause ‘Preventing the singer from performing in Indonesia’. The main Subject of the clause is ‘Preventing the singer’. Here, the social actor, the singer (Lady Gaga), is included; however, there is another actor who is excluded. This is realized by the presence of the Noun ‘preventing’. The Noun has proposition ‘someone prevents someone (the singer)’. Thus, it is definitely there is actor excluded from the clause.

The strategy above is categorized as nominalization which is a type of suppressions. Nominalization is the process of changing verb into Noun. Here, the Verb ‘prevent’ is nominalized by adding ‘-ing’, or in English it is usually called as gerund. By using this strategy, the text producer tries to hide the other actor and to drive the readers’ attention to the included actor ‘the singer (Lady Gaga)’. Thus, the actor who executes the action (preventing) is hidden. Here, the hidden actor is ‘FPI’ since FPI gives the effort to prevent Lady Gaga to perform in Indonesia. ‘FPI’ has been hidden; the only reason the producer does it is to get the readers who read this article more pay attention to ‘the singer (Lady Gaga)’ as the victim actor.

**Datum 4:** After clearing those bureaucratic hurdles, promoters in Jakarta had to submit several additional permit requests to the National Police. (*TJP: No permit for Gaga: Jakarta cops: May 15, 2012*)

The datum above consists of exclusion strategy since there is actor excluded in the datum at the first clause. To get the detail analysis, the Functional Grammar tool is used as follows:

After clearing those bureaucratic hurdles,	<u>promoters</u> in Jakarta had to submit several additional permit requests to the National Police.
x $\beta$	$\alpha$

Here, the datum is a sentence. By using clause complex analysis, it shows that the focus of message is in the first clause ‘After clearing those bureaucratic hurdles’. In the clause, there is an actor excluded, but the actor ‘promoters’ is presented in the second clause. This exclusion strategy is categorized as backgrounding.

By using this strategy, the text producer tries to drive the readers' attention to the activity or the action in the first clause. Thus, the the readers who read this article more pay attention to the action than the social actor.

## CONCLUSION

As the results of the study show that the exclusion strategies mostly used are suppressions (95%), we can conclude that The Jakarta Post newspaper uses radical way in representing the actors in this case. As stated by van Leeuwen that suppressions are kind of exclusion which is called as radical exclusion (2008:29). The results also show that Almost 90% of exclusion strategies go to the pro social actors of this case. The Jakarta Post newspaper does this for some reasons: first, to hide the excluded social actors; second, to protect the social actors; Third, to drive the readers' attention to the other actor (the victim) which here is Lady Gaga and her supporters as the Con group. Based on CDA perspective, we also can conclude that the results show that the discourse used by The Jakarta Post Newspaper is not neutral enough in presenting actors of this case. Actually, this is absolutely fair for mass media (which here is The Jakarta Post newspaper) to play its role as the medium of power. Thus, CDA can be used to disclose the media ideology (side) in presenting the news. The fact is also in line with van Dijk viewpoints that the focus of CDA is actually to criticize how power is abused; he also highlights dominance and inequality that can be meant as to elevate someone or group that have the power (a dominant group), and the other side to position someone or group that have no power in an inappropriate position. Therefore, this study can be useful to increase the readers' awareness in viewing news presented by media.

## LIMITATIONS OF THE STUDY

This study focuses on analyzing the representation of social actors from the headlines of a media mass. The term 'representation' is related to how something is presented in a text. Besides, according to van Leeuwen (2008:23), "the representation of social actor is related to how the participants of social practices can be represented in English discourse. This study implements a CDA model analysis put forward by Theo van Leeuwen (2008). According to van Leeuwen, there are two strategies in representing social actors in a text or in a news of media: inclusion and exclusion strategies. Exclusion means omitting actors of a social action by some linguistic mechanisms; whereas inclusion means putting the actors in the center of attention and being presented in the text clearly. However, in this study, the focus is only on investigating the exclusion strategies. According to Theo van Leeuwen (2008:29) there are two kinds of exclusion, suppression and backgrounding. Suppression is the exclusion that leaves no traces in the representation, excluding both the social actors and their activities, whereas backgrounding is the exclusion that leaves traces in the representation. Suppression might be linguistically realized by passive agent deletion, nominalization and process of nouns, and non-finite clauses. Backgrounding might be realized by simple ellipses in nonfinite clauses with *-ing* and *-ed* participles, in infinitival clauses with *to*, and in paratactic clauses. The theory above is implemented in the analysis of this study. Thus, the exclusion strategies will be the only focus of this study as this will also be the limitation of this study.

## INFORMATION TECHNOLOGY AND SECOND LANGUAGE TEACHING

**Marzieh Sadegh Pour**

*Islamic Azad University of Takestan*

### ABSTRACT

Various studies on the application of new technologies and advances stated that new improvements in communication should be included in language teaching curriculum. It is also emphasized that separation of new technologies from language classed will lead to failure in teaching and learning. The literature also argue that new technologies and advances should be integrated with traditional approaches to language learning, but this implementation of technologies in conventional classes needs strong and detailed analysis.

**KEYWORDS:** Information technology, Second language learning, Teacher training, Conventional teaching methods

### INTRODUCTION

New technologies and Internet has influenced all aspects of human life. Language, language learning, and teaching as one of the most important and inseparable parts of social life is not an exception. Language learning has always been affected by changes in the world we are living in. Advances in multimedia technology and computer-aided language learning (CALL) have changed traditional methods and approaches to teaching in order to help language learners and teachers (Ehsani & Knodt, 1998). Development of technologies and integrating them into conventional classrooms have changed many aspects in language learning environment. Therefore, Language teachers and curriculum developers have always been trying to integrate their teaching materials with the most recent technologies to help learners enhancing language learning.

### HISTORY OF USING TECHNOLOGIES IN LANGUAGE TEACHING

During the history of language teaching, every method or approach had its own technologies to support. Grammar-translation method relied on blackboard, one of the most common technologies as a one-way transmitter of information (Warschauer & Meskill, 2000). In the 1970s and 80s, audio tape was the medium in audio-lingual method, and in the 1980s and 90s, cognitive approach benefited from meaningful contexts to help learners (ibid 1) . ICT, electronic mail, multimedia, collaborative platforms, and computers have helped language learners in socio-cognitive approach to build meaning (Kalnina & Kangro, 2007).

### THE ROLE OF TECHNOLOGY IN LANGUEGES LEARNING AROUND THE WORLD

Place, frequency, and use of information technology (IT) in high schools and language institutes have always been a concern for researchers. In a study conducted in Iran, Shahamat (2009) investigated the role of ICT in Shiraz highschoools and language classes. For this purpose, 700 EFL female students were chosen to answer a questionnaire about the frequency of technology use in their school or language institute. Outcome of the study showed that most of the students in public schools of Shiraz never or hardly ever used technologies like e-mail, making web, power point, word processing, personal computers, digital cameras, laptops, overheads, printers, slide projectors, scanners, and recorders. On the other hand, in private institutes more means of educational technologies were used, except for computers, E-mails, making web, digital cameras, language labs, laptop computers, slide projectors, virtual classes and visualizers, but in public schools the percentages of use of technologies were very low, except for audio, sound recorder, video, and Xerox. The study also revealed that there were differences in using educational technology in different proficiency levels in private institutes. As for CD, electronic devices, Internet, word processing, the differences between elementary and intermediate, and elementary and, advanced levels were significant. As for overhead projection device, all cases are significant except for the difference between intermediate & advanced levels. Finally, concerning scanners, the only observable significant difference was between elementary and intermediate levels.

On the basis of outcomes of this study, it was discussed that teachers' avoidance of new technology may be a result of teachers' lack of up to date knowledge of using new technologies. For that, it was suggested to train teachers, so they will be able to adapt themselves to the changing world and using technologies for new learning and teaching

contexts. It was also pointed out that not using technologies is not always teachers' fault, it could be due to the top-down approach from administrators and school or government authorities; therefore, authorities should provide training courses, seminars, workshops and discussion groups, so that teachers can develop their teaching pedagogy. Finally, it is recommended that students should be able to use new technologies, too. They need training to be able to learn about and use technologies to be more independent learners, and also apply them in doing their homework in a way to fill the gaps present in the conventional teacher student method.

In a similar research, Kalnina and Kangro (2007) investigated the role of ICT in language curriculum in Bucharest University. The outcome of their study showed that vast majority of students in Bucharest study at schools where school principals want teachers to use the modern IT in the teaching-learning process. In Bucharest, students have used ICT to learn English or to master other foreign languages, some in history, geography, mathematics, and Latvian language (Kalnina & Kangro, 2007). It was also concluded that for achieving better results in implementation of ICT in education, it is not enough to equip schools with up-to-date hard wares, but pre-service and in-service training of teachers for the pedagogical integration of ICT in the teaching and learning process plays an important role. They had an experience of pre-service and in-service for teachers, and the result of these services showed that training makes teachers to be more curious, creative, and innovative in using new technologies themselves and in their teachings. Findings in Latvia University and students' reports on how they have learned at university, confirmed Shahamat (2009)'s research conclusion that integrating ICT into language curriculum is needed.

ICT can also have an engaging role. It can make materials more interesting and have learners take a more active part in class which contribute to better language learning. Bartram (2006) investigated German and English pupils' perspectives on learning a foreign language. English students' in the study believed that being aware of what they are exactly going to do next, as in traditional books and board classed, will make lessons boring for them and they lose their interest to follow the courses. Findings showed that ICT can increase learners' interests for continuing the lesson and, as students reported, it can make lessons more enjoyable for them.

ICT and new technologies can help development in learning of individual skills of learners that may seem more difficult with traditional and conventional methods. Shen and Suwanthep (2011) stated that in China, speaking is the most difficult skill to be learnt by language learners, so to find an effective solution to this issue, they studied the role of implementing constructive role plays via E-learning on Chinese EFL learners' speaking in college English classes. Researchers added new technologies like new laboratories, in which learners could use the Internet and chat, to their curriculum for 18 weeks, and results of their study showed that e-learning had positive effects on improving students' speaking, in terms of language quality and language production. In their new experience, students expressed positive opinions towards the implementation of e-learning constructive role plays and the process of learning was more enjoyable for them than the conventional laboratories and classes (Shen & Suwanthep, 2011). They also believe that appropriate integration of CALL and internet technology is essential to teach speaking and to teach and motivates learners to participate in learning process.

Ming (2009) in a recent more research in China examined the effectiveness of web-based instruction of on students who learned English for specific purposes. The researcher intended to find out if a one- semester network-based course of English could change attitudes and beliefs of language learners toward the development of their English skills and the use of Internet technology. For this purpose, freshman undergraduate students majoring in computer science in South China were asked to participate in a Chinese online learning programme called WebNing. WebNing provided two major instructional tools: a content tool which delivered course materials and the other is a communication tool which allowed users to interact with each other in cyberspace using a forum and blogs. Ming (2009) used this program to make sure that all the students interact with course materials outside the lecture time, and to increase student-teacher and student-student interaction in the web-based instructional environments. To improve writing skill of students, they were required to write an essay to answer open-ended questions, which were on topics related to the course textbooks or daily life every week. Students posted their completed assignments in blogs; therefore, other students could comment on their essays in the blogs, and the instructor then corrected the essays by writing comments and giving elaborative feedbacks in the form of hints about the incorrect answers. Students responded to the instructor's feedbacks and corrected their errors, and afterward they replaced the new revised writing with the previous one. Along with writing practice, students also had an opportunity to freely express

their opinions and to exchange ideas in small groups through informal social interaction on the assigned topics in an asynchronous forum board every two weeks, and their instructor frequently accessed the discussion forums, posted comments, and answered the questions. After two weeks of completion of the projects, all students were required to complete a 18 statements questionnaire and short-answer questions posted on WebNing (online website that students used) about their views in perspectives on web-based instructional environments, the effect of web-based-instruction on learning subject matter and skills, the effect of WBI on their interest, and the effect of WBI on their confidence as learners, their technical skills, and their performance on course assessments. According to the results, most of the students enjoyed using WBIs. Most of the learners reported they had more interaction and communication with the instructor, as well as with their classmates, and more than half said they felt free to ask questions from the instructor. Vast majority of the learners felt they learned more language skills than they had learned in regular classes, more than half stated their writing skills have been improved. For asynchronous discussion, students' comments were overwhelmingly positive. In addition to the mid-course questionnaire, students had an interview with instructor about their experiences and attitude toward WBI at the end of the semester. Majority of students regarded WBI as beneficial to their language development. Researcher believed that WBI helps students to improve learner-autonomy. Students using this WBI believed that they learned how to organize their work by retrieving documents from the blogs and placing them into their pages on time, to answer questions, and to discuss with others on the discussion board.

Ming (2009) in his study made an "asynchronous discussion group" and asked students to have discussion on interesting subjects with pre-modified rules and limiting time. For the reasons mentioned, his experience was successful in developing learners' language ability, interest, and motivation. Chen (2005), in a two-year exploratory study of two large university EFL content-based classes in where asynchronous discussion forums were set up for experience-based language learning, studied the effectiveness of peer exchanges in the asynchronous discussion forums. Outcomes of the study conducted by Chen (2005), like Ming (2009), showed that most of the participants had positive views on CMC learning activities, and their reflectiveness in asynchronous discussions was found to be affected more by peer interaction than by the instructor's participation. Also, students with higher participation level had more positive attitude toward CMC.

In a bit different internet based instruction, Blake (2005) studied the progress of a typical first-year language student as she interacts with the course instructor synchronously. His research showed that the learner remained engaged in the language-learning process, actively participated in negotiation of meaning, repaired her language errors, and was able to satisfy her own language-learning needs. Blake (2005) stated that in CMC, against the convention of the normal face- to face classes that a teacher is in the centre of the class and students less have less active role, in on-line learning system, there teacher and learner have the same power, and affective filters such as embarrassment are lower than face-to-face classes. Blake (2005) believed that although CMC classes are entertaining and make students more motivated, this technology without the support of a teacher can never be effective, and students constantly need immediate feedback from their teachers.

Liang (2010) in a rather the same study in Taiwan, investigated the role of synchronous online interaction on writing of undergraduate EFL learners. It was found that synchronous web technology was a valuable tool for facilitating group interaction while there are possible reasons why synchronous online peer response groups might be fun, but not very effective. Liang's (2010) analysis indicated that "the relationships among different types of online interactions and their connections with subsequent writings and revisions are complex and depend on group make up and dynamics. Findings suggested that such complex activity may not guarantee revision. Writing instructors may need to proactively model, scaffold and support revision-related online discourse if it is to be of benefit".

Lucas (2010) in a study on motivations of Philippines' students of Manila for learning foreign languages found that due to the increase of foreign media, computer mediated activities and reading materials in that country, reading has become one of the linguistic skills that students are intrinsically motivated in. So, it can be concluded that computers, Internet and new technologies will have effects on different aspects of language learning whether they are directly a part of our instruction or not. Also, it could be very useful for language teachers to add these technologies to their classes specially for less motivated learners.

## **TEACHERS AND NEW TECHNOLOGIES**

With the developments in technology and its application in second language learning and teaching methods, every teaching system needs teachers who are familiar with the latest developments and know how to apply them to help

student promote their learning. Although there are some controversies in the literature, some believe that technologies should only be a help in learning and others say they have to have more roles in learning contexts, nearly all researchers have stated teachers play essential role in E-learning environment. Teachers who do not have enough experience or familiarity with computers and new technologies may just make the process of learning more difficult for learners. As a result, in addition to integrating ICT to the conventional classes, teacher training programs and courses are needed to help teachers overcome this difficulty (Arnold & Ducate, 2006).

The findings of nearly all studies in language learning area confirm that integration of ICT and new technology into classroom are essential, but the role of teachers with the knowledge, skills, and attitude for designing, adapting, and applying technology in the classroom, appropriate to context is the part without which it is impossible to benefit from these technologies in classrooms (Warschauer, 2002). No computerized class or learning system can work on its own and be effective (Blake 2005, Ming 2009, Lucas 2010). Therefore, teachers need to be more prepared and have more information about the developments to be able to design language learning courses in new methods. Internet and computers also can be great help in preparing situation to discuss pedagogical problems and new ways of solving them with other colleagues. For this problem, Richards (2005) suggested teachers to stay up to date and be active and innovative "designers" of ICT.

### **INFORMATION TECHNOLOGY AND CONVENTIONAL METHODS**

Padurean and Margan (2009) classified different roles of computers and ICT in second language classes, as a teacher, tester, communication facilitator, and data source. They state that ICT can have advantages over conventional classes, like the capacity to control presentations, novelty and creativity, feedback, and adaptability. It is also mentioned that although ICT may have benefits over traditional methods, they cannot replace them, and can be used to make changes in traditional classes and class activities. They conclude that the use of computers makes classes more interesting and beneficial for learners.

Murphy (2007) in an on-line research combined new technologies to his conventional classes. He asked students to work on online readings in pairs on a single computer system and have interactions with each other to find the answers. The students then were compared with students doing readings alone on-line. Out comes showed that interaction helped learners to do better on reading comprehension tests. Therefore, as students in Ming's (2009) research said, learning a language could be facilitated by both interaction with teacher or other class mates along with new on-line materials.

Warschauer (2002) also emphasizes that the use of ICT and technologies should develop self autonomy, both in learners and teacher. He argues that "Students not only should be able to use today's search engines but should also have the right analytic framework to select and make use of new search engines as they emerge, and also teachers not only should be able to use today's CALL software but should also have successful strategies for evaluating and adapting the new waves of software that will surely come."

### **ICT IN LANGUAGE CLASSES AND CULTURAL AWARENESS**

One of the very important parts of every language learning or language teaching environments is culture. Language and culture are definitely inseparable and it is believed that learners may face troubles learning a language without knowing having necessary information about the target culture. In teaching language through ICT, teachers and educators need to put culture into account. Liaw (2006) design a project "to foster the growth of tertiary level EFL students' intercultural competence via English language development". In Liaw's (2006) project, in a web-based reading and writing environment for EFL and culture learning, students read articles on topics of their own culture and communicate their responses with speakers of another culture. By using web, students exchanged information about their cultures, and at the same time tried to use the foreign language; therefore, as a result of negotiation with another person in another culture, they learnt new information about the other culture and tried to be fluent to tell others about their own cultures. The findings of Liaw's (2006) project showed that all EFL participants were able to communicate fluently in the target language without much help from the corpora-based e-referencing tools provided in the system and the use of the online dictionary decreased after the first two readings. Findings of the project demonstrated the benefits of using computer technology for intercultural learning, and remind educators and curriculum developer that in any kind of language learning plan, culture is an essential element.

## CONCLUSION

The new and modern technologies are now inevitable parts of learning and teaching. Studies on the use of IT around the world have shown the positive and helpful impact of this technology on language learning. This application of modern communication devices needs changes in curriculum development and teacher education, they should help language teaching systems to be compatible with the advances in new technologies. On the other side, it discussed that this development cannot help learning and teaching without the assistance of the conventional teaching methods. Therefore, both new and traditional methods of teaching should be blended and complement each other for successful teaching and learning.

**ABSTRACT**

Speakers goals in social interaction when use politeness strategies may face problem such as disagreement. In this paper, I build a research which shows the politeness strategies can also fail in the end by facing disagreement from the hearers. Besides to minimize the face-threatening acts, politeness strategies stand as instrument to succeed the speaker's purpose, but not always good as expected. The disagreements, somehow, will become the hearer's responses. I categorize the hearer's disagreements towards the speaker's politeness strategies as the politeness failure. This qualitative descriptive research explores the politeness strategies seminal work by Brown and Levinson (1987). The data are taken from the movie *The Iron Lady*. The study suggests that the failure happens in all politeness strategies dealing with face-threatening acts, i.e: the negative politeness strategies (quotative particle 'it is said, beg forgiveness, give deference, state FTA as general rule) are more frequently used among the colleagues, especially by those who have less power than the hearers; positive politeness strategies (be optimistic, exaggerate, assume or assert reciprocity, address forms), bald on record (case of non-minimization face threat) and off record (be vague) are more frequently used among the family members and used by the speakers who have more intimacy with the hearers.

**KEYWORDS:** Politeness Strategies, Failure, Disagreement, Hearer, Speaker.

**INTRODUCTION**

Brown and Levinson politeness strategies (1987) have influenced many aspect of communication and inspired many researchers to conduct politeness publication. The most salient factors is due to the familiarity of politeness in everyday life. The study of politeness is about to find the motive behind choosing a less straightforward courses action in language. Pinker (2007) argues that people are not just in the business of downloading information into each other's head but are social animals concerned with the impressions they make. It means that: as the speakers, all efforts will be done in order to gain a successful result when delivering their utterances.

Talking about politeness strategies is also talking about face. Because this Brown and Levinson's politeness concept born after 'face'. The notion of 'face' derived from Goffman (1967:5) which refers to the "positive social value a person effectively claims for himself". Brown and Levinson divide "face" into two: negative face, positive face. Negative face deals with the desire not to be imposed while positive face deals with the desire to be claimed, to be liked and to be affirmed. Politeness becomes strategies to soften the face-threatening acts that threaten both of faces. It becomes essential due to the everyday interactional activity. In accordance with Janney and Arndt (2003) that maintaining relationship and avoiding conflicts are rooted in the human need by doing the politeness. In line with Ungureanu (2004) who argues that we are usually trying to avoid damaging face, by adjust our choice of words in order to protect the interlocutors from unease. Brown and Levinson (1987) also state that P (power), D (distance), R, (rank of imposition) are crucial in determining the level of politeness that will be used by the speaker. The greater the FTA, the higher level of politeness will be used by the speaker.

It means, the use of politeness strategies is expected to minimize the face threatening acts and succeed the purpose of speaker's utterances. However, politeness strategies are not always success in both of them. As what Coulmas (2005:86) says that "the notion of 'politeness' is a broad and complicated one with numerous theories and approaches, and it is socially determined. It is linked with social differentiations, with making appropriate choices which are not the same for all interlocutors". It can be inferred that somehow, the failure of politeness strategies will occur. Although we are trying to gain our purpose by using these strategies, still, the hearer will make the probability response to disagree with our utterances. That is why, the hearer's disagreement becomes challenge for the speaker. I call this situation as politeness strategies' failure. As Pomerantz (1984) says that disagreeing with one another is uncomfortable, difficult, risking threat, insult or offence, whereas agreeing with one another is comfortable, supportive, reinforcing, and perhaps sociable, since it demonstrates that interlocutors are like-minded.

This study conducted to figure out the types of politeness strategies which fail then causing disagreement from the hearer's responses in *The Iron Lady* movie. The speaker's utterances meant by the writer are those which containing politeness strategies and persuading the hearers to agree or to follow the speaker's view but fail due to the hearer's responses: disagreements.

## LITERATURE REVIEW

Hearer's disagreement as the result of speaker's politeness strategies should be mitigated or avoided. As Brown and Levinson (1978 & 1987) in Leech (1983) say that disagreement is seen to verge on impoliteness and should thus be avoided in the interest of interlocutors 'face'. When the speaker tries to seek the hearer's agreement by using politeness, but the hearer's response is disagreement, it can be categorized as politeness strategies' failure. The speaker should make an extra effort in avoiding the disagreement. As Coulmas says (2005:84) "speakers makes many choices when speaking including the politeness level of their utterances". What Coulmas says is about to succeed the speaker's purpose in the utterances by means of some strategies. Gaining the purpose without disagreement result is the most important in interaction. Once the hearer refuses with disagreement, any bad probabilities of communication could happen, e.g: conflict; disappointment, etc. As what Waldron and Applegate, 1994 (quoted in Locher, 2004:94) define disagreement as "a form of conflict....taxing communication events".

The failure of politeness strategies, therefore existing the disagreements, may be caused by some factors: the speaker's wrong choices of politeness strategies and the traits of the politeness strategies. Pinker (2007) in his work "The evolutionary social psychology of off-record indirect speech act" says that "a final problem for politeness theory is the built-in dilemma in its treatment of off-record requests. If an implicature is too much of treasure hunt, the speaker will have missed on opportunity". It means that the trait of one of the politeness strategies (off record) is ambiguous, make the hearer should interpret the speaker purpose carefully. Still in Pinker (2007) that also says about off-record politeness strategy, in same cases, it can be downright rude, like: "Didn't I tell you yesterday to pick up your room?", or, "Shouldn't you tell me who is coming to the party?". But theoretically, off-record indirect speech acts should express the most politeness which suitable for the biggest threats. His arguments tell us to use politeness strategy appropriately. If we do the mistake in choosing some strategies the probability of unexpected result will happen.

Rees-Miller (2000) investigates the act of disagreement in terms of the factors of power, severity and context in University courses and academic talks in the United states of America. It reveals that professors use more positive politeness strategies when disagreeing with students than do peers disagreeing with each other or students disagreeing with professors.

Sifianou (2012) in her paper "Disagreements, face and politeness" suggests that disagreements are complex, multidirectional and multifunctional acts. She argues that inter- and intra- cultural variation depending on various contextual parameters. Disagreements can be put as face threatening acts or face saving acts, due to the interlocutors' personal traits and relational histories.

The study about disagreement strategies for politeness between American English and Mandarin Chinese conducted by Guodong and Jing (2005) reveals that Chinese students when diasagreeing with the superior employ more politeness strategies and address forms than the American students do. In the case of peers, both the American and Chinese students apply less politeness strategies. Female students behave more sensitive to politeness and use more politeness strategies than male students do.

Damopolii, Mahdi and Sujatna (2013) in their article “The strategies of conveying speaker and hearer as cooperators in conversation class: sociopragmatic analysis” investigate the strategies used by the speakers in the conversation class and examine the perlocutionary effects caused by the strategy used by the speaker to the hearer. They find three strategies of positive politeness used by the speaker: strategy of asserting or presupposing speaker’s knowledge and concern for hearer’s wants, the strategy of including both speaker and hearer in the activity, the strategy of giving (or asking) reasons. The speakers use those strategies to motivate the students in speaking English, to share the student’s idea and experiences, to make the students confident. The students’ perlocutionary effects as hearers are being motivated, being confident to use English, feeling accepted and being enthusiastic to figure out new things from the others.

Cheung (2009) in her article “politeness strategies of Chinese and American speakers” investigates the different interpretations of the notion of politeness by different cultures, in particular Chinese and American cultures, which are generally perceived to be representing two extremes with the former one being more conservative and the later being more open. The analysis is carried out by comparing a scene from the movie “The Joy Luck Club” with the literature. It is found that since their attitudes and values towards face are different, what is considered to be able to preserve one’s face in one culture may often be interpreted as face damaging in another. That is, even when people from these two distinctive cultures have good intent of demonstrating politeness and attempt to save other’s face during the interaction, the consequences may not turn out to be as pleasant as expected. Cheung also says that misunderstanding may arise with both parties having the impression of being threaten impolitely, and at the same time lacking a realization that their politeness strategies are considered inappropriate by members from the other culture.

Many studies about politeness strategies and disagreements in communication, but a little are known that politeness strategies could also fail in communication by causing the hearer’s disagreements.

## **RESEARCH QUESTIONS**

The present study is undertaken to examine utterances by the speakers in the movie The Iron Lady which contain politeness strategies but fail in the end by receiving the hearer’s disagreements response. The present study, therefore, seeks to answer the following questions:

1. What types of politeness strategies which fail in The Iron Lady movie?
2. What types of sub strategies in each politeness which fail in The Iron Lady movie?

## **METHODOLOGY**

The method used in this research is descriptive qualitative method. Qualitative approach is concerned with the process of certain phenomenon (Fanani, 2010). This method focuses on words and description rather than numbers (Maxwell, 2000). Descriptive research method has the purposes: making a description arrange systematically, knowing the characteristics and relationships among phenomena investigated.

The data are taken from the utterances in The Iron Lady movie (2011) directed by Phillida Llayd. The movie is written by Abi Morgan. It is British biographical film based on the life of Margaret Thatcher, the longest-serving Prime Minister of the United Kingdom of the twentieth century.

The focus of this study is to find the utterances containing politeness strategies and replying by the hearer’s disagreement. Brown and Levinson politeness strategies (1987) are used: bald-on-record politeness strategies, positive politeness strategies, negative politeness strategies, off record politeness strategies. The fifth politeness strategies which is not doing FTAs politeness strategies will not be applied on this study. This study concerns with the utterances containing FTAs, so that the fifth strategy of Brown and Levinson is not involved in this study.

## **RESULTS AND DISCUSSION**

The eleven conversations selected are investigated and then reviewed to identify its politeness strategies used with disagreements responses. All politeness strategies dealing with FTAs usage are apparent. All failed-strategies found in the data: most of the speakers use negative politeness strategies, i.e: quotative particle ‘it is said’, beg forgiveness, give deference, state FTA as general rule. The positive politeness strategies are also used, i.e: be optimistic, exaggerate, assume or assert reciprocity, address forms. The use of bald-on-record politeness strategy is found only in one conversation by using cases of non-minimization of face threat. The last strategy, off-record politeness strategy is found only in one conversation by using strategy ‘be vague’.

*Table 1: Politeness strategies and its sub strategies failure*

Negative politeness	Positive politeness	Bald-on record politeness	Off-record politeness
The quotative particle ‘it is said’	Be optimistic	Cases of non-Minimization of the face threat	Be vague
Beg forgiveness	Exaggerate		
Give deference	Assume or assert reciprocity		
State FTA as general rule	Address forms		

Here are the explanation of the result: the symbol **(1st)** refers to the speaker’s politeness strategy while the symbol **(2nd)** refers to the hearer’s disagreement response.

#### *Negative politeness strategy*

This strategy consists of redressive action addressed to the addressee’s negative face; addresses the hearer’s desire that her actions and her attention be unimpeded (Brown and Levinson, 1987). In my data, there are five conversations using negative politeness. Such strategies as quotative particle ‘it is said’, beg forgiveness, give deference and state FTA as general rule are used by the speaker and failed by receiving the disagreements as the responses.

#### *The quotative particle ‘it is said’*

By using this strategy, speakers avoid responsibility for believing in the truth of the utterances. The participants in the conversation: Prior (the speaker labelled by the writer), PYM, Margaret (the hearer labelled by the writer).

(1) Margaret stands, swathed in a glittering long dinner dress. A Bank of Minister, including Heseltine, PYM, Prior, Howe and Gilmour, gather before her.

*Prior : **There’s** a perception, Margaret, rightly or wrongly, that we are now completely out of touch with the country. (1st)*

*Margaret : Really. How much is a pack of Lurpak?*

*PYM : Lurpak?*

*Margaret : Butter, Francis. Forty two pence. Anchor butter is forty pence. Flora Margarine, still the cheapest, is thirty eight pence. **I can assure you I am not out of touch. (2nd)***

In (1), Prior, the speaker, wants to inform Margaret about bad assumption towards Margaret policies. He hopes a changing from Margaret as the Prime Minister to make it stable. Prior uses quotative particle ‘it is said’ to inform Margaret what happening outside and to persuade Margaret to change her unpopular policies. However, Margaret has a different view. She disagrees with Prior. She describes the price of Lurpak, showing that she is not out of touch with the country and will run her policies. The first bold-utterances shows the speaker politeness strategies, the second one shows the hearer disagreement and make the speaker’s politeness fail.

#### *Beg forgiveness*

This strategy shows that speaker may beg hearer’s forgiveness, or at least ask for ‘acquittal’-that is, that hearer should cancel the debt implicit in the FTA. The participants in conversations: General Haig (the speaker labelled by the writer), Margaret (the hearer labelled by the writer).

(2) The situation is when Falkland Islands, which belong to British, attacked by Argentina. Before the British ships reaching the Islands, the British are not give up on trying to find a diplomatic solution. The U.S. Secretary of State (General Haig) comes to negotiate with British Prime Minister.

*General Haig : So you are proposing to go to war over these Islands. They're thousands of miles away, a handful of citizens, politically and economically...insignificant, if you'll excuse me...*

*Margaret : Just like Hawaii, I imagine.*

*General Haig : I'm sorry?*

*Margaret : 1941, when Japan attacked Pearl Harbour. Did America go capin hand and ask Tojo for a peaceful negotiation of terms? Did she turn her back on her own citizens there because the islands were thousands of miles from mainland United States? No, no, no! We will stand on principle or we shall not stand at all.*

*General Haig : **But Margaret with all due respect**, when one has been to war... (1st)*

*Margaret : **With all due respect, Sir, I have done battle every single day of my life, and many men have underestimated me before.** This lot seem bound to do the same but they will rue the day. (2nd)*

In (2), the speaker, General Haig, comes to London due to the negotiation with British Prime Minister about Falkland Islands. He wants Margaret to re think about war against Argentina, because it will involve a lot of victims. The first bold-utterances shows the speaker strategy by using 'beg forgiveness', but fail because Margaret disagrees with his purpose (the second bold-utterances) and will run her plan.

#### *Give deference*

Give deference shows the speaker humbles and abases himself; and shows speaker raises hearer (satisfies hearer's want to be treated as superior). In the data, the writer finds two conversations containing this strategy. In first conversation, the participant are Admiral Fieldhouse, PYM, John Nott (the speaker labelled by the writer), Leach, Minister (the speaker labelled by the writer), Margaret (the hearer labelled by the writer).

(3) In this situation, they stand surrounding a map of South Georgia and the Falkland Islands. Margaret starring at the map. A whispered message to one of the Attaches. He moves a model boat on the map a few inches, leading a fleet of smaller model boats.

*Margaret : Is this ship a threat?*

*Admiral Fieldhouse : Both of these ships are carrying Exocet misiles, Prime Minister. Just yesterday they launched-then aborted-an attack inside the exclusion zone. There is a risk they could try it again.*

*PYM : The Belgrano is sailing directly away from the islands. Can it really be regarded as a threat?*

*Admiral Fieldhouse : She's been changing course continually. There's a strong possibility that they're attempting a pincer movement on carrier group. I advise that we engange them: hit the Belgrano as warning to the others. Send them all back to port.*

*PYM : It'll play badly internationally. We'll be seen as aggressors.*

*John Nott : This will be an ascalation, **Prime Minister.** (1st)*

*Leach : If there is to be an escalation, it's better that we started it.*

*Minister : It is streaming away, **Prime Minister.** (1st)*

*Margaret : **Sink it.** (2nd)*

In (3), the speakers, John Nott and Minister, try to prevent Margaret to attack the ship of Argentinian. It is known that the escalation will be apparent if Margaret attacks the ship. In the other hand, Margaret gives an order to attack ship by shinking it. The first bold-utterances indicates that the speakers fail in persuading Margaret by using strategies 'give deference'. The disagreement from Margaret come in the end and can be seen in the second bold-utterances.

The second examples of using strategy 'give deference' in the data involving participants: PYM (the speaker labelled by the writer), Margaret (the hearer labelled by the writer).

(4) PYM : *The point is, **Prime Minister**, I don't think we can sell the idea of a tax that asks everyone to pay the same. (1st)*

Margaret : *Our policies may be unpopular, **but they are right policies**. (2nd)*

In (4), the speaker, PYM, has a different view with Margaret about the tax policies. The idea of a tax that should be paid equally by everyone is not good idea. He wants Margaret to cancel her tax policies. According to him, it is nonsense if the poor should pay the same amount of tax as a multi-millionaire. PYM uses strategy 'give deference' to assure Margaret, as we can see in the first bold-utterances. However, Margaret has another view. She thinks that despite unpopular, it is the right policies (the second bold-utterances). The speaker fails in assuring Margaret and fails in gaining his purpose about cancelling Margaret's tax policies.

#### *State FTA as general rule*

Speaker may use this strategy if does not want to impinge but is merely forced to be circumstances, is to state the FTA as an instance of some general social rule, regulations or obligations. The participants: John Nott (the speaker labelled by the writer), Margaret (the hearer labelled by the writer).

(5) In this situation, while war happening, John Nott tells Margaret about the peace plan comes from President Reagan and President Bellaunde.

John Nott : ***President Reagan and President Bellaunde of Peru** have some new proposals for the peace plan- (1st)*

Margaret : *The peace plan? **there will be no appeasement**. This is a war. A war they started and by God, we will finish. Shall I tell you what I'm going to write to every single one of these families? I am going to tell them that no British soldier will die in vain for the Falklands. (2nd)*

In (5), the speaker, John Nott informs Margaret about the peace plan. He carries the peace plan came from President Reagan and President Bellaunde. The speaker fails in using strategy 'state FTA as general rule'. He fails in persuading Margaret. Margaret seems to be furious indeed.

#### *Positive politeness strategy*

Positive politeness strategies are used to enhance positive face. Brown and Levinson say that the use of positive politeness has a purpose to respect hearer's positive face and to make intimacy one another. In my data, there are some strategies of positive politeness found: be optimistic, exaggerate, assume or assert reciprocity, address forms. These strategies are unsuccessful in its usage by receiving the disagreements from the hearer.

#### *Be optimistic*

This strategy gives a sharp distinction with the negative politeness strategy (be pessimistic). The participants in conversation: Margaret (the speaker labelled by the writer), while Male guest, Hostess and Partly host are the hearer labelled by the writer.

(6) The situation is in dinning room, Dartford (a 1950's drinks party).

Male guest : *I'm not sure a home economics lesson is quite what the Dartford constituents need. They see industry being nationalized, the unions on the up, the pound on the slide...whoever can sort that lot out-he's my man.*

Margaret : ***Or woman?** (1st)*

Hostess : ***Ladies shall we?** (2nd)*

Portly host : ***Miss Roberts, do join the ladies.** (2nd)*

In (6), the speaker, Margaret, delivers her face-threatening acts by using positive politeness strategy, be optimistic. Margaret who hoping to be chosen as candidate for parliament, optimistically assure the other with question 'or woman?'. The males in the room give signal "get them out of here". In the end, the men rise and the Hostess says "Ladies shall we?", in order to move Margaret to another room. Margaret fails using strategy 'be optimistic'. The answer from others is disagreement towards Margaret view.

#### *Exaggerate*

Speaker may use this strategy to give interest, approval, sympathy with hearer. The participants in conversation are Howe (the speaker labelled by the writer), Margaret (the hearer labelled by the writer).

(7) The Falkland Islands, the British Colony in the South Atlantic, has fallen. Argentina claims its marines went ashore this morning as a spearhead to capture key targets, including the capital, Port Stanley.

*Howe* : Margaret, the cost of sending 28,000 men and a hundred ships twelve thousand miles, almost to Argentina, will be **absolutely crippling**. (1st)

*Margaret* : **I don't think** we should worrying about money at this point. (2nd)

In (7), the speaker, Howe, wants to stop Margaret's plan on sending 28,000 men and a hundred ships twelve thousand miles because it causing crippling. But Margaret still on her plan to do it. The speaker fails in persuading Margaret by using strategy 'exaggerate'. Although he informs Margaret confidently, Margaret disagrees with him.

#### *Assume or assert reciprocity*

By using this strategy, speaker may soften his FTA by negating the debt aspect and/or the face-threatening aspect of speech acts such as criticisms and complaints. It makes an effect 'I'll do X for you if you do Y for me'. This effect is found in the data. The participants in conversation are Shadow Minister (the speaker labelled by the writer), Margaret (the hearer labelled by the writer).

(8) The situation: Margaret now secretary of state for education, fighting hard in her speech against the opposition labour benches.

*Shadow Minister* : Me thinks the Right Honourable Lady doth screech too much. **If she wants us to take her seriously she must learn to calm down**. (1st)

*Margaret* : **If the Right Honourable Gentleman could perhaps attend more closely to what I am saying, rather than how I am saying it, he may receive a valuable education in spite of himself**. (2nd)

In (8), the speaker, Shadow Minister criticizes Margaret. He tells Margaret to change the way of her speak. It is better for Margaret to calm down and to reduce her screech voice. Margaret disagrees with that. She convinces the speaker to attend more to what she is saying, rather than how she is saying it. The speaker fails in criticizing Margaret by using strategy 'assume or assert reciprocity'. Indeed, Margaret criticizes him back to concern to the material of speaking rather than the way in delivering it.

#### *Address forms*

According to Brown and Levinson, this strategy is used to convey such in-group membership include generic names and terms address, like: Mac, Mate, buddy, pal, honey, dear, duckie, luv, babe, Mom, blonde, brother, sister, cutie, sweet-heart, guys, fellas. The participants in conversation are Denis (the speaker labelled by the writer), Margaret (the hearer labelled by the writer).

(9) *Denis* : The Prime Minister has been very loyal to you, **MT**. (1st)

*Margaret* : **But he's weak, and he's weakened the party**. One must know when to go. (2nd)

In (9), the speaker, Denis, wants to make Margaret cancelling her planning to become the leader of party. He says that Prime Minister is very loyal to Margaret. The speaker uses MT as Margaret Thatcher to persuade her. But Margaret still want to run for the leader of party. The speaker fails to make Margaret changes her planning.

#### *Bald-on-record politeness strategy*

Bald-on-record politeness strategy is the usage of FTA directly without redressive action. The prime reason for bald-on-record usage may be stated 'simply' in general, whenever speaker wants to do the face threatening acts with maximum efficiency more than he wants to satisfy hearer's face, even to any degree, he will choose the bald-on-record strategy (Brown & Levinson, 1987). There is one conversation in the data. Strategy 'cases of non-minimization of face threat (in sympathetic advice or warning)' is used by the speaker.

*Cases of non-minimization of the face threat: in sympathetic advice or warning*

Based on Brown and Levinson explanation, the use of this strategy is where maximum efficiency is very important, and this is mutually known to both S and H, no face redress is necessary. The participants in conversation: Margaret (the speaker labelled by the writer), Denis (the hearer labelled by the writer).

(10) The situation: Margaret sits at breakfast with her husband Denis, sipping tea. Denis butters his toast. Margaret shakes her head.

*Margaret : Too much. Much too much butter. (1st)*

*Denis : I like butter. (2nd)*

In (10), the speaker, Margaret, without redressing her face-threatening acts, gives warning/advice to her husband. Margaret wants her husband to not buttering too much his toast. In the other hand, Denis disagrees with her. He likes butter, so no problem with that. The speaker fails in using strategy 'cases of non-minimization of the face threat in sympathetic advice or warning. The fact is, disagreement from her husband, Denis comes in the end.

### **Off-record politeness strategy**

If a speaker wants to do an FTA, but wants to avoid the responsibility for doing it, he can do it off record and leave it up to the addressee to decide how to interpret it (Brown and Levinson, 1987). One expression of this strategy found in the data. Strategy 'be vague' was used by the speaker.

### **Be vague**

By using this strategy, speaker may go off record with an FTA by being vague about who the object of the FTA is, or what the offence is. The participants in conversation: Margaret (the speaker labelled by the writer), Denis (the hearer labelled by the writer).

(11) *Denis : You're insufferable, Margaret, do you know that?*

*Margaret : Denis, you married someone who is committed to public service, you knew that. And it is my duty. (1st)*

*Denis : Don't call it duty. It's ambition which has got you this far. Ambition. And the rest of us, me, the children, we can all go to hell. (2nd)*

In (11), the speaker, Margaret, wants to assure Denis about her job. It is her duty to service the public. So that Margaret wants to run her plan to become the leader of party. Denis disagrees with that. He argues that it cannot be called a duty, but can be called an ambition. The speaker fails in assuring the hearer by using strategy 'be vague'. The hearer considers what the speaker meant by the duty as the ambition.

## **CONCLUSION**

The purpose of this study is to figure out politeness strategies used by the speaker to succeed his/her purpose, but fail in the end. The failure can be seen by the hearer's responses: disagreements.

The findings indicate firstly, most of the speakers use negative politeness strategies and fail in succeeding their purposes by receiving the hearer's disagreements. Strategies such as quotative particle 'it is said', beg forgiveness, give deference and state FTA as general rule are found and used by the speaker. Secondly, referring to the study, there are four strategies of positive politeness used by the speaker and then fail in the end, i.e: be optimistic, exaggerate, assume or assert reciprocity, address forms. Thirdly, only one strategy of bald-on-record politeness used by the speaker and then also fails: cases of non-minimization of the face threat. Lastly, same as bald-on-record, it is found one strategy for the usage of off record: be vague.

The study suggests that negative politeness are more frequently used among the colleagues, especially by those who have less power than the hearers. While positive politeness, bald-on record and off record are more frequently used among the family members. Moreover, positive politeness, it is also used among colleagues but for those who have more intimacy with the hearer.

## **LIMITATIONS OF THE STUDY**

This study is about to find the utterances in The Iron Lady movie containing politeness strategies produced by the speaker but fail in its usage by receiving disagreements from the hearer. Brown and Levinson (1987) politeness

strategy concept is applied on this study. Five strategies are postulated, i.e: bald-on record politeness; positive politeness, negative politeness, off-record politeness; do not do the FTA politeness.

According to Brown and Levinson (1987), bald-on record politeness is used when the speaker wants to make efficiency of his/her utterances. This strategy shows that efficiency is more important than the hearer's satisfaction face. Positive politeness is used when the speaker wants to do the FTA then delivers his/her utterances with redressive action. The redressive action in positive politeness strategy can be delivered by making the speaker more intimacy with the hearer. Negative politeness is used same as situation with the positive politeness. But the difference is in the redressive action. In negative politeness, the speaker keeps the distance with the hearer to satisfy hearer's negative face: do not want to be imposed or disturbed. Off-record politeness is used when the speaker wants to do the higher level of face-threatening acts to the hearer. The speaker can do it by off record. The last strategy, do not do the FTA politeness is used when the speaker knows the bad effect of his/her utterances to the hearer, he/she as the speaker will choose the last strategy by not doing the face-threatening act at all.

Those strategies deal with face-threatening acts except the last strategy: do not do the FTA politeness. This study, therefore, focuses on the politeness strategies deal with face-threatening acts. So, the last strategy will not be applied on this study. This study also conducted to figure out the sub strategy of each politeness strategy in The Iron Lady movie.

**ABSTRACT**

Vocabulary learning is incredibly noteworthy to English language acquisition. It is unfeasible for a learner to communicate without the required vocabulary. In high educational levels, learners are habitually forced to become autonomous and make conscious effort to learn vocabulary outside of the classroom. Consequently, the autonomy of the learners plays an important role in developing and enhancing their vocabulary. This study investigates the relationship between English as foreign language (EFL) learners' autonomy and vocabulary learning strategies, with major emphasis on predicting learners' autonomy through their vocabulary learning strategies. To meet the above purpose, a total number of 144 male and female students, between 20-25 years old, studying English Language Teaching and English Language Literature at Islamic Azad University, Central Tehran, Iran were randomly selected and given Learner autonomy and vocabulary learning strategies questionnaires. Pearson Product Correlation results revealed a statistically significant relationship between EFL learners' autonomy and vocabulary learning strategies ( $P < 0.01$ ). Also, the results of multiple regressions indicated that social strategy was the best predictor and predicted about 23.8 percent of learner autonomy. Moreover, the memory strategy was the second best predictor, which increased the predictive power to 30.9 percent ( $R = .55$ ,  $R^2 = .309$ ). The findings of this study may lead students' attention to the awareness of the determining role of language learning strategies and learning autonomy as contributing factors to their success in the process of learning a target language, and point out the need for the implementation of autonomy in relation to vocabulary achievement.

**KEYWORDS:** learner autonomy, vocabulary learning strategies, learner independence

**INTRODUCTION**

According to Gee (2004), traditional school systems have been criticized for emphasizing information and skills disconnected from students' real lives, which can discourage some from learning at school. Some teachers believe a considerable number of junior high and high school students confessed that they dislike studying English (Seyed Rezaei, Karbalaeei, Afraz, 2013). However, according to Benson (2003), Dickinson (1992), and Little (1991) and students who think and work strategically are more motivated to learn and have a higher sense of self-efficacy or confidence in their own learning ability.

Under these circumstances, the concept of "autonomy" has attracted attention as an alternative approach to language learning (Benson, 2001; Gremmo & Riley, 1995). Benson (1996) defines autonomy as "the capacity to take control of one's learning" (p. 25). According to Scharle and Szabo (2000), the process of autonomy essentially involves three phases, which are: raising awareness, changing attitudes and transferring roles to learners.

As vocabulary is one of the main problems encountered in developing language proficiency, it is therefore imperative that learners develop a sense of autonomy in learning lexical items. Thus, in vocabulary learning, the qualities aspired of a good language learner when learning lexical items would involve being able to take advantage of potentially useful learning situations, and if necessary create them. In this regard, there is a need to draw a line between "learning the meanings of specific words" and "learning strategies to become independent word learners" (Blachowicz & Fisher, 2000, p. 505), that is, learners should not only learn how to acquire new words for themselves per se, but also learn to be responsible for their own vocabulary development.

## **REVIEW OF THE LITERATURE**

### ***Learner Autonomy***

There are many educators and thinkers who tried their best in defining learner autonomy and writing down its principles. For example David Little (1991) defines it by saying that "autonomy is a capacity for detachment, critical reflection, decision-making, and independent action. It presupposes, but also entails that the learner will develop a particular kind of psychological relation to the process and content of his learning" (Little, 1991). Holec (1981) defines learner autonomy as "the ability to take charge of one's own learning", which he then specifies as "to have, and to hold, the responsibility for all the decisions concerning all aspects of this learning". According to Holec (1981) there are varying degrees of self-direction in learning, which may be connected to varying degrees of autonomy. He outlines the following components as an entirely self-directed process of learning:

- Fixing the objectives;
- Defining the content and progressions;
- Selecting the methods and techniques to be used;
- Monitoring the acquisition procedure; &
- Evaluating what has been acquired.

In other words, a learner who wants to learn autonomously must follow specific steps when learning a subject as deciding what his objectives in learning are, selecting the most suitable techniques, monitoring his acquisition, and evaluating his experience.

### ***Vocabulary Learning Strategies***

As stressed by Nation (2001), "no matter what the teacher does or what the course book presents, ultimately it is the learner who does the learning" (p. 394). In other words, it is mostly the learner factor that seems to underpin the problem of low lexicon because it is ultimately the goals set by the language learner that would determine the extent of success of his or her learning process.

Foreign language learners may then use various strategies to acquire the target language word knowledge. Vocabulary learning strategies are "any set of techniques or learning behaviors, which language learners reported using in order to discover the meaning of a new words, to retain the knowledge of newly learned words, and to expand their knowledge of vocabulary" (Intaraprasert, 2005, p. 165). A comprehensive inventory of vocabulary learning strategies was developed by Schmitt (1997). He distinguishes the strategies into two groups: the ones to determine the meaning of new words when encountered for the first time, and the ones to consolidate meaning when encountered again. The former contains determination and social strategies and the latter contains cognitive, metacognitive, memory and social strategies. Schmitt includes social strategies in both categories since they can be used for both purposes.

In sum, learning how to learn vocabulary autonomously and taking particular strategies is a very crucial component. Strategies provide exposure to the target language and contribute indirectly to learning since they do not lead directly to the obtaining, storing, retrieving, and using of language.

## **RESEARCH QUESTIONS**

The aim of this study is to investigate two research questions:

- 1) Is there any significant relationship between EFL learners' autonomy and vocabulary learning strategies?
- 2) Is there any significant difference in the predictability of EFL learners' autonomy in terms of predicting their use of vocabulary learning strategies?

## **METHODOLOGY**

### ***Participants***

To fulfill the objectives of this research, 144 junior and senior students between 20-25 years old, majoring in English Language Teaching and English Language Literature at Islamic Azad University, Central-Tehran, Iran were randomly selected. Participants' of the study consisted of 92 females (64%) and 52 males (36%). During the study,

26 students were excluded from data analysis due to missing questionnaire responses, or disagreement to answer certain questionnaire.

### ***Instrumentation***

The following instruments were used to gather data at this study:

1. *Vocabulary Learning Strategies Questionnaire*: In order to determine the degree of participants' use of vocabulary learning strategies, Schmitt's (1997) taxonomy of vocabulary learning strategies, which consists of 60 statements, was used. Schmitt's Taxonomy of Vocabulary Learning Strategies (1997) contains five categories that are, metacognitive, cognitive, memory, determination, and social. The participants were asked to rate the frequency of each category they use on a five-point Likert-scale, ranging from 1 (never) to 5 (always). As a result, the scores could range within 60 to 300 and the high score indicated students' use of more vocabulary learning strategies.

2. *Learner Autonomy Questionnaire*: To evaluate the participants' level of autonomy, a questionnaire of autonomy, developed by Spratt, Humphreys, and Chan (2002), including 52 items was administered. The instrument has four sections. The first section (13 items) focuses on examining the students' views of their responsibilities and those of their teachers'; the second section (11 items) explores the students' confidence in their ability to operate autonomously; the third section (1 item) aims to measure the levels of student motivation to learn English. Finally, the fourth section (27 items) investigates the students' practice of autonomous learning in the form of both inside and outside class activities.

### ***Procedure***

A brief introductory session with students studying at Islamic Azad University was arranged. Students were informed that their performance on the test is voluntary and will not affect their final course results and they were assured for the confidentiality of the data gathering procedure. After giving an oral instruction of how to perform on the questionnaires each participant received a package of research instruments containing the Vocabulary Learning Strategies questionnaire and Learner Autonomy appraisal along with the written instructions for each form. The students were asked to fill the questionnaires and return the results on the same or next session at the same class. Also it is worth mentioning that the researcher computed the reliability index of the learner autonomy and Schmitt's questionnaire and questionnaires' reliability were sequentially 0.87 and 0.80 in Cronbach alpha.

## **RESULTS**

### ***Descriptive Statistics of Learner Autonomy***

One of the instruments used in this study was the learner Autonomy questionnaire. The descriptive statistics of the participants' autonomy scores is given in Table 1.

*Table 1: Descriptive Statistics of the Learner Autonomy Questionnaire*

	N	Range	Minimum	Maximum	Mean		Std. Deviation	Variance
	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error	Statistic	Statistic
Learner Autonomy	144	122.0	111.0	233.0	164.35	1.7879	21.454	460.284
Valid N (listwise)	144							

As it is shown above, the maximum and minimum scores obtained by the participants were 111.0 and 233.0, respectively. The mean was 164.35 and the standard deviation was 21.454.

### ***Descriptive Statistics of Vocabulary Learning Strategies Questionnaire***

The second instrument used in this study was vocabulary learning strategies questionnaire (Schmitt, 1997). The descriptive statistics of the participants' score is presented in Table 2.

*Table 2: Descriptive Statistics of the Vocabulary Learning Strategies Questionnaire*

	N	Range	Minimum	Maximum	Mean		Std. Deviation	Variance
	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error	Statistic	Statistic
Vocabulary Learning Strategies Valid N (listwise)	144 144	149.0	88.0	237.0	154.083	2.7319	32.7823	1074.678

In addition, descriptive statistics related to the subcategories of vocabulary learning strategies questionnaire also appears below in Table 3.

Table 3: Descriptive Statistics for the Subcategories of the Vocabulary Learning Strategies Questionnaire

	N	Range	Minimum	Maximum	Mean		Std. Deviation	Variance
	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error	Statistic	Statistic
Metacognitive	144	17.0	8.0	25.0	15.264	.3388	4.0659	16.531
Cognitive	144	33.0	9.0	42.0	23.417	.5952	7.1424	51.014
Memory	144	69.0	42.0	111.0	73.000	1.4202	17.0429	290.462
Determination	144	28.0	9.0	37.0	24.965	.3946	4.7355	22.425
Social	144	24.0	8.0	32.0	17.438	.4428	5.3136	28.234
Valid N (listwise)	144							

Based on the obtained results, memory-strategies enjoys the highest mean (73.000) indicating the point that they are the most favorable strategies used by the students. Determination Strategies stand on the second rank and Cognitive Strategies and Social Strategies are the followings ranks; and the least favorite strategies are Metacognitive Strategies with the mean of 15.264.

#### Checking the Assumptions of Correlation

Three assumptions of interval data, independence of subjects, and normality were met before running parametric tests to probe research questions (Field, 2009). As displayed in Table 4 the values of skewness and kurtosis were within the range of  $\pm 2$  (Bachman, 2005). The assumption of normality was also met.

Table 4: Testing Normality Assumption

	N	Skewness		Kurtosis	
	Statistic	Statistic	Std. Error	Statistic	Std. Error
Learner Autonomy	144	.088	.202	.073	.401
Metacognitive	144	.521	.202	-.598	.401
Cognitive	144	.498	.202	-.231	.401
Memory	144	.264	.202	-.508	.401
Determination	144	-.138	.202	.528	.401
Social	144	.856	.202	.175	.401
Vocabulary Learning Strategies (Total)	144	.298	.202	-.196	.401

#### Correlation between Autonomy and Vocabulary Learning Strategies

In order to investigate the relationship between variables, the researchers utilized Pearson Product Moment Correlation Coefficient as is displayed in Table 5:

Table 5: Pearson Correlations between Learner Autonomy and Choice of Vocabulary Learning Strategies

		Learner Autonomy
Metacognitive	Pearson Correlation	.450**
	Sig. (2-tailed)	.000
	N	144
Cognitive	Pearson Correlation	.450**
	Sig. (2-tailed)	.000
	N	144
Memory	Pearson Correlation	.483**
	Sig. (2-tailed)	.000
	N	144
Determination	Pearson Correlation	.420**
	Sig. (2-tailed)	.000
	N	144
Social	Pearson Correlation	.488**
	Sig. (2-tailed)	.000
	N	144
**. Correlation is significant at the 0.01 level (2-tailed).		

As it is shown in Table 5, EFL learners' autonomy showed significant correlations with the five components of vocabulary learning strategies.

#### ***Predictability of Vocabulary Learning Strategies through Learners' Autonomy***

A multiple regression was run to probe the power of autonomy in predicting EFL learners' vocabulary learning strategies. Based on the results displayed in Table 6, it can be concluded that the social strategy was the best predictor of learner autonomy ( $R = .48$ ,  $R^2 = .238$ ). Social strategy predicted about 23.8 percent of learner autonomy. The memory strategy was the second best predictor, which increased the predictive power to 30.9 percent ( $R = .55$ ,  $R^2 = .309$ ).

*Table 6: Model Summary Statistics Vocabulary Learning Strategies and Learner Autonomy*

Model	R	R Square	Adjusted Square	R Std. Error of the Estimate
1	.488 <sup>a</sup>	.238	.232	18.7965
2	.556 <sup>b</sup>	.309	.299	17.9572
a. Predictors: (Constant), Social				
b. Predictors: (Constant), Social, Memory				
c. Dependent Variable: Learner Autonomy				

The results of the ANOVA test of significance of the regression model ( $F(1, 142) = 44.29$ ,  $P .000 < .05$ ) for the first step and ( $F(2, 141) = 31.56$ ,  $P .000 < .05$ ) for the second step, indicated the components of vocabulary learning strategies significantly predict learner autonomy as shown in Table 7.

*Table 7: ANOVA Test of Significance of Regression Model Vocabulary Learning Strategies and Learner Autonomy*

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	15650.667	1	15650.667	44.297	.000 <sup>b</sup>
	Residual	50169.972	142	353.310		
	Total	65820.639	143			

2	Regression	20353.883	2	10176.941	31.560	.000 <sup>c</sup>
	Residual	45466.756	141	322.459		
	Total	65820.639	143			
a. Dependent Variable: Learner Autonomy						
b. Predictors: (Constant), Social						
c. Predictors: (Constant), Social, Memory						

The Normal Probability-Probability (P-P) Plot depicted in Figure 1 shows the assumption of linearity was met. All of the dots fall almost on diagonal.

Figure 1: Normal P-P Plot for Linearity of Regression Model Vocabulary Learning Strategies and Learner Autonomy (LA)

## DISCUSSIONS

The research described is one of the few empirical studies of language learning and learner independence in which it has been possible to obtain results about vocabulary learning strategies and autonomy from university students. The data obtained in this research were developed from 144 students. This instills some confidence in the comprehensiveness of the database and the relationships that were assessed in this research. This study investigated the relationship between vocabulary learning strategies and autonomy of EFL learners with major emphasis on predictability of vocabulary strategy use of learners through their autonomy.

The findings revealed that there was a significant correlation between EFL learners' autonomy and vocabulary learning strategies, and autonomy could significantly predict EFL learners' vocabulary learning strategies. These findings were also in line with the findings of Baradaran, Azimi, and Abadi (2013). Also, many researchers reported that learner autonomy promoted higher-order thinking and problem-solving abilities in students (Brown, 2002; Palincsar & Herrenkol, 2002). Moreover, many researchers found that the use of cooperative learning produced gains in enhancing autonomy. Some researchers reported findings similar to the present study, in which the use of cooperative learning as a way for enhancing autonomy increased student achievement measurably more than traditional strategies (Riley & Anderson, 2006; Stevens 2003).

In this regard, one can infer that no student is thoroughly without a sense of autonomy and vocabulary learning strategies use. This statement is consistent with Scharle and Szabo's (2000) notion that no student is completely without a sense of responsibility and we are not to face with an ideal responsible student, either. Scharle and Szabo (2000) express learning strategies as one of the most important building blocks of responsibility and autonomy. However, preferred learning style, cultural attitudes, and personality traits; may set limit to the development of autonomy.

## CONCLUSIONS

Aoki (2008) states that the strategies learners use in self-instruction context and the degree of autonomy they exercise would help them develop foreign language skills without the help of a teacher or language group(s). Based on the importance of these two factors in developing language skills, this study was conducted to investigate the relationship between EFL learners' vocabulary learning strategies and autonomy, with a major emphasis on predicting learners' vocabulary learning strategy use through their autonomy. The findings of this study may lead students' attention to the awareness of the determining role of language learning strategies and learning autonomy as contributing factors to their success in the process of learning a target language. Moreover, teachers can focus on strategy-based instruction for more effective learning and also find faster and less time-consuming ways to teach based on learners' autonomy levels. At the end, it is important to stress that any conclusion should be interpreted in the light of the many limitations and delimitations that the researcher had in conducting the research. Also, no significant relationship may be found in some parts, which might be attributed partly to the nature of the instruments used for data collection. A difficulty with the use of questionnaires is the fact that some participants might have not reported what they actually do due to either personal or educational reasons (Hatch & Farhadi, 1982).

