## AIMS AND SCOPE

The international journal of language learning and applied linguistics world performs as a platform for the new scholars to share their insights with other scholars in the form of original papers.

The international journal of language learning and applied linguistics world is a double-blind peer-reviewed international journal dedicated to promoting scholarly exchange among teachers and researchers in the field of language teaching and applied linguistics. Papers submitted to the journal will immediately be sent to two related reviewers who are responsible to provide feedback on the content and the language use.

The journal is published monthly in online and print versions. The scope of the journal includes, but not limited to, the following fields:

*Theory and practice in English*  
*Language teaching & learning*  
*Teaching English as a second or foreign language*  
*Applied linguistics*  
*Discourse studies*  
*Syllabus design*  
*Language learning problems*  
*Computer assisted language learning*  
*English for specific purpose*  
*English for academic purpose*  
*Language teaching & testing*  
*Translation studies*

## **ABSTRACT**

This paper is a synthesis of seven studies which focus on interaction in multilingual university environments. These studies are synthesized to determine how power relations affect these interactions and what specific factors play a major role in influencing these power relations. Four codes were developed from previous literature on power and a review of the studies: identity, authority, control, and participation. In combining these four codes and analyzing the included studies, a cyclic model of influences on power relations in multilingual environments in higher education was identified. In creating this model, this paper attempts to provide a clear approach to viewing power in a multilingual setting, thereby informing students, teachers, administrators and researchers about how identity, authority, control, and participation influence interactions. A specific focus of this paper is on the importance of this model on foreign language teaching and foreign language teacher training.

**KEYWORDS:** multilingualism, power, control, identity, authority, participation

## **INTRODUCTION**

Academia is a complex environment, composed of complicated relationships between students, faculty and administrators functioning at differing authoritative positions, creating multiple identities, and employing different levels of control in different scenarios. In addition, academia has become increasingly multilingual, with students and faculty from different parts of the world collaborating, competing and interacting in a number of different ways. Within this complex system, different power relations are created between its members, thus creating a continually fluctuating state of power relations.

The negotiations that these different members undertake play an important role in creating the fabric of academic society. Critically investigating the interactions between members of the academic community is significant because a deeper understanding of the influences at work both inside and outside the classroom can shed light on the intricate network of power relations in which our students and fellow educators find themselves, whether they are aware of these forces or not. As a number of studies have already investigated student-student and student-teacher interactions in a university setting, this paper seeks to synthesize the results of qualitative studies which have catalogued and analyzed such interactions. In doing so, I will show that a few key interactional components, specifically authority, control, participation, and identity, are present in each of the studies incorporated in this synthesis, and I propose these components play a pivotal role in the substantiation and reformulation of power relationships between members of the multilingual academic community.

### ***Defining Power***

As this synthesis aims to investigate the negotiations of power in multilingual university environments, it is first essential to define what is meant by power, how that power is negotiated, and how those negotiations both impact and are impacted by the multilingual university environment. I begin here with power and define the remaining two items in the following sections.

Power has always been a contested term with varying definitions, but few notions of what power is and how it operates in society have had as stunning an impact as the ideas of Michel Foucault. Foucault operationalizes power not as something preexisting, but rather something that is constantly constructed and reconstructed within a social environment, and the changes within the relations of power come about from both participant internal and external factors (Foucault, 1982). One of the primary reasons for my adoption of this idea of power is its ability to encompass both the factors involved in the negotiation of power, as well as its inclusion of dynamicity. Dynamicity is important for this study, because it provides hope for those people in situations of low-power that their status is not static and changes can and should be made to improve their status.

Another key element in this definition of power that is critical to academia is the inseparable link Foucault makes between power and knowledge, which can be seen in the popularized term power/knowledge in Foucaultian terms. As Hall (2001) explains, “[Foucault’s Theory] saw knowledge as always inextricably enmeshed in relations of power because it was always being applied to the regulation of social conduct in practice,” (pp. 75). Because knowledge and power are “enmeshed” in this theoretical approach to power and because academia is focused on the search for knowledge and understanding, Foucault’s theory appropriately applies to the context under investigation. Knowledge is significant to the multilingual environment as well, because knowledge can be understood in both general terms, but also used to identify linguistic aptitude, ability and status as important aspects of knowledge.

### ***Negotiating Power***

While the operationalized definition of power selected for this synthesis can encompass what is investigated as power in the selected studies, it still lacks the idea of negotiation. Knowing that power relations are dynamic does not quite extend far enough to include what it means to negotiate power, and it is negotiation which can be seen in the interactions of participants, not the underlying power, which can only be theorized from an analysis of different social and individual aspects.

Negotiation then, is the actual real-world interaction (or lack of interaction, because not interacting is also an observable behavior) between individuals in which power is co-constructed. One important part of interaction is the right to interact, which is an idea clearly theorized by Pierre Bourdieu (1977). According to Bourdieu (1977),

*An adequate science of discourse must establish the laws which determine who (de facto and de jure) may speak, to whom, and how... Among the most radical, surest, and best hidden censorships are those which exclude certain individuals from communication (e.g. by not inviting them to places where people speak with authority, or by putting them in places without speech).*

It is clear that the right to speak is not something that everyone is always in possession of, according to Bourdieu, but rather something to be granted or taken away. By removing someone’s right to speak, you remove his or her right to interact, and thereby removing from him or her the capacity to negotiate their current status, or realization of power.

### ***Negotiations of Power and the Multilingual University Environment***

Finally, it is also important to contextualize the idea of negotiating power within the focal environment, namely multilingual university settings. As Foucault’s ideas on power have expanded, many researchers have investigated power in academic settings (Cummins, 2009; Grainger, 2011; Levine, 2008; MacIntyre, Noels & Moore, 2010; Norton, 1995; 2001; Norton & Toohey, 2001; Öhrn, Angervall, Gustafsson, Lundahl & Nyström, 2009; Ushioda, 2009; Vigoda-Gadot, Talmud & Peled, 2011). Rather than providing hypothetical accounts and simply a description of how power relations could be negotiated, I would like to introduce two studies from the above list which have investigated how Foucaultian notions of power relations and their negotiations by individuals do play out in academic scenarios. It is important to note that while not all of the studies above specifically cite Foucault, their ideas of power and how they are related are tightly correlated with those expressed by Foucault.

First, Cummins (2009) describes the relations of power by bilingual and bicultural deaf students in a Swedish and Danish context. In his investigation of these deaf children who were subjugated and put in positions of minimal power by authoritative figures, he found that the constraints on their abilities “are socially-imposed rather than representing any inherent limitation specific to Deaf students,” (267). Thus, it is not the fact that the children investigated here were deficient, but rather that they were seen as deficient and therefore barred from conversation by removing their right to speak.

A second example comes from Bonny Norton (2001), in which she describes the issues of non-participation and imagined communities by ESL students in a Canadian university classroom. From her investigation of diary excerpts from two participants, Norton concludes that their nonparticipation, which could be redefined here as their right to speak, removes personal investment in language learning and thus negatively impacts both the participants’ abilities to learn as well as their abilities to redefine their identity in the second language classroom. Overall, these two examples give a brief description of how power relations can and sometimes cannot be negotiated in academic contexts. While both examples given here, and most that I’ve found, center on the abuse of power and the negative impacts that arise from that abuse, it is important to remember the positive impact teachers and other authorities can have on their students by providing them the right to speak, participate, gain authority and redefine their identities in positive ways.

***The Student as Subject (or Object?)***

One final section I would like to add to this introduction is another topic from Foucault (1982), in which he discusses the idea of power and what he calls the “subject”. Specifically I would like to discuss the role of the student within the multilingual academic environment. Over the course of conducting this synthesis I came to the realization that one of the major factors in negotiating power relations was how the students and teachers viewed the role of the learner. While this discussion is more suited to parts of this paper which are post-synthesis, such as the discussion and pedagogical implication sections, I wanted to draw attention to the idea that power and viewing the student as the subject may be one of the most impactful ways for teachers to empower their students, instead of seeing themselves as the subject and their students as the object. By allowing students to be the subject, they have more control over their development of their own identity, rather than being forced into a preformed mold handed down from the academic institution.

**RESEARCH QUESTIONS**

The two research questions that came out of the initial review of power and which guided the final synthesis of the selected studies are:

1. How do negotiations of power play out in multilingual academic environments?
2. What factors play a major part within these negotiations of power?

As this is a qualitative synthesis, I first created more general research questions and developed them more fully over the course of data collection. Initial questions about power within the classroom were posed and refined as studies were found and appraised. The major part the initial search and appraisal played was to help me to narrow my topic to focus on adult learners, university/academic environments, multilingual participants, and student-student and student-teacher negotiations of power. In addition, the inclusion/exclusion criteria, which will be discussed in detail below, also helped to shape the final research questions. Specifically, after the application of the exclusion criteria, two studies discussed interactions and power relations between students and instructors, but not within a classroom setting. This expanded the research questions to include the entire academic environment, rather than limiting it only to the classroom. This was seen as important because student-teacher interactions outside of the classroom, such as one-on-one writing conferences, are also critical sites for the negotiation of power between students and teachers, and these out-of-class situations can have a significant impact on what happens inside the classroom as well.

**METHODOLOGY**

This section outlines the methodological approach and procedures taken to collect, appraise and analyze the studies used for this synthesis.

***Research Procedures***

The initial search for texts to include in this synthesis was conducted using two primary data sources, Google Scholar and the Linguistics and Language Behavior Abstracts (LLBA) database. LLBA was used in the initial search and Google Scholar provided supplementary material. The individual keywords used to collect the original sample were “classroom”, “power”, “negotiation”, “L2”, “multilingual”, “second language”, and “interaction”. These individual keywords were then combined into phrases and used as the search terms, for example, “second language classroom negotiations of power.” By recombining these search terms in multiple ways and selecting topic-appropriate articles from each search, 61 articles were chosen as possible candidates for synthesis.

***Inclusion/Exclusion Criteria***

Of the 61 articles, 7 were chosen for the final synthesis by applying the following inclusion/exclusion criteria:

1. The study must focus on student-student or student-teacher interactions.
2. The study must contain the original data, as both the original data and interpretations of that data will be drawn upon for this synthesis.
3. The study must focus on interactions within an academic context, whether inside or outside the classroom.
4. At least one of the participants in the interactions recorded in the study was multilingual.
5. The interactions took place between adults.

By applying these five requirements, the total number of studies was reduced from 61 to 7. All of the seven studies included in this synthesis focus on student-student or teacher-student interactions between multilingual adults in an academic context. The rationale for these criteria sprung from my own teaching experiences. As a current instructor at Carnegie Mellon University, my students are representatives of the population under investigation in this study. In conducting this study, I hope to provide fellow teachers, researchers and myself with a more comprehensive understanding of the negotiations of power in multilingual academic environments.

### *Final Sample/Evaluation of Sources*

While the object of a synthesis is to recombine previous findings in new ways, it is still important for a qualitative synthesis to provide appropriate contextualization of the individual studies. This contextualization will allow for a more transparent and salient application of my own analysis in the following section. I will first briefly introduce each article via the following table. Its purpose is to summarize the focus and types of interactions of each study included in this synthesis, after which a more complete contextualization will be provided for each. For complete citations of the included articles, please see the Reference section. Each article included in the synthesis is preceded by a \*.

The following chart also includes the appraisal score given to each article. The appraisal was based on three major criteria. First, the methodology presented in the study was clear and easily replicable. Second, a large amount of the original data was included by the researcher. This allowed for easier inclusion within this synthesis. Third, and finally, the study was judged on how logical and convincing the interpretations of the data proposed by the researcher were. Each study was given a score of 1, excellent, 2, fair, or 3, poor.

Author(s) Publication Year	Focus of Study	Types of interactions recorded	Appraisal Score
Achugar, M. (2009)	The creation of a professional identity in a bilingual creative writing graduate program	What: Student-student and teacher-student classroom interactions in a Spanish-English bilingual graduate student creative writing program at a Southwestern US university near the Mexico border How: videotaped classroom observations and formal interviews with the students	1
Gu, M. (2011)	Language choice and identity construction in peer interactions in a multilingual university environment	What: Students in a teacher training program views on intra- and inter-group interactions and language use on campus at a university in Hong Kong. How: Individual and focus group interviews.	2
Mayes, P. (2010)	The discursive construction of identity and power in the critical classroom	What: Two sections of an ESL composition course, with a focus on two teacher and five students at a US university in Wisconsin How: Class observations, videotaped student-teacher writing conferences, and student writing samples and course documents	1
Mohamed, H. & Banda, F. (2008)	Classroom discourse and discursive practices in higher education	What: Student-writer and lecturer-reader interactions at a university in Tanzania. How: Review of documents, student and lecturer interviews and five sessions of classroom observation.	1
Morita, N. (2004)	Negotiating participation and identity in second language academic communities	What: Open-ended in-class discussions either as a whole class or in small groups during graduate seminars over the course of one academic year at a Canadian university How: Weekly reports from students, formal interviews with the researcher, and classroom observations	1
Nelson, G. (2000)	Individualism-collectivism and power distance in second language classrooms	What: Classroom misunderstandings presented in a narrative fashion. How: unclear, however narrative suggests the retelling of anecdotal first-hand experience	3
Starfield, S. (2009)	Negotiating writer identity and authority in a first-year university course	What: Academic student writing in a first year sociology course at a South African university How: Classroom observations, interviews with some students and all teachers, and written documents	2

The seven studies listed in the chart above are each unique social environments with their own players, settings and interactions. Before a synthesis can be useful, each study must be fixed within its unique context. Beginning with Achugar (2009), the study is conducted at a US/Mexico border university and focuses on the development of the professional identities of aspiring writers in an English/Spanish bilingual graduate program. The location of this study, the US/Mexico border, plays an important role in defining the context in which this graduate program functions. As Achugar describes, "This academic community is unique since it is the only bilingual creative-writing program in the United States and also because it is located in an area characterized by continuous contact between native speakers of Spanish and English...resulting in a complex cultural and linguistic landscape," (pp. 68). In addition to the unique surroundings in which the recorded interactions take place, the program itself is unique in that it is the only one of its kind currently in existence within the US.

While the researcher conducted a qualitative longitudinal project to obtain her data, the focus of this study is on a specific classroom interaction between one of the program's professors and the rest of his class, specifically three students who dominate the interaction between each other and the professor. The class is a writing course and this specific interaction takes place during the critique of one student's paper. The topic of discussion focuses on the use of dreams in writing.

Similarly, Starfield (2002) also investigates the development of writer identity and authority, but the context is quite different from that in Achugar (2009). In her study, Starfield looks at this development in a sociology one course at a South African university. These participants, unlike the ones in Achugar (2009), are not graduate students, but rather beginning level university students, and therefore these students will have much different levels of authority in their academic setting. Even the manner of multilingualism is different. While the first study took place in a bilingual program, Starfield's study is located in an environment in which English is seen as the dominant language, which is not the native language of the participants in her study. Also, Starfield looks at two one-on-one interactions between an instructor and a student with the focal event being the discussion of the students' papers, which is much different from the classroom interaction investigated in Achugar (2009).

Like Starfield (2002), Mohamed and Banda (2008) locate their study in an African (in this case Tanzanian), English-dominant university setting, where they target the interactions of multilingual students. The bulk of the data from this study arises from faculty interviews and their feedback on students' writing, in which the authors foreground the role of the instructor as the dominant figure.

In another study which focuses on identity, Morita (2004) looked at identity in second language academic communities at a western-Canadian university. Like Achugar's study, these participants were graduate students, but were native Japanese speakers entering different graduate programs. Again, their position as graduate students, even in their first year, affords these participants a different identity and sense of authority than those undergraduate first semester students in Starfield (2009). Because of these students' involvement in different departments, e.g. language education, educational studies, and Asian studies, they were not located within a singular English-dominated context. Rather, each student in this study had multiple connections to different language communities. The interactions analyzed in this study were taken from in class whole-group and small-group discussions.

Another study centered on classroom interactions is that by Mayes (2010). This study is located at a university in Wisconsin whose five main participants are either from the Midwest US and consider themselves to be bilinguals (3) or international students (2). Mayes details their interactions with their instructors and fellow students in an ESL composition course.

Coming from a completely different part of the world, Gu (2011) describes the issues of language choice and identity construction in peer interactions. Gu's study is located at a multilingual university in Hong Kong and uses interviews with ten students to investigate her research questions.

Finally, Nelson's (2000) study is difficult to situate entirely due to a lack of contextualization, but she does provide some detail that the two interactions described in her study at a US university. The first interaction is with a 19-year-old Japanese student who is embarrassed by the printing of her name on her test by the ESL teacher. The second interaction is between an ESL teacher and her advisor, which is not included in the analysis of this study.

Each study is located in a unique context and those contexts range in their similarities and differences to the other studies included in this synthesis. Because of the breadth of contexts which this synthesis is taking into consideration, I believe that the conclusions drawn from the coding and findings present next are strengthened and the proposed model of power relations has the ability to encompass a variety of multilingual academic environments.

### *Coding*

The approach to coding and analysis for this synthesis was comprised of both predetermined categories as well as the inclusion of categories that arose from the data themselves. First, coming from the theoretical background of this paper which includes both Foucaultian ideas about the networks of power in which every social event takes place as well as the idea of the right to speak from Bourdieu, the initial two categories for coding were identity and authority. The idea of identity fits with Foucault's idea that each social event occurs as an interplay between members of differing levels of power. Identity could thus be said to be formed within these social events as a result of different personal and social aspects which convey or detract power from the members of a particular social event. Authority could also be seen as a co-creation by members in a social event, but in addition, authority can also be seen within Bourdieu's theory of the right to speak. Identity is important in social interaction, but it is the authority both given to oneself as well as given by others that provides a person with the right to speak in an interaction.

In addition to identity and authority, two other categories arose from the investigation of the selected articles, control and participation. Participation was identified in all of the texts, and it was catalogued in terms of the amount of verbal or physical involvement in a given interaction or situation. While participation is fairly straight-forward, control arose out of the need to create a category that was in between authority and participation. Authority on its own was not sufficient to encompass situations in which participants without authority were given the right to speak and participate in a particular situation. For example, Mayes (2010, p. 204) provides a transcription of an interaction between a student and a teacher in which the teacher, Becky, is trying to explain an assignment to the student:

Becky: I understand that you guys wanna take the assignments and try to figure out what I want from you  
but,  
..really what I want from you,  
is t- kinda try to take the assignment and, and,  
(1.1) do with  
(.7) do with it what you will

In this interaction, it is clear that the students, as well as the teacher, see the teacher as the person with authority, but the control over what to do with the assignment is delegated to the students, who lack authority in this situation. Because of these situations in which authority does not automatically result in power over a particular event or activity, the category of control was developed.

Each of the four categories (identity, authority, control, and participation) are located within the framework of power, that is, power has a dialogic relationship with each of these categories. For example, as a person is given more control, their power in a certain situation goes up and their ability to negotiate power relations with others in that situation changes. On the other hand, when a person's self-image is that of an outsider, their identity inhibits access to social power and they therefore lose some of their ability to negotiate power in a specific social situation. Thus power, as overarching negotiational resource, can be influenced by each of the four proposed categories, and they, in turn, can be influenced by power itself, as manifested within a social environment. Figure 1 below provides a graphic of this explanation.

Figure 1: Direct bidirectional influences on classroom power

For coding purposes, these four categories were divided into thematic and linguistic representations found in the text. Thematic representations were those in which the actual topic was being discussed, either in the original data or by the article's author, while linguistic representations were those that were seen as manifestations of a particular category in the actual linguistic aspects of the original data set. Linguistic categories were not identified in the interpretations or writing style of the authors.

## RESULTS AND DISCUSSION

### *Research Question One*

How do negotiations of power play out in multilingual academic environments?

In short, negotiations of power are always unique to their specific contexts and the ways in which those power relations play out in interactions cannot be predetermined because of the constant dynamic nature of the creation and recreation of power in social environments. For example, each of these studies were conducted in drastically different geographical environments with their own cultures. It would be impossible to guess how power relations in two sites, even if they were exactly the same, would play out due to the distinct situations in which those power relations are negotiated. The participants' in Achugar (2009) who were in a bilingual program on the US/Mexico border would have had a much different experience had they been more centrally located in the US, where there would possibly be less interaction between two groups of native speakers. That could have drastic effects on what those writers saw as important in creating a professional identity and change all of the interactions they had with their peers and professors. While this first synthesis questions has not be as fruitful as hoped, it has still provided evidence for one important claim, that power relations are dynamically constructed and reconstructed in every social context, and thus it may be more important to look at negotiations of power as something to be aware of and developed within a context, rather than something used to predict interactions in a decontextualized space.

In stating this, I do not mean to say that there are no patterns to be found within the multilingual settings analyzed in this synthesis. Once a situation has been properly contextualized, it is then possible to draw conclusions about the ways in which power is negotiated between participants. As an example, it is possible to identify similar roles between teachers as authority figures in both Mayes (2010) and Mohamed and Banda (2008). Mayes (2010) investigates classroom power in a multilingual, but English-dominated English composition course at a US university, while Mohamed & Banda (2008) investigate classroom interactions between lecturers and their students in an English course at a Tanzanian University. Despite the differing contexts in which these studies were conducted, both studies indicate that authority-role, as assumed by the teacher/lecturer, plays an important part in the actions undertaken by the students in these contexts. By assuming a position of authority over the students, the instructors

and teachers in these two studies demonstrate how the concept of authority is universally available, and that the context in which the instructor or teacher found him or herself allowed for that individual to assume that authority. It is the importance of context as the provider of social positions which I would like to emphasize here. Only within context can we establish power relations, and it is the decisions and actions of the individuals within that context that determine how power is negotiated from one point in time to the next.

### ***Research Question Two***

What factors play a major part within these negotiations of power?

To answer this question, this section will first analyze each code developed individually. The discussion section of this paper will then use these categories to show how each of the four factors interact with each other, creating a model of power relations which manifests itself in a multilingual higher-education environment.

#### *Power as identity*

Identity, as conceived in this paper, allows students to locate themselves within an interaction and is constantly changing due to both internal and external factors. This creation of identity was the focal point for many of the studies included in this synthesis (Achugar, 2009; Gu, 2011; Mayes, 2010; Morita, 2004; Starfield, 2002). Identity is important in interaction and the web of power relations, as can be seen in this excerpt from original data from Morita (2004): “I found that my self-image got really lowered after I came here . . . But I don’t feel comfortable calling myself a nonnative speaker,” (pp. 586). In this excerpt from the participant Lisa, one can see that self-image, or her identity, has a major impact on her feelings and how she thinks about herself. She does not identify herself as a nonnative speaker of the language, which is important to recreate her self-image in a more positive way, one transferring from her former low self-image upon arrival. By redefining her identity as something other than a “nonnative speaker” she recreates her identity in a more empowering way. Morita (2004) also analyzes this data as a change in identity, surmising that, “Her commitment to improvements . . . allowed her to employ various strategies, and as a result, she experienced some positive personal transformations,” (pp. 586). These “positive transformations” manifest themselves as a reinvented self-image which in turn changes Lisa’s identity within her multilingual context. Her change in identity can be seen as a way to provide herself with more power, thus identity itself is not only acted upon by power, e.g. Lisa’s initial identity problems as a newly-arrived person, but change in identity itself can enhance an individual’s power.

Identity is also an important part of writing, in that one’s identity inherently affects the way in which he writes, as well as providing a personalized voice which defines a person as a writer. Starfield (2002) represents this data in two ways, with the original data and with her interpretation of that data. Starfield puts forth evidence for the creation of writer identity by presenting the use of the first person plural “we” her participant Philip’s essay: “Most intriguingly, Philip uses the first person plural pronoun ‘we’ three times in his introduction: ‘we will look at,’ ‘we look at’ and ‘we need to look at.’ This use of ‘we’ directly inserts a writer into the text,” (pp. 129). By using “we” Phillip places his own identity in relation to the reader of his paper, who is his instructor. By providing this relational pronoun, Philip creates his identity as part of the readership and thus uses this to enhance the interaction between himself, the author, and his instructor, the reader. In presenting identity within an academic work, the author in this multilingual setting was able to promote positive interaction with his reader, which intern reflects his power as a writer.

#### *Power as authority*

In addition to identity, authority was also essential in interactions as a source of power in the synthesized studies. For example, Achugar (2009) provides evidence that authority is a major factor in the construction of a bilingual professional identity. As a writer, one needs to show that he or she has the authority to speak/write about a topic, which is significantly more than simply placing his or her identity within a text. The key term which relates to authority in Achugar’s study is “professional”. In attempting to create a professional identity, one is asserting that they have the authority to be authors, which is a pivotal area of struggle for many of her participants. Achugar provides linguistic data which shows significant hedging in student responses, which can be interpreted as underlying assumptions about each student’s right to speak, and how far that right extends. One example comes from the researcher’s transcription of an interaction between one of the participants, Martina, and her professor: “Martina/Professor: To me it takes on a surrealism - and I don’t know if that is good - or if that’s accurate-” By using terms such as “I don’t know” and questioning whether her idea is “good” or “accurate”, Martina shows that in the interaction between her and her professor, she is not the person with authority on the subject and defers the evaluation of the ‘correctness’ of her idea to the professor for approval. From this example, it is clear that authority plays a major role in the linguistic behavior of these individuals. Martina lacks authority in her current situation, or at least believes she does, and therefore gives up some of her power to her professor. With increased authority on the

subject matter, Martina could provide herself with more power in future interactions with both her peers and her professor.

Authority is also a very salient topic in Starfield (2002). Up to this point, I had assumed that greater authority results in greater power, and while this is still part of my interpretation of the impact of authority on power and vice versa, Starfield provides an example of a student who assumes too much authority, thereby failing to properly cite his ideas. The issue here is that the participant, Philip, is not given or does not possess the authority to write in the manner in which he does and thereby his assumption of more authority than he possess has a negative impact on his reader. Starfield asserts this over-assumption of power by stating that "Philip has presumed too much (author's emphasis) authority - that he does not need to provide evidence." The over-assumption of authority which does not exist has a negative effect on the interaction between this student and his reader, and what logically follows is that legitimate authority, which can be defined as the authority allowed a person within a given context by other individuals within the same context, would then have a positive impact on the interaction between writer and reader. Authority provides a person with power that can have a significant impact on interactions, and that authority can be highly useful in multilingual environments, especially for people who find themselves as second language speakers in an environment dominated by the person's second language.

#### *Power as control*

Control, which again is defined as the space between authority and participation in an environment is much more evident in student-teacher interactions because authority is clearly given to the teacher over the student and the dissemination of control to the student is a result of teacher choice. This is especially evident in the observations recorded by Mayes (2010) with teachers who were attempting to implement a more student-centered classroom. While these interactions could be interpreted as authority, the importance, to reiterate the explanation above in the coding section, is that the people with authority provide control over a situation to those who lack the authority. The teachers do not give up their authority, but rather only their control over a certain situation for a certain period of time. Control may be the most difficult part of power relations encountered in this synthesis because the ability to provide control falls mainly on the part of the instructor. Students seem to have little power to change the amount of control they have over situations in which they are interacting with a person of greater authority. This can be seen in the teachers from Mayes (2010), who have the goal to give students more control, but struggle with it so much. The following data from Mayes (2010) shows one teacher's struggle with relinquishing control in the classroom:

...(9)I mean right now I'm trying to approach it from the critical..pedagogy  
...(7) point of view.  
..but,  
..it's also difficult because I find myself=,  
kinda wanting to creep in and -  
and,  
and do this teacher-centered,  
..you know  
[curriculum]. (pp. 201)

The teacher has the goal of placing her own authority in the background in order to provide control to her students, but the actual process of doing so is a struggle. This struggle can be interpreted as the difficulty relinquishing one's own power to raise the amount of power of another. By relinquishing authoritative power, the teachers are attempting to enhance the students' power in the form of their own control over their situation, despite their lack of authority in that situation.

#### *Power as participation*

The final category created for coding was that of participation. While each of the four components are important, it is interesting that participation is the only one that is actually observable. By this I mean identity, authority and control need to be interpreted by people's actions or explained by them verbally. On the other hand, actual participation in a social event can be physically observed in the actions taken by the participants. Because this is the only observable action, it plays a key role in power relations. By simply including people and encouraging participation, we could empower those individuals, which would hopefully have an impact on the other three factors included in this model of power and interaction.

While participation can be observed and interpreted in each article, participation plays a particularly crucial role in the interactions discussed in Morita (2004). Morita provides interview data of one participant, Lisa, and Lisa's views on the importance of participation: "I always feel that I have to say something in class to contribute to the class. . . . A small thing is okay. . . . It's not just about my own participation, it's about cooperation. . . . I have to play some role in the classroom," (pp. 584). Here we can see that Lisa's participation is more than just part of some requirement, her participation is part of her self-empowerment in the classroom and as a member of the class. Additionally, Morita explains that participation, or lack thereof, can be the indication of a feeling of less power, displayed as anxiety: "The apparently passive participation of L2 learners, especially learners from certain Asian cultures, is often explained by language learning anxiety or cultural tendencies," (pp. 586). From the examples found in Morita (2004), participation is of vital importance to becoming part of a multilingual community and increasing one's power in that community.

Like Morita (2004), participation was also important in understanding the negotiations of power in Mohamed & Banda (2008). In this study, the researcher observes a number of interactions in which a lecturer is speaking to a class and attempting to interact with them. While Morita's (2004) study displayed an array of interactions, the formality of the Tanzanian lecture environment described in Mohamed & Banda (2008) shows the lack of participation available to the students in this environment. All of the excerpts taken from the classroom observations reveal only two types of interaction between the lecturer and the students, either the lecturer talking directly at the students or the lecturer asking the students whether they are comprehending the material. In the latter case, students only react in chorus by shouting "yes" or remaining silent, as can be seen in the following example from the study:

Lecturer: You only mention the item on which the action was what...  
was performed! Is that clear?

Students: (Silence)

Lecturer: Are we – are we working the same – bus all of us here?

Students: (Chorus) Yes!

Lecturer: Do you know what we are doing?

Students: (Chorus) Yes! (pg. 105)

In the scenarios depicted here, the students have limited opportunities to interact with the lecturer, and no opportunity whatsoever to interact with one another. In this situation, the lecturer stagnates any would-be attempts to negotiate power by restricting participation between himself and the class, as well as between members of the class. In this environment, the authority and control asserted by the lecturer dominate the power relations. Without the opportunity to diversify and expand their participation, at least insofar as feeling comfortable asking questions to clarify their apparent misunderstanding of the material, the students will never be able to negotiate for more power in this environment. In saying this, I understand that a lecture environment is not the same as an interactive classroom environment, nor do I think that every teaching situation calls for equal amounts of participation by students and the lecturer. A lecture environment calls for greater participation on the part of the lecturer and giving students too much time to participate could easily derail the goal of this type of course, but from the examples provided, it is obvious that more participation is needed on the part of the students, at least in terms of the chance to and a certain comfortability with asking questions of the lecturer for clarification. The ability to clarify understanding in a lecture format is a necessary part of the learning process and, in returning to Foucault, the ability to clarify one's understanding will lead to a greater understanding of the subject matter. With a greater knowledge of a topic comes greater power, which can later be translated to authority, which will be essential for the students in Mohamed & Banda's (2008) study as they graduate and seek jobs in which they are assumed to possess the necessary knowledge and skills. Via class participation, these students would gain the necessary knowledge to negotiate power and assume roles of authority outside the classroom, even if the role of lecturer/student remained very distant in terms of power within the classroom.

One final point to make about the importance of participation is the social expectations of people within a particular context about what appropriate participation is. In addition to the expectations of people in positions of authority, such as teachers and lecturers in a classroom environment, participation can also be influenced by the cultural and social norms of a given individual. In multilingual environments, the disparity between one individual's cultural expectations of participation may be quite distinct from those of the culture in which an individual finds him/herself. While none of the articles included in this synthesis defined culturally appropriate expectations of participation for their subjects and the examples of participation found in the sample texts do not define distinctions between the subjects' participation and target-culture norms, the idea that participation is also culturally constrained is integral in understanding how and why students participate, especially in multilingual and multicultural contexts. To emphasize the importance of this idea, I will cite an example from Philips (1972). In this study, Philips is investigating the participation structures and communicative competence of native-American children in community and classroom

settings. Over the course of her observations, she notes that participatory expectations from the community often overlap with students' amount of participation in the classroom. Philips (1972) describes the communicative competence in the community as being largely based on non-verbal, physical expression, which contrasts starkly to the expectations their teacher has of them within the classroom. As Philips explains,

*Indian children fail to participate verbally in classroom interaction because the social conditions for participation to which they have become accustomed in the Indian community are lacking. The absence of these appropriate social conditions for communicative performances affects the most common and everyday speech acts that occur in the classroom. If the Indian child fails to follow an order or answer a question, it may not be because he doesn't understand the linguistic structure of the imperative and the interrogative, but rather because he does not share the non-Indian's assumption in such contexts that use of these syntactic forms by definition implies an automatic and immediate response from the person to whom they were addressed. For these assumptions are sociolinguistic assumptions that are not shared by the Indians (pp. 341).*

From this explanation of the importance of conflicting social expectations of participation, we can clearly see that not only does participation play an important role in the interactions between students and teachers, but it also complicates the idea of participation within the classroom. In addition to providing students the opportunity to participate, it is also necessary to define what participation is within a specific context, as well as identify conflicts between students' cultural expectations for participation and the expectations held by people in a position of authority in the classroom.

## **CONCLUSION**

### ***Summary of Findings and Discussion***

In sum, this synthesis has shown that identity, authority, control and participation each play a major role in interactions in a multilingual higher-education environment. Power, as defined in this study, both influences and is influenced by each of these four factors and that changes within those factors change the amount of power an individual has. These factors are context specific and a high amount of power in one scenario does not mean that an individual will have the same amount of power in another. For example, in the student-teacher interactions discussed in this synthesis, the teacher possessed more power within the interaction, but this power does not translate to situations in which that teacher interacts with a fellow teacher. The four factors of identity, authority, control, and participation change to suit the current environment. For this reason it is important to see power as relative, rather than associating power with a particular individual. It is not that an individual is powerful, it is that they have power within a given context. In addition to the bidirectional effects of power on each of the four factors investigated in this study, I also propose that these four factors operate in a cyclical manner, diagrammed below in figure 2.

Figure 2: Bidirectional cyclic interactions between influences on classroom power

As this is a cyclical model, there is no “beginning”, but in order to describe the relationship each factor has with the other I will begin with identity. The identity of an individual is made up of a number of factors which are both internally and externally generated, for example the title Doctor is an institutional part of a person’s identity. In an academic setting, the title of Doctor has a significant impact on how one sees him or herself, as well as how others see that person. In the creation of this identity within this specific context, that person is both granted and grants him- or herself a certain amount of authority. With significant authority, a person is then capable of providing others some amount of control. With insignificant authority, a person can be granted control, increasing his or her ability to participate. When people then participate in an interaction, they are then forced to express their identity within that interaction.

While this cycle sounds positive, it can also have negative effects. For example, if those with authority fail to allow others control over situations, they will deny those without authority the ability to participate. A lack of participation can force people to create an identity which is that of the “other”, the “outsider”, resulting in less authority and a lower self-image.

### ***Pedagogical Implications***

The implications from this model for interaction could have a significant impact on the multilingual academic context. First, and maybe most importantly, this model could help inform programs in teacher education about the importance of participation and student-centered models of instruction. This synthesis has shown that allowing students to control their own participation, they are positively impacted in terms of their reformation of identity and development of authority. Aspiring educators and new teachers may feel apprehensive about allowing students to take control for fear of losing control of the classroom, but in reality this may have a detrimental effect on the students’ ability to participate. By allotting students more control, teachers can help students reinvent their identities in a more positive way, help them gain authority and thereby become more independent, critically thinking, invested member of the classroom environment.

While this claim is generally applicable to all learning scenarios, I would like to also focus on the multicultural environment, especially those in which low-proficient speakers are forced into interactions with more proficient or native speakers. By informing these individuals that their participation is vital to establishing a positive identity, and in so doing more authority, I hope to inspire those individuals to take risks and continue to participate. For individuals who have the power, for example a teacher, emphasizing and encouraging participation will empower those with less authority and help integrate them into the multilingual classroom, where they can focus on the

acquisition of the target language, rather than on their identity as an outsider. Overall, this model can be used to make educators and students aware of the underlying factors affecting their interactions in a clear and concise way, as well as give them some direction as to how they can positively affect themselves and their students.

### **Future Research**

Future research in this area is needed to apply this model in different multilingual settings. While this model has been developed by synthesizing previous studies, and thus has some inherent validity in that it can be used to describe the studies included in the synthesis, there is a need to study whether this model can be applicable in describing other academic contexts. In addition, this model needs to be tested to discover whether it can also be applied to teacher-teacher, teacher-administrator, and student-administrator interactions.

Finally, research into the effects of making students and teachers aware of different power relations could show what kind of an impact, if any, the knowledge of power relations has on the interplay of those relations, and whether being aware of one's situation can foster positive growth and development.

### **ABSTRACT**

This paper endeavors to introduce the major thinkers in the field of Critical Discourse Analysis, with their models of analysis, fully described and explained. Among those thinkers are Fairclough, Van Dijk, Wodak, and others. Critical discourse analysis (CDA) is practically oriented form of discourse analysis addressing social problem. "Critical" is used in the special sense of aiming to show up connections which may be hidden from people such as the connections between language, power, and ideology. It is a form of applied linguistics; linguistics applied to the remedying of imbalances of power and various forms of social injustice. In this view, since ideologies permeate society by disguising themselves as common sense, the way to resist them is to unmask them. CDA may be defined as being fundamentally concerned with analyzing opaque as well as transparent structural relationships of dominance, discrimination, power and control as manifested in language. In other words, CDA aims to investigate critically social inequality as it is expressed, signaled, constituted, legitimized by language use or in discourse.

**KEY WORDS:** Critical discourse analysis, General methodology, Micro /Macroproposition, soci-cognitive model.

### **DISCOURSE ANALYSIS**

Before describing the term of discourse analysis, we need to define and explain the term of discourse itself in order to comprehend the basic concepts of discourse analysis. As a branch of language study, discourse is a complete unit that has two forms: written and spoken. Discourse is a unit of language that is the most complete and higher than a sentence or a clause with high cohesion and coherence continuously, that have the beginning and ending, that is delivered both in oral and written. Cook (1989: 7ff.) stated that the term of discourse is the language in use for communication.

According to Widowson (2007: XV), discourse is an area of language study concerned with how people make meaning, and make out of meaning in texts and as social practice, whether simple or complex, all texts are the uses of language which are produced with the intention to refer to something for some purposes.

In sum, referring to some theorists (Trappes-Lomax, 2004: 136), discourse is a term used in linguistics to describe the rules and conventions underlying the use of language in expanded stretches of text both spoken and written. Discourse practically always relies on the speaker or the writer (what he is talking about or writing) and the hearer or reader (what he is listening or reading). In discourse analysis, each of linguistic analysts use different theories and techniques of a number of disciplines for the study of language in use. They tend to favour one or more of a variety of approaches to conducting their research that have developed from these various sources. There are four main headings related to the ways and means of discourse analysis: rules and principles, contexts and cultures, functions and structures, and power and politics:

1. Rules and principles
  - pragmatics (including speech act theory and politeness theory)
  - conversation analysis
2. Contexts and cultures
  - ethnography of communication
  - interactional sociolinguistics
3. Functions and structures
  - systemic-functional linguistics (SFL)

- Birmingham school discourse analysis
- text-linguistics
- 4. Power and politics
  - pragmatic and sociolinguistic approaches to power in language
  - critical discourse analysis

Discourse analysis approach of language includes critical discourse analysis which is not only doing the textual interrogation but also revealing the relationship of the interrogation product with the macro contextual behind the text. It is more specifically as a study on how the power misused or how the domination and the inequality put into the community (ibid.).

### CRITICAL DISCOURSE ANALYSIS

Critical discourse analysis (CDA) is practically oriented form of discourse analysis addressing social problem. "Critical" is used in the special sense of aiming to show up connections which may be hidden from people such as the connections between language, power, and ideology (Fairclough, 1989: 5). It is a form of applied linguistics; linguistics applied to the remedying of imbalances of power and various forms of social injustice. In this view, since ideologies permeate society by disguising themselves as common sense, the way to resist them is to unmask them (Trappes-Lomax, 2004: 158). CDA may be defined as being fundamentally concerned with analyzing opaque as well as transparent structural relationships of dominance, discrimination, power and control as manifested in language. In other words, CDA aims to investigate critically social inequality as it is expressed, signaled, constituted, legitimized by language use or in discourse (Wodak & Meyer, 2001: 1ff.).

According to Van Dijk, CDA is a type of discourse analytical research that primarily studies the way social power abuse, dominance, and inequality are enacted, reproduced, and resisted by text and talk in the social and political context (Van Dijk, "18 Critical Discourse Analysis", 353 – 371) (<http://www.discourses.org/OldArticles/Critical%20discourse%20analysis.pdf>).

He added that CDA is a specific form and practice of discourse analysis obviously always needs to account for at least some of the detailed structures, strategies and functions of text and talks, including grammatical, pragmatic, interactional, stylistic, rhetorical, semiotic, narrative or similar forms of verbal and paraverbal organization of communicative events (Wodak & Meyer, 2001: 97). Referring to Van Dijk, Fairclough, and Wodak's opinions, one can provide the characteristics of Critical Discourse Analysis as follows:

**First**, action concerns that discourse is observed as the matter that has goals whether it is to influence, debate, persuade, react, etc.

**Second**, context confirms that discourse considers the context such as background, situation, event, condition and all of matters outside of the text and other factors which influence the meanings such as language participants, the situation when text is produced and aimed. Discourse should be interpreted in a certain situation and condition.

**Third**, history places discourse in a specific social context and cannot be understood without concerning the attached context.

**Fourth**, power elaborates that what discourse form whether spoken or written language is not neutral and natural but it represents a form of power fight.

**Fifth**, ideology focuses that text, conversation, and others are forms of ideological practice. More specifically, CDA focuses on the ways discourse structures enact, confirm, legitimate, reproduce, or challenge relations of power and dominance in society (Ibid.).

There are many types of critical discourse analysis. Hence, the theoretical and analytical use is also different. Critical discourse analysis of conversation is different from the critical discourse analysis of news reports in the press, lesson, and teaching at school. But, overall the common perspective of conceptual and theoretical framework is closely related. Most kinds of CDA ask questions about the way specific discourse structures are deployed in the reproduction of social dominance, whether they are part of a conversation or a news report or other genres and contexts. Thus, the typical vocabulary of many scholars in CDA will feature such notions as "power", "dominance", "hegemony", "ideology", "class", "gender", "race", "discrimination", "interests", "reproduction", "institutions", "social structure" and "social order" besides the more familiar discourse analytical notions (Van Dijk, 1993: 354).

Based on the explanation above, it can be concluded that the study of critical discourse analysis deals with the relationship between discourse and social problems. CDA was developed to identify the hidden socio-political control which proponents of CDA believe actively constructs society on some levels. This may be one reason the highly politicized media has much influence on the society's view (Atkins, 2002: 2).

### **SOME MODELS OF CRITICAL DISCOURSE ANALYSIS**

There are three major models of critical discourse analysis which are always associated with the researchers such as Norman Fairclough, Teun A. van Dijk and Ruth Wodak. They essentially have the same idea of critical discourse analysis, but they have distinctive models of analysis. Generally, they analyse how social and political inequalities are manifested in and reproduced through discourse. It is very clear among researchers that only Fairclough and van Dijk who have detailed models of critical discourse analysis.

#### ***Norman Fairclough's Dialectal-Relational Approach (DRA)***

Norman Fairclough is one of the founders of critical discourse analysis that looks at "the influence of power relations on the content and structure of writings". Fairclough explains that CDA aims to "systematically explore often opaque relationships of causality and determination between (a) discursive practices, events and texts, and (b) wider social and cultural structures, relations and processes; to investigate how such practices, events and texts arise out of and are ideologically shaped by relations of power and struggles over power" (Fairclough, 1995: 132). He provides us with a useful definition that summarizes most other definitions of CDA:

CDA is the study of often opaque relationships of causality and determination between (a) discursive practices, events and texts, and (b) wider social and cultural structures, relations and processes; to investigate how such practices, events and texts arise out of and are ideologically shaped by relations of power and struggles over power; and to explore how the opacity of these relationships between discourse and society is itself a factor securing power (ibid.:133).

Looking at language as discourse and social practice, someone cannot analyse the text only, not just analyse the process of production and interpretation, but also analyse the texts, processes, and their social conditions. Accordingly, Fairclough distinguishes three dimensions or stages of Critical Discourse Analysis (ibid.: 98):

- a.** Description is the stage which is concerned with formal properties of the text.
- b.** Interpretation is concerned with the relationship between text and interaction with seeing the text as the product of a process of production, and as sources in the process of interpretation. Notice that Fairclough uses the term interpretation for both the interactional process and a stage of analysis.
- c.** Explanation is concerned with the relationship between interaction and social context with social determination of the process of production and interpretation, and their social effects.

The following figure is Norman Fairclough's Model of Critical Discourse Analysis

According to Meyer (2001), his method is, like Wodak's, pragmatic and problem oriented. First, he sets out to identify and describe the social problem to be analysed. Then, he goes on with the structural analysis of the context, then the interactional analysis focusing on linguistic features (such as agents, time, tense, modality and syntax), and finally, he conducts an analysis of interdiscursivity, which seeks to compare the dominant and resistant strands of discourse. Fairclough's analytical framework is represented schematically below:

1. Focus upon a specific social problem which has a semiotic aspect; go outside the text and describe the problem and identify its semiotic aspect.
  2. Identify the obstacles to it being tackled, through an analysis of:
    - a. The network of practices it is located within
    - b. The relationship of semios to other elements within the particular practice(s) concerned
    - c. The discourse (the semiosis itself)
      - structural analysis: the order of discourse
      - interactional analysis
      - interdiscursive analysis
      - linguistic and semiotic analysis
  3. Consider whether the social order (network of practices) in a sense 'needs' the problem.
  4. Identify possible ways past the obstacles.
  5. Reflect critically on the analysis.
- (Ibid: 28) and Fairclough (2001: 125-127)

#### ***Van Dijk's Socio-Cognitive Approach (SCA)***

Van Dijk's Socio-Cognitive Discourse Analysis is an approach characterised by the interaction between cognition, discourse and society. It began in formal text linguistics and subsequently incorporated elements of the standard psychological model of memory, together with the idea of *frame* taken from cognitive science. A large part of van Dijk's practical investigation deals with stereotypes, the reproduction of ethnic prejudice, and power abuse by elites and resistance by dominated groups.

Van Dijk also emphasizes the control of discourse dimensions as a means to gain access to power. A further element in his account of discourse production and comprehension is the *K-device*, which is shorthand for personal, interpersonal, group, institutional, national and cultural knowledge (Van Dijk, 2005: 75). Cognition, realised in collective mental models as a result of consensus, is the interface between societal and discourse structures (Van Dijk, 2009: 62-85). While societal structures influence discursive interaction, in the latter the former are said to be "enacted, instituted, legitimated, confirmed or challenged by text and talk" (Fairclough and Wodak 1997: 266). Van Dijk (2009:62-85) believes CDA needs a model of context such as Moscovici's (2000) social representation theory: One individual's cognition is informed by dynamic constructs known as *social representations*, that is, the concepts, values, norms and images shared in a social group, and activated and maintained in discourse.

**This approach therefore suggests concentrating the analysis upon linguistic markers as follows:**

- stress and intonation
- word order
- lexical style
- coherence
- local semantic moves such as disclaimers
- topic choice
- speech acts
- schematic organization
- rhetorical figures
- syntactic structures
- propositional structures
- turn-takings
- repairs
- hesitation.

It supposes that most of these are exemplary forms of interaction which are in principle susceptible to speaker control, but in practice mostly not consciously controlled. Other structures, such as the form of words and many structures of sentences, are grammatically obligatory and contextually invariant and hence usually not subject to speaker control and social power.

**SCA further suggests six steps of analysis:**

1. The analysis of *semantic macrostructures*: topics and macropropositions.
2. The analysis of *local meanings*, where the many forms of implicit or indirect meanings, such as implications, presuppositions, allusions, vagueness, omissions and polarizations are especially interesting.
3. The analysis of '*subtle*' *formal structures*: here, most of the linguistic markers mentioned are analysed.
4. The analysis of *global and local discourse forms* or formats.
5. The analysis of *specific linguistic realizations*, e.g. hyperbole, litotes.
6. The analysis of *context* (Meyer, 2001: 26).

***The Discourse-Historical Approach (DHA) (Wodak and colleagues)***

It attempts, *inter alia*, to describe those cases where language and other semiotic practices are used by those in power to maintain domination (Reisigl & Wodak, 2009: 87-121). Initially, it was concerned with prejudiced utterances in anti-Semitic discourse. Recent developments include the discursive construction of national sameness and the social exclusion of out-groups through the discourses of difference, and the reconstruction of the past through sanitised narratives. The general approach reflects sociolinguistics and ethnography; it also gives an important place to Habermas's notion of the public sphere and to strategic communicative action as opposed to ideal communication oriented to understanding. Its central tenet is the importance of bringing together the textual and contextual levels of analysis. **The model of context used in this approach invokes historical knowledge understood in terms of four layers:**

- (a) The linguistic co-text,
- (b) The intertextual and interdiscursive level,
- (c) The extralinguistic level, and
- (d) The socio-political and historical level (Wodak & Meyer, 2009: 1-33).

The interconnection between various texts and discourses leads directly to the notions of ***de-contextualisation*** and ***recontextualisation***, processes in which elements typical of a particular context can be taken out of it and inserted into a new context with which it has not been conventionally associated.

DHA has further produced a series of analytical and descriptive tools, drawing on linguistic models and argumentation theory. In particular, **DHA lists six strategies for identifying ideological positioning: *nomination, predication, argumentation, perspectivisation, intensification* and *mitigation***, which are analysed as part of a larger process that includes also the characterisation of the contents of a discourse, linguistic means of expression and context-dependent linguistic realisations of stereotypes. One of the strengths of DHA is the emphasis on the combination of observation, theory and method, and the continuum between application and theoretical models. Its historical, political and sociological analyses are also an important part of its methodology, especially in relation to systems of genres, although the lack of a fully systematic procedure in this regard is one of its weaknesses.

The discourse-historical approach concentrates upon these six discursive strategies as follows (Wodak, 2001: 73):

- *Referential strategy or strategy of nomination*, where the linguistic devices of interest are membership categorization, metaphors and metonymies and synecdoches.
- *Strategies of predication* which appear in stereotypical, evaluative attributions of positive or negative traits and implicit or explicit predicates.
- *Strategies of argumentation* which are reflected in certain *topoi* used to justify political inclusion or exclusion.
- *Strategies of perspectivization, framing or discourse representation* use means of reporting, description, narration or quotation of events and utterances.
- *Strategies of intensification and mitigation* try to intensify or mitigate the illocutionary force of utterances.

## GENERAL METHODOLOGY

Methodology is one of the most complex issues within the field of CDA. Meyer, for instance, claims that there is no such thing as a common methodology or theoretical viewpoint in CDA:

CDA theoreticians draw on a number of theoretical levels in their analyses, from epistemology, grand theories or general social theories, middle-range theories, microsociological, socio-psychological theories, discourse theories to linguistic theories (see Meyer, 2001: 18-20 for a more thorough discussion).

CD analysts are both aware of this criticism and recognize it. Van Dijk states that CDA, like any good scholarship, should integrate the best work from all the relevant contributors and disciplines (Van Dijk, 2001: 95-96), whereas Wodak points out that CDA has never attempted to be or to provide one single or specific theory. Quite the contrary: 'studies in CDA are multifarious, derived from quite different theoretical background, oriented towards different data and methodologies. Researchers in CDA rely on a variety of grammatical approaches. The reason for this, according to Wodak (2001: 8), is that relationships between language and society are so complex and multifaceted that interdisciplinary research is necessary.

Furthermore, Meyer (2001) claims that in CDA there is an assumption that all discourses are historical and can therefore only be understood with reference to their context, making him conclude that CDA, thus, is open to the broadest range of factors that exert an influence on texts. Consequently, by applying extra-linguistic factors such as culture, society, and ideology, CDA scholars, by necessity, have to make use of an interdisciplinary procedure. Nevertheless, there are at least a few features that are common no matter which approach to CDA one chooses.

**Firstly**, they are all problem oriented and not focused on specific linguistic items (although linguistic expertise is obligatory for the selection of the items relevant to specific objectives).

**Secondly**, both theory and methodology are eclectic, i.e. both are integrated as far as it is helpful to understand the social problems under investigation (ibid: 29).

As for a single and applicable methodology, even Fairclough admits that it simply does not exist. CDA is not a technique, nor a tool from a toolbox; it is as much theory as method (Fairclough, 2001: 121). Van Dijk elaborates: 'In CDA, theory formation, description, problem formulation and applications are closely intertwined and mutually inspiring' (Van Dijk, 2001:96). However, the aim of CDA is clear: It can only make a significant and specific contribution if it is able to provide an account of the role of language, language use, discourse or communicative events in the (re) production of dominance and inequality (Van Dijk, 1993:279).

Nevertheless, the method of CDA is generally composed of four main steps: 1) Having a text or discourse to be analyzed. This text or discourse must be authentic from any social event. 2) Interpretation from a selection of information that may portray or reveal any structure of power, domination, and/or exploitation. The interpretation can be done from the phonetic, morphological, syntactic, or semantic analysis. 3) Launching theory from the interpretation and further examination of the assumptions of the information that contains the structures issued. 4) Operationalization which is the conceptualization of the selection of theoretical concepts, relations, and assumptions.

## ILLUSTRATIVE EXAMPLES (VAN DIJK, 2006:728-740)

Van Dijk uses some fragments from a debate in the British House of Commons on asylum seekers, held on March 5, 1997. Mrs Gorman, representative of Billericay for the Conservative Party, then still in power, had taken the initiative for this debate, which she opened with a critique of the alleged costs of asylum seekers, costs she claimed were being paid by poor old English ratepayers. Among those who opposed her was Jeremy Corbyn, of the Labour Party.

In order to enhance the usefulness of our analysis, he shall assign an analytical category to each example, and order the categories alphabetically. After the category name he shall add the domain of discourse analysis to which the category belongs (e.g., meaning, argumentation, etc.). The main point of the analysis is to show how various ideologies, especially those of racism and antiracism, are expressed in various kinds of structures. There are in principle hundreds of such categories, so a small selection is made.

### *Some Categories of Ideological Discourse Analysis*

#### *Actor description (meaning).*

The way actors are described in discourses also depends on our ideologies. Typically we tend to describe ingroup members in a neutral or positive way and outgroup members in a negative way. Similarly, we will mitigate negative

descriptions of members of our own group, and emphasize the attributed negative characteristics of Others. Here is how Mrs Gorman describes a Romania asylum seeker:

(1) In one case, a man from Romania, who came over here on a coach tour for a football match decided that he did not want to go back, declared himself an asylum seeker and is still here 4 years later. He has never done a stroke of work in his life (Gorman).

*Authority (argumentation).*

Many speakers in an argument, also in parliament, have recourse to the fallacy of mentioning authorities to support their case, usually organizations or people who are above the fray of party politics, or who are generally recognized experts or moral leaders. International organizations (such as the United Nations or Amnesty International), scholars, the media, the church or the courts often have that role. People of different ideologies typically cite different authorities. Thus, Mr. Corbyn ironically asks Mrs. Gorman whether she has not read the reports of Amnesty or Helsinki Watch.

*Burden (topos).*

Argumentation against immigration is often based on various standard arguments, or *topoi*, which represent premises that are taken for granted, as self-evident and as sufficient reasons to accept the conclusion. One of the *topoi* of antiimmigration discourse is that asylum seekers are a financial ‘burden’ for ‘us’:

(2) It is wrong that ratepayers in the London area should bear an undue proportion of the burden of expenditure that those people are causing (Gorman).

*Categorization (meaning).*

As we also know from social psychology, people tend to categorize people, and so do speakers in parliament, especially when Others (immigrants, refugees, etc.) are involved. Most typical in this debate is the (sub) categorization of asylum seekers into ‘genuine’ political refugees, and ‘bogus’ asylum seekers, a categorization formulated in the following ways:

(3) There are, of course, asylum seekers and asylum seekers (Gorman).

(4) . . . those people, many of whom could reasonably be called economic migrants and some of whom are just benefit seekers on holiday, to remain in Britain (Gorman).

*Comparison (meaning, argumentation).*

Different from rhetorical similes, comparisons as intended here typically occur in talk about refugees or minorities, namely when speakers compare ingroups and outgroups. In racist talk, outgroups are compared negatively, and ingroups positively. In antiracist talk, we may negatively compare our country or government with loathsome undemocratic regimes. In the following example, Mr. Corbyn uses an argumentative comparison with the Second World War to emphasize the plight of asylum seekers:

(5) Many soldiers who were tortured during the Second World War found it difficult to talk about their experiences for years. That is no different from the position of people who have been tortured in Iran, Iraq, West Africa, or anywhere else (Corbyn).

*Consensus (political strategy).*

To claim or insist on cross-party or national consensus is a well-known political strategy in situations where the country is threatened, for instance by outside attack. Immigration is often seen as such a threat. Thus, Mrs Gorman insists that the current immigration law is the fruit of consensus, and hence should not be tampered with:

(6) The Government, with cross-party backing, decided to do something about the matter (Gorman, C).

*Counterfactuals (meaning, argumentation).*

(see also Counterfactuals.) “What would happen, if . . .” the typical expression of a counterfactual, is often used in this debate by the Labour opposition in order to suggest that the conservatives try to imagine what it would be like to

be in the situation of asylumseekers, an persuasive argumentative move that is also is related to the move of asking for empathy:

(7) I suggest that he start to think more seriously about human rights issues. Suppose he had to flee this country because an oppressive regime had taken over. Where would he go? Presumably he would not want help from anyone else, because he does not believe that help should be given to anyone else (Corbyn).

(8) If that happened in another country under a regime of which we disapproved, the British Government would say that it was a terrible indictment on the human rights record of that regime that prisoners were forced to undertake a hunger strike to draw attention to their situation (Corbyn).

*Disclaimers (meaning).*

A well-known combination of the ideologically based strategy of positive self-presentation and negative other-presentation are the many types of disclaimers. Note that disclaimers in these debates are not usually an expression of attitudinal ambiguity, in which both positive and negative aspects of immigration are mentioned, or in which humanitarian values are endorsed on the one hand, but the 'burden' of refugees is beyond our means. Rather, disclaimers briefly save face by mentioning our positive characteristics, but then focus rather exclusively on Their negative attributes. Hence our qualification of the positive part of the disclaimer as Apparent, as in Apparent Denials, Concessions, Empathy, etc.:

(9) [Apparent Empathy] I understand that many people want to come to Britain to work, but there is a procedure whereby people can legitimately become part of our community (Gorman).

(10) [Apparent Denial] I did not say that every eastern European's application for asylum in this country was bogus. However. . . (Gorman).

*Euphemism (rhetoric; meaning).*

The well-known rhetorical figure of euphemism, a semantic move of mitigation, plays an important role in talk about immigrants. Within the broader framework of the strategy of positive self-presentation, and especially its correlate, the avoidance of negative impression formation, negative opinions about immigrants are often mitigated, especially in foreign talk. The same is true for the negative acts of the own group. Thus, racism or discrimination will typically be mitigated as resentment or unequal treatment, respectively. Similarly Ms Gorman in this debate uses the word 'discourage' ('to discourage the growing number of people from abroad. . .') in order to refer to the harsh immigration policies of the government, and thus mitigates the actions of the conservative government she supports. Similarly, the Labour (Corbyn) opposition finds the condemnation of oppressive regimes by the Government 'very muted' instead of using more critical terms. Obviously, such mitigation of the use of euphemisms may be explained both in ideological terms (ingroup protection) as well as in contextual terms, e.g., as part of politeness conditions or other interactional rules that are typical for parliamentary debates.

## CONCLUSIONS

In this approach described above, discourse is treated under three perspectives: as text endowed with linguistic form, as 'discursive practice' through which texts are produced, distributed, and consumed and as 'social practice' which has various ideological effects, including normativity and hegemony.

CDA emphasizes power, exploitation, inequality as the social conditions of language, tracing them through various contexts including political and economic discourse, racism, advertising and media, and institutional settings such as bureaucracies and education. Notice that, while these may be played out in individual speech events, the frame of reference is broader than, and logically prior to, any given event. Moreover, the focus on speakers' intentions as the source of meaning that is common to methodological individualist approaches is absent in all large-scale approaches.

## INVESTIGATING COLLOCATION ERRORS OF PAKISTANI EFL LEARNERS

**Abdul Ali MPhil Scholar**

*Department of English, Punjab Colleges Faisalabad*

*Email: ahmadali.ma@gmail.com*

### ABSTRACT

The purpose of this study is to contribute literature in the field for the researchers to do empirical analyses. The research points out collocation problems that Pakistani English as a foreign language (EFL) learners come across. This study is of a qualitative nature. The researcher has studied a great deal of literature to find out actual problems being confronted by EFL learners. In collocation problems, first language transfer seems to be the most dominant problem. In addition to first language (L1) transfer, the learners also use synonymy and overgeneralization which contribute to collocation digression in the target language.

**KEYWORDS:** Collocation, EFL learners, First language transfer

### COLLOCATION ERRORS DUE TO FIRST LANGUAGE TRANSFER

Pakistani EFL learners commit collocation errors due to the transfer of first language into the target language. Learners' native language (L1) largely has an influence on their consequent learning of L2 collocations (Nesselhauf, 2003, 2005). Learners' dependence on their L1 collocation knowledge may lead them to assume that there exists a one-to-one correspondence between L1 and L2 collocation options. Fortunately where there is an exactly identical match between collocations in both languages, transfer from the learners' mother tongue could result in a positive, satisfying production (Ellis, 2008). However, such success based on native language transfer is not always the case (Nesselhauf, 2003, 2005). The difference between L1 and L2 collocations can also cause some problems for EFL learners. In other words, whenever collocations in the mother tongue and the target language do not match deviant and unusual collocation structures often arise. According to several past studies, native language impact is evident in EFL learners' collocations. By and large, there obviously exists negative transfer from L1.

Bisk-up (1992), explored Polish and German EFL learners' performance in English collocation use, reported that the learners, based on risk taking, did transfer their L1 collocation knowledge to their production of L2 collocations, thus clearly leading to the erroneous use of English collocations. For example, while the targetlike collocation in English is to set a record, the Polish learners tended to use to state a record, which indicates an L1 collocation pattern. L1 interference can be seen in Huang (2001) as well when Taiwanese EFL university students, when they were asked to do a sentence-completion test, created L2 combinations based on L1, such as a black horse rather than the target-like collocation a dark horse. Nesselhauf (2003) provided help for the previously mentioned studies in that L1 influence, in her study of collocations used by German EFL learners, is significant, resulting in L2 errors for many times. She also confirmed the importance of native language impact on L2 collocation learning and suggested that since L1-L2 collocation disharmony is a major cause of errors in learner language, English teachers should focus on such incongruent collocations in the two languages in order to avoid learners from committing such transfer errors.

It is also worth noticing that Koya (2003) reported that even high-proficiency students seem to heavily depend on their knowledge of L1 collocations, which surprised the researcher himself since he had predicted to see the least evidence of L1 transfer among high-proficiency students. On the other hand, low-proficiency learners were found to apply an avoidance strategy and astoundingly depended less on their first language. These supplies counter evidence against much past literature which indicated that L1 transfer is trait of low-proficiency learners (e.g. Ellis, 1987; Odlin, 1989). Moreover, Fan (2009), examined Hong Kong ESL learners' collocation production in writing, also discovered an adverse effect that L1 Chinese had on the learners' use of English collocations. In particular, the study found substandard L2 collocations that seem to result from word-for-word translation from Chinese, such as left/right face or left side face, which are not found in native speakers' corpora (Fan, 2009, p. 118).

Another study that is in line with the aforesaid ones as to L1 transfer is Ying (2009). In the study of English collocations produced by Chinese speakers, i.e. English majors and non-English majors, Ying discovered that collocations which have no translation equivalents in L1 are considered difficult, in comparison to those which are congruent with L1. In more details, the learners probably searched for L1 equivalents with no awareness of L1-L2 incongruity and then produced L2 erroneous combinations, which is in harmony with Nesselhauf (2003). Moreover, for both groups of learners, errors in lexical collocations clearly outnumber those in grammatical collocations. With reference to research on L2 acquisition of English collocations by Thai EFL learners, L1 transfer has also been

widespread. As discovered by Boonyasquan (2006), who investigated Thai learners' collocation errors in translating a Thai business article, into English, mother tongue, i.e. Thai, was one of the most common sources of errors. The learners seemed to directly translate some L1 collocations into non-target like English. An example given in this study is \*expensive price, which is assumed to be directly translated from raakhaa p 'high price', i.e. literally raakhaa 'price' and p 'expensive'. Another study the results of which are consistent with Boonyasquan (2006) in terms of first language influence on collocation use is Mongkolchai (2008), who explored English collocation competence of third-year English majors in a university in Bangkok, Thailand. The research instruments, viz. a sentence completion test and a multiple-choice test, seemed to elicit collocation data presenting evidence of the native language transfer.

A clear example of transfer-based errors is the use of the preposition "in" in place of "at" in the sentence \*I became skillful in drawing (Mongkolchai, 2008, p. 46). It is self-evident that interference from EFL learners' native language plays vital role in L2 collocation acquisition. As demonstrated in the above mentioned studies, the mother tongue seems to exert an adverse effect on their use of English collocations, which results in L2 erroneous combinations.

### **COLLOCATION ERRORS DUE TO USE OF SYNONYMS**

Apart from dependence on their native tongue, EFL learners in the process of learning collocations are sometimes seem to resort to an analogy strategy referred to as synonymy strategy. This is often used by learners whose L2 proficiency is limited. They may try substituting a synonym for a word in L2, and they are unaware of constituting a collocation violation. In reality, a very restricted number of synonyms in English can occur in the same grammatical pattern (Nation, 2001). In other words, words that are very close in meaning do not always share the same grammatical collocation. For instance, even though the verbs ask and plead are semantically similar, i.e. involving making a request (Cambridge advanced learners' dictionary, 2008, pp. 74-75 & 1085), the grammatical patterns in which the verbs are likely to occur are different. That is, the verb ask is used in the pattern ask someone + infinitive with to, whereas the verb plead requires the preposition with, as in plead with someone + infinitive with to. For this reason, a substitution of plead for ask in the grammatical pattern of the latter verb, i.e. without with, causes ungrammaticality in English (Phoocharoensil, 2010, p. 242).

According to many studies of L2 English collocation acquisition, synonymy has been a common learning strategy. In Farghal and Obiedat (1995), it was implied that Arabic EFL learners greatly relied on the open-choice principle for word choice, replacing a word with its synonym. Such a strategy often led them to deviant, ungrammatical collocations in English. In a similar fashion Howarth (1996, 1998) reported L2 learners seemed to draw an analogy between collocates of two synonyms, thus frequently resulting in errors in the target language. For example, they produced the erroneous combination \*adopt ways, which was presumably caused by analogy with the correct collocation adopt an approach (Howarth, 1998, p. 41). Like the above studies having been mentioned, Zughol and Abdul-Fattah (2001) discovered assumed synonymy in the use of English collocations by Arabic speakers. It was reported that as a result of the nature of the instructional /pedagogical input the learners received in class and the influence of bilingual dictionaries, the learners' collocation use was evidently based on a synonymy strategy, which violates the selection restrictions, i.e. semantic constraints, of the target language. For instance, the verb failed was incorrectly employed as opposed to defeated in the sentence \*The enemy failed in the battle (Zughol & Abdul-Fattah, 2001, p. 11).

With respect to some research studies on Thai learners' acquisition of English collocations, synonymy has also been discovered. Boonyasquan (2006), in her study of how Thai EFL learners translated a business news articles from Thai to English, reported on their collocation violations arising from an application of synonymy, which accounts for 8.62% of all the collocation errors. A clear example given in the study is \*a qualified hotel in lieu of a quality hotel, which may reflect the learners' confusion over the use of the synonyms qualified and quality (Boonyasquan, 2006, p. 83). Lending support to Boonyasquan (2006), Mongkolchai (2008) noticed collocation errors committed by English majors, who speak L1 Thai, through synonymy. For instance, they used \*a newspaper booth, which is a digression from the target like one a newspaper kiosk, commonly found in a native speaker corpus.

### COLLOCATION ERRORS DUE TO REPETITION AND OVERGENERALIZATION

Repetition and overgeneralization are also one of the factors because of which Pakistani learners get indulged in making collocation errors. Repetition is another strategy on which EFL collocation learners often rely. With repetition, learners resort to the repeated use of a limited number of familiar collocations. Moreover, repetition may occur as a consequence of learners' lack of confidence to create L2 collocations through analogy (Howarth, 1998). Put simply, they may not want to risk using L2 combinations with which they are not familiar. Research studies on L2 English collocation learning have pinpointed repetition as an origin of collocation problems. Among those studies, Granger (1998) shows that French learners of English tended to repeatedly employ the intensifier *very* in the combination of adverb + adjective. Furthermore, some other collocations, e.g. deeply-rooted, repeatedly occurred in their writing as well. Granger, Paquot & Rayson (2006) agreed with Granger (1998) in that EFL learners seem to overuse a limited group of collocations perhaps because they stick to familiar formulaic sequences which they feel safe to use. Similarly, Howarth (1998) also discovered a difference between individual writers' repetition of conventional collocations. Shih (2000) was investigated overused of collocations in a Taiwanese learner corpus of English, focusing on a set of synonyms *big*, *large*, and *great*. The findings from a comparative study of Taiwanese Learner Corpus of English and British National Corpus (BNC) showed that the collocations with *big* were importantly overused by Taiwanese learners. More precisely, the learners used *big* far more frequently than native speakers normally do when describing abstract concepts, whereas the use of *big* referring to concrete objects occurs with more frequency in the native speaker corpus. Shih reported that repetition is viewed as a simplification strategy or overgeneralization applied by Taiwanese learners when faced with L2 collocation problems. In other words, the word *big* is perhaps extended to abstract concepts, which is not a normal practice of native speakers'. According to Zughol & Abdul-Fattah (2001), overgeneralization, i.e. the extension of the use of a certain L2 feature to another, has been found as a source of incorrect use of L2 English collocations, and this strategy is seen as a feature of learner language. The subjects in this study confused the words *shame* and *ashamed*, thereby extending the use of *ashamed*, while the word *shame* was intended.

### ABSTRACT

This study explored the relationship between emotional intelligence (EI) and self-efficacy in 71 Iranian EFL teachers in private language institutes. The participants' EI and self-efficacy were rated through questionnaires. They were also administered a demographic sheet. The findings revealed that EFL teachers' EI was significantly and positively correlated with their self-efficacy, and it could also account for a considerable amount of variance in teachers' self-efficacy. Another line of the results showed significant differences in the teachers' EI and self-efficacy with respect to the demographics- marital status and years of teaching experience. Implications are discussed.

**KEY WORDS:** Emotional Intelligence, Self-efficacy, EFL Teachers

### INTRODUCTION

Recent research clearly indicates that teachers can highly affect students' educational outcomes (Anderson, 2004). Research also shows that schools make a difference in terms of student achievement, and the significant factor in that difference is that it can be attributed to teachers. Particularly, differential teacher effectiveness is a strong determinant of differences in student learning (Darling-Hammond, 2000). Research also reveals that there is a strong positive correlation between teacher effectiveness and student learning. Successful teachers believe that they can make a difference in student learning outcomes and they teach accordingly (Gibbs, 2002). Teacher effectiveness is also in close connection with their self-efficacy levels i.e., the belief teachers have about their teaching skills and capacities (Gibbs, 2002; Tschannen-Moran, Woolfolk-Hoy & Hoy, 1998). Bandura (1995) opined that people with high self-efficacy persisted with the task in the face of hardship and obtained better results with substantially lower levels of stress. In addition, self-efficacy beliefs can contribute to one's accomplishment and well-being in several ways (Pajares, 2002).

Dembo and Gibson (1985) argued that the issue of pinpointing antecedents of efficacy and the ways to augment teachers' sense of efficacy is of high importance and relevance. Sutton and Wheatley (2003) also opined that great amount of variation in teacher self-efficacy could be attributed to variance in teachers' emotions. This is specifically true with respect to careers such as teaching, with its affectively challenging disposition, high levels of emotional involvement, difficulty and continuous interaction. As such, research should investigate the relationship between teacher emotions and self-efficacy (Emmer & Hickman, 1991) to see whether and how they are related with each other. To this end, this study set out to examine the relationship between emotional intelligence and teacher self-efficacy among foreign language teachers in private language institutes in Iran.

### LITERATURE REVIEW

#### *Teacher Self-Efficacy*

Research on teacher self-efficacy has been inspired by Bandura's (1997) social cognitive theory. Bandura (1995) argued that self-efficacy can be referred to as people's beliefs about their potentiality to create expected levels of performance that exert influence on events that impact their lives, and that these beliefs indicate how people feel, think, motivate themselves and behave. People with a strong sense of self-efficacy set themselves more challenging goals and maintain stronger commitment to those goals than do people with lower levels of self-efficacy (Bandura, 1995).

Teacher self-efficacy refers to the extent to which teachers believe they can make change and impact on student behavior and learning outcomes (Gibson & Dembo, 1984). Or as Tschannen-Moran et al (1998, p. 22) opined teacher self-efficacy is "the teacher's belief in his or her capability to organize and execute courses of action required to successfully accomplish a specific teaching task in a particular context". Teachers who have a high sense of self-efficacy about their teaching potentiality can enhance students' motivation and cognitive development (Bandura,

1995). The task of making environments suitable to learning depends on the talents and self-efficacy of teachers (Bandura, 1995).

Tschannen-Moran, et al, (1998) emphasized the importance of teacher self-efficacy and its connection with a broad range of teaching and learning outcomes. These outcomes embrace teachers' classroom behavior, effort and goal-setting, their openness to novel ideas and desire to try innovative methods, planning and organizational competence, perseverance, resilience, commitment and eagerness for teaching and longevity in their profession. Furthermore, teacher self-efficacy can influence student achievement, attitude and emotional growth and is related to the organization health, atmosphere in the school, classroom based decision-making and to student self-efficacy.

Atay (2007) also stated that teachers' self-efficacy can highly affect their instructional activities as well as student attitudes and achievements. Research findings also indicated that teacher efficacy affects teacher's control orientations and control behaviors; their use of classroom discussions and creative teaching practices; their feedback to learners; stress level and their satisfaction with the teaching profession (Bandura, 1997; Tschannen-Moran et al., 1998). However, little research has been conducted which examines EFL teachers' self-efficacy.

### ***Emotional Intelligence***

EI has its root in the concept of "social intelligence" that was first identified by Thorndike (1920). Thorndike (1920, cited in Wong and Law, 2002, p. 245) defined social intelligence as "the ability to understand and manage men and women, boys and girls –to act wisely in human relations".

Definitions of emotional intelligence widely vary. Some researchers see EI as an ability, which can be measured most precisely by a performance test (Salovey & Mayer, 1990). The skill sets which are included in this explanation of EI are using emotion to facilitate thinking, understanding emotion, managing emotion, and perceiving emotion. Other researchers view EI as a mixed model, including both ability and dispositional traits (Goleman, 1995). Still, other mixed models take into account the factors of mood, motivation, social skills and well-being to define emotional intelligence (Bar-On, 2007). Bar-On credits, Darwinism, Thorndike's theory of social intelligence, Wechsler's observation of non-cognitive factors, and Gardner's theory of multiple intelligences, and others as major impacts on his famous model (Bar-On, 2007). Bar-On, Bar-On (1997) defined EI as "an array of non-cognitive capabilities, competencies, and skills that influence one's ability to succeed in coping with environmental demands and pressures" (p. 14).

For testing individuals' emotional intelligence, Bar-On developed a 133-item self-report Emotional Intelligence scale. The Bar-On EI test, called the emotional quotient inventory (EQ-I), is a self-report measure of emotionally and socially intelligent behavior that offers an estimate of emotional-social intelligence (Bar-On, 1997). This test covers 5 major scales and 15 subscales contributing to the emotional energy and self-motivation required to deal with daily environmental challenges and obstacles as follows (see also Bar-On, 2000):

- (1) Intrapersonal: managing oneself, the ability to know one's emotions.
  - (a) Emotional self-awareness (the ability to be aware of, recognize and understand one's emotions).
  - (b) Assertiveness (the ability to express one's feelings, beliefs, thoughts and to defend one's right).
  - (c) Self-regard (the ability to be aware of, understand, accept and respect oneself).
  - (d) Self-actualization (the ability to realize and reach one's potential).
  - (e) Independence (the ability to be self-directed and self-reliant in one's thinking and actions and to be free from emotional dependency).
- (2) Interpersonal: managing relationships with others.
  - (a) Empathy (the ability to understand and appreciate others' feelings).
  - (b) Interpersonal-relationship (the ability to establish and maintain mutually satisfying relationships that are characterized by emotional closeness and intimacy and by giving and receiving affection).
  - (c) Social responsibility (the ability to demonstrate oneself as a cooperative, contributing and constructive member of one's social group).
- (3) Adaptability: ability to adjust to change.
  - (a) Problem solving (the ability to effectively solve problems).

- (b) Reality testing (the ability to validate one's feelings and thoughts by assessing the correspondence between what is subjectively experienced and what objectively exists).
- (c) Flexibility (the ability to adjust one's feelings/thoughts to change).
- (4) Stress management: controlling stress
- (a) Stress tolerance (the ability to manage one's strong emotions, adverse events, and stressful conditions by positively coping with problems).
- (b) Impulse control (the ability to control one's emotions and resist an impulse to act).
- (5) General mood: the ability to be optimistic and positive as well as to enjoy life.
- (a) Happiness (the ability to feel satisfied with life and to have fun).
- (b) Optimism (the ability to look at the brighter side of life and maintain a positive attitude in the face of problems).

EI has been extensively under study both theoretical and experimental within the few last decades. It has been associated significantly and positively to enhanced adapted behavior such as: overall relationship satisfaction and stability (Gottman, et al., 2001), social life with higher quality social life (Lopes, et al., 2003), improved academic achievement (Nelson and Nelson, 2003; Parker et al., 2004), longer retention in the educational arena (Parker, et al, 2006), more satisfaction in one's life (Bastin, et al. , 2005) and the utilization of better adjusted coping strategies (Gohm & Clore, 2002; Matthews et al., 2006).

Moreover, teachers' EI, especially that of EFL teachers, has been under research scrutiny. Iordanoglou (2007), for instance, explored the relationship between EI, job commitment, leadership and satisfaction among Greek 332 primary education teachers. The findings revealed that EI could positively impact leadership effectiveness and is also closely related to teachers' satisfaction and commitment. The results insinuate that in addition to cognitive abilities, the selection criteria in education should also cover emotional competencies to ensure educators' acceptable performance.

## OBJECTIVE OF THE STUDY

As noted earlier, much research has been done on EI (e.g., Brackett and Salovey, 2006; Schutte et al., 1998) and on self-efficacy (e.g., Ross, 1994; Tschannen-Moran et al., 1998), but little (Chan, 2004) has been conducted on the relationship between these two constructs. As long as these two coping resources, EI and efficacy, are of current concern in all areas of education (Tschannen-Moran et al., 1998) and since they contribute to teaching effectiveness (Mortiboys, 2005; Pajares, 1992), some research should be done in the EFL setting to investigate if and how they are related. Summarizing, the current study aims at exploring the bond between EFL teachers' EI and self-efficacy.

As such, the following two research questions were addressed in the study:

- 1) Is there any statistically significant relationship between emotional intelligence and self-efficacy among EFL teachers?
- 2) Is there any statistically significant difference in teachers' EI and perceived self-efficacy regarding demographics?

## METHODOLOGY

### *Participants*

Upon obtaining permissions from principals, 5 private language institutes were sampled based on accessibility criterion in Iran. Out of 103 recruited EFL teachers, 71 returned completed questionnaires (about 69 % return rate). Of the teachers who responded, 45 were male and 26 were female. Their ages ranged from 23 to 48 years old ( $M=34.36$ ,  $SD=9.36$ ) with a range of between 1 and 24 years of teaching experience ( $M=10.18$ ,  $SD=11.22$ ).

### *Instruments*

EI and self-efficacy measures were utilized along with a demographic form asking about the participants' age, gender, marital status and years of teaching experience.

### *Emotional Intelligence Scale*

To assess language teachers' EI, the researcher used Bar-On EI test (Bar-On, 1997). This test employs a 5-point response scale with responses ranging from strongly disagree to strongly agree. It consists of 5 major factors and 15 sub-factors or components. A Persian version of the EI scale with 90 items was used in this study (Appendix A). To analyze the norms of the Farsi version of the questionnaire, Samouei (2003) sampled 500 university students (with

age range of 18-40 years) in Iran. He found that the test has appropriate internal consistency, test-retest reliability, and constructs validity. With the adapted Farsi version, the Cornbach's alpha coefficient was found to be 0.93 and the reliability index gained through odd-even, split-half method was [0.88].

#### *Self-efficacy Scale*

In this study, the short form of the Teacher Sense of Efficacy Scale (Tschannen-Moran and Woolfolk Hoy, 2001) was utilized (Appendix B). The short version of this scale consists of 12 items. Participants responded to the items by indicating their degree of agreement with each of the 12 statements using a five-point likert-type scale ranging from 1 (nothing) to 5 (a great deal). The reliability for the original 12-item scale is 0.90 (Tschannen-Moran and Woolfolk Hoy, 2001). In the current study, the reliability estimate (Cornbach's alpha coefficient) of the scale was  $\alpha = 0.86$ .

#### **Procedure**

To get reliable data and comply with research ethics, the researcher explained the objective of the research to the subjects and informed them about the estimated time required to fill in the scales (about 25 minutes). Furthermore, all participants were assured that their taking part in the study would be anonymous and optional. It was also added that the findings would include group data and that individual participants and language institutes would not be publicized or known. This information was offered in an informed permission sheet that was submitted with the survey folder. The completion of the survey suggested implied consent and therefore no signed consent form was returned. Teachers were encouraged to contact the investigator if any questions or concerns showed up as a result of their participation in the research. They took the questionnaires home, completed them and submitted to the researcher within 2 weeks.

Finally, in order to answer the research questions, the responses received from the scales were arranged in tables and analyzed.

#### **RESULTS**

In order to investigate the relationships between teachers' EI and self-efficacy, a Pearson Product-Moment Correlation analysis was conducted. The findings showed that there was significant positive correlation between these two constructs ( $r = 0.71$ ,  $p < 0.01$ ) (Table 1).

**Table 1: The results of correlation between teachers EI and self-efficacy**

	Self-Efficacy
EI	0.71**

\*\*. Correlation is significant at the 0.01 level (2-tailed).

To analyze the data further, Regression Analysis was conducted. The results indicated that teachers' total score of EI was a positive predictor of the dependent variable (teacher self-efficacy). In this part of the research  $R^2 = 0.50$  ( $\beta = 0.71$ ,  $t = 8.41$ ,  $p < .01$ ,  $F(1, 71) = 70.76$ ), indicating that 50 % of the variance in self-efficacy is explained by the independent variable, EI (see Table 2).

**Table 2: Regression analysis summary for EI predicting self-efficacy**

Predictor	R	R <sup>2</sup>	F(1, 70)	B	SEM	Beta ( $\beta$ )	t
EI	.71	.50	70.76**	9.69	14.85	.71	8.41**

\*\* $p < .01$

Pearson product-moment correlation was used to investigate the role of teaching experience in teachers' EI and self-efficacy. The results showed that teachers' years of teaching experience was positively related with their overall EI ( $r = 0.42$ ,  $p < 0.01$ ) and self-efficacy ( $r = 0.62$ ,  $p < 0.01$ ) (Table 3).

**Table 3: Correlations of teacher EI and self-efficacy and burnout with years of teaching experience (YTE)**

	YTE	
EI		0.42**
Self-Efficacy	0.62**	

\*\**. Correlation is significant at the 0.01 level (2-tailed).*

Finally, to explore whether there were significant emotional intelligence and self-efficacy differences among EFL teachers with respect to gender and marital status, two factorial ANOVA analyses were conducted for emotional intelligence and self-efficacy separately with independent variables of gender and marital status. In this way, individual and joint effects of the two independent variables on the dependent variable could be checked.

Since all the prerequisite ANOVA assumptions - Independence of observations, Normality, and Homoscedasticity - were met. First, a 2X2 ANOVA was run to explore the impact of gender and marital status on self-efficacy. The results revealed statistically significant main effect for marital status ( $F(1, 71) = 13.75, P = .001$ ), and the effect size was (eta squared = 0.17). It was shown that married teachers' self-efficacy ( $M = 144.35, SD = 21.51$ ) was noticeably higher than that of unmarried participants ( $M = 125.57, SD = 17.23$ ). However, the main effect for gender ( $F(1, 71) = 1.63, P = 0.26, \text{Eta Squared} = .02$ ), and the interaction effect (Gender \* Marital Status) ( $F(1, 71) = 1.29, P = 0.25, \text{Eta Squared} = .01$ ) did not reach statistical significance (Tables 4 and 5).

**Table 4: Descriptive Statistics (Dependent Variable: Self-Efficacy)**

Gender	Marital Status	Mean	Std. Deviation	N
Female	Married	137.33	19.75	12
	Single	125.14	15.33	14
	Total	130.76	18.23	26
Male	Married	148.78	21.90	19
	Single	125.80	18.46	26
	Total	135.51	22.84	45
Total	Married	144.35	21.51	31
	Single	125.57	17.23	40
	Total	133.77	21.26	71

**Table 5: Tests of Between-Subjects Effects (Dependent Variable: Self-Efficacy)**

Source	Type III Sum of Squares	Df	Mean Square	F	Sig.	Partial Eta Squared
Corrected Model	7128.81 <sup>a</sup>	3	2376.27	6.495	.001	.22
Intercept	1173243.43	1	1173243.43	3206.94	.000	.98
Gender	597.58	1	597.58	1.63	.206	.02
Marital Status	5031.77	1	5031.77	13.75	.000	.17
Gender * Marital Status	473.66	1	473.66	1.29	.259	.01
Error	24511.57	67	334.45			
Total	1302232.00	71				
Corrected Total	31640.39	70				

a.  $R^2 = .25$  (Adjusted  $R^2 = .19$ )

To explore the impact of gender and marital status on Emotional intelligence among EFL teachers, another two-way between-group ANOVA was conducted. The results indicated a statistically significant main effect for marital status ( $F(1, 71) = 9.73, P = .003, \text{eta squared} = 0.12$ ) with married teachers' EI ( $M = 362.61, SD = 45.88$ ) significantly lower than that of single teachers ( $M = 331.02, SD = 33.25$ ). But no significant gender effect ( $F(1, 71) = 6.95, P = .032, \text{eta squared} = 0.01$ ) and interaction effect ( $F(1, 71) = .69, P = .40, \text{eta squared} = 0.00$ ) was noticed. In other words, the effect of one independent variable on the dependent variable did not depend on the level of the second independent variable (Tables 6 and 7).

**Table 6:** Descriptive Statistics (Dependent Variable: EI)

Gender	Marital Status	Mean	Std. Deviation	N

## DISCUSSION

The current study explored the relationship between emotional intelligence and self-efficacy and the extent to which these two constructs are moderated by gender, teaching experience, and marital status in a sample of Iranian ELT teachers. The results revealed that there is a significant positive relationship between EI and teaching efficacy. In other words it was shown that the higher teacher EI, the higher their self-efficacy. Further, EFL teachers' EI proved to be a potent predictor of teacher self-efficacy. This is consistent with previous theoretical and empirical studies, though limited in TESOL context.

Bandura (1997) opined that somatic information caused by physiological and emotional states affected efficacy beliefs (p. 106). Also part of the variation in teacher efficacy is the result of variance in teachers' emotions (Sutton and Wheatley, 2003). Along the same line, Chan (2004) found that components of EI could significantly predict self-efficacy. The results of the present study corroborate those of Penrose et al. (2007) indicating that there is a moderate association between EI and teacher self-efficacy of primary and secondary school teachers. Therefore, it is interesting and useful to curriculum planners, teacher educators and language teachers that EI and self-efficacy are positively correlated, because each of them has the potentiality to be ameliorated, and each can positively affect the other. Put it another way, increasing EI during teacher education programs can help to the burgeoning of teachers' self-efficacy and vice versa.

The results also revealed a positive correlation between participants EI and years of teaching experience. In other words, teachers' emotional experiences are likely to increase with every year of teaching. This is in accordance with

previous research indicating that EI is acquired and enhanced through learning and continuous experience (Goleman, 1995). Bar-On (2000) also argued that EI can be ameliorated through training, programming and therapy.

As for the influence of gender, it was shown that there was no significant difference between EI and self-efficacy of male and female teachers. It shows that, disregarding experience, both male and female teachers can be triumphant in their career. These results corroborated those of Gencer and Cakiroglu (2007). These findings were also in line with the findings of Hopkins and Bilimoria (2008) while in discordance with those of Ciarrochi, Chan and Bajgar (2001) which showed that there were significant differences between females and males, with females reporting higher EI levels. This conflict may be connected to cultural and environmental issues. Another reason for this lack of gender difference is that female teachers might underrate their competence or men might overrate theirs or both. Whether there were no real gender differences, or the real gender differences could not be noticed by self-report scales in the current lines of results has to await further research.

Finally, the results revealed significant EI and self-efficacy differences with respect to marital status among EFL teachers, such that married teachers' EI and Self-efficacy were significantly higher than those of single teachers. One plausible explanation for these findings is that marriage could offer an emotionally fulfilling intimate association, meeting the need for social connection and involvement, which could have implications for both physical and mental health (House, Umberson & Landis, 1988). Research shows that marriage reduces depressive symptoms in both men and women (Simon, 2002). As such, married teachers can more efficiently avail themselves of their emotional resources in coping with stressful situations in EFL context. Moreover, the influence from the people in one's life, family, occupation or education, can estimate the level of self-efficacy in that person (Bandura, 1997). Likewise, married teachers' responsibilities on parenthood, marital life and occupational affairs yield a high self-efficacy.

## CONCLUSION AND IMPLICATION

In essence, the findings of the present study suggest that ameliorating teachers' emotional intelligence might positively influence their self-efficacy. These findings may have implications for teachers' well-being, pro-social behavior, motivation and teaching effectiveness and accordingly students' achievement. As Bar-On (2000) argued, EI develops gradually and can be enhanced via educational programs and therapy. As such, the findings underline the importance of establishing and developing pre-service and in-service programs for teachers to focus on the skills related to emotional management and regulation. According to Moafian and Ghanizadeh (2009, p. 715), "these courses are expected to help teachers manipulate their emotions appropriately, shift undesirable emotional states to more productive ones, understand the link between emotions, thoughts and actions, attract and sustain rewarding interpersonal relationships in the classroom, and be sensitive to students' emotions."

In addition, based on the results of this research, it is not equitable to judge a teacher based on only one of his/her characteristics. Each teacher with certain kinds of demographics is unique and no over-general statements can be made about him/her. Thus, educational stakeholders can help teachers to surmount their problems better by knowing how different teachers are and how these differences lead to different performances, outcomes and perceptions in the school and classroom arenas.

In the current study, the participants were not diverse enough. Therefore, any generalization of the findings to other contexts should be done with caution. It is recommended that the present study be replicated with a larger and more representative and diverse sample of the EFL teacher population. Also Future research should utilize measures based on objective performance along with self-reporting measures to gain a more precise estimate of teacher EI and self-efficacy. Future research should also examine demographic variables such as academic subjects taught, grade level taught, and economic status. Last but not the least, in future research, different dimensions of emotional intelligence and self-efficacy should be taken into account. In the current study only overall measures of teacher self-efficacy and EI were considered.

## **ABSTRACT**

The present study attempts to determine the theoretical basis of the Noun Phrase Accessibility Hierarchy in second language acquisition. Various studies have reported that the order of this hierarchy can be a valid predictor of the difficulty of relative clauses. However, it is unclear whether this difficulty should be attributed to the grammatical function of noun phrases (grammatical relation) or the configurational differences in the relative clause structure. A few articles have reported that learners of English would be more sensitive to configurational distinction than grammatical relation distinction in relative clause production, implying that the former determines the difficulty of relative clauses in comprehension and production. In order to clarify this issue, two experiments were conducted. The results indicated that Japanese learners of English have a tendency to be more sensitive to configurational distinction than to the difference in grammatical relation and the difference in thematic role in both comprehension and production. The implications of these findings and directions for future research are also discussed.

**KEYWORDS:** second language acquisition, relative clause, configuration, grammatical relation

## **INTRODUCTION**

Relative clause acquisition in second language acquisition (SLA) has been one of the most active areas in applied linguistics. Relative clauses have been considered to be a grammatical item that is acquired in the later stage of language acquisition in both first and second languages. This is because relative clause formation includes syntactically complex linguistic manipulation. In other words, the relative clause is a relatively more complex feature than other grammatical features. Since the 1970s, research on English relative clause acquisition and/or learning has been conducted among a variety of contexts using different approaches. There are a few strong hypotheses on the difficulty of relative clauses in comprehension and production. Among these hypotheses, the Noun Phrase Accessibility Hierarchy proposed by Keenan and Comrie (1977) has been validated by many researchers so far.

Keenan and Comrie (1977) proposed this hierarchy (subject > direct object > indirect object > object of preposition > genitives > object of comparative; where > means 'is more accessible than') based on the framework of relational grammar. The grammatical relation in relational grammar is assumed to be primitive and a derivative of the configurational structure<sup>(1)</sup>. This hierarchy originally suggested that if a language can relativize a given position in the hierarchy, then it will be able to relativize all the higher positions in that hierarchy (Ohba, 1995: 19). However, after Comrie (1981) argued that the hierarchy may be able to predict the learning order and the frequency of the appearance of relative clauses in written materials, SLA researchers began examining the validity of this order in the hierarchy in terms of a variety of contexts. Although Keenan and Comrie (1977) did not explicitly argue that the grammatical relation in relative clauses plays a crucial role in determining the difficulty of relative clauses in comprehension and production, SLA researchers absorbed in the markedness theory in the 1980s utilized the hypothesis to find some practical implications for language teaching (Gass, 1982; Eckman, Bell, and Nelson, 1988)<sup>(2)</sup>. This was done without testing whether the grammatical relation per se determines the difficulty of relative clauses. Eventually, the Noun Phrase Accessibility Hierarchy was adopted in SLA research where researchers believed, without much consideration, that the grammatical relation in the relative clause structure could account for the difficulty of relative clauses. The validity of a grammatical relation as a theoretical basis for determining the difficulty of relative clauses was never tested, but the language data collected from second language learners basically conformed to the order in this hierarchy. This fact has only made it easier for SLA researchers to conclude that the grammatical relation could account for the difficulty of relative clauses.

However, some SLA researchers have begun questioning the theoretical foundation of the Noun Phrase Accessibility Hierarchy in SLA due to the observation that the genitive relative clause (GEN) is sometimes produced more accurately by second language learners than the hierarchy initially predicts. The GEN is placed after the object of preposition (OPREP) in the hierarchy and should therefore be more difficult than a relative clause of a subject (SU), direct object (DO), indirect object (IO), and OPREP. Despite this, the GEN is often produced as accurately as or more accurately than a subject relative clause, which is predicted to be the easiest item in the hierarchy. Gass (1980) reported that in language production tasks such as sentence combining tasks, her subjects showed equally high accuracy in GEN test items and subject relative clauses. Her study also mentioned that GENs in English are constructed as units of [whose + noun phrase (NP)] and the role of the NP following the GEN marker *whose* may be able to determine the difficulty of GENs. This implies that if the role of the NP in the GEN is the subject, then the difficulty of the GEN may be equivalent to that of the subject relative clause. However, she did not clearly explain why the GEN could be produced as accurately as a subject relative clause.

The proposal<sup>(3)</sup> made by Hamilton (1994) is clearer and even more specific than Gass's explanation. Hamilton (1994) proposed another theoretical foundation for the Noun Phrase Accessibility Hierarchy based on Chomsky's Standard Theory. Chomsky's theory, the polar opposite of the relational grammar approach (Keenan & Comrie, 1977; Gass, 1982; Eckman, Bell, & Nelson, 1988), assumes that the configurational structure is primitive: the grammatical relation emerges from this structure in generative grammar. Hamilton (1994) argues that, based on the theoretical framework applied in Wolfe–Quintero (1992), the varying difficulty of the different relative clauses is due to the degree of phrasal discontinuity set up by the *wh*-extraction in each of the English relative clause types. He also argues that the high accuracy of second language learners in the GEN test items in Gass (1980) can be explained by the configurational approach using the following two points: (1) the *wh*-extraction site in GEN relativization changes according to the phrasal structure position of the possessed NP and (2) all the GEN sentences in Gass (1980) and the tasks prepared by other researchers that involved the possessed subject or direct object NPs (Hamilton, 1994, p. 150)<sup>(4)</sup>.

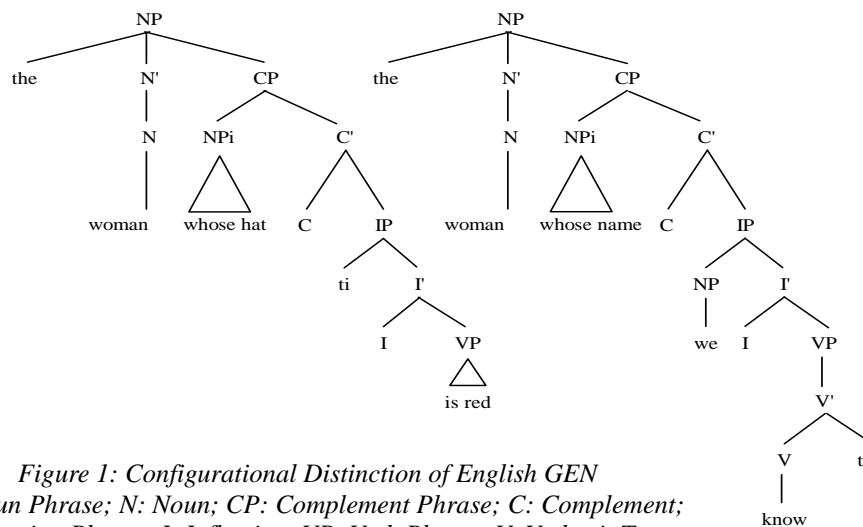

Figure 1: Configurational Distinction of English GEN

NP: Noun Phrase; N: Noun; CP: Complement Phrase; C: Complement;  
IP: Inflection Phrase; I: Inflection; VP: Verb Phrase; V: Verb; ti: Trace

The configurational distinction of English GEN according to the phrase structure position of the possessed NP is exemplified by the two tree-diagrams displayed above (see Figure 1). If we count the nodes intervening between the gap and the head of the relative clause, we can see that the structural distance between the gap and the head is greater in [whose + NP (DO)] than in [whose + NP (SU)]. This is because the number of nodes between the gap (trace) and the head (woman) is 3 (IP, C', and CP) in [whose + NP (SU)] and 6 (V', VP, I', IP, C', and CP) in [whose + NP (DO)]. Therefore, we can assume that the transformation distance in relativization is longer in the unit of [whose + NP (SU)] than in that of [whose + NP (DO)], which implies that in relativizing<sup>(5)</sup>, [whose + NP (SU)] may be more difficult for the participants than [whose + NP (DO)]. In an attempt to test the validity of this configurational account on the difference in the difficulty of [whose + NP], Ito (1995) carried out a research project in order to examine if there is another Noun Phrase Accessibility Hierarchy in GENs, [whose + NP (SU)] > [whose + NP (DO)] > [whose + NP (IO)] > [whose + NP (OPREP)] > [whose + NP (OCOMP)]. The results indicated that there may be another hierarchy in GENs and the each GEN's difficulty level can be explained in terms of the role of the unit of [whose + NP]. In other words, although a certain relative clause is GEN, its difficulty may change according to the type of NP. However, Ito's study could not directly explain the supremacy of the configurational approach over the grammatical relation approach in interpreting the second language learners' data because he did not provide any evidence to prove

that the former approach is more useful than the latter one. In other words, he only provided indirect evidence to show that the difficulty of GENs changes in direct proportion to the order in the original Noun Phrase Accessibility Hierarchy. As a consequence, Ito should consider that since different types of GENs differ in terms of their difficulty levels, their difficulty may be related to the difference in the location of the NP. Thus, his argument can be interpreted based on grammatical relation and not configurational account.

Thus far, there are two different interpretations of the Noun Phrase Accessibility Hierarchy. The question that arises is which of the two is better.

In the first attempt to clarify the effects of configurational distinction on English relativization, Hamilton (1995) measured second language learners' sensitivity in English relativization in terms of the configurational distinction associated with argument prepositional phrases (PPs) versus adjunct PPs and the difference in grammatical relation between the IO and the OPREP. If we attempt to find the configurations that are constant throughout but are clearly different in terms of the grammatical relation or vice versa, the similarity in terms of word order and distinction in terms of the configuration between the IO and the OPREP can be used in order to empirically examine the language sensitivity to configurational distinction or the grammatical relation.

In English, both the IO and the OPREP are PPs. In addition, the IO is always an argument PP, while the OPREP can be either an argument or adjunct PP. With regard to the phrase structure, the adjunct PP has a tendency to be placed higher than the argument PP (Radford, 1988: 237–239). Pinker (1989: 40–41) argues that the argument status of an NP is indicated by it being existentially entailed by the verb or being obligatory in the surface structure. Moreover, IOs are identified by their ability to undergo dative shift, which most OPREPs are unable to do.

In sentence combining tasks, in Hamilton (1995) investigated whether his participants performed differently on the same OPREPs if the configuration was different. His study indicated that second language learners showed sensitivity to configurational distinction in English relative clause production. Since a statistically significant level was not found, the results only showed that the configurational version may be more promising than the account based on the grammatical relation. It is thus reasonable to state that Hamilton's study has made a significant contribution in determining the theoretical basis of the Noun Phrase Accessibility Hierarchy in SLA research. However, there are several drawbacks in his research design. One of the most serious drawbacks was the sampling of participants. The investigation consisted of three comparisons of the participants' test performances in sentence combining tasks. In the first investigation, participants were sampled from the University of South Carolina to examine if there was any statistical difference in the participants' test scores in a pair of configurational differences: argument (OPREP) versus adjunct (OPREP). In the second investigation, participants were gathered from the University of Alabama and the University of North Carolina (Charlotte) to determine if there was any statistical difference in the participants' test scores in a pair of grammatical relation difference: argument (IO) versus argument (OPREP). Finally, in the third investigation, the participants were gathered from the three universities mentioned above to test the effects of thematic distinction on the difficulty of relative clauses: adjunct (OPREP, beneficiary goal) versus adjunct (OPREP, goal). The third investigation was conducted to ensure that the thematic value never affected the difficulty of relative clauses, which provided essential evidence for interpreting the results of the second investigation because Hamilton could not construct the test items with the same thematic values. Therefore, he attempted to conclude that grammatical relation does not affect their accuracy in English relativization if thematic distinction does not have any effect on the participants' accuracy in relativization. Since the purpose of Hamilton's study was basically to test the superiority of configuration to the grammatical relation, the author believes that the same participants should have been gathered if he intended to show that the same English learners were sensitive to configurational distinction but not to the distinction based on the grammatical relation. Therefore, at this point, his study should be replicated in a more controlled condition.

Moreover, in mainstream SLA research, the Noun Phrase Accessibility Hierarchy has been accepted as a valid predictor of the difficulty of relative clauses based on the grammatical relation because the order in the hierarchy has conformed to the linguistic data from second language learners not only in production but also in comprehension. Therefore, we should also examine whether or not second language learners show sensitivity to configurational distinction in either production or comprehension tasks.

Two experimental studies are reported in this paper. The first is the replication of Hamilton's study in a more controlled condition. By employing a grammaticality judgment test, the second study examines if the second language learners are more sensitive to configurational distinction than the distinction of the grammatical relation at the level of linguistic comprehension.

## EXPERIMENTS

### *The First Experiment*

#### *Purpose*

The purpose of the first Experiment was to replicate and expand the findings of Hamilton (1995). In this investigation, Japanese learners of English as a foreign language (EFL) in a formal instructional setting were sampled and their performance in (1) configurational distinction, (2) distinction of the grammatical relation, and (3) thematic distinction were examined in terms of their test scores in sentence combining tasks. The participants were expected to be more sensitive to configurational distinction in English relativization. Based on the discussion thus far, the following hypotheses, which are originally from Hamilton (1995), were developed for the present study.

#### *Hypotheses*

Hypothesis 1: The performance of Japanese EFL learners will be significantly different for the relativization of NPs in argument versus NPs in adjunct if other factors are constant.

Hypothesis 2: The performance of Japanese EFL learners will not be significantly different for the relativization of NPs in IO versus NPs in OPREP if other factors are constant.

Hypothesis 3: The performance of Japanese EFL learners will not be significantly different for the relativization of NPs in beneficiary goal versus NPs in goal object if other factors are constant.

#### *Analysis*

The three hypotheses were evaluated by performing a one-way analysis of variance (ANOVA) with repeated measures in order to examine the overall difference of the test scores. Then, using Ryan's method, a multiple comparison test was conducted on three pairs of six testlets to clarify the location of the significant difference<sup>(6)</sup>.

#### *Participants*

The participants in this study ( $N = 116$ ) were freshmen enrolled in English reading comprehension classes at a private university, Japan. All of them were native speakers of Japanese. The average age was 18 years and 6 months. Their ages varied from 18 to 20 years. All had completed at least six years of formal English courses prior to this study. The male:female ratio was 2:1. In general, Japanese students are required to learn the usage of English relative clauses in junior high school and high school.

#### *Materials*

The 30-item sentence combining test in Hamilton (1995: 113–114) (Appendix I) was administered. This test consists of six parts (A, B, C, D, E, and F), and each part has 5 items. The values of the configuration, grammatical relation, and theme are as follows: [(A) argument/OPREP/location], [(B) adjunct/OPREP/location], [(C) argument/IO/beneficiary goal], [(D) argument/OPREP/goal], [(E) adjunct/OPREP/beneficiary goal], and [(F) adjunct/OPREP/goal]<sup>(7)</sup>. All the intended relative clause sentences are right-embedded because the difference in the placement of the relative clause in each sentence is one of the influential factors of the difficulty of relative clauses (Kawauchi, 1988).

#### *Test Item Classification*

Example: configurational distinction

Type A: argument/OPREP/location

We left the table. I placed the money on the table.

Type B: adjunct/OPREP/location

She drove the bus. I did my homework on the bus.

In order to clarify the configurational distinction between argument and adjunct, the author has added some explanations describing the test items in A and B. The tree diagrams displayed below (Figure 2) show that a

reanalysis, which should be carried out in V', can be conducted in the case of argument but not in the case of adjunct. The argument "on the table" is one of the components of V' but the adjunct "on the table" is attached to the VP. In other words, the adjunct "on the bus" is generated from the VP "did my homework." Therefore, the argument and adjunct can be said to differ in terms of configuration.

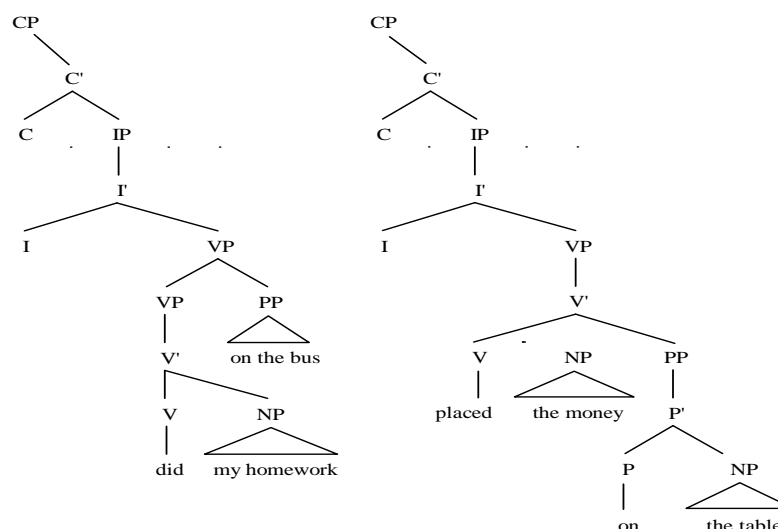

Figure 2: Configurational Structure  
 CP: Complement Phrase; C: Complement; IP: Inflection Phrase; I: Inflection;  
 VP: Verb Phrase; V: Verb; PP: Prepositional Phrase; P: Preposition;  
 NP: Noun Phrase

### Procedures <sup>(8)</sup>

The sentence combining test was administered to the participants in a warm-up period in the author's English reading comprehension classes. The participants were given oral and written instructions in Japanese, and they were given 30 minutes to complete the test. Although the participants were not informed of the purpose of the investigation, they were encouraged to answer as many questions as possible. The test papers were scored by the author. The scoring was based on whether the participants had used an appropriate relative pronoun in order to combine the two sentences based on the criterion established in Celce-Murcia and Larsen-Freeman (1983) and Quirk, Greenbaum, Leech, and Svartvik (1985). The author ignored local errors such as spelling, agreement, articles, third-person singular present verb markers, plurality, and so forth as long as he could understand the meaning of the participants' answers.

### Reliability Estimation

The Spearman-Brown split-half method was performed in order to measure the reliability coefficient of the relative clause test. The split-half method can be used when each test item is considered to be independent and can also contribute to the total test score independently (Brown, 1996, pp. 194-196). Since each item is clearly independent in this relative clause test, this method is a permissible estimating procedure for the test. In this method, the author scored the odd and even numbered items separately and first, examined the Pearson's product-moment correlation ( $r$ ). Each value was then corrected for the reduction to half-test length using the Spearman-Brown prophecy formula ( $r_{xx'} = 2r/(1+r)$ ).

### Test Item Validation

In order to calculate the contribution of each item to the total test score, this correlation was estimated. Moreover, the calculated value of this correlation was first changed by the Fisher z transformation in order to average the mean score of the correlation coefficient of each item. Then, the estimated value was adjusted to its corresponding Pearson's product-moment correlation coefficient value. The reason why the estimated values of point-biserial correlations were transformed by the Fisher z format is that, in this type of test, it is necessary to convert correlation coefficients from an ordinal scale to an interval one. The value of this mean score of the point-biserial correlation

( $r_{phi}$ ) will be used as an indicator of the validity of the relative clause test.

## RESULTS AND DISCUSSION

The reliability coefficient of the 30-item relative clause test by the *Spearman-Brown split-half method* was 0.84. In addition, the validity coefficient was 0.26. Since the reliability coefficient was high and the validity coefficient was acceptable (Brown, 1996), the test scores were used for statistical analyses without any modifications.

Table 1: Descriptive statistics ( $N=116$ )

Test section	Grammatical Relation	Configuration	Thematic Role	Mean	Full Score	SD
A	OPREP	argument	location	5.00	3.19	1.35
B	OPREP	adjunct	location	5.00	2.16	0.82
C	IO	argument	Beneficiary-Goal	5.00	3.58	0.98
D	OPREP	argument	Goal	5.00	3.37	1.13
E	OPREP	adjunct	Beneficiary-Goal	5.00	2.44	1.18
F	OPREP	adjunct	Goal	5.00	2.31	1.25

Table 1 shows the mean scores and standard deviations in each section of the sentence combining test. In order to examine the difference between the mean scores in each pair of the configurational distinction groups (A and B), grammatical relation distinction group (C and D), and thematic distinction group (E and F), one-way ANOVA with repeated measures was first performed.

Table 2 indicates an overall significant difference ( $F = 87.14$ ,  $p < 0.01$ ). Multiple comparison tests using Ryan's method were conducted on the three pairs of six testlets (A and B, C and D, and E and F) in order to address the three hypotheses. The results of the multiple comparison tests were discussed by examining each of the three hypotheses given below.

Table 2: Analysis of Variance (ANOVA) ( $N=116$ )

Source	SS	df	MS	F-ratio	p level
Participant	449.13	115	3.91		
Distinction	331.16	5	66.23	87.14	<0.01
Error	438.67	575	0.76		
Total	1218.96	695			

GR: grammatical relation; TIC: test item characteristic

**Hypothesis 1: The performance of Japanese EFL learners will be significantly different for the relativization of NPs in argument versus NPs in adjunct if other factors are constant.**

The result of the multiple comparison tests on the mean scores in the configurational distinction group (A and B) revealed that there was a statistically significant difference between the mean scores (A:  $M = 3.19$ ; B:  $M = 2.16$ ), which implied that the Japanese EFL learners performed significantly better in the argument condition than in the adjunct one ( $t = 8.86$ ,  $p < 0.01$ ). Therefore, the first hypothesis was supported. It can be concluded that the Japanese EFL learners were sensitive to the configurational distinction in English relativization.

**Hypothesis 2: The performance of Japanese EFL learners will not be significantly different on the relativization of NPs in IO versus those in OPREP if other factors are constant.**

Another multiple comparison test on the mean scores in the grammatical relation group (C:  $M = 3.58$ ; D:  $M = 3.37$ ) shows that there was no statistically significant difference between the mean scores. This implies that the Japanese EFL learners performed equally on the two pairs without being influenced by the difference in the grammatical relation ( $t = 1.80$ ,  $n.s.$ ). Therefore, the second hypothesis was supported.

**Hypothesis 3: The performance of Japanese EFL learners will not be significantly different for the relativization of NPs in beneficiary goal versus NPs in goal object if other factors are constant.**

Another multiple comparison test on the mean scores in the thematic distinction group (E:  $M = 2.44$ ; F:  $M = 2.31$ ) revealed that the performance of the Japanese EFL learners did not differ ( $t = 1.13$ , *n.s.*). This implied that the third hypothesis was also supported<sup>(9)</sup>.

The results may suggest that Japanese EFL learners are sensitive to configurational distinctions in various English relativizations. However, they are not sensitive to grammatical relation and thematic distinctions<sup>(10)</sup>. These results implied that the participants are sensitive “in the same way to hierarchically relevant distinctions in either grammatical relations or thematic roles” (Hamilton, 1995, p. 110). This also indicated that the data pertaining to second language learners’ data should be interpreted based on configuration rather than the grammatical relation and the thematic role. In other words, configurational distinction is more economical than the other two because the configurational approach elegantly illustrates the changes in the scores of relative clause production. Although many SLA researchers do not deny the effectiveness of the Noun Phrase Accessibility Hierarchy as a predictor of the difficulty of various types of relative clauses in both comprehension and production, we perhaps consider that the difficulty of relative clauses should be explained in terms of configurational differences rather than grammatical relations. However, the hierarchy is the hypothesis that was initially put forward as an implicational universal grammar. The results of this study should be interpreted as a counterargument not for the theoretical foundation of the hierarchy itself but for the attitudes of SLA researchers. These researchers simply hastened to use the implicational grammar hypothesis for interpreting SLA data and were easily convinced that grammatical relation is the main factor in determining the difficulty of English relative clauses without examining the suitability of the theoretical basis of the hierarchy in the SLA context.

### ***The Second Experiment***

#### ***Purpose***

The first purpose of this study was to evaluate the validity of the hypothesis proposed by Hamilton (1995) from a different perspective. In this investigation, Japanese EFL learners were sampled and their grammaticality judgments on the distinction of (1) grammatical relation and (2) configuration were examined. Since the validity of Hamilton’s hypothesis was ascertained in linguistic production tasks such as sentence combining tests in Experiment I, the participants were expected to be more sensitive to configurational distinction than to grammatical relation even in linguistic comprehension tasks such as grammaticality judgment tests. The present study employed the difference between (1) IO and OPREP as the distinction of grammatical relation and (2) argument and adjunct as that of configuration. The difference between pied-piping (PDPG) and preposition stranding (PPSG) is used in constructing the grammaticality judgment test. In “Government and Binding Theory,” as mentioned before, the reanalysis that should be carried out in V’ can be conducted in the case of argument but not in the case of the adjunct PP. Thus, PPSG is grammatically acceptable in the argument PP but not in the adjunct PP because reanalysis cannot be carried out in V’ in the case of adjunct. On the other hand, PDPG is grammatically acceptable in either argument or adjunct PP, which implies that the difference between PPSG and PDPG reflects the configurational difference between argument and adjunct (Mazurkewich, 1984; Bardovi-Harlig, 1987; White, 1987; Goodluck & Stojanovic, 1996; Park & Lee, 2001). Therefore, when other factors are constant, second language learners are expected to show different judgments in different configurational conditions but the same judgment in different grammatical relation conditions. In other words, this study will investigate whether second language learners show different grammaticality judgment on the acceptability of PPSG and PDPG if the configuration in the PP changes.

The author developed the following hypotheses based on the above discussion:

#### ***Hypotheses***

Hypothesis 1: The grammaticality judgment of Japanese EFL learners will not be sensitive to the distinction of grammatical relation. Thus, their performance will not be significantly different for the grammaticality judgment of IO versus that of OPREP.

Hypothesis 2: The grammaticality judgment of Japanese EFL learners will be sensitive to the configurational distinction. Thus, their performance will be significantly different for the grammaticality judgment of NPs in argument PPs than in adjunct PPs.

Hypothesis 3: Japanese EFL learners will show a higher grammatical acceptability of sentences with NPs in

argument PPs than in adjunct PPs.

Hypothesis 4: Japanese EFL learners will show a higher grammatical acceptability of sentences with NPs in PPSG in argument PPs than in adjunct PPs.

Hypotheses 1 and 2 are developed in order to investigate whether grammatical relations or configurational distinction determines the participants' performance in grammaticality judgment. Hypothesis 3 is proposed because in argument PP, both PPSG and PDPG are grammatically acceptable; it can therefore be expected that more sentences will be judged correct in argument condition than in the adjunct one where PPSG is not permissible. Hypothesis 4 is constructed to interpret the result of hypothesis 3. Since both PPSG and PDPG are grammatically acceptable to the same extent in the argument condition, it is predicted that the participants will show a higher grammatical acceptability to PPSG in the argument condition than in the adjunct one where PPSG is not grammatically acceptable. If hypothesis 3 is supported, then the author will examine whether or not hypothesis 4 can be confirmed.

### ***Analysis***

The four hypotheses were evaluated by performing two two-way ANOVAs with repeated measures in order to examine the overall difference of test scores. A multiple comparison test using Ryan's method was conducted to clarify the location of any significant differences. The details of factorial design will be described when discussing the results.

### ***Participants***

The participants in this study ( $N = 77$ ) were sophomores enrolled in English reading comprehension classes at a private university, Japan. All of them were native speakers of Japanese. The average age was 20 years and 3 months. Their ages varied from 19 to 24 years. All of them had completed at least 6 years of formal English prior to the present investigation. The male: female ratio was 1:1. The sample was homogeneous with regard to nationality and language. In general, Japanese students are required to learn the usage of relative clauses in junior high school and high school. Therefore, it was concluded that the participants may have basic skills in comprehension and production of English relative clauses.

### ***Materials***

The 16-item grammaticality judgment test was constructed using the sentences provided in the sentence combining task prepared by Hamilton (1995) (Appendix II). This grammaticality judgment test consists of three parts [(A) (4 items)], [(B) (4 items)], and [(C) (8 items)]. The values of their grammatical relation and configuration are as follows: [(A) OPREP/argument], [(B) IO/argument], and [(C) OPREP/adjunct]. The difference between (A) and (B) is the value of the grammatical relation. In part A, 2 items present PPSG and the remaining 2 items PDPG. In part B, 2 items present PDPG and the remaining 2, PDPG. In part C, 4 items present PPSG and the other 4, PDPG. All the relative clauses are right-embedded because the difference in the location of the relative clause in each sentence is one of the influencing factors in the difficulty of relative clauses in comprehension and production (Sadighi, 1994; Aarts & Schils, 1995).

### ***Native control***

The author administered the grammaticality judgment test to a group of native English speakers ( $N = 10$ ). All the participants were teaching English at tertiary schools in Japan. None of them accepted the sentences in PS in the adjunct condition.

### ***Procedures***

The grammaticality judgment test was administered to the participants in the author's English reading comprehension classes. They were given oral and written instructions in Japanese. They were asked to put an 'O' mark on all the sentences that they judged to be correct. Although the participants were not informed about the purpose of the test, they were encouraged to take the test seriously. The author scored the tests and only counted the test items that indicated each participant's acceptance in each section of the test. In addition, the reliability estimation and test item validation was carried out using the same procedures shown in Experiment I.

## **RESULTS AND DISCUSSION**

The reliability coefficient of the 16-item grammaticality judgment test obtained by using the Spearman-Brown split-half method was 0.75. In addition, the validity coefficient was 0.21. Since the reliability coefficient was moderate to

relatively high and the validity coefficient was acceptable, the test scores were used for statistical analyses without any corrections for attenuation. Table 3 presents the mean scores of and standard deviations in each test item characteristic (PPSG and PDPG) in tests A (argument OPREP) and B (argument IO). The distinction between tests A and B is based on the distinction of grammatical relation.

Table 3: Descriptive statistics ( $N=77$ )

	Grammatical Relation	Configuration	Test item Characteristic	Mean	Full Score	SD
Test A	IO	argument	PP	1.08	2.00	0.64
Test A	IO	argument	PS	0.97	2.00	0.70
Test B	OPREP	argument	PP	1.07	2.00	0.67
Test B	OPREP	argument	PS	1.08	2.00	0.73

TIC test item characteristic

In order to determine whether there is a statistically significant difference between the mean scores, a two-way ANOVA was performed. The present inquiry employed a  $2 \times 2$  factorial design, with the difference between grammatical relation (IO and OPREP) and test item characteristic (PPSG and PDPG).