## ABSTRACT

Today, integrating computer and internet technology in classrooms has had a great influence on educational environments. Based on presence of information technology in the education system of Malaysia, the present study was designed to explore the attitudes of Malaysian English as a second language (ESL) teachers toward integrating the internet technology in English language classes. In addition, it aimed to find out motivating and preventing factors that led these teachers to use or not to use technology in their teaching process. Five Malaysian ESL teachers were selected randomly to take part in the study. In order to get in-depth information, a semi-structured interview was conducted. The analysis of data gathered from interviewing with teachers revealed that Malaysian teachers showed positive attitudes toward internet usage in general, but because of some reasons they utilized it rarely in their teaching. Lack of internet access and computer facilities, insufficient computer skills, and lack of time was reported as obstacles to integrate internet in the classrooms. These findings suggested some implications for policy-makers to help teachers to integrate internet technology in their classrooms.

**KEYWORDS:** Teachers' attitudes, Internet use, English language classrooms, motivating factors, preventing factors, ESL, Malaysian

## INTRODUCTION

In recent years, integrating computers and internet technology in teaching and learning process changed the way in which instruction was delivered to students. The internet plays a great role in second/foreign language teaching and learning. According to Yang and Chen (2007), learners have access to many English language resources if they use computers and internet in language classes. They can improve their listening, speaking, reading, and writing skills through real-world situation. Lots of various activities in the internet can produce more fun and excitement for the learners. There are some reasons for using computer and internet technology in classes: a) Technology helps teachers to make the instruction individual through permitting students to learn in an environment which they feel more secure; b) It can provide stimulating learning experiences for learners; c) It helps students to have access to different learning sources not only at school, but also outside of it (Peck and Domcott, 1994, cited in, Al-Zaidiyeen, Mei, Fook, 2010). Hence, integrating computers and internet technology in learning environments modified the type of interaction between teachers and students (Kern, 1995) and make the learning process more student-centered. According to Jaber (1997), utilizing computers and internet in student-centered classes enable students to collaborate, use critical thinking, and work together to find solutions to the problems that they face. Therefore, it is expected that language teachers develop useful resources in their teaching process to assist learners' learning more efficiently. In this kind of technology-enhanced classrooms, learners are capable of assembling information themselves, making decision, and become more independent (Lam & Lawrence, 2002).

Because of the widespread use of computers and internet in educational settings, language teachers are motivated to implement this technology in their classes in order to facilitate language teaching and learning process. Educators are the real representatives of utilizing technologies in language learning (Albirini, 2004). One important factor which influences the use of educational technology in classes is the attitudes of teachers toward integrating internet in their language classes. Teachers' attitudes toward technology use can be concerned as a facilitating or hindering factor which give them more comfort or obstacle to utilize technology in their educational environments (Kim, 2002). Computers and internet technology are the most effective tools among various existing technological aids in teaching and learning language. Integrating and applying computers and the internet in a learning environment can strengthen the way that students acquire a foreign language effectively. Hence, teachers' attitudes have a fundamental role in the real utilization of technologies in classrooms.

Attitude specifies different definitions to itself. It is an opinion that one has about someone or something. It can reflect a favorable, unfavorable, or neutral judgment. According to Albarracin, Johnson, Kumkale, and Zanna (2005), attitude is a kind of psychological disposition to see a special thing or behavior with a degree of like or dislike. In an educational setting such as classrooms, teachers' attitudes like students' attitudes play a significant role in the attainment of educational goals. Lam (2000) stated that the personal beliefs of teachers about the benefits of technology utilization in teaching of language affect their decision in using technology. Therefore, enough time should be given to teachers in order to become more familiar with the new presented technologies. Incorporating training programs will also be helpful in motivating teachers to utilize technology in their classes. Some researchers

such as Yildirim (2000) and Oh and French (2007) mentioned that in their study of teacher training programs, teachers obtained more abilities and more confidence with technologies which promoted their attitudes toward technology positively.

Having positive attitudes toward internet use, help teachers to increase learning to utilize this technology in the teaching and learning process. It means that positive attitudes of teachers should be motivated and developed. In fact, having positive attitudes can stimulate teachers to learn the required skills which are essential for applying technology-based exercises and activities in classes. In a study by Mcalister, Dunn, and Quinn (2005), teachers showed positive attitudes toward using technology, although they did not have enough experience about technology utilization. The researchers concluded that more time, training, and value should be given to teachers who are as a model for students. The accessibility to suitable softwares and teachers' tendency to utilize that softwares have a positive influence on the attitudes of teachers toward the acceptance of technology in their classes (Sepehr & Harris, 1995). Kersaint, Horton, Stohl, and Garofalo (2003) stated that positive attitudes of teachers have an effect on the use of technology. They feel more confident and comfortable with technologies and integrate it in their teaching process. Teachers who have access to enough computers and the required instructional technology at schools possess more positive attitudes toward integrating technology in their classes (Becker & Riel, 1999).

On the other hand, teachers' negative attitudes towards technology could affect negatively on students' perceptions of computer technology (Weil, Rosen, & Wugalter, 1990). If teachers show negative attitudes to the change of traditional instructional practices, the new curriculum will not be successful. For the use of technology in the educational environment, the change encompasses both the learning of new proposed technology skills and pedagogies (Woodrow, 1987; Saye, 1998). In a study on pre-service teachers by Erdemir, Bakirci, and Eyduran (2009), they found that teachers feel themselves inadequate for utilizing computer and internet technology for the aim of teaching. Hence, negative attitudes of teachers lead to negative effects on the implementation of technology in classrooms.

There are some factors which prevent teachers from utilizing internet technology in their classes. One of those factors is teachers' anxieties in relation to technologies (Dawes & Selwyn, 1999). They are afraid of having less knowledge about technologies than their students. Teachers feel fear of having no more control on the activity of their students through utilizing technologies in classes. The feeling of anxiety causes negative attitudes which affect the teaching and learning process. Other factors such as financial problems, fixed curriculum, lack of materials, and insufficient internet access can be also effective. In a study by Gulbahar (2008), the lack of technological facilities and inadequate training programs showed an important impact on the teachers' tendency toward technology use. Based on the findings of a study by Mohd Yunus (2007), which is related to the perception of Malaysian ESL teachers toward challenges into the integration of ICT in schools, he found that "ICT integration in teaching is dependent upon adequate access, adequate computer resources, teacher development opportunities, and on-site support – all of which require funding, thought, planning and support" (93). Having just positive attitudes does not mean that teachers are capable of using internet technology in classes. Kim (2002) conducted a study on teachers' attitudes toward technology use and obtained that although teachers had positive attitudes and interest toward utilizing technology, but they use web-based lessons rarely. The reasons for such behavior were lack of time, insufficient knowledge, confidence deficiency, and some other factors.

Based on Vision 2020, which was stated by Dr. Mahathir Mohamad -Malaysian prime minister- Malaysia aims to become a total developed country by the year 2020 (The Malaysian Dream: Vision 2020). In order to obtain Vision 2020, the Malaysian government planed different national policies. One of those formulated policies was named the Smart School Policy which was designed to present the information technology (IT) into the education system. According to Ya'acob, Mohd Nor and Azman (2005), in recent years, lots of Malaysian teachers have been instructed in utilizing computers in teaching English language. Therefore, because of the growth of information technology in the education system of Malaysia, teachers are supposed to have enough ability and the right attitude toward applying computer and internet technology in their classes. However, there are some studies such as: Chong, Sharaf, and Jacob (2005) and Yusof, Taib, and Adnan (2010) which demonstrated that Malaysian teachers are not sufficiently ready to utilize technology in educational environments. According to Woodrow (1992), having positive attitudes of teachers toward internet use in English language classes is not obvious yet.

Moreover, there are many studies such as Johns and Torrez (2001) that mentioned how technology increases the motivation of ESL students to learn. But according to Lam (2000), a few numbers of studies had been conducted to investigate the teachers' point of view toward integrating internet technology in language instruction. Positive attitudes of teachers toward technology may lead to more achievement in teaching and learning process (Simonson, 1995). In addition, the previous studies investigated teachers' attitudes mainly quantitatively (through obtaining mean, standard deviation, frequency, and correlations), but this study aims to explore the attitudes of teachers qualitatively, in order to know the teachers' viewpoints about technology use deeply. Accordingly, the significance of teachers' attitudes toward integrating internet in English language classes warrants the need for the researchers to conduct a study on this issue.

## RESEARCH QUESTIONS

The present study aims to answer the following research questions:

1. What is the overall attitude of Malaysian ESL teachers toward integrating the internet technology in English language classes?
2. What factors lead Malaysian ESL teachers to integrate the internet technology in their classes?
3. Which factors hinder Malaysian ESL teachers from using the internet technology in their English language classes?

## METHODOLOGY

### *Research Design*

In order to obtain the goals of this study, a qualitative research design was used. According to Bogdan and Biklen (2007), a qualitative research can provide a very thorough insight about the feelings and thoughts of participants.

### *Participants*

Five Malaysian ESL teachers with different levels of experience were selected randomly to take part in the interview. All of them had at least a bachelor degree in TESL (Teaching English as a Second Language). The age of participants ranged from 23 to 35 years old. This study was conducted at a public university in Malaysia. Simple random sampling was used to choose the participants.

### *Instruments*

This research was based on a semi-structured interview with six open-ended questions. The interview questions were developed by the researchers based on the objectives of the study. According to Fraenkel and Wallen (1999), a semi-structured interview is a verbal questionnaire which includes a set of questions in order to achieve special answers by the interviewee. In a semi-structured interview, the researcher can change the order of questions or give explanations about the questions. It is the flexible type of interview. Through applying an interview, the researcher allows the participants to express their opinions and experiences freely. In this study, the interviews had been conducted in order to obtain in-depth information about the attitudes of Malaysian ESL teachers toward integrating the internet technology in their teaching classes.

### *Procedure*

The interview questions were sent to the emails of the five participants at a pre-arranged times. Before sending the interview questions, the interviewees had been informed about the goal of this research. With the permission of them, all of the five interviews were transcribed. After receiving the responses, the researchers sent other questions to the participants in order to clarify or get additional information. The interviewees could answer the questions freely and openly until the researchers made sure getting the in-depth information on what they were researching. Data gathered from interviews (interviewees' responses) were coded and classified for the purpose of categorizing the responses of the participants. The major questions of the interview are as follows:

1. Do you use the internet technology in your language classes?
2. What do you think about using internet technology in ESL classes?
3. What is your opinion about the advantages and disadvantages of utilizing internet technology in English language classes?
4. What factors do you think encourages you to use internet technology in your teaching process?

5. What factors do you think hinders you use internet technology in your classes?
6. Do you believe that using internet technology in English language classes improve language learning of students?

Before applying the semi-structured interview, two experts (one Post-Doc student and one PhD candidate in TESL) evaluated the content validity of the interview questions in order to check and verify the relevance of questions to the objectives of the study.

## **FINDINGS**

In order to achieve the objectives of the study, all of the five interviews were analyzed carefully. The analysis of data gathered from interviews produced five major themes related to the objectives of the study. The themes are : i) using internet in ESL classes, ii) advantages and disadvantages of using internet in ESL classes, iii) Students' language learning improvement, iv) motivating factors, and v) preventing factors. In order to support the findings, the genuine quotations of participants' answers are provided.

### ***Using Internet in ESL Classes***

All of the five participants mentioned that they utilized internet technology inside of their classes to somewhat. For example, Magi stated that

"I use it [internet technology], but not very frequently. It's very useful and interesting as students enjoy it."

Farah replied that

"I will go online during class only sometimes if when I want to find information that I cannot get from the textbooks and dictionaries. But I use power point every time during class to show notes to the students. I will also e-mail the regarding notes to the students after the class. They also receive their assigned tasks via e-mail."

Izzati keep that

"I use it [internet] in my classes to some extent. I think that it is a very helpful technology."

Tan maintained that

"I use it [internet technology] to find materials/ videos that will entertain students during class, but I don't use it much."

Attirah said that

"I think it's really good, especially for adult learners as they can be independent learners who are capable of searching for information on their own. It's good to promote lifelong learning as well."

According to aforementioned data, these Malaysian teachers believed internet technology as a useful tool in teaching and learning process, but they used it rarely in their classes.

### ***Advantages and Disadvantages of Using Internet in ESL classes***

Two of the teachers believed that using internet made learning process interesting and enjoyable for students. Atirah remarked some advantages of utilizing internet technology as follow:

"It promotes independent, lifelong learning. Students can gain extra information, gain interesting materials, audio and visual stimulants which make learning enjoyable for them."

Magi stated that

"Through using internet, students become interested and adventurous in trying something new. They [students] will not get bored easily."

Three teachers referred to internet facilities. They expressed that teachers and students could communicate with each other through using internet. For example:

Izzati claimed that

“The internet technology facilities are available almost at every corner in the world, students could be able to connect to the internet wherever they are. So, teachers will be able to give out assignments and return them back anywhere they [students] are. Moreover, students can also access to the resources the teachers have provided on the internet anytime and anywhere.”

Farah commented that

“Home work and assignments can be done at home without forgetting to give them in the class. Teachers can e-mail the notes and tasks with the internet facilities. Students can also submit the work via e-mail.”

Beside mentioning advantages of internet usage, all teachers complained about some negative aspects of it. Two of them pointed out the internet connection as a problem in classes. For example, Izzati mentioned that

“The internet connection would sometimes be unreliable at the time we need it [internet] the most.”

Atirah claimed that

“Poor internet connection can be problematic in our classes, because we don’t have laptops or special language labs.”

They also believed that supervising the students can be difficult when they use internet technology in classes. Izzati expressed that

“Teachers have to be extra in control as the students might be using the internet for other purposes during class.

Farah pointed out that

“Not all students can focus only to the lessons when they have an internet connection. Teachers must be alert towards every student when he or she wants to use technology facilities in the classroom.”

Magi remarked that

“The students intend to explore many new things without teachers' knowledge.”

As another negative aspect of utilizing internet technology in ESL classes, two of teachers referred to the new information that comes to the internet every day. They claimed that it would be difficult for teachers that check the internet all the times for becoming aware of new things. For instance, Tan emphasized that

“Teachers cannot control the continuous changes in the applications/ softwares related to internet. In doing this, they have to update with the latest information every day.”

### ***Students' Language Learning Improvement***

All five teachers revealed their willingness in using internet technology in their classes as a good tool for developing language learning of students. For example, Atirah stated that

“It improves students' language learning since they can learn English through audio and visual medium provided in internet. Moreover, they can search for several of information which will train them to think critically and wisely.”

They mentioned that through using internet, students can access to authentic English materials. Izzati reported that

“Students will be exposed to authentic English materials though teachers still need to guide the students to choose the best suitable materials.”

Atirah explained that

“Students will be exposed to real life and interesting materials that can motivate them to learn better. For example through using social networks such as facebook, they can communicate with other people in the target language.”

### ***Motivating Factors***

Based on analysis of data gathered from interviews, all teachers saw some value in using internet technology that provoked them to integrate it in their classes. For example, Tan stated that

“Through using internet, teachers have a wide range of selection. We can choose lots of images, videos, clips, activities, and everything that will be helpful for our students to improve their language learning.”

Other teachers considered the motivation of students. They claimed that using internet made the classes more appealing for students. izzati said that

“It [internet] will make the class more interesting for the students; also it can encourage independence in learning through opening up a vast amount of possibilities of learning materials for the students.”

Farah pointed out that

“I use technology in my class because it is easier and more interesting than just depending on text books for classroom lessons. I can display my notes to the students with the use of fascinating power points which increase students’ motivation to learn better.”

Atirah also mentioned some factors that stimulate her to utilize the internet in her classes such as:

“Easy accessibility to sources, interesting materials from websites and YouTube, save my time as I don’t have to browse for information in books anymore.”

Furthermore, Magi believed that through internet use she could access to novel teaching methods,

“Through searching on the internet, new teaching methods and materials can be found easily.”

### ***Preventing Factors***

Teachers mentioned some factors which lead them not to integrate internet technology in their classes. The most important preventing factor that they were concerned about was the lack of computer and internet facilities in their classes. For instance, Atirah pointed out that

“No equipment such as laptop, LCD, and also no internet connection discourage teachers to use internet in their classes.”

Farah reported that

“Sometimes, we lose the electricity or the internet connection which makes it hard for me to show the notes to the students. I can only depend on the text books or white board, which make it slower for me to finish all in one lesson because I need to write down notes on the board or I need to read the notes to the students.”

Magi remarked that

“Lack of number of classrooms prevents us to use the internet, because schools are only provided with 2 computer rooms and can’t accommodate many classes. Students are only allowed due to the availability of the rooms.”

Two of the teachers claimed that lack of computer skills and lack of time may affect the utilization of internet. For instance, Izzati mentioned that “Some teachers may have not been exposed to use the internet enough, so they have difficulty in using computer and internet and need more training. This took up class time.”

## **DISCUSSION**

### ***Teachers’ attitudes toward integrating internet technology in English language classes***

Based on the findings of this study, these Malaysian ESL teachers showed generally positive attitudes toward integrating internet in classrooms. What is surprising is that besides mentioning some advantages of internet use, they revealed that they integrate internet technology rarely for teaching English in their classes. The findings of the current study concur with some empirical research studies such as Darus and Luin (2008) that investigated the attitudes of Malaysian teachers toward teaching English utilizing computer technology. In their study which was conducted through questionnaires, Malaysian teachers displayed that they use computer technology rarely for teaching English.

Almost all of the teachers believed that integrating internet in English language classes will increase the motivation of students and make learning process more interesting for them. They tended to describe technology as a useful source for communicating with other people around the world in the target language. Moreover, they pointed out that through integrating technology, students will be able to access many authentic language materials which can stimulate them to learn better. These findings further support the idea of Lam (2000) who stated that teachers take into consideration technology as a supporting tool in teaching and learning process.

Although they believed that using technology is appealing for students, but some of them complained that making control of students becomes difficult when they use the internet in their classes. According to Shin and Son (2007), the source of this problem could be associated with insufficient pedagogical training of teachers in conducting

technology in classes. In order to integrate technology in classrooms and develop the quality of the classes, teachers should be aware of different approaches and methods which are necessary to know for applying technology in educational environments.

#### ***Factors leading teachers to integrate internet technology in classes***

All teachers mentioned some factors that motivated them to integrate internet technology in their classes. The present results seem to be consistent with other research such as Park and Son (2009) in which teachers accepted the usefulness of technology in classes.

Teachers believed that through using internet technology they will be able to access to a wide range of information and learning materials which can develop language learning of students. Some of them stated that they could make classes more engaging for students if they use different language websites. Moreover, one of the teachers claimed that internet-assisted language teaching help teachers to become familiar to new teaching methods and materials. These findings are in agreement with Bordbar's (1999) findings who found some factors as motivating ones for teachers to use technology in English language classes.

#### ***Factors hindering teachers from utilizing internet technology in classes***

Besides mentioning usefulness of internet technology, all teachers reported that the existence of some obstacles discouraged them from integrating internet and caused they use it infrequently in classes. Lack of internet access, lack of computer and internet facilities, insufficient computer skills, and lack of time were the barriers that expressed by these teachers. These findings corroborate some factors that had been recognized by previous studies on factors preventing teachers from using technology in classes (e.g., Egbert, Paulis, & Nakamichi, 2002; Shin & Son, 2007; Park & Son, 2009; Bordbar, 2010).

Teachers claimed that lack of computer and internet facilities was an influential barrier to utilize internet technology in classrooms. A few number of language labs restrained them to integrate internet during the teaching process. Sometimes the low internet connection produced some problems for them. They should waste lots of time for further connections. Researchers such as Gibson and Oberg (2004) and Martins, Steil, and Todesco (2004) related the infrequent use of internet by teachers to lack of internet access.

In addition, two of the teachers mentioned insufficient computer skills of teachers as another important hindering factor which discourages them to use technology. They believed that teachers' lack of computer skills takes time of class, because they need more time for finding materials from the internet. According to Al-Oteawi (2002), lack of knowledge and skills about technology cause that most of the teachers revealed negative or neutral attitudes toward ICT usage in classes.

### **CONCLUSION**

The present study was designed to explore the attitudes of Malaysian ESL teachers toward integrating internet technology in English language classes. It also aimed to find out motivating and preventing factors that lead these teachers to use or not to use technology in their teaching. Through analyzing data gathered from interviewing with five Malaysian teachers, this study has found that Malaysian ESL teachers showed positive attitudes toward internet usage in general, but because of some reasons they utilized it rarely in their classes.

All the teachers believed in some value of integrating internet technology which could help them to teach in a more interesting environment. Besides this, they were concerned about the lack of internet access, lack of computer and internet facilities, insufficient computer skills, and lack of time which discourage them to utilize the internet in their classrooms.

Albirini (2004) stated that for helping teachers to use technology in classes, decision-makers should uncover the obstacles remarked by teachers. Based on findings of this study, in order to integrate information technology in the education system of Malaysia's schools which is one of the national policies of Vision 2020, policy-makers of Ministry of Education in Malaysia should support and equip all schools with enough language resource rooms including sufficient computers and easy access to the internet. They should also equip teachers with on-going training programs to develop the practical skills of teachers through doing necessary practices related to computer skills.

### **LIMITATIONS OF THE STUDY**

According to Creswell (2003), limitations of the study are the potential weaknesses of it which are not controllable by the researcher, but may affect the results of the study. There are some limitations for this study that should be mentioned as follow:

1. The number of participants was relatively small and with a small sample size, caution must be applied, as the findings might not be generalized to other Malaysian ESL teachers. Hence, further work needs to be done with more participants to get more reliable results.
2. This study considered the attitudes of teachers who are majoring in TESL and it will not be generalized to the teachers who are majoring in other fields of studies.
3. The interview questions are limited to questions developed by the researchers based on the analysis of literature reviewed.

**ABSTRACT**

The role of language teachers' ongoing reflection while practicing inside the classrooms and after it has been widely recognized as a crucial factor in their professional development. This study is therefore an attempt to investigate the effect of EFL teachers' language awareness (TLA) and gender on their reflective behavior. In so doing, a language awareness test and a reflectivity questionnaire were administered to fifty teachers busy teaching English in language institutes in Shiraz, Iran. The statistical results confirmed that TLA significantly affects EFL teachers' reflective

behavior. The statistical results however were not found to be significant for the effect of gender on teachers' reflectivity. The findings of the current study depicts that reflection and language awareness are two complementary tools for practicing teachers to enhance their professional developments.

**KEYWORDS:** teacher language awareness, EFL, teacher reflectivity, subject-matter knowledge

## INTRODUCTION

There has been a growing attention to the concept of teacher language awareness (TLA) since 1990s. TLA has become an increasingly important component of the professional standards expected of the L2 teacher. Thornbury (1997) describes TLA as the knowledge that teachers have of the underlying systems of the language that enables them to teach effectively. According to such a view, TLA is essentially concerned with subject-matter knowledge and its impact upon teaching. In other words, according to (Edge, 1988), it relates to the L2 teacher's need to be able to function effectively as an analyst of the language, with the ability to talk about the language itself, to analyse it, to understand how it works and to make it judgments about acceptability in doubtful cases. According to Andrews and McNeil (2005), the teacher language awareness of good language teachers is to willingness and ability to engage with language-related issues; self-awareness (with particular reference to awareness of the extent of their own subject-matter knowledge) accompanied by a desire for continuing self-improvement of their teacher language awareness. Hales's (1997) definition shows a similar focus on subject-matter knowledge: language awareness could be glossed as a sensitivity to grammatical, lexical, or phonological features, and the effect on meaning brought about by the use of different forms.

As far as the concern in this article is towards the subject-matter knowledge of grammar and it deals with explicit knowledge of the grammatical issues, the explicit/implicit distinction need to be elaborated for better understanding.

In the L2 context, explicit knowledge is defined by Ellis (2004) as declarative knowledge of the phonological, lexical, grammatical, pragmatic and socio-critical features of an L2. According to Ellis, such knowledge is held consciously and is learnable and verbalisable. Implicit knowledge, by contrast is procedural, is held unconsciously and can only be verbalized if it is made explicit. Implicit knowledge is also agreed to be the type of knowledge that enables a language user to communicate fluently. The nature of the relationship between these two types of knowledge/awareness has also been a long-standing concern of those interested in language awareness (see, e.g., Little, 1997).

The contrast between explicit and implicit knowledge is closely relevant to the distinction between declarative and procedural knowledge. Anderson (1983) claims that separate systems are responsible for declarative (factual) knowledge and procedural knowledge of how to apply factual knowledge during skilled performance. According to Anderson (1983), declarative knowledge is explicit knowledge that we can report and of which we are consciously aware. Procedural knowledge is knowledge of how to do things, and it is often implicit. On the whole, the distinction between on the one hand applying rules of grammar successfully in production and comprehension, and on the other hand being able to explain those rules is of considerable significance for the L2 teacher. Conventional wisdom would suggest that both types of knowledge are essential parts of the L2 teacher's TLA.

Reflection in its simplest form means thinking about something. Loughran (2002) noted that it is a well-defined and crafted practice that carries very specific meaning and associated action (p.33). reflective teaching at a general term involves thinking about one's teaching and the cognition involved can take place before the event of teaching and manifest itself as planning, after the event as evaluation and simultaneous to the teaching as reflection in action involving adjustments to or accommodation of some of the contingencies with arise (Parker, 1997, p.8). Boud, Keogh and Walker (1985) view reflection as 'intellectual and affective abilities in which individuals engage to explore their experiences in order to achieve new insights and understandings. Hubball, Collins and Pratt (2005) define reflective practice as 'the thoughtful consideration of what we do, what works and what doesn't, and logics underline our teaching and that of others'. Minott (2009), defines reflection as careful consideration or thought; it is a process of disciplined intellectual criticism combining research; knowledge of context, and balanced judgment (critical thinking) about previous, present, and future actions, events or decisions.

There are a lot of reasons for the rising of reflectivity in the scope of teaching pedagogy. One of them is that reflective teaching was introduced to mitigate the clash between theoreticians and practitioners in the eclectic approach that was put forth by practitioners and reflective teaching promised to be the solution to the predicament (Akbari, 2007). Also according to Kumaravadivelu (2001), the post-method era questioned the traditional customs about the teachers and theorist and encourage teachers to become critical thinkers and theorize what they practice and practice what they theorize constantly. Also reflective teaching has emerged as a response to the problems of teachers in coping with their practical problems (Richards and Lockhart, 1999). As Gimenez (1999) noted that the efflorescence of reflectivity was the 90's and it continues to be dominant so that today nobody can ignore its prominent role in this field. Reflection has been a great importance in teacher's educational development in recent years and is an outstanding component of teacher development (Clarke & Otaky, 2006; Jay & Johnson, 2002; Vieira & Marques, 2002; Griffiths, 2000). "Reflection has become an integral part of teacher education" (Jay & Johnson, 2002, p.73), and as Tabachnick and Zeichner (2002) put it, "there is not a single teacher educator who would say that he or she is not concerned about preparing teachers who are reflective" (p.13). Teacher's reflectivity has gained in popularity in almost all facets of teacher education encompassing adult and vocational education (Cornford, 2002).

### **RELATED LITERATURE**

Language awareness is a kind of teacher's knowledge which testifies what teachers know about language systems (Wright & Bolitho 1993; James 1999; Hawkins 1999). The need for language sensitivity among teachers has given rise to the language awareness movement (Brumfit 1997), which places emphasis on the knowledge about language for teachers and cognition. Language awareness emerged as a movement in the UK in the beginning of the 1980s, as a reaction to theories about language learning based on behaviourist and also against who favoured the Direct hypothesis theory. Hawkin's (1984) proposals of language awareness are very pragmatic and became an inspirational factor in the LA movement.

The National Council in the UK for Language in Education (N.C.L.E) which supported research on language awareness gave the following definition in 1985: language awareness is a person's sensitivity to and conscious awareness of the nature of the language and its role in human life. Also the Association of language awareness (ALA) gives the following definition: language awareness can be defined as explicit knowledge about language, and conscious perception and sensitivity in language learning, language teaching and language use (ALA website). Language awareness is a holistic view. James and Garrett (1991) divide it into five domains: The affective, social, power, cognitive and performance domain. From a teacher's perspective these domains could serve to facilitate the language awareness work in the classroom as the scope covers many relevant aspects of language (Prtic Soons, 2008). According to Carter (1994), language awareness involves awareness of a) some of the properties of language, b) the embedding of language within culture, c) the greater self-conscious about the forms of the language we use and d) the close relationship between language and ideology.

In the case of teachers, it is assumed that an understanding of the language they teach and the ability to analyse it will contribute directly to teaching effectiveness. Wright (2002) pointed out that language awareness for teachers contains an awareness of learner's developing interlanguage, and awareness of how subject-matters cause problems for learners. Edge (1988) noted that knowledge about language and language learning still has a central role to play in English language teacher training for speakers of other languages. The language awareness development activities in Bolitho and Tomlinson (1980; 1995), Wright (1994) and Thornbury (1997) reflect such an assumption. Recent research such as Andrews (1999b) and McNeill (1999) suggests that TLA does have the potential to exert a powerful effect upon teaching effectiveness, at least as far as L2 teachers are concerned. Wright and Bolitho (1993) noted that TLA may have a significant positive impact on preparing lessons, evaluating and adapting materials, interpreting and designing syllabuses and also assessing learner's performance. Also regarding TLA and students' achievement, there exist a lot of researches in the literature. A study conducted by Strauss and Sawyer (1986), also discussed by Bransford, Darling-Hammond and LePage (2005a:15), revealed that awareness and quality of teacher has a major impact on student learning.

John Dewy's (1983) definition of reflective teaching is fundamental to the conception of professional development through reflection (Pollard, 2002, p.4). In his view, reflective teaching is applied in a cyclical process, in which teachers monitor, evaluate and revise their practice continuously and thereby creatively mediate developed

frameworks for teaching and learning ( cited in Pollard et al., pp. 14 & 15). According to Reiman (1999), practitioners, through reflective teaching, demonstrate the ability to analyze the process of what they are doing, while at the same time make judgments to modify their practice so that they can best match the needs of students.

In language teacher education, reflective teaching has been put forward as a way out of the teacher's dilemma and as a counteraction against the influences of "centralization and control" in which "teachers are seen simply as deliverers of a fixed curriculum" and are not valued as professionals who test out their interpretations and solutions about problems (Johnstone, 2006, p.661). Osterman and Kottkamp (2004) as cited in (Hung, 2008) define reflection as a professional development strategy that brings opportunities for professionals to explore, articulate and represent their own ideas and knowledge. Bartlett (1990) points out that becoming a reflective teacher involves moving beyond a primary concern with instructional techniques and "how to" questions and asking "what" and "why" questions that regard instructions and managerial techniques not as ends in themselves, but as part of broader educational purpose. According to McAlpine, Weston, Berhiau and Fairbank (2004), teachers generally reflect on their teaching and students' learning, how effective their instructional decisions are, approaches to teaching, improving practice and cognitive awareness of their reflective process. Also Ronald Schon's conceptions about reflection pave the way for further improvement and have an undeniable role. (Farrell, 2004; Stanley, 1998; Zeichner & Liston, 1996).

Also there is a wide range of models regarding the reflectivity of teachers in the literature. Maybe one of the best known models is belong to Schon. According to Schon (1987), reflection is a way of coping with difficulties of practice after and during the teaching process. He distinguishes between two types of reflection. The first one called "reflection in action" and deals with the mental analysis of events after the teaching process and the second type called "reflection in action" which takes place during the teaching act and deals with analyzing and providing solutions to the complex situations in the class.

Another model is the one provided by Van manen (1991) that have much in common with Schon's model regarding reflection in and on action and further it contains "reflection for action" that allows a teacher decide a course of action and anticipate further consequences of actions. Zeichner and Liston (1996) provides a five-dimensional model. The first phase is likely to be somehow personal and occurs during teaching action. The second phase repair and is reflection-in-action but with a stop for further thought. The third is review is interpersonal and can occur anytime the teaching process. The fourth phase is research in which teacher's observations becomes narrow down to specific matters. And finally the last phase, retheorizing phase, which is more abstract in contrast to other phases. Pachecho (2005) provides five critical reflection based on Schon's framework. It deals with a) identifying a problem, b) coping with the problem by comparing it with other similar contexts, c) evaluating the problem to find appropriate solution, d) testing the consequences of the solution and finally e) reevaluating the solution by defining whether the consequences are acceptable or not. The other model is belongs to Farrell (2004) and so initiative. It contains five levels. 1) Teachers can approach reflective teaching by observing other teacher's classrooms, keeping diaries and portfolios. 2) Each activity in teaching process should be based upon a systematic regulation that could serve all learners. 3) Planning for four time phases during reflective practice. 4) Teachers should not be exclusively have an individual reflection practice, but also should keep themselves update about what is going on in the real teaching practice and finally 5) considering the major role of the group discussion and provide a sedative atmosphere for discussion.

## STATEMENT OF THE PROBLEM

The very first shortcoming of what of much has been done on the subject is that all of them has tended to concentrate in the main on methods of promoting TLA, as, for example in the works of Bolitho and Tomlinson (1980; 1995) and also Thornbury (1997). Another pitfall of previous researches is that there has been relatively little research into the nature of TLA, also core of TLA, subject-matter knowledge. Meanwhile, in L2 education, as noted above attention seems to have centered mainly on ways of helping teachers to develop that knowledge and enhance their language awareness, rather than on investigating the nature of TLA or its impact on pedagogical practice or its relationship with other teaching issues like reflectivity. Also as Andrews (2007) noted, since the concept of TLA is a contextualized issue, I believe that investigating the relationship between TLA and reflectivity in Iranian EFL context will broaden our understanding of the efficacy of both TLA and reflectivity.

## RESEARCH QUESTIONS

1. Does EFL teachers' TLA significantly affect their reflective behavior?
2. Does EFL teachers' gender significantly affect their reflective behavior?

## METHODOLOGY

### *Participants*

The participants are 50 (28 male and 22 female) Iranian English language teachers from three language learning institutes in Shiraz, Iran. All the teachers are non-native English teachers and have B.A or M.A degree in English language Teaching and English language Translation and all of them have at least one year experience in teaching language.

### *Instruments*

Two instruments are used in this study. The first one is the language awareness test or LA test developed by Alderson, Clapham, and Steel (1996) to measure the subject-matter knowledge of teachers regarding grammatical issues, and the other is the questionnaire developed by Akbari, Behzadpour, and Dadvan for measuring teacher's reflectivity.

### *Data collection and data analysis procedures*

All participants were introduced to the purpose of the study prior to administering the instruments. Having the teachers familiarized with the tests and provided some guidance on how to complete them, the researchers administered the tests to them. At first, the LA test was given to the teachers. It contains 15 questions for metalanguage production and takes 30 minutes to answer them. Then the reflectivity questionnaire was given to them. It contains 29 items and there is no time limit for answering them. The LA test as mentioned above contains 15 questions and 2 points were allocated to each question, so the total point would be 30. The reflectivity questionnaire contains 29 items and the participants must read the statements and decided whether they 'never', 'rarely', 'sometimes', 'often', or 'always' does the asked matters in each statement. Each answer has its point ranging from 1 to 5. So the total range would be from 29 to 145. In order to analyze the data, SPSS software was used to assess descriptive and inferential statistics. A set of correlations was carried on to recognize different relationships. For this purpose, Pearson Correlation Coefficient was used for both hypotheses. Also an independent sample t-test was used to investigate the Gender differences.

## RESULTS

Table 1 shows the descriptive statistics conducted to examine the mean scores of reflectivity questionnaire and awareness test for the whole group. The mean scores for the awareness test was 108.96 out of 145 and the mean scores for the reflectivity questionnaire was 23.29 out of 30 for the whole group.

*Table 1: Descriptive statistics for questionnaire and awareness test for the whole group*

Test	N	Min	Max	Mean	SD
Questionnaire	50	69	131	108.96	17.834
Awareness	50	16	30	23.29	3.655

Table 2 indicates the correlation between the awareness test and reflectivity questionnaire. Using the Pearson Correlation Coefficient, we intended to determine whether the teachers' reflectivity is affected by their language awareness. As it can be seen from the table below, the correlation is .900 which is high. The results reveal that there was a significant and direct relationship between the two variables.

*Table 2: Correlations For the whole group*

Test	Questionnaire	Awareness
Questionnaire	Pearson Correlation Sig. (2-tailed)	1 .900** .000

N	50	50
---	----	----

Table 3 indicates the descriptive statistics conducted to compare the mean scores of awareness test and reflectivity questionnaire for both male and female group. The mean scores of awareness test for male and female group are 106.46 and 112.14, respectively. Also the mean scores of reflectivity questionnaire for male and female group are 22.50 and 24.29, respectively.

*Table 3: Descriptive statistics for male and female and for questionnaire and for awareness test*

Gender	Test	N	Min	Max	Mean	SD
Male	Questionnaire	28	69	131	106.46	18.775
	Awareness	28	16	30	22.50	3.949
Female	Questionnaire	22	79	131	112.14	16.433
	Awareness	22	18	30	24.29	3.042

To find out whether there was a significant difference between male and female groups regarding reflectivity questionnaire and awareness test, an independent sample t-test was conducted. Table 4 indicates that there was not a significant difference between male and female groups regarding reflectivity questionnaire. The significant value (.269) was above the p-value (.000) which is insignificant.

*Table 4: Independent Samples Test for male and female groups individually*

Variable	t-test for Equality of Means		
Reflectivity	t	df	Sig. (2-tailed)
Questionnaire	1/119	48	.269

Table 5 below also indicates that there was not a significant relationship between Gender and awareness test for male and female groups. The significant value (.483) was again above the p-value (.000) which is insignificant.

*Table 5: Independent Samples Test for male and female groups individually*

Variable	t-test for Equality of Means		
Awareness test	t	df	Sig. (2-tailed)
	0/707	48	.483

## DISCUSSION

This study provides a definition of teacher language awareness and teacher's reflectivity and addresses the question of whether these two variables have a significant relationship or not. Language awareness and reflectivity are two indispensable part of each teacher's teaching process which can be enhanced and developed through different ways and strategies. These two variables contribute significantly to teachers' effective practice inside the classrooms. Language awareness is a crucial tool for reflection on ones' own teaching behaviors and practices.

Based on the results of the current study it was proved that teacher the language awareness regarding subject-matter knowledge has a direct and significant relationship with teacher's reflectivity. At the first glance, it may seem that being aware of subject-matter knowledge regarding grammatical terms lonely cannot have a prominent relationship with being reflective in teaching. As I mentioned earlier, teacher language awareness contains both declarative and procedural knowledge, both the subject-matter knowledge and the knowledge to and ability to draw upon it for communicative purposes. But the results of this study reveals that even being aware of subject-matter knowledge has a notable relationship with reflection in teaching and it accentuates the incontestable role of awareness in language education. The findings are also in line with the works done in the literature regarding these two variables. The importance of both having awareness and reflection in post-method era is supported by many scholars (kumaravadivelu, 2003b; Richards & Renandya, 2002).

Also the findings are in direct path with the work by Andrews and McNeill (2005), which beautifully elaborate that attempting to foster an active awareness of content issues, we do not need to isolate teacher language awareness from broader aspects of teacher thinking and teacher reflectivity. The development of teacher language awareness could be promoted as part of an endeavor to encourage reflection across the broad spectrum of pedagogical concerns.

## CONCLUSION

The aim of the present study was to investigate two features of teaching pedagogy and the relationship between them. The findings revealed that language awareness and reflectivity has a direct and significant relationship with each other. According to Kumaravadivelu (2006), the postmethod teacher must not only know how to develop reflective approach, but also need to be aware of all aspects of teaching practice. The findings accentuate the importance of knowledge of subject-matter regarding grammatical rules, as the results shows that even being aware of subject-matter knowledge can apparently enhance and develop reflectivity of the teachers. Because little to no research has specifically investigated the relationship between teacher language awareness of subject matter knowledge and other pedagogical practice in the Iranian EFL context, the findings of this study are valuable. The findings can help the teachers and practitioners to take the awareness and reflectivity much more seriously.

## LIMITATIONS OF THE STUDY

Given the fact that the field has much to study about teachers' ways of knowing how to teach more effectively in response the particularities of learning contexts, the findings of the current study could trigger interested researchers to conduct further studies on reflection on/in teaching. Needless to point out that reflection on actual practices inside the classrooms is key to teachers' creativity and autonomy. So, some limitations of this study are highlighted here to leave the door open for further projects:

1. The instruments used in this study enjoy high levels of reliability and validity as claimed by the developers however the researchers did not reassess these two values for the particular participants cooperated in this study.
2. Reflectivity questionnaire was the only instrument used to detect teachers' reflective behavior. The participants were not available to conduct interviews for data collection triangulation purposes.
3. Time limit Considerations led the researchers to select a LA test with 15 items. The interested researchers can use tests with more items to measure individuals' metalanguage ability more confidently.

## **A CONTENT ANALYSIS OF THE ENGLISH SECTION OF UNIVERSITY ENTRANCE EXAMS BASED ON BLOOM'S REVISED TAXONOMY**

**Seyyed Ayatollah Razmjoo**  
*Associate Professor, Shiraz University*

**Haleh Madani**  
*MA in TEFL, Shiraz University*

### **ABSTRACT**

The objective of this study was to analyze University Entrance Exam (UEE) items, in terms of Bloom's revised taxonomy, to find out which levels of this taxonomy were more reflected in these items. To this end, UEE items in three years, 1380, 1385, and 1390, in three fields, Mathematics, Natural Sciences, and Humanities, and in two Universities, State, and Azad, were codified based on the coding scheme designed by Razmjoo and Kazempourfard (2012). The frequencies and percentages of the data were calculated and since the data appeared in frequencies, Chi-Square was used to estimate the significance of differences between the frequencies of different levels of thinking

The results indicated that Lower Order Thinking Skills (LOTS) were more considered in UEE items. Also the results showed the complete absence of “Creating” which is the highest level of thinking in the mentioned taxonomy. Accordingly, UEE in Iran cannot make learners critical thinkers.

**KEY WORDS:** Content analysis, Bloom's Taxonomy, Bloom's Revised Taxonomy, University Entrance Exams

## INTRODUCTION

Many researchers have paid due attention to the significance of tests and also University Entrance Exams (UEE). For instance, Chastain (1988) asserted that “Testing is an aspect of learning that enables learners to grasp what they have missed previously and the teacher to comprehend what can be done in subsequent lessons to improve learning” (p.381). Furthermore, Bachman (1995) believed that the primary aim of educational testing is to gain knowledge for decision making. Razmjoo (2004) stated that “the main objective of the UEE is to select and place the students with a high academic aptitude in the higher education institution of their choice” (p. 57). Moreover, Mohammad Pour and Abdul Ghafar (2009) believed that UEE in Iran has enormous effects on learners’ and their families’ feelings and future fate.

### *Bloom’s Original Taxonomy*

The framework of this study is Bloom’s revised taxonomy. For this reason first an introduction to Bloom’s original taxonomy is presented and then Bloom’s revised taxonomy will be completely described.

The idea for making a taxonomy which was at first regarded as a classification came up in 1948 at the “American Psychological Association Convention” in Boston. This “theoretical framework” represented the main concern of the taxonomy construction which is “facilitating communication” among test takers (Bloom, Engelhart, Frust, Hill, Krathwohl, 1956). They thought that this classification may encourage changing beliefs about testing. Moreover it may be useful for evaluating the connection between examination and education. After some years in 1956 it was published under the title of Bloom’s taxonomy. This taxonomy has three domains: “cognitive”, “affective”, and “psychomotor”. (Bloom, et al., p. 7). They argued that constructing taxonomy is a way for enhancing the transfer of ideas and materials among test developers, also among those involved in educational studies. The intention of taxonomy is to categorize the aims of education system; it would help lots of people involved in the design of the curriculum and also evaluation. One goal in the Bloom’s original taxonomy is to show in what way MC tests (Multiple Choice tests); can be used in order to examine the different categories of the taxonomy (Airasian & Miranda, 2002). Taxonomy is defined as a “classification of items into classes and subclasses” (Richards & Schmidt, 2002, p. 541). They also added that Bloom’s taxonomy mainly represents the cognitive domain. Furthermore, “the taxonomy of EDUCATIONAL OBJECTIVES is a framework for classifying statements of what we expect or intend students to learn as a result of instruction” (Krathwohl, 2002, p. 212). He mentioned that Bloom’s original taxonomy shows a “cumulative hierarchy”, it means that reaching higher levels needs first acquisition of lower levels of thinking. This taxonomy is organized based on a hierarchy of concrete to abstract levels. In addition, he believed that this taxonomy was mainly used for the categorization of syllabus objectives and test items.

According to Richards and Schmidt (2002) Bloom’s original taxonomy has six levels, ordered from “Knowledge” “which focuses on reproduction of facts” to “Evaluation” “which represents higher level thinking” (p. 56). So, the order and names of Bloom’s original taxonomy are as follows: “Knowledge”, “Comprehension”, “Application”, “Analysis”, “Synthesis”, and “Evaluation”.

### *Bloom’s Revised Taxonomy*

Contrary to the original taxonomy, the revised Bloom’s taxonomy has two dimensions. The horizontal dimension resembles Bloom’s original taxonomy (cognitive dimension) with a difference that in Bloom’s original taxonomy the names of the categories are nouns, but in the revised one they are verbs. In fact the names of “Application”, “Analysis”, and “Evaluation” have been changed in a sense that they are converted into verbs. Also “Knowledge” altered to “Remember”, “Comprehension” to “Understand”, and “Synthesis” to “Create”. So the order and names of categories in Bloom’s revised taxonomies are: “Remember”, “Understand”, “Apply”, “Analyze”, “Evaluate”, and “Create” (Figure2). Furthermore, the vertical dimension has four levels: “Factual Knowledge”, “Conceptual Knowledge”, “Procedural Knowledge” and “Metacognitive Knowledge” (Anderson, 2005; Anderson & Krathwohl, 2001; krathwohl, 2002). Figure 1 shows the framework of this taxonomy.

Figure 1: The Order of Bloom's Revised Taxonomy (Adopted from Churches, 2007)

Pintrich (2002) stated that regarding knowledge dimension, the original taxonomy contains all these three types of knowledge expect "Metacognitive Knowledge". Having two dimensions for conducting the procedures of explaining the goals besides planning and directing instruction results in a more obvious evaluation and a better correlation of evaluation with objectives and instructions. Therefore, taxonomy is a valuable means for evaluating and developing this correlation (Airasian & Miranda, 2002). They also believed that Bloom's revised taxonomy with its two dimensions concentrates on the need for evaluation to extend the isolated bits of knowledge and single cognitive procedures in order to concentrate on more complicated dimensions of learning. Moreover, Su, Osisek, and Starnes (2004) mentioned that categorizing "educational objectives" in this way, (in two dimensions), meaning relating knowledge dimension to the cognitive dimension brings researchers a clearer understanding of learning and will help them through constructing more reliable instructions.

What is more, Forehand (2005) stated that like the original taxonomy, the revised version took some years for revision, and eventually was published in 2001. In comparison with the original taxonomy, the revised one has some changes mainly in three classes: "terminology", "structure", and "emphasis". And finally Valcke, Dewever, Zhu, and Deed (2009) believed that the update of Bloom's original taxonomy shows that it is currently usable not only for analyzing learning outcomes but also for analyzing the cognitive processes which are used by learners to finish a work.

The Knowledge Dimension	The Cognitive Processes Dimension					
	Remember	Understand	Apply	Analyze	Evaluate	Create
Factual Knowledge						
Conceptual Knowledge						
Procedural Knowledge						
Metacognitive Knowledge						

Figure 2: The Framework of Bloom's Revised Taxonomy

## LITERATURE REVIEW

### *Studies Done on University Entrance Examination in Iran*

Razmjoo (2004) analyzed the effect of the English section of University Entrance Examination on the way pre-university teachers teach English, from the standpoints of both teachers and learners in Shiraz. Furthermore, he

compared the attitudes of teachers and learners. The outcomes of his study revealed that teachers paid more attention to reading skills, translation from English into the native language, grammar and also vocabulary, and less to speaking, listening and pronunciation skills, because they attempted to focus on skills which were crucial in UEE. Moreover, there existed a significant difference between teachers and learners' attitudes with regard to what to teach and how to teach. Eventually the researcher claimed that the method of teaching in pre-university English classes resembled Grammar-Translation Method (GTM), while mostly nowadays the emphasis is on Communicative Language Teaching and Testing.

Fazilatfar and Barzegar (2009) constructed a test which comprised 30 "conceptual" items as a comparison with TEFL M.A. University Entrance Exam in Iran. They supposed that TEFL M.A. Entrance Exam consists of items that test insignificant or even memory-based items, and also it is so lengthy. The findings of this study can be interpreted from different views. Since Iranian learners are adapted to memory-based items, their performance on the newly developed test was so poor. As a solution to this problem, the researchers offered that learners can have 3-4 years tutorial period in order to feel ready for exams that comprise "conceptual" items. Moreover the findings of this study showed that participants of M.A. entrance exam, who were B. A. TEFL students at Tehran University, did better on the entrance exam, because most of their professors were test developers of entrance exams, and so they were familiar with the content of the exam. And finally the researchers suggested that the sources for B. A. TEFL learners should be the same all over the country, in order to make similar conditions for them when they want to take part in TEFL M.A. Entrance Exam.

Barati and Ahmadi (2010) investigated the "differential item functioning" (DIF) on the "Special English Test of the Iranian National University Entrance Exam" (INUEE). Moreover, they considered the impact of gender and also subject-matter. The results of the study confirmed the existence of DIF on the test. The Cloze test section of the test showed the lowest DIF while the highest DIF was found in the language function section. Furthermore, the findings of this study revealed the presence of gender DIF samples in the subject matter. While females liked the grammar, language function, and cloze test parts, males liked the sections of vocabulary and also word order. With regard to the reading comprehension, it was found to be favoured by both genders. Most important of all, this study indicated that not only in determining DIF, the forms of items are important but also the subject matter plays an important role.

Razmjoo and Heydari Tabrizi (2010) analyzed the TEFL MAEE (M.A. Entrance Examinations) administered in 2007 in Iran. They scrutinized the basis of testing and also test structures. In this study they had two goals. First, they wanted to see if there exist any principles in constructing such exams. Second, they aimed to construe the problems existing in these exams and suggest some solutions. To this end, they developed a coding scheme which comprises a checklist of the probable content classifications. The results indicated that due to the irregular arrangement of the content classifications, the exam did not have high validity. Moreover, they indicated that the exam was not standard, because the required principles of constructing exams did not match. As a solution they offered to have experienced test developers in developing such exams.

Comparable to the results of Razmjoo's study (2004), Yunus, Salehi, and Kashefian Naeeni (2011) investigated the effects of high-stakes University Entrance Examination, which is a multiple choice in Iran, on high school English teachers. The results revealed that EEU ("Entrance Exam of the Universities") has a negative effect in the way English teachers teach in the classrooms. Most teachers use the native language in the classrooms because they want to transfer the meaning to learners more clearly and in this way prepare them for EEU. Also since speaking, listening, and writing are not tested in EEU, teachers do not pay attention to them in the classrooms. Despite the fact that EEU affected teaching negatively, the researchers of this study proposed that it not still possible to omit EEU, instead EEU items should be revised in a sense that they affect teaching and learning positively during high school years.

Salehi and Yunus (2012) studied the wash back effect of University Entrance Examination in Iran. Wash back means "the positive or negative impact of a test on classroom teaching or learning" (Richards & Schmidt, 2002, p.586). The researchers believed that UEE in Iran affects many people involved in it such as learners, teachers, parents, etc in one way or another. Therefore, in this study they aimed to consider the wash back effect of UEE on English teachers especially high school teachers, learners and their parents. As a result, they offered two suggestions for replacing entrance examination in Iran. These two are as follows: first, considering the GPA of the last four years of educating as a criterion for entering universities. And second, let learners to enter universities more easily but

make harder laws for graduating from universities.

#### ***Studies Done on University Entrance Examination outside Iran***

Each year many college and also university applicants who have learning disabilities (LD) provide grades from standardized exam as a step of admission to higher education. Lots of these grades are from tests managed with non-standard processes because of applicants' LD. To this end, Zurcher and Bryant (2001) used a case of college learners who had LD and a case that did not to analyze the criterion validity of grades on the "Miller Analogies Test", of course the situations necessary for learners with LD were met. The grades for learners with LD were comparable to those without LD, although they were not comparable with a GPA of learners without LD. The outcome of this study confirmed that, to the contrary, grades for learners with LD on non-standard tests are comparable to grades of learners without LD, they do not have desirable validity.

Tansel and Bircan (2005) scrutinized the impact of private teaching on university entrance exam success in Turkey. Since entering university plays an important role in the lives of young people in Turkey, it becomes a competitive type of exam. And parents spend large amounts of money on private teaching of their children. The findings of their research confirmed that learners who attended private classes gained better scores in University Entrance Exam and entered universities more successfully.

Azar (2010) investigated the discrepancies between academic achievement in the selection and placement entrance examination of participants' with high critical thinking and those with low critical thinking, and if this discrepancy is related to their gender, degree level and field in Turkey. For assessing participants' critical thinking dispositions, the "Critical Thinking Disposition Scale" (CTDS) was used in this study. Based on the participants' grades on the CTDS, they were classed into sub-classes. The first class belonged to participants with high critical thinking and the second group to participants with low critical thinking. From the results of his study, it can be concluded that no significant difference exists between participants' success and critical thinking dispositions. Furthermore, critical thinking dispositions did not have any relationship with gender, degree level, and their fields.

Besoluk (2011) probed into the relationship between morningness-eveningness preference and performance in University Entrance Exam in Turkey. By using a questionnaire labelled as "Morningness-Eveningness Questionnaire" (MEQ) he recognized four groups of participants: "moderately morning type", "moderately evening type", "definitely evening type", and those who did not belong to any of these groups. It is clear that no "definitely morning type" existed. The results of this study depicted that learners who belonged to the morning type performed better in UEE, since most entrance examinations are administered at this time.

Like Barati and Ahmadi (2010) in Iran, Kalaycioglu and Beberoglu (2011) detected differential item functioning (DIF) in science and mathematics items regarding gender classes, the content of item, and also they studied the impact of DIF item in the University Entrance Exam (UEE) in Turkey. The cause of DIF items in the UEE arises from the subject area, cognitive skills estimated, and features of item format. It is clear that higher levels of cognitive skills and graphical images in the item content are those that cause DIF and are liked by males, while the routine algorithmic estimation can cause DIF against males. Among all the factors mentioned, cognitive skills evaluated by items are the most important factors in producing gender DIF. "However DIF items do not create a threat to the criterion-related validity of the quantitative section of the UEE" (p. 467). Furthermore, considering gender differences in the selection of items for the purpose of assessing is crucial.

In (2012), Myskow and Gordon explored the kind of audience engagement strategies that a Japanese learner used in order to be prepared for impromptu writing assignment on the entrance exam of university. This study was based on the appraisal theory. This study also dealt with the instructional methodologies used by the teachers in order to help learners become familiar with the expectations of university admission officers. The results showed that learners performed better in the post-test than the pre-test since they become more engaged in the amount of engagement strategies they used.

#### ***Studies Based on Bloom's Original Taxonomy***

Betts (2008) used Bloom's taxonomy as guidance for designing graduate courses. Graduate learners often hope to use their experience to be involved in high level of discussions and also participate in advanced use of the course

subjects. To this end, he tried to design a course, which is advanced from concrete concepts to abstract ones within one semester. His attempt appeared in a course material which considered both the lower levels of thinking in Bloom's taxonomy such as "Knowledge" and "Understanding" and higher level of thinking like "Synthesis" and "evaluation".

Wang and Farmer (2008) applied Bloom's taxonomy to find out whether adult teaching techniques in China follow the first three levels of Bloom's taxonomy or the last three ones. They applied an instrument which was called as "Lower-Order Thinking Skills and Higher-Order Thinking Skills" ("LOTSHOTS"). The results of the study revealed that Chinese teachers of adults paid more attention to lower-levels of thinking regarding Bloom's taxonomy in their teaching. The researchers suggested that teaching higher- levels of thinking in Chinese adults may bring good outcomes for them in their learning.

Riazi and Mosalanejad (2010) used Bloom's original taxonomy to examine the senior high school and also pre-university English textbooks in Iran in terms of learning objectives. Four textbooks were included in this study, three high school textbooks and one pre-university textbook. A coding scheme was developed to codify the learning objectives in these textbooks. It is worth mentioning that the data in this study were gathered through analyzing the exercises and tasks of the textbooks. The results of this research revealed that in all the four textbooks lower-orders of thinking were more apparent, meaning that in these textbooks more attention is paid to lower-levels of thinking such as "Knowledge", "Comprehension", and "Application". Moreover, the results revealed that there existed no significant change between the high school textbooks and pre-university textbook in terms of higher-orders of thinking.

Due to the shift in ELT from teacher-centred classes to learner-centred ones, instructors and also researchers pay more attention to learners and all the things that lead them to function in the classes such as classroom activities. For this purpose, Alavian (2011) used Bloom's taxonomy to identify the kind of thinking that Iranian EFL teachers like to use in their classes. To this end, he mailed some questionnaires to instructors of different universities. Moreover, to become sure about the answers of instructors to each item in the questionnaire and their real performance in their classes, he observed some of their classes. The results of his study presented an inconsistency between instructors' answers and their real performance. Also it was shown that gender, experience, and the degree of education had a direct impact on the results.

Liu and Yang (2012) created an online information ethic course in terms of Bloom's taxonomy and Bird's 3C model. They wanted to have a better perception of how the learners' cognitive discourse is revealed in their learning. The content which was surveyed consisted of the learners' message posts, the quality of the conversation and scaffolding strategies for teaching. The results indicated that the quality of discourse was affected by hard scaffolding.

#### ***Studies Based on Bloom's Revised Taxonomy***

In a multi-institutional study, Whalley, *et al.*, (2006) investigated the reading skills of beginner programmers. In doing so, they used Bloom's revised taxonomy and also SOLO taxonomies. From this study it can be concluded that applying Bloom's revised taxonomy for classifying programming MCQ's brings some challenges. They can be due to some deficiencies in the taxonomy or the authors did not know exactly how to use it. Moreover, it is obvious that estimating programming is a difficult task. On the other hand, learners' performances using SOLO taxonomy resulted in more consistency, since less proficient learners did not reach higher levels in the taxonomy, whereas more proficient learners showed a tendency toward higher levels of the taxonomy.

Razmjoo and Kazempourfard (2012) evaluated *Interchange* textbook series (2005) based on Bloom's revised taxonomy. They aimed to investigate which levels of the taxonomy were mentioned more in these textbooks. For this every reason, they codified the content of these textbooks using the coding scheme developed by them. The findings of their study depicted that Lower Order Thinking Skills (LOTS), the first three levels in this taxonomy were the most frequent levels considered in these textbooks. Furthermore, a significant difference existed among the textbooks in considering diverse levels of Bloom's revised taxonomy. Also it was claimed that these textbooks lack metacognitive knowledge.

#### ***The Application of Bloom's Original Taxonomy in Entrance Examinations and other Types of Exams***

Written exam is a usual tool for assessing learners' performances on a given exam, especially where the cognitive ability of learners are determined through learning outcomes. Written exams are able to evaluate learners' ability, if

they comprise appropriate questions. Of course, required skills for reasoning and problem solving should be attained through useful training. Teachers can support this training by considering all types of questions such as higher, intermediate and lower order cognitive skills in their exams. Accordingly, an acceptable exam should consider all these types of questions. Jones, Harland, Reid, and Bartlett (2009) studied the degree of difficulty of every question in the written exam with regard to the key words existing in those questions based on Bloom's taxonomy. Moreover, they considered the performance of learners, required cognitive skills, and the learning outcomes. They concluded that a relationship exists between written exam items, learning outcomes, and the performance of learners; also they provided some implications for changes in order to have better evaluation strategies.

Item templates not only include usual true and false, multiple choice, completion and short answer items, but also they comprise items such as link, match, classification, and order. Because all these kinds of items have their confinement in testing all types of knowledge, difficulty always happens in constructing test items. For this purpose, Koong, Wu, and Chiu (2010) clarified what type of item templates are suitable for measuring specific kinds of knowledge based on Bloom's taxonomy. The findings revealed that 1) Link template is suitable for measuring remembering knowledge. 2) Match template is applicable for understanding and applying knowledge. Furthermore 3) Link and match templates together can measure analysing type of knowledge.

Evaluation has a significant role in the teaching-learning procedure. Learners' learning can be estimated by various processes. Veeravagu, Muthusang, Marimuthu, and Subrayan (2010) used Bloom's taxonomy to study the relationship between procedures of thinking levels in reading comprehension tests and the performance of learners in Malaysia. It is worth noting that higher levels of thinking happens when learners search beyond the content they are reading, to find out the answer or achieve comprehension. Predicting, concluding, inferring are instances of reading comprehension strategies that evoke higher levels of thinking. From the results they implied that the level of items developed based on Bloom's taxonomy affect the performance of learners in answering reading comprehension items. What is more, it can be understood that a relationship exists between the level of thinking procedures required and the learners' ability to answer the item properly.

Bloom's taxonomy is often used as a coding scheme to show diverse levels of cognitive orders. CBT (computer-based testing) has always been described as a tool for testing lower order of thinking in Bloom's taxonomy. In other words, it was believed that it enhanced rote learning, because it was claimed that it is difficult to construct tests based on the higher orders of thinking. With regard to this point, Bruyn, Mostert, and Schoor (2011) carried out a study in the "Faculty of Health Sciences at the University of Pretoria" to find out the conception of learners and teachers toward the CBT in terms of testing higher levels of thinking, based on Bloom's taxonomy. Their study indicated different results from what has been previously thought about CBT, because the results indicated that CBT can test various levels of cognitive skills.