**Hypothesis 1: The grammaticality judgment of Japanese EFL learners will not be sensitive to the distinction of grammatical relation. Thus, their performance will not be significantly different for the grammaticality judgment of IO versus that of OPREP.**

Table 4 describes the results of the two-way ANOVA investigating the effects of the two factors: (1) the difference between the grammatical relation (IO or OPREP) and (2) test item characteristic (PDPG or PPCG) on the participants' performances in the grammaticality judgment test.

Table 4: Analysis of Variance (ANOVA) ( $N=77$ )

Source	SS	df	MS	F-ratio	p level
Participant	20.01	76	0.26		
A: GR	0.16	1	0.16	0.33	0.56
Error [AS]	36.49	76	0.48		
B: TIC	0.16	1	0.16	0.18	0.67
Error [BS]	67.59	76	0.89		
A×B	0.26	1	0.26	0.93	0.34
Error [ABS]	21.4	76	0.25		
Total	146.07	307			

GR: grammatical relation; TIC: test item characteristic

The results indicated that neither of the two factors is statistically significant (grammatical relation:  $F = 0.33$ ,  $p = 0.56$ ; test item characteristic:  $F = 0.18$ ,  $p = 0.67$ ), which implies that Japanese EFL learners were neither sensitive to the grammatical relation nor to the test item characteristic when they attempted to judge the grammaticality of the sentences. The interaction between the two factors is not significant ( $F = 0.93$ ,  $p = 0.34$ ). In order to confirm the fact that there was no statistically significant effect of each factor on the grammaticality judgment, multiple comparison tests were also conducted using Ryan's method. First, the multiple comparison test on the distinction of grammatical relation revealed that there was no statistically significant difference between IO ( $M = 1.03$ ) and OPREP ( $M = 1.08$ ) ( $t = 0.58$ ,  $p = 0.56$ ). In addition, another multiple comparison test on the test item characteristic also indicated that there was no statistically significant difference between PDPG ( $M = 1.08$ ) and PPCG ( $M = 1.03$ ) ( $t = 0.43$ ,  $p = 0.67$ ). The results confirmed that the distinction of the grammatical relation and that of the test item characteristic did not affect the participants' grammaticality judgment. Therefore, hypothesis 1 was supported.

**Hypothesis 2: The grammaticality judgment of Japanese EFL learners will be sensitive to configurational**

*distinction. Thus, their performance will be significantly different for the grammaticality judgment of NPs in argument PPs versus adjunct PPs.*

In the examination of hypothesis 1, the equivalency of tests A and B was ascertained because the distinction of the grammatical relation and the difference of the test item characteristics were shown not to affect the grammaticality judgment of Japanese EFL learners. Table 3 describes the mean scores of and standard deviation of each test item characteristic (PPSG and PDPG) in the combination of tests A (argument OPREP) and B (argument IO) and in test C (adjunct OPREP).

Table 5: Descriptive Statistics ( $N=77$ )

	Grammatical Relation	Configuration	Test item characteristic	Mean	Full Score	<i>SD</i>
Test A&B	OPREP & IO	argument	PP	2.15	4.00	1.04
			PS	2.05	4.00	1.17
Test C	OPREP	argument	PP	2.03	4.00	1.07
			PS	1.81	4.00	1.16

This study also employed a  $2 \times 2$  factorial design, with configurational distinction (argument and adjunct) and test item characteristic (PPSG and PDPG) as within subject factors. Table 4 shows the results of the two-way ANOVA examining the effects of (1) configurational distinction (argument or adjunct) and (2) test item characteristic (PPSG and PDPG) on the participants' performances in the grammaticality judgment test.

Table 6: Analysis of Variance (ANOVA) ( $N=77$ )

Source	<i>SS</i>	<i>df</i>	<i>MS</i>	<i>F</i> -ratio	<i>p</i> level
Participant	40.75	76	0.54		
A: Configuration	2.37	1	2.37	6.41	<0.05
Error [AS]	28.38	76	0.37		
B: TIC	1.43	1	1.43	0.51	0.48
Error [BS]	213.32	76	2.81		
A×B	0.55	1	0.55	0.43	0.52
Error [ABS]	98.2	76	1.29		
Total	385.00	307			

TIC: test item characteristic

The results indicated that the effect of configuration was significant ( $F = 6.41$ ,  $p < 0.05$ ) but the effect of test item characteristic was not significant ( $F = 0.51$ ,  $p = 0.48$ ), which implies that Japanese EFL learners are sensitive to the configurational distinction but not to the difference in the test items. In other words, the participants have a tendency to accept more sentences in the argument condition than in the adjunct one. The interaction between the two factors is not significant ( $F = 0.43$ ,  $p = 0.52$ ). At this point, we can argue that the participants are sensitive only to the configurational distinction. Therefore, hypothesis 2 was supported.

***Hypothesis 3: Japanese EFL learners will show a higher grammatical acceptability of sentences with NPs in argument PPs than those in adjunct PPs.***

In order to examine hypothesis 3, we conducted multiple comparison tests using Ryan's method on each of the two factors. The multiple comparison test on the configurational distinction revealed that there was a statistically significant difference between argument ( $M = 2.10$ ) and adjunct ( $M = 1.92$ ) ( $t = 2.52$ ,  $p < 0.01$ ). This result indicates that the participants showed significant grammatical acceptability in the argument condition than in the adjunct one. Therefore, hypothesis 3 was supported.

***Hypothesis 4: Japanese EFL learners will show a higher grammatical acceptability of sentences with NPs in PPSG in argument PPs than in adjunct PPs.***

In order to examine hypothesis 4, another multiple comparison test was conducted on the test item characteristic. The result showed that there is no statistically significant difference between PDPG ( $M = 2.08$ ) and PPSG ( $M = 1.94$ ) ( $t = 0.71$ ,  $p = 0.48$ ). The results indicated that Japanese EFL learners did not accept PPSG in the argument condition more than they did in the adjunct condition. There was also no statistically significant difference between their grammaticality acceptability in PDPG and PPSG. Therefore, hypothesis 4 was not supported.

In summary, although the participants accepted more sentences in the argument condition than in the adjunct one, they did not show a higher grammatical acceptability of sentences with NPs in PPSG in argument PPs than in adjunct PPs. Therefore, we cannot strongly claim that Japanese EFL learners are always sensitive to configurational distinction in grammaticality judgment.

## CONCLUSION

This paper determined the basis of the Noun Phrase Accessibility Hierarchy in SLA by conducting two experiments. Experiment I investigated the superiority of the configurational distinction to the distinction of the grammatical relation in accounting for the degree of difficulty of relative clauses in sentence combining among Japanese EFL learners. The participants consisted of 116 Japanese university students studying English as a foreign language. The research findings lead us to consider that second language learners of English are more sensitive to configurational distinction than to grammatical relation and thematic distinctions when they produce relative clauses in English. Experiment II investigated the effects of configurational distinction and grammatical relation with regard to Japanese EFL learners. The participants consisted of 77 Japanese university students who were studying English as a foreign language. The research findings revealed that the participants were affected by the configurational distinction when they judged the grammaticality of the presented sentences that had relative clauses but were not sensitive to the distinction of the grammatical relation. However, the participants did not accept PPSG in the argument condition more than in the adjunct one. Therefore, we cannot strongly claim that they were always affected by the configurational distinction in linguistic comprehension. However, it is justifiable to say that the difficulty of relative clauses should be attributed to the configurational difference rather than the difference of grammatical relation in the relative clause structure. Thus, the results of these two experiments indicate the supremacy of a configurational account over a grammatical relation one with regard to the Noun Phrase Accessibility Hierarchy in SLA.

It should be acknowledged that one of the limitations of this investigation is that it focused on the participants' language data. Thus, the results can be generalized only for Japanese students. However, many previous studies conducted on participants with various language backgrounds, ages, and educational backgrounds. As a result, findings have often been difficult to interpret because they can only be generalized to the single situation in which the data was collected. In addition, the results of this study may be influenced by certain internal and external factors:

1. The nature of the reliability of measures in general and
2. The restrictions on the range of abilities that were sampled in the investigation.

In general, tests are not simply reliable and valid but they can be reliable and valid for specific types of students and specific ranges of abilities. In this regard, this research should be replicated with a larger sample of participants from a considerably wider population.

The author is interested in learning about the participants' cognitive processes that are engaged in solving the types A and B in the sentence combining test. If we are able to determine the difference in the cognitive processes used in taking tests A and B, we can better understand the reason why the participants were able to provide more correct answers in the argument condition than in the adjunct one. This issue should be explored in future research.

## NOTES

*\* This article is a theoretical and experimental synthesis of the author's research projects from 2001 to 2009.*

*(1) Throughout this paper, 'configurational structure' refers to 'syntactic structure.'*

*(2) For a historical overview of the Noun Phrase Accessibility Hierarchy in the SLA context, see Ohba (1995). For a basic distinction between rational grammar and generative grammar in terms of the assumptions in research, see Matsunami, Ikegami, and Imai (1983).*

*(3) For the same type of account from the perspectives of maximal projections, see Berent (1994).*

*(4) Hamilton (1995) argues that Gass (1980) constitutes an appeal to the identity of configuration.*

*(5) On the other hand, in generative grammar, the degree of difficulty has not been treated as a main concern because the research focus is always on the possibility of transformation itself.*

- (6) Some statisticians and psychologists consider the use of Ryan's method as a multiple comparison procedure to be problematic. However, the author decided to employ Ryan's methods based on constructive comments from Dr. Fumiko Matsuda, Professor, Department of Educational Psychology, Faculty of Education, Hiroshima University, Japan.
- (7) The test items in E and F are used to investigate the effects of grammatical relation, which have different thematic values, on learners' interlanguage performance. For further discussion of thematic values, see Jakendoff (1994).
- (8) Since we do not have anything that resembles an external criterion relative clause test, we cannot investigate the concurrent validity of the relative clause test. Therefore, the author focused on the discrimination ability of the relative clause test and attempted to internally examine its validity. For further discussion on the relationship between the discrimination ability of test items and test validity, see Brown (1996).
- (9) The mean frequency of preposition omission for C versus D as well as for E versus F was not significantly different for paired *t* tests, which suggests that Japanese EFL learners approach these test sentences in the same way as far as factors related to preposition omission are concerned.
- (10) It is possible that the thematic relationship between the NP and the verb may have made the participants perform better in the argument condition than in the adjunct one. However, this issue was ignored in the present study. Further study should be conducted in this area.

#### **APPENDIX A: The SENTENCE COMBINING TEST**

##### **Type A: [argument/OPREP/location]**

- (1) We left the table. I placed the money on the table.
- (2) My friend mailed the letter. I put a stamp on the letter.
- (3) The student wanted the paper. The teacher put a grade on the paper.
- (4) This is the desk. I laid my pen on the desk.
- (5) This is the chair. She set her coat on the chair.

##### **Type B: [adjunct/OPREP/location]**

- (6) She drove the bus. I did my homework on the bus.
- (7) My wife found the bug. I dropped a book on the bug.
- (8) We found the train. I lost my bag on the train.
- (9) This is the sofa. The boy took a nap on the sofa.
- (10) This is the highway. He drove his car on the highway.

##### **Type C: [argument/IO/beneficiary goal]**

- (11) Everyone likes the teacher. I gave a present to the teacher.
- (12) We watched the student. The teacher handed the paper to the student.
- (13) This is the boy. I passed the ball to the boy.
- (14) I know the woman. He offered the money to the woman.
- (15) This is the child. I told a story to the child.

##### **Type D: [argument/OPREP/goal]**

- (16) Everyone liked the store. They took me to the store.
- (17) She left the party. I took my friends to the party.
- (18) We found the beach. She sent the children to the beach.
- (19) This is the house. The girl brought her bags to the house.
- (20) This is the country. I mailed a postcard to the country.

##### **Type E: [adjunct/OPREP/beneficiary goal]**

- (21) You know the woman. I cooked a cake for the woman.
- (22) This is the man. I bought a book for the man.
- (23) She brought the child. He made a toy for the child.
- (24) This is the boy. The girl sang a song for the boy.
- (25) Everyone liked the teacher. She brought flowers for the teacher.

##### **Type F: [adjunct/OPREP/goal]**

- (26) I remember the trip. My son took a pillow for the trip.
- (27) I watched the game. She brought a camera for the game.
- (28) This is the party. I baked cookies for the party.
- (29) This is the meeting. He wrote a speech for the meeting.
- (30) No one liked the class. I read a book for the class.

#### **APPENDIX B: THE GRAMMATICALITY JUDGMENT TEST**

##### **Argument OPREP**

- (1) We left the table, which I placed the money on.
- (2) My friend mailed the letter on which I put a stamp.

- (3) The student wanted the paper, which the teacher put a grade on.
- (4) This is the desk on which I laid my pen.

***Argument IO***

- (5) Everyone likes the teacher whom I gave a present to.
- (6) We watched the student to whom the teacher handed the paper.
- (7) This is the boy whom I passed the ball to.
- (8) I know the woman to whom he offered the money.

***Adjunct OPREP***

- (9) She drove the bus which I did my homework on.
- (10) My wife found the bug on which I dropped a book.
- (11) You know the woman for whom I baked a cake.
- (12) She likes the boy whom I bought a car for.
- (13) This is the highway which he drove his car on.
- (14) This is the sofa on which the boy took a nap.
- (15) She brought the child for whom she made a toy.
- (16) This is the man whom I bought a book for.

**VERIFICATION OF TASK-INDUCED INVOLVEMENT HYPOTHESIS THROUGH  
LANGUAGE MODALITY IN INCIDENTAL VOCABULARY LEARNING  
(READING VS. LISTENING MODALITY)**

**Afsane Ravandpour**

*Payamnur University, Bojnourd Branch & Islamic Azad University, Jajarm Branch, Iran  
Email: afsane.ravandpour2009@yahoo.com*

**ABSTRACT**

Laufer and Hulstijn (2001) proposed “the Involvement Load Hypothesis for second language (L2) vocabulary learning, which was a motivational-cognitive construct of involvement, consisting of three basic components: *need*, *search*, and *evaluation*” (p.14). Tasks that induce a higher involvement load have proved more effective in terms of vocabulary retention as compared with tasks with a lower involvement load. However, it is not much clear whether task involvement load is a function of language modality; does it have different representation and load if modality platform changes from reading to listening? In a bid to address this question the present study aimed at investigating “The effect of task-induced involvement on incidental vocabulary learning through listening and reading modality-based activities among Iranian Intermediate EFL Learners.” 125 female English as a foreign language (EFL) students in the form of four experimental and one control groups formed the participants of this study, who were exposed to reading- and listening-oriented context of task presentation to compare the effects of six tasks with different involvement loads (tasks with high involvement load like writing, unscrambling, and text-reconstruction; tasks with low involvement load like fill in blanks, matching and multiple-choice) and to see which skill is more useful for vocabulary retention. The control group (N=25) received vocabulary instruction through conventional methods while the experimental groups (N=100, in every group 25 students) were taught using the target tasks through two different modes of presentation; reading and listening with different involvement loads. Based on a quasi-experimental design, respective statistical analyses including t-tests and ANOVA were run. All experimental groups outperformed the control; task-induced involvement instruction was more effective in improving learners’ vocabulary retention. However, the reading-based instruction with high involvement load tasks outperformed the listening-based one; an indication of the modality-dependent nature of both task presentation and involvement load hypothesis.

**KEY TERMS:** Incidental Vocabulary Learning, Task-induced involvement, and Gloss.

**INTRODUCTION**

English is becoming more and more important for international communicative purposes, such that in Iran, it has become such a necessity that has been one of the most important subjects in secondary and high schools as well as in institutions of higher education. Contrary to this prominence, most of us as both a language teacher and language learner can appreciate the feeling of frustration when conversation fails because we do not have enough words or when looking at a word and feeling that we have seen it many times before, but we cannot remember its meaning. To compensate for such an instructional failure, some of the teachers employ the audio-visual method, and others use the task oriented approach, etc, but it should be accepted that vocabulary learning cannot be confined to just classroom settings. Therefore, how to help students enlarge their vocabulary size and ensure better retention when they come across new words incidentally should be considered by language teachers and researchers. Although teachers know importance of vocabulary learning in English teaching, it is impossible for them to spend most of the class time on vocabulary learning alone. Moreover, students themselves are not interested in intentional vocabulary learning in which they are requested to do some exercises that focus on vocabulary itself. So, most EFL learners prefer incidental vocabulary learning in which their attention is focused on some other features. Based on this approach, they learn vocabulary through reading texts, working on reading comprehension tasks or doing other activities that are not directly related to vocabulary learning itself. Listening process, similar to reading, may be taken another platform for incidental vocabulary learning. A growing number of studies in recent years (Hulstijn, 1992, Rott & Williams, 2003; Rott, 2005) have examined the effectiveness of several techniques to promote incidental vocabulary learning through reading, such as glossing (i.e. providing the meaning of words in the margins of a text) since it is held that texts provide learners with a rich input where lexical items are highly contextualized.

The most common area for text-based instruction of vocabulary concerns that of incidental vocabulary. “Incidental vocabulary learning means learning without the intention to learn, or the learning of one thing (e.g., vocabulary) when the learner’s main concern is with something else (e.g., communication). In contrast, intentional vocabulary learning refers to the learning of vocabulary by deliberately committing lexical information to memory” (Laufer and Hulstijn, 2001, p. 27). Furthermore, empirical evidence for the effectiveness of incidental learning over the intentional mode is simply substantial. Shelton and Newhouse (1981), for example, observe that “learners who were exposed to the stimulus material in an incidental-learning situation significantly performed better in a subsequent recall test than subjects who were simply instructed to learn the same material” (pp. 36-38). Huckin and Coady (1999) argue that “texts in which learners are interested can be more conducive to incidental vocabulary acquisition” (pp. 181-193). Taylor and Beach (1984) claim “overall, empirical evidence shows that for most students, expository reading cause a greater challenge than narrative reading. Although many factors may contribute to run into difficulty with expository reading, the four most commonly cited are text structure, conceptual density and familiarity, vocabulary knowledge, and prior knowledge” (pp. 134-146).

“Empirical research on tasks and incidental acquisition points to a variety of factors conducive to successful retention of words. The presence of marginal glosses was found to enhance vocabulary retention, when compared to the absence of marginal glosses (Hulstijn, 1992; Hulstijn, Hollander & Greid anus, 1996; Jacobs, Dufon, & Fong, 1994; Watanabe, 1997). Laufer and Hulstijn (2001) present the Involvement Load Hypothesis in the incidental L2 vocabulary learning building on the levels of processing framework. Craik and Tulving (1975) suggested that “what is critical to retention is not simply the presence or absence of semantic encoding (depth of processing; a qualitative construct), but also the richness with which the material is encoded (spread or elaboration of encoding, a quantitative construct)” (pp. 268-294). Craik and Lockhart’s levels of processing theory was challenged by Bad Deley (1978), Eysenck (1979), and Nelson (1977). The main points of criticism were concerned with the following two questions: (1) What exactly constitutes a level of processing, and (2) How do we know that one level is deeper than another? In a response to these questions, Lockhart and Craik (1972) acknowledged that the terms depth and spread/elaboration lack operational definitions and independent indices, and thus that circularity is inherent in the levels of processing approach. They also acknowledged the importance of investigating the effect of encoding tasks and processes in conjunction with the effect of retrieval tasks and processes (pp. 671-684).

### THE INVOLVEMENT LOAD HYPOTHESIS

Laufer and Hulstijn (2001) advanced the Involvement Load Hypothesis for second language vocabulary learning, in which they proposed a motivational-cognitive construct of involvement, comprising three basic components: *need*, *search*, and *evaluation*. The *need* component refers to the motivational, non-cognitive dimension of involvement. *Search* and *evaluation*, as opposed to *need*, are conditional upon the allocation of attention to the form –meaning relationship (R. Schmidt, 1994, pp. 165-210, 2001, pp. 3-32). *Search* refers to “the attempt to find the meaning of an unknown L2 word or trying to find the L2 word form expressing a concept (e.g., trying to find the L2 translation of an L1 word) by consulting a dictionary or another authority like a teacher” (Laufer & Hulstijn, 2001, p. 14). *Evaluation*, on the other hand, refers to “the assessment of an appropriate meaning or use of a given word as is prescribed by a specific context” (Laufer & Hulstijn, 2001, p. 14). The component of *evaluation* implies “a comparison of a given word with other words, a specific meaning of a word with its other meanings, or combining the word with other words in order to assess whether a word does or does not fit its context”. These three factors have two degrees of prominence (ibid).

**The degrees of the components in the involvement load hypothesis (Mayumi Tsubaki, 2008, p. 178)**

Components	Degrees of involvement load	Explanations
<b>Need</b>	Index 0 (None)	The learner does not feel the need to learn the word.
	Index 1 (Moderate)	The learner is required to learn the word.
	Index 2 (strong)	The learner decides to learn the word.
<b>Search</b>	Index 0 (None)	They do not need to learn the meanings or forms of the word.
	Index 1(Moderate)	The meaning of word is found.
	Index 2(Strong)	The form of word is found.
<b>Evaluation</b>	Index 0 (None)	The word is not compared with other words.
	Index 1(Moderate)	The word is compared with other words in the provided context.
	Index 2(Strong)	The word is compared with other words in self-provided context.

According to Laufer and Hulstijn (2001, p. 14), it is not the case that all of the three involvement factors can be at work simultaneously during a reading or listening task. The combination of these factors with their degrees of prominence comprises involvement load. Hulstijn and Laufer (2001) proposed “the idea of an involvement index, in which the absence of a factor is marked as 0, a moderate presence of a factor equals 1, and a strong presence of a factor signifies 2” (p. 15).

#### **INVOLVEMENT LOAD HYPOTHESIS (ILH)**

Involvement Load Hypothesis has been the subject to various research studies. For example, Laufer and Hulstijn (2001) conduct the study reporting the importance of hypothesis. Among the three components, need was 1 because that learners were required to do the task as a class activity, and they had no search or evaluation index condition. The participants in one group did not look for the meaning because the meaning of the target words was glossed. They did not need to evaluate them against other words. But, their study can be held as an evidence for a partial support to the ILH. Then, they (2001) suggested some empirical support for the task factors need; search, and evaluation that are found in several studies. The findings are as follows:

- Word retention is higher when learners choose the meaning of target words in a text from several synonyms (moderate evaluation) compared to when word meaning is explained by a synonym (no evaluation) (Hulstijn, 1992).
- Using new words in original sentences during a read and retell task (strong evaluation) results in greater word knowledge compared to using the words in unoriginal sentences (no evaluation) (Joe, 1995, pp. 149-158, 1998, pp. 357-377).
- Support for task-induced involvement also comes from studies that compare reading-based tasks to word-focused tasks without reading. (pp. 1-26).

#### **GLOSSES AND TEXT ENHANCEMENT**

Glosses, by definition, are notes that are written in L1 or a simpler form in L2 to facilitate learners' reading. To attract learners' attention, glossed words or information can be boldface typed or underlined (Roby, 1999, pp.94-101). With the provided information next to unknown words, learners know their meanings immediately and proceed with minimum interruption of reading or listening process (Lomicka, 1998; Nagata, 1998). Glosses are viewed as a valuable tool that facilitates reading in a foreign language (Richgels & Hansen, 1984; Watanabe, 1997). They are largely used in materials that textbook writers include potential unknown words or words of low frequency to L2 learners (Davis, 1983, pp. 185-197).

Using glosses on reading and vocabulary learning has advantages. Boldfaced or underlined glosses can make unfamiliar words salient to the learners and lead them to pay more attention to the unknown words, which in turn enhance their vocabulary learning (Jacobs et al., 1994, Kost, Foss, & Lenzini, 1999; Nagata, 1998). The presence of gloss enables learners to look back and forth between the text and target words, which creates multiple encounters of the words to facilitate word retention (Watanabe, 1997, pp. 287-307). Hulstijn (1996) claimed that the effects of L1 or L2 marginal gloss were greater than the effects of dictionary, because learners tended to regard dictionary as the last resort as they didn't want to interrupt their reading or they couldn't find the correct meanings among so many entries in the dictionary. So, marginal glosses can solve the problems of learners' ignoring new words and wrong inference of word meanings (pp. 327-330).

Furthermore, various types of task have been experimented via reading modality of presentation. There are some evidences for the superiority of reading activity as it includes high involvement tasks over low involvement tasks. A research was carried out by Shehade, A (2005) to compare reading with sentence writing on incidental acquisition of ten unfamiliar words. Thereby, the 'sentence writing' group had significantly higher scores on the immediate test and on the delayed test (pp. 13-30). In another study reading was compared with sentence writing and with fill-in the blanks task. Participants were high school learners aged 16. One group read a text and looked up ten unknown words, the second group wrote sentences with the target words, and the third group filled in the target words in given sentences, one word in each sentence. To perform tasks 2 and 3, the groups received a list of the ten target words

with explanations of their meaning. Both on the immediate and the delayed tests, the reading group performed significantly worse than the other two groups. On both tests, the sentence writing condition yielded the highest score (Long, M. H., 1985, pp. 77-99).

### **INCIDENTAL VOCABULARY LEARNING THROUGH LISTENING**

Contrary to the commonality of reading-based vocabulary instruction on the experimentation of ILH, few studies have examined L2 vocabulary acquisition through listening. Brown, Waring and Donkaewbua (2008) examined the rate at which Japanese EFL students learned vocabulary from reading, reading-while-listening, and listening-only. They found the reading-while-listening mode produced the greatest gains (5 of 28 words), and the listening-only mode produced the smallest gains (1 of 28 words) (pp. 136-139). Little (2007) examined whether listening and generative tasks could enhance incidental L2 vocabulary acquisition and retention. The generative model assumes when learners actively generate or elaborate on target items read in a text, better retention occurs as new and known information is integrated (Wittrock, 1974, cited in Joe, 1998, pp. 357-377). Little found listening to and retelling twelve 3-5 minute stories helped high proficiency among Japanese EFL learners who managed to acquire 300 target words in two weeks and it aided in retention over four weeks. He constructed and recorded stories for this purpose because research showed it took less time to learn associated words in a story line of listening context and providing opportunities for recalling enhance acquisition and retention, suggesting the task's qualitative nature rather than intention to learn determines retention (Little, A & Kaoru Kobayashi, 2011, pp. 63-74)

### **METHODOLOGY**

#### ***Participants***

One hundred twenty five EFL learners with age range of 18-23 enrolled in the intermediate level in an Iranian private language school were the participants who were identified as homogeneous group based on the Nelson proficiency test.

#### ***Materials***

##### ***Passages selected for the experiment***

Ten similar reading and listening comprehension passages were chosen from a reading textbook named "Active Skills for Reading" (Neil J. Anderson, 2008) as the course book with 10 target words in every passage. This book provided learners of English with high interest reading passages that included audio CD for listening groups, many of them adapted from authentic sources.

##### ***Tasks selected for the experiment***

Six tasks were used in this study that include:

Task 1: Reading/listening comprehension with marginal glosses

Task 2: Reading/listening comprehension plus fill -in -blanks

Task 3: Reading/listening comprehension with matching questions

Task 4: Reading/listening comprehension with text-reconstruction exercise

Task 5: Reading/listening comprehension with unscramble questions

Task 6: Reading/listening comprehension with composition

#### ***Instruments***

##### ***Nelson test***

A sample of Nelson as proficiency test with 35 items was used to determine the learners' level of proficiency for choosing nearly homogeneous groups.

##### ***Pre-test***

A 50-item multiple-choice vocabulary test was retrieved from [www.elc.thomson.com](http://www.elc.thomson.com). These 50 tested words were chosen quite randomly from 100 target words of treatment passages. Before starting the main study, it was piloted in order to make sure of its applicability and reliability index via KR\_21 formula. Then, it was administered as a pretest to both groups (control and experimental) to capture the initial differences between the groups. This pretest was conducted to ensure the novelty of the words to be learned by the subjects during the treatment period.

##### ***Post-test***

The same pre-test was administered as an achievement post-test after seven weeks of time interval to measure the amount of vocabulary learning by the experimental and control groups. The point should be underscored that the pre-test and post-test were equal in all respects except the arrangement of the target words.

#### *The Target Words*

One hundred target words were selected from ten reading texts, based on three criteria:

1. Assumed unfamiliarity to the participants.
2. Ease of incorporating the words into a narrative describing personal experiences, and
3. Ease of supplying a synonym or a definition in English.

The list of the target words was also submitted to some experienced English teachers for comments on the unfamiliarity to intermediate levels in the Institute.

#### *Procedure*

This study was basically quasi-experimental in design as schematically represented as follows:

G1 (experimental) T1 x T2

G2 (experimental) T1 x T2

G5 (control) T1 T2

T1= pretest

G3 (experimental) T1 xT2

G4 (experimental) T1 x T2

X= treatment

T2=posttest

To implement the design, first sampling was done. In order to select the participants of the study, the researcher administered a standardized Nelson test among 140 students enrolled at Zabansara, an English school in Bojnurd. 125 students could take part in the research, they were selected through stratified random sampling. It should also be noted that their participation was quite voluntary. The result of the Nelson test was used to assign the subjects into five homogenous groups on the basis of the dispersion of scores around the mean. So, the sample was randomly stratified into 25 subjects in each group. It was not plausible to assign the learners into 5 groups of intermediate language learners unless this Nelson test was administered. So, the NELSON test was administered to 140 cases. The mean (13.96) and standard deviation (3.05) for the NELSON test are displayed in Table 1. Based on the mean score plus one and half SD, 125 cases were selected to participate in the main study. They were divided into one group as a control group and four groups as experimental groups. Every group included 25 participants. Then, a 50-item test was retrieved from [www.elc.thomson.com](http://www.elc.thomson.com) to use it as a pretest for diagnostic purpose. The reliability of the test was estimated (0.70) through KR-21 formula.

In an interval of one week after the pretest administration, the treatment took place for ten sessions; two sessions a week, and each session was 60 minutes during which the participants in their respective groups were required either to read or listen to one of the passages. After one week following the treatment, the same pretest was used as posttest to measure the progress.

#### *Control group*

The group members were exposed to an alternatively rendered reading and listening materials thereby they were asked to answer reading/listening comprehension questions (true/false, multiple-choice ...). But the tasks induced no need; students did not feel the need to learn the target words because they could answer the questions without referring to the marginal glosses, and without searching. Because meaning of the target words were glossed for them, they did not search the meaning of new words by looking up the dictionary, and no assessment was run because they did not compare and decide on the meaning of the words in comparison with different words or different senses of the same word. Time for the tasks was 60 minutes. These tasks emphasized on whole understanding of the reading/listening text; therefore, they induced low involvement load for learning new vocabulary. So, the involvement index was 0.

#### *Experimental groups*

The experimental groups were exposed to low and high involvement tasks through reading and listening modalities based on two distinct frameworks displayed in tables 1 and 2 along with detailed explanation as follows:

**1. Experimental groups with low involvement tasks** (reading or listening group with same tasks):

- Two groups of students read and two groups of students listened to the text (for 10 minutes). They, then, were asked to answer true /false reading/listening comprehension questions. The instruction was accompanied by three tasks. As details are presented in table 1, the tasks were true/false, fill-in blanks and matching integrated with glossing, glossing listed with distracters, and glossing with time on task, respectively. The first one, as was experienced with the control group, was characterized by 0 index at all three levels including need, search and evaluation; then equally 0 involvement index.
- As to the second task they were asked to fill in the blanks with the words provided. Contrary to the first type, in this task the levels were characterized differently; need and evaluation each being moderated enjoyed 1 index value since the need to learn the target words was imposed by the task not by the students so involvement index was 1. But if the students felt the need to learn the target words by them not by task the need index would be stronger; index 2. Meanwhile, the task did not address the search level because all the target words were glossed for the students. They did not look for the meaning of new words. Moderate evaluation index is also justified on the ground that the words were compared with other words in context provided by teacher so involvement index was 1. But if the students were to compare the new words with other words in context provided by them, there would be a stronger evaluation index. Altogether, the involvement index was 2.
- The third matching-exercise task which asked the participants to match target words with their definitions, enjoyed moderate need because the need to learn the target words was imposed by the task; no search, because all the target words had been glossed for them, and also no evaluation was addressed since they were not required to compare and decide on the meaning of the words in comparison with different words or different senses of the same word.

*Table 1: The tasks given to the students inducing low involvement load*

Task		Learning Activities and time on task	Need	Search	Evaluation	Involvement Index
1. Reading comprehension questions		Glossed	0	0	0	0
2	1	0	1	Glossed, listed with distracters	2. Comprehension + Blank-filling	
1	0 Words not evaluated at all	0 The meanings of the target words were provided	1 Target words not needed	Glossed Time on task: 60 minutes	3. Matching	

*Note: Total Involvement Index was the result of the sums of the three indexes for each component.*

**2. Experimental groups with high involvement tasks** (reading or listening group with same tasks):

- Two groups of students read and two groups of students listened to the text for 10 minutes. Then, they were asked to answer true/false reading/listening comprehension questions. Similarly, the groups, as displayed in table 2, were exposed to three tasks including text-reconstruction, unscrambling, and composition which they were integrated with glossing, glossing and glossing time on task activities, respectively. ?
- As to the first task, the participants were encouraged to memorize reading/listening texts, and produce a summary using the target words. The task was characterized moderate in terms of need because the need to learn the target words was imposed by the task not by them; search level was absent since all the target words were glossed for the students, and they did not look for the meaning; however, a strong evaluation was required in that the learner had to use the new words in learner-generated contexts. So the task involvement index was equated to 3.

- The second task being concerned with rearranging unscrambled sentences and the third task addressing text composition were very much similar in the respective activities to the first task, and the indices of all three levels (i.e., need, search and evaluation) were 3.

*Table 2: The tasks given to the students inducing high involvement load and the involvement index was 3*

Task	Learning Activities and time on task	Need	Search	Evaluation	Involvement Index
3	2	0	1	Glossed	4.Text-reconstruction
3	2	0	1	Glossed	5.Unscramble
3	2 Words not evaluated at all	0 The meanings of the target words were provided	1 Target words not needed	Glossed Time on task: 60 minutes	6.Composition

## RESULTS

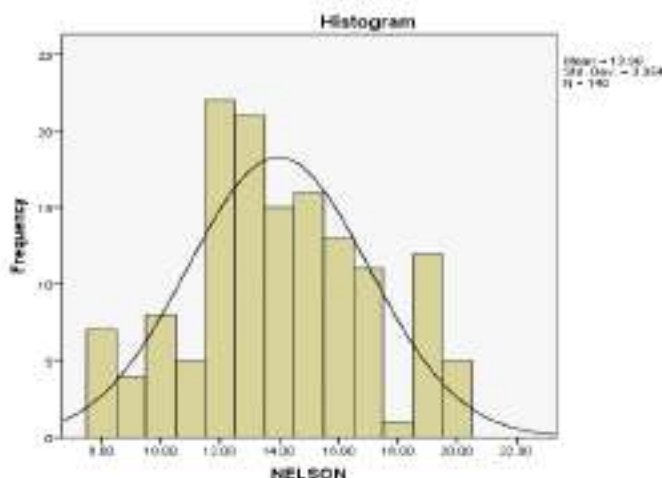

### *Homogenous subject selection*

As descriptively shown in table 3, sampling was statistically conducted out of 140 originally available learners out of which and based on their position on the normal probability curve, the participants whose scores lied between  $\pm$  SD mean score were selected (N=125) being homogenous groups on the basis of the dispersion of scores around the mean.

*Table 3:Nelson test used for homogeneity purpose*

N	Valid	140
	Missing	0
Mean		13.9643
Std. Deviation		3.05445
Variance		9.330

Based on the mean score plus one and half SD, 125 cases were selected to participate in the main study.

### *Testing statistical assumptions*

Four assumptions must be met for an appropriate parametric test, i.e. interval data, independence, normality and homogeneity of variances. The assumption of normality – as displayed in Table 4 – is probed based on the ratios of

skewness and kurtosis over their respective standard errors. If the ratios are within the ranges of  $\pm 1.96$  the data enjoy normal distribution as is the case for the present data. The assumption of homogeneity of variances is reported below when discussing one-way ANOVA results.

Table 4: Normality Test

GROUP		N	Skewness		Normality of Skewness	Kurtosis		Normality of Kurtosis
		Statistic	Statistic	Std. Error		Statistic	Std. Error	
1	PRETEST	25	-0.03	0.46	-0.06	-1.26	0.90	-1.40
	POSTTEST	25	0.03	0.46	0.06	-1.02	0.90	-1.14
2	PRETEST	25	-0.38	0.46	-0.83	-0.04	0.90	-0.05
	POSTTEST	25	-0.56	0.46	-1.21	-0.48	0.90	-0.53
3	PRETEST	25	-0.75	0.46	-1.62	0.38	0.90	0.42
	POSTTEST	25	-0.27	0.46	-0.58	-0.60	0.90	-0.67
4	PRETEST	25	0.04	0.46	0.09	-0.50	0.90	-0.55
	POSTTEST	25	0.44	0.46	0.96	0.39	0.90	0.43
5	PRETEST	25	-0.49	0.46	-1.05	-0.51	0.90	-0.57
	POSTTEST	25	0.28	0.46	0.60	-0.52	0.90	-0.58

#### The pretest statistics

The pretest was administrated to both groups (control and experimental groups). To ensure the participants' homogeneity in terms of vocabulary knowledge prior to the treatment, One-way ANOVA was run to compare the mean scores of the five groups on the pretest. As displayed in Table 5, the mean scores for the five groups are: control (M = 11.92), Reading with High Involvement Tasks (RWHIT) (M = 12.64), Reading with Low Involvement Tasks (RWLIT) (M = 12.56), Listening with Low Involvement Tasks (LWLIT) (M = 12.88) and Listening with High Involvement Tasks (LWHIT) (M = 11.88). Table 5, 6, and 7 show the results of the ANOVA.

Table 5: Descriptive Statistics Pretest

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean		Minimum	Maximum
					Lower Bound	Upper Bound		
CONTROL	25	11.9200	2.44813	.48963	10.9095	12.9305	8.00	16.00
RWHIT	25	12.6400	2.46441	.49288	11.6227	13.6573	7.00	17.00
RWLIT	25	12.5600	2.69382	.53876	11.4480	13.6720	6.00	16.00
LWLIT	25	12.8800	2.00666	.40133	12.0517	13.7083	9.00	17.00
LWHIT	25	11.8800	2.38607	.47721	10.8951	12.8649	7.00	15.00
Total	125	12.3760	2.40518	.21513	11.9502	12.8018	6.00	17.00

As displayed in Table 6 the assumption of homogeneity of variances is also met (Levene's  $F = .55$ ,  $P = .69 < .05$ ). Based on these results it can be concluded that the experimental and control groups were homogenous in terms of their ability on lexical component.

Table 6: Assumption of Homogeneity of Variances for Pretest

Levene Statistic	df1	df2	Sig.
.552	4	120	.698

The results of the one-way ANOVA indicate that there are not any significant differences between the mean scores of the five groups on the pretest ( $F = .87$  (4, 120),  $P = .482 > .05$ ). Since  $t$  critical value at 120 df equals 1.98 which is higher than  $F$  value of .87. Then, the groups were not significantly different from each other prior to the treatment.

Table 7: One-Way ANOVA Pretest by Groups

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	20.288	4	5.072	.873	.482
Within Groups	697.040	120	5.809		
Total	717.328	124			

Furthermore, the Levene Test for equality of means shows that significance value is .698 which is higher than .05. This means that there is no significant difference between the groups prior to the treatment. So the groups are homogenized. In quantitative research, if significant value is smaller than 0.05, the null hypothesis is rejected. So, the probability value (p-value) is calculated:  $P\text{-value} = .698 > \alpha = 0.05 \rightarrow \text{Accept } H_0$

To compare the variances, if we had the same variances, we should use the ANOVA to compare the variances. So, we have:  $P\text{-value} = .482 > 0.05 \rightarrow \text{Accept } H_0$

It means that there is no significant difference in means of the groups in pretest. as indicated in Figure 2.

Figure 2: Mean Scores on Pretest

#### The posttest statistics

Similarly, a One-way ANOVA was run to compare the mean scores of the five groups on the posttest in order to probe the effect of low and high reading and listening involvement tasks on vocabulary retention. As displayed in Table 8, the mean scores for the five groups are; control (M = 13.92), Reading with High Involvement Tasks (RWHT) (M = 17.48), Reading with Low Involvement Tasks (RWLI) (M = 15.40), Listening with Low Involvement Tasks (LWLI) (M = 15.24) and Listening with High Involvement Tasks (LWHT) (M = 16.20).

Table 8: Descriptive Statistics Posttest

	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean		Minimum	Maximum
					Lower Bound	Upper Bound		
CONTROL	25	13.9200	2.13931	.42786	13.0369	14.8031	10.00	18.00
RWHT	25	17.4800	1.73494	.34699	16.7639	18.1961	14.00	20.00
RWLI	25	15.4000	2.30940	.46188	14.4467	16.3533	11.00	19.00
LWLI	25	15.2400	1.87705	.37541	14.4652	16.0148	12.00	20.00
LWHT	25	16.2000	1.80278	.36056	15.4559	16.9441	13.00	20.00
Total	125	15.6480	2.27984	.20392	15.2444	16.0516	10.00	20.00

As displayed in Table 9 the assumption of homogeneity of variances is also met (Levene's  $F = 1.01$ ,  $P = .40 < .05$ ).

Table 9: Assumption of Homogeneity of Variances for Posttest

Levene Statistic	df1	df2	Sig.
1.013	4	120	.403

Table 9 shows the equality of variances in five groups by using Levene Test and the result is that variances in five groups are equal. According to this table significant value is higher than 0.05.

P-value= .403 >  $\alpha$ = 0.05 → Accept H<sub>0</sub>

The results of the one-way ANOVA also indicate that there are significant differences between the mean scores of the five groups on the posttest ( $F = 10.90$  (4, 120),  $P = .000 < .05$ ). This shows a positive result. Therefore, we conclude that the means between five groups are not equal and there is a significant difference between them. Thus the null-hypothesis as low and high reading and listening involvement tasks do not have any significant effect on the improvement on the EFL learners' reading and listening abilities **is rejected**.

Table 10: One-Way ANOVA Posttest by Groups

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	171.872	4	42.968	10.909	.000
Within Groups	472.640	120	3.939		
Total	644.512	124			

Although the F-value of 10.90 indicates significant differences between the mean scores of the five groups on the posttest, the post-hoc Scheffes tests must be run to compare the groups two by two.

Table 11: Post-Hoc Scheffe's Tests

(I) GROUP	(J) GROUP	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
					Lower Bound	Upper Bound
CONTROL	RWHIT	-3.56000*	.56133	.000	-5.3163	-1.8037
	RWLIT	-1.48000	.56133	.146	-3.2363	.2763
	LWLIT	-1.32000	.56133	.244	-3.0763	.4363
	LWHIT	-2.28000*	.56133	.004	-4.0363	-.5237
RWHIT	RWLIT	2.08000*	.56133	.011	.3237	3.8363
	LWLIT	2.24000*	.56133	.005	.4837	3.9963
	LWHIT	1.28000	.56133	.274	-.4763	3.0363
RWLIT	LWLIT	.16000	.56133	.999	-1.5963	1.9163
	LWHIT	-.80000	.56133	.730	-2.5563	.9563
LWLIT	LWHIT	-.96000	.56133	.572	-2.7163	.7963

\*. The mean difference is significant at the 0.05 level.

Figure 3 shows the difference between means of groups in posttest.

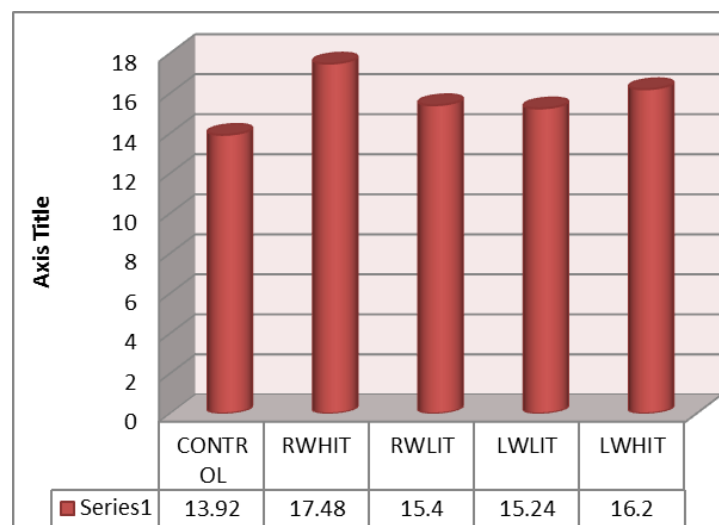

Figure 3: Mean Scores on Posttest

***Testing the first hypothesis***

Based on the results displayed in **Table 11** it can be concluded that:

A: There is a significant difference between the mean scores of the control group ( $M = 13.92$ ) and RWHIT ( $M = 17.48$ ). The reading high involvement tasks group outperformed the control group on the posttest.

B: There is not any significant difference between the mean scores of the control group ( $M = 13.92$ ) and RWLIT ( $M = 15.40$ ).

C: There is not any significant difference between the mean scores of the control group ( $M = 13.92$ ) and LWLIT ( $M = 15.24$ ).

D: There is a significant difference between the mean scores of the control group ( $M = 13.92$ ) and LWHIT ( $M = 16.20$ ). The listening high involvement tasks group outperformed the control group on the posttest.

E: There is a significant difference between the mean scores of the RWHIT group ( $M = 17.48$ ) and RWLIT ( $M = 15.40$ ). The reading high involvement tasks group outperformed the reading with low involvement tasks group on the posttest. Thus the second null-hypothesis as reading comprehension activity with higher involvement load tasks does not result in more vocabulary retention than tasks with lower involvement load **is rejected**.

Accordingly, we can have a result that this method (reading comprehension activity with higher involvement load tasks) caused to increase the vocabulary retention scores.

***Testing the second hypothesis***

F: There is a significant difference between the mean scores of the RWHIT group ( $M = 17.48$ ) and LWLIT ( $M = 15.24$ ). The listening high involvement tasks group outperformed the reading with low involvement tasks group on the posttest.

G: There is not any significant difference between the mean scores of the RWHIT group ( $M = 17.48$ ) and LWHIT ( $M = 16.20$ ).

H: There is not any significant difference between the mean scores of the RWLIT group ( $M = 15.40$ ) and LWLIT ( $M = 15.24$ ).

I: There is not any significant difference between the mean scores of the RWLIT group ( $M = 15.40$ ) and LWHIT ( $M = 16.20$ ).

J: There is not any significant difference between the mean scores of the LWLIT group ( $M = 15.24$ ) and LWHIT ( $M = 16.20$ ). Thus the first null-hypothesis as listening comprehension activity with higher involvement load tasks does not result in more vocabulary retention than tasks with lower involvement load **is supported**.

Accordingly, we can have a result that the effect of this method (listening comprehension activity with higher involvement Load tasks) does not have significant difference with other methods (reading with low involvement tasks and listening comprehension activity with lower involvement Load tasks).

As a result, task-induced involvement has significant effect on vocabulary retention scores as we had an increase in mean scores of the four experimental groups (the mean scores of experimental groups: Reading comprehension activity with higher involvement Load tasks, Listening comprehension activity with higher involvement Load tasks, Reading comprehension activity with low involvement tasks and Listening comprehension activity with lower involvement Load tasks are equal to 17.48, 16.20, 15.40, and 15.24, respectively which are higher than the mean score of control group's posttest that is equal to 13.92).

## DISCUSSION

The findings of this study provide strong support for the Involvement Load Hypothesis (Laufer & Hulstijn, 2001), which claims that tasks with a higher involvement load are more effective for vocabulary retention than tasks with a lower involvement load. Drawing upon the criteria outlined in the hypothesis, the involvement index was 3 for writing, unscrambling, and text-reconstruction tasks, 2 for fill-in-blanks, 1 for matching and 0 for multiple-choice task. Thus, the following prediction was formulated:

*The retention scores of the ten target words will be highest in tasks with high involvement loads (writing, unscrambling, and text-reconstruction), and lower in tasks with low involvement loads (fill-in-blanks, matching, and multiple-choice tasks).*

The results of this study suggest that foreign language pedagogy would benefit from the inclusion of task-induced involvement Load. According to obtained results, tasks with higher involvement Load through reading activity is more effective than conventional methods of vocabulary instruction. Results also show that vocabulary retention in reading skill with high involvement tasks is more than listening skill with high involvement tasks. So, the results of this study are against Vidal (2003) results concerning the priority of listening skill to reading skill, she believed listening is more effective for vocabulary retention. But results of this study emphasize Marcella and Nation (2001) results about high effect of reading for vocabulary retention.

## CONCLUSION

The results of this study are in accordance with what has already been achieved by Hustijn and Laufer (2001) in the experiment done among adult EFL learners in Israel and the Netherlands to investigate whether retention of incidental vocabulary acquisition is contingent on amount of task-induced involvement. Their experiments showed that the task of composition with incorporated target words produced best retention results, and the task of reading comprehension plus filling in target words produced better results than task of reading comprehension with marginal glossing for target words.

In conclusion, the Involvement Load Hypothesis is applicable to the incidental vocabulary acquisition, and the study demonstrates that in listening and reading practice, incidental acquisition does occur and task with higher involvement load does produce better retention. But according to the results, incidental acquisition is more in reading activity than listening activity. So, In light of the findings of the present study, we may find some useful implications for vocabulary teaching and learning.

- First, the results of this study suggest that teachers should design a variety of listening and reading-based tasks that can induce the need for the attention to target words to develop learners' vocabulary knowledge.
  - Secondly, teachers could design or select tasks varying in involvement load for different words depending on the type of reinforcement they want to provide.
  - Finally, the findings of this study also suggest that tasks with high involvement loads like writing with new words could serve as an efficient means to increase learners' vocabulary.

## LIMITATIONS AND DELIMITATIONS OF THE STUDY

Like any other study, some inevitable limitations, which may raise new questions for further researches in the field in the future, were imposed on this study. Several limitations are present in this study like short duration and failure to consider personal variables. All data in this study have been collected from selected intermediate English learners studying at Zaban Sara, one of the best English institutes in Bojnurd, north Khorasan, Iran, so the result obtained by studying this population may not be generalizable to others who differ significantly in terms of factors such as levels of general proficiency or vocabulary size. Since the population utilized for this study is solely limited to Iranian EFL learners, we can mention the most important restriction in this study can be related to the over generalizability factor. In sum, it should be mentioned that:

1. The participants of the study were all females; the result could not be generalized to other groups of language learners.

2. The participants were all non-English major speakers who were learning English as a foreign language in intermediate level, so the result might not be generalized to English major.
3. This project was limited to the study of the effect of reading and listening tasks on vocabulary retention. These tasks might comprise of different parts and integrate different skills.
4. This study only tested the effects of task-induced involvement on learners' passive (receptive) knowledge of words. It is not known how task-induced involvement affects active (productive) recall of new acquired words.
5. The current study investigated the short-term effect of tasks with different involvement loads on vocabulary learning.
6. In practice, it was too difficult to conduct the study empirically with two different language skills; reading-based and listening-based vocabulary tasks.

### Appendix A

#### Nelson Proficiency Test

**Direction for questions 1-35. Read the following questions carefully. Then select the one item a, b, c, or d which is the best answer and mark your sheet.**

1. I'm going to spend a few days with some ..... of mine, who live in the north of Scotland.  
a. Relatives      b. families      c. neighbors      d. companies
2. The ..... outside the house said "No Parking".  
a. Advice      b. signal      c. label      d. notice
3. He has no ..... of winning.  
a. Occasion      b. luck      c. opportunity      d. chance
4. These people over there are speaking a language I don't understand. They must be .....  
a. Foreign      b. strange      c. rare      d. outlandish
5. I didn't write it. That is not my ..... on the cheque.  
a. Mark      b. letter      c. firm      d. signature
6. The actors have to ..... before they appear in front of the strong lights on television.  
a. Cover up      b. paint up      c. make up      d. do up
7. It's a difficult problem but we must find the answer .....  
a. By one way or other      c. somehow or other  
b. Anyhow or other      d. anyway or other
8. I want ..... immediately.  
a. That this work is made      c. this work made  
b. That this work is done      d. this work done
9. He's used to ..... in public.  
a. Be speaking      b. the speaking      c. speaking      d. speak
10. You can fly to London this evening ..... you don't mind changing planes in Paris.  
a. Provided      b. except      c. unless      d. so far as
11. It's ages ..... him.  
a. That I don't see      c. that I didn't see  
b. Ago I saw      d. since I saw
12. He made me .....  
a. Angry      b. be angry      c. to be angry      d. that I got angry

13. Do what you think is right, ..... they say.  
a. However      b. whatever      c. whichever      d. for all
14. He arrived late, ..... was annoying.  
a. What      b. that      c. which      d. the which
15. His job is ..... yours.  
a. The same that      b. as      c. alike      d. similar to
16. He needs a .....  
a. Few days` rest      c. few days rest  
b. Little days` rest      d. little days rest
17. Do you know ..... the repairs?  
a. To do      b. how to do      c. to make      d. how to make
18. We usually have fine weather..... summer.  
a. At      b. on      c. in      d. while
19. Your work has been .....so we`re going to give you a rise in salary.  
a. Regular      b. well      c. satisfactory      d. available
20. The weather ..... says it will rain tomorrow.  
a. Provision      b. forecast      c. advertisement      d. advice
21. There are a lot of mistakes in this exercise. I`ll have to .....it again with you.  
a. Come through      b. go over      c. repass      d. instruct
22. If there are no buses, we`ll have to take a taxi. We must get there .....  
a. Somehow or other      c. somewhere or other  
b. On one way or another      d. anyway or other
23. .... I read, the more I understand.  
a. The more      b. so much      c. how much      d. for how much
24. .... he does his work, I don`t mind what time he arrives at the office.  
a. So far as      b. so long as      c. in case      d. meanwhile
25. .... entering the hall, he found everyone waiting for him.  
a. At      b. while      c. on      d. in
26. It`s years .....a picture.  
a. That I don`t paint      c. that I didn`t paint  
b. Since I painted      d. ago I painted
27. I found the first question .....  
a. To be easy      b. the easy      c. that it was easy      d. easy
28. .... an empty seat at the back of the bus.  
a. She happened to find      c. she happened to meet  
b. It happened her that she found      d. it happened her that she met
29. It was raining, ..... was a pity.  
a. What      b. that      c. the which      d. which
30. Your car is ..... mine.  
a. The same that      b. as      c. similar to      d. alike
31. I`m going away for a .....  
a. Holiday of a week      c. week holiday  
b. Holiday week      d. week`s holiday
32. Why ..... ? it`s not very important.  
a. To worry      b. worry      c. you are worried      d. you worry
33. I don`t like ..... at me.  
a. Them shouting      b. them shout      c. their shout      d. that they shout
34. It often snows ..... January.  
a. On      b. in      c. for      d. at
35. That`s the best horse in the .....  
a. Career      b. run      c. rate      d. race

*Appendix B*

*Pre Test/ Post Test*

**Direction for questions 1-50. Read the following questions carefully. Then select the one item a, b, c, or d which is the best answer and mark your sheet.**

1. Martin and David disagree a lot, but they are very .....of each other's opinions.  
a. exhausting    b. variable    c. tolerant    d. unique
2. Susan has a great deal of .....for her grandfather and visits him at least once a week.  
a. client    b. affection    c. confidence    d. possession
3. I've been to many neighboring countries, but I've never traveled to any really.....places.  
a. critical    b. aggressive    c. far-off    d. permanent
4. That beach community has become a favorite .....for retired people to live in.  
a. locale    b. facility    c. insulting    d. credit
5. Clara's father has some very .....beliefs. For example, he thinks a woman shouldn't work after she gets married.  
a. sacred    b. conservative    c. decorated    d. enthusiastic
6. The doctor told me to take two pills if the pain .....  
a. modifies    b. intensifies    c. drops    d. digests
7. That island is a ..... for birds. They can live there undisturbed by people.  
a. brisk    b. off-beat    c. sanctuary    d. scene
8. Hotel rates are always significantly lower during the .....  
a. accommodation    b. endurance    c. off-season    d. infection
9. Before 1776, the United States was a .....of Great Britain.  
a. vehicle    b. organ    c. colony    d. genre
10. That top secret information is only .....to the president and his closest advisors.  
a. accessible    b. impossible    c. believable    d. universal
11. Thirty elephants were killed with machine guns in a wildlife sanctuary in a (n) .....incident of illegal hunting.  
a. helpless    b. appalling    c. vulnerable    d. resilient
12. When the ..... for a species of animal for pets is high, they can be sold at high price.  
a. command    b. knowledge    c. demand    d. chore
13. Unable to adapt to the new conditions of life, the dinosaurs became.....  
a. survival    b. significant    c. extinct    d. hectic
14. Because it was against their religion to have children, the believers were slowly .....  
a. disappeared    b. edited    c. organized    d. preserved
15. It is .....that the most endangered animals should be those most carefully protected by laws.  
a. wandering    b. fitting    c. regarding    d. simplistic
16. During the show ....., platform shoes and synthetic fabrics were trendy.  
a. demon    b. shift    c. era    d. vanity
17. In the wild, animals that are ..... are the more vulnerable to attack.  
a. frail    b. sanitary    c. final    d. skeptical
18. There are many ..... questions about cloning, and particularly about human cloning.  
a. ethical    b. scarce    c. careful    d. deficient
19. The American bison nearly went extinct due to unreasonable ..... of it for meat and leather.  
a. exploitation    b. reputation    c. introduction    d. determination
20. In Jurassic park, a scientist ..... dinosaurs from extinction with appalling consequences.  
a. fertilized    b. revived    c. expected    d. invaded
21. Can you use your computer to ..... how much my property in Arizona will be worth in 2015?  
a. calculate    b. scamper    c. relate    d. consume
22. This year I hope to realize my dream of ..... in the sky in a hang glider.  
a. soaring    b. fulfilling    c. figuring    d. reacting
23. Experts say that when a country's money supply is very high, that means that things start to get more expensive and .....is the result.  
a. property    b. inflation    c. flood    d. ritual
24. You should stop smoking! It decreases your ..... and increases your life expectancy.  
a. fear of living    b. cost of living    c. lack of living    d. aim of living
25. The population is so ..... here. An average of ten people lives in each apartment.

- a. graded    b. popular    c. dense    d. distinctive
26. White flowers are a symbol of .....  
a. awareness    b. advance    c. purity    d. logo
27. Because of her ..... Sara would never speak out during class discussions, even if she had good ideas.  
a. modesty    b. progress    c. salary    d. shortage
28. The jeweler .....the wrong name inside my wedding ring.  
a. encountered    b. engraved    c. saved    d. excluded
29. In the spring, flowers .....and show us their beautiful colors.  
a. bloom    b. blast    c. cover    d. exceed
30. Eileen loves to ..... her engagement ring to her jealous friend.  
a. blank    b. reserve    c. show off    d. expel
31. Many .....move their head offices to other countries to reduce the amount of tax they must pay.  
a. Appreciation    b. corporation    c. reduction    d. ingredient
32. For years scientists have tried to .....the meaning of whale songs.  
a. throw    b. increase    c. interpret    d. pressure
33. Our company ..... a cutting- edge computer system last week.  
a. adopted    b. blackmailed    c. committed    d. remained
34. The soaring cost of living is ..... with the rising price of oil.  
a. overdone    b. associated    c. banned    d. cultivated
35. The ..... broadcast two different versions of the new story, which confused the viewers.  
a. aisle    b. media    c. corridor    d. currency
36. It's important to say "thank you" to show that you are ..... for something.  
a. affluent    b. good-looking    c. grateful    d. wholesome
37. John searched ..... for his passport as his flight was getting ready to leave.  
a. intentionally    b. frantically    c. eventually    d. equivalently
38. One of my coworkers was promoted to .....this week.  
a. supervisor    b. extract    c. dependence    d. slogan
39. While some snakes are dangerous, the ones in my garden are completely .....  
a. bitty    b. innocuous    c. reckless    d. addicted
40. When my daughter asked my permission to go abroad, my ..... answer was no, but later I changed my mind.  
a. mild    b. initial    c. capital    d. lethargic
41. The key to healthy diet is to eat a ..... amount of food each day: not too much and not too little.  
a. veteran    b. moderate    c. alternate    d. concentration
42. Aspirin didn't help my headache, but that massage you gave me ..... I feel great now.  
a. did the trick    b. refined well    c. eliminated fast    d. put out soon
43. Cookies and candy have lots of .....that give you quick energy.  
a. fiber    b. carbohydrate    c. portion    d. crop
44. The hula hoop was a ..... in the 1950s and 60s. It was very popular for a time, but then it disappeared.  
a. fad    b. feature    c. medium    d. detail
45. I'm ..... the rising cost of living and the high prices of property in this city! I've decided to move to the country.  
a. satisfied with    b. fed up with    c. dealt with    d. interested in
46. When the ship hit a rock, its ..... of oil spilled into the sea.  
a. veracity    b. cargo    c. gravity    d. balance
47. If we could only ..... the energy of the sun, the world's energy problems would be solved.  
a. harness    b. channel    c. invest    d. commute
48. The stolen car was quickly ..... in the thieves' garage and the parts sold.  
a. ventilated    b. connected    c. dismantled    d. emigrated
49. Medical ..... has developed a cutting-edge method of treating tumors.  
a. pioneer    b. comparison    c. function    d. struggle

50. The criminal's story is supposedly true, but I doubt its .....  
a. attainment      b. concept      c. correctness      d. appealing

**“LIFE IS BETTER THAN DEATH”  
“LOVE IS BETTER THAN HATE”  
A STUDY OF THREE SURREALIST PLAYS BY TOM STOPPARD**

**Hana' Khalief Ghani**

*Department of Translation, College of Arts, University of Al-Mustansiriyah*

**ABSTRACT**

Tom Stoppard is a leading figure in contemporary British drama. Since he began writing in the early 1960s, he makes use of various literary movements and trends that were dominant in the first half of twentieth century, both thematically and technically. Some of the plays he wrote in the 1970s; namely, *After Magritte*, *Jumpers* and *Artist Descending a Staircase*, show his deep admiration and diligent employment of the tenets of the surrealist movement. Of special importance to Stoppard was the movement's call for a revolt against all restraints on free creativity and its insistence on freeing man's mind before freeing him socially or politically. The expressed aims of this paper are first to shed light on the points of similarities between Stoppard and the surrealists; and second, to try to show to what extent Stoppard succeeds in employing the ideas advocated by the surrealists in his plays.

**KEY WORDS:** Stoppard, Surrealism, *After Magritte*, *Jumpers* and *Artist Descending a Staircase*,

After the theatrical and financial success of Tom Stoppard's *Rosencrantz and Guildenstern are Dead* (1967), he became vocal in the English theatre during the 1970s. Critics generally considered him "the new white hope of British theatre" (Taylor, 1971, p.99). He was in a favorite position at that time, and this may account for his preference to write for the stage rather than for television or radio. Actually he wrote nothing for television between 1968 and 1975. Meanwhile, he wrote only two plays for radio: *Where are They Now?* (1970), and *Artist Descending a Staircase* (1972).

The plays discussed in this paper reflect clearly Stoppard's "distrust for naturalistic drama...[his] constantly breaking the illusion and playing with the audience's expectations" (qtd. in Sheildley, 1994, p.105). Also the same preoccupations of his earlier plays are still manifest in these plays: his fascination with the eccentric and his presentation of various kinds of misleading images- visual or oral- which, according to Stoppard, must always have logical explanations to them. As a matter of fact, he repeatedly stresses the logic that undergirds the structure of his highly theatrical and imaginative plays: "I would think it a personal failure to write a play which is not consistent in every way...They've got to make absolutely logical sense to me" (qtd in Fleming, 1996, p.114). This is what happens in *After Magritte* (1970), *Artist Descending a Staircase* and *Jumpers* (1972). These plays revolve around the themes of the relativity of truth, man's apparent need to divert himself from painful realities, the inability of rational mind to explain man adequately to himself. A more important theme is man's consistent need for love, sympathy and mutual understanding. *Jumpers* and *Artist* are plays about love: love of a woman, of one's vocation, and of life itself. Moreover, these plays reflect Stoppard's exploitation of situations rather than plots: "I have enormous difficulty in working out plots, so actually to use Hamlet, or a classical whodunit...for a basic structure, takes a lot of pressure off me" (qtd in Jenkins, 1987, p. 50). This statement is important, in the sense that it informs us of Stoppard's intention to continue exploiting the plays-within-plays technique, and of his extensive borrowing from others, as in *Artist* and *Jumpers*.

Stoppard first came to know Surrealism in 1963, when he and Anthony C. H. Smith-his friend and would-be agent-were commissioned by John Boorman to write for a television series that would employ a new form of documentary. Stoppard was assigned Surrealism, and the excerpt suggests that the documentary functioned by illustrating Surrealism via examples rather than by talking about it. While this script was probably not filmed, in early 1964 Stoppard did assist Smith and Boorman in a pseudo-documentary series entitled *The New Comers*. The show featured the Smith family and was loosely based on the family's attempt to adapt to a life in a country town. In one of the episodes, Stoppard made a rare acting appearance, as he "played with a violin bow the cords [from which] that suspended a bookcase" (Fleming, 1996, p. 117). Similar surrealist visual jokes appear in *Jumpers* and *After Magritte*.

Although Stoppard persistently insists on the existence of a predetermined pattern and logic in our life, he sometimes gives pronouncements that befit a Neo-Surrealist. In an interview with Hayman (1974), he declares: "What's wrong with bad art is that the artist knows exactly what he's doing" (p.17). On another occasion, he states: "Each day is a sort of new beginning. I rarely sit down knowing what I want to do next. And I feel that it is something of a miracle to get to the end of a play" (Hardin, 1981, p. 157). This may account for the fact that his plays often begin with an image and move towards other images which may remain unresolved either for the characters or the spectators or for both of them, as in *Artist, Jumpers* and *After Magritte*. In other words, Stoppard's plays give the impression that he starts writing without knowing how the strands will eventually come together.

In fact, Stoppard shares with the surrealists many characteristics. He upholds Magritte as his favorite painter, imitating his method of confusing the viewers by presenting many contradictory and incongruous images at the same time. He shares their optimism, faith in life and their confidence in man's ability to participate in life actively.

*After Magritte* is a one-act play, written for the Ambience Theatre Club. As the title suggests, this play shows the impact of Surrealism on Stoppard, for the play's events supposedly occur after a visit to an exhibition by the Surrealist painter René Magritte. It represents an elaboration of the fact that truth changes with perspectives and of the assurance made by Harris, one of the characters in the play, that "There is obviously a perfectly logical explanation for everything" (Stoppard, 1971, p.32). (All subsequent quotations are from this edition.) In commenting on the play's theme, Stoppard points out that *After Magritte* "starts with total illusion," and that the whole play is "an explanation of how illusions came to take place" (Smith, 1977, p.5).

Stoppard uses in this play the idea of the conflict between appearance and reality. As a matter of fact, it is constructed out of the characters' various attempts to account for and interpret two visual puzzles: the bizarre visual puzzle which the play opens with, and the apparently unidentifiable hopping figure, who will prove the innocence of the Harris family from the non-existent crimes they are accused of.

The opening tableau of the play represents a visual puzzle for the audience, and it is more indicative of a modern painting than that of a situation likely to occur in real life. (Hayman, 1979, p.143) The room where the events take place is almost bare, for most of the furniture which includes a bench-type table, a settee, two chairs, a television set, a cupboard and a gramophone (p.9) is piled against the street door in a sort of barricade. The audiences see also an old woman in a bathing cap, lying face upon an ironing board with a white bath towel over her body and a black bowler hat over her stomach. Reginald Harris stands on a wooden chair in order to blow into the lampshade, which is on a pulley, counterweighted by a basket overflowing with different kinds of fruit. He wears his black evening dress trousers underneath his thigh-length green rubber fishing waders. Thelma, dressed in a ball gown, crawls about on all fours, "giving vent to an occasional sniff" (p.10). Through the window, at the back of the stage, the Police Constable PC. Holmes, who will report to Inspector Foot this bizarre spectacle, looks in. Hayman (1977) rightly describes the impact of the opening scene as "very much like that of a Surrealist painting," (p.82) in the sense that one can hardly discern any comprehensible meaning at the first view.

The audiences perceive the opening tableau of the play without attempting to connect cause and effect, just as a painting of Magritte rearranges ordinary objects, such as a rock, a train, a bowler hat in a way that divorces them from their expected roles. The difference between the play and Magritte's painting lies in the fact that the former does not let the visual puzzle go unexplained, whereas the latter admits no such intention. In Magritte's painting

The images must be seen *such as they are*...The mind loves the unknown. It loves images whose meaning is unknown, since the meaning of the mind itself is unknown. The mind doesn't understand its own *raison d'être*, and without understanding that... the problems it poses has no *raison d'être* either. (qtd in Jenkins, 1987, pp. 54-5)

This means the existence of a great gap between reality and appearance, and the relativity of truth and reality, since they are governed by our limited perception of the appearances one sees. Henceforth stem Magritte's continuous efforts to disorient and disturb the viewer by creating tension between two opposing kinds of visual reality. For instance, he paints a man with a bowler hat, whose face is obliterated by a dove. In other words, Magritte builds an atmosphere of tension and menace by explaining little or nothing in his paintings, whereas Stoppard creates a comic effect by offering multiple and opposing explanations for the same visual puzzle.

In the course of the action, the audiences are informed through the characters' actions and dialogues of the reason behind this bizarre spectacle. The furniture has been piled up to clear space for the Harrises who have been practicing for a professional dance competition. The Mother is resting on the ironing board because she has been given a massage by Thelma. Harris blows on the light bulb to cool and then remove it. He has been wearing waders

to replace a bulb in the bathroom while the bath was full. He is bare to the waist, because his dress shirt has to be ironed. Thelma was looking for her shoes, PC Holmes is there because Harris's car has been traced as having parked in a non-parking area in Ponsonby Place in the afternoon.

Stoppard manages to confront his audience with yet another puzzle, verbal this time, immediately after clarifying the first visual puzzle. The Harrises argue about a one-legged man who hobbled up to their car while driving out from the Tate Gallery back home.

Harris and his wife are preoccupied with a debate about the identity of that "bizarre and desperate figure," whom they saw at Ponsonby Place. Each one of the characters gives his opinion of what that figure might be by using language. Thelma thinks him a footballer, with shaving foam on his face and a football in his hand. Harris insists that he was not wearing football shirt but pajamas, had a white beard; was carrying a tortoise, and that he must have been blind, because he had a white stick. Instead of football or turtle, the Mother insists that the mysterious figure is a man who "was playing hopscotch on the corner,...He carried a handbag under one arm, and with the other he waved at me with a cricket bat" (pp.38-9).

Consequently, what the audiences see in *After Magritte*, is an attempt at deduction and the existence of conflicting explanations for everything. In their conversation with Inspector Foot, who arrives there to investigate the meaning of this bizarre spectacle, which he regards as suspicious, immediately after everything is restored to normal, each member of the Harris is adamant that he/she is only reporting what he/she has seen and insists that his/hers is the only right explanation.

What emerges here is that language may sometimes lead to the mounting of confusion and ambiguity rather than to clarification of the situation. Stoppard here shares both the Surrealists and the Absurdist's concept of the unreality of language and its inadequacy as a means of communication. Magritte, the painter, always confuses the viewer, by deliberately distorting the harmony between the visual and written images, and by using the objects in an unexpected Surrealist manner. For instance, he considers labeling the picture of a pipe as 'Pipe' an abuse of language, since no one can touch or smoke it; so, he writes "This Is Not a Pipe," or he inscribes a door under the picture of a horse. Magritte seems to say that reality is not what seems to us, and that language is no rescue in this respect. As far as Stoppard is concerned, the meaning of words depends on a "learned code which continually blinds us to its inherent unreliability" (Jenkins, 1987, p.57). The conversation between Harris and Thelma at the beginning of the play illustrates this well:

*(Harris blows into the lampshade)*

Thelma: It's electric, dear.

Harris: *(mildly)* I didn't think it was a flaming torch.

Thelma: There is no need to use language. That's what I always say. (p. 11)

During his investigation of the meaning of the suspicious spectacle in Harris's house, Inspector Foot accuses the Harrises of being accomplices in a 'non-existent' robbery that was supposed to have taken place in Ponsonby Place. Depending on a 'misleading' report by an old lady who deduces a robbery upon seeing a broken crutch and two metal coins on the pavement, Foot puts forward a hypothesis, explaining what happens. According to his hypothesis, the Harrises are charged with performing without an anesthetic an illegal surgery at Mafeking Villas on a bald-nigger minstrel, and of helping a one-legged man who uses his crutch as a weapon to steal money from the Post Office, for the robbery happened in the same place where Harris parked his car.

Foot's insistent search for evidence to substantiate his hypothesis about the supposed double crime committed by the Harrises has great ironical implication, for it turns out later that Foot himself is the bizarre figure who occasions much dissension between Harris and Thelma.

The end of the play reflects Stoppard's obsession with working events out to their logical conclusion, which would eventually pervade all his plays. Indeed, although Stoppard has eschewed linear cause-to-effect realism in his highly imaginative plays for theatre and radio, he has repeatedly stressed the logic that underlies them.

As we shall see, the same method will be repeated in *Artist* and *Jumpers*. As audience, we come to the conclusion that the apparent surrealistic absurdities of the play's action are not wholly arbitrary or accidental; in fact, they are confined to a prearranged pattern in spite of Stoppard's insistence that he does not know how his genius works. Commenting on Stoppard's tendency to construct his plays, however absurd and surrealistic their actions are, Billington (1987) points out:

What knocks the play on the head for me is that Stoppard never really rejoices in the absurdities of family life. Stoppard is more orderly, and consequently he misses some of the fun of the arbitrary, the accidental, the unforeseen, the irrelevant which gives life to drama. (p.90)

Inspector Foot deduces from the characters' apparently contradictory versions of what they have seen that it was he who hobbled up to Harris's car. During the blackout, as Harris extracts the bulb, Foot tells us that he left his car outside his house in Ponsonby Place one night and woke up late in the following morning. Upon seeing a car pulling away from the only parking space in the road, Foot stopped shaving, rushed into the street, seized his wife's bag and parasol which he failed to open, and, in his haste to put on his pyjamas, he put both feet into the same leg. In other words, the whole puzzle about the burglar was the result of the Old Lady's misleading report about the scattered coins on the pavement, because leaving unconsciously the handbag open, Foot scattered the money all his way back to his home. (pp. 45-6)

When the light comes on again, the audiences see the characters in yet, another bizarre spectacle, which is as grotesque as the earlier ones. Unable to interpret it, Holmes recoils in paralysis. The scene runs as follows: The Mother stands on one bare foot only on a wooden chair, playing the tuba; Foot is standing on one foot, wearing sunglasses, and eating a banana; Harris, blindfold, is standing on one leg and counting to test Foot's hypothesis that a blind man cannot stand on one foot; and Thelma is crawling around the table sniffing and searching for a needle to mend her evening dress.

Beyond this, Stoppard hardly provides information on the characters themselves. It is as if he reports to us a series of images he has seen in one of modern painting galleries. In other words, the characters lack psychological depth. For instance, we do not know anything about Thelma and Harris except their interest in attending parties, about Foot except his love of details and precision, about The Mother except her enthusiasm to play the tuba, one of the favorite objects in the paintings of Magritte. Hearing that tubas are figured in his exhibition in the Tate Gallery, the Harrises decide to take her there, thus initiating the whole chain of subsequent events in the play.

Accordingly, the play deals with what happens after the Harrises visit Magritte's exhibition. It further shows to what extent Stoppard has exploited Magritte's style of painting in the dramatic construction of the play.

It is not surprising to know that Magritte is one of Stoppard's favorite artists. In fact, what attracts Stoppard towards Magritte is an affinity with the painter's sense of humor, and an interest in his argumentative insistence that object and image are not identical, that similarity can never be considered a proof of identity, and that there is no logic of causality to map the relations between things, images and names. (Hayman, 1979, p.144) Accordingly, Stoppard, like the Belgian painter, questions the nature of perception and our ability to perceive clearly the images presented to us. To both of them, truth is relative and constantly distorted by our personal desires and prejudices. Commenting on Stoppard's application of Surrealism, Brassell (1985) points out:

Following Magritte's theory, Stoppard creates a pair of three dimensional, quasi-surrealistic canvases in which there is a minimum of movements...and the visual arrangement of setting takes absolute primacy. The description of the controversial figure in Ponsonby Place has a certain surrealistic quality too. (pp. 100-101)

Like most surrealistic painters, Stoppard rearranges the ordinary objects in the most unexpected way. In the visual as well as verbal puzzles he presents in *After Magritte*, he draws his audience's attention to daily life objects which lost their appeal and ceased to attract our attention. In this way, he asks them to rediscover things around them in order to view them in new and unexpected ways. Consequently Stoppard often creates a work of art which escapes the possibility of having any direct rational meaning. Hence, its appeal to the subconscious and imagination rather than to the perception and senses. This accurately befits the surrealist doctrine which considers the subconscious and imagination as the sources of the artist's inspiration.

Stoppard's next play after *After Magritte* is *Jumpers* (1972). As a play, *Jumpers* achieved what *After Magritte* failed to: to affirm Stoppard's dramatic genius and ensure him a wide literary fame as a first-rate modern dramatist of everlasting importance. *Jumpers* is basically a play about love, an assertion of man's need for love, humility and charity in a mechanistic world. In this respect, as Cahn puts it, the play represents a "positive step out of the disjointed world of the tradition of the absurdists" (Ibid.). Love, which is the central Surrealist theme, is presented in

variety of forms; love of man for woman, of man for his vocation, and of God for man. Also, there is the love of power over others, which is presented through Archie.

As a surrealist play, *Jumpers* celebrates the world of the irrational, of mystery, of the unexpected within man's life. Stoppard, in reminiscence of *After Magritte*, teases his audience's expectations with various perplexing visual puzzles, which are logically explained afterwards. In this respect, Jonathan (1975) points out that "*Jumpers* is a mildly surrealist farce which plays with confusions and cross purposes like Stoppard's *After Magritte*. [It] involves switches between reality and various kinds of illusion" (p. 5). The play opens with two visual tableaux, in which we see, in a pseudo-surrealist mode, a brilliant juxtaposition of various incongruous and disparate realities. Hayman (1979) makes a comparison between the metaphysical poets and Stoppard's dramatic style, in the sense that their literary output contains "the most heterogeneous ideas yoked by violence together" (p.141). Violence, as Hayman points out, was to become a policy for the Surrealist. André Breton says: "For me, the only real evidence is a result of the spontaneous extra-lucid and defiant relationship suddenly sensed between two things which common sense would never bring together" (Ibid). Stoppard's plays, as a matter of fact, are full of relationships, among other things, which common sense would never have brought together.

The first five pages of the play feature a series of puzzling tableaux. Archie, unseen, is a master of ceremonies at Dotty's party. He announces the reappearance of the much-missed and much-loved star of a musical comedy, Dorothy Moore. This is followed by a series of incoherent songs by Dotty, who describes herself as "unreliable and neurotic" (Stoppard, 1972, p.17). (All subsequent quotations are from this edition). After that, the audiences see a dazzling spectacle of the poker-faced secretary performing a striptease on a swing hanging from a chandelier. She moves like a pendulum in and out of the spotlight, and each time she appears, she takes off some clothing. Another character on the stage, Crouch, is bewildered by what is going on, because "*every time he turns downstage, the secretary is in view behind him, and every time he looks upstage, the gap is empty*" (Ibid, p.18).

The second tableau is a vivid theatrical spectacle. It begins with Archie announcing the appearance of the "INCREDIBLE-RADICAL!-LIBERAL!!-JUMPERS!!," (Ibid) four of which come from either side of the stage, jumping, tumbling, and somersaulting. What is important is that when we first hear of the word 'Jumpers,' it is coupled with the name of a political party and it soon acquires an overtone of expediency. 'Jumpers,' in fact, acquires multiple meanings as the play progresses. The jumpers form a human pyramid and stand on each other's shoulders in a 3-2-1 formation. Stoppard says that "the initial impetus for the play...is an entirely visual image. ...the image of a pyramid of gymnasts, occupying the stage, followed by a gunshot, followed by the image of one gymnast being shot out of the pyramid and the others imploding on the hole" (Hayman, 1977, p.5). Dotty looks down in surprise as the dying man pulls himself against her legs, shedding blood on her white dress.

These events force us to wonder what an extraordinary household George's is! This is done deliberately in order for the audience to prepare themselves for any theatrical eccentricities that may confront them. In fact, the play, as we shall see, ends just as it begins, with a seemingly dream-like and surreal sequence of events. Therefore, the audience must keep in mind that Dotty and George's world is not an ordinary one.

The ideas of the play revolve around issues concerned with moral philosophy, which Professor George, a deist in Archie's materialistic university which serves as a microcosm for the new British society, will be debating in a departmental symposium. Theatrically, the play is about a professor dictating a lecture to his secretary while, in the next room, his wife is trying to hide the corpse of the murdered jumper.

Ironically, while George is trying to bring order to his chaotic world through philosophy, the real world that surrounds him appears "crazily surreal in its bizarre and dream-like progress" (Morwood in Bareham, 1990, p.126). Moreover, as a character, George is sometimes comically presented. For example, he wears unmatched socks, tries to drink from a tumbler full of pencils, and answers the front door, in reminiscence of *After Magritte*, with "*a bow-and-arrow in one hand and a tortoise in the other, his face covered in shaving foam*" (p.43).

George explains that the acrobatic troupe contains "a mixture of the more philosophical members of the university gymnastics team and the more gymnastic members of the Philosophy School" (p.51). As a young man, Stoppard must have come across many cultural trends and philosophical movements in the seventies and the play's characters

testify to this. The members of the university are combination of “logical positivists...linguistic analyst...Benthamite, Utilitarians, Kantians...Empericists...[and] Behaviorists” (pp. 50-51).

The jumpers are led by Archie, a jack of all disciplines and the power behind the new Rad-Lib Government. He is a man of no convictions whose actions spring wholly from elastic pragmatism. Believing goodness and truth to be unknowable, he condones whatever is expedient. Duncan McFee opposes Archie’s epistemological relativism, believing that “good and bad aren’t actually *good* and *bad* in any absolute or metaphysical sense,” for he actually believes them to be “categories of our own making, social or psychological conventions which we have evolved in order to make living in groups a practical possibility” (p. 48).

Therefore, in Archie’s world, where good and bad do not exist, McFee’s conventions are very important, because they enable the gymnasts to jump to any number of philosophical, psychological and political positions.

However, in the second Act, Stoppard chooses to disclose the fact that the murdered jumper, who was shot out of the pyramid in the opening scene, was indeed McFee himself. At the end of the same act, the audiences are told by Crouch of McFee’s decision to leave the university, break off a clandestine affair with George’s secretary and to enter a monastery. This happens after McFee’s recognition of the possibility of altruism, the existence of good and evil and, in effect, of moral absolutes in our lives.

When Stoppard was asked if the play was a political one, and why he avoided discussing political issues explicitly, he insisted that all political questions hinge on more basic questions of morality: “*Jumpers* obviously is not a political play, nor is it a play about politics, [or] ideology...The play reflects my belief that political acts have a moral basis to them and are meaningless without them” (Stoppard, 1974, p. 12).

This means the crushing down of any position the jumpers leap to, since they remove the premise that moral absolutes do exist. In this way, Stoppard is siding with George against Archie who holds a materialistic view of life which is considered by Stoppard an insult to the human race. Stoppard asserts here man’s need for things other than materialism and rational thinking in his life.

In addition, George’s long speeches throughout the play reveal his certainty, not only of the existence of moral absolutes but of a realm of a spirit which transcends both the Darwinian view of man as animal and the Marxist view of man as a material.

Moreover, George does not dismiss humanity as valueless, nor does he offer a humanistic view that mankind is the measure of all values. Rather, George sees human imperfection and, in this way, reiterates Stoppard’s belief in the “perfectibility of society, and the concomitant of that belief is a recognition of its imperfection. That’s why I am not a revolutionary person, I don’t believe that the painful progress towards the perfect society happens in revolutionary spasms. I think it is a gradualist thing of growing enlightenment, I believe in the contagious values” (qtd in Roberts, 1978, p. 86).

This optimism which Stoppard advocated is what links him to the surrealists. He thinks hopefully of the future, of man’s ability to transform his life to something better. It is not necessary, for him, to wait for revolutions and political actions to free man. Freedom, to Stoppard, is man’s responsibility. Consequently, man is not a puppet in an absurd universe; he is an active participant, fully aware of his limited abilities as a fallen creature, yet capable of exploiting what is available in order to improve his living conditions.

George is a staunch believer in God and in moral absolutes which he finds embarrassing nowadays. His values cannot survive in the universe where quarrelsome jumpers can land on the moon, and churches are converted into gymnasiums. Stoppard also believes in the existence of an ultimate external reference for all our actions, that our view of good behavior must not be relativist and that it is wrong and unacceptable to rely on social conventions in our judgment of what is good and bad. This leads him to the conclusion that if “our behavior is open to absolute judgment, there must be an absolute judge” (qtd in Delaney, 1990, p.47). The play, then, seems to be a celebration of the spirit, of moral instinct and of a metaphysical realm within the modern world.

The other character, through which Stoppard presents his own concept of the world’s irrationality and love, is Dotty. Dotty’s role is sometimes wrongly dismissed as unimportant, especially if we regard the weighty philosophical arguments in the play. However, hers is a vital one, which helps to illuminate and emphasize the dilemma of modern man. She is the first character to appear on stage and has the last words in the play. Although, Dotty is mentally disturbed, as she cannot distinguish one moon song from the other, she occupies a unique position in the structure of the play for a number of reasons. First, she forms the centre of emotional interest for three male characters in the play; second, she plays a special role in the murder investigation; and finally, she is to become the medium through

which the impact of moon landing is illustrated. Throughout the play, Stoppard uses the idea of madness associated with the full moon in his portrayal of her disintegrating world.

Her work as a musical comedy performer affects her view of things: she is mindlessly optimistic and romantic. Her beliefs centre symbolically on “that old-fashioned, silvery harvest moon, occasionally blue, jumped over by cows and coupleted by Junes, invariably shining on the one I love” (p.41). For her, people are not good or bad, but eternally hopeful, full of limitless possibilities. George first thinks of her when she enters his class as the “hyacinth girl” (p.33), a symbol of hope and renewal in T. S. Eliot’s “The Waste Land.” (Morwood in Bareham, 1990, p. 127)

Presently, Dotty realizes the shallowness of her beliefs in this world of uncertainties and crises. Crump (1979) analyses Dotty’s plight penetratingly. He says that Dotty represents man’s nature, uncomplicated and unrefined by intellect, emotions or appetites. She is an entertainer and spends most of the time in her bedroom. She has been psychologically traumatized by the triumph of rational materialism in the modern world, represented by the activities of the Rad-Lib Party on the one hand, and by the technological achievements such as moonlanding on the other. (p.359) Actually, Stoppard wants to indicate, through the disastrous incident which takes place on the moon, the impact of technology on man’s spiritual values. Dotty’s suffering is deepened by what happens on the moon. The spaceship is so damaged that only one astronaut is capable of returning to earth. Captain Scott and Astronaut Oates struggle until Oates is knocked to the ground to be last seen by millions of television viewers as that “tiny receding figure waving forlornly from the featureless wastes of the lunar landscape” (p.22).

This incident destroys the planet’s aura of romance and poetry. The moon becomes a land of desolation and ugliness. Technology has defiled Dotty’s romantic ideals, and her metaphysical world is left in fragments. In a passionate speech, she laments the demise of moon in poetry, citing Keats, Shelly, and Milton (p.41), and, as a university graduate, she tearfully reflects that moon landing has made the world seem little and local and has undermined the absolutes men previously took on trust. She is appalled by this vision of the moral anarchy that she believes will be unleashed. (p.75)

Dotty’s realization of man’s evil and the inadequacy of her optimism should not be confused, Delaney (1990) affirms, with the existentialist despair that life is meaningless. Her collapse into insanity signifies the persistence of emotional and spiritual needs, which seem irrational when viewed from a sane and materialistic perspective. She longs for something incredible rather than credible. She wants to believe in God, the soul, or right and wrong, absolutes which the jumpers refuse to believe in. (p.51) Her blight thus corresponds partially to that of modern man, who is in constant search for means to function in a grim and chaotic world, from which the spiritual consolations of the past have been withdrawn.

The moments of the most intense feeling in the play are those in which she pleads for George’s emotional support that might make her life worth living. It is worth mentioning here that *Jumpers* is the first of Stoppard’s plays to explore human relationship in any depth. For example, Dotty and George make convincing, though unsuccessful, attempts to come at with each other. George, whose lecture tries to prove that man is good or bad but not indifferent, fails Dotty and remains inhumanely indifferent to her feelings and pains.

Moreover, Dotty’s involvement with George, Bones and Archie signifies three types of personal relations, from which one may find some emotional support and understanding. This also represents, as Crump (1979) suggests, “three stages in the historical development of the relationship between man and woman,” in the sense that George offers traditional married love, Bones offers idealistic and romantic love while Archie offers merely physical relationship of the modern type. (p. 360)

Dotty also forms, along with the other female character, the secretary, part of the puzzling reality the men try to interpret. Both women play scenes of physical exposure. Stoppard, as a surrealist artist, invests woman with an air of enigma, which like the world, defies man’s rational thinking and scientific approaches. She is part of the irrationality of the world, of its mystery. In this way, she is a true surrealist heroine.

The play ends with a Coda, which is dramatically important, for it recapitulates the themes of the play. As audience, we see in a bizarre dream form the departmental symposium, George’s failure to bring order to his chaotic world, to help Clegthrope in his ordeal, and also the murder of Clegthrope. The Coda carries out McFee’s prediction: “I have

seen the future...and it's yellow" (p.80), in clear reference to the Jumpers' yellow uniform. It is Archie's world, not George's; a world of meaninglessness and chaos. Billington (1987) rightly recognizes that *Jumpers* demonstrates that "a world that denies the metaphysical absolutes of good and evil, that sunders any tolerance of the irrational, that subverts moral sanctions...will fall into chaos" (p. 87).

Archie interrupts George's attempts to confirm the values he believes the world should hold, insisting:

Do not despair-many are happy...more eat than starve, more are healthy than sick...and one of the thieves was saved...vast areas are unpolluted; millions of children grow up without suffering deprivation...and millions, while deprived and cruelly treated, none the less grow up...Wham, bam, thank you Sam. (p. 87)

Archie's statement represents an acceptance of the status quo, a reconciliation with the state of absurdity that Beckett has dramatized. Nevertheless, Archie is not pessimistic about the future, as he urges us to see only the good in life, for there is little use in dwelling on the negative aspects. Archie's speech vindicates the most crucial theme of the play: that mankind is not simply a passive victim in the world, but can be an active participant. Our world is full of miseries and bad things, the play suggests, but man's task is not to submit or wait endlessly for someone to save him, he must create his own world.

Stoppard, through George, Clegthroe and McFee, is protesting against such a world vision. George's speeches represent a reaction against modern man's denial of all values and are affirmation of the belief that something within us makes us human, something which makes us believe in goodness and beauty. Clegthroe was killed because of his decision to shift from agnosticism and of his insistence on "find[ing] room for man's beliefs" (p.84). Archie orders Clegthroe's killing because he cannot tolerate the intrusion of spiritual values into his bleak world order. Those characters' actions assert that man is not a mechanical object in this world, without heart to feel and a soul to yearn. Man must move beyond materialism and must go in search for spiritual realms, for the irrational. As a matter of fact, irrationality stamps us as human. So, the play, as a whole, insists on the innate goodness in man, that he must be hopeful and active in this world, however bleak it may seem.

*Artist Descending a Staircase* (henceforth *Artist*) was broadcast in the same year as *Jumpers* (1972). This play is considered Stoppard's radio masterpiece, although he undervalues it, describing it as merely a "dry-run," (Hardin, 1981, p.156) for ideas that will appear in his stage play *Travesties* (1974). However, *Artist* turns out to be one of Stoppard's most highly praised works. As in all his other radio plays, Stoppard exploits the opportunities the radio, as a medium of dramatic action, offers, to the extent that much of the play's meaning resides in the radio performance, and cannot be captured on stage, on screen, or even in print; it depends heavily on sounds and our proper explanation as to what they mean.

The play addresses itself to many crucial issues in modern art which again reflects Stoppard as that relentless dramatist who never tires of moving endlessly from one point to another in his plays, hence his plays' everlasting importance. In *Artist*, Stoppard repeats the same methods used in *Jumpers* and *After Magritte*, that is of presenting a group of characters whose interpretations of the plays' puzzles, audible this time, are as different as their personalities and personal predilections. Stoppard, in this respect, always insists that his plays represent:

A series of conflicting statements made by conflicting characters, and they tend to play a sort of infinite leapfrog. You know an argument, a refutation, the rebuttal of the refutation, then a counter-rebuttal, so that there is never any point in this intellectual leapfrog of which I feel that is the speech to stop it on, that is the last word. (Stoppard, 1974, pp. 6-7)

The characters in *Artist* express different viewpoints regarding the problem of artist innovation, freedom, love, truth, all along with other crucial issues the play touches, such as the 'usefulness' of the artist to his society, the impact of literary works on society or whether the artist has the ability to change his society, and who is the artist. As Donner explains to Martello, looking back on their days in Paris of the World War I, all art, whether rational which celebrates reason, history and logic, or their own "anti-art of lost faith...[became] the same insult to a one-legged soldier and the one-legged, one-armed, one-eyed regiment of the maimed"(Stoppard, 1973, p. 27). (All subsequent quotations are from this edition.) This view clearly indicates the state of affairs after World War I: everything became meaningless and an object of ridicule including art itself when measured against the atrocities of the war.

In this sense, *Artist* is a serious play that makes a shift in Stoppard's artistic tendencies. After denying a direct involvement in the socio-political preoccupation of his time, Stoppard now admits that "there is no such thing as 'pure' art-art is a commentary on something else in life...I think that art ought to involve itself in contemporary

social and political history as much as anything else” (qtd in Roberts, 1978, p. 84). In this way, *Artist* is a commentary on the literary and artistic tendencies that dominated Europe in the period between 1914 and the time of writing the play, i.e., 1972.

In *Artist*, characters adopt various literary trends which range from realism to surrealism. Beauchamp, one of the three artists, who carries the central debate in the play, busies himself with tonal art, a surrealist tape-recording of apparently unrelated and frequently unidentifiable sounds. To Beauchamp, the mind is a tablet upon which has been inscribed the manifestoes of realism, and that man is capable of new experience if his means of expression are liberated. For him, “Art consists of constant surprise. Art should never conform. Art should break its promises. Art is nothing to do with expertise: doing something well is no excuse for doing the expected” (p. 42).

In this way, Beauchamp is a true Surrealist: he believes that man must liberate himself first, because only through this he will be able to rediscover things around him, as this liberation will provide him with new means of expression. His art will be a series of surprises for the viewer as well as the reader. In short, he must always look for the unexpected and the hidden.

Donner, the other artist in the trio, holds the opposite point of view. In his youth, he was attracted to Avant-gardism, the movement of experimentation and surprise, but he is now engaged with realism, with what the eyes see. He tells Beauchamp: “I have returned to traditional values, that is where the true history of art continues to lie, not in your small jokes” (p.22). Donner, then celebrates those literary forms we have labeled as Realistic. He will do the expected. He believes that, by conforming to the expectations of every man, he has rediscovered the criterion which decides the value of the work of art and also the link between art and life. Thus, his works become an imitation of life itself, i.e., nothing unexpected.

Martello criticizes both his friends’ opinions on art. For him

Painting...is a technique and can be learned, like playing the piano. But how can you teach someone to *think* in a certain way?-to paint an utterly simple shape in order to ambush the mind with something quite unexpected about that shape by hanging it in a frame and forcing you to see it, as it were, for the first time. (p.39)

This recalls the surrealists’ belief that anyone can be an artist once he is liberated. Paul Eluard says that anyone can be a poet, since imagination and the subconscious are characteristics we all share. This also reminds us of Duchamp’s “ready-mades,” and his assertion that any object can be an artistic object by the simple choice of the artist; that is to choose objects from our daily life, put them in a frame and force the viewer to look at them in a new way.

Through Martello, Stoppard uses once again the idea of ‘ambush’ to describe those moments of discovery and revelation in man’s life. Stoppard, as a surrealist, tends to arouse his audience’s expectations in a certain direction, then he surprises them from another. Significantly, he describes his own plays as advancing through a “series of small, large, and microscopic ambushes- which might consist of a body falling out of a cupboard, or simply an unexpected word in a sentence” (Stoppard, 1974, p.6). Martello is the most important character in the play. He often uses words and phrases unexpectedly. He once says: “...my brain is on a flying trapeze that outstrips all possibilities of action. Mental acrobatics, Beauchamp- I have achieved nothing but mental acrobatics-*nothing!*- whereas you, however wrongly and for whatever reason, came to grips with life at least this once, and killed Donner” (p.16). The fun that underlies these statements makes us, Sammelles (1988) suggests, take a second look at language. It means that Martello uses clichés to hang up language in a frame, forcing us to see it, as it were; for the first time. (p.30) In fact, the comic exchanges among the three artists help to show us that talk is inconclusive, evasive: it creates confusion, not clarity. The following passage, for example, entertains us by leading us astray:

Donner: I think, in a way, edible art is what we’ve all been looking for.

Martello: Who?

Donner: All of us!- Breton!-Ernest!-Marcel-Max-you-me remember how Pablo used to shout that the war had made art irrelevant?-Well-

Martelo: Which Pablo?

Donner: What do you mean which Pablo?- *Pablo!*

Martello: What, that one-armed waiter at the Café Suisse! (p. 26)

In this audible scene, as listeners, we tend to take Pablo for Pablo Picasso, because we depend in our understanding on hearing only. The play, as a whole, abounds in such audible illusions, especially if we take into consideration that most of the events in the play are the old men's memories. They usually cannot remember the exact names of places or persons.

The play, furthermore, shows Stoppard as being influenced by the surrealist artist, Marcel Duchamp, who was known in America long before the Europeans paid him any heed. He was discovered by the British towards the end of his life. The first major Duchamp exhibition in Europe was held at the Art Council in Britain, in 1966. During the exhibition, BBC Television showed a film about him entitled 'Rebel Ready-Made'; and the Art Council issued a catalog including nearly all his works. Guralnick (1990) suggests that Stoppard might have visited this exhibition, because this play reveals, among other things, his extensive knowledge of Duchamp, and that he developed "so preternatural affinity with [Duchamp] that even the play's least assuming details have demonstrable connections to the artist" (p.291).

The title of the play echoes Duchamp's "Nude Descending a Staircase," one of the most famous paintings in the twentieth century. This painting shows Duchamp's experimentation with motion while the Cubists and every other modern painter had abandoned the subject. Duchamp also sensed the contemporary fascination with machinery. For nearly all his life, he was so intensely modern that much of his work eluded and outraged even the avant-garde. Moreover, Stoppard's title implies that Duchamp is the "giant who casts in the shadow those pygmies Beauchamp, Martello, and Donner," who are nothing themselves if not "versions of Duchamp himself, cubistically fragmented" (Ibid). Indeed, the whole play is in essence a translation of Duchamp's famous painting. For, just as the painting is a portrait of a nude who emerges from the interplay of geometric shapes that attempt to evoke her, the play is a portrait of an artist, Duchamp, who emerges from the interplay of innumerable allusions to his life and work.

Beauchamp, in particular, resembles Duchamp. Like Beauchamp, Duchamp devoted himself for decades to eccentric projects, such as motorized optical experiments and miniaturized production of his major works. In addition, he turned his attention to chess, eventually publishing a book on the subject and competing in international tournaments. Painting, Duchamp contended, bored him: he was wary of art that appealed to the eye instead of the mind. He once said: "I am interested in ideas- not merely the visual products. I want painting once again to be in the service of the mind" (qtd in Roth, 1973, p. 463).

In this way, he is very much like Beauchamp, who defends his recordings saying: "I am trying to liberate the visual *image* from the limitation of visual *art*. The idea is to create images-pictures-which are purely *mental*...I think I'm the first artist to work in this field" (p.36).

Furthermore, Beauchamp's ludicrous tapes of ping-pong recall Duchamp's "musical work," which he produced with John Cage in Toronto in 1968. This work consists of a chess game played on a board that had been wired for sound. Even Beauchamp's recordings of silence evoke Cage and Duchamp, as it is evident from one of Duchamp's provoking pronouncements:

Happenings have produced into art an element no one had put there; boredom. To do a thing in order to bore people is something I never imagined! And that's too bad, because it's a beautiful idea. Fundamentally, it's the same idea as John Cage's silence in music, no one had thought of that. (qtd. in Guralnick, 1990, p. 292)

The correspondence among Duchamp, Martello, and Donner is also interesting. Martello's "mental acrobatics" remind us of Duchamp's insistence on not taking his artistic endeavors- though they often cause critical uproar-too seriously (Richter, 1965, p.87) Besides, Martello's attempt to create "a wooden man with a real leg"(p.32) mirrors Duchamp's proposal to create a number of projects that earned the name of art, purely by being impossible to create. (Ibid., pp. 89-90) More important, Martello's bust of Sophie, the only female character in the play-with its hair of ripe corn, teeth of pearls, feathers upon her swan-like neck- recalls Dali's 'Ruby Lips,' a work that "takes literally the romantic cliché of lips like rubies and teeth like pearls"(Guralnick, 1990, p. 293).

Donner's curious proposal to make art edible is by sculpting a Venus de Milo in sugar or a thinker in salt. (p.26) his sugar art alludes directly to Duchamp's wooden birdcage filled with sugar cubes sculpted from marble-a work that amazes us as unexpected. Finally, Donner's interest in "justify[ing] a work of art to a man with an empty belly," recalls Apollinaire's predication that "it will be the task of an artist as detached from aesthetic preoccupations, and as

intent on the energetic as Marcel Duchamp, to reconcile art and the people” (Guralnick, 1990, p. 293). Donner is also the only character in the play who refers to Duchamp directly, when he quotes him, saying: That was Marcel...I think he had talent under all those jokes. He said to me, ‘There are two ways of becoming an artist. The first way is to do the things by which is meant art. The second way is to make art mean the things you do.’ What a stroke of genius! It made everything possible and everything safe!- safe from criticism since our art admitted no standards outside itself; safe from comparison, since it had no history; safe from evaluation, since it referred to no system of values beyond the currency it had invented. (p. 24)

This is an exact summary of avant-gardism. It reflects modern times search for change and experimentation, for new criteria, methods, techniques that would be appropriate. It also reflects the surrealist doctrine of making everything possible and the surrealist’s constant search for new techniques to embody their ideas. One more similarity between Donner and Duchamp lies in their return to Realism after the Dadaism of their youth and after experimentation with almost every kind of abstract art.

What is significant here, is that Sophie is the cause behind Donner’s conversion. Her first meeting with the three artists took place just after World War I ended, in 1919, in their joint exhibition, ‘Frontiers in Art,’ which consisted of series of pictures of fences and barbed wire. She was attracted to the face of one of them, though she was not sure who was who, because her sight was failing when she visited the exhibition. In 1920, Sophie becomes totally blind. She visits the attic, where the three artists lived, and, from her description of the newspaper photograph, they realize that the one she fell in love with was actually Beauchamp who stays with Sophie for two years. Consequently, he decides to desert her, although she informs him of her constant need for him. She is utterly blind now and rejected by the man she loved. In doing this, Beauchamp shows an innate lack of feeling. Sophie’s situation, in fact, creates the first centre of pain in the play. The second centre is related to Donner, who is the most sensitive of the three artists. He was the first to recognize Sophie at the exhibition and he believed they exchanged a look. When Beauchamp deserts her, Donner expresses his desire to stay with her, but she tells him that she has lost her ability to fall in love:

Sophie: (*Cries out*) It’s not possible!...-What are you thinking of, Mouse?...We can’t live here like brother and sister. I know you won’t make demands of me, so how can I make demands of you? Am I to weave you endless tablemats and antimacassars in return for life?... (p. 49)

Sophie wants real love; she does not want to be the object of others’ pity. While she is speaking, her panic at the silence of the room is intensified by her sense of helplessness and exposure, which ultimately culminates in throwing herself through the window. In this way, she vindicates Martello’s description of her as a “nice girl due for a sad life” (p. 51).

Donner is sincere in his love; he remains constant to Sophie’s memory. This explains his anger and rejection of both Beauchamp’s criticism of his post-pop, Pre-Raphaelite portrait of her and of Martello’s metaphorical surrealist figure of her. He tells Martello: “What right have you to sneer at her memory?-I won’t allow it, damn you! My God, she had a sad enough life without having her beauty mocked in death by your contemptible artistic presumptions” (p. 28).

Just before the play ends, in the ninth flashback, Martello reveals to Donner his suspicion that it might have been Donner not Beauchamp whom Sophie loved. We do not know the real motive behind Martello’s decision to tell Donner. What is important is the impact of this revelation on the latter. Fired by his love, he decides to abandon avant-gardism to adopt a more realistic attitude towards art. So, just before his own death, he becomes a committed artist engaged in a realistic portrait of his beloved, Sophie. In short, he discovers himself as an artist, as soon as he discovers that Sophie might have loved him. Stoppard, through this dénouement, suggests that love, sympathy and openness are essential to the artist. Donner is finally redeemed by his ability to love and to feel.

In this play, Stoppard once again confirms man’s need for love and sympathy. Sophie says: “I will not want to be alone, I cannot live alone, I am afraid of the dark; not *my* dark, the real dark” (p.49). She refers, here, not only to her blindness, but to a life of loneliness, misery and solitude, if she does not find someone to love or communicate with.

Sophie, in her own way, tries to define love, that world's mystery, which is at the centre of man's existence, and one of the most important preoccupations of philosophers, thinkers, artists, and even scientists. For Donner, his unrequited love means, before Martello's revelation, that: "even when life was at its best there was a small part missing and I knew that I was going to die without ever feeling that my life was complete"(p.51). What was missing in Donner's life was a woman's love. But, once he knows that the one Sophie loved might have been him, he imagines, hopefully the happy life they might have led if they had lived together. Sophie's portrait brings her closer to him. His love and her memory endow his work with meaning.

Finally, in a typical surrealist manner, Stoppard tends to remove the situations presented in these plays from reality. *After Magritte* presents a situation more indicative of a modern surreal painting than one likely to happen in real life. Most of the events in *Jumpers* are presented in a dream-like form which are crazily surreal in their bizarre and strange atmosphere. Stoppard tries in these plays to convey bewilderment of modern man who is put under constant pressure from the outside world.

The plays discussed in this paper represent an invitation for man to enjoy and celebrate life. In spite of the bleak world and the total incomprehension the characters suffer from in *Jumpers*, George wonders that even the logical positivist believes that: "life is better than death, that love is better than hate, and that the light shining through the east window of their bloody gymnasium is more beautiful than a rotting corpse" (p.87).

Stoppard in *After Magritte* stresses the fact that irrationality is a part of our world, while *Artist Descending a Staircase* stresses man's creative abilities and at the same his need for love and sympathy. All these plays seem to stress the fact that there is more in life than we expect. This is clearly evident in George's belief that 'there is more in [him] than meets a microscope,' vindicating thus the inadequacy of modern man's scientific approaches to life.

## AIMS AND SCOPE

The international journal of language learning and applied linguistics world performs as a platform for the new scholars to share their insights with other scholars in the form of original papers.

The international journal of language learning and applied linguistics world is a double-blind peer-reviewed international journal dedicated to promoting scholarly exchange among teachers and researchers in the field of language teaching and applied linguistics. Papers submitted to the journal will immediately be sent to two related reviewers who are responsible to provide feedback on the content and the language use.

The journal is published monthly in online and print versions. The scope of the journal includes, but not limited to, the following fields:

*Theory and practice in English*

*Language teaching & learning*

*Teaching English as a second or foreign language*

*Applied linguistics*

*Discourse studies*

*Syllabus design*

*Language learning problems*

*Computer assisted language learning*

*English for specific purpose*

*English for academic purpose*

*Language teaching & testing*

### ABSTRACT

Measuring the difficulty of the tasks and the cognitive loads they require have been always controversial. Besides, students themselves do not have a clear understanding of their fluency according to the level of task complexity. Assessing the oral production in terms of fluency based on subjective evaluation is one of the main results of the lack of empirical studies regarding task structure and its relation to fluency. This study was an attempt to bridge the gap in literature by exploring the effects of task complexity on the quality of learners' linguistic output, especially in fluency. Thirty Iranian EFL learners between the ages of 21 to 34 participated in this study. Some sets of picture narration tasks based on Robinson's resource-directing model were selected for the aim of the study. All the subjects were asked to perform the simple version as well as the complex version of the same picture narration task. The results of a parametric test of MANOVA revealed that increase in task cognitive complexity had no statistically significant effect on fluency. The outcome of this study might shed new light on designing tasks with appropriate level of cognitive complexity.

**KEY WORDS:** Fluency; Task; EFL Learners; Cognitive Complexity

### INTRODUCTION

It is assumed that among all the four skills (listening, speaking, reading, and writing), speaking is the most important one. People who know a language are referred to as a "speaker" of that language as if speaking covers all other skills. In addition, many language learners are eager to speak fluently. Proficient language speakers need to be capable of processing language in their own heads and put it in coherent way so that it is not only comprehensible but also can transfer the intended meaning. Rapid language processing is one of the main reasons for including speaking activities in language. This process includes the retrieval of words and phrases from memory into syntactically and propositionally proper sequence. Our aim is to process the information in the moment we get it. The longer it takes us to reply, the less effective and fluent language speakers we are in our communication (Ur, 1996).

To Segalowitz and Freed (2004) the term oral fluency refers to those aspects of oral performance associated with the smoothness of the language use. They consider fluency in terms of speed, hesitation-based measures, efficiency of (second language) L2-specific lexical access, and finally the attention control. It is believed that fluency could be associated with the cognitive demands that the task require. Assessing the students' oral proficiency based on the level of cognitive complexity has always been difficult for teachers; hence it is felt that we need some more studies in the field of task complexity.

### LITERATURE REVIEW

Designing appropriate tasks with an acceptable level of complexity has been the main purpose of syllabus designers for many years. In addition, some applied linguists have been interested to find out the effects of different levels of task difficulty on language learning. As different studies prove, human beings possess a limited processing capacity and are not able to attend fully to all aspects of a task simultaneously. So, in order to achieve a success particularly in oral skills reasonable level of cognitive complexity is appreciated.

According to Harmer (2001), the major elements which are necessary for spoken language are 'connected speech'. He argues that proficient speakers of English need to be able not only to produce the individual phonemes of

English, but also to use fluent connected speech. It is assumed that this fluent speech cannot be separated from the characteristics in task and task's structure.

Iwashita, McNamara, and Elder (2001) tried to define oral ability based on the characteristics of the tasks because according to them oral ability is not well defined by differences in task difficulty. In their work, Iwashita *et al.* (2001) refer to Skehan's (1998) statement regarding task dimensions and performance conditions influencing task difficulty. Among the factors addressed by Skehan (1998), time pressure and degree of visual support are significant. Other aspects of performance conditions may affect task difficulty in a more complicated way (Iwashita *et al.*, 2001).

Skehan (2003) considers various categories that have impact on task complexity or fluency:

- Familiar information: Fluent performance is the result of familiar information.
- Structured tasks: The task with clear sequential structure, will elicit more fluent and accurate performance.
- Complex and numerous operations: Increasing the number of online operations and transformation of material will lead to more difficult task. This may result in greater complexity, but at the expense of accuracy and fluency.
- Complexity of knowledge base: More open knowledge, based on which a task draws, results in more complex language.
- Differentiated outcomes: If a task outcome requires more differentiated justification, the complexity of the language will increase.

Robinson (2001, 2005) divides task variables into two categories: resource-dispersing and resource-directing dimensions. In his categorization, resource-directing dimension is linked to three elements (reasoning demands, number of elements, and here-and-now vs. there-and-then-condition). Robinson also associates resource-dispersing dimension with planning, number of tasks, and prior knowledge. The theory of *Cognition Hypothesis* proposed by Robinson relates more cognitively complex tasks to more accuracy and linguistic complexity in the oral production of learners. However, based on the *Cognition Hypothesis*, more complex tasks lead to less fluent language. Robinson relates this decrease in fluency to the anxiety of the learners.

The insufficient amount of research related to the impact of task difficulty on fluency demands more studies in this area. In this study we try to depict the influence of task type on fluency through resource-directing dimension of Robinson's model. The following research question is proposed to pinpoint the relationship between task structure and fluency.

To what extent does increase in task cognitive complexity affect the fluency of Iranian EFL learners' oral production?

## **METHODOLOGY**

This study is based on the Robinson's resource-directing model with the aim of addressing the influence of different level of complexity on the fluency of Iranian EFL learners' picture narration task. To this end, a quasi-experimental design was used to examine the effect of increase in cognitive difficulty of a task on the fluency of learners.

### ***Participants***

The participants in this study included 30 female students at the intermediate level. Their age ranged from 21 to 34. The subjects were all native speakers of Persian, and on average they have been studying English for three years at Kish Institute in Tehran, Iran. A non-random sampling was used to select the subjects from two intact classes. The participants were divided into two experimental groups with 15 subjects in each. In order to check the homogeneity, a version of Test of English as a Foreign Language (TOEFL) was administrated.

### ***Instruments***

For the purpose of the present study, two tests were administered: a TOEFL IBT test for homogenizing the students' general English, and a post-test for comparing the fluency of the two groups. To check the homogeneity of the subjects, the researchers chose three speaking assignments, two independent and one integrated task, from the book *Official Guide to the New TOEFL* by McGraw (2006).

For the treatment plan as well as the post-test, some narrative tasks were selected from the book *English Result* by Hancock and McDonald (2012). The tasks in this book were designed for intermediate level and they were appropriate for the aim of the post-test (see Appendix A).

### **Procedure**

As mentioned earlier, the participants were divided into 2 experimental groups. The data were collected from 30 subjects attending the class five times a week for a period of two hours. The researchers chose some picture narration tasks for the treatment plan as well as for the post-test purpose.

First, for checking the homogeneity of the 2 groups, TOEFL IBT Speaking Rubric was chosen. The speaking tasks were rated from 0 to 4. For the operational definition in the present study, we decided to assign 0-1 to beginners, 1-3 to intermediate, and 3-4 to advanced level. The participants' scores ranged from 1 to 3, therefore the researcher could be assured that the subjects were all at intermediate level. Then the obtained scores from 0 to 4 were converted to a score scale of 0 to 30. The results of the independent *t-test* [ $t(28) = .843, P = .406 > .05$ ] indicated that the two groups were homogeneous in terms of their general language proficiency. The mean scores for the two groups were 17.66 and 17.31 respectively which proved the homogeneity of the two groups.

Second, before administrating the post-test, we planned 5 sessions for the treatment of the 2 experimental groups. During these sessions the subjects became familiar with the post-test tasks. They were asked to take note of their mistakes and pay attention to the feedbacks given by the teacher and the researcher. The first experimental group worked on more difficult tasks (see Appendix B). These tasks required more causal reasoning and justification for the replies. The practice plan for these subjects included all the aspects which were the purpose of the post-test such as +/- reasoning demands, +/- few elements, and here and now vs. there and then condition. For reasoning demands aspect of the task, two sets of pictures were selected, one with correct order and the other with scrambled pictures. For checking the impact of number of elements on learners' oral performance, the researcher asked the subjects to narrate the story once with 9 pictures and the other time with 6 pictures (with 3 pictures missing). Finally, for the last aspect of Robinson's (2001) resource-directing model, here and now vs. there and then condition, the participants were required to tell the story once with pictures in view and another time they had to turn the picture strips over before beginning their narration. For both narrations, the researchers gave the subjects prompts and instruction. The second experimental group, however, were exposed to simpler picture narration tasks with familiar topics (see Appendix C). In this case, a set of four pictures were selected.

Third, to elicit subjects' oral performance on the post-test, a monologic picture narration task was used. The tasks in this study were manipulated along Robinson's resource-directing dimension in terms of +/- few elements, +/- reasoning demand, and +/- here and now condition. In order to reach the goal of the study, all the subjects were required to accomplish the simple version as well as the complex version of the same narrative task. The less complex tasks were associated with low complexity conditions such as [+ few elements], [+ here and now], and [- reasoning demands] while the more complex tasks involved high complexity conditions including [- few element], [- here and now], and [+reasoning demands]. In all the steps in the post-test, to avoid practice effect counterbalancing was suggested by the researchers.

Fourth, according to Mackey and Gass (2005), a reliable test should cover rater reliability including inter-rater and intra-rater reliability. In this study, post-tests were scored by 2 raters; they were also scored at different times to assure intra-rater reliability. For assessing the reliability, Pearson Correlation was estimated for both inter-rater and intra-rater reliability. Based on the results, there was a significant agreement between the first and the second raters' ratings and also between the two sets of scores which were evaluated by one rater at different times. The Pearson R-value was .97 ( $P = .000 < .05$ ). Therefore, the probability associated with the R-value was much lower than the alpha level of .05. Thus it can be concluded that the two ratings enjoyed both inter-rater and intra-rater reliability.

Finally, for scoring the obtained data from the post-test, the Iwashita *et al.* (2001) rating scale was used (see Appendix D). In this scale, fluency aspect is associated with hesitation due to word-finding, false starts, and modification of attempted utterance. In the end, a parametric test of MANOVA was conducted to present the results.

## **RESULTS**

Based on the MANOVA analysis, the findings for assessing fluency are as follows:

Based on Table 1, the results indicate that the F-observed value for the effect of the difficulty level on the students' overall fluency in oral production was not statistically significant [ $F(3, 36) = 2.94, P = .051 > .05$ , Partial  $\eta^2 = .25$ ].

This data represents a large effect size. However, the results should be interpreted cautiously because the effect size value indicates that there is a genuine effect although it was not statistically detected.

Table 1: Multivariate Tests of Total Fluency by Groups

Effect	Value	F	df	Error df	Sig.	Partial Eta Squared
Intercept	Pillai's Trace	.98	638.24	3	26	.00
	Wilks' Lambda	.01	638.24	3	26	.00
	Hotelling's Trace	73.64	638.24	3	26	.00
	Roy's Largest Root	73.64	638.24	3	26	.00
Group	Pillai's Trace	.25	2.94	3	26	.05
	Wilks' Lambda	.74	2.94	3	26	.05
	Hotelling's Trace	.34	2.94	3	26	.05
	Roy's Largest Root	.34	2.94	3	26	.05

As Table 1 represents, the F-value of 2.94 indicated non-significant difference between the overall means scores in the experimental groups on the fluency of oral production. Following the results displayed in Table 2 and Table 3, it could be concluded that on average, the experimental group 1 who performed more difficult tasks ( $M = 1.93$ ,  $SE = .13$ ) did not outperform the experimental group 2 who accomplished easier tasks ( $M = 2.20$ ,  $SE = .13$ ). The following information is obtained from Table 3:  $F(1, 28) = 2.03$ ,  $P = .165 > .05$ ,  $\text{Partial } \eta^2 = .068$ . The statistics confirm a moderate effect size, thus there was not any significant difference between the two groups' means scores on the fluency in the case of different reasoning demands.

Table 2: Descriptive Statistics of Total Fluency by Groups

Dependent Variable	Group	Mean	Std. Error	95% Confidence Interval	
				Lower Bound	Upper Bound
Fluency of Reasoning Demands	Difficult Task	1.93	.13	1.66	2.20
	Easy Task	2.20	.13	1.92	2.47
Fluency of Number of Elements	Difficult Task	2.13	.08	1.97	2.29
	Easy Task	2.06	.08	1.90	2.23
Fluency of Here-and-Now Vs. There-and-Then	Difficult Task	2.26	.11	2.02	2.50
	Easy Task	1.93	.11	1.69	2.17

Considering the number of elements, the differences between the means' score on fluency in tasks with different number of elements was not statistically significant (see Table 2). Table 3 also reveals that  $F(1, 28) = .35$ ,  $P = .55 > .05$ , and  $\text{Partial } \eta^2 = .01$ . These results proves a weak effect size, hence there was not any significant difference between the two groups' means on the fluency while checking number of elements.

Table 3: Univariate Statistics for Accuracy in Tasks

Source	Dependent Variable	Type III Sum of Squares	df	Mean Square	F	Sig.	Partial Eta Squared
Group	Fluency of Reasoning of Elements	.53	1	.53	2.03	.16	.06
	Fluency of Number of Elements	.03	1	.03	.35	.55	.01
	Fluency of Here-and-Now Vs. There-and-Then	.83	1	.83	3.97	.05	.12
	Fluency of Reasoning of Elements	7.33	28	.26			
Error	Fluency of Number of Elements	2.66	28	.09			
	Fluency of Here-and-Now Vs. There-and-Then	5.86	28	.21			
	Fluency of Reasoning of Elements	136.00	30				
Total	Fluency of Number of Elements	135.00	30				
	Fluency of Here-and-Now Vs. There-and-Then	139.00	30				

Moreover, Table 2 reveals that the first group's performance ( $M = 2.26$ ,  $SE = .11$ ) was not significantly different from the second group scores ( $M = 1.93$ ,  $SE = .11$ ) on the fluency in here-and-now vs. there-and-then task. Table 3, also proves a non-significant difference between the two groups' means on the fluency in these tasks [ $F(1, 28) = 3.97$ ,  $P = .06 > .05$ , Partial  $\eta^2 = .12$ ].