Demir and Eryaman (2012) analyzed the teachers' exam items at the "Primary Education Department" based on the exam's duration, the perception of teachers, cognitive level, and the applicability to the critical thinking. The results indicated that the exam items were mostly at the Knowledge level based on the cognitive domain and they were not applicable to critical thinking.

### ***The Application of Bloom's Revised Taxonomy in Entrance Examinations and other Types of Exams***

Good test items are those items that can assess the performance of learners effectively. Chang and Chen (2009) developed an automatic inference system in terms of Bloom's revised taxonomy to analyze the quality of test items. They aimed not only to retrieve the knowledge dimension of test items but also the cognitive dimension of them. For doing so, they analyzed the "verbs" and the "question words" of test items. From the results they concluded that the inference system is able to automatically analyze test items' quality and paves the way for constructing good test items.

Lan and Chern (2010) used Bloom's revised taxonomy to investigate the English reading comprehension questions of college entrance exams in Taiwan, administered from 2002 to 2006. They considered both the cognitive dimension and also knowledge dimension. It is worth mentioning that in college entrance exam in Taiwan two tests are administered per years: SAET ("Scholastic Achievement English Test") and DRET ("Department Required English Test"). In the first step of analysis which is SAET, learners who have shown the qualifications needed for a

specific university are introduced to that university by their high schools. On the other hand, in the next step, that is DRET, the aim is to recognize learners who have aptitude in specific subject matters needed by a peculiar university. For this reason, DRET is more difficult than SAET because it is meant to distinguish among learners who have more proficiency in English. Therefore, the aim of this study was to compare and contrast between the content and cognitive skills of these two exams, to see in which one higher orders of thinking in Bloom's revised taxonomy are considered more. The results indicated that in both tests four types of cognitive dimension ("Remember, Understand, Apply, and Analyze") and three types of the knowledge dimension ("Factual, Conceptual, and Procedural") had the highest frequency. So it is clear that in both of them lower orders of thinking were considered more. Moreover, the results of this study may bring positive wash back effect for EFL teachers in high schools.

As the literature review indicates there is a lack of analysis of University Entrance Examination (UEE) based on Bloom's revised taxonomy. Hence it is necessary to do this research in order to find both the weak and the strong points of entrance exam items in Iran regarding Bloom's revised taxonomy, and also see whether entrance examination in Iran makes students critical thinkers or not.

### ***Statement of the Problem***

The topic of this research is related to the nature of thinking according to Bloom's revised taxonomy, and how the items of English section of the State and Azad University Entrance Exams (UEE) in the fields of Mathematics, Humanities and Natural sciences in the years, 1380, 1385, and 1390 (based on Iranian solar calendar), reflect these levels of thinking.

### ***Significance of the Study***

The results of this study will help entrance exam test developers and also high school teachers to pay more attention to higher levels of thinking regarding Bloom's revised taxonomy, in developing and constructing entrance exam tests and also teacher made tests. Moreover, the results of the current study can provide useful suggestions for writing high school textbooks, and also for material developers.

### ***The Objective of Study and Research Questions***

In this research, the researchers intend to investigate which levels of Bloom's revised taxonomy are reflected more in entrance examinations. A comparison will be made among different years (1380, 1385, and 1390), different fields of study (Mathematics, Natural Sciences, and Humanities) and also between State and Azad University Entrance Exams, to see in which field, in which year, and also in which university attention is paid more to higher levels of thinking.

In line with the objectives of the study the following research questions are raised:

1. Is Bloom's revised taxonomy reflected in entrance examinations in Iran or not?
2. In which field or fields, higher levels of thinking are considered more?
3. Can any changes be observed in University Entrance Exam items regarding Bloom's revised taxonomy in different years?
4. In which exam, State or Azad Universities are higher levels of thinking reflected more?

### **DESIGN AND METHODS OF THE STUDY**

This research is a mixed research which means that it is both qualitative and quantitative. A coding scheme developed by Razmjoo and Kazempourfard (2012) is used for conducting this research. All the questions and choices (here choices mean correct responses) are codified and also the frequency of occurrence of each coded item is estimated. Because this study is in terms of frequencies, Chi-Square is used to estimate the significance of differences between the frequencies of different levels of thinking based on Bloom's revised taxonomy.

### ***Materials***

Materials of this research are the English section of State and Azad Universities **in Iran** in all the fields, and years mentioned below:

The English section of State and Azad University entrance exam (UEE) items in Mathematics, Humanities, and Natural Sciences fields, in years 1380 (2001), 1385 (2006), 1390 (2011).

### ***Instrument***

The instrument for this research is a coding scheme developed by Razmjoo and Kazempourfard (2012). They developed this coding scheme for analyzing *Interchange* textbook series. This coding scheme which is developed based on Bloom's revised taxonomy has two dimensions: Knowledge Dimension and Cognitive Dimension. The Knowledge dimension represents four types of knowledge which are "Factual Knowledge", "Conceptual Knowledge", "Procedural Knowledge", and "Metacognitive Knowledge". On the other hand the Cognitive Dimension comprises the names of categories which are "Remember", "Understand", "Apply", "Analyze", "Evaluate", and "Create". Moreover, it shows "Generic Skills", "Sample Verbs" and also "Sample Questions". The cognitive dimension of this coding scheme starts from Lower-Orders of Thinking (LOTS) or concrete levels, and moves toward Higher-Orders of Thinking (HOTS) or abstract levels. The following tables present this coding scheme.

*Table 1: The Coding Scheme Developed Based on Bloom's Revised Taxonomy Adopted from Kazempourfard (2011, p. 47)*

The Knowledge Dimension	The Cognitive Process Dimension					
	A. Remember	B. Understand	C. Apply	D. Analyze	E. Evaluate	F. Create
1.Factual Knowledge	A1	B1	C1	D0	E0	F0
2.Conceptual Knowledge	A2	B2	C2			
3.Procedural Knowledge	A3	B3	C3			
4.Metacognitive Knowledge	A4	B4	C4	D4	E4	F4

*Table 2: The Description of Codes Based on Bloom's Revised Taxonomy Adopted from Kazempourfard (2011, p. 48)*

The Knowledge Dimension	The Cognitive Process Dimension					
	A. Remember	B. Understand	C. Apply	D. Analyze	E. Evaluate	F. Create
1.Factual Knowledge	Remember Facts: Recalling, restating and remembering terminology, specific details and elements	Understand Facts: Interpreting and translating terminology and specific details and elements	Apply Facts: Applying and adapting terminology and specific details and elements	Analyze using Facts, Concepts, Principles	Evaluate using Facts, Concepts, Principles	Create using Facts, Concepts, Principles
2.Conceptual Knowledge	Recalling, restating and remembering classifications	Interpreting and translating classifications and categories,	Applying and adapting classifications and categories,	and Procedures	and Procedures	and Procedures

	and categories, principles and generalizations, theories, models and structures	principles and generalizations, theories, models and structures	principles and generalizations, theories, models and structures			
<b>3.Procedural Knowledge</b>	Recalling, restating and remembering subject specific skills, techniques and methods, Recalling criteria for determining when to use appropriate procedures	Interpreting and translating subject specific skills, techniques and methods, Interpreting criteria for determining when to use appropriate procedures	Applying and adapting subject specific skills, techniques and methods, Applying criteria for determining when to use appropriate procedures			
<b>4. Meta cognitive Knowledge</b>	Recalling, restating strategic knowledge, knowledge about cognitive tasks, including appropriate contextual and conditional knowledge	Interpreting and translating strategic knowledge, knowledge about cognitive tasks, including appropriate contextual and conditional knowledge	Applying and adapting strategic knowledge, knowledge about cognitive tasks, including appropriate contextual and conditional knowledge	Analyzing strategic knowledge, knowledge about cognitive tasks, including appropriate contextual and conditional knowledge	Appraising and assessing strategic knowledge, knowledge about cognitive tasks, including appropriate contextual and conditional knowledge	Developing and creating strategic knowledge, knowledge about cognitive tasks, including appropriate contextual and conditional knowledge

*Table 3: The Compilation of Ideas Based on Bloom's Revised Taxonomy  
Adopted From Kazempourfard (2011, p. 49)*

<b>Code Name</b>	<b>Code Meaning</b>
<b>A1</b>	Remember Factual Knowledge
<b>A2</b>	Remember Conceptual Knowledge
<b>A3</b>	Remember Procedural Knowledge
<b>A4</b>	Remember Metacognitive Knowledge
<b>B1</b>	Understand Factual Knowledge
<b>B2</b>	Understand Conceptual Knowledge
<b>B3</b>	Understand Procedural Knowledge
<b>B4</b>	Understand Metacognitive Knowledge
<b>C1</b>	Apply Factual Knowledge
<b>C2</b>	Apply Conceptual Knowledge
<b>C3</b>	Apply Procedural Knowledge
<b>C4</b>	Apply Metacognitive Knowledge
<b>D0</b>	Analyze using Facts, Concepts, Principles and Procedures
<b>D4</b>	Analyze Metacognitive Knowledge
<b>E0</b>	Evaluate using Facts, Concepts, Principles and Procedures

<b>E4</b>	Evaluate Metacognitive Knowledge
<b>F0</b>	Create using Facts, Concepts, Principles and Procedures
<b>F4</b>	Create Metacognitive Knowledge

*Table 4: The Coding Scheme for the Cognitive Dimension of Bloom's Revised Taxonomy  
 Adopted from Kazempourfard (2011, p. 50)  
 (With Some Changes)*

Category	Generic Skills	Sample Verbs	Sample Questions
<b>Remembering Recalling information</b>	The learner is able to recall, restate and remember learned Information.	Choose, Cite, Enumerate, Group, Label, List, Listen, Locate, Match, Memorize, Name, Quote, Read, Recall, Recite, Record, Relate, Remember, Repeat, Reproduce, Review, Select, Show, Sort, State, Underline	What happened after...? How many...? What is...? Who was it that...? Can you name...? Find the meaning of... Describe what happened after...Who spoke to...? Which is true or false...?
<b>Understanding Explaining ideas or concepts</b>	The learner sizes the meaning of information by interpreting and translating what has been learned.	Account for, Annotate, Associate, Classify, Convert, Define, Describe, Discuss, Estimate, Explain, Empress, Identify, Indicate, Interpret, Observe, Outline, Recognize, Reorganize, Report, Research, Restate, Retell, Translate, Understand	Can you write in your own words? How would you explain...? Can you write a brief outline...? What do you think could have happened next...? Who do you think...? What was the main idea...? Can you clarify? Can you illustrate? Does everyone act in the way that...?
<b>Applying Using information in another familiar situation</b>	The learner makes use of information in a new situation from the one in which it was learned.	Adapt, Apply, Calculate, Change, Collect, Compute, Construct, Demonstrate, Dramatize, Draw, Exhibit, Generalize, Illustrate, Interview, Make, Manipulate, Operate, Paint, Practice, Sequence, Sketch, Solve	Do you know of another instance where...? Can you group by characteristics such as...? Which factors would you change if...? What questions would you ask of...? From the information given, can you develop a set of instructions about...?
<b>Analyzing (Critical Thinking) Breaking information into parts to explore understandings and relationships</b>	The learner breaks learned information in to its parts to best understand that information in an attempt to identify evidence for a conclusion.	Analyze, Appraise, Arrange, Calculate, Categorize, Compare, Contrast, Criticize, Debate, Detect, Diagram, Discriminate, Dissect, Distinguish, Examine, Experiment,	Which events could not have happened...? If...happened, what might the ending have been? How is...similar to...? What do you see as other possible outcomes? Why did...change occur? Can you explain what

		Inquire, Inspect, Investigate, Order, Probe, Question, Relate, Research, Scrutinize, Separate, Sift, Subdivide, Summarize, Survey, Test	must have happened when...? What are some Or the problems of...? Can you distinguish between...? What were some of the motives behind...? What was the turning point? What was the problem With...?
<b>Evaluating (Critical Thinking) Justifying a Decision or Course of actions</b>	The learner makes decisions based on in-depth reflection, criticism and assessment.	Argue, Assess, Choose, Compare, Conclude, Criticize, Critique, Decide, Deduce, Defend, Determine, Differentiate, Discriminate, Evaluate, Infer, Judge, Justify, Measure, Predict, Prioritize, Probe, Rank, Rate, Recommend, Revise, Score, Select, Validate, Value	Is there a better solution to...? Judge the value of... What do you think about...? Can you defend your position about...? Do you think...is a good or bad thing? How would you have handled...? What changes to...would you recommend? Do you believe...? How would you feel if...? How effective are...? What are the consequences...? What influence will... have on your lives? What are the pros and cons of...? Why is.... of value? What are the alternatives? Who will gain& who will lose?
<b>Creating (Critical Thinking) Generating new ideas, Products, or ways of viewing things</b>	The learner creates New ideas and Information using what Has been previously Learned.	Act, Assemble, Blend, Combine, Compile, Compose, Concoct, Construct, Create, Design, Develop, Devise, Formulate, Forecast, Generate, Hypothesize, Imagine, Invent, Organize, Originate, Predict, Plan, Prepare, Propose,	Can you design a...to...? Can you see a possible solution to...? If you had access to all recourses, how would you deal with...? Why don't you devise your own way to...? What would happen if...? How many ways can you...? Can you create new and unusual uses for...? Can you develop a proposal which would...?

***Procedures of Data Collection and Data Analysis***

The data for this research were gathered through the English section of university entrance exams in the fields, years, and universities mentioned before. All these UEE items were coded according to the coding scheme.

Moreover the frequencies of occurrence of each coded item was estimated, and through Chi-square the significance of the differences between the frequencies of the different levels of thinking based on Bloom's revised taxonomy were estimated. The reliability of the coding scheme was also estimated through SPSS 16. For this reason 5.55% of the whole data was chosen. The intra-coder reliability equalled 99.2%, and the inter-coder reliability equalled 98%.

#### ***A Sample of UEE Items as an Illustration***

In order to show how the data were codified and analyzed, some part of the total data was chosen as an illustration. For this reason, some items of the English section of State University in the Humanities field and in the year 1385 are presented as an example.

76. The teacher asked the students.....while he was teaching.  
 1) not be talking      2) not to talk      3) not talking      4) don't talk

The correct choice is number 2. Since the learners deal with structure in this question, and because they are asked to apply grammar this question is codified as C2 ("Applying and adapting classifications and categories, principles and generalizations, theories, models and structures").

83. Child labour is also a growing concern in Eastern Europe. "Concern" means.....  
 1) aspect      2) habit      3) reason      4) worry

The correct choice is number 4. Answering this question does not need higher orders of thinking because this question only needs remembering a definition of a simple word, so it is codified as A1 ("Remember facts: recalling, restating and remembering terminology, specific details and elements").

#### **Cloze Test:**

*Persian has an old and fun literature. Two great poets of the 11<sup>th</sup> century were Omar Khayam and Ferdousi. The beauty of old Persian art is..... (91) .....famous. This art..... (92) .....it's most perfect..... (93) ..... in books. They were written in..... (94) .....handwritings, and decorated with brightly coloured miniature paintings. They used different colours..... (95) .....blue ones, for decoration on walls and floors both inside and outside.*

91)  
 1) also      2) as well      3) too      4) the same

The correct choice is number 1. Since it is related to applying structure, it is codified as C2.

#### **Reading Passage:**

*Peter Pan, the boy who never grew up, became known to the world in the play Peter Pan by the Scottish writer Sir James Barrie. The play was first acted in 1904 and is nowadays put on the stage nearly every year at Christmas. One of Sir James Barrie's friends had five small sons, and the story of Peter Pan's adventures grew out of the long series of games that the author and the boys played together.*

*According to the play, all children when they are little would like never to have to grow up, but to be children for ever in an imaginary land of adventure. This was just what Peter Pan was able to do, for he had escaped from*

ordinary life and lived in the Never Never Land. Sometimes Peter would come to the real world and take real children back with him to the Never Never Land, and in the play it was the Darling family....Wendy, John, and Micheal...who went with him and shared his adventures. With Peter too were a number of Lost Boys who had no mothers and could not get back to the ordinary world. During her visit Wendy Darling looked after them and became a mother of them.

Peter was very sure of himself and very brave in danger. When he thought in one adventures that he was going to be drowned, he did not let himself be afraid, but just said, "To die will be an awfully big adventure". He was saved, however, and together with the children managed to destroy Captain Hook. The Darling family went back to their home and their parents, but Peter returned to the Never Never Land to live as a boy for ever.

96) All the following are some of the people in the play Peter pan EXPECT.....

- 1) Lost Boys
- 2) Wendy Darling
- 3) John and Micheal
- 4) five small sons of Barrie's friend

The correct choice is number 4. For answering this question, the learners have to grasp the meaning by translating and interpreting, so it is codified as B1.

## RESULTS AND DISCUSSION

### *Learning Objectives in UEE Items Based on Bloom's Revised Taxonomy*

In what follows the learning objectives based on Bloom's revised taxonomy for different fields, years, and universities are analyzed. To this end, table 5 is designed which shows the frequencies and percentages of the learning objectives.

Table 5: Learning Objectives in UEE Items

Learning Objectives for UEE Items		A. Remember				B. Understand				C. Apply				D. Analyze		E. Evaluate		F. Create	
Codes		A1	A2	A3	A4	B1	B2	B3	B4	C1	C2	C3	C4	D0	D4	E0	E4	F0	F4

In the Mathematics field, State University and the year 1380 (2001), B1 has the highest percentage, and it equals 64%. The order of learning objectives after B1 from the highest one to the lowest is as follows: C2 (28%), A1 and D0 (4%). The order of learning objectives for the Mathematics field, State University and the year 1385 (2006) is: B1 (48%), C2 (24%), D0 (16%), A1 (8%), and B2 (4%). And considering the year 1390 (2011), State University and the Mathematics field the order of learning objectives is, B1 (48%), D0 (24%), C2 (20%), and D4 (8%).

The fourth, fifth and sixth rows indicate the learning objectives of Natural sciences field in the years 1380 (2001), 1385 (2006), and 1390 (2011), and for the State University. In the year 1380 the order of learning objectives is: B1 (64%), C2 (20%), B2 (12%), and D0 (4%). In the year 1385, this order exists for learning objectives: B1 (64%), C2 (20%), D0 (8%), and A1 and B2 (4%). Moreover in the year 1390, B1, has the highest percentage. The order of learning objectives based on their percentage is as follows: B1 (44%), D0 (16%), C2 (12%), A1 and E4 (8%), and B2 and E0 (4%).

The next three rows show the frequencies and percentages for the Humanities field, State University, and the mentioned years. In the year 1380 (2001), the order of learning objectives with regard to their percentages is as follows. B1 (64%), C2 (24%), D0 (8%), and B2 (4%). In the year 1385 (2006), the order of learning objectives is: B1 (48%), C2 (20%), D0 (16%), A1 (8%), and B2, and E0 (4%). What is more in the year 1390 (2011) the order of learning objectives is as follows: B1 (52%), C2 (24%), D0 (12%), and A1, D4, and E0 (4%).

In the field Mathematics, Azad University and the year 1380 (2001), B1 is a learning objective which has the highest percentage among others. The percentage of it equals 46.66. After B1, C2 (26.67%), D0 (23.33%), and B2 (3.33%), have the highest percentages. In the year 1385 (2006), in the same field and university the order of learning objectives from the highest one to the lowest is: B1 (56%), D4 (24%), C2 and D0 (8%), and B2 (4%). Moreover in the year 1390 (2011), B1 with the percentage of 50% is more frequent. After it the order of learning objectives is: D0 (25%), C2 (20%), and D4 (5%).

In the year 1380 (2001), Natural sciences field and Azad University the learning objectives which are considered are as follows: B1 (46.67%), D0 (26.67%), C2 (23.33%), and B2 (3.33%). And in the year 1385 (2006), the order of learning objectives is: B1 (64%), D4 (12%), C2, and D0 (8%), and A1, and B2 (4%). Moreover, in the year 1390 (2011), B1 has the highest percentage. So the order of learning objectives for this exam is: B1 (45%), D0 (30%), C2 (20%), and B2 (5%).

In the year 1380 (2001), Humanities field and Azad University as the results indicate, B1 is a learning objective which has the highest frequency and percentage. Its percentage equals 56.67. After it, C2 (23.33%), D0 (13.33%), and C3 (6.67%), have the highest percentages. Moreover in the year 1385 (2006), in the mentioned field and university the order of learning objectives is: B1 (60%), D0 (24%), C2 (8%), and B2, and D4 (4%). Furthermore, in the year 1390 (2011), like all the previous years, B1 has the highest percentage. The order of learning objectives in this exam is: B1 (60%), C2 (25%), and D0 (15%).

Eventually the last row in table 5 indicates the total average of UEE items in all the fields, years, and in both universities mentioned before. For the purpose of this paper, the results are also analyzed for different fields, years and universities in terms of HOTS and LOTS. Generally speaking the first year in considering more HOTS is the year 1390 (2011), since HOTS=25.85% and LOTS= 74.15%, so in the year 1385 (2006), HOTS= 20.67%, and

LOTS= 79.33%, finally in the year 1380 (2001), HOTS= 13.22% and LOTS= 86.78%. Different years are also compared together in both universities, the order of years in State University regarding considering more HOTS is 1390 (2011) (HOTS=26.67%, and LOTS= 73.33%), 1385 (2006) (HOTS= 14.67%, and LOTS= 85.33%), and 1380 (2001) (HOTS= 5.33%, and LOTS= 94.67%). But in Azad University the order of years is like this: 1385 (2006) (HOTS=26.67%, and LOTS= 73.33%), 1390 (2011) (HOTS= 25%, and LOTS= 75%), and 1380 (2001) (HOTS= 21.11%, LOTS= 78.89%). Moreover the first field in considering more HOTS is the field Mathematics because HOTS= 22.89%, and LOTS= 77.11%, after it more attention is paid to HOTS in the Natural Sciences field, since HOTS=19.45, and LOTS= 80.55%, eventually Humanities field is the last field in considering HOTS, in this field HOTS= 19.05%, and LOTS= 80.95%. However, when these fields are compared together in the two universities some contradictions appear. The first field in considering HOTS in both universities is the field Mathematics, but the second field in Azad University is Natural Sciences field, while in the State University Humanities is the second field. Moreover, the third field in Azad University is Humanities, whereas Natural Sciences is the third field in the State University. Furthermore, in Azad University more attention is paid to HOTS, because HOTS=24.25%, and LOTS= 75.75%, but in State University, HOTS= 15.56%, and LOTS= 84.44%.

Figure 3: Total Average of UEE Items in the years 1380, 1385, & 1390

Since the data in this study are in terms of frequencies, and because frequencies are non-parametric, Chi-square is used to estimate the significance of differences between the frequencies of the different levels of thinking based on Bloom's revised taxonomy.

Table 6: Chi-Square Test for Azad and State Universities in Terms of Learning Objectives

Universities	Azad University	State University
Chi-Square	1.465E2 <sup>a</sup>	2.379E2 <sup>a</sup>
df	3	4
Asymp.sig	.000	.000

Table 7: Chi-Square Test for Years in Terms of Learning Objectives

Years	1380 (2001)	1385 (2006)	1390 (2011)
Chi-Square	1.282E2 <sup>a</sup>	1.734E2 <sup>a</sup>	1.069E2 <sup>a</sup>
df	3	4	4
Asymp.sig	.000	.000	.000

Table 8: Chi-Square Test for Fields in Terms of Learning Objectives

Fields	Mathematics	Natural Sciences	Humanities
Chi-Square	83.333 <sup>a</sup>	1.677E2 <sup>a</sup>	164.067 <sup>a</sup>
df	3	4	4

Asymp.sig	.000	.000	.000
-----------	------	------	------

As the tables (3, 4, 5) illustrate the differences between universities, years and fields are significant (Sig=.000). It means that the differences between the frequencies of the different levels of thinking in UEE items are significant. Thereby, in University Entrance Examination, learning objectives occur by chance and are random.

### **Discussion**

As the results of this study shows, in the year 1390 (2011), more attention is paid to HOTS, after it is the year 1385 (2006) and finally the year 1380 (2001). Although an improvement is seen among years toward considering more HOTS in UEE items, but the consideration of higher levels of thinking in UEE items are still not satisfactorily, since LOTS are considered more in UEE items, even in the year 1390 (2011). And regarding different fields, HOTS are considered more in Mathematics field, then Natural Sciences field and at last Humanities field. Moreover when the universities are compared together it is obvious that more attention is paid to HOTS in Azad University.

To recast, the last row in Table 5 provides the total average of learning objectives in UEE items based on Bloom's revised taxonomy. In all the years, fields, and in both universities, B1 always had the highest percentage. So here again, it has the highest percentage (54.50%). In this sense, after B1 which belongs to the lower levels of thinking, the order of learning objectives is as follows: C2 (19.70%), D0 (15.62%), D4 (3.16%), B2 (3.1%), A1 (2.22%), E0 (0.66%), C3 (0.60%), and E4 (0.44%). So, generally speaking, HOTS=19.88%, and LOTS=80.12%. Therefore, these learning objectives, A1, B1, B2, C2, C3, D0, D4, E0, and E4, are considered in UEE items, while these are not included: A2, A3, A4, B3, B4, C1, C4, F0, and F4. Consequently, only considering the cognitive dimension, one can easily see that all the levels are considered more or less, except "Creating". In other words, no attention is paid to "Creating" which is the highest level of thinking in Bloom's revised taxonomy. (Figure 4).

Accordingly, based on the results of this study, it can be concluded that Lower Order Thinking Skills (LOTS) are the main concern of UEE items. Hence, University Entrance Examination in Iran cannot make learners critical thinkers. Furthermore, it is clear that those crucial principles necessary for constructing good items are not met in UEE items in Iran.

The results of this study are similar to, Fazilatfar and Barzegar (2009), Razmjoo and Heydari Tabrizi (2010), Karamustafaoglu, Sevim, Karamustafaoglu, and Cepini (2010) Swart (2010), Lan and Chern (2010), and Demir and Eryaman (2012).

### **CONCLUSION**

In this part the research questions are answered one by one.

#### ***Is Bloom's revised taxonomy reflected in entrance examinations in Iran or not?***

The results of this study indicates the presence of all levels of thinking in University Entrance Exam (UEE) items in Iran, expect "Creating" which is the highest level of thinking in Bloom's revised taxonomy. Paying attention to more details, it is obvious that B1, among all levels of thinking has the highest percentage; its percentage equals 54.50%. Accordingly, the order of thinking levels for UEE items from the one with the highest percentage, toward the lowest one is as follows: B1 (54.50%), C2 (19.70%), D0 (15.62%), D4 (3.16%), B2 (3.10%), A1 (2.22%), E0 (0.66%), C3 (0.60%), and E4 (0.44%). On the other hand, these levels of thinking are absent in UEE items: A2, A3, A4, B3, B4, C1, C4, F0, and F4.

#### ***In which field or fields, higher levels of thinking are considered more?***

The results of the study show that the Mathematics field is the first field in considering higher levels of thinking. In this field, the percentage of HOTS=22.89 %, and LOTS=77.11 %. The second field is Natural Sciences because HOTS=19.45%, and LOTS=80.55 %. Eventually the last field is Humanities, in this field HOTS=19.05%, and LOTS=80.95%. But, when Azad and State Universities are compared together in terms of different fields some contradictions appear. While in both universities the Mathematics field is the first field, the second field in Azad University is Natural Sciences, and in the State University Humanities is the second field. Accordingly, in Azad University the third field is Humanities, and in the State University, Natural Sciences is the third field, in considering higher levels of thinking based on Bloom's revised taxonomy.

#### ***Can any changes be observed in University Entrance Exam items regarding Bloom's revised taxonomy in***

*different years?*

In the year 1380, the percentage of HOTS equals 13.22, and the percentage of LOTS equals 86.78. While in the year 1385, HOTS=20.67%, and LOTS=79.33%, and finally in the year 1390, HOTS=25.85%, and LOTS=74.15%. Hence, it is obvious that an improvement exists among these years toward considering more HOTS although in University Entrance Exams in Iran more attention is still paid to LOTS. Moreover, when State and Azad universities are compared together regarding various fields it becomes clear that in State University in the year 1390, more attention is paid to HOTS, while in Azad University in the year 1385, more attention is paid to HOTS.

***In which exam, State or Azad Universities are higher levels of thinking reflected more?***

In the Azad University higher levels of thinking are considered more, since in the mentioned fields the percentage of HOTS equals 24.25, whereas in the State University it equals 15.56%.

***Pedagogical Implications***

The results of this study indicated that in the University Entrance Exams in Iran more attention is paid to Lower Order Thinking Skills (LOTS). Accordingly, based on the results of this study some pedagogical implications can be reached.

1. "Once prospective teachers graduate from their programs without attaining high-level cognitive questions during their education, they do not prefer to assess their students' progress with high-level questions as a teacher" (Demir & Eryaman, 2012, p. 60). So, teachers, specifically high school teachers should be made aware of Bloom's revised taxonomy in order to engage higher levels of thinking in their teaching.
2. High school textbooks should also be designed in line with the mentioned taxonomy in order to contain all levels of thinking, specifically the higher ones.
3. Since high school textbooks are directly influenced by the University Entrance Exams, more attention should be paid in constructing and developing UEE items.
4. Moreover, high school teachers should use the exam items that encourage higher levels of thinking in their students since "the questions given in the exams by the instructors reflect the objectives, goals, outputs and the methodologies that the instructors apply in their teaching" (Demir & Eryaman, 2012, p.60).
5. And, eventually, and maybe most important of all is the point that University Entrance Exam test developers should be trained in the right way to consider all types of questions in these exams. It means that they should consider not only Lower Order Thinking Skills (LOTS), but they should also focus on Higher Order Thinking Skills (HOTS).

***Recommendations for Further Studies***

1. Future studies can be done comparing all the five fields. It means that future studies can compare all the fields Mathematics, Natural Sciences, Humanities, Art, and Foreign languages together.
2. Since university entrance examination has a direct impact on the way high school teachers teach in their classes, a study can be conducted in order to observe to what extent these teachers consider higher levels of thinking based on Bloom's revised taxonomy in their teaching.
3. Similar to the above mentioned point, also it is good to conduct a study to analyze the English textbooks of high schools which play a role in UEE in terms of Bloom's revised taxonomy.
4. Moreover, a study can be done to analyze the items of textbooks which are prepared to help learners become ready for the actual entrance examination.
5. And finally as this study compared Azad and State Universities, future studies can include Payame Noor Entrance Exam items.

## THE ROLE OF TEXT FAMILIARITY AND IQ IN READING COMPREHENSION AND RECALL PROCESS OF A GROUP OF IRANIAN ADVANCE STUDENTS

Mohammad Pazhouhesh

*Lecturer at Farhangyan University of Mashhad*

### ABSTRACT

This study is designed to find more evidence of the role of background knowledge as well as intelligence quotient (IQ) in reading comprehension and recall of students in English as a Foreign Language (EFL) situations. The study was conducted in three succeeding phases. First, 90 subjects took the Teaching of English as a Foreign Language (TOEFL) test. The results enabled the researcher to select 20 subjects in advance level for the study. In the second phase, an IQ test was administered to measure the intelligence level of the subjects. In the third phase, a questionnaire and four reading comprehension texts were administered. The students were supposed to read the questions on the questionnaire and answer them to decide their level of familiarity with the texts. Then, based on their answers two texts were considered familiar and two unfamiliar. The subjects were supposed to read the texts and write their recalls on a separate sheet of paper. Finally, the recall protocols were analyzed. The result of the t-tests showed that background knowledge did not have effects on reading comprehension and the recall of the texts. The correlation procedures further showed that IQ and recall were correlated but it was not significant. Based on the results it can be inferred that in advance level other factors such as reading strategies can play a role in comprehension.

**KEYWORDS:** Background knowledge, Reading comprehension, Recall process, IQ

### INTRODUCTION

---

Reading as the most important skill in EFL/ESL situations, particularly in advanced level occupies the most class time to achieve different goals. Thus, an important prerequisite to advanced proficiency English is the ability to read and comprehend well. Quite simply, without having reading proficiency, second language learners are not capable of performing well communicatively. As a result, researchers attempt to find new approaches to meet these educational needs.

There have been some views to second language reading over the past years. The first one holds a passive, bottom-up view of second language reading. This view assumes that the reader first recognizes the printed letters and words and then builds up meaning from the smallest units in the text or at the “bottom” to larger units at the “top” and then reconstructs the whole intended meaning.

It was about 1970 that background knowledge was recognized to have a great role in second language reading. Especially the lack of cultural familiarity with reading texts influences negatively the total comprehension. According to Fries (in Patricia L. Carrell, 1988), a failure to relate the linguistic meaning of reading passages to culture factors would result in deficiency in comprehension. This is culture-specific knowledge which is known as “schemata”.

The second view on second language reading, which emerged about some decades ago, is a psycholinguistic model of reading which has a strong influence on reading comprehension. According to this model, the reader predicts meaning and then confirms the predictions by relating them to his past experiences and knowledge of the language. This is in line with what schema theory has suggested.

The crucial role of background knowledge in comprehension and recall of text has been investigated and shown in different studies. In relation to comprehension and retrieval of a text, Orasana (1986) states that “the knowledge a reader brings to a text is a principle determiner of how that text will be comprehended, and what may be learned

and remembered” (P. 32). He also mentions that “schema theory would predict that propositions which are rated as important in light of the schema are more likely to be learned and remembered” (P. 41). Anderson et al. (1983) concluded “a schema influences learning and memory when activated before reading and retrieval when accessed after reading” (P. 43). Hammadou (1991) reported “readers with more knowledge about the topic showed more logical (correct) inferences based on the text and fewer illogical (incorrect) inferences” (P: 178).

One of the procedures to measure the amount of comprehension of texts and recall of them is to use recall protocols. Recall protocol is a technique by which the amount of comprehension is measured by analyzing the idea units retrieved from the text. Bernhardt (1983, 1991) and Swaffar et al. (1991), among others (Carrell, 1983, 1984a, 1984b; Wells, 1986), suggest the use of recall protocols as a measure of holistic or overall reading comprehension.

This study has been designed to find further evidence on the effect of background knowledge and IQ on reading comprehension and recall of the texts. Although a number of studies have been carried out with reference to the processes and factors which affect reading comprehension among which is the role background knowledge in retrieval of the text, the role of background knowledge and IQ in retrieving expected information is not yet known to the best knowledge of present researcher. So, it can become a significant research topic to be investigated through this study. So many students especially at university levels have comprehension problems. More studies regarding the comprehension problems are needed to provide both the teacher and learners with a good understanding of the nature of the problem and factors involved with it. So to serve this purpose and also due to few studies in relation to the effect of schema theory and IQ on recall of the text in Iran, this study has been carried out.

## **RESEARCH QUESTIONS**

1. Do students comprehend and remember the familiar texts better than unfamiliar ones?
2. Does IQ have any relationship with comprehension and recall of the texts?

The positive finding related to the effect of background knowledge on reading comprehension and retrieval of the texts led the researcher to consider one main positive directive hypotheses and one subsidiary hypothesis for this study.

H: There is a positive relationship between background knowledge and recall of the text in advance learners.

H: There is a positive relationship between IQ and recall of the texts in advance learners.

## **METHODOLOGY**

### ***Participants***

The subjects for this study were 90 EFL students at Iran Language Institute (ILI). These students have been studying English as a foreign language for at least three years. On the basis of a sample TOFEL proficiency test (Barron's 1986) 20 subjects with the score above 525 (total 650) were considered at advance level. Both sexes – about 50 girls and 40 boys- took part in this study. To have a check over probable intertwining variables, only subjects whose native language was Persian and their age level was between 18 to 30 were selected.

### ***Instrumentations***

**In this study, the following tests have been used.**

### ***TOFEL TEST***

The experimental TOFEL published by Barrons ((1986) was used to determine the proficiency level. The statistical features of the test relating to reliability and validity have been reported by the publisher and it is claimed to be highly valid and reliable. This test was administered to decide the level of subjects for this study and on the base of this test the subjects were considered advance learners. The score on this test has been calculated based on the method available in the BARRONS TOFEL book available in the market. It includes three sections; listening comprehension (50 questions), vocabulary and structure (40 questions), and reading comprehension and vocabulary (60 questions). The total time is 120 minutes. All three sections of the test were administered simultaneously.

***IQ TEST***

The Advanced Progressive Matrices Sets one and two (or APM) was used as a measure of IQ level. It is constructed in 1943 and in 1947 a revision was prepared for general use. In 1962 edition, twelve problems have been taken out so the total scores on the revised set advanced from 0 to 36. These 36 problems increase in difficulty more steadily and become considerably more complex.

The test showed a high retest reliability of 0.91 with adults of more than average intellectual capacity and above 18. This test is also quite suitable for eliciting the higher intellectual functions and for assessing superior intellectual efficiency, as the publisher declares (Test Manual, 1962).

***FOUR READING COMPREHENSION TEXTS***

These texts were chosen from some reading comprehension books available in the market. The length and the readability of these texts are almost the same (see table 1. below). Many factors have been established to measure the readability but in fact their aim, construction and validity are not very different (Alderson & Urquhart, 1987). A typical readability is the Fog Index which is used in this study.

$$\frac{\text{No. word}}{\text{No. sentences}} + \frac{\text{no. 3syllable words}}{\text{no. words}} \times \frac{100}{1} \times 0.4$$

And the result is interpreted as 12- = easy, 13-16 = undergraduate, 16+ = postgraduate. This formula is based on the number of words in a sentence.

These texts were to be read and recalled by the students. Two of these texts –Robin Hood (RH) and Family Size and Economic Development (FSED)- were hypothesized to be familiar and the other two –Professional Sport (PS) and Earth Day (ED)- were hypothesized to be unfamiliar.

*Table 1: The readability and length of the texts*

Texts	Text length	Readability
ROBBIN HOOD	330 Words	22.7
FAMILY SIZE AND ECONOMIC DEVELOPMENT	319	21.5
PROFESSIONAL SPORTS	321	20.3
EARTH DAY	322	20

***A Questionnaire***

To determine the amount of familiarity of subjects with the texts, the researcher gave a questionnaire with 10 questions on the reading passages –three questions on Robin Hood, three questions on Professional Sports, two questions on Earth Day, and two questions on Family Size And Economic Development- was used. The results were used to once again divide them into homogeneous groups in relation to familiarity and unfamiliarity with the texts.

***Procedure***

In the first phase of the study, a TOFEL exam was given to about ninety students at the ILI. Before the exam, the students were provided with enough information about the test. Based on the results 20 students with the score above 525 were considered advance learners.

In the second phase of this study which was held on a separate session, these twenty subjects took an IQ test. The subjects were briefed on the content and the way to answer the questions. The time limit was announced and the results were collected. This test was corrected based on the number of correct answers as suggested by the test developers. The range of scores was between zeros to 36.

In the third phase of this study which was also held on a separate day, first a questionnaire was given to each subject and they were told to answer the questions on the paper. They were also told that they can easily leave blank any questions they did not know. The purpose of this was to determine how familiar the subjects had been with the text. After completing this questionnaire, they were supplied with the first reading text. An empty sheet was also given to them to write their recalls on it. They were already informed of what they were supposed to do. The subjects were asked to consider the following points when writing the recalls.

- (1) The students should not read the text longer than ten minutes and they should not go back to the text while they are writing the recalls.
- (2) The subjects should write their recalls on a separate sheet.
- (3) They should write their recalls in full sentences.
- (4) They should write their recalls in English.
- (5) They should write whatever they remember about the text.
- (6) They have enough time to write their recalls.
- (7) Grammatical and spelling mistakes are not important.

The same procedure was followed for the rest of the texts. Then, the questionnaires and the recall protocols were collected. The questionnaires were rated. The score above 50 was considered familiar and below that unfamiliar. The two texts –Robin Hood and Family Size and Economic Development were proved to be familiar as it was hypothesized and the other two texts –Earth Day and Professional Sports- were also proved to be unfamiliar.

As put forward by Alderson (1984), the idea unit is the unit of text analysis and widely used in reading comprehension oriented research. Thus, as a test of comprehension students can be asked to write a recall protocol of a text they have read which in turn is scored in terms of the number of idea unit it contains. So in order to correct the recall protocols, each text was parsed into idea units. For the ease of scoring, an effort was made to establish a unit in which there was only one bit of information expected to be significant for the analysis as recommended by Alderson (1984). It was also set that every parallel or paraphrased sentence are to be accepted. So all recall protocols were analyzed and graded based on these idea units. In RH text which was 330 words in length, there were 36 idea units; in FSED text which was 319 words in length, there were 28 idea units; in PS text which was 321 words in length, there were 30 idea units; in ED text which was 322 words in length, there were 28 idea units (see Table 2). These idea units were verified by two independent judges.

*Table 2: The number of Idea Units in Each Text*

Texts	Length	Number of Idea Units
RH	330	36
FSED	319	28
PS	321	30
ED	322	28

*Table 3: Examples of idea units are given as follows.*

---

Robin Hood text (2 idea units)

Robin Hood is a legendary hero/ who lived in Sherwood Forest, in Nottingham, with his band of followers. / (As illustrated above the sentence contains 2 idea units as separated off by two virgules.)

Family Size and Economic Development (1 idea unit)

Poor people often have larger families than middle class and upper class people./

---

Based on this criterion, any sentence presented in this way was given a point. For example one of the students recalled the first idea unit in Robin Hood this way; "*Robin Hood was a hero and he lived in Nottingham with his friends.*" Or for the second text one wrote; "*there are more children in poor families than high- class families*". Both of these students got a point for their recall. Two scorers scored the recall protocols and using Pearson Product-Moment Correlation, the inter-rater reliability was found to be .85.

### Data analysis

The data gathered were analyzed using the SPSS statistical software. At first, descriptive data for the IQ and recall protocols were computed. As stated already, the main aim of this study was to confirm that the background knowledge of the subjects had a role on their reading comprehension and recall protocols. The design of the study made the application of one matched t-test necessary. The aim was to compare the means of two familiar and unfamiliar texts. The value of the t-observed for the comparisons of means and that of t-critical were calculated and tested for the significance of the comparisons. The alpha for achieving significance was set at 0.05. Finally, correlation procedures were used to examine the direction and magnitude of the relationship between IQ and the recall protocols.

## RESULT AND DISCUSSIONS

To investigate the probable effect of background knowledge on reading comprehension and recall of the Iranian EFL students, four reading texts were selected- two familiar and two unfamiliar.

Table 3. indicates the mean score for two familiar and unfamiliar texts which turned out to be 13.3 with standard deviation of 3.9. The observed-t is 1.136 with degree freedom of 19 which is not greater than the t-critical.

Table 3: The result of t-tests for Familiar and Unfamiliar texts in advance group

<i>Group</i>	<i>N</i>	$\overline{X}$	<i>SD</i>	<i>T</i>	<b>d.f.</b>
Advance	20	13.3	3.9	1.136	19

Table 4. illustrates the correlation matrix for IQ and recall protocols. As it is shown in the table, the correlation between IQ and recall of the familiar texts is 0.4745 and 0.42. and the correlation between IQ and recall of the unfamiliar ones are 0.3781 and 0.27 respectively.

Table 4: Correlations between IO and recall protocols

RECALL	RH	FSED	PS	ED
IQ	0.4745	0.42	0.3781	0.27

The result of t-test indicates that the observed  $-t$  1.136 is not significant at 0.05 level. In other words, advanced students did not comprehend and remember the familiar texts better than unfamiliar ones. This finding is not in line with what previously mentioned regarding the role of background knowledge in reading comprehension and retrieval of texts. Orasana (1986), Anderson et al. (1983), Hammadou (1991), Fries (in Patricia L. Carrell, 1988) all reported that the knowledge a reader brings to the text while reading helps him understand and remember the text better. However, it seems that other factors besides background knowledge have affected subjects' performance here.

By taking a look at the correlation results taken in the second table, one can infer that although there exist a correlation between IQ and recall protocols but the relationship is not very strong and significant. IQ –as it is expected- did not have any effect on their comprehension and recall of the texts. This finding again is not in line with what previously found. Jacobsons (1996) found that the children with low average IQ scores are much behind in reading comprehension.

## **CONCLUSIONS**

As it can be seen in the fourth table, the observed  $t$  is 1.136 with the d.f. of 19 is not significant at 0.05 level; therefore this hypothesis is rejected. The advance students did not remember the familiar texts better than the unfamiliar ones. This finding is not in line with the previous findings regarding the role of background knowledge in reading comprehension and their recall of the texts. The researcher believes that one probable explanation for this rather strange result may be due to the advance level of the subjects. In other words, advance learners are capable of using other skills such as reading comprehension strategies for better comprehension of the texts and therefore better recalling. According to (Baker & Brown, 1984; Garner, 1987) good readers possess a number of flexible, adaptable strategies that they use before, during, and after reading to maximize their comprehension. Furthermore, strategy use increases students' awareness of their own performance as they read (Garner, 1987; Pressley et al., 1989; Pressley et al., 1992). When confronting the unfamiliar texts, advance learners attempt to use other skills other than their background knowledge they are familiar with to comprehend and recall the texts. This can be a good explanation to the reason that their recall of the unfamiliar texts were not that much different from familiar ones.

In addition, the researcher found an additional result. As it is indicated in table 5, the correlation between IQ and recall are to some extent interesting and a bit strange since no significant relation is shown. In other words, the subjects' intelligence has no role or effect on comprehension and recall of the texts. This finding is not in line with previous findings. Jacobsons (1996) gave a series of IQ and achievement tests to 212 children. The children with low average IQ scores are likely to be at least two years behind in reading comprehension. The researcher believes that there can be three main reasons for this finding: the first reason is the number of the subjects; with a greater population of subjects the result can be more reliable. Better results can be obtained in correlation with a population above 30. The second reason can be the unfamiliarity of the subjects with the test. This lack of subjects' familiarity with the test format can also affect their performance to a great extent and therefore, on their performance on IQ test. The third reason can be the time limitations. The subjects were supposed to take the test in forty minutes. According to test developers, this can be considered as a kind of speed test of measuring intelligence. If more time had been given to the subjects, the results could have been different.

### ***Pedagogical Implications***

The findings of this study may have some implication for teachers, syllabus designers and evaluators. Teachers may find it useful to assess student comprehension with free recall method. Since it is argued that recall protocol is an attentive for testing reading and listening comprehension. Each student's verbal report might tell the teacher how the individual approaches the reading comprehension task and what aspects of the particular text seem to cause comprehension difficulties. Similarly, each student's recall protocol might indicate common linguistic and conceptual difficulties experienced through the reading or those which are specific to the individual. Thus, teachers can gain insights in the nature of their student's comprehension and therefore can meet their student's needs effectively.

Material designers can also take advantage of these findings too. The learner's background knowledge (linguistic and non-linguistic) should be taken into consideration in material selection. As indicated in this study, both linguistic and extra-linguistic knowledge can influence the speed and success in EFL reading comprehension. Thus, syllabus designers and material developers may make careful provision in moving in line with meeting the readers' extra-linguistic knowledge when designing some materials for them.

The results can also be useful in material designs especially for ESP courses whose aims are to make students familiar with the texts in their specialization. The closer the material is to the students' fields of specialty, the more familiar they are with the texts and consequently the better their understanding will be. Therefore, syllabus and material designers should make the texts compatible with the student's specialization as much as possible.

On the level of classroom practice, the results clearly provide support to the use of previewing activities, indicating that if such activities are appropriately structured and sufficiently be learner sensitive they can play a significant role in aiding learners to comprehend the materials better.

### ***Limitations of Study***

This study is only a scratch on the surface of the role of background knowledge in comprehension and student's recall. Of course further studies can be done related to the present hypothesis. Here are some suggestions. In this study we examined how much information was remembered. We must also examine how much of what kind of information is remembered, and what kind of information is further created from the repeated reading.

In the present study, students were above eighteen years old and of different ages. Other studies can be done regarding the age of the students to see whether the factor of age has any roles in recall protocols of students. The subjects in this study wrote whatever they recalled in English. This can affect their recalls. It is quite possible that subjects could recall more but unable to express it in English. So, it seems a good idea to do the same research allowing the students to write their recalls in their native language. There can be different and noticeable results.

In the present study, the readability and content familiarity were considered, still we do not know if formal schemata has had any effects on recalls or not. Further research can be carried out regarding the role of formal schemata in reading comprehension and recall protocols.

**ABSTRACT**

What teachers can actually do to increase their students' learning and develop their creativity is still in need of more focus in second/foreign language education research. Needless to point out that reflection on actual practices inside the classrooms is key to teachers' creativity and professional development (Aghaii & Jadidi, 2013). The present study is therefore an attempt to find out the relationship between Iranian English as a foreign language (EFL) teachers reflection and strategy-based instruction. Two Likert-scaled questionnaires – one on teachers' reflection and another on teachers' views on language learning strategies – were administered to a group of 50 EFL teachers. Both questionnaires were based on five-likert scale ranging. The participants were both males and females with 5-8 years of experiences. The results from Pearson product-moment correlation revealed a high, positive correlation between teachers' reflection and their views regarding the incorporation of language learning strategies in instruction. The findings of the current study is in line with the general consensus in the field that practicing teachers should be equipped with reflective skills to be able to deal with contextual instructional challenges.

**KEYWORDS:** Language Learning Strategies, Strategy-Based Instruction, Reflection

**INTRODUCTION**

The role of teachers' reflection in making an effective strategy-based instruction is often neglected in second/foreign language instruction. Reflective thinking is a specific way of thinking that is distinguished by an individual's mental and emotional association in the thinking process. Reflective teaching means looking at what teachers do in the classroom, thinking about why they do it and thinking about if it works – a process of self-observation and self-evaluation. By gathering information about what happens in their classrooms and by considering and assessing this information, they recognize and investigate their own practices and basic beliefs. This may then cause shifts and enhancements in their teaching. Reflective teaching is therefore a means of efficient development which starts in our classroom (Submitted by TE Editor, 2011).

In fact, teacher reflection is a significant part of teacher growth and should be a part of their career. Reflection let teachers look at themselves, accept what they have done, and sometimes decide to change it. Akbari, Behzadpoor and Dadvand (2010) asserted that reflective teacher is:

“one who critically examines his/her practices, comes up with some idea as how to improve his/her performance to enhance students' learning, and puts those ideas into practice”.

Having recognized the importance of teacher reflectivity, teacher education programmers also sought to develop a reflective approach to teaching aim to develop the skills of considering the teaching processes thoughtfully, analytically and objectively, as a way of improving practices. According to Kelly (2012), there are some methods that teachers can follow them to benefit from reflection:

Daily Reflection - All teachers should spend a few times to debrief on the day's events. Typically, this only takes a very short time and during time the information can be quite valuable. Some teachers have daily journals while others simply write quickly notes about problems that they had in class.

End of Term Reflection - At the end of each term, looking back over the student's marks and referring back to their daily and unit reflection notes, teachers attempt and make a broad conclusion about things that are positive and things that require change and improvement.

End of Year Reflection – At the end of the year, read their notes and write down what they are most satisfied with along with things that require enhancement. Then, they should move on to the next step of the process: performing changes based on what they have learned.

Recent emphases on language learners' autonomy and their active participation in the learning contexts had practitioners try to implement strategy-based instruction (SBI). Brown (2007) defines strategies-based instruction as teaching learners with an emphasis on the strategic options that are available for learning; usually implying the teacher's facilitating awareness of those options in the learner and encouraging strategic action. Cohen, Weaver, and Li (1996) state that strategies-based instruction is a learner-centered approach to teaching that has two major parts: 1) students are explicitly taught how, when, and why strategies can be used to help language learning and language tasks, and 2) strategies are combined into every class materials, and may be explicitly or implicitly present into the language tasks. The objective of Strategy-Based Instruction is therefore to help learners become more responsible for their attempts to learn and use the target language. It also aims to help them become more active learners by allowing them to individualize the language learning experience (Cohen, 2000). It helps second language learners become more conscious of the ways in which they can learn most effectively, ways in which they can increase their own comprehension and production of the target language, and ways in which they can learn after leaving the classroom (Andrew D. Cohen, 1996).

During SBI students themselves should choose the strategies they want to apply not the strategies imposed on them. So learners should be taught not only the language but also guided toward strategies to heighten more useful learning (Rubin, Uhl Chamot, Harris, & Anderson, 2008). Teachers who have used this approach claim their students become more competent in completing classroom language tasks, take more responsibility for managing their own learning outside classroom, and get more self-assurance in their ability to learn and use the target language (Cohen, 2000). Common to all the models of SBI is an arrangement of four steps: 1. increasing consciousnesses of the strategies learners are already using 2. Teacher present strategies and act as models so that students become increasingly aware of their own thinking and learning processes 3. Preparing opportunities for students to help them move towards independent use of the strategies through slow removal of the scaffolding 4. Self assessment of the effectiveness of the strategies used and transfer of strategies to new situations.

SBI is not a mechanistic practice, neither for the learner nor the teacher, but needs reflection and assessment. Hence it is affected by the learning context, the quality of the task, and each learner's style, goals and past knowledge (Rubin, Uhl Chamot, Harris, & Anderson, 2008). The significance of helping students to become effective and autonomous learners has been noticed by a lot of second language teachers and researchers recently. It is also the goal of language learning instruction (Oxford 1990; Oxford & Leaver 1996; Wenden 1991). Learners should be taught not only the language but also skills and strategies needed to become autonomous learners who are more responsible for their own learning.

Language learning strategies are specific actions, behaviors, steps, tactics, or techniques that language learners use to improve their learning of the target language. All language learners use language learning strategies in the learning process. In fact, language learning strategies are used for all strategies that language learners use in learning the target language. Because there is a lot of information to be processed by learners in language classroom, learners use various language learning strategies to do tasks and process new input. Language learning strategies provide valuable information about how students evaluate the situation, plan, select appropriate skills in order to understand, learn, or remember new input they face in language classroom. According to Fedderholdth (1997), the language learner who is able to use a wide variety of language learning strategies appropriately can improve his language skills in a better way. Oxford (1990) maintained that students use L2 learning strategies as specific behaviors or thought processes to enhance their own learning.

## LITERATURE REVIEW

Foster (2012) once noted that “learning strategies and the factors that influence their use have received much attention in recent years since it became widely accepted that learning is a process and the role of the teacher is to facilitate that process”. According to his findings, language teachers are aware of language learning strategies and they also realize that language learning strategies facilitate the learning of the target language.

According to Dabaghi (2012), the social and cultural capitals played a significant role in EFL learners’ language learning strategies. Therefore, not considering social and cultural capitals may accumulate to EFL students’ inability to get excellence in academic achievement.

Expert teachers adjust their thinking to accommodate the level of reflection a situation calls for. Their teaching is characterized by an intentional competence that enables them to identify and replicate best practice, refine serendipitous practice, and avoid inferior practice. Because of their ability to reflect, great teachers know not only *what* to do, but also *why*. Research (Constantino & De Lorenzo, 2001; Danielson & McGreal, 2000; Glickman, 2002; Lambert, 2003) substantiates the role of reflection in teachers’ professional growth. A disposition toward reflection—and a good sense of when the teacher needs to step back and think deeply—should be part of all teachers’ knowledge base.

Brown (2007) states, “it has been found that students will benefit from SBI if they( 1) understand the strategy itself, (2) perceive it to be effective, and (3) do not consider its implementation to be overly difficult” (p.140). Therefore our efforts to teach students some technical know-how about how to tackle a language are well advised. He also asserted that, “the effective implementation of SBI in language classroom involves several steps and considerations: (1) identifying learners’ styles and potential strategies, (2) incorporating SBI in communicative language courses and classrooms, (3) providing extra-class assistance for learners (p.141).

Investigating whether or not there is any relationship between SBI and students’ listening comprehension, Li & Liu (2008) conduct a study and they conclude that if the instructors systematically introduce and reinforce strategies that can help students to improve listening competence and that are specially designed for any given test, their students may well improve the performance on language tasks.

In another study by Fu Yao (2012) the researcher tries to find if strategies-based instruction influences reading comprehension. It is found that SBI emphasizes skills for text comprehension, which makes reading more efficient. For many learners the formats have remained implicit and reading strategies makes these formats explicit. According to him the strategies-based reading instruction has not only exerted positive influence but also made a positive change in attitudes in terms of reading in English and teaching reading strategies can work in helping college students improve their reading in both proficiency and attitude.

Reflective practice helps teachers to be free from both impulsive and routine behavior. Additionally, reflection provides the means for teachers to build their daily experiences, allows them to act in a deliberate critical and intentional manner, raises their awareness about teaching, enables deeper understanding, and causes positive change (Farrell, 2003). Reflective thinking is necessary for teachers to control their teaching and become influential decision makers (Cole & Knowles, 2000; Osterman & Kottkamp, 2004; York-Barr, Sommers, Ghore & Montie, 2001). Some of the scholars believe that it is only through teachers’ reflections of their own teaching that they become more professional and efficient practitioners who are able to describe their function in the context of educational objective (Michener & Liston, 1996). Larrivee(2006) believes that by taking part in systematic reflection about their work, teachers can be powerful decision makers who can act as change agents.

In a study Akbari and Karimiallvar (2010) investigate the relationship between three teacher-related variables – teaching style, teachers’ sense of efficacy, and teacher reflectivity – and students’ achievement in an English language teaching. They conclude that there is a high correlation between teacher reflectivity and students’ achievement outcomes. According to them, reflection is a teacher’s passionate desire to change problematic classroom conditions into a safe environment for students to learn and grow.

Schon (1998) speaks about two types of reflection. The first one is “reflection in action” which refers to the teacher’s ability to interpret and analyze and find solutions to the complex situations in the classroom while they are happening. During this time teacher relies on his past experiences. The second one is “reflection on action” which

takes place after the event has happened. It lets teachers think and analyze the actions and events that have taken place in the classroom and try to find solutions or decide to change their methods and ways of teaching. According to Schon both types of reflection are essential to become an effective teacher. Teachers can develop their teaching process through reflecting on their strengths and weaknesses. Being reflective means being self-critical with the purpose of improving one's teaching practices. Christodoulou (2012) states:

“naturally, each teacher is a part of a school and each school is a part of a community so even if a teacher concentrates basically only on his/her teaching in his/her reflection, its effects can influence primarily the pupils in the class he/she teaches and secondarily the school and the society both the pupils and the teacher are parts of”(p.).

## STATEMENT OF THE PROBLEM

This study attempts to investigate the effect of Iranian EFL teachers' reflection on their incorporation of Strategy-Based Instruction principles. There have been few researches on the effect of teacher reflection on strategy-based instruction. Abandoning from traditional transmission models of language teaching, current pedagogic environment has recently emphasized on the significant role of the teachers in creating learning contexts in which learners are taught to learn how to learn namely effective SBI. In fact, more studies need to be conducted in this area for us to develop true understanding of the factors which affect teachers' application of SBI inside the classrooms.

## RESEARCH QUESTION

Is there any relationship between teachers' reflection and their use of strategy-based instruction principles?

## METHODOLOGY

### *Participants*

A group of 50 teachers teaching in 10 institutes located in Marvdasht city in Iran was selected to participate in this study. The managers of these institutes were asked about the number of their teachers and then 5 teachers from each institute were randomly selected and asked to complete the questionnaires. 6 of them were not complete and 9 were not given back. So, we conduct a study with 35 participants. Participating teachers were both males and females with five to eight years of experience. All of them had Bachelor of Arts (BA) or master of arts (MA) degrees in English Literature, English Translation and English language teaching.

### *Instruments*

The above mentioned instruments were used to elicit information from the participants in this study:

- 1) Teacher reflectivity questionnaire. The teacher reflectivity questionnaire used in this study was developed by Akbari, Behzadpour, and Dadvand (2010). The questionnaire includes 29 items on a 5-point Likert format ranging from 1 = never to 5 = always. The questionnaire enjoys high reliability and validity as an instrument for measuring teacher reflectivity (Akbari, et al., 2010).
- 2) A questionnaire for teachers' perspectives on language learning strategies. Siriruck Thijittang Foster (2012) used this questionnaire in his study. This questionnaire contained 23 items on a 5-point Likert scale ranging from 1 = strongly disagree to 5 = strongly agree. It was designed to determine EFL teachers' views about language learning strategies.

### *Procedures*

#### *Data collection procedures*

The above mentioned questionnaires were typed in English. First, teachers were explained about the purpose of the study and about the problems related to this study. And also they were asked to complete the questionnaires carefully and honestly because their answers would be kept confidential and would be used just for research purposes. They were thanked in advance. After that, the first questionnaire (teachers' views on reflection) was distributed among them and they were asked to take them with themselves and give them back after three days. Then, the same teachers received the second questionnaire (teachers' perspective on language learning strategies). Again they were required to take them home and give them back after three days. Each questionnaire was coded in order to have a pair of questionnaires for each teacher.

#### Data analysis procedures

The above mentioned instruments were distributed to the teachers. As it was stated before, those questionnaires which were not complete and not given back were removed from the study. The data collected from the two questionnaires were analyzed and processed by SPSS version 20. Descriptive statistics (table 1) were reported in order to explore the teachers' views on their reflection and language learning strategies. To investigate the impact of teachers reflection on language learning strategies, Pearson product-moment correlation (table 2) was applied to the data.

## RESULTS AND DISCUSSION

The first table indicates the descriptive statistics on two variables under study. To study the nature of the distribution, this table was applied. Table 1 summarizes the descriptive results of the two instruments –teachers' reflection questionnaire and language learning strategies questionnaire. This table presents the descriptive statistics related to the teachers' reflection and their awareness of language learning strategies.

Table1: Descriptive Statistics

	N	Range	Minimum	Maximum	Mean	Std.	Variance
Teachers 'Reflectivity	35	47	79	126	106.86	12.866	165.538
Learning Strategy	35	42	80	122	100.31	8.491	72.104
Awareness							
Valid N (list wise)	35						

To investigate the existence of relationship between teachers' reflection and their views towards incorporating language learning strategies, Pearson product-moment correlation was employed. Table 2 clearly shows that there is a high positive correlation between the two variables. The correlation is (.000 < .05) and it is statistically significant.

Table 2: Correlation between teachers reflection and their SBI incorporation

		Teachers' Reflectivity	SBI
Teachers 'Reflectivity	Pearson Correlation	1	.211
	Sig. (2-tailed)		.000
	N	35	35
Learning Strategy	Pearson Correlation	.211	1
	Sig. (2-tailed)	.000	
	N	35	35

The findings of the current study confirm the importance of both teachers' reflection and strategy-based instruction. In order to have pleasant classroom and acceptable teaching experiences, teachers need to be reflective. Lana M. Danielson (2009) mentioned that great teachers know when to make decisions quickly and when to step back and reflect. Implicit in SBI is teachers' autonomy without which they cannot make strategic decisions in response to the contextual demands of particular learning contexts. Teachers with low reflective skills cannot act autonomously. So, the results of the study clearly depict that we need to develop a reflective approach in our teacher education systems if SBI is intended to be accurately and effectively applied by practicing teachers. The fact however is that teachers' reflective behaviors and their effect on the quality of language education are so complex that one cannot easily and confidently generalize the findings from a single study to actual and real learning and teaching situations.

The major point therefore is that care must be taken not to oversimplify the issue by thinking of SBI as a pre-determined readymade package waiting for the teachers to be implemented in the classrooms. As Kumaravadivelu (2006) rightfully stated, in each learning context there are particular teachers teaching particular learners who pursue

particular objectives and teachers utilizing their teaching competences need to make context-specific decisions about the whatness and howness of SBI. This, of course, seems not realizable for teachers with low reflective skills. Thus, it sounds plausible to revise SBI and call it strategy-based reflective instruction (SBRI) as we believe that reflection is central in the sense that Without reflective skills one cannot expect learning strategies to be adequately embedded in language instruction.

## CONCLUSION

The purpose of this paper was to investigate the relationship between Iranian EFL teachers' reflection and strategy-based instruction. The findings indicated that there is a high positive correlation between the two variables. Reflection is considered to be an important part of learning in teacher progress and is often the core of teacher progress activities (Richards & Schmidt, 2010). The findings of this study showed that Iranian EFL teachers are aware of the crucial role of their reflection. They realize that by being a reflective teacher they can improve their teaching. Studies on learning strategies indicate that a teacher's orientation and expertise in language learning strategies play a critical role in successful learner strategy instruction (Thompson & Rubin, 1996). The results of this study also indicated that Iranian EFL teachers are cognizant of the importance of strategy-based instruction. They know that language learning strategies are a learning tool for students and help learners learn the target language better.

## Limitations of the Study

There were some limitations in relation to this study: 1. A small number of the participants cooperated with the researcher in this study. 2. The instruments used in this study enjoy high levels of reliability and validity as claimed by the developers however the researchers did not reassess these two values for the particular participants cooperated in this study. 3. Because of the limited number of the participants the researchers did not control for the possible effect of teachers' experience on the relationship of the two variables investigated in this study.

## THE MANIFESTATION OF LOTUS IN POEMS OF SOHRAB SEPEHRI

Nahid Zarindast

### ABSTRACT

As a contemporary poet, Sohrab Sepehri has influenced a wide range of poems. He is a representative for a new era. He fearlessly represents the domination and influences of religions in his poems. The reason of emersion of different religions is to meet and satisfy the spiritual needs of man in their own ways. Based on the religious beliefs of each person, he or she- in deep sense- can put beauty on his or her mind. There are numerous researches which has been conducted about Sohrab Sepehri and among them we can mention "the other Sohrab" by Ziyaodin Torabi which is quite a valuable piece in this relation. However, the emphasis on this paper is the influence of Buddhism on Sohrab's poetry and we cannot see a considerable research on this topic except a brief reference in the book of "Sohrab's utopia" by Mohsen Maghami. analyzing the foundation of Buddhism through the symbol of Lotus is the aim of this research. The Strong presence of eastern thought and footsteps of live religions in the works of this modernist invite us to have more and extensive research in this issue.

**KEYWORDS:** Sohrab Sepehri, Lotus, Budhha

### INTRODUCTION

Sohrab Sepehri was a ultra-religious poet which means he worshiped and praised what is beyond religion and that doesn't mean he wasn't a religious person but he felt himself more close to God.as an evidence to such claim we can refer to his forth Book which is "East of Sorrow" (1961). Sohrab went through this process gradually in which he ultimately gained a ultra-religious belief in religion. However, it has to be mentioned that his re-birth and consistency of thought and personality started with his "Water's Footfall" (1965), in this period he become a sentient, deep and wise poet.

*According to Sohrab, by reason we cannot know God and only by heart we should begin to know God. Essentially, when we want to study and analyze his insights and thoughts we shouldn't underestimates the influence of principles and beliefs of Zen Buddhism on him but this influence is not in a way that the poet absorbed in Zen Buddhism. (Niksefat, 2004:15)*

About the issue of supernaturalism, Sohrab attracted to Buddhism More than any other school. For him Buddha as a way to reach to metaphysics was the best path to choose. By the use of the symbols which is presented in Buddhism, Sohrab has brought a new feature to contemporary Persian poetry. Just like Buddhism, by the use of symbols Sohrab created a poetry in which the readers were invited to think in order to decoding. Along being a poet, Sohrab has numerous paintings which has been exhibited in the art galleries of around word both after and before his death .the main approach of this paper is the symbolism of Lutos in Sepehri's poetry by the use of ..... and Yoga Ritual.

### LITRATURE REVIEW

#### *Lotus*

*In my dreams I see*

*A Buddha in Lotus*

*Wherever benediction flowers grow, I pick them*

*I have a bouquet... (Sepehri,2001:68)*

In Sohrab Sepehri's poetry there is always a news about Lotus and this point becomes more interesting when we find out that Buddha considered himself as a Lotus which is came from the muddy waters of the universe .in another poem Sepehri says:

*At the edge of muddy waters,*

*I saw your smile on black mud,*

*I prayed.*

*In a thorn, your memory was hidden, I picked it up, I sprayed it to world ... (Ibid: 137)*

Also in the book of “Motahedin” it has mentioned that:

*In deep down of darkness, a Lotus grew from the ground and Buddha walked inside it in order to not stare to ten points of space (Motahedin,1976:525).*

*After birth wherever he went, from his footstep a Lotus grew. He saw gods and humans who honored him. He took seven steps to north and by each step a Lotus grew.(Ibid:182)*

This issue continued in “Motahedin” as following:

*Then as his first Avatar, he emerged as a young man called “Mage”. On his way to see the city of “Dipe Vetì” he talked with a girl who had seven Lotus in her hands. Buddha asked her that for whom is these flowers? And she told him that she want to give these flowers to “Dipnokeh” as a present. The girl had bought five of them with the value of five hundred coins and the other two had been given to her by a friend. “Mage” who is happy about the intents of this girl, asked her to sell five of them to him with value of five hundred coins. But she will accept this condition only if he marries her. After met with ancient Buddha “Dipnokeh” and listening to his preachings, he decide to become a “Buddhisto”. (Ibid:244)*

In Sepehri’s poetry “Lotus” has a mystery but this mystery is connected with its arrival in another land. The seed of this “Lotus” has come to the land of his dream and therefore changed his existence.

*Roof of Porch collapses*

*And Lotus stalk wraps around all the columns*

*Which reckless wind*

*Brings the seed of this Lotus to the dream land? (Ibid:205)*

Buddhism shows lots of respects for Lotus. There are numerous sculptures which display Buddha while he has a Lotus in his hand or he is sitting on a Lotus.

Regarding this issue, we can also mention the ideas of Rabindranath Tagore who was Indian poet, dramatis, thinker and also the winner of Nobel Prize. He has influential works such as “The Sacrifice”. He had a mystic and gnostic personality and his ideas were very close to Sohrab Sepehri’s ideas in Persian literature. Rabindranath Tagore has a poem about Lotus in which he says:

*Lotus hand,  
 Lotus place,  
 Lotus winter,  
 Lotus of light,  
 Lotus tear,  
 Lotus cycle,  
 Lotus foot,  
 Lotus fire,  
 Lotus dream*

....

*For Tagore this flower is a symbol of re-birth and awakening of man and also the perfection of man’s thought. (Tagore ,1975: ?)*

As we can see in the poem of Tagore, he talks about a Lotusian code or mystery which can be also found in Sohrab’s poetry. What Tagore mean by a mystery of Lotus is a simile of Lotus in which Lotus opening is compared to man’s evolution. Such a viewpoint goes back to Indian mythology.

*Based on the Indian mythological history “from earth, Lotus appeared (which has eight petals) which is the eight direction of the universe. In the flower someone was found which called him free”(Tagore,1975:10-11)*

About this issue In Buddhism it has been mentioned that in the center of the land of happiness in which “there is no hardship and darkness and every hours passes like a song” there is a lake “with clear and bright water which patting the gold sand of that beach very calmly.

*Big Lotuses, as big as chariot wheels and in different colors and lights, are everywhere. A blue color shines from the blue Lotus, a yellow color shines from the yellow one, a red color shines from the red Lotus and a white color shines from the white flower. The scent of flowers occupies the space. In Buddhist texts, it has been severally mentioned that Lotus grows in and comes out of water but it looks upwards so it couldn't be tainted. (Rajabzadeh, 1999:125-126)*

With above explanations, now we can take a look at this Indian poem.

*Lotus grew  
Its stalk entered through the crack of my dream  
I was dreaming  
The wake flood came  
I will open my eyes in ruins  
Lotus was wrapped around all my life. (Ibid: 364)*

In the first edition of his first book "Downpour of Sunshine" (1958) he wrote this sentence:

In order to understand this sentence completely, we should take a look at Indian mysticism of Yaga in which we can clearly see the philosophy of Brahman. The main source of this mysticism is "Upanishads" or gnosis of "Vedanta". In this philosophy Brahman is the unchanging reality amidst and beyond the world and he is the ultimate essence of material phenomena. As there is no difference between the seabed and sea itself so in this way of thinking there is also no difference between universe and Brahma. Along with Brahman there is also an inner principle, the true self of an individual beyond identification with phenomena or the essence of an individual, which is called Atman.

Hinduists believes that Atman and Brahman are the same and what is in the man's essence is identical with the transcendent self but what is important here –which Sepehri also mentioned on the introduction of his book- is man's liberation from the apparent separation which is between human and Brahman which is also the biggest misery of human. The solution is the existence through physical appearances and continuous passing through reincarnations which is called "Samhara" and by this passing the man's spirit-as an Hindu mystic who says the man's spirit in this situation is like a frog which is trapped in a hole of a well- becomes free and will reach to salvation which is called "Mokshha".

Sohrab wrote:

*May be our job is  
Between Lotus and century  
Looks for the song of truth (Ibid: 277)*

Here, by Lotus Sohrab means the short time which human beings have during their lives.

*By century he means the long time and then he says that in such a short time of our lives ,the best we can do is to listening the song of truth and do not be distracted by other things for example who sang the song or from where this song is coming (Pourebrahim ,2000:245).*

In Hasht Ketab (eighth books) he said :

*I was passing the border of my dream  
The dark shadow of a Lotus  
Was on all these ruins  
Which reckless wind  
Brought the seed of this Lotus to my dream land?(Ibid:308)*

In this poem, Sohrab passes the border of the dream and explains to us what has happened in his dream. Now what is in his dream? The answer is definitely the Lotus which mystery and code for maturity and blooming. The blooming of a seed of a Lotus which came to the dream world by the wind and caused the passage through the border of dream, is in a way as if it is the passing of Lotus in Sohrab's dream which has transformed himself too.

There is a point in the world "Karma" in Persian language which I find it interesting and that is in Persian with a little change in pronunciation "Karma" would mean "our action". In Buddhism "Karma" is a principle in which the

results of man's actions would come back to him during his life or his future lives and each one of us should pay the penalties of our actions in our continuous lives until they become refined.

Lotus is the symbol of mysticism; it grows in muddy waters but it has no signs of mud on itself. Lotus is like a mystic person which is born in this world but he will not be tainted by this world. Lotus stays in the muddy waters but it will not get wet and because of this it is the symbol of cessation. Maybe that's why people who practice Yoga are trained to sit in a Lotus position. Some believe that in this position internal energies go to brain through spine and will be blossomed and flourished there because Lotus's petals come out from the darkness of water and move towards light in order to be blossomed. Lotus has the elegance of a classic world in which whenever we look there is still the scent of a new in contrast to nowadays which is the century of worshipping metals. As Chamisa said: *"this century is the century of technology and industry; the era of ascension of steel and metal friction"* (Shamisa, 1995:122)

Buddha said that: "as Lotus comes from muddy waters but it never gets tainted, I, myself, have come from this world and I passed this world without being tainted"

By the comparison of this sentence of Buddha with Sohrab's poetry (especially those which are related to Lotus) we can understand the intellectual influence of Buddha on Sohrab.

An important issue which should be considered here is the issue of Lotus in Sohrab's poetry which has a mystic essence.

According to Hinduism, Lotus grows from a firm world which is symbolized by "water" and has an inactive mode. Brahman who is one of the three important gods in Hinduism comes from a Lotus too. Brahma's existence is emerging from Vishnu's navel (another Hindu god). By these explanations we can understand then in Hinduism Lotus is a symbol for divine throne.

*"basically in Hinduism we encounter with a kind of divine throne which has a lion-like feature which is a symbol for defeated universal forces and a Lotus feature (padmasanga) which conveys the harmony and impressionable effect of universe"* (Burckhardt, 1988:118)

Lotus as the divine throne situated in first waters; "in some of Buddhist images, the Tathagata comes from a lake". Just like the birth of Agni from first waters, Lotus next to Buddha is the main content of Buddhist art. In other words, this art is completely located between these two extremes; the shape of Lotus is an expression, in a direct and impersonal mode, of what Buddha as a human image represents in a more complicated and personal mode. But the symmetry and perfection of human form of Buddha is very close to shape of Lotus and that's one of the names of Buddha is "manipadma" meaning "a jewel in lotus". In Hinduism as an inactive symbol is like the fly of manifestation of god while in Buddhism Lotus is the juice of first plant which had a dark and shapeless form (mud and water) and after being blown it attracted the light of "Bodhi" and became the myth of fire. Sohrab Sepehri used this viewpoint in the following poem:

*It was a moment, doors were open.  
No leaf, no branch, the garden was ruined  
Birds were silent, silence everywhere  
What was happening: sheep was next to wolf  
Sound was fading ....  
Beauty became alone  
Every river, every sea  
Every existence had become a Buddha (Sepehri, 1997:213)*

In this poem Sohrab mentioned that everything is Buddha. He compared Buddha to river and sea. In Sohrab's viewpoint, universe is Buddha. Now we should take another look to Lotus. Here we should compare "spirit" and "universe" together. In a Buddhist viewpoint, universe and spirit have a close connection. Lotus which is a key element

in Buddhist art is a cycle of universe and spirit and also the symbol of those two (mandala). About the moving of Buddha around four direction, Burckhardt said :

*“when Sakyamuni Buddha who lived 25 century before in India went up from under the Bodhi tree ,after a long time of contemplation which liberated him from the slavery of life and death ,very strange lotuses rose from under his feet .after rising from Bodhi tree , Sakyamuni Buddha went to for direction of space”*

Now we can analyze and study the same issue-which explained in above- in Sohrab’s poetry:

*I was passing the border of my dream  
The dark shadow of a Lotus  
Was on all these ruins  
Which reckless wind  
Brought the seed of this Lotus to my dream land?  
Beyond the glass window of dreams  
In muddy water,without any mirrors  
Any where that one of my part was dead  
A lotus grew  
As if it was pouring in my hollow self  
And me in the sound of its blossoming  
Dying every second  
Roof of Porch collapses  
and Lotus stalk wraps around all the columns  
Which reckless wind  
Brings the seed of this Lotus to the dream land? (Sepehri,1997:73 )*

In “Lotus” poem which is one of the most beautiful poems in his second book “The Life of Dreams” (1953).”the dark shadow of a lotus” was on the ruins of poet and he who was dead in “muddy waters, without mirrors” -or anywhere else- and living beyond the glass doors of dreams, he feels that the essence of Lotus was penetrated in his whole existence .this interpretation that the essence of lotus became the his essence, “lotus” can be mean mysteries that will change the Sepehri’s life so the seed of “lotus” grows and poet’s eyes will open to “ruins” of his dream.

*“Lotus penetrates in all aspects of poet’s life and his existence becomes intertwined with essence of lotus .in this poem lotus can be a symbol for prosperity and awakening. we can understand that poet is not hopeless and there are lots of hopes in his heart as big as a lotus .an hope for reaching to complete salvation in order to become free from thinking about profits and losses of today’s life” (Meghdadi, 1998:84).*

“Bodi” poem

In poem of “Bodhi” Sohrab refers to Buddhism ideas. “Bodhi”roots from “Budh” meaning awakening .

*It was a moment, doors were open.  
No leaf, no branch, the garden was ruined  
Silence here ,silence there ,silence every where  
(Sepehri, 1997:59)*

In this poem when Sohrab says “doors were open” he means that he has reached to Nirvana or “silence”In Veda we read that “you, the Righteous, this is the truth of relieving pain which is the silence of desire and hunger by killing all desires and this silence is like a light which consume oil”. The above sentence from Veda is comparable with this verse of the poem which says “silence everywhere”

*Beauty became alone  
Every river, every sea  
Every existence had become a Buddha (Ibid: 213)*

As we can see in above, Sohrab has compared and interpreted this silence to “beauty” and then “Buddha”.

The place of gods in Lotus

In symbolization of celestial heaven and perfect human (Budhha), Lotus has a very important role.

*"Celestial heaven of Vishnu and Ikanta is located in Marv Mountain and in many myths this is the place of Indra. Ikontra consists of five lagoons in which blue, red and white lotuses grow there and the place of Vishnu and his wife Lakshmi is between white lotuses where they shine like two sun"(Rajabzadeh, 1999:118).*

In Buddhist art the image of Buddha sited in a lotus is the sign complete peace of soul which reached to light. For more understanding in this regard let's take a look to explanations of Miguel Serano about Loutus position in Yoga:

*"it is usual in Yoga that individuals sit in a Lotus position and such a position has some points: one of them is that Lotus comes from muddy waters but it is not tainted at all and is free from any infection, also the petals of lotus come out of dark muddy waters and move towards light and blossom on the water"(Miguel Serano, 1995;12).*

In Yoga the petals of lotus and Chakras (centers of life force (prana), or vital energy) are symbolic aspects of soul features. In Tantra Yoga, the lotus with 1000 petals (Sahasara) is the seventh and last stop and by reaching to this point one can gain ultimate freedom and knowledge. Exercising Yoga in Lotus-position will bring inner energies to brain through spin and they will be blossomed in brain.

In "Lotus" poem, Sohrab pinpoint the release on these inner energies very gently:

*Anywhere that one my part was dead  
A lotus grew (Sepehri, 1997:78)*

When Sohrab give us an example of one of his part which is dead, he means that Chakra that usually will mentioned in Yoga. Nozar Parang, a Persian contemporary poet has also a poem with similar content:

*I had no choice, only  
Like lotus lean to water so rise from earth (Parang, 1997: 178).*

Such a viewpoint in poems of Parang and Sepehri shows us two things: the use of Buddhism elements and use of Yoga teachings so we can conclude that some parts of contemporary Persian poetry is under the influences of Indian mysticism.

#### ***The reason of mystic name of lotus***

Lotus was the first mystic pretext .the reason for attention of Buddhism to this flower is that lotus grows in muddy waters but never be tainted .from the viewpoint of Buddha, human being should be like lotus because this world is like a muddy water and human being is a lotus who shouldn't be infected and upon his death he should leave everything behind easily. Buddha said that: "as Lotus come from muddy waters but it never be tainted, I, myself has come from this world and I passed this world without be tainted". He also said: "you ,my followers! They cared me very much .... In my father's home I was maid with pools full of lotuses ,one pool with blue lotus ,the others from red lotus and white lotus" the first poem of Sohrab which refers to this mystic issue is mirror flower from his "Downpour of Sunshine" (Hojat,1997:70-72).

#### ***Mirror flower***

*It's frosting moonlight  
The plain is full of blue lotus vapor  
On the ground, a formless mirror shines  
The border slide through my hand  
Where I have slide in dream?*

*My Desperate look in calm night of mirror  
In this muddy waters there is not leaf image*

in the collection of "The Life of Dreams" 1953 there is a poem called "Lotus" in which Sephri brings some images of Budhhist thinking .he has mentioned in that poem that:

*Which reckless wind  
Brought the seed of this Lotus to my dream land?  
Lotus was wrapped around all my life...*

The above mentioned sentences have a direct reference to Buddha and his ideas. For the poet, lotus is a means for liberating himself from life's obligations. "The reckless wind" is a way that Sohrab choose for reaching to his mystic thoughts. Lotus essence become intertwined with all aspect of poet's existence. Lotus in the love and passion of poet towards Buddhism. Lotus is the symbol of truth (Hojat,1974:78).

*Lotus grew  
Its stalk entered through the crack of my dream  
I was dreaming  
The wake flood came  
I will open my eyes in ruins  
Lotus was wrapped around all my life  
In its vessels it was me who flows there  
Its essence is in my roots  
It was all me  
Which reckless wind  
Brought the seed of this Lotus to my dream land? (Ibid:186)*

As Hojat said, for Sohrab lotus is an aspect of truth which we can in Buddha too. One an important point which we should pay attention is the essence which wrapped in Sohrab's root. When Sohrab finishes his poem with an question- like a post-modern movie- he put the responsibility on reader shoulder in order to finish the poem .Sohrab questions his own existence in which lotus has an important role. Now we as readers -with paying attention to the truth which is lies in lotus of Sohrab's poem- should answer his question. Tthe reckless wind which brings the seed of lotus to Sohrab's dream is the ideas and teachings of Buddha. The ideas which Sohrab gained by years of journey around the world and selecting Buddhism as best choice. This choice brings a hidden joy and happiness for Sohrab.

#### *Happiness*

Another poem in which Sepehri talks about lotus and Budda joyfully is "my passion" from the book of "East of Sorrow" 1961.

I am an instrument  
I run, I wrap, I slide, I'm destroy

.....

This poem remind us of happiness ritual in Buddhism. In this poem Sohrab consider himself as an instrument in hands of his beloved. He is joyful and happy because the true happiness will be gained by being happy with the happiness of others, when we see that somebody is happy, we can create this happiness in ourselves too.

The followers of Buddha and also this poem is a person who will be happy by the happiness of someone who is neither his enemy nor his dear. Because making some one happy, whoever he is, the follower will gain happiness too.

Micheal Kiriders, the famous Buddalogist, mentioned 11 advantages of "happiness" of followers in his book:

When a follower can make someone happy he will gain 11 advantages: 1. Calm sleep 2. He will walk with no trouble 3. He will be dear for human and non-humans 4. No bad dreams 5. Gods will protect him 6. Fire, poison and weapon will have no effect on him 7. He will gain empathy easily. 8. He will have a calm and nice face 9. He will gain complete thinking 10. He will die in relief. I if couldn't reach to higher level than in his eleventh advantage he will born again in Brahma world.it should be also noted that the inner enemy of this happiness is jealousy (Kiriders: 1992:135).

Lotus which Buddha sits on it is also an important feature in Hinduism and maybe that's why in some interpretations lotus with eight petals substitutes itself with Ribas plant.the reason of such thing is a kind of necessity for poetry and manifestation of plants, flowers and tree. The symbol of lotus was also seen in the art of Aryans for example in tiles which is found in Syalk or in silver utensils from Lorestan. In these images display Ahura Mazda and lotus with eight petals .about lotus and sohrab, Hosseini said:

According to special logic of poetry and manifestation of tree,plants and flower ,we can say that the image of two Ribas in India will represent itself as lotus with eight petals in tiles of Syalk in Iran ....so by blending different

element of plants, tree, flower and garden, Sohrab connects the mythological history to religion (Hosseini,1991: 24-25).

## CONCLUSION

Lotus has an important role in "eight book" (or Hasht Ketab). It is also a fundamental idea in Hinduism.

"In Yoga it is usual in Yoga that individuals sit in a Lotus position and such a position has some points: one of them is that Lotus comes from muddy waters but it is not tainted at all and is free from any infection, also the petals of lotus come out of dark muddy waters and move towards light and blossom on the water"(Miguel Serano, 1995;106). The world of lotus has been mentioned in eight books for twenty two times .in the poems of "lotus" and "mirror flower" this word mentioned respectively seven and six times. I think it is better to end this paper with following poem :

Still It needs some time to burn the snow on the ground  
 Still it needs some time so these butterfly-like lotuses become close (Ibid: 76)

For Sepehri lotus is a very special flower because among all these beautiful flowers in the nature ,only lotus is a medium for oprning the doors of heaven (Vazirnia, 19999:106-107).

We can say that Sohrab Sepehri is one the Persian influential poets who could create a new poetry in Persian petty by the use of Buddhist notions ,therefore ; it had and has lots of influences on the poets of his next generation

## **ABSTRACT**

Numerous studies have been carried out to find the relation between neighborhood effect and retention of lexical items. This study was an attempt to find such a relationship among Iranian English as foreign language (EFL) learners. The participants, advanced second English learners, were chosen based on the Oxford Placement Test. The participants completed a lexical decision task that was designed and performed by computer software. The results of this study support the idea that English language learners use the same strategies of lexical item retentions as native speakers. The results also support Interactive Activation and Competition (IAC) and Dual Route Cascade (DRC) model of word recognition.

**KEYWORDS:** neighborhood effect, retention, lexical items

## **INTRODUCTION**

The concept of N-metric was first introduced by Landauer and Streeter (1973) to refer to the number of words that can be created by changing a single letter of a target word. One of the first studies in this area was conducted by Coltheart, Davelaar, Jonasson, and Besner (1977) who reported that classification of high-N non-words (high number of neighborhoods for non-words) is slower than that of low-N non-words (low number of neighborhoods for non-words). Coltheart (1977) called these as orthographic neighborhoods.

A more recent term, 'neighborhood' closely related to frequency has received attention. Landauer and Streeter (1973) first defined neighborhood of a word as the number of orthographically related words or non-words that can be created by changing a single letter of the target word. Coltheart (1977) called this neighborhood size or metric (N-size/N-metric). Orthographic neighborhood has two features: first, the number of orthographic neighbors (the orthographic neighborhood density or size) (Samson & Pillon, 2004), commonly defined as the number of words that sound similar to a target word (Ziegler, Muneaux & Grainger, 2003) and second, the number of orthographic neighbors of higher frequency than the target stimulus (the orthographic neighborhood frequency). In simplified language, orthographic neighborhood is the number of the neighbors of a word and the frequencies of the neighbors (Snodgrass & Mintzer, 1993). Beside orthographic neighbors, there are five other kinds of neighbors: phonographic neighbors, phonological neighbors, body neighbors, lead neighbors and consonant neighbors (Peereman, 1997). The literature on neighborhood effect, however, is not without contradictory results. For example, Andrews, (1989) reported that high-N results in a better performance in lexical decision and naming tasks while Grainger, O'Regan, Jacobs and Segui (1989) reported that high-N results in slower classification than low-N. However, few studies have actually measured neighborhood effect on foreign language learners' lexical retention. The aim of this study is to move beyond first language and test current lexical retention models and methods on second language learners' lexical retrieval.

Word frequency effect is based on the idea that words that frequently occur in the printed language are easy to recognize. Whaley (1978) reported that the most important factor in lexical decision tasks (LDT) is frequency. Research has reported that by using lexical decision task (LDT) high neighborhood non-words were classified more slowly than non-words with few word neighbors and there was no relationship between performance of words and N (Coltheart, Davelaar, Jonasson, & Besner, 1977). In 1989 two papers were published which were contradictory in their conclusions. Andrews (1989) reported that high neighborhood resulted in better performance in LDT and naming task. However, Grainger, O'Regan, and Segui (1989) reported that words with high-N are classified more slowly and Lexical Decision Task (LDT) and eye fixation duration are longer in words with at least one high frequency neighbor. These contradictory results opened the flood gate of research in this field which attempted to evaluate current models of word recognition. A very comprehensive review of these papers was published by Andrews (1997).

Ziegler and Perry (1998) examined the role of body neighbors (BN) in facilitation or inhibition of LDT. They state that the relation between N and BN is in such a way that BN is facilitative provided that words are matched for N. However, N has a tendency to inhibition. Also it must be considered that BN has no inhibitory effect on non-word retentions. Research also has emerged examining neighborhood effect among mental patients. A study by Gordon (2002) on aphasic speech errors concluded that both lexical frequency and neighborhood density exert a facilitative effect on the accurate retrieval of words in aphasic speech production, just as they do in normal speech production. Westbury, Buchanan and Brown (2002) moved beyond orthographic level providing a new insight into phonological neighborhood effect and phonological lexical organization. Westbury, et al (2002, p.639) suggested that lexical activation moves through whole-word and sub-word units. They implied that there is time delays that sub-word phonological components may remain active. This activation could affect text comprehension, because it may create conjunction errors. However, they believed that there is solution to this as semantic restrictions are entangled with the phonological/orthographic complexity of a text or discourse.

Research shows that bilingual speakers try to keep interference of both languages at minimal level. The fact is, however, that interference is inevitable in both languages (Walter, et al., 1998). Their experiments provide evidence for parallel activation of words in an integrated Dutch/English lexicon. On the whole, their findings support the Bilingual Interactive Activation model (BIA).

## RESEARCH QUESTIONS

Regarding the foregoing discussion, the study aims at answering the following research questions:

- 1) Does lexical neighborhood have any effect on retention of vocabulary items by Iranian advanced EFL learners?
- 2) Is there any relationship between orthographic neighborhood effect and retention of vocabulary items by Iranian advanced EFL learners?

## METHODOLOGY

### *Participants*

Twenty-eight (N = 28) bilingual males and females aged from 16 to 23 who were advanced EFL learners and whose native language was Farsi were recruited in this study. These students had passed OPT (Oxford Placement Test) and were graded as advanced EFL learners. Participants were randomly selected using simple random sampling from within participants who successfully passed OPT.

### *Instruments*

In this study, the following instruments were utilized:

The Oxford Online Placement Test is a standardized test which places students into the appropriate level for a language course. It can be also used as a quick measure of a student's general language ability. It contains two sections for listening and grammar with each section of 100 questions and total grade of 200. This research used participants who were all passed Oxford placement test and were graded as advance learners.

### *Materials*

In English the number of words which have many orthographic neighbors and few body neighbors is limited. Furthermore, another problem is the number of words with many body neighbors but few orthographic neighbors is limited. Therefore, a perfectly orthogonal design of neighbors and body neighbors cannot be obtained in English. Thus, we had to limit our study to the ideal orthogonal design. Professor Conrad Perry kindly helped us in the materials and permitted us to use his method in this study. Thus, we used the design and items he had used in his studies (Ziegler & Perry, 1998). We manipulated body neighbors in two different approaches. In the first one we manipulated BN while keeping N constant and manipulated N while keeping BN constant in the second one. Words and non-words were manipulated in this way. Items were selected from computerized databases. The stimulus collection of this study consisted of 160 items, 80 words and 80 non-words. Half of the items were five letters long and the other half were four letters long. According to the word frequency count that was established by Kucera and Francis (1967), all of the selected words were considered as low frequency. In the Body Neighbors (BN) manipulation, 20 words had few body neighbors ( $BN < 3$ ) and 20 words had many body neighbors ( $BN > 14$ ). For these 40 words N was kept constant and both groups were matched for word frequency and word length. In the N

manipulation, 20 words had few orthographic neighbors ( $N < 3$ ) and 20 words had many orthographic neighbors ( $N > 5$ ). For these 40 words, BN was held constant. The non-word manipulation was done like word manipulation. In BN manipulation 20 non-words with few body neighbors and 20 with many body neighbors were used while keeping N constant. In N manipulation 20 non-words with few orthographic neighbors and 20 with many orthographic neighbors were used while keeping BN constant. Pseudo words were used as primes. Pseudo words have been suggested as stimuli because they prevent semantic priming effects in the course of experience (Harley, 2008).

### **Procedure**

Participants (Twenty-eight ( $N = 28$ ) bilingual males and females aged from 16 to 23) were randomly selected using simple random sampling from within participants who successfully passed OPT.

Participants were given a trial section in order to get familiar with the procedure. Participants were seated in front of an Asus Eee PC laptop computer screen (10 inches) and were given verbal instructions. This experiment used 15 trial items and 160 experimental items. The experimental and trial were presented in random order for each participant. The trial began with the presentation of an item at the center of the screen. After 1500ms the item in the case of no response was replaced with the next stimulus that remained on the screen until a response was given. Participants knew that they had to indicate as rapidly as possible whether that stimulus was a word or a non-word. When a participant was ready s/he pushed a button (Right SHIFT for words and Left SHIFT for non-words). Then the prime was removed. Participants did not receive any feedback. Reaction times were measured by the computer between the onset of the stimulus and each participant's response. After the experiment some participants reported that they saw a word several times, while the software was designed to show each word and pseudo-word just once.

## **RESULTS AND DISCUSSION**

The results show that large body neighbors had an inhibitory effect on word recognition because when N is constant and BN is manipulated, mean word RTs for small BN is negative (-37), which means that participants made more errors. On the other hand, when N was manipulated, the effect is facilitative for BN Constant/Many N, which means that large N has a facilitative effect. It must be mentioned that these results are obtained based on orthographic neighborhood effect. Consistency of these results over other kinds of neighborhoods must be measured and could be subjects of other studies. The following table shows the mean correct response time (RT) latency of body neighbor (BN) and neighbor (N) manipulation of this study.

*Table 1: Mean Correct RTs of BN and N manipulation*

BN Constant/ Few N	Mean	84.1114
	Median	415.7550
	Variance	658282.053
	Std. Deviation	811.34583
BN Constant/ Many N	Mean	3.0846
	Median	341.1750
	Variance	669194.869
	Std. Deviation	818.04332
N Constant/ Few BN	Mean	-37.4853
	Median	-272.7100
	Variance	692099.362
	Std. Deviation	831.92509
N Constant/ Many BN	Mean	96.4196
	Median	425.9850
	Variance	653767.239
	Std. Deviation	808.55874

Figure 1: Mean of RTs

The results reveal that Iranian advanced second language English learners are more confident with words with fixed BN and large N (~3.08ms) and that this has a facilitative effect on word recognition. On the whole, participants showed difficulty in the cases of "N Constant/Few BN" (~ -37). In the case of "BN Constant/Few N" and "N Constant/Many BN", it seems the effect is "NULL" because for both of these groups inhibitory effect plays the same role and has the same effect.

Figure 2: Correct/Incorrect Response ERROR RATE

The figure illustrates error rates for correct and incorrect responses in four categories of N and BN manipulation. Overall, as it is obvious that correct responses are slightly larger in number than incorrect responses.

Table 2: T-Test (word/non-word)

**Group Statistics**

	Word.nonword	N	Mean	Std. Deviation	Std. Error Mean
RTs	word	2240	95.8481	801.51256	16.93504
	non-word	2240	-22.7830	832.36960	17.58702

*Table 3: Levene's Test*

**Independent Samples Test**

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
RTs	Equal variances assumed	13.864	.000	4.859	4478	.000	118.63109	24.41514	70.76536	166.49682
	Equal variances not assumed			4.859	4471.625	.000	118.63109	24.41514	70.76534	166.49683

Table 3 illustrates level of meaningful result calculated from F (Levene's test) is less than .05 or 5%, as equal variances for both groups (word and non-word) are not assumed. The results the t-test reveal that there is a significant difference (sig. is less than 5%) between word and non-word groups with confidence level of 95% in terms of establishing RTs.

*Table 4: T-Test (Correct/Incorrect)*

**Group Statistics**

	Error.Rate	N	Mean	Std. Deviation	Std. Error Mean
RTs	Correct Response	2425	727.7371	283.82063	5.76352
	Incorrect Response	2055	-779.1223	372.10140	8.20834

*Table 5: Levene's Test*

**Independent Samples Test**

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
RTs	Equal variances assumed	203.424	.000	153.558	4478	.000	1506.85938	9.81299	1487.62107	1526.09769
	Equal variances not assumed			150.240	3796.616	.000	1506.85938	10.02971	1487.19524	1526.52352

The results of the t-test revealed that there is a significant difference (sig. is less than 5%) between correct and incorrect response groups with confidence level of 95% in terms of establishing RTs. Given that the significance of the Levene's test is greater than 0.05, the variances are equal in all four groups.

Table 6: ANOVA

**ANOVA**

RTs

		Sum of Squares	df	Mean Square	F	Sig.
Between Groups	(Combined)	13941332.680	3	4647110.893	6.953	.000

	N Constant/Many BN					

\*. The mean difference is significant at the .05 level.

Table 8: Homogeneous Test

**RTs**Scheffe<sup>a</sup>

BN.N.Manipulation	N	Subset for alpha = .05	
		1	2
N Constant/Few BN	1120	-37.4853	
BN Constant/Many N	1120	3.0846	3.0846
BN Constant/Few N	1120		84.1114
N Constant/Many BN	1120		96.4196
Sig.		.710	.063

Means for groups in homogeneous subsets are displayed.

a. Uses Harmonic Mean Sample Size = 1120.000.

As indicated in the first column (sig.> .05), "N Constant /Few N" and "BN Constant/Many N" are not significantly different (homogeneous). And the second column (sig.> .05) shows "BN Constant/Many N" and "BN Constant/ Few

N" and "N Constant/Many BN" do not differ significantly. The highest mean is related to "N Constant/Many BN" and the minimum mean is related to "N Constant/Few BN".

### **Discussion**

Our study of advanced Iranian Second language learners revealed that when BN is constant and N is manipulated, mean word RTs for large N are faster than large BN. This means that large neighbors have a facilitative effect on word recognition. On the other hand, the results showed that when we manipulate BN and keep N constant, the effect is inhibitive for few BN (i.e., Mean RTs are negative) which means that participants made more errors. For two categories of BN Constant/Few N and N Constant/Many BN the effect is Null, because the inhibitive effect played the same role for both of them. Coltheart, et al (1977) found the same Null effect by manipulating the number of word's neighbors (N). They found that N does not have any effect on lexical decision task. They reported that there is no relationship between performance of words and N showing that high N had an inhibitory effect and low N had facilitative effect.

Other studies (e.g., Andrews, 1997; Snodgrass & Minzer, 1993; Carreiras et al., 1997; Coltheart et al., 1977) found the same Null relationship between N numbers and retention. However, this study showed that large N has a facilitative effect on word recognition. Ziegler, et al (1998) reported that body neighbor manipulation has a facilitative effect on participants' word recognition. On the other hand, when N is manipulated, it has an inhibitory effect. They believe that these findings might be consistent in various studies because English has many body neighbors (BN). However, our study showed that small number of BNs has inhibitory effect and large N has a facilitative effect. The reason why some studies reported that BN manipulation has a facilitative effect and N manipulation an inhibitory effect on words may be related to the body/time feature of English language. Andrews (1997) believed that this feature provides a link between orthography and phonology of words. During reading, this feature helps readers to disambiguate word phonology during reading. Our findings for Iranian advanced second language learners do not support this idea.

Words with high BN may speed up lexical access, because they look familiar to the participants and at the same time high BN reduces ambiguity. On the other hand there is an inhibitory effect when N is manipulated, because N manipulation increases competition between orthographically similar words. Andrews (1989) reported that N effect occurs for low frequency words in lexical decision tasks. This is contrary to our findings. The pattern for non-words recognition is different. Both BN and N manipulation show an inhibitory pattern over RTs. Mean RTs for non-words are high probably because people have a tendency to find the evidence of wordiness; if we do not find any evidence of wordiness, we would reject it, and this takes much longer for the mind to process. On the other hand, it may seem that the reason for this inhibition comes from the number of N and BN, because simply when the number of N and BN increases, the likeness of pseudo-words to words increases making them harder to reject.

The contribution of the results to models of word recognition is that at first spot Serial Search Model (Forster 1976, 1979) does not account for our results because it suggests that words are categorized in mind by orthographic and phonological features into several bins. The Serial Search Model predicts that words with a high frequency are easier to recognize. However, as we saw in our results frequency has a facilitative (at least for N manipulation) rather than inhibitory effect. Another model of word recognition, the Interactive Activation and Competition (IAC) model (McClelland & Rumelhart, 1981; Rumelhart & McClelland, 1982), consists of three levels: input level with visual feature units, intermediate level where units are individual letters, output level where each unit is a word. Units within the same level are connected with each other through inhibitory connections; therefore, they compete with each other in the case of recognition. English has a body/rime feature that IAC model does not support. On the other hand, based on predictions of this model it must be in such a way that words with high BN must be recognized slowly. As our results show BN has an inhibitory effect. Therefore, this model explains why BN has an inhibitive effect. Also, our results are in harmony with DRC model which predicts that BN manipulation must have an inhibitory effect. The results of our study, in line with the predictions of this model, show that similar words share common sublexical nodes with each other and these nodes become activated during word reading and recognition. Therefore, words with many letters shared with a target word are more active than words with an overlap (Plaut, McClelland, & Seidenberg, 1996).

The parallel distributing model (Seidenberg & McClelland, 1989) is not capable of explaining why the present study found that BN has an inhibitory effect. This failure comes from the fact that parallel distributing model predicts that words with the most shared letters are more active than others, and thus are more easily recognized. It is necessary to mention that our results are obtained based on orthographic neighborhood effect. The generalizability of these results to other kinds of neighborhoods must be examined by future research.

## CONCLUSION

Based on the information was gathered from Iranian advanced English learners, it showed that neighborhood effect had two sides based on different situation. The results of this study showed that small body neighbors had an effect on word recognition. The nature of this relationship is inhibitory in word recognition process for advanced Iranian English learners. Furthermore the nature of this relationship for more frequent orthographic neighbors is facilitatory.

The results supported IAC and DRC models of word recognition. These models are able to explain why N has facilitative effect. They also predict that words with the most shared letters are more active than others, and thus are more inhibited.

This was a first attempt to study English second language learners' vocabulary retention in Iran with Persian native language. As far as our results suggest, on the whole orthographic neighbors have facilitative effect on word retention and recognition. Therefore, we can theorize that for teaching words, it is better to find texts that are somehow rhythmic or using songs. We can use songs to enhance vocabulary learning. There is evidence that using songs in the classroom is a great help to learning and retention of lexical items (Zhang, Wu, Wei, & Wang, 2011; Salcedo, 2002). Attempts in Iran about finding the relationship between songs and word learning and retention showed that this relation is facilitative and learners acknowledge that they prefer this kind of learning, and they are more motivated and relaxed in the classroom (Gorjian, Alipour, & Saffarian, 2012; Alipour, Gorjian, & Zafari, 2012).

## Implications

The implication of the results is that for teaching words, it is better to find texts that are somehow rhythmic or using songs. We can use songs to enhance neighborhood effect and increase the rate of vocabulary learning. There is evidence that using songs in the classroom is a great help to learning and retention of lexical items (Zhang, Wu, Wei, & Wang, 2011; Salcedo, 2002).

## Limitations of the study

It is necessary to mention that these results are obtained based on orthographic neighborhood effect. Consistency of these results over other kinds of neighborhoods must be measured and could be subjects of other studies.

There is not a perfect Persian lexicon to repeat this experience on Persian native speakers. The results of this study cannot be generalized into Persian native speakers because the study was conducted with EFL Persian learners. This study did not have an intention to separate females and males. Therefore, there is a chance for other studies to separate these categories to find out if there is a difference or not. This study was based on Oxford Placement Test; other studies can base their studies on other proficiency criteria.

### ABSTRACT

In our informational era, when the informational flow has increased in many ways, it is not a simple task to make the young people to sit before the text-books. Innovations and computer technologies have given an opportunity to optimize the process of mastering non-native languages. Russian language has its own complexities, which can be handled by new programs easily which are not easily accessible in Iran. In other hand, a student in Iran cannot hear the Russian speech and communicate in Russian language anywhere except in the University, and then these conditions together obligate us to enhance the environment for Iranian learners. Technical training aids give an opportunity to realize modern tendencies in educational systems of teaching. To learn a foreign language can be so important in a human life as it can change the method of life or job ant etc. So the availability of a foreign culture learning environment is very necessary for all learners; this condition obligates us to provide the requirements.

**KEYWORDS:** Russian Language, Iran, Education, new methods.

### INTRODUCTION

Many different methods of teaching foreign languages have appeared in the past. The so-called «memo-methodology» is among them, where the major is the attraction of three main principles in education system: vision, hearing and contact sensations, which allow our memory to remember foreign words on a deep level, quickly and without extra efforts to use further the foreign language easily.

Russian language has its own complexities in which student face with difficulties but thanks to internet and other modern technologies these issues are easily solved. In iran unfortunately these programs or other necessities like enough institutions are not now considered. So The Russian language is not in the line of poggess in the view point of learners. This condition makes us to pay attention to the structures to handle the Russian language learning in iran and make it easier.

### NEW TECHNOLOGIES IN LANGUAGE LEARNING

The great assistant in the work of institutes' teachers, who teach their pupils Russian language far away from Russia, is Internet (Arkadieva, 1998).

A student in Iran cannot hear Russian speech and communicate on Russian language anywhere except in the University, because of that it is considered that it is necessary to create for Iranian students learning Russian language environment where they can listen to and speak on Russian language. Russian literature was taken off from the preparatory faculty while language existence and learning without literature is impossible (Polat, 1998).

Computerization of educational process has been implemented in Iran at present time, but Internet for most Iranian teachers and students is still not accessible enough. A modern Iranian youth can poorly imagine a Russian life. Reading the works of Russian writers and poets, they know a little about the Russian culture and history. A lot of TV serials and commercials have little value and do not allow the Iranian youth to grow accustomed to the rich Russian culture and to get the scientific knowledge. Internet has taken this educational function. Thus we should note that unfortunately it includes a lot of unnecessary and sometimes harmful information, there are not such a lot

of serious portals where we can find an illustrative and meaningful material on different fields of Russian science and culture (Polat, 2003).

Computer programs give an opportunity for Iranian students to study independently not only at auditoria practical lessons but also at home.

We can find internet voiced tales, poems and songs. But every teacher knows how it is important to listen often to a standard Russian speech for the development of verbal skills of the learners: schoolboys, students, listeners of Russian language courses. Tales, voiced by well-known artists, who have a good Russian speech and a standard pronunciation, can help the Russian language teachers in distant regions of the republic.

There are some programs on Russian languages in internet. They are:

1. «Vladimir». A course of Russian language oriented to the improvement of verbal skills mastering. The submitted material is oriented on students of different preparation (3 levels).
2. «Voices», the third edition. A voiced program consists of the voiced alphabet, situational dialogues, which we may listen and record for further use on the lessons of Russian language and for an independent work of students and pupils.
3. «Ruslang» is a program, where you can not only find some exercises, but also listen to songs and poems.

Besides the following programs may be useful: Privet.ru; Languageguide.org; Mentor.ru. In portal «Gramota.ru» we can find a comprehensive electronic referential literature: different dictionaries on Russian language, articles on different sections of linguistics and many others.

Therefore during the process of teaching the highest quality of memorizing the material is achieved with the direct combination of the teacher's word and a showed by learner picture. Computer programs just let us better use the opportunities of visual and auditory analyzers of the learners (Shvedova, 1983).

At those places, where Internet is not still connected for its users, it is obligatory to use computer programs on Russian language. Every program is good by itself; each of them takes into account the level of students' preparation. Their distinguishing feature is in entering the complicated material in a light playing mode, which is well absorbed at required frequency of execution.

The most known and popular among them are:

1. «1C: Tutor» (audio dictations and another variety of tasks allow you not only to improve spelling skills, but also pronunciation and expand linguistic horizons).
2. «Family mentor – Russian language 5, 6, 7 classes» (it may be used not only by schoolchildren and teachers, but also by students and tutors in institutes). There are a lot of tasks on different language sections and different forms of control. One of them is the most attractive. When you answer correct a virtual candy or a diploma with a sound effect appears. There are some other virtual prizes.
3. Program «Doctor Higgins» is also interested and may be used on the lessons of Russian language during preparation to them and at first learning the phonetics of Russian language.
4. Program «Talk Russian now!» is differed with its unusual way of presenting the material: colourfulness, entertaining, sound accompaniment, promoting the development of the correct pronunciation and many others that allow successfully use the program when teaching foreigners to Russian language.

All mentioned programs have an informational material and tests, passing over which you can increase your literacy in a playing mode, without a tedious grind, what surely will increase the motivation of pupils/students in mastering the complicated for many foreigners Russian language(Rogova, 1984).

Due to Internet and computer the teachers in distant regions could enrich their teaching and informational base with a large illustrated material. This would let to improve the relations between the teacher and the pupil, because «the teacher, who uses a computer during the educational process (the more the better), is accepted by pupils as a closer and more modern person. This, in its turn, also positively affects on the speed of the establishment of interpersonal relations and as a result on the educational effectiveness(Dmitrieva, 1998).

Internet became a large helper in work for the teachers educating their pupils to Russian language far away from Russia. The global network contains the models of the lessons of leading specialists and innovators, lesson-by-lesson plans and many other useful things for the educational process. In Internet you can also upgrade your qualification.

«Zlatoust» educational and publishing center, for example, invites to pass over the qualification upgrading course on the program of «Methodological subscription: new educational technologies and Russian language teaching».

When computer was created for the first time, nobody imagined that he would be able to sit in front of the computer and study without entering the auditorium classes in university, pass exams and even get diplomas. Computer technologies today give a lot of opportunities to receive education. And we can even say bravely that today a man would not be able to continue his valuable life without a computer.

Modern students from their childhood grow used to understand that television solves many issues on social inequality and receipt of professional education. They study unconsciously when spend much time watching the programs for children and teenagers. The more interesting and various programs are the more pleasures they get from.

A new generation of people, but Iranians are exclusive in this case, grows up used to computer from the childhood. Different entertaining computer games programs are developed for them. They are not tired from computer. Now we can confidently confirm that a computer has a great influence on education. As we already know the mastering of language is improved with the assistance of vision and hearing.

Russian physiologist I.P. Pavlov has opened an orientating reflex, which was named «What is it?» reflex: if any object enters the field of a person's view, a person involuntarily begins to look at closely to understand what it is. Even having heard a sound, a man tries to find its source with his eyes that makes easy the perception of sound information.

Therefore, during the educational process the highest quality of the material memorizing is achieved at spontaneous combination of the teacher's word and the picture showed by a pupil. And computer programs just let us use visual and auditory analyzers of the learners in full.

The technology of interactive education to foreign languages and culture as the aim of the modern educational process itself considers the interaction between the teacher and learner as a key activity that defines the meaning of interactivity of today lesson of a foreign language (Shvedova, 1983).

### **DIFFICULTIES IN TEACHING RUSSIAN**

Teaching Iranian students to Russian language is very difficult, because first, there is a big difference between Russian and Persian letters, and second most Russian grammatical rules are absent in Persian language, including characteristics of the nouns in Russian language and also gender and case as well as the declination of the adjectives, pronouns and ordinal numbers.

Consequently, learning Russian language by Iranian students is very difficult, especially in a foreign language speaking environment, and mastering Russian language requires a great will, enough time and special efforts.

By this computer programs can facilitate the educational process. Teachers, applying to the habit of students to watch television, use MP-3 and a computer, can easily arrange the educational materials in the form of entertaining and various computer programs and games. (Games can successfully be combined with different psychological and pedagogical trainings on the development of communicative skills). Technical training aids give a chance to realize modern tendencies in educational systems of many countries of the world.

These are the world tendencies in education. Unfortunately, there are none computer programs for Iranians learning Russian language, and we hope that after we define the role of these programs in Russian language teaching the specialists will create such programs.

Computer programs like «MOYES SOFT WORD» and «ROSSETA STONE (dynamic immersion) language learning success» 2009 and «Kirill and Mefodiy 2002» are of great interest from the view of their high educational potential. They are coloured and musical, it is interesting to submit letters of the Russian alphabet with spelling and correct pronunciation. Though these programs are created not for Iranians, but Persian speaking students will easily learn Russian letters by means of the named above computer programs(Fokina, 2003).

Students in Iran got used to write in English with Latin letters, but the letters in Russian language are written in another way with Cyrillic. Like letters (B) in English and (М) in Russian and many others. However, watching programs only is not enough. The teacher should teach the students to write correct in notebooks with a pencil and certainly correct their mistakes. Then it becomes clear, what a big role in teaching the spelling and correct pronunciation of letters the teacher plays.

Phonetics is not a less important than graphics and orthoepic part in teaching a foreign language, because when we know phonetic rules we pronounce and write the words correctly. A stress in Persian language usually falls on the last syllable. That is why Iranian students should listen to and repeat Russian words a lot to remember their stress. Computer programs help them in this case too. Explaining the phonetic rules, including the assimilation of voiced and breath consonants or the pronunciation of the vowels *o, a, e* under stress and others, computer programs help students perceive more by ear and see Russian words repeating phonetic rules of these words' pronunciation. For example, «ROSETTA STONE» 2009 computer program in case when a student pronounces a word wrong corrects his mistakes pronouncing such words correct. Thus to learn with an assistance of a computer is much more interesting than to learn phonetic and grammatical rules and laws of Russian language without it. For example, in «dragon» computer program you may type a text and the program will read and show the stress of the words.

## **CONCLUSION**

It is exclusively interesting for students that declination of words in Russian language; a stress in the word can change its position because the Russian stress as we know is mobile and multi-located. For an Iranian student as well as for any foreigner, who learns Russian language, it is difficult but due to such a computer program it becomes easier to define the correct stress in words. That is the «dragon» program affiliates to the development of the skills of the correct positioning of the word stress. A student in Iran cannot hear the Russian speech and communicate on Russian language anywhere except in the University. That is why we consider that it is necessary to create for Iranian students learning Russian language more available.

Based on the believes of modern century, the students have rights to select what to learn, so the structures respondent to this selection should be available and accessible for all students. Learning a foreign language can be as important in a human life as it can change the destiny, job and an important of life.

## **ANXIETY AS A DETERRING ELEMENT IN LEARNING ENGLISH FOR ORAL COMMUNICATION AMONG EFL STUDENTS**

## **ABSTRACT**

The present study was designed to investigate the effects of anxiety on English language oral performance. In so doing, one hundred undergraduate students doing English in Islamic Azad University — located in Abadan, Iran — participated voluntarily in the experiment of this research and were asked to answer a Horwitz-based 33-item questionnaire. Analyses of the data revealed that foreign language anxiety remarkably impinges upon learners' English speaking. Likewise, the main sources of anxiety were identified as: appearing in front of the audience, making mistakes, losing face, inability to express oneself, fear of failure, teachers as class authorities, and fear of not achieving up to the expectations. Further findings also suggested that anxiety can originate from learners' own feelings, language learning and language speaking difficulties, and fear of being negatively evaluated. The above findings along with a few more, such as the lack of motivation and interest, helped to conclude that teachers can dispel students' feelings of anxiety through establishing a friendly learning environment in class filled with care and mutual respect as well as sense of direction and fun.

**KEYWORDS:** Anxiety, English as a Foreign Language, Speaking Skill, Communicative Competence, Communication Apprehension.

## **INTRODUCTION**

The role of anxiety is one major topic which has increasingly drawn the attention of those involved in the study of foreign language leaning and speaking. A rich body of research and literature has been presented related to EFL learners when asked to perform oral tasks in their English learning classes. This paper will attempt to address this issue in an effort to dig up the reasons that cause foreign language communication anxiety and explain how learners would be best off by taming this mood which very often has a debilitating impact on learning and performing a foreign language.

A large number of learners express their inability and sometimes even acknowledge their failure in learning to speak a second/foreign language. These learners may be good at learning other skills but, when it comes to learning to speak another language, they claim to have a 'mental block' against it (Horwitz et al., 1986: 125). What, then, hinders them to succeed in learning a second/foreign language? In many cases, students' feeling of stress, anxiety or nervousness may impede their language learning and performance abilities. Theorists and second language acquisition (SLA) researchers have frequently demonstrated that these feelings of anxiety are specifically associated with learning and speaking a second/foreign language, which distinguishes L2/FL learning from learning other skills or subjects. Both teachers and students are aware and generally have a strong feeling that anxiety is a major hurdle to be overcome when learning to speak another language. Learning a language itself is "a profoundly unsettling psychological proposition" because it directly threatens an individual's 'self-concept' and world-view (Guiora, 1983 cited in Horwitz et al., 1986: 28).

## **LITERATURE REVIEW**

### ***Anxiety: Definition***

Darwin (1872) thought of anxiety as an emotional reaction that is aroused when an organism feels physiologically under threat. At the beginning of the twentieth century, Freud (1925) thought that anxiety was akin to 'fear' or 'fright'. He stated, "I avoid entering upon the discussion as to whether our language means the same or distinct things by the word anxiety, fear or fright. I think anxiety is used in connection with a condition regardless of any objective, while fear is essentially directed toward an object. (p. 343)

Later in the following decades, anxiety was seen as a state of "apprehension, a vague fear that is only indirectly associated with an object" (Scovel, 1975, p. 134). Rholes, Riskind, and Neville (1985) submitted that anxiety may originate when physical peril is expected, and while both anxiety and depression may arise following a loss, anxiety on its own appears when a loss is anticipated. May (1977) saw it as "an emotional response to threat to some value that the individual holds essential to his existence as a personality" (p. 205).

### ***Types of Anxiety***

#### *State Anxiety versus Trait Anxiety*

There are several kinds of anxiety the two most well-known of which are state anxiety and trait anxiety. State anxiety, on one hand, is fleeting and not an enduring characteristic of an individual's personality. It is a "transitory state or condition of the organism that varies in intensity and fluctuates over time" (Spielberger, 1966, p. 12). Spielberger (1983) gives as an example of state anxiety the apprehension experienced before taking an examination.

Trait anxiety, on the other hand, has been referred to as "a constant condition without a time limitation" (Levitt, 1980, p. 11), and is a stable feature of personality, referring to an "acquired behavioral disposition that predisposes an individual to perceive a wide range of objectively non-dangerous circumstances as threatening" (Spielberger, 1966, p. 16).

#### *Situation-Specific Anxiety*

The ideas and discussions over state anxiety and trait anxiety which were dealt with in the previous section gave rise to the notion of so-called 'situation-specific' anxiety. The latter can be "considered to be the probability of becoming anxious in a particular type of situation, such as during tests (labeled as 'test anxiety'), when solving mathematics problems (math anxiety) or when speaking a second language (language anxiety)". (MacIntyre & Gardner, 1994b, p. 2). The author Oh (1990) thought of foreign language anxiety as a "situation-specific anxiety that students experience in the classroom which is characterized by self-centered thoughts, feelings of inadequacy, fear of failure, and emotional reactions in the language classroom" (p. 56). MacIntyre and Gardner (1989) put forward the idea that situation-specific anxiety solidifies (p. 272) in a language learner as a result of suffering state anxiety on several occasions.

#### *Facilitating Anxiety and Debilitating Anxiety*

A distinction has been made between facilitating anxiety and debilitating anxiety by other approaches (Alpert & Haber, 1960; Kleinmann, 1977; Scovel, 1978). Facilitating anxiety, as the name suggests, is thought to be a kind of anxiety that improves learning and performance.

Early research suggested that different quantities of facilitating anxiety and debilitating anxiety may be present in the same individual at the same time: Alpert and Haber (1960) asserted that "an individual may possess a large amount of both anxieties, or of one but not the other, or of none of either" (p. 213). It has been proposed that facilitating anxiety and debilitating anxiety may function together (Scovel, 1978).

#### *Foreign Language Classroom Anxiety*

Various studies comparing students' levels of anxiety in their foreign language class to their other classes (e.g. math, history, etc.) indicate that students experience considerably more anxiety in their foreign language classes (Muchnik & Wolfe, 1982; Horwitz et al., 1986; MacIntyre & Gardner, 1989). The concept of 'foreign language anxiety' is still in its infancy, thus second language research has not yet adequately defined it in precise terms (Horwitz et al., 1986). Further, there are many varying degrees of intensity, which seemingly make it difficult to apply boundaries towards a set definition (MacIntyre & Gardner, 1991; Doyon, 2000). Some generalizations can, however, be made. Gardner and MacIntyre (1993: 5) define language anxiety as "the apprehension experienced when a situation requires the use of a second language with which the individual is not fully proficient". Some of the symptoms include nervousness, tension, apprehension, and introversion.

Arising out of discussions with beginner foreign language students about anxiety experiences at the Learning Skills Center at the University of Texas, Horwitz and her colleagues (1986) described the physiological and psychological symptoms of this phenomenon, many of which occur in anxious states in general: "tenseness, trembling, perspiring, palpitations, and sleep disturbances" (p. 129).

Anxiety was also observed in language learners in such symptoms as 'freezing' in class, 'going blank' before exams, and feeling reticence about entering the classroom (Horwitz, 1986, p. 128). They researchers noted how these learners experience apprehension, worry, even dread. They have difficulty concentrating, become forgetful, sweat, and have palpitations. They exhibit avoidance behavior such as missing class and postponing homework (p.126).

These observations and discussions led the authors to put forward a definition for foreign language classroom anxiety as “a distinct complex of self-perceptions, beliefs, feelings, and behaviors related to classroom language learning arising from the uniqueness of the language learning process” (Horwitz, 1986, p. 128).

### ***Effects of anxiety on Learning***

Much of the early research (Chastain, 1975; Kleinmann, 1977; Scovel, 1978) devoted to anxiety and language learning was difficult to interpret because of its contradictory results. Part of the reason for this has been attributed to the general measurement employed. Some of the early research suggests that a certain amount of anxiety can actually help learners’ performance in the classroom (Scovel, 1978). For example, Kleinmann (1977) reports positive correlations between facilitating anxiety and the use of more difficult linguistic structures. However, as Gardner and MacIntyre (1993) have suggested, this may have more to do with the general measures taken in the studies. More recent studies, using a more specific approach to measurement, support the widespread view that anxiety generally has a debilitating effect on L2 performance (Gardner et al., 1976; Horwitz et al., 1986; Gardner & MacIntyre, 1993).