Figure 1 depicts the results for all the three elements of Robinson's resource-directing model:

Figure 1: Means scores for fluency by groups

## DISCUSSION

This study sought to explore the effects of increase in task cognitive complexity on fluency of Iranian EFL learners' oral production in narrative tasks. Considering the findings, it can be inferred that increasing the cognitive complexity along reasoning demands had negatively affected the group who performed more complex task. The second group, exposed to scrambled pictures, needed more processing time to decide on a correct order in order to narrate the story. In addition, they were under more pressure to provide correct forms. The researchers also realized that this group were monitoring and self-correcting themselves extensively while narrating the story; therefore, they were more anxious and that led to slower speech with hesitation. Besides, the time limitation, the cognitive loads of the tasks, and the fear of evaluation by the teacher had negative impact on the fluency of the subjects when they were required for more justifications. This finding is in line with Robinson's statement about the negative impact of increasing the task complexity on fluency in oral production.

However, the investigation of the impact of increase in task cognitive complexity on fluency proved that the results were not significantly different in the case of number of elements and here-and-now vs. there-and-then condition, that is, there was not a glaring discrepancy between the two groups' means in fluency aspect of oral performance. Although, Iwashita *et al.*'s (2001) findings show that a complete set of pictures (- condition) leads to more fluency in narrative tasks, there is little justification in related literatures for the effect of task complexity on fluency.

The findings regarding here-and-now vs. there-and-then condition proved non-significant differences in fluency. However, more complex task (there-and-then condition) led to more fluent speech in the current study. This outcome does not bear out the claim of Iwashita *et al.*'s (2001) about remembering and coding the events in there-and-then condition which make learners' speech less fluent.

According to Robinson (2005, as cited in Kim, 2009), the theory of Cognition Hypothesis, shows that more complex tasks may result in more accurate but less fluent speech. Robinson relates this outcome to the anxiety of the learners. In the case of reasoning demands elements in this study, it is felt that the negative impact of complex task on fluency could be due to stressful conditions as well as individual factors in learners such as intelligence.

In general, considering the previous studies and the findings in this study it could be realized that there is not a clear cut statement about the influence of increase in task complexity on fluency; this demands some more studies in the related areas to realize the inconsistencies among different findings.

## CONCLUSION

All in all, one of the most crucial aims of the Iranian EFL learners is to speak L2 without pause and hesitation. To reach this goal some studies have been conducted to investigate the effect of different task types and task constructions on the fluency of the learners' speech. The findings of the current study proved that although there was

not a significant difference between the scores of the two groups in terms of fluency, the group exposed to more cognitively complex tasks got better scores considering the number of elements and here-and-now vs. there-and-then condition in Robinson's model. Furthermore, it could be realized that by reducing the stressful conditions we may achieve better results while checking reasoning demands element.

To broaden our understanding about the ties between the task structure and the results it can have on oral production, and to gain profound insights in this field some more studies are appreciated in the related area.

#### **LIMITATIONS OF THE STUDY**

Before generalizing the results of this study to other scope, some limitations should be taken into consideration:

First, due to the time constraints this study was only based on resource directing dimension of Robinson's model. Resource dispersing dimension, including +/- prior knowledge, +/- single task, and +/- planning time, could have revealed more justification for the hypothesis in this study.

Second, the scope of this study was designed based on cognitive factors; however, interactional factors such as peers correction and feedbacks as well as intra-learner factors including intelligence could have changed the findings.

Third, gender differences were not considered in this research, and the participants of this study were all females, hence the results may not be generalized for coeducational systems.

Finally, it is felt that the small sample size in this study could have influence on external validity.

**ABSTRACT**

Feedback plays a central role in writing development. One of the crucial roles in writing instruction is the role of paragraph writing in providing feedback to students' writing. This feedback attempts to aid students to reflect on their writing. The purpose of the current study was to compare the impact of recast and prompt on EFL learners' tense awareness and their use of tense in writing. To fulfill the purpose of this study, 60 elementary learners were chosen from among first-grade students at Mesbah-e-Noor high school who were homogenized by KET Oxford proficiency test. They were divided randomly into two experimental groups to receive the two treatments: prompt and recast feedbacks. After the instructional period, a test of tense awareness and a composition test were given to both groups as the posttests, and the participants' scores were analyzed through calculating two Man-Whitney U tests, the results of which led to the rejection of the null hypotheses implying that there was no significant difference between the effect of recast and prompt on EFL learners' tense awareness and their use of tense in writing.

**KEYWORDS:** Recast, Prompt, Tenses Awareness, Writing Skill.

**INTRODUCTION**

Learning a foreign language is a long and complex undertaking. One person is affected as he/she struggles to reach beyond the confines of his/her first language and into a new language, a new culture, a new way of thinking, feeling, and acting. Many factors are involved in the acquisition process. Brown (2007) asserts that, "Language learning is not a set of easy steps that can be programmed in a quick do-it-oneself kit. So much is at stake that courses in foreign languages are often inadequate training grounds for the successful learning of second language" (p.1).

With a view of language learning as a creative construction process comes the view that error is an inevitable and positive part of that process. There are conflicting views on the role of error correction in the classroom. According to Hedge (2000), "critics were quick to point out that adult learners can be encouraged to process error correction in useful ways, and the role of the teacher is to provide feedback which learners can work on in order to refine their understanding" (p.15).

Among the different kinds of feedback the role of recast can be useful in helping learners to recognize the corrective intent of the repetition and to attempt a more target-like reformulation. Recast also resembles explicit error correction because it includes full target-like reformulation of the initial error ;however, recasts are distinctive in that they are not introduced by phrases signaling its corrective feedback spectrum ( Lyster & Ranta,1997 pp.136-137).

Another alternative type of feedback which is very commonly used is prompts which have been usually compared with recasts in classroom settings (Lyster, 2007). Prompts provide signals that stimulate learners to self-repair rather than providing them with a correct reformulation of their non-target utterance, as do recasts. The following techniques build up the very core of prompts which include clarification requests, repetition of learner error, metalinguistic cues, and elicitation moves.

Furthermore, comparing the effectiveness of explicit and implicit feedbacks Lyster (2004) noted the advantages of prompts over their more implicit opponents-recast. Learners receiving prompts showed greater acquisition than those provided with recasts on both written and oral tasks. He interpreted this as, "the result of prompts' capability of enabling students to self-repair by using accurate forms. Recasts, despite of allowing learners to hear target forms repeatedly in input, rarely make them notice and correct their own mistakes" (pp.399-426 ).

One of the grammatical aspects that learners have to notice to correct their own mistakes is using precise form of tenses. English has three main tenses (present, past, future), though, these are made more complex by existence of simple, perfect, continuous and perfect continuous form. One of the approaches that scholars have been interested in

is determining participants' attitudes to learning tenses through the use of two types of feedback. Despite the strong theoretical claims regarding the acquisition of feedback such as recasts and prompts are more effective (Ellis & Sheen, 2006 p.597).

Teaching tenses could be done through two techniques of instruction. A deductive instruction grammar provides explicit explanations of grammar tenses for themselves and an inductive one provides implicit which explains rules of grammar through examples. For Brown (2007), "On one side of a long continuum are explicit, discrete-point metalinguistic explanations and discussions of rules and exceptions, or curricula governed and sequenced by grammatical or phonological categories. On the other end of the continuum are 1) implicit, incidental references to form; 2) noticing (Ellis,1997) 3) the incorporation of forms in to communicative tasks, or what Ellis,1997 called grammar consciousness raising"(p.276 ).

As William (1988) maintains, "an array of possible spontaneous focus on form, ranging from reactive, teacher-initiated feedback to preemptive comments made in anticipation of student error"(pp.139-151).

According to Doughty and Williams (1998a), communicative language instruction in general, as opposed to simple "exposure" to a studies have shown that rate of acquisition and level of ultimate attainment in a language are enhanced by instruction. Error treatment and focus on language forms appear to be most effective when incorporated into communicative, learner-centered curriculum, and least effective when error treatment is a dominant pedagogical feature-what "called Neanderthal practices" (pp.197-261).

This research also appears to confirm that, " a primary factor in determining the effectiveness of FFI is a learner's noticing of form and the relationship of form to recast and prompt feedback being given and a secondary but important factor has to do with the quality of the learner's uptake"(Brown,2007 p.279).

Often students face problems in developing their ability to think in more meaningful or creative ways. Many of them may often be inexperienced in how to form tenses upon receiving feedback and also construct a sentence then make a paragraph. Therefore, the teacher needs to develop her knowledge through experience and eclectic theoretical techniques for discovering what kind of corrective feedback is appropriate at the given moment and what form of uptake should be expected with focusing on awareness in tenses and using them in writing skill.

## **LITERATURE REVIEW**

### ***Tense***

In this study the focus is on "tense" which according to Swan (1988) is among those parts of grammar that have an important role in conveying a comprehensible message. Different linguists have proposed different definitions for tense.

Cormie (1992) brings about a definition which seems to be more comprehensive than the rest: " tense is a grammatical category referring to the location situations in time, it is the basic grammatical category which together with lexical and other indications of temporal ordering, enables the hearer to reconstruct the chronological relations among the situations described in a text and between them and speech situation" (p.458) .

An important factor in this definition is the way Cormie(1992) treats the notion morphologically, because traditional pays great attention to the "inflectional" structure of a tense.

In order to gain insight into how EFL learners acquire morphological tense, numerous studies have examined the order of morpheme acquisition (Alderson,1997; Bailey, Madden, & Krashen, 1974; Dulay and Burt,1974; Larsen freeman, 1997; Pienemann, John, & Brindley, 1988). In addition, a great deal of research has been devoted to ESL learner acquisition of tense and morpheme meaning (Alderson, 1983; Baily, 1974; Hatch, 1976). Whereas some specialists on language and tense acquisition believe that learners acquire tense meaning before their morphological forms, others hold the opposite view. EFL teachers and L2 researchers recognized that English tenses are difficult to acquire (De Carrico,1986; Richard, 1982).

Smith (1988) indicates that his Polish students had difficulty relating to the past progressive and its form. Richard (1982) discusses the complexity of introducing English progressive tenses and their explicit and implicit meanings. Dialect variations even within English speaking societies make for significant differences in tense usage and meanings.

### ***On the nature of writing ability***

Among the four major language skills, creating coherent and extended piece of writing has always been considered the most difficult task to do in a language. Writing is a skill that even most native speakers of a language can hardly master (Zamel, 1985 pp.79-102).

Foreign language learners, especially those who want to continue their education in academic environments, usually find writing a highly difficult and challenging task. Over the years, different approaches have been adopted for teaching and assessing writing (Raimes, 1991).

Traditionally, writing was viewed as transcribed speech. It was often assumed that the acquisition of spoken language was sufficient for, and had to take precedence over the learning of written language. Therefore, teachers mostly avoided introducing writing early in the process of language learning. Because they believed that the difference between pronunciation and spelling would interfere with the proper learning of speech (Silva & Matsuda, 2002).

The primary focus of this approach (transcribed approach) was on formal accuracy. Teachers were required to employ a controlled program of systematic habit formation in order for the learners to avoid errors. The learners' writing skill was assessed mainly through discrete-point tests of vocabulary, grammar, and sentence patterns, as well as through tests of controlled compositions. Therefore, the main focus of this approach was on the students' final written products.

Later, particularly after the mid 1970s, understanding the need of language learners for producing longer pieces of written language led scholars to realize that there was more to writing than constructing well-formed grammatical sentences. This realization led to the development of the paragraph-pattern approach in which Raimes (1991) emphasized the importance of organization at extra sentential levels. The major concern of this approach was the logical construction and arrangement of discourse forms, especially to create different forms of essays. This was also product-oriented approach in which learners were required to focus their attention on forms or final products (Silva & Matsuda, 2002). The assessment in this approach was based on how well learners would be able to create error-free final products. However, these product-oriented approaches were not consistent with the new emerging idea of discourse analysis after mid 1980s which emphasized the non-linear generation of thought and its expression in the process of communication. This reaction was mostly due to the prescriptivism and linearity inherited in product-oriented approaches.

Dissatisfaction with the product-oriented approaches paved the way for the emergence of process approach to writing. According to Silva and Matsuda (2002) process approach to writing is a recursive, explanatory, and generative process or the strategies involved in writing. In the classroom, the objective of the process approach is to help the learner develop practical strategies for getting started drafting, revising and editing.

From what was said so far, writing, which was once considered the major expertise of the privileged and well educated individuals, has become an essential skill for people at all levels of education in today's global community. Writing is usually used in many communicative activities, such as composing academic, essays, business reports, letters, reporting analysis of current events for newspapers, web pages, e-mails, and/or short off-line messages in widely used messenger program. Therefore, the ability to write expressively and effectively allows individuals from different cultures and backgrounds to communicate their thoughts and their needs.

### ***Recast***

According to Long's (1996) interaction hypothesis, "environmental contributions to acquisition are mediated by selective attention and the learner's developing L2 processing capacity" (p. 414). In other words, conversational interaction may facilitate L2 learning because it constitutes a context in which L2 learners' attention is directed toward some formal aspects of the language. In particular, Long argued that "Negative feedback obtained during negotiation work where may be facilitative of L2 development, at least for vocabulary, morphology, and language-specific syntax, and essential for learning certain specifiable L1-L2 contrasts" (p. 414).

Recasts are one such type of negative feedback. By utilizing a stimulated recall technique to elicit introspective data, the present experimental study addresses the issue of how L2 learners interpret recasts for the learning of

morphology, in particular, irregular past tense forms. According to Nicholas, Lightbown, and Spada (2001), recasts are “utterances that repeat a learner’s incorrect utterance, making only the changes necessary to produce a correct utterance, without changing the meaning” (pp. 732-733).

### ***Prompt***

An alternative type of feedback that has been compared with recasts in classroom settings is referred to as *prompts* (Lyster, 2004, 2007; Lyster & Mori, 2006, 2008; Ranta & Lyster, 2007), because they provide signals that prompt learners to self-repair rather than providing them with a correct reformulation of their non-target utterance, as do recasts. Prompts include clarification requests, repetition of learner error, metalinguistic clues, and elicitation moves. Several classroom studies have shown prompts to be more effective than recasts; for example, Havranek and Cesnik (2001) found repair following prompts to be the most effective feedback combination in a range of English as a foreign language (EFL) classrooms.

In a classroom study of adult ESL learners, Ellis, Loewen, and Erlam (2006) compared the effects of recasts versus prompts on students’ use of the simple past tense in English. Operationalizing prompts as a repetition plus a metalinguistic clue (e.g., “you need the past tense”), they found significantly superior effects for prompts over recasts on delayed posttest measures. In a similar ESL context, Ellis (2007) compared the effects of recasts and prompts (again operationalized as a repetition plus a metalinguistic clue) on the acquisition of past tense *-ed* and comparative *-er* in English. He found that prompts were overall more effective than recasts but more so for the comparative than for past tense forms.

### ***Prompt versus Recast***

The relative effectiveness of different types of feedback continues to attract attention in the field of second language acquisition (SLA), equally so for researchers with theoretical interests in the cognitive processes triggered by feedback and for researchers and practitioners alike interested in how feedback can be effectively yet seamlessly integrated into classroom interaction in ways that drive second language (L2) development forward.

A considerable amount of recent research, both in and out of classrooms, has concerned *recasts*: implicit reformulations of learners’ non-target utterances (for helpful reviews of this literature, see Ellis & Sheen, 2006; Nicholas, Lightbown, & Spada, 2001).

Knowledge about the characteristics and effectiveness of recasts continues to expand, and it is now widely accepted that their effectiveness is constrained by a wide range of variables. Specifically in classroom settings, the extent to which teachers’ intentions and learners’ perceptions overlap is known to affect recast effectiveness (Mackey et al., 2007), as is the interactional context in which recasts are provided. For example, Oliver and Mackey (2003) found in child English as a second language (ESL) classrooms that learners produced significantly more modified output following recasts in explicit language-focused exchanges than in exchanges that were content based, management related or communicative in nature. In addition, recasts of phonological and lexical errors are more noticeable than recasts of errors in morphosyntax (Carpenter, Jeon, MacGregor, & Mackey, 2006; Han, 2008; Lyster, 2001; Mackey, Gass, & McDonough, 2000), as are recasts that are short and contain minimal changes (Egi, 2007; Philp, 2003; Sheen, 2006).

Recasts benefit developmentally ready learners more than unready learners (Mackey & Philp, 1998) and learners with high accuracy scores in their use of the target forms more than learners achieving low accuracy scores (Ammar & Spada, 2006). Trofimovich, Ammar, and Gatbonton (2007) found not only that higher proficiency learners benefit more than lower proficiency learners from recasts but also that, independent of L2 proficiency, other learner characteristics associated with accurate L2 production after hearing a recast include phonological memory, attention control, and analytic ability.

Ellis and Sheen (2006) argued that recasts have received an inordinate amount of attention in SLA research, owing in large part to their ubiquity and consequent availability for study. They continued: Despite the strong theoretical claims regarding the acquisition potential of recasts, there is no clear evidence that recasts work better for acquisition

than other aspects of interaction such as models, prompts, or explicit corrective strategies. Indeed, there is some evidence that the last two of these are more effective than recasts (p. 597).

Similarly, Lyster (1998, 2002, 2007) argued that, especially in classroom settings that are more meaning-oriented than form-oriented, other types of feedback might serve more effectively than recasts as negative evidence (i.e., information about the incorrectness of an utterance; see Gass, 2003). A growing number of studies have recently investigated the effects of different types of feedback on L2 development in both classroom and laboratory settings but with different outcomes across these different settings.

## RESEARCH QUESTIONS

To meet the mentioned purpose the following research questions were raised:

- Is there any significant difference between recast and prompt in their effect on EFL learners' tense awareness?
- Is there any significant difference between recast and prompt in their effect on EFL learners' use of tense in writing?

## METHODOLOGY

In order to find appropriate answers to the posed questions, the researchers followed certain procedures and made use of certain instruments, which are reported in this section.

### *Participants*

The 60 participants were selected out of initial 90 participants based on the scores which they obtained in the proficiency test which included reading, writing and listening skills. This is the while, the pre-post tests included only writing was the focus of the study. My main concern is that the participants in each group might not have been at the same level of writing at the beginning of the study. They might have been selected because of the good scores which they could obtain in the listening and reading tests but not the writing component.

### *Instrumentation*

In order to obtain measurable data with which the results of the study could be statistically analyzed, the following instruments were utilized.

The English language proficiency test used in this study was a sample of the Key English Test (KET) adopted from KET practice tests by Capel and Ireland (2008).

The reliability and item facility of the test were checked in the piloting phase of the study and the test was thus determined to be reliable for the actual purpose of homogenization. KET is Cambridge ESOL's exam which recognizes the ability to deal with everyday written and spoken English at basic level. It has two pamphlets and in the present study, the first pamphlet comprising reading and writing was used. The participants had to understand simple written information such as signs, brochures, newspapers, and magazines. They also had to fill in the blanks and use some words in simple sentences and write a short paragraph of writing around 25 words. This section consisted of 55 questions and a writing passage and it took about 1 hour and 10 minutes.

The second pamphlet was listening, in which the participants had to show their ability to understand conversations and other spoken materials. This part had 25 questions and it took the participants 30 minutes to answer.

The mentioned proficiency test was selected based on the average level of proficiency of the participants. KET test was piloted on 60 participants with similar characteristics of the main participants of the study at the same high school.

In addition to KET proficiency test, students wrote a paragraph as a pre-test in order to check their use of tenses before treatments. The topic of the paragraph was based on the students' supplementary book. In addition to writing a paragraph, both groups took a 20-item multiple-choice test of tense in order to be homogenized with respect to their tense knowledge before the treatments.

### *Procedure*

To achieve the purpose of the study the following steps were taken:

At the very outset of the study, 90 female elementary students were selected through convenient-random sampling method. The test used in order to homogenize the participants was Key English Test (KET) since the researcher assumed it suitable for elementary level EFL learners.

The KET proficiency test was administered to 90 participants in two classes at first grade level in Mesbah-e-Noor high school. The mentioned test consisted of two pamphlets. The first part was reading and writing and the second one was listening.

The KET was first piloted on 60 participants with almost similar characteristics as the target group before the actual administration in order to make sure that test had appropriate item and test characteristics. The data were analyzed and 10 items showing poor item facility and malfunctioning indexes were discarded. The reliability was calculated to be 0.78, and the test was thus suitable for the screening of the target sample.

Next, the test was administered to the main participants of the study in order to homogenize them. Participants whose scores fell between the range of one standard deviation above and below the estimated sample mean were selected for the actual purpose of study. Then they were randomly divided to two groups to receive the two treatments. Both groups were checked for their homogeneity regarding their writing abilities and their tense knowledge. The study lasted for 28 sessions of 90 minutes twice a week.

Tenses investigated in this study (according to students' 1<sup>st</sup> grade English text book in high school) included: present, past, future (to be going to & will), present continues, and present perfect according to their main course book. The rationale for selecting these tenses was that they are the ones that are included in the syllabus to be taught to students at the first grade of high school.

The participants in one experimental group received recast on the use of tenses in writing and the other experimental group received prompt. In order to write in the recast or prompt group, the participants viewed a picture and used their understanding of the picture to make a story. For instance: the researcher made a picture about their friend's birthday party, then at the bottom of the picture asked them, what will you do?( practice on using future tense). In addition, they wrote their paragraphs according to the titles of Top Notch book. A paragraph lasted about 30 minutes and consisted of 50 words. On the other hand, to make the recast group write, the researcher taught a specific tense then gave them a topic to write about to provide the participants with practicing on the use of that tense in writing. For instance, the researcher asked them to write, "what are you going to do when you grow up?" They wrote the composition using future tense.

Recast and prompt were individualized through the researchers' written notes in different colors on the margins of the participants' writings. A recast, as Lightbown and Spada (2006) reformulated a student's incorrect utterance while maintaining the central meaning of utterance.

The following example was provided by the researcher in the recast group:

Participant's writing: When I was child, I don't clean my bed room. In line with what Tomlin and Villa (1994) propose for providing recast, the researcher underlined the wrongly used tense, then expected the participant to correct it by herself. Then the teacher checked her corrections in the following session (p.132).

According to Lyster (2004) an alternative type of feedback that has been compared with recast is referred to as prompt, because it provides signals that prompt learners to self repair rather than providing them with a correct reformulation of non-target utterance, as do recast.

As Lyster (2007) mentioned prompts appear in the form of certain set of body gestures that the teacher demonstrates immediately after students' misusing of the tenses. In the present study the students were asked to read aloud their writings slowly to the class and the researcher provided them with prompt in case they used the tense in question wrongly. For instance, if the participants failed to use simple past tense correctly the teacher moved her hand backward across her shoulder to indicate past tense. Or she moved both hands smoothly across the chest to mean

that progressive tense had to be used. The researcher used body gesture during the treatment while the participants read their writings orally.

The tenses were covered during 28 sessions of the course. Then every two or three sessions, the participants wrote a paragraph according to the lesson title and tense which was taught to them. The sum of scores of paragraph writings were calculated as the post-test scores. After the instructional period, the participants of the two groups were given the tense awareness test.

As for inferential statistics employed to verify the null hypotheses of this study two Mann-Whitney U tests were used in order to estimate the significance of the difference between the means of the two groups on the writing and tense awareness test.

## RESULT AND DISCUSSION

This study was aimed to compare the impact of recast and prompt on EFL learners' English tense awareness and use of tenses in writing. The design of this study is "A Experimental group design" which is a subset of Ex post facto design. In this study, the feedback types (recast and prompt) were the independent variables. Tense knowledge awareness and use of tenses in writing were dependent variables and the level of language proficiency (elementary level) and gender ( female) were control variables.

The data analysis in this study comprised two series of calculations: Descriptive and Inferential statistics.. In order to standardize the KET test and the post-test, the researcher calculated the test reliability, item facility and item discrimination of the tests in the pilot stage. After piloting the Key English Testing (KET), it was administered on the main participants to choose those who turn to be homogeneous.

As for inferential statistics employed to verify the null hypotheses of this study two Mann-Whitney U tests were used in order to estimate the significance of the difference between the means of the two groups on the writing and tense awareness tests. The process of data analysis began with the selection of the required sample of population (participants). At the very outset, the selected section of KET (Key English testing) was piloted among a group of participants with very similar characteristics to the target group. Item facility and discrimination were calculated along with basic descriptive statistics i.e. mean and standard deviation. Ten malfunctioning and non-functioning items were discarded, and the reliability was calculated to be .78. The test was thus determined to be suitable for actual homogenization of the target sample.

In the next step, the piloted test was administered to the main participants. Basic descriptive statistics were calculated and accordingly those participants whose scores fell between one standard deviation above and below the mean were selected, and then divided into two groups to receive two different treatments . The researcher-made tense awareness post-test was piloted before the actual administration. It was piloted on a sample of participants with very similar characteristics as to the target group. An item analysis was conducted, and then its reliability was calculated (as reported below), and it was determined to be suitable in order to be administered as the achievement post-test.

### *Homogenizing the participants at the outset*

The homogeneity of the two groups with respect to their writing abilities before the intervention had to be checked. The following table presents the descriptive statistics of the scores that the participants obtained from the KET writing test.

Table 1: Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation	Skewness		Ratios
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error	
recast writing	30	.50	4.25	2.5583	1.09009	-.075	.427	.18
prompt writing	30	.75	4.25	2.5417	1.15423	-.132	.427	.31
Valid N (listwise)	30							

As the skewness ratios both fell within the normality range of  $\pm 1.96$ , it is concluded that both sets of scores were normally distributed. Therefore, the significance of the difference between the two means shown in the above table (2.55, and 2.54) can be tested through a t-test. The following table shows the result.

Table 2: Independent Samples Test

		Levene's Test for Equality of Variances		t-test for Equality of Means						
										95% Confidence Interval of the Difference
		F	Sig.	T	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Lower	Upper
writing pretest	Equal variances assumed	.051	.822	.057	58	.954	.01667	.28986	-.56355	.59688
	Equal variances not assumed			.057	57.811	.954	.01667	.28986	-.56359	.59692

As illustrated in the above table, the difference between the means of the two groups on the writing pretest turned out to be insignificant ( $t=.057$ ,  $p=.954$ ) with the equality of the variances assumed ( $F=.051$ ,  $p=.822$ ). Therefore, the researcher was rest assured that the two groups were not significantly different regarding their writing abilities before the treatments.

Also, to make sure that the two groups were not significantly different with respect to their tense knowledge before the outset of the treatments, a t-test was conducted to compare their mean scores on the test. But prior to that, the normality of the distribution of both sets of scores was checked as an assumption for a t-test. The following descriptive statistics table shows the results:

Table 3: Descriptive Statistics

	N	Minimum	Maximum	Mean	Std. Deviation	Skewness		Ratios
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error	
Recast	30	7.00	19.00	12.4333	2.87298	.485	.427	1.14
Prompt	30	7.00	18.00	12.9000	2.69546	.136	.427	.32
Valid N (listwise)	30							

As the above table demonstrates, both sets of scores were normally distributed as the skewness ratios fell within the normality range of  $\pm 1.96$ . Also, the table shows that the two groups obtained the mean scores 12.43 and 12.90. The following table depicts the results of the Levene's test, and the t-test:

Table 4: Independent Samples Test

		Levene's Test for Equality of Variances		t-test for Equality of Means						
									95% Confidence Interval of the Difference	
		F	Sig.	T	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Lower	Upper
tense knowledge	Equal variances assumed	.048	.827	-.649	58	.519	-.46667	.71925	-1.90640	.97307
	Equal variances not assumed			-.649	57.766	.519	-.46667	.71925	-1.90652	.97319

With the variances assumed to be equal ( $F=.048$ ,  $p=.827>.05$ ), the result of the t-test can be interpreted as showing a non-significant difference between the means of both groups ( $t=.649$ ,  $p=.519>.05$ ). Therefore, the researcher was rest assured that there was no significant difference between the tense knowledge of the two groups before the intervention.

#### Post Tests

An achievement post-test was administered among the participants of the two groups once the treatment was completed. Then other post-test which was the sum of writings paragraphs were given to students during the treatment. The results of the details of both descriptive and inferential statistics are presented hereunder:

To show the inter-rater reliability between the raters of the writing test, correlation between their scores had to be estimated. But before that, the assumptions of correlation had to be met: the first assumption is normality of distributions of the sets of scores. The following table shows the descriptive statistics of the scores the two raters gave to the writings of the recast group.

Table 5: Descriptive Statistics, Recast group

	N	Minimum	Maximum	Mean	Std. Deviation	Skewness		Ratio
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error	
rater1	30	3.50	9.50	7.4167	1.50478	-.831	.427	1.94
rater2	30	3.00	9.50	7.2833	1.55188	-.780	.427	1.86
Valid (listwise)	N 30							

As depicted in the above table, both distributions were normal as the ratios (skewness statistic/std.error) did not exceed the normality range of  $\pm 1.96$ . The second assumption is linearity of relationship between the two variables.

Figure 1: Scatter plot of the scores given by the two raters to the writings of the recast group.

As the graph shows the dots are clustered around a straight line and form a cigar shape, hence the linearity of the relationship.

As the assumptions were met, it was safe to calculate the correlation between the two sets of scores given by the two raters to the writings of the recast group. The following table shows the result:

Table 6: Correlations, Recast group

		rater1	rater2
rater1	Pearson Correlation	1	.945**
	Sig. (2-tailed)		.000
	N	30	30
rater2	Pearson Correlation	.945**	1
	Sig. (2-tailed)	.000	
	N	30	30

\*\*. Correlation is significant at the 0.01 level (2-tailed).

As shown above the correlation coefficient was as high as .945 and significant ( $p=.000<.05$ ). Therefore, the mean of each pair of scores was to be considered as the final score of each student.

The same assumptions were checked for the scores given by the two raters to the writings of the prompt group. The following table shows the descriptive statistics :

Table 7: Descriptive Statistics, Prompt group

	N	Minimum	Maximum	Mean	Std. Deviation	Skewness		Ratios
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error	
rater1	30	4.00	9.50	7.5250	1.40404	-.640	.427	1.41
rater2	30	3.50	9.00	7.3167	1.35655	-.733	.427	1.71
Valid N (listwise)	30							

As depicted in the above table, both distributions were normal as the ratios (skewness statistic/std.Error) did not exceed the normality range of  $\pm 1.96$ .

The following graph shows the linearity of the relationship to meet the second assumption.

Figure 2: Scatter plot of the scores given by the two raters to the writings of the prompt group

As shown above, the clustered dots around the straight line demonstrate a cigar shape, hence the linearity of the correlation. The following table shows the result of the correlation analysis:

Table 8: Correlations

		rater1	rater2
rater1	Pearson Correlation	1	.842**
	Sig. (2-tailed)		.000
	N	30	30
rater2	Pearson Correlation	.842**	1
	Sig. (2-tailed)	.000	
	N	30	30

\*\* . Correlation is significant at the 0.01 level (2-tailed).

As the correlation turned out to be significant ( $r=.842$ ,  $p=.000<.05$ ), the mean of each pair of scores given by the two raters to the same student was considered as the final score.

To compare the effect of prompt and recast feedbacks on the tense recognition and writings of the students, a MANOVA had to be calculated. But first the assumptions had to be met. First, the normality of the distributions of each set of scores was checked. The following table shows the descriptive statistics:

Table 9: Descriptive Statistics of the scores obtained by both groups on posttests

	N	Minimum	Maximum	Mean	Std. Deviation	Skewness		Rtaios
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error	
rcstT	30	26.00	40.00	34.8667	3.83930	-.717	.427	1.67
prmpT	30	30.00	40.00	36.6000	2.79901	-1.054	.427	2.46
recast writing	30	3.50	9.37	7.3487	1.50657	-.805	.427	1.88
prompt writing	30	2.25	9.25	7.3687	1.48631	-1.399	.427	3.27
Valid N (listwise)	30							

The following graphs show how each set of scores is distributed.

Figure 3: Histogram of the tense scores obtained by the recast group

Figure 4: Histogram of the tense scores obtained by the prompt group

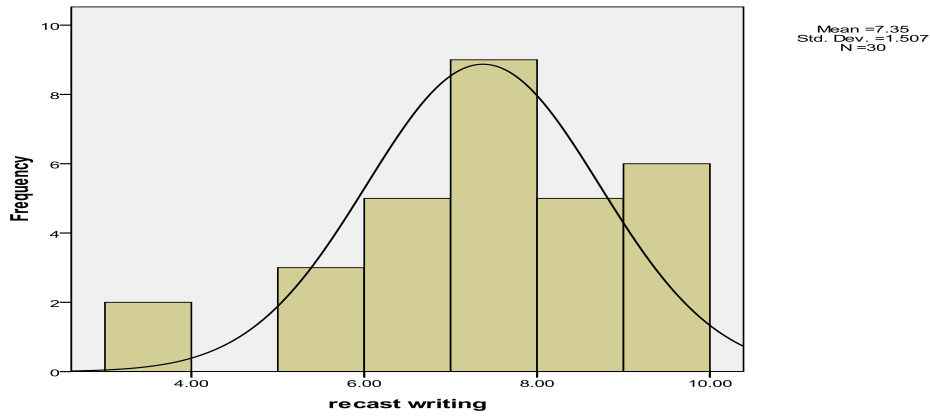

Figure 5: Histogram of the writing scores obtained by the recast group

Figure 6: Histogram of the writing scores obtained by the prompt group

As displayed in table 9 above, the tense and writing scores of the prompt group did not show normality as the ratios exceed the range of  $\pm 1.96$ . But the rest were normal. Therefore, the researcher had to compare the tense scores and the writing scores of the two groups separately through t-tests. To compare the tense knowledge of the two groups and conduct a t-test, the normality of distribution of each set of scores was checked again. As shown already the scores obtained by the prompt group were not normally distributed. Therefore, a Mann-Whitney U test was conducted. The following table shows the result:

Table 10: Ranks

Grouping	N	Mean Rank	Sum of Ranks
Tense Recast	30	26.55	796.50
Prompt	30	34.45	1033.50
Total	60		

Table 11: Test Statistics<sup>a</sup>

	tense
Mann-Whitney U	331.500
Wilcoxon W	796.500
Z	-1.774
Asymp. Sig. (2-tailed)	.076

a. Grouping Variable: grouping

As shown in table 10, the prompt group obtained a higher rank compared with the recast group in the tense knowledge test. However table 11 shows that the difference was not significant at .05 level of significant ( $M=331.5$ ,  $p=.07>.05$ ). Thus, the corresponding null hypothesis was confirmed.

To compare the posttest writings of the two groups also a t-test was needed, and again the assumption of normality of the two related sets of scores had to be checked. As shown in table 4.9 the distribution of the writing scores of the prompt group turned out to be not normal. Therefore, again, the nonparametric Mann-Whitney U test was run. The following tables show the result.

Table 12: Ranks

Grouping	N	Mean Rank	Sum of Ranks
Writing Recast	30	30.53	916.00
Prompt	30	30.47	914.00
Total	60		

Table 13: Test Statistics<sup>a</sup> of the writing scores

	Writing
Mann-Whitney U	449.000
Wilcoxon W	914.000
Z	-.015
Asymp. Sig. (2-tailed)	.988

a. Grouping Variable: grouping

As shown in table 12, the recast and prompt groups approximately obtained the same ranks, and table 13 depicts that the minor difference between the ranks was not significant ( $M=449$ ,  $p=.988>.05$ ). Therefore the corresponding null hypothesis was confirmed.

The following figures show the bar graphs representing the mean scores obtained by the two groups on the two tests.

Figure 7: Bar graph representing the mean scores of the two groups on the tense knowledge test.

Figure 8: Bar graph representing the mean scores of the two groups on the writing test.

The researcher also opted for a comparison between the pretest-posttest scores of the two groups, to explore whether each group benefited significantly from the treatments or not. To this end, two-way repeated measures ANOVA was needed to be calculated once for the pre-test and posttest scores of the two groups on the tense awareness measure, and one more time for the pre-test and posttest scores of the two groups on the writing measure. But firstly, the assumption of normality of the distribution of the scores was checked for each set of scores. The following table shows the descriptive statistics of the scores.

Table 14: Descriptive Statistics of the pretest-posttest scores of the two groups on the two measures

	N	Minimum	Maximum	Mean	Std. Deviation	Skewness		Ratios
	Statistic	Statistic	Statistic	Statistic	Statistic	Statistic	Std. Error	
prompt tense pretest	30	7.00	18.00	12.9000	2.69546	.136	.427	.32
prompt tense posttest	30	30.00	40.00	36.6000	2.79901	-1.054	.427	2.47
prompt writing pretest	30	.75	4.25	2.5417	1.15423	-.132	.427	.31
prompt writing posttest	30	3.75	9.25	7.4727	1.34626	-.773	.427	1.81
recast tense pretest	30	7.00	19.00	12.4333	2.87298	.485	.427	1.14
recast tense posttest	30	26.00	40.00	34.8667	3.83930	-.717	.427	1.68
recast writing pretest	30	.50	4.25	2.5583	1.09009	-.075	.427	.18
recast writing posttest	30	3.50	9.38	7.3247	1.56541	-.783	.427	1.84
Valid N (listwise)	30							

As depicted in the above table all the skewness ratios fall within the normality range of  $\pm 1.96$  except for the scores on the tense awareness posttest obtained by the prompt group ( $2.47 > 1.96$ ). Therefore, a two-way RM ANOVA was run on the pretest-posttest scores of the two groups on the writing measure, and their scores on the tense awareness measure had to be compared separately as the assumption for the normality of the distribution of scores was not met for the post test scores of tense awareness belonging to the prompt group. Therefore, to compare the pretest-posttest

scores of the prompt group on the tense awareness measure, the Wilcoxon Signed Rank test, as the non-parametric equivalent for a repeated measures t-test was run. The following tables show the result.

*Table 15: Descriptive Statistics of the tense awareness pretest-posttest scores of the prompt group*

	N	Mean	Std. Deviation	Minimum	Maximum	Percentiles		
						25th	50th (Median)	75th
prompt tense pretest	30	12.9000	2.69546	7.00	18.00	11.0000	12.0000	15.0000
prompt tense posttest	30	36.6000	2.79901	30.00	40.00	35.7500	37.0000	38.2500

As shown in table 15, the prompt group obtained a higher mean on the tense awareness posttest compared with that on the pretest. The following tables show whether the difference was significant.

*Table 16: Ranks*

	N	Mean Rank	Sum of Ranks
prompt tense posttest – Negative Ranks	0 <sup>a</sup>	.00	.00
prompt tense pretest Positive Ranks	30 <sup>b</sup>	15.50	465.00
Ties	0 <sup>c</sup>		
Total	30		

*Table 17: Test Statistics<sup>b</sup>*

	prompt tense posttest – prompt tense pretest
Z	-4.792 <sup>a</sup>
Asymp. Sig. (2-tailed)	.000

As displayed in the above table, the difference between the ranks of the two sets of scores turned out to be significant ( $Z=4.79$ ,  $p=.000<.05$ ). Therefore, it is concluded that the prompt group improved its tense awareness across time (before and after treatment). To compare the pretest-posttest scores of the two groups on the writing test, a two-way RM ANOVA (mixed between-within ANOVA) was conducted. The following tables show the results:

*Table 18: Descriptive Statistics of the pretest-posttest scores of the two groups on the writing measure*

	feedback type	Mean	Std. Deviation	N
writing pretest	Recast	2.5583	1.09009	30
	Prompt	2.5417	1.15423	30
	Total	2.5500	1.11310	60
writing posttest	Recast	7.3247	1.56541	30
	Prompt	7.4727	1.34626	30
	Total	7.3987	1.44945	60

Table 18 above depicts that both groups improved their use of tense in their writings across time, as their posttest means were higher than their pretest means (recast=2.55 vs. 7.32, and prompt= 2.54 vs. 7.47).

*Table 19: Box's Test of  
Equality of Covariance  
Matrices<sup>a</sup>*

Box's M	.831
F	.267
df1	3
df2	605520.000
Sig.	.850

Table 19 shows that the assumption of equality of covariance is not violated as the sig. value is not less than .001 (.85>.001).

*Table 20: Multivariate Tests<sup>b</sup>*

Effect		Value	F	Hypothesis df	Error df	Sig.	Partial Eta Squared
Time	Pillai's Trace	.881	431.031 <sup>a</sup>	1.000	58.000	.000	.881
	Wilks' Lambda	.119	431.031 <sup>a</sup>	1.000	58.000	.000	.881
	Hotelling's Trace	7.432	431.031 <sup>a</sup>	1.000	58.000	.000	.881
	Roy's Largest Root	7.432	431.031 <sup>a</sup>	1.000	58.000	.000	.881
time * grouping	Pillai's Trace	.002	.124 <sup>a</sup>	1.000	58.000	.726	.002
	Wilks' Lambda	.998	.124 <sup>a</sup>	1.000	58.000	.726	.002
	Hotelling's Trace	.002	.124 <sup>a</sup>	1.000	58.000	.726	.002
	Roy's Largest Root	.002	.124 <sup>a</sup>	1.000	58.000	.726	.002

The above table reports that the interaction effect between time and grouping was not significant ( $p=.726>.05$ ). Hence, the main effects should be inspected separately. The value for Wilks' Lambda for time is .119 with a sig. value of .000 (less than .05). This suggests that there was a change in the writing performance of the participants across the two time periods, and the main effect for time was significant. Also the Partial Eta Squared value suggests a large effect size using the criteria proposed by Cohen (1988): .01=small effect, .06=moderate effect, .14= large effect. Afterwards, the researcher explored the between - subjects effects. The following table reports the result:

*Table 21: Tests of Between-Subjects Effects*

Source	Type III Sum of Squares	Df	Mean Square	F	Sig.	Partial Eta Squared
Intercept	2969.279	1	2969.279	1691.460	.000	.967
grouping	.129	1	.129	.074	.787	.001
Error	101.816	58	1.755			

As shown in table 21, the main effect for grouping turned out to be insignificant ( $F=.074$ ,  $p=.787>.05$ ), implying that there was no significant difference between the two groups with respect to their pre test and post test scores on the writing measure.

Overall, the latter inferential statistics demonstrated that both groups developed their tense knowledge and their ability in using tense in writing, and that both treatments (recast and prompt) were significantly effective, though there was no significant difference between the two groups on the posttest scores, and that both groups developed their tense knowledge and use equally.

## **CONCLUSION**

The outcome of the post test analyses demonstrated that the corresponding null hypotheses which stated,

- There is no significant difference between the effect of recast and prompt on EFL learners' tense awareness.
- There is no significant difference between the effect of recast and prompt on EFL learners' use of tense in writing were confirmed.

As the two groups were checked to be homogeneous with regard to their tense knowledge and their ability in using tenses in their writings, the final absence of any significant difference between their mean scores on the achievement post tests could be contributed to the equivalence of the effects of the types of instruction they received. It implies that there is no significant difference between the effect of recast and prompt on EFL elementary learners' both tense knowledge and tense use in writing.

Based on the findings of the present study and the researcher's observations during the actual conduct of the study, a number of pedagogical implications can be drawn for EFL learners.

With respect to corrective feedback, the study contributes significantly to debates with both theoretical and practical relevance by confirming that recasts, when compared to other feedback options especially, "prompts" are not necessarily the most effective type of feedback in getting students familiar with tenses and their correct use in writing. In terms of pedagogical implications, one might not expect these findings to generalize to other instructional contexts, yet Ammar (2003) drew similar conclusions in the context of intensive ESL instruction, which entails communicative language teaching but not content-based instruction.

Moreover, immersion teachers can expect to continue their balancing act, varying their use of prompts and recasts according to context (Lyster, 2002 pp.381-397). But it is necessary to act more systematically in planned ways, taking in to account the cognitive dimensions of processing and representation associated with specific target features in L2 learners' developing interlanguage system. Recast and prompt feedbacks such as those suggested in this study, can be easily used in several classrooms once students understand recasts and prompts and have some experiences with them.

## **LIMITATIONS OF THE STUDY**

Like any other study, the researcher faced limitations which were beyond her control as follows:

- Due to the regulations of high schools, the researcher could not have access to male participants ;therefore, the result of the study may not be generalized to male population of EFL learners.
- The researcher conducted two briefing sessions, one at the beginning of the term and the other in the middle of the term to provide the students with two written guidelines and to direct them throughout the whole treatment procedure. Because of time limitations in high schools the researcher could not allocate more than two sessions of the course to the briefing explanations of written guidelines while more sessions seemed to be needed for the successful mastery of the issue by the students.
- The participants in each group might not had been at the same level of writing at the beginning of the study. They might had been selected because of the good scored which they could obtain in the listening and reading tests but not the writing component.

**ABSTRACT**

Margaret Atwood's novel *The Handmaid's Tale* describes a futuristic society where all sexual affairs, except that for procreation, have been abandoned. This investigation tries to show that the acquisition of identity in the symbolic order portrayed by Atwood consists of a process of identification with figures of authority. Žižek's reworking on cultural notions introduces the concept of fantasy into the political field. In Žižekian view, the symbolic identity is achieved by the register and internalization of cultural norms through identification with figures of symbolic authority in the field of fantasy. In Žižek's Lacanese, the subject is decentered and a person's sense of identity is constructed by external Ego Ideals that center upon sublime objects of Ideology. They allocate the subjects different places in the socio-political totality and give them a social mandate, a definite role to play in worldly affairs. The Handmaids' fantasy is created into believing that the repression and lack of freedom, they experience, is the ideal condition for a human being. Virginity and pregnancy are two sublime objects of ideology that help the government to regulate the Handmaids' fantasy. This study uncovers the ways system refers to Virgin Mary, Jesus Christ, and a character called Janine to present Ego-Ideals for the Handmaids as the most important group in the novel.

**KEY WORDS:** Ego-Ideal, Sublime Object of Ideology, Symbolic Order, the Handmaids.

**INTRODUCTION**

Margaret Atwood occupies a central place in recent development of North American literature. Today she has published more than forty books of fiction, non-fiction, and poetry dealing with diverse themes as feminism, ecology, gothic tradition, political relationship between Canada and the United States, and power politics. The American Library Association (ALA) lists her masterpiece *The Handmaid's Tale* (1985) as number 37 on the 100 Most Frequently Challenged Books of 1990–2000. In *The Handmaid's Tale*, published in 1985, Canadian writer Margaret Atwood paints her most vivid portrait of a futuristic state, named Gilead that deals with themes of identification and the various means by which it gains agency. Atwood also satirically comments upon the deeply flawed ideology of Gilead; society is constructed to maximize the possibility of reproduction. In such a theocratic society, identities are simplified into different roles, each serving only one role and all forming an efficient machine of household and procreation.

Many critics work on Atwood's masterpiece *The Handmaid's Tale*. Coral Ann Howells (1995) remarks the novel is "closer to the new feminist scholarship which has moved beyond exclusively female concerns to recognition of the complexities of social gender construction" (p. 128). J. Brooks Bouson (1993) announces that Atwood "lays bare the cultural and literary script that assigns women the passive self-effacing roles and encourages them to collude in their oppression as they consent to femininity" (p. 9). These critical notions are crucial but they ignore the point that in any symbolic order different discourses operate all together to identify subjects with the symbolic values. Therefore, the study of characters' identification with a methodology that covers psychological and political elements all at once is still essential. In order to fill the mentioned gap, this thesis refers to Slavoj Žižek.

Born in 1949, Slavoj Žižek is a Slovenian philosopher and cultural critic who participates in various disciplines such as political theory, film theory, and theoretical psychoanalysis. He has a gifted mind, with a surprising understanding of contemporary theory. Studying Žižek is a stimulating experience, "one is simultaneously informed, edified, and entertained" (Sciull, 2011, 296). Žižek's works draw on three main areas of influence, philosophy, politics, and psychoanalysis. In each of these areas, Žižek is influenced by the writings of a single individual, "Georg Hegel in

philosophy, Karl Marx in politics, and Jacques Lacan in psychoanalysis” (Myers, 2003, p. 14). He is influenced by Hegel’s account of totality as the product of a process that preserves all of its moments as elements in a structure (Sharpe & Baucher, 2010, pp. 38-9), Marx’s focus on the mechanics of society as one “to clarify how the workings of individuals should be regarded” (Myers, pp. 17-20), and Lacan’s psychoanalysis and philosophy as “the most controversial psycho-analyst since Freud” (Macey, 1994, p. xiv).

This investigation tries to show that the acquisition of identity in the symbolic order portrayed by Atwood consists of the process of identification with figures of authority. Different Ego-Ideals allocate the subjects different places in the socio- political totality and give the subjects a social mandate, a definite role to play in worldly affairs. The Handmaids’ fantasy is created into believing that the repression and lack of freedom, they experience, is the ideal condition for a human being. Virginity and pregnancy are two ideas that help the government to manipulate the Handmaids’ fantasy. This study uncovers the ways system refers to Virgin Mary, Jesus Christ, and a character called Janine to present Ego Ideals for the Handmaids as the most important group in the novel.

### **SUBJECTS POLITICAL IDENTIFICATION WITH EGO-IDEAL AND SUBLIME OBJECTS**

In our fantasy, we “form our sense of selves” or manage loss of enjoyment by our identifications with various symbolic entities, which may include job titles, leisure activities, religious affiliations, nationalities, and value systems. All of these symbols are “abstract ideas” in some respects, yet they have a power to register and establish subjects in order to insure the continuity of symbolic order (Ryan, 2010, p. 59).

The symbolic Other, as split, is argued in Žižek’s book *How to Read Lacan* (2007), where Žižek elucidates the central distinction between the Ideal Other of the symbolic order (the Ego-Ideal) and the superego of the Real:

The Ego-Ideal is the agency whose gaze I try to impress with my ego image, the big Other who watches over me and propels me to give my best, the ideal I try to follow and actualize; and the superego is this same agency in its revengeful, sadistic, punishing, aspect. The underlying structuring principle of these three terms is clearly Lacan’s triad Imaginary-Symbolic-Real: ideal ego is imaginary, what Lacan calls the “small other,” the idealized double-image of my ego; Ego-Ideal is symbolic, the point of my symbolic identification, the point in the big Other from which I observe (and judge) myself; superego is real, the cruel and insatiable agency which bombards me with impossible demands and which mocks my failed attempts to meet them, the agency in the eyes of which I am all the more guilty, the more I try to suppress my “sinful” strivings and meet its demands. (p. 80)

Žižek points out that a person’s sense of identity – her ego – is constructed of two components. On the one hand, there is a person’s ideal ego. It is the one who the person would like others to see her. It relates to the imaginary category of human experience. By this technical term, Lacan argues that this level of our identity is at first “modelled on loved others we perceive around us, whose behavior we strive to mirror in order to win their love, and stabilize our sense of who we are” (Sharpe & Baucher, p. 47). On the other hand, there is a person’s Ego-Ideal. This component of the ego involves symbolic identification. As it has declared, the register of language and culture is called the symbolic Order, therefore, symbolic identification refers to the internalization of cultural norms through identification with figures of symbolic authority. A person’s Ego-Ideal is the perspective from or in which the subject would like to be seen as the person one hopes to be. The key thing is that the Ego-Ideal, as its name suggests, involves the dimension of the symbolic order. A person’s Ego-Ideal is some idea rather than any specific person with which the process of identification is achieved (ibid, pp. 48-9).

The Ego-Ideal centers upon a master signifier or a sublime object of ideology; Žižek believes:

To grasp this fully, we have only to remember the above-mentioned example of ideological 'quilting': in the ideological space float signifiers like 'freedom', 'state', 'justice', 'peace' [...] and then their chain is supplemented with some master-signifier ('Communism') which retroactively determines their (Communist) meaning: 'freedom' is effective only through

surmounting bourgeois formal freedom, which is merely a form of slavery; the 'state' is the means by which the ruling class guarantees the conditions of its rule; market exchange cannot be 'just and equitable' because the very form of equivalent exchange between labor and capital implies exploitation; 'war' is inherent to class society as such; only the socialist revolution can bring about lasting 'peace', and so forth. (Žižek, 1995, p. 102)

Master signifier is a key word for symbolic identification that, in itself, is just a signifier, but one that, in the "psychic economy of the subject," plays a special role: it is a signifier without a signified. It "quilts the field" of a certain context; in other words, it prevents the chain of signifiers by setting itself as the master one (ibid, p. 104). Rousseau, and finally "the Rousseau family," is just a name, just a succession of some sounds. If it is grouped in an entire family heritage, it will be full of meaning – especially for the subject Jean- Jacques Rousseau. More precisely, the family name specifies, here for Rousseau, "a place in society as a place of admirable achievements and the prominent ideals." In other words, in the psychic economy of the subject the Ego-Ideal maintains the place of the symbolic Order. It holds the sociocultural totality by giving the subject a position in society, a symbolic position with authority (Sharpe & Baucher, p. 50). Žižek believes that successful political ideologies necessarily refer to and turn around sublime objects posited by political ideologies (1995, p. 96). These sublime objects are what political subjects take it that their regime's ideologies' central words mean or name extraordinary Things like God, the Father, the King, in whose name they will (if necessary) transgress ordinary moral laws and lay down their lives.

### SYMBOLIC IDENTIFICATION IN *THE HANDMAID'S TALE*

In *The Handmaid's Tale*, Margaret Atwood describes a future where all sexual affairs, except that between a man and wife or for procreation, have been abandoned. Romance, love, and sexual pleasure have no place in human endeavors. They have been summarized to a ceremonial act wherein a Handmaid, as a servant, is used by her commander specifically for breeding purposes. Such a suppressive symbolic order banned the mere hint of sexuality in any form; even the showing of an ankle by a woman is considered illegal base on religious doctrines. Atwood describes:

What's going on in this room, under Serena Joy's silvery canopy, is not exciting. It has nothing to do with passion or love or romance or any of those other notions we used to titillate ourselves with. It has nothing to do with sexual desire, at least for me, and certainly not for Serena. (Atwood, p. 105)

All sexual fantasies are repressed in every possible way. As Žižek announces the Handmaids' fantasy manages or domesticates the traumatic loss of the enjoyment, which "cannot be symbolized" (Žižek, 1997, p. 97). The Handmaids' fantasy is manipulated into believing that the repression and lack of freedom they experience now is the ideal condition for a subject. There are two important ideas for the Handmaids' ego in Gilead with which they identifies: virginity and pregnancy. They are the core of ideas and master signifiers that fill the split between the symbolic meaning of social ideals and the institutional ritual that holds these social ideals (ibid, p. 103).

The Handmaids identify with the figure of Virgin Mary as an Ego-Ideal for the concept of virginity. They must cover themselves in such a way that their skins be invisible just as Mary does not show her body and her beauty. The narrator depicts his journey to the nightclub as:

We glide together through the darkening streets. The Commander has hold of my right hand, as if we're teenagers at the movies. I clutch the sky-blue cape tightly about me, as a good Wife should. Through the tunnel made by the hood I can see the back of Nick's head. His hat is on straight, he's sitting up straight, his neck is straight, he is all very straight. His posture disapproves of me, or am I imagining it? Does he know what I've got on under this cloak, did he procure it? And if so, does this make him angry or lustful or envious or anything at all? We do have something in common: both of us are supposed to be invisible, both of us are functionaries. I wonder if he knows this. When he opened the door of the car for the Commander, and, by extension, for me, I tried to catch his eye, make him look at me, but he acted as if he didn't see me. Why not? It's a soft job for him, running little errands, doing little favors, and there's no way he'd want to jeopardize it. (Atwood, p. 232)

This cover prevents them from sexual temptations and fantasies. The Handmaids' bodies are expected to be hidden from views because they are women and "Paul wrote that women should keep their heads veiled because they were not, like men, made in the image of God" (Warner, 1976, p. 178). The red dress is always there to remind them of their destiny and their role in the symbolic order, as that of the Virgin Mary. Virgin Mary is here the Ego-Ideal or the

agency whose gaze the Handmaids “try to impress with their ego image, the big Other who watches over” them and propels them to give their best, “the ideal they try to follow and actualize” (Žižek, 2007, p. 80).

Their garment is the same as the Virgin Mary in most Christian pictures, where her long red dress that covers all of her body is prominent. In the Handmaids’ ideological fantasy, an ideal Handmaid is one that is perfect the same as the Virgin Mary who is the symbol of female perfection; she was a perfect daughter, wife, and mother without sexual desires. The image of perfection “is built on the equivalence between goodness, motherhood, purity, gentleness, and submission” (Heartney, 2003, p. 6). Offred gives a picture of Gileadian pregnancy as:

Arousal and orgasm are no longer thought necessary; they would be a symptom of frivolity merely, like jazz garters or beauty spots: superfluous distractions for the light-minded. Outdated. It seems odd that women once spent such time and energy reading about such things, thinking about them, worrying about them, writing about them. They are so obviously recreational. (Atwood, p. 105)

The Handmaids’ conception should be without having an orgasm or any other kind of pleasure, just like the Virgin Mary, who was conceived without having any sexual intercourse with a man, without feeling any pleasure. Again, Virgin Mary, as Žižek believes, is the concern of “symbolic, the point of symbolic identification, the point in the big Other” from which the Handmaids observe and judge themselves (Žižek, 2007: 80).

As a virgin, it is expected that the Handmaids free themselves from any desire. The denial of desire derives from the Fall of Adam and Eve, who after “having eaten the forbidden fruit covered their genitals, knowing that they were naked” (Warner, p. 54). Therefore, the passion and the desire of making love are considered as sin, not as the sexual act by the big Other. In this symbolic order, like the Fathers of the Church, also, for Commanders the sexual act should not aim at pleasure, but only at reproduction. The Handmaids are accepted by and in the symbolic order firstly as virgins, because, as Kristeva writes in *About Chinese Women* (1977), “Christianity does associate women with the symbolic community, provided they keep their virginity” (p. 145). Virgins are accepted by the symbolic order because their sexuality is controlled. The big Other expects the Handmaids to leave their bodily and sexual instincts behind and concentrate on the spirit that is the symbolic order’s most privilege. The idea of virginity, which derives from the Virgin Mary, is very important for Gilead as “the son of God chose to be born from a virgin mother because this was the only way a child could enter the world without sin” (Warner, p. 54). The Handmaids, as a part of symbolic order, looks at themselves in a “narcissistic satisfaction,” that as Žižek affirms, is provided by looking at themselves “through the other” or Ego-Ideal (Žižek, 1993, p. 16).

Although the Handmaids are not virgins in usual sense, but the regime treats them as such. The paradox here lies in the fact that the Gileadian signified for virginity is not connected to the sexuality of the body but to the virginity of the senses: to what the Handmaids eat, see, and hear. In chapter twelve Offred narrates:

I put the tray on the small white-painted table and draw the chair up to it. I take the cover off the tray. The thigh of a chicken, overcooked. It’s better than bloody, which is the other way she does it. Rita has ways of making her resentments felt. A baked potato, green beans, salad. Canned pears for dessert. It’s good enough food, though bland. Healthy food. You have to get your vitamins and minerals, said Aunt Lydia coyly. You must be a worthy vessel. No coffee or tea though, no alcohol. Studies have been done. There’s a paper napkin, as in cafeterias. (Atwood, p. 75)

They are always given the healthy food in order to make sure that they are virgin and safe to do their functions. The Handmaids’ ears are exposed to the extracts from the Bible in their everyday life through their commanders and in their communication with other Handmaids. In addition, as Offred notes, “Given our wings, our blinkers, it’s hard to look up, hard to get the full view, of the sky, of anything,” they see what the veil they are wearing allows them to see (ibid, p. 40).

The Handmaids must be kept virgin because the symbolic order values the virginity of body as a channel of communication with God; and it is God who will allow them to have a baby. Offred explains the Commander's reading from the Bible as:

The Commander, as if reluctantly, begins to read. He isn't very good at it. Maybe he's merely bored. It's the usual story, the usual stories. God to Adam, God to Noah. He fruitful, and multiply, and replenish the earth. Then comes the moldy old Rachel and Leah stuff we had drummed into us at the Center. Give me children, or else I die. Am I in God's stead, who hath withheld from thee the fruit of the womb? Behold my maid Bilhah. She shall bear upon my knees, that I may also have children by her. And so on and so forth. We had it read to us every breakfast, as we sat in the high school cafeteria, eating porridge with cream and brown sugar. You're getting the best, you know, said Aunt Lydia. There's a war on, things are rationed. You are spoiled girls, she twinkled, as if rebuking a kitten. Naughty puss. (Atwood, p. 232)

Offred is allowed to go shopping, but she can do nothing else. When she returns home, she "takes a bath, goes into her room, where she waits for the food to be brought to her" (ibid, p. 43). To grasp this fully, we have to only remember that the idea of virginity is, in Žižekian term, an ideological quilt that in "the ideological space float signifiers like 'freedom', 'state', 'justice', 'peace' [...] and then their chain" is a master signifier "which retroactively determines their meaning" (Žižek, 1995, p. 102).

Gilead defined a Handmaid's position to "that of (grammatical) object and patient" (Staels, 1995, p. 459). Offred can do nothing more than just sit there, be served, and wait, keeping in mind that she is just a container and accepting her destiny, just like Virgin Mary, as Ego-Ideal, "who bowed her head and submitted uncomplainingly to her destiny" (Warner, p. 191). She puts this point in plain words:

So. More waiting. Lady in waiting: that's what they used to call those stores where you could buy maternity clothes. Woman in waiting sounds more like someone in a train station. Waiting is also a place: it is wherever you wait. For me it's this room. I am a blank, here, between parentheses. (Atwood, pp. 239-40)

Thus, the Handmaids' identities is made in a position of waiting; waiting to be fed, waiting to be impregnated, and waiting to be pregnant like their Ego-Ideal, Virgin Mary. Waiting is their "social and ideological function" that is constructed by "a superior and legitimate way" through their Ego-Ideal (Žižek, 1995, p. 123).

There are also no mirrors for the Handmaids because they want the Handmaids not to see and themselves as a whole subject. The house is characterized as:

As in a nunnery too, there are few mirrors.  
There remains a mirror, on the hall wall. If I turn my head so that the white wings framing my face direct my vision towards it, I can see it as I go down the stairs, round, convex, a pier glass, like the eye of a fish, and myself in it like a distorted shadow, a parody of something. (Atwood, p. 19)

Elsewhere she describes her bathroom as:

There's a blue bath mat, a blue fake-fur cover on the toilet seat; all this bathroom lacks from the time before is a doll whose skirt conceals the extra roll of toilet paper. Except that the mirror over the sink has been taken out and replaced by an oblong of tin, and the door has no lock, and there are no razors, of course. (Ibid, p. 62)

The only way they can see their body is on window glasses, where they see it in fragments; their body is present and absent at the same time. In the Household, "mirrors are practically absent, because freedom for self-reflection saves one from the traditional search for identity" (Staels, p. 457). In mirror, the Handmaids would see their hands, head, legs, and their body as a whole; but the symbolic order expects them to think of their body as a walking womb:

We are for breeding purposes: we aren't concubines, geisha girls, courtesans. On the contrary: everything possible has been done to remove us from that category. There is supposed to be nothing entertaining about us, no room is to be permitted for the flowering of secret lusts; no special favors are to be wheedled, by them or us, there are to

be no toeholds for love. We are two-legged wombs, that's all: sacred vessels, ambulatory chalices. (Atwood, p. 146)

This also goes back to the Virgin Mary, the mother who sacrifices her body and her desires in order to be accepted as a subject within the symbolic order. In order for the mother's body to be accepted as an ideal one, the Handmaids have to reject their sexuality. In such an ideological system, all people accept the Handmaids because of their dignified role as future mothers. It is clear in Offred's encounter with Guardians, "the two young Guardians salute us, raising three fingers to the rims of their berets. Such tokens are accorded to us. They are supposed to show respect because of the nature of our service" (Atwood, p. 31). It shows that a Handmaid's position in Gilead is considered as the one that Virgin Mary occupies in western cultures, an elevated one that every women wish to achieve. In Gilead, as "a kind of microcosm of the social structure, an image of society [...], as a stable totality with well-defined class distinctions," Virgin Mary is not as she "really was" but seen as "wanted to be seen in order to appear likeable, in brief the ego-ideal of society" (Žižek, 1995, p. 76).

Offred speaks also about Janine, a very important Handmaid in the novel, who represents the Handmaids' Ego-Ideal. Offred looks at her as:

Janine, was paraded out in front of her, her and the other Wives, so they could see her belly, feel it perhaps, and congratulate the Wife. A strong girl, good muscles. No Agent Orange in her family, we checked the records, you can never be too careful. And perhaps one of the kinder ones: Would you like a cookie, dear?  
Oh no, you'll spoil her, too much sugar is bad for them.  
Surely one won't hurt, just this once, Mildred.  
And sucky Janine: Oh yes, can I, ma'am, please? (Atwood, p. 115)

Janine, as an Ego-Ideal is "the perspective from or in which they would like to be seen as the person they hopes to be" (Sharpe & Baucher, p. 48). She is an idea with which the Handmaids deeply identify. Janine is the most powerful Handmaid in the novel. Although all the Handmaids could have power over the Wives, they do not, except Janine who is the only pregnant woman in *The Handmaid's Tale*. Before her pregnancy, in the Red Centre, she is described as a woman without a will of her own, whose existence is defined by serving others and is cast off the Handmaids' group. Offred believes "Janine was like a puppy that's been kicked too often, by too many people, at random: she'd roll over for everyone, she'd tell anything, just for a moment of approbation" (Atwood, p. 139).

In pregnancy, she is a woman who can control others. She is not like a puppet in the hands of whoever wants to control her; on the contrary, when she gets pregnant though, Janine gains the dignity she never had among the other Handmaids:

As we wait in our double line, the door opens and two more women come in, both in the red dresses and white wings of the Handmaids. One of them is vastly pregnant; her belly, under her loose garment, swells triumphantly. There is a shifting in the room, a murmur, an escape of breath; despite ourselves we turn our heads, blatantly, to see better; our fingers itch to touch her. She's a magic presence to us, an object of envy and desire, we covet her. She's a flag on a hilltop, showing us what can still be done: we too can be saved. (Ibid, pp. 36-7)

Janine has what all the Handmaids fantasize in the symbolic order, which is to be pregnant. Therefore, in symbolic identification Janine is a key figure for providing the Ego-Ideal for the Handmaids; Janine position is the very place from where they "are being observed," from where they look at themselves so that they appear to themselves "likeable, worthy of love" (Žižek, 1995, p. 116). Janine shows off, and this is true and at the same time expected, since it is her only chance to be on top of the other Handmaids; Offred says:

The women in the room are whispering, almost talking, so great is their excitement.  
"Who is it?" I hear behind me.  
"Ofwarren. No. Ofwarren."  
"Showoff," a voice hisses, and this is true. (Atwood, p. 26)

Therefore, whereas the symbolic order often devalues and trivializes women, “the pregnant woman can gain a certain sense of self-respect” (Young, 1998, p. 279).

Pregnancy is unique for every woman in Gilead because the woman is experiencing it by and for herself and everybody else is excluded. Although from the very beginning of her conception Janine knows that the baby she has in her belly shall not be hers, pregnancy gives her a desirable position among subjects in the symbolic order. In Žižek’s view, the ideology of Gilead, as a successful political ideology, necessarily refers to and turn around pregnancy as sublime objects posited by the political ideologies. This pregnancy is what political subjects take it that their regime’s ideologies’ central words mean or name extraordinary, in whose name they will (if necessary) transgress ordinary moral laws and lay down their lives (Žižek, 1995, p. 96).

Janine has the chance that other Handmaids do not have, to accomplish her mission in Gilead: giving birth to the baby. Atwood explains:

A woman that pregnant doesn't have to go out, doesn't have to go shopping. The daily walk is no longer prescribed, to keep her abdominal muscles in working order. She needs only the floor exercises, the breathing drill. She could stay at her house. And it's dangerous for her to be out, there must be a Guardian standing outside the door, waiting for her. Now that she's the carrier of life, she is closer to death, and needs special security. Jealousy could get her, it's happened before. All children are wanted now, but not by everyone. (Atwood, p. 26)

Since all of them are in menopause and cannot have a baby, Janine is the only example of the Handmaids’ power over the Wives. Because no other Handmaid is pregnant throughout the novel, she is an ideal among the subjects.

In addition to the sense of superiority, pregnancy allocates Janine the privacy that the other Handmaids do not have, but long for. Offred wishes to be like Janine as she imagines, “such a, so well behaved, not surly like some of them, do their job and that's that. More like a daughter to you, as you might say. One of the family. Comfortable matronly chuckles. That's all dear, you can go back to your room” (ibid, p. 115). During pregnancy, nobody can interfere in her relationship with the baby and her thoughts for it. Although the baby will be taken away at the moment of birth, nine months pregnancy gives her power. She is respected much more as a future mother because pregnancy and motherhood takes the reader back to the Virgin Mary, the absolute and perfect Mother of all, who in the Gileadian belief has the most valuable definitions. This situation of the woman changed in the face of the Virgin Mary “who gives birth to the redeemer” (Warner, p. 59) and becomes the “second Eve” (ibid), who brings in a new spiritual sense to all Christians instead of the sense of Fall.

These evidences gives credit to Žižek’s idea that fantasy operates in filling the split between the symbolic meaning of social ideals and the institutional ritual that holds these social ideals in political ideologies (Žižek, 1997, pp. 106-220). Being under these processes, a Handmaid’s fantasy is constructed in such a way as even starts to accept willingly the role of Handmaid that has been imposed upon her. The Handmaids have been manipulated into believing that this sinister symbolic order was designed for their own good, “Offred at first accepts assurance that the new order is for her protection” (Chauhan, Jul. 2011, p. 2). She even starts to measure her self-worth by the viability of her ovaries and this negatively affects her self-image. This is why Offred characterizes the deploring act of ceremony as “nor does rape cover it. Nothing was going on here that I haven’t signed up for. There wasn’t a lot of choice, but there was some and this is what I chose” (Atwood, p. 121). This statement is very strange. It shows to what extent a Handmaid’s identification with Ego-Ideal progresses that the deploring act is not considered so bad. It verifies that she is beginning to “embrace the system and justify the violations that are being committed against her” (Chauhan, Sep. 2011, p. 4).

The fantasy of the Handmaids, as “decentered subjects,” are constructed by external Ego-Ideals (Mary, Christ, and Janine) and external master signifiers (virginity and pregnancy) in such a way that they accept the values of symbolic order willingly (Žižek, 2007, p. 16). Broadly speaking, all people in general support Gilead’s existence by willingly participating in its rituals, serving as agents of the totalitarian state. A woman like Serena Joy, who has a trivial position in the symbolic order, works out authority within her own household delightfully. She jealously protects her little power and practices it eagerly. In a similar way, the women known as Aunts, especially Aunt Lydia, act as willing agents of the Gileadian state. They habituate other women into the ruling ideology, keeping a close eye out for rebellion. As Žižek resolves, the Ego-Ideals such as Virgin Mary and Janine become “externalized as the expectations of the social group to which the individual belongs.” The source of moral satisfaction is no longer the

feeling they are resisted, but rather “the feeling of loyalty to the group. The subject looks at himself through the eyes of the group, he strives to merit its love and esteem” (Žižek, 1991, p. 64).

## CONCLUSION

Explaining ideological symbolic orders is always Atwood’s subject in her novels and poetry. An in-depth analysis of her novel *The Handmaid’s Tale* offers that it is profoundly political; her novel represents the subjects’ conflict with power and its forms: dictatorship, tyranny, torture, and the reality of violence (Rigney, 1987, p. 104). For Atwood, literature is a political device to show the operation of ideology, the position of people in a society, and the behavior of that people in the symbolic order. In other words, Atwood’s portrayal of the order referred in *The Handmaid’s Tale* includes the investigation of political elements.

Contemplation on ideology introduces fantasy as a psychological implication into the political field. Therefore, the third part of the theoretical part of this thesis has taken into consideration theorists’ views on the notion of fantasy and its function in controlling thoughts and influencing the public. The concept of fantasy does not include what we would describe as daydreams. It is postulated to be the reservoir of innate, unconscious images and knowledge, which has been built up because of phylogenetic inheritance (Watt, Cockcroft & Duncan, 2010, p. 74). It is argued, “desire is always the desire of the Other” (Žižek, 1997, p. 9). Fantasy plays an important role in symbolic registration and identification.

This investigation has also shown that the symbolic order continues its career by identifying subjects with Ego-Ideals in the field of fantasy. As Žižek announces the Handmaids’ fantasy manages or domesticates the traumatic loss of the enjoyment, which cannot be symbolized (ibid, p. 97). Here, fantasy operates in filling the split between the symbolic meaning of social ideals and the institutional ritual that holds these social ideals in political ideologies. The symbolic order refers to Virgin Mary, Jesus Christ, and a character called Janine to present Ego-Ideals for the Handmaids. This referred figures are the concern of “symbolic, the point of symbolic identification, the point in the big Other” from which the Handmaids observe and judge themselves (Žižek, 2007, p. 80). Therefore, in symbolic identification Mary, Jesus, and Janine are key figures for providing the Ego-Ideal for the Handmaids; their position is the very place from where the Handmaids “are being observed,” from where they look at themselves so that they appear to themselves “likeable, worthy of love” (Žižek, 1995, p. 116). These Ego-Ideal are the agency whose gaze the Handmaids “try to impress with their ego image, the big Other who watches over” them and propels them to give their best, “the ideal they try to follow and actualize” (Žižek, 2007, p. 80).

The fantasy of the Handmaids, as “decentered subjects,” are constructed by external Ego-Ideals (Mary, Christ, and Janine) and external master signifiers (virginity and pregnancy) in such a way that they accept the values of symbolic order willingly (ibid, p. 16). It helps the overall regulation and integrity of the subjects and symbolic order. The Ego-Ideals, as the positions that the Handmaids long for and strive to achieve, center upon virginity and pregnancy as sublime objects of ideology. These sublime objects are master signifiers that determine the meaning of other signifiers. Virginity and pregnancy are what political subjects take as their regime’s ideologies’ central words or name extraordinary, in whose name they will (if necessary) transgress ordinary moral laws and lay down their lives (Žižek, 1995, p. 96). It is remarkable to note that these sublime objects are , in Žižekian term, an ideological quilt that is in “the ideological space float signifiers like ‘freedom’, ‘state’, ‘justice’, ‘peace’ [...] and then their chain”, a master signifier “which retroactively determines their meaning” (Žižek, 1995, p. 102). They quilt the chain of signifiers in symbolic identification and retroactively determines their meaning. Virginity and pregnancy are what the Handmaids take as the central word of Gilead’s ideology.

Kauffman (1996) proposes “*The Handmaid’s Tale* functions as an anatomy of ideology, exposing the process by which one constructs, psychologically and politically, subjects of the state and then enlists their cooperation in their own subjection” (pp. 233-34). The present study has been designed to provide concrete examples of these concepts within *The Handmaid’s Tale*. This thesis has uncovered Gilead’s use of different mechanisms to oppress its citizens and the reaction of characters to this oppression.

**ABSTRACT**

Investigating the philosophical foundations of education in Iran, the writers hold the philosophy behind curriculum in Iranian education system was earlier based on collecting facts whose reliability was determined by a group of elites. Accordingly, this philosophical trend was in line with Perennialism that follows more or less an idealist path. To the writers, it is a fallacy to claim that insights derived from traditional philosophies are in conflict with those of modern philosophies. Employing a descriptive method, the paper is in an attempt to elucidate the philosophical background of education in Iran and holds that although Iranian education system is perennialist per se, it has the potential to merit from the yardsticks of other branches of philosophies, particularly, progressivism and existentialism.

**KEY WORDS:** history, philosophy, curriculum, Perennialism, Sufism

**INTRODUCTION**

Long has been written about the history of curriculum development in Iran, but less has been paid attention to the issue whether the history of curriculum development inspired by a philosophical thought is in conflict with the newer philosophies or not. Certainly, we live in a time of change, and change affects the content of curriculum (Pring, 2004). As Riazi and Razmjou (2004) state, curriculum renewal is an ongoing process in educational planning. In this regard, Iranian education system is not an exception. Curriculum renewal provides educators and curriculum developers with the opportunity to incorporate new insights and expectations in academic programs. Thus, in failing to understand change, we may fall victim to criticism. Hanson (1962) claims, "history of science without philosophy of science is blind" (p. 580). Further, it is a fallacy to claim that traditional philosophies, e.g., perennialism, are in conflict with newer ones, e.g., progressivism. The importance of philosophy in the history of education is emphasized in Hopkin's (cited in Ediger & Rao, 2003). According to Hopkin, philosophy has penetrated into every important decision made about curriculum and teaching in the past and is the basis of every important decision in the future. It is a truism that rarely is there a moment when teachers are not faced with occasions where philosophy is of vital part of action.

Employing a descriptive method, the paper makes an attempt to assert that the history of curriculum is deeply rooted in the philosophy that feeds into it, and it is highly context-bound, but this boundary does not imply that the process of curriculum development is static and is strictly defined by fixed philosophical thoughts, intolerant of diverse perspectives.

**REVIEW OF RELATED LITERATURE**

Philosophy and history of science are part and parcel of each other. Hanson (1962) in his aphorism asserts "philosophy of science without history of science is empty" (p. 580). History can be understood either as events separated by time and space or as the events interrelated with time and space. Analytic philosophers are compatible with the first perspective. In effect, this group of philosophers either ignores historical analysis because of the subjectivity inherent in the interconnectedness of contextual realities or objectifies and segments history in order to control reality. In this way, analytic philosophers, or positivists, make an endeavor to conform within the paradigm of modernity (Slattery, 2006). In a nutshell, whether the ignorance of the past or the attention given to the present raises a conflict between tradition and modernity is among one of the central issues that the paper is willing to

investigate. Postmodern curriculum scholars, in contrast, are compatible with the latter—events are interrelated with time and space. To postmodernists, the idea of objectification of reality in order to control it is challenged.

In reality, what makes postmodernists distinct from analytic philosophers, as Slattery (2006) maintains, is the fact that postmodernists celebrate the eclectic, innovative, revisionist, and subjective dimension of historical interpretations. What postmodernism is not compatible with is the *domination* of a group of minority, e.g., the elites, and the *unification* of historical view. Accordingly, Mohsenpour (2008) asserts that existential philosophers (e.g., Molla Sadra) claim that the purpose of Islamic education is proving unification through looking at God's creatures. In effect, the concept of unification is elucidated through using subject-centered programs. In other words, students, in Iran, are taught to reason through structured lessons and drills in order to discover the reality; furthermore, in order to achieve refined wisdom, lessons are content-oriented. In fact, what makes postmodernism in conflict with modernism, as well as with traditionalism, is the notion of unification (Slattery, 2006), which is part of highly center-oriented cultures, such as Iran.

On elaborating the notion of unification, Hashemi (2012) asserts that unification is deeply rooted in music, calligraphy, painting, typography, and discourse in Iranian education system. According to Hashemi, the homophonic nature of Iranian music, for instance, is mostly characterized by “a single melodic line which moves around a theme” (p. 142). In fact, Iranians' inclination towards the center and the main theme is influenced by the fact that the religious culture, in Iran, guides people to appreciate and worship only one source of power, Allah. Henceforth, this deeply rooted religious belief, directly and indirectly, has an influence on every aspect of the people's life, leading them to seek unification everywhere (Hashemi, 2012).

In addition, in Iranian Sufism, the concept of Sufi who is in the quest for truth is so close to the meaning of teacher. The teacher has a messianic role. The teacher as the possessor of knowledge stands at the center of attention in class and is believed to be able to solve the problems of the world. Even the seating arrangement of the students would show the superiority of the teacher as the source of knowledge and discipline (Hashemi, 2012). In reality, as Hashemi asserts, the hierarchy that imposes itself upon the curriculum and education in such a context certainly inclines towards the legitimacy of top-down pedagogy. Henceforth, curriculum development in Iranian education system is in favor of the glorification of the past in order to revitalize the present. In a sense, the system of education insists on the reliability of facts that must be transmitted to the next generation.

In addition, what postmodernists insist on, according to Slattery (2006), is that when the norm chosen by curriculum developer is not compatible with the tenets of postmodernism, it results in hegemony. Elaborating the notion of hegemony is not in the scope of this paper, but it suffices to say when class schedules, bulletin boards, announcements, and dress codes all revolve around one activity, football, for instance which is chosen by a group of elites, and school leaders do not provide alternate and equitable activities for those who do not participate in the football rituals, then hegemony is created. Henceforth, educators must be aware of the ways that hegemony is created.

Curriculum development in the postmodern era deconstructs hegemony by challenging the dominance of logical positivism (Slattery, 2006). Logical positivism is challenged as it considers curriculum as a set of facts that can be enumerated; in fact, to logical positivists, some facts are considered as correct and others as wrong. Moreover, the analytic philosophers prefer to set strict aims for learning situations rather provide language learners with different narratives or genres to support their growth. In other words, postmodern educators can no longer teach a subject in terms of facts, or a series of events to be memorized (Tella, 2004).

In line with post-modernity, Lyotard (1984) also asserts that the Enlightenment notion of *totality* must also be challenged. Totality which is reflected in rationalistic and centric paradigms ignores difference (Slattery, 2006), or, according to Kumaravadivelu (2006), *particularity*. The parameter of particularity, according to Kumaravadivelu, contributes to the context-sensitive elements and individuality of the people involved. In fact, postmodernism is not compatible with modernists' notion of totality which is in line with certainty. Modernists' strivings towards totality and certainty led to an increasing instrumentalization of reason. To modernists, the enlightenment itself should be enlightened and not posed as a “myth-free” view of the world (Adorno & Horkheimer, 1997).

However, it is not plausible to claim that the tenets of post-modernity are in conflict with those of traditions. In fact, that learning situation has not been separated or isolated from the total context is crystal clear (Reid, cited in Yan, 2006, p. 50), but what is not fair to assume is that the stability of a postmodern ideology should not be at expense of marginalizing traditional voices. In sum, the survival of any type of education necessitates to let students celebrate

differences in order to “think globally, act locally” (René Dubos, cited in Gough, 2003, p. 55). In effect, it is obvious that we live in an era of information and technology, the influence of which on education is undeniable. Henceforth, the traditional language classroom is constantly changing with the advances and increasing uses of technology (Fakhraee Faruji, 2011).

### **CURRICULUM AS FACTS VERSUS CURRICULUM AS PRACTICE**

In the history of language curriculum, we face two contrasting views: curriculum as facts and curriculum as practice (Young, 1998). Similar to these two contrasting views, two contrasting approaches are presented: the banking approach and the problem posing approach (Freire, 1970). In the first approach, learners are observed as depositors. In contrast, the second approach, the problem posing perspective, respects the human dignity and helps to emancipate the individual. Investigating the philosophical foundations of education in Iran, the writers hold that the philosophy behind curriculum in Iranian education system was earlier based on collecting facts determined by the elites. Accordingly, this philosophical trend was in line with Perennialism that reflects conservatism of ideas and looks to the past for subject matter in the curriculum (Ediger & Rao, 2003). Perennialists, as Noroozi (2010) puts forth, deals with a realist philosophical base. Its instructional objectives are to educate the rational person; its main focus is on preserving the past. And as Maftoon and Shakouri (2012) claim, knowledge is considered as property that should be transmitted to an individual from an authority. This trend of thought which is inspired by Aristotle’s naturalism and his doctrine of the uniformity of nature connotes that there are natural truths that do not change and that such truths should be made the fixed intellectual content of education (Ediger & Rao, 2003).

### **PERENNIALISM IN LINE WITH SUFISM**

Perennialists trace the foundation of their philosophy back to Plato and Aristotle. Perennialists cling to the belief that certain universal truths or ideas exist at all times and that the level of existence that man attains is determined by his attention or inattention to these eternal principles (Jent, 2003). In line with Perennialism, Iranian education system was earlier inspired by Sufism (Noroozi, 2010). According to Ghadamyari (2012), Sufism most probably originated in Iran in the fourth century H. G. However, Orientalists introduced the term Sufism to European languages at the end of eighteenth century.

On providing a brief history of Perennialism, Jent (2003) defines a perennialist as “one who believes that certain perennial truths in and about education have existed from the very beginning and continue to have existence and validity as ‘first principles’ which all right-thinking men will accept” (p. 4). Among the sufists who propagate Plato’s thoughts in Iran was Shahaboldin Sohrevardi (cited in Azodi & Askari Sarvestani, 2013) and the philosopher who spreads the tenets of Aristotle was Abu Nasr Farabi (cited in al-Talbi, 1993). Farabi, to several scholars (e.g., Vallat, 2011) is a faithful Aristotelian. Farabi, as a peripatetic philosopher, asserts that reality can be achieved by reasoning; in contrast, the primary goals of education, to Sohrevardi, are not limited to achieve the ability to reason but to illuminate wisdom. The founder of Illuminationist Philosophy—Sohrevardi—considers God as the origin of all feeling and thinking. Henceforth, for human beings to be illuminated, they are supposed to be in quest of finding out unknown factors (Kamali Zadeh, cited in Azodi & Askari Sarvestani, 2013). Azodi and Askari maintain that to Sohrevardi, it is not possible to find out any realities of the world through reasoning only. To him, the purification of wisdom is necessary for finding the reality. What Sohrevardi brings is the pedagogy of integration. In fact, he integrates and juxtaposes ancient Persian wisdom, Greek rationalism, and Islamic knowledge. Accordingly, Habibi (2011) contends that to Sohrevardi, there are several ways of obtaining knowledge; i.e., deduction, induction (experience) and intuition. In a sense, deduction is the ability to derive a conclusion from given information by using a set of formal mental operations. Induction, in contrast, implies expanding knowledge by transferring knowledge from previous experience to new situation, and intuition implies gaining knowledge by using one’s feelings rather than considering the facts.

Toussulis (2011) referring to the work of Sedgwick (2004) claims the perennialist perspective cannot be easily discarded because it is inherent in much of Sufism, as well in much of Iranian education system. Toussulis also declares that perennialist perspective protects sufists from being attacked from two sources: modern relativism which denies the vitality of revelation and fanatical fundamentalism which negates esotericism, the concept that metaphysical or spiritual knowledge preserved or intended for a limited group and not for society at large.

Sufism curriculum, as Noroozi (2010) claims, with its themes of love, wonder, and tolerance manifested itself throughout the textbooks of poetry and prose and remained to be popular despite the traditional philosophy of schooling. As Noroozi reports, “poetry seems the right venue to search for these recurring themes” (p. 29). Compatible with the employment of poetry as the path to find reality, several sufists, e.g., Imam Mohamad Ghazali, portray the inability of reason to comprehend the absolute (Noroozi, 2010). Along the same line, the emergence of avoiding rationalism, which is probably part of Iranian culture, is viewed in the light of Sufi thoughts (Ghadamyari, 2012). Henceforth, the relativist stance of sufists lends a claim to the employment of poetry and verse in curriculum.

Noroozi, also in outlining the tenets of Perennialism in line with Sufism, claims “rote learning and educating moral obedient students [are] virtuous” (p. 33). Moreover, the classes held in khanegha and mosques would follow the perennialist path of teaching. In a sense, the linchpin of Perennialism and of traditionalism is that change in curriculum is unnecessary since truths are stable as revealed through study, and reason is learned by teaching eternal truths. Nevertheless, whether this school of thought suffers from ideological perspectives or is susceptible to change raises a bone of contention among scholars.

Jahani Asl (2003) asserts that “one of the results of this ideological education in Iran is the creation of alienated students, teachers and administrators (from one another) in the educational environments” (p. 118). Accordingly, Jahani Asl likens an obedient teacher to a laborer who is separated from any decision over the curriculum. To him, “the tragedy of creation of the obedient administrator is totalitarian enforcement creating an oppressor. (p.118)

Whether Jahani Asl is in quest of an ideal education inspired by postmodernism or not is unknown, but the employment of new pedagogy, such as progressivism and constructivism, in an absolute sense, in a context whose education is highly centralized involves dehumanizing students from their culture and history. According to Kelman (1976), dehumanization involves denying a person “identity”—a perception of the person “as an individual, independent and distinguishable from others, capable of making choices” (p. 301)—and “community”—a perception of the other as “part of an interconnected network of individuals who care for each other” (p. 301). When people are divested of the agentic and communal aspects of humanness they are deindividuated, lose the capacity to evoke compassion and moral emotions, and may be treated as means toward vicious ends (Haslam, 2006).

Nevertheless, claiming that students are passive and passivity makes students alienated sounds inappropriate because passivity in Sufism is a sign of respect held for Pir, and nowadays for teachers. Also, the system of education employed by a country, either centralized or decentralized, depends on the policies ruled over a country, and the demand of society that is affected by such social factors as language, customs, habits, traditions, and beliefs of people (Farjad, cited in Salari Chine & Soltaninejad, 2012).

The nature of change in curriculum development is contingent rather than certainty (Daniels, Katz, & Sullivan, 2012). The contingency in the nature of curriculum indicates that elaborating on the history of education without giving attention to the hybrid nature of philosophy is empty. Thus, attempting to fix one’s position on the absolutist camp in order to consolidate whatever postmodernists claim to some extent must be compatible with the history, together with the philosophy, that the system of education originated. However, no one denies the fact that the tenets of postmodernism is in stark contrast with the philosophical base of curriculum development in Iranian education system. But claiming that Iranian education system has some distance with the globalized level of education is not plausible. In the same way, prioritizing one norm over the other might be at the expense of creating alienated learners. In this regard, as Hashemi (2012) claims “making any attempt in order to lead curriculum towards postmodernist pedagogy results in dehumanizing of the target group by isolating them from their history and culture” (p. 143).

## **TRADITION AND MODERNITY RECONCILIATION**

The change in a society per se is dynamic, whether it is traditional or modern. Thus, as Gusfield (1967) maintains, “it is fallacious to assume that a tradition society has always existed in its present form or that the recent past represents an unchanged situation” (p. 352). If we do not know where we came from, we will not know where we are going. In fact, the relations between tradition and modernity do not necessarily involve conflict. Gusfield continues “modernity does not necessarily weaken tradition. Both tradition and modernity form the bases of ideologies and movements in which the polar opposites are converted into aspirations, but traditional forms may supply for, as well as, against change” (p. 351).

In this regard, Iranian teachers, not Iranian education system, though are perennialist in teaching, have some inclinations towards progressive existentialism. Atai and Mazlum (2012), on investigating Iranian teachers' views towards the educational philosophies of Aristotle, Dewey, and Rousseau, concluded that teachers were more or less interested in some aspects of Dewey's and Rousseau's philosophies of education. Henceforth, it is a fallacy to claim old traditions are displaced by new changes (Gusfield, 1967). Accordingly, Gusfield continues that the old and new cultures and structures can coexist co-productively without conflict; in fact, the old is not necessarily replaced by the new since mutual adaptations is a frequent phenomenon of social change. In other words, as Gusfield maintains, "the acceptance of a new product ... does not necessarily lead to the disappearance of the older form [...] new forms may only increase the range of alternatives (p. 355).

Although the challenge between tradition and modernity has always been a heated debate among scholars, Kebede (2004) contends that there is no necessary conflict between tradition and modernity. Modernity is a transient term. Herf (1996) radically asserts "there is no such a term as modernity in general" (p. 1). In fact, the conflicts exist between different value-systems that generate new waves of social change. In addition, the change in a value system does not result from an accumulative process; it is not a mechanistic process. In fact, what causes a shift in one value system is the pressure of new evidence and Iranian education system is not an exception. Revision and transformation of Iranian education system is immutable reality of the country when it is subjected to change (Tamer, 2010). On the plausibility of dynamic nature of change in Iranian education system, it can be claimed that due to the dynamic nature of education in any context, it is legitimate to claim that the history of curriculum development, thought deeply embedded in its philosophy, is constantly changing. In other words, an idea not coupled with its philosophical root will never get bigger if the idea is not tolerant of diverse perspectives.

## CONCLUSION

The effectiveness in a system is tied to how well different parts of it—students, teachers, and programs—perform. Along the same line, Mohsenpour (1988) asserts that the philosophy of education in any society is deeply rooted in the student behavior, the teaching programs, the curricula and textbooks, and the major goals of the educational system of that society. Thus, it is undeniable that when educators pursue a stream of philosophy, they incorporate their beliefs into the system, and since such beliefs reflect a specific time and place, they might be in need of revision, and therefore as the nature of change, in any society is dynamic, Iranian educational system is not an exception.

## BIO DATA

**Parviz Maftoon** is associate professor of teaching English at Islamic Azad University, Science and Research Branch, Tehran, Iran. He received his Ph.D. degree from New York University in Teaching English to Speakers of

Other Languages (TESOL). His primary research interests concern second language acquisition, SL/FL language teaching methodology, and language curriculum development. He has published nationally and internationally and written and edited a number of English books. He is currently on the editorial board of several language journals in Iran.

**Nima Shakouri** is currently a Ph.D. candidate of TEFL at Islamic Azad University, Science and Research, Tehran, Iran. He has taught English courses for over a decade at different universities. Moreover, he has published a number of articles in international journals and some English textbooks for GE and ESP courses.

## LITERATURE INSTRUCTION THROUGH READER-RESPONSE APPROACH: DOES IT FOSTER READING COMPREHENSION?

Cevdet Yılmaz

Çanakkale Onsekiz Mart University, Turkey

Email: cyilmaz@comu.edu.tr

### ABSTRACT

Reading comprehension is one of the four components, which pre-service English teachers in Turkey must acquire at advanced level, and the literature and language teaching course currently imposed by the National Curriculum is aimed at encouraging these students to improve their reading skills alongside literature. This article discusses how reader response approach to teaching English novels could be applied in an effort to maximize these students' reading skills. A study using a quasi-experimental design was conducted among 91 pre-service English teachers from four 3<sup>rd</sup> year, intact classes. An intervention of eighteen reading lessons using reader response-based strategies was employed over a period of three months. Tools for the data collection were a pretest, a posttest and an interview conducted after the treatment. The findings from the independent t-test showed a significant difference, revealing the effectiveness of the strategies, and the respondents from the Experimental Group gave a positive feedback regarding the use and effects of these strategies. The results also revealed that writing reading logs exploited as part of reader response activities helped students to get more out of novels and to express themselves freely. The study concludes with implications for pedagogy and research.

**KEY WORDS:** literature instruction, reader response approach, reading comprehension

### INTRODUCTION

In Turkey, English is taught to equip pre-service English teachers with various academic challenges through the development of critical thinking and the competent use of language skills. Among these skills is the reading component that has supposedly a heavier weight (nearly 50%) in assessing students' overall performance. By the same token, it is perceived that pre-service English teachers at the university level are expected to read more than they write. However, reading skill critical for students is not without its problems. Based on our teaching experience and students' previous results on the English courses, some students have been found to lack both motivation to read in English and adequate reading comprehension skills. This has in turn underscored the need to develop alternative ways of tackling reading skill.

With these considerations in mind, a new course entitled 'Literature and Language Teaching' was introduced to pre-service English teachers by Turkish Higher Education (commonly known as YOK) in 2009. The course was intended to assist pre-service English teachers in improving reading skill as a result of their exposure to a wide range of literary texts. The content of the Literature and Language Teaching course entails 'example short stories and novels from British and American literature; identification of the distinctive features of short stories and novels; different approaches to using literature; examining ways the teaching of literature and language in these two genres; exploring theoretical and practical dimensions of this integration' (Literature and Language Teaching Syllabus, 2009). Apparently, this course content is not clear-cut and straightforward in the sense that it does not propose a sound approach to integrating literature into language with an emphasis on the development of reading component.

In order for the pre-service English teachers to enhance their reading proficiency at the advanced level, we propose here to use reader-based strategies for teaching English novel, which in essence places the reader at the very centre throughout the reading process. The study reported here examines the effectiveness of the reader response strategies coupled with the presentation of English novel as a literary genre on a group of pre-service English teachers' reading skills.

### LITERATURE REVIEW

#### *Reader Response Theory in Language Teaching*

Reader response theory is having a growing influence on English as a foreign language (EFL) literature theory in English language teaching (ELT) classes (Carlisle, 2000; Hirvela, 1996; Elliot, 1990). Based on the literary theory of Rosenblatt (1995), reader response theory emphasizes a reciprocal relationship between the reader and the text.

The reader with the creative role brings his or her own cultural background and socialization to the text. The meaning, therefore, that the reader creates from the text is synthesized with the text and the life context the reader brings to the text (Rosenblatt, 1991). In this case, meaning is determined as the result of this transaction. Thus, reading, in this approach, is a reflective and creative process and meaning is self-constructed. The meaning and structure of the text are not inherent in the print but are invited by the author and imputed to the text by the reader (Swaffer 1988, 124). In a sense, readers construct their own meaning without heavy dependence on either text or writer.

It follows that Rosenblatt emphasized not only the transaction theory between reader and text as a way to view the reading process, but how reader response theory influences the teaching of reading and literature (Many & Wiseman, 1992). Rosenblatt describes two stances toward reading: efferent and aesthetic (Rosenblatt, 1985). For the purposes of this paper this aspect of the theory needs to be expounded. Rosenblatt (1995) found that a reader takes an efferent stance when the goal of reading is to gain information from the text (e.g. textbooks, newspapers, etc.). When the reader's attention is focused on the experience of reading itself, an aesthetic stance is taken, which results in the personal, experiential aspects of meaning (Rosenblatt, 1995; Many & Wiseman, 1992). During and after an aesthetic transaction, the reader has a response to the event, which involves the organizing of his or her thoughts and feelings about the text (Rosenblatt 1985: 40).

Admittedly, the teaching of literature as an aesthetic experience frees teaching of literature from the narrow restrictions imposed by, what Carlisle calls, 'information-gathering exercises' (Carlisle, 2000). This particularly applies to Turkish EFL readers, whose reading experience is often equivalent to one long comprehension exercise. In these classes, a novel in one hand and a dictionary in the other, learners plough their way through the pages looking up the new vocabulary until they 'understand' the story. Their focus of attention is not on the experience they have while reading, but on what facts they can retain for use after reading is over. The story is not being read as literature but as a piece of information (Carlisle 2000, 13).

On the contrary, in the reader response theory, the act of reading is viewed as an active, dynamic process in which readers are in charge of the exploration and development of meaning. In such a context, a variety of personal interpretations and analyses, based on not only the textual elements but also the reader's personal views, experiences and feelings are welcomed (Padley, 2006; Tyson, 2006; Diyanni, 2000). Thus, students come to recognize that the main concern is not 'What they understand' but 'how they feel'. Rosenblatt contends that the teacher should accept 'multiple interpretations' to a text rather than just one 'correct interpretation', which allows for creative and critical thinking to take place in the class (Rosenblatt, 1995).

Several activities and techniques have been used to apply the response based theory in EFL literature teaching: Reading Logs (Benton & Fox, 1985, 1990; Carlisle, 2000); Response Journal (Sheridan, 1991); Critical Questioning and Writing (Probst, 1994; Hirvala, 1996); Self-questioning (Davis, 1989). The main task proposed in this paper is centred on student-written reading logs originally put forward by Benton and Fox (1985: 121). It is a simple and direct tool to encourage and tap into learners' individual responses to a novel. It differs from the other kinds of activities in that students do this task while in the act of reading. Carlisle, a leading proponent of this activity, contends that through keeping a log, the hope is that the learner's reading experience will go beyond literal understanding and move towards aesthetic appreciation of the text (Carlisle 2000: 14). Hence, the reading log encourages students to enter and explore their secondary worlds. According to Benton and Fox (1985: 2-18), a reader inside a secondary world is engaged in four separate processes: *Anticipating/retrospecting*: guesses about what is going to happen next, what events lead to current situation, and how the book is going to end; *picturing*: images that come into the mind's eye, such as a character's face or a scene described in the book; *interacting*: opinions on a character's personality and actions or feelings about events and situations; *evaluating*: comments on the skill of the writer. In line with these four key elements of response to literature, the guidelines below, which have been adapted from Benton (1992: 35), explain how to write a reading log (Figure 1).

While you are reading the book write down all the things that go on in your head in a "stream of consciousness" style. As you read, you will be making a record of images, associations, feelings, thoughts, judgments, etc. You will probably find that this record will contain:

*Questions* that you ask yourself about characters and events as you read. (Answer these yourself when you can.)

*Memories* from your own experience provoked by the reading.

*Guesses* about how you think the story will develop, and why.

*Reflections* on striking moments and ideas in the book.

*Comparisons* between how you behave and how the characters in the novel are behaving.

*Thoughts and feelings* about characters and events.

*Comments* on how the story being told. For example, any words or phrases or even whole passages that make an impression on you, or motifs which you notice the author keeps using.

*Connections* to other texts, ideas and courses.

*An outline* of the chapter, no longer than a paragraph.

Please date each entry, and note down the time and place, as well as the mood you are in while reading.

Please note down the page number you are reading when you make an entry.

Please take pleasure and pride in your log.

*Please do not try to rewrite the book.*

Figure (1): Reading logs.

### ***Rationale for the Use of Novel***

The benefits of using novel in EFL literature teaching have been highlighted by many ESL/EFL practitioners. Many scholars (Lazar, 1993; Collie & Slater, 1987, Fowler, 1977) have presented compelling arguments for teaching novels in EFL/ESL classes. They argue that we should teach novels because

1. They are enjoyable to read.
2. They are authentic.
3. They help students understand another culture.
4. They are a stimulus for language acquisition.
5. They develop students' interpretative abilities.
6. They expand students' language awareness.
7. They encourage students to talk about their opinions and feelings.
8. They foster personal involvement in the language learning process.

The benefits of using novels as textbooks are numerous. Novels can supplement textbooks and form the central focus of instruction (Gareis, Allard, & Saindon 2009: 136). Novels allow for extensive reading (i.e., the reading of a large quantity of text), which has been shown to facilitate general proficiency (Grabe, 1991) and build fluency (MacGowan-Gilhooly, 1991) as well as vocabulary (Horst, 2005; Krashen, 1989). Novels also increase motivation by providing narrative and plot (Cho & Krashen, 1994), a fact evidenced by the growing number of educational novels.

Unabridged novels are especially effective. They not only provide authentic exposure to the English language, but also offer the quantity of reading required to produce substantial improvement in reading skills (Gareis, Allard, & Saindon 2009: 137). Students can be immersed in a context and activities for more than one or two days and thus practice all language skills systematically (Gajdusek, 1988; Gareis, Allard, & Saindon, 1998). An added benefit is that many novels have been adapted for film and in conjunction with their visual counterpart, can be used to teach other literacy skills such as film literacy (Pally, 1997; Seger, 1992).

The previous studies by Benton and Fox (1985) and Carlisle (2000) were restricted to the practical applications of reader response theory in literature EFL teaching. They did not look into the statistical results based on these classroom applications, which is a gap in this area of research. Therefore, to explore the effects of reader response approach to teaching English novel on EFL students in terms of reading comprehension and perceptions, this study investigated the following two research questions:

RQ1. To what extent do students who received a reader-based reading intervention comprehend better than those who do not?

RQ2. To what extent do students who received the reader-based reading treatment perceive the intervention?

## **METHODOLOGY**

### ***Participants***

The participants of the study were 91 pre-service EFL undergraduate students (73 females, 18 males) from two intact classes, with 48 and 43 students in each. The former served as the experimental group, the latter the control group. They studied English for at least six years in Turkish junior and senior high schools before coming to university. The students were prospective English teachers aged between 21 and 24 years ( $M=21.5$ ,  $SD=.96$ ) in their third year of study in the Department of English at Çanakkale Onsekiz Mart University, Turkey. The mean Grade Point Average (GPA) for the groups was 2.99 ( $SD=.43$ ) on a scale of 4. The students were assumed to be of a homogeneous level of English proficiency and reading comprehension skill on the grounds that they all were non-native speakers of English and they had been admitted to the programme on the basis of their scores on the English language component of the university entrance exam. The participants were enrolled in a required core course titled Literature and Language Teaching, the purpose of which was to assist students in acquiring advanced reading skills by means of selected literary texts and accompanying literary activities.

The baseline of the two groups was that they took exactly the same courses with the same amount of credit hours. The classes met for one three-hour session per week, for a total of 39 hours over 13 weeks. The teaching content of the two groups focused on the integration of literature into language capitalizing on the selected English novels and literary activities except that the experimental group also spent a good deal of their session on the application of reader response theory.

### ***Instruments and Procedures***

To assess the effect of the program on students' reading proficiency, a reading comprehension test was administered as a pre-test and post-test to both experimental and control groups before (i.e., week1) and after (i.e., week 13) the experiment. The reading comprehension test adopted for the study was specifically developed as part of Ph.D. thesis on ELT by Razi (2009). The reliability of test was .84. Based on students' previous scores on reading and the researcher's teaching experience, the test was considered suitable for the participants. The content mainly involves three parts, each of which contains familiar reading passages adapted from, respectively, an original reading text, a short story and a magazine article. The participants were required to answer thirty-two questions in the reading test. The former text contained eight multiple choice (MC) questions, the latter nine, and the last part fifteen, with a total of 32 MC questions. Each question contained four options. The same reading test was repeated at the end of the course. When the students took the pretest, they were unaware that the same test with the same reading texts would be given again, and most importantly, none of the test papers were retained by the students.

After reviewing several collections of English novels, two novels were chosen by the researcher based on the interest of the students in order to be covered in both the experimental and control groups throughout the course. The novels, in the order of their presentation, were "*The Great Gatsby*" by F. Scott Fitzgerald, and "*The Heart of Darkness*" by Joseph Conrad. The two novels were selected as they were supposed to evoke a considerable amount of emotional response and were promising to promote students' versatile opinions and interpretations of the novels. The researcher also hoped that these novels with their plots, characterisation, suspense and ironies could spark the attention of the students and drive them into the free expression of their individual interpretations.

In the control group the traditional method of teaching literature was pursued, and the instructor had the central role in directing students to generate one "correct" interpretation of the novels. The researcher initiated the debate asking about the summary of the novels involved, followed by analysis of the main characters, central themes, setting and other literary aspects of the novels. The students were encouraged to express what they thought about the underlying themes, character development, and the "message" that the novels conveyed; however, it was the instructor who provided the final correct interpretation and explanation. Conversely, the students in this class are onlookers of the teacher's instructions without assuming a role in changing the path of instruction determined by the instructor.

On the other hand, in the experimental group, the reader response approach to reading novels was implemented. In addition, the activity of student-written logs was introduced as a practical application of reader response theory. Benton and Fox (1985: 21) recommend devoting class time to instructing students on how to write their reading logs until they come to terms with the practice. Carlisle (2000) suggests explaining the main ideas of reader response theory in the first lesson as outlined above, followed by pointed questions such as 'What is the difference between

reading literature and reading for information?’ and ‘What do you do when you are reading a story?’. Students were made aware of the contribution the reader brings to the text thereby valuing their own responses. For this purpose, students were set a page from a novel and were asked to make notes of their responses to the text in their logs using the guidelines (Figure 1) for assistance whereby a free exploration of ideas was encouraged. Following this phase of preparation, reading logs were assigned as individual homework.

Having read the assigned chapter and made entries in their reading logs, students came to class. At the outset, an outline of the chapter was read out by one or two students. This enabled the teacher to check students’ understanding of the chapter and set the context for group discussion in which students would actively engage. In groups of five, students shared their ideas and feelings, referring to their logs. One student from each group reported the emergent points of their discussion to the whole class. At the end, the teacher collected the reading logs to be evaluated and employed as part of the discussion in the next lesson.

Returning the logs, the teacher mentioned some of the more interesting entries made in students’ logs. Drawing on these entries, students were asked to speculate about the complex strands involving central themes, characterisation and plot cited in the relevant chapter. The teacher acted as a ‘facilitator’ in eliciting responses from students. Likewise, the teacher, whenever necessary, cleared up any remaining areas of confusion in the form of lectures which were delivered on some criticism of the text and cultural aspects likely to be unfamiliar to them.

By reference to the two novels involved, the following samples have been selected from the students’ reading logs in order to exemplify the range of elements of response to literature as cited in Figure 1.

#### *THE GREAT GATSBY*

All these descriptions give me the sense that some characters are doomed to misfortune or death.

I guess Gatsby is in fact a smuggler although this is never explicitly stated.

I think I can understand the feeling of Daisy. It is a sorrow that when a man must abandon his lover, and his lover falls in love with another man during this period.

The author describes ‘a valley of ashes’ as ‘a fantastic farm where ashes grow like wheat into hills and grotesque gardens’ in a very active and pictorial way, so that the scene is really touching for me.

I find that Nick’s narration gives way to our emotions and feelings and the thought about Gatsby. The way he narrates the story leads us to love Gatsby’s personalities unconsciously although he does not intend to do so as mentioned in Chapter 1, ‘I’m inclined to reserve all judgements.’

#### *HEART OF DARKNESS*

The descriptions of the jungle give me the feeling of loneliness and misery.

The element of darkness is widely felt throughout the book. I think something terrible will happen sooner or later.

Would Captain Marlow and Mr. Kurtz be killed during the journey they made into, as mentioned in the book, ‘the heart of an immense darkness’? Particularly Marlow must survive as the sole witness who will be capable of depicting the events.

#### *Data analysis*

All the pretest and posttest scores pertaining to students’ proficiency in reading comprehension were analyzed using the Statistical Package for the Social Sciences (SPSS, Version 15) software program. Prior to the intervention, to ensure that both the Control and Experimental Group were as equivalent as possible, an independent sample *t*-test (Levene’s Test) was used to determine whether the Control Group and the Experimental Group were homogeneous. Then, an independent sample *t*-test was used again to determine whether if there was any significant difference in the means between the Control Group and the Experimental Group in the posttest scores. In addition, the paired-sample *t*-test was used to find out whether there was any significant difference in the means of the Experimental Group between the pretest scores and posttest scores in order to supply statistical verification. Regarding the qualitative data, all responses to the semi-structured questions during the interview phase were summarized and analyzed.

### **FINDINGS AND DISCUSSIONS**

RQ1. Did students who received a reader-based reading intervention comprehend better than those who did not?

#### *Quantitative Analysis on Pretest and Posttest Results*

The pretest scores of the two groups were compared using the independent *t*-test. From the data below (Table 1), the Levene’s Test for equality of variances shows  $F = 6.218$  and  $p = .014$ , proving that the variance of the groups was

equivalent. Moreover, the result also reveals  $t = 1.643$ ,  $df = 90$ , and  $p = .104$ , demonstrating that the two groups did not differ significantly, but were homogenous.

Table 1: Results of the Levene's Test for Equality of Variances

	F	Sig	T	Df	Sig (2-tailed)	95% CI lower	upper
Equal variance assumed	6.218	.014	1.643	90	.104	-.25375	2.67799
Equal variance Not assumed			1.615	73.558	.111	-.28377	2.70801

Significant at a confidence level of  $p < 0.05$  (2-tailed)

Based on the results above, it can be assumed that the samples of both groups were equal in their reading proficiency levels prior to the intervention. To answer the first research question, the means of the pretest and posttest scores were compared. Afterwards, independent  $t$ -test was employed to provide statistical verification.

Table 2: Posttest Scores between the Experimental and Control Groups

	Group	N	Mean	SD	SE	t	df	Sig (2-tailed)
Posttest	Experimental	48	25.45	1.934	.2791	6.619	90	.000
	Control	44	20.37	4.236	.6387			

Significant at a confidence level of  $p < 0.05$  (2-tailed)

These independent  $t$ -test results show that the mean for the posttest scores for the Control Group was 20.37, and the mean for the Experimental Group was 25.45, with a difference of 5.08 (Table 2). The result in Table 3 ( $t = -9.919$ ,  $df = 66$ , and  $p = .000$ ) shows that there was a significant difference in the mean for the posttest scores between the Control Group and the Experimental Group.

Table 3: Independent Sample Test Results on Posttest Scores

	Levene's Test for Equality of Variances			t-test for Equality of Means			
Post test	F	Sig.	t	df	Sig	95% CI lower	Upper
Equal variance assumed	13.221	.000	6.619	90	.000	3.1374	5.8284
Equal variance Not assumed			6.431	59.026	.000	3.0881	5.8779

Significant at a confidence level of  $p < 0.05$  (2-tailed)

To this effect, it can be concluded that with the help of the teaching strategies grounded in reader response theory, the Experimental group scored better than the Control Group. As gathered from both the results and the observations within the classroom, the students were experiencing a kind of 'the intensely personal nature of reading' (Carlisle, 2000) where they were gradually learning to recreate a story in their own style (Holland, 1975). As a group of students, they talked their way through selected literary texts to understand them. Notably, teacher led group work enabled students to share, as Holland says, their differing subjective viewpoints that make the conversation interesting (1975: 231). Working together assisted students in monitoring their understanding the various strands of the texts by stopping at regular intervals to direct pointed questions, summarize, interpret, predict and clarify.

RQ2. How did students who received the reader-based reading treatment perceive the intervention?

**Students' Perceptions**

The researcher instructed the participants in the experimental group to concentrate on three perspectives when they were engaged in their reports:

1. The benefits they obtained from the course which features the reader-response approach to teaching literature in ELT classroom.
2. The difficulties they encountered in practice.
3. The suggestions they wished to offer for future courses.

The frequencies for the most commonly mentioned items were tallied and are displayed in Table 4. Table 4 makes it evident that the students gave more positive comments than negative ones. As shown, 39 out of 48 students reported that they improved their reading skills, which they considered one advantage of employing reader-response approach. 32 students expressed that they made considerable gains in vocabulary growth, which in turn enhanced their confidence in reading literary texts because they could develop the very necessary skills for dealing with the unfamiliar vocabulary.

Other relevant benefits were that the majority of the students in the experimental group were enthusiastic about novel reading, and thus 42 out of 48 students reported that they would use the reader-response approach to the teaching of novel for their future English teaching. Likewise, another 37 students also mentioned that the progress that they made in this course would be of particular use to them in other university courses because, in Gajdusek's view (1988), students can practice all language skills systematically. The overwhelming majority of the students (92%) felt that the reader-response theory was better approach to acquiring English than formal instruction. This underscores the need to provide alternative innovative ways of teaching English which would satisfy students' varying language needs.

However, 16 students out of 48 reported that they were confronted with the unfamiliar vocabulary and the unusual use of language in reading particularly Conrad's masterpiece 'The Heart of Darkness' which in essence encapsulates the wealth of metaphors and similes. Only 7 students complained about the heavy workload whereby they were required to read the assigned chapter and prepare for the reading logs and then share their views in the classroom. In contrast, most of the participants did not agree with them, stating that it was worth this effort. They particularly reported that engaging in writing reading logs helped them to gain a clearer understanding of the novel. They remarked on how they enjoyed being given opportunity for expressing themselves freely alongside the reading logs.

*Table 4: Reported perceptions of reader-response activity by number and percentage of the participants*

Comments	Number of Students (n=48)
Improved reading skills	39 (81%)
Made gains in vocabulary growth	32 (67%)
Encouraged students to use novel for future English study	42 (88%)
Helped in other university courses	37 (77%)
Better approach to acquiring English than formal instruction	44 (92%)
Unusual use of language in some novels	16 (33%)
Heavy workload	7 (15%)

*Note.* The students were allowed to give as many comments as they want to make, so the total frequency is larger than the number of participants.

**CONCLUSION**

This study has yielded both quantitative and qualitative data in support of the use of reader response theory in ELT classroom, encouraging student teachers' reflection on their practices. The findings have considerable pedagogical implications for the ELT classroom in Turkey, as the results revealed that the application of reader response approach in ELT literary courses led to a noteworthy improvement in the reading comprehension of students. ELT teachers should be encouraged to model the strategies underlying reader response approach (Carlisle, 2000; Hirvela, 1996) in ELT classroom, providing an alternative to learning how to construct multiple meanings from the texts. In the process, reflective and creative skills can develop, producing an autonomous reader who is capable of expressing his or her own feelings in responding to the literary texts.

This study, which were restricted to a group of third year student teachers from ELT Department at a Turkish University, has potential for further research in that it would be worthwhile to expand this study to include students from different levels of schooling. As an alternative to teaching novel, texts from other genres can also be explored. For instance, short stories might be introduced as part of the reading component in the Turkish English syllabus for the lower or intermediate level. This in turn can provide more evidence as to determine the pedagogical effectiveness of the strategies underlying reader response approach in promoting and sustaining interest in teaching literary skills. Repeating the study in different contexts over a larger period and incorporating different techniques, such as response journal (Sheridan, 1991), writing prompts (Pritchard, 1993) and rewriting narratives from another characters' point of view (Oster, 1989), is recommended.

**ABSTRACT**

This article was an attempt to investigate the nature of two corrective explicit vs. implicit feedback typologies: 'Recasting' as implicit and 'Meta-Linguistic Talk' as explicit feedback on the writing performance of a group of Iranian non-major English as a foreign language (EFL) learners. To this aim, data were collected from 55 female Iranian university students majoring at Nursing at Islamic Azad university of Sabzevar, Iran. Based on a standardized Nelson English Level Test, they were first randomly divided into three homogeneous groups; (2 Exp. and 1 Con.). Each experimental group received one of the two corrective feedback types 'Recasting' vs. 'Meta-linguist talk' while the control group didn't receive any focused corrective feedback. A writing post-test sample was given after the three-month treatment stage. The writing sample was rated by two English instructors in terms of word order and tense use only. Data from three target groups above were analyzed by One-Way ANOVA to compare the performance of the three groups at 0.05 sig. level. The results showed that feedback treatments significantly improved writing skills in the experimental groups; however, the subsequent post-test Scheffet results didn't indicate an exclusive superiority for any of the two feedback types over the other in the two experimental groups (1&2). (Sig.0.09> 0.05). Possible educational implications have been contrastively discussed for the two corrective feedback typologies esp. in Iranian contexts.

**KEYWORDS:** Corrective Feedback, Explicit vs. Implicit feedback, Recasting, Meta-linguistic Talk, Writing Performance

**INTRODUCTION**

Error production by Language learners is considered a normal status and of a revealing nature; however, of more crucial fact is deciding on how to approach the errors made by the learners. In EFL contexts, this issue is even of more paramount importance since the kind of input and subsequent feedback that the learners take is usually confined to the class time period by his/her instructor. Accordingly, providing proper feedback on the part of the teachers gets really pertinent. Giving the feedback at the right time and place has always been a challenging issue as there is still no conclusive consensus among L2 scholars as to the nature and propriety of error correction approaches. (Ferries, 2004; Sachs & Polio 2007; Kepner, 1991 & Chandler, 2003)

***Significance of the Study***

A language teacher must always be aware of possible other varied sources for errors in his/her classes and realize the need to take the right route towards providing the right corrective feedback. Errors presumably reflect the learners' level of competence; however, a teacher needs to draw a distinction between errors which are noticed and corrected by the speaker himself through being prompted to do so, and errors which the learners cannot correct themselves because of a lack of linguistic knowledge. Changing the direction towards eradicating the errors without knowing the

exact root of the problematic areas is thus a naïve decision for the probability of teachers' taking wrongful strategies for error correction.

In natural settings of language acquisition, a child has an enormous opportunity to draw the proper input without being reminded explicitly as to what input to select and which content to attend to however the child is soon able to be changed into a very complex and developed language user, whereas foreign language learners, rarely have resource to such various aids except their teacher. Thus taking the proper technique by the language teacher in approaching the errors is to a large extent crucial as it might save the necessary time and energy put to the tasks by both teachers and learners.

In fact, in an EFL situation, the pedagogically appropriate approaches towards developing writing skills have been paid lip service to. Writing in and of itself provides a rich opportunity for sharing ideas and communicating intents for language development. Not only can writing be an excellent experience through which the interlocutors in teachers-students or student-students interactions can exchange ideas and messages in L2 in a warm atmosphere, but it can also be best employed for its own pedagogical aims like developing linguistic knowledge and enhancing academic literacy skills in an efficient way (Tan & Miller 2008).

In this article, the nature of two corrective feedback typologies: 'Recasting' vs. 'Meta-Linguistic Talk' by the teacher intervention was empirically evaluated on the writing performance of a group of Iranian non-major EFL learners. In recasts, teachers provide the learner with a well-designed form of a native-like utterance either in written or oral modality. The intention is that the provided information gives clues to the learner in an implicit way so that s/he can incorporate the changes on his/her own and make progress whereas in Meta-linguistic corrective feedback, all linguistic knowledge is communicated in an explicit and direct feedback provision by the teacher; all the necessary info plus the correct newly-made structure is given explicitly to the learners.

## BACKGROUND OF THE STUDY

A quick search through the existing literature on the right corrective feedback; direct vs. indirect shows some rather controversies. Ellis, Loewen, and Erlam, (2006) worked on an experimental research in which the effects of recast and meta-linguistic corrective feedback was studied on the acquisition of past tense -ed in a normal classroom situation. The participants were 34 ESL learners and their proficiency level was lower intermediate. During the communicative tasks, the first group elicited more correct target forms compared with the second group. At the end, there was a significant difference between the two groups' pre-test versus the delayed test results. The results were clue for the outperformance of the first over the second group. On the other hand, in another study by Frantzen's (1995), some college students of intermediate Spanish were studied. In one group, the structurally mal-formed were supplemented and they received direct correction. In the other group, the learners' errors were just marked but not corrected. At the end of the semester, both groups improved in overall grammar usage on the post essay however, neither group showed significant improvement in written fluency over the semester. Still, in another study by Robb, Ross, and Shortreed (1986) salience of feedback on error and its effect on EFL writing quality was surveyed; in their study, all the students had improved in terms of accuracy which was proved it had been at the result of being exposed with different types of error feedback including explicit direct correction, notation of the type of error using a code, notation in the text of the location of error, and marginal feedback about the number of errors in the line.

In another research by Pishghadam, Hashemi, and Kermanshahi (2011), the researchers proposed that when learners themselves notice there is a mistake, they get involved in something which this in effect aids in more consolidated learning, better than the time they are just passively following the teachers' commands.

Overall, the perplexing existing literature urged the authors to investigate the two contrastive corrective feedback patterns, namely recasting vs. meta-linguistic talk as indirect vs. direct feedback typologies on the performance of a group of adult Iranian learners. The purpose was to investigate the role which proper corrective written feedback: **explicit vs. implicit** plays in engaging the L2 learners' cognitive processes in their writing performance. Thus, the question put forward for the current research was:

1. To what extent, do Iranian university students benefit from explicit vs. implicit corrective feedback types in their writing tasks?

## **METHODOLOGY**

### ***Participants***

In order to find plausible explanations for the research question of the present survey, an empirical study was performed among 55 sophomore female Iranian university students majoring at Nursing who were taking their general English course (GE) at Islamic Azad university of Sabzevar, Iran. Their age range was 20-25.

### ***Data collection instruments***

The independent variables, namely two types of corrective feedback 'recasting' and 'meta-linguistic Talk' were systematically controlled during the data collection procedures. All three classes were directed with the same instructor. Number of proofread samples, time on task and the revising stage were tried to be averaged equally in all three classes. (Table 1)

After the treatment process, one post test of production type including a free-writing task was performed at the end of the experimentation stage. The three groups were asked to write a sample paragraph of approximately 100 words on a prescribed subject. Here, the topic was even controlled for any possible biasing on the part of the learners' interest. The chosen topic was "*Prevention is better than treatment*". The subjects weren't aware of the target analyzed grammatical forms in their writing samples.

The drawn samples were analyzed by two English instructors in terms of structural accuracy focusing only on tense use and word order in correct English usage. Inter-rater reliability was estimated for the two subsequent rates. Correlation Coefficient between the two rates showed an acceptable index. ( $r = 0.7$ )

### ***Procedures***

For initial screening of the population as to proficiency level, a standardized Nelson English Language Test battery at intermediate level was given to the students (Test 250 D). A typical test of this series entails 50 items comprising a 37-item grammar section along with 13 items on vocabulary knowledge. Through administering the test, the scores at two extreme poles (highest and the lowest 10 % scores) were removed from the experimental phases of the study to cater for the homogeneity of the subjects. Fifty-five homogenized subjects were chosen for the experimentation stage.

The whole subjects were randomly divided into three groups; Two experimental and one control group. Exp. Group 1 received recasting corrective feedback while Exp. group 2 was provided with a lengthy discussion in the guise of 'Meta-linguistic explications' glossed in their paragraph margins and finally the third group didn't receive any focused corrective feedback like the other two groups. All three classes were also directed with the same instructor.

In each session, after finishing the reading section of the main course, the students were asked to write a summary paragraph for the text in the post-reading phase of each lesson. Class periods were held three hours per week for each group. The average number of sample paragraphs which were commented by the instructor for each individual in three subsequent groups was approximately between 10-14 samples, since the researcher couldn't guarantee that all subjects be present in all sessions for the treatments. The written paragraphs were collected and analyzed in terms of the errors of tense and word order only in order to ensure the maximum control over the selected variables. The next session, the subjects were asked to revise their sample paragraphs which had been proofread by the instructor with the provided feedback. In the current study, no peer correction was allowed to be utilized in order to check the variability that recasting can bring about, since peer correction usually entails Meta-talk that could minimize the natural effect of recasting induced by the teacher.

The feedback type, average rate of proofread samples, and time allotment for the experimental and control groups has been illustrated in Table 1.

Table1: Treatment Characteristics for the experimental and control groups

Groups	Number of subjects	Feedback Typology	Number of proofread samples for the groups	Drafting Stage(Time on Task )	Revising Stage(Time on task)
<b>Experimental 1</b>	20	Recasting	217	20 min	10 min
<b>Experimental 2</b>	20	Meta-linguistic	210	20 min	10 min
<b>Control Group</b>	15	Non-focus	220	20 min	10 min

The whole process of data collection took one academic semester taking about three months.

### DATA ANALYSES AND FINDINGS

The research design in this study was experimental, with three different treatments for experimental and control groups, followed with a post-test. Several statistical analyses were conducted to answer the research question in this study.

In order to establish the purpose of the study, the following procedures were followed: At first, a validated proficiency test was administered catering for initial screening. In the second phase of the study, it was tried to examine and control the nature of two corrective feedback typologies, namely recasting and meta-linguistic **Talk** as the induced post-activity pointers by the teacher intervention. The procedures, as was illustrated in the previous sections, were followed for the three groups. In order to check the nature of input given to the three groups, a post-test production test consisting of a free-writing paragraph was assigned for the whole class at the end of the semester and analyzed in terms of tense use and word order only in order to ensure maximum reliability and control over the result.

The next step was checking the degree the means for the three groups were significant. Then, a repeated measure of one-way ANOVA (3\*3) analysis of variance followed with a post hoc Regression Scheffe was performed using SPSS statistical Package Database ver. 20. The results indicated a significant mean difference among the experimental and control groups at 0/05. (p value: 0/000< 0.05). A full-data set are then given below (Tables 2, 3 & 4).

Table 2: One-Way ANOVA for the two experiment and control groups

ANOVA					
scores					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	8278.267	2	4139.133	16.838	.000
Within Groups	12782.533	52	245.818		
Total	21060.800	54			

A closer look at analysis of variance for both within group and between groups in Table 2 above shows a reasonable F. ration (F = 16.8) which is large enough to reject the null hypothesis. In Table 5 below, the result for multiple comparisons are depicted for Scheffe Post hot regression test to care for mean differences.

Table 3: Multiple Regression Comparison (Post-hoc) for the three groups

### Multiple Comparisons

Dependent Variable: scores  
Scheffe

(I) feedback	(J) feedback	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
					Lower Bound	Upper Bound
exp. 1	exp. 2 meta-linguistic	-6.80000	4.95800	.397	-19.2941	5.6941
recasting	control group	23.36667*	5.35526	.000	9.8715	36.8618
exp. 2	exp. 1 recasting	6.80000	4.95800	.397	-5.6941	19.2941
meta-linguistic	control group	30.16667*	5.35526	.000	16.6715	43.6618
control	exp. 1 recasting	-23.36667*	5.35526	.000	-36.8618	-9.8715
group	exp. 2 meta-linguistic	-30.16667*	5.35526	.000	-43.6618	-16.6715

\*. The mean difference is significant at the 0.05 level.

As the data in Table 3 and the subsequent box plot figure 1 clearly shows, mean differences for the control and experimental in all three comparisons are significant. However, mean variability for the two experimental groups, though higher for meta-linguistic feedback type, isn't statistically significant.

Figure 1: Box plot for ANOVA analyses as to the contrastive corrective feedback types: recasting vs. meta-talk

As Table 4 for the Scheffe post test also shows the two experimental groups have been sub-categorized in the same column (exp. 1  $\mu = 59.7$  / exp. 2  $\mu = 66.5$ ) thus indicative of their insignificant variability.

Table 4: Sub-set for post-hoc Scheffe multiple comparisons for the three groups  
scores

Feedback	N	Subset for alpha = 0.05	
		1	2
control group	15	36.3333	
exp. 1 recasting	20		59.7000
exp. 2 meta-linguistic	20		66.5000
Sig.		1.000	.435

Means for groups in homogeneous subsets are displayed.

So, overall, based on the results gained through ANOVA analyses, the two corrective feedback typologies that entailed direct vs. indirect dichotomies were equally but not exclusively beneficent for the target group of the present study. Possible implications and concluding remarks are discussed in the next section.

## DISCUSSION

Overall, the present research which was a partial replication of Ellis et. al (2006) research, was aimed at surveying the nature of two induced corrective feedback namely recasting and meta-linguistic talk thought to be beneficent for a group of Iranian EFL university students. Going through various statistical analyses, it was found that providing both corrective feedback (recasting and meta-linguistic) as post-activity writing commentaries can equally but not exclusively improve the L2 learners' efficacy.

The main innovation in the present study was the inclusion of a non-focus control group which didn't receive any post commentaries in their performance. In Villalobos' work (2010) on the use of recast in EFL classrooms, the efficacy of recasting was investigated in pre-task and the preparation stage in order to prevent oral errors from happening during the main communicative stage among a group of university students attending an ESP chemistry class. However, he reported his findings working on two students through an action research. At the end, he was certain to claim that recasts in the pre-task and the preparation stage really prevented oral errors from happening during the task cycle. Although, in an action research, immediate application and not the development of theory on generalization of applications are habitually followed, the problem of non-randomization of population could at least be minimized by assigning a control group. Not using a control study in his study, he might be quite at stake to explain why and how the subjects benefited from this corrective strategy. In Rahimi & Dastjerdi's research (2012), a similar trend had been adopted; no control group was assigned. In their study, effective error correction method was investigated through immediate vs. delayed responding by the instructor in developing learners' complexity, fluency and accuracy in speech. The participants had been divided into two groups. For G1 errors were corrected immediately and for G2 with some delay, then it was finally reported that delayed error correction has had positive effect on fluency and accuracy but not on complexity. In effect, again, the true nature of the tasks used can't be verified if there is no control group.

In the present survey, the outperformance of the second experimental group that received meta-linguistic error correction, though not significant statistically ( $\mu = 66.5$ ) compared with the first experimental group receiving recasting as implicit corrective feedback ( $\mu = 59.7$ ), indicates, at least among other things, that it has been beneficial to some extent. Maybe, further research is still needed to be done for larger groups to verify the above data. Possible pedagogical implication could be inherent in Meta-Talk as a consciousness raising methodological practice in EFL vs. ESL situations. Recent communicative approaches which emphasize 'Focus on Form' (FonF) vs. over focus on meaning even in ESL settings are a case in point. As Ellis (1994) asserted, there are two ways to practice focus on form. The first can be accomplished through the activities that call for both communication and FonF, and the second through corrective or curative response which are given during the learners' performance in communication activities.

Now the crucial point is how of consolidating the right channel for the erroneous forms to get right. As it was already stated, in recasting, this guidance to the right channel isn't always done with ease, as some forms aren't noticed by the learners. A case in point, here, might be the effects that age and level bring to the learning circle. According to Lyster 1998 (cited in Schurt Rauber & Gil, 2004), *'young L2 learners may not easily take heed of the target vs. nontarget mismatches in the interactional input. In order to bring the learners' attention to such mismatches, teachers should provide some indicators in order to facilitate peer- and self-correction compared with just the repetition of a teacher's recast or explicit correction'*. Thus, different feedback types are claimed to bear various effects on learning and result in different degrees of attention.

## CONCLUSION

To recap, the main intention in the present study was to compare and contrast the effectiveness of two corrective feedback typologies current with the ongoing debate studies over error correction. The findings in this research were consistent with Schurt Rauber's (2004) & Ashwell's article (2000) in that teacher's correction true type feedback is highly appreciated and considered as an important asset for the development of EFL language skills in general and writing skill, in particular. Nevertheless, the findings in this research weren't consistent with Truscott's (2004) work. Truscott believed that due to inapplicability of providing corrective feedback in language classrooms and many inconclusive results in this regard, all corrective feedback must be abandoned. He argued that corrective feedback

can only be harmful in that it diverts time and energy away from more constructive activities like additional writing practices. Kepner (1991) also found no significant error counts between a group receiving error correction with the one getting message-related comments, though in this study since learners weren't asked to process the comments and didn't go for any self-correction, the results as to the nature of feedback type is still vague.

#### ***Limitations of the study***

**In the present survey**, the statistical analyses over mean variability though significantly showing the outperformance of the two experimental over control group, for the two experimental groups receiving the two dichotomous direct vs. indirect feedback typologies the results weren't significantly clue for the variability of the two feedback types at the significance level of 0.05 %. Two possible reasons might have been at work here; Time and Gender which can also be mentioned as the limitations of the present survey. Maybe further research projects can control these two factors to enlighten the findings in this regard.

Concerning time span, the current research was performed during an academic semester which due to subject variability, the researcher couldn't keep the subjects constant to demonstrate the nature of true feedback types in longer periods and get more assurance in the results. In a longitudinal study by Lalande (1982), students who had received indirect corrective feedback outperformed learners in the direct correction group. Further studies must maintain longer-term designs apart from academic settings which may let more time to focus on the nature of feedback typology efficacies. Still, another limitation of the present study was the matter of Gender. Since male candidates for Nursing weren't accessible for any investigation in this academic setting, the researcher used just female participants. Maybe further studies clarify the issue more clearly considering both males and females as to providing corrective feedback typologies. The debate still continues.

**ABSTRACT**

This study investigates the differences in the perceptions of the appropriateness in advice giving in English between Iranian Persian English as a foreign language (EFL) male and female learners. Data were collected through an adopted version of a Multiple Choice Questionnaire (MCQ) by Hinkel (1997). The questionnaire involves a series of questions with regard to advice giving or opting out to a peer acquaintance (equal status) and an instructor (higher status). The result of the study illustrated that both groups perceived the social distance in the situations with peer acquaintance (equal status) and instructor (higher status) differently. The learners also differed in the types of advice they used as the appropriate choice. For Iranian Persian EFL male learners, in both situations (peer acquaintance and instructor) they preferred indirect advice rather than the other three options which are hedge advice, direct advice and opting out. On the other hand, for Iranian Persian EFL female learners, they selected hedge advice in both peer acquaintance and instructor situations as compared to the other three options (direct advice, indirect advice and opting out). The study concluded that Iranian Persian EFL learners should be provided with programs that improve the awareness on different appropriate conversational strategies in English language. The findings of this study are expected to be beneficial in cross-cultural and cross-gender comparison studies.

**KEYWORDS:** Speech act, Advice-giving, Gender

**INTRODUCTION**

In communications, the speakers' behaviour and selection of certain words are particular based on several factors such as social distance between the speaker and the hearer, social status between the speaker and the hearer, gender, and the complexity of situations. Many studies of pragmatic awareness have conducted on different speech acts such as apology (Blum-Kulka, House, & Kasper, 1989; Eslami-Rasekh & Mardani, 2010), refusal (Beebe et al., 1990; Vaezi, 2011) and request (Blum-Kulka & House, 1989; Jalilifar, 2009). Those studies have contributed to revealing the differences between native speakers (NSs) and non-native speakers (NNSs) and to better understanding of the use of appropriate linguistic forms in different languages and cultures and further to avoiding communication breakdowns. Yet, not many studies were conducted on the speech act of advice (Hinkel, 1997; Matsumura, 2001; Bordería-García, 2006; Chun, 2009, Al-Shboul et al. 2012), and in Iranian context, to the researchers' best knowledge, there has been no investigation of giving advice conducted on Iranian Persian EFL learners. Consequently, it seems to be useful of examining how the speech act of giving advice is perceived in English by Iranian Persian EFL learners at University Kebangsaan Malaysia (henceforth, UKM) that would contribute in cross-cultural and cross-gender comparison studies. In other words, this study focuses on gender as the main focus to investigate the differences of the advice speech acts' realizations between Iranian Persian EFL male and female learners at UKM. The researchers aimed to reveal how gender can influence speakers' perception of advice giving. The reason for selecting English in the present study refers to the fact that English is the medium of instruction for Iranian Persian EFL learners in Malaysia and is also a language that is frequently needed in their everyday interaction. Hence, more attention should be paid to pragmatic competence of the Iranian Persian EFL learners rather than their grammatical competence.

### THE SPEECH ACT OF ADVICE

Unlike other speech acts such as refusals, apologies, and requests, the speech act of giving advices has not yet been explored adequately (Bordería-García, 2006; Chun, 2009). Accordingly, very few definitions of what advice giving entails are available. For example, Searle (1969) stated that advice giving is a type of speech act which the speaker believes will benefit the hearer. He added that by advice giving, the speaker is doing the hearer a favour because it is not clear to both of them that the hearer will do the act without the advice being given. Searle distinguished between advice and request as advising is more like telling on what is the best for his/her rather than what s/he should do. Another definition was given by Brown and Levinson (1987) who described advice giving as an “intrinsically face threatening act” (p. 65), where the speaker indicates that s/he does not mean to avoid obstructing the hearer’s freedom of action. Nevertheless, Brown and Levinson observe that the degree to which advice is a face-threatening act differs among cultures based on several factors such as social status and social distance between the interlocutors, gender, complexity of situations, and the politeness strategies considered appropriate in a particular culture. Once again, this study focuses on gender as the main focus to investigate the differences of the advice speech acts’ realizations between Iranian Persian EFL male and female learners at UKM.

### LITERATURE REVIEW

A large body of literature have illustrated that while speech acts are universal, the socio-pragmatic rules leading the appropriate enactment of any given speech act vary greatly among cultures and languages. There are some studies have been focused on advice giving in various contexts. For instance, Kuo (1996) investigated how gender emerges as a strong variable with respect to both the occurrence of advice giving as well as the form and style of this speech act. The findings of the study illustrated that female speakers were more likely to give advice to their same-sex interlocutors and they use various linguistic devices, sentence containing auxiliary models or hedge, and justifications with advice forms to convey advice. However, only 4 instances of advice are found in all-male conversations and, either seriously or jokingly, they are all in imperative form.

In another study, Hinkel (1997) conducted a study on cross-cultural differences of advice giving in terms of production collected by discourse completion test and perception collected by Multiple Choice Questionnaire (MCQ). The participants were 40 Chinese and 40 American native speakers. Hinkel split up the two groups in terms of males and females. The findings of the study revealed that one of the most significant differences between the Chinese with regard to collective self and Anglo-American individualism lies in the Confucian and Taoist precept of interdependence with others which is in contrast with cultural values emphasizing personal autonomy. Therefore, this study is significant since it compared the two different instruments which were a discourse completion test and multiple choice survey questionnaires to elicit participants’ perception in the framework of advice-giving studies.

Matsumura (2001) investigated a quantitative approach of second language socialization in terms of learning the rules for advice giving among Japanese and Canadian learners. The result of the study showed that the former group started lower in pragmatic performance than the latter but then suppressed them. Moreover, the study illuminated the variance of the perception of social status in both groups. This study is significant because it provides an important longitudinal analysis of how the pragmatic competence on advice giving developed over time. However, Matsumura did not specify what caused such important development of pragmatic competence with regard to cultural differences between Canadians and Japanese. In addition, Matsumura used only one method for the study of perception.

Bordería-García (2006) focused on cross-cultural differences in the productions and perceptions of advice giving. In the one hand, the result of the study illustrated that there is not any significant difference in the perceptions of appropriateness of non-conventionally indirect, conventionally indirect, and direct forms of advice by the native speakers of Spanish and the native English. On the other hand, the findings of the study revealed that these issues differed in the oral productions with the Spanish speakers showing a significant preference on giving direct advices. This study is significant for the reason that it is one of the speech act studies which looked at the concept of pragmatic transfer in the framework of advice.

Chun (2009) conducted a study on cross-cultural differences in the speech act of giving advice by Korean speakers and Canadian English speakers. The findings of the study indicated that there was a major difference between Canadian and Korean learners with regard to the social distance. The Canadian learners were less dependent on social distance compared to the Korean learners. The Canadian learners tended to give advice considerably less frequently to peers and superiors compared to the Korean learners. Therefore, this study is significant because it broadened the conventional framework of the existing two cultural types of individualism and collectivism in the Korean and Canadian contexts.

Recently, Al-Shboul et al. (2012) conducted a study focusing on the perceptions of the appropriateness in advice giving in English between American English native speakers and Jordanian EFL students. The findings of the study showed that two group of the respondents had the same perception of the social distance in the situations involving peer acquaintance and instructor. On the other hand, they were different in terms of the types of advice they showed as the appropriate choice. This study is significant since it is one of very small number of Arabic Advice studies that investigated the speech act of advice as recognized by Jordanian Arabic learners of English as a foreign language.

As it is mentioned above, the appropriateness of advice giving differs among various cultures, moreover, most of the studies have been done on advice giving so far, did not focus on gender as a main variable. Based on the literature no specific studies have been conducted on advice giving among Iranian Persians context. Thus, it would be beneficial to examine how the speech act of advice giving is perceived in English by Iranian Persian EFL learners at UKM that would contribute in cross-cultural and cross-gender comparisons.

## **THE STUDY**

This study aims to investigate gender differences in the perceptions of the appropriateness of advice giving in English between Iranian Persian EFL male and female learners. It also aims to give interpretations of these salient differences between the two groups. It is mainly based on the variable of gender and how it can influence speakers' perception of advice giving. The concept of gender is used to explain socially constructed categories in terms of sex. It has been argued that gender influences speakers' communication styles. Sukyadi and Ayu (2011) pointed out that language and gender focus on the language characteristics used by men and women: how gender stereotyping works in their preference of language styles. Wardhaugh (1992) also discussed gender as one of the characteristics that influenced people's communication. Results from these studies indicated that men and women normally use different linguistic styles. They describe women's speech as being different from that of men. According to Brend (1975) Women are found to employ certain patterns associated with surprise and politeness more frequently than men. Moreover, Lakoff (1975) stated that women may answer a question with a statement that employs the rising intonation pattern associated with making a firm statement. It is because they are less sure about themselves and their opinions than men are. In the present study, the researchers tried to reveal the differences of the appropriateness of advice giving in English between Iranian Persian EFL male and female learners. Thus, the related research question emerged from the literature is if there are any differences between Iranian Persian EFL male and female learners' perceptions of the speech act of advice giving.

## **METHODOLOGY**

### ***Participants***

The sample included 40 postgraduate Iranian Persians EFL learners in UKM. The participants involved 20 females and 20 males who were in the 25-34 year old age bracket majoring in PhD degree. All the participants were Iranian Persians monolingual who were sharing the same cultural background. Based on the participants' scores in international English language testing system (IELTS) and test of English as a foreign language (TOEFL), the participants' level of proficiency in English was intermediate.

### ***Instrument and Procedure***

A multiple choice survey questionnaire (see Appendix) adopted version of Hinkle's (1997) was used for the purpose of this study. The questionnaire involves eight situations that required advice giving or opting out: four included statements addressed to the social superior and four to the peer acquaintance. Each situation was accompanied by three MC selections in random order: (1) direct advice involving the model "should," (2) hedged advice using "need to" or other softeners or hedging advices, lexical hedging ("may be, I think"), or questions, and (3) indirect comment including no advice or suggestions. The fourth selection was an explicit choice for opting out that remained constant for all selection. Examples of direct advice, hedge advice, and indirect comments are illustrated in (1) to (3), respectively:

1. You shouldn't order the hamburger. I had it here before, and it was really greasy.
2. May be it's not a good idea to order a hamburger. I had it here before, and it was really greasy.
3. I had a hamburger here before, and it was really greasy.

The questionnaires were distributed among the participants in UKM campus. They were given instructions on how to answer the questions and no time limitation for answering the questions was mentioned in order not to make the participants stressed or in a hurry so that they could answer the questions carefully and patiently. In addition, the researchers welcome any questions from the participants in case they would face any difficulties while answering the questions.

## RESULTS AND DISCUSSIONS

The research question of the present study was formulated to find out if there are any differences in the perception of the speech act of advice giving between Iranian Persian EFL male and female learners. Hence, the results showed the existence of cross-gender differences between the two groups of participants. In general, Iranian Persian EFL male and female learners perceived the social distance in the situations with peer acquaintance (equal status) and instructor (higher status) differently. They also differed in the types of advice they utilized as the appropriate choice. For Iranian Persian EFL male learners, in both situations (peer acquaintance and instructor) they preferred indirect advice rather than the other three options which are hedge advice, direct advice and opting out. On the other hand, for Iranian Persian EFL female learners, they selected hedge advice in both peer acquaintance and instructor situations as compared to the other three options (direct advice, indirect advice and opting out). This is in accordance with findings from Kuo (1996) where female speakers were more likely to give advice to their same-sex interlocutors and they use various linguistic devices, sentence containing auxiliary models or hedge, and justifications with advice forms to convey advice. On the other hand, only 4 instances of advice are found in all-male conversations and, either seriously or jokingly, they are all in imperative form. In addition, Baca (2011) found that the interlocutor openly commented on his preference for more female-like advice, which he seemed to associate with greater care and concern for all parties involved. These comments could indicate that when giving advice, the interlocutor expected that females would differ from males in their interpersonal communication style.

Table 1: MCQ Data

Situation	Direct	Hedge	Indirect	Nothing
<b>Peer acquaintance</b>				
1. Unreliable car	M 11 (55) F 10 (50)	M 5 (25) F 7 (35)	M 4 (20) F 3 (15)	M 0 (0) F 0 (0)
2. Academic course	M 3 (15) F 1 (5)	M 5 (25) F 9 (45)	M 12 (60) F 9 (45)	M 0 (0) F 1 (5)
3. Repair shop	M 3 (15) F 5 (25)	M 5 (25) F 8 (40)	M 12 (60) F 7 (35)	M 0 (0) F 0 (0)
4. Library	M 4 (20) F 0 (0)	M 7 (35) F 17 (85)	M 7 (35) F 0 (0)	M 2 (10) F 3 (15)
<b>Instructor</b>				
1. Library	M 3 (15) F 0 (0)	M 3 (15) F 12 (60)	M 8 (40) F 4 (20)	M 6 (30) F 4 (20)
2. Illness	M 5 (25) F 8 (40)	M 8 (40) F 9 (45)	M 5 (25) F 3 (15)	M 2 (10) F 0 (0)
3. Bookstore	M 3 (15) F 5 (25)	M 8 (40) F 9 (45)	M 6 (30) F 4 (20)	M 3 (15) F 2 (10)
4. Restaurant	M 4 (20) F 10 (50)	M 4 (20) F 5 (25)	M 12 (60) F 5 (25)	M 0 (0) F 0 (0)

*Note: frequency count is listed in each cell, with percentages provided in brackets*

More specifically, Iranian Persian EFL male learners chose the options of direct advice more than females did in three out of four situations with peer acquaintance (see Table 1). In other words, they were more direct in the situations of *Unreliable Car*, *Academic Course*, and *Library*. However, Iranian Persian EFL female learners selected direct advice option more frequently than Iranian Persian EFL male learners did in the *Repair Shop* situation. Although their reflections were varied in the options of choosing direct advice between Iranian Persian EFL male and female learners, these differences seemed to be negligible. For instance, in the *Unreliable Car* situation, both Iranian Persian EFL male and female learners chose the option of direct advice in the mostly same frequency at 11 and 10 respectively. On the other hand, the differences between males and females seemed to be notable in the

*Library* situation as 4 out of 20 males used the option of direct advice while none of the females selected that option. This is in accordance with Kuo (1996) where male speakers use the form of imperative in all instances of advice conversation.

Iranian Persian EFL female learners selected the options of hedge advice more than males did in the all situations with peer acquaintance. For example, in the *Library* situation the differences between males and females were noticeable as 17 out of 20 females selected hedge options for the situation while only 7 out of 20 males chose the same option. These particular results agreed with those found in Kuo (1996) where female speakers were more likely to provide advice sentence containing auxiliary models or hedge, and justifications with advice forms to convey advice. However, Iranian Persian EFL male learners chose the options of indirect advice more than females did in the all situations with peer acquaintance. For instance, 7 out of 20 males selected indirect options in the *Library* situation while none of the females selected the option. This may be attributed to the fact that while giving advice may be considered as a face-threatening in conversations among male speakers, who either avoid doing it or choose to do it baldly, it is positively affective for women, who resort to a variety of stylistic and linguistic means to maintain equality and rapport.

Unlike peer acquaintance situations, Iranian Persian EFL male learners' frequency choices of direct advice were less than females in 3 out of 4 instructor's situations. In other words, Iranian Persian EFL male learners' frequency choice of direct advice was more than females merely in *Library* situation. As it is illustrated in Table 1, in the *Library* situation none of the females used the option of direct choice while 3 out of 20 males selected direct advice option. Therefore, Iranian Persian EFL female learners were more direct in the situations of *Illness*, *Book Store*, and *Restaurant*. According to Fishman (1978) formal features that characterize women's speech such as asking question aims to ensure reaction. In contrast, men's speech is marked by features (e.g. statement) than do little insure to further talk. In the present study, it would be seen that Iranian Persian EFL female learners viewed giving direct advice as a matter of friendliness, rapport-building, concern, sincere interest, and solidarity towards their instructor.

Iranian Persian EFL female learners chose the options of hedge advice more than males did in the all instructor's situations. Although their selections were different in the options of choosing hedge advice, these differences seemed to be unimportant in the situations of *Illness*, *Book Store*, and *Restaurant*. For example, in the *Illness* and *Book Store* situations, both Iranian Persian EFL male and female learners chose the option of hedge advice in the mostly same frequency at 8 (males) and 9 (females). However, the differences between males and females seemed to be significant in the *Library* situation as 3 out of 20 males used the option of hedge advice while 12 out of 20 females chose that option. As previously mentioned by Kuo (1996), female speakers are more likely to give advice to their same-sex interlocutors and they use various linguistic devices, sentence containing auxiliary models or hedge, and justifications with advice forms to convey advice. On the other hand, only 4 instances of advice are found in all-male conversations.

Finally, in the all instructor's situations (*Library*, *Illness*, *Bookstore* and *Restaurant*) Iranian Persian EFL male learners selected the indirect options more than females did. For example, with regard to the *Restaurant* situation 12 males out of 20 selected the option of indirect advice while 5 out of 20 females selected the same option. One could argue that the reason that males selected indirect advice more than females is evolutionary pressure has made status more important for males. Thus, since status matters relatively less for females, they can select direct advice more. This is in accordance with Juhana (2011) in her study of the use of apologizing speech acts realization by male and female students. She explained that a common reason as to why apologies are difficult is because an apology causes loss of status. She added one could argue that the reason women apologize more than men is due to evolutionary pressure has made status more important for men, because men need status to compete for mates. Therefore, as status matters comparatively less for women, they can apologize more.

According to the findings of this study, school curriculum should consider the differences between male and female learners in the area of speech act. For instance, providing examples of how male and female learners differ in terms of advice giving. The researchers would like to highlight that school curricula in EFL contexts should focus not only on structures and vocabulary but also on the sociopragmatic aspects of the language. Moreover, English teaching and learning in Iran have to give emphasis to not only linguistic competence but also pragmatic competence. Iranian Persian learners who aspire to study in an English speaking country should be careful about the language transfer

phenomena and they ought to be alert of the appropriateness of giving advices to the speakers of the target language, English, to avoid misinterpretation of intent and cultural understanding among the two groups of speakers.

## CONCLUSION

The findings of the study revealed how the speech act of advice giving is perceived in English among Iranian Persian EFL male and female learners. The present study illustrated that Iranian Persian EFL male and female learners differed in the perception of advice giving as well as the types of advice they used as the appropriate choice. Although this study answered the research question, further research on advice giving in the context of Iranian Persian EFL learners need to be conducted with regard to the production of advice giving and cross-cultural differences in advice giving. The findings of this study may be limited to the following considerations. More research is needed to support the current findings including a bigger number of participants with different social groups. Thus, the findings of this study cannot be generalized to other groups due to the small sample size. Moreover, the procedure of data collection is exclusive to merely using one instrument which is Multiple Choice Questionnaire to obtain the necessary data needed to answer the research question. Therefore, the data analysis is based on the nature of the data collection and the instrument used to conduct this study. Finally, and probably due to the fact that the questionnaire was not piloted with the participants of the present study, the researchers were not able to obtain estimates about the expected response rates, data quality, the validity and comprehensibility of the questionnaire. Hence, the questionnaire should be piloted with a similar group of people to the intended participants in order to make necessary adjustments to administrative aspects of the study such as the time needed to complete the questionnaire.

#### Appendix

##### *An Adopted Version of Hinkle's (1997) Multiple Choice Questionnaires (MCQ)*

#### Instructions:

Eight situations are described in the items below. Following the description of a situation, you will find a multiple choice selection of three possible statements, A, B, and C. Choose the statement (or question) that you think would be the most appropriate to say in the situation. If you think it would be appropriate to say nothing, choose option D.

When you are responding to the questions, please keep in mind the following imaginary student: **N H** is a student in your department. You have similar interests in your majors. You have talked to **N H** several times in the department lounge.

Also, please keep in mind the following imaginary college instructor: There is an **instructor** in your department with whom you have similar professional interests. You have talked to this **instructor** several times in the department lounge.

#### Situations

1. You see the **instructor** working in the library very late in the evening. The instructor looks tired. What do you think would be appropriate to say in this situation?

- A. You should not work so hard. It's very late
- B. Why do you work so hard? It's very late
- C. I'm going home soon. It is very late
- D. Nothing

2. **N H's** car breaks down frequently. **N H** is planning on driving it to New York to see some relatives. What do you think would be appropriate to say in this situation?

- A. I think it may be risky for you to take such a long trip in this car
- B. Taking such a long trip in this car may be risky
- C. You should not take this car for such a long trip. It may be risky
- D. Nothing

3. **N H** is considering taking a course. You have heard that the course is really difficult. What do you think would be appropriate to say in this situation?

- A. I've heard that this course is really difficult
- B. It's better not to take this course. I've heard it's really difficult
- C. You shouldn't take this course. I've heard that it's really difficult
- D. Nothing

4. You and the **instructor** in a *Bookstore*. The instructor is considering buying an expensive book. However, you think that another store may sell the book at a lower price. What do you think would be appropriate to say in this situation?

- A. You should buy the book at the other store. This store has high prices
- B. This store has high prices
- C. May be, it's not a good idea to buy the book here. This store has high prices
- D. Nothing

5. **N H** is thinking of taking a car to a *Repair Shop* downtown. However, you know of a shop on the corner where you have taken your car. What do you think would be appropriate to say in this situation?

- A. I usually take my car to the shop on the corner. It's closer
- B. You should take your car to the shop on the corner. It's closer
- C. It's better to take your car to the shop on the corner. It's closer
- D. Nothing

6. You and the **instructor** are in a *Restaurant*. The **instructor** says something about ordering a hamburger. You ordered a hamburger in this *Restaurant* before and, in your opinion, it was really greasy. What do you think would be appropriate to say in this situation?

- A. You shouldn't order the hamburger. I had it here before, and it was really greasy
- B. May be it's not a good idea to order a hamburger. I had it here before, and it was really greasy
- C. I had a hamburger here before, and it was really greasy
- D. Nothing

7. You see **N H** working in the library very late in the evening. **N H** looks tired. What do you think would be appropriate to say in this situation?

- A. Why do you work so hard? It's very late
- B. You should not work so hard. It's very late
- C. I'm going home soon. It is very late
- D. Nothing

8. You see the **instructor** working in the department office. The **instructor** looks ill and clearly doesn't feel very well. What do you think would be appropriate to say in this situation?

- A. You look like you don't feel well
- B. You should go home. You look like you don't feel well
- C. May be, it's better to go home. You look like you don't feel well
- D. Nothing

**Thank you for your time and effort!**

THE ROLE OF LANDSCAPE ON PROTAGONIST'S SPIRITUAL JOURNEY IN *THE STONE ANGEL* BY  
MARGARET LAURENCE

Parisa Talebi

Research Scholar, English Department, Mysore University

Email: Ptalebi85@yahoo.com

**ABSTRACT**

*The Stone Angel* is a story of Hagar's transformation and reconciliation. Hagar's inner quest is based upon reconciling and arriving to real self. Hagar tries to realize her inner landscape rather than external landscape. This paper examines the role of Manawaka landscape on Hagar's inner landscape.

**KEY WORDS:** Landscape, Manawaka, The Stone Angel, Manitoba, Internal and External Land

**INTRODUCTION**

The level of understanding of the protagonists of Margaret Laurence about geographical places is related to her experiences at this place. Laurence's awareness is developed through her life experiences. Northrop Frye in his essay "Conclusion to a Literary History of Canada" (1965), observes that Canadians have an identity crisis with a difference for they are less perplexed by the existential question "Who am I?" than by some riddle such as "Where is here?" (11)

*The Stone Angel*, shows Margaret Laurence's abilities in portraying the landscape of Manitoba and her ability to penetrate the mind of Hagar. Hagar, running away from her family, sits alone in the forest. Her mind is free from the boundaries; like the forest, she sees the forest as a free place, she reflects about the wind movement:

Now I perceive that the forest is not still at all, but crammed with creatures scurrying here and there on multitudinous and mysterious errands. A line of ants crosses the tree trunk where I'm sitting. Solemn and in single file they march towards some miniature battle or carrion feast. A giant slug oozes across my path, flowing with infinite slowness like a stagnant creek. My log is covered with moss—I pluck at it, and an enormous piece comes away in my hand. It's long and curly as hair, a green wig suitable for some judicial owl holding court over the thievish jays or scavenging beetles. (192)

**RECONCILING EXTERNAL AND INTERNAL LANDSCAPE**

Henry C. Phelps explains Hagar's connection to place and home: "her residence is always invested with an air of transience, waiting, and uneasy expectation – 'marking time' ([SA] 160), as she acutely characterizes it" (2000, 68). Hagar realizes that she would "never get out. The only escape from those places is feet first in a wooden box" (185). Her view of the Home is completely antithetical to the meaning of the word "home," as a secure place, where one's identity is grounded: "Those places have nothing to do with nursing or homes—the name's all wrong". (221)

Jason sees his family as an extension of himself. He dresses Hagar in a manner that will show others how prosperous he is. Hagar's life begins at the same time that her mother's life ends, leaving Hagar with her father and her brothers, Matt and Dan. She does not have any female role model. Hagar equates weakness with femaleness. She has a problem of communicating her feeling and thoughts from her father and society.

Hagar suffers from inner problems; Hagar is a victim of social circumstances. Some part of her problem relates to traditional society. When she travels to Manawaka, her attitude changes in a way reflected by the landscape. The novel shows the inner problem of Hagar and influence of outer landscape on her inner landscape.

Laurence brings the battle of oppositions in her novel; reconciliation of the external and internal world is the ultimate end of *The Stone Angel*. In Hagar's spiritual journey, the role of landscape and external world is clear.

Although her physical nature cannot help Hagar to overcome her problem and landscape of her inner world cause a lot of problems for her. One of her problem is her pride.

The first indication of her pride is in the second sentence of the novel. Hagar explains the stone angel on her mother's grave as "my mother's angel that my father brought in pride to mark her bones and proclaim his dynasty." (2) When Hagar encounters many problems on account of her pride, she seeks some place to hide.

In this situation forest brings peace for Hagar, when she senses her impending death and needs to find freedom to die. Her mind focuses on death when she feels her son and her daughter in law, Doris, are treating her like "a calf to be fatted" (35), and as though "she were not there" (32)

### PROTAGONIST'S INNER PROBLEM

Hagar's pride and inability to communicate were formed in her childhood and throughout her adult years and must be death with if she wants to complete her quest. Hagar has some fault in her way to find her real self. Pearson and Pop state that the hero's journey "complicated further by the human tendency not to understand completely all the ramifications of a single experience" (77). Hagar is talking about her pride as a wilderness; she compares her inner feeling with the wild nature of Canada.

Laurence suggests that this pride is as unnatural as civilizing the prairie bluffs with "portly peonies" (5). Silence is a prison for Hagar. This is another ambiguous nature of her inner landscape. Hagar uses language as a weapon against others. She lets the minister "flounder as she makes no reply to his conversation" (41). She likes her daughter-in-law's cooking but does not compliment her because she does not respect her (67). Due to her problem in communicating, she finds nature as a calm place. Nobody annoys her in the forest. She can think about her inner self.

Although she feels pride in being aligned with the town, yet she lives on the farm with her husband. Her world and her landscape have changed. Yet she is unable to talk about her feeling. When she understands that she cannot leave her father or her husband behind she decides to reconcile her past and present and shape her real self. In this struggle for identity, the role of her country and its wild nature is momentous.

In her old age she assumes Manawaka as a small place. W. H. New states "Hagar takes Manawaka into her son Marvin's suburban home and then into the multicultural; hospital in Vancouver". (New 2000, 69) Hagar's life is connected with the life of her country. Canadian history is between wars and prosperous times. Canada's previous security in its future is made insecure by the fact that over sixty thousand Canadians died defending unity, progress and the new national pride. This is the impact of her country in Hagar's life.

### TOWARD SELF-REALIZATION

Hagar's awareness happens on a trip into Manawaka, from farm to the city; Hagar goes to sell eggs with John, her second son. One of the houses she goes to sell eggs is the house of her childhood acquaintance, Lottie. Her daughter refers to Hagar as the "egg woman" (132). She realizes that she has lost herself and need to find herself in civilized environment. She looks at herself in a public space how a person could change so much and never see it. So gradually it happens. She sees herself in men's clothes with altered body and a face that does not change. During her life Hagar escapes from civilization to nature and goes from place to the garden. In urban area she feels dissatisfaction. In nature she feels led to unknown place. She learns to blend the inner world with outer world.

*The Stone Angel* can be read as a story of personal development from a position of weakness and alienation to a position of self-understanding and responsibility. The concerns with isolation and alienation are present themes in Canadian literature. Hagar also has a journey to inner part of her mind and she struggles with alienation and her environment.

For Hagar place may function as an element of connecting people in a community. The sense of community is explained by the train that is a symbol of leaving. When she hides in the forest, she sees in her imagination the train as a dragon:

The train stirred and shook itself like a drowsy dragon and began to move, regally slow, then faster until it was spinning down the shining tracks. We passed the shacks and shanties that clustered

around the station, and railway buildings and water tower painted their dried-blood red. Then we were away from Manawaka. It came as a shock to me, how small the town was, and how short a time it took to leave it, as we measure time....(142)

But at the same time she sees the water are the parts of wounded landscape. In this moment Hagar is ready to change; she finds herself in a womb-like place where she can be spiritually reborn. Guerin et al explains "water is the common symbol for the unconscious as is the blackness around Hagar" (150, 1). Water brings renewal for Hagar. She does not imagine herself as a stone again. Instead she plays like children on the beach. In this moment she feels as a free woman. In this beautiful place she does not fear again; instead she hears the "vapid chucking of the sea" (234)

## CONCLUSION

In Hagar's spiritual quest the role of landscape and nature is evident. Through the story, her physical nature cannot help her to overcome her problem, landscape of her inner world causes a lot of problems for her. Inner freedom for Hagar comes in forest, when finally finds her alliance with the community, the spiritually free protagonists depicted in Margaret Laurence's novel. Laurence has given opportunities to the heroine whose courage has allowed her to resist surrendering to the patriarchal society.

Laurence's protagonists penetrate and conquer nature and overcome the personals shortages. At the end of the novel, Hagar has returned to nature and her female self. Hagar has a glance to her past in the dark cannery. For the first time, she cries, she was unsatisfied on her own behavior. Hagar begins to value her female self. Hagar compares herself to the ancient mariner who gets rid of himself after he blesses the creatures of the sea. She finds the strength of older women who are rooted like old trees. Trees and nature bring strength for Hagar.

For Hagar, memories of the place help her to shape her real identity, this identity that brings her reaffirmation and reconciliation with her life. *The Stone Angel* is the story of the development of old Hagar's personal identities through her connection with nature.

**ABSTRACT**

In Friedrich Nietzsche's world there are two important features which have a decisive role for explaining his philosophy, "Death of God" and "Superman (Übermensch)". This paper, first is going to discuss about these two complicated theories and then study the way that Friedrich Durrenmatt, as a dramatist, applies these two concepts and other Nietzsche's notions and this would be the framework of this paper, but what is more important than a new explanation of the two famous Nietzsche viewpoints, is the way of applying them by Durrenmatt in his works.

**KEY WORDS:** Nietzsche, Superman (Übermensch), Durrenmatt

**THE APPLICATION OF NIETZSCHE'S PHILOSOPHY TO DURRENMATT'S SELECTED PLAYS**

The important thing in the world of playwriting is conveying deep and universal humanistic concepts which can be performed anywhere in the world. Friedrich Durrenmatt is among those dramatists, whose plays are not belonging to a specific people, but they are written for all the people and his emphasis on human has made him much more important in world of drama. "What encouraged Durrenmatt to write is his emphasis on human predicament." (Rahnama, 1978:175)

The more important point in this research is the ways that philosophical concepts can be applied in playwriting. Philosophy is a way of truth searching and truth is that compulsory "becoming". In "Beyond Good and Evil" Friedrich Nietzsche proposed a question about truth:

"What really is this 'Will to Truth' In us?" (Nietzsche, 2008:13)

And Überlohe in "The Marriage of Mr. Mississippi" says:

"Truth, I will tell her the truth" (Durrenmatt, 1950:90)

Drama has been intertwined with philosophy from its birth and Durrenmatt is not an exception. Durrenmatt had some studies in philosophy and theology at University of Zurich, therefore, he wrote his plays under the influence of his academic learning, but what kind of philosophy? The question is that as a stylized dramatist, Durrenmatt benefited from which philosophy?

This research is an effort in finding out whether Nietzsche's philosophy formed the theoretic basis of Durrenmatt's playwriting or not?

Answer to this questing can be a great assist to playwriting in order to find out that how we can use philosophy, which is a complicated truth, in simple language and apply it in playwriting. Of course this is a very important and complicated issue which has been used by different people in different eras. For example, Seneca who was a Stoic philosopher and dramatist used his philosophy in his writings.

Seneca's life was a combination of many contrasts. His position in Nero's court was a obstacle for him to practicing the principles he believed in and Since he gained a quite considerable wealth in a short time, he was under this criticism that his life is in contrast with basic notions of Stoic philosophy (Kosari, 2007:13).

The Representative of Stoics in medieval period in first century was Seneca who is known for his numerous letters and essays on moral issue (Babaei, 2007:214). Also, Machiavelli who was a writer in 15<sup>th</sup> and 16<sup>th</sup> Century created his works by using philosophy especially political philosophy .another example is Jean-Paul Sartre whose plays serve as a means of conveying his philosophy.

On the other hand Durrenmatt along with Bertolt Brecht and Max Frisch are among most influential and prominent German dramatists and we should also note that from early times until today Germany has always been rich in philosophy (Of course, if there is still any believe in the philosophy), therefore, understanding Durrenmatt's world, his philosophical ideas and his influences on drama can be very helpful to see how we can benefit from philosophy in our works. By applying philosophical concepts in dramatic texts we can have something to present to the whole world not only to a small region. According to Lacan's split subject, there is no need of local path for globalization. We do not need any antithesis for reaching globalization, rapidly from thesis we can reach to antithesis and the path to antithesis is to having a discourse for world. With a philosophical basis, Durrenmatt could have a new discourse for all; therefore we should understand and comprehend this discourse. His discourse, which can be traced and analyzed in a systematic structure starts with *Romulus the Great* (1959) and even until today we can still see the novelty in his works .investigating and finding this novelty is the aim of this research.

If the philosophical basis of Durrenmatt is Nietzsche, then the importance of this research would be solving one the complexity of playwriting which is Durrenmatt, himself and that's because of complex technique of Durrenmatt's wordsmanship, so by tracing his philosophical approaches we understand his complex works. In the middle of his plays, Durrenmatt reveal all the important information and until the end of plays he only elaborates on those information. Dramatic intrigues are a part of this information. For example in the middle of "The Visit" all the intrigues has been resolved. Claire Zachanassian says that I give you money if you kill Alfred Ill and all the townspeople of Gullen thinking about some ways to kill Ill and of course he will be killed, therefore from the middle of the play until the end it's the time for processing of this information which have two part; one aspect is the love of Ill and Claire and the other is the moral aspect (with Nietzsche's definition) of townspeople.

We are familiar with this technique and have been understand it, but it is the philosophical layer of the play which makes it more important. The question is that why Claire wants to kill Ill? They are both in love with each other. Claire has both money and power so what convinces her to kill Ill? At first glance "revenge" can be the answer but the more important question is that why she didn't forgive him?

By understanding the philosophical approaches of Durrenmatt's thinking, all these questions become evident. The hypothesis of this research is that Nietzsche and his philosophy have the answers to these questions so the following is an investigation to reach the answers.

## **THEORETICAL STRUCTURE**

The basis of this research is the philosophical concepts of Friedrich Nietzsche. He was born on 15 October 1844 in Röcken and died at the age of 55 on 25 August 1900 from severe pneumonia.

What make him more famous than the other philosophers is his theory on human's future in which he talked about "the death of God". By this theory he criticized the common ethics of humans both in his time and after. In general, Nietzsche was against four main traditions in West's civilization: ethics of Christianity ,Secular ethics ,morals and values of ordinary people and some of Socratic concepts which is remained in different societies. In Nietzsche's philosophy one of his main preoccupations is Christianity and human ,in his time and also in our time. Nietzsche became more and more obscure in Christian conversations. For him the main reason for "The death of God" is Christianity. One of His main problems is the absolute fact which is a basis in Kant's philosophy. In this regard J.P Stern said:

Nietzsche is always making special principles for special people. Unlike the absolute fact of Kant, he is completely against generalization of principles. Nietzsche's attack is not towards Jesus but Christianity (Magee, 2011:384). Nietzsche is not a fan of poor people and he attacked them severely in his philosophy. He believed that sympathy of a powerful person is alright but he hated the notion of supporting the poor from any possible source.

Thus he reproduces the contradiction as the pain of individuation but resolves them in a higher pleasure, by making us participate in the superabundance of unique being or universal willing (Deleuze, 2012.42).

Deleuze's idea about Nietzsche's philosophy is like saying yes to a which will be emerged inside of man, so after the death of God, man would say yes which is the basis for the theory of "superman". In this theory, Nietzsche tells us that

between ourselves and the other we should choose ourselves and instead we should use the other as jump ladder. Self and valuing one's existence is one of the factors of becoming a "Superman". This approach is a kind of self-analysis and Nietzsche is one the pioneers in this relation. The interesting point is that Nietzsche started this self-analysis from himself. About Nietzsche, Freud said:

No one never can know Nietzsche better than himself, not today not even tomorrow" (Magee ,2011:390). But what is the benefit of Superman in a world who's God has been died? From Nietzsche's point of view in a world without God, the man himself should become god and for reaching this he should value his own existence. Deleuze believed that "the death of God" is a formula which leads to the creation of "superman", for him this is not a theoretic proposition but it is a dramatic proposition:

It says at one and the same time: God existed and he is dead and he will rise from the dead, God has become Man and Man has become God. The phrase "God is dead" is not a speculative proposition but a dramatic proposition, the dramatic proposition par excellence (Deleuze, 2011:261). This dramatic basis with its focus on death becomes a pure mixed cognitive object. By transforming God to a mixed cognitive object, the existence or nonexistence of God won't be determined in an absolute way and death and life would have relative and partial determinations, so that's why Deleuze puts a dramatic basis for the death of god.

The dramatic proposition is synthetic, therefore essentially pluralist typological and differential. Who dies and who puts God to death? "When gods die, they always die many kinds of deaths" (Deleuze , 2011:261). This dramatic basis of Nietzsche's philosophy has attracted artists towards it. Nietzsche stated his ideas metaphorically and for an artist what is better than a free interpretation of ideas of a philosopher? Artistic and aesthetic issues are related with Nietzsche's thinking in different layers and in my opinion that's why he had a great influence of creative artists (Maggie, 2011:404).

#### ***Romulus, Claire, Alfro, Mississippi: Nietzsche's true children***

Karl Jaspers: "The only person who can understand the essence of Nietzsche's thought is the one who first has this essence in himself" (Jaspers.2004:41). Nietzsche believes that the thing that provides us with most interest is not that whether our interpretation from world is true or false because no one can know this by sure. The most important thing is that whether this interoperation can develop the will to power to strength and control the world or it expands anarchy and weakness? This theoretical basis which Nietzsche developed in "the will to power" is exactly the same action which Durrenmatt created in Great. In this play Romulus is deliberately helping the ruin of the Empire and for starting this he tried very hard to become the Emperor of Rome and then he became such a irresponsible Emperor and didn't take any action in response to the threats that led to the fall of Rome. In fact, Durrenmatt was trying to pursue Nietzsche's theory which he proposed in "the will to power". In his play Durrenmatt answers the question which Nietzsche asked in "the will to power". Romulus is the true image of the theory of superman. In the world which its God is dead, Romulus considers himself as the only person who can be God and rules in God's place.

"Now in a world without God, humans should have the courage to become Gods. The greatest need of today's civilization is to create a new kind of personality, Tough, powerful and brave superman who is intellectually and morally independent." (lavine,2005:413).

Based on the Nietzsche's theory of "the will to power", Romulus took the power and in relation to theory of "the death of God" he became a reason for the fall of Rome .Durrenmatt's answer to Nietzsche's question is that in a world without God "the will to power" would leads to anarchy which ultimately brings the freedom of body. In "Human, All Too Human" Nietzsche revealed a very important fact about his theory which is necessary for understanding Romulus, he says:

" Enough, I am still living; and life is, after all, not a product of morality: it wants deception, it lives on deception . . . but there you are, I am already off again, am I not, and doing what I have always done, old immoralist and bird-catcher that I am - speaking unmorally, extra morally, "beyond good and evil?" (Nietzsche, 1982:4). The above quotation is exactly the life of Romulus. He is awaiting death but suddenly Odoacer comes along and proposes him with a calmer throne. Odoacer is the first part of Nietzsche's viewpoint. Nietzsche has opened a new language for life and also Zarathustra had too much emphasis on language. Life should be with reason but rational because if we don't care for ourselves, nobody will care for us either. There is no other god who support us, so this is the strategy

of Romulus. He just cares about himself. Romulus words is Nietzsche's worlds too, he also wants to speak rationally. At first he pretends insanity but he finds out that nobody understands him, therefore, he is forced to tell the truth to his wife, Julia.

Romulus: I didn't do that because of severe ambition but because of need. What was the purpose for you, for me it was just a means? I became Emperor, just because of a political theory...

Julia: There's just something about you and that is Inaction.

Romulus: that's it .my political theory is to do nothing.

Julia: so for doing nothing you should become Emperor?

Romulus: only in this way, my inaction would have a meaning. The inaction of ordinary people cannot be effective.

Julia: this act will put the state endanger.

Romulus: that's the point!

Julia: what do you mean?

Romulus: you just got the reason of my inaction.

Julia: it's impossible to deny the necessity of reign

Romulus: I have no doubt about the existence of a state, I only doubt in the necessity of our reign which has become the World Empire. Before I became Emperor, this reign was a system which did Murder, pillage, oppression on behalf of other nations.

Julia: I'm surprised .if you have such an idea about the world governance of Rome, so why you became Emperor?

Romulus: the only reason that Rome has been alive from so many times ago until now is that it always had an Emperor. I had no choice but to become Emperor so I can ruin this empire.(Durrenmatt,2005:94-95)

What Durrenmatt pictures for us here is the same as the basis of Nietzsche's theory. Necessarily Nietzsche's superman must not have a mustache like Nietzsche. Nietzsche's superman is a person who can do anything on the way of reaching his purpose without having any fear from anybody else. In this theory, the action of superman would be remained. What Romulus wants to do -which he did very well too- is an ideal for Nietzsche's theory and only a superman can do that.

In "The Antichrist" Nietzsche stated that we should all put an end to your lives like Manis. We should enjoy life and Romulus did the same thing. He loves chicken so he prefers to stay at home breeding domesticated chickens. Now we can understand that "Romulus the Great" is not only a dramatic piece but it is a play which is exactly written based on two Nietzsche's theory of "the death of" and "happiness".

About happiness Nietzsche said:

"What is happiness? — the feeling that power increases — that a resistance is overcome" (Nietzsche, 2007:38)

Let's see what is the strategy of Romulus .he tells to Julia that:

Romulus: I married you so I can become Emperor and you married me because you wished to attain the status of Empress and I was the well-descended Romulus but you were born from the relation of Emperor with and a slave woman. I transformed you as a legitimate person and you gave me the Empire Crown. (Durrenmatt, 2005:91)

This the first part of Nietzsche's definition of "happiness" until "the power increases". In the second part Romulus's happiness is in a place where a resistance is overcome and without any doubt this resistance is the Rome's resistance which should be demolished . This the last dialogue of Romulus:

Romulus: now the rule of Rome Empire is ended (Durrenmatt, 2005:143).

Now it can be simply proved that theoretical basis and structure of “Romulus the Great” is Nietzsche’s theory of “happiness”. It is based on this theory that Romulus talks and provide others with speeches and ultimately he reaches to happiness .in the first place a happy person is the one who can be superman .

With another approach in this play and Nietzsche’s theory of “happiness” we can also mention the concept of “sympathy” in Nietzsche’s philosophy. For Durrenmatt, sympathy helped him in developing his text. For proving this we can compare one of Nietzsche’s sentences with a dialogue of Romulus.

“Not contentment, but more power; not peace at any price, but war; not virtue, but efficiency (virtue in the Renaissance sense, virtue, virtue free of moral acid). The weak and the botched shall perish: first principle of our charity. And one should help them to it. What is more harmful than any vice?--Practical sympathy for the botched and the weak--Christianity...” (Nietzsche, 2007:38).

Romulus: in all my life, my effort was to ruin Rome Empire. I gave myself the right to be the judge of Rome, because I had prepared myself for death. I asked my people to be victimized in a horrible way because I was also ready to become a victim .I let my people to be defenseless and I let them to be killed because I was also decided to be killed (Durrenmatt, 2005:134,135).

Romulus thought how he can be happy? How he can use his superman power? How he can reach to the thing that he is only worth of it? For this he has the help of Nietzsche. In the “Twilight of the Idols” he answered this question: war “All means are justified; every 'case' is a case of luck. Especially war. War has always been the most sensible measure for spirits who have become too inward looking and profound; even wounds have the power to heal. I have had a motto for a long time: The spirit soars, valour thrives by wounding.”(Nietzsche, 2005:155). Under the pretext of Nietzsche’s theory of war, Durrenmatt used a war scene for the manifestation of his protagonists: Minister: I just became the Prime Minister. Situation appears to be critical. Foreign governments are fully aware of everything. The market is tense. There are exaggerated rumors .but in fact the situation is perfect to take the run of everything (Durrenmatt 1956: 91).

In “The Marriage of Mr. Mississippi” the war situation put the power to minister and we can see the same situation in “Romulus the Great” in which he prefers a war. For starting this war, Romulus first tries to diminish Rome so the old rival, Germans, become tempted. When the Germanic army started the attack, the war started.

Like a superman, Romulus consider himself as the judge because like Nietzsche's Zarathustra he knows that the great judge, God has been dead and now he should do the judging because he has the power to do such. He has happiness now. He does his judging and at the end, in another part of the world he will live his life in a great peace, just like the Nietzsche's ideal. During the play he excessively said that he wants to be killed but his true fate would happen at the end of play.

Romulus: I appoint the German Prince Odoacer, to be the new king of Italy.

German: Viva King of Italy Odoacer : instead I will bestow Rome Emperor a pension of 6000 gold coins per year and a countryside villa. Romulus: now the hunger period of Emperor finished. Here this the glory crown and you can find the king's sword among gardening tools (Durrenmatt.2005:142).

The end of superman's life is stated in above and Durrenmatt tried to pass Nietzsche's theory through his artistic filter. Romulus would have a great life while embracing lots of coins every year. He would be happy for his beliefs and ideas led him to have a happy life. Romulus' life is the lesson of Durrenmatt's character from Nietzsche's concepts.

In "the visit", Durrenmatt has been close to this concept of Nietzsche. The town of Gullen once had a very advanced industry until Claire Zachanassian moved to Hamburg and became a prostitute .after marrying with Mr. Zachanassian, Claire became very rich. Since she had a big hatred from her hometown, she bought all the industrial sources of this city and made them all inactive. The play begins when Claire returns to Gullen. Here we see that she took everything out of the way in order to gain more power and this is her time to shows her power . Gullen is an example of recession in modernism which Nietzsche had been talked about it too. Claire announced that she will make a donation of one billion units of an unspecified currency, half for the town and half to be shared among the families. Her donation is conditional on someone's killing Alfred Ill who was the love of her youth. The town became developed by credit but even in the new situation nothing changed, as if everything is still calm and there is

no originality in the town such as humanity. Nietzsche has said the same thing .he said that development is a modern feature and it is a lie. This Nietzsche's point should be expressed by a superman who is Claire Zachanassian.

"True enough, it succeeds in isolated and individual cases in various Parts of the earth and under the most widely different cultures, and in these cases a higher type certainly manifests itself; something which, Compared to mankind in the mass, appears as a sort of superman." (Nietzsche, 2001: 2).

None of the characters in "the visit" have an evolution. And Durrenmatt wants them all just to be alive. They don't live. They are all alone.

"Nietzsche is the enemy of democracy, Socialism and Collectivism. he loves loneliness" (Ahmadi, 2005:155).

We can vividly see this love of loneliness in all of Durrenmatt's characters. Claire Zachanassian is an obvious example for this. She always tried to decrease her loneliness by marrying several times but still she prefers her privacy and her solitude. Nietzsche and Durrenmatt's characters have the same pain and joy which they both suffer from them and enjoy them. Mobius wants to be alone from all the people so he can be alone in a Luxurious mental hospital. Romulus empties the Imperial Palace so he can have more joy in his loneliness comparing to the time when he is with others. Alfro Traps travels alone with his car. Anastasia cannot be with anybody and she just gets rid of everybody who comes to her life. Überlohe prefers to be alone in a wood. A man, in the evening conversation has sat alone in his room waiting for the other to come. As if all the characters has become the "Steppenwolf" of Hermann Hesse. Solitude, the love of Nietzsche, but the difference between Nietzsche's solitude and Hesse's solitude is that the protagonist in Steppenwolf runs away from technology and industry to find solitude again but Nietzsche's superman became alone in order to gain power .in the following act of "The Marriage of Mr. Mississippi", the minister talks to powerful Anastasia:

Minister: you are an animal but I like animals. You don't have any plans .you are a day person.as you betrayed your husband, you will betrays me and others too .there is always a more powerful thing for you than what you already have .whatever comes in future will ruin today. No one can stop you. (Durrenmatt, 1950:74)

But Anastasia is always alone and this solitude is always in the search of power. A power which ultimately goes to a person who is lonelier than Anastasia: the Minister .this solitude has power inside it.

*"Truth" in ideas of Nietzsche and Durrenmatt*

"Which of us is the Oedipus here? Which the Sphinx?" (Nietzsche, 2008:13).

What is the relationship between truth and reality? Is every reality a truth? Does every truth become real? The answer is no. The relation between these two is in a way that some realities are truths and right. When a just, moral, social and economic system forms, it means that this system is both real and right. When you risk your life for the success of a movement, it means that your act is both real and right. You did a self-sacrifice which is an actual action. Some other realities are not real and right but they are false. When you violate a person's rights, it is a reality. You oppress him or her which is real thing but your oppression is not a truth and it is anti-truth and false. So we have two kinds of reality: the first kind are those realities which are true and right such as justice. When a justice is realized and achieved, it becomes a right truth. The second kind is those realities which are real but they are false and anti-right such as oppression and injustice. When you do an injustice, this reality is anti-truth and anti-right. This relation between reality and truth.

"Nietzsche said: reality needs to be criticized not worship and philosophy would release human from illusion no matter what it costs " (Jaspers, 2004.11).

In "Die panne " one thing become important which has not been addressed before the trial. There is a truth here but this truth is not a common and ordinary truth but it is a philosophical truth. In a trial that its judge has made it like a game, the truth would have another form. Alfredo Traps had a close relationship with his boss' wife sometimes ago and after some time from their relationship his boss died, but in trial this death is stated differently as if it was Traps who has killed his boss. This truth takes the exact definition that Nietzsche stated in his "The power to will".

"Truth" is therefore not something there, that might be found or discovered-but something that must be created and that gives a name to a process, or rather to a will to overcome that has in itself no end-introducing truth, as a processes in infinitum, an active determining-not a becoming conscious of something that is in itself firm and determined. It is a word for the "will to power." (Nietzsche, 1968:298).

And this truth has been created for the new game which has been planned by the judge, attorney and the lawyer. Christianity has explained that making a new truth for carrying out a goal is amoral but Nietzsche explicitly rejected morality.

"It is a painful and tragic spectacle that rises before me: I have drawn back the curtain from the rottenness of man. This word, in my mouth, is at least free from one suspicion: that it involves a moral accusation against humanity. It is used--and I wish to emphasize the fact again--without any moral significance..." (Nietzsch,2001:2)

Claire Zachanassian also creates a new truth :

Butler: do you know Mr. Ill ?

Koby and Loby: we are blind. We are blind

Butler: do you recognize him by his voice?

Koby and Loby : by his voice. By his voice.

Butler: in 1940 I was the Lord Chief Justice of Güllen. How did you two testify at that court?

Koby and Loby: we said that we had sex with her. We said that we had sex with her.

Butler: you testified this before me, the Court and God. Is it true?

Koby and Loby: it was a false testify. It was a false testify.

Butler: why did you lied?

Koby and Loby: Ill had bribed us. Ill had bribed us.

Butler: what did he gave you ?

Koby and Loby: one liter liquor. one liter liquor.

Claire Zachanassian: now Koby and Loby tell what did I do with you?

Koby and Loby : she ordered to find us. She ordered to find us.

Butler : that's right .she ordered to search for you two in all over the world. Koby, You went to Canada and Loby went to Australia but Claire Zachanassian found you both and what did she do with you?

Koby and Loby : she gave us to Toby and Roby. She gave us to Toby and Roby.

Butler: and what did Toby and Roby do with you?

Koby and Loby: they made us blind and they mutilated us. They made us blind and they mutilated us.

Butler: so this was the story. a judge.an accused. two false witnesses and an unjust verdict in 1910.so I am asking you Suer, is it right ?

(Claire Zachanassian stands)

Claire Zachanassian : yes

Ill : it was for a long long time ago.

Butler : what did happen to the child ?

Claire Zachanassian: (in a low voice) she only survived one year.

Butler : what did happen to you at that time ?

Claire Zachanassian : I became a prostitute

Butler : why ?

Claire Zachanassian : because of the court's verdict I became notorious....

Butler : and now you want justice , Claire Zachanassian ?

Claire Zachanassian: I have the power. Güllen can have one billion if someone's killing Alfred Ill (Durrenmatt.1963.34-35).

Claire can do whatever she wants but the first important thing for her is to create a truth and now by the help of that truth and her power, she can create the act of nature. We usually confront with a court scene in Durrenmatt's works, it can be public court like in "Die panne" and "The visit" or the court scene can be created by some answers and questions and interrogation in character's house or some other satiations like in "The Physicists", "abendstunde im spatherbst", "nachtliches gesprach mit einem verachteten menschen" and "The marriage of Mr. Mississippi". The reason of these trials is creating a new truth which is one of the basis of Nietzsche's philosophy. Durrenmatt just love to create new truths too. In the "Twilight of the Idols" Nietzsche made a new path for Truth:

"Twilight of the Idols - in plain language: the end of the old truth . . ." (Nietzsche,2005:137).

Sometimes for Durrenmatt this truth can have a root in the politics of his time and in some other time it is only a humanistic issue. The important thing for Durrenmatt is truth and creating that truth. In "The Marriage of Mr.

Mississippi " Durrenmatt had a great maneuver on the issue of truth in order to open a window to the idea of "creating the truth"

Mississippi : He betrayed you

Anastasia : who said such a thing ? (Durrenmatt.1950 , 24-25)

And now without mentioning anything about the betrayal of her husband, Mississippi circulates some rumors and continues his truth creation.

Mississippi: do you confess that you knew about your husband's betrayal (Durrenmatt:27)

And again only the truth is important for Durrenmatt.

Mississippi: (in a serious mode) in this very strange moments which we see the effect of truth in ourselves. the 25 years of being an attorney obligates me to warn you that for once ,both of us should confess before each other even if this confess costs our destruction. (Durrenmatt: 25)

And in the end of the play we again see the complexity of creating the truth .this time Mississippi, in the costume of insane, jump to the house from a window and interrogate his ex-wife .an interrogation for finding truth.

Mississippi: do you insist on the claim which says you weren't the mistress of Comte?

Anastasia : I cannot understand the reason of your suspicion .

Mississippi: its reason lays on the existence of good and evil in human's id .dear Anastasia, Comte Bodo confessed while he was drunk and drunk people always say the true things. (Durrenmatt :119,120)

Creating the truth is different from finding truth. In philosophy the simple definition of truth and real is that, real is what it is and truth is what it should be. In Nietzsche's definition of truth he assigned the "what it should be" to human so he creates what it should be and Durrenmatt also created truth in his works. The truths which does not exist because his characters always lie, from Anastasia in "The Marriage of Mr. Mississippi" to Alfro Traps in "Die panne".

About this issue Nietzsche said ironically:

"...is there any actual difference between a lie and a conviction?--All the world believes that there is; but what is not believed by all the world!...."( Nietzsche,2001:30)

### ***The Change of the world by Superman***

Thus affirms another world from the one of life, nature and history; and inasmuch as he affirms this "other world", must he not therefore deny its opposite, this world, our world, in doing so?( Nietzsche,2005,112). Nietzsche wanted to change the world. In his view, his true readers are not born yet and he said these both at the beginning of "Antichrist" and "Thus Spoke Zarathustra"

Thus Spoke Zarathustra : A Book for All and None (Nietzsche,2009:2).

Durrenmatt chose this view as the theme of "The Marriage of Mr. Mississippi" . In the first monologues of this play, Saint-Claude says:

Saint-Claude: the surprising fate of three men has been presented here. All three, same as each other, had this idea that with different ways they can change the world and save some parts, but they had bad-luck in their ways: they met a woman.

The theory of changing the world by Superman has exactly the above features. In this play, Durrenmatt tried to play with some of Nietzsche's thoughts. In fact Durrenmatt puts a woman as *Achilles' heel* of his protagonist and as we all know, when it came to women Nietzsche always had problem with them. In this play, Durrenmatt chooses the winner of his play a person who follows his thought better than any other superman . It should be noted that "The Marriage of Mr. Mississippi" is not a refusal to Nietzsche's thinking but it is like making a joke with Nietzsche. At the end Durrenmatt still performs what Nietzsche had been considered, the winner of the play is minister who rules and does not have any attention to others.

Minister: I don't have anything but greed for having more power and now I am embracing the world (Durrenmatt: 128).

Nietzsche said:

"Wherever the will to power begins to decline, in whatever form, there is always an accompanying declines physiologically, decadence." (Nietzsche, 2001:7)

And it would be this theoretical basis which Durrenmatt used to put minister as his power. Sometimes we may think that Durrenmatt wanted to make fun of these mortals, but the truth is that in Durrenmatt's time and in our time, mortals have still power and this power is the same power which Nietzsche had been talked about. In the next part we will analyze whether Durrenmatt was agreed with power or not?

### *Durrenmatt after Nietzsche*

If we make a route from what Nietzsche had been pictured for human and put "The death of God" in the beginning of the way and "Superhuman" at the end, we will find young Durrenmatt walking in mid-way.

"The only moral principle of Superman is the acceptance of life: to be powerful, creative, happy and free" (Lavine, 2005; 413).

In his wordsmanship, Durrenmatt had a certain path which can be traced by Nietzsche's philosophy. He wrote "Romulus the Great" in 1950 when he was 29 years old. He wrote this play to be a piece of Nietzsche's unquestioning thoughts. We can find all four features of superman in the character of Romulus. Since he is Emperor of Rome, he is powerful. He is smart and creative because he found a way to ruin the great Rome Empire happy which can conceived from his hobby of breeding chickens and his behavior. He is free because no one can stops him from doing anything.

Romulus: when an Emperor want to fire his country, he should ruin what he wants to break and trample what he wants to ruin. (Durrenmatt, 2005:83). But the path would not be stable for Durrenmatt, gradually his concerns passed Nietzsche and there is clear reason for this: Nietzsche did not see and experience the horrible and catastrophic war which Durrenmatt saw. Without any doubt, his path changed in 1956 when he wrote "the visit". Now Nietzschean superman has become a woman and she is not happy anymore. A woman as Superman who has muscular character. "When a woman has masculine virtues, you feel like running away; and when she doesn't have masculine virtues, she runs away herself." (Nietzsche, 2005:159). Without paying attention to above sentence, Durrenmatt Puts Claire in a virtue of superman. Claire only shows her femininity at the end of play. She does not cry. She does not escape from anything. Her kierkegaardian despair have more reflects than her Nietzschean happiness .now from four Nietzschean features we can only see three of them and the happiness has been gone . But the laws of nature are existed still and we can see this basis in characters of "The Marriage of Mr. Mississippi". Saint-Claude (to Mississippi): you have intelligence and I have power (Durrenmatt,?:64). Also Anastasia have the intelligence and minister have the power. In "The Marriage of Mr. Mississippi" all four characters of the play have power but their power has been broken between themselves.

In 1962 when Durrenmatt wrote "The Physicists" he takes away the power from his Superman who is Mobius. Now Nietzschean superman is in a mental institution and he cannot even move without having the permission of his nurse. He does not have any place to move. He does not have any purpose or intends and he even does not have the mood to sit besides other patients. from four features of Nietzschean superman, he only has one: creativity. At the end of this play you get this feeling that the last monologue of the play is like Durrenmatt's review of his path from Nietzsche to himself. He challenges Nietzschean superman and he claims that what can do a man who have only the creativity is to pretend to be a Psycho.

Mobius: I am Suleiman, the poor king Suleiman. Once I was very rich and god-believer. From my power all the other powerful people began to shudder. I was the Sultan of Freedom and justice. But my wisdom took off my fear of god and as I didn't fear from god anymore, my wisdom ruined my wealth. The lands which I was the king of them are ruined now. They are all vacant, like foggy desert ..... (Durrenmatt,19661:102).

Durrenmatt has vividly mentioned the "the death of God" theory and considers the "the death of God" as the reason of destruction of his character. I should also note that by "the death of God" Nietzsche didn't mean the death of transcendent God, he meant that the memory of God has been forgotten. As Lavine said:

"What Nietzsche meant by "the death of God" is the death of our memory of God. This is our belief in god which is dead now: at the end from the brutal attacks of Empiricists like David Hume and his followers, God was ruined" (Lavine, 2005:412).

Durrenmatt has the same idea of Lavine. His character whose once was like Romulus, Breeding chickens and had whatever he wants, is in despair now and as he knew his not crazy he should pretend that so he can have some peace away from people, the peace that Nietzsche hated it. People stay young only if their souls do not stretch out languidly and long for peace . . . Nothing is more foreign to us than that one-time desideratum of 'peacefulness of the soul', the

Christian desideratum; there is nothing we envy less than the moral cow and the fat happiness of good conscience. (Nietzsche, 2005:215).

Durrenmatt often used the Nietzschean concept of "Happiness" for the characters of his plays.

"Formula for my happiness: a yes, a no, a straight line, a goal . . ." (Nietzsche, 2005:161). In the Oxford Dictionary of Plays, under the title of "Dance of death" there is a statement by August Strindberg which says:

Edgar is a captain in the Swedish coast artillery. In all his life he is in constant hostility with his life, Alice. He has solid muscles and because of this illness he constantly goes to coma and come back to life again . . . . Durrenmatt used this play and creates a box game from it. A box game between Edgar and Alice. (Pettersson, 2002:100,101).

"Play Strindberg" is a play with all of Durrenmatt's thoughts which he has been dealing with from the start. These thoughts display not that much of Nietzsche's philosophy, as if "Play Strindberg" is the last paper of Durrenmatt's book. He makes a box game, a box game between those who have the claim of supermanity, those who always claim that they are the best but they are nothing. In somewhere in the play Alice wants to swagger him in this way:

Alice: If I did not marry you, I was still in theatre.

Edgar: what a lucky theatre!

Alice: I was a famous actress

Edgar: but critics didn't think that way

Alice: critics are all mean

Edgar: but they aren't fool (Durrenmatt, 2001:15)

In another part of the play, Edgar says:

Edgar: lean on me and you would never have any trouble, I rule in this island. The doctor is a fool obsequious person which will be shivers before me. In this island everybody have fear from me.

Alice: almost everyone (Durrenmatt, 2001:21)

The "almost everyone" here means no one. In this scene Edgar is talking proudly of himself, in front of Kurt, and Alice just humiliates him gradually. This is what Nietzschean superman does with each other. They just kill themselves.

Now Durrenmatt is somehow out of Nietzsche's path. Comparing to young Durrenmatt, the middle aged Durrenmatt does not have that much devotion to Nietzsche, to poet-philosopher.

"Nietzsche thought that there will be a crisis in which all the existed value systems with their loose bases and old judgments would collapse . . . . And after that there would be a re-birth" (Hollingdale, 2006: 217)

Durrenmatt still displays the world which is about to collapse and ruined, in cinema we can see this collapse in "Fight club" of David Fincher which is displayed in the last scene. It is the collapse of idea which we see in "Fight club" which is can be seen also in Durrenmatt way of thinking. As Nietzsche also said, after this collapse there would be another birth. Now Durrenmatt has independent ideas and thinking. His thinking follows Nietzsche's thinking but in different way: he routs Nietzsche's superman, he routs "happiness", he routs Nietzsche's "the death of God" just for one reason: the only thing that routs this Superman is nothing but himself.

Edgar: play something?

Alice: What?

Edgar: whatever you want.

Alice: Solveig Song

Edgar: Buyars migration

Alice: you don't have any interest to the songs which I like.

Edgar: you too.

Alice: so I won't play anything (Durrenmatt, 2001:9).

## CONCLUSION

What is completely clear is the great influence of Nietzsche on Durrenmatt's works and in this research I tried to show this impact. Durrenmatt criticized the human of his era by the help of Nietzsche's concepts on human. The human of his time is a man who has experienced war and needs help to stand up but there is nobody who can help him. By finding this approach in Nietzsche's philosophy, Durrenmatt creates a new world in his works which is no

longer under the influence of Nietzsche but himself. Durrenmatt became a superman and he ruled his own world. This world is not a Nietzschean's world, it belongs to no one but Durrenmatt himself.

As a great Swiss author who spoke German, German's world was very important to him. He has done such a great job in drama of the word which I believe doing research is necessarily needed to understand his world.

As a great philosopher, Nietzsche was a new theorist whose ideas have still great importance on certain schools of thought. The final result of this research is that although Durrenmatt was hugely under the influence of Nietzsche but at the end of his career he reached to an independent world of his own. For understanding this new word, extra researching is absolutely needed.

## ABSTRACT

This paper discusses the reasons why curriculum and syllabus design processes are required to be *glocalized*, introducing “glocalization” as a means for curriculum developers in general and syllabus designers in particular to maintain the local divergence within the global convergence. The paper introduces some ways in which the traces of the globalization trends can be found in syllabus and curriculum design in English language teaching (ELT), discussing that slavishly following the methodologies in syllabus design as well as the models in curriculum development introduced as optimal by the West may turn to be counterproductive in many non-western countries. It is suggested that to have an efficient curriculum, curriculum designers should strive to change the direction of pure globalization to glocalization which connotes consideration and awareness of the local needs, values, socio-cultural norms, and learning styles of the learners in a specific country, race, and culture and localization on the basis of some principles. The implications of glocalization for syllabus design and curriculum development have also been mentioned in the form of ten principles functioning as a framework within which curriculum and syllabus designers can make their local decisions.

**KEY WORDS:** curriculum models, Curriculum development, Syllabus design, Globalization, Glocalization

## INTRODUCTION

“Globalization” which is one of the main characteristics of the modern society is predominantly a loan from the science of economics (Sifakis & Sougari, 2003). It has, however, found its way into other sciences to convey the way the western societies are culturally, politically, and ideologically inviting the other societies to convergence.

Posing the globalization versus localization dilemma, in this paper, we will argue that resisting globalization in all aspect is not productive. Believing that being a radical supporter of either localization or globalization will lead us to irresolution, and a never-ending struggle, we would like to discuss some ways of providing fair circumstances and efficient syllabus for English learners in non-western parts of the world; globalization should be interwoven with localization. Considering the fact that in many countries, the learners' expectations about what fine materials have to offer, their learning styles, and their socio-cultural norms are not in line with those of the people in Western countries, it appears that following globalization slavishly without striving to maintain local identities is unrewarding. The following discussions include some of the ways globalization is mirrored in syllabus and curriculum design. The paper also embeds why and how *glocalization*- thinking globally and acting locally- can be opted for and employed both to reconcile the conflict between those who defend globalization and those who criticize it, and to provide efficient curriculum for learners of English in various countries.

### *Globalization and English Language learning*

Viewing globalization as the process that promotes surpassing national boundaries and increasing the interconnectedness and instant global communication among nations, Gray (2002) has (“has” should be deleted) identified three main ways in which globalization has affected the use of, and consequently the demand for learning English language in the world. He viewed the rise of international and intercontinental corporations, the headquarters of which are mostly located in English speaking countries as the first impetus for the spread of English language in the world, since typically, English is used as a lingua franca and the language of legal documentation in ventures

between such corporations and companies in non-English-speaking countries. This, in turn, motivates a large number of people to learn English for business purposes.

Besides, the fact that English language is employed in academic international conferences, banking, law and human rights, information technology has also increased the demand for learning English. The fact that English language is the prevailing language in the Internet communication is yet another factor contributing to the increase in the demand for learning English (Gray, 2002).

However, the increase in demands for learning English is merely one aspect in which ELT has been affected by globalization, and the impact of globalization on ELT is multifaceted.

Globalization, as defined by Giddens (1990), is a bidirectional dynamic process that necessitates local happenings to shape, and to be shaped by events occurring many miles away. However, what is mostly seen in practice is a unidirectional flow of norms from the western countries to the non-Western countries – locals – that are expected to adopt the standards dictated by the Western global.

Defined as above, globalization in ELT can be viewed as the movement advocating teaching and learning methods, values, strategies, and materials, as well as syllabus and curriculum design approaches proposed, favored, and supported by the ELT scholars in English speaking countries which form the inner circle, as termed by Kachru (1985), in other parts of the globe forming the outer and the expanding circles (Kachru, *ibid*). Such perception of globalization also affects the views about what *the correct* pronunciation, and the *proper* accent are, and whether or not native speakers teachers should be preferred to non-native ones. However, since, defined in this way globalization in ELT has too broad a scope to be discussed in a single paper, it is the impact of globalization in EFL syllabus and curriculum design that has been the focal point of discussion in the present paper.

#### ***Globalization or Localization Dilemma: "Glocalization" to the Rescue***

In order to thrive within the mainstream of globalization, it is required to think globally, and act locally as the slogan of the globalization suggests (Marquis & Battilana, 2009). Adopting the either embrace or oppose globalization view does not appear to bear fruit, as the merits of thinking globally and benefiting the globally designed and well-tried principles cannot be totally ignored. Opting for one of these two mainstreams, those who share Wilk's (1999) opinion by believing in the deep chasm and irreconcilable contrast between globalism and localism, are likely to limit their scope; consequently, they are fated to be deprived of the advantages the other trend has to offer. In even worse cases, viewing these two processes as mutually exclusive, they will be left with no solution, only to find themselves in a never-ending struggle, the result of which is to benefit from and to have faith in neither of the processes.

Since permitting oneself to be slavishly ruled by the dominating globalization trend in its pure sense has been proved counterproductive (Kim, 2010), what should be done is to take into account the factors like national cultural values, local needs and resources, during the cross-continental, cross-national, and cross-cultural course of globalization. Awareness of the existence of such factors and considering them while employing the techniques that are accepted globally, and hence, taken for granted by many, can assist the theoreticians, as well as the practitioners to redirect the process into that of glocalization. Modeled on Japanese word *dochakuka*, meaning adapting farming technique to one's own local condition, the term glocalization denotes the need for global products and processes to be tailored to suit the local cultures (Khondker, 2004). Thus, glocalization not only encourages acknowledging the effects of local factors, but also makes many of the desirable local particularities salient (Marquis & Battilana, 2009). Preserving local divergence, in terms of values, needs, the means to accomplish those needs, as well as the available expertise is not an easy task to do when individuals on top of the societies and nations are day by day overshadowed by the seductive globalization. Nonetheless, given the fact that some actions and choices cannot be understood and justified outside the cultural and historical frameworks in which such choices and actions are embedded, the maintenance of such context-specific divergence seems vital to the survival and development of organizations and systems. Unless attempts are made to preserve those local aspects that are vital to the survival of systems, globalization is prone to have serious differentiating effect in the non-Western countries rather than the unifying ones, "dividing each national community from within by generation, by class, by political stance, and so forth" (Kim 2010, p. 7367). In other words, globalization and the convergence of cultures, methodologies, approaches, and ideologies bear a number of adverse consequences for individuals who do not reside in the Western part of the globe that comprises the norm providing "inner circle" as termed by Kachru (1985).

Syllabus design and curriculum development are not exceptions to this rule. Both curriculum developers and syllabus designers are required to show sensitivity to and awareness of the local needs, localized solutions, and the aforementioned merits of glocalization. In other words, failing to acknowledge the role of the dominant learning style and habits, cultural values, power relationship within classrooms shaped by societal factors, as well as the local

needs and resources while designing a curriculum and syllabus, either nation-wide or institute-wide, the designers are prone to gain less than desired results.

### **GLOBALIZATION AND GLOCALIZATION IN SYLLABUS DESIGN: SELECTION FROM THE GLOBAL OR DESIGNING IN ACCORDANCE WITH THE LOCAL?**

For the reasons mentioned above, glocalization, the localization of the global principles, has been considered desirable when preparing educational programs and designing syllabi. However, to realize how such glocalization is feasible in syllabus design process, we need first to define globalization in the context of designing syllabi, so that we can discuss how the globalization process can be directed towards glocalization.

When globalization is discussed with respect to syllabus design in English language teaching and learning, various interpretations of globalization and its impact on various aspects in language teaching and learning are conceivable. Such interpretations may range from a desired convergence in pronunciation, accent, and lexis to be incorporated in materials and to be prescribed to the end-users of English materials, to a wider scope including the preferred convergence in learning styles, approaches to, and theories of learning and teaching, and approaches to syllabus design recommend to syllabus designers in various parts of the world. In other words, some limit their scope by viewing globalization in syllabus design as a matter of advocating similar content to be found in the materials (e. g. Honey, 1997), while others regard it as a movement aiming at uniting the syllabus design policies and to diminishing the local diversities in the routes taken in the syllabus design process. Adopting the latter view and the broader scope, in this paper, we aim to investigate the process of globalization in syllabus design in ELT with respect to the fact that decision makers in the language programs are encouraged to choose from the existing approaches to syllabus design and types of syllabi rather than design a syllabus totally geared to their local, contextual needs. In other words, in this paper, globalization in syllabus design in ELT is viewed as a process in which syllabus designers in various parts of the globe adopt one of the existing approaches to syllabus design and choose from the types of syllabi identifiable in the literature (e.g. structural, topical, lexical, task-based...), rather than glocally design a syllabus totally geared to their local, contextual needs.

A trend that might be noticeable in the present-day syllabus design is a global invitation to and inclination towards task-based syllabus. The task-based syllabus, which puts the emphasis on “means or processes” rather than “ends or products”, has gained considerable popularity (Crookes & Gass, 1993; Long & Crookes, 1992, 1993; Nunan, 1989; Prabhu, 1987; White, 1988; Willis, 1996). It owes, largely, the augmentation in its popularity to Prabhu's (1987) and Breen's (1984) works. In fact, this type of approach to syllabus design has been so welcomed by the decision makers and language program planners that it has successfully imported the concept of “language task” as a vital element to the curriculum (Nunan 1993, P. 66), and a basic unit for language syllabus design (Williams & Burden 1997:168).

Such an approach to syllabus design has been claimed to be compatible with research findings on language learning (Hatch 1983; Ellis, 2003a, Larsen-Freeman & Long 1991). It has also been alleged that task-based syllabus strives to incorporate classroom research findings when designing materials and methodologies (Chaudron, 1988). Such claims should, however, be considered with caution since the research the findings of which have been used to render task-based syllabi legitimate, like the ones mentioned above, has mostly been conducted in the Western settings. Thus, questioning the value of such an approach to syllabus design in other settings seems plausible.

Despite the prevailing urge among the scholars to adopt *task* as the unit of syllabus analysis (Crookes & Gass, 1993; Long & Crookes, 1992, 1993; Nunan, 1989; Prabhu, 1987; White, 1988, 1993) stemming from the popular opinion that the selection of tasks as the unit of syllabus can lead to a coherent approach to program design (Long & Crookes, 1993), adequate evidence proving that such a syllabus is equally productive in all settings and for learners with different learning styles and from different cultures is still lacking. While we do not mean to question the potential of tasks in curriculums, we would like to argue that prior to accepting it as a solution to all contexts and problems, practitioners are needed to gather empirically backed evidence that drives from their own local context. This concern is echoed in the ideas of Ellis (2003b, p. 331) who viewed tasks as “an Anglo-American creation” and stated that there are hidden socio-political messages of task-based teaching which could result in hesitations in and resistance to the application of the task-based syllabus in non-Western contexts. Ellis (ibid) argued that both the content of the tasks available in language teaching materials and the classroom practices necessitated by such a

method of teaching, such as the imposition of the participant role on teachers, might not always be congruent with non-Anglo-American cultural norms.

Demonstrating awareness of the adverse consequences of pure globalization and believing that the process of globalization should be redirected to that of glocalization will take us merely half the way. What is still lacking is the knowledge of how to implement glocalization in syllabus design. One further question, yet, is whether mixed syllabi (Brown, 1995) can be the proper means to glocalizing syllabus design.

As it was discussed earlier, globalization and in this case choosing from the options offered by scholars whose theories and ideas are likely to come from their experiences in their own educational contexts does not appear to be the right thing to do. Given the diversity in learning styles of the learners across cultures (Oxford, 1996), and considering the fact that not all learners in various contexts have the same needs and learning objectives, it cannot be claimed that one type of syllabus in its full-fledged form can cater for the needs of a group of learners in a language program. Therefore, better ways are required to be sought to empower the curriculum developers and syllabus designers to maintain and appreciate the local diversities within the process of syllabus design.

Brown (1995) proposes the mixed syllabuses, in which two or more types of syllabuses are incorporated to form one syllabus. Brown (ibid) viewed syllabuses like situational-topical syllabuses as belonging to this category of syllabuses.

In practice, this can be done in two main ways: incorporating different types of syllabuses in each lesson/unit all throughout the course, or allocating each lesson/unit to one specific type of syllabus. Nonetheless, neither of the aforementioned techniques is seemingly prolific in all contexts. One may also argue that juxtaposition of the syllabi which are rooted in very different theories and have been designed to trigger different types of competences do not result in a coherent syllabus.

A third solution is, thus, required. We would like to argue that, in order to preserve the local identity and cater for the local needs of the learners in a language program, glocalization needs to be reflected in the new plan for the design of the syllabus. Such a plan can be informed by the existing syllabi. It, however, should be anchored on the findings of the research carried out in the local context. As the aim of glocalization is not to totally deny the value of global convergence but to garnish it with the preservation of the local divergence when considered necessary, such a plan can be led by both local needs analysis and global considerations. The key point here is to study the similar contexts closely to gain insights with the potentials of the possible solutions. Affinities in racial, cultural, and political background among various groups of learners can particularly assist and guide the designers in the process of forming a new type of syllabus specially tailored to the needs and goals of a certain cohort of learners. In such a process, the global principles of syllabus design can be investigated and then incorporated in the local. In what has been referred to as the "post method area" in ELT (Kumaravadivelu, 1994), principled eclecticism in all aspects of educational programming seems to be more productive than blindly following the dictated rules that mostly come in a package. To apply glocalization in curriculum and syllabus design, the globally well-grounded principles are required to be applied with a local touch informed by the local studies.

While to some, mostly American, scholars, syllabus design and curriculum development can be used interchangeably (Hall, 2011), in the British usage, syllabus design is not identical to curriculum development and is defined as a specification of the content of a course of instruction, listing what will be taught and tested (Richards, 2001), and providing a rationale for how the content should be selected and ordered (Brown, 1995). The latter group of scholars refers to curriculum development as the totality of content to be taught as well as the goals to be realized and achieved within one educational system (White, 1988). Adopting the latter view, in this paper, we consider curriculum development to have a broader scope and to entail syllabus design, viewing the syllabus as the part of a curriculum related to the decisions pertaining to the content of a program. The principles of curriculum design to be discussed below, therefore, will entail the principles pertaining to syllabus design. Those principles related to the selection and sequencing of the content can be regarded as those of syllabus design. The rest of this paper is dedicated to naming and briefly discussing the ten global principles that possess the potential of functioning as a framework within which curriculum and syllabus designers can make their local decisions in order to have a "glocal" model of curriculum development.

**GLOCALIZATION AS APPLIED WITH REFERENCE TO GLOBALLY ACCEPTED COMPONENTS IN CURRICULUM DEVELOPMENT**

In the present paper, the globalization in the curriculum development has been investigated with respect to persuading the curriculum developers and practitioners to adopt one of the existing curriculum models available in the literature (e.g. the model proposed by Nation and Macalister (2010), or the one proposed by Graves (2000), to name only two). However, as with the process of syllabus design, some problems lie in such pure globalization in curriculum development. As far as the theoretical aspects are concerned, none of the available models seems to offer a complete picture of the process of curriculum design. Moreover, they impose the number and/or sequences of stages in curriculum development to the local designers. Nation and Macalister's (2010) model, for instance, which is one of the most recently designed ones, appears to rely heavily on the role of objectives and goals in curriculum development as it's designers have located the "Goals" in the center of the inner circle in their "Mercedes" symbol shaped model. This over-reliance may lead the developers to adopt an "objective" or "outcome-oriented" approach, as opposed to a "process" one (Littlewood, 2008). An out-come based approach to designing a curriculum is not devoid of drawbacks as practitioners and teachers are prone to be restricted by the objectives set at a superficial level or narrow specification (McKimm, 2009). This can, in turn result in the loss of valuable learning experiences and a plethora of learning opportunities otherwise available through allowing the natural course of interaction between learners and the teacher and among learners themselves. Moreover, the model by Nation and Macalister (2010) does not incorporate polity as defined by Rodgers (1989) as political concerns in a broad sense. Their model, in addition, appears to be based on a separationistic view of phenomena involved in curriculum development. In other words, it might be elicited that the dynamism, nonlinearity, and complexity of EFL curriculum development, stemming partly from the complexity of language learning (Larsen-Freeman, 1997) and partly from the complex nature of curriculum development (Doll, 2008), are not core issues.

Other models are not without their problems either. The models proposed by Murdoch (1989) and Graves (2000), as other instances, do not allow the practitioners to start the process of curriculum development with reference to the requirements of the circumstances. Moreover, Murdoch's (1989) model lacks some of the vital components of curriculum such as the assessment of the learners' performance and learning outcome, and the evaluation of the curriculum itself.

Therefore, as discussed earlier, what is required is localizing the global and opting for glocalization in the process of curriculum development. One way to achieve such glocalization is to apply the global principles, not the models themselves, and to build them into a glocal model designed based on the local expertise, resources, goals, and needs. In other words, to replace globalization by glocalization in curriculum development, we should no longer propose and prescribe models but encourage acting locally within frameworks drawing on global principles.

To do so, the first step would be to identify the global principles and to justify the reasons why they have been considered indispensable and valuable to the glocal model of curriculum. What is listed below as the curriculum development principles is merely a tentative list that can be added into as the result of a more thorough literature review and/or exploring the findings of locally conducted studies. The ten principles discussed below embed nine globally accepted components or sub-processes of curriculum development along with a suggestion of how their mutual interplay should be recognized by and reflected in glocally-designed models. Needless to say, a thorough and comprehensive discussion of the factors discussed within each principle does not fit into one paper. Thus, it has been tried to introduce the concepts and mention their significance in curriculum models briefly, so that the local designers can apply them according to the requirements of their specific context. The readers can refer to the cited sources to gain more information on the discussed concepts.

***Principle One: A Curriculum Based Theory***

The first principle is basing the curriculum on a sound theory of learning and teaching and, adequately stating the theoretical basis of the decisions made in various processes involved in curriculum design. Such a theory should be guided by research in second language teaching/learning (Nation & Macalister, 2010) and should inform the decisions made in various components of glocally designed curriculum models. Not only does making use of the research findings make the connection between the research and theory of language learning and the practice of designing in a curriculum (Nation & Macalister, *ibid*) but it also provides a defensible ground for decision makers in different stages throughout the process of designing an educational program. Nation and Macalister (2010) use the

term "stating the principles about content and sequencing, format and presentation, and monitoring and assessment", while, Graves (2000) calls it "articulating the beliefs about the language, the social context, language and learning, and teaching" to refer to this globally accepted component of a curriculum model.

***Principle Two: Comprehensive Needs Analysis***

"Needs Analysis" is another component which is critical for any curriculum to thrive as it not only can function as the basis for determining goals and objectives (Brown, 1995), but also can change the unidirectional mostly top down direction of curriculum design into a more egalitarian direction in which the learners' voice is heard, if done properly.

As defined by Brown (1995, p. 35), "in general terms, needs analysis refers to the activities involved in gathering information that will serve as the basis for developing a curriculum that will meet the learning needs of a particular group of students". The second principle can be stated as including an ongoing needs analysis into the process of curriculum development. In language learning curriculum development, by the analysis of needs, we mean a thorough investigation of both present (Richerich & Chancerel, 1977) and the target (Munby, 1978) situation of the learners which includes the investigation of what the learners need to use the language and function efficiently, what they lack, and what they wish to learn (Hutchitson & Waters, 1987). Such exploration of needs should also include both the "language" needs (Brown, 1995) of the learners and the linguistic behavior they need to acquire to communicate effectively in the target language (language needs) and the psychological affective "learning" needs (Brown, *ibid*). Such comprehensive assessment of needs should also embed the gathering data about the learners' felt needs – the needs the learners believe they have- as well as their perceived needs – what the teachers and other stakeholder consider as the learners' need (Berwick, 1989; Brindley, 1989) which are context sensitive. The strategies the learners should be equipped with to handle the process of learning, their learning needs (Hutchitson & Waters, 1987) should not be ignored either. An effective glocal curriculum model should also include the statement of the criteria and methods for evaluating the means used to analyze the various types of needs mentioned above.

***Principle Three: Realistically Defined Goals***

Thirdly, curriculums and educational programs are required to be directed towards sound, realistic, and well-grounded goals. Program goals are "general statements concerning desirable and attainable program purposes and aims" based on needs (Brown, 1995, p. 71). Although, in fact, he confines his definition of program goals to the ones derived from analysis of the perceived needs of the learners, we believe a well-carried out needs analysis which takes into account the subjective and felt needs of the learners as well as the perceived ones (Berwick, 1989; Brindley, 1989) can help the designer set more realistic goals. A comprehensive analysis can shed lights on the properness of the set goals with respect to the local milieu. In Iran, for instance, realistically viewed, language learning goals might be far from acquiring a native like oral proficiency, as the context necessitates mastery in written skills. Iranian English learners mostly require English to be to continue their studies; therefore, they need to be equipped with the skills to write papers and take part in international conferences.

The important fact that should not be ignored is the emergent nature of the goals, and thus, goal setting needs to be done dynamically in the process of designing a curriculum. Properly set goals can assist the designers to define and set objectives leading them towards the aim of the program.

***Principle Four: Attention to the Milieu of the Curriculum***

The forth principle pertains to incorporating a thorough analysis of the context in which the curriculum is to be applied. Such a comprehensive analysis should include not only consideration of the factors related to the situation in which the course will be used and determination of how the course should take account of them, but also consideration of factors associated with the participants (e.g. learners, and teachers) (Nation & Macalister, 2010). Crucial to the effectiveness of this stage, is the way learning situation is defined and the factors taken into consideration when analyzing the situation. Not only should the analysis go beyond the physical setting, but also it should include all the contextual factors affecting the decisions made in different stages of designing a program. Merely analyzing the resources offered or the limitations imposed by the context (such as the time and materials available, the teachers' skill and competence, the technological facilities available in classes, and the learners' motivation and interest) does not offer a complete picture to the curriculum designer. Other contextual factors such as the political and economical status of the participants, "polity" (Rodgers, 1989), and the role the society plays in shaping the participants' beliefs about teaching or learning certain subjects, and the philosophical values of the participants including their moral and religious ideas should also be considered while developing a curriculum. Such polity related factors play a crucial role in determining the content of the materials and course books, in particular. However, in real ELT practices, unfortunately, the local social milieu is ignored and the materials designed for other contexts, often quite with quite different socio-political values are applied in the curriculum. In Iran, for instance, the

New Interchange Series, by Richards et al. (1990), which have been originally written for English learners in Far East, has been among commonly used ELT course books in the past decades. This reflects the lack of, and the need for, a comprehensive analysis of the environment that embeds consideration of polity in present day Iran.

***Principle Five: Ongoing Evaluation in Coherent Curriculum***

The fifth principle, which actually makes the ongoing needs analysis and goal setting possible, is the inclusion of ongoing evaluation in the model. The output of such dynamic evaluation can feed into all the components of the model and function as a feedback loop. In a curriculum, both the process of curriculum design and the performance of the learners can be evaluated. Some scholars (e.g. Graves, 2000) do not differentiate between these two and use the term "evaluation" to refer to both. Nevertheless, some others (e.g. Nation & Macalister, 2010) use the term "assessment" to refer to the evaluation of the learning outcome and the term "evaluation" to talk about the evaluation of the program itself. Here, we would like to argue that both forms of evaluation carried out dynamically by both insiders (e.g. the instructors themselves) and outsiders (e.g. groups of educational inspectors) are essential for a program to flourish. In fact, what is desired is what Weir and Roberts (1994) have termed "a broad approach to evaluation" which encompasses both the accountability of the program, through monitoring the learners' improvement, and the development of the curriculum design process to improve the educational quality of the target program. Especially when it comes to globalization and EFL curriculum, the success of the curriculum might be evaluated with reference to the local milieu and the polity factors inherent in the educational system in general. Thus, a comprehensive local learners' needs analysis along with consideration of the socio-politico-economical factors in the local learning environment, which shape the stakeholders' expectation from, and definition of, a successful curriculum, can inform development of evaluation criteria.

***Principle Six: Dynamic Evaluation of Materials***

The sixth principle pertains to developing and evaluating materials to be employed in the program. In other words, for the curriculum to fulfill its aim to meet the expectations and the needs of its participants, careful development and dynamic evaluation of the materials is an imperative. Globalization advocates the export of the ELT materials, produced in the inner circle, to expanding circle countries. Even though intended for educational purposes, coursebooks are "highly wrought cultural constructs and carriers of cultural messages" (Gray, 2002, p.151). Therefore, in countries in the outer and the expanding circles (Kachru, 1985), prior to the adoption of ELT materials produced in, and mostly congruent with cultural norms and values of, inner circle countries (Kachru, *ibid*), careful evaluation is required. This reflects the needs for studies to provide empirically backed evidence on the appropriateness of such materials in the local milieu, and the decisions taken concerning the selection of the materials should be informed by such local studies.

Besides, local studies are needed to investigate whether the materials not designed locally can equip the learners with the knowledge necessitated by the local milieu. One of the very few studies carried out in Iran to address this issue is the one conducted by Soleimani and Dabbaghi (2012). According to the results of their study that was aimed at evaluating the efficiency of the New Interchange course books, by Richards et al. (1990), in terms of providing sufficient pragmatic input for a cohort of upper intermediate level Iranian English learners, the books could provide enough pragmatic input for language learners to deal with their basic communicative needs.

It is also worth noting that this principle does not totally exclude the possibility of adopting or adapting the existing course books or other materials. It, on the other hand, emphasizes the necessity and the importance of considering the potential role materials play in the success of a curriculum and the requirement of incorporating materials evaluation into the globally designed models of curriculum development.

***Principle Seven: Teacher Training Programs to Make Professional Curriculum***

Given that poor recruitment decisions and procedures can easily neutralize the possible desirable impact of a well-designed course and the huge role the teachers play in the success or failure of a program, we believe "dynamic Teacher Training Programs" should be included in any model. In other words, incorporating teacher-training programs is one of the global principles that can be integrated into global models. Teacher training has been considered a curriculum inside the curriculum (Johnson, 1989). Therefore, the seventh principle pertains to the incorporation of teacher training programs into curriculum development process. The teacher training programs can lead to the professional development of the teachers provided that they are motivated by the everyday challenges

EFL teachers in the local milieu are confronted with. If the training programs fail to interest the teachers and engage them mentally, they are unlikely to lead to any improvement. Thus, the content of such courses and programs needs to be decided with reference to a comprehensive analysis of the local teaching environment. Besides, the solutions proposed in these training sessions should also be congruent with the local realities, constraints, resources, and socio-cultural factors. Therefore, unless the decisions made in this stage are directed by the output of teaching and learning environment analysis stages, little change is expected to occur.

***Principle Eight: Glocally-Centered Content Selection***

In this paper, the proper selection and coherent sequencing of content is identified as the eighth principle in curriculum development. Viewing making reasonable, well-justified decisions about content as one of the crucial parts of curriculum design, Nation and Macalister (2010) have argued that poor content selection results in poor learning despite excellent teaching and learning effort. What is important, and global, with respect to the selection and sequencing of the content is the necessity of making sure that the decisions made at this stage are informed and in line with the output of other stages of design and can be defended and justified. The output of the needs analysis and environment analysis stages can provide the designers with valuable information based on which the glocal content can be selected. To be of use and motivating, content should be chosen with reference to the learners' socio-political, cultural, and ideological norms and values, and thus, the content promoting familial and social values incongruent with the religious and cultural norms in Iranian, for instance, would not be welcomed among Iranian English learners. Designers can maintain local diversities within this principle as long as the above-mentioned condition pertaining to the content selection is satisfied.

***Principle Nine: Proper Presentation of the Lessons***

The next, and the ninth, principle is deciding upon the proper format and presentation of the lessons. The format of the lessons should be commensurate with the locally shaped learning style and interest of the learners in a way that is attractive and encourages investment. To make globally informed decisions at this stage of curriculum design, the designers of the language programs can benefit from the ten principles proposed by Nation and Macalister (2010). To them, an optimal presentation of the lesson necessitates keeping the learners motivated, including an even balance of meaning-focused input, language-focused learning, and meaning focused output and fluency activities. It also requires providing interesting comprehensible input, providing activities aimed at increasing the learners' fluency. Nation and Macalister (ibid) have also argued that encouraging the learners to produce the language, including language focused learning activities, spending as much time as possible on the learning tasks, promoting the depth of processing, presenting the course in a way that the learners have the most favorable attitudes towards the language, language users, the teacher's skill in teaching the language, and their chance of success in learning the language positively affect the presentation of the lesson. Finally providing the opportunity for learners to work with the learning material in ways that most suits their individual learning style has also been known to lead to optimal presentation of the lesson (Nation & Macalister, 2010). By the same token, the principles of language teaching put forward by Ellis (2005) can provide guidelines for the curriculum developers at this stage.

***Principle Ten: The Interplay between the Components in the Glocal Model***

Finally, the tenth principle is the bi-directionality principle which can be gained through the recognizing the interplay between and the mutual effect of the components mentioned in the above principles when designing a glocal curriculum model. The glocal models of curriculum should be designed in such a way that all participants including syllabus designers, material designers, teachers, learners, and even other stakeholders like publishers, parents... can have the opportunity to be heard and taken into accounts. The glocal models should be designed in a way that they are not referred to as "top down" and unidirectional. This can be achieved through adding a feedback loop among all the components of the model, so that the output of each component can feed into and inform the decisions made in other stages or components of curriculum design. Another way to prevent a unidirectional decision making process in glocally-designed curriculums would be to avoid prescribing any pre-specified order in the selection and application of abovementioned stages.

Having named and briefly discussed the above principles, we should also note that the order of the presentation of principles in this paper by no means reflects their importance, and, as it was mentioned earlier, the above list can be added to as a result of further studies in educational program development.

**CONCLUSION**

In the present paper, it was argued that considering the diverse consequences of globalization in syllabus design process for people in different parts of the world (Schaeffer, 2003), striving for altering globalization process into the glocalization seems plausible in such countries.

Besides, such glocalization is required in the process of curriculum development and syllabus design. This can be achieved through a sort of principled eclecticism in the form of ten principles namely: basing the curriculum on a defensible theory of learning and teaching, incorporating needs analysis to the model, analyzing the socio-economic as well as the political context, setting goals and objectives, incorporating ongoing learner and program evaluation, including teacher training programs, dynamically developing and evaluating the materials, properly selecting and organizing the content, properly presenting of the lessons, and considering the interplay of various components of the model. The aforementioned principles can serve as a framework within which curriculum and syllabus designers can maintain the local divergence. It is argued that as long as the global principles are not violated, local diversities can be maintained in curriculum development so that the outcome would be a "glocally designed" model.

#### **ABSTRACT**

Besides putting forward an account of the empirical facts of language, a theory that carves to illuminate language from a biolinguistic perspective should aspire to an elegant corporation of linguistic phenomena with other known cognitive capacities and about the essence of human brain architecture. That is, biolinguistics seeks to shed light on the specifically biological nature of human language focusing on five foundational questions: (1) what are the properties of the language phenotype? (2) How does language ability grow and mature in individuals? (3) How is language put to use? (4) How is language implemented in the brain? (5) What evolutionary processes led to the emergence of language? In an endeavor to address the above longstanding questions and touch upon the current issues in biolinguistics, the present study basically focuses on genetics, modern genomics, and minimalism, while raising challenges for future research.

**KEYWORDS:** Biolinguistics, language phenotype, genetics, genomics, minimalism.

#### **INTRODUCTION**

Modern Biolinguistics aroused as a result of the marriage between biologists and linguists half a century ago. Amongst the distinguished scholars who contributed to the field one can mention initially Eric Lenneberg and Noam Chomsky, and later Salvador Luria exemplified in Lenneberg's *Biological Foundations of Language* (Lenneberg, 1967). In 1974, at an MIT international meeting, called "Biolinguistics", Piattelli-Palmarini launched this interdisciplinary field further. Nowadays, new books and papers scrutinizing the domain have loomed up (e.g. Jenkins 2000, 2004) and Givon (2002) who has pondered the domain from a new window. What is more, worldwide conferences in consonant with the launch of a topical journal, *Biolinguistics* and foundation of an international network on Biolinguistics.

Amongst the many questions brought up from the biological point of view one stands out. That is, the extent to which the declared principles of language are exceptional to this cognitive system. Besides, an even more foundational question in biolinguistics is how much of language can be given a principled explanation. The effort to

investigate such questions happened to be called the “**Minimalist Program**” recently. Answers to these questions can shed light on not only the nature and functioning of organisms but also on probing their growth and evolution.

As the co-founder of modern evolutionary theory, Alfred Russel Wallace, asserts, language faculty is one constituent of what he called “man” intellectual and moral nature”. In opposition to Darwin, the other founder of evolutionary theory, Wallace claims that human faculties cannot be illuminated just in terms of variation and natural selection, but desires other sources as well including gravitation, cohesion and others at the absence of which the material universe cannot abide.

It is an agreed upon fact that, putting the human intellectual capacity aside, the faculty of language is crucial to it. Based on the paleoanthropologist Ian Tattersall, the invention of language provokes the blossoming of human capacity in the evolutionary record. However, the question of language evolution should be dealt with through inspecting the organizations of disparate precursors into the faculty of language, conceivably arising from a modest genetic event that tended towards an essential innovation.

Salvador Luria in consonant with Francois Jacob were the compelling advocates of the view that uniqueness of language doesn’t lie in its role as a communicative system as it does in symbolizing and evoking cognitive images and mental construction of accomplishable worlds.

In the same vein, in biolinguistic domain, from the very outset the view of “**modular nature of learning**” was adopted. In the sense that in all animals, there exists a kind of instinct to learn in specific ways. However, this modular view doesn’t predetermine that the elements of the module are unprecedented to it.

According to Chomsky (2004), regarding the language faculty as a biological system, three factors interfere with the growth of language in the individual:

**Genetic Factors:** The identical principles across species, e.g. UG. The rationale behind children’s language acquisition uniformly at the same level of complexity.

**Experience:** The origin of variation within a narrow range.

**Principles** not unique to the faculty of language.

In line with the aforementioned statements I will elaborate on some related concepts in detail and introduce some new ones.

## **BIOLINGUISTIC REHABILITATION**

It is the nature of each novel science to enjoy a temporary period of popularity. The same proves to be true for biolinguistics. However, there are many a factors that contribute to the revival of this field in the world of science. What these two periods (before biolinguistic revival and after that) share is addressing some foundational questions:

- a. What accounts for linguistic competence in humans?
- b. How does this capability cultivate in the individual?
- c. How is this competence put to use?
- d. How is this qualification accomplished in brain structures?
- e. How did this competence evolve in human species?

Current biolinguistics is still involved with these questions. However, it advantages from recent improvements in different areas of linguistics and biology. Those breakthroughs are supposed to triumph over the old hindrances at the outset of biolinguistic appearance. Let us now delineate some of these ameliorations concisely.

Conceivably, the most fundamental progress in biolinguistics has been the exploration of the FOXP2 gene and subsequently, its interactome. Apparently, FOXP2 is not the language gene. Nonetheless, this gene in consonant with the ones with which it interacts, accommodate the concrete example of the genetic basis of language (Lenneberg 1967). It is where biolinguistics connects with the fervid genomic research in biology. FOXP2 experiments with other species yielded the result that in deed, there are many parallelisms between human speech and birdsong at various levels. Furthermore, the discovery of FOXP2 is apt to illuminate disparate linguistic deficits and disorders.

Comparably noticeable in the reappearance of biolinguistic concerns has been the outlook modification in comparative psychology. That is, based on Chomsky, Hauser, and Fitch (2002), investigation into the essence of human language may yield more rewarding outcomes if one differentiates between faculty of the language in the narrow sense (FLN), that which is unique to language and a faculty of language in the broad sense (FLB) that which is not.

In the same vein of utmost importance is an advanced synthesis in biology, the one that resonates strongly with the anti-behaviorist; innatist stance in Chomskyan linguistics.

A forth factor that expedited the reemergence of biolinguistics is the so-called problem of “**interdisciplinarity**” in the context of language, particularly in the context of neurolinguistics. To put it in other words, the two disciplines of linguistics and neuroscience are deprived of a common level of representation at which to esquire into processes and fundamental elements. This successively, averts the formulation of biologically grounded categorical descriptions of language processes in the brain.

The fifth factor that contributed to the renaissance of biolinguistics is the formulation of a “minimalist program” in theoretical linguistics.

In the words of Chomsky (2007):

At the time [pretty much throughout the history of generative grammar], it seemed that FL must be rich, highly structured, and substantially unique.  
[...] Throughout the modern history of generative grammar, the problem of determining the character of FL has been approached “from top down”:  
How much must be attributed to UG to account for language acquisition?  
The M[inimalist] P[rogram] seeks to approach the problem “from bottom up”: How little can be attributed to UG while still accounting for the variety of I-languages attained.

Minimalist ideas if cultivated firmly, can wind up the governing of isolationism in theoretical linguistics. It promises to reconcile linguistics with other branches of cognitive (and biological) sciences.

## **THE GENETICS AND EVOLUTION OF LANGUAGE: PROMISES AND PITFALLS OF MODERN GENOMICS**

Genetics and evolutionary analysis have benefited from comparative approach. In the sense that, through inspecting other species, parallel affinities and clashes have been instituted. Nevertheless, in the case of language this approach doesn't seem to bear any fruit as no other animal species appears to be endowed with language phenotype. As a result, what are the achievements of classical and modern genomics about language's genetic and evolutionary properties? This question has been addressed from two novel lines of research.

One approach seeks to investigate the systematic heritability of the subcomponents of language via twin studies, uncovering a closer coincidence between syntax and sound structure (phonological) abilities and fine motor control than syntax and the lexicon. Put it differently, for some very particular syntactic ability, they may be able to identify a candidate gene set correlated to this trait.

Another line of research has opted for a more explicit genetic and functional inspection of language. This was the discovery of FOXP2 gene by researchers as the one supposedly linked to language ((Hurst et al. 1990, Vargha-Khadem et al. 1995, Fisher et al. 1998, Lai et al. 2000, Lai et al. 2001, Vargha-Khadem et al. 2005). Initially, this exploration enjoyed a magnificent popularity as the one genetic window into human language development and evolution. It was hoped that, this gene could be implemented in animal studies beside human ones. In spite of this, such discovery didn't prove to be fruitful in the central computational aspects of human language. Based on Vernes et al (2006), a study on a family with language disorder revealed that FOXP2 affects the regions involved in general planning of fine motor output, sensorimotor integration, and multimodal sensory processing, as opposed to circuitry controlling mouth and lower face movements.

Furthermore, FOXP2 discovery is regarded as the starting point of modern evolutionary biolinguistics. There are two functional amino acid differences between FOXP2 and its variant in chimpanzees. Consequently, such accelerated evolutionary change led to human segregation from other species, and hence the emergence of language in homo sapiens.

The researchers' understanding of FOXP2 has also undergone a change. From a one phenotype picture, FOXP2 has turned into a molecular network (Fisher and Schorff in press). In addition, the relation between FOXP2 and procedural memory has been confirmed (Ullman and Pierport, 2005). But as researchers assert, such ever-increasing understandings of FOXP2 are just advances not departure. Since they serve as foundations for future genomics research about language. While there is a long path to pave for identifying the causal links of this gene to language impairment, its exploration provides an extremely worthwhile example of how to overcome the obstacles on the way of resolving the complicated human language phenotype.

### **MINIMALISM AND MODERN BIOLINGUISTICS**

Minimalism as proposed by Noam Chomsky lately endeavors to study the internal architecture of the mind in general and language in particular. In other words, it seeks to investigate how much of language can be given a principled explanation. Looking through the steps followed on the way to constituent structures creation, one finds out that it is where biolinguistics links to minimalist program. In the sense that, firstly, lexical items are merged externally; next due to internal merge, movement is generated and constituent structures are formulated. Making use of this mechanism, people are able to combine words into infinite strings. If all this are on the right track, then biolinguistics enquires to ascertain the principles underlying mental recursion.

According to the perspective of several linguists (Boeckx 2006, Hornstein 2009, among others), the minimalist program brings about an opportunity to address “granularity mismatch” proposed by Poeppel. That is, as mentioned previously, different levels of representations used in linguistics and neural science lead to vague metaphors linking brain structures to linguistic components. In addition, it is in line with the new themes in biology like optimization, specificity and laws of form based on Fodor and Piattelli-Palmarini (2010). It adopts a bottom-up approach to cognitive faculties like the new comparative psychology.

Moreover, nowadays, one central theme stands out in minimalism. In the sense that, there is a basic asymmetry between the way syntax subserves the sound and the meaning components it interfaces with (Chomsky 2007, 2008; Berwick and Chomsky 2011).

Based on Eric Reuland (2011), before the emergence of minimalist program, the linguistic principles were too language specific. They were considered as firmly modular in nature, hence, not welcoming the interaction between language, biology, and cognition until the advent of minimalism.

Summarizing, the minimalist program, framed within the circumferences of linguistic theory in line with other forces, resulted in the reemergence of biolinguistic concerns. In addition, as Jackendoff (2002) claims, minimalism guarantees to stop the “separation” of linguistics from other branches of cognitive (and biological) sciences.

### **CONCLUSIONS**

The breakthroughs witnessed in theoretical linguistics, comparative ethology, genetics, and evolution of language adds to our knowledge of biological foundation of language and paves the ground to upcoming discoveries in biolinguistics. Needless to say, the recent achievements and theories will be modified in the light of ongoing research. The significance of this review lies in its representation of how the study of language can converge with other scientific disciplines like genetics and biology.

Put differently, linguists can contribute to biolinguistics a great deal: they can provide the elements that researchers from other fields must seek at the neural and genetic levels. However, it is only feasible if the linguists are willing to turn into genuine biolinguists.

Although minimalist program has proved to be illuminating in biolinguistics, further neurobiological experiments are necessary. Moreover, due to the promises and pitfalls of modern genomics, additional lines of research are required in order to discern the pathways from genes to linguistic phenomena. Addressing justified questions and creating

hypotheses that are testable on diverse populations would lead us to more thorough understanding of the biology of human language.

## **FUTURE DIRECTIONS**

As Dobzhansky (1973) puts forward, nothing in language makes sense except in the context of the biology of grammar. The renowned figures like Chomsky and Lenneberg have initiated the effort to institutionalize linguistics as a natural science and instantiate the biolinguistics enterprise as a title for disparate courses and workshops. Due to this, the researchers in the field hope that the term biolinguistics will make its way into institutional categories.

In spite of many problems of communication and misunderstandings arisen by the uniquely interdisciplinary essence of biolinguistics, there is a possibility of calling for a growing community of scientists of diverse backgrounds. For instance, linguists, evolutionary biologists, molecular biologists, neuroscientists, anthropologists, psychologists, computer scientists, (language or speech and hearing) pathologists, and so on. This way, through cooperation and mutual respect hurdles can be mastered and satisfactory outcomes will be achieved.

**ABSTRACT**

Human beings are recognized as social beings, communicating with each other in order to fulfill their needs. To become social members with specific abilities, children acquire some pragmatic skills from early childhood; in other words, they become socialized first by direct and indirect helps of their caregivers and later on by learning from their environment. So caregivers who are mostly children's parents play an important role at the first stages of children's pragmatic development and their socialization. In this study, the pragmatic development of 26 children (4 to 5 years old boys and girls) was analyzed by means of a pragmatic profile especially prepared for every day communication skills of children by Dewart and Summers (1995). The information needed for the profile along with the family's educational and economical information was gathered through several interviews with each child's parent. The obtained results showed that parents' educational level and also the family's economical condition can be among the factors that affect the socialization process and the pragmatic competence.

**KEYWORDS:** Pragmatic skill; Socialization; Culture; First language acquisition

**INTRODUCTION**

Social life and social communication are among the features which distinguish human beings from other types of creatures. The key factor that enables humans to communicate is the ability to talk and to interact with each other. In fact all normal people learn at least one language and use that language to communicate with others in order to convey their intended meanings or to fulfill their needs. Using linguistic abilities for communicational purposes in social contexts is related to the field of pragmatics.

Yule (1996) defined pragmatics as the study of the relationships between linguistic forms and the users of those forms. In the Handbook of Pragmatics, Horn and Ward (2004) mentioned joint attention, common ground, convention and contrast, speech acts, speaker intentions, taking account of the addressee, taking turns and politeness as eight main aspects of pragmatic development. They claimed that by age six children have acquired considerable knowledge about how to use the language and they can also make inferences from what other people do or do not say. Mainly parents are those who guide children and help them to acquire these pragmatic skills. According to Verschueren (1999), pragmatics studies mainly focus on people's use of language which is either in form of behavior or in form of social action. He further described pragmatics as a general socio-cultural phenomenon. Therefore pragmatic development and socialization are two related factors and one cannot ignore one concept while considering the role of the other.