Some studies have shown that anxiety influences the communication strategies learners employ in a language class. Ely (1986), for instance, reports that anxious learners were less likely to take risks in the language class. Similarly, Steinberg and Horwitz (1986) found that anxious learners produced less interpretive and more concrete messages than relaxed learners. The results found in these studies are consistent with research on other types of specific communication anxiety, which states that anxious learners generally speak, write, and participate less in the language classroom than relaxed students (Spolsky, 1989).

### ***Causes of Language Anxiety***

Horwitz et al. (1986) theorize that foreign language anxiety in the classroom can be attributed to three performance anxieties: communication apprehension, social evaluation, and test anxiety. First, communication apprehension may be defined as the fear over the real or anticipated act of speaking. It is this type of anxiety that teachers find most prevalent in oral EFL classes in Japan. Second, social evaluation may be defined as the worry over how one’s actions will be perceived by others in the social setting. It is this type of anxiety that Zimbardo (1977) reports to be predominant in Japanese society. Lastly, test anxiety may be defined as the fear of failure, especially when skills are being measured formally as in exams. This theory is largely based on clinical experience and anecdotal evidence; however, it has received large support in terms of research activity and validating evidence is accumulating. The components receiving the strongest support seem to be communication apprehension and social evaluation, while the importance of test anxiety remains inconclusive (MacIntyre & Gardner, 1991).

Other studies have also helped us in understanding the causes of language anxiety. For instance, Bailey’s study (1983) in which she analyzed learners’ diaries found that learners’ competitive natures can act as a source of anxiety. In addition, some researchers have claimed that students may suffer language anxiety due to cultural inhibitions. Oxford (1992) likens this to the concept known as culture shock. Learners may fear the experience of losing their identities in the target culture (Ellis 1994).

### ***Previous Research***

The academic literature has offered a somewhat confusing account of language anxiety. Researchers have been unable to draw a clear picture of how anxiety affects language learning and performance. Some researchers reported a negative relationship between language anxiety and achievement, e.g. the higher the anxiety, the lower the performance, (Clement, Gardner, & Smythe, 1977, 1980: cited in Onwuegbuzie et al., 1999: 218). Others reported no relationship, or a positive relationship (Pimsleur, Mosberg, & Morrison, 1962; Backman, 1976; Scovel, 1978: cited in 1999:218). More recently, Horwitz (2001:121) has reiterated that the issue of understanding the relationship between anxiety and achievement is unresolved. The reason for these mixed results is perhaps, as stated by Philip (cited in Shams, 2006: 8), that “a comparison of the experimental research examining the relationship between anxiety and second language learning is, to a degree, perplexing, presenting some conflicting evidence and illustrating that anxiety is a complex, multi-faceted construct.”

In addition to the negative effects of anxiety on language learning and performance, anxiety has occasionally been found to facilitate language learning. Anxiety, in its debilitating and facilitating forms, serves simultaneously to motivate and to warn the learner. Facilitating anxiety “motivates the learner to “fight” the new learning task; it gears

the learner emotionally for approach behavior” (Scovel, 1991:22). Debilitating anxiety, in contrast, “motivates the learner to “flee” the new learning task; it stimulates the individual emotionally to adopt avoidance behavior” (1991:22).

### ***Language Anxiety in the Speaking Skill***

For many years it has been the common concern of EFL teachers to observe students’ apprehension during oral activities and especially during oral tests. Therefore, it will be interesting to read about how other researchers had delved into this issue. The literature suggests that the speaking skill is extremely anxiety-provoking in many language learners and that it is often seen to arouse more anxiety than the other skills. Indeed, Daly (1991, cited in Von Worde, (2003) reported that in some individuals “fear of giving a speech in public exceeded such phobias as fear of snakes, elevators, and heights” (p. 3).

Anxiety reactions suffered by many students when speaking or when being asked by the teacher to speak in the foreign language classroom include “distortion of sounds, inability to reproduce the intonation and rhythm of the language, ‘freezing up’ when called on to perform, and forgetting words or phrases just learned or simply refusing to speak and remaining silent” (Young, 1991, p. 430).

Horwitz et al. (1986) found that in counseling sessions at the Learning Skills Center at the University of Texas students said that they had most problems in the listening and speaking skills, with “difficulty in speaking in class [being] probably the most frequently cited concern of the anxious foreign language students” (p. 126). Learners said that they had time to plan their spoken interventions, but would “freeze” (p. 126) if they had to speak spontaneously.

### **RESEARCH QUESTION**

What elements constitute the sources of anxiety in foreign language learners when they try to speak in the new language?

### **METHODOLOGY**

#### ***Participants***

The participants in this study were recruited from the English Department in Abadan Islamic Azad University (Khoozestan, Iran). A total of 100 students volunteered for this research survey. Within the sample, 31 (N = 100) of the participants were male and 69 (N = 100) of them were female (Table 1 in Appendix 1). All of the experiment subjects had attended standardized English classes in guidance school and high school before entering university. On average, the students had 10 years of English learning experience from guidance school, secondary schools, and the university. In actuality, the participants were taught in the context of learning English as a foreign language. Thus, they all have a similar background in learning English.

#### ***Instruments***

The major instrument used in this study for data collection was that of Horwitz et al’s (1986). To put it narrowly, the Foreign Language Classroom Anxiety Scale abbreviated to FLCAS (Horwitz, Horwitz, & Cope, 1986) was used to measure the participants’ English language anxiety. This scale comprises 33 items. Each item is accompanied by a 5-point Likert scale: 1 = strongly disagree, 2 = disagree, 3 = neither agree nor disagree, 4 = agree, 5 = strongly agree. Though the subjects were required to answer all the 33 items in the FLCAS scale, only the items which tended to address the students’ speaking capability were considered as worth mentioning in the “data analysis” section.

This scale was chosen for this study because of its effectiveness in identifying respondents’ perception of foreign language anxiety. Preliminary evidence (Horwitz et al., 1986) indicated adequate test-retest reliability over a period of 8 weeks, yielding  $r = .83$  ( $p < .001$ ), and acceptable internal consistency  $.93$  ( $N = 75$ ). Saito, Horwitz, and Garza (1999) also reported this instrument has a reliability coefficient of  $.94$  (Cronbach alpha,  $N = 383$ ).

#### ***Procedures***

Volunteers were recruited in the fall semester of 2012. Fliers containing the relevant information regarding this research were made available to the students of the English Department. Afterwards, those who wished to participate in the experiment of the current research referred to the researcher and got enrolled. To encourage students' participation rate, they were told this research was important and would provide insights and guidelines for teaching approach and curriculum planning in the future. Students then completed a questionnaire containing their background information. In response to the statements on the FLCAS, students were asked to think about their experiences in their English courses in the spring semester of 1391 and the preceding ones. Therefore, students' FLCAS scores reflected their anxiety in the English classrooms they had been ever since they had entered university. In order to encourage honest answers, students were ensured that they were not required to provide their names and a coding system was utilized on their particular questionnaires. In this way, data did not contain any identifiable names. A number of codes were used throughout data collection, analysis, and interpretation. Any identifying information was kept separate and confidential.

## RESULTS AND DISCUSSION

As was formerly stated, the samples are the students of the English Faculty with a population of 100 students. The questionnaire was developed based on the Foreign Language Classroom Anxiety Scale (FCLAS). However, this study attempts to identify potential sources of anxiety relevant to the students' affective needs or concerns in an institution of higher learning through the use of an in-depth qualitative questionnaire. As the pre-administered questionnaire findings indicate, the differences in the level of language anxiety exhibited by the participants seem to vary by a few factors which will be dealt with in due course.

Moreover, since this study tries to explore the anxiety which comes about among male and female students while speaking English as a second language, the researcher treated the scale selectively. That is to say, emphasis has been put on those scale items which are, one way or another, more relevant to the subjects' oral production proficiency. They are listed and analyzed as follows:

### **Statement 1: I never feel quite sure of myself when I am speaking in my foreign language class.**

This statement was chosen to analyze whether the students felt confident when they were speaking in class and to identify which gender has more self-confidence. As it can be seen in table 2 (see appendix 1), 19% of students who were male along with 60% who were female, with a total of 79%, agreed with the statement. The amount is big enough to clearly indicate that most students, regardless of their gender, lacked self-confidence in terms of expressing themselves in English.

### **Statement 3: I tremble when I'm going to be called on in language class.**

It is not uncommon to think that language learners find themselves more or less trembling when speaking a new language. This feeling becomes even more acute if they have to do it in front of an audience and particularly teachers, who may as academically important authorities, negatively affect the students' performance. A glance at table 2 (Appendix 1) reveals the fact that 64% of respondents agreed with the above statement. Out of this amount, 10% accounts for males and 54% for females. This means that the idea of being called on by the teacher in class is fearful for many students. It can also be concluded that, in this study, the majority of the male students are less anxious compared to female students.

### **Statement 9: I start to panic when I have to speak English without preparation in language class.**

The results suggest that, when it comes to speaking English without preparation, a rather large number of students experience anxiety. Based on the statistics available in this research, 81% of all students — 22% male and 59% female students — subscribed to statement 9.

### **Statement 12: In language class, I can get so nervous I forget things I know.**

With reference to table 2 (see appendix 1), 64% of the participants find it annoying to forget to say things they know. This feeling of anxiety is observed in males and females comprising respectively 13% and 51% of all the respondents. As the figures show, female participants undergo more nervousness compared to male participants.

### **Statement 13: It embarrasses me to volunteer answers in my language class.**

Table 2 in appendix 1 reveals that 53% of respondents agree they feel embarrassed when they want to volunteer answers in their language class. Among them, 9% are male and 44% are female. One other remarkable implication here is that, in contrast with female students, male students volunteer answers more willingly in a language class. This might be indicative of the male students being more confident than female students as well.

**Statement 16: Even if I am well prepared for language class, I feel anxious about it.**

Through this statement, the researcher intended to determine whether the students were still nervous if they had prepared to speak in English (i.e.; during presentations, interviews, etc.). Drawing on the figures put forth in table 2 (Appendix 1), 56% of the respondents in total agreed with the above statement. This indicates that even preparation for speaking will not fully rob language learners of anxiety. Further analysis of table 2 suggests that female respondents are more anxious compared to males.

**Statement 19: I'm afraid that my language teacher is ready to correct every mistake I make.**

As for this statement, 42% of the all participants confirmed that their language teacher corrections frighten them. Out of this figure, 14% were male and 28% female. The statistics related to this statement also indicate that more female students were afraid that their lecturers would correct their mistakes in class. This is because they fear being embarrassed as a result of teacher's correcting them in front of others.

**Statement 23: I always feel that the other students speak the foreign language better than I do.**

The total percentage of those who agreed with this statement is 59% out of which 14% were male and 45% female students. Two major implications can be made here. First, more than half of the respondents were anxious that their classmates would do better in the foreign language speaking. Second, female respondents had higher anxiety levels compared to male respondents. The underlying reason might be sought in self-confidence, i.e., male students usually develop a positive attitude in a situation like this, and hence tend to show more confidence in their ability (here, speaking) compared to female students.

**Statement 24: I feel very self-conscious about speaking the foreign language in front of other students.**

One of the key stressors of speaking English is perception of others. In the findings, it can be analyzed that students have a tendency to keep thinking about the perceptions of others with 67% agreeing that they are afraid of others' perceptions. Of all those who agreed, 22% were male and 47% female. This suggests the superiority of male students over female ones as far as confidence is concerned, because, according to the figures, male participants proved to be less anxious.

**Statement 30: I feel overwhelmed by the number of rules you have to learn to speak a foreign language.**

The complaints made by foreign language learners about knowing and applying many rules to speak a new language seem to be never-ending. The reason is not too far to seek. It could be argued that speaking a foreign language (here, English) is a multi-faceted and extremely complicated task. Since, learners have to take into account a number of aspects such as; grammar, pronunciation, accent, choosing appropriate words to express the intended meanings and putting them into a proper order, self-monitoring, self-correcting, being worried about what other people around them would think of their oral performance, and etc. All these might provide one with compelling reasons not to be surprised by the fact that a total of 68% of all students agreed with the above statement with 17% being male and 51% being female.

***Discussions***

The findings of this study seem to be mostly supporting the findings offered by the previous research on language anxiety, though not agreeing with every detail. No significant difference was found between students' perceptions on the anxiety-evoking factors, though they differ in their interpretations of these factors according to their experience and level in ESL/EFL learning process. In spite of high correspondence of the findings to the existing research, the study also found some differences and discrepancies compared to some previous studies on language anxiety.

***Anxiety-evoking Factors***

The remainder of this chapter will be dealing with the anxiety-producing factors found in this study. These factors could range from psycholinguistic to socio-linguistic ones. Psycholinguistic factors, on one hand, refer to the

learners' cognition, that is to say their psychological or cognitive process of learning and using a language. The socio-cultural aspect of L2/FL learning, on the other, refers to learners' culture, social environment, status and power relations, gender, etc. Learners' manifestations of anxiety and the strategies to cope with language anxiety have also been discussed toward the end of the chapter.

#### *Psycholinguistic Elements*

How learners' perceive the language learning process, their perceptions about themselves and how they should be performing in any communicative event, and the linguistic obstacles they encounter while communicating in English have been found to be strongly linked with language anxiety. Such psychological and linguistic factors that may cause language anxiety for EFL/ESL learners are as follows: a) Formal classroom instruction. b) Class presentation. c) Fear of being negatively evaluated by others. d) Teachers presence in class. e) Pronunciation. f) Grammar. g) Vocabulary.

#### *Socio-cultural Elements*

In addition to psycholinguistic factors which can cause anxiety in speaking a new language as was formerly discussed, there are social several socio-cultural factors that are likely to bring about anxiety in a foreign language speaking context. Among them are; culture discrepancy, social status, learners' own sense of foreignness while speaking a language other than L1, gender, etc. All these have been found to be linked with L2/FL anxiety. Some participants of this study even remarked that social factors are a more important cause of language anxiety than linguistic factors.

### **CONCLUSIONS**

Although the existing research has provided a valuable insight into language anxiety from both statistical and descriptive aspects, the phenomenon, because of its complicated and multi-faceted nature, requires further exploration from a variety of perspectives and approaches. The results of this study clearly indicate that the most anxiety provoking skill in L2/FL (English) learning is speaking skill. Almost all research subjects acknowledged that people feel anxious and nervous while speaking English in front of others.

What seems to distinguish speaking is the public nature of the skill; this poses a threat to peoples' self-concept, self-identity, and ego, which they have formed in their first language as reasonable and intelligent individuals. Every factor or situation that creates possibilities or enhances the chances of exposing their deficiencies and language imperfections in front of others is likely to cause language anxiety for ESL/EFL learners. This situation could be either classroom interaction in the form of open class forum, group participation or class presentation, or giving a short talk in any public event is likely to challenge learners' communicative abilities.

However, for effective alleviation of language anxiety, the comparison of the results obtained in this study with those of the past studies suggests that there do not seem to be any specific remedies for language anxiety. Language anxiety, more than anything else, does demand the careful attitude of the language teachers in order to understand and to effectively diagnose this phenomenon in the learners. Then, it requires the application of modern approaches that lay emphasis on enhancing learning opportunities in an environment that is conducive to learning.

The problem of learners' language anxiety remains one of the greatest obstacles teachers have to overcome in language classrooms. I hope to have shed some light on this complex phenomenon, which teachers can only deal with successfully if they are properly informed. The research to date has contributed to our understanding of language anxiety, and provides useful insights to teachers as they consider classroom methods and practices. Nonetheless, there is much we do not yet know about language anxiety — especially, about its relationship with other factors such as motivation, personality, and self-confidence — hence, more research in this area would be urgently helpful.

There are limitations to this study that are worth being mentioned. The sample of the subjects who had willingly enrolled to participate in the research experiment was fairly small in size. Also, in order to investigate the complex issue of language anxiety, it was difficult to arrange that subjects would attend the experiments at the same time. This was basically due to the fact that they came from different levels and classes in their four year course of English study. Furthermore, the role played by individual experiences was difficult to evaluate from the questionnaire results, because the participants were not ethnically and culturally homogeneous. They varied in

language learning experiences, as well. It is also equally possible that the subjects might not have touched on some of the anxiety-producing factors, but rather having tried to relate some of their experiences with anxiety, which they may not otherwise have felt to be contributing to anxiety.

And finally, due to time shortages as well as administrative limitations, no proficiency test was held. Hence, the participants' homogeneity in terms of language proficiency level was based on the years they had been studying English as a foreign language both in school and university.

### ***Implications for pedagogy***

It is commonly believed that language anxiety can exert detrimental influence on second/foreign language learning and communication in the target language. Accordingly, the language instructors should recognize that anxiety is a major cause of students' lack of success in L2/FL communication and do anything they can to assist them to overcome their feelings of unease and discomfort. Based on the findings of this study, the following recommendations might be proposed.

The first thing is to recognize your own feelings of second language anxiety. It is vital to identify your own feelings, because in the process we will be able to recognize the causes of our anxiety. People sometimes happen to be nervous, however it shouldn't make one believe that they will perform poorly. Nervousness sometimes will help in enhancing the vitality and enthusiasm brought to the situation. The next important suggestion is to share your feelings with others. It is helpful knowing that you are not suffering those feelings alone. Even professionals such as artists or experienced speakers may feel some sort of anxiety when they have to speak in public. Thus, having a slight feeling of anxiety is normal as it is experienced by many.

It should be borne in mind by language learners that nobody is aware of their fright except if there are outward signs of nervousness. However, nervousness can be controlled. Students must focus on getting their message across to the audience and not be afraid to make mistakes. Most of the time, mistakes are signs of learning and progress. Many native English speakers do not speak a second language, so the fact that the students are able to converse in a second language should mean a lot. Innovative approaches should be adopted by universities to minimize apprehension and maximize students' achievement. Instructors must encourage the students to express themselves in English and help them reduce their anxiety by giving them support. Teachers might also use quick relaxation techniques such as tensing the body for a count of 10 and then breathing deeply in and out to a count of four for a period of three to five minutes. This is especially effective after a tension-producing event. The most important thing is, in order to increase the level of efficiency in the English language, we need to practice. Practice will make perfect. Practice speaking with friends or family, or even text messaging them in English which will also help to increase the level of proficiency in English and all these in turn would reduce the level of second language anxiety.

It is also highly recommended that for active participation in the classroom discussion, students should be provided with amicable, informal and learning-supportive environments. This can be done by teachers' friendly, helpful and cooperative behavior, making students feel comfortable when speaking in the class. A sense of fun is also indispensable to create a relaxed learning environment and sustain motivation. Caring and sharing activities can create a sense of fun which would eventually result in reducing the effect of social and status differences between students and teachers to a remarkable extent.

The above-mentioned recommendations and suggestions are not posited to be comprehensive covering all the instructional contexts. However, they are apt to drastically curtail the impact of anxiety in the process of foreign language learning, in general, and foreign language speaking, in particular.

This article derives from a research project titled '*Anxiety as a Deterring Element in Learning English for Oral Communication among EFL Students in Islamic Azad University — Abadan Branch*' which was funded by Islamic Azad University, Abadan Branch, Iran, and the author's acknowledgement is due where upon.

I also wish to express my deep sense of gratitude to my colleagues; Rahman Makvandi and Hoda Rezaei for their outstanding contributions to the research project.

#### Notes on table 2:

A) 'Neutral' corresponds to 'neither agree nor disagree'. B) 'So.' is short for sophomore, 'J.' for Junior, and 'S.' for senior. C) To save space and have a more compact table, choices 'strongly agree' and 'agree' are fused together as the general concept of 'agreement'; likewise, 'disagree' and 'strongly disagree' as that of 'disagreement'.

## Appendix 2

### Foreign Language Classroom Anxiety Scale (Horwitz et al, 1986)

1. I never feel quite sure of myself when I am speaking in my foreign language class.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
2. I don't worry about making mistakes in language class.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
3. I tremble when I know that I'm going to be called on in language class.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
4. It frightens me when I don't understand what the teacher is saying in the foreign language.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
5. It wouldn't bother me at all to take more foreign language classes.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
6. During language class, I find myself thinking about things that have nothing to do with the course.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
7. I keep thinking that the other students are better at languages than I am.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
8. I am usually at ease during tests in my language class.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
9. I start to panic when I have to speak without preparation in language class.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
10. I worry about the consequences of failing my foreign language class.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
11. I don't understand why some people get so upset over foreign language classes.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
12. In language class, I can get so nervous I forget things I know.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
13. It embarrasses me to volunteer answers in my language class.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
14. I would not be nervous speaking the foreign language with native speakers.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
15. I get upset when I don't understand what the teacher is correcting.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
16. Even if I am well prepared for language class, I feel anxious about it.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
17. I often feel like not going to my language class.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
18. I feel confident when I speak in foreign language class.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
19. I am afraid that my language teacher is ready to correct every mistake I make.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
20. I can feel my heart pounding when I'm going to be called on in language class.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
21. The more I study for a language test, the more confused I get.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
22. I don't feel pressure to prepare very well for language class.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
23. I always feel that the other students speak the foreign language better than I do. Strongly agree    Agree  
 Neither agree nor disagree    Disagree    Strongly disagree
24. I feel very self-conscious about speaking the foreign language in front of other students.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
25. Language class moves so quickly I worry about getting left behind.  
 Strongly agree    Agree    Neither agree nor disagree    Disagree    Strongly disagree
26. I feel more tense and nervous in my language class than in my other classes.

Strongly agree	Agree	Neither agree nor disagree	Disagree	Strongly disagree
27. I get nervous and confused when I am speaking in my language class.				
Strongly agree	Agree	Neither agree nor disagree	Disagree	Strongly disagree
28. When I'm on my way to language class, I feel very sure and relaxed.				
Strongly agree	Agree	Neither agree nor disagree	Disagree	Strongly disagree
29. I get nervous when I don't understand every word the language teacher says.				
Strongly agree	Agree	Neither agree nor disagree	Disagree	Strongly disagree
30. I feel overwhelmed by the number of rules you have to learn to speak a foreign language.				
Strongly agree	Agree	Neither agree nor disagree	Disagree	Strongly disagree
31. I am afraid that the other students will laugh at me when I speak the foreign language.				
Strongly agree	Agree	Neither agree nor disagree	Disagree	Strongly disagree
32. I would probably feel comfortable around native speakers of the foreign language.				
Strongly agree	Agree	Neither agree nor disagree	Disagree	Strongly disagree
33. I get nervous when the language teacher asks questions which I haven't prepared in advance.				
Strongly agree	Agree	Neither agree nor disagree	Disagree	Strongly disagree

## ABSTRACT

This study focused on the effect of two factors of complexity and salience and the mixture of both on listening comprehension. Advanced learners were divided into four separate groups (complex-salience-mixture-control) and each group was tested by different listening tests. Each group received a pre-test, 10 sessions of during-test instructions and a final post-test. In complex group, students experienced lack of time for checking the questions, lack of familiarity with the topic of listening, increasing the number of questions and the absence of background knowledge. In the mix group, beside the above mentioned items learners were deprived of looking at the questions in advance which made the task vague to (lack of saliency). In salience group, learners had some information about listening except what questions they are supposed to answer and in control group no changes was imposed in the task and questions. The results revealed that the mix group (complex and salience together) which had two factors of complexity and salience in their tests showed a significant change in their performance from pre to posttest. The difference between the scores of post-test for the *complex* and *salience* groups was somehow significant compared with their pre-test scores, but these scores of the two mentioned groups were not as much significant as were the scores of the *Mix* group. Applying the suggested method of practicing listening tasks for learners can somehow increase their concentration on the task and surging their quality of listening comprehension.

**KEYWORDS:** *task complexity, salience, listening comprehension*

## INTRODUCTION

Listening is an important language skill to be developed in second language acquisition (SLA) (Dunkel, 1991; Rost, 2001; Vandergrift, 2007). Rost (2001) maintains that "a key difference between more successful and less successful acquirers relates largely to their ability to use listening as a means of acquisition" (p. 94). A considerable body of research has been conducted on listening comprehension tasks in EFL contexts. According to Kurita (2012), numerous studies have been done on cognitive and linguistic factors, as well as on affective factors on listening comprehension. Although there are a variety of techniques to teach L2 listening comprehension this Cinderella skill (Nunan, 1997) is often treated as a passive and receptive skill and mere exposure to the spoken language is considered to be enough for learners to develop their listening skills automatically (Scarcella & Oxford, 1992). Using different tasks and changing the difficulty and clarity of listening activity for language learners may have an effect on mastering this skill (Nunan, 1997). Task based learning is based on the idea that if students just listen and do nothing, there will be no guarantee to learning, while having a task in all three stages of doing the listening, (pre/whilst and post listening activities) can give this confidence to students to believe that they have acquired the language. This study seeks to focus on the second stage of listening, which is "*while listening*". We aim to examine to what extent changing the complexity of the task given to the learners can affect their listening comprehension ability. Moreover, *salience* which refers to clearness of the listening activity and the presence or the lack of background knowledge about the targeted listening task will be scrutinized.

## REVIEW OF LITERATURE

A few studies have been conducted on using tasks to make listening more objective. Giving different activities to learners before they start listening or in the middle of it can boost the amount of understanding (Nunan, 2003).

For a long time, the role of listening comprehension in English teaching programs was neglected. According to Richards (2002), before 1970s listening was hardly appeared in journals. However, this ignored condition of listening changed after Krashen (1985) theorized that comprehensible input which was very fundamental in starting language development. The importance of listening was highlighted with the introduction of Communicative Language Teaching (CLT).

Over the last 20 years, tasks have become a unit of design in a communicative curriculum. They are made to engage learners in realistic communication on the assumption that engagement in communicating meaning leads to implicit learning (Crabbe, 2007). Research on task design attempts to find variables in task design that will lead to second language acquisition processes such as negotiation or noticing (Bygate et al., 2001; Ellis, 2003). Tasks and their components, characteristics, types, and implementation conditions have been the focus of much research (Albert & Kormos, 2004).

The great advantage of tasks is that they let learners engagement in realizing the communicative aims of the semantic resource (Widdowson, 2003) and the most important role for a language task is to allow learners to deal with certain language problems in completing the task (Long, 1985). Nunan (2003) pointed out that task-based language teaching is an approach to design language courses in which the point of departure is not an ordered list of linguistic items, but a collection of tasks. It potentially shows the experiential and humanistic traditions as well as the changing conceptions of language itself.

A study by Mahmudi investigated the impact of the type of syllabus (structure-based vs. task-based) on the listening comprehension of two homogeneous classes. The subject of the structure-based group was American Kernel Lesson: (O'Neil et al., 1978), and the second group was taught based on Expanding Tactics for Listening: intermediate (Richards, 2005). Contrary to the structure-based group, the task-based one showed considerable improvement in the post-test performance.

A present-day listening lesson is likely to have these stages, Albert and Kormos, (2004). It has pre-listening for context and motivation, extensive reading to design the situation, pre-set questions and tasks, extensive listening, reviewing the questions and finally inferring new vocabularies and testing new grammars. Yet, the method, complexity and salience of these stages have not been studied and more investigation is needed to find ways to improve listening comprehension. These changes have made 3 developments in listening skill; firstly, listening is a skill which has priority over the details of language content. Secondly, one is that it has tried to match the listening which students get in a class to the listening activities in the real world. Thirdly, learners' motivation has found its place in listening task to encourage them to develop expectation about what they will hear. Although teaching listening has become more sensitive to learners' need, it still follows the same procedure for the content and form. In order to get a good result in listening, it is necessary to provide micro-listening exercises which can be presented as a task in different level of complexity and salience (Field, 1983).

A few studies have been done in the field of listening proficiency about using task to make them more objective. Giving different activities to learners to do before they start listening or in the middle of it can boost the amount of understanding and producing language speeches. Complexity of the listening task and its clarity and salience is the matter which should be tested to find a clear answer to the question that how much difficulty in activities of listening and clearness of them can have an effect in elevating and fortifying learners listening comprehension.

#### ***Related researches on task complexity***

Foster and Skehan (1999) conducted a study on the effect of source of planning and its effect on task-based performance. Their study showed that the teacher can have significant effects on accuracy while planning can lead to more complexity, fluency. Group-based planning did not make performance different from that of the control group. Finally, there was little effect on performance as a result of the language versus content planning condition. Planning and on-line planning was equally grammatically complex. Moreover, the on-line planning led to more accurate language than pre-task planning.

Iwashita, (2001) made an attempt to find out that whether characteristics and performance conditions (involving different levels of cognitive demand) have any connection with different levels of fluency, complexity, or accuracy in students' responses. They were required to produce oral narratives from picturestrips that had been designed to differ in their cognitive demands. These four dimensions of task were considered: adequacy, immediacy, perspective and planning time. No significant effect for any of the measures (accuracy, fluency and complexity) was found, except an effect for accuracy in the immediacy dimension.

Yuan and Ellis (2003) operationalized planning at three levels: no planning, pre-task planning in which the students had 10 minutes to plan, and on-line planning where they had enough time to narrate the story. The results showed that pre-task planning fortified grammatical complexity, lexical variation and fluency while on-line

planning positively influenced accuracy and complexity of grammar. However, pre-task planning led to more fluent and lexically diverse language than on-line planning.

Ishikawa (2006) tested the effect of task complexity and language proficiency on speaking performance. Task complexity was performed along here-and-now / there-and-then dimension. The results indicated that increasing task complexity for advance learners had positive effects on accuracy, structural complexity and fluency, had negative effects on lexical complexity. Increasing task complexity for intermediate learners had positive effects on complexity of lexicon and structure, accuracy and fluency. He also investigated the effects of manipulating task demands of intentional reasoning on L2 speech performance. Three types of tasks were used: simple reasoning task, complex reasoning task, and no reasoning task. The results indicated that intentional reasoning had positive effects on syntactic as well as lexical complexity and accuracy, but it had a negative effect on fluency.

Gilbert (2007) studied the effects of performing cognitive complexity of L2 oral tasks on self-repair behavior during monologic production. Using three different types of tasks, the narrative task was manipulated along here-and-now / there-and-then, an instruction task was performed along few elements / many element and decision-making task was manipulated along with / without reasoning demands. The results showed the effect of task complexity on behavior based on the type of the task, with different behaviors among the three task types. In this study similar behavior was observed based on simple and complex performance. In performing simple tasks students made more errors and corrected more frequently. Besides, learners made a large proportion of errors in the oral task than in instruction-giving task and decision-making task. So, the narrative task produced the highest amount of self-repair.

Kuiken and Vedder (2007) studied the effects of cognitive task complexity on written production for accuracy and lexical variation by implementing specific measures of writing proficiency considering the type of errors the students made and the frequency of the words used by them. Task complexity was manipulated along errors and words frequency. The results indicated that both students of Italian and French had fewer errors in the complex task of lexicon. However, the students of French made more errors in complex tasks than in simple tasks. Also, the Italian students used more words with high frequency in complex task while the French students used more infrequent words in complex task.

Michel, et al. (2007) studied the impact of changes in task complexity, few elements, many elements, and task condition on L2 oral performance. The results showed that increasing task complexity promoted accuracy but had a negative effect on fluency and linguistic complexity to some extent. Dialogic tasks were more accurate and fluent but less complex output. Besides, in the monologic condition task complexity increased accuracy.

Rahimpour (2007) found that there-and-then task (complex task) made more accuracy while here-and-now task (simple task) caused more complexity. In terms of fluency simple tasks led to more fluency than the complex task.

Gilabert, et al (2009) studied the effects of using cognitive complexity on different task types and its impact on learners' interaction during oral performance. The result of the study based on decision-making tasks showed no clear differences between accuracy of the learners' performance on the two tasks. Gilabert and his colleagues used the result for the nature of the decision-making task types.

Kim (2009) conducted a study on the effects of task complexity on learner-learner interaction of students in different levels of proficiency. Task complexity was held along with / without reasoning demands and few / many elements. Tasks were two-way ones which need interaction among participants. The findings of the study clarified that task types and learner proficiency are important factors which have an effect on task complexity in L2 learning opportunities.

Yousefi (2009) tested the effect of task complexity on L2 learners' uptake. Two versions of simple and complex tasks were used as a decision-making type. The results of the study showed that the rate and achieved success in complex task were higher than its simpler version comparatively.

Ong and Zhang (2010) investigated the effects of task complexity on fluency and lexical complexity of 108 EFL students for writing. Task complexity was performed using three factors of time planning, ideas provision and, and

the availability of drafts. The results of the study manifested that: 1.increasing task complexity based on planning time made greater fluency. 2. Task complexity increasing through the provision of ideas produced higher lexical complexity without any effects on fluency. 3.increasing task complexity through the draft availability makes no clear differences in fluency, and lexical complexity.

Ahmadian and Tavakoli (2011) studied the effects of using online planning and task repetition simultaneously on oral performance of L2 learners as a matter of three linguistic areas of accuracy, fluency, and complexity. It was indicated that students in online planning groups spent more task completion than in control groups, and the differences were significant. This study provides more evidence on the limited and selective nature of attention capacity in which L2 learners using more time for task completion have produced more accurate language than those performing the task under time limitation. Moreover, the findings of the study also showed a high level of positive effect on complexity in EFL oral production.

Blau (1990) did a study on the effect of simplifying syntax or inserting surface clues for more complex sentences on L2 listening comprehension but found no effect. These results show that changing sentence structure (in terms of simplifying syntax and including cues) of aural scripts does not have an effect on second language learners' listening comprehension. Pica Young and Doughty (1987) investigated the effect of modifying syntax on listening comprehension. The results show that participants listening to scripts with lower syntactic complexity did not perform better than those who were given unmodified scripts and the opportunity to interact with the speaker.

From a psycholinguistic point of view, the ability to comprehend a language is known as a complex and active skill which consists many different mental processes (Taylor, 1981). According to Byrnes (1984, p. 318), listening comprehension can be considered as a "highly-complex problem-solving activity" which consists of a set of different sub-skills. While task-based activities in language provide nice opportunities for L2 learners, simultaneously they aim to create the conditions for acquisition and further L2 learning. Listening consists of real-time processing without going back to previous sections that the listener may have missed (Buck, 2001; Flowerdew, 1994). Moreover, as most listening involves full control of receiving speech, control over the speed of delivery for listeners varies much more widely (Osada, 2004). Besides, in spoken language comprehension, word boundaries must be inferred from a large number of lexical and phonological cues (e.g., Cutler, Dahan, & Van Donselaar, 1997). These factors are basic qualities of listening. However, there are other factors which are effective such as a fast speech rate, presence of infrequent vocabulary, task complexity, and task salience. In the late 1960s and early 1970s listening comprehension lessons had a consistent format. It included: pre-teaching new vocabularies, extensive listening which is questions about general context, intensive listening which are detailed questions, testing vocabularies and grammar and use of a play and repeat or recall words. Over the past 25 years there have been some advances in revising and modifying the method and stages of doing listening tasks for learners.

Among three aspects of task-based pedagogy, to Robinson (2001a) a task complexity is the task dependent and proactively manipulated cognitive demand of tasks. Robinson (2001) believes different criteria for task complexity; provide a basis for deciding about sequencing tasks in a task-based syllabus as well as a framework for considering the effects of increasing L2 task complexity on production, comprehension and learning. In this study an attempt has been made to study the effect of difficulty and salience of tasks on listening comprehension of advance English learners.

Several studies have investigated the effect of task complexity on different aspects of linguistic performance at different levels of L2 proficiency (e.g., Robinson, 1995; Robinson, 2001; Skehan & Foster, 1999; Rahimpour, 1997; Yuan & Ellis, 2003; Gilabert, 2005). One dimension of the present study attempted to examine the effects of task complexity on advanced EFL learners' listening comprehension. A well-known model of task complexity was put to the test, i.e. the 'Triadic componential Framework' known as 'Cognition Hypothesis' proposed by Robinson (2001). Cognition hypothesis claims that if dimensions of cognitive task complexity belong to different attentional resource pools (e.g., memory and attention), increases task complexity along the so-called resource directing variables (e.g., +/- few elements, +/- Here and Now, +/- reasoning demand) lead to higher complexity and greater accuracy of learner's output.

The two most influential models of task complexity are the Limited Attentional Capacity Model (Skehan, 1998; Skehan & Foster, 1999, 2001) and Triadic Componential Framework (Robinson 2001a, 2001b, 2003). The Limited Attentional Capacity Model is that attentional resources are limited and that increasing the complexity of tasks reduces a pool of general available attentional capacity and also it's notion founded on theories of 'working

memory'. The major claim of this model is that an increase in cognitive task complexity will make learners pay primary attention to the content of the task. In this model three dimensions of 'task complexity are distinguished (Skehan, 1998, Skehan & Foster, 1999, 2001): 'code complexity' which concerned with the linguistic of task,' cognitive complexity' concerns to task content, and 'communicative stress' refers to performance conditions.

Robinson (1996, 2001a, 2001b, 2003) proposes that input may be processed more deeply and elaborately if there are increases in the cognitive demands of tasks. This model distinguishing three dimensions: task complexity refers to two types of cognitive task features, resource-directing and resource-dispersing variables according to Skehan and Foster, task conditions refer to communicative stress category, and task difficulty a dimension which is lacking in the Limited Attentional Capacity Model, comprises learners' perceptions of the demands made by the task and is determined by the abilities (intelligence, working memory, language aptitude) and affective responses (anxiety, motivation, confidence) that learners bring to the task. In the following some criteria of task complexity by Robinson, Prabhu and Skehan are listed in tables.

*Table 1: CRITERIA SUGGESTED BY PRABHU (1987) TO DETERMINE TASK COMPLEXITY*

Degree of difficulty		
–		+
<i>Few elements</i>	AMOUNT OF INFORMATION	<i>Many elements</i>
<i>Few steps</i>	AMOUNT OF REASONING	<i>Many</i>
<i>Precise terms not needed</i>	DEGREE OF PRECISION	<i>Precise</i>
<i>terms needed</i>		
<i>Unfamiliar</i>	DEGREE OF FAMILIARITY	
<i>Familiar</i>		
<i>Objects and actions</i>	DEGREE OF ABSTRACTNESS	
<i>Concepts</i>		

Robinson (2001) has presented some factors which have an influence on the complexity of tasks from cognitive, interactive and difficulty point of view. In case of task complexity he is in agreement with Prabhu (1987).

*Table 2: ROBINSON'S MODEL OF TASK COMPLEXITY, BASED ON ROBINSON (2001A; 2001B; 2003A)*

Cognitive factors	Interactive factors	Difficulty factors

<b>Task complexity</b> a) Resource directing e.g., +/- few elements +/- Here-and-Now +/- No reasoning demand b) Resource dispersing e.g., +/- planning +/- Single task +/- Prior knowledge	<b>Task conditions</b> a) participation variables e.g., one way/two way convergent/divergent Open/closed b) participant variables e.g., gender Familiarity Power/solidarity	<b>Task difficulty</b> a) affective variables e.g., motivation anxiety confidence b) ability variables e.g., aptitude proficiency intelligence
--	---	--

The following table elaborates the criteria for task complexity, mentioned by Robinson (2001) and clarifies how different factors can cause the task to get complex.

*Table 3: TASK COMPLEXITY CONDITIONS ADAPTED FROM SKEHAN (1996; 1998) AND ROBINSON (2001A5) MODELS OF TASK COMPLEXITY*

<b>Dimensions</b>	<b>Complex/+</b>	<b>Simple/-</b>
<b>Planning time</b>	Not having time to look at the listening items before listening to the tasks	Having time to look at the listening items before listening to the tasks
<b>Perspective</b>	Answering the task items after listening to task with third person point of view	Answering the task items after listening to task with first person point of view
<b>Prior knowledge</b>	Listening to the task and answering the task items without prior knowledge	Reading related written prior knowledge before listening and answering the task

The following table describes the stages of learning process from task demands to performance based on resource directing. it shows the relationship between cognitive sources and learning mechanisms and their effects on performance.

*TABLE 4: TASK COMPLEXITY AND LANGUAGE LEARNING ALONG RESOURCE-DIRECTING (NOT RESOURCE DISPERSING) DIMENSIONS (FROM ROBINSON, 2001A)*

<b>Task demands</b>	<b>Cognitive resources</b>	<b>Learning mechanisms</b>	<b>Performance effects</b>
more cognitively —> input demanding tasks output, output salient	more attention—>  to input /output  and noticing/  rehears in memory	more rule and —>  instance learning/  stage shifts/  proceduralization/ cue strengthening	more incorporation of  more modification of  i.e., more uptake of  input, more stretching syntacticization of interlanguage

*Related researches on task Salience*

Salience depends on the accessibility of a category within a person's cognitive repertoire and on the fit of the category to the situation (Oakes, 1987). A category is more likely to be salient if the individual is predisposed to perceive that category as relevant (accessibility) and if both the category and the situation match the individual's expectations and if reality matches these expectations (Oakes et al., 1991). Accessibility describes the perceiver's readiness to accept a category (Oakes, 1987). Fit refers to the match between category specifications and the stimulus reality (Turner, 1999). Salience can be increased for example if a category is especially mentioned (Hogg & Turner, 1985), if the category is set into a context of relevant and other categories (Turner et al., 1987, p. 112ff), and especially if the category is contextualized by conflict with other groups (Wagner & Ward, 1993).

In one study, the literal salience assumption was tested in a Cross-modal lexical priming experiment on advanced Polish learners of English. The experiment focused on visual aims related to literal meanings of idioms constituent words than on targets which are related to the metaphoric interpretation of the idiomatic phrase. This effect clarifies if the stimulus sentence contained a literal or metaphorical idiom.

Based on salience, the meanings will be comprehended as the meanings which are activated strongly in the course of language processing, because their representations in the mental lexicon are much more strongly encoded as a matter of length of storage and completeness of representation than those of the less salient meanings. Salience is a psycho-perceptual impact which is related to a number of psycho-perceptual properties. First prosodic prominence which are the words perceptually salient, have been noticed by the listener. Words which are important are, perceptually salient. Not all words will be assumed as being prosodically prominent. In an abstract representation called *Information Structure*. Information Structure can be merged into a set of assumptions about the sentences process in discourse, and memory functions. Information Structure is, therefore, a grammatical system with significant processing impacts, called the psycho-perceptual effect of finding some part of an utterance salient

The salience of an event is also defined as its distance from a null-event. This semantic distortion can be shown to be equal to the relative entropy between the distributions of the output actions. The salience of an event is then the unique positive measure of how much information that event supplies about the variable of suitable machine responses. Salience refers to the most probable interpretations of a word unit. The most salient meaning of special word, expression or sentence is prototypical interpretation or the most determined, familiar and frequent word which happens. Salience is based on previous knowledge and experience; so, it is a function of degree of familiarity. Salience is active and ready to change if environments, society, use and speakers change. Different salience is the result of different experiences, and second language acquisition differs from first language one. As a result, whatever salient for one person who belongs to the target language community will not essentially be salient for the 'newcomers of second language'. When using another language, learners do two activities. First, they focus on previous knowledge which is the knowledge of the first language and the socio-cultural background knowledge which language 1 is based on. Second, they also give priority to certain meanings they face in the target language. So, the meaning appeared in the mind of a second language learner as the most salient meaning of a word unit is the result of experience with two languages and cultures. Therefore, it may considerably differ from what the native speakers of that language think of as the most salient meaning of that special lexical item or expression. This might cause misunderstanding in communication.

What gets salient in the mind depends on, familiarity, frequency and conventions of encounters (Giora, 2003), e.g. linguistic and socio-cultural experience. Salient meaning refers to standard context in which the lexical item occurs repeatedly, so, we build our expectations about what may happen, and our ability to understand and predict how the world around us works (Violi, 2000). The more we confront with this meaning, the more familiar the situation it occurs becomes. Factors like frequency or familiarity play a critical role in shaping the status of probable meanings and determine which one gets the most important possible meanings of a lexical unit. The most salient meaning is not always the literal meaning. Giora (2003: 33) defines 'literal meaning' as what is denoted by each single word, as well as to what is said by the compositional meaning of the sentence made up of these words intended non figuratively. The most salient meaning(s) of a lexical unit can be either literal or idiomatic or sometimes both.

## RESEARCH QUESTION

There are three research questions which this study tried to answer.

- 1) Does task complexity affect listening comprehension of Advanced EFL learners?
- 2) Does task salience affect the listening comprehension of Advanced EFL learners?
- 3) Does implementing task complexity and saliency together simultaneously affect the listening comprehension of Advanced EFL learners?

## METHODOLOGY

### *The Participants of the study*

In this study, 60 male and female advanced English as foreign language (EFL) learners aged between 17 and 30 who have studied English for nearly six years were recruited. There are 34 boys and 26 girls in this research who study English in Tehran Institute of Technology (MFT) in **Tehran** and **Hamadan**, Iran. The place of running this study was the Language institute where students were studying English language. Selection was based on a pass score of an OPT (Oxford Placement Test) exam (80 out of 100) and justification of institutes which certified the advance level for them based on the advanced level of the book. **OPT** exam involves two sections of Listening and Grammar questions which some countries like England and the USA use it as the exam of placing and clarifying the academic level of learners English knowledge. All these learners studied English at least for 3 years and experienced different language classes. Along with the OPT (Oxford Placement Test), it has been attempted to consider all necessary factors to make them homogenous as much as possible in their listening, speaking and grammar proficiency and knowledge. They were divided into 4 groups of control, complex, salience and mix with different tasks and tests.

### *Materials and Instruments*

Participants were tested in 4 different groups (one control and three experimental ones) and two types of listening tests were implemented. *Multiple choice* and *sentence completion* listening questions were chosen from two books, *TOEFL Test Preparation Kit* by Educational Testing Service (ETS) (2003) and *Advance listening and Speaking/CAE* by Kathy Gude (1999).. The tests involved one pre-test at the beginning of the semester and one post-test at the end . Both pre and posttests had two types of questions. The 10 other *while* tests were also chosen from the mentioned books to test students during the semester to see the effect of giving these types of listening tests on task complexity and salience. In multiple-choice tests, both control and experimental groups had eight questions, but in sentence completion tests, the experimental group had ten questions, while the control one had eight questions. This study focused on advanced learners of English language. In order to make the participants homogeneous, Selecting the participants from advanced language learners of Tehran institute of technology was accompanied with the OPT (Oxford Placement Test) which was given to them to increase homogeneity in participants' level.

### *Procedure*

All participants were assigned to four groups. One control group received standard questions and three experimental ones were given modified questions. The data were collected in advanced English classes of Tehran Institute of Technology (FMT). Data collection was done during twelve sessions. All the four groups of participants had pretest, ten main tests and a final posttest for both types of multiple-choice and sentence-completion questions. In order to qualify students as an advanced learners, the OPT (Oxford Placement Test) exam was run. Besides, the participants were selected from advanced classes of the MFT institutes in **Tehran** and **Hamadan**, Iran. After doing a level adaptation and confirming all participants as advanced learners, they were divided into 4 groups. In the pretest exam, all students were exposed to the same questions, (multiple choice and sentence completion). *TOEFL Test Preparation Kit* and *Advance listening and Speaking/CAE* books were used which are credited as the reliable sources of advanced books of English language and the listening tests of these books are considered as the advanced level listening exams. They answered eight multiple choice and eight sentence completion questions. Then, these four groups were given ten multiple choice and sentence completion tests, but in different conditions with different methods of performance. The multiple-choice and sentence completion questions for the first group called (**Control**) were exactly standard questions without any changes.

In the second group (**Complex**) just the focus of the study was only on task complexity in which the background knowledge, time, number of items, critical words and familiarity with the topic of the listening were targeted. Contrary to the Mix group in which student did not even see the questions until the listening was over, here the questions were given to the testers just a few seconds before the listening started, but they still had no time to check the questions in advance, furthermore; they did not know the meaning of difficult words and had no background

knowledge about the topic of the listening. The task was salient since they knew what they were asked to do and the required information was clear and salient.

In sentence completion questions, the condition was similar to the multiple-choice one. The students received the questions just before the listening started, but the task was complex because of the mentioned factors of task complexity. The summary was deleted and there were twelve gaps to fill. In addition, students were not familiar with the topic of the listening and had no time to check the questions. But, as they had the questions while listening, it was salient for them what missing information they were required to listen.

The third group of participants (*salient*) also experienced the different method of performing the task of listening. In multiple-choice questions, in order to removing salience from the task, students were not supposed to see the questions until the end of playing the listening. But for this group the task was not complex as the teacher gave students a summary of the topic of listening some minutes before the listening started. In addition, the teacher wrote some critical words related to the listening on the board and elaborated on their meaning. Students also got some background information about the listening task. But contrary to the *complex* group, who received the questions in advance before the listening, here the participants of the *Salience* group did not have a chance to see the questions and get to know what they must do about the listening activity. It was not salient for them what they had to do after the listening finished.

In Sentence-completion questions, the exact activities related to removing the complexity of the task were done such as giving the participants a brief summary, plus the meaning of unknown words and making them familiar with the topic. But still they had no idea what gaps they had to fill, and what information they were required to present by the sentences.

In the fourth group (*Mix*), the condition was different. Both task complexity and salience features were inserted. The questions were not given to the participants, they were asked to listen and take notes on a piece of paper, they had no idea what the listening was about, they were not given time to do anything, they had no background knowledge about the listening, the task was not salient for them and they did not know what they would be asked to do after the listening, so they had no prior information, no time, no familiarity with the task and no idea what to do after the listening. In addition, after the listening was played, the questions were given to the students, but they only had the options not the stem of the questions, then the speaker read the questions and students spontaneously understood what answers they were expected to present. The task was *complex* as they had no knowledge, time and familiarity about the topic of the listening and it was not *salient* as they did not know what activities they were supposed to do about the listening task and what question from what part of that listening they would be asked.

In sentence-completion questions, the same procedure followed in complex and salience groups was implemented here all together. After administrating the pretest and ten sessions of while tests for both multiple-choice and sentence-completion tests, the posttest questions were given to the participants. In posttest, the standard tests with mediocre level of complexity and salience were given to the testees. All different forms of task complexity and salience which were implemented for the three experimental groups changed into their original standard forms which were routine in most listening activities. Then the results of participants' performance were analyzed.

## RESULTS AND DISCUSSION

The first step to answer the research questions was to calculate the descriptive statistics for the related conditions, and the second step was to submit the data to repeated measures ANOVAs to determine if there were any significant differences between the conditions specified for each of these hypotheses. The following represents the steps of screening the data against each null hypothesis. In this study one pre-test, ten while-tests or treatment and one final post-test were given to every of the 60 participants. After giving the tests and correcting them, the true answers of each participant in their own group was calculated. The data collected from all four groups (Complex-Salience-Mix-Control) were computed by SPSS software. One-way ANOVA was used in order to analyze the variance of these four groups. Factors which were chosen were complexity-saliency-mix and control. The one-way ANOVA was measured for the pre-tests of the four groups of participants and the result was as follows.

## Test of Homogeneity of Variances

Levene Statistic	df1	df2	Sig.
2.000	3	56	.086

## ANOVA

preComplexSalienceMixControl

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	7.000	3	2.000	2.000	.088
Within Groups	58.000	56	1.052		
Total	66.000	59			

A one way ANOVA was conducted to explore the impact of complexity and salience and the mixture of them on advanced learners' listening comprehension. Subjects were divided into four groups. There was no significant difference in the scores for the four groups. There was absolutely no difference in mean scores between the groups. As the significance of both, the test of homogeneity of variance and ANOVA was more than 0.05 which showed that there was no significant difference among the four groups in the pre-test stage.

Test of homogeneity of variance was held and no significant difference was seen. As all participants were advanced language learners and their proficiency in listening skill was tested by the oxford placement test (OPT) and all of them had the mean score between 70 and 80 from the whole score of 100, so, no significant difference was expected to be observed among the variance of these four groups of subjects in the pre-test.

FIGURE 1: BAR GRAPH VARIANCE OF PRE-TESTS

Based on the information gathered in pre-tests these two bar and line graphs to show the differences among four tests in detail according to the number of correct answers and the homogeneity which was obvious among four groups of participants. The difference among them is not significant.

FIGURE 2: LINE GRAPH VARIANCE OF PRE-TESTS

The line graph above illustrates the homogeneity in the correct answers among four groups of participants in the pre-test listening questions. As the figure shows, all the sixty participants in four groups have answered the questions almost equally, as they were selected based on the result of OPT exam. After getting sure about the homogeneity of participants proven by the one-way ANOVA in pre-test, the data resulted in post-tests were analyzed. Like pre-test, participants were examined by the same test which was similar to pre-test. The format, planning and the number of questions in this test were similar to pre-test exam. The result of their tests was analyzed and like the pre-test, the one-way ANOVA was done over the four groups results in the post-test exam.

#### Null hypothesis number 1

The first research question of this study focused on whether there is a relation between changing the level of task complexity in listening activities and improving or weakening the listening proficiency of advanced EFL learners. The hypothesis stated that changing the complexity of the listening task may improve the listening skills of advanced learners.

By complexity it has been tried to involve some factors in the format of the test to see if they can have an impact on the listening comprehension of the learners. Based on Robinson's (2001), and Skehan's(1996), model of task complexity, the criteria considered to make the task complex were time planning in which students were not given any time to check the questions at first, background knowledge that was not given to students about the topic of the listening, so students could not activate their background knowledge about the listening task, and the number of elements which had changed to make the task more complex. The One-way ANOVA was performed on the post-test results of the four groups of *Complex, salience, mix* and *control*.

ANOVA					
POST TEST (complex-salience-mix-control)					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	142.000	3	47.000	12.000	.000
Within Groups	212.000	56	3.000		
Total	354.000	59			

Tests of homogeneity of variances and Equality of Means were performed for all four groups of subjects. Between groups mean square of 47.000 with F 12.000 showed significant difference between groups .Sig .000 showed that

there was somehow significant relation between the complexity and changing listening comprehension condition. Therefore, the first null hypothesis was admitted.

### ***Null hypothesis number 2***

The second null hypothesis of this study tested the effect of saliency (removing the clarity of the task) on the performance of learners and their listening Proficiency. Like the complexity hypothesis, there was a significant difference in inserting the factor of saliency in the task given to the participants. The salience group showed difference in comparison with the pre-test after running the one-way ANOVA and the mean difference is significant at the 0.05 level with two other groups of Complex and Control, so the second null hypothesis was admitted as well, because the relation between the salience and Mix group was significant as the mean difference was -3.00000.

### ***Null hypothesis number 3***

The third null hypothesis claimed that mixing both factors of complexity and salience in the listening task will lead to increasing listening comprehension and proficiency. Making the task complex and salience simultaneously was the third hypothesis which was tested on the last group of participants. One way analysis of variance was conducted among four groups of participants with three independent variables (complexity, salience and the mixture of both variables) to explore the impact of mixing complexity and salience features of the task on advanced EFL learners' listening comprehension. Participants were divided into four groups (complex-salience-Mix-control). There was statistically a significant difference at the  $p < .05$  level in scores of the Mix group with 3 other groups. Despite reaching statistical significance, the actual difference in mean scores between the groups was quite small. The effect size, calculated using eta squared (Eta squared = sum of squares between groups divided by the Total sum of square) was .03. Post-hoc comparisons using the Tukey HSD test indicated that the mean score for group *mix* was significantly different from group *complex*, *salience* and *control*. The difference in mean score of Mix group is significant with all three other groups mean scores, special control group with the significance of .03. Post-hoc comparisons using the Games- Howell indicated that the mean score for group mix is different from the other three groups and the mean difference is significant at the 0.05 level. The following is the graphs which have been designed to show the exact difference in the outcome of the posttests of all four groups. As the graph illustrates, the answers of the Mix group among the other three groups of participants were more than eleven questions which had been answered by learners in average.

## **Post Hoc Tests**

Dependent Variable: postComplexSalienceMixControl **Multiple Comparisons**

	(I) factor	(J) factor	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
						Lower Bound	Upper Bound

		salience	1.06667	.00000	.000	.0000	2.0000
		mix	-2.00000*	.00000	.003	-4.0000	.0000

Games- Howell	Complex	salience	.00000	.00000	.000	-2.0000	2.0000
		mix	-3.00000*	.00000	.000	-6.0084	-1.0000
		control	-1.00000	.00000	.000	-3.0000	.0000
	Salience	complex	.00000	.00000	.000	-2.0000	2.0000
		mix	-3.00000*	.00000	.000	-5.0000	-1.0000
		control	-1.06667	.00000	.000	-2.0000	.0000
	Mix	complex	3.00000*	.00000	.000	1.0000	6.0084
		salience	3.00000*	.00000	.000	1.0000	5.0000
		control	2.00000*	.00000	.000	1.0000	3.0000
	Control	complex	1.00000	.00000	.000	.0000	3.0000
		salience	1.06667	.00000	.000	.0000	2.0000
		mix	-2.00000*	.00000	.000	-3.0000	-1.0000

\*. The mean difference is significant at the 0.05 level.

Generally, among all four groups of subjects, the scores of Mix group which their questions had the features of both complexity and saliency showed a significant difference with all three other groups. It seemed a little peculiar for the learners to listen to something without having any background knowledge, time, familiarity with the topic of the listening or any knowledge about the type of the questions or the task which they are asked to answer. But repeating the tests during the treatment period helped the participants to find mastery over conducting this type of listening activity. As nothing was given to the subjects beforehand and they just had a permission to listen and take notes, they found it more helpful in concentrating on the task and listening comparing to other groups who were exposed to the listening text and questions in advance.

FIGURE 3: BAR GRAPH VARIANCE OF POST-TESTS

The answers to the post-test questions between the complex and the salience groups were nearly the same and the average number of correct responses is between eight and nine. The Mix group which experienced the combination of complexity and saliency factors had the highest average number of true answers which is nearly 11 correct answers.

FIGURE 4: LINE GRAPH VARIANCE OF POST-TEST

In this line graph the procedure of answering the questions by the four groups is illustrated. All four groups experience a state of fluctuation in giving the correct answers to the given questions. As it is clear, the Mix group is above the other three groups by the fluctuation of correct answers from 8 to 13 correct answers.

As the result of computing a One-way ANOVA shows, after subtracting the scores of each group in pre-tests from the acquired scores in Post-tests, it was observed that there was a significant difference in the mean score of the Mix group. As the sig ANOVA is less than 0.05, so it proves that the significance is meaningful.

ANOVA  
DiffComplexSalienceMixControl

	Sum of Squares	df	Mean Square	F	Sig.

	salience	complex	.00000	.00000	.000	-2.0000	2.0000
		mix	-3.00000*	.00000	.000	-5.0000	-1.0000
		control	.00000	.00000	.000	-2.0000	1.0000
	mix	complex	4.06667*	.00000	.000	1.0000	6.0000
		salience	3.00000*	.00000	.000	1.0000	5.0000
		control	3.00000*	.00000	.000	2.0237	4.0000
	control	complex	.00000	.00000	.000	-1.0000	3.0000
		salience	.00000	.00000	.000	-1.0000	2.0000
		mix	-3.00000*	.00000	.000	-4.0000	-2.0237

\*. The mean difference is significant at the 0.05 level.

The difference between posttest and pre-test was computed and the one-way ANOVA was calculated .the scores of all four groups of pre-tests were subtracted from the scores of four groups of posttests. The result was put in to one-way ANOVA and the post-Hoc results were analyzed. As the different score of Mix group was higher than other groups, so there was a significant difference variance of four groups.

The difference in mean score of Mix group is significant with all three other groups mean scores, special control group with the significance of .000. Post-hoc comparisons using the Games- Howell indicated that the mean score for group mix is different from the other three groups and the mean difference is significant at the 0.05 level.

## CONCLUSIONS

The main purpose of this study was to find out if making the listening task complex, salience or both together has any effects on listening comprehension of advanced learner. Comparing the differences of the scores provided by the pre and posttest and analyzing their variance by the one-way ANOVA revealed some difference in the listening comprehension ability of the language learners exposed to complex questions and tasks. Changing the structure of the sentences and making them more complex had a small effect on the performance of the learners; it also caused them to focus more on the task.

The second hypothesis concentrated on the effect of task saliency on learners' listening comprehension. No effective and extensive research has been performed to see what will happen if students don't know what activities they are asked to do about the listening task. Saliency has been performed in language learning about the degree in which the activity is getting vague. What gets salient in the mind depends on, familiarity frequency and conventions of encounters (Giora, 2003).Saliency in language learning focuses on the familiarity of the targeted language that the listeners are exposed to, so it can be noticed effective in achieving the listening objectives. The efficacy of language can be influenced by so many different factors, and the saliency of the listening task can be one of them.

The third research question in this study analyzed the impact of making the task mix, (complex and salience).considering the mentioned procedure for this group, based on the result of the given test and posttest as well, the subjects have been able to answer majority of questions correctly. Talking with the participants of the Mix group, they believed that just taking notes while listening and not looking at the questions simultaneously cause them to focus on the content of the listening more carefully .They found looking at the questions and accessing them while listening as the case of distraction. Doing a survey among participants and interpreting the result of the test show that exposing participants to the questions of listening and giving them background knowledge or letting them to know what task and activity they will be asked to do has no significant effect on their performance of the task and on their listening comprehension skills as well. Making the listening task both complex and vague will increase the concentration of the learners and as a result better listening comprehension.

### *Implications of the study and suggestions for further research*

Conducting the investigation on the effect of task complexity and salience on advanced EFL learners' listening comprehension provides implications and suggestions for further research. There could be more complete and extensive research by changing the dependent and independent variables based on different aspects of listening comprehension and a vast range of participants. The results of this study could be extended by investigating whether implementing the factor of anxiety which is caused because of lack of knowledge and information about the task can have an effect on the result of the study. There was a possibility of checking the effect of gender (male/female) on the performance of the participants based on comparing their mind mapping.