From the first moment that a child enters the first social group (i.e. the family) until s/he grows up and communicate with different people in different situations, s/he learns how to interact with other people; i.e. how to become socialized. So the process of pragmatic development and socialization start from early childhood. When children learn a language, not only do they learn the semantic or syntactic features of that language but also they learn how to use that language in different situations. As it is mentioned in Bavin (2009), pragmatic competence consists of more than one skill because the language is also used for more than one purpose. Considering this fact, Bavin continues to

say that although acquiring pragmatic competences is difficult, children learn them by helps of their caregivers whether in school or in the family. In Bavin's words: "it can be said that caregivers 'socialize' language" (p.348).

Blum Kulka (1997) defined pragmatic socialization as a way in which children are socialized to use language in context in an appropriate social and cultural way. When children start learning the basic pragmatic competence, they become able to participate in early social communication with their caregivers and little by little they expand their acquisition by means of some communication processes. According to Ochs (1990), these socialization processes are divided into explicit and implicit types. The former type is a process in which the social norms of the society are directly taught by the caregivers while in the latter process the children learn how to use the language by observing and interacting with other society members.

As Fletcher and Macwhinney (1995) cited from Ochs and Schieffelin, although cultural factors can be neglected in grammatical learning of a language, no one can deny the important role of culture in the process of socialization and in children pragmatic development. While according to Universal Grammar theory of language learning, all children have the capacity to learn a language, and they do so in similar stages regardless of their culture, the case is not the same for pragmatic development or for the process of socialization. Culture of each country is considered as a unique characteristic of that country and even within one society there are families with different sub-cultures. Therefore children are prepared in different family environments to acquire pragmatic skills and become ready to engage in social activities.

As Bavin (2009) mentioned, pragmatic skills play an important role in children's lives and since some aspects of preschoolers and young children pragmatic behavior are indicator of their future achievements, therefore the researchers hoped that the answers to the research questions of this study may shed light on the cases dealing with pragmatic developments in the process of first language acquisition.

## REVIEW OF THE LITERATURE

Based on Li's (2012) studies, most of the pragmatic socialization research has been on child's developmental pragmatics and the interactions between normal or abnormal children and their caregivers. The following are some of these studies along with their findings:

In a study by Vasques et al. (2013), four and six year old children were observed to discover whether they use their pragmatic competence to learn from others and produce valid labels for novel objects or not. They observed that four year olds used this pattern for quality maxims while six year olds follow the learning pattern for both quality and relation maxims. The researchers found that children use the pragmatic history of other people when they are faced with new information. This study reveals the important role of people who are training young children (i.e. caregivers, teachers, family, etc.) especially in the process of novel word learning.

Regarding pragmatic comprehension, a study was conducted by Loukusa et al. (2007) within a relevance theory framework. The results of the study showed that age of children had a direct relationship with their ability to use contextual information in comprehension which in turn supported the processing model which is suggested by relevance theory. As it is revealed from these studies, caregivers and age are among the effective factor that may result in different pragmatic competence outcomes. The above mentioned studies and many studies of these types observed the subjects, children or the caregivers, for a rather short period of time, since learning the pragmatic skills is an ongoing process, the findings of longitudinal studies are of great value. The following information is taken from the observation of two researchers who study the socio-cultural aspects of pragmatic development:

In 'Dinner Talk' by Blum Kulka (1997), a six year old longitudinal cross-cultural study was performed in which cultural patterns of socialization used by American vs. Israeli vs. American-Israeli family members at dinner time were observed and analysed. The observation revealed that during the dinner conversations, meta-pragmatic comments used by the parents had effective role in the process of children's language acquisition as well as their pragmatic development. Another fact revealed in the study was that the utilization of pragmatic aspects, such as turn taking, by family members was representative of the society they lived in and the dominant culture of that society. Finally by comparing the socialization process of the three groups of the study and also by considering other cultural and linguistic factors, the researcher made so many conclusions among which was the fact that parents listen more to their children while dinner talk compared to their listening to their own parents. This shows that almost in all cultures and countries, parents play an important role in children's socialization.

In another study by Ochs (1988) which is presented in a book entitled 'Culture and Language Development', children in Samoa were observed and interviewed very closely. Ochs believed that language acquisition and the socialization process occur along each other; therefore, she observed and examined both cognitive and socio-cultural features of language acquisition. Ochs found out that language could socialize children and also by living in a society child learn to use the language. Based on her results and findings, socialization and language acquisition were two related concepts and one could not hold to one while ignoring the other.

As it was shown in the available literature, parents play an important role in children's socialization and also their pragmatic competence process. In this study the family's educational and economical situation will be considered in details to see whether they can affect children's socialization or pragmatic competence process.

## **RESEARCH QUESTIONS**

Considering the importance of caregivers' role in the process of children's socialization and pragmatic competence, this study takes economical situation and educational level as two from many cultural setting developers (Hood et al., 2005) and tries to answer the following research questions through a qualitative research method:

- What are the effects of parents' education on children's pragmatic competence and socialization?
- What are the effects of a family's economical conditions on children's pragmatic competence and socialization?

## **METHODOLOGY**

### ***Participants***

There is some evidence from the studies of Dale (1991) and Camaioni et al. (1991), that parents have reliable and valid information about the process of the language development of their children. The participants of this study were the parents of 26 children (15 girls, 11 boys, who were 4 to 5 years old). To choose the participants of the study, first about 8 kindergartens in Shiraz were selected. From among these kindergartens, three of them accepted to take part in this research and allowed the researchers to interview with teachers and children's parents with the condition to remain anonymous. From the children attending these three kindergartens, only 29 parents accepted to take part in the research and 3 of them changed their mind at the time of the interview and considered the questions too personal to be answered. While parents' answers to interview questions were used to evaluate children's pragmatic competence and socialization level, teachers' interviews aimed on confirming the answers provided by children's parents.

### ***Instruments***

The instrument used in this study in order to gather data and then to analyze the data, was an interview taken from the revised edition manual of 'The Pragmatics Profile of Everyday Communication Skills in Children' prepared by Dewart and Summers (1995) (Appendix A). All of the questions of this interview were first asked from children's parents and then were asked from children's teachers to make sure that parents' answers were accurate. The questions were all translated into Persian by the researchers and to make sure that the translated version was as reliable as the original version, it was double-checked by two English teachers. In cases that there was a difference between researchers' translation and English teachers' translation, revisions were made.

The profile's questions focus on three major aspects of the development of pragmatics: development of communicative functions, child's response to communication and child's participation in interaction and conversation. The profile's information about the major developments of children between 4 to 5 years old in each of the above mentioned areas is presented at the end of the study (Appendix B).

Dewart and Summers (1995) also highlighted that the profile adopts a descriptive, qualitative approach. They added that reliability and validity of the profile are approached in terms of the use of the profile with an individual child (i.e. reliability is the consistency of an interviewee's responses and can be checked by asking a similar question again at a later time while validity can be obtained by obtaining information from additional sources, for example checking the answers with the child's teacher).

### ***Procedure of the study***

At the beginning of the study, 8 kindergartens were randomly selected for the study. Only the principals of three of them agreed to cooperate in this study. After getting permission from the principals, the researchers talked with the teachers of children between 4 to 5 years old and asked them to give the research participation request letters to children's parents. In the request letter, the aim and the process of the study and also the estimated time of the interview for parents were explained in detail and parents were assured that their personal information (e.g. name, phone number, number of children, etc.) would be kept confidential. 29 parents from the three kindergartens accepted to participate in the study. Then based on their free time, dates of interviews were specified and announced to them.

At the time of the interview, the pragmatic profile questions that were all translated to simple Persian along with some questions about the parents' educational level and their average income were asked from each child parent. The parents were provided with relevant examples to better understand the purpose of the questions. 3 parents refused to answer the interview questions at the time of the study and claimed that they prefer not to talk about their personal issues. Gathering the information from 26 parents took about four months due to kindergarten special programs on special occasions, the delayed arrival of parents and therefore shortage of time, bad weather and etc.; then the parents' answers to questions of interview were checked with the relevant teachers to avoid the probable inaccurate emotional answers of parents.

After gathering the necessary information, the pragmatic profile's milestones of the relevant age were used to determine the characteristics of each child's pragmatic competence. Then the children's profile results and answers to the 46 questions of the interview were grouped based on parents' educational level (with or without university degree) and parents' average monthly income (below 1 million tomans, above 1 million tomans), respectively. Then the findings of each group were presented in a qualitative form and were illustrated separately in different tables. The results of the obtained data are presented in the following.

## **RESULTS AND DATA ANALYSIS**

As it was mentioned earlier, the profile used in this study adopts a descriptive, qualitative approach. Regarding this fact, the parents' answers to interview questions were analyzed and then considering the milestone for the development of pragmatics for children of 4 to 5 years old (Appendix B), the following results were observed:

According to the data obtained from the interviews, in case of communicative functions almost all the children had shown an acceptable pragmatic competence in fifteen out of eighteen categories. The categories in which the pragmatic skills were not fully acquired were: rejecting, greeting on arrival and on departure and commenting. In case of rejecting, 19 (out of 26) of the children reject the undesirable situation or thing in a rather polite way while in 7 cases shouting and crying were reported. In case of greeting on arrival, 2 of the children had the habit of hiding and in case of greeting on departure, one of the children had the habit of crying. Regarding commenting on disappearance, 6 of the children were reported to start crying or nagging.

To compare children based on their parents' educational level, first an educational categorization was made (Table 1).

*Table 1: Categorization of children based on their parents' education*

	Total Number of children	Educated parents	Educated father	Educated mother
number of children	26	21 (80.76%)	2 (7.69%)	3 (11.53%)

This categorization consisted of 3 groups:

1. 21 Children with both parents educated in university
2. 2 children with their father educated and their mother with no university education
3. 3 children with their mother educated and their father with no university education

From among the 7 children who did not acquire 'rejecting' skill, 3 were from the first group, 2 from the second and finally 2 were from the third group (Table 2).

*Table 2: Frequency of children who do not acquire communicative functions*

			Total Number of children	Educated parents	Educated father	Educated mother
Children problem	with	rejecting	7 (26.92%)	3 (11.53%)	2 (7.69%)	2 (7.69%)
Children problem	with	greeting	On arrival	2 (7.69%)	1 (3.84%)	1 (3.84%)
			On departure	1 (3.84%)	1 (3.84%)	-
Children problem	with	commenting	6 (23.07%)	3 (11.53%)	2 (7.69%)	1(3.84%)

One of the children who did not acquire greeting on arrival was from the second group while the other one was from the first group. The only child who cried on departure was from the first group.

Both children of the second group, one of the third group and three children of the first group had difficulty with commenting on disappearance.

Considering the abilities in 'response to communication' category, all the abilities were acquired by the children except 'responding to no and negotiation'. 9 of the children did not have the proper pragmatic skill of their age to respond to no. It was reported that crying and repetition of the same word or phrase were used instead of the proper action. Both children of the second group along with 7 of the first group were those who need further instructions for responding to 'no' and for negotiation (Table 3).

*Table 3: Frequency of children who do not acquire response to communication*

	Total Number of children	Educated parents	Educated father	Educated mother
Children with responding to no and negotiation problem	9 (34.61%)	7 (26.92%)	2 (7.69%)	-

In case of interaction and conversation, it seemed that conversational breakdown was the only problematic category (Table 4).

*Table 4: Frequency of children who do not acquire interaction and conversation*

	Total Number of children	Educated parents	Educated father	Educated mother
Children with conversational breakdown problem	4 (15.38%)	1 (3.84%)	2 (7.69%)	1 (3.84%)

One child of the first group, both of the second group and one child of the third group were reported to have no concentration and therefore they were not able to fully understand the conversation.

Considering the contextual variation category, the differences aroused in pragmatic skills related to peer- interaction and books as a context for communication (Table 5).

*Table 5: Frequency of children who do not acquire contextual variation*

	Total Number of children	Educated parents	Educated father	Educated mother
Children with peer interaction problem	8 (30.76%)	6 (11.53%)	1 (3.84%)	1 (3.84%)
Children with problem of accepting books as a context for communication	2 (7.69%)	-	2 (7.69%)	-

The only children who did not show an interest in books were the two children of group two. In case of peer interaction, the data revealed that 5 of the children tried to be dominant (one from the second and 4 from the first group), two of them preferred to play alone (one from the first and one from the third group), 4 of them joined with enjoyment (one from second and 3 from the first group), 3 of them suggested an activity (from the first group), one of them clung to an adult (from the first group) and 11 of them play alongside others (2 from the third group and 9 from the first group)

To compare the children from an economical view point, the children were divided into three groups (Table 6):

*Table 6: Categorizing children based on their parents' income*

	Total Number of children	Average income of 1 million toman	Average income more than 1 million toman	Average income more than 2 million toman
Children with educated parents	21	16 (61.53%)	7 (26.92%)	1 (3.84%)
Children with educated father	2	-	-	2 (7.69%)
Children with educated mother	3	2 (7.69%)	-	-

- Living in a family with less than the monthly average income of 1 million toman (N=16).
- Living in a family with more than the monthly average income of 1 million toman (N= 7).
- Living in a family with more than the monthly average income of 2 million toman (N= 3).

It was revealed that both children of the former second group along with one of the first groups' child were placed in the economical group c. Children who were in group b, were all in the former first group. And finally group a consisted of two children of the former third group in addition to the rest of the first group's children.

## CONCLUSION

### *Discussion and conclusion*

Similar to the findings of Vasques et al. (2013) and Loukusa et al. (2007), the results of this study also indicated that children learn from their caregivers and people around them. In the present study, children with educated parents, especially with educated mothers, showed better results in pragmatic competence and also in becoming socialized. Therefore similar to Vasques et al. and Loukusa et al.'s findings, it was revealed that children are affected by their caregivers and people who are around them (i.e. their parents).

Along with the results of the study by Blum Kulka (1997), the results of the present study highlighted that the role of parents in children's socialization cannot be neglected. The present study also showed that factors such as education or economical situation of parents, as the most important caregivers, would affect children's early pragmatic competence and also their socialization.

An in depth analysis of the data gathered from this study showed that the two children who were in families with the most monthly income and who had an educated father and an uneducated mother, had less acquired the pragmatic competence and the socialization skills of their age. The common characteristic of these children was the use of crying in any undesirable condition.

Just one of the children who had an educated mother along with an uneducated father showed difficulties in more than two pragmatic skills. This child was placed in economical group a.

The pragmatic competence difficulties of the rest of the children were in case of just one or two pragmatic skills.

Considering the results of the study the following conclusions were made:

- Parents' education, especially mother's education, can affect children's socialization process and also children's pragmatic competence.
- Children who live in families with better economical conditions, learn the pragmatic skills related to tolerance of unwanted situations later than those children of their age who live in families with average economical conditions.

## LIMITATION OF THE STUDY AND SUGGESTIONS FOR FURTHER RESEARCH

The participants of this study were parents and teachers of 26 children of 4 to 5 years old in Shiraz, Iran. In this study only the effects educational level and economical situation of parents on the socialization process and pragmatic

competence of children were observed. It is recommended that the future studies consider the role of other parents' characteristics on children's pragmatic competence. It is also recommended that future studies analyze a greater number of subjects if possible.

## Appendices

### Appendix A. A brief list of interview questions taken from the pragmatic competence profile

Questions of Communicative functions		
1		How does (child's name) usually get your attention? ( To Self)
2	Attention Directing	If you and (child's name) were going along the street or walking in a park and (he/she) saw something interesting, what would (child's name) be likely to do? (To Other things)
3		If you were in the kitchen and (child's name) saw something (he/she) wanted to eat that was out of reach, how would (he/she) let you know? (Request for Object)
4	Requesting	How does (child's name) let you know if (he/she) wants to be picked up? (Request for Action)
5		If (child's name) needs your help, for example, if (he/she) was on a toy on wheels and got stuck, or needed straps undone to get out of the buggy, what is (he/she) likely to do? (Request for Assistance)
6		If you were bouncing (child's name) up and down on your lap and (he/she) wanted you to do it again, how would (he/she) let you know? (Request for Recurrence)

7		If (child's name) notices something new at home, how does (he/she) ask about it? (Request for Information)
8	Rejecting	If (child's name) is at the table and you are giving (him/her) some food that (he/she) doesn't want, what is (he/she) likely to do?
9	Greeting	If a familiar person comes to your home, how does (child's name) usually react? (Greeting on Arrival)
10		What does (child's name) do when someone is going away? (Greeting on Departure)
11		If (child's name) is enjoying something, how does (he/she) show it? (Pleasure)
12	Self-Expression and Self-Assertion	If (child's name) is hurt or upset by something, how does (he/she) let you know? (Upset)
13		If you are trying to help (child's name) do something like get dressed and (he/she) wants to do it without help, how does (he/she) let you know? (Asserting Independence)
14	Naming	When (child's name) identifies something (he/she) recognizes, how does (he/she) give it a name?
15		If you are putting things away and (child's name) sees something (he/she) is interested in, what type of comment might (he/she) make? (Comment on Object)
16	Commenting	If (child's name) notices that something has gone from where (he/she) would usually expect it to be, what sort of comment would (he/she) make? (Comment on Disappearance)
17	Giving Information	If something happened while you weren't around (for example, something got broken, someone got hurt), how would (child's name) let you know about it?
<b>Questions of Response to communication</b>		
18	Gaining Child's Attention	If you want to get (child's name) attention, how do you do it?
19	Interest in Interaction	If you are sitting close to (child's name) and talking to (him/her) how does (he/she) generally respond?
20	Understanding of Gesture	If you point to something you want (child's name) to look at, what does (he/she) usually do?
21	Acknowledgement of Previous Utterance	When you are speaking to (child's name), how do you know that (he/she) realizes that you are speaking to (him/her)?
22		If you give (child's name) an instruction, such as 'Go and get your shoes', then how does (he/she) respond? (Response to Request for Action)
23	Understanding of Speaker's Intentions	If you ask (child's name) for information, for example, 'What have you been doing?' how is (he/she) likely to respond? (Response to Request for Information)
24	Anticipation	How does (child's name) react to something like 'Round and round the garden' or a favorite action-rhyme?
25	Responding with Amusement	What kind of things make (child's name) laugh?
26		a) If you have to say 'no' to (child's name) how does (he/she) usually respond?
27	Response to 'No' and Negotiation	b) If you say 'in a minute' how does (child's name) respond?
<b>Questions of Interaction and conversation</b>		
28	Participating in Interaction	When you and (child's name) are playing or interacting together, how does (he/she) take part?
29	Initiating Interaction	If (child's name) ever starts up a conversation or a little game with you, how does (he/she) do it?
30	Maintaining an Interaction or Conversation	When a conversation or game gets started, how does it keep going?

31	Conversational Breakdown	When a conversation between you and (child's name) gets into difficulties, what is the usual reason for it?
32	Conversational Repair	If (child's name) is trying to tell you something and you haven't understood, what does (he/she) do about it?
33	Request for Clarification	If (child's name) doesn't understand something that is said to (him/her), how does (he/she) show it?
34	Terminating an interaction	How does an interaction between you usually end?
35	Overhearing Conversation	How does (child's name) react to conversations that (he/she) overhears?
36	Joining a Conversation	If (child's name) ever tries to join in a conversation that other people are having, how does (he/she) go about it?
<b>Questions of Contextual Variation</b>		
37	Person	Are there people that (child's name) likes to be with or talk to more than others?
38	Situation	Are there situations in which (child's name) is more communicative?
39	Time	At what times of day is (child's name) most likely to be communicative?
40		a) What things does (child's name) like to talk about?
41	Topic	b) Are there times when (child's name) will ask questions about abstract ideas such as God, death, how the world began? What sort of things does he/she discuss?
42	Books as a Context for Communication	How does (child's name) respond to books?
43	Use of Language in Play	When (child's name) is playing, what kind of talking goes on or what kind of sounds is (he/she) making?
44	Peer Interaction	When (child's name) is with other children, how does (he/she) take part?
45	Compliance with Social Conventions	To what extent does (child's name) show an awareness of needing to be polite and fitting in with social conventions to do with talking?

Appendix B. The development of pragmatics for children of four to seven years.

Children characteristics	
Communicative functions	<p>Learns to express intentions in a variety of forms to fit the communicative needs of the listener and politeness constraints.</p> <p>Begins to use indirect requests.</p> <p>Uses language to:</p> <ul style="list-style-type: none"> <li>• gain and hold adults' attention, for example 'know what?'</li> <li>• give information;</li> <li>• seek information from other people;</li> <li>• give instructions to peers;</li> <li>• state rules;</li> <li>• negotiate and bargain;</li> <li>• express a range of feelings/emotions;</li> <li>• state beliefs and opinions;</li> <li>• taunt and threaten.</li> </ul> <p>Begins to tell jokes (punch line often misses the point).</p> <p>Uses narrative to report experiences, complain about others' actions and to tell simple stories.</p>

Response communication	to	Understanding of indirect requests developing. Beginning to rely less on context for understanding, for example, in classroom. Requests clarification when hasn't understood. Takes instructions from peers and responds to their questions. Becomes able to treat language as an object of analysis and to use language to talk about language (metalinguistic awareness). Enjoys jokes but doesn't fully understand play on words/puns. Listens to extended stories from books and can read simple ones.
Interaction conversation	and	Can initiate conversation by verbal strategies, for example, vocative + comment or question. Becomes more able to communicate with strangers. With peers, talk may alternate between private talk to self and talk to partner. Can participate in pretend conversations and switch from one speech code to another when taking stereotypical roles in play. Will respond to things overheard in other people's conversations. Rapid change of conversational topics. When child is not understood, tends to repeat without modification.

**A STUDY OF THE IMPACT OF MOTIVATION AND ATTITUDE ON SPEAKING IN ACADEMIC  
CONTEXTS: A CASE OF IRANIAN EFL UNIVERSITY STUDENTS**

**Hamideh Marzban, Ph.D. Candidate**

**ABSTRACT**

This study aimed at investigating the interlaced relationship between attitude and motivation on the one hand, and speaking within the context of Iranian EFL university students on the other hand. The participants of the study consisted of 65 freshmen majoring in English Translation, English Literature, and Electrical Engineering at the University of Isfahan. Three instruments were used to gather the needed data: Oxford Placement Test (OPT) for homogenizing the students in terms of their English proficiency level, two subscales of AMTB (Attitudes and Motivation Test Battery) designed by Gardner (1985), to measure students' motivation and attitude toward learning English, a kind of indirect interview with the 65 chosen students in order to assess their speaking ability. Analysis of the results revealed that there were significant differences between the students with positive attitude and those with negative attitude regarding their speaking ability; namely, the students with positive attitude had higher speaking scores than the students with negative attitude. Further analyses showed that there was a significant difference between the speaking scores of integratively-motivated students and the instrumentally-motivated ones. That is, integratively-motivated students scored higher than instrumentally-motivated ones on speaking test. Moreover, gender did not make any differences amongst EFL learners as far as attitude, motivation, and speaking ability were concerned.

**KEY WORDS:** attitude, motivation, speaking ability

**INTRODUCTION**

It is taken for granted that English is important due to its international nature. This conclusion logically leads to the acceptance that English should be taught around the world. The universal nature of this trend can be seen in all industrial and developing countries. Asia is not an exception, as English is a required topic of study in high schools and is often used in university entrance exams. It is acknowledged in academic circles that English training is a prerequisite for a nation's industrial development. There are far more non-native English learners than native speakers-the underlying assumption that English has become an international language. In being an international language, the motivations for studying English may be quite different in the international context of a person joining a native English speaking culture.

If we take a look at the situation in Iran, English is taught as a foreign language from guidance school. That is, at least six years of compulsory EFL instruction for all students. With all the hard work we put into teaching English, many of the students will not be able to acquire the skills they need to communicate. Nakanishi (2002) believes that motivation and attitude to learn have something to do with this situation. He states that motivation and attitude determine the degree of effort one puts into foreign/second language learning. The more motivation one may have, the more efforts s/he tends to put into learning the language, and this could lead to success. Moreover, a learner with positive attitude would outperform the one with negative attitude as far as learning a foreign/second language is concerned.

Identifying factors that influence student learning in the classroom continues to be an important objective for teachers and administrators at all levels. Many researchers have investigated a multitude of instructional variables that impact students' motivation and attitude to learn. There is considerable interest today in the notions of

motivation and attitude to learn a foreign/second language, but it was not always this way. In 1956 when R.C. Gardner and Wallace Lambert began their research, it was generally agreed that learning another language involved intelligence and verbal ability. Concepts like attitude, motivation and anxiety were not considered to be important at all. Today, much of this has changed, and one sometimes gets the impression that affective variables are the only important factors involved in foreign/second language learning.

Most researchers and educators would agree that motivation and attitude are very important, if not the most important factors in language learning, without which even gifted individuals cannot accomplish long-term goals, whatever the curricula and whoever the teacher may be. Thus the concepts language learning motivation and attitude have been accepted by teachers and researchers as the two of the key factors influencing the rate and success of foreign/second language learning, often compensating for deficiencies in language aptitude and learning. It could be said that all other factors involved in L2 acquisition presuppose motivation and attitude to some extent.

In fact, motivational strategy for learning is an important aspect of students' academic performance in the classroom, especially for the college students. Despite much excellent research during the last two decades there is still a great deal we do not know about motivation and attitude. Many researchers consider motivation and attitude as the main elements that determine success in developing a foreign/second language, believing that these factors determine the extent of active, personal involvement in a foreign/second language learning.

For language learners, motivation and attitude are important factors for the vital reason that the more motivated learners will always surpass the unmotivated learners in performance and outcome. Furthermore, the learners with positive attitude will also outperform those with negative attitude regarding foreign/second language learning. People have an innate need to be competent and effective in their work, and motivation and attitude are key factors in helping them reach their goals. Moreover, learners who leave full-time language study motivated about their English communicative ability are more likely to continue acquiring the language, hence becoming lifelong learners.

The study of affect has thus become increasingly popular since 1980s and from then on it has been considered in the language teaching/testing domain. Affective variables related to second or foreign language learning include emotions, self-esteem, risk-taking, inhibition, anxiety, empathy, extroversion and introversion, motivation and attitude. However, in this study two of the affective variables; that is, motivation and attitude have been focused on and their relationship with speaking in a foreign language is investigated.

## REVIEW OF THE LITERATURE

Recent research has shown special interest in determining what distinguishes successful from unsuccessful language learners, particularly their use of modifiable second language (L2) variables, in the hope that such information can be passed onto less successful ones so as to improve their learning abilities. Prominent among these modifiable L2 variables are L2 motivation and attitude toward the second / foreign language. There has been a great deal of research on the role of attitudes and motivation in second language learning. The overall findings show that positive attitudes and motivation are related to success in second language learning (Gardner1985). Some would argue that in the relationship between attitude and second language acquisition, it cannot be definitely proved that one causes the other, but only that the sometime occur together (Skehan, 1989). Evidence does exist, however, that points to a casual relationship. After presenting evidence from Oller and other researchers who criticize Gardner's claims of an attitude/acquisition connection, Skehan (1989) goes on to argue that the weight of evidence seems to be on Gardner's side that attitude and motivation truly do appear to be casual factors of SLA based on empirical data. Gass and Slinker (2001) agree: "It makes sense that individuals who are motivated will learn another language faster and to a great degree. Furthermore, numerous studies have provided statistical evidence that indicates motivation is a predictor of language-learning success" (p. 349). They then proceed to validate attitude as one cause of motivation (Gass & Slinker, 2001). Gardner (1991) presents a logical argument as well- individually, the above-listed correlations of specific behaviors in language learning and attitude could probably be explained, but, taken as a whole, they constitute a formidable case for a causal relationship (p.251).

According to Noels (2001), it is generally accepted that motivation to learn an L2 is at least as important as language aptitude for successful acquisition of such language. An example is a study conducted by Kiss & Nikolov (2005) in which the researchers explored the relationship between the aptitude scores of 419 Hungarian primary-school children on English proficiency tests and a designated measure of their motivation. Based on multiple -regression analysis, the results showed that the variable of language aptitude was responsible for over 20% of the variation in English language performance, while motivation was also significant as it explained about 8% of the variation. As such, the researchers suggested that student's motivation can be raised by improving the quality of the teaching and

learning situation. Noels et al. (2001) explains that scholarly interest in L2 motivation can be traced back well over forty years. Since then, several models of second language motivation have been proposed; each extending our understanding of L2 motivation in its own way. In his influential definition of language learning motivation, Gardner (as cited by Noels et al., 2001) maintains that motivations basically the extent of the effort an individual is willing to exert to achieve the goal of learning a language because of a desire to do so and of favorable attitudes toward such language. Noels et al. (2000) states that several goals, or orientations, have been proposed, but two have received the most empirical attention. The first is *instrumental* orientation, which tackles reasons for language learning that emphasize the pragmatic consequences of L2 learning, such as job-hunting or improving one's education. The second is *integrative* orientation, which refers to reasons relating to interaction and communication with members of the second language community for social-emotional purposes.

According to Dörnyei (2005), the first important point to emphasize when exploring the field of second language motivation is that learning an L2 is different from learning other school subjects. The author points out that while an L2 is a "learnable" subject in that discrete elements of the communication code - grammatical rules and lexical items - can be taught explicitly, it is socially and culturally bound; making language learning a deeply social event that requires the incorporation of a wide range of elements of the L2 culture. For example, El-Dash & Busnardo (2001) presents the results of a study of stereotypical perceptions of 164 Brazilian university students studying diverse foreign languages. Socio-cultural stereotypes and motivation were investigated using "bipolar adjective" scales paired in a Likert-type format. The results showed that the students tended to have relatively positive stereotypes of the native speakers of the L2 and were, in most cases, motivated to learn it.

Yet another study which emphasizes the effect of the L2 culture on learner motivation and progress is that of Sasaki (2004). Using multiple quantitative and qualitative data sources, this study investigated possible changes in Japanese students' writing development. The results revealed that over the observation period, all of the students were able to improve their English proficiency, composition, and fluency; and that the experiences of the ESL overseas students were quite helpful in improving their writing strategy, motivating them to write better compositions. Masgoret & Gardner (2003), undertook a metaanalysis of investigating the relationship of L2 achievement to the socio-educational model. In addition, these relationships were examined using the Attitude/Motivation Test Battery and other motivational measures. According to the authors, the results showed that, "the correlations between achievement and motivation are uniformly higher than those between achievement and integrativeness, attitudes toward the learning situation, integrative orientation, or instrumental orientation.

In the same vein, Dörnyei (2005) mentions a recent extension of motivation research. Having a considerable theoretical and practical potential, this extension covers the study the L2 speakers' willingness to engage in the act of L2 communication. As MacIntyre et al. (2002) explain, all individuals display consistent tendencies in their predisposition toward, or away from, communicating, when one is given the choice. Because of its nature, the willingness to communicate (WTC) construct seems to lend itself to being used to examine specific learning contents. Yashima (2002) has used the WTC construct and Gardner's socio-educational model to investigate the relationship between L2 learning and L2 communication variables among Japanese learners of English. Using structural equation modeling analysis, the author reached the conclusion that motivation appears to affect self-confidence in L2 communication which, in turn, may lead to a willingness to communicate in the target L2.

Furthermore, Csizer and Dörnyei(2005) conclude attitude as an important factor in language learning in their study on the internal structure of language learning motivation and its relationship with language choice and learning effort, which was put forward previously as the Process Model of L2 Motivation (Dörnyei and Ottó 1999). There is a great amount of research on attitudes towards different languages (Marley 2004, Balcazar 2003, Villa 2002, Malallah 2000), towards different varieties of English and other languages (Karstadt 2002, Zhou 2002, Assaf 2001). Different aspects of language attitudes have also been studied such as the relation between attitudes and motivation (Donitsa-Schmidt et al.2004, Bernaus et al. 2004, Williams et al.2002), the relationship between attitudes and learning strategies (Gan 2004), the relationship between attitude and level of achievement (Graham 2004), beliefs and attitudes about target language use, first language use and anxiety (Levine 2003), attitudes to language and language learning at secondary and tertiary levels (Yang and Lau 2003), attitudes towards English- language usage among peers (White 2002), the relationship between negative attitudes towards non-native speakers and poor comprehension of those speakers (Lindemann 2002), attitudes towards debatable usages between teachers and their

students (Lee 2001a), attitudes of native speaker teachers and non-native speaker teachers towards disputable usages (Lee 2001b), the relationship between attitudes towards ideology, culture, people, language and factors affecting attitude (Flaitz1988).

Moreover, similar studies have been conducted in Iran. In an experiment (Sedaghat 2001) ,investigated the effects of attitude, motivation, and level of proficiency on the use of listening comprehension strategies by Iranian female EFL students. The subjects were 109 university students from both Shiraz Islamic Azad University and Shiraz University majoring n Teaching English and English Literature. The findings of the study revealed that students with positive attitude used metacognitive, memory, cognitive, compensation, and social strategies more than those having negative attitude. Regarding the affective strategies, none of the two groups showed any significant difference. In another study, (Sadighi & Zarafshan 2006), explored the effects of attitude, motivation, and years of study on the use of language learning strategies by Iranian EFL university students. The participants of the study consisted of 126 freshmen and seniors majoring in English Translation and Teaching English at Shiraz Islamic Azad University. After the analysis of the results, attitude proved to influence the use of language learning strategies (LLSs) significantly. That is, learners with positive attitude used LLSs more frequently than those with negative attitude. Regarding the factor of motivation, integratively-motivated students employed more strategies than instrumentally-oriented ones. Furthermore, seniors showed greater use of LLSs than freshmen. Still in another study, (Sadeghi 2004), investigated the motivation of Persian learners of English at Isfahan University. Based on the results, he concluded that the success or failure of the EFL program would depend on a variety of factors such as political, economic, cultural, educational, social, family, learner and the teacher, among which affective factors and in particular motivation and attitude play important roles. Taking these points into consideration, the present study aims to investigate the interlaced relationship between attitude, motivation and speaking within the context of Iranian EFL university students. Moreover, it seeks to find out which type of motivation (instrumental or integrative) is superior as far as second language acquisition and particularly face to face communication is concerned.

## PURPOSE AND RESEARCH QUESTIONS

The present study seeks to explore the relationship between attitude, motivation and, speaking within the context of EFL students in Iran. Furthermore, it aims to investigate the two types of motivation (integrative and instrumental) and their interlaced relationship to speaking in a foreign language. In other words the specific intent of this study is to determine whether there are any significant differences between integratively-motivated students and instrumentally-motivated students regarding their success in speaking a foreign language. Moreover, it intends to find out whether there are any differences between students with positive attitude and those with negative attitude concerning their speaking ability.

Considering the aforementioned problems, the present study was an attempt to provide plausible answers to the following research questions:

- 1) Are there any differences between students with positive and those with negative attitude regarding their speaking ability?
- 2) Are there any differences between integratively-motivated and instrumentally-motivated learners concerning their speaking ability?
- 3) Are there any differences between males and females' type of attitude when it comes to learning a foreign language?
- 4) Are there any differences between males and females' type of motivation concerning their foreign language learning?
- 5) Are there any differences between males and females regarding their speaking ability?

## METHODOLOGY

### *Participants*

The population for this study included 32 freshmen from both sexes (male and female) majoring in English Literature and English Translation and 50 freshmen majoring in electrical Engineering which were selected randomly amongst all the English freshmen at Isfahan University. The rationale behind choosing this latter group was just selecting students from majors other than English. Since most of the English students enjoyed positive attitude, for gathering a group with negative attitude, those engineering students were also selected. Finally, having administered the Oxford Placement Test, 65 students were chosen as the participants of the study.

### *Instrumentation*

For the purposes of the study the following instruments were used:

(1) Oxford Placement Test (OPT) was administered to guarantee the subjects homogeneity in terms of their English proficiency level. In fact, it was used to exclude from the study those students whose English proficiency level differed significantly from that of the others and to neutralize the subject selection effect.

(2) Two subscales of AMTB (Attitudes and Motivation Test Battery) designed by Gardner (1985) were used to measure students' attitudes toward learning English and their interest in foreign languages; with each subscale containing a number of likert- type items(see appendix B); that is, 16 items for integrative motivation, 12 items for instrumental motivation, 5 items for positive attitude and finally 5 items for negative attitude. Furthermore, this questionnaire was translated into Persian and piloted prior to the main study. An Alpha Cronbach method was applied to guarantee the reliability of the given questionnaire. The results indicated reliability index of 0.71 for the questionnaire. Therefore, it was acceptable for being used in the study.

The Attitude/Motivation Test Battery is a research instrument which has been developed to measure the major affective components shown to be involved in second / foreign language learning. Its development follows more than 20 years of research and its validity and reliability was estimated by Gardner and Smythe in 1975. Earlier research with this test battery by Gardner and Smythe has showed reliability estimate of .91 and its validity regarding the three types of validity (content validity, predictive validity and construct validity) proved to be high (1975a). In addition, the internal consistency estimate of reliability for the modified questionnaire was calculated, and Cronbach's Alpha was 0.7 in a study by ( Moiiinvaziri 2004) in Iran. In the same vein, the reliability of the questionnaire was estimated (in the pilot study) making use of an Alpha Cronbach method in the specific context of the study( $r=0.71$ ). All the items are measured using a Likert scale type.

As it was mentioned before, in this questionnaire there are two separate parts for integrative and instrumental motivation. That is, by considering the students' answers, it is possible to find out which student is mostly instrumentally-motivated and which one is mostly integratively-motivated. However, it cannot be said that instrumental orientation and integrative orientation are the two ends of a continuum. Therefore, it can be regarded as the limitation of this study. Furthermore, the parts related to negative attitude and positive attitude are also distinct; that is, separate parts are devoted to both positive and negative attitudes.

(3) A kind of indirect interview was used with the 65 chosen students in order to assess their speaking ability. (Speaking ability will be assessed based on some already established criteria mentioned in the book written by Farhadi , Birjandi and Jafarpour such as accent, structure, vocabulary, fluency and comprehension) and also Weir (1993). For ensuring reliability, two other raters (M.A students of Teaching English) assessed the recordings. (A sample of the questions which were asked from the students and the criteria for assessing speaking ability were presented in appendices C & D).

### ***Procedures***

After randomly choosing the students, Oxford Placement Test (Allen, 1992) was administered in order to decide on the proficiency level of the students. The test contained 100 items. To score the test, correct points were added up to a total sum and incorrect ones were ignored. There was no negative point for the wrong answers or for the items not answered at all (see appendix A for OPT). Having obtained the OPT results, the researcher decided to choose those participants whose score range fell one standard deviation above and below the mean. This being so, 65 students met this homogeneity criterion and were thus, selected to serve as the participants of this study. To decide on the type of the participants' motivation and attitude two subscales of AMTB (Attitudes and Motivation Test Battery) designed by Gardner (1985) were used. The questionnaire was translated into Persian and then given to the students (see appendix B). Before the administration of the questionnaire the participants received the necessary information about the purpose of the study and how to complete the questionnaire. The participants were free to ask questions or consult with each other while completing the questionnaire. In addition to the administration of the questionnaire, casual interviews were also held with the students whenever possible. The items of this questionnaire then were analyzed and tabulated. The last test was a kind of indirect interview which was administered by the researcher. Four questions about common topics in daily conversations were given to the students, e.g. talk about yourself. What would you like to do in future? (see appendix C). The questions were asked from the students one by one by the researcher. The participants spoke through the earphones after hearing each question within a time limit of three minutes while their voices were recorded. Totally, the speaking test took twenty minutes. First of all a friendly

atmosphere was created, then oral instruction was given in Persian. This method was used for the sake of ensuring its practicality. After that, the results were analyzed by two other M.A students who were experienced and fluent in English and then the average was calculated. Besides, inter-rater reliability was also estimated (0.8). Scoring was based on analytic speaking criteria introduced by Weir (1993) and Farhady, Jafarpoor, & Birjandi (1999)( see appendix D for the two of them). Each of those criteria was divided into six levels (from the weakest to the best) and a number from 1 to 6 was considered for each. Judges listened to the recorded cassettes and graded each student's performance according to the aforementioned scales. All the scores given by the judges were added up and the average for each student was tabulated. For all the above tests students were given the necessary instructions and the importance of those tests was explained to them.

## RESULTS

The findings of the research have been presented based on the stated research hypotheses. In order to analyze the data in addition to the statistical indexes like frequency, percentage, mean and standard deviation, an inferential statistics method series of independent samples t-test- has also been used. The raw data obtained from AMTB questionnaire and speaking test were submitted to SPSS program and the subsequent computations were made.

### *Investigating the Descriptive Statistics of the Sample Group*

In this section the descriptive characteristics of the sample group based on gender variable have been investigated (table 1).

*Table 1: Frequency Distribution of the Sample Group Based on Gender*

	Frequency	Percent	Valid Percent	Cumulative Percent
Valid Male	30	46.2	46.2	46.2
Female	35	53.8	53.8	100.0
Total	65	100.0	100.0	

*Figure 1: Percent Distribution of the Sample Group Based on Gender*

### *Results*

In order to investigate the aforementioned research questions, seven independent samples t-tests were conducted.

#### *Question 1*

- 1) Are there any differences between students with positive and those with negative attitude regarding their speaking ability?

*Table 2: Descriptive Statistics of Types of Attitude*

Attitude	N	Mean	Std. Deviation	Std. Error Mean
Speaking Positive	46	4.6413	.7428	.1095
Ability Negative	19	3.7526	.8422	.1932

Table 3: Independent- Sample t- test for Types of Attitude

Table 8: Independent Sample t-Test for 2 types of Animals						
		Levene's Test for Equality of Variances		t-test for Equality of Means		
		F	Sig.	t	Df	Sig. (2-tailed)
Speaking Ability	Equal variances Assumed	.027	.870	4.218	63	.000
	Equal variance not assumed			4.001	30.180	.000

Based on the table, in the independent-samples t-test output box, the results of Levene's test for the equality of variances are presented (Table 3.). Levene's test shows whether the variance of scores for the two groups is the same. The Sig. value of Levene's test is .870, which is larger than .05, so in Table.3., the first line of the table which refers to Equal variances assumed should be used. Under the section labeled t-test for equality of means, the column labeled Sig. (2-tailed), shows the value of .000. It means that there were significant differences between the speaking scores of the students with positive attitude and those with negative attitude. Investigating the means of the two groups showed that the students with positive attitude had higher speaking scores than the ones with negative attitude. Therefore, the first research hypothesis was rejected.

## Question 2

- 2) Are there any differences between integratively-motivated and instrumentally-motivated learners concerning their speaking ability?

Table 4: Descriptive Statistics of Motivational Orientations

Motivation	N	Mean	Std. Deviation	Std. Error Mean
Speaking Ability	49	4.5102	.7935	.1134
Integrative	16	3.9875	.9899	.2475
Instrumental				

Table 5: Independent Sample t-test for Motivational Orientations

		Levene's Test for Equality of Variances		t-test for Equality of Means		
		F	Sig.	t	df	Sig. (2-tailed)
Speaking Ability	Equal variances assumed	2.195	.143	2.150	63	.035
	Equal variances not assumed			1.920	21.658	.068

Based on the results-shown in Table 5, the Sig. value of Leven's test is .143, which is larger than .05, so the first line of the table which refers to Equal variances assumed should be used. Under the column labeled t-test for equality of means, the column labeled Sig. (2-tailed) shows the value of .035. It means that there were significant differences between the speaking scores of the students with integrative motivation and those with instrumental motivation.

Investigating the means of the two groups showed this fact that the speaking scores of integratively-motivated students were higher than those of instrumentally-motivated students. In this way, the second hypothesis was also rejected.

### Question 3

- 3) Are there any differences between males and females' type of attitude when it comes to learning a foreign language?

Table 6: Descriptive Statistics of Positive Attitude

Gender	N	Mean	Std. Deviation	Std. Error Mean
Positive Male	30	20.9667	3.5475	.6477
Attitude Female	35	21.3429	3.8649	.6533

Table 7: Independent Sample t-test for Males' and Females' Positive Attitude toward English

		Levene's Test for Equality of Variances		t-test for Equality of Means		
		F	Sig.	t	df	Sig. (2-tailed)
Positive Attitude	Equal variances Assumed	.140	.710	-.406	63	.686
	Equal variances Not assumed			-.409	62.684	.684

As the results indicate, the observed Sig. value of Levene's test is .710, and Sig. (2-tailed), shows the value of .686. It means that there were no significant differences between the mean scores of males' and females' positive attitude. That is, the extent of males' and females' positive attitude was approximately the same.

Table 8: Descriptive Statistics of Negative Attitude

Gender	N	Mean	Std. Deviation	Std. Error Mean
Negative Male	30	10.1667	5.9543	1.0871
Attitude Female	35	10.4000	6.7658	1.1436

Table 9: Independent Sample t-test for Males' and Females' Negative Attitude toward English

		Levene's Test for Equality of Variances		t-test for Equality of Means		
		F	Sig.	t	df	Sig. (2-tailed)
Negative Attitude	Equal variances Assumed	<b>.499</b>	<b>.483</b>	<b>-.146</b>	<b>63</b>	<b>.884</b>
	Equal variances Not assumed			<b>-.148</b>	<b>62.948</b>	<b>.883</b>

Based on the results, the observed Sig. value of Levene's test is .483. The Sig. (2-tailed) shows the value of .884. That is, there were no significant differences between the mean scores of males' and females' negative attitude. That is, the extent of males' and females' negative attitude was almost the same. In this way, the third hypothesis was confirmed.

**Question 4**

- 4) Are there any differences between males and females' type of motivation concerning their foreign language learning?

*Table 10: Descriptive Statistics of Integrative Motivation*

Gender	N	Mean	Std. Deviation	Std. Error Mean
Integrative Male	30	53.5000	14.1951	2.5917
Motivation Female	35	55.9143	10.8367	1.8317

*Table 11: Independent Sample t-test for Males' and Females' Integrative Motivation*

		Levene's Test for Equality of Variances		t-test for Equality of Means		
		F	Sig.	t	df	Sig. (2-tailed)
Integrative Motivation	Equal variances assumed	7.384	.008	-.777	63	.440
	Equal variances Not assumed			-.761	53.766	.450

As it is shown in the table, the Sig. value of Levene's test is .008, and Sig. (2-tailed) shows the value of .440. It means that there were no significant differences between the mean scores of males' and females' integrative motivation. That is, the extent of males' and females' integrative motivation was almost the same.

*Table 12: Descriptive Statistics for Instrumental Motivation*

Gender	N	Mean	Std. Deviation	Std. Error Mean
Instrumental Male	30	43.1667	5.4903	1.0024
Motivation Female	35	43.4286	4.7914	.8099

*Table 13: Independent Sample t-test for Males' and Females' Instrl Motivation*

		Levene's Test for Equality of Variances		t-test for Equality of Means		
		F	Sig.	t	df	Sig. (2-tailed)
Instrumental Motivation	Equal variances assumed	.586	.447	-.205	63	.838
	Equal variances not assumed			-.203	58.102	.840

Based on the results, the Sig. value of Levene's test is .447, and the observed Sig. (2-tailed) depicts the value of .84. That is, there were no significant differences between the mean scores of males' and females' instrumental motivation. In other words, the extent of males' and females' instrumental motivation was almost the same. In this way, the forth hypothesis was also confirmed.

#### Question 5

5) Are there any differences between males and females regarding their speaking ability?

Table 14: Descriptive Statistics for Speaking Ability

Gender	N	Mean	Std. Deviation	Std. Error Mean
Speaking Ability Male	30	4.2700	.9315	.1701
Female	35	4.4771	.8110	.1371

Table 15: Independent Sample t-test for Males' and Females' Speaking Ability

#### Independent Samples Test

			Levene's Test for Equality of Variances		t-test for equality of means		
			F	Sig.	T	df	Sig. (2-tailed)
Speaking assumed	Equal variances	Ability	1.694	.198	-.959	63	.341
Equal variances Not assumed					-.948	58.031	.347

As it is seen, the observed Sig. value of Levene' test is .198, and Sig. (2-tailed), shows the value of .341. It means that there were no significant differences between males' and females' speaking ability. In other words, the extent of males' and females' speaking ability was approximately the same. Therefore, the fifth hypothesis was also confirmed. Taking these points into consideration it was found that gender indeed, does not make any changes amongst EFL learners as far as attitude, motivation, and speaking ability are concerned.

## DISCUSSION

The first research question was whether there are any significant differences between students with positive attitude and those with negative attitude regarding their speaking ability. The means of the scores and the t-test revealed that at  $P < 0.05$  level, the t value shows a significant difference between the speaking scores of students with positive attitude and those with negative attitude. Having investigated the means of the two groups indicates that the Sig. value was 0.00. It means that students with positive attitude have got higher scores on speaking test than the ones with negative attitude.

In the same vein Munoz & Tragan (2001) obtained similar results in their study in which they analyzed the answers to a questionnaire in which learners of different age-groups and different proficiency levels were asked about their attitudes and types of motivation towards the L2 (EFL). First, motivation was seen to increase with school experience. Second, the younger learners showed more intrinsic types of motivation, while the older groups showed more extrinsic types and a preference for an instrumental type of motivation. That is, while the younger students did not, as a group, present higher motivation than the older students, they had a qualitatively different type of motivation. Third, significant statistical relations were shown between positive attitude towards language learning and achievement in some language tests, but not all. Significant relations were also found between achievement at the first measurement time and positive attitudes at the second in those students who were traced longitudinally, raising the issue of the directionality of the relation between motivation and second language achievement.

Still, recognizing the importance of student attitudes and motivation, several surveys have recently been conducted in Japan concerning this topic. Berwick and Ross' (1989) longitudinal study of Japanese college freshmen examined the correlation between learner positive attitude and motivation with proficiency in English. The results of the study showed that motivation to "learn English" peaked in the last year of high school and then dropped upon entering college. The authors attribute this drop to the college entrance exam system and to colleges themselves. They state that once the entrance exams are over, "there is very little to sustain this kind of motivation, so the student appears in freshmen classrooms as a kind of timid, exam-worn survivor with no apparent academic purpose at university" (p. 206). However, they also found that positive attitude and high motivation contributes to the task of second/foreign language acquisition to a great deal.

The obtained results of this study is also in line with the obtained findings of the study carried out by Sadighi and Zarafshan (2006) in which they explored the fact that learners with positive attitude used language learning strategies more frequently than those with negative attitude.

The discussion now turns to the second question; namely, whether there are any significant differences between integratively-motivated and instrumentally-motivated learners concerning their speaking ability. Based on the results, it was shown that at  $P < 0.05$  level, the Sig. value was 0.03, representing that there is a significant difference between the speaking scores of integratively-motivated learners and those of instrumentally-motivated ones. That is, integratively-motivated learners have higher scores on speaking test than the instrumentally-oriented ones. This result shows parallelism with the study of (Gass & Selinker, 2001; Lambert, 1952 & 1972). This study supports the findings in these studies, in that integrative motivation is superior to instrumental motivation for predicting the success of second/foreign language learning. In other words, success in a foreign/second language is likely to be lower if the underlying motivational orientation is instrumental rather than integrative.

In line with the aforementioned outcomes, Sadighi and Zarafshan (2006), found out that regarding the factor of motivation, integratively-motivated students employed more strategies than instrumentally-oriented ones.

The third research question was: Are there any differences between males and females as far as attitude, motivation, and speaking ability are concerned? Based on the results of this study it was found that there are no significant differences between males and females regarding the mentioned variables (attitude, motivation, and speaking ability).

The findings of this study are also in parallel with the ones obtained in a study carried out by Fazlul in 1989. In his study he investigated the interaction of attitudes, motivation and achievement in English as a foreign language in a new social and monolingual setting. More specifically, the study examined the relationship between Bangladeshi high school students' motivational orientation and their achievement in English as a foreign language. The study further investigated the possible effect of gender and academic major on students' attitudes and motivation and examined the influence of parents and teachers on students' attitudes and motivation to learn English.

The data for the investigation were gathered from 240 tenth grade students randomly selected from high schools in Dhaka City, Bangladesh using a modified version of the Attitude/Motivation Test Battery developed by Gardner (1985b) and an Achievement Test prepared by an English Language Teaching Task Force set up by the Government of Bangladesh in 1975.

Analysis of the data revealed that the students in the study were instrumentally oriented towards learning the English language and that an instrumental orientation was a better predictor of achievement than an integrative orientation. Achievement in English was facilitated by favorable attitudes towards and a strong motivation for learning the language. The results further showed that attainment in English was related significantly and positively to students' towards the learning situation. The sex of the learners was not found to have a significant effect on either attitudes/motivation or achievement. Although the academic major did not have any significant effect on students' attitudes and motivation, it affected their attainment significantly.

## CONCLUSIONS

The present study was carried out with the intention of investigating the interlaced relationship between attitude, motivation and speaking within the context of Iranian EFL university students. Moreover, it sought to find out which type of motivation (instrumental or integrative) is superior as far as face to face communication is concerned. The results of this study indicated that first, students with positive attitude have got higher scores on speaking test than the ones with negative attitude. Second, integratively-motivated learners have higher speaking scores than instrumentally motivated ones. Third, there are not any significant differences between males and females as far as attitude, motivation, and speaking ability are concerned.

## IMPLICATIONS OF THE STUDY

The results of the present study have led to the following pedagogical implications:

- 1) Teachers should promote the students' positive attitude toward academic English learning. They should create a lively, challenging and non-threatening atmosphere in the classroom where the affective barriers are kept at minimum.
- 2) Teachers should increase the students' positive attitude to the English culture through any possible medium such as promoting students' interaction with the native speakers.
- 3) Language teachers have an important role in maintaining and enhancing the students' motivation and attitude.
- 4) Teachers should use the best of the students' high motivation in order to contribute to the success in language learning.
- 5) Since attitude and motivation are interwoven, any kind of boost in attitude will increase students' motivation in learning English.
- 6) It is essential to make the students sure that it is not just the place of study and cognitive factors but affective factors such as high motivation (especially integrative motivation) and positive attitude that play an important role in language learning and in particular acquiring a high command in speaking.

## LIMITATIONS OF THE STUDY

This study faced some limitations throughout the accomplishment of different phases:

The first limitation of this study seems to be its limited number of participants. If more subjects had taken part in the study, the results would have been more reliable and closer to reality.

The second limitation that restricts the generalizability of the findings is that although the participants were supposed to answer the questions quite carefully and honestly, while answering the questions, they might not have taken the study seriously and they may have answered without thinking thoroughly, which may also have influenced the results.

The third limitation was the questionnaire used in this study. Different questionnaires might lead to different results. The Oxford Placement Test was not verified in terms of reliability for this particular context as it is widely used in many situations. Any how it can be regarded as another limitation.

The last point to be mentioned here is the difficulty of evaluation along with generalization of findings in human issues. One can hardly claim that all the variables have been controlled throughout the study, since some uncontrolled variables like fatigue, unwillingness to participate, and the affective mood may have affected the obtained results.

## SUGGESTIONS FOR FURTHER RESEARCH

This study aimed to answer a limited number of questions raised previously. This is while many other questions may be raised as the following in relation with the findings of this study:

- 1) This study investigated the impact of attitude and motivation on speaking in a foreign language. Other studies can focus on the impacts of motivation and attitude on other skills including listening, reading and writing.
- 2) The present study focused on the impact of attitude and motivation on speaking in a foreign language. Similar studies can be conducted to examine the impacts of other personality factors, namely, anxiety, self-esteem, inhibition, risk-taking, empathy, extroversion, introversion on speaking.
- 3) Further studies can investigate the impacts of the mentioned personality factors (anxiety, self-esteem, inhibition, risk-taking, empathy, extroversion, and introversion) on other skills such as listening, reading and writing.

## Appendix A

### Oxford Placement Test (OPT)

#### Appendix A. Oxford Placement Test © Dave Allen 1992

**First Name** .....

**Surname** .....

**Score** .....

=====

**Look at these examples. The correct answer is underlined.**

a. In warm climates people (like, likes, are liking) sitting outside in the sun.

b. If it is very hot, they sit (at, in, under) the shade.

**Now the test will begin. Underline the correct answers.**

1. Water (be freezing, is freezing, freezes) at a temperature of >0°C.

2- In some countries (there is, is, it is) dark all the time in winter.

3- In hot countries people wear light clothes (for keeping, to keep, for to keep) cool.

4- In Madeira they have (the good, good, a good) weather almost all year.

5- Most Mediterranean countries are (more warm, the more warm, warmer) in October than in April.

6- Parts of Australia do not have (the, some, any) rain for long period.

7- In the Arctic and Antarctic (it is, there is, it has) a lot of snow.

8- Climate is very important in (most of, most, the most) people's lives.

9- Even now there is (little, few, less) we can do to control the weather.

10- In the future (we'll need, we are needing, we can need) to get a lot of power from the sun and the wind.

11- Pele is still perhaps (most, the most, the more) famous footballer in the world.

12- He (had been, is, was) born in 1940.

13- His mother (not want, wasn't wanting, did not want) him to be a footballer.

14- But he (used, ought, has used) to watch his father play.

15- His father (made him to, made him, would make him to) practice every day.

16- He learned to use (or his left foot or, and his left foot and, both his left foot and) his right.

17- He got the name Pele when he (had only ten years, was only ten, was only ten years).

18- By 1956 he (has joined, joined, had joined) Santos and had scored in his first game.

19- In 1957 he (has been picked, was picked, was picking) for the Brazilian national team.

- 20- The World Cup Finals were in 1958 and Pele was looking forward (to play, to playing, to be playing).  
21- But he hurt (this, the, his) knee in a game in Brazil.  
22- He thought he (is not going, couldn't, was not going to) be able to play in the finals in Sweden.  
23- If he (had not been, were not, would not be) so important to the team, he would have been left behind.  
24- But he was (a such, such a, a so) brilliant player, they took him anyway.  
25- And (even though, even so, in spite of) he was injured he helped Brazil to win the final.  
26- The history of the World Cup is (quite, a quite, quiet) short one.  
27- Football (has been, is being, was) played for  
28- (above, over, more than) a hundred years, but the first World Cup  
29- competition (did not be, was not, was not being) held until 30- 1930. Uruguay (could win, were winning, had won) the Olympic football  
31- Final in 1924 and 1928 and wanted (be, being, to be) World Champions for the third time.  
32- Four teams entered from Europe, but with ( a little, a few, little) success.  
33- It was the first time (which, that, when) professional teams  
34- (are playing, would play, had played) for a world title.  
35- It wasn't until four years (later, more, further) that a  
36- European team succeeded (to win, in winning, at winning)  
37- for (the, a, its) first time. The 1934 World Cup was  
38- again won by (a, the, one) home team  
39- (what, this, which) has been the case several times since  
40- then. The 1934 final was (among, between, against) two  
41- European teams, Czechoslovakia and Italy. Italy (which, that, who) won  
42- went on (to win, winning, to have won) the 1938 final . Winning  
43- successive finals is something that (is not, was not, has not been) achieved  
44- again until Brazil did (these, them, it) in 1958 and 1962. If Brazil  
45- (would have won, would win, had won) in 1966, then the  
46- authorities would have needed to (have, let, make) the original World Cup replaced.  
47- But England stopped the Brazilians (to get, getting, get) a third successive win. And England player  
48- Geoff Hurst, scored three goals in the final and won it almost (by his own, on himself, by himself).  
49- 1966 proved (being, as being, to be) the last year that England  
50- (would, will, did) even qualify for the final till 1982, though they got in as winners in 1970.

#### **Grammar Test Part 2**

- 51- Many (persons, people, peoples) nowadays believe that everyone should learn to use computers.  
52- The Majority of Children in the UK (have, has, are having) access to a microcomputer.  
53- There are more computers per head in England than (anywhere else, somewhere else, anywhere other) in the world.  
54- Learning a computer language is not the same (as, like, than) learning a real language.  
55- Most people start off 'basic', (who, what, which) is the easiest to learn.  
56- Children seem to find computers easy, but many adults aren't used to (work, the work, working) with micro technology.  
57- There are not (no, any, some) easy ways of learning to program a computer.  
58- The only way to become really proficient is to practice a lot (on your own, by your own, on yourself).  
59- You can pick up the basics quite quickly if you (want to, would, are willing to) make an effort.  
60- Most adults feel it would be easier if only they (would have started, would start, had started) computer studies earlier.  
61- Some people would just (rather, prefer, better) not have anything to do with computers at all.  
62- A lot have resigned themselves to never even (know, known, knowing) how a computer works.  
63- Micro technology is moving so fast that hardly (anybody, nobody, no one) can keep up with it at all.  
64- It's no use (in trying to, to try, trying) to learn about computers just by reading books.  
65- Everyone has (difficulty in learning, difficulties to learn, it difficult to learn) if they cannot get 'hands-on' experience.
- =====

Below is a letter written to the *advice* column of a newspaper. Underline the correct answer.

Dear Merge,

66- (I am writing, I will write, I should write) to you because I  
67- (am not knowing, don't know, know not) what to do. I am twenty-six and a teacher at  
68- a primary school in Norwich where (I'm working, I've worked, I work) for the last five years.  
69- When I (was, have been, had been) there for a couple of years, one of the older members of staff  
70- (would leave, left, have been leaving), and a new teacher  
71- (would be, become, was) appointed to work in the same department as me.  
72- We (worked, have worked, should work) together with the same classes during her first year  
73- and had the (opportunity for building, possibilities to build, chance to build) up a good professional  
74- relationship. Then, about eighteen months after (she had arrived, to have arrived, arriving)  
75- in Norwich, she decided to buy (her own, herself, her a) house.  
76- She was tired of (to live, living, live) in rented accommodation and wanted a place  
77- (by her own, of her own, of herself). At about the same time, I  
78- (was given, have been given, gave) notice by the landlord of the flat  
79- (what I was living, that I have lived, I was living) in  
80- and she asked me if I (liked, had liked, would like) to live  
81- with her. She (said, told, explained) me that by the time she  
82- (would pay, would have paid, had paid) the mortgage  
83- and the bills (it, there, they) wouldn't be  
84- (a lot, many, few) left to live on. She suggested  
85- (us to, we should, we may) share the house and share the costs.  
86- It seemed like a good idea, so after (we'd agreed, we could agree, we agreed with) all the details  
87- (what, that, who) needed to be sorted out, we moved into the new house together.  
88- At the end of this month, (we have lived, we have been living, we'll have been living)  
89- together for a year and a half. It's the first time (I live, I'm living, I've lived) with anybody before, but  
90- (I should guess, I might have guessed, I'd have guessed) what would happen. I've fallen in love with her and now  
she's been offered another job 200 miles away and is going to move. I don't know what to do. Please give me some  
advice.

=====

Look at the following examples of question tags in English. The correct form of the tag is underlined.

- A. He is getting the 9.15 train, (isn't he, hasn't he, wasn't he)?  
B. She works in a library, (isn't she, doesn't she, doesn't he)?  
C. Tom didn't tell you, (hasn't he, didn't he, did he)?  
D. Someone's forgotten to switch off the gas, (didn't one, didn't they, haven't they)?

Now underline the correct question tag in the following 10 items:

- 91- Steve's off to China, (has she, hasn't he, isn't he)?  
92- It'll be a year before we see him again, (won't it, won't we, shan't it)?  
93- I believe he has given up smoking, (isn't he, don't I, hasn't he)?  
94- I'm next on the list to go out there, (am not I, are I, aren't I)?  
95- No doubt you'd rather he didn't stay abroad too long, (shouldn't you, wouldn't you, hadn't you)?  
96- He's rarely been away for this long before, (is he, hasn't he, has he)?  
97- So you think he will be back before November, (shall he, will he, do you)?  
98- Nobody disagreed with the latest proposal, (did he, has he, have they)?  
99- We'd better not delay reading this any longer, (should we, did we, had we)?  
100- Now is hardly the time to tell me you did not need a test at all, (did you, is it, isn't it)?

### AMTB (Attitude/Motivation Test Battery)

نام: \_\_\_\_\_ ميزات تحصیلات: \_\_\_\_\_  
سن: \_\_\_\_\_ جنس: مذکر / مؤنث

دانشجوی عزیز:

تقریباً ۵۰٪ از زبان‌آموزان ایرانی که در این آزمون شرکت می‌کنند، از «خیلی زیاد» (5) تا «خیلی کم» (1) در مورد موضوعات زیر پاسخ می‌دهند. سؤالات این قسمت از پاسخنامه دارای 5 گزینه به صورت عدد (1، 2، 3، 4، 5) بوده که از «خیلی زیاد» (5) شروع و به «خیلی کم» (1) ختم می‌شوند و شما باید دور عددی که بیان می‌کند که شما تا چه اندازه با سوال موافق و یا مخالف هستید را خط بکشید. در زیر یک مثال ذکر شده است.

با تشکر فراوان از همکاری شما

مثال:

(5) خیلی زیاد

(4) زیاد

(3) متوسط

(2) کم

(1) خیلی کم

تا چه حد .....

خیلی کم 1	کم 2	متوسط 3	زیاد 4	خیلی زیاد 5	سوال
					1 دوست دارید که معلم زبان انگلیسی شوید؟

تا چه حد .....

خیلی کم 1	کم 2	متوسط 3	زیاد 4	خیلی زیاد 5	سوالات
					1 یادگیری زبان انگلیسی به شما کمک می‌کند تا بهتر انگلیسی‌ها و شیوه زندگی آن‌ها را بفهمید؟
					2 یادگیری زبان انگلیسی به شما کمک می‌کند تا آسانتر بتوانید از میان انگلیسی زبان‌ها دوستان خوبی پیدا کنید؟
					3 یادگیری زبان انگلیسی شما را قادر می‌سازد تا مانند انگلیسی‌ها رفتار کنید و ببینید؟
					4 یادگیری زبان انگلیسی به شما کمک می‌کند تا با مردمان گوناگون و بیشتری ملاقات و گفتگو کنید؟
					5 یادگیری زبان انگلیسی به شما کمک می‌کند تا در حضور انگلیسی زبان‌ها احساس آرامش بیشتری کنید؟
					6 یادگیری زبان انگلیسی به شما کمک می‌کند تا هنر و ادبیات انگلیسی را بهتر درک کنید؟
					7 یادگیری زبان انگلیسی به شما کمک می‌کند تا بهتر در فعالیت‌های گروه‌های مختلف از فرهنگ‌های متفاوت شرکت کنید؟
					8 به شیوه زندگی انگلیسی زبان‌ها علاقمند هستید؟
					9 میل دارید که یک دوست انگلیسی داشته باشید که با او مکاتبه کنید؟
					10 دوست دارید که در یکی از کشورهای انگلیسی زبان زندگی کنید؟
					11 برایتان جالب است که با یک دختر و یا پسر انگلیسی زبان آشنا شوید؟
					12 از گفتگو و ملاقات با انگلیسی زبان‌ها لذت می‌برید؟
					13 دوست دارید که زبان انگلیسی زبان‌ها را یاد بگیرید تا بهتر انگلیسی‌ها را بشناسید؟
					14 دوست دارید که انگلیسی را در یک کشور انگلیسی زبان فراگیرید؟
					15 دوست دارید که ادبیات انگلیسی را به زبان انگلیسی مطالعه کنید تا به زبان فارسی؟
					16 از اینکه در دروسهای زبان راجع به زبان انگلیسی مطلب بیاموزید لذت می‌برید؟
					18 برای دست یابی به اعتبار اجتماعی شخص نیاز دارد که حداقل درباره یک زبان خارجی اطلاعات خوبی داشته باشد؟
					19 انگیزه شما از یادگیری زبان انگلیسی به این خاطر است که مردم برای شما احترام بیشتری قائل شوند؟
					20 با این عبارت موافقت کنید: «... او ...»
					21 برای فارغ التحصیل شدن از دانشگاه لازم است که زبان انگلیسی را یاد بگیرید؟
					22 شخص برای شغل‌های آینده‌اش به زبان انگلیسی نیاز دارد؟
					23 شخص در زندگی آینده می‌تواند بدون دانش انگلیسی خوب زندگی کند؟
					24 اعتقاد دارید که فراگیری انگلیسی برای ایرانیان سودمند است؟
					25 آن چه که شخص در درس‌های زبان فرا می‌گیرد برای زندگی آینده‌اش سودمند است؟
					26 اعتقاد دارید که زبان انگلیسی در خیلی از مسائل روزمره مفید است؟
					27 اعتقاد دارید که زبان انگلیسی نقش مفیدی را در تربیت و آموزش ایفا خواهد کرد؟
					28 مطالعه زبان انگلیسی به معلومات شما خواهد افزود و به شما کمک خواهد کرد تا یک فرد تحصیل کرده شوید؟
					29 اعتقاد دارید که زبان انگلیسی رشته خوب و جالبی است؟
					30 از یادگیری زبان انگلیسی لذت می‌برید؟
					31 اعتقاد دارید که زبان انگلیسی بخش مهمی از برنامه آموزشی دانشگاه به شمار می‌رود؟
					32 درس‌ها و واحدهای زبان را با اشتیاق و علاقه می‌گیرید؟

					33. تصمیم دارید تا آنجا که امکان دارد دانش زبان انگلیسی خود را افزایش دهید؟
					34. از زبان انگلیسی تنفر دارید؟
					35. ترجیح می دهید که وقتتان را صرف موضوعات دیگر کنید تا صرف زبان انگلیسی؟
					36. اعتقاد دارید که یادگیری زبان انگلیسی اتلاف وقت است؟
					37. اعتقاد دارید که یادگیری زبان انگلیسی يك کار كسل كننده است؟
					38. امکان دارد که پس از فراغت از تحصیل مطالعه و یادگیری زبان انگلیسی را به خاطر عدم علاقه کنار بگذارید؟

## Appendix C Interview Test

### Interview Test

1. Talk about yourself (your name, age, address). How many brothers and sisters do you have?
2. What would you like to do in future?
3. Talk about your university and professors. Are they good or not?
4. Which job is more important; being an engineer, a doctor, or a teacher?
- 5.

## 6. Appendix D Criteria for Assessing Speaking

### Analytic Speaking Criteria (Weir 1993)

#### Fluency

4. Generally natural delivery, only occasional halting when searching for appropriate words/expressions.
3. The student hesitates and repeats himself at times but can generally maintain a flow of speech, although s/he may need an occasional prompt.
2. Speech is slow and hesitant. Maintains speech in a passive manner and needs regular prompts.
1. The student speaks so little that no 'fluent' speech can be said to occur.

#### Pronunciation

4. Occasional errors of pronunciation a few inconsistencies of rhythm, intonation and pronunciation but comprehension is not impeded.
3. Rhythm, intonation and pronunciation require more careful listening; some errors of pronunciation which may occasionally lead to incomprehension.
2. Comprehension suffers due to frequent errors in rhythm, intonation and pronunciation.
1. Words are unintelligible.

#### Vocabulary

4. Effective use of vocabulary for the task with few inappropriacies.
3. For the most part, effective use of vocabulary for the task with some examples of inappropriacy.
2. Limited use of vocabulary with frequent inappropriacies.
1. Inappropriate and inadequate vocabulary.

#### Grammatical accuracy

4. Very few grammatical errors evident.
3. Some errors in use of sentence structures and grammatical forms but theses do not interfere with comprehension.
2. Speech is broken and distorted by frequent errors.
1. Unable to construct comprehensible sentences.

#### Interactional strategies

In this criterion, the term 'interactional strategies' means using strategies such as initiating the discussion, asking for clarification, expanding the topic, turn taking and concluding the discussion.

4. Interacts effectively and readily participates and follows the discussion.
3. Use of interactive strategies is generally adequate but at times experiences some difficulty in maintaining interaction consistently.
2. Interaction ineffective. Can seldom develop an interaction.
1. Understanding and interaction minimal.

Farhadi, Jafarpour, Birjandi (1994, p. 239) give guidelines for assessing rating speaking:

***Accent***

6. Phonetically acceptable pronunciation throughout
5. Few phonemic errors but never hindering comprehension
4. Occasional phonemic errors necessitate attentive listening
3. Frequent phonemic errors require frequent demand for repetition
2. Constant phonemic errors make comprehension very hard
1. Severe errors make understanding virtually impossible

***Structure***

6. Almost no error
5. Few insignificant errors only
4. Occasional petty errors but no problem with understanding
3. Frequent errors occasionally interfere with meaning
2. Constant errors interfere with understanding
1. Severe errors make understanding virtually impossible

***Vocabulary***

6. Appropriate and extensive use of words in any domain
5. Appropriate use of adequate vocabulary to discuss general topics and special interests
4. Occasional use of inappropriate words, which do not, however, affect the meaning
3. Frequent use of inappropriate words distort the message
2. Constant use of wrong words, limited vocabulary
1. Inadequate basic vocabulary

***Fluency***

6. Fluent and effortless speech like a native speaker
5. Natural and continuous speech with pauses at unnatural points
4. Fluent speech with occasional problems
3. Frequent problems hinder fluency and demand greater effort
2. Slow speech, hesitant, and sometimes silent
1. Virtually unable to make connected sentences

***Comprehension***

6. Comprehends everything
5. Comprehends everything except for every colloquial or rapid speech or low frequency items
4. Comprehends nearly everything but needs occasional rephrasing
3. Comprehends slower-than-normal speech
2. Comprehends only slow and simple speech
1. Comprehends very little of even simple and slow speech

## RELATIONSHIP BETWEEN READING SHORT STORIES AND THE WRITING PROFICIENCY OF IRANIAN EFL LEARNERS

### ABSTRACT

Despite the importance of writing in both academic and daily lives of people, most students suffer from difficulties of writing in a foreign language. What people write, represents their idea and their knowledge about a subject, so a poor writing can hide the actual viewpoint of a person or even can lead into misinterpretation of the message. Accordingly, there is a need to use a method that motivates the English as a foreign language (EFL)/English as a second language (ESL) students and helps them to improve their writing ability. This study examined two groups of students to find out the effects of short story reading on their writing ability. Within two months, the control group (N=23) was taught the school book, while the experimental group (N=24) was taught the school book and also was supposed to read three short stories. Relevant findings illustrated that the experimental group's writing had improved more than the control group's writing (gain score= 5.7 vs. 2.7; effect size= .31). Questionnaires were also given to the students who had read the stories and the teacher to evaluate the course design. The results showed that almost 79.17% of the students had found the course beneficial; furthermore, the teacher was also satisfied with the course program. Based on the obtained results, the study considered reading short story as an effective and beneficial tool for improving the EFL students' writing ability. The study has pedagogical implications for English writing classes aiming at educating EFL students.

**KEYWORDS:** writing proficiency; reading short story; schemata; reading strategies

### INTRODUCTION

Over the past decades, EFL reading and writing have undergone dramatic changes. Reading has moved toward a complex psycholinguistic, interactive model consisting of both bottom-up and top-down processes (Goodman, 1970). Accordingly, reading theories have in turn affected other language skills, including writing. Thus, reading is now viewed as a means for improving communicational skills, in which readers seek meaning and try to reconstruct writers' messages. One of the language skills is writing, an important skill that helps learners acquire language, content, culture and literacy in a second language.

L2 writing research has indicated that lack of competence in composing, rather than lack of linguistic competence, is the main source of difficulty (Jones, 1982; Jacobs, 1982). Studies have also identified difficulties in relation to the lack of composing competence. For example, L2 composing is more constrained, more difficult, and less effective. The process is more laborious, less fluent, and less productive. More revisions are needed and more difficulties are experienced in revising. Additionally, L2 text is less fluent, less accurate, less effective and with simpler structure (Silva, 1993).

In recent years, narrative and stories have been the focus of increasing attention. Researchers (Fitzgerald and Teasley, 1986; Cassell, 2004; and Collins 2010) who have talked about the use of short stories in the EFL classes have mentioned various benefits of short stories such as motivational, literary and cultural benefits. According to Murdoch (2002) if the instructor selects the short story appropriately, it can provide quality text content which will greatly enhance ELT courses, especially at the intermediate and advanced levels of proficiency. If instructors choose the correct story book, it will correspond to the comprehensible input that ESL theorists emphasize in the communicative classrooms. One of the main advantages of short stories is their proper length. They are neither like novels nor like small notes. Instructors are usually faced with lack of time for teaching the materials and therefore the length of short story permits them to bring literature into the classroom's syllabus. Students will not get bored of reading short stories because these stories are not too long.

Short stories motivate students to read, think and get involved. According to Celce-Murcia (1988), among many texts, story is in such an appealing position that everyone, including EFL students, loves it. Short stories can be used both for providing students with a proper input and for making the language learning process more interesting. Short stories, as a general and natural teaching tool, can provide the basis for effective communicative activities in an EFL class.

No one can neglect the role and importance of writing proficiency in daily, academic and business lives of all people. Nowadays there are many methods for improving writing proficiency of EFL students, among which we can mention computer task based strategies (Ortega, 1997), using online writing systems (Miyazoe and Anderson, 2010), etc. Most of these methods require special and expensive instruments and therefore they can be used just in special learning environments with the required equipment. Since learning English as a second language and therefore writing in English does not belong to a certain group of people, in this study the researchers try to introduce a more available tool: short stories.

## **REVIEW OF THE LITERATURE**

### ***Literature and language learning***

Literature is a tool that can be used in different areas of language learning, and help students with a better comprehension of the points being taught. Erkaya (2009) believed that it is important for EFL instructors to be familiarized with the effectiveness of using literature in language instruction. She mentioned that while some instructors may still believe that teaching EFL encompasses focusing on linguistic benefits only, their students eventually will communicate in the target language, others who have integrated literature in the curricula have realized that literature adds a new dimension to the teaching of EFL. The researcher concluded that in addition to the four skills, short stories help instructors to teach literary, cultural and higher-order thinking aspects. Furthermore, she claimed that integrating short stories into the curriculum will help EFL students to become well-rounded professionals and human beings since short stories teach more than the skills necessary for survival in the target language.

In another study by Hajimaibodi (2008), learning English through short stories has been explored. The findings of her study revealed that to enhance the reading comprehension skill, the learner must have the ability to understand the meaning of individual words and phrases on a local or word-to-word and sentence-to-sentence level and on a global level or constructing meaning from the text as a whole. She concluded that this interacted with the prior knowledge, interest and motivation that the learner brings to the task of reading. Since in general people forget the actual language but remember the message, they would like something that is not only informative but also entertaining, like short stories.

Hismanoglu (2005) aimed at emphasizing the use of literature as a popular technique for teaching both basic language skills (i.e. reading, writing, listening and speaking) and language areas. The results of the study suggested that literature played an important role in the English programs of many non-English speaking countries. However, there were some problems encountered by language teachers within the area of teaching English through literature.

Considering the new technologies, Cassell (2004) carried out a piece of research on story listening systems and effects of that on young children's writing. The findings revealed that systems were desirable, the researcher further concluded that the kinds of learning environments enabled by the systems, provided opportunities for children to bridge informal and formal contexts and hence help their learning.

### ***The importance of writing***

Writing ability in either first or second language is important. According to Tan (2011), students who are poor with written expression are often at serious risks of failure in an academic study program. Close or distant communication with different people is possible through writing. Unlike other language skills, writing is permanent and according to Brown (2001), the process of writing requires specialized skills, skills that not all speakers develop naturally. Brown (2001) maintains that writing is a learned behavior. It means that we learn to write if we are members of a literate society and if someone teaches us. Trupe (2001) maintained that L2 writing is a unique part of language learning.

Learners must attend to both the writing and thinking processes as well as the written product. That is, they must not only consider what they think, but also how best to communicate what they think to readers.

Kobayashi and Rinnert (2002) presented findings from a research on students' perceptions of first language literacy instruction and effects of that on second language writing. The researchers suggested that one way to utilize students' L1 background is to turn the writing class into a place where students research their own literacy and develop critical awareness about what they need to learn about L2 academic writing. The researchers also mentioned that in addition to the influence of L1 literacy, the kind of practice and experience students receive in L2 reading and writing could also affect the development of their L2 writing.

## RESEARCH QUESTIONS

The present study seeks to answer the following research questions:

1. Is there any significant relationship between reading short stories and writing?
2. Do students and teachers find reading short story a beneficial tool for improving writing proficiency?

It is hoped that the answers to the research questions of this study be useful for both teachers and learners. The answers may also help material developers in terms of choosing the best materials for learners. It is hoped that the results of the study will shed light on the related aspects of language learning.

## METHODOLOGY

### *Participants*

The participants of this study were 47 female students whose average age was 17. These students were selected from two classes at a pre-university school in Shiraz, Iran. The total population of the classes was 60. To choose a homogeneous group of students, the researchers obtained the scores of the writing section of the students' 3<sup>rd</sup> grade English exam. The high school 3<sup>rd</sup> grade exam is a standard exam that is given and corrected in a standard method and is uniform all over the country.

After calculating the mean and standard deviation of the students' scores of the writing section, those whose scores were within one standard deviation above and below the mean were selected (n=47). Table 1 shows the mean and standard deviation of the participants.

*Table 1: Descriptive statistics on final scores of the 3rd grade*

	N	Mean	Std. Deviation	Variance
score	60	16.1458	2.88380	8.316
Valid N (listwise)	60			

After choosing the total group of students, each student was given a number and then based on the systematic random sampling (i.e. odd and even numbers), they were randomly divided into two groups. The mean score of each group was calculated and as Table 2 represents, the mean scores were in the same range:

*Table 2: Mean scores of control group and experimental group*

	Groups	N	Mean	Std. Deviation	Std. Error Mean
scores	Experimental	24	16.7500	1.58629	.32380
	Control	23	16.5000	1.61667	.33710

Therefore, it was assumed that both groups were at the same level. However, to make sure that there was no statistically significant difference between the two groups, an independent samples t-test was run. The scores of the writing section of the students' 3<sup>rd</sup> grade English exam were used in this calculation. The p-value was greater than .05; therefore the null hypothesis (i.e. there was no difference between the groups) was retained. The results are given in Table 3.

Table 3: Independent samples t-test of control group and experimental group

Table 11. Independent Samples t-test of control group and experimental group										
		Levene's Test for Equality of Variances		t-test for Equality of Means						
									95% Confidence Interval of the Difference	
		F	Sig.	T	df	Sig. (2- tailed)	Mean Difference	Std. Error Difference	Lower	Upper
3 <sup>rd</sup> grade scores	Equal variances assumed	.316	.577	.535	45	.595	.25000	.46723	-.69105	1.19105
	Equal variances not assumed			.535	44.825	.595	.25000	.46742	-.69154	1.19154

One of these groups served as the control group and the other one as the experimental group. The students of both groups had the same teacher. During the time of the study, both groups used the school book as the main input material. The students who were in the experimental group also read three short story books

In order to check the effects of the treatment (i.e. reading short stories), pre-tests and post-tests were given to all participants. A paired-sample t-test was used to find out if the treatment had any effect. Then, the results obtained from the experimental group were compared with the results obtained from the control group. The procedures and the objectives of the study were explained to the students by the researchers. And all the students declared their willingness to participate in the process of the study. The school Principal had also agreed with conducting this study at the school.

### Instruments

The instruments utilized in this study were as follows:

1. Tests of writing. At the very beginning of the study, a writing test (see Appendix A) was given to the students of both control and experimental groups. This writing test was the pre-test consisting of two parts. The first part was the free writing part. In the free writing part, two topics were given to the students. These topics were related to the topics of their school book. The students were asked to choose one of the topics and write three or four paragraphs on it. The instructions were printed in their exam paper and further explanations were provided by the teacher. The second part of the test was the controlled writing. This part was divided into two sections. In the first, the first two lines of a text were given to the students and then they were asked to continue the writing and add at least three sentences of their own. In the second part of the controlled writing, students were asked to write a paragraph using the given words. The paragraph had to have no more than ten lines. The instructions for the second part of the test were available in the hard copies that the students had and further explanations were provided by the teacher. Having given the test, the teacher evaluated the writings based on Jacobs et al.'s (1981) scoring profile (see Appendix B). Based on this profile a score was assigned to each testee. Since in this research two tests were needed, this test was repeated after about two months as the post-test. As for the reliability of the writing test scores, inter-rater reliability was used on the pre-test and post-test scores. All the writing tests were corrected by the teacher and her colleague. In cases where the ratings were different, the mean of the rating scores were used. To check the reliability of the tests, Pearson correlation was obtained between the ratings of teacher 1 and those of teacher 2. The results are presented in Table 4.

Table 4: Correlation between two ratings

			teacher2
Pre-test	Teacher1	Pearson Correlation	.978**
		Sig. (2-tailed)	.000
		N	47
Post-test	Teacher1	Pearson Correlation	.988**
		Sig. (2-tailed)	.000
		N	47

\*\*, Correlation is significant at the 0.01 level (2-tailed).

The results of the correlation showed that the writing test was reliable. The reliabilities of the pre-test and post-test were  $r=.978$  and  $r=.988$  respectively. In the next step, to check the stability of the scores, the correlation values were checked by the inter-rater reliability formula. The results are presented in equation 3.1.

$$\text{Inter-rater reliability} = \frac{2r}{1+r}$$

$$\text{Post-test inter-rater reliability} = \frac{2 \times .988}{1 + .988} = .989$$

$$\text{Pre-test inter-rater reliability} = \frac{2 \times .978}{1 + .978} = .984$$

Based on the results of the inter-rater reliability formula, the scores had stability, and therefore the tests and the scores were reliable.

The writing test was constructed by the researchers and was checked by two other English teachers to make sure that it was assessing the writing production ability of the students based on the instructions and the writing exercises of the pre-university English book.

2. Short story book. Three short stories were used in this research. One week after dividing the students into two groups, the students in the experimental groups were given the first short story. The first short story was *The Gift of the Magi* by O.Henry. All the copies of the short story were online printable versions and were prepared by the researchers. Students had two weeks to read the first short story, and they could ask any question they had concerning the story. Then they had one week without any short story reading. The second short story was given to them at the beginning of the fourth week. The second short story was *The Necklace* by Guy de Maupassant. The same procedures were repeated for the second and third short stories. The third short story was *The Lottery Ticket* by Anton Chekhov.

3. Course evaluation questionnaire. After the post-test, the students in the experimental group were given a course evaluation questionnaire. The teacher also answered a course evaluation questionnaire. The aim of the students' questionnaire was to find out whether the students of the experimental group thought that reading short stories had any effect on their writing ability or not. The aim of the teacher's questionnaire was to look for teacher's opinion about the program and the process of the language learning. The course evaluation questionnaires were two distinct evaluation questionnaires for both teachers and students that were provided by ministry of education and were given to schools. These questionnaires were used for class evaluation at the end of the school year. In the student questionnaire, the students were asked to evaluate the course and to highlight the strong and the weak points of the materials used in classrooms and also the teachers' methodology. The teachers' questionnaires gathered information on the materials used in classrooms, the class progress, and the students' total accomplishment. Both students and teachers were asked to give their further suggestions.

### ***Procedure of the study***

At the beginning of the study, the researchers asked permission of the school Principal in order to conduct the study in the school. Then to choose a homogeneous group of students, the researchers obtained the students' scores of the previous year final exam. After that the researchers calculated the mean and standard deviation of the students' scores and those whose scores were within one standard deviation above and below the mean were selected ( $n=47$ ). In the next stage each student was given a number and then based on the systematic random sampling (i.e. odd and even numbers), they were randomly divided into two groups. One group just received the teaching of school book (control group), while the students of the other group were reading three short stories in addition to their school book (experimental group). It took two months to conduct the study.

## RESULTS AND DATA ANALYSIS

### Paired-samples t-test

After dividing the students into two groups, one group was treated as the experimental group and the other group as the control group. The students of the experimental group were given three short stories during the time of the study. These students also received the pre-university English book as the main teaching material of the course. Since the students who were in the control group received the pre-university English book as well, the short story books were considered as the treatment materials of the study. The treatment of the study was reading short stories during the time of the study, and the aim was to check the effects of the treatment. Two writing tests (a pre-test and a post-test) were given to all the students. A paired-sample t-test was run to observe the effects of the treatment. Mean and gain scores were calculated to check the effects of the treatment. The descriptive statistics of the scores obtained from the writing pre-test and post-test of both groups showed that while the mean scores of experimental group's pre-test and post-test were 65.58 and 71.29, respectively, the control group's mean scores were in turn 70.13 and 72.91. These scores are presented in Table 5.

Table 5: Descriptive statistics on the writing scores of control and experimental groups

		Mean	N	Std. Deviation	Std. Error Mean
Experimental	Pre-test	65.58	24	10.958	2.237
	Post-test	71.29	24	10.889	2.223
Control	Pre-test	70.13	23	10.563	2.202
	Post-test	72.91	23	9.876	2.059

A comparison of the pre-test and post-test of the groups showed that the students' scores had improved in both groups. To analyze the improvement and to check the effects of the treatment, a t-test was run and the results are presented in Table 6. Based on the information in Table 6, the significance of the tests of both groups was .000 and since it was smaller than .05, the null hypothesis was rejected. Therefore, the writing proficiency of both groups had improved.

Table 6: Paired samples t-test of the scores of control and experimental groups

Paired differences									
				95% Confidence Interval of the Differences		t	df	Sig. (2-tailed)	Effect size
		Mean	Std. Deviation	Std. Error Mean	Lower	Upper			
Experimental	Pretest-Posttest	-5.708	2.422	.494	-6.731	-4.685	-11.545	23	.000
Control	Pretest-Posttest	-2.783	1.906	.397	-3.607	-1.958	-7.002	22	.000

### Gain score

Based on the results of the paired-samples t-test, the writing proficiency of both groups had improved. The next step was to calculate the gain scores of each group and to run an independent samples t-test. The independent samples t-test would show us the effectiveness of the treatment. To calculate the gain score, the pre-test scores of the students

of each group were subtracted from their post-test scores. Table 7 shows the descriptive statistics of the gain scores of both groups.

*Table 7: Descriptive statistics on the gain scores of control and experimental groups*

	group	N	Mean	Std. Deviation	Std. Error Mean
Gain score	experimental	24	5.71	2.422	.494
	control	23	2.78	1.906	.397

The mean of the experimental group's gain score was 5.71, while the control group had a mean gain score of 2.78. In Table 8, the gain scores are compared, and results are presented.

*Table 8: Independent samples t-test of the gain scores of control and experimental groups*

		Levene's Test for Equality of Variances		t-test for Equality of Means					95% Confidence Interval of the Difference	
		F	Sig.	t	df	Sig. (2- tailed)	Mean Difference	Std. Error Difference	Lower	Upper
Gain score	Equal variances assumed	2.025	.162	4.589	45	.000	2.926	.638	1.641	4.210
	Equal variances not assumed			4.612	43.385	.000	2.926	.634	1.647	4.205

The null hypothesis of this test was that the improvement of both groups would be the same and the treatment would have no effects on the improvement of the experimental group. Based on the information in Table 8, the significance value of the test was .000; therefore, the null hypothesis was rejected and it was concluded that the improvement of the experimental group was not by chance, and in fact it was the result of the given treatment. Since the treatment was considered effective, the effect size of the groups was calculated in order to observe the effectiveness of the treatment. Equation 5.1 was used to calculate the effect size.

$$(5.1). \text{Etsquared} = \frac{t^2}{t^2 + df}$$

$$\text{Etsquared} = \frac{(4.589)^2}{(4.589)^2 + 45} = 0.318$$

The effect size was large (.31).

### **Course evaluation**

At the end of the study, two questionnaires were used to find out about the opinions of the students who were in the experimental group and their teacher about the program and teaching materials that were used in the process of the study. The course evaluation questionnaire of the students consisted of twenty eight items. The answers of the students to these items were obtained and their total scores were calculated. According to the interpretation's guideline of the questionnaire, the scores could be in the range of 28-140. Based on the guidelines of the interpretation, those who scored between the ranges of 20-65, believed that the course was not an effective course; those who scored between the ranges of 65-113 believed that the course was an ordinary course and the students who scored between the ranges of 113-140 believed that the course programs were effective (Figure 1).

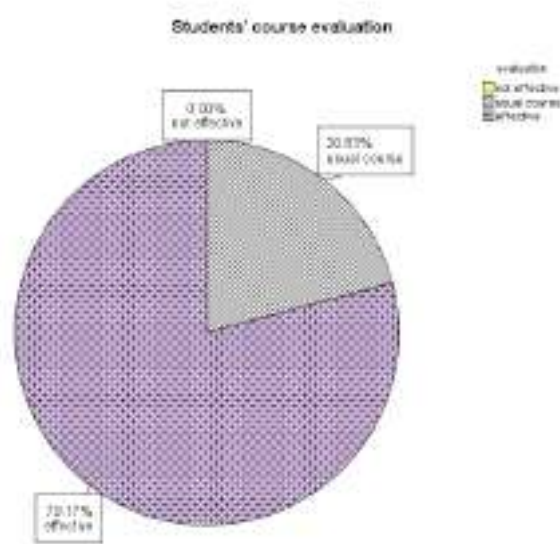

Figure 1: The pie graph of the course evaluation of the students

Figure 1 shows that 79.17% of the students of the experimental group had found the program and the teaching materials of the study, as effective. None of the students of the experimental group were unsatisfied with the program or the teaching materials and 20.83% of the students believed that the course was like the other English courses. A comparison of the results of this questionnaire showed that most of the students were satisfied with the integration of short stories in the process of English learning program.

The course evaluation questionnaire that was given to the teacher had 16 items. Based on the interpretation guidelines of the questionnaire, a score in the range of 64-80, indicated that the program of the course was excellent; 48-63 indicated that the program of the course was good; 32-47 indicated that the program of the course was fair and 16-31 indicated that the program of the course was poor. As it is shown in Table 9, the score of the teacher was 72 and therefore the teacher considered the program of the course as an excellent one.

Table 9: Course evaluation of the teacher

Evaluation ranges		Teacher's evaluation score
16-31	poor	-
32-47	fair	-
48-63	good	-
64-80	excellent	72 (excellent)

## CONCLUSION

### Discussion and interpretation of the findings of the research

The answer to the first and second questions of the study was that: there is a positive relationship between reading short stories and writing proficiency and both the students and the teacher consider short story as a beneficial tool in the process of language learning. In fact reading short stories helped the students with their writing skill. Erkaya (2009) had also emphasized the importance of integrating short stories into the curriculum. Furthermore, Hajimaibodi (2009) considered short stories as a tool that could enhance the reading comprehension skill. The

findings of a research by Hismanoglu (2005) were in line with the finding of this research. The result of the study was also in line with the findings of Cassell (2004); although the participants of his research were children, the findings were similar.

The findings of the study revealed that reading short story would have positive effects on the writing proficiency of English learners. The findings also showed that the students were satisfied with reading short stories; moreover the students believed that reading short stories would help them in the process of improving their writing skill. Based on these findings, the following conclusions were made:

- It was concluded that reading short story could enhance the writing proficiency of learners and thus it should be used as a teaching material of the ESL/EFL classes.
- It was concluded that since integration of short story was interesting and desirable for both students and teachers; therefore, it should be part of the teaching materials of all ESL/EFL classes.

The conclusions that were drawn about the integration of short story in the ESL/EFL classes, lead to the opinion that students, who received short stories as a reading material in addition to the main book, found it interesting. Thus it was suggested that the teachers should be careful about selecting the proper and interesting materials that could attract the students' attention.

#### ***Limitations of the study and suggestions for further research***

In this study all the participants were female students. Thus it would be beneficial to conduct further research with both male and female participants and to consider the gender difference effects. Also the population of the participants of this study was 47. Therefore, it would be beneficial to replicate this study with a larger number of participants and compare the results.

The short stories of this research were all classical short stories. Thus a further study, in which different genres of short story (for example fiction story or detective story) are used would be more desirable. Such study may help both students and teachers with the information about the effectiveness of selecting the stories according to the students' interests.

### *Appendices*

#### Appendix A. Writing test

Dear participant, the aim of this test is to evaluate your writing ability. In part A of the test, you are asked to choose one of the topics and write 3-4 paragraphs about it. In part B, two questions are asked. For the question number one, read the given sentences carefully and continue the text with 2-3 sentences of your own. For the last question, use the given words and write a paragraph.

Name .....

A. Free writing:

A1. Choose one of the following topics and write three to four paragraphs about it.

- Child labor problems in Iran
- Poverty

B. Controlled writing:

B1. Complete the following sentences with 2 or 3 sentences of your own.

- You have certainly seen and used a computer. A computer is a programmable machine that accepts data and processes them into information we can use. Its purpose is to.....

B2. Use the given words and write a paragraph.

Mother Teresa/ nun/ suffering/ poverty/ devote/ voluntary/ financial/ charity

#### Appendix B. Jacobs et al.'s (1981) scoring profile (cited from Hughes, 2002, p.104)

##### ESL COMPOSITION PROFILE

Content	<b>30-27.</b> Excellent to very good: knowledgeable, substantive, thorough development of text, relevant to assigned topic
	<b>26-22.</b> Good to average: some knowledge of subject, adequate range, limited development of the text, mostly relevant to topic but lacks detail
	<b>21-17.</b> Fair to poor: limited knowledge of subject, little substance, inadequate development of topic
	<b>16-13.</b> Very poor: does not show knowledge of subject, non-substantive, not pertinent, not enough to evaluate
Organization	<b>20-18.</b> Excellent to very good: fluent expression, ideas clearly stated/supported, succinct, well-organized, logical sequencing, cohesive
	<b>17-14.</b> Good to average: somewhat choppy, loosely organized but main ideas stand out, limited support, logical but incomplete sequencing
	<b>13-10.</b> Fair to poor: non-fluent, ideas confused or disconnected, lacks logical sequencing and development
Vocabulary	<b>9-7.</b> Very poor: does not communicate, no organization, not enough to evaluate
	<b>20-18.</b> Excellent to very good: sophisticated range, effective word/idiom choice and usage, word form mastery, appropriate register
	<b>17-14.</b> Good to average: adequate range, occasional errors of word/idiom form, choice or usage but meaning not obscured
	<b>13-10.</b> Fair to poor: limited range, frequent errors of word/idiom form, choice or usage, meaning confused or obscured
	<b>9-7.</b> Very poor: essentially translation, little knowledge of English vocabulary, idioms or

	word form, not enough to evaluate
	<b>25-22.</b> Excellent to very good: effective complex construction, few errors of agreement/tense/number/word order/word function/articles/pronouns/proposition
	<b>21-18.</b> Good to average: effective but simple construction, minor problem in complex construction, several errors of agreement/tense/number/word order/word function/articles/pronouns/proposition but meaning seldom obscured
Language use	<b>17-11.</b> Fair to poor: major problems in simple/complex construction, frequent errors of negation/agreement/tense/number/word order/word function/articles/pronouns/proposition or fragments/run-ons/deletions, meaning confused or obscured
	<b>10-5.</b> Very poor: virtually no mastery of sentence construction rules, dominated by errors, does not communicate, not enough to evaluate

## **ABSTRACT**

Numerous studies have focused on L2 written errors and corrective strategies to improve learners' writing accuracy, but choosing the best method or strategy to correct written errors has always been a topic of controversy, and still there is no solution that scholars can agree on.

The purpose of the current review was to study written errors, their causes, sources, types, and the types of error treatment methods. For treatment of written errors, it is suggested that teachers should pay attention to the error types, purpose and context of language learning, and affective factors influencing the process of learning. It is also discussed that the disagreement in the findings of the previous studies on the treatment of written errors are due to the methodologies used.

**KEY WORDS:** error, feedback, error correction, L2 writing

## **INTRODUCTION**

Making errors is an inevitable part of life, and language learning, as a unique characteristic of human beings, is not an exception (Maicusi, Panayota, & López, 2000). Writing, like other language skills, has been a matter of concern in error correction studies. Error, error correction and the efficacy of written error treatment in L2 have always been a challenge in language teaching. There are various kinds of errors in L2 writings, and different strategies have been suggested for correcting these errors.

## **ERRORS**

To find out about the best error treatment method, it is necessary to define error first. Different authors tried to define error and its type. Generally speaking, error means mistake, but in linguistic terms, the concept of error seems to be more complicated and different from error. McDonogh (2000) distinguished two situations to define error. In the first situation, learners may know a correct generalization or rule about the target language, but forget to apply it due to the stress or factors other than language factors. In the second situation, learners may have an incorrect rule in their mind, from whatever source. McDonogh (2000) calls the errors of the first situation 'mistake' or 'lapse' and errors of second situation as 'error'. Corder (1967) distinguished errors as 'errors of competence' and 'errors of performance'. He calls errors of competence 'error'; and errors of performance 'mistake'. According to Corder (1967), discrimination between error and mistake is highly important; if learner can recognize that the form produced was incorrect, then it is a 'mistake' or 'laps', if not, that would be an 'error'. Self correction is another test to distinguish error from mistake. Learners are able to self correct mistakes, but errors would appear repeatedly in learners' language. Lee (1990) discussed that definition of error in English language teaching is different from linguistics, and psycholinguistics definition. In ELT, error refers to the "pedagogical notion" of error and incorrect forms belong to competence and performance of L2 learners, but in the linguistic term error refer to the incorrect forms in the performance of native speakers (Lee, 1990).

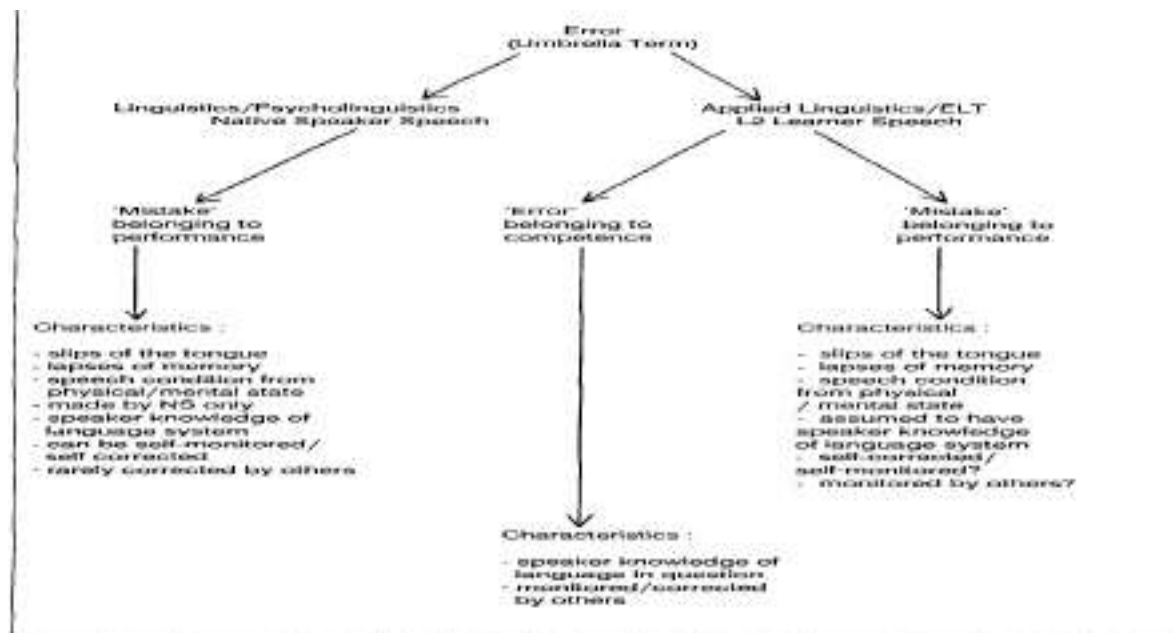

Figure 1: Lee's (1990) definition of error from linguistics and applied linguistic perspective

## ERROR CORRECTION AND FEEDBACK

Mistakes in spoken language may be allowed without being corrected because the message can normally be understood with the help of non-verbal cues and signals, but errors should be treated more carefully in written language, because unlike speaking they cannot be corrected after they are produced, or errors may hinder communication because the only means of conveying the message is the language (Lee, 1990).

There have been different views on the existence of the errors in learners' language. Corder (1967) believed that errors occur because of the inefficiencies in language teaching methods. So, for correcting learners' errors, the inefficiencies in teaching methods should be studied and treated.

Teachers play at least 4 roles when correcting L2 writings; they are a "respondent", a "writing guide", a "grammarian", and a "judge" (Keh, 1990). In the respondent role, teachers show their position toward the content of the writing. As a guide, teachers have their respondent role and they also guide learners through some parts of the writing and may ask them to clarify or revise some parts, but do not correct the errors. As a respondent, teachers help learners to find the correct form themselves but help them to find the right forms. In the grammarian role, teachers present grammar rules and mistakes, and comment on the part that needs revision. And finally as a judge, teachers grade writings and evaluate the final product.

Zourou(2008) believed that the type of feedback provided to learners should depend on the learners' purpose of studying and writing. The feedback, according to her, should be in harmony with the context that the learner is situated in, and the provided feedback has to be in accordance with what learners expect to learn and their needs.

Hendrickson (1984) believed that to choose the right error treatment method, teachers should have 4 factors in perspective:

- (1) Learners' level of proficiency in the target language
- (2) Learners' purposes of target language learning
- (3) Types of errors
- (4) Individual learners' attitudes toward error correction

Enginarlar (1993) used a questionnaire to find out about the feedbacks that language learners found more effective. The result of the study showed that in students' opinion "attention to linguistic errors, guidance on compositional skills, and overall evaluative comments on content and quality of writing" were the most beneficial feedbacks.

***Direct, indirect, and metalinguistic correction***

Teachers' reaction to the learners' errors is generally referred to error correction. Lee (1997) classified correction of written errors in terms of 'direct' and 'indirect correction'. Direct correction is when the teacher tells learner that the form used is incorrect and tells the correct structure, and indirect correction is when the teacher show learners that the form in their writing is incorrect and guide them to revise that. Lee (1997) also argued that indirect correction is not correcting the errors, but the "error feedback". Error feedback differs from overt correction; feedback is a technique that enables learners to find out about their problematic structure, while correction is providing learners with the exact correct form. He also claimed that error feedback may help learners more in their writings.

Ellis (2009) classified corrective feedbacks provided by teachers in 3 groups: direct, indirect and metalinguistic. In direct method the teachers mentions the errors and provides the correct forms, but in indirect correction, the teacher locates the errors and guides the learners to revise the errors themselves and does not mention the right forms. In metalinguistic correction, the teacher provides description of the error and learners should read and correct their errors. Description of errors can be in the form of error code, or by giving numbers to the errors and providing the grammatical description at the bottom of the text.

Beuningen et al. (2012) studied the effectiveness of direct and indirect corrective feedbacks and found that both direct and indirect corrective feedbacks helped writers to improve their accuracy. The outcome of their study showed that direct and indirect corrective feedback had short-time effect on accuracy of L2 writings, but only indirect feedbacks had long-term effect on learners' writings.

Erel and Bulut (2007) in their study tried to find out which of two different error-feedback strategies, direct vs. indirect coded, would be more effective for learners with regard to the number of errors they committed in their writing activities. They found out that both students who received indirect coded feedback strategy and direct correction decreased their errors and there was no significance difference between them, but the average number of errors showed that indirect way was more successful in eliminating errors and learners committed fewer errors in feedback correction than in error correction

***Explicit and implicit error correction***

Hashimoto (2004) presented another categorization for error treatment. He classified errors into explicit and implicit error correction; explicit correction was defined as a treatment in which the teacher directly mentions the incorrect form and provides the exact correct form, and on the contrary, implicit correction referred to a type of correction in which the teacher indirectly mentions the error and help learners to correct it on their own or by the help of other learners.

***Focused versus unfocused corrective feedback***

Ellis (2009) distinguished two types of error feedbacks according to the aspect of writing errors that teachers address; focused and unfocused feedback. In unfocused feedback, the teacher corrects all the possible errors while in focused feedback only certain types of errors are corrected. Providing correction for all errors could be time consuming and will put too much burden on teachers and language learners (Ellis, Sheen, Murakami, & Takashima, 2008), and according to Bitchener and Knoch (2009) correcting various linguistic categories can cause "cognitive overload" for learners.

In focused corrective feedback, the teacher selects only specific types of errors to correct (Ellis et al., 2008). Focused corrective feedback may be highly focused, which is limited to correcting a certain type of errors, or they may be less focused, which corrects more than one type of errors but still ignores some errors (Ellis et al., 2008). Ellis et al. (2008) believed that focused corrective feedback could be more advantageous than unfocused corrective feedback for it can help learners to concentrate on certain limited type of errors, and can learn more and better about that type of error and how correct or avoid that.

Several studies on the effectiveness of focused corrective feedbacks (like Sheen, 2007; Bitchener, 2008; Bitchener & Knoch; 2009, Sheen et al.; 2009) showed that the writing accuracy of students who received written focused corrective feedback was improved more than the writing of students who received unfocused feedback or no feedback. On the other hand, Ellis et al. (2008) found both focused and unfocused feedbacks were equally effective

### ***Electronic corrective feedback***

By development of science and technology, new ways of correcting learners' errors have emerged. Electronic feedback, new electronic means for error correction, provides learners corrective feedback by computers (Ellis, 2009).

Yeh and Lo (2009) and Nagata (1997) found slightly better improvement in writing and correcting errors of L2 learners by online feedback than the conventional paper-based feedback.

One short coming of electronic feedback is that learners have to have access to the computer and they have to be able to use that, a necessary condition which some learners may not meet.

### ***Reformulation***

In this approach, a native speaker reads the learners' writing and rewrites the whole text to correct the errors and modify the text to the extent that it sounds native like, without changing the tone and content of the L2 learner. In reformulation, the native speaker's writing is a model for L2 students to use the proper forms and expressions, and to find about their own errors (Ellis, 2008).

In a study conducted by Sachs and Polio (2007) on the effectiveness of reformulation, it was found that traditional direct error-correction approach was more effective in improving L2 learners writing accuracy.

One problem associated with reformulation is that reading the whole text to rewrite all the parts is time consuming for teacher, and it may not be possible to have native teachers in some L2 learning contexts.

## **LEARNERS' RESPONSE TO FEEDBACK**

Error correction in EFL writing classes can be used as a consciousness-raising activity (Naeini, 2008). She believed that feedback on errors and form-focused instruction would draw learners' attention to the form, and not only the meaning, of the language they are using for communication. Lightbown (1998) believed that focusing on form in the class can help second language acquisition. He suggested teachers that explicit explanation about the form of the language can be facilitative in L2 learning.

So, a successful corrective feedback can help learners to uptake and correct their uptake (El Tatawy, 1998).

## **EFFICACY OF WRITTEN ERROR TREATMENT**

There have always been debates on the efficacy of written error correction. Valero et al. (2008) believed that errors should be corrected because if they are left uncorrected they become "fossilized", and Antos et al. (2010) found positive effects of corrective feedbacks on learners' noticing and feedback. On the other hand, Krashen (1982) believed that continuous correction can make affective filters which prevent L2 students to practice writing.

Grammar correction is an inevitable part writing correction for many teachers, but Truscott (1996) argued that correcting grammatical errors could be disadvantageous in improving learners' writings. He then discussed that students whose errors are not corrected will develop more positive attitudes toward writing, and are willing to write more in comparison with students that every little grammatical errors of their writing have been corrected. This positive attitude encourages students to write more, and in long term they would make better writers than students who are corrected continuously and write less. Time is another important factor for language learners and teachers, so to save time Truscott (1996) believed that grammar should not be corrected in writing; learners whose grammatical errors are constantly corrected spend more time to think and correct their mistakes and will have less time to spend on "productive learning objectives", and teachers who spend too much time correcting grammatical errors can use this time to focus more on "productive processes". So, he suggested extensive reading and writing to practice grammar and to develop accuracy of L2 writers rather than grammar correction.

On the contrary, Ferris (1999) believed that error correction effectively improves learners' writing accuracy, and what Truscott (1996) claimed to be harmful or ineffective is poor error correction, not the effective one.

Truscott (1999) in support of his previous findings claimed that no positive impacts of the error correction that previous studies suggested can help learners to overcome the negative effects of correction. Beuningen et al. (2012) studied the impact of error treatment on L2 learners' writing and found that "comprehensive correction" can help students to improve their writing accuracy.

Hashimoto (2004) discussed that not all errors should be corrected. He believed that the focus of error treatment should be on frequent errors, the errors related to the topics that learners have already studied them in the L2, and the errors that correcting them would prevent communication failure. By frequent errors, he meant those errors that are repeated many times when learners are learning a new language, and emphasized that correcting repeated errors and allocating more time to these types would be more beneficial than correcting all errors. Errors which learners have already studied about should also be corrected by teachers. Hashimoto (2004) mentioned that students will be confused if teachers do not correct the errors learners have learnt their structure in their lessons. For the last factor in error correction, error gravity, he classifies errors to two categories of "local errors" and "global errors". Local errors are the structures which seem correct according to the L2 rules, but not used by native speakers. And global errors are those structures that prevent successful communication and may cause misunderstanding. Then, it can be concluded that global errors should be prioritized to be corrected.

Studying the controversies in the outcome of different studies, Guénette (2007) argued that the conflicts in the findings can be due to the different methodology and the effects of the uncontrolled variables.

## **SUMMARY AND CONCLUSION**

In this review error, different systems of classifying them, errors of writing, and their treatments were studied. As different kinds of errors are committed in L2 writings, different ways are also available for correcting or treating these errors. Error correction should pay attention to learners' affective factors, their purpose of writing in L2 and the context in which they are learning the language.

The impact of error treatment on students' writing has been widely studied in the literature. Results of numerous studies ((Bitchener, 2008; Bitchener et al., 2005; Ellis et al., 2008, Chandler (2003) and Ferris (1999) showed that error treatment had positive effects on learners' writing accuracy, and also helped noticing and uptake. There have also been studies (Truscott, 1999, 2004, 2007; Truscott, & Hsu, 2008) that argued against error treatment and believed that error correction can cause affective filters which is harmful for the process of learning to write.

It is also discussed that the disagreement on the outcome of the research may be due to the different research designs of the previous studies (Guénette, 2007).

### ABSTRACT

The present study, attempted to examine the relationship between gender and theoretical knowledge of translation and practical skills on translation in Iranian translators. For this purpose, 35 Master of Art students both males and females studying English translation were selected from Mashhad Ferdowsi University in Iran. In order to collect data two tests were applied: one made up of questions selected from the Ph.D and M.A entrance exams together with a test of actual translation from Persian to English and the reverse. Data analysis and statistical calculations through T-TEST, one way ANOVA and Pearson Correlation revealed that Gender was an important factor on theoretical scores, while it was not an important factor on practical translation (English to Persian and Persian to English translation).

**KEYWORDS:** Translation, theory, theoretical knowledge, translation Studies, gender

### INTRODUCTION

Science and technology are developing rapidly and cultural, economic and political growths make some difficulties for human adjustment on information. The language barriers and assimilation of terms in different languages are some of these difficulties we can mention to. Overcoming these barriers is vital and translation can play this role. Entering globalization in modern world we can say that translation is a fundamental issue. In the process of exchange and cross communication translators are central. As Levy (1963) said translation studies have emerged as a new international and academic field. In the fifties and the seventies centuries translation studies shaped the basic part of applied and general linguistics which were seen as the only source of translation studies. Holmes (1988) was the first to offer a framework for this regulation. He divided translation into two principle area: translation theory and applied translation studies dealing with activities such as the training of translators and the condition of translation aids for translators as well as translation policy. The need for systematic study of translation comes directly from the problems happening during the actual translation process and it is essential for those working in the field to bring their practical experience to theoretical discussion.

Many scholars attempt to bridge the gap between theory and practice. Today, the dominating view is that theory and practice should be integrated (Leinhardt et al,1995). According to Hill (2002) several models of professional education on the continuing cycle of interaction between theory, practice and reflection as the way to create changes in students' thoughts and practices. Another effective new model of professional education is the 'realistic approach' that directs the theory towards the largest challenges of practice (Korthagen & Kessel, 1999; Korthagen, 2001). The increasing awareness of the new approaches in translation education has made us interested in the notion of relationship between theory and practice in translation. The study of translation and the training of professional translators is an important aim of scholars. The need to the process of teaching and learning is obviously felt in translator and interpreter training programs around the world.

This study will investigate on one hand, how academic theories and beliefs are reflected in the work place and in a translated texts, on the other hand, it investigates the effect of gender on translation of English to Persian and Persian to English. This study will help the students of translation to get familiar with the possible challenges like including theory into practice and the effect of theoretical knowledge on translation. The study is useful for the students

majoring in English translation and those who are interested in translation studies. This study tries to help translators and students of translation to include theory and practice in their translations and show some ways to fill the gap between theory and practice. It also aims at outlining new, realistic ways for the courses of translation at Universities and exploring the current relevance of the theory to the practice of translation,

### ***Statement of the problems***

Problems encountered during the actual translation process show the necessity of systematic study of translation. It is essential for those working in the field to bring their practical experience to theoretical discussion. Separation of theory from practice is a problem for translation. Baker (1992, p.248) mentioned that as a discipline, translation studies has reached a stage in its development where it was both ready for and needed the techniques and methodology of corpus linguistics in order to make a major jump from prescriptive statements, from methodologies to theorizing, and from individual and fragmented pieces of research to powerful generalizations. In that case the distinction between the theoretical and applied branches of the discipline will be apparent and believable.

The realization that translations are never produced in a vacuum, regardless of time and culture, and the desire to explain the time and culture bound criteria which are at play, result in a shift away from a normative and prescriptive methodology towards a descriptive methodology for a study of the subject (Hermans, 1985).

The situation for the realization of equivalence differs from one language culture to another. A valid strategy for translation in the past is not acceptable. Varieties of linguistics continue to govern the field in the 1990s. Students spend hours taking course but when they confront with direct situations, they are unable to use their learning in practice. "There is no balanced curriculum for translation theory and practice to provide a solid grounding in a professional setting. If a particular kind of source text couldn't be interpreted accurately by a translator, the target text does not achieve its particular function. The gap between theory and practice is the main problem. There is no acceptable curriculum program to bridge this gap. There are big gaps between the needs of translation training and the points offered by theory. From one aspect, students are disappointed at being troubled with theoretical reflections (translation theory and general linguistics) which they feel have nothing to do with the activity of translating, and from another aspect, scholars talk irreverently of translators who are unwilling to investigate the theoretical basis of their work, therefore reducing it to a simple practical skill" (Snell-Hornby, 2006).

Toury (1995, p. 69) claims that achievements of actual studies can themselves supply us with clues as to necessary and possible methodological improvements' and that if we hold up research until the most systematic methods have been found, we might never get any research done, the basic methodological problem is still unresolved. In general, translating needs to unite theory and practice in order to be successful.

### **REVIEW OF LITERATURE**

Translation is a complex activity which requires both great patience and impeccable mastery. It can be a process or a kind of product. These two aspects of translation are interdependent and interrelated. Invisibility" is the term Venuti (1995, p.1) used to describe the translation and translator's situation. According to him a translated text, whether prose or poetry, fiction or nonfiction, is judged acceptable by most publishers, reviewers and readers when it reads fluently, when the absence of any linguistic or stylistic specialty makes it seems obvious giving the appearance that it reflects the foreign writer's personality or intention or the essential meaning of the text (Venuti 1995, p. 1). According to Venuti (1998, p. 135) translation is powerful and it can represent foreign cultures. The selection of foreign texts and development of translation strategies can make domestic traditions for foreign literatures, therefore show access, exclusions and peripheries that deviate current in the foreign language.

The first efforts at theory can be traced back over 2000 years to Cicero and Horace. To the second half of the 20<sup>th</sup> century this discussion continued when more systematic analyses were undertaken by western European theoreticians. These systematic analyses, which raised translation studies from its role of being a language learning activity, centered on theories of translation in new linguistic, literally, cultural and philosophical contexts (Munday 2001, p.162).

In the 1970s, changes took place that translation theory and translation science transformed into "Translation Studies". This term was coined by Holmes in 1972, the use of a label that had proved productive in the field of

humanities (Holmes, 1988, p.70). Some scholars, (Hermans, 1999, preface), for the first time looked at translation in a descriptive term, so translated texts were noticed as texts in their own right (Even-Zohar 1978).

According to Benjamin (2008) there are many reasons to say that developing the pragmatic aspects of a linguistic theory of translation is important. First, pragmatic had been ignored by the linguistics who tried to create a general theory in the 1950s and the 1960s. Second,

A pragmatic theory can be used more than any other theories like semantic, syntactic or phonetic, because they are considered as a micro-linguistic theory and a micro-linguistic theory of translation is impossible, while micro-linguistic practice is best left to itself or to translator trainers and teachers. A pragmatic theory of translation must be illustrated, and illustration involves the micro-linguistic aspect. The terms of theory and practice are used frequently by scholars and translators. Some translation scholars maintain that they are working together while in the sight of some others there is a difference between theory and practice. Many studies suggest that there is a gap between what is taught by university and the action of translation. An interesting discussion of the theory and practice is given by de Beaugrande (2000, p.27). He declares that the relation between theory and practice should be dialectical by the nature, where the two sides interact and guide each other as they co-evolve in strategic contact. Several models of professional education focus on the continuing cycle of interaction between theory, practice and reflection as the way to create changes in students' attitudes and practices (Hill, 2000, p. 54). According to Vreugdenhil (2000) the theory-practice problem is a 'theory-student' 'teacher-practice' problem. To deal with it he developed a schedule, including three components:

- The objective theories or, more in general, the information available;
- The subjective theories of student teachers;
- The everyday practice as experienced in schools. According to his assumption, two inter-linked process of adaptation between the three components will bridge the gap between theory and practice. The first process consists of student teachers restructuring the theories that are instructed to them. Consequently, student teachers have to formulate for themselves meaningful knowledge they can apply in the classroom. They have to be trained to act in the class in accordance with their renewed knowledge. They can develop their subjective theories about teaching. The second process is matching their subjective theories to the particular situation. After investigating they can formulate a set of rules to act adequately. To bridge the gap between theory and practice we have to take into account what is already in the mind of the student teachers about the teaching (Vreugdenhil, 2000, p. 3).

Kiraly (2000), points out there is sufficient room for the more consistent accomplishment of social practical approaches in translator training, with large parts of the program still conquered by teacher-centered methods. He calls for a 'much-needed' shift in translator education (2000, p.27). According to him the goal of translator education must be to help students develop their own self-concept and to help 'in the mutual production of individually adapted tools that will allow every student to role within the language negotiation community leading graduation' (Kiraly, 2003, p.49).