## ACQUISITION OF PRENOMINAL AND POSTNOMINAL GENITIVES BY IRANIAN EFL LEARNERS

**Shokufeh Pakru Khosroshahi<sup>1</sup>, Ramin Rahmany**  
*Islamic Azad University, Takestan Branch*

## **ABSTRACT**

This study examined the acquisition of prenominal and postnominal genitives by Iranian English as a foreign language (EFL) learner. Two variables were considered: possessive categories and language proficiency. We considered the influence of possessive categories such as lexical modifier, semantic relationship, and weight and syntactic complexity on genitive alternations by Iranian EFL learners. Also, we examined whether the learners' different levels of language proficiency have any effect on the acquisition of the prenominal and postnominal genitives. To do this, 120 male and female students at BA and MA levels in English translation and teaching major with ages between 23 and 28 were selected. After administering a proficiency test, they were divided into two groups: high (58 students) and low (62 students). The results indicated that possessive categories including lexical modifier, semantic relationship and weight and syntactic complexity improved the students' acquisition. Also, there existed a positive correlation between the students' mastery level in English and the acquisition of prenominal and postnominal genitives.

**KEYWORDS:** Genitive Case, Prenominal Genitive, Pronominal genitive, Postnominal genitive.

## **INTRODUCTION**

Language speakers have the knowledge to perceive the component morphemes of a word since their mental grammar includes a mental lexicon of morphemes and the morphological rules for their combination (Hellar, 2002). There are a number of morphological and syntactic properties which differentiate subjects from complements. In English, subjects generally precede predicates and complements follow them. Moreover, subjects give various case properties to complements.

According to Lardiere (1998), case is a grammatical category specified by the syntactic or semantic function of a noun or pronoun, like many languages, English case markers are grammatical morphemes added to nouns to indicate whether the noun is subject, object, possessor or some other grammatical role. Also, he claims that case is a grammatical category in accordance with nouns and adjectives and also demonstratives, articles and other determiners. Also, he believes that cases are mostly marked by verbs, but not always. Within a sentence, case is narrowly associated with syntactic functions. Such as:

- Subject function is performed by a noun or NP in nominative.
- Direct Object function is conducted by a noun or NP in accusative.

Different case forms of typical pronoun and noun expressions include: nominative (as subject), accusative (as direct object), dative (as indirect object which is nearly lost or inactive in English language), locative (as location), vocative (as respect), and genitive (as possession). Kreyer (2003) states that the most commonly used term in describing the grammar of various languages is genitive case; genitive forms are used to mark ownership. In a broad sense, possessive form is a word or construction used to display a relationship of possession. Nouns or pronouns taking the form of a possessive are sometimes described as being in the possessive case; however, this usually denotes case with a broader range of function than just producing possessive forms. Therefore, it can be concluded that genitive case is part of a system in which relationships between noun and other parts of the sentence are signaled by inflection (Hinrichs & Szmrecsanyi, 2007).

Genitive case has three different types: 1) prenominal possessor used for animated entities (e.g. Peter's book) (Szmrecsanyi & Hinrichs, 2008). 2) pronominal possessors which are classified into two forms (a) possessive pronouns (mine, yours, his, hers, ours, yours, their) which are used nouns (Suda, 2007). (b) possessive adjectives (my, your, his, her, its, our, your, their) are inserted into sentences before noun as adjectives (Suda, 2007). 3)

---

postnominal possessor used for entities that do not indicate any traits of personality (e.g. the roof of the house) (Kreyer, 2003).

## REVIEW OF LITERATURE

Both in speech and writing, possession is a significant subject in grammar. Language learners bump into the usage of possession marker specially prenominal and postnominal genitives (so-called s-genitive and of-genitive, respectively). The English possessive marker 's is generally recognized as a clitic. Even though the term 'clitic' is used to identify a wide variety of elements, it can be said that it is an element which does not have the independence of a word (prosodically) (Scott, Denison & Börjars, 2007).

English nominal constructed with the morpheme -s as a so-called possessive marker may have an indefinitely large number of interpretations depending on the context of utterance. From a meaning-based viewpoint, possessive constructions are interesting largely due to the indeterminate number of interpretations to which they are subject. A simple nominal such as *Peter's shirt* might refer to the shirt owned by Peter, the shirt worn by Peter, the shirt Peter designed, the shirt he painted, or photographed, or has stolen.

Certainly the possessive morpheme is either extremely polysemous, or the encoded content it brings with it into the nominal is adequately abstract to be compatible with a very wide range of meanings (Aitken, 2009). According to Kreyer (2003), there exist many situations of overlap where both prenominal and postnominal genitives are appropriate option although in particular contexts the s-genitive ('N1's N2') can be substituted by the of-genitive ('the N2 of N1'), and vice versa. In these areas, both constructions are not a free variation since a number of possessive categories, linguistic as well as extra-linguistic specified an appropriate one (Altenberg, 1982).

Basically, prenominal possessive construction is a construction in which the possessor phrase precedes the head of the possessed phrase. In the s-possessive construction, the possessor phrase is followed by the morpheme s, which is traditionally considered as a genitive case marker that is an inflectional suffix on the head noun of the possessor phrase (Strunk, 2004).

Stefanowitsch (2003) states that a modifier with the possessive clitic -'s that precedes the head noun can produce prenominal genitive and if the modifier is syntactically marked by the preposition "of" and also possessor phrase follows the head of the possessed phrase, it makes postnominal construction that is a possessive construction.

According to Biber (2003), tendency of written genres to be more closely similar to spoken registers cause variation in written styles; colloquialization indicates progressing genitive variations in writing which prefer to use spoken styles as well. The clear evidence for this alternation is accepting more conversational writing styles, newspapers and news magazines which have been using styles that more nearly parallel patterns in speech. However, certain publications such as academic and technical journals, which like to involve more formal, passage with intricate grammatical structures and larger, more particular vocabularies do not confirmed colloquialization (Biber, 2003). Biber (2003) claims that in particular written genres (e.g newspaper reportage) an informational explosion has created pressure to communicate information as economically as possible. The s-genitive is naturally encouraged in these compressed contexts (Szmrecsányi & Hinrichs, 2008).

In written English, the of-genitive has been the more frequent construction, while in speech, s-genitive are more frequent than of-genitive (Szmrecsányi & Hinrichs, 2008; Tagliamonte & Jarmasz, 2008). The s-genitive is comparatively frequent in both spoken English and contemporary journalistic English. The s-genitive is, on the whole, more frequent in spoken data than in written data (Hinrichs & Szmrecsanyi, 2007). Raab-Fischer (1995) claims that the s-genitive has become importantly more frequent in press language in the period between the 1960s and the 1990s, with respect to genitive frequencies, press language has over time become more similar to spoken varieties of English.

Hinrichs and Szmrecsányi (2007) state that there existed a high frequency of s-genitive between 1960 and 1990. They claim that in modern English, the tendency of s-genitive usage has kept on through modern English. The of-genitive form is often considered as having formal limitations (Rosenbach 2002; Tagliamonte & Jarmasz 2008). The relationship between formality and the of-genitive guides the hypotheses that women, who have been found in

sociolinguistic studies to make use of formal structures more frequently than men, are more likely to utilize the *of*-genitive constructions and that people with higher education utilize more *of*-genitive (Shih, Grafmiller, Futrell & Bresnan, 2009).

## **RESEARCH QUESTIONS**

The present study was an attempt to find answers to the following research questions:

- 1) Do possessive categories such as lexical class of the modifier, semantic relationship, weight and syntactic complexity affect the acquisition of prenominal and postnominal genitives by Iranian EFL learners ?
- 2) Does learners' language proficiency have a significant effect on the acquisition of prenominal and postnominal genitives ?

## **METHODOLOGY**

### ***Participants***

The participants of this study included 120 males and females. They were Persian native speakers who were studying English at Islamic Azad University of Takestan, Shahre- ghods, Tehran Research and Science in Iran both at BA and MA levels in English translation and teaching major. In order to assess the participants' language proficiency, a Michigan proficiency test was used. After the proficiency test, based on their scores, they were divided into two groups: low and high. Both groups had to take a multiple choice test related to prenominal and postnominal genitives. We aimed to find out whether there existed any relationship between students' proficiency level and correct choice in the genitive test. From among 120 participants, 58 high and 62 low proficiency students were employed to fulfil the aim of this study.

### ***Materials***

The materials employed in this study fall into two types. First, Michigan ECCE practice tests by Jain Cook (2001) as a proficiency test. Actually, it contains 100 items: 40 items on grammar, 40 items on vocabulary, 20 items on reading comprehension (Appendix 1). Second, a genitive test which was developed by Kreyer (2003) consists of 25 items: 9 items were related to lexical class of modifier (proper name, common noun, collective noun, higher animal noun, lower animal noun, personified noun, semi-collective noun, time & measure, non-personal), 10 items were related to semantic relationship (origin, attribute, time & space, disposal, objective, subjective, partitive, possessive, kinship, descriptive), 6 items were related to weight and syntactic complexity (N<sub>2</sub>+finite clause, N<sub>2</sub>+non-finite clause, N<sub>2</sub>+prepositional phrase, N<sub>1</sub>+finite clause, N<sub>1</sub>+non-finite clause, N<sub>1</sub>+prepositional phrase). These items were selected from English Grammar in Use book (N<sub>1</sub>=modifier, N<sub>2</sub>=head noun).

### ***Procedures***

A proficiency test (Michigan test) was first administered to measure participants' general English proficiency. Then, they were divided into two groups: high proficiency and low proficiency. At last, genitive test was presented which was associated with prenominal and postnominal constructions. Each item of this test was related to lexical class of modifier, semantic relationship, weight and syntactic complexity.

## **RESULTS AND ANALYSIS**

In order to analyze the data to investigate the research question one, first the participants' performances on the prenominal and postnominal genitives in three different possessive category types, i.e. lexical class of modifier, semantic relationship, and weight and syntactic complexity were assessed. Table 1 presents the descriptive statistics.

Table 1: Descriptive statistics for Participants' Performances on Three Possessive Category Types

Possessive Category Types	N	Range	Mean	Median	Mode	SD	Variance
Semantic relationship	120	1.00	.702	.800	.80	.199	.040
Lexical modifier	120	.78	.556	.555	.56	.170	.029
Weight & syntactic complexity	120	.83	.468	.500	.50	.199	.040

Figure 1 below provides a graphical representation of the results.

Figure 1: Prenominal and Postnominal Results for Three Possessive Categories

Repeated Measures ANOVA was used with possessive category types as the within-subject variable to compare the participants' performances on three possessive category types.

Table 2: Multivariate Tests of Repeated Measures ANOVA for the Effects of Possessive Categories on Prenominal and Postnominal Genitives

Effect	Value	F	Hypothesis df	Error df	Sig.	Partial Squared	Eta
Possessive Category Type	.575	43.666	2.000	118.000	.000	.425	

ANOVA detected a statistically significant effect for possessive category, which is the within-subject factor ( $F_{(2, 118)} = 43.66$ ;  $p = .000$ ,  $p < .05$ ); as a result, we did not find a statistically significant difference between the possessive category types (lexical class of modifier, semantic relationship, and weight and syntactic complexity) in the acquisition of prenominal and postnominal genitives by Iranian EFL learners.

Also, the interaction between possessive category type and proficiency level was not significant ( $F = .26$ ;  $p = .76$ ,  $p > .05$ ). Since we have obtained a statistically significant result from the previous analysis, this suggests that there is a difference somewhere among our factors. Post-hoc Pairwise Comparisons were run to compare each pair of possessive category types. Table 3 below displays the results.

Table 3: Post-hoc Pairwise Comparisons for Three Possessive Categories

Possessive types	Possess. Types	Mean Diff.	Std. Error	Sig.
1. Semantic relationship	2	.146 <sup>*</sup>	.021	.000
	3	.234 <sup>*</sup>	.026	.000
2. Lexical modifier	3	.088 <sup>*</sup>	.022	.000
3. Weight & syntactic complexity	2	-.088 <sup>*</sup>	.022	.000

The results of Post-hoc Pairwise comparisons showed significant differences ( $p = .000$ ) for all possible pairs; Semantic relationship gained the largest value ( $M = .70$ ,  $SD = 19$ ), lexical modifier the second ( $M = .55$ ,  $SD = 17$ ), and weight and syntactic complexity the third ( $M = .46$ ,  $SD = 19$ ).

In order to put the participants into two low and high proficiency levels, the Michigan Proficiency Test was administered. Table 4 shows the descriptive statistics.

Table 4: Descriptive Statistics for Michigan Test

N	Range	Min.	Max.	Mean	Median	Mode	SD	Variance
120	22	62	84	73.31	73	73	6.383	40.732

Those ( $N = 62$ ) students whose scores were equal to or lower than the mean were considered as low proficiency students, and those ( $N = 58$ ) students who scored higher than the mean were assigned to high group. The participants' raw scores on Michigan proficiency test are shown in Table 5. The performances of possessive category types in two low and high language proficiency levels were assessed. Table 6 presents the related descriptive statistics.

Table 6: Descriptive statistics for Participants' Performances on Three Possessive Categories and Two Proficiency Levels

Possessive Category	Proficiency Level	Mean	SD	N
Semantic relationship	Low	.6500	.21033	62
	High	.7550	.17508	58
	Total	.7025	.19977	120
Lexical modifier	Low	.5167	.17094	62
	High	.5963	.16104	58
	Total	.5565	.17013	120
Weight & syntactic complexity	Low	.4333	.19456	62
	High	.5028	.20003	58
	Total	.4681	.19955	120

Figure 2 below provides a graphical representation of the results.

Figure 2: Prenominal and Postnominal Results for Three Possessive Categories and Two Proficiency Levels

To see whether learner's language proficiency has any statistically significant effect on acquisition of prenominal and postnominal genitives, Repeated Measures ANOVA was used with possessive category type as the within-subject variable and proficiency level as between-subject variable.

Table 7: Tests of Between-Subjects Effect of Repeated Measures ANOVA for the Effect of Proficiency Level on Prenominal and Postnominal Genitives

Source	Type III Sum of Squares	Df	Mean Square	F	Sig.	Partial Squared	Eta
Intercept	119.306	1	119.306	2969.017	.000	.962	
Level	.646	1	.646	16.065	.000	.121	
Error	4.742	118	.040				

ANOVA results showed a statistically significant effect for level of proficiency as the between-subject variable ( $F = 16.06$ ;  $p = .000$ ,  $p < .05$ ); The purpose of this study was to investigate the acquisition of prenominal and postnominal genitives. This was approached by raising two research questions. The first research question of the present study enquired about whether the lexical class of modifier, semantic relationship, weight and syntactic complexity affect the acquisition of prenominal and postnominal genitives by Iranian EFL learners. The participants' mean score on semantic relationship condition turned out to be .70, lexical class of modifier .55, and weight and syntactic complexity .46. These results suggest that these possessive categories influence the learning of prenominal and postnominal genitives. Therefore, semantic relationship gained the largest value ( $M = .70$ ,  $SD = 19$ ), lexical class of modifier the second ( $M = .55$ ,  $SD = 17$ ), and weight and syntactic complexity the third ( $M = .46$ ,  $SD = 19$ ).

Descriptive statistics for participants' performances on three possessive categories and two proficiency levels indicated that by comparing high and low students' performance on semantic relationship, lexical class of modifier, and weight and syntactic complexity, there existed a significant difference between the mean score of two groups. Since the results showed a statistically significant effect for level of proficiency as the between-subject variable ( $F = 16.06$ ;  $p = .000$ ,  $p < .05$ ) it can be claimed that learners' language proficiency has a significant effect on the acquisition of prenominal and postnominal genitives.

Our study lends support to Kreyer's (2003) finding that examined the effect of lexical modifier, semantic relationship, and weight and syntactic complexity on the choice between prenominal and postnominal genitives. He concluded that *of*-genitive is associated with entities that do not show any traits of personality, whereas *s*-genitive is usually used with modifiers that designate animate entities. Therefore, the result of this study supports Kreyer' (2003) idea that the choice depends on the degree of personality assigned to the modifier or on the degree to which the modifier tends towards human reference. Thus, the *s*-genitive is favored with nouns which denote human beings whereas the *of*-genitive is, apart from some exceptions, usually regarded as the only choice with concrete or abstract inanimate nouns.

The results of a study by Szmrecsányi and Hinrichs (2008) agree with the findings of this research in that among the possessive categories, lexical class of the possessor is a crucial possessive category for predicting genitive variation choice. Hence, the more human and animate a possessor, or the more it conveys the idea of animate things and human activity, the more likely it is to take the *s*-genitive.

The findings of the present paper support Gragmiller's (2010) idea that possessors with final sibilants are much more likely to be used in the *of*-genitive than possessors without a final sibilant. However, he has different ideas about the Animacy as he believes that speakers are much more likely to use the *s*-genitive with animate possessors in speech than in writing, suggesting that the influence of animacy is significantly weaker in writing than in speech particularly noteworthy is the influence of animacy, which is quite strong in speech, slightly weaker in most written genres, and substantially diminished in newspaper texts. It appears that journalists' genitives and genitives of conversational speech are not at all affected by animacy to the same degree.

## **DISCUSSION AND CONCLUSION**

The results of this study suggested that the trend of the acquisition of prenominal and postnominal genitives was discouraging because there was a remarkable overgeneralization in the acquisition of prenominal and postnominal genitives. Szmrecsanyi and Hinrichs (2008) argue that there is no doubt the instruction of possessive categories such as lexical class of modifier, semantic relationship, weight and syntactic complexity can have a positive influence on the acquisition of them independently. With respect to those three main possessive categories which include lexical class of modifier (proper name, common noun, collective noun, higher animal noun, lower animal noun, personified noun, semi-collective noun, time & measure, non-personal), second, semantic relationship (origin, attribute, time & space, disposal, objective, subjective, partitive, possessive, kinship, descriptive), the last category is weight and syntactic complexity (N2+finite clause, N2+non-finite clause, N2+prepositional phrase, N1+finite clause, N1+non-finite clause, N1+prepositional phrase (N1 =modifier, N2=head noun) impact on students' correct choice directly. The second result of this study is the positive correlation between language proficiency and acquisition of prenominal and postnominal genitives. The higher the students' proficiency, the more correct the choices.

**Shokufeh Pakru Khosroshahi**, was born in Tehran on 1985, received her BA degree in English translation in 2008 from Shahre Ghods Islamic Azad University, Iran. She received her MA degree from Takestan Islamic Azad University in 2013. She has been teaching English courses for three years at several institutes. Her research interests are in Linguistics, foreign language teaching and learning, reading comprehension.

**Ramin Rahmany** is a Ph.D. holder of teaching English as a foreign language from Tehran University, Iran. Currently, he is an assistant professor in Azad University of Takestan, Iran. His major interests are language and acquisition, computer assisted language learning, and psycholinguistics. He has taught several courses at university like Language methodology and discourse analysis. He has published several articles in language learning acquisitions e.g. Acquisition of English Relative Clauses by Persian EFL Learners published by Journal of Language and Linguistic Studies in October 2009.

#### ACQUISITION OF GRAMMATICAL ASPECT BY IRANIAN EFL LEARNERS

## ABSTRACT

This study investigated the acquisition of grammatical aspect by Iranian English as a foreign language (EFL) learners. The main question addressed in this study was whether Iranian EFL learners could distinguish conditions under which they must use either the perfective aspect or imperfective aspect. A group of 110 adult, Persian-Speaking learners of English both at BA and MA levels in English teaching major Took a Michigan test based on which they were assigned to two levels of proficiency namely, low and high were selected. A test of Grammatical Aspect was then administered to detect the factors which affect their choice of perfective and imperfective aspects. The results showed that temporal-linguistic and knowledge based semantic factors affected the learners understanding of perfective and imperfective aspects. They also showed that proficiency level affect learners to understand different types of grammatical aspects. Telic, Transitive, and Inanimate features are the best combination for determining the temporal grammatical perfective aspect. As for imperfective aspect, Atelic, Intransitive, and Animate temporal features are the best combination for understanding grammatical imperfective aspect.

**KEYWORDS:** Tense, Lexical aspect, Grammatical aspect, Perfective aspect, imperfective aspect

## INTRODUCTION

Tense and aspect have long been the focus of language pedagogy. In the study of the acquisition of temporal systems, three concepts are necessary: tense, grammatical aspect and lexical aspect. Tense refers to a situation on a time line. Grammatical aspect states the internal temporal constituency of a situation. Finally, lexical aspect refers to the characteristics inherent in the lexical items that define the situation (Fan, 2005).

Aspect gives importance to other temporal information like duration, completion or frequency and states the temporal flow of time. Different from tense which shows the relationship of a situation at different time periods, aspect shows a single situation as being ongoing or completed. Generally, there are two types of aspect: grammatical aspect and lexical aspect. Aspect should be distinguished from tense which is primarily concerned with location in time rather than its duration. Tense refers to *temporally when* while aspect refers to *temporally how* (Olbishevskaya, 2004). Grammatical aspect is expressed through grammatical markers, linguistic devices such as auxiliary and verb inflection. It is a grammatical category that shows temporal flow in a given action or states the point of view of the speaker.

English has two aspects that combine freely with tense and mood: the perfective (e.g. I have/had read the book), and progressive (*I am/was reading the book*). According to Durich (2005), the perfective aspect states a position outside of the situation so the writer or speaker views an eventuality as an entity. Conversely, the imperfective aspect views eventualities from inside and emphasizes the internal temporal structure of the situation. The imperfective is a grammatical aspect which demonstrates a situation considered as internal structure, such as ongoing, whether that situation happens in the past, present, or future. The perfective aspect is a grammatical aspect which demonstrates a simple whole situation, whether that situation occurs in the past, present, or future.

Anderson, Matlock and Spivey (2008) explain that aspect has obtained appreciable attention over the past 40 years. Aspect shows aspectual classes of verbs and the mixture of the verb with its arguments and adverbial phrases or to morphological aspectual markers, such as inflectional or derivational morphemes marked on the verb. Aspect shows two related processes: the ability of verbs and other lexical items to delineate how a condition progresses or holds in time (Lexical Aspect) and verbal auxiliaries and affixes show the result of a situation at a given time (Grammatical Aspect). In sum, aspect emphasizes situation, action, state and event.

Another parameter used for identifying grammatical aspect is morphological inflection. Comrie (1976) postulates that the perfective aspect considers a situation beyond the writer/ speaker's views as an eventuality. Conversely, the imperfective aspect emphasizes eventualities from inside and considers internal temporal structure of the situation, since it can both look backwards towards the start of the condition, and forwards towards the end of the situation, considering that the situation is persistent and continues, without any beginning and end. The imperfective aspect concentrates on a certain point of time inside a situation, not regarding the beginning or the end of a situation. Comrie argues that the meaning of the perfective aspect does not show that conditions are not durative, but that it just views a situation from the outside. Regarding the lack of reference to the internal temporal structure of a situation of the perfective aspect, the imperfective aspect refers to the internal temporal structuring of a situation. However, the differences between perfective and imperfective aspect should not disguise the identical specifications between the two, as they both happen within the same verb phrase (VP) and not reject each other. Additionally the semantic features of imperfective and perfective aspect complete each other.

Olbishevskia (2004) believes that the main aspectual topic in Grammatical Aspect is that of perfectivity and imperfectivity. The semantic part of the perfective is shown as a function that shows contingency to a 'total event'. Hence, the perfective shows events that constitute wholes. Stoicescu (2009) states that grammatical aspect or viewpoint aspect constitutes the differentiations between the perfective and imperfective viewpoints. Regarding perfective viewpoint, the speaker assumes the event externally and views it as finished or completed. Perfective aspect morphology shows completion with an endpoint (telic event) or termination for event without natural endpoint (atelic event). An imperfective viewpoint shows the incompleteness of the condition and its ongoing nature.

Durich (2005) demonstrates that the semantic features of the perfective aspect is shown by short duration, but imperfective aspect is shown in a longer period of a situation due to its atelic specification and limited duration and the perfective is telic, inchoative and resultative, since the perfective often refers to either the beginning or the end of a situation.

According to Jabbari (1998) Grammatical Aspect is the way speakers look at part of a situation (i.e. incompleteness or imperfective). Different forms of grammatical aspects cannot change inherent lexical aspect:

- 1) A. John paints a picture. (grammatical aspect = perfective, inherent aspect = accomplishment)
- 2) B. John is painting a picture. (grammatical aspect = imperfective = inherent aspect accomplishment)
- 3) C. John has painted a picture (grammatical aspect = perfective, inherent aspect = accomplishment)
- 4) D. John has been painting a picture (grammatical aspect = perfective = inherent aspect = accomplishment)
- 5) E. John has painted a picture (grammatical aspect = perfective inherent aspect = accomplishment)
- 6) F. John has been painting a picture. John has been painting a picture(grammatical aspect = imperfective, inherent aspect = accomplishment)
- 7) G. John will paint a picture (grammatical aspect = perfective, inherent aspect = accomplishment)
- 8) H. John will be painting a picture. John has been painting a picture (grammatical aspect = imperfective, inherent aspect = accomplishment)
- 9) I. John will have paint a picture (grammatical aspect = perfective, inherent aspect = accomplishment)
- 10) J. John will have been painting a picture. John has been painting a picture (grammatical aspect = imperfective, inherent aspect = accomplishment)

Verbs can be divided into four aspectual categories using three universal aspectual values:[punctual][telic] and [dynamic]. Achievements are [+punctual] and [+telic], accomplishments are [-punctual] and [+telic], activities are [-telic] and [+dynamic] and stative are [-dynamic].

According to Fedder (2012), there are three types of cues to grammatical aspect. The first cue is a temporal-linguistic which specifies if an event has an endpoint. Atelic predicates prefer imperfective aspect, while telic predicates prefer perfective aspect. The second set of cues are knowledge-based semantic cues, which focuses on subject animacy, presence/absence of a patient and presence/absence of locative information. Here we assumed that the sentences with animate subjects, no patients, and locative information would prefer imperfective aspect, while sentences with inanimate subjects, patients, and no locative information would prefer perfective aspect. The third type of cue is discourse cue, which shows a narrative introduction to each sentence, and the order in which locative information is presented. In light of the foregoing discussion, the present study aimed to answer the following research questions:

## **RESEARCH QUESTIONS**

- 1) Do temporal-linguistic and semantic factors affect Iranian EFL learners' understanding of perfective and imperfective aspect?
- 2) Does proficiency level affect Iranian EFL learners' understanding of different types of grammatical aspect?

## **METHODOLOGY**

### ***Participants***

A group of 110 male and female participants were randomly selected from among the Iranian adult students of English at Islamic Azad University of Takestan, Shahreghods and Tehran Research and Science Center both at BA and MA levels with ages between 20 and 30.

### ***Materials***

Two tests were used. One of the tests was devised based on English Michigan ECCE practice test for checking students' proficiency level. They had 40 multiple choice grammar items, 40 multiple choice vocabulary items, and 20 multiple choice reading comprehension items. The total score was 100 based on which the participants were ranked. Then a test was administered extracted from Fedder (2012) to check potential factors which may affect students' understanding of perfective and imperfective aspects. There were 8 factors: 4 factors related to perfective aspect and other 4 other factors related to imperfective aspect.

### ***Procedure***

We first aimed to find out if proficiency level affects Iranian EFL learners' ability in distinguishing different types of grammatical aspect. To select homogenous participants and put them into two low and high proficiency levels, the Michigan Proficiency Test was administered. Fifty six students whose scores were equal or lower than the mean were considered as low proficiency students, and 54 students who scored higher than the mean were regarded as high group. Our main test was given to determine factors which influence the use of perfective and imperfective aspects.

## **RESULTS AND DISCUSSION**

The first research question addressed if temporal-linguistic and knowledge based semantic factors affect Iranian EFL learners' understanding of perfective and imperfective aspects. Following Fedder (2012), first the descriptive statistics for perfective aspect related to four temporal-linguistic and knowledge based semantic factors were assessed. Table 1 represents the related descriptive statistics.

Table 1: Descriptive Statistics for Temporal-linguistic and knowledge based semantic Factors related to Perfective Aspect

Factors	Mean	Std. Deviation	N
1. Telic Transitive Animate	2.59	1.383	110
2. Telic Transitive Inanimate	2.87	1.434	110
3. Telic Intransitive Inanimate	2.38	1.585	110
4. Atelic Transitive Inanimate	2.15	1.551	110

Figure 1 below displays the graphical representation of the results.

Figure 1: Perfective Results of Four Temporal linguistic and knowledge based semantic Factors

Repeated Measures ANOVA was carried out to compare the mean score of 110 participants on four temporal-linguistic factors to see whether there is a significant difference between them. The results of ANOVA are presented in Table 2 below.

Table 2: Multivariate Tests of Repeated Measures ANOVA for the Effects of Temporal-linguistic and knowledge based semantic Factors related to Perfective Aspect

Effect	F	Hypothesis df	Error df	Sig.	Effect size
Temporal Factors	12.091	3.000	107.000	.000	.253

ANOVA found statistically significant effects for temporal-linguistic and knowledge based semantic factors, which is the within-subject factor ( $F_{(3, 107)} = 12.09; p = .000, p < .05$ ). However, the interaction between within-subject and between-subject factors, i.e. temporal and knowledge based factors and proficiency level was not significant ( $F = 1.74; p = .16, p > .05$ ). Besides, the interaction effect between factors and level of proficiency was not significant ( $F_{(3, 106)} = 1.74; p = .16, p > .05$ ).

Because we have gained a statistically significant result from the preceding analysis, this implies that there is a difference somewhere among our factors. As a result, Post-hoc Pair wise Comparisons were applied for perfective aspect. Table 3 presents the results.

*Table 3: Post-hoc Pair wise Comparisons between each two Temporal-linguistic and knowledge based semantic Factors in Perfective Aspect*

(I) Factor	(J) Factor	Mean Difference (I-J)	Std. Error	Sig.
1. Telic Transitive Animate	2	-.282	.121	.127
	3	.209	.143	.884
	4	.436*	.141	.015
2. Telic Transitive Inanimate	3	.491*	.134	.002
3. Telic Intransitive Inanimate	4	.227	.147	.751
4. Atelic Transitive Inanimate	2	-.718*	.123	.000

Post-hoc Pair wise comparisons showed that there was a statistically significant difference between factor1 and 4 ( $p = .01, p < .05$ ) and between factor 2 and 4 (.000,  $p < .05$ ). In conclusion, factor 2 (Telic Transitive Inanimate) has the highest mean ( $M = 2.87, SD = 1.43$ ). Then the descriptive statistics for temporal-linguistic and knowledge based semantic factors related to imperfective aspect were assessed. Table 4 represents the related descriptive statistics.

*Table 4: Descriptive Statistics for Temporal-linguistic and knowledge based semantic Factors related to Imperfective Aspect*

Temporal Factors	Mean	Std. Deviation	N
1. Telic Intransitive Animate	1.77	1.450	110
2. Atelic Transitive Animate	2.20	1.393	110
3. Atelic Intransitive Animate	2.71	1.546	110
4. Atelic Intransitive Inanimate	2.34	1.467	110

Figure 2 below displays the graphical representation of the results.

Figure 2: Imperfective Results on Four Temporal-linguistic and knowledge based semantic Factors

Repeated Measures ANOVA was used to compare the mean temporal factors in imperfective aspect. The results of ANOVA are presented in Table 5 below.

Table 5: Test of Within-Subject Effects for the Effects of Temporal-linguistic and knowledge based semantic Factors on Imperfective Aspects

Source		Type III Sum of Squares	df	Mean Square	F	Sig.	Partial Eta Squared
Temporal-linguistic Factors	Greenhouse-Geisser	49.327	2.393	20.61	12.132	.000	.100

ANOVA results revealed significant effect for temporal-linguistic and knowledge based semantic factors based on Greenhouse-Geisser ( $F = 12.32$ ;  $p = .000$ ). Therefore the first null hypothesis was rejected. In addition, the interaction effect between factors and level of proficiency was significant ( $F_{(3, 106)} = 6.27$ ;  $p = .001$ ,  $p < .05$ ).

ANOVA shows the difference somewhere among our factors. It does not tell you which factors differ from each other. Consequently, Post-hoc Pair wise comparisons was used. Table 6 represents the relate results.

Table 6: Post-hoc Pair wise Comparisons between each two Temporal-linguistic and knowledge based semantic Factors on Imperfective Aspect

(I) Factor	(J) Factor	Mean Difference (I-J)	Std. Error	Sig.
1. Telic Intransitive Animate	2	-.427	.175	.099
	3	-.936*	.187	.000
	4	-.564*	.184	.016
2. Atelic Transitive Animate	3	-.509*	.122	.000
3. Atelic Intransitive Animate	4	.373*	.124	.019
4. Atelic Intransitive Inanimate	2	.136	.135	1.000

Post-hoc showed that there was statistically significant difference between all possible pair of factors except for the difference between factor 1 and 2 ( $p = .09$ ,  $p > .05$ ) and between factor 2 and 4 ( $p = 1.00$ ,  $p > .05$ ). To sum, factor 3 (Atelic Intransitive Animate) has the highest mean ( $M = 2.71$ ,  $SD = 1.54$ ). The second research question was raised to see whether students' proficiency level has any effect on their understanding perfective aspect and imperfective one.

To put the participants into two low and high proficiency levels, the Michigan Proficiency Test was administered. Table 7 represents the descriptive statistics for results of this homogeneity test.

Table 7: Descriptive Statistics for Michigan Test

N	Range	Min	Max	Mean	Median	Mode	SD	Variance
110	22	57	79	68.16	68.00	67	6.420	41.221

The mean score of Michigan test was 68.16, median was 68, and the mode was 67, which are to a large extent the same. However, mode is a little smaller. From the participants, those (N = 56) students whose scores were equal or lower than the mean were considered as low proficiency students, and those (N =54) who scored higher than the mean were regarded as high group. The participants' raw scores on Michigan proficiency test are represented in Table 8. In order to test this null hypothesis, the between-subject ANOVA was utilized first for perfective and then imperfective aspects. Table 9 presents the descriptive statistics for perfective.

Table 9: Descriptive Statistics for Temporal-linguistic and knowledge based Factors on Perfective Aspect

Temporal factors	Proficiency Level	Mean	SD	N
1. Telic Transitive Animate	Low	1.77	1.293	56
	High	3.44	.861	54
	Total	2.59	1.383	110
2. Telic Transitive Inanimate	Low	1.84	1.345	56
	High	3.94	.231	54
	Total	2.87	1.434	110
3. Telic Intransitive Inanimate	Low	1.29	1.217	56
	High	3.52	1.023	54
	Total	2.38	1.585	110
4. Atelic Transitive Inanimate	Low	1.23	1.221	56
	High	3.11	1.254	54
	Total	2.15	1.551	110

Figure 3.below provides a graphical representation of the results for perfective.

Figure 3: Perfective Results for Temporal-linguistic and knowledge based semantic factors in Two Proficiency Levels

Table 10 below shows the results of Between-subject ANOVA for the perfective aspect.

*Table 10: Tests of Between-Subjects Effect of ANOVA for the Effect Proficiency Level on Perfective Aspect*

Source	Type III Sum of Squares	df	Mean Square	F	Sig.	Partial Eta Squared
Intercept	2788.687	1	2788.687	1422.150	.000	.929
Level	428.223	1	428.223	218.382	.000	.669
Error	211.777	108	1.961			

ANOVA detected a statistically significant effect for level of proficiency as the between-subject variable on perfective aspect ( $F = 218.38$ ;  $p = .000$ ,  $p < .05$ ). Then another between-subject ANOVA was used for testing the effect of level of proficiency on imperfective aspect. Table 11 shows the related descriptive statistics for imperfective.

*Table 11: Descriptive Statistics for Temporal-linguistic and knowledge based semantic Factors on Imperfective Aspect*

Temporal factors	Proficiency Level	Mean	SD	N
1. Telic Intransitive Animate	Low	1.41	1.108	56
	High	2.15	1.664	54
	Total	1.77	1.450	110
2. Atelic Transitive Animate	Low	1.32	1.162	56
	High	3.11	.965	54
	Total	2.20	1.393	110
3. Atelic Intransitive Animate	Low	1.61	1.448	56
	High	3.85	.359	54
	Total	2.71	1.546	110
4. Atelic Intransitive Inanimate	Low	1.37	1.259	56
	High	3.33	.890	54
	Total	2.34	1.467	110

Figure 4 below is a graphical demonstration of the descriptive statistics for imperfective.

Figure 4: Imperfective Results on Temporal-linguistic and knowledge based semantic Factors and Proficiency levels

Table 12 below manifests the ANOVA results for imperfective.

Table 12: Tests of Between-Subjects Effect of ANOVA for the Effect Proficiency Level on Imperfective Aspect

Source	Type III Sum of Squares	df	Mean Square	F	Sig.	Partial Eta Squared
Intercept	2266.210	1	2266.210	1347.075	.000	.926
Level	311.300	1	311.300	185.042	.000	.631
Error	181.690	108	1.682			

ANOVA results showed a statistically significant effect for the level of proficiency ( $F = 185.04$ ;  $p = .000$ ,  $p < .05$ ) on imperfective and as mentioned in Table 6 ( $F = 218.38$ ;  $p = .000$ ,  $p < .05$ ) on imperfective aspect.

## DISCUSSION

The main concern of the study was to see whether temporal linguistic and knowledge based semantic factors affect Iranian EFL learners understanding of perfective and imperfective aspects. The results show that the factor 2 (Telic Transitive Inanimate) was the only factor in perfective aspect that was considerably more effective than three other factors. In fact, the results showed that Telic, Transitive, and Inanimate features are the main clues used for determining the temporal grammatical perfective aspect.

Moreover, the results showed that in imperfective aspect, Factor 3 (Atelic Intransitive Animate) was the only factor in imperfective aspect that was considerably more effective than three other factors. In fact, the mean value for Factor 4 (Atelic Intransitive Inanimate) was 2.34 with standard deviation 1.367. The mean for factor 2 (Atelic

Transitive Animate) is 2.20 with standard deviation 1.393. Also the mean for factor 1 (Telic Intransitive Animate) was 1.77 with the standard deviation of 1.450. Thus, it can be inferred that Factor 3 with Atelic, Intransitive, and Animate temporal features are the best combination for understanding grammatical imperfective aspect. So, it was found that Atelic, Intransitive, and Animate features are the main clues used for understanding the temporal-linguistic and knowledge based semantic grammatical imperfective aspect.

The second purpose of the present study was to examine the effect of language proficiency level on the Iranian EFL learner's ability to understand different types of grammatical aspect. The results obtained from the participants showed that proficiency level had a significant impact on the learner's ability to understand different types of grammatical aspect. So it can be said that the students with high proficiency level distinguish better than the students with low proficiency level both in perfective and imperfective aspects.

## CONCLUSION

The results of this study suggested that temporal-linguistic and knowledge based semantic factors affected the learners' understanding of perfective and imperfective aspects. They also showed that proficiency level affects learners' understanding of different types of grammatical aspects. This is in line with the findings of Fedder (2012) who claims that three factors are effective in grammatical aspects understanding: 1. Temporal-Linguistic Cues to Grammatical Aspect, 2. Knowledge-Based Semantic Cues to Aspect, 3. Discourse Cues to Grammatical Aspect. The results showed that Telic, Transitive, and Inanimate features are the best combination for determining the temporal grammatical perfective aspect. As for imperfective aspect, Atelic, Intransitive, and Animate temporal features are the best combination for understanding grammatical imperfective aspect.

## Limitation of the study

Factors such as the types of material, participants, personal interest in the topic, and some other factors influence the outcome of the study.

- Because of the lack of a well-known valid test, the validity of the proficiency test and our main test is in question.
- The results of the study cannot be generalized to all second language learners because the study was run in Iranian EFL context.
- The sample employed in the current study was limited to 120 students. Therefore, similar experiments with greater numbers of subjects are required to support the findings of this study.
- The study was conducted with university students and research could be done with all students in institute and other places.

**Nasim Shams** was born in Ardebil on 1984, received her BA degree in English translation in 2003 from Tabriz Islamic Azad University, Iran. She received her MA degree from Takestan Islamic Azad University in 2013. She has been teaching English courses for three years at several institutes. Her research interests are in linguistic, foreign language teaching and learning.

**Ramin Rahmany** is a Ph.D. holder of teaching English as a foreign language from Tehran University, Iran. Currently, he is an assistant professor in Azad University of Takestan, Iran. His major interests are language and acquisition, computer assisted language learning, and psycholinguistics. He has taught several courses at university like Language methodology and discourse analysis. He has published several articles in language learning acquisitions e.g. Acquisition of English Relative Clauses by Persian EFL Learners published by Journal of Language and Linguistic Studies in October 2009.

## APPLICATION OF READER RESPONSE THEORY IN IRANIAN TERTIARY-LEVEL READING CLASSES: A 'PRACTICAL DEMONSTRATION' STUDY

Rahman Sahragard

Alireza Rasti

*Associate professor in Applied Linguistics, Shiraz University  
Farhangian University*

### ABSTRACT

In many of the Iranian universities, currently there seems to exist a huge lacuna in the way practitioners of the two fields of English Literature and Teaching English as a foreign language (both enjoying the same departmental or collegiate residency) are involved, if any, in a give and take of their ideas and practices. The present study sets out to show how some analytic tools at the literary critic's disposal can be put into practice in language classes at large. One such notable tool, instantiated practically by the investigation, in vogue internationally (Carlisle, 2000, Elliot, 1990, Hirvela, 1996), but apparently still not in the limelight in the Iranian context, relates to the use of Reader Response Theory in reinterpreting the role of the reader and the mode through which they make sense of L2 reading texts. This study aims at sketching the theoretical and practical implications of employing the said literary tool in L2 classrooms.

**KEYWORDS:** literature, L2 teaching, Iran, Reader Response Theory, reading skills

### INTRODUCTION

In Iranian universities and higher education institutes, the two fields of Teaching English as a Foreign Language (henceforth TEFL) and English Language and Literature have been enjoying the same departmental or collegiate residency for some decades now (the two fields of Theoretical Linguistics and Translation Studies are rather new arrivals in the arena). All the same, there seems to be a widening gulf in the way academicians of both sides are involved, if any, in the give and take of their theories and practices. In fact, they seem to occupy their own ivory towers as far as cooperative or collaborative research undertakings are concerned. The situation is very much akin to the one in the U.S. at university level, where observers have spoken of and, for that matter, witnessed "the institutionalized dichotomy between literary studies and language training" (Kramsch & Nolden, 1994, as cited in Paran, 2008, p. 466). By adopting such an unfortunate division of labor (especially) in tertiary education, we are bound to miss many valuable opportunities for enriching the way we go about teaching languages *as well as* literature(s). In Iran, English Language and Literature is considered a far cry from TEFL in the academe – a conception running deep in related departments and colleges across the country. Currently, to the best of the knowledge of the present researchers, there has not been much serious attempt by professors of English literature at delving into the way literature should be taught. It seems that there is a tacit consensus between literary figures in Iran as to how literature is to be taught or learnt. No empirical studies have ever been conducted or reported on the mechanisms for teaching and/or learning English literature in the Iranian context by such literary academicians.

A number of factors are at work for this apparent dearth of proper empirical investigations on how to go about teaching various aspects of (English) literature, especially, to foreign language learners and students. For one thing, literature professors' research methodological tools and the way they conceive of research, even the language they use in their research reports, are totally (or for the most part) different from what holds sway in the field of TEFL. At this point, there is a perceived research gap this same study attempts, among other things, to draw investigators of both sides' attention to. It seems that annual joint conferences (e.g., TELLSI International Conference hosted annually in a different geographical region of the country and some other sporadic colloquia) are far from being adequate to do justice to this important issue. In fact, the results of studies on the interface between literature teaching and foreign language teaching, if any, fall short of having any practical realization in colleges and departments.

Another justification for the undue attention given to the afore-mentioned issue, itself being touched upon by the present research, is the lack of common ground between the two fields at graduate levels. Few, if any, departments offer courses to students of English Literature on Discourse Analysis (a sub-branch of Applied Linguistics) and related disciplines, to wit, Pragmatics, Semantics, etc. On the other hand, few, if any, departments offer to students of TEFL courses in Literature teaching and literary criticism – itself a must for developing students' critical thinking skills at graduate levels. In the past, several Iranian universities (e.g., Shahid Chamran University located in South West of Iran and University of Tehran) used to offer optional courses in English Literature (teaching, criticism, etc.) to PhD students of TEFL but the trend has apparently ceased to continue in recent years.

Several TEFL researchers, on the other hand, have made some sporadic references to the role of literature as a "bone of contention" in foreign language education (Bagherkazemi & Alemi, 2010) drawing specifically practitioners' attention to the "payoffs" of integrating literature into language education currently underway in the country (See also Aghagolzadeh & Tajabadi, 2012; Alemi, 2011; Khatib, Rezaee, & Derakhshan, 2011). It is unfortunate that much of the said research, (mostly in the fashion of review papers, or, at most, "practical demonstration" types) has been reinventing the wheel in the sense that some themes including the arguments for or against the use of literature in EFL/ESL classes (Amer, 2003; Ghosn, 2002), the (in)attention literature has historically received in some ELT methodologies, etc. have been gleaned from the relevant literature and synthesized into synoptic articles. Rarely has such research - universal in nature - tapped into the possibility of localized concerted efforts by the practitioners of the two neighboring disciplines at academic give-and-take encounters in Iran.

Far from making any originality claims, the present study, sets out to further the issue a step or two by pointing to the possibility of a contributory trade-off between the instructors of the two camps in the Iranian context. Specifically, it aims at showing, in a practical fashion, how some analytic tools can be employed and deployed by academicians of both sides instantiated by putting some form of Reader Response Theory into practice in teaching foreign language skills, most notably among them, the reading skills. As such, following a very brief historical review of the relevant literature, we set out to elaborate on the implications and applications of integrating some form of Reader Response Theory (henceforth RRT) into the foreign language curricular content area.

## **STATUS OF LITERATURE TEACHING IN ESL/EFL TEACHING METHODOLOGY: TO BE OR NOT TO BE?**

This section, consisting of two parts, deals initially with the 'pendulous' role of literature in various ELT methodologies popular at given times and then takes up the discussion with a report on the positive taken-on-board feelings directed by ELT researchers and practitioners at the inclusion of literature into the language education curriculum.

Hall (2005) mentions three, at times, diverging approaches to literature integration into foreign language curriculum, to wit:

*Traditional approaches*, deriving heavily from nineteenth-century notions of the canon and a moral agenda for literature, with at best a little New Criticism or elementary sentence-based stylistics study thrown in, but with linguistic dimensions often neglected or assumed. Typically found in 'foreign language' and higher academic contexts ('humanism').

- Approaches typically deriving from or prompted by *communicative language teaching approaches* (clt) [sig], in which literature is viewed as discourse, and literary texts on more equal terms with the other texts comprising a culture ...
- The productive consonances of *clt* [sig] and 'theory' as reader response or poststructuralist ideas of the inevitability of different responses to texts by different readers, according to background, gender, race, nationality, etc., or in general the contexts of reading (critical reading; 'culture') feed into 'sociocultural' approaches to language teaching and learning ... (p. 49).

To cut a long story short, the *traditional* approaches, being represented in effect by Grammar-Translation method of foreign language teaching, make a case for teaching a second language through literary texts. Literature is the means as well as the end of mastery of the (written) system of a given language. Some well-known specialist textbooks dealing with a historical progression of ELT methods and teaching models have addressed the issue of the salience of the role of literature in Grammar-translation view of language teaching/learning (see specifically Larsen-Freeman & Anderson, 2011).

The *Communicative* approaches to language teaching see literature, at the most, as a resource or as materials for language teaching. Some advocates of communicative approaches have welcomed integration of literature into the act of language teaching (e.g., Widdowson, 1975), whereas some other figures have frowned upon or, looked suspiciously at the part it can play at furthering students' linguistic competencies.

The *sociocultural* approaches see literature at the service of self-actualization of learners' linguistic as well as other cognitive needs. This final view of the role of literature within language curriculum has opened promising avenues for conducting empirical research into the said interface between literature and language teaching.

With regards to the perceived value of inclusion of literature into language classes, Hall (2005) synoptically points to three arguments in favor of it, to wit

- affective arguments (pleasurable, motivating, personalising);
- cultural arguments (cultural knowledge, intercultural experience);
- psycholinguistic arguments ('focus on form', discourse processing skills – inferencing, processing of non-literal language, tolerance of ambiguity and others) (p. 48).

The problem with such a conception of the role of literature in language education is that the above claims "have too often been taken on trust, and typically need to be framed more empirically and precisely for any useful investigation to be possible, to be researched, in short" (ibid).

## READER RESPONSE THEORY

Reader response theory (or, it makes more sense to talk of *theories*) is an umbrella term referring to a number of approaches towards literary text analysis all shifting the undue emphasis on the author or the text to a focus on the reader's interactions or transactions *with* the text. As such, the theory considers "a concern for the reader" (Bressler, 2007, p. 80) to be at the heart of any analytical journey through literary artifacts:

Believing that a literary work's interpretation is created when a reader and a text interact or transact, ... (Reader Response Theory) critics assert that the proper study of textual analysis must consider both the reader and the text, not simply a text in isolation. For these critics,

Reader + Text = ... Meaning

Only in context, with a reader actively involved in the reading process with the text, can meaning *emerge* [italics added]. (ibid)

The above quotation by Bressler aptly (though mostly in a tacit way) captures the distinctive features of RRT as well as the theory's ontological and epistemological takes. For one thing, from an ontological vantage point, we can maintain that we have multiple realities, not one single monolithic reality, waiting to be discovered. Secondly (from an epistemological viewpoint), meanings are not discovered. Rather, they are constructed in an active engagement of the individual with semiosis (in the broad sense of the word). Such a view of the (individual) reader and the semiotic artifact are quite in keeping with (as mentioned previously) the sociocultural or ecological perspectives – approaches which are currently household words in both general as well as language teaching education.

Similarly, through taking an RRT perspective to reading texts (literary or nonliterary), readers come to not only *transact* with the text but also *interact* with it (not to be confused with Brown & Yule's (1983) typology of *transactional* and *interactional* functions of discourse which is stark opposite of what RRT critics mean by them. For Brown & Yule, the former has to do with "the efficient transference of information. Language used in such a situation is primarily 'message oriented'". The latter is related to the interpersonal as well as emotional side of human beings.). According to Rosenblatt (1978), as readers we are engaged either in *efferent* or *esthetic* reading types or both:

When we read for information-for example, when we read the directions for heating a can of soup-we are engaging in **efferent reading** ... During this process, we are interested only in newly gained information that we can "carry away" from the text, not in the actual words as words themselves. When we read efferently, we are motivated by specific needs to acquire information. When we engage in **aesthetic reading**, we experience the text. We note its every word, its sounds, its patterns, and so on. In essence, we live through the transactional experience of creating the [work] ... Rosenblatt adds, however, that at any given moment in the reading process, a reader may shift back and forth along a continuum between an efferent and aesthetic mode of reading (Bressler, p. 79).

Alongside with what was said, the present study sets out to lay bare the implications and applications of use of one such literary analytical tool for the classroom language teacher. The aim is to spark off empirical investigations of the applications of literary analytical tools in language education – a research phenomenon which is sadly missing in the current state of affairs in our country. At this point, in the study, we aim at proposing a model of L2 reading based on RRT principles and assumptions. A note is in order here. The theory has been employed and deployed globally by some researchers (see, in particular, Ali, 1993; Carlisle, 2000; Elliot, 1990; Hirvela, 1996). In the domestic context, however, it seems that it is not as yet tested and tried.

#### A MODEL OF TEACHING L2 LITERARY SHORT READINGS BASED ON RRT

The following is a set of techniques proposed for implementing an RRT approach towards teaching especially short literary extracts. The techniques and procedures will be instantiated by their application on the opening page(s) of Dickens' *Hard Times* (see Appendix). The said techniques are supposed to fit in well with the three-phase interactive model of reading, to wit, *pre-reading* tasks, *while-reading* tasks, and *post-reading* tasks. Having followed the selection criteria as mentioned by Ghosn (2002, p. 174) (i.e., universal theme(s), a clear and appealing storyline, (a bit of) literary language, and illustrations), we can proceed with the first phase, which is dealing with pre-reading activities.

I. Pre-reading phase. The purpose of this part is activating the class' mental schemata of their lived experiences and activating the relevant vocabulary. There are a host of techniques which can be employed in this phase. We will, however, confine our discussion of this section to two procedures we have tried our hands at various points in our reading classes. They include *brainstorming* and *group work/discussions*.

- *brainstorming*. Ask students (intermediate or above) to brainstorm on words or phrases pertinent to the general theme(s) of the novel such as 'school', 'being a student', 'the socially desirable behavior at school', etc. The idea is that students give full vent to their perceptions, attitudes, personalized responses, worries, etc. aroused by the literary stimulus i.e., excerpts. Tell students that they can either come up with their own off-the-cuff responses and comments, or build upon what their classmates mentioned. Having done that, a general discussion on the themes developed can be taken up by the class with the instructor orchestrating it.

- *group work*. Having already formed several groups, ask them to make a list of characteristics of 'good' and 'bad' school environments in their *own views*.

II. While-reading phase. In this phase students are actively engaged in the *process* of reading the text and the subsequent sense-making of it. Again, this phase can take on a variety of forms to deliver and reinforce the reading materials. We recommend what we have specifically experimented with in our own classes, to wit: (what we have termed) *dialogizing*, *reflexivity* and *vicarious identification*.

- *dialogizing*. This technique, exacting as it may be at first blush for the teacher, brings much pay-off if done properly. The teacher, having already familiarized himself/herself with the extract, reads the rather short excerpt to the class and adapts the main character's (harsh and domineering) tone of voice as best as they can while students are listening.

- *reflexivity*. Tell the class to read the first two pages of the novel silently in a given allocated time and, while engaged in the act of reading, think of the situation being described with the one they have formerly gone through or probably are going through i.e., schooling. Ask them to write in black and white or make a mental note of any feelings the situation described arouses in them. At the end of the time allocated to reading, students embark on a 'think-aloud' statement of their sentiments.

- *vicarious identification*. After the class is done with the act of reading, ask them who they identified with more and why. Also, urge them to talk about the character(s) they hated more. Ask them to give their reasons. Encourage them to personalize their replies by thinking about any similar experiences they have undergone.

III. Post-reading phase. This section can be conducted by the teacher in a number of ways. Again our proposed courses of action are what we are most comfortable with and we have found to be useful as a result of experimenting with it. Two specifically beneficial techniques that can be implemented are *predicting* and *ending the story* (the extract covered in the class).

- *predicting*. As a strategy belonging in teaching the final phase of reading (non)literary texts, students can be encouraged to anticipate what will happen in the course of the story. It can be about the storyline or it can encompass the fate of given characters e.g., Bitzer or Sissy Jupe, in regard to Dickens' opening page(s) of the novel.

- *ending the extract*. Students can also be called on to tell how the story is going to come to an end.

## CONCLUSION

RRT is far from being a unified and coherent theory of literary appreciation or analytic tool. Studies aiming at implementation of the theory have at the most come up with some techniques and procedure in realizing it. Techniques as varied as role play and newspaper articles (Elliott, 1990), reading logs (Carlisle, 2000), rewriting narratives from another character's point of view (1989), and critical questioning procedures (probst, 1994) have been employed by international researchers to show the efficacy and efficiency of integrating an RRT procedures into the language curriculum.

The present research, being of a "practical demonstration" (Maley, 2001, p. 183) type, all its perceived shortcomings notwithstanding, is predicated upon our real-life practices with some techniques of teaching (non)literary passages gleaned from the assumptions of RRT. We have tried to include in it a set of practical procedures at teaching L2 texts, especially literary ones to show the applicability of the analytic tools at the literary critic's disposal and to show heightened awareness of the role of literature in language education curriculum. We have also had in mind the possibility of academic give and take of ideas and practices between the neighboring fields of English Language and Literature and TEFL, both enjoying the same departmental or collegiate residency in Iranian universities.

### **Appendix**

#### **The opening page of Dickens' *Hard Times***

'NOW, what I want is, Facts. Teach these boys and girls nothing but Facts. Facts alone are wanted in life. Plant nothing else, and root out everything else. You can only form the minds of reasoning animals upon Facts: nothing else will ever be of any service to them. This is the principle on which I bring up my own children, and this is the principle on which I bring up these children. Stick to the principle, Facts, sir!'

The scene was a plain, bare, monotonous vault of a school-room, and the speaker's square forefinger emphasized his observations by underscoring every sentence with a line on the schoolmaster's sleeve. The emphasis was helped by the speaker's square wall of a forehead, which had his eyebrows for its base, while his eyes found commodious cellars in two dark caves, overshadowed by the wall. The emphasis was helped by the speaker's mouth, which was wide, thin, and hard set. The emphasis was helped by the speaker's voice, which was inflexible, dry, and dictatorial. The emphasis

was helped by the speaker's hair, which bristled on the skirts of his bald head, a plantation of firs to keep the wind from its shining surface, all covered with knobs, like the crust of a plum pie, as if the head had scarcely warehouse-room for the hard facts stored inside. The speaker's obstinate carriage, square coat, square legs, square shoulders, - nay, his very neckcloth, trained to take him by the throat with an unaccommodating grasp, like a stubborn fact, as it was, - all helped the emphasis.

'In this life, we want nothing but Facts, sir; nothing but Facts!'

The speaker, and the schoolmaster, and the third grown person present, all backed a little, and swept with their eyes the inclined plane of little vessels then and there arranged in order, ready to have imperial gallons of facts poured into them until they were full to the brim.

THOMAS GRADGRIND, sir. A man of realities. A man of facts and calculations. A man who proceeds upon the principle that two and two are four, and nothing over, and who is not to be talked into allowing for anything over. Thomas Gradgrind, sir - peremptorily Thomas - Thomas Gradgrind. With a rule and a pair of scales, and the multiplication table always in his pocket, sir, ready to weigh and measure any parcel of human nature, and tell you exactly what it comes to. It is a mere question of figures, a case of simple arithmetic. You might hope to get some other nonsensical belief into the head of George Gradgrind, or Augustus Gradgrind, or John Gradgrind, or Joseph Gradgrind (all supposititious, non-existent persons), but into the head of Thomas Gradgrind - no, sir!

**THE EFFECT OF COLLOCATION AWARENESS-RAISING ON THE EAP LEARNERS'  
ACHIEVEMENT OF ACADEMIC COLLOCATIONS THROUGH WRITING TASKS**

**Hassan Soleimani, Manoochehr Jafarigohar, Tahereh Iranmanesh**  
*Payame Noor University*

**ABSTRACT**

The effect of collocation awareness-raising plays an important role on achievement of academic collocations by English for academic purposes (EAP) learners. In order to provide a developmental inquiry into raising learners' awareness to achieve academic collocations through writing tasks, this study examined a sample of 38 English language learners in two groups: one group with teaching academic collocations through underlining, as a measure of noticing, and the other group with explicit teaching of academic collocations within a six-week semester. The participants' collocational competence was tested running a pretest of academic collocations prior to teaching and a posttest of academic collocations following six sessions of teaching the collocations in question. The results demonstrated that the learners who learnt academic collocations through Collocation Awareness Raising (CAR) showed a constant increase in success rate, the number of collocations learnt, and making use of collocations to make more fluent and correct English sentences instead of creating incorrect, long and inappropriate phrases and utterances. Pedagogical implications of these findings are discussed in terms of training effect.

**KEYWORDS:** Collocation, Academic Collocations, Collocation-Awareness Raising, Noticing

**INTRODUCTION**

Knowledge of academic vocabulary is crucial for students studying at an English-speaking university, particularly for reading and writing fluently in an academic context, including but not limited to essays, articles, texts and even giving lectures in English. The bigger the range of vocabulary, the more English as a foreign language (EFL) learners can cope with reading and writing skills. In the past decade, there has been increasing interest in the nature of vocabulary acquisition. One growing area of research focuses on vocabularies and collocations but there are different views as regards vocabulary acquisition process, the importance of contextualization of collocations acquisition, and strategies used by students to learn vocabulary during their English life. It has been suggested that learners learn vocabularies through exposure to language such as reading as well as linguistic contexts in which the words occur (e.g. Gray & Holmes, 1938; Werner & Kaplan, 1950; Sternberg & Powell, 1983; Jenkins, 1984; Nagy, 1987).

Specifically speaking, many researchers have conducted research on second language acquisition and pedagogy over the two past decades; to them the core point of their research was focused on whether learners acquire an L2 language consciously or subconsciously, and whether consciousness learning is necessary condition to internal information. Introducing Acquisition Hypothesis, Krashen (1983) viewed acquisition as a subconscious process. Contrary to Krashen's Acquisition Hypothesis is Schmidt's Noticing Hypothesis, which as Schmidt (1994) claims acquisition is largely a conscious process (cf. Izumi/Bigelow 2000: 240). Tomlin/Villa (1994) is among other scholars who claim that acquisition is partly conscious and partly subconscious (cf. Hulstijn/Schmidt 1994: 7). However attention has constituted the core part of many researches in recent years (Sharwood Smith 1993; Long 1991; Ellis 1994; Schmidt 1994).

EFL learners need learning academic collocations which are necessary for gaining a native-like fluency in an academic context. There are several studies that point at second Language learners' incomplete knowledge of second language vocabulary, but there are no studies that follow the development of this incomplete knowledge into a native-speaker-like meaning. Since at advanced levels, students really need to be aware of collocation if they are to be effective in English, and since at higher levels, it is possible that students find useful word partnerships themselves, rather than focusing on grammar, they need to be looking at patterns in a more generalizable sense.

Texts are a great way in noticing collocations. When learners engage in reading text enriched with academic collocations they encounter such collocations as such their attention will draw to them. Noticing as viewed by Schmidt is a tool for conscious attention that aid learners to change input into intake.