Kiraly believes that learning should take place as a mutual social procedure in all translation relations, not just in special work assignments. In that environment, the trainer's role is like a facilitator and should support students to find solutions. In translation teaching focus has been on the translation theory and translation practice. It means that Students became familiar with theories and then operated within a special theoretical approach for example functionalist approach. Translators produced a target text according to the source text and the culture and tradition in a country. Kiraly (2000) distinguishes between translation competence and translator competence. According to him translation competence signify all the specific skills need to produce a right target text, while translator competence means 'knowing how to work within the various overlapping communities of translators and subject matter expert for completing work mutually, to proper knowledge, norms and conventions; and to affect to the growing conversation that represents those communities' (Kiraly, 2000, p.13).

In Hong Kong and Taiwan, especially in Hong Kong, the teaching of translation as a university major began at an earlier time. The first translation program in Hong Kong started in Chinese university of Hong Kong (CUHK) in 1972. Li Defeng in Hong Long carried out interesting and critical examination of the curriculum design and teaching methodology of specialized translation courses (including courses on commercial translation, government document translation, science and technology translation, mass media translation, and legal translation). He made valuable suggestion on how to improve the course content and teaching methodologies along with educational curricular theories and thoughts on translation teaching (Li Defeng, 2000;2002;2003;2005). According to Sylvia Bernardini (2004, p.19-22), people do not fully understand the important distinction between translator training and translator education. A vast expansion in specialized translating and interpreting programs has soared at both undergraduate and graduate level. These programs, which attract thousands of students, are mainly oriented towards training future professional commercial translators and interpreters in UK.

## **RESEARCH QUESTIONS**

The following research questions are posed for the purpose of this study:

1. Is there any relationship between gender and theoretical knowledge?
2. Is there any relationship between gender and practical skill on translation?

## **METHODOLOGY**

### ***Participants***

Participants selected for this study were chosen from M.A students of Ferdowsi University of Mashhad. A total of 35 students including: 7 males and 28 females. The students who participated in this study were enrolled in the third semester so they had already passed two courses on translation. All the participants were Iranian and factors such as age and sex were assumed to be randomly distributed. Both males and females were given the same questions. Nearly 30 minutes was given for theoretical test. The questioner at the end included some questions showed participant's interest in translation, their experience on translating and the years they have been translating. Participants were in different ages from 23 to 40.

### ***Instruments***

The results of this study have been drawn from two tests, theoretical and practical. The theoretical test, a collocation composed of 30 multiple-choice items adopted from M.A and PhD entrance exam, held in the years 2011, 2012, public and Azad University course in Iran. This test was chosen from M.A and PhD entrance exams, because they are made by the most qualified test makers and scholars of the country and altogether the test could be considered as valid. Selected questions were those only concerning translation theories and not linguistic or general proficiency. Students answered 30 questions related to theories of translation. The time given was 30 minutes for 30 questions. With this sample test just their knowledge on translation theories was examined.

A variety of texts on the scope of human science were selected to check the participants' translation proficiency. Selected texts were about 40 lines including two parts, English to Persian and Persian to English translation. This practical exam was their term paper, so they answered carefully. Some parts of these texts were unseen and some others were seen because their proficiency on vocabulary was not important for this test and just the students' proficiency in practical translation was the main point. They were free to use dictionary. Translation test was administered to all subjects at the end of the term. Their practical exam was written and scored by their professor considering the meaning and grammatical rules and instructions.

### ***Procedure***

In this study the performance of students in university course on theoretical and practical aspects was compared to assess the correlation between their theoretical knowledge and their practical skill in gender groups. Prior to the practical experiment on translation, the subjects were given a theoretical test as it was mentioned, a multiple choice test with 30 questions related to translation theories to evaluate students proficiency on theories, then at translation second stage at the end of the term they passed a practical exam to compare their dexterity on practice and theory.

A Practical test including Persian to English and English to Persian was employed to check their proficiency on both kind of translation. It consisted of 40 lines of a human science text to check just their ability on techniques of translation, not their vocabulary. The practical test was assigned by their professor considering grammatical points and meaning. Before the treatment of the participants (students), their professor and the researcher held a meeting and the researcher gave an overview of whatever needed to be done in the study helping them understand its core principle. The data were collected through these two tests. The purpose of this study was to help translators and students in translating field, using theory and practice at the same time specially theories which are more practical and functional. Munday (2001, p. 79) mentions that Skopos theory focuses on the purpose of the translation which establish the translation methods and strategies that are to be employed to produce a functionally adequate result. Therefore, in this theory we should know why a source text should be translated and why the function of the target text will be important for the translators. Munday writes that an important advantage of skopos theory is that it makes possible for a translator to translate the same text in different ways according to the purpose of the target text (ibid, p. 80). Functional approaches in translation studies can help translators to view the text as a kind of

communicative unit and awareness of functional theories of translation make better the quality of students' translation.

## RESULTS

To verify the scores of theoretical test and practical translation from English to Persian, a one-way ANOVA test was calculated.

*Table 1: distribution of frequency and percentage of the sample scores according to translation from English to Persian and Persian to English*

Translation scores	Eng. to Per.	Per. to Eng
0 - 24.9	5(14.3%)*	5(14.3%)
25 - 49.9	9(25.7%)	10(28.6%)
50 - 74.9	13(37.1%)	12(34.3%)
75 - 100	8(22.9%)	8(22.9%)
Total	35(100%)	35(100%)

*\*Number(percent)*

The score is expressed in percentage to make all scores comparable. So the raw score is not important, only the percentage.

*Table 2: English to Persian. \* Persian to English. Cross tabulation*

			Per. to Eng.				Total
			0 - 24.9	25 - 49.9	50 - 74.9	75 - 100	
Eng. to Per.	0 - 24.9	Count	2	2	1	0	5
		Percent	5.7%	5.7%	2.9%	0%	14.3%
	25 - 49.9	Count	3	3	1	2	9
		Percent	8.6%	8.6%	2.9%	5.7%	25.7%
	50 - 74.9	Count	0	2	6	5	13
		Percent	0%	5.7%	17.1%	14.3%	37.1%
	75 - 100	Count	0	3	4	1	8
		Percent	0%	8.6%	11.4%	2.9%	22.9%
Total	Count	5	10	12	8	35	
	Percent	14.3%	28.6%	34.3%	22.9%	100%	

### *Kappa Coefficient agreement and statistical result*

		Kappa coefficient	P-value
Measure of Agreement	Kappa	.096	.343

Measure of agreement in Kappa in this study is (Kappa=0.096). In other words, the agreement between two variables is low so it is not significant (according to table 2).

*Table 3: distribution of mean scores for theory in gender groups examined.*

Theory	Sex	Mean	SE
	Female	18.60	1.29
	Male	25.70	3.70

*Table 4: the result of statistical exam, comparing theoretical scores in two groups by T-Test*

			T-Test Result
t	Df	P-value	Mean Difference
-2.251	33	.031	-7.10143

Mean difference in gender groups (Male and Female) is compared. It is obvious from the table that mean difference of theoretical scores in females is  $18.6 \pm 1.29$  and mean difference for male is  $25.7 \pm 3.7$ . Mean difference of theoretical scores in male and female is 7.101. According to the table there is a significant difference in theoretical scores between male and female, ( $p=0.031$ ).

***Mean score of translation in gender groups***

Mean score of translation (from Persian to English and English to Persian) in males and females is presented in above table.

Tables 5 and 6 show the scores in two groups are very similar. Mean score of practical translation in females is  $50.32 \pm 4.00$ , while this score in male is  $50.30 \pm 6.39$ .

*Table 5: distribution of mean scores for practical translation in gender groups examined*

	Sex	Mean	SE
Practical translation	female	<b>50.32</b>	<b>4.00</b>
	male	<b>50.30</b>	<b>6.39</b>

*Table 6: the result of statistical exam, comparing Practical translation scores in two groups by T-Test*

T-Test Result			
t	Df	P value	Mean Difference
<b>.002</b>	<b>33</b>	<b>.999</b>	<b>.01571</b>

The result of these score makes clear that there is no significant difference in two groups. ( $p=0.999$ ).

***Mean scores of English to Persian translation in gender groups***

As table 9 displays Mean scores of English to Persian translation in females are compared to the Mean scores of English to Persian in males.

*Table 7: distribution of mean scores of English to Persian translation in gender groups examined*

	Sex	Mean	SE
Eng. to Per.	Female	<b>50.47</b>	<b>4.43</b>
	Male	<b>50.59</b>	<b>8.97</b>

*Table 8: the result of statistical exam, comparing English.to Persian scores in two groups by T-Test*

T-Test Result			
t	Df	P-value	Mean Difference
<b>-.012</b>	<b>33</b>	<b>.990</b>	<b>-.11929</b>

There is no significant difference in both groups. Mean score in females is  $50.47 \pm 4.43$ , while this score in male is  $50.59 \pm 8.97$ . Statistical test shows no significant difference in these groups. ( $p=0.99$ ) p value is greater than 0.05.

*Mean scores of Persian to English**Table 9: distribution of mean scores for Persian. to English translation in gender groups examined*

	Sex	Mean	SE
Per. to Eng.	Female	<b>50.16</b>	<b>4.77</b>
	Male	<b>50.01</b>	<b>6.78</b>

*Table 10: the result of statistical exam, comparing Persian to English scores in two groups by T-Test*

T-Test Result			
t	Df	P-value	Mean Difference
<b>.015</b>	<b>33</b>	<b>.988</b>	<b>.15071</b>

In this table we can see that Mean scores of Persian to English translation in both gender groups are similar to their scores in translation of Persian to English, nearly 50. As it is shown in the table, comparison of translation scores in males and females, Mean scores of translation in females is equal to  $50.16 \pm 4.77$ , while this scores in males is equal to  $50.01 \pm 6.78$ . P-value of observed T-Testis ( $p=0.988$ ), greater than .015, as a result there is no significant differences between two mentioned groups' scores. According to the scores of practical translation (English to Persian and Persian to English) in both genders and T-Test was resulted that:  $H_0$  is accepted, because T observed is smaller than critical.

**DISCUSSION**

The main purpose of this study was to investigate the relationship between gender, theoretical knowledge of translators and their practical translation skills (English to Persian and Persian to English). Consequently, a group of M.A students majoring in translation were selected. The finding of this study shows that students' practical skill in translation was better than their theoretical knowledge. The result of students' scores in practical translation was compared to their scores in theoretical exam in two gender groups in order to investigate, whether gender had any significant effect on students' translation skill and their theoretical knowledge. This study shows that there was not any relationship between gender and translation capability, but there was a direct relationship between gender and theoretical knowledge.

**CONCLUSION**

This study attempts to undertake an approach seeking to know the difference between the translators' theoretical knowledge and their practical skill in gender group, on translating field at the university level, undergraduate students. The finding of this study shows that students' practical skill in translation both male and female was better than their theoretical knowledge, but male's theoretical scores were better than females.

Based on the findings of the present study, we can conclude, that gender is an important factor on theoretical scores.

**LIMITATIONS OF THE STUDY**

Like any other research, some unavoidable limitations, which may raise new questions for further researches in the same field in the future, will be imposed on this research. In addition to the small sample size and its short duration, some limitations are present in this study. Variables such as age and personal variables are not taken into account due to the limited number of the available participants. Another important restriction in this study can be related to the reliability of the theoretical test, due to lack of any other sources.

#### **ACKNOWLEDGEMENTS**

The researchers would like to thank all members who participated in this study. It is worth mentioning that this study has not received any funding from any sources except the researchers' own financial sources.

### ABSTRACT

This study is an attempt to investigate the effect of weblogs on the improvement of Iranian EFL learners' writing skill. To achieve this goal, the researchers designed a weblog, which was shared by the treatment group of the study; the study had 50 EFL students divided into two groups of treatment and control. Mainly two steps were taken during the study, a pre-test and a post-test. The pre-test administration was due to check the proficiency of the participants and the post to measure the impact of the study process. The data obtained from tests and questionnaires throughout the academic year 2012, and from comments made on the blog, revealed that the students responded positively to the use of the blogs inside a class. It was found that the blog helped them to improve their writing through the collaborative learning environment that was established and through the process of writing that was adopted. There was consensus that writing for an audience and peer review contributed to the development of the collaborative learning environment and this was conducive to developing writing skills.

**KEYWORDS:** Weblog, CMC (Computer Mediated Communication), Blogger, Webopedia, Blog

### INTRODUCTION

The increasing use of the Internet over the past few years and its expansion to educational contexts has provided language learners with new opportunities for interaction outside classroom setting. Vygotsky (1978) confirmed this interaction as a key factor in enhancing language skills from a socio-cultural view of learning. Today, almost everyone has the experience of communicating with a peer via computer in one form of online communication or another, and in recent years, the use of such online communication has become very common in educational settings in general, and language learning in particular (Gorbanpoor, 2013). In language learning, online communication increases learners' access to comprehensible input, and provides them with opportunities to practice producing the language (Warschauer, 1996). This is especially helpful in contexts where the foreign language is not widely used and learners do not have much exposure to language outside classroom setting. In addition to the mere provision of the learners with new opportunities to interact with others, online communication is said to have other advantages as well, which might make it more efficient in some aspects than the face-to-face communication taking place in the classroom.

Research by Bolke (2003) suggests that in online communication, participation on the part of learners is increased and involvement is more equalized among learners, unlike traditional classroom settings in which usually a small group of students tended to dominate the whole class interactions. The teacher's role is not anymore one of the authorities disseminating knowledge, rather it changes to a moderator of discussions, thus increasing learners' participation (Heift, 2007).

With the advent of computer-based technology, and its applications to teaching and learning, many students practice their writing skills synchronously as in chatting, instant messaging, and live discussion boards (Smith, 2006) or asynchronously as in emailing and blogging. Therefore, EFL teachers use these Computer-Mediated Communication (CMC) platforms to develop and improve students' English learning and collaborative skills in the cyberspace. The internet has provided a chance for writers to express their feelings and voice their ideas in a variety of ways such as

personal blogging, Face-book, Twitter, and other similar social networks. Bloch (2002) maintains that ELT research has tapped into the pedagogical implications of blogs for learning and teaching writing in English. Kim (2008), who has laid the theoretical foundations of blog use in educational contexts, has also underlined the significance of blogging.

Halik (2010) has considered blogs as an effective replacement for all CMC applications to English learning, taking into account socio-technical systems theory. In this concern, he has adeptly noted that the popularity of blogs among young people has made them interesting to educators seeking to integrate CMC tools at the university level. He has also asserted that these kinds of tools are seen as having the potential for enhancing student engagement and providing an environment for collaboration and creation of knowledge. Indeed, the emergence of these technologies encourages teachers to re-examine and redefine their goals for the classroom as king and demonstrating how established teaching practices can be expanded with the introduction of new technological practices. The interactive feature of blogging nominates it not only as a textually social environment, but also as a practice inducing a writing orientation embedded in a social network orientation. Based on the above-mentioned premises, the present paper aims to investigate the effect of using weblogs on Iranian EFL learners' writing skill and their attitudes towards English learning.

### **PURPOSE OF THE STUDY**

This study is designed to find out if the implementation of blog-based assignments as an extra and modern form of out-of-class activity would have any significant effect on learners' writing ability. To achieve this goal, the researchers designed and launched a weblog for EFL learners participating in the study. The present study, thus, was an endeavor to explore how Iranian EFL learners responded to the use of blogs as a tool to improve their writing skill.

### **METHODOLOGY**

This is a quasi-experimental study to examine the effects of blogging (blog-based writing activities) on the writing skills of the Iranian EFL learners. To accomplish the goals of this study, the researchers followed a number of steps. At first, in order to check the homogeneity of the participants, a standard proficiency test was administered to make sure the participants were homogeneous in terms of their proficiency level. Once the preliminary test was administered and the group members were selected out, the researchers designed a weblog called "Research.blog.com" which was launched in the Blogfa.com, a powerful service provider to design and manage personal weblogs. The main objective of this weblog was to compare the members of treatment group, as the main users of this weblog, with the members of the control group who received writing instruction through the traditional classroom-based method.

#### ***Participants***

The participants of this study were 60 students (23 males & 37 females), all of the subjects majored in English Translation at Islamic Azad University (Islamshahr branch). In order to have the subjects fully accompany through the research, I tried to give a general explanation of what will be going on through the research at the beginning of the study. The participant's age ranged from 20 to 27. The subjects were randomly divided into two groups of 30. The decision as to which of the two groups being experimental and which one as control was also made randomly; thus, the first group treated as experimental and the second one as control.

To make sure that the students placed in the experimental group would have no problem with blog-based activities, they were asked to check if they all had email accounts and access to the Internet at the beginning of the course. They, rather, all had the basic knowledge about using the Internet, and since signing up and checking email and blog do not require much techno-literacy on the part of users, they did not need any special instruction in this regard. In regard with the control group, they were supposed to do their writing activities as scheduled and submit their jobs to their teacher weekly. Simply put, the distinctive feature between the first and the second group was the setting of writing where the control group used the traditional paper-based writing methods while the experimental group employed the computer-based writing techniques.

### ***Instrumentation***

*Pre-Test:* An essay-type test was administered to check the general proficiency of the participants. As the test proved that the majority of participants were homogeneous, they were divided into two equal groups in terms of their scores on the test. All the way through the research, the students in the experimental group involved were in an active methodology in dealing with the writing course syllabus and participating in blogs to practice writing skills and the control group followed the traditional class-based instruction methods, such as using paper-based dictionaries etc. In sum, the purpose of pretesting students' was to establish both groups' equivalence on English proficiency before the experiment, and to use the pretesting information for later comparisons with the post test. The test was administered in 50 minutes.

*Class blog:* The blog created in this website was accessible to the participants, but as for posting new topics and even for commenting on the posts, the blog provided a feature which let the administrator customize the people who were allowed to contribute to the content by posting new topics or comments. In other words, the administrator could choose to allow everyone to post on the blog, or else, he or she could moderate the privacy of the blog and let only the invited people who were members of the blog to submit new posts.

The main posts of the blog started by the administrator (i.e. one of the researchers), stating the topics about which the participants were supposed to write. They were required to write and submit their writing activities in the comment bar of the blog. The participants were also asked to check their classmates' activities and send their comments as well. The editing window of the blog comment section included a spell-checker feature, which prevented the participants from doing probable spelling errors by underlining the misspelled word. However, it did not have the more complex features included in word processor programmers such as Microsoft Office Word, which provides users with more advanced writing features like grammar checker, thesaurus, etc.

Since the research was already programmed for eight weeks, eight topics were uploaded on the weblog screen by the researchers. Before choosing the topics, there was a consultation between the researchers and the participants, because the motivation of the participants was important to the researchers, as a result of our consultation, the topics were mostly dominated by social topics. The given topics were as bellow:

- . Write about your last trip
- . Write about your city
- . How can we make good friends?
- . Regarding genders, which one is adept at language learning, males or females?
- . Write about your social troubles.
- . Where do you wish to spend your next vacation?
- . What is the dress code in your country? (Clothing do's and don'ts)
- . Is staying in shape important to you?
- . What do you usually do to keep fit?

The mentioned topics were presented to the experimental group within eight weeks. At the beginning of each week, the researcher started a topic in a new post and students were to contribute it by writing their own posts. They needed to submit at least three posts for each topic, either replying to the teacher's original post at the beginning of the thread, or commenting on their other friends' postings.

Since the blog featured threaded (nested) comments, students were able to choose to write in response to the original post by the teacher at the top of the thread, or else to write a comment in response to other classmates' posts (comments and sub-comments). This way they were encouraged to read all the posts by other members, which was a very effective strategy to make reading and writing connections. It should be mentioned that the treatment group was not limited only to a certain number of topics. They were also asked to surf the Internet and share the interesting materials they found with the whole group. This method proved to be very useful, since the participants in treatment group were engaged in different techno-based activities, like emailing, commenting, chatting and so on.

*Post-Test:* At the end of the course, learners in the two groups took a writing test around the topics and grammar points covered during the treatment. The purpose was to check if there was any significant difference between the average scores of the two groups' performance on writing test, and if the treatment had any effect on the writing proficiency of the learners in experimental group. This test also was designed to find out the extent of advance in the

control group who had been receiving the traditional classroom-based writing instruction. The post-test required the participants to write a paragraph of at least eight sentences long. The whole test-time was about 50 minutes.

During the study, the participants in both groups were to write on the same topics that the researchers uploaded for the experimental group through the weblog and the control group through the class sessions respectively. But, the differentiating border between the two groups was in the process of writing and the sources that they could refer to.

As part of the post-assessment, the researchers also tracked the quantity of group posts and comments, considered the quality of writing and effort and assigned grades accordingly. All the posts and comments were later analyzed in class for linguistic accuracy. Together with the experimental group instructor, the researchers also organized in-class discussion encouraging participation reflecting on the content of the flow of messages exchanged what they had learned through specific entries and the impact of the entry on its readers. To raise the reliability of the results, essay writings were judged by two instructors.

### **Procedure**

The researchers conducted the proficiency test on the same day for both groups. The T-test was carried out to investigate the difference in performances of both groups, which indicated almost similar performances for the two groups. To remove any contingent test ambiguities, the participants were asked to raise their questions before test administration. The research was conducted during the second semester of Iranian Academic year of 1391 coinciding with the second half of 2012 and it took a period of eight weeks as I presented a topic for a week.

At the start, the participants in the experimental group were told they would be participating in a Weblog-based writing research activity, consisting of some topics presented by the researchers on the weblog, which was shared between the researchers and the treatment group. The participants in treatment group were to log on the Internet and check for the topics to do their writing activity using their EFL knowledge. Since the main goal of the study was to investigate the development of writing skill for the treatment group, therefore they were told to get their best to use computer software's like "Word spell checker" and Internet as well. Besides, the control group was given the same topics to write about without using computer and Internet and they were asked to write just using their own knowledge and paper-based dictionaries.

In order to keep the research atmosphere as real as possible and to motivate the participants, we allocated 10% of their final writing score for this study. To make the participants familiar with the whole procedure of the study, the instruction was orally given in both English and Farsi. For the sake of eliminating any sort of probable misunderstandings, illustrative examples were given prior to the study.

## **RESEARCH FINDINGS**

### ***How did Iranian EFL students respond to the use of blogs as a tool to improve their writing skill?***

*Pre-Test of Writing:* An independent t-test was run to compare the treatment and control groups' mean scores on pretest of writing in order to prove that the two groups enjoyed the same level of writing ability prior to the main study. As displayed in Table 2, the mean scores for treatment and control groups on pretest of writing were 68.40 and 68.20 respectively.

*Table 1: Descriptive Statistics Pretest of Writing by Groups*

Group	N	Mean	Std. Deviation	Std. Error Mean
Treatment	25	68.40	15.028	3.006
Control	25	68.20	15.177	3.035

The results of the independent t-test ( $t_{48} = .047$ ,  $P = .96 > .05$ ,  $r = .007$ ) indicated that there was not any significant difference between treatment and control groups' mean scores on the pretest. Thus, it can be concluded that the two groups enjoyed the same level of writing ability prior to the main study. The details for the independent t-test pretest mentioned on Table 2 and Graph 1 below.

Table 2: Independent t-test Pretest of Writing by Groups

	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	T	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Equal variances assumed	.007	.935	.047	48	.963	.200	4.272	-8.389	8.789
Equal variances not assumed			.047	47.995	.963	.200	4.272	-8.389	8.789

It should be noted that the assumption of homogeneity of variances was met (Levene's  $F = .007$ ,  $P = .935 > .05$ ). That is why the first row of Table 2, i.e. "Equal variances assumed" was reported.

Graph 1: Pretest of Writing by Groups

*Post-test of writing:* An independent t-test was run to compare the treatment and control groups' mean scores on posttest of writing in order to probe the effect of using blogs on the improvement of their writing skill. As displayed in Table 3 the mean scores for treatment and control groups on posttest of writing were 75.12 and 64.76 respectively.

Table 3: Descriptive Statistics Posttest of Writing by Groups

Group	N	Mean	Std. Deviation	Std. Error Mean
Treatment	25	75.12	13.752	2.750
Control	25	64.76	14.051	2.810

The results of the independent t-test ( $t_{(48)} = 2.63$ ,  $P = .011 < .05$ ,  $r = .35$  it represents a moderate to large effect size) indicated that there was a significant difference between treatment and control groups' mean scores on the posttest of

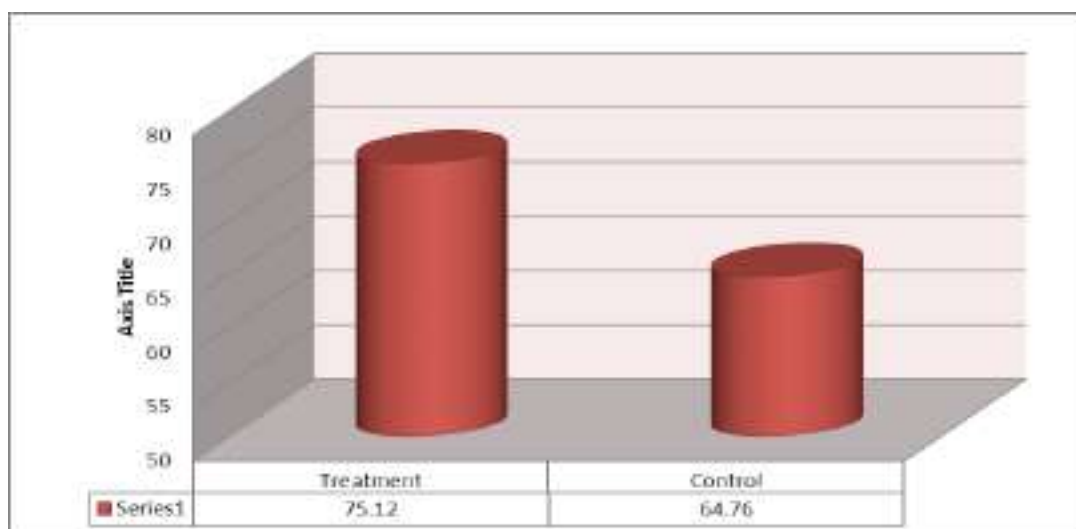

writing. Thus the first null-hypothesis as using blogs does not have any significant effect on the improvement of the writing skill of the students was rejected. The treatment group following blogs writing outperformed the control group on the posttest of writing. The details for the independent t-test posttest elaborated on Table 4 and Graph 2.

*Table 4: Independent t-test Posttest of Writing by Groups*

	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	T	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Equal variances assumed	.010	.922	2.635	48	.011	10.360	3.932	2.454	18.266
Equal variances not assumed			2.635	47.978	.011	10.360	3.932	2.454	18.266

It should be noted that the assumption of homogeneity of variances was met (Levene's  $F = .01$ ,  $P = .922 > .05$ ). That is why the first row of Table 4, i.e. "Equal variances assumed" was reported.

*Graph 2: Post-test of Writing by Groups*

#### *Reliability Indices*

Table 5 indicates the reliability of the test based on K-R21 reliability indices.

*Table5: reliability indices*

	N of Items	Mean	Variance	K-R21
Pretest	100	68.30	223.439	.91
Posttest	100	69.94	216.711	.91

## DISCUSSION

The feedback that the researchers received through having interviews with the participants indicated that web-blog was an appropriate media to use to improve the students' motivation in writing. It was because the web-blog can challenge students to write texts and its use was not complicated for the students. This statement is in line with Carreira (2006) who points out that the challenging materials that suit the learners' capability are important for motivating students.

There was also a set of facilitating factors that played an important role in mediating the motivation of the student teachers. First, the prior experience and habit of individual students regarding blogging determined their readiness for blogging. Those who already had the habit of sharing their daily life and thoughts in personal blogs seemed likely to embrace blogging. Second, the social and environmental conditions could also affect the level of engagement in class blogging. Since the students were already well acquainted with each other, there was a strong sense of community and social relationships among classmates, which served as an effective channel for doing blog-activities to share and communicate with one another. In this respect, this study supports the idea that the pre-existing social relationship can provide an impetus for online engagement (Kavanaugh, Carroll, Rosson, Zin & Reese, 2005). At the same time, the social resources available in one's immediate physical environment can encourage the adoption of academic blogging. For those students who were not familiar with blogging, a fellow student who was able and willing to provide help and support could be a valuable resource. On the other hand, lack of social support in one's physical context could serve as a strong impetus for using blogging as an alternative outlet for emotional release and reaching out for support. In this respect, our findings are in line with previous studies that show that inadequate social support available in real life engenders increased motivation and engagement with online groups (Turner, Grube & Meyers, 2001).

## CONCLUSION

In this study, the use of the blog encouraged the development of improved teaching and learning strategies to approach the skill of L2 writing and it is apparent that the benefits outweighed the drawbacks and challenges in the TEFL L2 classroom. The blog created an innovative, more engaging and more authentic experience for the students. Despite the issues surrounding confidence and trust, it was proved a user-friendly communication tool that was useful in the development of students' critical thinking skills through analysis of comments made from other students. The collaborative learning environment established allowed students to learn through modeling and through exposure to other students' opinions, ideas and perspectives. Furthermore, writing for an audience and the process approach to writing incorporating peer review, self-editing and revising undoubtedly affected the students writing quality.

The study confirmed the benefits of blogging in the language classroom mentioned by Arena (2008) regarding the students' choice of more appropriate language and the motivational aspect of realizing that one's voice echoes in distant parts of the globe. Writing for a purpose, i.e. self-expression and self-reflection in blogs for professional development has encouraged them to produce language more fluently. Although the purpose of the activity aimed at improving writing skills, readings skills are likely to have also improved. As Thorne and Pyane (2005) suggest, creative guidance from the instructor and collaboratively chosen activities are needed to integrate online writing in the university syllabus. This new learning environment and the meaningful context have raised high motivation in the students and will help them become life-long and more efficient learners.

## LIMITATIONS OF THE STUDY

The current study had the following limitations:

**Lack of blogging skills among Iranian learners.** While almost all of the Iranian students are familiar with the basics of computer and the internet skills, not everyone may be familiar with blogging. Therefore, this may introduce some problems during the program implementation.

**Log on difficulties in Iran.** There is always log on difficulties here in Iran, connecting to Internet is not feasible wherever and whenever the users wish. This may potentially hamper the implementation of this piece of blog-based research.

**Time limit of the study.** Due to educational limitations, the time limit of the study could affect the written production of the students. If the study time had been longer, the results might have been different.

**Gender imbalance.** The number of female and male students in language classes was not balance i.e. females outnumbered males.

## EFFECTS OF A BLENDED LEARNING MODULE ON EFL STUDENTS' ATTITUDES IN AN INTRODUCTORY READING COURSE IN AL-QUDS OPEN UNIVERSITY SETTING

**Ibrahim M. R. Al-Shaer**

*Al-Quds Open University*

### ABSTRACT

The purpose of this study was to investigate the impact of using blended learning (BL) in teaching/learning a reading comprehension course on English as a foreign language (EFL) students' attitudes and motivation. Twenty-seven students taking Reading I class at Al-Quds Open University (QOU) participated in the study. The class received instruction through a blended learning module (i.e. a mix of both conventional and computer-assisted methods). Participants were required to complete pre-and post-questionnaires to track their attitudes and motivation before and after employing computer-based activities. After the implementation of the intervention, comparison of the students' mean scores of the pre-and post-questionnaires showed a statistically significant improvement in the students' attitudes and motivation toward learning English and employing computer-based activities.

**KEYWORDS:** blended learning; e-learning, attitude, motivation, computer-assisted language learning.

### INTRODUCTION

The delivery of higher education nowadays is mired with challenges, foremost that of the need to teach more learners more efficiently, more cheaply, and with less staff. This has driven many institutions toward new technology, which – with its different forms of discussion boards, weblogs, synchronous chat environment, e-mail, instant messaging, online learning environments as well as social media Internet – has opened up new horizons in the world of education in general and language education in particular (Connell, 2006; Farmer, 2004; Fichter, 2005; Richardson, 2008). This has also offered learners a wide range of learning options and allowed them to easily exchange information and ideas, which is consistent with the growing interest not only with what people learn but also with how they learn. While some prefer to study on their own, others choose to study with peers. Some people favor using print materials; others prefer multimedia, which involve all the senses. That is, different learners enjoy different ways of learning which are widely known as “learning styles” or “learning preferences” (for more see Celce-Murcia, 2001).

In the same vein, Bates (1993: 221) stresses the need to choose the medium which best suits the given mode of presentation and the central composition of the subject matter. Learners may not always get equal benefits as some media may suit one group of learners but not suit another group, depending on their educational, social backgrounds, experiences, wants, needs, and cultural orientations. Despite their widely acknowledged advantages, for socioeconomic, pedagogical, psychological, or technical considerations, neither conventional face-to-face learning per se nor e-learning per se can be an exclusive path for effective learning. Al-Shaer (2011) recommended Al-Quds Open University (QOU) combine new technologies with the conventional mode of teaching and learning on the assumption that using such a blend can give the students the freedom to choose their preferred media.

Accordingly, all courses offered by QOU are taught using optional modern electronic learning tools as a supplement to the conventional methods of teaching through the academic portal, instructional materials, the Moodle system of administering learning, the system of virtual classes - Blackboard, and videostreaming. The university academic portal provides all electronic services and tools of communication for the electronic parts of the university courses via the synchronous and asynchronous forums of each course in addition to e-mail, file management, and announcements services which enable faculty members and students to communicate together on the one hand, and the faculty members and students with the university administration, colleges, and educational and technological centers. On the other hand, these conventional courses, which have an optional electronic component implemented through the electronic portal, are still evaluated in the traditional way in which students have paper assignments and exams.

More recently, QOU has adopted blended learning, a combination of e-learning and conventional face-to-face learning, to accomplish feasibility and maintain flexibility in time and place of learning. It is meant to establish an interactive multimedia environment in addition to the face-to-face meetings that suit learners' different wants, needs, and expectations. Therefore, QOU has introduced a new mode of electronic courses that embraces video streaming

courses; electronic template courses; and blended courses (electronic activities). The video streaming courses incorporate both conventional and electronic teaching. The conventional part has face-to-face classes while the electronic part has classes transmitted via videostreaming technology either directly or through recorded videos. They follow a timetable prepared at the beginning of each semester and are available for the students on the academic portal. The videostreaming courses have paper assignments; some courses, such as History of Jerusalem, are designed in the form of interactive electronic courses.

The electronic template courses are designed electronically using Moodle technology to administer the learning process. The course is completely designed by using various technologies such as video, audio, PowerPoint and templates.

The blended learning courses follow the units specified in the textbooks, which have been developed to facilitate interaction. The ease and clarity of these courses make the content absorbable. The course includes course management, study units, first and second activities, forums, and self-assessment questions. Some study units are electronically designed to be interactive by using tools to compile the content and the multi-media instruction. Due to the significance of reading in the learning process, program designers give the most attention to claims that blended learning offers supplementary and/or alternative options to develop EFL students' reading skills.

The system of virtual classes enables students to attend lectures synchronously and record them. Students can access these recordings later through Moodle. The electronic activity English courses offered in the current semester (1121) are reading (1); writing (1); ELT (1); and the Twentieth Century American Literature. To clarify the characteristics of this mode of courses, take for example Reading I which is offered for first year English major students who, despite studying English for at least eight years at school, still have problems with certain basic tasks such as finding the main idea of paragraphs, discovering the relationship between paragraphs in a text, providing a summary of a passage, or guessing the meaning of unfamiliar words. The new students' poor reading skills are among the concerns of administrators and tutors at QOU. It goes without saying that reading skills are very important in the context of language teaching and use. It is widely known that, as Durukan (2011: 102) suggests, "In the learning process there is a high correlation between reading comprehension and academic achievement."

## **STATEMENT OF THE PROBLEM**

QOU has recently opted for combining conventional learning with e-learning in various modes (e.g. virtual teaching/learning, video streaming, etc.) in certain English language courses offered for English major students. As stated above, this mode of learning is defined as 'blended learning'. The attitudes and motivation of EFL students who were used to conventional EFL learning at school need to be taken into account. As Tselios et al (2011) put it, "Little is known about students' perceptions in a blended learning setting", and as far as I know, no studies have been conducted in Palestine to investigate EFL students' attitudes toward blended learning. Therefore, this study will examine the impact of combining e-learning with face-to-face meetings in a reading comprehension course on those EFL students' attitudes and motivation.

## **THEORETICAL BACKGROUND/ LITERATURE REVIEW**

### ***Blended Learning***

Blended learning is generally defined as a mix of e-learning and conventional face-to-face learning (Young, 2002; Usta, 2007). Thorne (2003) views blended learning as a means of facing the challenges of modeling learning to suit the needs of learners by combining the best benefits derived from technological developments with the best advantages of interaction and participation obtained from conventional learning. In the same vein, Bersin (2004) takes blended learning as a way of supporting conventional education with electronic learning. It is meant to employ computer-assisted activities embedded in a conventional learning environment in order to help learners do the work to the best of their abilities. Bodie et al. (2006) describe blended learning as a method of teaching that makes the most of two or more complementary means to instruct the same content. In their view, the tutor is "experimenting

with blended learning” through mixing traditional classroom meetings with activities, discussions, and/or web-based modules.

Using blended learning in EFL has been the subject of much research, which has not produced consistent results. Some studies present a positive image of blended learning. For example, Burgon and Williams (2003) claim that blended learning helps boost students’ satisfaction with and interest in learning. In a comparative study of an accounting principles course, Vamosi et al. (2004) concluded that students’ satisfaction with online courses increased as the course proceeded as a result of getting more acquainted with the e-learning scheme, and their reactions toward the online courses were positive in the post course assessment. Similarly, in comparing a group of 251 students’ learning performance and satisfaction in a blended learning general health course with traditional face-to-face classroom instruction, Melton et al. (2009) found that students following a blended learning scheme significantly outperformed those following traditional instruction and expressed higher satisfaction levels.

In a similar study intended to investigate Greek university students’ attitudes toward blended learning, by using the Moodle learning content management system, in the context of a university course offered using a blended learning approach, Tselios et al (2011) found that both ease of use and perceived usefulness have positive effects on students’ attitudes toward use. In an investigation of students’ views on a blended learning environment, Akkoyunlu and Soylu (2006) found that students’ achievement and positive attitudes toward blended learning increase as a result of enjoying participation in the online discussion forums. The study also concludes that both face-to-face meetings and online activities enrich the learning process. Cottrell and Robinson (2003) examined the students’ attitudes toward the application of blended learning in an accounting course and concluded that students opted for the blended learning approach. In a study conducted by Humbert and Vignare (2005) investigating students’ perceptions toward introducing blended learning into their courses, students showed inclinations toward the blended learning approach. Similarly, in an investigation of the students’ satisfaction with a blended course, Chen and Jones (2007) found that students showed more interest in registering for a blended course than a traditional one. Brown (2003), Osguthorpe and Graham (2003) and Graham (2005) have all agreed that blended learning has a potential to enrich pedagogy, boost cost-effectiveness, accessibility, flexibility and reconsideration.

Other studies on blended learning give a more tentative stance regarding blended learning. For example, Pereira et al. (2007) found that learners expressed equal satisfaction with conventional and blended learning models. Jones and Chen (2008) concluded that the students on a blended course preferred traditional classroom meetings because they offered better contact with their teacher. The students also expressed their concern that one or two students had to take on the burden while doing group work online. In the same vein, Parkinson et al. (2003) concluded that the students in the traditional classes expressed satisfaction with the class atmosphere and criticized the blended learning contexts for lacking class community.

As far as the EFL context of this study is concerned, following Dziuban et al. (2004) blended learning will be used as a pedagogical approach that synthesizes the merits of effectiveness and socialization derived from the actual classroom with the technologically developed learning prospects of an electronic environment.

QOU, as a pioneer in open learning in the Middle East, is bound to select a combined set of media that suit a large number of learners taking into consideration their experiences, backgrounds, ages, and accessibility to selected media. With combined media the learner should be at ease in using at least one of them, which works in harmony with the essence of open education. As Rowntree (1992: 9) suggests, if various media are put together then there may be an additional possibility that all will find at least one of their favorite mediums.

Although the bulk of given a rather encouraging indication of the merits of e-learning (Murray, 2001; Nicol and Anderson, 2000), much still remains to be done to investigate students’ attitudes toward blended learning which integrates e-learning with traditional learning. Consequently, employing blended learning with these students should be carefully scrutinized. Cohen (2003) stressed the significance of assessing factors associated with the students and the learning process. When it comes to blended learning, Miller et al. (2003) and Freddolino and Knaggs (2005) also observed the importance of taking into account the students’ motivation and their needs for guidance and technical backing.

#### ***Attitudes and motivation***

It has been widely acknowledged that a student's attitude and motivation play the most important role in success within computer-assisted language learning settings (Warschauer, 1996a, 1996b; Gilbert, 2001; Brandl, 2002; Desmarais, 2002; Murday & Ushida, 2002).

Eagly and Chaiken (1998) describe an attitude as “a psychological tendency that is expressed by evaluating a particular entity with some degree of favor or disfavor.” Dornyei and Otto (1998:65) define language learning motivation as “the dynamically changing cumulative arousal in a person that initiates, directs, coordinates, amplifies, terminates, and evaluates the cognitive and motor processes whereby initial wishes and desires are selected, prioritized, operationalized and (successfully or unsuccessfully) acted out.” According to Crookes and Schmidt (1991), motivation involves interest, relevance, expectancy of success or failure, belief in forthcoming rewards, decision to be involved, persistence, and high activity level.

Drawing upon social psychology, Gardner and Lambert (1959, 1972) argue that motives for learning a given language split into two types. The first are the “instrumental” motives which represent the tangible gains derived from the mastery of that language, and the second are the “integrative” motives which subsume the learners’ positive attitude toward the native speakers of that language and their interest in their culture. These correspond to the two types of motives proposed in the self-determination theory, namely, intrinsic and extrinsic. While an intrinsically motivated activity stems from the inner self and is featured by the pleasure and satisfaction of engaging in an activity, an extrinsic motivation hinges upon realizing an instrumental outcome, such as gaining a reward as a result of engaging in an activity. This boils down to saying that an intrinsically motivated learner would most likely persist on learning a language even without external incentives, and an extrinsically motivated learner would most likely give up language learning as soon as the sought-after goal is realized.

In an investigation of 79 Iranian undergraduate students’ integrative and instrumental motivation toward learning English as a foreign language, Vaezi (2008) points out that the two types of motivation affect the learners’ focus regarding what aspects of a second language (L2) to study. She argues that learners motivated by an integrative approach are more interested in knowing about the culture and community of the foreign language (FL). However, instrumentally motivated students have different considerations and purposes; they learn L2 to help them find a job or make a living. Vaezi (2008: 54) notes, “For a long time, integrative motivation was regarded as superior to instrumental motivation for predicting the success of second language learning”, but then she refers to Dornyei (1996) as opposing this “by claiming that instrumental motivation and the learner’s need for achievement are more important than the integrative motivation”. Although Vaezi’s study reveals that integrative motivation on the part of the Iranian students was high, she concludes that the Iranian students were more instrumentally oriented. This result is in line with the opinions of many researchers who believe that in an EFL situation students are instrumentally oriented.

Ardito et al (2006:271) maintain that the degree of the student’s motivation and attitude is a key predictor of the success of any medium. If an inadequately designed medium leaves students feeling baffled or lost, it will inhibit efficient learning. Similarly, Spencer and Jago (1951) and Gardner and Lambert (1959) view motivation as an important factor in language learning. MacIntyre et al. (2009: 44) go further to describe it as “the engine that drives the system”. Noels (2001) and Ryan and Deci (2000) stress the need for identifying the students’ motivational orientations in order to set the language learning goals, and check the classroom environment as a prelude to defining the degree of dependence or independence needed for educating autonomous, self-regulated learners. Brown (2005: 467) argues that the time spent by students on using e-learning can be predicted by the students’ motivation.

Hwang and Arbaugh (2006) conducted a study of students’ feedback on a blended management course and concluded that those students who responded positively toward the blended learning material participated more in the discussion forums. In contrast, those whose responses were negative were not active in the online activities. That is why Mantyla and Woods (2001: 330) stress the idea that e-learning courses need self-motivated and independent learners.

Following Newcomb (1950), the ‘motive’ in this study will be taken as an element of the concept of attitude which will be seen as a state of readiness that stimulates the motive. More specifically, the terms ‘attitude’ and ‘motivation’ will be used in the following senses. The term ‘attitude’ will be used to describe QOU EFL students’ beliefs about English and its general impact on them, as well as their views about the reading module course they attended as part of this study. Following Noels et al. (2000:59-60), the term ‘motivation’ will be used to describe the incentives – whether integrative or instrumental, including the reward value of developing their skill in the target language.

## RESEARCH OBJECTIVES, RESEARCH QUESTION AND HYPOTHESIS

This study is meant to examine the extent to which using blended learning as an EFL learning/teaching method can affect students' attitudes and motivation. More specifically, this study attempts to investigate whether teaching reading skills through computer-assisted activities embedded in a conventional mode of learning affects students' attitudes and motivation. In other words, the study attempts to answer the question: Is there a statistically significant difference in attitudes toward learning English language between EFL students before and after receiving instruction through blended learning?

## METHODOLOGY

### *Participants*

The population of the study included 27 students enrolled in Reading I (5150) at the Bethlehem branch of QOU. Twenty students were female and seven students were male. The participants were all Palestinians and were all native speakers of Arabic. Their median age was 22 years, and the range was 18-30. They all had eight years of EFL instruction in grades 4-12 prior to their admission to QOU. Most students were concurrently taking listening I (1 hour weekly), structure I (one hour and a half biweekly), writing I (1 hour weekly) courses as part of their English language program at QOU.

### *Questionnaire*

The selection of the dimensions to be included in the questionnaire (see Appendix I) was inspired by the original 7-point Likert Scale format of Gardner's Attitude/Motivation Test Battery (AMTB) (Gardner, 1985). For the purposes of the current study, additional dimensions were included on the basis of a thorough review of theoretical literature pertaining to blended learning and EFL as well as on the researcher's personal experience as a tutor and an administrator dealing with issues related to the implementation of blended learning at QOU. Statements in the questionnaire were categorized into seven main domains. The first eight items identify the students' attitudes toward learning English (ALE), and the second eight items identify the students' attitudes toward computer use (ACU). The items (17-21) address the students' confidence in computer-based English class (CCOMC). The items (22-27) address the students' confidence in conventional English class (CCONC). The items (28-40) address the students' attitudes toward using computers in learning English (ACLE). The items (41-49) deal with the students' attitudes toward ease of using electronic assignments (ELCASS). The rest of the items (50-55) are related to the domain of students' attitudes toward handwritten assignments (HWASS). The scoring for the questionnaire was established as follows: A seven-Likert scale was used: (1 = strongly disagree; 2 = disagree; 3 = somewhat disagree; 4 = neutral; 5 = somewhat agree; 6 = agree; 7 = strongly agree).

The motivation scale was presented to a panel of experts to eliminate any threats to its validity. To make sure that the questionnaire is valid, expert opinions were taken into consideration. With regard to the reliability of the questionnaire, the overall Cronbach's alpha coefficient was 0.913, as shown in Table (1) below.

*Table 1: Reliability of Motivation Scale.*

	Cronbach's alpha	No. of participants	No. of items
ALE	0.895	27	8
ACU	0.865	27	8
CCOMC	0.874	27	5
CCONC	0.812	27	6
ACLE	0.825	27	13
ELCASS	0.843	27	9
HWASS	0.876	27	6
Overall Motivation	0.913	27	55

For the purpose of measuring the participants' attitudes and motivation, before the students received any instruction, they all completed the researcher-made motivation scale. In order to guarantee that students understand the items, Arabic translation was provided beside each item. Before starting to fill out the questionnaire, the English teacher explained to the class the procedure, and stayed in the classroom to answer any queries the student might have.

***Data Collection Procedure***

The students were asked to register in the online part of the course in addition to the face-to-face meetings. That is, they received instruction through computer-assisted activities embedded in a conventional EFL learning. One student who declared that she could not participate in the computer-based activities on a regular basis due to work commitments was exempted from participating in the study. Another student who signed up for joining the study missed three sessions. His account was automatically disabled and he was restricted from participating in the whole process; therefore, the total number of the students who actually participated in the study was twenty-five.

***Intervention (blended learning)***

The Reading I course is a basic one tailored to develop students' reading comprehension skills, vocabulary recognition, retention and use, as well as developing critical thinking through discussion and evaluation exercises. The book contains seven chapters. Each chapter consists of three interrelated reading passages, and each reading passage comprises three subsections on reading comprehension, vocabulary, discussion and evaluation. The three subsections of the unit consist of integrated exercises, self-assessment questions, activities and puzzlers.

Reading I, as a blended course (or electronic activity-based course) was offered to the class in a manner incorporating both conventional and electronic style. In accordance with the system of virtual classes, students were required to attend lectures synchronously and record them. The Reading I course, which was taught in Fall 2012 for sixteen weeks, needed sixteen classes per semester, eight classes of which were virtual and eight were face-to-face. That is, 50 percent of the meetings were face-to-face, and the remaining 50 percent were virtual classes using Blackboard system. It was easy to use. The students were free to use their own PC's and the Internet either from home or on campus. The students were given the class key and they enrolled themselves. Prior to online instruction, the students' computer literacy skills were assessed by a questionnaire. A tutorial was given to them for reference. The components of the online reading course were described and instructions on how to use certain course components were also posted in the conferencing area. Online instruction was initiated by posting a welcome note and by starting a discussion topic. Throughout the semester, a lab technician provided technical support on using the different components of the online course, and responded to individual students' needs, comments and requests for certain sites. For the purpose of this study, the researcher made use of the virtual classes using Blackboard system, which was scheduled by the university. In addition to face-to-face meetings, the researcher kept in touch with students through e-mail and other electronic tools. The researcher also used the discussion forums in the Moodle learning system and uploaded different reading tasks in accordance with the course objectives. Such tasks were taken from the students' textbook and the students had to read and answer short questions on condition that they use two or more of the vocabulary items used in such passages or from the related articles they were required to read from the textbook in relation to the topic in question. Some tasks were optional, and there were online quizzes about the reading passages they should have read. The teacher served as a facilitator and sent public and private messages to encourage the students to interact and communicate. He searched for relevant websites and posted them in the "link sharing" area. He also posted questions and discussion topics, wrote model responses, and advised students to correct each other's mistakes.

The students were expected to start chatting on the forum by exchanging ideas based on the passages of their textbook. It is also worth mentioning that the students could upload and download exercises, sample tests, and related information such as dates of exams. They could also stay in touch with the teacher and, at the same time, comment on their classmates' answers. The main aim behind using such tasks was to help the students to employ the integrative approach to learning in which they could read, listen, and comment orally or in writing at the same time in line with the course intended learning outcomes. In this course, there were asynchronous chatting sessions, which had no marks. This course, which was divided into study units, had many resources to enrich learning, and the virtual classes were central and accessible by all students enrolled in the course. As for evaluation, instead of paper assignments, the course contained electronic activities for which 10 percent of the total grade was allocated. The activities, including reading comprehension questions and answer sheets, were attached to the e-mail. In the body text, the students were asked to read the assigned material and then individually write down two or three paragraphs as summaries and send them back through e-mail. All the interactions with the teacher were done electronically. The teacher corrected the answer sheets, scored them, and sent them back through e-mail to each student. The same procedure was followed for other lessons. The mid-term exam covered 35 percent and the final 55 percent. The total mark was 100 percent.

## DATA ANALYSIS, RESULTS AND DISCUSSION

For the purpose of conducting statistical analyses, the statistical package of social sciences (SPSS) was employed. In addition to the descriptive statistical analyses of the data (means and standard deviations), a paired samples t-test was performed to compare the students' mean scores of the pre- and post-questionnaires.

In order to measure each aspect, several parameters were devised. The overall mean or "grand mean" for the whole dataset of each aspect was calculated by taking the mean of the means of the individual parameters. The third column of Table (2) below presents the overall means (degrees out of 7) with respect to a (1-7) point Likert scale.

### *Students' Attitudes (before intervention vs. after intervention)*

As shown in Table (2) below, a paired samples t-test performed on the mean scores of the students' attitudes before and after the trial showed statistically significant difference at the level of  $\alpha = 0.05$ . The p-value is 0.000, which gives overwhelming evidence that the students' attitudes significantly changed as a result of employing computer-assisted learning in their reading comprehension classes with the exception of their attitudes toward two aspects of conventional classes and handwritten assignments, for which the p-values obtained were (0.232) and (0.194) respectively.

*Table 2: Paired samples t-test to compare means for the class before and after.*

		Mean difference		std	t	f	D	Sig.
ALE	after	5.87	1.54	2.20	-3.529	4	2	.001
	before	4.33						
ACU	after	4.91	0.85	1.17	-3.429	4	2	.001
	before	4.06						
CCOMC	after	4.34	1.08	1.89	-2.963	4	2	.005
	before	3.26						
CCONC	after	4.62	0.59	2.41	-1.210	4	2	.232
	before	4.03						
ACLE	after	4.43	1.20	1.26	-4.417	4	2	.000
	before	3.23						
ELCASS	after	4.66	0.99	1.50	-3.780	4	2	.000
	before	3.67						
HWASS	after	4.83	0.46	1.37	-1.318	4	2	.194
	before	4.37						
Overall Motivation	after	4.80	1.00	0.94	-5.030	4	2	.000
	before	3.80						

That is, these two exceptional results show that the students' attitudes toward conventional learning and toward using paper assignment did not change. Having experienced computer-assisted learning, students gained a more positive attitude toward using computers but they retained their confidence in and positive attitudes toward conventional learning. This suggests that EFL students at QOU have a tendency to get a mix of both e-learning and conventional learning in their English language classes.

As shown in Table (2), a paired t-test performed on before and after results of the students' attitudes gives overwhelming evidence that there is a highly significant difference at the level of  $\alpha = 0.05$  between their attitudes toward language learning; computer use in general; learning English; electronic assignments; and their confidence in computer class (p-value = 0.005). Nevertheless, the t-tests performed indicated that the difference was nonsignificant (p-value = 0.232) with regard to the students' attitudes toward handwritten assignments and their confidence in conventional class (p-value = 0.194). Interestingly, the p-value here represents the highest non-significant value obtained for all results.

The mean score of the students' attitudes increased from pre-questionnaire to post-questionnaire. This suggests that students' experience in computer-assisted learning positively affects their attitudes toward computer-based education but does not negatively change their attitudes toward conventional education.

## **DISCUSSION**

According to the results in Table(2) above, after the trial, no statistically significant difference was observed in the students' confidence and ease in conventional English class (CCONC) and attitudes toward handwritten assignments (HWASS). It can be easily understood that nothing noteworthy changed regarding these two issues.

However, after experiencing blended learning, the students expressed more positive attitudes toward learning English (ALE) in the post-questionnaire. This suggests that computer-based classes embedded in a blended learning module succeeded in offering a dynamic and interesting learning/teaching style, which made students show better attitudes.

Moreover, as shown in Table (2), the students demonstrated more positive attitudes toward computer use in general (ACU) after trial. This may be attributed to their realization of the potential benefits and applications of the computer in their English language learning. Similarly, when asked about their attitudes toward learning English in general, they gained, after experiencing computer-based learning, more confidence and ease in the computer-based English classes as shown in Table (2) above. Further, the students' attitudes toward electronic assignments increased positively.

These positive attitudes and improved confidence can be attributed to paying attention to the participants' technical concerns lest they inhibit them from engagement in the different online options. As mentioned earlier, throughout the semester a lab technician provided technical support on using the different components of the online course. As Purvis et.al. (2011: 98) put it:

"Online discussion in groups of any size is dependent upon the confidence of the learners to post messages and share information with fellow learners.... Many of the issues were confidence related and focused on the students' perceived ability to comment on their peers work.... Giving students the support, guidance and confidence to contribute effectively to online discussion should be of most importance to the online facilitator using this type of learning and assessment model."

Undoubtedly, lack of comfort and anxiety could deter the students from successfully performing the required language tasks, which stresses the need to provide a comfortable blended learning experience. This shows that blended learning, if properly and carefully implemented, produces a positive impact, or at least does not yield any negative effects on the students' attitudes. Although the students had to work hard to adjust to the new learning experience, they yielded more positive attitudes toward blended learning. Despite these positive attitudes, the levels of confidence in conventional class and handwritten assignments remained the same.

The results presented above have shown that when students go through a credible, dynamic, and effective learning experience, their attitudes do change positively. The benefits of blended learning seem to extend beyond an improvement in students' attitudes to other important gains. Undoubtedly, students who are not used to e-learning might find some aspects of blended learning challenging, but a positive change in their attitudes as a result of a successful experience in a blended course of reading could be the first step toward more active, responsible, and self-dependent language learners. This is consistent with Doob's (1947) conclusion that 'learning' can account for the largest part of people's attitudes, which, unlike personality, are expected to transform as a function of persuasion and experience.

The effectiveness of blended learning largely hinges upon the extent to which the participants academically and emotionally get involved in their learning project. This involvement requires devoted and capable tutors. During the implementation of this study, participants who volunteered to help their peers gained the experience of being a student tutor. They clearly built up knowledge by developing not only skills related to reading ability, but also skills vital for EFL learning/teaching practices. This might have contributed to increasing their motivation to work harder to become effective tutors.

Since the main objective of the English language program at QOU is to train English language teachers, the activities involved in blended learning could help students to understand more intentionally practical issues they might encounter in their following EFL courses. As a tutor of the course, I observed that some student teachers took

responsibility and felt empowered by the experience of teaching their peers. By the same token, many students reported that they benefited a lot from their peers during the on-line sessions (or virtual classes) and the discussion forums taking place at different times. They valued employing an integrative approach to learning in which they had the chance to read, listen, and comment orally or in writing at the same time.

From a pedagogical point of view, this study concludes that the more varied the teaching/learning styles, the stronger the attitudes of the learners and thus the better the learning outcome. This study has shown that blended learning, which combines e-learning and conventional classroom meetings, is rewarding as a means of increasing students' attitudes and motivation, which in turn gives a better learning outcome. This indicates that a difference in the learning/teaching method spells a difference in the learning outcome.

More importantly, these results should be rightly interpreted that without the tremendous efforts paid by the tutor and the lab technician to give the participants the needed technical and emotional support to contribute effectively to online discussions this scheme would not have succeeded. Admittedly, there is much more to a blended learning endeavor than simply having computers or, as Galloway (2008: 6) suggests, knowing how to merely perform discrete mechanical operations in a program. Perkins (1986) argues that knowledge is not something teachable in the traditional sense, but is a process of design that entails taking decisions on the part of the learner as to which part of the information is to be transformed, highlighted, internalized, and represented.

### CONCLUSION AND LIMITATIONS

This research represents an attempt to measure students' attitudes toward a blended course module. After having experienced a blended course module, the EFL students registered statistically significant progress in their attitudes toward English language learning and computer-based activities from the pre-questionnaire to the post-questionnaire. But their attitudes toward handwritten assignments and their confidence in conventional class remained almost the same.

The EFL students, whose attitudes positively changed regarding all aspects of blended learning, comfortably accepted making the switch to blended learning. This could be attributed to the circumstance whereby they had to play a more active role in the classroom, which gave more weight to dialogues and interactive activities on their part. This is in keeping with Colesca et al.'s (2009) assertion that an important function of blended learning is to transform students from inactive note-takers to dynamic learners capable of gaining more from their learning.

These results show that blended learning with its two components (i.e. conventional classroom meetings and e-learning activities), when properly implemented, represents an effective avenue for helping EFL students develop more positive attitudes toward their learning. Clearly, technology, which is at the heart of blended learning research (Ayala 2009), plays a key part in the prospects of blended learning. To investigate the implications of our findings for practice and policy, to explore the immediate and long-term impact of using blended learning, and to examine its effectiveness and popularity for the purpose of facilitating the creation of the most effective course module for EFL education, future follow-up studies need to be conducted.

The fact that the present study relies on data collected only from a special group of EFL students at QOU in a given semester places restrictions on the kind of conclusions that have been drawn. It is not clear how these conclusions can be extended as to how other EFL students' attitudes in other contexts can change under the given trial. It would be unlikely that what applies to the EFL students at QOU in this particular reading course also applies to other EFL students in other contexts. Thus, it appears that it is worth conducting similar studies on the basis of data collected from other contexts.

### **Appendix I** **Survey Questionnaire (English-learning Motivation Scale)**

#### **INSTRUCTIONS**

The purpose of this questionnaire is to determine your attitudes towards learning English via face-to-face meetings and computer-assisted activities. Below are a number of statements with which some people agree and others disagree. We would like you to indicate your opinion about each statement by ticking the boxes below which best indicates the extent to which you disagree or agree with that statement. We would urge you to be as accurate as possible since the success of this investigation depends upon it.

There are no right or wrong answers. We want you to indicate your own ideas and impressions. If you have any questions, please ask them now. In answering this part of the questionnaire, work quickly and don't stop to think about each scale. It is your immediate impressions in which we are interested.

Gender:.....

Age:.....

1 = Strongly Disagree; 2 = Disagree; 3 = Somewhat Disagree; 4 = Neutral; 5 = somewhat Agree; 6 = Agree; 7 = Strongly Agree

Item	1	2	3	4	5	6	7
<b>1. Attitudes toward Learning English</b>							
Studying English is an enjoyable experience.							
English is an important part of the university program.							
Knowing English is really an important goal in my life.							
I feel very much at ease when I have to use English.							
If it were up to me, I would spend all of my time learning English							
I love learning English.							
If there were an English Club in my university, I would be most interested in joining.							
Using English anywhere makes me feel happy.							
<b>2. Attitudes toward Computer use</b>							
Computers are important for communication.							
Computers are important for acquiring knowledge							

I keep up to date with computer by working on it almost every day.							
Computer use is an important part of the university program.							
Using computers is important because I will need it for my career.							
I feel very much at ease when I use computers.							
I love working on computers.							
Using computers allows me to meet and converse with native speakers of English.							
<b>3. Confidence and Ease in Computer-based English Class</b>							
I enjoy the computerized activities of our English class much more than the conventional classes.							
Computer-based classes offer a more dynamic and interesting teaching style than conventional classes.							
I feel more secure when I do English activities via the computer than in face-to-face classes.							
I feel more confident when asked to participate in computer-based classes than in my conventional English class.							
I never get embarrassed when I have to answer a question in a computer-based English class.							
<b>4. Confidence and Ease in Conventional English Class</b>	<b>1</b>	<b>2</b>	<b>3</b>	<b>4</b>	<b>5</b>	<b>6</b>	<b>7</b>
I would rather spend more time in my conventional English class and less on computer-based classes.							
I feel more active in the conventional English classes than in computer-based English classes.							
When I have a problem understanding something we are learning in English class, I immediately ask the teacher for help.							
I feel more confident when asked to participate in my conventional English class than in computer-based classes.							
I never get nervous when I am doing language activities in my conventional English class.							
I think my conventional English class offers a more dynamic and enjoyable experience.							
<b>5. Attitudes toward using computers in learning English</b>							
Using computers to learn English is useful.							
Learning English through computers is an enjoyable experience.							
I feel happy when I am using the computer to learn English.							
Using computers allows me to interact with native speakers of English.							
Studying English via computers enables me to become teacher-independent.							
Using computers can be important for me because other people will respect me more if I have a knowledge of new technology.							
Virtual English classes are useful for developing my language skills.							
I prefer to use a mix of face-to-face learning and computer-based learning in my EFL classes.							
If it were up to me, I'd rather have more computer-assisted learning in my English class.							
Computer-based activities increase my English class participation.							
In Internet-based learning, I can save time of traveling to campuses and also save transportation costs.							
I feel more confident to participate in the computer-assisted learning than in face-to-face classes.							
I accept computer-based learning as an alternative to face-to-face meetings.							
<b>6. Homework and Assignments: Electronic assignments</b>							
I prefer to hand in my assignments via the computer rather than in person.							
When I have a problem understanding something outside my English class, I immediately resort to my computer.							
I find computer-based English assignments more useful than paper assignments.							
If my teacher wanted someone to do an extra computerized English assignment, I							

would definitely volunteer.							
Electronic English assignments allow me to work faster and more carefully than written assignments.							
During the English language course, I prefer to get feedback from my teacher via electronic media.							
Computerized assignments are more enjoyable to deal with than written ones.							
When I have a problem understanding something in my English hand-written assignments, I prefer to send an email message to my teacher.							
What I like about electronic assignments is the immediate feedback I get from my tutor.							
<b>7. Homework and Assignments: Hand-written assignments</b>	<b>1</b>	<b>2</b>	<b>3</b>	<b>4</b>	<b>5</b>	<b>6</b>	<b>7</b>
When I have a problem understanding something in my English assignments, I prefer to see my teacher in office.							
With paper assignments, I can sit anywhere, change reading positions, and move easily from place to place.							
Paper assignments are easier to deal with than computerized ones.							
I prefer paper assignments as a medium for learning because they are more familiar, more practical and cheaper.							
I prefer to print out the content of electronic assignments because I get tired reading onscreen.							
My problem with print-based assignments is the delay in getting the tutor's feedback.							

## THE EFFECTS OF TRANSLATION ACTIVITIES ON READING COMPREHENSION OF IRANIAN EFL STUDENTS

### ABSTRACT

There have already been different perspectives on the use of translation in the second language classrooms. Almost all procedures and approaches in teaching and learning a language have their opponents and proponents, and this approach is not an exception. When it comes to using translation in the language 2 reading classrooms, some scholars and teachers like Avand (1993) concentrated on it as a facilitative tool in the process of comprehending a text. This is while other scholars like Cook (1995) gave the prescription to totally ban the use of translation in an language 2 classrooms, no matter if it is a speaking, listening, writing or reading class. Therefore, the present study was carried out to investigate the relationship between the use of translation and EFL learners reading comprehension, i.e. to determine whether or not making use of translation has any effect on the EFL learner's reading comprehension.

**KEY WORDS:** Translation, reading comprehension, teaching technique,

### INTRODUCTION

Reading is probably the most important skill for second language learners in the academic contexts. In other words, in the academic settings, reading is supposed to be the central means for acquiring new knowledge and gaining new access to alternative explanations and interpretations (Grab & Stoller, 1997, cited in Celce-Murcia, 2001). If a student cannot read and comprehend a written language, they cannot be expected to be good in other content areas which will indispensably require some reading ability (Decker, 2007). As Rivers (1981) asserted, among the four second language skills, reading is the most stable and durable one. There has been a great deal of research about the different aspects of reading comprehension (Ediger, 1993, cited in Celce-Murcia, 2001), (Kasmer, 1999); however, little has ever been done on the effect of translation on more efficient reading comprehension. Translation has been used by many language learners to facilitate language learning for centuries but, under different language teaching methods, it has played different roles. The teaching of foreign languages in general, and the teaching of English as a foreign language (TEFL) has undergone many changes over the past decades. From the end of the 19th century until the beginning of the 20th century the Grammar Translation Method of teaching a foreign language was the widespread method (Titone & Danesi, 1985). Very little attention was paid to the content of texts or to communication skills. This lack of attention resulted in the unpopularity of the Grammar Translation Method, paving the way to new methods of foreign language teaching. However, translation is regaining its respectability in the language-learning classroom (Malmkjær, 1998), not essentially as an end, but as an additional aids towards language learning.

Teaching reading skills to nonnative speakers of English includes unique problems and challenges at all conceivable levels of instruction (Celce-Murcia, ibid). It is certain that every teacher has their own way of teaching reading comprehension. The fact is that the methods for teaching reading have subjected to substantial changes over time.

### BACKGROUND

#### *Translation*

The term translation itself has different meanings: It can be referred to as the general subject field, the product (the text has been translated) or the process (the act of producing translation, known as translating). The translation between two separate languages includes the translator rendering an original written text (the source text or ST) in the original verbal language (the source language or SL) into a written text (the target text or TT) in a different verbal language (the target language or TL) (Munday, 2001).

We can view translation as a pragmatic-integrative language activity that integrates different skills; it requires competence in both the source language (SL) and the target language (TL). Translation is the process in which a word, segment or text is conveyed from one language into another, going beyond sheer words; it includes interlingual relationships, cultural differences - and when spoken, gesture - in order to ultimately transfer the source text's message in the target language (Sewell, 1996).

One of the most important aspects of translation, requiring careful and skillful handling, is that translation is "not just transferring of information between languages, but a transfer from one culture to another" (Hervey et al., 1995, p.20). It necessarily involves the treatment of cultural issues. Although the relative importance will vary depending on text as well as on the reader and functions of translated text, among other considerations.

Miremadi (1991) held that "translation is a two way process from one culture to the other, and from one culture into one's own culture". Generally speaking, a give and take procedure involved (Miremadi, 1991, p.23). The main purpose of translation is to use it as a cross-cultural bilingual communication vehicle amongst people. In the past decades, this procedure has promoted because of the rise in international trade, increased immigration, globalization and the expansion of technological and scientific knowledge.

In a recent survey in Birbeck College in England Sewell (1996) searched to determine what transferable skills and knowledge could be improved in a translation studies class, presented as one of the eleven courses needed to complete a BA. It was concluded that translation could be taught as a means of developing students' linguistic ability, as it involved the following transferable skills: The ability to read correctly, perform efficiently on a socio-linguistic level, i.e. awareness of register, text-type, comprehend theory of communication, use contextual knowledge efficiently, work to a brief, perform instructions, see when further research is required, prioritize, do in a steady way, post-edit one's own work, figure out what makes the two languages work, produce unspoken assumptions. Students indicated that they were gaining insight in both their mother tongue (English), and their second language (French), into which they translated. They also found that translation is a "good intellectual training." The prominent courses in the foreign language were reading comprehension and textual analysis during the first two years of this foreign language course, so the students were expected to become competent in these two skills - skills which shaped the foundation of the translation course. They were required to consider metalinguistic dimensions, e.g. reading correctly, socio-linguistic awareness, register, and text-type, contextual knowledge, editing, and producing unspoken assumptions.

#### *Translation and formulaic language*

Collocations, fixed expressions, lexical metaphors and idioms can all be considered as examples of formulaic language (Howarth, 1998; Wray, 1999), in which word strings occurring together tend to convey holistic meanings that are either more than the sum of the separate parts, or else depart substantially from a literal, or word for word meaning and perform as a single semantic meaning (Gairns and Redman, 1986, p.35). The nature of formulaic language makes resistant to literal translation; the target language may not use lexical formulas that are directly equivalent to those used by the source language to express the same meanings, or at least not with the same frequency. Thus a literal translation of formulaic language may at best sound unusual or marked in the TL, or else fail to convey one or more of the intended dimensions of meaning.

#### *Translation in the foreign language classroom in the past*

##### *The Grammar Translation Method*

The Grammar Translation Method was implemented in the latter part of the nineteenth century as a method of teaching a foreign language (Howatt, 1984) for students that interested in learning classical languages, such as Greek and Latin (Brown, 2000). Its purpose was to teach students a foreign language using intense grammatical analysis and to familiarize them with the grammar of their native and the foreign language, and introducing lists of

vocabulary items in order to teach them to read and write classical materials in a foreign language and to pass standardized exams (Zimmerman, 1997). It was also believed that this comparative method of languages might have an impact on the students' comprehension of their native language. Students were given either literary or religious texts and with the help of a dictionary were required to translate the texts according to the grammar structures they had acquired. Sometimes they were given isolated texts that had little purpose other than the task at hand – which was to compare grammatical structures and improve vocabulary. The Grammar Translation Method was viewed as a scientific approach, in which the students acquired grammar and vocabulary explicitly, they couldn't discuss about possible alternatives. Teachers elicited the "correct" answers from students and there was little or no discussion of alternatives among the students. The most of these students usually had a high level of analytical proficiency and could easily perform these tasks, therefore this method was not regarded suitable for the less motivated or gifted student.

#### *The use of translation in the language teaching and EFL*

Despite the wide spread popular assumption that translation should play a major role in the field of foreign language, the recent theories of language teaching and learning have at best disregarded the role of translation, and at worst repressed it. From the beginning of twentieth century onwards, almost all famous theoretical works on language teaching have assumed without argument that a new language (L2) should be taught without reference to the student's first language (L1).

Needless to mention that most modern and so-called innovative methods have their roots in the former traditional or old-fashioned methodologies; however, these new approaches have often resulted in throwing out well-established procedures instead of rethinking of them. It may be some comfort for the experienced teacher to be aware that yesterday's 'old-fashioned' method has come back, albeit in a slightly different form.

Farrand-Rogers (1996) reported that the practice of using translation in English classes of university in Tolca-Mexico, proved to have been very successful. He has concluded that translation as a teaching technique is enjoying a return as an "innovation". Based on Pieneman's teachability hypothesis (1989), there are two sequential dimensions of language learning relevant when teaching translation as a tool to enhance language ability and not for the sheer purpose of teaching a separate skill (Azizinezhad, 2007):

1. Progressive sequence takes place regardless of the learner or the method of teaching and is controlled by the inherent nature of each learner's language acquisition scheme, which is ordinary to all language learners.
2. Variational sequence explains the language-learning process using different methods in which language learners acquire language skills, according to the relationship between them and their individual situations, i.e. level of intelligence, ability to acquire a foreign language and socio-economic status.

#### ***Reading comprehension***

##### *The importance of reading comprehension:*

The importance of reading comprehension in a foreign language was stated by Alderson (1984) which the foreign language in many parts of the world's knowledge is often important to academic education, professional success and personal improvement. This is potentially true that so much technical, professional and scientific literature is written in English today. In fact, it is common that English reading comprehension ability is required of students by their subject departments often evaluated by a test of reading comprehension. A reading ability is often all that is needed by learners of English as a foreign language. Reading probably is the most generally needed skill in learning a second or foreign language (Robinson, 1991).

#### ***Teaching translation to develop skills in L2 reading comprehension***

Bassnett (1998) believed that "translation offers a crucial lesson in how to read, since it is a critical way into the text." She saw it as an effective means of forcing students to read texts thoughtfully and to concentrate on the lexical, grammatical and textual levels, and improving general knowledge, while "unveiling students' problems in comprehending (English) texts" (Brini, 2000). Teachers can stimulate the development of students' awareness by paying attention to terminology, register, slang, expression and idioms that may characterize an individual text (Petrocchi, 2006). Translation can be a useful tool to analyze comprehension pitfalls, which may lead to problems in discourse processing (Abdrabou, 2003). Reading comprehension exams are demanding to assess because they do not allow the instructor to find out how students have gotten their answers, and they don't take into account students' comprehension or interpretation of the comprehension questions themselves (Mahmoud, 1998). In the English matriculation exam in Israel (Garb, 1997), tests that were once designed to have students read the texts in English at first, and then answer the comprehension questions in their L1 were put an end on the grounds that experts believed

that these kinds of the tests did not provide the tester with enough evidence to assess the students' level of language production.

## **RESEARCH METHODOLOGY**

### ***Sample selection***

The initial population for the study was 90 students. To get more homogeneity, the subjects were selected from those who were studying in second year of university in EFL major. They were male and female students. They were all from Azad university of Hamedan. They were majoring in EFL and the range of age was 19-21. At first, a standard proficiency test (TOEFL) (60 questions, Reading comprehension test, and multiple questions) was administrated to 90 students. Some of them quitted to collaborate with the researcher. So, the number of participants decreased and out of them 60 was selected on the basis of the mean score as the sample of the study. The rest were excluded. Then, they were randomly assigned to two groups of thirty. The following is matching of the students in these two groups.

*Table 1: Subjects characteristics*

Group	Number	Gender	Age
Experimental	30	Male and female	19-21
Control	30	Male and female	19-21

### ***Instrumentation***

In the current study, a TOFEL reading comprehension tests were selected to be given to the participants to measure their level of proficiency in the form of a pretest. Five reading comprehension texts were selected from the TOFEL (Reading comprehension test, 2005) reading to be administrated to the participants during the course of study. The rationale behind selecting the passages rested upon the fact that the level of the difficulty and the content validity of the passages were suitable for the participating students, so it was possible to apply them for the participants. At the end, the same type of text in a controlled way was administrated to participants to see how they would perform on the posttest.

### ***Data collection***

Since the participants were assigned in different groups by the faculty, a standard proficiency test (TOFEL) (15 questions, Reading comprehension test) was administrated to the participants to make sure that the two groups were at the same level of proficiency. The allotted time for the participants to answer the TOFEL test was 70 minutes. The mean score of the two groups and the T-test showed that the two groups were nearly at the same level of proficiency. The experimental group received the treatment-instruction through native (Persian) language translation as a medium of instruction whereas; the control group went through regular instruction without translation. The course went on for five sessions of instruction. Each session took about 90 minutes. In each session 10 minutes of the class was allotted to asking and answering about the words and expression of the previous text. In the first session, the researcher handed out one of the reading comprehension texts to the both groups. The process was introduced to them. The participants in the control group were told to read the text and comprehend it just through the second language. They were not allowed to make use of any bilingual dictionary. What could be of help to them was just monolingual dictionary, of course, in the case of necessity. On the other hand, the experimental group received the same text but they were supposed to read and comprehend it through their first language. Where necessary, they were allowed to use bilingual as well as monolingual dictionaries. During the course of instruction, the instructor asked participants some questions related to the vocabulary part. The control group was supposed to give the definition of the words in English or through some examples while the experimental group was supposed to give equivalents of words just in Persian.

The second proficiency test or the posttest was given to the participants at the end of the course of instruction to compare the two groups' grades and to see the effect of using translation on their learning and comprehension process.

**Data analysis**

In order to statistically analyze the results of the two proficiency tests, the software statistical package for social sciences (SPSS) was of great help in this research. The first step was to conduct two independent T-tests to compare the results of the pretest for two groups so as to make sure that there was no significant difference between the groups before they underwent the experiment. In the end, two independent T-tests were administered to compare the results of the control group with those of the experimental group of posttest.

**RESULTS AND DISCUSSION*****Pretest of Reading Comprehension***

An independent t-test was run to compare the experimental and control groups' mean scores on pretest of reading comprehension in order to prove that the two groups enjoyed the same level of reading comprehension ability prior to the main study. As displayed in Table 3 the mean scores for experimental and control groups on pretest of reading comprehension are 30.43 and 29.73 respectively.

*Table 2: Normality Tests*

Group		N	Skewness		Kurtosis	
		Statistic	Statistic	Std. Error	Statistic	Std. Error
Experimental	Pretest	30	.092	.427	-.798	.833
	Posttest	30	-.011	.427	-.151	.833
Control	Pretest	30	.074	.427	-.801	.833
	Posttest	30	.366	.427	-.155	.833

The assumption of homogeneity of variances will be discussed when reporting the results of the independent t-test although in case the group sizes are equal there is no need to test this assumption (Bachman 2005).

*Table 3: Descriptive Statistics Pretest of Reading Comprehension by Groups*

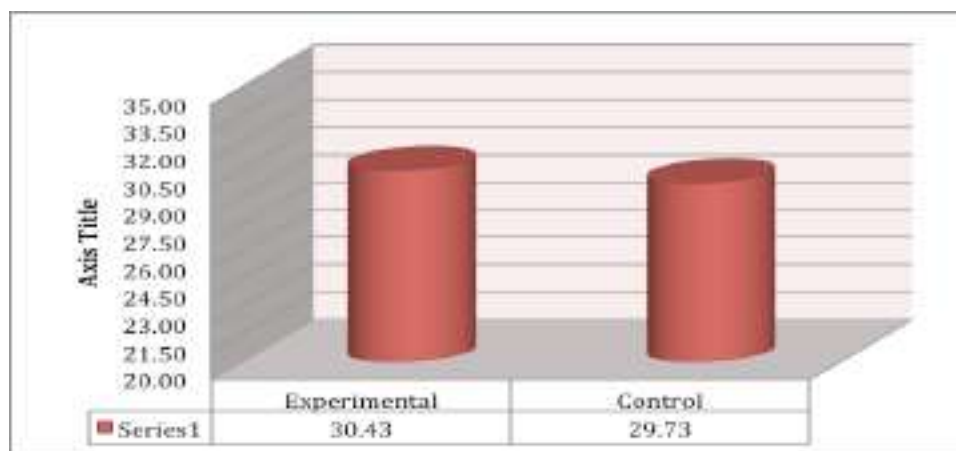

Group	N	Mean	Std. Deviation	Std. Error Mean
Experimental	30	30.433	4.4465	.8118
Control	30	29.733	3.9735	.7255

The results of the independent t-test ( $t(58) = .64$ ,  $P = .52 > .05$ ,  $R = .08$  it represents a weak effect size) indicated that there was not any significant difference between experimental and control groups' mean scores on the pretest of reading comprehension. Thus it can be concluded that the two groups enjoyed the same level of reading comprehension ability prior to the main study.

*Table 4: Independent t-test Pretest of Reading Comprehension by Groups*

	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	T	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Equal variances assumed	.441	.509	.643	58	.523	.7000	1.0887	-1.4793	2.8793
Equal variances not assumed			.643	57.281	.523	.7000	1.0887	-1.4799	2.8799

It should be noted that the assumption of homogeneity of variances is met (Levene's  $F = .441$ ,  $P = .509 > .05$ ). That is why the first row of Table 3, i.e. "Equal variances assumed" is reported.

Graph 1: Pretest of Reading Comprehension by Groups

### Research Question

Does using translation as an ELT technique have a significant effect on reading comprehension of Iranian EFL?

An independent t-test was run to compare the experimental and control groups' mean scores on posttest of reading comprehension in order to probe the effect of using translation as an ELT technique on the improvement of the Iranian EFL learners reading comprehension ability. As displayed in Table 5 the mean scores for experimental and control groups on posttest of reading comprehension are 32.70 and 30.30 respectively.

Table 5: Descriptive Statistics Posttest of Reading Comprehension by Groups

Group	N	Mean	Std. Deviation	Std. Error Mean
Experimental	30	32.700	3.7060	.6766
Control	30	30.300	4.0527	.7399

The results of the independent t-test ( $t(58) = 2.394$ ,  $P = .02 < .05$ ,  $R = .30$  it represents a moderate effect size) indicate that there was significant difference between experimental and control groups' mean scores on the posttest of reading comprehension. Thus it can be concluded the null-hypothesis as using translation as an ELT technique does not have any significant effect on reading comprehension of Iranian EFL **is rejected**. The experimental group – after receiving translation techniques – outperformed the control group on the posttest of reading comprehension.

Table 6: Independent t-test Posttest of Reading Comprehension by Groups

	Levene's Test for Equality of Variances		t-test for Equality of Means						
	F	Sig.	T	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
								Lower	Upper
Equal variances assumed	.293	.591	2.394	58	.020	2.4000	1.0026	.3930	4.4070
Equal variances not assumed			2.394	57.542	.020	2.4000	1.0026	.3927	4.4073

It should be noted that the assumption of homogeneity of variances is met (Levene's  $F = .293$ ,  $P = .591 > .05$ ). That is why the first row of Table 5, i.e. "Equal variances assumed" is reported.

Graph 2:

*Posttest of Reading Comprehension by Groups*

### Discussion

As it can be derived from the above-mentioned data, the experimental group which was being taught through using translation has performed better. Thus, it can be concluded that the treatment (taught through translation) was more effective. Due to the fact that the control group also underwent a course of instruction, it makes sense that at the end of the course, they have made some progress. But the point is that the control group has made little progress compared to the experimental group which is certain proof of effectiveness of treatment. The finding of the study answered the research question by rejecting the null hypothesis. All the details related to the results of pretest and posttest proved the effectiveness using translation in teaching and learning reading comprehension since the mean difference of the two groups 2.4, it can be concluded that the experimental group has made a significant progress compared to the control group, and then the null hypothesis for the research question is rejected.

### CONCLUSION

As mentioned earlier, the present study was supposed to answer a question regarding the effect of translation on the reading comprehension. Before the outset of the study, a null hypothesis was developed. It was hypothesized that making use of translation has no significant effect on the students reading comprehension. Surprisingly, the result of the study revealed that making using of translation as a channel of instruction had a significant facilitative role in students reading comprehension; thus, rejecting the null hypothesis. In this study, the mean scores of the two groups were compared and the mean difference 2.4 was observed. The P value was .02 which is less than 0.05. All in all, because of the observed mean difference and because the P value less than 0.05, it is concluded that translation seems to be effective and can play an important facilitative role in Iranian EFL students' reading comprehension process. Although the results of this study indicated the efficacy of translation in the reading comprehension classes, this study may have suffered from some pitfalls. First, conducting the research in five sessions of 90 minutes might not be a reliable estimate of the effectiveness of the experiment. Second, there is no guarantee that the experimental group might not have consulted with each other in Persian in the class. Third and most importantly, the students in the experimental group might have used bilingual dictionaries out of the classroom. It is true that reading comprehension is the goal; still, the integration of all four skills in any class activities is an undeniable fact.

### ABSTRACT

During the last decade, much attempt has been made to integrate computers, electronic devices, and Internet technologies into educational settings to provide a new, rich and integrated environment with a variety of systems and contents that help learners learn and assess their learning simultaneously. Test, measurement and evaluation were concepts, already been well defined and employed for estimating learners' achievement in traditional teaching and learning settings. Postmodern era with the dominance of constructivism learning approach and increasing use of information technology has offered new concepts to instruction such as teacher-facilitator, learner-centered, knowledge-centered and learner autonomy scales. Shifting from teacher centered instruction to learner centered setting necessitates the learners take the responsibility of assessment as well. Consequently, the concept of assessment needs to change to meet the requirements of new instructional setting. Whereas traditional testing can be formative or summative, postmodernist assessment tends to be spontaneous. To materialize recent concept of assessment in e-learning instruction-based setting (E-assessment-based instruction), the present study has focused on two surveys: Primary data elicitation was an oral interview with five language testing researchers via video conferencing. They expressed their expertise opinion on the spontaneous assessment and the extent to which it is in line with instruction and provides supportive feedback for instruction. They significantly believed that the e-assessment models introduced are unprecedented successes in postmodernist digital age. But the study seems to suffer from shortcomings in the instrumentation. The secondary data elicitation from IT-literate teachers, learners and administrators favored to pave the path to that end.

**KEY WORDS:** E-assessment, E-learning, Digital age, Web 2.0, Assessment2.0

### INTRODUCTION

The external environment has transformed during the last 30 years, but teaching has resisted change. ICT is more than a tool, but fundamentally alters what and how we teach. Therefore, both teaching and assessment need to be modernized. There is no e-pedagogy, but we need one, and we need a new approach to assessment.

The recent advances in technology have necessitated both new approaches and new methodologies in the field of foreign language learning and thoroughly teaching. Internet and the virtual learning environments have diversified the opportunities for school teachers, instructional developers as well as learners by varying and broadening the alternatives for learning and teaching of languages. Implementing tools and applications, instead of classroom and course books, in the learning of foreign languages necessitate reconsidering the pedagogy, approach, applications, instructor roles, interaction forms, and teaching setting itself.

Learning and assessment are closely related to each other. Learners learn more in classes in which assessment is a central part of education than in those where it lacks. Brief assessment, which offers regular and enlightening feedback about learning advancement, is more effective than long, infrequent ones with judgmental feedback, like once-a-term tests.

Different types and approaches to assessment are described with numerous terms. Though somewhat subjective, it is useful to these various terms as demonstrating dichotomous poles (McAlpine, 2002).

Formative <-----> Summative

Informal <-----> Formal

Continuous <-----> Final

Process <-----> Product

One of the constructivist principle of assessment in their classroom is not to isolate evaluation as a single exercise. learning is perceived as a cyclical process in Constructivists setting. Since the form of a circle has no beginning and no end, therefore the point of where to assess could become blurry. Constructivists do not perceive assessment as an ending activity, but rather an continuing process that helps the learner continue to teach themselves how to learn (Holt & Willard-Holt, 2000).

Therefore, assessment on constructivist learning environment has different assumptions and forms from traditional instructivists' approaches. Since constructivists believe that individual learners construct their own learning, they are interested in assessing their learning process rather than explicit knowledge and skills we can easily see (Jonassen, 1992; Choi & Hannafin, 1995) indicate that traditional tests and testing methods fail to measure important educational outcomes because they emphasize homogenized recall of memorized factual knowledge and procedures rather than unique, and highly differentiated reflections. Based on this notion, they propose student-centered assessment, emphasizing the ability to diagnose and manage students' cognitive growth rather than evaluating student achievement.

Shepard (2000) claims that we need new frameworks and theories for assessments. In constructivist paradigm, we are sharing principles of curriculum ideas, psychological philosophies and assessment concepts affected by constructivist's epistemology and need to emphasis on improving students' actual learning instead of judging and ranking their achievement.

Jonassen (1992) shows us several criteria to evaluate students' meaningful learning and knowledge construction in constructivist learning environments - goal-free evaluation, authentic tasks, knowledge construction, experiential constructions (process versus product), context-driven evaluation, context-dependent evaluation, multiple perspectives, multimodal, and socially constructed meaning.

## **E-ASSESSMENT**

The use of computer technology in educational assessment has decades-long history. Computers were firstly used for assessment in the 1970s to reduce human raters' scoring load. Since that time, assessment has progressed in relation with technological developments. Computer-based assessment has become extended in large-scale assessments, for instance language testing and college entrance examinations, because of its convenience and accuracy. The terms "computer-adaptive testing" and "web-based assessment" are used interchangeably with "computer-based assessment", however they are actually two distinct cases of computer-based assessment. Specifically, computer-adaptive testing has a stronger stress on nonlinear item selection by quickly estimating the examinee's ability based on his/her preceding replies. Web-based assessment denotes to computer-based assessment that is normally distributed through online learning management systems.

Though improvements in computer-based assessment offer the technological basis for e-assessment, the present focus in e-assessment is in exploring the opportunities of the progressively widespread amusing digital media, such as web 2.0 tools and video games. Also, mobile and tablet devices are offering new occasions for e-assessment. For instance, the personal response systems (also known as clickers) have significantly simplified formative assessment in large classroom environments. We should be cautious that the main emphasis on e-assessment is not developing new assessment tools but refining learning by means of new assessment technologies. Consequently, educational benefits and drawbacks of e-assessment technologies need to be cautiously considered. An extensively dispersed report by the Joint Information Systems Committee [JISC] (2007) also highlights that "e-assessment, in fact, is much more than just an alternative way of doing what we already did... Assessment is perhaps the best way of identifying the support needs of learners and can instill a desire to progress further if linked to appropriate resources, good quality, timely feedback, and to challenging but stimulating ways of demonstrating understanding and skills."

Traditionally, e-assessment makes use of computer and information technology for the purpose of making the assessment process more effective by computerizing functions that would otherwise need human evaluators. These functions consist of item creation and selection, assessment distribution, item analysis, interpretation, scoring, and score presentation (Baker & O'Neil, 1995). Currently, though, e-assessment refers to present efforts within the

educational community to take benefit of technological developments. These efforts are promoted by the need to go further than “fill-in the bubble” tests and move toward authentic assessments of complex skills and knowledge (Pellegrino, Chudowsky, & Glaser, 2001).

## **STRATEGIES AND RESOURCES FOR ONLINE ASSESSMENT AND LEARNING**

### ***(E-) assessment for learning***

Plenty of attention has been paid in the last decades to various forms of outcomes-based assessment, or assessment of learning. However, there has been a simultaneous increase of research on process-based assessment, or assessment for learning, which can be defined as 'any assessment for which the first priority is to serve the purpose of promoting students' learning' (Black et al, 2003). Assessment for Learning (henceforth AfL) therefore refers to 'a set of practices and methodologies that might be used by both teachers and students to understand what students know and are able to do so that instruction and learning can be regulated more effectively' (Bennett, 2010).

### ***Student-involved assessment***

That is, an assessment, which provides learners “with a clear insight of the learning target from the beginning of the learning, along with samples of strong and weak Work.

### ***Effective feedback***

In E-learning environment, providing clear and informative (rather than judgmental) feedback, which can be used to revise learning goals (Stiggins, 2005). Feedback on assessments is an integral feature of effective and efficient teaching and learning, and can be one of the most influential methods to improve and strengthen student learning (Black & Wiliam, 1998). Feedback enables learning by providing information that can be used to improve and enhance future performance. This paper explores current literature around the appropriate use of technology in the production and delivery of feedback. It was anticipated that the literature would support the hypothesis, based on which technology has the potential to enhance student engagement with feedback.

### ***(Self-) assessment skills***

By engaging the learners in self-assessment, “they can watch themselves successfully negotiating the road to competence. [and ultimately] learn to generate their own descriptive feedback and to set goals for what comes next in their learning” (Stiggins, 2005).

Self-monitoring, a skill necessary for effective self-assessment, involves focused attention on some aspects of behavior or thinking (Schunk, 2004). Self-monitoring students pay thoughtful attention to what they are performing, often related to external standards. Thus, self-monitoring concerns awareness of thinking and progress as it occurs, and as such, it identifies part of what students do when they self-assess.

A second component of self-assessment, self-judgment, involves identifying progress toward targeted performance. Made in relation to established standards and criteria, these judgments give students a meaningful idea of what they know and what they still need to learn (Bruce 2001).

The third essential step is that students choose subsequent learning goals and activities to improve partially correct answers, to correct misunderstandings, and to extend learning. Because students at this stage need skills in determining learning targets and further instruction that will enhance their learning, they should be aware of options for further goals and instruction. Once the appropriate "instructional correctives," as they are referred to, are complete, students resume self-monitoring.

The growing literature on formative assessment has implications for self-assessment. Formative assessment can be defined as employing appropriate activities to provide feedback to enhance student motivation and achievement during instruction- as students learn. Providing helpful information as learning occurs contrasts with providing feedback solely after instruction. There is substantial evidence that appropriate formative assessment activities relate positively to student motivation and achievement (Black and William 1998). In addition, self-assessment is a valuable skill in effective formative assessment. Both Sadler (1989) and Black and William (1998) contend that self-assessment is essential to using feedback appropriately.

## **LITERATURE REVIEW**

### ***Traditional assessment (Assessment 1.0)***

‘Assessment 1.0’, also known as traditional assessment is the form of assessment applied from 618 AD to today. It is recognized with the following characteristics:

- Mostly paper-based
- Mostly classroom-based
- Very formalized (in terms of administration)
- Highly synchronized (in terms of time and place)
- Highly individualized
- Highly controlled (in terms of contents and marking).

#### ***Computer based assessment (Assessment 1.5)***

Computer based assessment (CBA) or computer based test (CBT) is a more up-to-date form of assessment, which has appeared in the last ten years, replicates the traditional assessment, using computers and modern technology in the assessment process.

‘E-testing’ (a form of on-screen testing of knowledge) and ‘e-portfolios’ (a digital repository of assessment evidence normally used to assess practical skills) are examples of CBA. Learning management systems (LMS) and virtual learning environments (VLE) are templates, which provide conditions for implementing these forms of assessment.

#### ***Problems with assessment 1.0 and 1.5***

In spite of that traditional tests need a lot of time and energy to be spend for their preparation, carrying out, and marking, learners fail to gain the skills like problem solving, innovation, collaboration and creativity needed in the modern external environment.

Proponents of computer-based testing systems boast about assimilation of paper-based assessment in the virtual environment, While E-testing is not more than imitating traditional assessment and a limited number of question types (almost always selected response questions) and, at best, simple reproductions of traditional tasks are supported by computer-based testing systems. Similarly, most current e-portfolio systems assimilate the existing approach to assessment, which is highly focused on content rather than student and process. Consequently, it is also nothing more than online storage for students’ work.

Students’ feelings are not encouraging both paper-based and computer-based assessments, because they perceive them as something external to them; something over which they have no control; something that is “done” to them. In addition they consider the assessment instrument something unnatural and artificial, just a barrier to be leaped over, not as a part of their learning. Or, worse, they perceived it as the only purpose of their learning, which they should focus all their efforts and attention on, to pass the test instead of the acquisition of new knowledge and skills.

Traditional and computer-based assessments are highly individualistic; i.e. assessment activities should be done individually; as a result, competition is encouraged and collaboration (or cheating in the lexicon of traditional assessment) is forbidden. Virtual learning environments (VLEs) also tend to assimilate the traditional classroom, lecture hall, instructor’s office and the pupil common room. While some teachers with the familiarity of VLEs tried to implement them, it has been proposed that the use of VLEs can reduce innovations in the classroom because the classroom time is wasted in practicing into traditional (classroom-based) and new approach, (VLE-based), instead of implementing and exploring the full potential of e-learning.

The use of current e-assessment systems also inhibits progress in assessment by similarly replicating practice to traditional (paper-based) assessment with the limited form of computer-based assessment, made possible by these systems.

Pellegrino (1999) rightly believes that “in 21<sup>st</sup> century learning environments, decontextualized drop-inform-the-sky assessments consisting of isolated tasks and performances will have zero validity as indices of educational attainment.” Based on the foresaid concepts, the present study intends to shed some lights on certain research questions such as: Which e-assessment templates better satisfies the following ideals in real life situation.

#### **SIGNIFICANCE OF THE STUDY**

Both the ministry of education and higher education of Iran have shown some symptoms of understanding the emergent implementation of e-assessment in education and emitted several circulations to this end, but in action, What is done is nothing more than assimilation of traditional form of testing in virtual environment, which unveils some misunderstanding of the issue. This article tries to highlight the new concepts of e-assessment to help teachers and administrators take the right direction to the end.

## RESEARCH QUESTION

How familiar are teachers and learners with the E-assessment concepts?  
How much workable is the scheme?

## METHODOLOGY

### *Survey*

Survey was supposed to be the usual and desirable method, based on the literature, to elicit data from the following participants. TAP was also favored by some teachers to talk about their own personal understanding of the agenda, but they are not significant enough based on certain limitations, which come later.

### *Participants*

Candidates,  $28 \pm 1$  in each stratum, were selected based on stratified sampling model among high IT literate university and school teachers, key administrators and university students, from a variety of disciplines in Fars province universities & educational organizations. According to Kothari (2004), stratified sampling involves dividing the population into homogeneous groups containing subjects with similar characteristics. Gender was out of control for academicians and administrators but equal sizes of male/female learners took part in the data elicitation procedure.

### *Instruments*

To this end, a synchronous Likert 5 items online/offline questionnaire- ranging from perfectly agree(5), agree (4), perfectly disagree (3), disagree (2), no idea (1)- charged with interview- web-based / in-person- was used. Eight items were selected based on Richards (1995) four related maxims: the Maxim of Accuracy, the Maxim of Efficiency, the Maxim of Conformity, and the Maxim of Empowerment. Twenty other items were taken from related texts in the literature, based on Kothari's (2004) stratified Sampling Model. Hence, probability sampling was avoided to minimize the risk of chance. These twenty eight items were calculated in split-half format to test their validity, reliability and viability.

### *Materials*

For practicality purposes and to test the viability of the hypotheses, the sample template was driven from a general English book, entitled: ESAP, whose materials were to be covered for university candidates, but for high school students, their centralized textbook, developed by the ministry was the basis for the purpose.

### *Procedures*

The learners, from the university/school students stratum discussed above, were asked to work out the task for a four-month period of time or one semester and other candidates (teachers and administrators) followed the URL, designed for the purpose. They were supposed to be familiar with the practicality aspects of e-assessment concepts.

At the end of the one semester period, candidates were invited to complete the questionnaire, (mostly, supporting the rationale behind the e-learning and e-assessment concepts) while receiving descriptions and instructions, without which almost all were unable to respond.

Data elicited were put into Effects Matrices in order to be statistically analyzed and be interpreted. A t-test was favored to compare our two means, calculated based on two halves of items in the questionnaire and a chi-square test, based on the same split-half procedure to compare variances. That technique is reported to be effective in identifying Brown and Richard's (1997) triangulation model in which reliability- internal / external; validity- internal / external; transferability; credibility; dependability- internal / external; objectivity; conformability and viability are parts and parcels.

## RESULTS

Items were analyzed in a split/half procedure to measure their reliability. Reliability indices are analytically measured. Results derived from the survey are as follows:

Table 1: Item-Total Statistics

	Scale Mean if Item Deleted	Scale Variance if Item Deleted	Corrected Item-Total Correlation	Cronbach's Alpha if Item Deleted

## DISCUSSION

To materialize the new concepts of e-assessment, a primary study focused on a survey using oral/online interview with five testing experts. Although, they all proposed that e-assessment as a requirement not a need for digital age theoretically, they also acknowledged that it should be researched in action.

To this end, the present study focused on administrators, teachers and learners who were regarded the stakeholders of education.

Although results, derived from the questionnaire statistically seem to lend support to the hypothesis one and show that participants have high relevant literacy but it should be noted that participants answered the questionnaires while receiving instructions and explanations. More problematic questions were those related to personalization, collaboration and goal free concepts of e-assessments.

### *Core concepts of Assessment 2.0 (E-assessment)*

#### *Web 2.0*

Current state of web development is called web 2.0. It is believed that there are the following six big ideas behind web 2.0

1. user-generated content
2. the power of the crowd
3. data on an epic scale
4. architecture of participation
5. network effects
6. openness.

For the e-assessment purpose four of them are relevant.

1. **User-generated content** refers to the easiness of producing content. MySpace, Blogger and YouTube are the examples of Web services, which have made it possible to create content without a need for much effort.
2. **The power of the crowd** refers to the shared intelligence that can be connected to large collections of people. The basic idea is that, a large group of well-informed (but non-expert) users can make better decisions than any individual expert. Web services like Digg and Wikipedia are instances of this collective intelligence.

3. **Architecture of participation** is founded on the undistinguishable philosophies that Web services must be easy to use (in this manner promoting participation) and must be organized in such a way that the more they are used the better they will improve. Google Search is a good case since it is very easy to use and its search algorithms improve, based on the results of previous searches.
4. **Openness** refers to both the use of open source software for many Web 2.0 services and the idea of the free sharing of information and resources among users, which make it possible to access and share information or resources easily, like embedding a YouTube video in a blog.

### *Digital natives*

Today's students are living and learning in an era called digital age. Prensky (2003) claimed that there is a major dissimilarity between today's learners and those of the past regarding "the arrival and rapid spreading of digital technology... a phenomenon, which alters things so fundamentally that there is totally no going back". He called these new learners "digital natives" and contrasted them with "digital immigrants". He claimed that: "The single biggest problem facing education today is that our digital immigrant instructors, who speak an outdated language (that of the pre-digital age), are struggling to teach a population that speaks an entirely new language".

Digital natives are characterized with the following common set of learning styles as follows:

- skilled use of tools
- active learning rather than passive receiving of knowledge
- authentic learning experiences rather than contrived tasks
- construction rather than instruction
- task-based (not product oriented one)
- just in time learning
- searching not memorizing
- utilizing social networks
- not knowing the answer but knowing where to find it
- Google not libraries
- Collaborating not competing.

When a digital native learner faces a problem, at the first step he/she is likely to explore the Google for appropriate information, look up wikis or send an email to a friend for help. Finally, he/she will organize the consequential information into a comprehensible document by means of a range of web-based and desktop applications.

### *Assessment 2.0*

Assessment 2.0 is an alternative form of assessment 1.0, which embraces the modern technology including internet and more specifically, web 2.0, as illustrated above, with the four big ideas related to assessment. Assessment 2.0 is in fact seeking the way to bring the 21<sup>st</sup> century's technology into examination room and therefore speak in a language that is known to digital natives, assign them the tasks that they are familiar with in their real life and provide them activities adapted with their ability and digital age learning styles.

The type of assessment activity best suited to the digital native would exhibit some or all of the following characteristics. (Elliott, 2007)

- **Authentic:** involving real-world knowledge and skills.
- **Personalized:** tailored to the knowledge, skills and interests of each student.
- **Negotiated:** agreed between the learner and the teacher.
- **Problem oriented:** original tasks requiring genuine problem solving skills.
- **Socially constructed:** using the student's social networks.
- **Collaboratively produced:** produced in partnership with fellow students.
- **Recognize existing skills:** willing to recognize the student's existing work.

And the types of evidence that best fits this form of assessment would be (Elliott, 2007):

- **occurring naturally:** already in existence or generated out of personal interest
- **offering multimedia:** existing in text, audio and video format
- **using modern technology:** such as e-mail, instant message logs, blog posts, wiki contributions, audio and video recordings
- **distributing via different channels:** may be distributed across various sources (such as web sites, blogs, inbox, iPod).

**Assessment 1.0 and Assessment 2.0**

Comparing these two alternative forms of assessment will illuminate the new concepts of assessment more. It can be summarized in the following table:

*Table 1: comparison assessment 1.0 & 2.0*

<b>Assessment 1.0</b>	<b>Assessment 2.0</b>
Given	Negotiated
Done alone	Done collaboratively
Descriptive	Researched/Deep
Text	Text/audio/video
Closed book	Open web
Done in class	Done anywhere
Teacher assessed	Self- and peer-assessed
individualized work	Collaborative work
Highly controlled	no control
Artificial /unnatural	Authentic /Natural
Industrialized	Personalized
Memory based	Problem-based

Consequently, results derived from the survey via oral interview performed in chat format or in-person one seems to be supportive to the speculation of Illium, et al (2010). According to them, when candidates are not perfectly familiar with core rationales behind the items or they have low literacy to certain concepts, the driving force for their responses will be the researchers' descriptions. Hence, one easily witnesses a discrepancy between what goes on in their mind as universe and their responses to items in reality. Consequently, surveys are not mutually exclusive enough and they should be avoided in such social contexts.

## **CONCLUSION**

Assessment, test and measurement are the terms which are used for years in educational settings with clear concepts for all. They are also separated from teaching and learning process. Postmodern digital age with its new approaches to learning, posed new concepts to the previous existing terms. It has also integrated teaching, learning and assessment arousing some resistance due to accepting previous terms with their new concepts. As, new concepts are accepted and learned more easily with their own new terms, generating new terminology for digital age educational concepts seems vital.

On the other hand, administrators and teachers are needed to equip themselves with new educational concepts knowledge as soon as possible, since they are far away from learners who are just now using and learning via web 2.0 tools in variety of disciplines which shows emergent embrace of relevant and enlightening workshops for teachers and administrators to this end.

Due to the methodology, the concluding word is that based on Illium's, et al (2010) speculation, survey is workable when there is no discrepancy between what goes on in the mind of the researcher – cognition- and what goes on in the mind of the respondent- simple mind, which is packaged, not open to criticism and in short based on Low literacy. Hence, in such contexts, survey does not work and exploratory or descriptive scheme seems to work.

## LIMITATIONS & DELIMITATIONS OF THE STUDY

- 1- The subjects participating in this study were selected from learners, teachers and administrators from schools and universities of Shiraz, Fars, Iran, because they were the only available sources for the researcher. Therefore, the findings are limited to them and it might ruin the generalizability power. Because of IT literacy problems, the researcher seems to have been biased in his sample selection as well as treatment manipulation.
- 2- Low IT literacy of teachers and administrators was a problem, but misunderstanding of E-assessment by those supposedly IT literate was a hindrance, which couldn't be removed easily by the explanation of e-assessment concepts, since there was a discrepancy between what they had in their mind and what went on in researcher's cognition.

The same research is required to be replicated on different sample sizes in a variety of environments to add to its consistency.

## AIMS AND SCOPE

The international journal of language learning and applied linguistics world performs as a platform for the new scholars to share their insights with other scholars in the form of original papers.

The international journal of language learning and applied linguistics world is a double-blind peer-reviewed international journal dedicated to promoting scholarly exchange among teachers and researchers in the field of language teaching and applied linguistics. Papers submitted to the journal will immediately be sent to two related reviewers who are responsible to provide feedback on the content and the language use.

The journal is published monthly in online and print versions. The scope of the journal includes, but not limited to, the following fields:

*Theory and practice in English*  
*Language teaching & learning*  
*Teaching English as a second or foreign language*  
*Applied linguistics*  
*Discourse studies*  
*Syllabus design*  
*Language learning problems*  
*Computer assisted language learning*  
*English for specific purpose*  
*English for academic purpose*  
*Language teaching & testing*  
*Translation studie*

### ABSTRACT

Evidence is accumulating that phonological memory (PM), a sub-component of working memory (WM), is closely related to different facets of second language (L2) learning. Moreover, little research has specifically delved into the relationship between the PM capacity and grammar among adult learners at different L2 proficiency levels. Therefore, it seems necessary to verify to what extent PM capacity might be related to grammatical knowledge in English as a foreign language (EFL) learners with different proficiency levels. To achieve this objective, the present study investigated the relationship between PM and L2 grammatical knowledge among native Persian-speaking male adults undergoing a 6-week intensive English course. The number of participants was 180 and their age ranged from 20 to 30. The participants were assigned to three different language proficiency levels (beginner, lower intermediate, advanced), 60 each, by using the Quick Placement Test (2001). PM capacity (as referenced by nonword repetition and nonword recognition tasks) and L2 grammatical knowledge were assessed in the first week of their course. After ensuring the normality of the data through SPSS 21, Pearson correlations and multiple regression analyses were conducted. The findings showed that L2 grammatical knowledge and PM tasks as assessed with English nonword repetition and recognition tests were moderately correlated among adult EFL learners in different levels of language proficiency. However, the correlation coefficients for the advanced group were lower than the other groups. Thus, the findings may imply that grammatical knowledge can be more closely related to PM capacity for beginners and lower intermediate learners than for advanced learners.

**KEYWORDS:** phonological memory; grammatical knowledge; language proficiency; L2 learning; adult EFL learners

### INTRODUCTION

According to Skehan (1998), “memory is important all along, goes hand in hand with success in language learning until an advanced level is reached, and then becomes even more important” (p. 218). One of the popular issues in contemporary cognitive psychology as well as the area of individual differences is working memory (hereafter WM). As Baddeley (2003) puts it, WM refers to the “temporary storage and manipulation of information that is assumed to be necessary for a wide range of complex cognitive activities” (p.189). WM has been investigated extensively in the field of SLA during the last 20 years and some scholars even believe that “WM capacity help predict learning rate and ultimate levels of attainment in the L2” (Ortega, 2009, p. 90).

One of the most influential WM models is that of Baddeley’s model (Baddeley, 1986, 2000; Baddeley & Hitch, 1974) which views WM as incorporating several components (Figure1): (a) a central executive, an attention control system responsible for integrating information from different WM subsystems and long-term memory and supervising basic WM operations; (b) the phonological loop, The phonological loop, which deals with the storage of verbal, speech-based material.; (c) the visuo-spatial sketchpad, which handles visual images and spatial information; and (d) an episodic buffer, involved in the binding of information from subsidiary systems and long-term memory into a unitary episodic representation (Hummel & French, 2010).

Figure 1: Multi-Component Working Memory Model (Adapted from Baddeley, 2000)

Most studies on WM, in effect, have used verbal information which is claimed to depend on the operation of the phonological loop (Baddeley, 1986, 2000; Baddeley & Hitch, 1974). The phonological loop consists of two parts: a phonological store and an articulatory rehearsal process. Figure 2 pictures the structure of the phonological loop. As Figure 2 displays, speech input has access to the phonological store directly but nonspeech input has to enter through the articulatory rehearsal process. Another function of the rehearsal process deals with the maintenance of information. Unless a stored phonological code is kept fresh through the rehearsal, it fades gradually in the phonological store process (Baddeley 1986; Gathercole & Baddeley 1993).

Figure 2: The Phonological Loop Model (Gathercole and Baddeley, 1993, p. 8)

In the literature, phonological loop has been interchangeably referred to as phonological memory (hereafter PM) (Hummel & French, 2010). Some scholars have highlighted PM as an important source of individual differences in L1 acquisition (e.g. Baddeley, 1986; Baddeley, 1996; Gathercole & Baddeley, 1993) and in L2 learning (Gathercole & Thorn, 1998; Harrington & Sawyer, 1992; Papagno, Valentine, & Baddeley, 1991). Ellis (1996) claims that significant portion of language learning involves sequence learning, and even abstract grammatical knowledge is a product of the analysis of sequential information. According to Kormos and Sáfár (2008, p.263), “as PM is responsible for remembering sequential information, its role in language learning is far greater than previously supposed.” Furthermore, some studies carried out in SLA found that the role of PM in both L1 grammar acquisition and L2 grammar learning can be influential. However, their results have been controversial. The literature pertinent to this issue is reviewed below.

Gathercole and Adams (1996) conducted a study on children of 4 and 5 years old. The participants were required to tell a story which they had previously listened to. Results showed that the ability to recite the story was closely related to the ability to repeat nonwords. Further analysis showed that children who were more accurate at nonword repetition had richer lexicons and produced longer utterances than those with lower repetition accuracy. In other words, children who were better at PM stimuli were also grammatically more proficient. In another study, Willis and Gathercole (2001) found that 4-year-old children with better PM capacity were more accurate at repeating complex sentences in their L1 than children with weaker PM capacity.

As in L1, PM has also been revealed to be related to L2 grammatical ability. Service (1992) tested young Finnish children and found that PM did not correlate significantly with simple English grammar tasks. However, learners’ performance on other language tasks, such as reproduction of structures and written production (to reflect learners’ syntactic ability) revealed a slight association with nonword repetition. Ellis and Sinclair (1996), later, tested adults’ ability to learn Welsh as a foreign language and they concluded that the more often foreign language structures are rehearsed in PM, the easier it is to learn them and to generalize rules from them. O’Brien et al. (2006) examined the role of PM in L2 speech production by English-speaking adults learning Spanish (33 females, 10 males; M= 21.84 years old). They found that PM correlated with vocabulary scores, narrative abilities, and use of free grammatical morphemes and subordinate clauses, both at the beginning and at the end of a semester of Spanish learning ( $r$ s between .30 and .41). In another study, French and O’Brien (2008) conducted a study on Francophone children learning English as a part of a 5-month intensive program in Quebec’s Saguenay region. French and O’Brien (2008) found that nonword repetition at the beginning of language program (Time 1) predicted L2 grammar scores at the end of the language program (Time 2) ( $r$ s between .79 and .82). PM explained almost 30% of the variance in grammar scores at Time 2, even after controlling for vocabulary knowledge. In a more recent study, Martin & Ellis (2012), examined PM and WM and their relationship with vocabulary and grammar learning. The memory measures used were nonword repetition, nonword recognition, and listening span. The participants were tested on their ability to induce the grammatical forms and to generalize the forms to novel utterances. Individual differences in final abilities in vocabulary and grammar correlated between 0.44 and 0.76, depending on the measure. The results, also, showed significant independent effects of PM and WM on L2 vocabulary learning and on L2 grammar learning.

It appears, from the literature reviewed here, that PM may be related to the development of grammatical skill. However, studies in this area have not reached conclusive results and further studies are needed to shed light on this issue, and in particular, among adults learning an L2. Moreover, there have been a number of studies which have dealt with the PM influence at different levels of language proficiency.

French (2003) found PM to predict L2 learning in low but not in high proficiency learners. Later, O’Brien et al. (2006) found connections in both low and high ability groups, but the aspects of L2 knowledge involved differed. Kormos and Sáfár (2008) conducted a study on teenage Hungarian native speakers participating in an intensive language program in English (L2). The participants were divided into two proficiency groups, beginner and pre-intermediate. Kormos and Sáfár (2008) found no significant relationship between the nonword span score and success on the L2 exam for beginners, whereas the nonword score of the pre-intermediate participants correlated moderately with their scores on writing, use of English and total points, and the fluency and range of vocabulary scores of the oral exam. The backward digit span test, however, was found to correlate with all the components of the L2 exam except the writing one. Furthermore, the digit span and nonword scores were not correlated. Kormos and Sáfár (2008) concluded that WM (assessed by the backward digit span task) and phonological loop (measured by the nonword task) likely separate constructs and influence language learning in various ways.

Some other studies investigating adults failed to find significant correlations between PM and L2 proficiency. Mizera (2006) used nonword repetition tasks designed for children with the adult participants and found no significant correlation between the PM task and the participants’ proficiency. Hummel (2009), in a recent study of young adults, found that the relationship between PM (measured by non-word repetition) and L2 proficiency remained significant in non-novice learners but disappeared at the most advanced proficiency level. “this finding provides further empirical evidence that the role of PM in L2 learning appears to diminish as a function of language proficiency level and not necessarily of age” (Hummel & French, 2010, p. 377). To summarize, the research conducted on adult L2 learners in various L2 contexts suggests that while some research has failed to find significant correlations between PM tasks (e.g., digit-span, word-span, and non-word repetition) and L2 proficiency (e.g., Hummel, 2002; Mizera, 2006), other research studies have reported significant relationships between PM and aspects of L2 proficiency in adults (e.g., Hummel, 2009; Martin & Ellis, 2012; O’Brien et al., 2006).

Evidence from the previous research shows that PM is closely associated with different aspects of L2 learning and it seems to be an essential memory component throughout much of L2 development.

## RESEARCH QUESTIONS

Based on the literature reviewed above, the present study attempted to investigate the extent to which the L2 grammatical knowledge and PM tasks, i.e. nonword repetition task and nonword recognition, associate in three proficiency groups (beginner, lower intermediate and advanced). Hence, the following questions were investigated in this study:

1. To what extent do nonword repetition task (as a measure of phonological memory) and L2 grammatical knowledge correlate in the beginner, lower intermediate, and advanced groups of adult male EFL learners?
2. To what extent do nonword recognition task (as a measure of phonological memory) and L2 grammatical knowledge correlate in the beginner, lower intermediate, and advanced groups of adult male EFL learners?

## METHODOLOGY

### Participants

Among L2 studies dealing with WM and PM few have examined adult L2 learners (e.g., O'Brien et al., 2006). Therefore, the present study assessed EFL adult learners. This allowed the researchers to find out whether the adults' reliance on PM is similar to that of the children in the previous studies. 180 male EFL learners were involved in the study (60 beginners, 60 lower intermediate and 60 advanced learners of English). The participants' age ranged from 20 to 30. In order to control the participants' language proficiency level and their homogeneity in each proficiency group, a Quick Placement Test v.1 (QPT) and a demographic questionnaire were administered. QPT v.1 (2001) is an objectively-scored 60-item multiple-choice test and the participants were given 30 minutes to answer them. Based on the obtained results, the participants were assigned to three proficiency groups, i.e. beginner, lower intermediate, and advanced.

### Instruments

#### Questionnaire

In order to gain specific information about the type and amount of exposure to English outside the program, a demographic questionnaire in the participants' L1 (Persian) was administered.

#### Nonword Repetition Task

In order to assess PM, both nonword recognition (henceforth NWRC) task and the nonword repetition (hereafter NWRP) task were applied. The merit of the present research is in that it employed two different PM tasks, i.e. NWRC and NWRP. One of the most widely used tests of PM capacity is the NWRP, where participants have to repeat nonwords of different lengths that do not exist in the given language but conform to its phonotactic rules. Gathercole and Baddeley (1993) proposed two advantages of using a NWRP test over other assessment methods to measure PM capacity. First, NWRP test may be more sensitive than other measures because this test prevents long-term memory knowledge influencing the assessment of PM, although the effects of prior language knowledge cannot be completely eliminated by nonwords. The second advantage of NWRP tests is that the NWRP test is viewed simple and somewhat more natural compared to others measures because both children and adult language learners hear and repeat new vocabulary items during their learning process. The participants in the current study heard a list of 1-syllable nonwords and were asked to repeat them. Following the study carried out by Martin & Ellis (2012, p.385), "there were four lists at each of four lengths: three, four, five, and six words." Example stimuli used for the NWRP task are displayed in Table 1. The nonwords were taken from a stimulus pool of nonwords provided by Gathercole et al. (2001). All participants heard the lists, beginning with the shortest lists and continuing with lists of increasing length. The participants' responses for all items throughout the study were recorded. The researchers did the scoring offline on a phoneme-by-phoneme basis. The maximum number of phonemes recalled on any one repetition set was calculated for each participant. The highest possible score for this task was 22 correct phonemes. Two raters scored the participants' responses to the NWRP to ensure the homogeneity of the calculated scores. The inter-rater reliability of the two sets of scores was  $r = .94$  ( $p < .01$ ).

Table 1: Example Stimuli for NWRP Task

3-word stimuli	barch	kig	norb			
4-word stimuli	chad	dorl	teck	parn		
5-word stimuli	cherl	goot	jarm	tidge	bup	
6-word stimuli	jert	coom	lorc	ged	nerch	darch

#### Nonword Recognition Task

NWRC task was used as an additional measure of PM. This task is highly correlated with performance on similar NWRP tasks but is less affected by unfamiliar phonotactics and pronunciation difficulties (Gathercole et al., 2001). The participants listened to two presentations of a list of nonwords and decided whether they were the same or different. The participants received 1 point for each correct same or different judgment. Eight lists were used at each of four lengths: four, five, six and seven items. The maximum possible score for this task was 16 correct recognitions. The stimuli were taken from Gathercole et al. (2001). Table 2 illustrates example stimuli applied for the NWRC task. Stimuli were tape-recorded by an English native speaker. Two sequences of items were presented on each trial, with an inter-stimulus interval of 1.5 s separating the last item in the first presentation and the first item of the second presentation.

Table 2: Example Stimuli for NWRC Task

Examples of nonword recognition stimuli	Correct responses
List 1 : chad pook <b>mun jick</b> terdge	different
List 2 : chad pook <b>jick mun</b> terdg	
List 1 : turg deet peb chim nam ked	Same
List 2 : turg deet peb chim nam ked	

#### *Grammar Test*

The grammar test used in this study was selected from the Oxford Placement Test (OPT) designed and developed by Allen (2004). The grammar section of the OPT consists of 100 items. Fifty minutes were allotted for completion. Test-takers were asked to read the stem with a blank and to choose one of the three options for the blank.

#### *Quick Placement Test*

As Granpayeh (2003, p. 8) put it, "QPT is a test of English language proficiency developed by Oxford University Press and Cambridge ESOL to give teachers a reliable and time-saving method of finding a students' level of English." This test is available in both paper-and-pencil and computer-based versions. It is designed to calculate accurately English language learners' level of proficiency, from the beginner to the advanced level. QPT, which includes 60 items, takes 30 minutes to complete. According to Granpayeh (2003), the SEM of the test is around 4 and its reliability is close to 0.9.

#### *Procedures*

First, all the participants were given the QPT v.1 (2001) and a demographic questionnaire in order to assess their level of proficiency. Based on the obtained scores on the QPT, the participants were assigned to one of the three proficiency groups, i.e. beginner, lower intermediate, and advanced. In QPT, the band scores for the beginners, lower intermediate, and advanced levels are 0 to 15, 24 to 30, and 48 to 60 respectively. The participants' classes were held four sessions a week, twenty four sessions on aggregate. Each session lasted for two hours. The setting of the data collection was Estahban, a city located in Fars province, Iran. The NWRC and NWRP tasks, and the grammar test were measured during the first week of the English course. The allocated time for the NWRC and NWRP tasks were 15 and 5 minutes respectively. The NWRC as well as the NWRP tasks were administered in language laboratories since headphones were needed to allow the participants to listen to sequences of the tape-recorded nonwords. For the grammar test, the participants answered the grammar section of the OPT in 50 minutes.

#### *Data Analysis*

In order to answer the research questions, data from the NWRP task, NWRC task, and the grammar test were entered into SPSS 21 (2012). First, Shapiro-Wilk test was used in order to make sure that the distribution was normal. Shapiro-Wilk test is the most powerful normality test (Keskin, 2006; Mendes & Pala, 2003; Razali & Wah, 2011). After ensuring the normality of the data, Pearson product-moment correlations followed by multiple regression were investigated for the PM tasks and the grammar test scores. Significance level was set at  $p < 0.05$ .

## **RESULTS AND DISCUSSION**

As mentioned before, the participants of the study were selected out of 180 Adult male students of English. Shapiro-Wilk test was used in order to make sure that the distribution was normal. In all proficiency groups, the significance value shows that there is normal distribution since the p-value is more than 0.05 (see Table 3).

*Table 3: Test of Normality for All Groups*

	<b>Shapiro-Wilk Test</b>								
	Beginner			Lower Intermediate			Advanced		
	statistic	df	Sig.	statistic	df	Sig.	statistic	df	Sig.
Scores on the Grammar	.97	60	.77	.96	60	.85	.96	60	.29
Scores on the NWRP	.96	60	.22	.94	60	.18	.95	60	.10
Score on the NWRC	.95	60	.19	.94	60	.14	.92	60	.11

Table 4 shows the mean (Ms), standard deviations (SDs), and ranges of the scores of the grammar test, NWRP and NWRC tasks for the beginner group.

*Table 4: Descriptive Statistics (Each Group No.= 60)*

Variables	Beginner Group				Lower intermediate Group				Advanced Group			
	M	SD	Max	Min	M	SD	Max	Min	M	SD	Max	Min
Grammar Test	17.42	4.34	26	8	36.05	4.83	46	24	66.53	6.82	79	55
NWRP Task	14.77	2	19	11	14.3	1.69	19	11	<b>15.7</b>	1.97	<b>20</b>	12
NWRC Task	9.28	1.83	13	6	9.65	1.51	<b>14</b>	6	<b>11.05</b>	1.5	<b>14</b>	8

As Table 4 depicts, the advanced group had the highest mean score on both NWRP task ( $M= 15.7$ ,  $SD=1.97$ ) and NWRC task ( $M= 11.05$ ,  $SD=1.5$ ). The maximum score on the NWRP task was obtained by the advanced group ( $Max= 20$ ). Both the lower intermediate and advanced groups gained the highest score in the NWRC task ( $Max= 14$ ). Table 5 displays the correlation coefficients between NWRP, NWRC, and grammar scores in the beginner, lower intermediate, and advanced groups.

Table 5: Pearson Correlations between PM Tasks and Grammar Test in the Beginner, Lower Intermediate, and Advanced Groups

	Beginner Group			Lower Intermediate Group			Advanced Group		
Variable	1	2	3	1	2	3	1	2	3
1. Grammar	—	<b>.49**</b>	<b>.53**</b>	—	<b>.41**</b>	<b>.48**</b>	—	<b>.36**</b>	<b>.47**</b>
2. NWRP	<b>.49**</b>	—	<b>.52**</b>	<b>.41**</b>	—	<b>.40**</b>	<b>.36**</b>	—	<b>.50**</b>
3. NWRC	<b>.53**</b>	<b>.52**</b>	—	<b>.48**</b>	<b>.40**</b>	—	<b>.47**</b>	<b>.50**</b>	—

\*  $p < .05$ , \*\* $p < .01$ 

Table 5 shows that NWRP task was significantly correlated with the grammar scores for beginners ( $r = .49, p < .01$ ), intermediate students ( $r = .41, p < .01$ ), and advanced students ( $r = .36, p < .01$ ). Moreover, NWRC task was significantly correlated with the grammar scores at all proficiency levels (beginners:  $r = .53, p < .01$ ; intermediate students,  $r = .48, p < .01$ ; and advanced students,  $r = .47, p < .01$ ). The correlation coefficients show a moderate relationship for the three tests. The highest correlation between grammar test scores and NWRP task was that of beginners,  $r = .49, p < .01$ . Further, the beginners' scores on grammar test enjoyed the highest correlation with NWRC task,  $r = .53, p < .01$ . Then multiple regression between independent variables (NWRP and NWRC tasks as measures of PM) and dependent variable (grammar test scores) was computed so as to figure out the level of relationship between the variables, and to find out which variable could be a better predictor of L2 grammatical knowledge (Tables 6 and 7).

Table 6: Model Summary in Multiple Regression

Proficiency Level	R	R Square	Adjusted R Square	Std. Error of the Estimate
Beginner	.59 <sup>a</sup>	<b>.35</b>	.32	3.57
Lower Intermediate	.54 <sup>a</sup>	.29	.268	4.14
Advanced	.47 <sup>a</sup>	.22	.198	6.12

a. Predictors: (Constant), Nonword Recognition Task, Nonword Repetition Task

Table 7: Coefficients in Regression Analysis <sup>a</sup>

Proficiency Level		Unstandardized Coefficients		Standardized Coefficients Beta	Sig.
		B	Std. Error		
Beginner	(Constant)	-.279	3.523	—	.94
	Nonword Repetition Task	.622	.272	<b>.287</b>	<b>.026</b>
	Nonword Recognition Task	.916	.297	<b>.386</b>	<b>.00</b>
Lower Intermediate	(Constant)	14.057	4.864	—	.00
	Nonword Repetition Task	.763	.348	<b>.266</b>	<b>.03</b>
	Nonword Recognition Task	1.199	.389	<b>.375</b>	<b>.00</b>
Advanced	(Constant)	38.865	7.080	—	.00
	Nonword Repetition Task	.623	.468	.180	.19
	Nonword Recognition Task	1.618	.616	<b>.356</b>	<b>.01</b>

a. Dependent Variable: Grammar Test Scores

As Table 6 depicts,  $R^2$  for beginner, lower intermediate, and advanced groups are .35, .29, and .22 respectively. In other words, the results tell us that for beginner, lower intermediate, and advanced groups, the PM tasks accounted for 35%, 29%, and 22% of the variance respectively. Therefore, in the beginner group the PM tasks accounts for 35% of the variance in scores of the grammar test. Table 7 displays the coefficients in the regression analysis and it shows that between the measures of PM, NWRP task had the higher Beta values than NWRP task across different groups of language proficiency (B= .386 for the beginner group; B= .375 for the lower intermediate group; B= .356 for the advanced group) ( $p < .05$ ). Moreover, except for the Beta value of the NWRP task for the advanced group (B= .18,  $P = .19$ ), the Beta values for both NWRP and NWRC tasks were statistically significant across different levels of language proficiency.

The results are in line with those of French and O'Brien (2008) and Martin and Ellis (2012). Yet the results are in contrast with those of Kormos and Sáfár (2008) and Mizera (2006) because the findings of the present study revealed that the correlation between the PM tasks and the grammar knowledge was significant and moderate for beginners and lower intermediate participants. In the present study the PM tasks and grammar test in the advanced group showed a moderate correlation and this finding is inconsistent with that of Hummel (2009). Moreover, the correlations found for the beginners were higher than those of the lower intermediate students, and the correlations obtained for the lower intermediate group were higher than those obtained by the advanced group. Thus, it can be inferred that grammatical knowledge was more closely related to PM capacity for beginners than for lower intermediate and advanced learners. In fact, it could be concluded that the grammar items involved in the grammar test (multiple choice task) were generally unfamiliar to the beginner learners because they have presumably lower proficiency levels in the L2. It indicates that beginners would have highly relied upon PM capacity in order to achieve long-term learning of these items. On the other hand, advanced learners were more likely to know the grammatical items because they were more familiar with the L2 and it may result in making the contributions from PM less important. Further, NWRC task enjoying a higher Beta value was found to be a better predictor of the participants' L2 grammatical knowledge.

## CONCLUSION

The present research was an attempt to investigate the relationship between PM capacity, measured by NWRP and NWRC tasks, and the L2 grammatical knowledge at different levels of language proficiency. The findings suggest the possibility of a causal link between PM capacity and L2 grammatical knowledge. A significant finding in the present study is that PM and L2 grammar were moderately correlated during the six-week intensive English course in all levels of language proficiency. Findings therefore confirm results in previous studies that PM is actively involved in initial L2 learning and also contributes to subsequent L2 development. NWRC task was also found to be a better predictor of the participants' L2 grammatical knowledge than NWRP. In addition to the evidence reported in the present study, more

extensive research is needed to provide answers to the remaining questions germane to the relationships between PM capacity and various aspects of L2 learning in other EFL classroom contexts. Moreover, teachers can help students expand their PM capacity by applying various strategies and techniques and see the effects of this expansion on the students' L2 learning. In addition, as it seems that there are strong associations between PM and L2 knowledge, the first step should be to provide aid for those with poor PM capacity. The current understanding is that little can be done to expand poor PM but that there are ways to remove this obstacle in L2 learning as much as possible. This goal can be achieved by the teacher favoring strategies and techniques that do not require learners to rely heavily on their PM. Besides, learners themselves can choose learning strategies that lighten the processing load on PM. Therefore, more research is needed to confirm whether specific training and techniques intended for enhancing PM capacity and efficiency can be successfully taught to L2 learners (Hummel & French, 2010). Moreover, future research should study the relationship between the L2 grammatical knowledge and phonological memory between both male and female learners of a second language. Finally, it is important to remember that the design of the present study was correlational. In showing existing relationships among factors, the causal mechanisms should be uncovered and this requires further investigation.

### ABSTRACT

The purpose of the present study is to investigate the effect of metacognitive strategy instruction on listening comprehension of Iranian English as Foreign Language (EFL) learners at Iran Language Institutes (ILI) in Parsabad, Iran. To do so, 72 EFL learners were selected among 102 learners based on the 1 standard deviation (SD) above and below the mean score of a listening comprehension test. They were divided into two groups, one experimental and one control group. Then, Metacognitive Awareness Listening Questionnaire (MALQ) was administered to identify their metacognitive strategy awareness. The experimental group underwent a treatment based on Chamot and O'Malley (1994) model and regular instructional plan of ILI, while control group did not receive any strategy-based treatment. A post-test from "Expanding Tactics for Listening" (Richards, 2011), was given to both groups after 6-session instruction. The findings revealed that (a) instruction of metacognitive strategy had positive effect on listening comprehension of Iranian EFL learners and (b) instruction of metacognitive strategy had no differential effect on listening comprehension of female and male learners.

**KEYWORDS:** listening comprehension, metacognitive strategies, strategy instruction.

### INTRODUCTION

"Listening is an important skill through which language learners internalize linguistic information without which they cannot produce language" and it is the first step in the process of language communication (Brown, 2001, p.248). Listening comprehension is an active and conscious process, in which listeners focus their own attentions on taking the important information from the aural input, comprehend the meaning of the input, and combine them with the contextual information and background knowledge to produce output (O'Malley, Chamot & Küpper, 1989). Based on the above mentioned statements, listening comprehension is a cognitive skill. It may develop through acquisition of learning strategies. Explicit instruction of listening strategies is necessary and useful for EFL learners.

Anderson (1991) considered metacognitive strategies as the most important strategy to develop learners' skills and it was proposed by O'Malley and Chamot (1990) that learners without them have no ability to monitor and regulate their development, performance, and future learning. On the other hand, learners who use metacognitive strategies are more proficient learners (Hauck, 2005). Chamot, Bernhardt, El-Dinary and Robbins (1999) mentioned four metacognitive strategies: planning for learning, thinking about the learning process, monitoring production or comprehension, and evaluating learning processes.

Metacognitive strategies differentiate proficient and less proficient listeners from each other. Yang (2009) affirms the opinion that increasing metacognitive awareness assists listeners to accomplish listening tasks more effectively. Goh (2008) states some of the positive effects of metacognitive strategy instruction on listening comprehension of EFL learners. She expresses that teaching metacognitive strategies enhances learners' confidence and reduces learners anxious during the listening to oral input and also less skilled listeners benefit much from the strategies instruction.

Instruction of strategies explicitly enhances the listeners' metacognitive knowledge and makes better their listening comprehension (McDonough, 1999). Chamot and Rubin (1994) express the importance of finding and the strategies that students use for accomplishing specific learning assignments, presenting new strategies explicitly, describing when and where metacognitive strategies can be used and supplying more practice. Different models were proposed to increase listening comprehension of learners at EFL and ESL contexts (Anderson's model (2002), Cognitive Academic Language Learning Approach (CALLA) and Metacognitive Awareness Listening Questionnaire MALQ). In this study, CALLA model was used to increase metacognitive strategy awareness and use during listening comprehension. It will be described in the following part of the present study in detail.

### Statement of the Problem

Educational System of Iran put aside listening skill and foreign language learners do not have any opportunities for aural input, therefore it regarded as a passive skill. One of the conditions in which Iranian FLLs can be learning listening is Language institutes. Thus, finding most efficient way of making learners aware of their metacognitive strategy awareness and enhancing use of these strategies might assist EFL learners to improve their listening comprehension ability. It has been remarked that most researchers try to improve students' listening comprehension in Iran. Many studies have aimed at finding solutions to deal with advanced students' weaknesses in accomplishing listening comprehension assignments through strategy training. Some of the researches are focused on metacognitive strategies awareness through questionnaire (e.g., Akbari, 2003; Salehi & Farzad, 2003; Zarei & Sarmadi, 2004; Pishghadam, 2009; Salarifar & Pakdaman, 2010) and other investigated the effect of metacognitive strategies instruction explicitly (e.g., Maleki, 2005; Meshkat & Nasirifiruz, 2009). But few studies (e.g., Tavakoli, Hashemi and Rezazade 2012) have been conducted to uses a mixed method design. The present study aims to investigate the Iranian EFL learners' metacognitive strategy awareness and the effect of metacognitive strategy instruction based on Chamot and O'Malley (1994) on listening comprehension of Iranian EFL male and female learners.

### LITERATURE REVIEW

Listening is a receptive skill in which listeners passively incorporate the message presented to them by speaker (Morley, 1991). It had been assumed that a learner's ability to comprehend spoken language would develop entirely on its own through repetition and imitation (Jinhong, 2011). According to above mentioned definitions, listening is a passive process but many other researchers pointed out that listening comprehension is an *active process* (Jinhong, 2011; O'Malley, Chamot & Küpper, 1989; Rost, 2002). Based on their definitions, listening

comprehension is not a passive activity in which listener receive information and then comprehend it but is a process-oriented activity which process the represented aural input step by step and combine background knowledge to information in the listening text.

### Metacognition

In cognitive psychology, metacognition is defined as an executive control which includes monitoring and self-regulation. Biehler and Snowman (1993), in relation to cognition, define metacognition as:

The term cognition is used to describe the ways in which information is processed –i.e. the ways it is attended to, recognized, encoded, stored in memory for various lengths of time, retrieved from storage and used for one purpose or another. Metacognition refers to our knowledge about these operations and how they might best be used to achieve a learning goal. (p. 390)

Based on the above mentioned characteristics of metacognition, a successful language learner is a person who has metacognitive knowledge about the self, task and using appropriate strategies to achieve cognitive aims (Devine, 1993).

According to Flavell (1979), components of metacognition are knowledge of cognition and regulation of cognition: *Knowledge of cognition* comprises declarative, procedural, and conditional knowledge. Declarative knowledge refers to learners' knowledge about themselves and learning strategies such as note-taking, planning, self-questioning. Procedural knowledge is about learners thinking processes. It refers to knowledge about actual use of listening strategies during listening and conditional knowledge refers to knowledge about selecting and using specific listening strategies appropriately in different contexts and evaluating the benefit of using learning strategies. Learners in order to have conditional knowledge need to clarify when and where use declarative and procedural knowledge.

And *Regulation of cognition* is about planning before accomplishing different tasks (e.g., listening), self-monitoring learning process and problem-solving during the doing tasks, and evaluating the effectiveness of learners' approach after accomplishing tasks.

Livingston (1977) identified metacognitive knowledge and metacognitive regulation as the two dimensions of the metacognition. He stated that metacognitive knowledge comprises three types of knowledge. 1) *Knowledge of person variables* refers to how learners process information. 2) *Knowledge of task variables* refers to having knowledge about the nature of the task. 3) *Knowledge of strategy variables* refers to having conditional knowledge and knowledge about cognitive and metacognitive strategies, i.e., when and where it is appropriate to use these strategies.

### Listening Strategies

Research into facilitating language learning through strategy instruction started from the past quarter of a century (Rubin, 1975; Wenden & Rubin, 1978; O'Malley & Chamot, 1990). Learning strategies are procedure undertaken by the learner, in order to make their own language learning as effective as possible.

In the view of O'Malley and Chamot:

Learning strategies are complex procedures that individuals apply to tasks; consequently, they may be represented as procedural knowledge which may be acquired through cognitive, associative, and autonomous stages of learning. As with other procedural skills at the different stages of learning, the strategies may be conscious in early stages of learning and later be performed without the person's awareness (O'Malley and Chamot, 1990).

Mendelsohn (1994) proposed 'strategy-based approach' to instruct listening comprehension based on researches about strategy instruction. People are commonly not aware about how they listen in their first language. Therefore, EFL learners require to use strategies consciously which they use unconsciously in the first language (Schmitt, 2002).

Learning strategies are generally divided into metacognitive, cognitive and social/affective. Proficient listeners use all of them altogether, the pattern of strategy use change according to the different situations. Dornyei (2005) proposed four types of strategies: Cognitive, metacognitive, social, and affective strategies. According to O'Malley and Chamot (1990), metacognitive strategies are "higher order executive skills that may entail planning for, monitoring or evaluating the success of learning activity". Cohen (1998) said that "metacognitive strategies deal with pre assessment and pre-planning, on-line planning and evaluation, and post evaluation of language learning activities". Metacognitive are defined as thoughts or behaviors consciously employed by the learner to think about the learning task, plan for the task, monitor the task, and evaluate how well he/she has completed the task (Wendy, 2010).

Chamot, Bernhardt, El-Dinary and Robbins (1999) proposed four types of metacognitive strategies, planning, monitoring, problem-solving and evaluating. *Planning* is making a comprehensive plan for comprehending the aural input. It arouses learners' interest, expectations, and promotes their motivation to find out what will happen during the listening and it also clarifies the purposes for listening and to activate different kinds of schemata (Sequero, 1998). *Monitoring* –or comprehension monitoring- is listener's self-regulation of his or her own comprehension during listening (Glazer, 1992). Monitoring strategy assists listeners to compensate lost comprehension and to use listening strategies to enhance comprehension (Schunk, 1997). *Self-assessment* "has its foundations in metacognition and self-regulated learning and is seen as having the potential to provide teachers and students with opportunities to understand and enhance the ways students monitor and adjust strategic thinking in literacy learning" (Shoemaker, 1998, p. 410).

A number of researchers have attempted to investigate the effect of strategy instruction on listeners' comprehension performances. Their aim is to identify the effect of different contexts and variables on metacognitive strategy instruction. In New Taipei City, a study was conducted to probe the effects of metacognitive listening instruction on EFL learners. The results showed that there was no significant difference between Young Learner English (YLE) scores of the experimental and the control group in the post-test. However, the experimental group significantly outperformed the control group in directed attention and person knowledge (Lin, 2011). Jinhong (2011) explored the students' metacognitive strategy use, the relationship between metacognitive strategy use and their performance in a listening comprehension TEM-4 test. The finding revealed that there is a positive relationship between metacognitive strategy use and performance in the listening comprehension test. Then an interview was conducted among the students whose scores showed a negative relation between strategy use

and listening performance to find the reasons. The results revealed that learners have different problems in using metacognitive strategies for doing listening comprehension tasks.

In a study at Allameh Tabataba'i and Shahid Beheshti, Baleghizadeh and Rahimi (2011) explored the relationship among metacognitive strategy use, motivation and listening performance of EFL students. In this study MALQ, AMS (Academic Motivation Scale), and the listening section of the TOEFL were used as instrument. After administering the pretest, students completed MALQ and AMS. The results showed significant correlation between metacognitive strategy use and listening performance, listening performance and intrinsic motivation, as well as metacognitive strategy use and intrinsic, extrinsic motivation. Bozorgian (2012) in a small scale study looked into the impact of metacognitive instruction on listening comprehension of Iranian high-intermediate EFL listeners in a "strategy-based" approach of advance organization, directed attention, selective attention, and self-management in IELTS listening texts. The results showed that the less-skilled listeners improved more than more-skilled listeners in the IELTS listening tests.

## RESEARCH QUESTIONS

This study was motivated by the following research questions:

RQ.1. Does metacognitive strategy instruction has any effect on listening comprehension of Iranian EFL learners?

RQ.2. Does metacognitive strategy instruction has any differential effect on listening comprehension of Iranian female and male EFL learners?

This study is guided by the following null hypotheses:

Ho.1. Instruction of metacognitive strategies had no effect on listening comprehension of Iranian EFL learners.

Ho.2. Instruction of metacognitive strategies had no differential effect on listening comprehension of Iranian female and male EFL learners.

The purpose of this study is examining the effect of metacognitive strategy instruction based on Chamot and O'Malley model's (1994) on listening comprehension of Iranian female and male EFL learners. This model provided repeated exposure and practice with learning strategies to enhance learners' use of strategies.

## METHODOLOGY

### Research Design

In this study, the researcher selected participants non-randomly and divided them into experimental and control groups. Experimental group received the treatment and the other group, control group, did not receive any treatment. Both groups received a test before (pretest) and after (post-test) treatment. These steps constitute the principles of the quasi-experimental research. Therefore, the design of this study is quasi-experimental. The independent variable in this study is the metacognitive strategy and the dependent variable is the listening performance of the experimental and the control groups. And in this study the gender is the moderate variable.

### Participants

A total number of 102 female and male learners who were studying English as a foreign language at Iran Language Institute (ILI) in Parsabad, Iran participated in this study. Learners at ILI are homogenous; because before entering to the ILI classes they were participated in a placement test. But in order to confirm their homogeneity in listening comprehension a listening comprehension test based on Richards's "Expanding Tactics for Listening" (2011) as a pretest, including four texts with 24 multiple-choice items, was administered to determine their homogeneity in listening comprehension. The learners' scores were 1 SD ( $SD=2.84$ ) above and below the mean score ( $M=14.5$ ) were selected. Thirty-six male ( $N=36$ ) and thirty-six female ( $N=36$ ) learners, between 16 to 21 years old, were participated in this study.

### Instruments

Four research instruments were used for the purpose of this study: A *listening comprehension test* (pretest) was used in order to determine the homogeneity of participants' in listening comprehension; *Metacognition Awareness Listening Questionnaire (MALQ)* was used to identify Iranian males and females metacognitive strategy awareness; a post-test, *listening comprehension test*, was used in order to determine effect of metacognitive strategy instruction on listening comprehension (the pre and post-test were selected from "Expanding Tactics for Listening" (Richards, 2011) and their reliabilities which were estimated based on Cronbach's Alpha Level were, respectively, .74 and .71), and an *Interview* was used to asking some questions about how learners evaluate their own use of the metacognitive strategy and how the strategy is working for them and whether they applied these strategies in other context or not? It included six questions about the effect of using metacognitive strategies (Appendix A), based on the findings of Barbosa (2012).

### Procedure

102 male ( $N=48$ ) and female ( $N=54$ ) EFL learners at four classes at ILI in Parsabad participated in the present study. All of them were homogenous because before entering to these classes they participated in a placement test and in order to confirm their homogeneity in listening comprehension, a pretest from Richards's "Expanding Tactics for Listening" (2011), was administered to 102 learners (the learners of all classes were asked to complete a pretest in one 50-minute class period). The learners whose score were 1 SD ( $SD=2.84$ ) above and below of the mean score ( $M=14.5$ ) were selected. Seventy-two male ( $N=36$ ) and female ( $N=36$ ) learners, homogenous in listening comprehension, among four classes at ILI, were selected as participants in the present study (two of four classes were randomly considered as experimental and other as control group). After identifying the homogeneity of learners in listening comprehension, a Metacognitive Awareness Listening Questionnaire (MALQ) was administered to determine learners' metacognitive strategy awareness before treatment. After an introduction on the purpose of the study and on the directions about what they requires to do for the following 8 sessions, the learners in experimental group participated in the MSI project. Then Chamot and O'Malley's model (1994) of strategy instruction (five stages) were applied. 1. *Preparation*: Instructor prepares learners for strategy instruction by identifying their background knowledge about the metacognitive strategies. 2. *Presentation*: The instructor demonstrates the new strategies and explains how and when to use them. 3. *Practice*: In this stage learners practice presented metacognitive strategies in processing represented input. 4-5. *Evaluation and Extension*: The instructor asks the learners evaluate their own comprehension and how they used strategies and so on. After 6-session metacognitive strategy instruction, a post-test (listening comprehension test) was given to both experimental and control groups. The scores of learners in post-test were compared in order to determine the effect of metacognitive strategy instruction on listening comprehension of Iranian male and female EFL learners. Finally at end of the study, through an interview, the instructor asks some questions about the strategies that learners (12 out of the 36 learners were randomly selected) were used during listening comprehension test and some questions about their experiences in learning the new strategies.

# RESULTS AND DISCUSSION

## Results

In order to answer the research questions, two research hypotheses were mentioned. To test first and second research hypotheses independent samples *t*-test was proposed.

### Testing the Metacognitive Awareness

After determining the learners' homogeneity in listening comprehension through one-way ANOVA, a Metacognitive Awareness Listening Questionnaire (MALQ) was used to identify learners' metacognitive strategy awareness. At first, through independent samples *t*-test, the researcher investigated wheatear there is any difference between Iranian EFL listeners in metacognitive strategy use or not (planning-evaluation, person knowledge, problem-solving, direct attention and mental translation)? Table 1 presents the descriptive statistics of the learners' awareness that categorized based on the experimental and control groups.

Table 1: Experimental and Control Groups Descriptive Statistics for MALQ

	N	Mean	Std. Deviation	Std. Error Mean
Experimental	36	114.71	15.790	3.446
Control	36	120.00	22.669	4.947

The findings of descriptive statistics (Table 1) revealed that there isn't significant difference between mean scores of experimental (M=114.71) and control (M=120.0) groups in metacognitive strategy use. The estimated p-value for MALQ (Sig.= .386) is more than the level of significance ( $p = .05$ ). Therefore, there is no significant difference between experimental and control groups in metacognitive strategy use. Table 2 displays the results of the independent samples *t*-test for the experimental and control groups.

Table 2: Independent Sample *t*-test for the Experimental and Control Groups (MALQ)

	Levene's Test for Equality of Variances		t-test for Equality of Means		
	F	Sig.	t	df	Sig. (2-tailed)
Equal variances assumed	.104	.765	.877-	40	.386
Equal variances not assumed			.877-	35.708	.386

After identifying the homogeneity of experimental and control groups in MALQ, an independent sample *t*-test was performed to identify females and males (experimental groups) metacognitive strategy use.

Table 3: Experimental and Control Groups Descriptive Statistics for MALQ

	N	Mean	Std. Deviation	Std. Error Mean
Experimental	18	250.40	146.257	65.408
Control	18	232.60	122.693	54.870

According to Table 4 the estimated p-value ( $p = .840$ ) is higher than the level of significance, .05. Therefore, there is no significant difference between Iranian female and male learners in terms of their reported use of metacognitive strategies. Table 4 displays the results of the independent-samples *t*-test for the female and male learners.

Table 4: Independent-samples *t*-test for MALQ

	Levene's Test for Equality of Variances		t-test for Equality of Means		
	F	Sig.	t	df	Sig. (2-tailed)
Equal variances assumed	.144	.714	.208	8	.840
Equal variances not assumed			.208	7.765	.840

Although the results of the independent-samples *t*-test showed that there was no significant difference between Iranian females and males in terms of their reported use of metacognitive strategies, in order to verifying the strategies that females and males were different, in detail, independent-samples *t*-test was conducted for each strategy independently. Table 5 displays the results of descriptive statistics for five strategies that were included in MALQ.

Table 5: Descriptive Statistics for MALQ by Gender

		N	Mean	Std. Deviation	Std. Error Mean
1	Male	18	53.000	21.33073	9.53939
	Female	18	51.6000	22.86482	10.22546
2	Male	18	63.8000	26.08064	11.66362
	Female	18	60.8000	28.27897	12.64674
3	Male	18	49.4000	34.56588	15.458333
	Female	18	49.6000	37.20618	16.63911
4	Male	18	43.2000	40.80686	18.24938
	Female	18	35.4000	21.32604	9.53730
5	Male	18	38.6000	32.05932	14.33736
	Female	18	35.2000	21.93627	9.81020

1)Planning-evaluation 2) Person knowledge 3) Problem-solving 4) Direct attention 5) Mental translation

Based on the results of the independent-samples *t*-test (Table 4), in total, there is no significant difference between Iranian females and males in metacognitive strategy use. In detail, the independent-samples *t*-test for the each strategy (Table 6) shows that the estimated *p*-values for planning and evaluation, person knowledge, problem solving, direct attention, mental translation are .923, .866, .993, .715 and .850, respectively, higher than the level of significance .05. Therefore, there are not significant differences between males and female in each metacognitive strategy. Table 6 displays the results of independent-samples *t*-test for five strategies that were included in MALQ.

Table 6: Independent Samples *t*-test for Metacognitive Strategy Use

		Levene's Test for Equality of Variances		t-test for Equality of Means		
		F	Sig.	t	df	Sig. (2-tailed)
Planning Evaluation	Equal variances assumed	.012	.915	.100	8	.923
	Equal variance not assumed			.100	7.962	.923
Problem Solving	Equal variances assumed	.048	.833	.174	8	.866
	Equal variances not assumed			.174	7.948	.866
Direct Attention	Equal variances assumed	.059	.815	-.009	8	.993
	Equal variances not assumed			-.009	7.957	.933
Mental Translation	Equal variances assumed	7.336	.027	.379	8	.715
	Equal variances not assumed			.379	6.033	.718
Person Knowledge	Equal variances assumed	2.243	.173	.196	8	.850
	Equal variances not assumed			.196	7.072	.850

#### Testing the Research Hypotheses

In the first research question, the researcher intended to investigate the effect of metacognitive strategy instruction on the listening comprehension of Iranian EFL learners. To test this question, the researcher proposed the first null hypothesis:

Ho.1 Metacognitive strategy instruction had no effect on listening comprehension of Iranian EFL learners.

In order to investigate the difference between control and experimental groups, the gathered listening comprehension scores subjected to statistical analysis of independent samples *t*-test. The results of this analysis show that there is significant difference between performance of the participants in the control and experimental groups. Table 7 displays the descriptive statistic for the experimental and control groups.

Table 7: Descriptive Statistics for the Experimental and Control Groups

	N	Mean	Std. Deviation	Std. Error Mean
Control	36	16.08	1.131	.188
Experimental	36	18.23	1.477	.205

Table 8: Independent Samples *t*-test for the Experimental and Control Groups Post-test

	Levene's Test for Equality of Variances		t-test for Equality of Means		
	F	Sig.	t	df	Sig. (2-tailed)
Equal variances assumed	4.388	.040	-6.884	69	.000
Equal variances not assumed			-6.858	63.696	.000

To test this research hypothesis, an independent samples *t*-test was conducted. The results of this analysis are represented in Table 8. According to the results of this table, there is significant difference between performances of experimental and control groups. The observed

p-value (Sig.= .04) is less than the level of significance (.05). Therefore the research hypothesis that claimed metacognitive strategy instruction had no effect on listening comprehension of Iranian EFL learners was rejected.

Finally to test second research hypothesis, the independent samples *t*-test was conducted. The results of this analysis are represented in Table 10. As the results in Table 4.10 shows, there is no significant difference between females and males in the listening comprehension test (post-test). The observed p-value (Sig.= .640) estimated for H0.2 is more than the level of significance (.05). Therefore the research hypothesis that claimed metacognitive strategy instruction had no differential effect on listening comprehension of Iranian female and male EFL learners was supported. Table 4.10 displays the results of the independent samples *t*-test for the female and male experimental groups.

*Table 9: Group Statistics of Females and Males Post-test Scores*

	N	Mean	Std. Deviation	Std. Error Mean
Female	18	17.56	1.247	.294
Male	18	18.94	1.391	.337

*Table 10: Independent Samples t-test for the female and Male in the Experimental Group*

	Levene's Test for Equality of Variances		t-test for Equality of Means		
	F	Sig.	t	df	Sig. (2-tailed)
Equal variances assumed	.223	.640	-3.107	33	.004
Equal variances not assumed			-3.097	32.105	.004

### **Discussion**

With two main research questions, this study examines (a) the listeners' metacognitive awareness (b) the effect of metacognitive instruction and (c) the differential effect of metacognitive strategy instruction on listening comprehension of female and male EFL learners who are studied English at ILI in Parsabad, Iran.

#### *The Results of the MALQ and Interview*

In this study, at first, data from the Metacognitive Awareness Listening Questionnaire (MALQ) were collected from 72 Iranian EFL learners in experimental and control groups. Analysis of the data through independent samples *t*-test revealed that there was no difference between experimental and control groups. And then, through independent samples *t*-test, the difference of females (N=18) and males (N=18) experimental group was examined. Analysis of the data also showed that there was no significant difference between females and males in metacognitive strategy use. This questionnaire has 21 items which measure five metacognitive strategies, planning, problem-solving, direct attention, mental translation and person knowledge, (Vandergift, Goh, Mareschel & Tafaghodtari, 2006).

#### *Planning and Evaluation Strategy*

Planning describes the purposes for learning, activate different previous information, and it is a comprehensive plan to accomplish the listening tasks (Dutta, 1995; Sequero, 1998). Analysis of the questionnaire responses showed learners did not fully use planning and evaluation strategies to assist them to accomplish their listening comprehension tasks (M=52.30). According to the table 5, only 51.6 % of female and 53.0 % of male learners planned how they listened to oral input. The estimated p-value for the planning and evaluation strategies (Sig.= .915) was more than the level of significance (p= .05). Therefore there was no significant difference between female and male EFL learners in planning and evaluation strategies. And at the end of study, learners responses to interview questions showed that their using planning and evaluation strategies were improved through comment such as "it is helpful for me because I can guess what the text is going to talk about and it's easier for me if I know what the listening parts are going to talk" and "before I start to listen, I have a plan in my head for how I am going to listen".

#### *Problem Solving Strategy*

Problem solving strategies assist listeners to compensate lost comprehension and to use different listening strategies to enhance comprehension (Schunk, 1997). Analysis of the questionnaire responses revealed that (Table 5), prior to the treatment, the learners did not use more problem-solving strategies to overcome comprehension difficulties as they listened to aural input (M= 37.7). According to the table 4.5, only 39.2 % of female and 36.2 % of male learners could inference and monitor those inferences. Based on the independent samples *t*-test, the observed p-value for the problem solving strategies (Sig.= .833) was more than the level of significance (p= .05). Therefore there was no significant difference between female and male EFL learners in terms of using problem solving strategies.

And at the end of study, learners' responses to interview questions revealed that learners using problem solving strategies were improved through comment such as "I use the words I understand to guess the meaning of the words I don't understand" and " I compare what I understand with what I know about the topic".

#### *Direct Attention Strategy*

Directed attention refers to how listeners concentrate, stay on task, and focus on their listening efforts (Vandergift, 2004). The collected data from the questionnaire showed (Table 5) that learners did not use more directed attention strategies in overcoming comprehension difficulties as they listened to listening comprehension (M= 49.50). According to the table 4.5, only 49.6 % of female and 49.4 % of male learners could inference on what is not understood and monitor those inferences. Males and females focus harder on the text when they have trouble understanding and try to get back on track when they lose concentration, respectively (M=49.40; M=49.60). Based on the independent samples *t*-test, the estimated p-value for the direct attention strategies (Sig.= .815) was more than the level of significance (p= .05). Therefore there was no difference between female and male EFL learners in terms of using direct attention strategies.

And learners' responses to interview questions showed that learners using direct attention strategies were improved through comment such as "I try to get back on track when I lose concentration" and "I focus harder on the text when I have trouble understanding".

#### *Mental Translation Strategy*

The collected data from statements 4, 11 and 18 revealed that most learners translated key words, translated word by word to comprehend the content and they like to translate words or sentences into Farsi in order to understand ( $M=39.3$ ). The data showed (Table 5) that the use of mental translation (is defined as taking a bottom-up processing to listening comprehension) of female ( $M=35.40$ ) is less than male learners ( $M=43.20$ ). Based on the independent samples  $t$ -test, the estimated  $p$ -value for the mental translation strategies ( $\text{Sig.}=.027$ ) was less than the level of significance ( $p=.05$ ). Therefore there was difference between female and male EFL learners in terms of using mental translation strategies.

Learners' responses to interview questions revealed that females and males using of these strategies were decreased through comment such as "after MSI, I use less word by word translation as I listen".

#### *Person Knowledge Strategy*

According to Vandergrift and Tafaghodtari's (2010) definition, person knowledge refers to learners belief about how they learn best, the difficulty presented by L2 listening, and their self-efficacy in L2 listening. The data revealed that learners found listening in English more difficult than reading, speaking, or writing and it was challenging for them ( $M=36.90$ ). All the learners feel nervous when they listen to English (female= 35.2; male=38.6). Based on the independent samples  $t$ -test, the observed  $p$ -value for the person knowledge strategies ( $\text{Sig.}=.173$ ) was less than the level of significance ( $p=.05$ ). Therefore there was difference between female and male EFL learners in terms of using person knowledge strategies. The gathered data from interview questions revealed that some individuals' self-efficacy beliefs were improved, through comments such as "prediction and activating related schemata can increase confidence," and "if I used these strategies all the time I think my listening skill will be the easiest for me."

In brief, the above findings revealed that there were differences between females and males in person knowledge, and mental translation but females and males approximately are the same in terms of planning-evaluation, directed attention and problem solving strategies. But the observed  $p$ -value for overall use of metacognitive strategies ( $\text{Sig.}=.714$ ) was more than the level of significance ( $p=.05$ ). Therefore, there was no difference between Iranian females and males in terms of their reported use of metacognitive strategies.

#### *First and Second Research Hypotheses*

The data from the listening comprehension test were collected from 72 females and males in four experimental and control groups. The groups were homogenous in terms of their listening skill at the beginning of the instruction. Then, the instructor presented metacognitive strategy instruction to the experimental groups based on Chamot and O'Malley's model (1994), the control groups didn't receive any metacognitive based instruction. In order to compare the experimental and control groups' listening performance at the end of the 8-sessions instruction, both the experimental and control groups were administered a post-test (listening comprehension test) at the end of the study. The independent samples  $t$ -test analysis of the post-test showed that the mean scores of the experimental groups ( $M= 18.23$ ) were significantly different from the control groups ( $M= 16.08$ ) (see Table 4.13).

To answer first research question, based on the results of the independent samples  $t$ -test, the observed  $p$ -value ( $p=.40$ ) was less than the level of significance ( $.05$ ). Therefore the research hypothesis that claimed instruction of metacognitive strategies had no effect on listening comprehension of Iranian EFL learners was rejected. This result is in accordance with the previous studies (Baleghizadeh & Rahimi, 2011; Bozorgian, 2012; Lin, 2011; Selamat & Sidhu, 2011; Yang, 2009). And finally in order to answer second research question, based on the results of the independent samples  $t$ -test, the observed  $p$ -value for RQ.2 ( $p=.640$ ) was more than the level of significance ( $p=.05$ ). The collected data showed that there was no significant difference between the mean scores of the female experimental group ( $M= 18.94$ ) and male experimental group ( $M = 17.56$ ). In brief, these results supported the second research hypothesis (instruction of metacognitive strategies has no differential effect on listening comprehension of Iranian female and male EFL learners).

### **CONCLUSION**

According to many researchers (e.g., Jinhong, 2011; O'Malley, Chamot & Küpper, 1989; Rost, 2002; Thompson, 2003; Vandergrift, 1999) listening comprehension is an active and conscious process in which the listeners actively receive and process the aural input, compound the information and then interpret it. Previous studies indicated the important role of metacognition on improving listening comprehension (e.g., Akbari, 2003; Cross, 2009; Jinhong, 2011; Lin, 2011; Pishghadam, 2009; Salarifar & Pakdaman, 2010; Salehi & Farzad, 2003; Yang, 2009; Zarei & Sarmadi, 2004).

Based on the findings of this study, both the experimental and control groups developed their listening comprehension. However, the development of the experimental group was significantly more than the development of the control groups. The fact that the control groups development may be attributed to ILI programs. On the other hand, the significantly higher development of the experimental groups can be attributed to the 6-sessions metacognitive strategy instruction. At the end of instructional period, the female and male experimental groups' development was approximately the same.

In the beginning of this study, data analysis showed that learners in experimental and control groups had same metacognitive strategy awareness. And independent samples  $t$ -test also revealed that there was no difference, in overall, between females and males. Moreover, in a sporadic investigation, the data analysis revealed that female and male listeners used different metacognitive strategies. The metacognitive strategies that were explored in this study include planning, monitoring, problem-solving, and evaluating. The data showed that there were differences between female and male learners in person knowledge, and mental translation strategies but they approximately were the same in terms of planning-evaluation, directed attention and problem solving strategies.

#### *Pedagogical Implications*

The findings of the present study will give teachers some guidelines as to improve EFL learners' listening comprehension. Since language learning is a slow and long-term process, it is suggested that explicit strategy training needs to be integrated in to listening instruction curriculum in language institutes. Another implication of this study goes to teacher-training programs. The aim of such programs should be familiarizing teachers with beneficial effects of explicit strategies instruction on learners' progress. The administrators, curriculum designers, material developers, and teachers, can use the findings of the present study to shape/design curricula, create syllabi, develop materials, and conduct classes accordingly.

#### *Suggestions for Further Studies*

For future studies, the period of instruction and sample size can be extended in order to reach more generalizable findings. This study investigated all metacognitive strategies, planning, monitoring, problem-solving and evaluating, but for future research, the segments of metacognitive strategies can be investigated. The metacognitive strategy instruction in a repeated manner through Chamot and O'Malley's model (1994) can be applied to studies focused on other skills. In upcoming studies, researchers can examine the effect of teaching other

learning strategies, cognitive and socioaffective, through Chamot and O'Malley's model. The questionnaire was used for this study is MALQ which includes (planning, problem-solving, direct attention, mental translation and person knowledge). For further study, the questionnaire could be modified to include new findings of specific behaviors of listening comprehension in order to have a more complete list of listening strategies.

#### APPENDIX A

##### Interview

Based on the research questions and objectives, the following questions led in the interview.

1. What was the effect of the MSI in your listening comprehension?
2. Do you consider that the use of metacognitive strategies helped you to improve your listening comprehension? Why?
3. Did the way in which your listened change into a disciplined and conscious process? Why?
4. With the use of the metacognitive strategies were you able to plan, monitor, solve problems, and evaluate your own progress?
5. Which of the strategies do you consider most useful for you? Why?
6. How did you feel during the whole process?

## A CRITICAL LOOK AT THE VARIATIONIST APPROACH TO STUDYING LANGUAGE

### ABSTRACT

One of the approaches to language acquisition and language use is the variationist approach pioneered by William Labov in the 1960's. Contrary to many theories in linguistics which seek for categorical rules to explain the underlying principles in language, the variationist approach claims that language varies systematically in accordance with social characteristics of the speakers. The very basic question which arises here is that if language use varies from a situation to another, how can it be described, and more importantly explained as a systematic apparatus. Labov's theory of linguistic variation seem to be central to the issue since it starts with real phonological sample analysis and takes into consideration the sociolinguistic factors behind such variation. However, when it is compared with more systematic schools in linguistics and language acquisition research, one finds out that although both Labovian and categorical approaches to language studies seem to be right in their system of enquiry, there is a sharp gap between the two models in providing a cogent explanation of the mechanisms and processes involved in language production, use and also acquisition. The present paper tries to deal with these gaps and suggest a solution for dealing with such mismatches in theory of language variation as a central issue in language studies including language acquisition.

**KEYWORDS:** Variation; Variationist rules; Categorical rules; Optimality theory

### INTRODUCTION

Variation in language is among the very basic obvious features of this highly complex phenomenon in human societies. Language is schematic for its instances, and speaking a language implies speaking a given variety of that language. Among the very first scientists who commented on language variation is the splendid biologist Charles Darwin (1859) who pointed out that the messiness of linguistic variation is in some ways comparable to the messiness of variation among species of horses, and that there is an important relationship between variation and evolution in both languages and living things. Darwin also observed variability in language use noting that "we see variability in every tongue, and new words are continually cropping up" (quoted in Labov, 2001, p. 8). In expounding language variation based on a biological theory of evolution, Darwin argued that language change results from a kind of natural selection similar to that of races for species.

However, since language is a social contract flowing and integrating within human societies, it is more common and even sounder and wiser to provide a social account of a natural fact like variation in language. Accents, for instance, are socially diagnostic, and in many disciplines including sociolinguistics, it has been assumed that speech forms can trigger social meaning. Other disciplines, in turn, have consistently denied that the lectal variety-society link should have any kind of bearing on the systematic configuration of linguistic codes (Coupland, 2007).

In theoretical linguistics, there has been a widespread tendency to equate standard variety to the acceptable language. A very clear example is Chomskyan linguistics which has always been seeking for a homogeneous speech community systematically eradicating social variation. Such a model and understanding of language is even known as homogeneous competence. However, according to Coupland (2007), the impression that we are working at the level of "langue" when standard varieties form the basis of our analysis, but at the level of *parole* when the object of study is a nonstandard variety, is obviously misleading, if both of them are considered varieties of the same language. An aspect of linguistic variation is that within a speech community, speakers who belong to different age groups, social classes, ethnic groups, and genders show systematic differences in the way they talk.

According to Adamson (2009), by proposing an alternative model for language description, Halliday (1978) tried to solve the problem of mismatch between linguistic competence and variational fluctuations in language through dividing language into "language as system" (language as a system analyzable in terms of levels of linguistic structure) and "language as institution" (language as constituted by independently formed varieties). According to Halliday, stylistic variation and registers belong to "language as system" and regional and social varieties (regiolects, sociolects, accents) to "language as institution".

Although Halliday's division conveniently includes styles and registers within the study of language as system, it excludes dialectal variation. In fact, both models ultimately turn out to be reductionist, as none of them focuses on language as it is globally and actually used in real situations by multilectal speakers.

Later research on linguistic variation revealed the fact that the frequency at which a speaker uses variable forms depends not only on the speaker's demographic characteristics, but also on the linguistic environment in which the form occurs. For example, according to Labov (1969), all speakers sometimes delete final /t,d/ when the following word starts with a consonant. Final /t,d/ deletion is also less likely in native speaker speech if the final /t,d/ does not serve as a past tense morpheme.

All these issues necessitate the emergence of a new trend in sociolinguistics known as Variationist approach which began during the 1960s, when Labov and Weinreich, developed a theory of language change which mostly adopted an ethnographic dialectological, probabilistic approach to the study of linguistic variation (Weinreich et al., 1968). As was mentioned above, Labov began his work at a time when the ruling linguistic paradigm was Chomsky's (1965) Standard Theory, and Labov considered his own work to be an extension and refinement of that theory. However, as shall be mentioned in the present paper later, that attempt was later argued by some linguists to be a category error since generative grammar is not concerned with the probabilities at which linguistic forms are used, but only with whether the forms are grammatical and part of a native speaker's linguistic competence. So, acceptability judgment was considered the norm for any recognition of language rules in generative thought.

Another introductory recognition which needs to be stated at this point of our analysis is that prior to Labov's research paradigm, two approaches in variationist tradition could be recognized: the system-oriented approach which started by linguistic form and their

distribution, and the behavior-oriented approach which started by examining speaker's behavior. Labov adopted a system-oriented approach which shows a marked departure from psychological approach to the study of language both by behaviorists and cognitivists in the two structural and transformational traditions in language studies. In fact, Labov's contribution was a practical step into inserting data-driven social and ethnographic approach into linguistics. According to Labov (1969), Morphosyntactic variation is not confined to competition between dialect and standard forms. Variation occurs in all spoken varieties, even in those which can be considered to be fairly standard.

Labov's endeavors to systematize the methodology of analyzing language variation and change later developed the field from an approach into a method known as "variation theory". In this theory, variation is an inherent part of language which can be observed and studied both synchronically and diachronically, in that it shows variation and change in its historical development and also denotes that language varies across different dialects within linguistic communities and socio-geographical distribution. Such variations which can even be traced in everyday vernacular of a language are at the same time rule-governed as is true for all natural languages. In other words, it is established in sociolinguistic research that language variation is not a haphazard phenomenon, but happens rather systematically (Togliamonte, 2012).

A starting point for variationist linguistics was the research with semantic equivalence as differences in pronunciation corresponded with the same meaning (Labov, 1969). However in his later studies in the field, Labov (2001) contained relevant discussion of some possible sociolinguistic principles which relate language change to social perceptions of language. In other words, Labov's approach moves gradually from a purely linguistic study on variation into a more sociolinguistic account of variation seeking to find a socio-ethnic explanation on linguistic variation. According to Togliamonte (2012), one example of such a principle of social perception is Labov's Golden Age Principle which states that at some time in the past, language was in a state of perfection (Labov, 2001). This principle is intended to explain, among other things, why older generations do not typically adopt speech norms of younger generations. Although such a sociolinguistic attitude apparently seems not to belong to anything like a universal grammar, it has clear implications for both synchrony and diachrony and would, therefore, appear to be an externally oriented account of a cross-linguistic grammatical generalization.

The relationship between meaning and form based on variationist sociolinguistics is defined by attributing meanings to varieties based on patterns of variation itself. Labov (1972) introduces the concept of salience noting that if a speech feature is used more frequently by one group rather than another group, or in one speaking situation than another, it is common practice to claim that the feature has group-salient or situation-salient meaning. Labov further formalizes this pattern of interpretation in his use of the terms marker, indicator and stereotype (Labov, 1972). By definition, markers are sociolinguistic variables that show variation in both social and stylistic dimensions. Indicators show stable, social variation. They distinguish social classes but show no variation across speaking situations. Stereotypes are variables that are highly salient to speakers and are subject to overt comment and control. The concept of marking is addressed to specify the social and stylistic circumstances of variational distribution.

#### **VARIATIONIST METHODOLOGY**

A preliminary consideration with regard to variationist approach to sociolinguistics is that variation analysis requires a large number of tokens of the variable being studied for providing sufficient data for further analysis. The task of identifying and analyzing variable forms is greatly aided by full transcription of the interview data. Except for the case of the study on phonological variations which requires a more detailed and meticulous recording of data, a fine balance between level of detail and accessibility is the norm in variationist data collection (Llamas, 2007). As far as syntactic variations are concerned, all pertinent grammatical variations should be preserved, whether they conform to standard rules or not. Frequency of occurrence is the criterion for determining the status of a form. However, morphosyntactic variables tend to be much less recurrent than phonetic variables, which can be a problem for quantitative analysis (Labov, 1966).

An example of Labovian sociolinguistic analysis is that Labov (1966) found the frequency at which a variable feature is used depends on the circumstances of speaking. /r/ deletion in New York City is a clear example of the case where New Yorkers can delete it after a vowel. Labov found that this deletion correlated not only with the linguistic environment and the speaker's social class but also with the speaking task. According to Labov, speakers tended to delete /r/ more often when they are telling stories than when they were providing demographic information. Labov suggested that the speakers tended to delete /r/ more in the casual style because they paid less attention to how they sounded, concentrating instead on telling the story. However, in formal style the speakers monitored their speech, trying to avoid stigmatized forms like deleted /r/.

To understand how Labov analyzed sociolinguistic variation as for the case above, we should note that a primary stage in the initial phase of variable selection is functional equivalence (Lavandera, 1978), where the differing variants are recognized as alternative ways of saying the same thing. The next step is circumscription of the variable context or the envelope of variation which is a major part of the analysis. Then in the analysis, we have extraction of all contexts where a variant can potentially appear in line with the 'Principle of Accountability' (Labov, 1972). In other words, where a particular variant does not appear is just as important as where it does.

According to Llamas (2007), the first stage in the phase of statistical analysis is to count the number of tokens overall, and the proportion of different variants within different instances of use. At this point, decisions and judgments are made on how many occurrences of the use of the variable under study are in the data and also on the different numbers of variants that make up these occurrences. These initial figures are known as the "overall distributions" and are normally the first set of results reported. While overall distributions of forms indicate how common particular variants are, they shed little light on the processes underlying the choice of mechanism. To validate data collection, it is also necessary to examine closely the forms that a linguistic variable takes, and note what features of the context co-occur with these forms (Bayley, 2002). These include both surrounding linguistic environment as well as social features. Using the multivariate analysis, which can deal with these competing influences, it permits us to model the combined contribution of all the contextual factors simultaneously. According to Llamas (2007), the outcome of such analysis is: (1) which factor groups have a statistically significant effect on the choice of the particular variant (factor groups which are not significant are often shown in brackets), (2) which factor group has the strongest effect (shown by the largest range) and (3) which factors within the different factor groups favor.

Related to Labovian approach to the study of language variation is work on the relationship between culture and linguistic patterns (Evans, 2003). Much of the work in this area tries to show that the presence of a particular cultural trait in a community may explain the presence of some fairly specific grammatical patterns in that community's language. However, some apparent grammatical universals may actually be the result of cultural universals.

In spite of all relevant works and studies on the issue of variation ranging from formalistic approaches to cultural accounts of the issue, Labov's approach is still the most quoted and at the same time, the most cogent study done on the issue which has contributed a lot not only to the field of variation studies in particular, but also to the expansion of sociolinguistics as an independently developed branch of interdisciplinary studies in general, with some by-product approaches, techniques and theories, ranging from linguistic ethnography to optimality theory. However, researchers who wished to write a grammar that described probabilistic patterns in speech production, such as those found by Labov, faced a basic problem. How could frequency information be included in a Standard Theory grammar? The solution that Labov and his colleagues proposed was to modify the transformational rules of the Standard Theory so that they specified the linguistic factors that affected rule application. At first, this change appeared to be minor. Generative grammar already contained optional rules, like the rule for particle movement mentioned previously, which generated alternative forms. Labov's (1969) answer was to propose the "variable rule", which specifies the environmental features (constraints) that favor rule application.

According to Labov (1969), there are two central facts with regard to variation in language. On one hand, since it is a rule governed phenomenon, it is even prone to quantificational analysis as is the case with Labov's own research findings. On the other hand, a key factor in variation is the context in which this phenomenon occurs which can be dealt with at two levels. One is at the level of description which is a function of relatively more stable features of language like language universals. However, when it comes to the stage of interpretation, the outcome would vary in accordance with which context a special variation happens.

#### VARIATIONIST POSITION AND THE REALM OF PSYCHOLOGY

From a psychological point of view, what in everyday terminology is referred to as *language, accent, dialect, style* and *social group* constitute concepts; categorizations and schemas on different levels of abstractions that relate to one another in the sense that they form part of a larger frame (Kristiansen, 2008). Not only the speech style, but also the non-linguistic social meaning seems to form part of such frames. Accordingly, when human beings categorize other humans into a series of social categories and subcategories, simplified images representing what such groups are like develop as social stereotypes. However, the role of cognitive sciences in interpreting the linguistic processes, mechanisms and mental representations and also in providing an understanding of language variation is assigned to pure linguists who have their own understanding of variation phenomenon. In order to understand the position of variationist theory in linguistics, it is essential to make a distinction between E-language (Externalized language) and I-language (Internalized language) linguistics. According to Chomsky (1986), E-language linguistics focuses on sentences understood independently of the properties of the mind. However, I-language linguistics is concerned with the speakers' knowledge of the language and the origin of such knowledge in human mind. Therefore, it can be inferred that E-language approach treats language as a social phenomenon. Considering this distinction, variation in linguistics can be recognized as an E-language approach to the study of language while optimality perspective, though not apparently a mentalist approach to the study of language, is more prone to be categorized in the I-language linguistic studies. Some scholars believe that optimality theory was a revisionary concept to reconsider variation which is a probabilistic program dealing with widespread structured variation and specifically aims to know how mental program (I-language) is organized, so that variations arise (Adger & Smith, 2005).

Elsewhere, Milroy and Gordon (2003) provide a relatively inclusive picture of the basic reasons why variationists and generativists cannot reconcile, namely that:

- A) generativists have moved towards more and more abstraction (universalities),
- B) distinction between competence and performance is very basic in generative theories,
- C) generativists treat language as asocial,
- D) for variationist sociolinguists, language flows in social context and is subject to variation and change interpersonally and intrapersonally, and speech participants are considered social actors.

#### PROBLEMS WITH LABOVIAN APPROACH

Labov's adoption of descriptive structural method focused on contrasts in comparing instances of variation. However, there was the problem of mismatches between judgment and independent observations. Moreover, in many cases grammatical rejections emanated from pragmatic considerations. Also, as Labov was under the influence of methods in traditional dialectology which focused on geographical accounts of linguistic differences, there was lack of attention to the social group where the informant came from and the way he might have been influenced by special exposures to language. In addition, for many cases, there was lack of representativeness which was a negative point for the validity of the whole.

Labov (1972) mentioned linguistic variation as "orderly heterogeneity" denoting that alternating variants occur in regular patterns, not in a random distribution. These patterns exhibit two facts, the social regularities and the linguistic regularities. As far as social regularities is concerned, higher status speakers use more of the socially valued variants. For the fact of linguistic regularities, certain linguistic contexts favor the occurrence of particular variants such as phonological reduction process.

However, the concept of variable rules proposed by Labov was debated from the very outset. By some scholars (e.g. Bickerton, 1971) on the ground that they considered variable rules as being unnecessary since mental grammars with different rules or different constraints on the same rules could produce the same results. Others argued that variable rules would require a "variable rule speech community" where the same variable rules would be in the minds of each speaker (Fasold, 1990). The casting of an aggregated set of "variable rules" for the speech community would appear to be unavoidable as they allow no individual grammars which are not informed from the community grammar (Sankoff, 1980).

#### CRITICISM FROM CRITICAL APPROACHES TO VARIATIONISM

The scope of variation today is not limited to formal aspect of language and can even extend to the scope of discourse. Coupland (2007) alludes to a number of serious criticisms to variationist sociolinguistics and especially the pure variation-oriented approach from the discourse and critical perspective. Among these critical standpoints, Sankoff's (1988) position is historically the first documented argument from a critical doctrine casted on variationism, stating that language variables are alternative options within the same grammar system which have the same referential value meaning in running discourse. Therefore, nuances of variations in a language form which may even lead to nuances of meaning would lead researchers to categorize a special variation as belonging to the same structure. In other words, little variation in meaning resulting from variation in form does not prevent linguists from recognizing the variation as being categorized under the same structure.

However, from the 1990s onwards, the critical approach to variationism receives more official disciplinary treatment by the emergence of critical discourse analysis and critical applied linguistics requesting for more ideologically-grounded approaches to the study of linguistic variation. For instance, Trudgill (1974) proposes that it is not so much linguistic, but political and cultural factors which determine whether a variety should be categorized as part of this or that language. He applies the notions *heteronomous* and *autonomous* in order to describe the relative dependency of non-standard varieties on a given standard variety. The sum of an autonomous variety (the standardized one) and a series of heteronomous varieties (non-standard varieties dependent on the standard) together constitute a language. As Trudgill argues, the nonstandard dialects of Germany, Austria and German-speaking Switzerland are heteronomous with respect to standard German because speakers of these dialects look to German as their standard language; they read, write and listen to German in their everyday use of language. Speakers of dialects on the Dutch side of the border, in the same way, will read and write in Dutch, and standardizing changes in their dialects will take place in the direction of standard Dutch, not standard German.

Elsewhere, by addressing the conventional sociolinguistic concepts such as “speech repertoire”, Ronald Wardhaugh (2002) stated that we can talk about a speech repertoire when an individual controls a number of varieties of a language or of two or more varieties. So the concept of speech repertoire confirms Labov’s principle that ‘there are no single-style speakers’ (Labov, 1972) and throws the definition of an idiolect (a single person’s distinctive way of speaking) into confusion.

Pierre Bourdieu’s sociological research on linguistics has also been influential in his critical account on sociolinguistic variation. According to Bourdieu (1984) the symbolic and cultural value of language varieties are the significant aspects of the social use of language. For instance, prestigious varieties of English have cultural capital which often translates into real, material advantages for speakers. Bourdieu also tries to theorize style directly noting that any form of cultural practice is a system of social distinctiveness that is ideologically structured through socialization (Bourdieu, 1991). Although Bourdieu criticizes the purely form-based variationist linguistics, he stresses acknowledges variationists’ traditional claim that language variation is socially structured in communities.

Also, in spite of the fact that Bourdieu regularly cites Labov, Labovian theory and agenda is hardly politically-laden. However, it has become increasingly obvious that the sociolinguistic structures that matter for speakers in their social lives are not simply the describable statistical patterns of speech co-varying with class and situation. They are the ideological structures that imbue language variation with social meaning, and often with social disadvantage.

Elsewhere, Lesley Milroy defines language ideologies as ‘thoroughly naturalized sets of beliefs about language intersubjectively held by members of speech communities’ (Milroy 2004).

In another strand of critical analysis of language use, Norman Fairclough (1995) challenges the idea of contextual ‘appropriateness’ in language use. He argues that the orderliness of language variation perhaps carries the implication that speakers know which ways of speaking are ‘appropriate’ to which social contexts, such as how to speak in formal settings. According to him, appropriateness models in sociolinguistics should therefore be seen as ideologies projecting imaginary representations of sociolinguistic reality which correspond to the perspective and partisan interests of one section of society.

Elsewhere, David Lee (1992) asks whether the differences between linguistic dialect varieties – specifically between standard and non-standard varieties – are simply a matter of superficial formal contrasts, or whether there are more important differences having to do with the kinds of meanings expressible in different varieties’.

These political points make it necessary to revisit a taken-for-granted assumption in variationist sociolinguistics – the idea that sociolinguistic variants are semantically equivalent, or different ways of saying the same thing. Another criticism is based on that ground that variations viewpoint does not match social actors’ own perceptions of meaningful speech differences. But even if we set that issue aside, there are still reasons to doubt the validity of the device of inferring social meaning from speech-form distribution.

### **OPTIMALITY THEORY**

Criticisms against variationist position in linguistics and its shortcomings to deal with a number of significant facts in language motivated the emergence of a new trend in the study of language variation known as Optimality Theory. To provide a background to the necessity for this theory, it should be noted that variationist position was attacked from the camp of pure linguistics from two fronts. On one hand, Kay (1975) objected to the uniform constraints assumption, noting that numerous studies had, in fact, found that the linguistic constraints on a variable rule were not similarly ordered for all of the demographic groups within a speech community, so a single variable rule could not describe the speech community as a whole. Romaine (1982) raised a similar objection to the uniform constraints assumption. She pointed out that within larger speech communities, there exist separate social networks whose speech patterns may differ.

On the other hand, Milroy (2004) stated that speech in British cities is more varied than speech in American cities. He characterized the regular variation observed by American sociolinguists as the “tip of the iceberg” and said that British sociolinguists, looking beneath the waterline in cities like Glasgow, Edinburgh, and Belfast, have observed a lot more irregularity. A different kind of objection to variable rules was raised by Derek Bickerton (1971), the eminent creolist. He claimed that linguistic variations were unlearnable: If we accept the variable-rule principle, we must also accept that the mind possesses not only the apparatus necessary for framing two quite different types of rules (standard grammatical rules and variable rules), but also some kind of recognition device to tell the speaker whether to interpret a particular set of data as rule-plus-exceptions or as area-of-variability.

Elsewhere in the applied linguistics enquiry, Gregg, a second language acquisition (SLA) scholar from the generative camp, and Rod Ellis (1990) and Elaine Tarone (1990), SLA scholars from the variationist camp pronounced criticism against Labov. Gregg reiterates that variation theory does not include a theory of acquisition; that is, that variation theory has no explanation for how speakers can learn the probabilities embedded in variable rules.

Yet, another strand of criticism from the pure linguistic point of view was exerted to Labov’s variationist linguistics on the ground that, contrary to what is claimed by Labov and his disciples, the model lacks to account for the generative aspect of linguistic systems. Kay and McDaniel (1979) & Gregg (1990) stated that generative grammar had two major goals: (1) to construct an algorithm for generating all and only the grammatical sentences of a language, and (2) to discover principles of Universal Grammar that explained how speakers can learn the grammar described by (1). Generative linguists believed that both of these goals could be accomplished by a competence grammar, and a

competence grammar did not address questions of how often or under what linguistic and social circumstances a particular rule would be used, as we have seen. Generative research involved the study of *types* of structures (what are the possibilities for pronouncing the *-ing* morpheme?). Variation research involved the tabulation of *tokens* of a structure. This question was considered to be a matter of performance. Labov was committing a category error by introducing probabilistic description into a generative grammar. What caused the most controversy between variationist theory and generative linguistics was that probabilistic grammars had a different logical status from categorical grammars, and variable rules were rules of production.

Optimality theory and variationist position in linguistics, though highly related to each other in the main objective they follow which is to deal with language variation, can be considered two poles with respect to their approach in studying linguistic variation as a natural phenomenon in language. We should not forget that for variationists, competing outputs and constraint ranking show great promise for handling not only cross-linguistic variation, but also language-internal variation. As one of the goals of sociolinguistics is to understand the correlation between social factors and linguistic variation and ordering of linguistic constraints with respect to variability of rules, linguists and sociolinguists who were aware of the reality of linguistic variability and mostly belonged to the non-categorical camp of linguistic studies began to devise a system of language description which provided systematic description of linguistic variations which could also be compatible with universal rules of language. This was an effort to put variability into a systematic frame so that the field of sociolinguistics was not blamed anymore for lack of systematicity and haphazardness. By definition, optimality theory is a framework that evaluates the interaction between violable constraints in a language (Blutner & Zeevat, 2004). Initially developed by Prince and Smolensky (1993) as a new phonological framework, Optimality Theory is a framework for the development of grammars that generate variable outputs. This theory was extended beyond the realm of phonology to areas of morphology, syntax and even pragmatics. As opposed to variationist linguistics, optimality theory aims at exploring relatively stable characteristics of variation common to all of world languages. The aim for doing so is to minimize the level of variation which is usually observed between competence and performance (Blutner & Zeevat, 2004).

Optimality theory is viewed as particularly well-suited for developing linguistic analyses that account for both categorical and variable outputs. It seeks for establishment in the rules and patterns operating within languages with the assumption that the more we study the established characteristics of a language, the more we can get close to the neuro-psychological basis of the languages in general. Therefore, one may conclude that optimality theory is a way of interpreting constraints even through adopting a typological approach (Blutner & Zeevat, 2004). In generative approaches to linguistics, constraints are interpreted in a binary all-or-nothing fashion. However, according to Prince and Smolensky (1993), in optimality theory, constraints are ranked with respect to each other, such that lower-ranking constraints may be violated in order for higher-ranking ones to be respected. In fact, it is a core concept in optimality theory that it rejects the inviolability of constraints which is a characteristic of Universal Grammar and to consider a set of violable constraints. It is at this point that optimality theory, though being considered a sister theory to Universal Grammar and Linguistic typological approaches, departs from those perspectives to provide a new system of explanation which presents new possibilities on marrying variationist and categorical features of language.

A more clear account of optimality theory and its comparison with Universal Grammar is given by Tesar and Smolensky (2000), where they reiterate that Universal Grammar is assumed to be determined by a generative part *Gen* and a system of violable constraints *Con* (UG\_*Gen\_Con*). The language-specific part of Grammar relates to a particular ranking of the constraints in *Con* which is the only learnable part of the grammar. The implication for learning the language is that inferring the ranking of the constraints in *Con* is what should be mostly mastered by a language learner.

Elsewhere, Gregory R. Guy (2007) addresses optimality theory as a constraint-based approach in which general universal principles are summarized in a ranked list of constraints each of which will prevail unless in a given case, it would cause a variation of a higher-ranked constraint. According to optimality theory, the alternatives of a single grammar form are evaluated based upon the type and the severity of constraint violation which that special form incurs. It is at this point that the possibility of a dialogue between optimality theory and variationist linguistics can be reviewed. The extreme version of optimality theory asserts that there is only one optimal candidate for any set of circumstance-conditioned options, with a special form resulting from the optimal choice of language according to the hierarchy of constraints. This reading of optimality theory is highly categorical and reflects a typological view of language and grammar. As a matter of fact, such an understanding of optimality theory cannot explain the real sociolinguistic variations that happen in everyday language use. Although there are categorical rules and constraints in the formal grammar of any languages, this does not mean that the sentences and words both in their sequence of occurrence and in their phonological manifestation do not deviate from their defined categories and constraint-ranking when they occur in the social context by the language users. The crucial fact about sociolinguistic phenomena is that in contrast to pure language phenomena which are mostly conceptually-driven and fledge out of a general model of language, the sociolinguistic phenomena are highly data-driven, realistic and subject to variation as a function of social variation. Human-being is not a machine to be planned by language rules and to be expected to copy sentences limited to the same rules and disciplined by the categorical constraints defined for these rules. Although the same degree of computational planning is now believed to be at work with language acquisition, the system will certainly be subject to live variations in different social contexts and for different sociolinguistic groups in human communities.

However, the more moderate version of optimality theory can be more compatible with variationist theory. One option for doing so is the proposition of variable or partial constraint ranking by Anttila and Fong (2000) and also Boersma and Hayes (2001). Their model is a competition model which relies on the different selections made by different rankings to predict the frequencies of occurrence of competing forms. According to this approach, the actual frequency of occurrence of phonological variables in differing contexts is the criteria for constraints to be considered valid and at priority in a language. Such an understanding of the concept of constraints and language optimality brings factors such as frequency of occurrence and actual situation into account. In fact, this understanding of optimality theory is compatible with the natural use of language in its sociolinguistic context.

As the most valid device to understand and formalize variability is to observe the types of variation, their frequency of occurrence and the language context in which they occur. It is exactly at this point that optimality theory and variationist linguistics meet each other since their philosophy of enquiry reaches the maximum shared ground. However, what yet remains for more scrutiny is to find formulations for variation in language. In fact, one problem with variationist linguistics is that many discussions in the field remain at the level of simple description of the variationist phenomena without any contribution to general formulations. At this point, a moderate and well-adapted version of optimality theory can come into play to more soundly institutionalize variations as a sociolinguistic phenomenon. In other words, the field of sociolinguistics can utilize theorizations of optimality theory to provide well-established universal generalizations which are necessary for every field of enquiry.

Using the descriptive mechanism of optimality theory, sociolinguists can raise the validity of the conclusions they make about a construct as versatile and as complex as sociolinguistic variation of constrained-based approaches: general, universal principles accounts for phonological generalizations. In Optimality theory (originally deterministic and categorical), these principles are summarized in a list of constraints. The point of focus in optimality theory can be recognized as how linguistic variation is minutely conditioned by linguistic structure and how it is, in many instances, intrinsically connected to various aspects of social structure.

Although optimality theory seems to be very promising to provide a more systematic account of variational phenomena in language, there is criticism against it from many linguists who argue that this framework does not, in the normal case, generate variable outputs. This position is illustrated by the following quote from Tesar (1995:3): "The idea is that by examining the marks assigned by the universal constraints to all the candidate outputs for a given input, there is one which is least marked, or optimal: this is the one and only well-formed description that may be assigned to the input by the grammar."

#### CONCLUSION: PROSPECTS FOR A MORE REALISTIC VIEW ON VARIATIONISM AND LANGUAGE ACQUISITION

Without trying to negate any facts found via research and theoretical enquiry in variation and optimality, it is necessary to have a more realistic look at how language users use language in real context and what really is the function of variation in language. I prefer to think of language as an apparatus of availability and requirement. When an individual wants to start speaking, there is a variety of factors which may be at work for language production to happen. In other words, there is at least some motive, whether internal or external, for any language production to happen. The motivating bank and the feature of the credit through which language production should happen is subconsciously very decisive on the choice of form. So, in mathematical terms, the speaker chooses alternative X or X' from a domain of alternatives which can vary from the topic, addressee, register, geography age of addressee or age of speaker and so forth.

However, the job is not over at this point, but the speaker takes the motive of talk to his/her apparatus system. This apparatus is in fact what the speaker finds available to himself from knowledge of how to use language (communicative competence).

We can use the mathematical metaphor to better understand the issue. If we consider the relation:

$F(x) = y$  the terminal form "y" is in fact the form of language which is actually produced and heard or read in its physical shape.

As we are dealing with human beings which are under the influence of affective factors and also under emotional impact from both inside and outside (e.g. a tendency to copy a person to whom a speaker feels kinship or in whom he has detected some prestige, we cannot expect the equation  $F(x) = y$  to be always true as a mathematical function (as the definition of function in mathematics calls for:

If  $F(x) = y$  and  $F(x) = y'$ , hence  $y = y'$

In other words, we may have  $F(x) = y$  and  $F(x) = y'$  in different situations even by a single individual in a similar context, which will be in sharp contradiction with mathematical functions. Therefore, any consideration of language as working like mathematical processes is a myth. Although some basic algorithms in language follow some categorical patterns at a very general level, it is by no means to consider that the same thing should be true for the whole corpus of language. Therefore, instead of optimality theory which is trying to provide a systematic account of language variation, we need to develop a more realistic model of language use which takes into consideration both psychological and social influences of human mind on the outcome of language.

## ABSTRACT

This study explores the effect of Focus on Form (FonF) method of instruction on Iranian learners. It particularly focuses on teaching simple past tense (PT) and definite and indefinite articles (ARTs) as the linguistic targets to Iranian EFL learners. Studies on the effect of FonF instruction in L2 were extensively conducted and the results have shown positive empirical evidence for FonF instruction (N. Ellis, 1995; Spada, 1997; Norris and Ortega, 2000; and R. Ellis, 2002). To this end, 56 female EFL learners whose age ranged from 18 to 24 participated in this project and formed the experimental and control groups. The experimental group received the FonF instruction as the treatment. The tests used in this study were a diagnostic test, a pretest, a posttest, and an open-ended questionnaire. The data were subject to ANOVAs and the results indicated that the experimental group did significantly differently from the control group in the posttest. The conclusion drawn is that this approach was positively effective to teach English simple past tense and definite and indefinite articles to the learners of English as a foreign language.

**KEYWORDS:** Focus on Form instruction, Simple past tense, Definite and indefinite articles

## INTRODUCTION

Second language acquisition (SLA) may take place in natural environments, in educational settings, or in mixed contexts (R. Ellis, 2008; Pica, 1983). Some learners may simply be exposed to a target language environment and learn the language; some may acquire a target language through instruction in a classroom, and some may acquire a second language in both natural and educational settings. However, for a majority, instructed second language learning in the classroom plays a crucial role in SLA both in the learner's native environment and in a target language context (R. Ellis, 2005). Historically, for a successful second language acquisition, language practitioners and researchers have been seeking effective instructional methodology (Richards & Rodgers, 2001) for fruitful outcomes.

Brown (2007) sketched the development of language pedagogy in the past several decades from the Grammar Translation Method (GTM), the Series Method, the Direct Method, Cognitive Code Learning, the "designer" methods, to Communicative Language Teaching (CLT). Some methods emphasized formal language aspects (e.g., GTM); others forbade the formal instruction of language forms (e.g., the Natural Approach); and still others stressed meaning negotiation for communication (e.g., CLT). Under the umbrella of CLT, some proponents insisted on paying no attention to linguistic forms, whereas others advocated embedding form-focused instruction into communicative language teaching. From about twenty years ago, the focus of the majority of language teaching has shifted to form-focused instruction and only a few SLA researchers insisted on no focus on form. Thus, the importance of focus on form embedded in communication in L2 teaching appears to be currently agreed upon (Brown, 2007). SLA researchers, such as Long (1991) and Doughty and Williams (1998) have proposed Focus on Form in L2 instruction. They claimed that based on meaning or communication, students' attention needs to be occasionally shifted to linguistic features when communication difficulties such as problems with comprehension and production are encountered due to non-target-like language used. In response to the proposed FonF approach, studies on the effects of FonF instruction in L2 were extensively conducted and indicated mixed results.

The results have shown positive empirical evidence for FonF instruction, as those reviewed in N. Ellis (1995), R. Ellis (2002), Norris and Ortega (2000), and Spada (1997). On the other hand, some research on the effects of Focus on Form has revealed no positive effects (Stein, 1998), and the arguments as to the effect of focus on form have been existent (R. Ellis, 2005; R. Sheen, 2005, 2007). In addition, FonF instruction has been criticized by Sheen (2005, 2007), who claimed that there was no sufficient empirical evidence to support the effectiveness of this approach. However, R. Ellis (2008) has pointed out that "He is clearly wrong" (p. 833). Thus, it appears that there is a gap among the various pedagogical perspectives in the SLA field that needs more empirical evidence to bridge.

In addition to the issues in ESL settings, EFL contexts have also faced pedagogical problems. English teaching in compulsory education in Iran, for example, has not satisfactorily met the demands of higher level English proficiency. Being an EFL context, Iran is a globalization-oriented country, where international communication has been in high demand for both academic and non-academic purposes. Owing to the previously and currently non-FonF approaches that have been little fruitful in the Iranian context, it appears that there is a need to seek alternative teaching approaches to improve the English education in Iran. To this end, FonF, as a current "hot topic" in the instructed SLA field (H. D. Brown, 2010), is taken into consideration when exploring a more effective alternative to teach simple past tense as well as definite and indefinite articles in the Iranian EFL context.

## RESEARCH QUESTIONS

Concerning what appeared above, the following research questions are formed?

- 1) Is Focus on Form instruction a more effective approach in terms of accurate production of the simple past tense than the non-FonF method being used in Iranian EFL context?
- 2) Is Focus on Form instruction a more effective approach in terms of accurate production of the definite and indefinite English articles than is the non-FonF method being used in Iranian EFL context?

## METHODOLOGY

### *Participants*

The participants of this study were 70 female students learning English at elementary level in Safir English Language Institute in Esfahan, Iran. The learners' age ranged from 18 to 24. Some of them had graduated from different universities in Iran at BA level, some of them had completed 12 years of schooling, and some were following their education at high school. Furthermore, all participants were Iranian and their mother tongue was Persian.

### *Instruments*

The instruments used for collecting the quantitative and qualitative data consisted of a diagnostic test, a pretest, a posttest, and a questionnaire.

### *The Diagnostic Test*

The diagnostic test consisting of 35 questions was compiled by the institute itself for placement purposes. The test which was a mixture of multiple choice sentence completion, cloze test, and reading comprehension multiple choice questions was compiled by the institute itself for placement purposes. Hence, its reliability had already been verified by the institute's test developers. It was administered at the very beginning of the data collection procedure to verify whether the general English proficiency level of the two groups was comparable from the outset of the study. Ideally, the comparison of the proficiency level between the two groups should be similar statistically so that the effects of the treatment in the experimental group and no treatment in the control group can be compared.

### *The Pretest*

It was used to ensure participants' readiness for the two target structures, PT and ARTs. They showed their readiness by reaching approximately 50 % accuracy of the TOTAL scores (average of the Grammar Judgment Test (GJT) and Free Writing (FW)) for each of the two linguistic targets in the two measures, GJT and FW. The two measures are described as follow.

*The Grammaticality Judgment Test:* The test was composed of 60 items in sentence level. Of the 60 items, 20 focused on the PT (10 grammatically correct and 10 ungrammatical), another 20 on the ARTs (10 grammatically correct and 10 ungrammatical), and the other 20 other than the two targets as distracters (10 grammatically correct and 10 ungrammatical). To compile this test, the book "*Grammar Practice in Context*" was used. The reliability of the items was already verified by the authors.

*The Free Writing:* In order to create a context for the participants to produce the target structures, the FW was prompted using:

*About a year (#years) ago, I took the Entrance Examination...*

This prompt was used based on the fact that almost every learner has to take the high school entrance exam in order to select the high school that s/he is interested in, and the university entrance exam to be admitted to a college or university s/he desires. The participants were advised to write as much as they could in the time limit, but they were not allowed to consult any dictionaries or their classmates. The FW production was to elicit the participants' use of the PT and the ARTs, along with the GJT, as an indicator of the participants' readiness for the target structures, and also as the pretest baseline data to compare with those from the posttest.

### *The Posttest*

Similar to the pretest, the posttest also consisted of two measures, a different GJT and FW. The contents of the GJT, based on the instructional materials taught during the instructional treatments, differed from the pretest; but they were similar in terms of the level of complexity and proficiency. In a similar vein, the topic of the FW sample on the posttest was also based on the instructional contents, but it differed from the pretest, too.

*The Grammaticality Judgment Test:* A second GJT, similar to the pretest in format but different in content and also consisted of 60 sentence items, was used. Of the 60 items, 20 focused on the PT (10 grammatically correct and 10 ungrammatical), 20 on the ARTs (10 grammatically correct and 10 ungrammatical), and 20 other than the two targets as distracters (10 grammatically correct and 10 ungrammatical). It was administered to collect data for comparison with those of the pretest to examine whether there was any significant difference in gains within the groups and between groups after the instructional treatments.

Similar to the pretest, the book "*Grammar Practice in Context*" was employed to compile this test. The reliability of the items was already verified by the authors.

*The Free Writing:* After the GJT described above, the participants composed another FW

Titled *My Last Visit to the Zoo*, which was related to the teaching materials used, *A Postcard from Rio* and *Two Fables* by Aesop. It was assumed that all participants had been to a zoo and therefore held the appropriate schema to be able to write on this topic. Further, in the instruction of the writing test, the learners were directed to pretend they had been to the zoo if there was anyone who had not. To establish a context for the participants to produce the targets, the FW posttest was prompted:

*In my last visit to the zoo, I...*

The participants were again advised to write as much as possible, but they could not use any dictionaries or discuss any questions with their classmates during this activity. The FW production and the GJT on the posttest were intended to elicit the linguistic targets to evaluate and compare the effects of the treatments within group and between groups.

### *The Questionnaire*

A questionnaire consisting of a series of 8 open-ended questions was also used to evaluate the participants' experience of instruction. The questions were prepared by the researchers considering the type of instruction which the experimental group received during the treatment. They were based on the types of activities, typographic input enhancement, pair/group work, as well as peer/teacher feedback. The reliability of the questions included in the questionnaire was not verified. As it was based on the treatment, it was not conceivable to run a pilot study and thus verify the reliability.

**Procedures**

*Participants Selection Procedures*

In selecting the sample, the researchers employed two intact classes as the control and experimental groups. Although the 70 participants selected for this study were studying English at the same level determined by the institute, the level of their language proficiency was determined by the diagnostic test which consisted of 35 questions and was compiled by the institute itself for placement purposes. The test was a mixture of multiple choice sentence completion, cloze test, and reading comprehension multiple choice questions. The students took the test, then, based on the normal probability curve, those students who were placed between one standard deviation above the mean and one standard deviation below the mean were selected as the main participants. It is worth pointing out that some of the participants were dropped from the study due to their absence in some treatment sessions, resulting in 56 participants. 30 participants formed the experimental group and the rest 26 formed the control group of this study.

*Data Collection Procedures*

Quantitative data were gathered by the pretest, and posttest, using grammaticality judgment test (GJT) and free writing production (FW). Also, some open-ended questions concerning the participants' experience of the instruction (treatment) were collected for qualitative analyses.

In order to collect the data required for the fulfillment of the objectives, a lengthy procedure was taken. At the beginning, the participating teacher was informed about the study and the types of focus on form instruction to be used in her related classes. At the very beginning of the experiment, a diagnostic test was first administered to verify whether the two groups of the participants were comparable in terms of treatment of the two respective groups or not. Finally, the results of those participants placed between +1SD and -1SD were considered for data analysis.

The participants, then, took a pretest consisting of GJT and FW to measure their knowledge of the two targets, PT and ARTs. The pretest was utilized to verify their developmental readiness for the treatment of the two linguistic targets, and also as the baseline data to compare those of the posttest. The PT was operationalized as simple rules and the ART, complex rules in terms of form and/or function. The two grammar points were instructed for eight hours; each for four hours, respectively. For the treatment, the two groups were taught by the same instructor who was familiar with both the non-FonF teaching methods the institute was currently using (e.g., GTM, CLT) and the Focus on Form approach. The control group received non-FonF treatment, whereas the experimental group was instructed with the FonF procedures and techniques such as dictogloss, input enhancement, input flood, contextualized activities, pair/group work for interaction and output activities, peer/teacher corrective feedback, and implicit and explicit teaching of the two linguistic targets.

Finally, after the treatment, both groups took the posttest on the GJT and FW regarding the linguistic targets taught. They also answered the open-ended questions about the instruction experience.

*Data Analysis Procedures*

Data collected from the GJT and FW on the pretest and posttest were compared using SPSS 15.0 to carry out ANOVAs, One-Sample Kolmogorov-Smirnov Tests, and Gain Scores. Both the GJT and FW results were scored. The results were analyzed to examine whether there were gains that were significantly different at a  $< .05$  level (confidence interval 95%) between tests within groups and between groups after eight-hour instruction for the effects of the FonF approach; furthermore, the data were subject to the ANOVAs and One-Sample Kolmogorov-Smirnov Tests.

**RESULTS AND DISCUSSION**

Two distinct linguistic features, past tense (PT) and definite and indefinite articles (ART), were examined in order to investigate the effects of FonF instruction on two types of rules, simple vs. complex rules. Each linguistic feature was measured by means of Grammatical Judgment Test (GJT). For comparisons of the PT scores on the GJT between the control and the experimental groups at the two test time points (the pretest, and the posttest), one-way ANOVA were carried out using SPSS 15.0 to compare the scores and triangulate the results for the GJT on the two tests.

In order to see whether we are able to use ANOVAs, first we should check whether the data have been normally distributed or not. If the level of significance is more than 0.05, it indicates the normality of data distribution.

*Table 1: One-Sample Kolmogorov-Smirnov Test for experimental and control groups*

		Pretestcontrol	Pretestexperimental
N		26	30
Normal Parameters(a,b)	Mean	17.88	17.80
	Std. Deviation	3.374	3.643
Most Extreme Differences	Absolute	.096	.096
	Positive	.096	.091
	Negative	-.096	-.096
Kolmogorov-Smirnov Z		.491	.524
Asymp. Sig. (2-tailed)		.969	.946

As it is clear from Table 1, the result of the normality test shows that p values of the two groups (.969, and .946) are more than the significance level (0.05). Therefore, we can accept the assumption of normality and we can use parametric test such as ANOVA for comparing the results of the pretest and posttest in the control and experimental groups. In order to answer the first research question, first the gain scores from pretest to posttest in PT experimental group and control group were

computed and then ANOVA was used to see whether there was any significant difference among the two groups in pretest and posttest stage. The following tables show the results:

Table 2. Mean pre- and posttest of past tense scores for experimental and control groups

Group	N	Mean	Std. Deviation	Std. Error	Minimum	Maximum
Control	26	1.42	1.922	.377	-5	4
Experimental	30	3.67	1.749	.319	0	7
Total	56	2.63	2.137	.286	-5	7

The results of data analysis (ANOVA) in Table 3 below indicates that there is a statistically significant difference between the experimental and control groups in the results of PT pretest and posttest because the obtained F value of 20.916 was found to be significant at .001 level ( $P=.000$ ). In fact, the learners had a better performance in learning the past tense when they were taught through Focus-on-form instruction than when they were taught by non-FonF method.

Table 3: ANOVA analysis for mean pretest scores of past tense scores for experimental and control groups

	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	70.112	1	70.112	20.916	.000
Within Groups	181.013	54	3.352		
Total	251.125	55			

Figure 1 below indicates that there is a statistically significant difference between the experimental and control groups in the results of PT pretest and posttest.

Figure 1: Pre- and posttest of Past Tense (PT) scores for experimental and control groups

Regarding the effects of FonF instruction on the acquisition of the PT, there are three aspects of the results to be discussed. First, in comparison of the test results of the control and the FonF group, there is a statistically significant difference between the two groups on the GJT. These results are incongruent with those of Stein's (1998) study, in which no significant difference was found between groups with or without FonF treatments, although the factors that may have contributed to the results of the two studies vary. Overall, these results demonstrate an advantage of the FonF group over the control group. In other words, the benefits of FonF instruction on the acquisition of the PT became evident as time passed. Thus, FonF instruction appears more effective than non-FonF instruction in terms of the acquisition of the PT. The treatment effects of this target structure in the current study are contrary to Mackey (2006) and Takashima and Ellis (1999), in which they found little treatment effect of the past tense. In contrast, these results lend support to other studies (R. Ellis, 2006), in which their results showed also positive effects. In a similar vein, the findings support another study (S.-Y. Chen, 2007) that was conducted in the same context as the current study, also indicating the positive effects of FonF instruction.

Finally, the positive effect of FonF instruction on the PT in the current study may be partly due to the simplicity of the target structure. It may also be, as Ellis, Loewen, and Erlam (2009) have pointed out, that the target structure is a structure that the participants have begun to acquire, and thus helps to result in positive treatment effects. This assumption may be theoretically grounded in Pienemann's (1989) Teachability/Learnability Hypothesis and Wilson's (2011) Learnability Principle. In their study of the effects of FonF, Wilson (2007) also found similar results that learner's developmental readiness for a form facilitated the acquisition of the linguistic structure (participial adjectives in their study), which demonstrated the effects of FonF instruction.

In order to answer the second research question, first the gain scores from pretest to posttest in ARTs experimental group and control group were computed and then ANOVA was used to see whether there was any significant difference between the two groups in pretest and posttest stage. The following tables show the results:

Table 4: Mean pre- and posttest of definite and indefinite articles scores for experimental and control groups

Group	N	Mean	Std. Deviation	Std. Error	Minimum	Maximum
Control	26	1.04	1.732	.340	-3	4
Experimental	30	3.97	1.671	.305	0	7
Total	56	2.61	2.238	.299	-3	7

The results of data analysis (ANOVA) in Table 5 below shows that there is a statistically significant difference between the learners' performance in experimental ART group and control group in the results of pretest and posttest because the obtained F value of 41.360 was found to be significant at .001 level ( $P=.000$ ). In fact, regarding the instruction of definite and indefinite article, the participants in the experimental group had a better performance when they were taught through Focus on Form instruction than those in control group when non-FonF method of instruction was used for teaching definite and indefinite article.

Table 5: ANOVA analysis for mean pretest scores of definite and indefinite articles scores for experimental and control groups

	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	119.429	1	119.429	41.360	.000
Within Groups	155.928	54	2.888		
Total	275.357	55			

Figure 2 below shows that there is a statistically significant difference between the learners' performance in experimental ART group and control group in the results of pretest and posttest.

Figure 2: Mean pre- and posttest of definite and indefinite articles scores for experimental and control groups

Concerning the effects of FonF instruction on the acquisition of the ART, Prior to the instructional period, the control and experimental groups showed no significant difference on the GJT. However, In consideration of the gain scores for each individual group, the control group obtained no significant gains on the GJT on the posttest. By contrast, the FonF group has improved significantly on the GJT, and TOTAL scores on the posttest.

Thus, the effects of FonF instruction are evident in the immediate improvements in the acquisition of the ARTs and the instructional effects were sustained over time. These results are in part contrary to Pica's results (1983), which revealed no instructional effects on the acquisition of the indefinite article. Nevertheless, this study is generally consistent with previous studies, such as Bitchener (2008), which has shown both immediate and delayed effects on the acquisition of the ART.

Unlike the results of the PT in the current study, the results of the acquisition of the ART indicate immediate effects. This may suggest that the instructional period was not long enough for the participants' practicing and internalizing this target because articles are complex and multi-functional in use, and thus a longer treatment time may be needed for acquisition of the ART to be fully complete. That is, a sufficient instruction time appears needed for the learners to proceduralize the declarative knowledge of the target, and then, with repeated production, to lead to automaticity, according to the Comprehensive Output Hypothesis (Swain, 1985, 1995) and the Output Principle (Wilson, 2008).

In sum, FonF instruction in the current study, compared to non-FonF instruction, points to effectiveness with positive effects on the acquisition of the PT. As Ellis (2008) has pointed out, some instructional effects do not become evident immediately until later. This is a case in point as the results of the acquisition of the PT have indicated. Furthermore, FonF instruction has a tendency toward being more effective than non-FonF instruction, with immediate effects on the acquisition of the ART. It may be, as some scholars have pointed out, that English articles are difficult for non-native speakers to acquire due to its complexity in use and function and absence from many other languages (Celce-Murcia & Larsen-Freeman, 1999; Master, 2002; Wilson, 2008), including the participants' mother tongue in this study.

On the basis of all the quantitative analyses, focus-on-form instruction provides an efficient way for learners to expand their knowledge of using past tense and definite and indefinite articles. Taking into account the findings of both PT and ARTs acquisition, the overall results

show that the control and experimental groups started with almost the same pretest scores on the GJT and FW. However, the GJT and FW scores increased moderately on the posttest, an indication that non-FonF instruction had little or no impact on the acquisition of the two targets.

With respect to the qualitative data obtained from the participants by asking 8 open-ended questions, the participants' answers were quoted question by question in the following discussion. These quotations were for most part translated from the participants' mother tongue.

For the first question "Which activity in this class do you like most? Why?" thirteen participants answered, "Group work." The reasons were because we can discuss questions asked and resolve problems together, share ideas, and learn from one another in the group." Five participants answered "Fables." "It's fun", "It's interesting", "I like to read stories", were the reasons participants provided. Still seven

participants answered “None”; three did not answer or answered “No idea”; and three answered “All” or “Nothing particular”. There were various individual answers provided by only one participant, such as “Writing, because I can know what I haven’t learned about grammar during the process”; “Listening Cloze test”; and “After-test class discussion”. Most of the participants’ answers were general responses to the class activities instead of specific FonF techniques used in the study.

Questions 3 to 5 were related to typographic input enhancement such as color-code, font size, and boldface used in the reading text. Almost all the participants like these typographical enhancement devices. Regarding color-coding, participants stated that the device “gets my attention, shows the key points, is easily distinguishable,” etc. With respect to different font sizes, participants wrote that they “help to read, stand out, are distinguishable,” and so on. With regard to boldfaced targets, participants expressed that they “show importance, indicate key points, attract attention and notice, are distinguishable,” and so forth. These answers substantiate the results from the closed-ended questions.

Question 6 pertained to pair/group work. As reflected in their responses to Question 1, many participants, 34 out of 43, answered that they liked it with reasons such as “sharing ideas, exchanging opinions, discussing questions, helping one another (cooperation), spirit of team work, learning from one another, and more interaction between classmates.” On the other hand, 4 answered that they did not like it, because they had to move the tables and chairs around. There was only one participant who answered “I don’t like it. It didn’t work.”

Questions 7 and 8 were concerned with peer and teacher feedback. More than 30 participants expressed that they liked peer and/or teacher feedback. From peer feedback, they can learn “What their shortcomings are”, “What needs to be improved”, and also “to learn more”. From teacher feedback, they can learn “what mistakes to correct”, “to improve” their English, and “to learn more”.

The results of open-ended questions appear to be consistent. The results point to the fact that participants perceive pair/group work, typographic input enhancement, and peer/teacher feedback to be advantageous to contributing to student learning outcomes. These results may also contribute partly to the positive effects of FonF instruction that the quantitative data have shown in the previous sections.

Regarding the qualitative data obtained from eight open-ended questions, there are various reasons that participants express in their responses to the open-ended questions why they like the input enhancement, such as personal preferences, “I like it because it helps me to read”; attention catching, “I like it because it gets my attention”; prominence, “I like it because it shows key points”, “it stands out”, “it shows importance”, “it is distinguishable”, etc. On the other hand, the font size was rated almost the lowest. The reason this device was rated one of the lowest may be due to the fact that the target structure was already either color-coded or in bold that the font size made little prominence in the combination of typographic enhancement. Another reason may be that the size was not large enough (the enlarged size was 16, while the regular in the text is 12) to catch the participants’ attention. The participants’ opinions about the input enhancement may contribute in part to the positive results of FonF instruction, which is apparently different from White (1998), which found no significant difference between input flood with and without typographic input enhancement.

In addition to the typographic input enhancement, the participants also expressed their approval of group work, and (explicit) peer and teacher feedback. As the participants mentioned, they liked discussing the questions asked, working out problems together, sharing ideas, and learning from each other in the group. Working in groups contrasts with the typical individual work in this institution, in which classroom seating is always arranged in rows (the teacher even received a complaint email forwarded from the department chair, stating that this class left the classroom setting in group instead of restoring it to the column-by-column seating).

The participants’ positive experience with the FonF treatment (e.g., visual input enhancement and corrective feedback) may have contributed to the learning outcomes of both target structures. Also, the complexity of a structure may have affected the acquisition of the targets impacted by FonF instruction in terms of effectiveness. The structural complexity may have resulted in the varied instructional effects of the two targets, in general, with positive effects on simple structure (PT) and complex structure (ART).

Pair/group work appears one of the participants’ favorite activities in this study. It can be utilized with other FonF techniques or activities together to benefit the learners for optimal learning consequences. One example is to employ the dictogloss procedure in group. Dictogloss (VanPatten, 1990) in small group work can be used with immediate or higher level non-native language classes as utilized in this study. In carrying out this activity, participants need to pay attention not only to meaning as they are listening to language input and taking notes, then sharing notes in group during meaning negotiation, but they also must pay attention to form as they are producing and refining their version as a language output for a group production.

Furthermore, corrective feedback, as researchers have pointed out, plays a crucial part in FonF instruction that provides learners with an opportunity to notice form relative to their intended meaning during communication (Loewen & Nabei, 2007). It is also necessary to provide learners with negative evidence of the target language in order to notice the gap between received input and intended output, and be able to acquire native-like proficiency in the language process. Various types of corrective feedback (R. Ellis, 2006; Loewen & Nabei, 2007) can be used in different activities and with different groups of learners. In communication-oriented activities with intermediate or higher level learners, implicit corrective feedback such as confirmation check and recast can be incorporated into the activities to enhance both fluency and accuracy. In accuracy-oriented writing practice with higher beginners or adult learners, explicit corrective feedback, such as metalinguistic corrective feedback and explicit correction, may be utilized to improve the accurate use of their intended meaning and form.

## CONCLUSION

The main purpose of the study was to explore the effectiveness of the FonF instruction on learning simple past tense as well as definite and indefinite articles among Iranian EFL learners. From both quantitative and qualitative perspectives, and taking both the PT and the ART into account, FonF instruction appears evident in acquisition of these two targets with varied effects. The overall conclusion which is drawn is that FonF instruction is more effective than non-FonF instruction on the acquisition of the two targets in the current study showing significant positive effects on the acquisition of the PT and ART.

As suggestions for further research, other aspects of FonF instruction, such as fluency, other levels or types of learners, different treatment timing and other linguistic features may be further investigated. To measure proficiency, both accuracy and fluency need to be taken into account. When evaluating effectiveness of a second/foreign language approach, aspects of accuracy and fluency should be explored to a proficiency level at least as standardized tests claimed to measure. Thus, investigation of fluency, in addition to the accuracy examined in the current study, for other individual linguistic features might be conducted in the future for a thorough examination of the effects of FonF instruction. Also, different groups of learners with different levels of proficiency should be considered for assessing the full scope the effects

of FonF instruction. Additionally, a longer treatment period (e.g. for a whole semester or two) and various timing for FonF techniques can be taken into account for optimal instructional effects, in particular in an EFL context, because some linguistic features may need more treatment than others, and some structures may be more positively impacted by FonF instruction than others. Thus, other linguistic code features, such as other simple and/or complex rules than the target items in the current study, reception and production of other linguistic features, and explicit and implicit learning and knowledge of specific grammatical structures, can be further explored for closer scrutiny of the FonF approach and its further pedagogical implications for the TESOL Field.

### ABSTRACT

The role of textbooks cannot be overlooked in the triangular net of elements in language learning which includes the learner, teacher, and textbook. Thus, it goes without saying that so much attention should be paid to the way the textbooks are evaluated to fulfill both the learners' and teachers' needs. Textbook evaluation can potentially be a particularly worthwhile means of conducting research as well as a form of professional improvement. Nowadays, the Top Notch series have become one of the most frequently used series in almost all of the institutes and also most of the tutoring for English teaching and learning especially in Iran. Thus, this study aimed to evaluate the series based on Littlejohn's (1998) framework. To evaluate the series, 30 Iranian English as a foreign language (EFL) teachers were recruited from different language institutes. To collect and interpret the data, both qualitative and quantitative statistics were used. The findings indicated that the series fulfill the intended objectives and enjoy benefits for language learners through encouraging the L2 learners to communicate successfully by offering opportunities for interaction. However, one shortcoming of the series is the lack of activities or discussions for presenting new words that require EFL teachers' consideration. The results of this study have some pedagogical implications for teachers and materials developers in EFL contexts. The results of the study help L2 teachers know the detailed points of the series and detect areas of weakness and strength. Moreover, novice English teachers profit from this study because they have an idea about the nature of the textbook they want to teach.

**KEYWORDS:** *Littlejohn's (1998) framework; the Top Notch series; textbook; textbook evaluation; checklist.*

### INTRODUCTION

Millions of people attempt to learn English throughout the world and the number of speakers who learn it as first or second language and its range of uses and adaptability to general and specific tasks are increasing everyday (Long, 2005). There are many factors that affect the process of L2 learning. Among them, the role of textbooks in the process of learning is of cardinal significance. Textbooks are really crucial in today's realm of language teaching and learning because the textbooks are generally considered to be essential component of teaching and will therefore have a great impact on a teacher's methods of instruction (Long, 2005). Although there might be some disagreements over using textbooks in English teaching classes, most people dealing with language education, teaching, and learning prove the importance of textbooks in L2 classes. According to Tom (2004), advocates of textbooks argue that they are the most effective way of presenting materials, help learners achieve a sense of system, cohesion, and progress, and also help teachers to be prepared. In some contexts, teachers are untrammelled to choose their own textbooks. The vast majority of teachers, however, have textbooks suggested, prescribed, or assigned (Tomlinson, 2001). According to Riazi and Mosalanejad (2010, p. 3), "textbooks play a very crucial role in the realm of language teaching and learning and are considered the next important factor in the L2 classroom after the teacher."

Textbooks are tools in the hands of the teacher and s/he must know not only how to use it, but also how useful it can be. The wealth of published materials for English language teaching (ELT) available in the market makes selecting the right textbook a challenging task. Moreover, the selection of a particular core textbook signals an executive educational decision in which there is considerable professional, financial, and even political investment (Sheldon, 1988). As Richards (2010) asserted, textbooks are key elements in most language programs. In some situations, textbooks serve the basis for much of the language input learners receive and the language practices that occur in the classroom. They may lay the foundations for the content of lessons, the balance of skills taught, and the kinds of language tasks students actively use. In other situations, textbooks may primarily serve to supplement the teachers' instruction. For L2 learners, textbooks may provide a major source of contact they have with the target language, excluding the input provided by the teacher. In the case of novice teachers, textbooks may also be utilized as a form of teacher training, that is, they provide ideas on how to plan and teach lessons as well as formats that teachers can use (Richards, 2010).

To choose fruitful materials for a course whether by a teacher or by an administrator, evaluation is done in the realm of language teaching and learning. To this end, many different schemes and checklists have been offered by prominent scholars and evaluators. Although the number of checklists is numerous, all of these checklists have a lot of similarities. Despite some commonalities among different checklists, every well-designed checklist is certainly driven from a framework which specifies and develops checklist. In this vein, this paper will concentrate on carrying out an evaluation on the Top Notch series of ELT materials based on Littlejohn's (1998) framework. This framework seeks to evaluate the selected textbook irrespective of how it is used in the classroom. Littlejohn (1998, p. 54) mentioned it "as analyzing the materials as it is, a set of materials can be used quite differently in different contexts based on the knowledge, abilities, and preferences of different teachers." This framework, thus, was claimed to be devoid of impressionistic criteria about what is desirable in a set of materials. By analyzing the individual activities/tasks in detail and by studying important features of the book, this framework was claimed to be in-depth and objective rather than subjective.

### Statement of the Problem

There are too many factors that affect the process of learning a language. Based on the aforementioned facts, materials especially textbooks have always been a mind-boggling concern of L2 teachers and learners. First, they are important because it is impossible to learn a language without them. Saphier and Gower (1997) (cited in Haldeman, 2008) have stated that "many things are important for good schools: curriculum ... parent involvement ... a clean, safe building ..., but of all the things that are important ... nothing is as important as the textbook and materials" (p. 15). During the last few decades, researchers have begun to recognize that textbooks, apart from the methods and teachers, are central to improving English teaching (Freeman, 2001; Richards & Nunan, 1990 cited in Bedir, 2010). Moreover, language teachers have become aware that learning is a process, and that the role of textbooks is to facilitate this process (Bedir, 2010).

Second, since there are many different ELT textbooks on the market, there is a necessity for the evaluation of textbooks in order to recognize the advantages of one over the others which, in turn, will lead to the adoption of the textbook. This would assist teachers with making optimum use of a book's strengths and with recognizing the shortcomings of certain exercises, tasks, and entire texts. Hence, the results of this evaluation may be beneficial to English teachers and materials developers who are going to use the mentioned series in their classes and institutes and might give them insight into the course book they use and help them to consider how to exploit it.

Last but not least, to the best of the researchers' knowledge, none of the studies conducted so far has investigated the Top Notch series based on Littlejohn's (1998) framework and its impact on different aspects of L2 learning. So, there has been no empirical or theoretical evidence on it. Consequently, the central goal of the research is to investigate and to evaluate the Top Notch series to know what explicit features and pedagogic values they have. In this respect, Littlejohn's (1998) framework is applied which comprises comprehensive checklists and questionnaires. By using these checklists, the researchers will be able to examine selected textbooks in first (what is there) level and second (what is required of users) level of Littlejohn's (1998) framework to arrive at the third level of evaluation (what is implied).

## **LITERATURE REVIEW**

There is a vast body of literature on textbook selection and evaluation in an EFL setting. These studies mainly revolve around the exploitation of textbook evaluation checklists. There is a host of evaluation checklists based on different criteria that can be employed by teachers and researchers. For example, in evaluation study of two textbook packages, namely, opportunities and New English File incorporating 134 teachers' survey results, Kayapinar (2009) pointed out that there is not an overall positive view of the aforementioned course book packages among teachers and the course books must be adapted in a way to meet learners' needs and interest at nationwide scope. He suggested that the materials used in any teaching process should be evaluated on a regular basis to be kept renewed.

In another study by Dominguez (2003), the representation of gender in examples, dialogues, and job positions in both texts and examples of the New Interchange Intro was examined. She found that there is an upsurge in ESL system of Canada to adopt the series due to its perceived uniqueness. Hence, the study aimed at establishing the appropriateness of the New Interchange Intro for diverse multinational dwellers of Canadian cities. She concluded that the New Interchange Intro was a worthwhile source for the teachers as it takes into account both multicultural and multiracial settings. Also, she highlighted the soundness of the textbooks for considering learners' settlement and integration needs especially in beginner levels and offering a balance in portraying the two genders.

Applying Cunningsworth's (1984) four guidelines, Ranalli (2002), also, evaluated New Headway Upper-Intermediate instructed at the Foreign Language Institute of Yonsei University in Seoul, Korea. He found that the textbook follows a present-practice-produce (PPP) approach to learning as units of the book offer a semiauthentic context for examples and the target language patterns ending with controlled and semifree exercises. He also maintained that the methodology of the textbook is too preoccupied with the knowing of grammatical rules and developing analytic knowledge which hinders further learners' preparation for unplanned discourse and predictable achievements in language ability.

Besides, Darali (2007) studied the important features of new English textbooks such as the Spectrum series to see how cultural pragmatic knowledge of the language is included in the lessons. The results of the study showed that the series provided a variety of language functions, but the most frequent ones in daily speech were not focused as much as other functions.

Azizifar, Koosha, and Lotfi (2010) examined an evaluation of two series of ELT textbooks used for teaching English in Iranian high schools from 1965 to the present. To do so, Tucker's (1975) textbook evaluation model was employed and the findings suggested that one of the main factors for the students' achievement in English is the ELT textbooks. They suggested that in the textbooks, there should be enough opportunity for the learners to practice the language they are learning communicatively.

Additionally, Jahangard (2007) evaluated four EFL textbooks used in Iranian high schools by the Ministry of Education. He discussed their merits and demerits with reference to 13 common criteria extracted from different materials evaluation checklists. The results of the study indicated that book four had better features in comparison with the three other textbooks.

Moreover, Sahragard, Rahimi, and Zaremoayyedi (2008) evaluated Interchange (3<sup>rd</sup> Ed.) according to Littlejohn's (1998) framework. The study was set to find out the values of the newest version of Interchange in particular, the correspondence between the newly developed and widely used Interchange textbooks (3<sup>rd</sup> Ed.) and their stipulated objectives, and the strengths and weaknesses of the series. The findings of the study indicated that the Interchange series (3<sup>rd</sup> Ed.) own several pedagogical values, nonetheless, they suffer from certain drawbacks. The tasks of the series can be considered productive with regard to promotion of communicative competence and are promoting in that they give learners the opportunity to personalize the newly learned pieces of language through production.

And in accordance with Bloom's (1956) taxonomy of learning objectives, Riazi and Mosallanejad (2010) investigated the types of learning objectives represented in Iranian senior high school and pre-university English textbooks. To codify the learning objectives, three high school textbooks and one pre-university textbook were included in the analysis, and a coding scheme was developed based on Bloom's (1956) taxonomy. The results of the study indicated that in all grades the lower-order cognitive skills were more prevalent than the higher-order ones. Furthermore, the difference between the senior high school and the pre-university textbooks in terms of the level of the taxonomy were significant insofar as the pre-university textbook used some degrees of higher-order learning objectives.

## **RESEARCH QUESTIONS**

With regard to the role of textbooks in all aspects of L2 learning and based on what was suggested above and in line with recent approaches to the study of this phenomenon, the present study seeks to find answers to the following questions:

1. To what extent is Top Notch series able to fulfill the objectives claimed to be set for them?
2. What features do Top Notch series have?
3. What pedagogic values do Top Notch series have?

4. What are the strengths and weaknesses

of the series examined in this study?

## METHODOLOGY

### *Research Design*

The purposive, convenient sampling procedure was used in this study; purposive in the sense that only English teachers were recruited, and convenient in the sense that the participants were easily accessible ones which were intended to be representative of the whole population as diverse as possible. It should be mentioned that ethical issues such as confidentiality, originality of research, and morality were observed. The participants were made assure that their personal information would be kept confidential, and only treated data without referring to their names would be published. Also, they were informed of the fact that they were selected to take part in this research, and the obtained data would be used merely for the sake of research. The participation was voluntary, that is, there was no penalty for refusing to participate, and that the subjects may withdraw at any time without penalty.

They were given a clear statement of the purpose of the researchers' study or the basic outline of what the researchers would like to explore, making it clear that this research is dynamic activity that may shift in focus as it proceeds. The procedure in the research project and the types of information that the researchers are collecting for their study were explained. Moreover, the participants were given sufficient contact information so that they could reach the researchers for answers to questions regarding the research. Besides, any foreseeable risks and discomforts as well as direct benefits involved in agreeing to cooperate were described in detail. And, a signed consent form had been obtained from each subject that sets out the terms of the researchers' agreement with the participants.

### *Participants*

The participants of this study consisted of 30 EFL teachers teaching at language institutes in Esfahan, Iran. Each of these teachers had the experience of teaching the textbooks under investigation. The rationale behind the selection of these participants was that they had already been familiar with the textbooks under investigation, and they had the required experience to work with them. Therefore, it was assumed that these participants were in a better position to help the researchers to carry out the study. It should also be noted that the Top Notch series has been recently introduced to Iranian EFL institutions.

### *Materials*

The first source of material in the present study is the Top Notch series (Ascher & Saslow, 2011), a six-level communicative English course with two beginning entry levels namely fundamentals A and fundamentals B for adults and young adults. Generally, the Top Notch series consist of 12 textbooks on the whole, written by Joan Saslow and Allen Ascher in 2006 and published in the United States of America by Pearson Longman Incorporation. A sample of these books which contains about 15% of the total materials was chosen – Littlejohn (1998) argued that it is useful to analyze about 10% to 15% of the total material. This sample included some units, each of which is composed of three lessons plus one page of reading and one page of writing activities. The sample contained a number of tasks. Each task was labeled by a number that was applied in task analysis sheets (TAS). Additionally, the Checklist for explicit nature of a set of materials, TAS, and Design Questionnaire with reasonable measures of validity and reliability, were used to fulfill the research. It should be mentioned that the validity and reliability of the aforementioned questionnaires and sheets had already been examined via experts' views and Cronbach's Alpha.

### *Procedure*

As far as the study was theoretically based on Littlejohn's (1998) framework, about 15 percent of the Top Notch series was selected as a sample material. Since the Top Notch series are 6 textbooks, 50 tasks were randomly selected from each of the books. Hence, the total number of selected tasks was three hundred. Due to the wide range of tasks, it was impossible to expect each participant to analyze all 300 tasks alone. Therefore, the tasks were divided into three categories, each category involving 100 tasks, which was given to 30 teachers. Each participant was provided with a sample of 100 tasks and checklists to work with. Then, by the use of the three checklists offered in the framework, the sample was evaluated by the participants. As Littlejohn (1998) claimed, the framework tries to be in-depth and objective rather than subjective by analyzing the individual activities in detail and based on important features.

### *Data Analysis*

For the first checklist, Checklist for explicit nature of a set of materials, a report on explicit features of the Top Notch series is provided by the researchers. For the TAS checklist, after the required data were collected, the researchers applied the Statistical Package for Social Sciences (SPSS) to analyze the data. Then, frequency counts and percentage indexes were reported for individual features listed in TASs to provide a basis for interpreting the research results. For the third checklist, Design Questionnaire, an analysis was performed to find an accepted view on each of the sections mentioned in Littlejohn's (1998) framework. By the use of statistical procedure, a general percentage index was also reported for subcategories of this checklist.

## RESULTS AND DISCUSSION

### *Results*

#### *What is the Learner Expected to Do?*

In the Top Notch series, more than half of the tasks (60.06%) demand L2 learners to respond (see Table 1). Also, 29.36% demand L2 learners to initiate and 10.56% are the tasks that do not require learners to initiate or respond. These results showed that the Top Notch series encourage L2 learners to use the language and more importantly require them to express themselves rather than being a listener. In sum, the Top Notch series care for learners' participation in the classroom activities.

*Table 1: frequency and percentage for "Turn Take"*

Turn take	Frequency	%
Initiate	2643	29.36
Respond	5406	60.06
Not required	951	10.56
Total	9000	100

As shown in Table 2, 55.47% of the total tasks concentrate on meaning, 28.52% on form as well as meaning, and 16.00% on language system. This can be judged that meaning is more significant than form, thus, the series enhance comprehension of learners.

*Table 2: frequency and percentage for "Focus on"*

Focus on	Frequency	%
Language system (rules/form)	1440	16.00
Meaning	4993	55.47
Meaning/system relationship	2567	28.52
Total	9000	100

Based on the data in Table 3, "apply language rule" (18.00%) is more than the other operations, "decode semantic meaning" is 17.00%, "retrieve from long term memory" is 15.00% of the total portion. Activities that demand "draw on prior knowledge" are 11.00%, "select information" is 5.00% of the whole. Activities that refer to "build text" are equal to the tasks by which learners need to "deduce language rule", that is, (10.00%). Tasks which ask students to "compare" the information are 8.00% of the whole. Finally, "relating sound to objects" and "repeat with expansion" are the two next mental operations with 4.00% and 2.00%, respectively, which are less than the others. It can be concluded that the Top Notch series provide L2 learners with activities by giving them the opportunity to infer the meaning of the texts that accompany applying language rule, recalling previous learning, and using prior linguistic knowledge. These features aid L2 learners to improve and enhance their communicative and linguistic competence as much as possible and also contribute learners to associate the new information to the old information in their mind. "Repetition" is the least among the rest that reveals L2 learners are not required to learn English through a lot of repetition.

*Table 3: frequency and percentage for "Mental Operation"*

Mental operation	Frequency	%
Retrieve from LT memory	1350	15
Built text	900	10
Draw on prior knowledge	990	11
Relate sounds to objects	360	4
Compare	720	8
Decode semantic meaning	1530	17
Select information	450	5
Repeat with expansion	180	2
Deduce language rule	900	10
Apply language rule	1680	18
Total	9000	100

#### *Who with?*

As can be seen in the Table 4, activities which involve interaction of "learners in pairs or groups" compose 45.83%, tasks that involve "learner to class" are 38.88%, and 15.27% demand task completion by "learner individually simultaneously". It can be concluded that group activities in the process of learning are more emphasized than individual ones.

*Table 4: frequency and percentage of "Who with"*

Who with	Frequency	%
Learner to class	3500	38.88
Learner individually simultaneously	1375	15.27
Learner in pairs/groups	4125	45.83
Total	9000	100

#### *Input to the Learners*

As shown in Table 5, the input may be in the form of "graphic" like pictures, illustrations, and diagrams; "oral words/phrases"; "written words/phrases"; and "sound/music". In the Top Notch series, written words/phrases have dominant source of input (40.80%). Oral words/phrases are the next main source of input which is 28.00%. Sound/music with 15.10%, and finally graphic with 16.10% covers the whole portion of input to the learners. The results clearly showed that writing is utilized as a major source of input to learners, that is, the series have concentrated on writing as an input. In contrast, oral words/phrases are fewer. The next sources of input in tasks belong to graphic which has a satisfactory amount of input.

*Table 5: frequency and percentage for "Input to Learners"*

Input to learners	Frequency	%
Graphic	1444	16.10
Oral word/phrases	2520	28.00
Written word/phrases	3672	40.80
Sound/music	1359	15.10
Total	9000	100

#### *Expected Output from Learners*

The expected output from learners in tasks can be either written or oral, with either the form of word or phrase length or the form of extended length. In Littlejohn's (1998) framework, discourse which is more than 50 words is considered as extended form. The frequency and percentage of the expected output from learners for oral words/phrases are 2770 and 30.77% respectively, and written word/phrases have the proportion of 31.23% with the frequency of 2810 (see Table 6). As a result, there is a balance between written and oral forms of expected output from learners in tasks of the series and the attention was paid equally to both the oral and written form.

Table 6: frequency and percentage for "Expected Output from Learners"

Expected output from learners	Frequency	%
Oral word/phrases	2770	30.77
Oral extended discourse	1791	19.90
Written word/phrases	2810	31.23
Written extended discourse	1539	17.10
Total	9000	100

*Source*

The Top Notch series provide a great amount of materials and contents for lessons itself (70.10%). The next sources of content are teachers with 21.00% and learners with 8.90%. The noticeable point here is that the textbook provides more shares of tasks and activities. It seems the series demand teachers to be abided by their teachers' book and other components.

Table 7: frequency and percentage for "Source"

Source	Frequency	%
Materials	6309	70.10
Teacher	1890	21.00
Learner	801	8.90
Total	9000	100%

*Results of Design*

The second section in Littlejohn's (1998) framework, Design, relates to the thought underlying materials. This part involves consideration of areas such as the explicit purposes of the materials and how the tasks, language, and content in the materials are selected and sequenced. The results of the study of Design can assist teachers to know to what extent materials developers have been successful in achieving their intended goals. The results depicted that the series obtained up to 80.00% of the optimum score (120 out of 150) for aims and objectives part (see Figure 1). The next part regarding the selection of the tasks in the series acquired the average of 74.75%. Regarding the sequence of tasks in the books received 77.00%. Also, the form, source, and nature of the contents in the series obtained 81.75% which seem to be rather high. Types of teaching and learning activities obtained 63.33%. The participation received 46.50%. The classroom roles of teachers and learners, and the learner roles in learning obtained 55.33% and 67.00% respectively. Finally, the role of materials as a whole received 68.66% of the total.

Figure 1: Design

*Discussion*

After analyzing the data, the results demonstrated that that regarding turn-taking L2 learners are more likely to respond than to initiate. Also, the textbook encourages L2 learners to use language and requires them to express themselves rather than being a listener. This indicates that the Top Notch series care for learners' participation in the classroom activities.

Moreover, meaning is more significant than form in the Top Notch series. This can be judged that the series enhance comprehension of learners. Because one of the objectives of the book is to develop a communicative competence which is achieved by enhancing comprehension of the language, and comprehending the language needs giving attention to meaning. So, the results can be seen as one sign of success for this textbook. Regarding the mental operation, it was revealed that a variety of mental operations exist in tasks with the highest portion of 18.00% for apply language rule and the least one focusing on repeat with expansion (2.00%).

Regarding the type of interaction, it was revealed that tasks in the Top Notch series mostly require learners to act in pairs and groups (45.83%), thus, group activities in the process of learning are more emphasized than individual ones (only 15.27%). The study also showed that written words and phrases are dominant forms of input (40.80%) while sound or music is almost 16.10%. This means that that writing is utilized as a major source of input to learners. In other words, the series have more emphasis on writing as an input. In contrast, oral words/phrases are less. The next sources of input in tasks belong to graphic which has a satisfactory amount of input (16.10%).