Taking into consideration the above points, the primary objective of this study was to reduce this gap by providing a qualitative inquiry into the development of L2 academic collocations to speak and write fluently in an academic context, which is deemed as an area of research that is extremely vital for instruction. In this research, noticing is deemed as a major tool to draw learners' attention on learning academic collocations to promote the quality of learning. However there were some inconsistencies among the findings of applied linguistics as regards the effect of Collocation Awareness-Raising (CAR) on the EAP Learners' Achievement of Academic Collocations. To bridge the gap and to understand the importance of selecting appropriate tasks to promote learners' awareness of such collocations, it is necessary to conduct more studies in the field.

## LITERATURE REVIEW

Since vocabulary is an important part of learning a second language researchers have been interested for years to explore the impact of learning collocations, type of teaching collocations and the importance of context on learning collocations, in general. Knowledge of vocabulary has constituted the core part of many research conducted in recent years. In order to read and write successfully, EFL learners need to be able to recognize as many words as possible in their textbooks and use as many academic vocabularies as possible in writing essays, articles, texts and even giving lectures in English. The bigger the range of vocabulary, the more EFL learners can cope with reading and writing skills. Although many researchers have conducted research on vocabulary acquisition (e. g., Haastrup, 1991; Mondria & Witde- Boer, 1991; Wang, Thomas, Inzana & Primicerio, 1993), but there are different views as regards vocabulary acquisition process, the importance of contextualization of collocations acquisition, and strategies used by students to learn vocabulary during their English life.

### *Vocabulary in language learning and Strategies to Learn Vocabularies*

Vocabulary is a component of language learning such as other language skills as reading or speaking but having a sufficient range of vocabulary, however, does not yield fluency in language skills. On the one hand, researchers believe that context is important in vocabulary acquisition and comprehension but since learning words from context is a slow process, the contexts of use must be encountered before mastering a new word, as a result, extensive reading is required to acquire an extensive range of vocabularies. Collocations however illustrate the importance of context. For instance, "fair" has several meanings and so does "way" but when they occur near each other to make a collocation all the probable meanings fail to be established. The context in which a word is used is an important aspect in considering the word's meaning. Contextualization shall be considered a ground for removing any ambiguities as regards work knowledge (Miller, 1996).

Learners of English language make use of many strategies to acquire vocabulary such as consulting a dictionary to check on a guess made in the initial reading, writing the word's meaning in the margin of the text, adding the word to a personal word list, or perhaps entering the word and its meanings into a card system of the kind recommended by Mondria and Mondria-de Vries (1994). The more effectively the vocabulary is elaborated during acquisition, the more readily it will be recalled by learners (Mayer, 1992; Wittrock, 1992).

There are many studies, on the other hand, emphasizing on the importance of learning vocabularies independently through learners' own experience and strategies. Among these studies are those carried out by McCarthy and Nation (McCarthy & Nation, 1990). Keyword method, as an example, is a strategy used by high school-level students. Levin (1979) carried out a study on high-school Spanish students and concluded that about half of them used strategies involving cognates, phoneme correspondences, and some other mnemonic tricks. Nation (1999) proposes types of *word knowledge*, which are necessary to be able to use a word in a wide variety of language situations that one comes across. These include: the meaning(s) of the word, the written form of the word, the spoken form of the word, the grammatical behavior of the word, the collocations of the word, the register of the word, the associations of the word and the frequency of the word. Therefore, it was concluded that only a fraction of words are likely to be acquired through formal study and others will have to be acquired through simple exposure to the language such as reading a text or hearing a conversation.

### *Definitions and Types of Collocations*

A number of studies have investigated the meaning and types of collocations (Firth, 1968; Hoey, 1991; Jones & Sinclair, 1974; Peters, 1983; Lewis, 1993). The technical term of collocation, linguistically, implies rather more than mere placing words side by side but, according to Firth (1968), it is the habitual juxtaposition or association of words with each other or group of words together. Firth believes that: "You shall know a word by the company it keeps" (1968, p. 179). By words' meaning he does not mean the exact meaning of the words which are put near each other but rather the broader sense of 'meaning' characterized by Wittgenstein's statement as "the meaning of words lies in their use" (Firth, 1968). According to Jones and Sinclair (1974), collocations are words which occur near each other with a random frequency than is expected. Sinclair (1991) believes that "words which stand in such a relationship can be said to 'predict' one another because the presence of one makes the presence of the other more likely than it would otherwise be (Sinclair, 1991)."

Many terms are used by second language researchers to refer to collocations as fixed lexical units including *speech formulate* (Peters, 1983), *lexicalized stems* (Pawley & Syder, 1983), *lexical phrases* (Nattinger & DeCarrico, 1992; Schmitt, 2000) and, above all, *prefabricate chunks* (Lewis, 1993). Collocation is a term used for advanced learners who try to write in an academic context like a native-like speaker.

Researchers define collocations from two points of view as semantic and non-semantic. Firth (1968), on the one hand, believes that collocation concerns meaning, and he gives priority to the term as regards lexicon study. Sinclair (1966), considers the term in view of memory and argues that grammar can be described by structures and systems, while the former refers to language rules the latter to lexical items collocating with one another. On the other hand, some researchers regard collocations from non-semantic point of view. Among them is McCarthy (1988) who considered the notion of collocation as a kind of cohesive device. In his view, collocation is co-occurring lexical items but non-semantically (McCarthy, 1988).

Other researchers, for instance, Nattinger & DeCarrico (1992) describe collocations as 'chunks' of language of varying lengths, such as *on the other hand*. Lexical phrases, in their view, are conventional form/function formations that go together more frequently having an idiomatic meaning as they occur more frequently near each other. Lewis (1997) believes that "collocations are those combinations of words which occur naturally with greater than random frequency".

In the light of making benefits of the term "collocation" in many linguistic areas, many researchers classified collocations from different perspectives such as semantics, phraseology, corpus linguistics and systematic linguistics, pure idioms, figurative idioms, restricted collocations, and open collocations (Cowie & Mackin, 1975; Wood, 1981; Howarth, 1993).

Collocations and phrases are of paramount importance in the light of assisting EFL learners to gain a native-like fluency in an academic context. "Collocational Competence" as Lewis (2000) asserts is a characteristic of advanced learners which assist them to produce accurate, fluent and correct English sentences, while lacking such a knowledge yield creation of incorrect, long and inappropriate phrases and utterances impeding them from expressing the exact idea they are trying to say. Research on collocation has recently absorbed many attentions but little work is done as regards collocation as well as contrasting the collocational behavior in different languages (Xiao & McEnery, 2006).

#### ***Role of Noticing in Learning Academic Collocations***

In fact, awareness or noticing concept has been considered mainly from cognitive psychological point of view. Many scholars in this view believe that language learning is the same as other types of learning. Noticing, as considered by psychologists, is a means which links input to memory system. There are challenging views as regards noticing and awareness. Noticing is considered an important tool in learning foreign language as some scholars (Schmidt, 1990; Ellis, 1999; Swain, 1995; Long, 1983, 1985; McLaughlin, 1987) believe that no acquisition takes place without awareness or noticing; while others, such as Truscott (1998) view noticing only as a means for the acquisition of metalinguistic knowledge.

To Schmidt, (Schmidt, 1990, 1994) Noticing, is a conscious or subconscious process to change input into intake; this input, however includes lexicon, grammatical form, pragmatics, etc (Schmidt, 1990), which in his view once

learners attend to these kinds of input it becomes intake. Therefore, he considers noticing as a necessary and sufficient condition for language acquisition. In Schmidt's view (1994), consciousness is defined as awareness, intention and knowledge. Different levels and degrees of awareness as Schmidt (1990) claims include noticing and understanding. Among those who consider noticing as both conscious and subconscious process are Smith and McLaughlin (Sharwood Smith, 1981; McLaughlin, 1987).

Schmidt's view of Noticing hypothesis is a strong form of changing input into intake. The weak form of noticing as viewed by researchers has also a helpful but not a necessary role in language learning. To Robinson (1995) memorizing linguistic forms such as reading, repeating etc. can aid learners to attend consciously to linguistic form for changing input into intake. This definition of noticing, as viewed by Robinson (1995) is termed as detection plus rehearsal, which is a significant tool to assist transferring linguistic features to their short-term memory.

Many researchers put an emphasis on the role of noticing in cognitive approaches to second language acquisition (Gass, 1988, 1991; Schmidt, 1990, 1992, 1993; Schmidt & Frota, 1986). Assisting learners notice the forms and focus their attention on the contrasts between their interlanguage and the target language has constituted the core point of many research carried out in EFL context (e.g. Ellis, 1997, 1999; Sharwood Smith, 1981, 1991; Swain, 1995; Swain & Lapkin, 1995; VanPatten & Cadierni, 1993a, 1993b).

Many researches have been carried out concerning learning English structures, forms and vocabularies through raising students' awareness (Alanen, 1992; Lynch, 2001; Fotos, 1993). Although these studies are not directly related to development of raising students' awareness of academic collocation through noticing, their findings are useful in understanding raising L2 learners' awareness of academic collocations in general. In short, findings are mixed. For instance, major researches in this arena are conducted by Schmidt and Frota (1986). To assess Noticing Schmidt conducted a research on a native speaker who noticed a diary prepared by Schmidt; his interaction was recorded by Schmidt (1986). Schmidt (1986) found a connection between recorded noticing in the form of diary entries and linguistic forms used by him.

However, the missing part in the previous studies is the importance of academic collocations and the effect of noticing academic collocations in an English language context. As a whole, the aim of this research is to assess the effect of noticing and awareness raising on learning academic collocations and the effects of learning academic collocations to be a fluent writer in English context. Researchers now understand the worth of academic collocations in English context especially to be a fluent writer or lecturer during their English life.

## RESEARCH QUESTIONS

To identify the relations, contradictions, and gaps in the literature, the following research questions were formulated to check the aim of the study:

**Question 1:** Do Iranian EAP learners learn academic collocations by noticing them in an academic context?

**Question 2:** Does EFL/ ESL learners pay attention to academic collocations through writing tasks such as noticing?

These questions are concerned with whether paying EAP learners' attention to academic collocations results in a change in learning academic collocations behavior, specifically, focusing on noticing and raising their awareness.

Taking these questions into account, the following hypotheses were formulated:

**Hypothesis 1:** Collocation awareness-raising does not lead to the noticing of academic collocations by Iranian EAP learners in an academic context.

**Hypothesis 2:** Collocation awareness-raising has no significant effect on the achievement of academic collocations by Iranian EAP learners.

## METHODOLOGY

This quasi-experimental research drew preliminary on Schmidt Noticing Hypothesis which was a foundation for investigating the impact of raising learners' awareness on learning academic collocations in an EFL context.

### ***Participants***

For the purpose of the present study, there were 38 participants (9 males and 29 females). The participants ranged from early 23 to 35 years of age. All study participants were L1 Persian speakers studying English as a Foreign Language enrolled in Islamic Azad University (North Tehran Branch, Iran). An obligatory writing course entitled "Advanced Writing" was selected for the purpose of the study, because this level was intended for those with basic skills but struggle in academic writing and speaking. Placement of the subjects into the classes was based on the enrollment procedures of the university and students' passing the preparatory grammar courses.

In order to measure their current knowledge level of academic collocations, a critical factor in academic contexts, the participants were asked to take an Academic Collocations Test as a pretest to be selected to serve as participants of this study. To acquire desirable result, it was necessary that all of the students in the two available classes present in all phases of the experiment: for the pretest, the instructional treatment, and the posttest session.

### ***Materials and Data Collection***

To collect data four types of materials were used for the purpose of the study:

#### ***Testing materials***

In order to evaluate learners' collocational competence, two tests were used by the researchers: a pretest of academic collocations for checking learners' knowledge level of academic collocation, and a posttest with the aim of measuring and comparing acquiring collocational competence of the two groups after treatment.

To assess level of the students' knowledge of academic collocations, participants in both groups were given an Academic Collocations Test as a pretest prior to treatment and the same test as a posttest following treatment. *Academic Vocabulary in Use* by Michael McCarthy and Felicity O'Dell (2007) was taken benefit as a source and guidance to plan the tests. The pretest consisted in 45 and the posttest in 34 multiple-choice items on the English structure testing academic collocations. The reliability of both tests was determined by administering the test on a group out of the two groups in question with the same college level as the two groups in question.

Attempts were made to plan the tests on academic collocations which appeared to be more beneficial in academic contexts such as giving lectures, writing articles, papers and thesis. The questions were designed as multiple-choice items so that students had four choices to select the correct answer. Having used the Kuder-Richardson formula 21, the reliability score of the pretest was estimated to be 0.86 and of the posttest to be 0.89. Following estimation of reliability, the tests were administered as a pretest and a posttest on the two groups in question to determine level of the students' knowledge of collocations prior and after treatment. The rationale behind administration of the test was to ensure the knowledge of the test takers on the items in question, to obtain good facility values and discrimination and to have enough items as Crocker and Algina (1986) found the following:

Whenever a test is administered, the test user would like some assurance that the results could be replicated if the same individuals were tested again under similar circumstances. This desired consistency (or reproducibility) of test scores is called reliability. (p. 105)

#### ***The model paragraph***

A model paragraph containing academic collocations to be underlined by the subjects was used per session. The model paragraph was a paragraph enriched with ten beneficial academic collocations chosen from *Academic Vocabulary in Use* by Michael McCarthy and Felicity O'Dell (2007). The significance of the academic vocabulary items focused on in this book is verified by the Cambridge International Corpus of written and spoken English and also the Cambridge and Nottingham Corpus of Discourse in English (CANCODE) corpus of spoken English developed at the University of Nottingham in association with Cambridge University Press. These corpora include large collocations of written and spoken academic text so that it includes the language which is distinctive for academic contexts.

Topics were selected in conformity with the aim of the study which was teaching typical academic collocations with the specifications of enjoying topic for writing in an academic context and enrichment with academic collocations of the most frequency to be used for academic purposes. In each sentence of the paragraph would learners notice and underline academic collocations. Therefore the model paragraph seemed to be consistent with the aims of the study in line with Schmidt's Noticing Hypothesis.

#### *A list of academic collocations*

For each session, a list of ten academic collocations was prepared with examples and comments on them (including but not limited on key nouns, key verbs, key academic expression and terms, key phrasal verbs and key quantifying expressions). Since the purpose of the research was to aid EFL learners to speak and write fluently in an academic contexts attempts were made to choose the academic collocations which intended to be of paramount importance in giving lectures and writing theses, dissertations, papers as well as articles in an academic contexts. The list in question included ten beneficial academic collocations chosen from *Academic Vocabulary in Use* by Michael McCarthy and Felicity O'Dell (2007). The significance of the academic vocabulary items focused on in this book is verified by lexicography and computational team at Cambridge University Press which has build up Cambridge International Corpus to provide evidence about language use that assists to better enhancement of teaching materials.

#### *Matching exercises*

As an assignment seven to ten matching exercises was designed so that the participants should try on them at home to master the academic collocations they have been taught per session.

#### **Research Design and Procedure**

To examine the research hypotheses, two groups were established: one comparison group and one noticing group. The groups were two classes which were selected randomly; their homogeneity was verified utilizing the pretest of academic collocations.

All the participants in the comparison group one and noticing group were thoroughly informed of the procedures to be followed throughout the study prior to the tasks. A weekly reading and noticing academic collocation session was administered for 6 weeks. A text enriched with the most beneficial and useful academic collocations which assumed to be of paramount importance in assisting learners to write and speak in academic contexts was presented and taught to the participants per session.

#### *Noticing Group*

The maximum length of experimentation time for each group participating in the study was around 20 minutes. For the passage reading and underlining, in order to have the participants focus on the activity of reading and noticing academic collocations, they were instructed to read the passage at a comfortable speed and to focus on overall passage to raise their awareness of academic collocations. Underlining was used as a measure of noticing as the participants were requested to underline academic collocations they come across within the text in question. All of the participants underlining the collocations in question exhibited a basic understanding of them (within a time limit of 5 minutes in average). After reading and underlining the researcher handed out a paper including ten academic collocations in form of sentences and taught them to participants emphasizing on their synonyms and comments. The maximum time allotted to complete the task was 5 minutes.

Following checking their awareness of collocations, the researcher handed over a passage of ten academic collocations as a quiz to the participants to check their understanding of academic collocations which they had learnt in previous session. The participants in the noticing group were told to read the paragraph carefully and underline the collocations acting as the input to help them in writing attempt. They were required to underline all and every academic collocation available in the paragraph. Underlining such collocations they showed their promotion level of collocational competence. The participants completed the task in approximately 5 minutes in average. Such quiz-papers were collected for assigning a mark to each participant to announce them their level of promotion.

In the third phase of the treatment, the students were required to receive feedback on the quiz administered in the previous session. However, such quiz was an opportunity to motivate them to challenge on learning academic collocations. In approximately 3 minutes in average, the task was accomplished. The remaining hour of the class time was allotted to give them feedback on matching exercises which they were requested to do at home as an assignment (approximately 2 minutes).

#### *Comparison Group One*

Following research conducted by Carter (1998) concerning explicit instruction of collocations, the comparison group one received academic collocations just through teaching them in context explicitly. Teaching collocations explicitly is important in the light of Carter's (1998) claim that "collocational mismatches are frequent in the language production of second-language learners since learners never encounter a word or combinations of words with sufficient frequency" (pp. 73-74). Therefore, the comparison group one received no treatment to acquire academic collocations. They were given a paper of ten academic collocations per session the same as noticing group and a paper of matching exercises including 7 to 10 sentences of previously-learned academic collocations as an assignment.

### **5. Data Analysis**

To examine the research hypotheses, the data were collected using a three-fold instrumentation procedure: the pretest of academic collocations prior to treatment, underlining academic collocations during the treatment and the posttest of academic collocations following the treatment. For the purpose of this study, since the researcher focused on the acquisition of academic collocations included in paragraphs with the theme written for academic purposes, underlining was used as a measure of noticing constructs in question. In the present study, underlining academic collocations was indicative of their learning the academic collocations. The data obtained from 45 multiple-choice items as pretest and 34 multiple-choice items as posttest concerning academic collocations were analyzed as well. The reliability coefficient of both tests was estimated through the Kuder-Richardson Formula 21 (KR-21). The rationale behind administration of the tests was to ensure the knowledge of the test takers on the items in question, to obtain good facility values and discrimination and to have enough items as Crocker and Algina (1986) found that test scores shall have desire consistency (or reproducibility), i.e. the results could be replicated if the same individuals were tested again under similar circumstances. The mean (M) and standard deviation (SD) of the scores were calculated. Corresponding to the research hypothesis, the data analyzed herein are of two types: a) the noticing, b) the effect of noticing on achievement of collocations.

The descriptive statistics such as measure of tendency as the mean, mode and median as well as measures of dispersion like the range, variance and standard deviation was run to summarize the participants' characteristics. The normality tests were run to examine the distribution of data. To test the research hypotheses various statistical tests were used.

### **RESULTS AND DISCUSSION**

To probe the research questions raised in this study a number of different statistical analyses were employed. The first and foremost of all is the testing of the assumptions of research hypotheses. However, the nature of the study permitted the researcher to employ parametric tests. The main research questions are analyzed through independent and paired-sample t-tests. These are followed by relevant graphs and descriptive statistics. The first step to test any research hypothesis is to determine the distribution of the scores obtained. For this purpose, the assumptions of normality and homogeneity of variances were tested empirically. To prove normality of the data, the ratios of skewness over their respective standard errors should be more than .05. For this purpose, the Kolomogorov-Smirnov Test was conducted as regards posttest of both groups in question. The ratio of Kolomogorov-Smirnov Test for both groups (comparison group one and the noticing group) are displayed in table 1. As displayed in the table 1, the ratio of Kolomogorov-Smirnov Test for comparison group one is .802, i.e.  $.802 > 0.05$ ., and the same ratio obtained for noticing group in pretest is .574, i.e.  $.574 > 0.05$ . That is to say the students' scores on the pretest enjoy normal distribution. However the students' score in posttest for comparison group one is .508, i.e.  $.508 > 0.05$ , while the

same ratio for noticing group is .629, i.e.  $.629 > 0.05$ , indicating that the data obtained for both groups in question is normal.

*Table 1: One-Sample Kolomgorov-Smirnov Test of Groups Under Study*

Pretest (Comparison Group One)	Posttest (Comparison Group One)	Pretest (Noticing Group)	Posttest (Noticing Group)
.802	.508	.574	.629

### ***Hypothesis 1***

In response to the first question of the present research, hypothesis 1 predicted that collocation awareness-raising does not lead to the noticing of academic collocations by Iranian EAP learners in an academic context. Following the Noticing Hypothesis, if the learners were asked to notice the academic collocations in the model text, a good effect could be achieved. In other words, awareness raising task could make the learners' performance in learning academic collocations more appropriate than those did in another group (comparison group 1). The participants underlining of the model passage was analyzed to address the noticing issue as an on-line measure. Therefore, the results obtained from both pretest and posttest of the noticing group supports Schmidt's (1993) noticing hypothesis in relation to the fact that noticing could direct to understanding and understanding to a good learning effect. Table 2 shows the descriptive statistics of pretest and posttest of noticing group.

*Table 2: Descriptive Statistics, Pretest and Posttest of Noticing Group*

	N	Mean	Std. Deviation
Pretest	23	6.4609	2.18429
Posttest	23	13.0000	3.54837

The mean score obtained by the students on pretest is 6.4609 while the same mean score on posttest obtained by them is 13.00. Consequently, there is a significant difference between the mean scores of the noticing group on the pretest and posttest. Therefore, it can be concluded that the first hypothesis as "collocation awareness-raising does not lead to the noticing of academic collocations by Iranian EAP learners in an academic context" is rejected.

The main supposition based on hypothesis 1 was whether underlining as a measure to raise learners' awareness lead to acquisition of academic collocations. Table 3 shows a paired- samples *t-test* to compare the noticing groups' means scores on the pretest and posttest of noticing. As is displayed in the table 3, the t-observed value is -10.96 (df=22,  $p=.000 < .05$ ) (Table 3).

*Table 3: Paired Samples Test of the Noticing Group*

Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference		t	df	Sig. (2-tailed)
			Lower	Upper			
-6.53913	2.86090	.59654	-7.77628	-5.30198	-10.962	22	.000

Based on the results obtained it can be concluded that there is a significant difference between the mean scores of the noticing group on the pretest and posttest. As displayed in Table 2, the students in noticing group outperformed on the posttest in comparison to pretest with a mean score of 13.00. The statistics showed that a significant difference emerged between the scores obtained by the noticing group in pretest and posttest of academic collocations.

### ***Hypothesis 2***

According to hypothesis 2, collocation awareness-raising has no significant effect on the achievement of academic collocations by Iranian EAP learners. In other words, the prediction based on the second hypothesis was: having raised learners' awareness in terms of academic collocations does not impact on the acquisition of academic collocations by Iranian EAP learners. In this case the participants in noticing group were presented with a paragraph enriched with ten academic collocations per session, and they were requested to underline the academic collocations in the text. Underlining therefore was used as a measure of noticing.

As Table 4 shows, the mean score for the Noticing participants (Mean = 13.00) exceeded that of the comparison participants (Mean = 10.23). The t-test was applied to find whether any statistically significant difference existed between the scores obtained on posttest of academic collocation by both groups in question. (see Table 4).

*Table 4: t-test (Comparison Group One vs. Noticing Group)*

	Mean	N	Std. Deviation	Std. error Mean
Comparison Group One	10.3214	14	2.83933	.75884
Noticing Group	13.0000	23	3.54837	.73989

An Independent Sample Test was applied to find the assumption of homogeneity of variances (see Table 5). As table 5 displays, Levene's F of homogeneity of variances obtained was 2.054. Since the probability associated with this F-value, i.e. .161, is higher than the significance level of .05, it can be concluded that the assumption of homogeneity of variances is met. In addition, referring to the results, it can be claimed that there is a significant difference between the score obtained by the comparison group one and that of the noticing group.

*Table 5: Independent Samples Test*

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
VAR00004	Equal variances assumed	2.054	.161	-2.392	35	.022	-2.67857	1.11959	-4.95146	-.40568

### **Discussion**

The main research question motivating this study was to investigate whether or not collocation awareness-raising has a significant effect on the achievement of academic collocations by Iranian EAP learners. To this end, the participants were divided into two groups: Comparison group One and Noticing Group. Table 1 displays the normal distribution of the scores obtained by the two groups participating in the study.

The first research hypothesis investigated whether collocation awareness-raising does lead to the noticing of academic collocations by Iranian EAP learners in an academic context or not. To this end, the noticing group's score on pretest was compared with the same scores obtained by them in posttest. Table 2 displays that the mean score obtained by the noticing group on pretest (6.4609) is much less than the same mean score on posttest obtained by them (13.00).

The results of the *parametric paired- samples t-test* for learners' performance on the posttest after noticing academic collocations gives support for positive answer to this critical research question. A significant difference was found between the noticing groups' means scores on the pretest and posttest of noticing. As is displayed in the table 3, the t-observed value is -10.96 (df=22, p=.000 < .05) (see Table 3 for details). The result might be used to imply that the differing experimental conditions of the noticing group show significant difference of the extent of attention paid by the learners to and noticing the target academic collocations. In fact, as a result of noticing the academic collocations as input, the learners' awareness to such input was raised and they probably noticed the input to change it into intake. The finding of the first research hypothesis might be used to confirm Schmidt's Noticing Hypothesis for the noticing function, which is deemed as a necessary and sufficient condition for language acquisition. Schmidt however introducing the noticing hypothesis asserts that having attend to input, the learners change input into intake (Schmidt, 1990).

The second research hypothesis examined whether collocation awareness-raising has significant effect on the achievement of academic collocations by Iranian EAP learners or not. In fact, the prediction was that raising learners' awareness of academic collocations does not lead to acquiring collocations in question. To this end, the

results of parametric t-test for two related samples revealed a significant difference between the scores obtained on posttest of academic collocation by both groups in question. The mean score for the Noticing participants (Mean = 13.00) exceeded that of the comparison participants (Mean = 10.23) (see Table 4 for more details). The results showed that the noticing group outperformed in posttest in comparison with the comparison group one. The result indicates that individual variation in terms of noticing the collocations in question for the comparison group was considerably less than that of the noticing group. In other words, it reveals that the comparison group's attention was paid to the collocations much less than the noticing group. Taking the noticing function of input into account, it might be claimed that the participants output of noticing group acted as noticing promoter, and consequently it resulted to draw the learners' attention to the target collocations. In fact, as a result of their reaction to the task of underlining as a measure of noticing, the learners bridged the gap found and noticed the input they received.

To test the related hypothesis, an independent sample test was run, too, to compare the mean scores of the comparison group one and the noticing group. Before discussing the results of the independent sample test, the assumption of homogeneity of variances was probed. The Levene's F of homogeneity of variances obtained was 2.054 (Table 5). The probability associated with this F-value, i.e. .161, is higher than the significance level of .05. Based on these results, it can be concluded that the assumption of homogeneity of variances is met. As displayed in Table 4, the noticing group with a mean score of 13.00 outperformed the comparison group one with a mean score of 10.32. Thus the second null-hypothesis as "collocation awareness-raising has no significant effect on the achievement of academic collocations by Iranian EAP learners" is rejected.

## CONCLUSION

This study made an attempt to explore a significant aspect in language learning, the impact of academic collocations to be a fluent-writer or speaker in an academic context, which is disregarded by language teachers in writing classes especially at college level. This research, also, was carried out to provide beneficial teaching techniques in language classrooms to improve students' range of vocabularies to increase their ability to access communicative competence for expressing themselves in English language context. In this study, noticing is deemed as a necessary condition to raise learner's awareness of academic collocations so that assisting them to gain native-like fluency. The main focus of this study was on providing input activities to assist learners to change input into intake through raising their awareness of such constructs. The findings of this study, however, support Schmidt's Noticing Hypothesis.

To attain such objective, raising learners' awareness of language elements, underlining parts of input was used by the researcher as a writing task. Underlining, as a measure of noticing, has been subject to some criticisms by scholars for its precision and accuracy, therefore, taking into account the shortcomings, results obtained from conduction of this research should be interpreted cautiously. Also, in the light of logistic considerations, the maximum length of experimentation time for each of the groups participating in the study was around 20 minutes. It appears that within such time limit for applying experimentation and treatment, participants might be restricted to perform at their utmost ability to attain desirable outcomes. In addition, selection of participants and insufficient number of the participants were among other things as problems to affect negatively on the validity of the results; consequently, care must be taken in generalization of the research results.

**ABSTRACT**

The purpose of this study was to measure up the impact of lexical collocation instruction on pre-intermediate Iranian language learners' writing proficiency. For the purpose of this study, 50 male and female Iranian English as a foreign language (EFL) learners studying at Ahvaz Islamic Azad University in Iran majoring in teaching English as a foreign language were selected through non-random convenient sampling procedure. The results of the proficiency test underlined the homogeneity of the groups. Then they were randomly divided into experimental and control groups. The control group was taught based on conventional methods of writing instruction and the experimental group received treatment based on lexical collocation instruction in writing one paragraph essays. The design of the research was based on pre and post-test method. Pre-test was a lexical collocation test included 35 items focusing on collocations proposed in McCarthy and O'Dell (2005). Pre-test was administered before the treatment period to make the researchers sure that the groups' homogeneity on lexical knowledge in writing paragraphs. During the treatment period five topics were administered to the students to write one paragraph essay for each topic. Having done the treatment, the researchers administered a post-test on lexical collocation consisting of 35 items of multiple-choice, matching, and cloze task dealing with lexical collocations acquired through the treatment. Then, the results of the tests were analyzed through statistical analysis of Independent Samples t-test. The results showed that there was a significant difference between the scores of the participants in the control and experimental groups. In addition, all the one paragraph essays of the study were analyzed through analyzing the components of writing including grammar, vocabulary, fluency, relevance and mechanics based on the checklist extracted from Heaton (1990). The results also showed that there was a significant difference between the mean scores of control and experimental groups in writing these components ( $p < 0.05$ ). Lexical collocation instruction developed the writing components of vocabulary and mechanics rather than grammar, relevance, and fluency in writing one paragraph essays.

**KEYWORDS:** lexical collocation, instruction, writing skill, EFL learners

**INTRODUCTION**

Many applied linguists (e.g., Zahedi & Mirzadeh, 2010) have emphasized the importance of drawing second language learners' attention to standard multiword expressions such as collocations and idioms. Lewis (2000) claimed that the mental lexicon of a learner is larger than previously recognized and that it mainly consists of multi-word items rather than individual words. Hyland (2008) argued that multi-word structures are components of fluent linguistic production and key factors in language learning. Lewis (2008a) states language includes grammaticalized lexis rather than lexicalized grammar (p. 89). Bahns (1993) also noted that lexical items and grammar are inseparable.

According to Lewis (2008b), lexical approach is based on the idea that language consists of meaningful chunks that combined, produce continuous coherent text. Lewis (2008a) believes that, it is the repertoire of 'chunks' which forms the raw data by which learners start to perceive patterns, morphology and other linguistic features. Nattinger and DeCarrico (1992) explain that language is not stored as individual words but in chunks that may take the form of multi-word items, sentence heads and fully institutionalized sentences. According to Ghonsooli, Pishghadam, and Mahjoobi (2008), Iranian English as Foreign Language (EFL) learners may have a good knowledge of English grammar and vocabulary but serious problems with acquiring the ability to use English language in a collective way. Bahns and Eldaw (1993) cite while students may have acquired a huge of vocabulary, they still lack collocational

knowledge. Also, Siik (2006) stated that students who suffer from the lack of collocational knowledge may have a store of “good vocabulary” but still produces unnatural language. Martynska (2004) claimed that collocations remain difficult to define. According to Koosha and Jafarpour (2006), although phonological transfer is most common in Second Language Acquisition, lexical and collocational transfer seems to be major cause of poor proficiency. Bahns (1993) reports that learners may rely on a first language transfer in which majority of collocational errors could be found. McCarthy (1990) believed that collocational knowledge is a part of native speakers’ linguistic competence, and can make problems for learners who are using second language in communication. However, the collocational studies point to the impact of lexical collocation instruction on other specific aspects of general English proficiency (e. g. Hsu, 2010; Mounya, 2010).

Even though several studies have been done in the area of grammar, lexis and collocation, very few of them have investigated the relationship between teaching lexical collocation and EFL learners’ writing proficiency (Ghonsooli et al., 2008; Mounya, 2010). This study tries to fill this gap, thus the present study investigated the effect of lexical collocation instruction (i.e., noticing, highlighting, and consciousness-raising) on learning lexical collocations and the impact of lexical collocation instruction on developing writing proficiency of EFL learners.

## RESEARCH QUESTION

The research questions were:

1. Does lexical collocation instruction (i.e., noticing, highlighting, and consciousness-raising) have any significant affect on learning lexical collocations?
2. To what extent does lexical collocation instruction affect students’ writing proficiency?

The focus of the study was not on the teaching and learning of vocabulary items, but on a pairing of the lexis combined in lexical collocations. Research on the individual vocabulary items is very extensive (Hunt and Beglar, 2005; Nation, 2005) but studies in lexical collocations are very much lacking. Also, this study may show the relationship between lexical collocation instruction and students’ writing proficiency. Accordingly, the teaching of vocabulary has not been in its rightful status, vocabulary errors would be treated as trivial. On the other hand, Taiwo (2004) regarded lexical errors as equally important as grammatical errors. However, Lewis (2008b) noted that fluency can be acquired through the acquisition of a several fabricated items. The current study attempted to show that the relationship between teaching lexical collocations and the learners’ writing proficiency and the role of lexical collocation instruction (i.e., noticing, highlighting, and consciousness-raising) in learning lexical collocations. Since recent studies on collocations are set in a foreign environment (Hsu, 2010; Hsu & Chui, 2008; Mounya, 2010), this study serves to add on to the list of research on collocations already carried out. So, this study may help those practitioners who are dealing with foreign language teaching, such as textbook designers, syllabus designers, test developers, teachers, learners, translators and the like.

## METHODOLOGY

### Design

This study was conducted based on an experimental design which involved control and experimental groups, a pre-test, a post-test, and a treatment with experimental group. Each group was taught the same materials with different methods of teaching. The participants of experimental group received 10 sessions treatment. To teach the participants of the experimental group lexical collocation instruction (i.e., noticing, highlighting, and consciousness-raising) was applied. Furthermore, five topics were administered to students of two groups to measure the effect of lexical collocation instruction on developing writing proficiency of students at the end of study.

### Participants

The participants of this study were fifty male and female students of Islamic Azad University of Ahvaz (including twenty two male and twenty nine female). They were majoring in Teaching English as Foreign Language (TEFL) and their age ranged from 20 to 30 years old. They were studying writing courses in English at the third semester. They were selected through non-random convenient sampling procedure. In order to find out whether they were homogenous, a simulated proficiency test of English extracted from *Nelson English language tests. Book 1 elementary* developed by Fowler and Coe (1976) was administered. No absolutely difference was found between the participants. Then they were divided into experimental and control groups (i.e. each included 25 participants) based on systematic random sampling method through which learners were given odd and even numbers from 1 to 50. Students' odd numbers were classified in experimental group and the students' even numbers were put in control group.

### **Instrumentation**

Initially, the subjects took the simulated proficiency test extracted from *Nelson English language tests. Book 1 elementary* developed by Fowler and Coe (1976) to ensure the homogeneity of the groups at the very beginning of the course. The test included seventy five multiple-choice items. The reliability of the instrument was estimated through KR-21 approach and the obtained reliability index as (0.77) which seemed to be an acceptable reliability value.

The second instrument was a pre-test that contained thirty five items of cloze task and matching task from *English Collocations in Use* and *English Vocabulary in Use* developed by McCarthy and O'Dell (2005) and *Oxford Collocations Dictionary* (2009) was administered to measure the learners' actual knowledge at the beginning of treatment. The reliability of the test was measured through Cronbach Alpha as ( $\alpha = 0.85$ ). Finally, a post-test including thirty five items of cloze task and matching task and multiple-choice administered to determine the effectiveness of experimental and control groups' lexical collocation instruction. The reliability of the test was calculated through Cronbach Alpha as ( $\alpha = 0.93$ ). In addition, 5 topics were being selected to write one paragraph essay including one hundred and fifty words and the analytic method of scoring was being employed. Heaton's (1990) rating scale was used to assess grammar, vocabulary, mechanics, fluency, and relevance of the essays; moreover, the researchers allocated 1.40 points to each of these components in order to correct the learners' writings analytically. Also, the students' writings were corrected holistically (on a scale from zero to 7) and were scored by two raters. Inter-rater reliability was run to examine the reliability of scoring the essays. The inter-rater reliability of control group's scores on the essays was estimated through Cronbach Alpha as ( $\alpha = 0.747$ ). The inter-rater reliability of experimental group's scores was estimated through Cronbach Alpha as ( $\alpha = 0.873$ ).

### **Procedure**

A simulated proficiency test of written English extracted from *Nelson English language tests: Book 1 elementary* (1976) by Fowler and Coe administered to determine the homogeneity level of the participants. Then a pre-test was being run to ascertain both groups' knowledge on collocational elements at the initial stages of the study. Then, the explicit instruction was being occurred during one academic semester including 10 sessions. The *English Collocation in Use* and *English Vocabulary in Use* developed by McCarthy and O'Dell (2005) were being effectively used for teaching lexical collocations in each session. Since one of the obstacles to teaching collocations as pointed out by Bahns (1993) is that we deal with samples of collocations here. In experimental group first, we restricted our examples to verb + noun mis-collocations. For instance, the first sentence was: *I have to make my homework*. This is an extremely common *verb + noun* mis-collocation in which the verbs *make* and *do* are used with inappropriate nouns, so "make and do" collocations provide a useful starting point for introducing the notion of collocation to learners. An effective platform for raising awareness of collocation is to focus on a selection of students' mis-collocations (Lewis, 2000).

A simulated proficiency test of written English extracted from *Nelson English language tests: Book 1 elementary* (1976) by Fowler and Coe administered to determine the homogeneity level of the participants. Then a pre-test was being run to ascertain both groups' knowledge on collocational elements at the initial stages of the study. Then, the explicit instruction was being occurred during one academic semester including 10 sessions. The *English Collocation in Use* and *English Vocabulary in Use* developed by McCarthy and O'Dell (2005) were being effectively used for teaching lexical collocations in each session. Since one of the obstacles to teaching collocations as pointed out by Bahns (1993) is that we deal with samples of collocations here. In experimental group first, we restricted our examples to verb + noun mis-collocations. For instance, the first sentence was: *I have to make my homework*. This is an extremely common *verb + noun* mis-collocation in which the verbs *make* and *do* are used with inappropriate nouns, so "make and do" collocations provide a useful starting point for introducing the notion of collocation to learners. An effective platform for raising awareness of collocation is to focus on a selection of students' mis-collocations (Lewis, 2000).

### **Data Analysis**

To analyse the data quantitatively, descriptive statistics and Independent Samples of *t-test* for comparing the performance of the two groups at the pre-test and post-test were being employed. Also, the students' writings were being scored analytically based on the checklist provided by Heaton (1990). To analyse the subjects' process of learning and to explore the possible effects of collocational teaching, the mean scores of different writing

components on each topic (five topics in total) for both groups were being analysed. Essays were scored by two raters. Inter-rater reliability coefficients were calculated to meet the reliable scoring on the essays. Then an Independent Sample *t*-test was run to calculate any significant difference between the means gained by experimental and control groups in five topics as well as in pre and post-tests at the level of significant ( $p < 0.05$ ).

## RESULTS

Descriptive statistics including minimums, maximums, means, and then standard deviations of pre-test and post-test

Groups	N	Minimum	Maximum	Mean	Std. Deviation
Pre-test(Control)	25	5.0	28.00	18.28	7.021
Post-test (Control)	25	7.00	32.00	23.2400	6.46323
Pre-test (Experimental)	25	9.00	29.00	20.4400	4.66440
Post-test (Experimental)	25	20.00	33.00	26.8000	3.87298
Valid N (list wise)	25				

of all groups were computed. They are presented in Table 1.

*Table 1. Descriptive Statistics of the Control and Experimental Pre-test and Post-test*

Results indicated that the mean score of control group which had been 18.28 in pre-test exam promoted to 23.2400 in post-test exam. It also indicated that the mean score of experimental group which had been 20.4400 in pre-test exam promoted to 26.8000 in post-test exam.

### Pre-test

As there were one dependent variable and one independent variable, a *t*-test was run; the results are shown in the following table.

*Table 2. Descriptive Statistics of Experimental vs. Control (Pre-test)*

Groups	N	Mean	Std. Deviation	Std. Error Mean
Pre- test(control)	25	18.28	7.021	1.404
Experimental)	25	20.44	4.664	.933

Table 2 Indicates the observed  $t$  ( $t_o = -1.281$ ) is less than the critical  $t$  ( $t_c = 2.044$ ) with df (48); therefore, the difference between the two groups is not significant at the level ( $p < 0.05$ ). This shows the groups' homogeneity at the beginning of the experiment.

*Table 3. Independent Samples t-test (Pre-test)*

Experimental vs. Control (Pre-test)	T	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference
	-1.281	48	.206	-2.160	1.686

### Post-test

After there were one dependent variable and one independent variable, a *t*-test was run; the results are shown in Table 4.

Table 4. Descriptive Statistics of Control vs. Experimental (Post-test)

	N	Mean	Std. Deviation	Std. Error Mean
Control vs.	25	20.4400	4.66440	.93288
Experimental	25	26.8000	3.87298	.77460

Table 5. Independent Samples t-test (Post-test)

Experimental vs.					
Control (Post-test)	T	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference
	- 5.245	48	.000	-6.36000	1.21255

Since the observed  $t$  ( $t_o = -5.245$ ) is greater than the critical  $t$  ( $t_c = 2.044$ ) with df (48), the difference between the two groups is significant at the level ( $p < 0.05$ ). In other words, the treatment of lexical collocation has been effective in developing participants' knowledge of lexical collocation. Thus it indicates that students' knowledge of lexical collocation in experimental group improved significantly.

Figure 1. Using lexical collocations in writing essays

Figure 1 indicates that the subjects' learning process for vocabulary and mechanics components develops quite significantly while this process regarding relevance and fluency takes place to a lesser extent. This learning process develops to a small extent with regard to grammar component. A comparison of the experimental group curve for the whole treatment period would reveal the process of experimental subjects' writings improvement by the type of instruction. In sum, the polygon shows the positive effect of lexical collocation instruction on vocabulary and mechanics components of writing. The comparison of vocabulary and mechanics lines on the graph shows that the mean of vocabulary and mechanics was greater than the other components of writing.

## DISCUSSION

Regarding research question one, results showed the positive effect of lexical collocation instruction on experimental students' post- test was significant compared to control group. The results of Independent Samples t-test analysis showed that there was a significant difference between control and experimental groups in terms of lexical collocation knowledge ( $p < 0.05$ ). By the comparison of mean scores of participants, the instructional method of lexical collocation appeared much more beneficial to experimental group rather than to the control one. The post-lexical collocation test scores indicated that the lexical collocation knowledge has been positively gained by the experimental group. The post-test scores of the experimental group indicated that the group had better retention rate compared to the control one. Participants received instructional method of lexical collocations in the paragraphs included noticing, highlighting, consciousness-raising, translation activities, and dictionary use to increase their knowledge of lexical collocations. Therefore, lexical collocation instruction had positive effects on learning collocational elements. This finding is consistent with Lewis (2008a) who suggests that encouraging learners to notice language, especially collocations, is central to any methodology connected to a lexical view of language. Lexical collocation instruction is a method to help students notice these lexical chunks through using them in writing process.

Results dealing with the second research questions showed the experimental group outperformed the control group. Descriptive statistics also showed that the mean scores of the experimental group were greater than that of control group in each topic.

The effect on students' grammar failed to be of great significance. One possible justification for this is the fact that the experiment was conducted on 10 teaching sessions and learners required more time to be able to extract the grammar themselves. Also, just five topics were given to the learners during the treatments. So, the participants had not received enough exposure and feedback to develop their grammar themselves.

In addition, the analysis of paragraph writings showed that the subjects' learning process for vocabulary and mechanics components (i.e. spelling, punctuation, and capitalization) developed quite significantly while this developmental process regarding relevance and fluency takes place to a lesser extent. Therefore, there was a positive effect of lexical collocation instruction on vocabulary and mechanics components of writing skill. Exposure and feedbacks received by teacher may have the positive impacts on vocabulary and mechanics of writing skill. In addition, exposure to language materials (e.g. dictionary) was an influential factor for EFL learners to develop their vocabulary knowledge.

The results of the present study are; therefore, in line with the findings of studies conducted by some scholars (e.g., Bahardoust, 2012; Bahardoust, 2013; Mounya, 2010). According to these results, collocational knowledge is a source of fluency in written communication among students. The commonality of these studies is that instruction on lexical collocation should be encouraged to replace conventional single-item vocabulary instruction for the purpose of enhancing EFL learners' writing abilities. Therefore, in line with the above mentioned studies and the present study, it could be strongly argued that lexical collocation instruction can significantly influence EFL pre-intermediate language learners' developing writing proficiency.

## CONCLUSIONS

This study was an attempt to investigate whether lexical collocation instruction had any impact on writing proficiency of Iranian pre-intermediate language learners. It also sought to find out whether lexical collocation instruction (i.e., noticing, highlighting, and consciousness-raising) had any significant affect on learning lexical collocations by Iranian pre-intermediate learners of English as a foreign language. In doing so, two groups were selected; one group was taught on the basis of traditional approach. The other group was taught through noticing, highlighting, consciousness-raising, translation activities, and dictionary use to teach lexical collocations in each paragraph. Then five topics were administered to write one paragraph essay by students. Next, each paragraph was scored and the result was analysed through specific statistical analysis Independent Samples t-test. The results showed that there was a significant difference between the scores of the participants on traditional approach and their scores on the other approach. Students have used lexical collocations in their paragraphs of the examination because they have become aware of the fact that using lexical collocations can improve their writing and make it more natural. There was a positive impact of the method on students' mechanics and vocabulary components of writing. That is, lexical collocation instruction can significantly influence EFL pre-intermediate language learners' writing proficiency. Therefore, it could be claimed that lexical collocation instruction should be included in the writing syllabus at the university so that collocational competence could be developed in order to enhance students' communicative competence.

The results also indicated lexical collocation instruction (i.e., noticing, highlighting, and consciousness-raising) had significant effect on students' learning lexical collocations. The results obtained by experimental group were compared with the mean score of control group which was taught on the basis of traditional approach. The results of

Independent Samples *t*-test analysis showed that there was a significant difference between the mean score of experimental group and mean score of control group. The descriptive statistics also showed that the mean scores of the experimental group were greater than that of control group. On the basis of the results of the present study, teaching lexical collocations is the major endeavour to reach proficiency in writing. They are taught explicitly through highlighting, noticing, consciousness-raising. Teaching individual words come in the second position, and it is useful only if these words are taught in context. Feedback on mis-collocations is very important because it will raise learners' collocational competence and consequently communicative competence (Jeremie, 2013). Exposure to language materials (e.g., collocation dictionaries and concordancing) are influential factors for EFL learners. Therefore, activities that enhance students' knowledge and use of lexical collocations are required. In addition, compared to vocabulary, grammar has a minor role in raising writing proficiency. So, lexical collocation should be included in the criteria of evaluating compositions.

Many Iranian EFL learners have serious problems with collocations. Instruction on collocation should be encouraged to replace conventional single-item vocabulary instruction for the purpose of enhancing EFL learners' writing abilities. Besides, collocation instruction is what most EFL students would prefer and believe to be useful in enhancing their writings. Future investigations may again look into the role of knowledge of collocations and writing, by stretching the study to a long period of time instead of 10 sessions and involving more participants. In addition, the study can be wider in scope, to include all the possible lexical collocations and going beyond the two-word collocations so that the data could be more representative of the participants' knowledge of collocations. Another area of improvement over the present study could be the selection of texts within which the phrases could be found. Future research should also consider grammatical collocations and similarly its effectiveness in improving written fluency.

**ABSTRACT**

Anxiety as an affective variable has been shown to be negatively correlated with performance in learning a language as a foreign language. So many researches have been conducted about anxiety for college student. This survey, however, focuses on the high school students. This study was an attempt to study the effect of anxiety on the English learners in Andimeshk city, Iran. Subjects included 120 students from a high school in Iran. Two instruments were employed for this study: a questionnaire assessing students' anxiety level and an Oxford Placement Test. It was a Standard English language test which was administered to check the final English achievement level of students. It was administered to determine the proficiency level of the students. The findings indicated that students experienced some degree of anxiety in English classes. From the results of the study, the sources and the amount of anxiety were as follows respectively: second language deficits, fear of negative evaluation, and perfectionism. Finally, some suggestions are offered to teachers in dealing with this phenomenon in language classes especially those conducted communicatively

**KEYWORDS:** learning anxiety, English achievement

**INTRODUCTION**

When asked to participate in classroom activities, high school students flounder and hesitate to come up with an answer even the wrong one. They often complain that they have got the palpitations and feel embarrassed to take part in class activities. The worst thing is that teachers ignore this fact in their classes and make no attempt to deal with it. As an affective variable, Anxiety is assumed to influence second language acquisition. Much research (e.g., Bailey, 1983; Horwitz, Horwitz & Cope, 1986; MacIntyre & Gardner, 1994; Young, 1991), has been carried out to find the correlation between anxiety and achievement in learning a second language. Most studies (e.g., Horwitz, 1986; MacIntyre & Gardner, 1994) found that anxiety and achievement are negatively correlated. In Iran, similar survey has also been conducted with different groups of people. In this survey, the author attempted to rescue this group of learners who have been fallen into oblivion by teachers in English classes.

**LITERATURE REVIEW**

The concept of anxiety plays a major role in second language acquisition. Spielberger (1983, p.1) defines anxiety as the subjective feeling of tension, apprehension, nervousness, and worry associated with an arousal of the automatic nervous system. Anxiety usually falls into two types: one is trait anxiety that is a more permanent predilection or to be anxious about everything (Scovel, 1978) and the other state anxiety, experienced when performing a particular task or activity in a particular situation such as giving a lecture in front of the class (Brown, 2001). Trait anxiety, because of its global and ambiguous nature has not proved to be helpful in predicting second language achievement.

Accordingly, the present study on language anxiety focuses on the situational nature of state anxiety (Gardner & MacIntyre, 1993).

With the shifting of research focus from teachers to learners in SLA (Second Language Acquisition), affective factors, such as attitudes and motivation, were thought to account a lot for language learning outcomes. Anxiety, as a very important affective factor, has been considered very important, and many studies have been undertaken to explore it since the 1970s.

The major concern of the earlier studies was the causes of language anxiety. As early as 1983, Bailey, through the analysis of the diaries of 11 learners, had found that competitiveness can lead to anxiety. Besides, he (1983) found that tests and learners' perceived relationship with their teachers also contributed to learners' anxiety. These three aspects that Bailey identified were supported in subsequent studies, especially in Young's study. According to Young (1991), there are six potential causes of language anxiety which include personal and interpersonal, learner beliefs about language learning, instructor beliefs about language teaching, instructor-learner interactions, classroom procedures and language tests. From this list we can see that Young, in fact, identified the causes from three aspects, that is, the aspects of learners, teachers and instructional practice, to which Bailey's findings also complied. Research findings by Horwitz and Horwitz and Cope (1986) cast some light on nature of language anxiety. Building on these studies, three causes of language anxiety have been identified. (a) communication apprehension, arising from learners' inability to air their thoughts and feelings. (b) test anxiety due to academic evaluation, and (c) fear of negative evaluation, growing out of a learner's need to make a positive social impression on others.. Based on these three components they also designed a Foreign Language Classroom Anxiety Scale including thirty-three items. This scale was later widely used by researchers to measure foreign language learners' anxiety and examine the effect of anxiety on learning in different contexts.

Another important insight can be gained from the distinction between debilitating and facilitative ramification of anxiety on learning (Alpert & Haber, 1960). Most studies, to date, indicate a negative relationship between anxiety and language achievement. To put another way, anxiety is a debilitating in language learning. Krashen (1985) in his affective filter hypothesis maintains that high anxiety will prevent input that learners receive in the classroom from reaching the language acquisition device. Horwitz (1986) also states that language anxiety can cause students to postpone language study indefinitely or to change majors. MacIntyre and Gardner (1994), based on a study of 97 college students that learn French, concluded that compared with more relaxed learners, those with anxiety find it more difficult to express their own views and tend to underestimate their own abilities. They also found that in the three stages of language acquisition, that is, input, processing and output, anxiety and learning achievement are negatively correlated. Moreover, there have also been some studies conducted to find the negative correlation between anxiety and four aspects of language learning, especially speaking and listening. For example, Macintyre and Gardner (1991) found that speaking is by far the main agent of anxiety-arousal, and that students with high anxiety perform worse than those with low anxiety. However, there have been some studies which found neutral and positive relationships between anxiety and second language achievement. Bailey's (1983) investigated the relationship between competitiveness and anxiety and found that facilitative anxiety was one of the keys to success, and closely related to competitiveness. The results from a study into English learners in Taiwan (Zhang Baoyans, 1996) indicated that there was no relationship between anxiety and learning achievement. Therefore, drawing from these studies, it can be seen that the relationship between anxiety and achievement is probably not a simple linear one. It may be influenced by some other factors, such as culture and learners' proficiency in the second language. Some researchers (Sparks, Ganschow, & Javorsky, 2000) ascribe the cause of anxiety in second or foreign language classes to deficits in the first language codes (i.e., phonological, syntactic, lexical, semantic features.) and maintain that anxiety is a product of poor performance in first language. They have attempted to prove the case by examining what they call the Linguistic Deficit Coding Hypothesis (LCDH).

This study was an attempt to examine the general situation of high school students' foreign language anxiety and the effects of anxiety on FL (Foreign Language) learning. As well, a comparison of male and female students' language anxiety was examined.

## RESEARCH QUESTION

The aim of the present study is to investigate the effects of anxiety on Iranian EFL Learners' performance on final Achievement Test in English classes of High schools, So the following research question is addressed:

Does anxiety has any effect on Iranian EFL Learners' performance on final Achievement Test in English classes of High schools?

## METHODOLOGY

### *participants*

The subjects in the study were 120 four-year high school students (60 males and 60 females) from Khuzestan province, Andimeshk city. Their major fields of study were mathematics, Humanities and their age was between 17 and 19 years old. They all had 7 years of learning English as second language learners in Iranian public schools

### *Instruments*

Two instruments were employed for this study: a questionnaire assessing students' anxiety level and an Oxford Placement Test.

The first instrument was a questionnaire which was made up of two parts. The first was intended to collect personal information about the participants, such as their age, name, gender, etc. The other was the Persian version of FLCAS that was designed by Horwitz (1986). This questionnaire comprised of 33 statements, of which 8 items were for communication anxiety (1, 9, 14, 18, 24, 27, 29, 32), 9 items for fear of negative evaluation (3, 7, 13, 15, 20, 23, 25, 31, 33) and 5 items for test anxiety (2, 8, 10, 19, 21). As to the remaining 11 items, they were placed under the rubric which was labeled as anxiety of English classes. The participants were asked to rate each item on a five-point Likert scale ranging from 1 ("strong disagreement") to 5 ("strong agreement").

The next instrument was OPT. It was a Standard English language test which was administered to check the final English achievement level of students. It was administered to determine the proficiency level of the students. The reliability of the test was calculated afterwards which happened to be 0.89. All the students were administered the proficiency test in a single testing session. The 30 items test included grammatical questions about conditional sentences.

### *Data Collection*

The questionnaire was administered to 60 science students and 60 arts students. 120 copies were collected back and 116 replies were found statistically valid. Only the students from the science class supplied their English scores of the final exam.

### *Data Analysis*

SPSS (Statistical Product and Service Solutions) 13.0 was employed to analyze the data. First, descriptive analysis was performed to calculate the means and standard deviations for each item and each kind of anxiety to see the general situation of high school students' anxiety in English classrooms. Second, t-tests (t distribution tests) were employed to see whether there were any differences in language anxiety between male students and female students. Then correlational analysis and t-tests were conducted to find out the effects of anxiety on achievement in English.

## RESULTS AND DISCUSSION

The descriptive analyses of the results revealed that there were 15 items whose means were above 3.25. Amongst the statements the 11th had the highest index of 3.5671. The mean of the anxiety indices of all the participants in English classrooms, as Table 1 shows, was 2.8432 which indicated that high school students suffered from a feeling of anxiety in English classes. Besides, by computing the means and standard deviations of each kind of anxiety, it was revealed that students' fear of negative evaluation, with a mean of 3.7581, was worth considering. Among the 15 items whose mean values were greater than 3.00 8 statements related to it, especially item 3, with a mean of 3.6579.

*Table 1: General High School Students' Anxiety in the English Classes*

Anxiety Variables	Mean	Standard Deviation
Communication Apprehension	2.8865	.48557
Fear of Negative Evaluation	3.7581	.76055
Test Anxiety	2.7737	.71570
Anxiety of English Classes	2.7412	.66185
English Classroom Anxiety	2.9310	.60911

***The comparison of anxiety between males and females English classes***

Table 2 shows that means of males' were always higher than females, which signified that males may experience more anxiety than females in English classes. However, the results of t-tests indicated that there were no significant differences between males and females in most anxiety variables except that of English classes ( $p=0.025<0.04$ ).

*Table 2: Males and Females' English Classroom Anxiety*

Anxiety Variables	Gender	Mean	Standard Deviation
Communication Apprehension	Male	4.1791	.62023
	Female	4.0277	.67788
Fear of Negative Evaluation	Male	4.4439	.84691
	Female	4.1747	.69737
Test Anxiety	Male	3.8022	.70588
	Female	3.5511	.72789
Anxiety in English Classes	Male	3.8734	.67983
	Female	3.7033	.65544
English Classroom Anxiety	Male	4.0117	.66634
	Female	3.7932	.61445

*Table 3: The Comparison of Males and Females*

Anxiety Variables	t-value	Significance of t-value ( $p<0.03$ )
Communication Apprehension	1.231	0.255
Fear of Negative Evaluation	0.407	0.675
Test Anxiety	1.930	0.056
Anxiety of English Classes	2.251	0.026*
English Classroom Anxiety	1.235	0.216

***The relationship between anxiety and English achievements***

The results of the correlation analysis indicated that anxiety and English achievement were only correlated in terms of test anxiety. And they were negatively correlated ( $-.277$ ,  $p=0.039<0.05$ ). It was noted that the coefficient of anxiety for English classes was  $-0.232$  which approached the significant level of  $-0.25$ . Therefore, the students from the science class were divided into two groups according to their English scores in the final exam. A t-test was then employed to see if there were any significant differences in the anxiety of English classes between these two groups. The results of the analysis supported the hypothesis that was proposed above. It was found that anxiety of English classes indeed affects high school students' English achievement ( $p=0.037<0.05$ ).

*Table 4: The Correlation of Anxiety and English Achievement*

Anxiety Variables	Correlation Coefficient	p-value ( $<0.05$ )
Communication Apprehension	-.103	0.458
Fear of Negative Evaluation	-.098	0.566
Test Anxiety	-.287*	0.041
Anxiety of English Classes	-.242	0.078
English Classroom Anxiety	-.236	0.103

***Discussion***

The present study revealed that high school students suffer considerable feeling of anxiety in their English classes that needs to be addressed by English teachers. And they experienced more fear of negative evaluation. There are two possible sources for anxiety in language classes. One can be associated to the high school students themselves. The other may emanate from some external factor. Regarding students themselves, the presence of anxiety, during

language related activities, could be associated to their English proficiency, which was not adequate to enable them to participate in class activities, cooperate with their partners, or come up with the right answer to the questions posed by the teacher or classmates. Thus, high school students are more apprehended during communicative activities given their low proficiency in the second language in English classrooms. The other can be attributed to their cultural background. In a collective society like Iran peoples' face is lost if they are criticized or scolded in front of others. So in order not to make a mistake they prefer to sit on the fence in order not to receive negative evaluations. That is why they endure grater fear of negative evaluation comparing to any other kind of anxiety. The stress of the nation-wide entrance examination and the ruthless competition among students can prevent candidates from demonstrating their true abilities and perform less satisfactory than usual. One striking finding, during careful examinations of items on the test, was that some students with grater language ability answered the easier questions wrongly. This may have its root in the fact that such students set quixotic goals and are perfectionist and are too meticulous about trivialities on the test. To put another way, they cannot see the wood for the trees.

The reasons for external anxiety can originate from the setting of English learning in Iran. Research has shown that contact with the people and culture of the target language could reduce anxiety (Tang, 2005).Iranian learners have no direct access to native speakers or especially designed English programs for the purpose of teaching English to learners of English. They also find little opportunities to test their inter language hypotheses through communication and remove inaccuracies in their output. What is worse is that the purpose of teaching English as a foreign language in Iran is not to foster communication but to help students grow intellectually though reading and instruction on grammar points. There is no emphasis on listening and speaking. Reading and teaching grammar take up most of the class time. There are little opportunities for students to practice speaking or voice their opinions in English. Writing, like speaking, has plunged into oblivion and it is at the service of teaching grammatical structures such as transformation or expansion drills. Moreover, most Iranian teachers themselves are not proficient speakers of English thus they tend to avoid teaching speaking in their classes and emphasize grammar points. The type of exercises included in textbooks attempt to prepare students for the Nationwide College Admission Examination. Therefore, teachers make special efforts to teach to testing and familiarize students to those of tests confronted on this test by learners. Another matter that is worth consideration is that English classes in Iran are teacher-fronted. Teachers are deemed as the source of knowledge and dominate the class activities and learners dot have the right to challenge teachers and are silent during class activities. Teachers disfavor pair or group work due to the large size of classes. It is clear that Iranian learners of English, as the present study indicated, undergo substantial amount of anxiety during communicative activities and are afraid of making mistakes in front of teachers or their peers.

Generally speaking, females are better in language learning than males. Female students usually perform better than male students on achievement exams. Thus one can posits that females show greater confidence in their abilities to learn a new language. As soon as they gain faith in their capabilities, they will be more willing to "tackle with threatening situations" (Dörnyei, 2001) in English classes. In contrast, males who have repeated failures in learning a second language tend to attribute their poor performance in English classes to their low capabilities and are more anxious about English classes.

To enter college in Iran, students must take a compulsory test and reach the necessary standard. Therefore they make every effort to study English as a subject of study. Although, males are less gifted for English than females, they compensate for this by allocating more time and energy into their English. However, the gap between males and females is not very large now. In many English tests the highest scores were attained by some male students. That is the reason why no significant differences were found between them, though males' means were a little higher than females.

#### ***Anxiety has a debilitating role in language learning.***

The results from the present study showed that test anxiety and anxiety of English classes were significantly correlated with high school students' English achievement. In terms of the other factors, although the relationship was insignificant, the coefficients were all negative. Thus, it can be said that anxiety plays somewhat a debilitating role in language learning.

Many previous studies have reported the negative role of anxiety in language classes. e.g., Horwitz (1986), MacIntyre and Gardner (1994), Tang (2005).High anxiety can be a hindrance to learners and a source of

discouragement. The ramification is that they give up easily and shirk their duty in participating in class activities. Therefore, learners with higher anxiety often fail to demonstrate their true abilities in classes.

Another striking finding in the study was the significant correlation between English achievement and test anxiety, anxiety of English classes. In Iran, high school students, compared to, college students, take more tests. For this reason, Therefore, some students with poor English achievement were anxious about and even felt disheartened by English classes and tests.

## CONCLUSION

This study cast some light on the nature and the source of high school students' anxiety in Iranian EFL classroom. It was found that most students experienced a feeling of trepidation and fear in classes. Above all the fear of negative evaluation. Male learners were found to have greater anxiety than females in English classes. What is more, it was revealed that anxiety is an obstacle to language learning, especially anxiety of tests and English classes.

Now that it has been recognized that anxiety is prevalent in Iranian high school English classes, teachers must pay special attention to it. Moreover, teachers should take the students' affective factors into account during teaching and learning activities. (Zhang & Chang, 2004). For one thing, they should strive at creating a relaxed atmosphere for students to air their grievances and views freely. Secondly, teachers should eschew negative evaluation about learners in front of peers and point out positive points about them. Thirdly, teachers would be better to take a criterion-referenced approach toward testing and shun ranking students on a scale. Unfortunately, some teachers compare students based on their performance on exams and fail to realize that this can be a source of anxiety and a feeling of shyness in language classes. Teachers can free learners' minds from the fear of getting higher scores. In short, much research indicates that judicious anxiety plays a positive role and can motivate students to maintain their efforts on learning. Therefore, the teachers' real job is to help students keep adequate anxiety, neither too high nor too low.

## Limitations of the study

The story of second language acquisition is interestingly comparable to the story of the elephant which was supposed to be described by a group of people in a dark room. And they all came to different descriptions of the whole body because they just touched parts of the body. The same story still is the case for SLA. As it is the case with almost all studies done in the field of teaching English as a foreign language, this study is not free of limitations. That is to say, because of the eluding nature of anxiety which is defined differently by different people one cannot claim to provide all inclusive criteria to list the problems with which EFL teachers wish to come to a conclusion in evaluating anxiety as an approach in EFL contexts. Therefore, the authors of this paper have not intended to come to an absolute conclusion about the perceived problems with which EFL teachers might face in using anxiety measurement in their real classes. ALL in all, it is hoped that this survey be of use for all colleagues. All defects of this paper are of ours. That is, no fault is to the participants in this study.

### ABSTRACT

Various studies focusing on the effectiveness of teacher-parents relationship emphasize the positive effects of parents' involvement in education. This study aimed to examine the effects of teacher-parents relationship on Iranian English as a foreign language (EFL) learners' language proficiency at elementary level. It also aimed to find how this relationship may influence parents' motivation and attitude with regard to their role in education. In this study a permanent relationship with parents was created through writing weekly letters to them. By these letters parents were informed about absence or presence of their children, quality of doing assignments, children's behavioral problems, children's scores in class quizzes, etc. The results showed that permanent teacher-parents relationship can increase students' language proficiency and parents' motivation.

**KEYWORDS:** parents, parents' involvement, teacher-parent relationship, motivation, students' success

### INTRODUCTION

Traditionally parents think that teachers and schools are the only responsible agents for their children's education and training. As teachers try to make a relationship with parents in order to involve them in their children's education, parents may perceive teachers as being incompetent. The teacher must enlighten the parents on the physical, spiritual, mental, and emotional development of the child. Therefore, the teacher should display the activity of the child to the parents, for example, through films documenting the child's developmental stages, books, handiwork, and drawings made by the child (Tos, 2001). These reports should be shared so that each parent can view them and use them as examples. The parents wish to feel reassured that the teacher values the child and is concerned about him/her, and that the teacher needs their support for the successful performance of the child at school. The parents do not want to perceive the teacher as someone who accuses, judges, or influences their children. It is very important to communicate properly with the child, expecting responsible behavior from him/her at home and at school, and consistently ensure that he/she abides by the rules. Parents have the knowledge, skills, and ability required for nourishing, nurturing, and supporting their children (Humphreys, 2000). Parents and teachers should make efforts to create a suitable learning environment for children. The first learning experience acquired by the child at home should support the efforts to learn at school. This would increase the success rate of the teacher in his/her class applications (Burns, Roe & Ross, 1992).

Consistent parent involvement dramatically increases the expectancy that suitable learning will occur in the classroom and at home. Parents play such a crucial role in their children's academic, physical, social, and moral development that we, as teachers, make a huge mistake if we view them as anything other than indispensable collaborators. It is not enough to keep parents pleased, appeased, or out of our hair. If we are committed to bringing the best out of our students and teaching the whole child, we need to build and maintain long-term relationships of loyalty, trust, and respect with their parents. Investing the time and effort to work closely with parents throughout the year maximizes our chances of fulfilling our mission and achieving our goals.

The following points provide a strong rationale as to why teachers should make parent involvement a top priority (Reifman, 2011): 1. Parents are their children's first and most important teachers. Though not all teachers are parents, all parents are teachers. As such, they have the greatest impact on a student's motivation to learn. Parents are usually eager to play a significant role in their children's education, but they often don't know how. By establishing caring relationships with parents, we can help them help their children. 2. Consistent communication

between the home and school enables parents to reinforce the skills, knowledge, habits, and priorities that we emphasize in class. This fact is especially true in situations where our teaching methods and approaches may differ from the norm and require parent follow-up on a regular basis. 3. It is important that teachers are aware of students' strengths and weaknesses, likes and dislikes, areas of special sensitivity, and any factors at home that are affecting school performance. Parents are in the best position to provide this information and are usually glad to do so when asked. 4. Students act, behave, and perform differently when they know that their parents and teachers communicate frequently. 5. Frequent communication earns parents' confidence, trust, and respect. With open lines of communication, it is unlikely that feelings of uncertainty, mistrust, and alienation will ever arise. The favorable impression that we create makes problems easier to solve when they occur. 6. When teachers and parents communicate in a respectful manner, we model positive adult interactions for the kids. These occasions serve a pro-social function because many children, unfortunately, do not often have the opportunity to observe this type of relationship. 7. Parents can become our biggest supporters and most loyal allies. Should a colleague or supervisor ever doubt our methods or question our approach to teaching, these allies will be there to come to our defense. 8. Parents are often valuable classroom resources. The better we know parents, the more we will be aware of the various ways in which they can assist the class. This assistance may come in such forms as classroom volunteering, donations of supplies and other materials, technology support, and arranging for special field trips. 9. Forming trusting relationships with parents can reduce the feelings of isolation that so many teachers, especially newer ones, often experience.

Parents may not know how to be involved in their child's school (Feldman, 2003). They may be unsure of their role or what the school or teacher expects of them, which may keep them from becoming involved in the schools or may lead to a perception that they are not involved. Studies show that poor and minority parents are less likely to be involved in their child's education in the ways that schools would like them to be involved (Shannon, 1996). This does not necessarily mean that parents are not involved, but, rather, that the school does not acknowledge the type of help that parents are demonstrating. Both teacher and parents have the interest of the child in mind; however, their ideas of how to help the child with regard to school may differ (Howe, 2005). For example, some schools may expect parents to be involved in helping their child do homework and in reading to their child every night while other schools may interpret involvement as attendance at parent-teacher committee meetings and helping in the classroom. If a parent is helping with homework and the school expects them to be in the classroom, the school may report that the parent is not involved. Parents, too, may have a completely different view than the school about what role they are expected to play (Young & Westernoff, 1996). They may feel that they can best help their child by providing food and a loving environment, and that in this manner they are involved in the child's learning. Such differences in the interpretation of what constitutes parental involvement may lead to perceptions that parents are not involved. There are also teachers who believe that parents' lack of education is a reason why parents are not involved in their child's education (Shannon, 1996). There is significant research, nationally and internationally, to suggest that parental involvement in children's learning is positively related to achievement. Cotton and Wiklund (1989) in their study on parental involvement in education propose that the more intensely parents are involved in their children's learning; the more beneficial are the effects on pupil achievement. Moreover, they state that this holds true for all types of parental involvement in children's learning and for all types and ages of pupils.

According to Gould (1999) the research all shows that children do better in school when their parents are involved. He found that parents are involved in school in four ways. The first two are widely accepted: parents serve as teachers of their children at home and also serve as volunteers and supporters at school. The next two include parents becoming advocates for their children and decision-makers in school in such areas as school policy, hiring, and budget. It is easy to understand that not all administration and faculty would be comfortable with these last two. Hickman (1999) cited research which focused on secondary school level. These research findings provide seven types of parent involvement: (a) parent as communicator, (b) parent as supporter of activities, (c) parent as learner, (d) parent as advocate, (e) parent as decision maker, (f) parent as volunteer/professional, and (g) parent as home activities teacher.

#### **PURPOSE OF THE STUDY**

One of the problems that teachers face at the end of the term in Iran is that parents usually complaint about being unaware of what their children do during the term. At the end of the term parents find that the children have many

behavioral problems, low scores, repeated absence from school and a lot of incomplete assignments. Parents say that when the term is finished there is no time to compensate children's weakness and solve their possible problems. Teachers also expect parents to pursue the children performance during the term. Both of teachers and parents expectancies are right. The problem is the lack of a means of communication. Teachers and parents need to have a permanent relationship during the term to improve the children language development. The purpose of this study, as such, is to determine how teacher-parent relationship affects the Iranian EFL learners' language proficiency. It examines the extent to which this relationship can influence parent's motivation. It also shows how teacher-parent relationship influences the parents' attitude and perception of language learning.

## RESEARCH QUESTIONS

The researcher in this study tried to find the answers of these questions:

1. Do the scores of students in the experimental group significantly differ from the pre-test to the post-test?
2. Do the scores of students in the control group significantly differ from the pre-test to the post-test?
3. Do the attitude and motivation of the parents of the participants in the experimental group significantly differ from the first questionnaire to the second one?

In the following parts the researcher investigated the answers of these questions in detail.

## METHODOLOGY

As it was mentioned before this study was an attempt to investigate the effects of teacher-parent relationship on students' achievement in the English language learning. This section will describe the subjects under study and how they were selected for inclusion in this study. In addition, the instrument being used to collect information will be discussed as to its content. Data collection and analysis procedures will then be presented.

### *Participants*

This study was conducted with the participation of fifty male elementary-level English language learners at Nikan Elementary School. The proficiency level of the learners was determined by a placement test, a multiple-choice exam, at the beginning of the term. The participants were between twelve to fourteen years old. They were at the pre-intermediate level who had studied English through Top Notch series (Saslow, J. & Ascher, A., 2006). They were grouped into two groups, control group and experimental group. Both groups have the same English teacher but each group has its own classroom. They learn English through similar materials but in different times in a week.

### *Instruments*

The researchers utilized four sets of instruments for doing this research. The first instrument was a general proficiency test to make sure of learners' language ability and homogeneity of their levels. This test was adopted from Top Notch placement test (Saslow & Ascher, 2006). The second instrument was an attitude and motivation questionnaire which was administered before and after the treatment. As the third instrument, a series of letters were sent to the learners' parents to inform them weekly. These letters contained information about what learners do during a week, their participation in the classroom activities, the quality of doing homework, learners' scores in different skills and activities such as speaking, listening, spelling, and handwriting. The fourth instrument was the school final test trying to measure the course achievement. This test was administered to both groups then the scores of students in this test, as post-test, compared with the scores of students in the pre-test. Cronbach' Alpha test was used to determine the reliability of the questionnaire which proved the questionnaire very reliable (Cronbach' Alpha = 0.71).

### *Procedure*

As the first step Top Notch Achievement Test (Saslow & Ascher, 2006) was used as the pre-test to determine the homogeneity of participants and their level of language proficiency. As a result of this test participants divided into two twenty-five-student groups, experimental group and control group. The researcher, the teacher of the classroom, tried to put the participants of each group into equal level of the language proficiency. So participants in both groups were at the same level of the language proficiency. Then both groups received a four-month term of treatment. The parents of the participants in the experimental group received a questionnaire through which they represented their opinions and attitudes about being involved at school, participating in education, being in contact with teachers, and being responsible for the children's language learning. Parents were informed about their responsibility and their role in the research in detail. They became more aware of learning strategies. Then parents in the experimental group received weekly and sometimes daily reports in which they found information about the students. These letters informed parents of their children absence or presence in the classroom, the quality of their homework, scores,

behavior, etc. Through these letters parents could be given advice, suggestions, and strategies to treat properly with their children. Parents also could communicate their opinions, suggestions and possible problems to the teacher through these letters. For example a letter might include: "Please control Ali's sleeping time. He looks very sleepy in the classroom during this week. He gets low scores in spelling. He needs to practice unit 2 new words every day during this week" or a teacher might receive a response involving: "Ali had flu this week. He could not finish his homework". Finally at the end of the term parents in the experimental group received a questionnaire to indicate how they thought about the effect of parent-teacher relationship, parents' involvement, and their ideas about language learning. Once the instruction period was over, the researcher conducted the post-test among the control and the experimental group to check whether there existed any statistically meaningful difference between the participants in the two groups due to the treatment.

## RESULTS AND DISCUSSION

First, independent-samples t-test was used to compare the results of the pre-test in order to find out whether there were any statistically significant differences between the control and the experimental group at the beginning of the study. To analyze the results of the post-tests again independent-samples t-tests were run at the end of the study. The gain scores of the post-tests of each group were also calculated to find out if any significant improvements happened inside of each group or not. Another independent-samples t-test was used to compare the result of questionnaire which was given to the parents at the beginning and at the end of the term in order to determine whether there were any statistically significant differences between first and second questionnaire or not.

This research was an investigation to see the effects of teacher-parents relationship on EFL learner language proficiency. It was an attempt to answer these questions: Does teacher-parent relationship have any significant effect on Iranians EFL learners' language proficiency? Does teacher-parent relationship have any significant effect on parents' attitude, perception of language learning and motivation?

As the first step the proficiency level of the learners was determined by a placement test at the beginning of the term. Twenty-five students were assigned to the control group and a class of twenty-five students was chosen as the experimental group. At the end of the term students' final examination scores in both groups were compared to determine the effects of the teacher-parents relationship on the students' language proficiency. As the second step at the beginning of the term parents in the experimental group were given a questionnaire in order to test their motivation and attitude toward teacher-parents relationship and parental involvement. For the second time parents answered the items of this questionnaire at the end of the term when the study was finished. Then the parents' answers to sixteen questions of these questionnaires were compared.

In the following sections the results of each test will be put under investigation one by one to find out if there were any significant differences between the results of the control group and the experimental groups' tests or not and if there were any significant differences between the parents' motivation at the beginning of the term and at the end of the term or not.

### *Investigation of the first research question*

Do the scores of students in experimental group significantly differ from pre-test to the post-test?

Table1 shows the results of paired sample t-test through which the experimental group scores in the first and second tests were compared. By considering the mean of the first test which is 14.26 and the mean of the second test which is 18.75 we can come to the conclusion that there is a significant improvement in the scores of the experimental group. Table 2 shows that scores of students in the experimental group significantly differs from the first test at the beginning of the term to the second test at the end of the term. This shows that teacher-parent relationship has improved students' language proficiency.

*Table1: Comparison of pre-test and post-test (experimental group)*

	Mean	N	Std. Deviation	Std. Error Mean
sum of scores (1 <sup>st</sup> Test)	14.2600	25	.64542	.12908

sum of scores (2 <sup>nd</sup> Test)	18.7500	25	.69970	.13994
--------------------------------------	---------	----	--------	--------

Table 2: Paired Samples Statistics t-test for the experimental group

	Paired Differences					t	df	Sig. (2-tailed)
	Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
				Lower	Upper			
1 <sup>st</sup> and 2 <sup>nd</sup> test	4.49000	.90133	.18027	-4.86205	-4.11795	-24.908	24	.0001

According to the above *T-Test Table*, Sig equals 0.0001 and it is smaller than 0.05. So we can conclude that students' scores on the second test in the experimental group are significantly different from their scores on the first test. According to the results students in experimental group have got better and higher scores in second test than on the first test.

#### Investigation of the second research question

Do the scores of students in control group significantly differ from pre-test to the post-test?

Table 3 shows the results of paired sample t-test through which the control group scores in the first and second tests were compared. The mean of 14.36 for the first test and 14.88 for the second test also reveal the fact that the difference between the scores on the pre-test and the post-test was insignificant and that no improvements were achieved for the participants in the control group. *Table 4* shows that scores of students in the control group do not significantly differ from the first test at the beginning of the term to the second test at the end of the term.

Table 3: Comparison of pre-test and post-test (control group)

	Mean	N	Std. Deviation	Std. Error Mean
sum of scores (1 <sup>st</sup> Test)	14.3600	25	.73272	.14654
sum of scores (2 <sup>nd</sup> Test)	14.8800	25	1.04176	.20835

Table 4: Paired Samples Statistics t-test for the control group

	Paired Differences					t	Df	Sig. (2-tailed)
	Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
				Lower	Upper			
1 <sup>st</sup> and 2 <sup>nd</sup> test	.52000	.70589	.14118	-.81138	-.22862	-3.683	24	.622

According to the above *T-Test Table*, Sig equals 0.62 and it is greater than 0.05. So we can conclude that students' scores in the second test in the control group are not significantly different from their scores in the first test. *Table 3* and *Table 4* indicate that students in the control group have got higher scores on the second test but it is not a significant difference.

#### Investigation of the third research question

Do the attitude and motivation of the parents of the participants in the experimental group significantly differ from the first questionnaire to the second one?

Table 5 shows that parents' motivation and attitude toward teacher-parents relationship and parents' involvement changed from the first questionnaire to the second one. The mean of 39.96 for the first questionnaire and 59.88 for the second questionnaire also reveal the fact that the difference between the score on the first and the second questionnaire was significant. Thus, teacher-parent relationship positively influenced the parents' motivation in the experimental group.

*Table 5: Comparison of parents' motivation through first and second questionnaire*

	Mean	N	Std. Deviation	Std. Error Mean
1 <sup>st</sup> questionnaire	39.9600	25	5.83438	1.16688
2 <sup>nd</sup> questionnaire	59.8800	25	2.60320	.52064

*Table 6: Paired Samples T-Test (Parents' motivation)*

	Paired Differences					t	df	Sig. (2-tailed )
	Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
				Lower	Upper			
1 <sup>st</sup> questionnaire and 2 <sup>nd</sup> questionnaire	19.92000	5.92256	1.18451	-22.36471	-17.47529	-16.817	24	.000

According to *Table 6*, Sig equals 0.0001 and it is smaller than 0.05 so we can conclude that parents scores in the second questionnaire in experimental group are significantly different from their scores in the first questionnaire. So *Table 5* and *Table 6* show parents in experimental group have got better and higher scores in second questionnaire than the first questionnaire.

## CONCLUSION

Thus, the following findings were attained. Research indicates that students and parents consider homework and home learning to be an important part of education. This relationship makes a positive attitude towards homework. The evidence further confirms that parents play an important role encouraging their children to spend time on home work and eliminating distractions such as watching television. Teacher parents relationship results in enhancing confidence, self-esteem, awareness that learning is a normal activity throughout life, pleasure from collaborative learning, parents increased confidence in contacts with school, teacher and education system, leading better relationships with children, and understanding the strategies that can be used to help children to learn. By the end of the research parents increased their contact with their children's school and the number of parents actively involved in their children's school increased significantly.

We found that mothers were more likely to say that they were very involved than fathers. Parents found that they had an equal responsibility with the school for their children's education. The continuity of family involvement at home appears to have a protective effect on children as they progress through education system. The more families support their children's learning and educational progress, the more the children tend to do well in school and continue their education. Students act, behave, and perform differently when they know that their parents and teachers communicate frequently. Taking the time to send out notes to parents throughout the school year – the notes must focus on both the positives and the negatives of the student in the classroom and must not be sent just to complain to parents about their child.

The research indicates that teacher-parent relationship decrease students behavioral problems in the classroom. Parents whose children have behavioral problems were invited to observe their children in the classroom and to attend in counseling sessions. They represented that their children problems have been solved after these treatments. After the study most parents were likely to have special program to check and control their children's education. Parents represented that they were interested to spend more time with their children after school time to talk about what happened in the classroom. In this study parents much preferred weekly letters to the other means of communication such as phone calls, e-mail messages, voice mail, and face to face meetings.

## Limitations of the study

There are some limitations and delimitations in this study which may influence the generalizability of the findings.

In running this research, the researcher confronted with some limitations. First of all, negotiation with parents was not an easy endeavor because all of the parents were not very cooperative. Second, students did not like their parents be informed weekly from their learning qualification. Third, writing weekly letters and responding to them could be too time-consuming for teacher and parents. Finally, parents felt embarrassed unsupported, misunderstood, and overwhelmed by the demands placed on them.

### ***Delimitations***

This research was confined to just male learners. This was a small group, about 50 students from an elementary school. It was also conducted only in one of Tehran Elementary schools and did not consider other levels, schools or cities. It only investigated the pre-intermediate-level learners. Another limitation of this study was the length of the treatment for both groups. The period of the treatment was a semester. Maybe this length of time was not long enough to improve the effects of teacher-parent communication on the student language proficiency.

## **ABSTRACT**

That a paradigm directs educational practices to pursue its basic assumptions is undeniable. Nevertheless, curriculum development in the 21<sup>st</sup> century has probably reached the edge of maturity. Now is the time to cynically reconceptualize the existing curriculum to raise new knowledge. In fact, to the present writers, the emergence of a new paradigm shift in curriculum development is not an ad hoc process. For a paradigm to shift, several factors get involved. In this regard, the paper with a cynical look on what happened in curriculum development intends to elicit the factors in charge of the shift in paradigms and cast light on our perceptions in the third millennium.

**KEY WORDS:** doubt, incommensurability, paradigm shift, progressivism, reconstructionism

## **INTRODUCTION**

Curriculum development is seen as an ongoing process, rather than as an ad hoc event. The new millennium marks a moment when it is appropriate to think about what we have done, where we are now, and how we should plan for the future (Littlejohn, 1998). As Pring (2004) contends, we live in a time of change, and change, undeniably, affects the content of curriculum. However, new paradigms cannot keep coming forever (Craig, 1993). Furthermore, as Craig puts forth no change will occur if a paradigm in curriculum development is fully consistent with reality. In other words, if all educators in the related fields agree on the epistemology of an existing paradigm, no shift in paradigm is felt necessary. Accordingly, Craig asserts, to Khun (1970), a paradigm can only shift if it is *wrong* (not fully consistent with reality); if it is wrong, it *will* shift, as reality eventually will prove inconsistent with it. Thus, a paradigm which is fundamentally right cannot be shifted, only refined, as reality cannot fundamentally contradict it (Craig, 1993). Henceforth, to the present writers, a real paradigm is hard to grasp at the onset. From the first time that Einstein's theory of relativity, for instance, was proposed, and it was hard to grasp, to the present time that nobody is found to provide solid evidence to reject it, Einstein's theory becomes an indicator of the fact that a real paradigm shift never occurs in a vacuum.

In the history of curriculum development, many paradigms have emerged, but, from a relativist look, none can be compared with one another. Inspired by Kuhn's (1970) incommensurability thesis, Antley (2010) puts forth that theories from different paradigms cannot be directly compared with one another because the conflicting assumptions underlying the paradigms are different. Still, the proponents of paradigm shifts are supposed to agree that at least one paradigm is indeed true: *the paradigm of paradigm shifts*. Nevertheless, the future is always uncertain (Rodgers, 2001), and it is not plausible to anticipate a paradigm shift in curriculum development. In this regard, Kuhn (1970) asserts that the direction of science is caused by doubt. Most change initiatives fail not because of a lack of vision but because people cannot come to an accurate and insightful view of reality. Rinpoche (cited in Larsen-Freeman, 2001) asserts that "our contemporary education, then, indoctrinates us in the glorification of doubt...; we have to be seen to doubt everything, to always point to what's wrong and rarely to ask what is right or good" (pp. 5-6). This paper, from one side, concerning the philosophy of doubt, has a critical look at the nature of change in curriculum development in the 21<sup>st</sup> century. From another perspective, the paper is an attempt to investigate what makes a change in curriculum development, in particular, and in paradigms, in general. In sum, to the present writers, casting doubt upon the existing paradigms is not respected as an obstacle, but, as Rinpoche (2002) asserts, "a door to realization, and whenever doubt appeared in the mind, a seeker would welcome it as a means of going deeper into the truth" (p. 129).

## NATURE OF CHANGE IN CURRICULUM DEVELOPMENT

Change seems to be an undisputable constant in curriculum development. The shift from second to third millennium thinking, as traced by Felix (2005), identifies a tangible shift from instructivist to constructivist pedagogy. Hadley (1998) holds that in the third millennium, “it is expected that the dominant ELT syllabus design will have returned full circle” (p. 67). That is, instead of offering new syllabi, it is predicted that scholars pondering on the available syllabi attempt to generate new knowledge.

There is no doubt that education is the most contested sector in any country. Both Platonist and anti-Platonist perspectives in education have undergone changes. For philosophers on the Platonist side who take a metaphysical approach, the pursuit of truth is vital, whereas for anti-Platonists who are non-metaphysical/materialist per se, there exist hidden desires for spiritual perfection. Furthermore, anti-Platonists share the view with materialists in that they are dependent upon bodies for their existence.

Along the same vein, there are a variety of factors that trace the shift from Platonism to anti-Platonism, but what is plausible is that power and politics often dictate which path in education will hold sway at any point in time in any part of the world. In this regard, in dissatisfaction with traditional education, constructivists/progressivists focus on the students’ interests and experiences rather than on the predetermined bodies of knowledge. What makes progressivists distinct from perennialists is that from progressivists’ perspective knowledge is not static, but dynamic, and student’s interests and needs are as important as the content to be learned. For Dewey (1933), a prominent figure in progressivism, the primary purpose of education is to get people ready for a democratic life. In a democratic life, doubt and democracy are part and parcel of each other; henceforth, the absence of doubt diminishes the possibility of democracy (Hiley, 2006). In this way, as Hiley asserts, it can be claimed that progressivism relies on the tenets that doubt about traditional beliefs and distrust of authority were the foes of dogmatism and tyranny.

Similarly, dissatisfied with the progressive educationalists, radical educationalists, who stand on two camps of *reconstructionists* and *critical theorists*, claim that education should do more than prepare students for participatory democratic citizenship; to them education should also prepare students for deliberative citizenship. More specifically, to reconstructionists (e.g., Brameld, 1950), societal change can be achieved through education (Kilgour, 1995). In brief, dialogic democracy results in liberal democracy. Central to reconstructionists is the conviction that progressivists are too slow or too soft to lead to change in the existing social order. As to Uys and Gwele (2005), two distinct groups in the reconstructionist school of thought are the *ideological* and the *methodological*. Ideological reconstructionism places emphasis on theory development and advances reconstructionism as a philosophy of action in education. Methodological reconstructionists, in contrast, focus on advancing the application of research-based strategies for effecting social change in education. In sum, according to reconstructionists’ perspective, the purpose of education is to reconstruct society through students’ acquisition of problem-solving skills applied to real life. In the same line, students must be equipped with tools to do the process of reconstructing. In fact, a conscientizing and liberating curriculum, according to Uys and Gwele, is seen as most worthy of ensuring that education fulfils its purpose of changing the social order. Put another way, a utopian future, according to reconstructionists, is a realist wish and genuine possibility for human beings if we learn how to direct change and innovation.

In contrast, to the advocates of critical theorists (e.g., Freire, 1970; Giroux, 1988; Hooks, 1994), as Uys and Gwele (2005) conceive, the purpose of education is to enable students to become transformers of society. Transforming the society towards equality for all human beings will be achieved if the members of the given society are actively participating (Giroux, 1988; Hooks, 1994). With the transformation, a very different conception of privacy develops. Privacy becomes the place of individuality; the place where individuals are free to conduct their lives in their own ways; the survival of such individuality entails doubts. “Doubt about the validity of one’s convictions breeds relativism” (Hiley, 2007, p. 102). In fact, as Goldfarb (cited in Hiley, 2007) puts forth, “cynicism has its philosophical basis in relativism. When we no longer know that our way of life is the best way, [not only] we learn to respect others, but we also begin to doubt ourselves” (p. 24).

The movement from traditionalism to progressivism has not occurred as a step-by-step, additive process. In effect, the process of paradigm shifts is not a simple, mechanistic process. Instead, new paradigms emerge as a result of tradition shattering revolutions in the thinking of a particular professional community (Kuhn, 1970). Nevertheless, to Brown (2001), “the introduction of a new paradigm into an intellectual arena [is] similar to the diffusion of an innovation into a particular setting” (p. 109). The term diffusion refers to “the percentage of adopters who implement an innovation over a given period of time” (Kogers, cited in Markee, 2001, p. 122). Moreover, paradigms are chosen by those who use them rather than by those who produce them. In this regard, Patton (1975) asserts that “paradigms are deeply embedded in the socialization of adherents and practitioners telling them what is important, what is legitimate, what is reasonable” (p. 9). Nevertheless, what obsessed our mind in this paper is to answer such questions

as what factors cause such shifts in curriculum development, which shift is better, and was there a time without a paradigm shift?

### **THE REASONS FOR A PARADIGM SHIFT**

Generally what causes a paradigm shift is the pressure of new evidence. But the question is how this evidence is manifested? The fact that reality emanates such evidence is not valid (Craig, 1993). Craig maintains that reality is inconsistent with theory. In other words, a theory cannot shift the fact of reality. Thus, scholars (e.g., Kuhn, 1970) appeal to doubt rather than reality. In effect, Kuhnian paradigm shifts are shifts inside the main body of science, and do not change life very much unless life itself becomes scientific, rational, etc.

Central to the tenets of Kuhnian paradigm shift, it can be asserted that when a paradigm in curriculum development is replaced by a new one, albeit through a complex social process, the new one is always better, not just different (Kuhn, 1970). This contention led to one of the most controversial themes raised by Kuhn—his thesis of incommensurability. That is, there is limiting communication between the competing theories since they lack a common measure and use different concepts and methods to address different problems. Still, in Kuhn's philosophy, as Chen (1997) claims, there is an implicit incomparability between paradigms. To avoid criticism of relativism, Kuhn (1983) uses the term *untranslatability* rather than *incommensurability*. On elaborating his argument of untranslatability, Kuhn maintains that "most of the terms common to the two theories function the same way in both; their translation is simply homophonic. Only for a small subgroup of (usually interdefined) terms and for sentences containing them do problems of translatability arise" (pp. 670-71). "Incommensurability [, thus,] becomes untranslatability caused by the meaning change of a small group of terms" (Chen, 1997, p. 258).

Most attempts in the realm of curriculum development are complementary rather than contradictory by nature. There is not much space in this paper to discuss Kuhn's thesis of incommensurability except to say, according to Kuhn (1970), paradigm shift is a sort of *metamorphosis*—a transformation. This transformation takes place not at the expense of losing the significance of old paradigms. Nevertheless, the most important reason for accepting a new paradigm is that it solves the anomalies that the old paradigm could not (Kuhn, 1970). In other words, as a normal science develops, a set of anomalies emerges that the existing paradigm fails to solve. Henceforth, the emergence of a new paradigm appears to be contradictory in respect to that given anomaly. In fact, the new paradigm, though better, has a complementary look at the previous paradigm.

Brown (2001), comparing the emergence of a new paradigm to the diffusion of innovation, refers to Rogers (1983) who examines variables affecting the rate at which innovations are adopted. In fact, diffusion is a type of communication "in which participants create and share information with one another in order to reach a mutual understanding" (Rogers, 1983, p. 5). Furthermore, to Rogers, there are five elements that contribute to the diffusion of innovation: *compatibility*, *relative advantage*, *complexity*, *observability*, and *trialability*. Rogers holds that compatibility of a new idea with current ideas or paradigms and with client needs (in this case, teacher and student needs) affects whether the new idea is adopted or not. Moreover, the compatibility of a new idea is in line with the relative advantage of that new idea, whether the new idea is better than the previous ones. The term complexity is self-explanatory, but paradoxical. From one side, complexity can be interpreted as the interconnectivity among the elements of a system (Larsen-Freeman, 1997). In a sense, the effectiveness of a system depends upon how well different parts of the system interconnect (Maftoon & Shakouri, 2013). From another perspective, it is the opposite of simplicity. Complexity, to Rogers (1983), means that if an idea is seen as being too complicated, it will not be adopted. Likewise, if an innovation is too complicated, its degree of visibility decreases; henceforth, another factor, to Rogers, that is conducive to the perception of innovation is observability, referring to how visible an innovation is. Also, consideration needs to be given to the trialability of innovation. Trialability, to Rogers (1983), is the degree to which an innovation may be experimented with on a limited basis. In sum, adoption becomes much easier if farmers, for instance, can try an innovation on a small scale. Likewise, Brown (2001) contends that if researchers can work with a new idea on a trial basis, they may be more likely to adopt it.

Nevertheless, the term innovation in theory construction may make no sense since theories, as to Kuhn (1970), are not commensurate. Still, what "the diffusion of innovation emphasizes [is] the flow [and integration] of information [...]" (Cooper, 1989, p.70). Newtonian physics, for example, is not comparable with Einstein's physics, but Einstein's physics findings can be integrated with Newton's physics ones. In effect, the integration of flow of

information can provide sufficient conditions for the emergence of a new paradigm. In a nutshell, although theories are not commensurate, innovations need to be integrated consistently to increase the performance capability of a new paradigm.

According to Kuhn (1970), paradigms are developed in an open-ended way that has nothing to do with rational choice or even awareness of progress. That is, there are no rational reasons for preferring one theory over another. To him, “aesthetic or subjective factors play an important role in a paradigm shift, since the new paradigm only solves a few but critical anomalies” (p. 74). In fact, theories compete rather than contradict one another. Those who decide to advocate a particular theory are not those who have made the theory, rather than those who use it. Henceforth, it seems implausible to claim that a new theory always emerges at the expense of marginalizing the findings of other theories. A multitude of theories can coexist. Each theory makes an endeavor to show reality from its own lens. Schumann (cited in Maftoon & Shakouri, 2012a), comparing two competing theories which can exist co-productively, asserts that SLA theories, including Krashen’s and McLaughlin’s, “can coexist as two different paintings of the language learning experience” (p.28). To Schumann, the two theories are respected as the reflection of reality, while symbolized in two different ways. Whether viewers have inclination towards Krashen’s theory or McLaughlin’s is quite aesthetic. That is, viewers interpret the paintings based on their *Weltanschauungs*; no one can claim which position is true as they are simply alternative representatives of reality.

Any history, per se, is subjective (Littlejohn, 2012), and the history of curriculum development is not an exception. It is a truism that in any subjective understanding of the world, there is a high amount of uncertainty and unpredictability. Thus, due to the uncertain nature of curriculum development, prediction is highly perilous. In this regard, Littlejohn (1998) asserts “predicting the future is always a hazardous business” (p. 3). In fact, innovations in the field of technologies and increasing global links turn the future into a much more uncertain and dynamic condition than ever before. In a sense, as Kozulin (2010) asserts, “educational systems are facing a paradoxical task of preparing students for future activities whose parameters are still unknown as the student is learning” (p. 384). Henceforth, it is plausible to claim that facing an uncertain period entails casting doubt on the ongoing practices so that curriculum developers can exert positive effects on the educational systems (Schechter, 2004).

#### **ATTEMPT TO DISCARD CONFORMITY IN THE THIRD MILLENNIUM**

In the history of language curriculum, we face two contrasting views: *curriculum as facts* and *curriculum as practice* (Young, 1998). In the former view, knowledge is considered as property that should be transmitted to an individual from an authority (Maftoon & Shakouri, 2012b). In contrast, the basic premise of the view of curriculum as practice centers on “how knowledge is produced by people acting collectively” (Young, 1998, p. 27). In fact, curriculum developers in the third millennium are not in favor of transmitting a set of facts to the students. Henceforth, postmodernist educators, as Marsh (2005) claims, insist that teachers and students should reflect upon events of the present and how they provide access to the future.

In fact, as Felix (2005) maintains, success is based on how well students learn as individuals and work together as a team. For this to occur, it is a felt need that curriculum developers should make an attempt towards cooperative learning founded on constructivist epistemology. According to Hassaskhah (2005), two critical features of such an epistemology are *positive interdependence* and *individual accountability*. These two features of constructivist epistemology are mutually intertwined. Felix believes that there are three ways to increase the sense of accountability among students: (1) *materials interdependence*, i.e., providing materials that could be shared, (2) *task interdependence*, i.e., fostering group cohesion by assigning different members of a team a piece of material that could be shared, and (3) *goal interdependence*—assigning a small part of each student’s course grade improves the students’ performance.

Interdependency will not be achieved until one does not base his/her perspective on conformity. Conformity is the extent to which human beings are willing to adhere to behavior pattern of a particular group (Asch, 1955). However, as Chernus (1992) insists, supporting mindless conformity can put an end to diversity. Chernus further asserts that if we impose our experience on others in order to achieve conformity, we certainly close our eyes to many new experiences and become narrow-minded. Thus, when interdependency becomes possible, conformity diminishes. Postmodernism argues that the image of totality observed in modernism is not simply false but dangerous since it results in conformity. In this regard, Hadely (1998) asserts that instead of searching for the latest teaching techniques or the most recent discoveries, we should be aware of the cyclic trends taking place and reflects upon our own beliefs as educators. What postmodernists claim is that human beings are free from the pressure for conformity; they are more in touch with the way things really are (Chernus, 1992).

However, achieving conformity among human beings about what to do in order to achieve a goal is appreciated. Along the same line, it can be suggested that it is important to re-describe inquiry (Reason, 2003). Re-describing, according to Rorty (cited in Reason, 2003), refers to “a talent for speaking differently, rather than for arguing well as the chief instrument for cultural change” (p. 105). In fact, as to Rorty, the goal of inquiry is not seeking for truth. Instead, the purpose of inquiry is to achieve unanimity among human beings about what to do in order to achieve a goal. Hence, great importance should be attached to developing a talent for speaking differently and articulating what should be done with new metaphors. In effect, as Cavagnini (2012) declares, according to Rorty, inspired by Kuhn’s thesis of incommensurability, any revolution in theory construction is simply a matter of changing the terminology. To Cavagnini, confining oneself to a fixed, predetermined category leads to intellectual, cultural, and personal stagnation. What scholars, therefore, should do in the third millennium is re-describing vocabularies.

Inspired by Klein (cited in Ortega, 2013) who claims that second language acquisition has reached maturity in the 25 years of disciplinary existence, we see a shift in the inclination of scholars (e.g., Ortega, 2013) in the 21<sup>st</sup> century towards transdisciplinarity. In this regard, it can be claimed that in line with Reason (2003), who insists inquiry has to be redescribed, it is time to ponder on disciplinary achievement that might be conducive to raising new knowledge. By re-describing, we do not mean that the same terminologies employed by our predecessors to be used in our argument; however, to achieve agreement it is indispensable to have a complementary look on what is suggested. This complementary look entails that scholars should avoid proposing syncretistic recollection of old vocabulary. Furthermore, success in transdisciplinarity is deeply rooted in cynical attitudes towards disciplinary achievement because progress will not achieve if we move in line with solid reality. As Goldfarb (cited in Hiley, 2006) argues, “cynicism in our world is a form of legitimization through disbelief” (p. 30). Moreover, the notion of cynicism needs to be revisited; a cynic should not be viewed as one refuting “facts without evidence” (Mihailidis, 2008, p. 171). However, sowing seeds of reasonable doubt about the value-systems of our education is worthy of attention. In this regard, Sim (2006) claims that societies get healthy when doubt is an integral part of their value-systems. Doubt, as a value of society, should be celebrated since cynicism contributes to the reliability of our beliefs system (Hiley, 2006). In sum, cynicism resonates with our belief that shifting in a paradigm entails casting doubts on the contemporary issues, in general, and disciplinary achievement, in particular.

## CONCLUSION

The wry observation made by the great British scientist—Huxley (1870): “the great tragedy of science: the slaying of a beautiful theory by an ugly fact” (cited in Lashway, 2001, p. 1) applies plausibly to the thesis of the present paper that the emergence of a new paradigm shift is not an ad hoc process; furthermore, if any available paradigm in a system is consistent with reality, no paradigm shift occurs. In a sense, when our beliefs system appears to cast doubts on the existing paradigm, the emergence of a new paradigm can be expected. However, it is irrational to reject any new fact simply because it is not integrated with our past knowledge.

Shifting paradigms in curriculum development is a difficult task. As Brown (2001) claims, individuals who have completed their own professional preparation under one paradigm may not see a reason to shift. Even if they wish a shift in their ideology, they face several limitations on their way. Accordingly, Brown claims that there are at least five possible impediments to any paradigm shift or curricular innovation: amount of time, background schemata, text availability and level of difficulty, material availability, and workshop availability for methods instructors. Tollefson (cited in Brown, 2001), also, puts forth that the intellectual beliefs system an individual might adhere to is often not seen as a set of lenses; that is, individuals may hold to particular ideologies without even recognizing that there is something subjective about these ideologies. Thus, before any shift in ideologies comes about, the first step must be to recognize and name the paradigm to which one has been intellectually socialized. However, in a context (e.g., China) that people are greatly influenced and socialized by their cultural ideologies (e.g., Confucian tradition in China), shifts on the trends of old paradigm appear impossible (Reid, 2002, cited in Yan, 2006). Thus, a paradigm shift does not occur cumulatively, and very occasionally, the dominant paradigm is overturned, but when a paradigm shift comes up, the new paradigm shift will dictate the re-conceptualization of everything that had come before.

## INCREASING DEPTH OF VOCABULARY: A HIDDEN ASPECT OF VOCABULARY KNOWLEDGE

**Azadeh Nemati (Ph.D)**

*Department of English language teaching, Jahrom branch, Islamic Azad University, Jahrom, Iran*

*E-mail Address: azadehnematiar@yahoo.com*

### ABSTRACT

Based on most researchers learning vocabulary is central to mastery of a language. There are many degrees of knowing about a word. This study mainly intends to show increase in depth of vocabulary knowledge of different proficiency groups by the intervention of memory strategies. 310 pre-university Indian female with different proficiency levels (high, mid, low) served as control and experimental groups. The result of t-tests between control and experimental groups after teaching through memory strategies indicated that although groups were homogeneous before treatment, teaching through memory strategies increased depth of vocabulary knowledge of experimental group significantly. Patterns of movements of vocabulary knowledge from unknown to known were also shown by vocabulary knowledge scale (VKS). The significant of the study lies in the fact that the importance of vocabulary learning strategies in enhancing depth of vocabulary knowledge of the students was shown.

**KEYWORDS:** vocabulary, depth of vocabulary, size of vocabulary, vocabulary knowledge scale

### INTRODUCTION

Research has highlighted vocabulary as an indication of how well a learner can comprehend text and communicate effectively. Therefore, one thing that all the researchers can all agree upon is that learning vocabulary is an essential part of mastering a second language (Schmitt, 2008). In all methods and approaches vocabulary learning was not given prominence, as it lacked a profound idea of how to teach vocabulary and for the first time it was in reading method that vocabulary teaching received particular attention. Meara initially noted in 1987 (and which has since become something of a cliché) that vocabulary studies is now a neglected area and largely ignored by most researchers, a situation that, in some respects, has not significantly changed today. However, recently there has been a surge of interest in vocabulary learning strategies (Najar, 1998). This can be seen in the number of textbooks and teacher prepared materials that are being developed promoting strategy as a key approach to L2 [second language] learning instruction (Oxford, 1990).

#### *Lexical Knowledge*

Researchers and theoreticians have pointed to the fact that vocabulary knowledge is multi-faceted (Harley, 1996). Lexical knowledge, that is, the question of what it actually means for a language learner to know a word, is not only about knowing the simple form and meaning of the word, but also demands the learner to recognize, understand and produce a word together with scores of other words in different contexts and situations that are acceptable in the language. As Laufer and Paribakht (1998) observe, no clear and unequivocal consensus exists as to the nature of lexical knowledge apart from the general agreement that it should be constructed as some sort of continuum of several levels/dimensions rather than all or nothing phenomenon.

Words are not isolated units of language, but fit into many interlocking systems and levels. There are many things to know about a particular word and many degrees of knowing (Nation, 2001). The lexical knowledge are as follows:

#### *Breath of vocabulary knowledge*

Breadth or size of vocabulary knowledge has been taken up to refer to the quantity or number of words learners know at a particular level of language proficiency (Nation, 2001).

#### *Depth of vocabulary knowledge*

Breath can be opposed to depth of vocabulary or the quantitative aspects of knowing a word, Nation (1990) believed that knowing a word means being familiar with the 'spoken' form, 'written' form, 'grammatical' pattern, 'collocations', 'frequency', 'appropriateness', 'meaning', 'concept' and 'association' of that particular word in terms of 'receptive' and

'productive' aspects. In other words, it has been used to refer to the quality of lexical knowledge, or how well the learner knows a word (Meara, 1996).

According to Ur (2000) another piece of information about the new words, which may be worth teaching, is collocation — a factor that makes a particular combination sound right or wrong. Different aspects of meaning namely, denotation, connotation and appropriateness are also other aspects of meaning that need to be taught especially connotation which is a less obvious component of teaching. For example, the word 'dog' as understood by most British people has positive connotations of friendship and loyalty whereas the equivalent in Arabic countries has negative association of dirt and inferiority. Meaning relationships such as synonym, antonym, hyponyms, coordinates, subordinates, and even translation are all sub-parts of aspects of meaning which can be exploited in teaching to clarify the meaning of new items. The last point to be taught, as mentioned by Ur (2000) was 'word formation', alongside teaching prefixes and suffixes and so on.

In researching into the depth of vocabulary knowledge, it is important to be able to measure the changes of word knowledge in subjects in order to establish whether vocabulary knowledge had been deepened as a result of treatments provided to the subjects.

#### ***Receptive and productive mastery***

Regarding vocabulary knowledge still another point should be considered which deals with 'receptive' and 'productive' vocabulary or 'passive' and 'active' as they are often called. Usually, these two terms are defined in relation to the language skills of reading, listening, speaking and writing. An individual's active vocabulary includes words which are used in speech and writing. Contrarily, one's passive vocabulary embodies those which are understood as they occur in reading materials or while hearing something.

#### ***Memory strategies***

The history of learning strategies goes back to Rubin (1975) who pioneered much of the work in the field of strategies. From then, different classification and taxonomies came into vogue (Cohen, 1990; O'Malley & Chamot, 1990). From among those researchers tackled language learning strategies Oxford's (1990) classification is the most comprehensive detailed system embodying direct and indirect strategies.

Oxford (1990) classifications embodied direct and indirect strategies with 6 categories, 19 strategies and 62 sub-strategies. Direct strategies consist of 'memory', 'cognitive' and 'compensation' strategies. Indirect strategies support and manage language learning without directly involving the target language hence, they underpin the business of language learning and include 'metacognitive', 'affective' and 'social' strategies.

With the emergence of the concept of language learning strategies scholars have attempted to link these strategies to other aspects of language such as vocabulary as well. Studies such as O'Malley and Chamot (1990) confirmed that most language learning strategies are used for vocabulary tasks too. In the same vein, all memory strategies based on Oxford taxonomy can be used for vocabulary learning tasks the effect of which has been a motive to conduct the present research on vocabulary retention. Memory strategies that are the main concern of this article fall into four sets of 'creating mental linkage', 'applying image and sound', 'reviewing well', and 'employing actions'. Other researchers dealt with systematic reviewing and different types of mnemonic strategies (Nemati, 2008).

In this study from among the four sets of memory strategies classified by Oxford (1990), the three sub-strategies of 'grouping', 'making acronyms' and 'using imagery' were selected. Grouping refers to classifying language material into meaningful context to make the material easy to remember by reducing the number of discrete elements. Based on Oxford (1990) using acronyms is a kind of placing new words into a context in order to remember them better. Relating new language information to concepts in memory by means of meaningful visual imagery, either in the mind or in the actual drawing is called using imagery.

#### **RESEARCH QUESTIONS**

In this study 3 research questions were posed as follows:

- 1) Does teaching memory VLSs to experimental groups impact learners' depth of vocabulary in comparison to control groups?
  - 2) Does teaching memory VLSs to experimental groups impact different proficiency (low/intermediate/high) learners' depth of vocabulary knowledge in comparison to control groups?
  - 3) Is vocabulary gain that reflected in depth of vocabulary knowledge for control and experimental groups the same?
- Thus the following null hypotheses were formulated to be answered:

- 1) Teaching memory VLSs to experimental groups does not impact learners' depth of vocabulary in comparison to control groups.
- 2) Teaching memory VLSs to experimental groups does not impact different proficiency (low/intermediate/high) learners' depth of vocabulary knowledge in comparison to control groups.
- 3) The vocabulary gain as reflected in depth of knowledge of given words for control and experimental groups are the same.

## METHODOLOGY

### *Participants*

The overall sampling method employed in this study was multi-stage random sampling. The subjects of this study comprise 310 female Pre-University (PUC) students from an all-female governmental school in Mysore (Karnataka State, India). Their age range was from 16 to 18. After dividing the students to control and experimental group randomly 140 students were in control group and 170 in experimental group (Table 1). A standard proficiency questionnaire (Nelson Test 400B) was distributed amongst the students of control and experimental groups to divide the participants into 3 levels (high, intermediate and low) of proficiency. The participants with 0.5 SD below and above the mean were grouped as 'intermediate' and those below and above 0.5 SD were considered as 'low' and 'high' proficiency levels respectively. The total number of participants left in each proficiency group has been shown in Table 1.

*Table 1: The number of participants in 'control' and 'experimental' groups*

<i>Level</i>	<i>Control</i>	<i>Experimental</i>
Low	42	63
Intermediate	60	58
High	38	49
Total	140	170

### *Instrument*

#### *Nelson Proficiency Test*

An already available standard proficiency test (NELSON Series 400B) was utilized to divide the participants into high, intermediate and low proficiency levels. This instrument, in the form of multiple choice questions, consisted of one cloze comprehension passage as well as vocabulary, grammar and pronunciation sections.

#### *Treatment material*

The treatment handout prepared by the researcher included 9 unknown vocabulary items (for each strategy of grouping, making acronyms and imagery 3 vocabularies) to be taught by memory strategies in the experimental groups. The treatment material started with a general definition of vocabulary learning strategy and continued with an elaboration and exemplification of each strategy and some exercises all in the form of a handout to be used by participants in the experimental groups. The full information regarding memory strategies and the prepared handout is published in another article by Nemati (2009).

#### *Vocabulary Knowledge Scale (VKS)*

One of the most commonly accepted views of vocabulary acquisition maintains that it occurs along a continuum of development (Waring, 2002). The simplest continuum view of vocabulary is from less knowledge of words to more knowledge of words. In the present study the Vocabulary Knowledge Scale (VKS) developed by Paribakht and Wesche (1993) was utilized to measure depth of vocabulary knowledge. The purpose of VKS was to track the early development of knowledge of specific words in an instructional or experimental situation.

This VKS differs from the other scales since it requires the verification of evidence of knowledge held at higher levels. Their scale is thus a control scale of how well words are known and what type of control one has over them. The basic idea of this scale is to measure progressive degree of word knowledge.

It consists in effect of two scales, one for eliciting responses and one for scoring responses. The first scale is presented to the students with each word on the top. The scale has five steps or categories. Students are asked to decide which category best represents how well they know the word. Category I means that the word is not recognized at all, while in category II the word is recognized but the meaning is not known. These first two categories rely on honest reporting whereas at the three higher levels they are required to give some verifiable evidence for their response (Read, 2001). The distinction between categories III and IV also involves an element of judgment by the test-takers as to how sure they are of what the word means, but in either case they have to demonstrate their understanding by means of a synonym or translation equivalent. Category V moves from receptive knowledge to production, in that the test takers need to show they can use the word in a sentence.

Subjects are presented with a target word in written form and required to indicate their self-perceived knowledge of the item in question by completing one or more of five self-report categories. These range from total unfamiliarity with the word to knowledge of how to use it in grammatically and semantically correct ways in a sentence.

### **Procedure**

The main study was carried out in three steps. Both control and experimental groups experienced the three steps of pre-test with VKS, training and post-test with VKS. Training for control group involved different modes of vocabulary presentation such as a) presentation of the words in isolation; b) giving pronunciation of the words orally; c) writing those words on the board; d) giving a short explanation about their parts of speech; e) elaboration of the meaning of each word through introducing synonyms (and antonyms if needed), and f) using minimal contexts, that is, some meaningful sentence. While for the experimental group training consisted of a) strategy awareness, b) explanation and example of each memory strategies in handout.

### **Data analysis**

To check the homogeneity of control and experimental groups, independent sample t-tests were computed in pre-test.

*Table 2: independent sample t-test in pre-test*

Strategy	Groups	N	Mean	SD	t	df	Sig.
<b>Memory</b>	Cont.	140	13.02	2.79	.68	308	.496(NS)
	Exp.	170	12.84	1.69			

In Table 2 it is indicated that there was no significant difference between the pre-test scores of control and experimental groups. Findings showed the homogeneity of control and experimental groups at the starting point.

*Table 3: Descriptive statistics for memory strategies*

Memory Strategies	Pre-test		Post-test	
	Mean	SD	Mean	SD
<b>Control</b>	13.05	2.78	23.85	3.99
<b>Experimental</b>	12.87	1.59	28.47	4.66
<b>Total</b>	12.94	2.20	26.39	4.94

To work out the better performance of the experimental group the mean scores tabulated in Table 3 were taken advantage of. Based on the table, the pre-test mean score of the control group was 13.05, which increased to 23.85 in post-test, while the mean score of experimental group increased to 28.47 in post-test which was more.

*Table 4: independent sample t-test in post-test*

Strategy	Groups	N	Mean	SD	t	df	Sig.
<b>Memory</b>	Cont.	140	23.85	3.99	5.32	308	.000(HS)

	Exp.	170	28.47	4.66			
--	------	-----	-------	------	--	--	--

Based on the results of the t-test in Table 4, the change in performance resulting from the teaching phase was highly significant ( $t=5.35$ ,  $P < .000$ ).

The next tables will answer the second hypothesis concerning the impact of teaching memory strategies to different proficiency groups of experimental group comparing control group. First homogeneity of groups before training was tackled with.

*Table 5: independent sample t-tests for proficiency groups in pre-test*

Level	Groups	N	Mean	SD	t	df	Sig.
Low	Cont.	42	30.33	5.64	0.61	103	.544 (NS)
	Exp.	63	29.74	3.23			
Mid	Cont.	60	29.20	5.62	0..89	116	.374 (NS)
	Exp.	58	29.91	2.54			
High	Cont.	38	30.44	5.27	1.85	85	.070 (NS)
	Exp.	49	28.73	2.43			

As indicated in Table 5, control and experimental participants at each proficiency level were homogeneous in pre-test phase since no significant difference was observed between any of the pairs compared.

*Table 6: Independent sample t-tests for proficiency groups in post-test*

Strategy	Level	Groups	Mean	SD	t	Sig.
Memory Post-test	Low	Cont.	23.47	3.83	7.12	.000(HS)
		Exp.	29.34	4.54		
	Mid	Cont.	24.38	3.62	3.88	.000(HS)
		Exp.	27.37	4.67		
	High	Cont.	23.44	4.63	5.19	.000(HS)
		Exp.	28.65	4.65		

Table 6 illustrated that all the independent sample t-tests between control and experimental groups at each proficiency level were highly significant at the .01 level. The low, intermediate and high proficiency students of the experimental group outperformed low, intermediate and high proficiency students in control group in post-test. This means that teaching 'memory' strategies was a contributing factor in improving depth of vocabulary knowledge amongst participants. Therefore, the null hypothesis could be rejected at the .01 level.

In the section below, the distribution of unknown and known vocabulary items as obtained by control and experimental groups in pre-test as well in post-test has been analyzed. The main objective here was to show what percentage of the words had moved from the unknown (scores 1 and 2) to known (scores 3-5) as a result of the teaching phase.

*Table 7: Distribution scores in pre, and post-test*

	Time	1	2	3	4	5
		(1,2 not known)		(3,4,5 known)		
Control	Pre	57.5%	41.6%	.6%	.2%	.1%
	Post 1	12.7%	21.3%	59.3%	3.8%	2.9%
Experimental	Pre	61%	37.8%	.9%	.3%	.1
	Post 1	6.9%	8.1%	65.0%	10.7%	9.3%

*Note: 1 = I don't remember having seen this word before, 2 = I have seen this word before, but I don't know what it means, 3 = I have seen this word before and I think it means-----, 4 = I know this word. It means -----, and 5 = I can use this word in a sentence -----.*

The same information is shown graphically for the ease of understanding where umbers 1-5 show depth of vocabulary knowledge.

Figure 1: Distribution of depth of vocabulary knowledge

Quantitatively, the comparison of the scores of control and experimental groups in post-test 1 showed that more vocabulary items remained in unknown state in the control group (34%); whereas, in the experimental group more vocabulary items moved to known category (85%) and less remained in the unknown one (15%). This proved that students of experimental group learnt more due to treatment than the control group.

Patterns of movement in Table 7 and Figure 1 illustrated that after treatment, in the control group, more vocabulary items remained in category 1 'I have never seen this word before' and category 2 'I have seen this word before but I cannot remember its meaning' in comparison to the experimental group. Regarding category 3 and in post-test 2 students of the experimental group provided synonyms for more vocabulary items (65%) compared to the control group with less than 59%. In addition, the percentages of grammatically incorrect but semantically correct sentences produced (category 4) and both semantically and grammatically correct sentences (category 5) were higher for the experimental group than the control group.

## CONCLUSIONS

Although the scores of the control and experimental groups were not statistically significant in the pre-test phase, the difference between the two groups was highly significant. This implied that memory strategies can boost learning and retention of vocabulary items if embedded in the teaching method. The importance of memory strategies can be justified by the following theory and discussion. In 1975, Craik and Tulving introduced a theory called the 'depth of processing' or 'levels of processing' framework. According to this theory, how well information is remembered is not a function of how long a person is exposed to that information, but instead depends on the nature of the cognitive processes that are employed to process that information.

The second hypothesis tackled with different proficiency groups. Findings of the study may help English teachers to overcome the challenge of teaching heterogeneous groups since memory strategies were effective for all proficiency groups. As regards qualitative analysis there was a dramatic decrease after treatment for control and experimental groups of both environments from category 1 (word never seen) to other categories. This decrease for the experimental group was more showing that more vocabulary items were moved to the higher categories.

After the teaching phase, in control and experimental groups some of the words moved to category 2 (recognition level, 'I have seen this word before but I don't know what it means') in both post-tests. This implied that in both methods of teaching, students improved, and this improvement was more of course for the experimental group that had undergone the strategy enriched treatment. More vocabulary items moved to higher categories of knowledge (3, 4, 5, or known) after treatment in both groups and both countries. The move into the known category (3 to 5) was more in the experimental group. In other words, the experimental learners achieved greater depth in their knowledge of these words compare to the control groups. The implementation of VKS in pre-test and post-test instead of a multiple-choice test, was an issue that added to the value of the present study. A standard multiple-choice item consists of two basic parts viz., a problem which is called 'stem' and a list of suggested solutions or 'alternatives' which contains one correct or best alternative as 'correct answer' and a number of incorrect or inferior alternatives

called 'distractors'. Writing a plausible multiple-choice item is usually difficult. Hence, most poorly written multiple-choice items have the weaknesses of word ambiguity and contain clues to correct answers.

Despite having good advantages, such as, being appropriate for use in many different subject matter areas, measuring a great variety of educational objectives, or being amenable to rapid scoring and item analysis, multiple-choice items have some major drawbacks the reliability of multiple-choice items is susceptible because of the presence of the guessing factor which reduces its reliability. For example, if the test includes a section with only two multiple-choice items of 4 alternatives each (a, b, c, d), you can expect 1 out of 16 of your students to correctly answer both items by blindly guessing. It is possible to answer correctly without knowing much or doing any real thinking because the answers are in front of the students, some people call these tests 'multiple-guess'.

In sum, multiple-choice items are inexpensive and efficient ways to check on factual (declarative) knowledge and routine procedures. However, they are not useful for assessing critical or higher order thinking in a subject, the ability to write, or the ability to apply knowledge or solve problems. Thus, by highlighting the shortcomings of multiple-choice questions in this research, the vocabulary knowledge scale (VKS) was used as a substitute the characteristics of which have been explained in detail in Chapter three. This study is significant since it shows the importance of vocabulary learning strategies in enhancing depth of vocabulary knowledge of the students.

### Limitations

Each study is not without its limitations. In this study the participants were just among pre-university students. Furthermore, they were all female from an ESL environment like India. Other researchers can do the same with other participants in EFL environments like Iran.