In case of expected output from learners, it was proved that there is a balance between written and oral forms of expected output from learners in tasks and attention was paid equally to both the oral and written form (31.23% and 30.77%, respectively). In addition, it was shown that the main source for the tasks in the Top Notch series is the textbook itself (70.10%) and learners provide the least amount of materials (8.90%). The noticeable point here is the fact that the textbook provides more shares of tasks and activities.

Regarding the nature of tasks, fact is more frequent than others, about 40.00%. Personal information and personal opinion are almost equal (18.30% and 19.40%, respectively). And, fiction has the least frequency (2.30%). This could be interpreted as a sign of variety in the text. In fact, the Top Notch series expose students to authentic contexts using their own information. The aforementioned points are all pedagogic values of the Top Notch series based on the TAS.

**CONCLUSION**

The authors claimed that the Top Notch series prepare students to interact successfully and confidently. According to the results of TAS and Design Evaluation, it can be concluded that the Top Notch series are almost successful in fulfilling the claimed objectives. Moreover, as Design Evaluation results showed, the evaluators believe that the course book is appropriate and successful in with regard to design.

As to answer the second question “What features the Top Notch series have?”, it should be mentioned that the Top Notch series are a corpus-informed course backed by the extensive database of the Longman Corpus Network, and it uses both the Longman Spoken Corpus and the Learners’ Corpus of Common Learner Errors. The Top Notch series are also based on use of a broader, more informal corpus of spoken and written language including authentic interviews, real conversations, and authentic texts to ensure that conversation strategies are well understood and applied. In addition, the title and topic of the units found in the Top Notch series are tangible and worldly, for instance names and occupations, directions and transportation. The context of the course book is not suitable for any English for specific purposes, but suits a general course on English. The themes and topics of the units throughout the book clearly indicate this fact. The book was also designed to raise learner “grammar awareness”. Hence, L2 learners are able to perform self-correct more readily.

The material in the course book is all core rather than supplementary. Moreover, in the Top Notch series, there is an alphabetical word list for the whole book at the end of the book, which is very convenient because of alphabetically ordered presentation. In addition, there is a section named “Vocabulary Booster” which presents additional vocabulary. It seems as though the list provided in the Top Notch series is convenient.

There are also lively, colorful, and authentic photographs and pictures in the Top Notch series. Moreover, the series were printed in glossy paper and was not culturally biased in anyway. A variety of information from different cultures and nationalities were used in the series. In the course book, there is some review sections, assessing the previous aspects worked on in the preceding sections. This type of assessment is not a test per se but it is more like a class activity. So, it can be useful for the learners to see what they have accomplished and what problems they still have.

Usually in other English course books, the material presented in different sections of a unit varies from one unit to the next, so, learners don’t have an idea of the amount of material presented under each heading before going through the unit, but in the Top Notch series as mentioned earlier, each unit is made up of 2-page lessons. On every 2-page lesson, there are conversation and vocabulary sections. So, to some extent the organization of the material is predictable. As a whole, the Top Notch series seem to be systematic, presenting the material in an easy to difficult order.

Another advantage of the series under investigation is that, as the findings of TAS evaluation revealed, they introduce tasks that mainly demand learners to participate in pairs and groups activities (45.83%). As it is known today, working in pairs and groups let learners learn from each other. Furthermore, working in groups reduces learner’s anxiety which is one major problem when an individual learner is responsible for doing the task and answering individually.

Finally, the tasks of the series can be considered productive with regard to promotion of communicative competence and are promoting in that they give learners the opportunity to personalize the newly learnt pieces of language through production. The series, in addition, focus mainly on pair works and meaning. They also encourage students to use the language and more importantly they more often require them to express themselves than to be a listener.

However, with regard to the checklists, the series suffer from other shortcomings that require EFL teachers’ consideration. One of the drawbacks is the lack of activities or discussions that present new words or vocabularies. There is a need to improve textbooks in terms of providing more activities or discussions in order to present new words. The second shortcoming, as the results of TAS evaluation showed, is that writing is utilized as a major source of input to learners. In other words, the series have more emphasis on writing as an input. In contrast, oral words and phrases are fewer. It is believed that there should be a balance between written and oral form as an input. The third drawback of the series is that they do not use learners or even the teachers as a source for its content. Suprasentential level is ignored for both the expected output and input of the learners. More importantly, in most cases these are not the learners who initiate the tasks but the teachers. Moreover, the majority of tasks in the Top Notch series require learners to respond, and a much smaller proportion require them to initiate using the language. This is not desirable if we want to have an active class. According to the in-depth examination of the Top Notch series, the researchers concluded that the series met most of the criteria. In general, they are considered to be an appropriate material of education despite shortcomings and negative points, mainly because the turning points have triumph over the demerits.

As stated earlier, although questionnaires and checklists used in the study have undeniable advantages, namely the Checklist for explicit nature of a set of materials, Task Analysis Sheet, and Design Questionnaire, it cannot provide as rich as investigation of the other factors of a textbook. There are different kinds of frameworks for textbook evaluation and each of these frameworks examines the selected textbook based on a number of theories and assumptions. Thus, the results may have been different if it had used other frameworks as data elicitation method. There is also a limitation in the fact that the number of participants in the research, namely L2 teachers, was 30. It is beyond denial that studies with larger numbers of participants will produce more reliable results. There is also a limitation in the fact that collecting data do not have time constraints and participants can change their answers. As a result the answers may differ from what participants really think. As mentioned earlier, the participants of the present study were L2 teachers. A major limitation would go to selecting teachers with the same years of teaching experiences. L2 teachers with different experience may have different ideas about a specific course book so they evaluate it differently.

THE EFFECT OF TEACHING SYSTEMIC-ORIENTED SUMMARIZATION STRATEGIES ON THE READING  
COMPREHENSION OF ADVANCED IRANIAN  
EFL LEARNERS

#### ABSTRACT

Reading comprehension is central to language and reading is often referred to as the most important of the four language skills for English as a Foreign Language (EFL) learners. One of the problems, however, that EFL learners complain about is how they can summarize the text and comprehend the text immediately. In this regard summarizing strategies through expansion (de-expanding) is an approach which helps learners. Therefore, this study is an attempt to study the effects of systemic-oriented summarization strategies on the reading comprehension of advanced Iranian EFL learners. To do so, out of a pool of 100 learners, 68 advanced-level EFL learners were randomly selected based on the results obtained from the Preliminary English Test (PET). They were divided into two groups, one experimental group ( $n=34$ ) and one control group ( $n=34$ ). In order to get assurance as to the homogeneity of the learners they were pre-tested. The same test was repeated as a post-test after 9 weeks. The experimental group was taught three expansions' sub-classes (such as elaborating, extending, and enhancement) while the control group did not receive any strategies. The results based on the *t*-test indicated that teaching systemic-oriented summarization strategies had no effect on the reading comprehension of advanced-level Iranian EFL learners. Moreover, it was found that systemic-oriented summarization strategy instruction made no statistically significant difference in reading comprehension of male and female EFL learners.

**KEYWORDS:** Reading comprehension, Learning strategies, Cognitive Reading Strategies, Meta-cognitive Strategies, Summarization, Expansion, SFL(Systemic Functional Linguistics), Clause Complex, Tactic

#### INTRODUCTION

The English language is an international language and people in different areas of expertise need to be proficient in this language. For this reason, learning four skills of it is necessary; but reading is a highly valued skill by teachers and learners because it helps learners to read for different purposes, particularly for academic purposes. People all over the world in non-English speaking countries use English as a foreign language. Learning to read in English is a great challenge for EFL learners, especially when it is for academic purposes. Students' academic success depends on well-developed reading comprehension ability. People in non-English countries, have English only in the classroom, for this reason learners need to have both good language proficiency and strong cognitive skills in strategic thinking and learning. Reading is not only understanding of printed words, but also it is the kind of process in which learners need to comprehend its implied ideas. "Learning to read is not only learning to recognize words; it is also learning to make sense of texts" (Tierney, 2005; p. 51). Reading comprehension is a thinking process. Comprehension takes the readers to a new level of active understanding and insight. Comprehension increases language knowledge.

According to Chamot (1987, P.P.71-84), "learning strategies are techniques, approaches, or deliberate action that students take in order to facilitate the learning". Teaching strategies can help students comprehend text more efficiently (Palinscar, Brown, & Trathen, 1996, Brown, Pressley, Van Meter & Schuder, 1996). Readers must use different types of comprehension strategies in order to be proficient readers. Pressley (2002) asserted that good readers know how to use specific strategies. In contrast, poor readers are weak at making

inference. Reading comprehension consists of metacognitive and cognitive strategies. One important type of these strategies is summarizing a text (Armbruster, Anderson, & Ostertage, 1987). According to (Armbruster, Anderson & Ostertage, 1987, Doctrow, Wittrock & Marks, 1978; Wittrock & Alesandirini, 1990) including students to write summaries of text have been shown to improve reading comprehension.

#### Statement of the problem

Reading is often known as the most important of the four language skills for EFL learners. As it enables students to obtain presentation to the target language and receive valuable linguistic input to build up language proficiency. It is a fluent and energetic process which involves the reader and reading material in making meaning (Anderson, 1988).

Reading comprehension is a complex skill, it which students are asked to find main idea and details and make a distinction between the two. On the other hand, learning strategies play a decisive role in second or foreign language learning. Learning strategies also help learners to gather new information and then assimilate this information into their available knowledge. According to some studies that revealed when strategies are taught explicitly, this knowledge helps ESL/EFL students become more strategic in reading process (Anderson, 1999; Block, 1992; Brown et al., 1994; Carrell, 2001; Casanave, 1988; EL-Hindi, 1997; Krapels, 1990; McGee & Richgels, 1990; Paris et al., Colomb, 1993).

Summarizing is conceived of as a challenge for learners, especially for those in EFL and ESL setting, because they do not know what to include and what to leave out in their summaries (Friend, 2002). In investigating the previous studies in using summarization strategies there is nothing on the qualities of summary which students stray from main subject of the text and wrote disconnected summaries with theme. Although, students must use their own sentences, but digression from the theme and main ideas of the text is not a correct way. Although, writing short summaries is the rule, but heart of the matter should be offered. All of this indicates that teaching summarizing strategies is inadequate. Readers at first must have a better reading comprehension in the use of summarizing strategies.

According to some studies that have been observed, most EFL teachers tried to improve students' reading comprehension. Many studies (e.g., Ahmadi, 2001; Poorahmai, 2009; Ebadi, 2002; Khalaji & Vafaeeseresht, 2012; Ghabel, 2004; Kazemi & Khalili, 2012) have aimed at finding solutions to deal with students' weaknesses in accomplishing reading comprehension

assignments. Some of the proposed solutions are focusing on cognitive and metacognitive strategies or using translation as a supplementary reading technique. But few studies have been conducted to investigate the effect of systemic-oriented summarization (e.g., Hallidays'1985 clause complex and expansion) strategies, on reading comprehension of female and male EFL students in Iran. This reason motivated the present study. Today EFL/ESL reading instruction is shifted from teaching texts to teaching readers (Hass & Flower, 1988). Reading strategies and skills are now taught learners for understanding such elements as textual features, rhetorical elements, content and cultural background. One of these strategies is summarization. Summarization is an effective reading strategy that can help students to make a summary of important proposition from text and summarization help students to comprehend knowledge, transferring it to long-term memory because it leads students to reading to understand, to recognize important ideas and to express the information by using their own words (Senemoglu, 2001: 569).

Some teachers still use traditional approaches to teach reading comprehension. This study investigated the effect of teaching systemic-oriented summarization strategies on the reading comprehension of advanced Iranian EFL learners. To put in simple terms, it finds out whether the systemic-oriented summarization strategies can help to solve the problem of EFL readers in reading and enhance their reading comprehension ability. This study attempted to search for ways to effectively enhance students' reading comprehension. English teachers do not know how to use reading strategies effectively. So, this study attempted to introduce more effective strategies to EFL learners (especially Iranian EFL learners) through Hallidays'(1985) clause complex Expansion. Finally, this study investigated how systemic-oriented summarization strategies can be useful for students' comprehension of text.

## REVIEW OF LITERATURE

Most of the research which has been done on teaching summarization is based on the model of the text comprehension developed by Brown and Day (1983), and another model developed by Kintsch and Van Dijk (1978). Three kinds of operations which take place during the reading process are taken into account by these models including:

- 1) The elements of meaning are integrated into a coherent whole;
- 2) The whole meaning of the text is compressed into its main ideas;
- 3) The gist is used to modify those elements which have previously been constructed and to have an effect on those yet to be constructed.

Regarding Kintsch and Van Dijk's (1978) models of text comprehension a lot of researchers based teaching summarization as a applicable model (e.g., Brown & Day, 1983; Hare & Borchardt, 1984). According to this model, the students are taught "How and Why" to summarize and to understand that the component skills are essential comprehension operations (Brown, 1978; Brown, Day & Jones, 1983). As mentioned, know-how of teaching summarization strategy, there are at least two major approaches:

First, rule-governed approaches which rely heavily on Kintsch and Van Dijk's (1978) theoretical model of text comprehension emphasizing macrostructure propositions and Brown and Day's (1983) two sets of macro-rules for producing summaries emphasizing, especially written summaries. These rules consisted of six rules including:

1. Delete unnecessary information;
2. Delete redundant information;
3. Compose a word to replace a list of items;
4. Compose a word to replace the individual parts of an action;
5. Select a topic sentence;
6. Invent a topic sentence if one is not available.

Wittrock and his colleagues suggested that, the process of generating summaries help readers build relation among concepts contained in a text as well as link these concepts to prior knowledge. There are considerable research evidence regarding the validity and reliability of summaries as a measure of reading comprehension (Head, Readence, & Buss 1969, Taylor, 1984). In recent years, the importance of the reading comprehension strategies has been understood better; therefore, work on the summarizing strategy training increased. Some of them are as follows: With his study which includes the summarizing strategies Hamman (1995), researched the effect of the strategy training on students' achievement. Palinscar and Brown's (1984) reciprocal teaching method was used in these strategy training. The other study done by SusarKirmizi (2006) used cooperative learning method based on the Multiple Intellect Theory in the training for summarizing strategy. Comprehension Strategies: These are strategies that occur before, while and after reading. Comprehension failure may happen at the three phase of reading. Good readers of all ages engage in conscious, active comprehension strategies before, during and after reading (Pressley & Wharton – MC Donald, 1997). At college, reading activities are made to comprehend the academic materials and to learn how learners can read conceptually. Unlike traditional material, reading comprehension strategies help learners to be an effective reader. Reading comprehension strategies can help readers remember the points, distinguish the necessary and unnecessary information, think about the main idea and comment on the subject matter. Good readers use lots of strategies before and after reading (Dogan, 2002). Haller (2000, P. 21-24) modeled a number of school-based post-reading activities, which enhance learning comprehension through the use of matching exercises, cut-up sentence, and comprehension questions. To achieve comprehension in reading, an effective reader should be able to successfully implement such practices as relating the text with his/her own background knowledge, summarizing information, drawing conclusions, and posing questions at the text (McNamara, 2007; Block, Rodgers & Johnson, 2006; Keer & Verhaeghe, 2005; Allen, 2003). Language teachers help the reader to be an effective and proficient reader through possible procedures pre, while and after the reading activity.

### *Before Reading*

Before reading a text some readers use different types of strategies. For instance, they overview the text, make plan for how to read the text and often readers clarify their purpose and some of them before reading consider what they know about a topic and about the structure of a text. Before reading activities are called as enabling activities, because these activities provide a reader with necessary background knowledge to organize activity and help reader to comprehend the text (Ringler & Weber). This kind of activity motivates students to want to read. Activities that are mentioned are as "devices for building the gap between the text's content and the reader's schemata". Some scholars believed that pre-reading activities are called as planning activities. In planning activities, readers use it before reading, they activate their own background knowledge to get prepared for reading. It can be an example of planning strategies (Almasi, 2003; Israel, 2007). Also previewing a title, picture illustration, heading or subheading can help readers grasp the overview of the text. Readers may also preview the general information in the text and its structure (Almasi, 2003; Paris, Wasik, & Turner, 1991).

***While and Post Reading Activities***

Students must be aware of what is their level of comprehension. Many students read but they are not aware of what is happening and they do not comprehend the text. When expert readers, read a complex text, they use controlled strategies (Pressley, 2000). Proficient readers for example while and after reading, ask questions of the text and relate information in the text to their previous understanding of the topic; and re-read, summarize, and make notes, to monitor their comprehension and clarify their understanding. Research has shown that students' comprehension of complex texts can be improved by teaching them a number of strategies to use while they are reading and after they finish the reading text (Pressley & Wharton-McDonald, 1997; Schuder, 1993). List of prompts intended to facilitate student strategic thinking during and after reading:

1. Attending to text structure (e.g. How is the text organized?)
2. Summarizing the text
3. Checking understanding (e.g. readers ask themselves Can I answer who, what, When and Where and Why questions about the text?).
4. Using fix-up strategies (e.g. monitoring comprehension, seeking clarification).

As mentioned before, there are some strategies that readers use during and after reading. They are named as Monitoring strategies (those occur during reading), and another one that readers use it when they finish their reading activity is called as Evaluating strategies. Monitoring strategies take place during reading and some examples of them are as follow (Israel, 2007; Pressley, 2002):

- 1- Comprehension of vocabulary,
- 2- Self-questioning
- 3- Summarizing and,
- 4- Inferring the main idea of each paragraph

Evaluating strategies are strategies in which readers use them after reading process. For example, after reading a text, a learner may think about how to use what they have read to other situation. They may identify with the author, a narrative or main character, and may have a better perspective of the situation in the book than they did at first.

***A. What is Summarization?***

To achieve reading comprehension, an effective reader should be able to successfully use such practices: Summarizing information, drawing conclusions, posing questions, etc. Summary writing is an activity which contains both reading and writing. Summarizing is a strategy to help to understand what is being read and is an activity that requires students to comprehend, analyze and synthesize ideas. It is an important skill for readers of all levels, even those in college and beyond. A summary therefore, is a shortened version of an original text, stating the main ideas. Garner (1982), defined efficient summarizers as a person who can "integrate important pieces of information". He believed that, the summaries in this study became like new texts for the reader i.e. their mental representations of the original texts. Then he conclude that effective summarizers probably "streamline" the information they have read so successfully and comprehend them, that the summary product becomes the text which is stored and retrieved. One of the most important priorities for summarizing is comprehensive reading of the text. To learn summarizing, students must take these steps: 1) Setting main and second ideas of each paragraph within the text. 2) Setting the most important paragraph within the text. 3) For writing a good summary, in general, discovering and setting of the main idea of the text. 4) Referring the concepts and the ideas of the text, and paraphrasing, that is, using his/her own words (Wormeli, 2004; Garcia & Michaelis, 2001). Summarizing is semantic processing in which it occurs during reading process and it also is cognition process. It is an effective learning strategy that can help students to construct and retain a succinct summary of important propositions from text. So, summarization as comprehension strategies is important to teach. Summarization is an intervention for teachers and has been demonstrated to improve reading comprehension (Anderson & Armbruster, 1984; Pearson & Fielding, 1991; Rinehart, Stahl & Erickson, 1986).

***B. What is Systemic-Functional linguistics (SFL)***

The last five decades have been marked by an interest in functional approaches to language, such as Systemic Functional linguistics (SFL), Functional Discourse Grammar, Role and Reference Grammar, Emergent Grammar and Word Grammar, etc. It involves the notion that language consists of a set of systems which offers the writer/speaker choices in expressing meaning. The view of language within Systemic Functional Linguistics is both rich and complex. It is a modeling of language that sees discourse as text-in-context. It is concerned with how people use language and how language is structured for use. Systemic Functional Linguistics views meaning as social meaning impact on linguistic forms. Systemic Functional Linguistics is that a meaning-making system. Systemic Functional Linguistics, established by M.A.K. Halliday, is the most influential. As a functional theory of language rather than just a theory of grammar, SFL seeks to be applicable and 'applicable' describing, explaining, and evaluating why and how people communicate with each other by use of language (cf. Halliday & Mathiessen, 2004). Systemic functional theorizing is all about exploring the function of language as enabling humans to make meaning in the world. To that end, it models language as a multi-dimensional phenomenon, as language in context (Halliday, 1978; Mathiessen, 2007). Second, it develops comprehensive description of language that brings out the uniqueness of particular language as meaning-making resources.

**A clause complex:** is a constituent of grammar. When a number of clauses are linked together grammatically we will use the term clause complex. It is serial structure, where the same element is repeated again and again by iteration. Clause complex, when one or more clause s linked by tactic and logico-semantic relations. Clause complexes are formed either by combining two Independent clause through linking words known as Coordinators, or by combining an Independent clause with Dependent one through the binding words known as Subordinators.

***What is Expansion?***

the secondary clause expands the primary clause. Expansion is subdivided into elaboration, extension, and enhancement. Theoretical framework of this study is Halliday's (1985a) description of clause complex relation. SFL is an approach to linguistics developed by Halliday. He sees language in a social context. The theory behind this approach is functional rather than formal, that is, it considers language as a resource used for communication and not as a set of rules. Language based on the SFL, consists of discourse-semantic and lexico-grammar levels. Discourse-semantics describes language from discoursal and semantic perspectives. From discoursal point of view, cohesion and coherence are of focal attention at the text level; and from semantic point of views three layers of meaning such as ideational, interpersonal and textual (are as internal organization of a clause) are investigated at the clause level. According to Halliday and Hassan (1976), the interpretation of some parts of a text depends on the understanding of some other parts of mentioned earlier or later in the body of the text or out of the text in the surrounding environment. There is "scale of rank" in the grammar of every language, but for English it is

as clause, phrase/group, word and morpheme. Units of every rank form complexes. External organization of a clause consists of Expansion and Projection. Above the clause named as clause complex. There are two systemic dimensions when interpreting clause complexity:

1. *Interdependency (or tactic) system: Parataxis, Hypotaxis*
2. *Logico-semantic system: Expansion: Elaboration, Extension, Enhancement*

Clause complexes or above the clause: The notion of "clause complex" enables us to account in full for the functional organization of sentences. A sentence will be defined, in fact as a clause complex. The clause complex will be the only grammatical unit which we shall recognize above the clause. Hence, there will be no need to bring in the term 'sentence' as a distinct grammatical category. It simply can be refer to the orthographic unit that is contained between full stops. This will be avoiding ambiguity: A sentence is a constituent of writing while, A clause complex is a constituent of grammar. When a number of clauses are linked together grammatically we will use the term clause complex. Clause complexes are formed either by combining two independent clauses through the linking words known as Coordinators, or by combining an independent clause with dependent one through the binding words known as Subordinators.

*Example of clause complex:*

/// Rita enters, // close the door, // goes to the desk, // and dumps her bag on it. /// (1, 2)

*What is Paratactic?*

in parataxis, elements are equal status. Each element could stand as a functioning whole. The relation can be logically (in general) symmetrical (salt and pepper, pepper and salt) or transitive (salt and pepper, pepper and mustard, salt and mustard). Paratactic structures will be represent by a numerical notation 1, 2, 3 with nesting indicated in the usual way.

11 [2 2 3] 3 2 means 1(1 2)2 3 (1 2)

*What is Hypotactic?*

Hypotactic relationships are elements of unequal status. The dominant element (primary) is free; the dependent (secondary) of course is not. The relations are in general logically non-symmetrical (I breathe when I sleep is in contrast with I sleep when I breathe) or non-transitive (I fret when I have to drive slowly + I have to drive slowly when it's been raining is in contrast with I fret when it's been raining).

*Example of hypotactic relation:*

When she graduated from high school, she undertook a trip through the country (Hypo-taxis  $\alpha=\beta$ ).

As mentioned above, there are two systemic dimensions when interpreting clause complexity. One is the system of interdependency, or 'tactic' system, Parataxis and Hypo-taxis, which is general to all complexes- word, group, phrase and clause alike. The other is thelogico-semantic system of expansion and projection, which is specific to clause combining. Parataxis and Hypo-taxis illustrated:

2 and then (she) undertook a trip through the Country (Parataxis).

$\beta$  When she graduated from high school,

$\alpha$  she undertook a trip through the country (Hypo taxis).

#### *A. Elaboration*

One clause expands another by elaborating on it, restating it in other words, specifying it in greater details, commenting or exemplifying it. In elaborating, nothing new is added to the message in the primary clause. In every clause complex, the secondary clause has an elaborating, extending or enhancing relation to the primary clause (Halliday, Mathiessen, 2004). Example of clause connectors of elaborated paratactic clauses: (And, in other words, that is to say, for instance, i.e.,for example, to be precise, in particular, in fact, actually, indeed, at least).

*Example of clause connectors of elaborated hypotactic clauses:* Which, When, Where

#### *B. Extension*

One clause expands another by extending beyond it, adding some new element, giving an exception to it, or offering an alternative. Example of clause connectors of extended, paratactic clauses: (Both...) and, Not only...but also,(Neither...)nor, (And) yet, But, But not, Not...but only, except, (Either...) or (else)

///Jim entered the class and took a seat next to me. /// (1 +2)

*Example of clause connectors of extended, hypotactic clauses:* Whereas, while, except that, as well as, without, instead of

///Whereas the director gave no votes, his deputy said aye. ///

#### *C. Enhancement*

One clause expands another by embellishing around it, qualifying it with some circumstantial feature of time, place, cause or condition. Examples of clause connectors of enhanced, paratactic clauses: (Then, so, for, but, yet, however, still, meanwhile, at that time, in that way, therefore, nevertheless).

Examples of clause connectors of enhanced, hypotactic clauses: (As, in case, while, before, since, after, provided that, because of).

Table 1: Logico-semantic relationship in a clause complex along with notations (Pandian&Assadi, 2010)

Logico-semantic relationship		Paratactic	Hypotactic
E X P A N S I O N	Elaboration (=)	Apposition (1 = 2)	Non-defining relative clause ( $\alpha = \beta$ )
	Extension (+)	Coordination (1 + 2)	While, whereas clause Apart from/as well as/except for non-finite clause ( $\alpha + \beta$ )
	Enhancement ( $\times$ )	Otherwise/and then/for/thus/so/but clause (1 $\times$ 2)	Subordination ( $\alpha \times \beta$ )

#### De-expansion

A clause complex is formed by combining two or more clauses. The clause complex are formed either two independent clause (Paratactic) or by combining one In-dependent clause with a dependent clause (Hypotactic).

#### Examples of clause complex:

/// Rita enters, // close the door, // goes to the desk, // and dumps her bag on it. ///

In Hallidayan expansion there are three sub-types such as elaborating, extension and enhancement. In elaborating one clause expands another by elaborating on it, restating in other words, or commenting it. In this type of expansion nothing new is added to the message in the primary clause. For example:/// she is green; she is envious of everything.///

According to this example the secondary clause is restating the primary clause in other words.so, the readers must notice to it and write only primary clause and de-expand it, because nothing new is added to the message in the primary clause. Finally, the above example can be de-expanding in this way: //She is green.//

The second kind of the Hallidayan expansion is extension. In this type, one clause expands another by extending beyond it, adding some new element, giving an exception to it, offering an alternative. In extending, the secondary clause adds further information to the primary clause. According to below example the secondary clause adds further information about the primary clause

///My favorite season is spring, but my mother hates it///.

The above example can be de-expanding in this way: //My favorite season is spring//.

Enhancement is another type of Hallidayan expansion. In this type one clause expands another by embellishing around it, qualifying it with some circumstantial features of time, place, cause and condition. Here, the secondary clause provides background information for the message in the primary clause. See below example:

///We didn't have the rehearsal on Monday because it was a public holiday///.

In this example the secondary clause give reason for the message in the primary clause and it can be de-expanding in this way:

//We didn't have the rehearsal on Monday//. (De-expand)

## RESEARCH QUESTIONS

The questions that can be addressed in this study are:

1- To what extent does teaching systemic-oriented summarization strategies affect reading comprehension of advanced Iranian EFL learners?

2- Is there any difference between the effect of teaching systemic-oriented summarization strategies on the reading comprehension of male and female advanced Iranian EFL learners?

H<sub>1</sub>:The teaching of systemic-oriented summarization strategies has an effect on the reading comprehension of advanced Iranian EFL Learners.

H<sub>2</sub>: The teaching of systemic-oriented summarization strategies has a differential effect on male and female advanced Iranian EFL Learners.

## METHODOLOGY

### Research Design

In this study the learners were selected and they were divided into experimental and control groups. Then a pre-test and post test were administered to them. Only the experimental group received treatment and control group did not receive any treatment. These are principles of quasi-experimental study. therefore, this study is type of quasi-experimental research design. The independent variable in this study is the systemic-oriented summarization strategies and the dependent variable is the reading performance of the experimental and the control groups. And in this study the gender is moderate variable.

### Participants

The participants in this study were 68 male and female EFL learners (their L1 was Turkish). Their age range was between 22-28. They were at advanced level. The study was conducted at Payame Noor University in MeshkinShahr, Iran. Sixty eight learners were chosen through administration of PET test (Preliminary English Test). Learners whose score were 1 SD (SD=7.9) above and below of the mean score (M=33.83) were selected. All learners participated in this were advanced level and only the advanced level learners whose score were one standard deviation above and below of the mean score were selected as participants of the present study. In order to get assurance as to the homogeneity of the learners they were pre-tested on their level of proficiency in reading comprehension. Then, these 68 male and female English learners were divided into two groups experimental and control groups. The aim of this study is to train students to learn strategies

### **Instruments**

*Proficiency Level Test (PET)*, PET (Preliminary English Test) was used in order to determine the proficiency level of participants' in reading, writing, speaking and listening. To select the participants, all 100 students took part in PET English Language Test.

*Reading Comprehension Test from TOEFL Test (pre-test and post-test)*, this test was selected from "TOEFL Actual Tests" administered by ETS 7full-length test. The test-retest reliability estimated for these tests indicated that the all instruments were reliable ( $\alpha = 0.75$ ).

### *Treatment (Lesson Plan)*

Different research materials were used for the purpose of this study:

Hallidays' (1985a) clause complex techniques were selected materials for this study. These material (Sample of Lesson Plan for Experimental Group, See Appendix A), were chosen from "The ABC's of Functional Grammar (Pandian, &Assadi, 2010), Chapter 5, The Clause Complex.

Another material of this study was selected from "ENGLISH REXT", system and structure by J.R. Martin, University of Sydney. John Benjamins Publishing Company Philadelphia/Amsterdam 1992 (See Appendix A). Chapter 4, Conjunction and Continuity the logic of English text.

Some materials of the present study used for the lesson plans were selected from "An Introduction to Functional Grammar" by M.A.K. Halliday and Christian M.I.M. Matthiessen (2004), Chapter7; above the Clause: the clause complex (See Appendix A).

Another material was taken from Functional Grammar in the ESL Classroom by Rondey H. Jones and Graham Lock (2011), Chapter 6 Elaborating (See Appendix A).

During this study, the participants in Experimental group received Hallidays'(1985) clause complex expansion in order to learn the de-expansion' rules and summarize text. On the other hand, the participants in control group did not receive any techniques. This technique was introduced to the experimental group then, they received some examples about de-elaboration, de-extension and de-enhancement. In order to, use these techniques for summarizing the given reading passage.

### *De-expansion:*

A clause complex is formed by combining two or more clauses. The clause complex are formed either two independent clause (Paratactic) or by combining one In-dependent clause with a dependent clause (Hypotactic).

### *Examples of clause complex:*

/// Rita enters, // close the door, // goes to the desk, // and dumps her bag on it. ///

In Hallidayian expansion there are three sub-types such as elaborating, extension and enhancement. In elaborating one clause expands another by elaborating on it, restating in other words, or commenting it. In this type of expansion nothing new is added to the message in the primary clause. For example: /// she is green; she is envious of everything.///

According to this example the secondary clause is restating the primary clause in other words. So, the readers must notice to it and write only primary clause and de-expand it, because nothing new is added to the message in the primary clause. Finally, the above example can be de-elaborating in this way: //She is green.//

The second kind of the Hallidayian expansion is extension. In this type, one clause expands another by extending beyond it, adding some new element, giving an exception to it, offering an alternative. In extending, the secondary clause adds further information to the primary clause. According to below example the secondary clause adds further information about the primary clause

///My favorite season is spring, but my mother hates it. ///

The above example can be de-expanding (de-extension) in this way: //My favorite season is spring.//

Note: notation for clause complex is (///) while a clause notation is (/).

Enhancement is another type of Hallidayian (1985a) expansion. In this type one clause expands another by embellishing around it, qualifying it with some circumstantial features of time, place, cause and condition. Here, the secondary clause provides background information for the message in the primary clause. See below example:

///We didn't have the rehearsal on Monday because it was a public holiday.///

In this example the secondary clause give reason for the message in the primary clause and it can be de-expanding in this way:

///We didn't have the rehearsal on Monday///. (De-enhancement)

### **Procedure**

One hundred male and female EFL learners were selected as participants in this studyand the entire study took 10 weeks. Male (N=50) and female (N=50) EFL learners at four classes at Payame Noor University in MeshkinShahr, Iran participated in the present study. They were at advanced level and the PET (Preliminary English Test) was administered to establish participants' proficiency level. The learners of all classes were asked to complete a PET test in two hour and thirty minute. The learners whose score were 1 SD (SD=7.9) above and below of the mean score (M=33.83) were selected. Sixty eight English learners (males and females) were chosen. Reading comprehension test from TOEFL test administered to the students in order to homogenize them. Then, two groups (n=68) were selected and assigned into experimental and control groups. The students in control group were instructed in reading comprehension through regular instructional plan of Iran University. They didn't receive any systemic-oriented summarization strategies based instruction. They only were given the PET and pretest (reading comprehension test), and a post-test (reading comprehension test) the same as experimental groups. Their scores were compared with learners in experimental groups in order to determine the effect of systemic-oriented summarization strategies instruction on reading comprehension. On the other hand, the experimental group received treatment. The experimental group was instructed through using Hallidays'(1985) clause complex expansion. In the treatment session of the third week, the experimental group received their treatment

while, the control group did not receive any treatment (Table 3.1). The pre-test was administered before the treatment sessions while post-test show the effect of treatment. All of the 68 EFL learners were asked to complete a post-test after the treatment sessions. The same test was repeated as post-test seventh weeks after the pre-test.

Experimental Groups		Control Groups	
-	Pre-test (Reading Comprehension)	-	Pre-test (Reading Comprehension)
-	Treatment (7 sessions), Instructional Plan of Iran University	-	Treatment (7 sessions).Regular Hallidays'(1985a) expansion
-	Post- test (Reading Comprehension)	-	Post-test(Reading Comprehension)

## DATA ANALYSIS

### Findings Regarding Pre-test Homogeneity (Descriptive & Inferential Statistics)

A number of descriptive analyses such as minimum, maximum, mean, and standard deviation have been conducted on the data collected from students' pre-test homogeneity in control and experimental group. The descriptive statistics of the participants' pre-test in control and experimental group are presented in the table 2. Regarding the experimental and control groups' homogeneity, it has been found that students' mean score in experimental group was 22.02 with the standard deviation of 6.16. Pre-test scores in control group revealed a mean score of 22.91 with the standard deviation of 6.39

Table 2: Descriptive Statistics for Pre-test Scores

	N	Mean	Std. Deviation	Std. Error
Experimental	34	22.029	6.1668	1.0576
Control	34	22.911	6.3930	1.0963
Total	68	22.470	6.2497	.7578

According to Table 3, ( $F= 0.33$  and  $Sig., 0.56$ ), there was no difference between the experimental and the control group in their pre-test scores. However, both groups are homogenous.

Table 3: Test of Homogeneity of Pre-test Between and Within Groups (one way ANOVA)

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	13.235	1	13.235	.335	.564
Within Groups	2603.706	66	39.450		
Total	2616.941	67			

Table 4 presented the descriptive statistics results for pre-test homogeneity of male and female EFL learners in the study. Regarding the male and female learners' homogeneity, it has been found that students' mean score for the male learners was 22.38 with the standard deviation of 6.90 and students' mean score for the female learners was 22.55 with the standard deviation of 5.62.

Table 4: Descriptive Statistics for Pre-test Scores

	N	Mean	Std. Deviation	Std. Error
Male	34	22.382	6.9063	1.1844
Female	34	22.558	5.6202	.96387
Total	68	22.470	.75789	.75789

According to Table 5, ( $Sig. = .908$ ), there was no difference between male and female learners(experimental and control group) in their pre-test scores. So, both groups are homogenous.

Table 5: Test of Homogeneity of Pre-test Between and Within Groups (One Way ANOVA)

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	.529	1	.529	.013	.908
Within Groups	2616.412	66	39.643		
Total	2616.941	67			

## Hypothesis Testing

Research Question One: Does teaching systemic-oriented summarization strategies affect reading comprehension of advanced Iranian EFL learners?

Descriptive analyses such as mean and standard deviation have been conducted on the data collected from students' posttest in control and experimental group. The descriptive statistics of the participants' posttest in control and experimental group are presented in the table 6. Regarding the effect of teaching systemic-oriented summarization strategies in the experimental and control group, it has been found that students' mean score in experimental group was 25.35 with the standard deviation of 5.89. Post test scores in control group revealed a mean score of 23.38 with the standard deviation of 6.22

Table 6: Descriptive Statistics

Group		N	Mean	Std. Deviation	Std. Error Mean
Post mark	Experimental	34	25.352	5.8923	1.0105
	Control	34	23.382	6.2232	1.0672

As it is shown in Table 7, the P-value is equal to 0.18 which is higher than 0.05, so with regard to the first hypothesis of the study, that is, the teaching of systemic-oriented summarization strategies has an effect on the reading comprehension of advanced Iranian

EFL learners, an Independent samples t-test was conducted and it showed that teaching systemic-oriented summarization strategies had no effect on the learners' reading performance. The results of this analysis are shown in Table 7.

Table 7: Independent Samples Test for the Experimental and Control Groups

		Levene's Test for Equality Of Variance		T-test equality of Mean		
		F	Sig.	t	df	Sig. (2- tailed)
Post mark	Equal variances assumed	.893	.348	1.341	66	.185
	Equal variances not assumed			1.341	65.804	.185

The Results Regarding the Second Research Hypothesis. (The teaching of systemic-oriented summarization strategies has a differential effect on the reading comprehension of male and female advanced Iranian EFL learners).

Research Question Two: Is there any difference between the effect of teaching systemic-oriented summarization strategies on the reading comprehension of male and female advanced Iranian EFL learners'?

Descriptive analyses such as mean and standard deviation have been conducted on the data collected. The descriptive statistics of the male and female participants' posttest in the control and the experimental group are presented in the table 8. Regarding the effect of teaching systemic-oriented summarization strategies on the reading comprehension of male and female advanced Iranian EFL learners in the experimental and control group, it has been found that male students' mean score was 24.41 with the standard deviation of 6.85. Post test scores of the female learners revealed a mean score of 24.32 with the standard deviation of (5.33).

Table 8: Descriptive Statistics (Gender)

Group		N	Mean	Std. Deviation	Std. Error Mean
Post mark	male	34	24.411	6.8539	1.1754
	female	34	24.323	5.3355	.91504

As it is shown in Table 9, the P-value is equal to 0.95 which is higher than the level of significance 0.05, so with regard to the second alternative hypothesis of the study, that is, the teaching of systemic-oriented summarization strategies has a differential effect on male and female advanced Iranian EFL learners, an analysis of an independent sample t-test was conducted. The results of this analysis are shown in Table 9. According to the results available, there is not a significant difference in the male and female students' performance in post-test. In other words, the second alternative hypothesis of the study is not accepted. It means that there is not any significant difference between the reading performance of Iranian male and female EFL learners in two groups.

Table 9: Inferential Statistics Independent Sample Test

		Levene's Test for Equality Of Variance		T-test equality of Mean		
		F	Sig.	t	df	Sig. (2- tailed)
Post mark	Equal variances assumed	4.125	.039	.059	66	.953
	Equal variances not assumed			.059	62.253	.953

## DISCUSSION OF THE FINDINGS

In this study, at first, data from the pre-test were collected from 68 Iranian EFL learners in experimental and control groups. Analysis of the data through independent samples t-test revealed that there was no difference between experimental and control groups. The observed p-value estimated for the first question of the study which is as follow:

Does teaching systemic-oriented summarization strategy affect reading comprehension of advanced Iranian EFL learners? P-value observed that (Table 4.7) Sig=.18 is more than the level of significance ( $p=0.05$ ). The research hypothesis that claimed there is an effect of teaching systemic-oriented summarization strategies on the reading comprehension of advanced Iranian EFL learners was not supported. The findings of the present study proved that there is no significant difference between score of participants of experimental and control group. Then results reject the related alternative hypothesis of the study. However, it can be said that systemic-oriented summarization strategies has no effect on Iranian EFL learners reading comprehension. The results of the study revealed that learners' post test scores in experimental group and control group have not had significant differences.

Although the result of this study proved that teaching systemic-oriented summarization strategies have no effect on Iranian EFL learners' Reading comprehension, but teaching strategies have significant effect in increasing EFL learners' reading knowledge. Oxford (1990) defined LLS (Language Learning Strategies), as conscious manipulation and movement toward a goal. All three types of LLS are important to the language learning process. Meta-cognitive strategies help students monitor and evaluate their learning after an activity is completed

while cognitive strategies are more limited to specific learning task and involve more direct manipulation of the learning material itself. It includes using previous knowledge to help to solve new problems. Another strategy is socio-affective strategies include asking a classmate to work together on a particular language problem. These strategies help the learners control their own learning (OMalley et al, 1987; & Fedderholt, 1997). Reading comprehension has a multi-dimensional aspect so; mastering all of these dimensions takes time and need large number of participants.

Summarization is in the category of cognitive strategies and it is reading-writing connection activity. Summarization is a strategy that learners use to comprehend knowledge and recognize important ideas and express information by using their own words. For years and more recently, summarizing have been called as an important tool in reading comprehension by the National Reading Panel (2000) and a lot of researchers (Brown et al., Duke & Pearson 2002; Graham & Harris, 2005; Pressley & Block 2002; Taylor, 1986).

Summarization is important as tool for improving comprehension (Pressley, 2000). Some other studies indicated that summarization have significant impact on the reading comprehension (Armbruster, Anderson, & Ostertage, 1987; Doctrow, Wittrock & Alensandrini, 1990). Cordero – Ponce (2000) in their study randomly selected 64 intermediate college level learners of French as a foreign language. They divided their participants to experimental and control groups. The result revealed that summarization training was effective for L2 readers. All above views show the importance of summarizing strategies on the reading comprehension. While, the results of the present study revealed that there is no effect of teaching systemic-oriented summarization strategies on the reading comprehension of advanced Iranian EFL learners.

It is worth mentioning that student's prior knowledge (experimental and control group) may have effects on their production. They may have seen the TOEFL test in other situations. The students' prior knowledge in control group regarding Hallidays' (1985) expansion strategies may have been taught previously in other classes. These two points should be affecting the results of this study.

As mentioned before LLS are used to refer to all strategies language learners apply in learning the target language and summarization strategies are one type of language learning strategies. Different factors affect language learning strategies. Rees-Miller (1993) concludes "attempt to translate the theory behind learner-training is far more complex owing to the different factors that interact to influence the teaching and learning strategies: culture, situation, age, personal learning style. Pressley, et al. (1983), proposed that students need to be able to practice the learning strategy over a long period of time. Further research in this area will be necessary to determine the features of summary skill and the length of time will help students use the summarization skills.

This study was conducted among advanced level subjects. Main point in this study is about the different results gained by experimental group. The result of this study revealed that teaching systemic-oriented summarization strategies had no effect on the learners' reading comprehension. Also answering to this question that why the result of experimental group is different maybe depend on different factors. One of the main points in this study is maybe because of little schedule time. Learners should have the opportunity of practicing the learning strategies. They should ask to make conscious effort to use Hallidays' (1985a) expansion strategies. The learners should become aware of systemic-oriented summarization strategies. However, students practice should be increased along with re-explanation which can continue as long as necessary for the students to acquire the strategic procedure (Palinscar, 1986; Palinscar & Brown, 1984). And another point as mentioned above is students' prior knowledge. So, further investigation is required with regard to using systemic-oriented summarization strategies within EFL contexts.

#### ***The Results of the Effect of Teaching Systemic-oriented Summarization Strategies on the male and females' Reading Comprehension***

As the result of the study indicated, there was no significant difference among scores of participants (males and females) in control group with scores of participants in experimental group. Thus, results rejected an alternative hypothesis with respect to the related research question. However, according to the results it can be concluded that there is no any difference between the effect of teaching systemic-oriented summarization strategies on the reading comprehension of male and female advance Iranian EFL learners. The second hypothesis (The teaching of systemic-oriented summarization strategies has a differential effect on the reading comprehension of male and female advanced Iranian EFL learners.) was not confirmed because there were no any differentiates between the performance of the male and female advance Iranian EFL learners. According to the results the p-value estimated for the second research question of this study is (Sig=.95) and it is more than the level of significance ( $p=.05$ ). So, male and female learners to English report no significance difference in their using of systemic-oriented summarization strategies.

Language learning strategies help learners become more autonomous. They also enhance self-efficacy, and individuals' perception that can help learners to successfully complete a task or series of tasks (Carter & Nunan, 2001). According to Oxford, et al. (1990), language learning strategy use is influenced by many factors. One of these factors is gender. Research in second language showed that female and male learners to English report differences in their use of language learning strategies. The another core interest in this investigation, thus, was to identify the gender differences in EFL context in terms of using systemic-oriented summarization strategies by boys and girls in Iranian University. Research in second language teaching shows that female and male learners of English report differences in their use of language learning strategies while, the result of this study revealed that there was no any significance difference between Iranian EFL learners in using systemic-oriented summarization strategies. Therefore the research hypothesis that claimed the teaching of systemic-oriented summarization strategies has a differential effect on male and female advanced Iranian EFL learners was not confirmed.

#### **CONCLUSION**

According to many researchers (e.g., Armbruster, Anderson & Ostertage, 1987; Bean & Steenwyk, 1984; Berkowitz, 1986; Doctrow, Wittrock & Marks, 1978; Wittrock & Alesandrini, 1990) instructing students to generate summaries of text has been shown to improve comprehension. Previous studies indicated that summarization can help readers to focus on gist information and therefore improve comprehension (e.g., Anderson & Armbruster, 1984; Pearson & Fielding, 1996). Based on the findings of this study, the experimental and control groups developed their reading comprehension. However, the development of the experimental group was not significantly than the development of the control group. The fact that control groups' development may be attributed to their previous knowledge. It may have effects on their production. The learners in control group may have seen the TOEFL test in other situations. The students' prior knowledge regarding Hallidays' (1985) expansion strategies may have been taught previously in other classes.

At the end of instructional period, the female and male experimental groups' development was approximately the same.

In the beginning of this study, data analysis showed that learners in experimental and control groups had same reading comprehension strategy awareness while, independent samples t-test also revealed that there was no difference among them in their post test scores. The obtained data showed that there was no any difference between female and male learners in using systemic-oriented summarization strategies. The present study was also carried out to investigate the degree of probable difference between post-test scores of male and female EFL students. The researcher draws some conclusion based on the comparison made between the performance of the male and female EFL learners in posttest.

The findings of the study revealed that explicit teaching of systemic-oriented summarization strategies was not effective in the improvement of the EFL learners' reading performance. It is also indicated that there is not a significant difference between males and females reading performance after taking the treatment. Based on the findings of the study, it became clear that systemic-oriented summarization strategies did not affect Iranian EFL learners' reading comprehension and according to the findings of the present study the participants in the experimental groups did not outperform the subjects in the control group significantly. In conclusion, the arguments raised in this paper indicate that learning strategies in this study depend on different factors such as learners' prior knowledge.

#### ***Pedagogical Implications***

This study was an attempt to investigate one of the most important issues in EFL situations, i.e., learning to read through using Hallidays' (1985) expansion. The findings of this study suggest that teaching reading through using Hallidays' (1985) expansion did not improve the students' performance in the process of reading. Although the results did not carry an important effect for EFL learners of this study, teacher must not easily neglect the influence of teaching systemic-oriented summarization strategies on the reading comprehension of EFL learners. This study is expected to be helpful for those teachers who feel disappointed in attempting a creative approach to the teaching of the reading process. It is already known that in academic setting reading is the most important skill for students to be independent readers. However, how to teach students in order to be proficient readers is important issue. Syllabus designers, teachers, curriculum developers can use these strategies but they should consider the following suggestions. They should pay attention to students' prior knowledge and their awareness of these strategies and they may need to modify the design of the study was used in the present research because the important point in further research which should be taken into account is learner's schedule time.

#### ***Suggestion for further research***

In this study different levels of proficiency were not taken into account. To examine the effects of the strategies used, different levels of proficiency can be included in the further studies. The number of participants was rather small in this research, and the results may not be generalized to a larger population of the learners. Thus, this study could be conducted with a large sample size. Important point in further research which should be taken into account is learner's schedule time. Another important point is the student's prior knowledge (experimental and control group). It may have effects on their production. The group that we were working on may have seen the TOEFL test in other situations.

The students' prior knowledge regarding Hallidays' (1985) expansion strategies may have been taught previously in other classes. These two points should be taken into account in further research.

## ABSTRACT

The current study aims to investigate Iranian learners' beliefs about learning English and the stability of these beliefs over time. 50 learners, males and females, studying English as a foreign language in different English institutes in Isfahan were selected. Horwitz (1987) Beliefs about Language Learning Inventory (BALLI), a 34-item survey instrument, was used to collect data twice with the interval of three months. After data analysis was done, the results indicated that generally, learners recognized the existence of foreign language aptitude and placed strong emphasis on excellent pronunciation, vocabulary acquisition, and the benefits of practice. Most of them reported of being highly motivated and interested to learn English. The findings also revealed that with the exception of slight change to two items on language learning difficulty, two items on nature of language learning, and five items on learning and communication strategies, most of their beliefs were stable over time.

**KEYWORDS:** Learner's Belief, Language Learning, Language Learning Inventory (BALLI), Communication Strategy.

## INTRODUCTION

Recently, research on learner beliefs has evolved out of a growing interest in the role of affect in language learning. Beliefs are defined as "psychologically held understandings, premises, or propositions about the world that are felt to be true" (Richardson, 1996, p. 103) and are said to act as strong filters of reality (Arnold, 1999). "Beliefs are predispositions to action" (Rokeach, 1968); they influence what and how students learn. It has been shown (Schoenfeld, 1983) that one's belief systems, social cognitions and metacognitions are important force for intellectual performance, including learning and acquisition of foreign languages. According to Horwitz (1987), learners' beliefs or notions about language learning can influence both their experiences and actions as language learners. Educational psychologists believe that learners' self-beliefs are a defining factor of their learning behavior (Bandura, 1986; Pintrich & DeGroot, 1990). Learners with high self-efficacy are likely to expend more effort at a learning task and persevere even in the face of failures. Conversely, learners who doubt their ability to continue a learning task will put in less effort and give up easily in the face of challenges. According to Bernat and Gvozdenko (2005), beliefs have the potential to influence the learners' attitude to language learning, their motivation to learn, and also shape their experiences and actions in the classroom. It has been noted that successful learners develop insightful beliefs about language learning processes, their own abilities, and the use of effective and efficient learning strategies, which have intensified their competence and performance in language acquisition. On the other hand, learners can also have misconceptions, uninformed or negative beliefs about language learning, resulting in their reliance on less effective strategies and negative attitude and perspective towards learning and autonomy (Victori & Lockhart, 1995), classroom anxiety (Horwitz, Horwitz and Cope, 1986), and poor performance (Reid & Hresko, 1981). Victori and Lockhart (1995: 225) discussed differences between insightful beliefs that successful learners hold, and the negative or limited beliefs that poor learners hold, and stated that:

if students develop or maintain misconceptions about their own learning, if they attribute undue importance to factors that are external to their own action, they are not likely to adopt a responsible and active attitude in their approach to learning and may never become autonomous.

---

For instance, a learner who assumes that one shouldn't say anything in English until one can say it accurately and fluently will not make an effort to practice speaking in English while a learner who believes that it is important to repeat and practice a lot will benefit from applying that strategy. Similarly, learners who believe that they do not possess any special aptitude necessary for acquisition of English will start off with a relatively negative expectation of ultimate success compared to someone who believes otherwise.

## Literature Review

---

Since beliefs about language learning have been found to significantly affect language learning and outcomes, one of the areas of research interest in recent years is the factors that affect beliefs, such as individual learner differences and contextual diversity (Bernat & Lloyd, 2007). Interdisciplinary research suggests that learner beliefs are intertwined with factors such as self-percepts (e.g. self-concept, self-efficacy), personality traits, and other individual differences (Bernat, 2007; Langston & Sykes, 1997; Siebert, 2003). Recent studies have examined learners' beliefs about language learning for their relationship to factors such as strategy use (Yang, 1999); anxiety (Kunt, 1998; Tsai, 2004); learner autonomy (Cotterall, 1995; Wendley, 1991); gender (Bacon & Finnemann, 1992; Siebert, 2003), personality traits (Bernat, 2006); and language proficiency (Mantle-Bromley, 1995; Peacock, 1998, 1999; Tanaka & Ellis, 2003). Among other things, these studies have found that learners who held unrealistic beliefs or misconceptions about language learning were more anxious and intolerant than those who held more positive and realistic beliefs. Moreover, these beliefs have direct links to proficiency in that the more proficient learners were the more realistic and/or positive were their beliefs. Learner beliefs about language learning have also been found to be dynamic and context-specific (Alexander & Dochy, 1994; Chawhan & Oliver, 2000; Cotterall, 1995; Ellis, 2008; Horwitz, 1999; Riley, 2009). Learner beliefs have been revealed to change over time to new experiences and learning as well as change of attitude. The results also indicated that there were significant differences between groups of diverse language background students, for example students studying in Australia (Chawhan & Oliver, 2000) and New Zealand (Cotterall, 1995). However, studies conducted using the BALLI did not have consistent findings (Kern, 1995; Peacock, 2001). Kern (1995) conducted a survey involving university students studying French, reported that 35% to 59% of the responses changed over a period of 15 weeks. A significant change was observed in the response to the statement: "If you are allowed to make mistakes in the beginning, it will be hard to get rid of them later on", with 37% of the students reporting greater agreement and 15% lesser agreement. This suggests that many students were becoming increasingly conscious of their mistakes and were having difficulty in avoiding them, although they tried to correct them. Another change was in responses to the statement: "Learning a foreign language is mostly a matter of learning a lot of grammar rules", with 32% showing greater agreement and 20% lesser agreement. Meanwhile, Peacock (2001) reported a longitudinal study that investigated changes in beliefs about L2 learning of trainee ESL students in a three-year program at the City University of Hong Kong. His findings revealed that there were no significant changes in learner beliefs at the end of the program. Since the research findings regarding change in learner beliefs so far are not comprehensive and thorough, Bernat and Gvozdenko (2005) suggested that there is need for further investigations on the stability of beliefs and effects of instructional

interventions based on students' beliefs about language learning. The present study aimed to explore this phenomenon among Iranian learners belief.

Wong (2010) did a research to explore learners' beliefs about learning English and the stability of these beliefs over time by using the Horwitz' BALLI in Malaysia. The findings revealed that learners recognized the existence of foreign language aptitude and placed strong emphasis on excellent pronunciation, vocabulary acquisition, the benefits of practice, and an immersion approach to language learning. Most of them reported of being highly motivated to learn English and were positive about their ability to master the language. The findings also revealed that with the exception of slight change (ranging from 4% to 20%) to two items on language learning difficulty and six items on nature of language learning, most of their beliefs were stable over time.

As it was mentioned, research on learner beliefs in teacher education research has gotten significant attentions in recent years, particularly in investigating teacher beliefs and the connection between their beliefs and educational practices (Brown & McGannon, 1998; Calderhead, 1996; Peacock, 2001), since their beliefs play an important role in their learning. Brown and McGannon (1998) and Breen (1991) studied teacher beliefs and concluded that teachers had many incorrect beliefs about how foreign languages are learned and that this influenced their teaching practices later. Kennedy (1996) argued that real and effective change in teachers' practices could only occur through a change in their beliefs.

In Iran, a place where English is being learnt as a foreign language, no studies have been reported investigating learners' or pre- service teachers' beliefs about language learning over time, particularly studies involving English learners who are learning English in institutes for different purposes to teach English. Documenting language learners' beliefs is indispensable, so that efforts can be made to bring about awareness and changes in beliefs while they are still undergoing training to learn English. Discernment into learners' language learning beliefs would prove practical to teacher educators in incorporating appropriate and pertinent instruction on language learning during English lessons. The present study aimed to fill a gap in research on language learning beliefs.

## RESEARCH QUESTIONS

In line with what was stated above, this study aimed to gain insights into the following research questions:

1. What are the main Iranian EFL learners' beliefs about language learning?
2. To what extent are Iranian learners' beliefs stable over time?

## METHODOLOGY

### *Participants*

Participants were fifty English students, male and female, who were learning the language in different English institutes at least for six months. The age range of learners was from 18 to 30 years.

### *Instrument*

The survey instrument used to collect data consisted of 34 items from the Beliefs about Language Learning Inventory (BALLI) designed by Horwitz (1987). This instrument has been widely used (Bernat, 2006; Bernat & Lloyd, 2007; Horwitz, 1989; Siebert, 2003; Tanaka & Ellis, 2003; Yang, 1999) to assess learners and teachers' beliefs in relation to second or foreign language learning. Nikitina and Furuoka (2006) showed that the BALLI is a valid and suitable tool for research on language learning beliefs in different context. The BALLI measures learners' beliefs about five language learning categories: (1) foreign language aptitude, (2) the difficult of learning language, (3) the nature of language learning, (4) learning and communication strategies, and (5) motivation and expectations. Participants were required to respond to the items on a 5-point rating scale, with 34 items ranging from agree (1), neutral (2), and disagree (5). The reliability of the inventory was estimated at 0.92 in this study.

### *Procedure*

The BALLI was administered on the English learners in this study. The learners were not informed that they were involved in a study to investigate their beliefs about learning English but they were asked to check their ideas. They were told that there were no right or wrong answers. What was important was that they answered according to their beliefs about learning English. Most of the learners completed the inventory in 20 minutes and all the instruments were collected back for analysis. Three months later, the same instrument was administered again on the same group of learners. In both sessions they did not have any difficulties in understanding any of the statements in the BALLI. They were asked to write their names but they did not know that they would be asked to answer to the BALLI in three month again.

### *Data Analysis*

Descriptive analysis was used to calculate the frequency of responses for each item. Additionally, the BALLI is a multidimensional instrument where each item assesses a specific belief about language learning. Therefore, the scores for the items were not added together or averaged. For ease of viewing, the BALLI item ratings were collapsed into three categories namely agree (for strongly agree and agree), neutral and disagree (for disagree and strongly disagree). Changes in beliefs were investigated through comparing learners' responses to each item in the five language learning areas over the interval.

## FINDINGS AND DISCUSSION

The findings of this study have revealed some interesting insights into learners' beliefs about language learning and the variability of learner beliefs over time. The frequency of learners' responses for the items in the BALLI and the relevant discussion are presented according to the five language areas of the instrument (outlined in the method section) in Tables 1 to 5. This is then followed by results on the stability of beliefs of the learners over time in tables 6 to 8.

### *Learners Beliefs about Learning English*

#### *Foreign Language Aptitude*

The items in this language area refer to various aspects of the individual's potential to be successful in language learning. The findings show that majority of the English learners (40 of them) agreed with the commonly held belief that it is easier for children than adults to learn a second language (table1). Their beliefs were consistent with research findings that show a positive effect of young age on aspects of

language learning such as phonological development (Patkowski, 1990) and fluency (Donato, Antonek & Tucker, 1996). Similarly, English learners in the present study agreed that some people have special abilities for learning a foreign language. Their ideas about items 10: It is easier for someone who already speaks a foreign language to learn another one were mostly neutral (21 out of 50), seventeen of them agreed and the twelve left disagreed. Examining item 11 just one participant believed that people who are good at mathematics or science are not good at learning foreign languages and most of them (31) disagreed. This response suggests that the majority of the learners do not make a distinction between an aptitude for the sciences versus an aptitude for the humanities-type subjects — a distinction put forward by Gardner (1983) in his Multiple Intelligence theory distinguishing linguistic intelligence from logical/mathematical intelligence.

For Item 16, twenty three learners agreed that they had this special ability while some of them (15 out of 50) believed that they did not have this special ability although the majority of them (45 out of 50) agreed that everyone can learn to speak a foreign language (Item 33). Learners' response to Item 33 is very encouraging as it shows a positive attitude towards learning a foreign language among EFL learners. The effect of culture and gender were addressed by Items 6 and 19. Here, 25 of them agreed that people in Iran are very good at learning second languages while six of them were neutral about this and the remaining nine disagreed with the statement. In terms of gender ability in language learning, the learners had interesting beliefs. Half of them agreed with the statement while 10 were neutral as to whether women are better than men are at learning languages and 15 of them disagreed that Women are better than men are at learning foreign languages.

Regarding the effect of intelligence on language learning aptitude (Item 30), the learners believed differently. Twenty two of the learners agreed with this belief while 17 were neutral and eleven disagreed that People who speak more than one language are very intelligent. According to Lightbrown and Spada (1999), intelligence is a strong factor in language learning when it comes to language analysis and rule deducting but it has less effect on language learning in the classroom where instruction focuses more on communication and interaction.

*Table 1: Foreign Language Aptitude*

Items		Frequency		
		A	N	D
1	It is easier for children than adults to learn a second language.	40	5	14
2	Some people have a special ability for learning a second language.	31	10	9
6	People in my country are very good at learning second languages.	25	16	9
10	It is easier for someone who already speaks a foreign language to learn another one.	17	21	12
11	People who are good at mathematics or science are not good at learning foreign languages.	1	18	31
16	I have a special ability for learning foreign languages.	23	12	15
19	Women are better than men are at learning foreign languages.	25	10	15
30	People who speak more than one language are very intelligent.	22	17	11
33	Everyone can learn to speak a second language.	55	2	3

Note: A = Agree and Agree; N = Neutral; D = Disagree and Strongly Disagree

#### *Difficulty of Language Learning*

Items 3, 4, 15, 25 and 34 were on difficulty of language learning. Nearly all of the learners (46 out of 25) agreed that some languages are easier than others (Item 3) while three of them were neutral and the remaining one disagreed with the statement. Regarding difficulty of the English language, 17 of them rated the English language as a language of medium difficulty while 25 in the group rated it as very easy or easy and the remaining 8 agreed that English is very difficult.

Meanwhile, a few (19 out of 45) of the learners agreed that it would take 3 to 5 years to learn a foreign language well if one spent an hour a day learning the language, although 25 of them believe that it would take 5 to 10 years to learn a language well if one spent an hour a day learning the language. As it is obvious in the table .2 nobody answered that people can learn English less than 1 year if they spent one hour a day learning a language. Items 25 and 34 assessed the relative difficulty of language skills (speaking, reading, and writing). Learners appeared to be divided on this issue. Three of the learners agreed with the statement while nineteen were neutral on this and a larger number (28 persons) disagreed with the statement. For Item 34, there were more learners agreeing that it is easier to read than to write a foreign language; forty of them and seven of the learners were neutral and the remaining three disagreed. It is important to mention that items 15 and 34 had different answers in the interval which will be completely explained in table 6.

*Table 2: Difficulty of Language Learning*

Items		Frequency		
		A	N	D
3	Some languages are easier than others are.	46	3	1
4	The English language is*	8	17	25
15	If someone spent one hour a day learning a language, how long would it take them to speak it very well?			
	Less than 1 year	-	-	-
	1 to 2 years	8		
	3 to 5 years	19		
	5 to 10 years	10		
	You can't learn a language in 1 hour a day	13		
25	It is easier to speak than understand a foreign language.	3	19	28
34	It is easier to read than to write a foreign language.	40	7	3

Note: A = Agree and Agree; N = Neutral; D = Disagree and Strongly Disagree \* A = A very difficult or difficult language; N = language of medium difficulty; D = A very easy or easy language

#### *Nature of Language Learning*

Items 8, 12, 17, 23, 27 and 28 are related to the nature of the language learning process. Items 8 and 12 investigated learners' opinion regarding the role of cultural contact in language learning. More than half of the learners (36) agreed that it is necessary to learn about the culture of the foreign language under study in order to speak the language while the 10 of them were neutral and the remaining 4 disagreed about this view. A larger number of learners (42), however, supported the immersion-type setting in language learning, judging from their

response to Item 12, that it is best to learn English in an English-speaking country. In such a setting, there would be greater exposure to the foreign language, its culture, and its people. A majority of the learners (38 out of 25) agreed that the most important part of learning a foreign language is learning new words (Item 17). Two persons however, did not agree that vocabulary acquisition was that important while ten neither agreed nor disagreed. For Item 23, learners were asked to rate the importance of learning grammar, and the remaining eight disagreed this view. Half of the learners agreed with the statement but seven of the learners were neutral. Mentioning that participants' beliefs were changed about this item over time is important. Item 27 surveyed learners' views regarding learning English as different from other types of learning. Thirty out of fifty learners agreed with the statement and just three of them disagreed this statement. Meanwhile, quite a large number of learners (30 out of 50) agreed with the belief that translating from one's mother tongue is a highly valued learning strategy in language learning (Item 28). Therefore their belief does not support the Communicative Language Teaching (CLT) approach, where the target language is used during authentic, functional, communicative activities, and students' native language has no particular role in the classroom. The best way for learners to achieve native-like control of the target language is to think in that language rather than to translate or reprocess the target language into their mother tongue. However, five of the learners, agreed that translation is not important in language learning while the rest were neutral on the matter. The answers to this item were changed over time.

Table 3: Nature of Language Learning

Items		Frequency		
		A	N	D

12	It is best to learn English in an English-speaking country.	42	3	5
17	The most important part of learning a foreign language is learning new words.	38	10	2
23	The most important part of learning a foreign language is learning grammar.	25	17	8
27	Learning a foreign language is different than learning other academic subjects.	30	13	3
28	The most important part of learning English is learning to translate from my own language.	30	9	5

Note: A = Agree and Agree; N = Neutral; D = Disagree and Strongly Disagree

#### Learning and Communication Strategies

BALLI items 7, 9, 13, 14, 18, 21, 22 and 26 investigate the use of learning and communication strategies in language learning practices. most of the learners (40 out of 50) believed that it is important to speak English with an excellent pronunciation (Item 7), but the majority of them (43 out of 50) did not believe that one should only say something when one can say it correctly (Item 9). This finding revealed that while they support the idea of achieving excellent pronunciation, they also believed that it is all right to make mistakes, as is reflected in their responses to two Items 13 and 14. It is elating to note that many of these learners believe in the benefits of practicing speaking in English without waiting to be perfect and accurate before attempting to use the language. In fact, as seen in their responses to these two items, most of them enjoy practicing speaking in English with people who speak English well and felt that it is okay to guess when they don't know a word. Griffiths (2003) said that instead of literally translating, painstakingly, and meticulously looking up every new word, good language learners guess and keep going. Guessing the meaning of new words instead of relying too much on mono or bilingual dictionaries is a useful skill. Nearly all of the learners also believe that it is important to repeat and practice a lot when trying to master the language (Item 18). If this belief is put into practice more often, it would help them to improve their proficiency in English, as this English proverb says practice makes perfect. Meanwhile, superiority of the learners appeared to agree over whether it is important to practice using tapes and CD-ROMs and nobody disagrees with this item (Item 26). Learners' responses to Item 21 are encouraging in that half of them did not feel shy about conversing in English. Ten of them indicated that they felt shy speaking in English with other people and fifteen of them had neutral ideas in this view. Finally, for Item 22, greater of the learners did not agree that if mistakes are not corrected immediately, it is difficult to 'unlearn' them. Few (3) of them agreed with this while the rest (9) neither agreed nor disagreed with the statement.

Table4: Learning and Communication Strategies

Items		Frequency		
		A	N	D
7	It is important to speak English with an excellent pronunciation.	40	6	1
9	You shouldn't say anything in English until you can say it correctly.	3	4	43
13	I enjoy practicing English with people who speak English as a native language/speak English very fluently.	45	4	1
14	It's OK to guess if you don't know a word in English.	43	5	2
18	It is important to repeat and practice a lot.	44	4	2
21	I feel shy speaking English with other people.	10	15	25
22	If beginning students are allowed to make mistakes in English it will be difficult for them to speak correctly later on.	3	9	38
26	It is important to practice with cassettes/tapes or CD ROMs.	46	4	-

Note: A = Agree and Agree; N = Neutral; D = Disagree and Strongly Disagree

#### Motivation and Expectations

The items in this language category concern the desires and opportunities learners associate with learning English. The responses of the majority of the learners indicates that they were positive about their ability to speak well in English (Item 5), have a strong desire to do well in English (Item 31), and they would like to improve in English through getting to know native speakers of English (Item 32). Learners' responses to items 29 and specially 24 suggest that they have strong motivation to learn English. A majority of the learners indicated that they would like to learn English because of its utility value, that is, it enables them to understand native speakers of English better (Item 24) and to have better job opportunities (Item 29). For the item 20 most of the learners (38 out of 55) believed that people in Iran feel like that it is important to speak English. as the table shows the majority of learners had a positive attitude and motivation toward learning English. There was no change in their beliefs in the motivation and expectations area.

*Table 5: Motivation and Expectations*

Items		Frequency		
		A	N	D
5	I believe I will learn to speak English very well.	42	8	-
20	People in my country feel that it is important to speak English.	38	9	3
24	I would like to learn English so that I can better understand people who speak English as a native language.	40	7	3
29	If I learn to speak English very well, I will have better job opportunities.	29	13	8
31	I want to speak English very well.	46	4	-
32	I would like to get to know people who speak English as a native language.	30	14	6

Note: A = Agree and Agree; N = Neutral; D = Disagree and Strongly Disagree

*Table 6: Change in Beliefs about Difficulty of Language Learning*

Items		Frequency		
		A	N	D
15	If someone spent one hour a day learning a language, how long would it take them to speak it very well?			
	i. less than 1 year	-	-	-
	ii. 1 to 2 years	(8)5		
	iii. 3 to 5 years	(19)15		
	iv. 5 to 10 years	(10)25		
	v. You can't learn a language in 1 hour a day	(13)10		
34	It is easier to read than to write a foreign language.	(40)35	(7)9	(3)6

Note: the numbers in the parenthesis show the results of the first survey

#### *The Stability of Beliefs over Time*

The results of the BALLI administered learners after three months showed that there was no change in two of the five language learning areas, namely foreign language aptitude, and motivation and expectations. There were, however, slight changes ranging from .5% to 9% in the responses to two of the items on difficulty of language learning, five of the learning and communication strategies and two items on nature of language learning, as presented in Tables 6 and 7 and 8. As is evident in Table 6, there seems to be a change in learners' beliefs regarding the issue of the length of time it would take to learn a foreign language well. While there were still 19 learners who indicated that it would take 3 to 5 years the rest of the learners seemed to be in favor of a shorter length of time compared to previously. There was an increase of 1.5% of those who believed that it would take less than a year, decrease of 2% for those who believed it would take between 1 to 2 years, and an increase of 7.5% for those who thought it would take 5 to 10 years to master the language and finally an increase of 1.5% in the last statement: You can't learn a language in 1 hour a day.

It could be that the experience and knowledge acquired over the past three months have shown them that it does not really take that much time to master the language. Another change in belief is seen in Item 34, regarding whether it is easier to read than to write a foreign language. The number of learners who were neutral on this seems to have increased by 1% while those who agreed with the statement decreased by 2.5% and those disagreed increased by 1.5%.

*Table 7: Nature of Language Learning*

Items		Frequency		
		A	N	D
23	The most important part of learning a foreign language is learning grammar.	25(27)	(6)7	(8)10
28	The most important part of learning English is learning to translate from my own language.	(30)36	(9)4	5(10)

The results about the nature of language learning were different in two items 23 and 28. In 23, there was an increase of 1% in learners' beliefs regarding the most important part of learning a foreign language is learning grammar, a decrease of 2% who were neutral and an increase of 1% who disagreed this view. Regarding item 28 there was an increase of 2.5% who agreed that the most important part of learning English is learning to translate from my own language, the number of learners who were neutral have decreased by 2.5% by which those who disagreed with the statement increased by 3%.

Meanwhile, the bulk of the change in beliefs seems to be concerning the learning and communication strategies. As shown in table 8 there was an increase 9% in the number of learners who agreed that it is important to speak English with an excellent pronunciation while there was an increase of 1.5% in those who were neutral and an increase of .5% who disagreed the statement (item 7). The next strategy was that you shouldn't say anything in English until you can say it correctly (item 9), the results show that the learners who agreed this view had a decrease of 5% , there was an increase of 1.5% in those who had a neutral idea and finally a decrease of 1% in those who disagreed this statement. With the respect to the matter of whether it is Ok to guess if you don't know a word in English, there appears to be an increase of 2% in those who agreed this statement and a decrease of about 1% in those who were neutral and disagreed this view. As for the attitude to feel shy speaking English with other people (item 21) learners seemed to have changed their beliefs on this, judging by the drop of 3.5% in those who agreed with the statement , decrease of 3% in those who were neutral and an increase of 6% who disagreed this view. The last statement which revealed the learners change in strategy was item 22 which states if beginning students are allowed to make mistakes in English it will be difficult for them to speak correctly later on; there was a decline of 5% in those who agreed and a drop of 1.5% in those who were neutral, and a rise of 1% in those who disagreed this statement. Although the percentage change in beliefs is small, learners appear to be more divided on the issues put forward in the statements on learning and communication strategies. Generally, the findings concur with those of previous researchers (Alexander and Dochy, 1994; Chawhan and Oliver, 2000; Cotterall, 1995; Ellis, 2008; Horwitz, 1999) in that learner beliefs can change with time due to new experiences and learning as well as change of attitude.

Table 8: Learning and Communication Strategies

## CONCLUSION

In summary, the analyses of findings in this study provide some interesting insights into EFL learners' beliefs about the five language areas covered in the BALLI. Learners' responses to nine of the items changed slightly ranging from 0.5% to 9% after three months when they were asked to report on their beliefs again, supporting the view that learner beliefs are situational and dynamic in nature. In terms of pedagogical implications, the findings presented here will be useful to teacher educators in planning activities, to learners and administrators that could increase awareness and even adjustment of learners' beliefs about language learning. However, it is important to pay attention that the beliefs about language learning held by the respondents in this study are only those specified in the BALLI instrument. As Bernat (2006) noted, for such a cognitively and affectively rich construct such as one's belief system, it is difficult to capture the complete picture merely through responses to a set of normative statements. Future researchers might want to employ a contextual approach and use a variety of qualitative data collection methods such as semi-structured or unstructured interviews, observations, and questionnaires to gain more insights into learners' and even teachers' beliefs and any change in their beliefs over time.

### ABSTRACT

This paper will analyze one of mitigation device type in the novel “*Ketika Cinta Bertasbih*”. It focuses on hedge, how it works as mitigation device. Hedge in this paper is to show how the speaker can save his or her utterance because of uncertain utterance. It will be divided into two classes according to Fraser (2010), propositional hedging and speech act hedging. These classes will help the speaker utters something and will achieve speaker’s goal easier. Finally, the aims of this paper are to find the function, the perlocutionary act of hedge and to find hedge as a mitigation devices in conversation to achieve speaker’s goal easier and to save his or her utterance because of uncertain utterance.

**KEYWORDS:** Hedge, Mitigation Devices, Indonesian Novel.

### INTRODUCTION

When two or three people open a conversation, they or one of them will do some impolite utterance. The interlocutor will ignore the speaker’s utterance or some will feel offended of the utterance. In order to avoid the interlocutor’s negative response, mitigation device is needed. The function of mitigation is to soften the speaker’s utterance. As Caffi (1999), mitigation is “the attenuation of unwelcome effects on the hearer”. Many type of mitigation devices; shield, bushes, opener, softener, filler, preparator, grounder, disarmer, expander, promise of reward. One of the types is Hedge. Hedge occurs if someone utters something inaccurately, something uncertainty. Hedge usually involves adjective, adverbs, predicate adjectives, predicate nominal and declarative sentence such as *actually, extremely, anyway, I guess*, etc. In bahasa, the word or phrase or even sentence which is involved to hedge is the same as in English. But the attunation may be different. Hedge can be affected by the speaker’s speech act. One of the uses of hedge also will affect the perlocutionary act where the interlocutor will do the speaker’s utterance as the function of mitigation device; the interlocutor will achieve the speaker’s goal easier. In this case if the speaker uses hedge in their utterances the achievement will be occurred. But what if the result is unequal from the theory?. As the background above, the authors will analyze beside the function of hedge as mitigation. The authors analyze the perlocutionary act and to analyze whether hedge as mitigation is same as the theory. Here, the authors use *Ketika Cinta Bertasbih* as data.

### THEORETICAL BACKGROUND

Hedge is introduced famously by Lakoff (1972) as fuzziness. “For me, some of the most interesting questions are raised by the study of words whose meaning implicitly involves fuzziness – words whose job it is to make things fuzzier or less fuzzy (195)”. As Hyland (1998) wrote the function of hedge is either a lack of complete commitment to the truth value of an accompanying proposition or a desire not to express that commitment categorically. Another hand, the function of hedge is to express inaccurate the speaker utterance. Here, hedge as a device or known as mitigation device is to make easier the speaker conveys his or her meaning or to attenuate the strength of utterance. As Zuck and Zuck (1986) mentioned that “Hedge is the process whereby the authors reduce the strength of a statement.” Hedge in this paper will be divided into two classes; propositional hedging and speech act hedging. Propositional hedging involves predicate adjectives, predicate nominal, and declarative sentence. It where the truth value of the proposition is affected (Prince *et al*, 1982). Another class of hedge is speech act hedging where hedge is depended on the speech act. It is not a semantic point of view anymore but it is a pragmatic point of view and it focuses on illocutionary force of speech act. As Brown and Levinson (1987) said that

*“A hedge is a particle, word, or phrase that modifies the degree of membership of a predicate or noun phrase in a set; it says of that membership that it is partial, or true only in certain respect; or that it is more true and complete than perhaps might be expected.” (145)*

Here hedge re-divided into two classes according to Prince *et al*, Fraser and Brown and Levinson that are approximators and shields. Approximators is another term of propositional hedging which work on the propositional content. For example: *sort of, kind of, somewhat, some, a little bit*, etc. Second type is Shields or speech act hedging. It is to changing the relationship between propositional content and the speaker’s uncertain utterance. For example: *I think, probably, as far as I can tell, right now, I have to believe, I don’t see that, etc*. Here, Hedge will be related to speech act. Speech act divided into three; locutionary act, illocutionary act and perlocutionary act. According to Yule (1996) locutionary act is act which has no a meaningful power. Illocutionary act is act which has a meaningful power and perlocutionary act is the effect of locutionary act and illocutionary act. Those are the theories of hedge are bringing the authors to analyze; my focus is on hedge as mitigation device in Indonesian novel which is in Indonesian sentences.

### DATA AND METHODS

The data in this research are from Indonesian Novel titled *Ketika Cinta Bertasbih part I. Ketika Cinta Bertasbih* written by Habiburrahman El Shirazy. He was a student who graduated from Al Azhar Cairo University, founder and main owner of Basmala Islamic boarding school. The novel is ...these were best selling novel in 2002 and had many awards such as the most favorite book in 2005. Because of its popularity, these novels were made as movie and became one of favorite movie in that time. The story was about finding their soul mate. The method of this research is the writer sorts and finds hedge in the novel. and the data are analyze by the type and the function as mitigation devices. The data are literally and followed by the analysis.

## RESULTS AND DISCUSSIONS

This research focuses on hedge as mitigation devices in novel “*Ketika Cinta Bertasbih*”. It would examine the function, the perlocutionary act of hedge as mitigation devices. Based on the data, the authors found most of the uses of hedge in the novel are; *kayaknya*, *jika* or *kalau*, *mungkin* and *ngomong-ngomong*. The authors took some data which contain the hedges.

- (1) Pak Ali : “Kalau boleh tahu berapa umur mu Mas Khairul?”  
*If may know how age you, Mas Khairul?*  
“May I know how old are you, Mas Khairul?”  
Khairul : “Dua puluh delapan Pak.”  
*Twenty Eight Sir.*  
“Twenty Eight years old, sir.”  
Pak Ali : “Kalau aku perhatikan, gurat wajah mu lebih tua sedikit dari umur mu.  
*if I notice line face you more old little from age you.*  
**Kayaknya** kamu memikul sebuah beban yang lumayan berat.  
*Like you carry a burden which quite heavy.*  
Aku perhatikan kau lebih banyak bekerja daripada belajar di  
*I notice you more many work then study in*  
Mesir ini. Boleh aku tahu tentang hal ini?.”  
*Egypt this. May I know about thing this?*  
“I see your face is quite older than your age. As if you carry a heavy burden. I notice you like working than studying in Egypt. May I know what is happened?”  
Khairul : “Ah Pak Ali terlalu perhatian pada saya. Saya memang harus bekerja keras Pak.  
*ah Mr. Ali too care to I. I indeed have to work hard Sir.*  
Bagi saya ini bukan beban. Saya tidak merasakannya sebagai beban.  
*For I this not burden. I not feel as burden.*  
Meskipun orang lain mungkin melihatnya sebagai beban.  
*Even though people other maybe see as burden.*  
Saya memang harus bekerja untuk menghidupi adik-adik saya di Indonesia.  
*I indeed have to work for live sister sister I in Indonesia.*  
“You too care about me. I indeed must work hard sir. For me it is not a burden and I don’t feel as a burden. Even though other people see as it. I must work for supporting my sisters’ finance in Indonesia.”

In the data (1) *kayaknya* is hedge because *kayaknya* shows the speaker hesitation. In English *kayaknya* is translated to *as if*. *Kalau aku perhatikan, gurat wajah mu lebih tua sedikit dari umur mu. Kayaknya kamu memikul sebuah beban yang lumayan berat.* The sentence is uttered by Pak Ali to Khairul. Here, the speaker uses hedge; speech act hedging which affect the speech act of the speaker’s uncertain utterance. The function in the data is the speaker does not sure whether his utterance is right or wrong. *As if* can represent the function of hedge to cover the speaker’s inaccurate utterance. The perlocutionary act of hedge for interlocutor is when the speaker utters *kayaknya*, the interlocutor covers his condition from the speaker, but in the end he tells his condition. Here, hedge *kayaknya* as mitigation device works because the interlocutor follow the speaker’s goal to achieve easier the goal.

- (2) Khairul : “Apa tidak ada topic lain Pak, selain Eliana?”  
*what not there topic another Sir, beside Eliana?*  
Pagi- pagi gini sudah membahas Eliana. Eliana lagi.”  
*Morning morning already discuss Eliana. Eliana more.*  
“Is not another topic beside Eliana’s topic, sir? In the morning, we have already talked about her.”  
Pak Ali : “Aku ingin menceritakan hal penting pada mu. Untuk kebaikan mu.”  
*I want tell thing important to you. For goodness you.*  
“I want to tell an important thing to you. It is for your goodness.”  
Khairul : “Tentang Eliana?”  
*about Eliana?*  
“about Eliana?”  
Pak Ali : “bisa dikatakan tentang Eliana bisa juga dikatakan tidak.”  
*can say about Eliana can also say not.*  
“It can be said about Eliana and it can be not.”  
Khairul : “mendengar nama Eliana saja saya sudah bosan Pak.”  
*Hear name Eliana just I already bored Sir.*  
“hearing Eliana’s name, I have been already bored, sir.”  
Pak Ali : “Ah yang benar?”  
*ah which right?*  
“are you serious?”  
Khairul : “Benar Pak, sungguh,”  
*right Sir, really.*  
“Yes, I am sir.”  
Pak Ali : “Mas, bapak ini sudah makan asam garam lebih dari mu.  
*Bro, father this already eat sour salt more from you.*  
Bapak tidak bisa kau bohongi.  
*Father not can you lie.*  
Jujur saja, bapak sungguh memperhatikan mu empat hari ini. Dan bapak  
*Honest just father*  
*really notice you four day this. And father*  
Melihat kamu ini sesungguhnya sangat mengagumi Putri Pak Dubes itu.  
*See you this really very admire princess Sir ambassador that*  
Bahkan bapak berani menyimpulkan kamu itu sebenarnya suka sama dia.”  
*Even father brave conclude you that actually like to she.*  
“hey, I have experienced the bittersweet of life than you. I can not be lied by you. Just be honest, I have been noticing you for four days. And I noticed that you admire the ambassador’s

daughter. Even I dare to say that you really like her.”

In the data (2) *bisa dikatakan tentang Eliana bisa juga dikatakan tidak* is hedge because *bisa dikatakan tentang Eliana bisa juga dikatakan tidak* shows the speaker hesitation. In English that sentence is translated to *It can be said about Eliana and it can be not. bisa dikatakan tentang Eliana bisa juga dikatakan tidak*. The sentence is uttered by Pak Ali to Khairul. Here, the speaker uses hedge; speech act hedging which affect the speech act of the speaker's uncertain utterance. The function in the data is the speaker does not sure whether his utterance will be heard by the interlocutor. *It can be said about Eliana and it can be not* can represent the function of hedge to cover the speaker's inaccurate utterance. The perlocutionary act of hedge for interlocutor is when the speaker utters *bisa dikatakan tentang Eliana bisa juga dikatakan tidak*, the interlocutor seems lazy to hear the speaker's utterance, so the conversation did not go well. Here, hedge *bisa dikatakan tentang Eliana bisa juga dikatakan tidak* as mitigation device does not work because the interlocutor does not follow the speaker's goal.

- (3) Eliana : "Tapi tadi malam dia berkata kasar di telpon pada saya Pak.  
*but ago night he say rude in phone to I Sir.*  
 Dia juga memutus pembicaraan seenaknya saja!  
*He too decide conversation arbitrarily just!*  
 Apa itu tidak penghinaan Pak Ali?"  
*What that not insult Sir Ali?*  
 "but last night he said rudely to me on the phone. He also stopped the conversation. Was that an insult, sir?"
- Pak Ali : "Mungkin saat itu Mas Khairul sedang capek. Letih.  
*maybe moment that bro Khairul average tired. Exhausted.*  
 Orang kalau letih itu pikirannya bisa tidak jernih.  
*People if exhausted that thinking can not clear.*  
 Cobalah ingat, kemarin itu ia kerja sejak pagi sampai malam."  
*Try remember, yesterday that he work since morning until night.*  
 "Semestinya Mbak Eliana harus berterima kasih pada Mas Khairul.  
*Should sister Eliana have to thank you to brother Khairul.*  
 Enam hari ini tenaga dan waktunya ia curahkan untuk membantu Mbak  
*Six day this energy and time he lav ished to help sister*  
 Bahkan dalam kondisi sangat letih, dia masih mau membakarkan ikan *Even in condition*  
*really exhausted. He still want burn fish*  
 untuk membantu Mbak Eliana. Dan pagi ini,  
*to help Sister Eliana. And morning this,*  
 dia mengirim sesuatu yang sangat Mbak suka.  
*he send something which very sister like.*  
 Semestinya Mbak berterima kasih sama dia. Saya dengar orang Barat yang  
*Should sister thank you to he. I listen people west which*  
 terdidik itu mudah mengucapkan terima kasih pada orang yang  
*educate that easy say thank you to people which*  
 membantunya."  
*help.*  
 "Maybe last night, Khairul was being tired. Exhausted. If People are being exhausted, their thinking is not clear. Try to remember. He had been working since in the morning until in the night. You should say thank you to him. He had already spent his energy and his time to help you. Even, in exhausted condition. He still wanted to grill the fish. And in the morning, he sent something that you like. I hear that educated foreigner is easy to say thank you."
- Eliana : "Baik Pak. Saya akan meneleponnya untuk meminta maaf. Terima kasih ya Pak.  
*Fine Sir. I will call for ask sorry. Thank you yes Sir.*  
 "Oke. I am going to call him to ask apologize. Thank you Sir."
- (4) Sara : "Saya mengundang Tuan nanti malam jam 19.30 di Abu Sakr Restaurant  
*I invite Mr. later night clock 19.30 in Abu Sakr Restaurant*  
 di Qashr Aini Street, tepat di depan Qashr El Aini Hospital.  
*in Qashr Aini Street exactly in front Qashr El Aini Hospital.*  
 Setelah berkenalan dengan Tuan di perpustakaan itu,  
*After introduce with Mr. in library that.*  
 saya lalu mencari data lebih jauh tentang Tuan di bagian kemahasiswaan.  
*I then search data more far about Mr. in part student*  
 Saya jadi mengetahui banyak hal tentang Tuan. Saya juga sering melihat  
*I become know more thing about Mr.. I too often see*  
 Tuan melintas di gerbang kampus, tapi Tuan pasti tidak tahu.  
*Mr. pass in gate campus. But Mr. exactly not know.*  
 Saya harap Tuan bisa memenuhi undangan saya malam ini"  
*I hope Mr. can fill invitation I night this.*  
 "I invite you tonight 7.30 PM at Abu Sakr Restaurant in Qashr Aini Street, in front of Qashr El Aini Hospital. After I knew you in the library. Then, I looked for more about you. I often see you passing the campus gate. But you do not know. I hope you can fill my invitation tonight."
- Furqan : "Maaf, mungkin saya tidak bisa Nona. Ada yang harus saya kerjakan."  
*sorry, maybe I not can miss. There which have to I do.*  
 "I am sorry miss, maybe I can not fill your invitation. There is something that I have to do."
- Sara : "Tidak harus Tuan jawab sekarang. Lihat saja nanti malam,  
*not have to Mr. answer now. Look just later night,*  
 jika ada waktu silakan datang. Jika tidak, tidak apa.  
*if there time please come. If not, not what,*  
 Namun saya sangat senang jika Tuan bisa datang. Ini saja Tuan,  
*but I very happy if Mr. can come. This just Mr.*  
 maaf mengganggu. Sampai bertemu nanti malam. Syukran."

*sorry disturb. Until meet later night. Syukran (thank you)*  
"you do not answer now. We will see tonight. If you have time, please come. If not, it is alright. But I am very happy if you can come. That is all, sorry to disturb you. See you later. Thank you."  
Furqan : *"Afwan."*  
*sorry.*  
"I am sorry"

In the data (3) and (4) there two statements which contain hedge  *mungkin*. It shows the speaker hesitation. In English  *mungkin* is translated to  *maybe*.  *Mungkin saat itu Mas Khairul sedang capek. Letih and Maaf, mungkin saya tidak bisa Nona*. Here, the speakers use hedge; Propositional hedging which contains adverb is  *maybe*. The functions of hedge in the data are to express the speaker's doubt. In data (3) beside express the speaker's doubt,  *maybe* here has another function; to save Khairul's face. While in data (4) beside express the speaker's doubt,  *maybe* here has another function; to reject the Sara's invitation. In data (3) the perlocutionary act of hedge to interlocutor is when the speaker utters  *maybe*, the interlocutor realizes that her attitude was bad to Khairul and she felt guilty. Here, hedge as mitigation device works because the interlocutor follows the speaker's goal. In data (4) the perlocutionary act of hedge for interlocutor is when the speaker utters  *maybe*, the interlocutor does not want to understand about the speaker utterance. Here, hedge as mitigation device does not work because the interlocutor does not follow the speaker's goal to achieve easier the goal.

- (5) Furqan : "Ya siapa ini?"  
*Yes who this?*  
"Yes, who is this?"  
Sara : "Ini Sara, Tuan Furqan. Mengingatkan aja. Anda tidak lupa dengan undangan  
*This Sara, Mr. Furqan. Remember just. You not forget with invitation*  
*saya bukan? Pukul 19.30 di Abu Sakr Restaurant."*  
*I not? Clock 19.30 in Abu Sakr Restaurant.*  
"I am Sara, Furqan. To remind about my invitation, you do not forget, do you? At 07.30 PM at Abu Sakr Restaurant."  
Furqan : "Saya tidak lupa. Tapi saya kelihatannya tidak bisa datang"  
*I not forget. But I look not can come.*  
"I do not forget. But I think I can not come."  
Sara : "Saya sangat berharap Tuan datang."  
*I very hope Mr. come.*  
"I wish you came."  
Furqan : "**Kalau** tidak datang semoga Nona tidak kecewa."  
*if not come, hope miss not disappointed.*  
"If I can not come, I hope you will not be disappointed."  
Sara : "Justru saya kuatir, jika Anda tidak datang, Anda menyesal."  
*exactly I worry, if you not come. You regret.*  
Undangan ini mungkin hanya sekali Anda dapatkan dalam hidup Anda"  
*Invitation this maybe only once you get in life you.*  
"I am exactly worried. If you can not come. You will regret it. Maybe this is the invitation that you get once in your life."  
Furqan : "Terima kasih, saya merasa tersanjung."  
*thank you. I feel flattered.*  
"Thank you. I feel to be honored."  
Sara : "Saya merasa lebih tersanjung jika Anda berkenan datang."  
*I feel more flattered if you can come.*  
"I will feel more to be honored, if you can come."  
(6) Erna : "Mbak kita jadi ke Palace?"  
*sister we become to Palace?*  
"Anna, are we going to Palace?"  
Anna: "Sekarang, sudah jam tujuh lebih lima, tapi Wan Aina dan Sholihati belum pulang."  
*now, already clock seven more five, but Wan Aina and Sholihati not yet return home.*  
Apa tidak terlalu malam jika kita keluar setelah mereka pulang?"  
*What not too night if we out after they return home?*  
"already seven past five now, but Wan Aina and Sholihati have not come back home yet. will not be too late we go out if we wait them come back home?"  
Zahraza: "Iya, terlalu malam. Nanti dilihat orang tidak baik."  
*yes, too night. Later see people not good.*  
"yes it is too late. It will be a gossip"  
Erna : "Atau tidak usah ke Palace saja Mbak. Nanti kalau mereka pulang  
*Or not have to to Palace just sister. Later if they return home*  
kontak Babay saja. Pesan makanan minta diantar ke sini."  
*contact Babay just. Order food ask deliver to here.*  
"Or we do not have to go to Palace. If they come home just call Babay. Order some foods, ask him to deliver it"  
Anna : "Yah, nanti **kalau** mereka pulang kita musyawarah. Enaknya bagaimana."  
*Yes. Later if they return home we discuss. Taste how.*  
Yang jelas malam ini insya Allah tetap syukuran  
*Which clear night this insya Allah still expression of gratitude*  
Seperti yang saya janjikan."  
*like which I promise.*  
"oke. If they come back. We will discuss it. For tonight, I hope the thanksgiving party is held like I promise."  
Erna : "Oke"  
*Oke*  
"Oke"

In the data (5) and (6) there two statements which contain hedge *Jika* shows the speaker's expectation. In English, *Jika* is translated to *If*. *Kalau tidak datang semoga Nona Nona tidak kecewa and nanti kalau mereka pulang*. Here, the speakers use hedge; Propositional hedging which contains noun is *if* and adverb is *exactly*. The functions of hedge in the data are to express the speaker's expectation. In data (5) the perlocutionary act of hedge for interlocutor is when the speaker utters *if*, the interlocutor felt worry her invitation was rejected by the speaker and in her utterance contains *justru = exactly* which she has a big expectation and she tends to threaten the speaker. Here, hedge as mitigation device does not work because the interlocutor does not follow the speaker's goal. In data (6) the perlocutionary act of hedge for interlocutor is when the speaker utters *if*, the interlocutor follows the speaker utterance. Here, hedge as mitigation device work because the interlocutor follows the speaker's goal.

- (7) Pak Ali : "Eh **ngomong-ngomong** Mbak Eliana sudah makan pagi?"  
*talk talk sister Eliana already eat morning?*  
 "ehm. By the way, have you already had breakfast?"  
 Eliana : "Belum Pak. Lagi tidak nafsu. Apalagi menu hotel. Sudah bosan sekali rasanya."  
*yet Sir. More not appetite. Moreover menu hotel. Already bored really taste.*  
 "not yet sir. I do not have an appetite to eat. Moreover, I do not have an appetite of the taste of hotel's food"  
 Pak Ali : "Kalau *habasy takanat mau?*"  
*If habasy takanat want?*  
 "what is about *habasy takanat*, do you want?"  
 Eliana: "Wah itu boleh Pak. Sebenarnya saya lapar. Yuk kita keluar cari *habasy*"  
*that can Sir. Actually I hungry. Let's we out search habasy*  
*takanat Pak Ali yuk?"*  
*takanat Sir Ali let's?*  
 "wow, I love it. Actually, I am hungry. Let's go to find *habasy takanat* sir?"  
 Pak Ali : "Tak usah keluar. Ini saya sudah bawa. Tadi saya baru saja makan"  
*not have to out. This I already bring. Ago I already eat*  
*tha'miyah bil baidh. Ini saya bawa untuk Mbak Eliana."*  
*tha'miyah bil baidh. This I bring to sister Eliana.*  
 "do not have to go out. Here I bring it. I have already eaten *tha'miyah bil baidh*. Here, I bring *Habasy takanat* for you."
- (8) Khairul : "**Ngomong-ngomong** Nasir kemana kok belum pulang?"  
*talk talk Nasir where not yet return home.*  
 "by the way, where is Nasir?"  
 Nasir : "Nasir tadi pamit tidak pulang. Dia ada urusan ke Tanta"  
*Nasir ago permit not return home. He there business to Tanta*  
 "Nasir asked not to go home. He has a business to Tanta."  
 Khairul : "O ya sudah kalau begitu."  
*o yes already if that.*  
 "oh, ok"

In the data (7) and (8) there statement is *ngomong-ngomong*. In English, *ngomong-ngomong* is translated to *by the way*. Here, the speaker uses hedge; speech act hedging which affect the speech act of the speaker's uncertain utterance. The function of hedge in the data is not to express the speakers' uncertain utterance but to change the topic conversation. The speakers want to know another thing so they change the topic. The perlocutionary act of hedge for interlocutor is when the speakers utter *by the way*, the interlocutors follow the speakers utterance to answer the different topic. Here, hedge as mitigation device work because the interlocutor follows the speaker's goal.

## CONCLUSION

The data in this paper revealed that there are 30 data which contain different result. But the data contain hedge;  *mungkin, jika* and *ngomong-ngomong*. So, the authors took some data which the hedges. The data involve eight data. From the eight data, the type of hedge is propositional hedging and speech act hedging. The propositional hedging is represented by  *mungkin, jika* and *justru*. While the speech act hedging is represented by *Kayaknya, bisa dikatakan..bisa dikatakan tidak* and *ngomong-ngomong*. In the data, the function of hedge beside to show the speaker's uncertain utterance, the authors find out that there are three functions of hedge are to save the third person's face, to reject something in hedge  *mungkin* and to change the topic conversation in hedge *ngomong-ngomong*. In this paper, hedge as mitigation device is equal and there some is contradicted as the theory that mitigation device is to attenuate the strength of the speaker's utterance to achieve the speaker's goal. Hedge as mitigation device affects the perlocutionary act. The perlocutionary act which occurs in this paper is different from the theory whereas the interlocutor follows the speaker's utterance. He/she helps achieving the speaker's goal easier. In this paper, authors find out that in perlocutionary act, the interlocutor deny the speaker's utterance. He/she does not help achieving the speaker's goal.

THE EFFECT OF DIGITAL STORIES ON READING COMPREHENSION: AN  
INTERNET-BASED INSTRUCTION FOR IRANIAN EFL YOUNG LEARNERS

**ABSTRACT**

The purpose of this study was to measure up the impact of digital stories on reading comprehension among Iranian young learners through an internet-based instruction. The design of the study was based on experimental method through pre and post test procedure. Thus, 90 students ranging from 11 to 16 years old were selected to take a placement test based on their English course book "Family and Friends 3" and the young learners whose scores were one standard deviation above and one standard deviation below the mean were chosen. Finally 60 subjects (18 boys and 42 girl, mean age = 12.7 years) were randomly divided in to three groups, two experimental and one control group. They took a pre-test of reading comprehension based on 10 digital stories based on three different groups' instructions: 1) Internet-based with pre and post reading tasks, 2) Paper-based with the same pre and post reading tasks, 3) Conventional instruction group without any pre or post reading tasks. For the first group, 10 digital stories available at the site [WWW.learnenglishkids.britishcouncil.org](http://WWW.learnenglishkids.britishcouncil.org) were worked on in 10 sections, together with pre-reading and post-reading tasks. For the two other instructions the hard copy of the same 10 digital stories were used. Finally, an immediate post-test was conducted to measure the effect of instructions on reading comprehension immediately after the final section. Immediate post-test measured the learners' reading comprehension in the short-term recall. After two weeks, a delayed post-test was administered to assess the retention of the learners. Based on the results there was significant difference between the means of the three groups. Findings showed that the internet-based instruction of digital stories had the most effect on young EFL learners' reading comprehension. Moreover, it was found out that using pre and post work activities can also help to improve learners' reading comprehension.

**KEYWORDS:** Digital stories, reading comprehension, Internet-based instruction, EFL

**INTRODUCTION**

Technological advances, such as more powerful personal computers and internet, directly affect the way people live and people's literacy world in this information century (Mishan, 2005, p. 242). People, nowadays, tend to rely more on computer-based resources (such as writing emails, sending free e-cards, watching online video, reading online news, transmitting instant messages and photos by Yahoo or MSN messengers, exchanging information in online chat room or discussion area) than paper-based resources (such as writing letters, sending cards and postcards, reading newspapers, magazines, novels, and sending pictures by regular mails). Other affected areas by the advance of technology, particularly, include the education system (Gulek & Demirtas, 2005, p. 1).

Recent advances in computer technology and Internet have led to opportunities to teach and learn English through practical ways and authentic materials. Today, computer technology is integrated into almost every aspect of learning in higher education: virtual classes are hold, textbooks arrive with CD-ROMs; homework is delivered and graded on the World Wide Web (WWW); audio ESL (English as a Second Language) files are available on the net; assignments are designed to be completed collaboratively through electronic mail. There are also numerous websites (e.g., ESLPOD, My English Club, Ebaby) available for independent self study especially for young learners and beginners. These websites if appropriately selected and organized can be very useful to improve all skills and proficiency level in a joyful and interesting way. Today's students must be involved in both text and multimedia which can help them gain four skills ( i.e., listening, reading, writing and speaking), through understanding and creating by using their multisensory abilities. Many studies (e.g., Cope & Kalantzis, 2000) suggest that integration of technology can improve student's performance, enhance motivation, and promote learning. Digital sources, such as internet-based digital stories, allow young learners to develop creative presentations and participate in a playful context. In such contexts authentic language, its culture, linguistic and paralinguistic features such as body language, prosody, and gestures can be introduced in to the classroom.

The aim of this study is to improve Iranian young learners reading skill. In this regard, one of the crucial techniques of enhancing this is to use digital stories in an internet-based instruction which is associated with meaningful and playful context for young learners. Here we have three instructions of Internet-based, paper-based, and conventional to determine which instruction is more effective to teach reading.

**Computer-assisted Language Learning (CALL)**

CALL is very well-known and applicable nowadays and can be defined as learning language in formal or informal contexts through computer technology. In CALL, learners and teachers can be involved in different activities from communicating or writing in distance courses to carry out task or leaning structure and reading. It is comprised of the combination of learners, language, and context such as physical and temporal environment or other external influences, tools, and pedagogical activities or tasks. Peers, teachers, or other practitioners can influence this process. All these factors are important and crucial in conducting research on CALL. The number of researches and studies conducted on CALL has been increased due to the increase of computer use and availability nowadays, which leads to the lack of agreed-upon standards for CALL research. Thus, in CALL research, some factors and criteria should be called upon to reduce the faults affecting research outcomes, factors such as a good theoretical support, limitation on CALL such as having a valid design, describing both the benefits and limitations of computer use. The concept of environment or context in CALL can be quickly connected to the concept of authenticity. Lived and real life (RL) environments are something undeniable in cyber and internet-based instruction (IBI) learning in that these are good infinite resources of authentic materials (Cope & Kalantzis, 2000).

Teaching of reading has been a principle focus for many years. Based on Chastain (1988) the reading goal is to read for meaning or to recreate the writers' meaning, it involves comprehension which require a productive fashion

so as to determine meaning even when some of the words, endings, and patterns are not immediately meaningful. The students should control the speed at which they read, they should not be forced to receive and process language at a rate controlled by someone else (Chastain, 1988).

## REVIEW OF LITERATURE

### *Theoretical Background*

Using computer technology and Internet-based syllabus may be of great help in teaching young learners. Hayati (2005, p. 75-81) states in his article "Computer and Language Teaching", the benefits of using computers in language learning, for instance, improving intonation, grammar, structure, giving learners confidence and freedom, testing learners' knowledge, self-evaluation, more contact with language in different situations, problem solving activities toward authenticity and automaticity, etc.

Computer technology and Internet can be used by teachers and authorities as a practical and useful tools to improve learning, Chen, Belkade and Okamoto (2004, p. 47) in their article "How a Web-based Course Facilitates Acquisition of English for Academic Purposes", argue that technological innovations foster changes in SLA, facilitate computer-base learning activities, and encourage student autonomy, they are ultimately tools in the hands of course authors who must use them creatively to maximize the students' language learning experience and to increase their language acquisition for communicative purposes.

There are many literatures based on the potential of technology and using computer for language teaching and learning. Dunkel (1990), for example, mentioned the possibilities of computer technology as a tool include increasing language learners' (1) self esteem, (2) vocational preparedness, (3) language proficiency and (4) overall academic skills. Armstrong & Yetter-Vassot (1994) and many others explored the benefits of multimedia, the Internet, and various forms of distance education. Ehsani and Knodt (1998) emphasized the role of CALL programs, especially speech technology and voice-interactive CALL for improving learners' speaking skills. Computer technology in combination with a conferencing system was an effective tool for organizing a goal-directed writing and reading instructions.

Computer assisted language learning (CALL) in language education, which relates to the use of technology and specially computers in language teaching, is maturing and showing that can be a perfect and efficient tool in the hands of experienced teachers. CALL can offer solutions to the teaching and learning processes through different interactions. Learning would be fun and effortless and it can relatively alleviate the burden on the teachers' shoulders.

### *Internet-Based Instructions Vs Traditional Instructions*

Nowadays, many internet-based and online instructions and courses are in process and the number of students interested in such instructions is growing (Bryan & Hegelheimer, 2007). Even distance education has grown fast in recent years. Until now the benefits of using internet and online instruction was not known. On one hand, Clark (1985) maintained that media do not influence learning in any condition. On the other hand, Liu (2005, p. 61) debated that educational technologies influence learning by interacting with an individual's cognitive and social processes in constructing knowledge.

With online instruction, the student is separated from the teacher and connected through the use of a computer and the Internet. More and more institutions are offering online courses and/or programs to their students in order to meet various learners' needs. Online learning and instruction, as an integral part of the teaching and learning process in higher education, is growing as fast as the technology itself. On the other hand, conventional classroom instruction is face-to-face instruction, typically conducted in a classroom setting in a lecture/discussion/note taking mode.

Kearsley (1995) found that some benefits of online courses include increased student satisfaction, better examination scores, and a higher level of critical thinking. Other cited benefits of internet-based instruction are user-friendliness, self-paced learning and 24-hour access. With regard to information retention, Barth (1990) found that interactive multimedia computer lessons resulted in an 80 per cent retention rate, while lecture and associated visuals resulted in a mere 20 per cent retention rate in a sample of students. Other studies have found that computer-assisted instruction allows teachers to deliver the same material in a shorter period of time (Jain & Getis, 2003, p. 2)

The advancement of the Internet has created new ways of learning and teaching English as a second/foreign Language (ESL/EFL). For instance, the Internet can be considered as an ideal learning and teaching tool because it offers authentic learning resources available.

### *Reading Comprehension*

Chastain (1988, p. 216) in his book developing second language skills illustrated that reading is a receptive skill because the reader receives a message from the writer. Various writers also referred to reading as a decoding skill which considers language as a code which should be deciphered to arrive at the meaning of a message. Learners of the second language can probably learn to read more easily in compare with any other skill and also can use reading materials as a fundamental source of comprehensible input.

Chastain (1988, p. 217) inserts that the goal of reading is to read for meaning or to recreate the writer's meaning. By this definitions, reading for grammatical forms, study vocabulary or improve pronunciation is not reading at all, because reading involves comprehension. The process of the type that students may look up too many words in a laborious and painful effort to decipher the text should not be the type of reading in the mind of the teacher or students. Instead they have to learn to interact with the reading in a productive way so that be able to determine the meaning even when some of the words and patterns are not clear to them, and will be able to understand the writers' general meaning and use reading for enjoyment.

Two of the psychological, emotional, and cognitive benefits of reading skill are that students can control the speed at which they read and can also read in privacy which is an advantage for those students who are apprehensive about reading in front of their classmates. Chastain (1988, p. 218) also emphasized the importance of the relationship between reading and other skills. The teacher should not underestimate the relationship between sound and its written symbols. Without this knowledge students will not meet the objectives of a reading class with comprehensible input.

### *Experimental Background*

There are several empirical researches conducted on using stories in language teaching and learning. Ghasemi and Hajizadeh (2011, p.72) investigated teaching L2 reading comprehension through short stories, they concluded that the exposure of the students to literature as ESL material can ensure that they enjoy, understand and appreciate a life-like material while they are improving their linguistic proficiency.

Thus, it will be to the overall benefit of the ESL learners if the instructors promote the use of stories as a tool to introduce, accompany, and supplement tried and basal teaching techniques. The power and emotional impact found in a short story can offer the learners deeper meaning about the acquisition of language skills. Finally, short stories invite students to engage in a more active and informed discussion of their involvement with the text and their own personal experiences relevant to the world of the text.

Stories also can have a great effect on vocabulary learning. In a study conducted by Collins (2005), the effect of storybook reading on 70 ESL pre-school kids' vocabulary acquisition was investigated. The results showed that the treatment (i.e., explanation of new vocabulary) effected significant gains in ESL preschoolers' new vocabulary acquisition from storybook reading.

Žigárdyová (2006), in his thesis investigated the role of stories in English learning. He argues that Texts in pupils' textbooks are quite difficult to read. Pupils do not feel confident when reading some texts and exercises. Some of them can read fluently but the rest of the class needs practice. Story brings many interesting opportunities for reading and in addition it is a good way to improve the pupils' interest.

In another study by Yoon (2012) on sixty two Korean elementary students, he explored the effects of an e-book reading on the following aspects: 1) vocabulary increase over the experiment period, and 2) the changes of affective factors on learning English through an e-book. The results showed that with an e-book reading, vocabulary knowledge, motivation, and interest on reading and English learning have been remarkably increased. In addition to four skills, Digital stories through their multisensory effects can bridge the gap between two cultures and may have higher thinking benefits. The combination of animation pictures, sound, music, rhyme, and narration can help learners to understand the meaning in a faster way.

## **RESEARCH QUESTIONS**

The main questions to be investigated in this study are:

- (1) Do Internet-based instructions of digital stories improve Iranian young EFL learners' reading comprehension?
- (2) Is there any difference between students' reading comprehension proficiency in conventional, paper-based, and internet-based instructions?

## **METHODOLOGY**

### ***Participants***

The study is conducted at Pooyandegan institute in Abadan. 90 students ranging from the age 11 to 16 took a placement test based on their course book "Family and Friends 3" written by Tamzin Thompson and Naomi Simmons (2010). This test contained 60 questions including multiple choice, short answer, and true-faults. The learners whose scores were one standard deviation above and one standard deviation below the mean were chosen as the participants of the study. The reliability coefficient of the proficiency-test in this research was calculated by Kuder-Richardson formula (KR-21). The reliability coefficient for the test was 0.76. Finally, 60 subjects (14 boys and 48 girls, mean age= 12.7 years) were divided randomly into three groups for participating in three different groups of conventional, paper-based, and internet-based-based instruction to be taught reading through digital stories.

### ***Instrumentation***

#### ***Proficiency Test***

90 students ranging from the age 11 to 16 took a placement test based on their course book "Family and Friends 3" written by Tamzin Thompson and Naomi Simmons (2010). This test contained 60 questions including multiple choice, short answer, and true- faults. The reliability coefficient for the proficiency test was 0.76.

#### ***Pre-test***

The next instrument was a pre-test of reading comprehension including 10 digital stories to measure the participants' reading comprehension skill before the instructions (Appendix C). The pre-test contained 50 items and was organized around three types of items: true and false, multiple choice, and short answer questions (Heaton, 1990). The reliability coefficient of the pre-test calculated by Kuder-Richardson formula (KR-21) was 0.78.

#### ***Post-test***

Finally, an immediate post-test was used to determine the effects of treatment period and the result of the two other instructions. The immediate post-test also contained 50 items based on 10 digital stories. The reliability coefficients of the test calculated through KR-21 formula was 0.77.

### ***Procedure***

To make a homogenous group, the learners took a placement test of their course book "Family and Friends 3". The test took 30 minutes, then the scores were obtained and average mean of the scores were calculated. The subjects whose scores were one standard above and one standard below the mean were divided into three groups for three different conventional, paper-based, and internet-based instructions. The number of subjects in each group was 20. The whole research project took place in 12 weeks. The reading classes were carried out once a week in one and half hour classes. It is worth to mention that the instructor for all three instructions was the same to prevent any interference of different teaching methods, pronunciation, accent, motivation, etc.

The participants in the internet-based instruction group met with the researcher in the first week at a computer lab, where in the first session, each was asked few questions about their background knowledge of synchronous CALL program and working with internet. The purpose of the interview was to provide data concerning participants' use of computer for the purpose of language learning.

At the beginning of each section in the computer site, the instructor started the class with some pre-reading activities, such as simple questions related to the topic of the story and new vocabularies, and tried to elicit some words from the students and write them on the board. After that the name of the story was announced and the students were asked to find it at the site and listen to it as much as they want in the time limit of 35 minutes. The students were supposed to write down each and every word that they understand clearly or have problems to find the meaning. After all the students finished their listening, the instructor asked some related questions about the story and check students' comprehension of the new vocabulary, story, and also answered their questions, if any. Then the printed form of the story

was given to the students and they started to read the story voluntarily to check their pronunciation. Finally, after all the students finished reading the story aloud, a printed paper of the activity worksheet presented at the site was given to students for checking their comprehension and also their writing skill.

In the paper-based instruction class, the same pre and post reading tasks such as question and answer or volunteering reading were applied but there was no computer and internet access, instead the students were given just the printed form of the same digital story and activity worksheet and the same pre and post reading activities were applied.

In the conventional reading class which is the control group, the students were given the printed text of the same 10 digital stories. There were no pre and post work and the teacher's role is to read and translate the story and answer students' questions. Finally the students had to read the story aloud. The time of the two instructions was the same, one and half an hour, and also volunteering reading was applied. Finally, each group was given a post test based on 10 digital stories. The post-test contained different reading comprehension questions such as questions with short yes/no answers, true and false, and multiple-choice. Then obtained scores were compared to see which group had more progress in reading comprehension. In order to determine whether or not the three groups differed, One way- ANOVA was conducted. Because the F value was significant a post-hoc analysis was used. Two weeks later after the end of the course and without prior knowledge of the students, the instructor administers the delayed post-test. The sudden, without notice presence of the instructor in the class was to test the reading comprehension to see the real effect of the treatment and also retention. Obviously as far as long-term retention is concerned in this study, we adopted the definition provided by Laufer (2007). She asserts that "some people administer a test a week or two later, some a month or even three months, some people repeat measurement several times to check how much learners retain in different points of time" (p.30). The only difference of this delayed test from the immediate post-test was that the items were changed to wipe out the probable recall of immediate test answers.

## RESULTS

### *Results of Three Groups' Pre-test*

At the beginning of the study, three groups were given a pre-test which their statistical data is presented in Table 1.

*Table 1: Groups' Descriptive Statistics in Pre-test Scores*

95% Confidence Interval for Mean								
Groups	N	Mean	Std.Deviation	Std.Error	Lower Bound	Upper Bound	Minimum	Maximum
1. Control	20	9.0000	4.58838	1.02598	6.8526	11.1474	3.00	20.00
2. Paper-based	20	8.9000	4.58717	1.02572	6.7531	11.0469	3.00	20.00
3. Internet-based	20	8.6500	4.15838	.92984	6.7038	10.5962	3.00	21.00
Total	60	8.8500	4.37568	.56490	7.7196	9.9804	3.00	21.00

As can be seen in Table 1, the number of the students in three groups is 20. Initially, each student's pre-test score on the proficiency test was obtained. Then descriptive statistics of mean and standard deviation of each groups, were calculated. Results indicated that the average means for every three groups was 8.8500 and the difference among the three groups' was not significant. Regarding the standard deviation (SD), it was found out that the SD of conventional instruction in control group was 4.588, a bit higher than other two groups, and SD of the internet-based instruction group was 4.158 as the lowest comparing to the other two groups.

In order to find out whether the difference among the performances of the three groups was statistically significant, One- way ANOVA for the three groups was applied, and the results of the test were interpreted from two points: Level of significance and F-ratio. Table 4.2., displays the results of the statistical operations.

*Table 2: One-way ANOVA (Pre-test)*

	Sum of Squares	df	Mean Square	F	Sig
Between Groups	1.300	2	.650	.033	.968
Within Groups	1128.350	57	19.796		
Total	1129.650	59			

Table 2, indicates the statistical analysis of One-way ANOVA on the three groups' pre-test scores. Results of the pre-test on the subject's scores did not reject the null hypothesis at ( $p < .968$ ) level of significance which indicated that the difference among the means was not significant, because of the fact that the probability level chosen for rejecting the null hypothesis of no difference was  $\alpha = .05$ , so that the null hypothesis was not rejected if the amount of signification was lower than 0.05. By dividing the between-group variance by the within-group variance and finding the ratio between them, we found the probability that the ratio we obtained would recur if the experiment were repeated an infinite number of times with three sample groups on the same participants or any other experimental groups under the same conditions (Hatch & Farhady, 1981, p. 132). The critical F was (19.47) while the observed F was (0.033); therefore, the observed ratio was not large enough to convince the researcher that the mean difference was significant. On the other hand, in Table 2, the amount of observed F (0.033) for the three groups was lower than Critical F (19.47) suggesting that the difference between three group's mean was not significant. This showed that the groups were homogenous before the research period at the pre-test level.

### Results of the Three Groups' Post-test

The descriptive statistics for the three groups on the post-test are presented in Table 4.5.

Table 3: Groups' Descriptive Statistics in Immediate Post-test

Groups	N	Mean	95% Confidence Interval for Mean				Minimum	Maximum
			Std.Deviation	Std.Error	Lower Bound	Upper Bound		
Conventional	20	32.9000	5.24053	1.17182	30.4474	35.3526	25.00	42.00
Paper-based	20	37.3000	6.05327	1.35355	34.4670	40.1330	25.00	48.00
Internet-based	20	46.4000	3.06766	.68595	44.9643	47.8357	39.00	50.00
Total	60	38.8667	47.47077	.96447	36.9368	40.7966	25.00	50.00

It can be seen in Table 3, that the mean in the internet-based group differs significantly from two other groups, and also the mean for paper-based instruction group shows difference to some degree from conventional group. The mean for internet-based, paper-based, and conventional instruction groups were 46.4, 37.3, and 32.9 respectively. To describe the statistical significance of the three groups' mean, One-way ANOVA was applied, and the results of the test were interpreted from two points: Level of significance and F-ratio. The results of the statistical operations are analyzed in Table 4.

Table 4: One-way ANOVA (Immediate Post-test)

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	1896.133	2	948.067	38.688	.000
Within Groups	1396.800	57	24.505		
Total	3292.933	59			

Based on Table 3, the results of the immediate post-test on the subject's scores rejected the null hypothesis at ( $p < .000$ ) level of significance which shows that the differences among the means were significant. The amount of observed F (38.688) for the three groups was higher than Critical F (19.47) suggesting that the difference between the three group's mean was significant. Since the probability level for rejecting the null hypothesis was smaller than  $\alpha = 0.05$ , therefore the null hypothesis was rejected. To clarify which group outperformed other groups in the post-test, the Post-hoc Scheffe test was conducted to compare the specific mean effectiveness among the three groups. Data are illustrated in Table 5.

Table 5: Post-Hoc Scheffe Tests, Multiple Comparisons (Immediate Post-test)

(I) Groups	(J) Groups	Mean Difference (I-J)	95% Confidence Interval			
			Std. Error	Sig.	Lower Bound	Upper Bound
Conventional	Paper-based	-4.40000 *	1.56542	.025	-8.3347	-.4653
	Internet-based	-13.50000 *	1.56542	.000	-17.4347	-9.5653
Paper-based	Conventional	4.40000 *	1.56542	.025	.4653	8.3347
	Internet-based	-9.10000 *	1.56542	.000	-13.0347	-5.1653
Internet-based	Conventional	13.50000 *	1.56542	.000	9.5653	17.4347
	Paper-based	9.10000 *	1.56542	.000	5.1653	13.0347

\*. The mean difference is significant at the 0.05 level.

It can be inferred from Table 5, that conventional instruction group is significantly different from paper-based instruction group ( $p < 0.025$ ) and internet-based instruction ( $p < 0.000$ ). Also the Paper-based instruction group shows difference in compare to two other conventional and internet-based instruction groups with significance of 0.025 and 0.00 respectively. Also in the third row internet-based instruction group shows great difference from conventional and paper-based groups with the significance level of 0.000. The differences among the three groups were significant but it cannot be understood from the table that which groups gained more significant difference toward others. The results of post hoc Scheffe are shown in three columns showed with numbers one to three. It can be inferred that three groups of conventional, paper-based, and internet-based instructions show great difference in compare to each other. But internet-based instruction group shows the greatest difference (46.4000) in compare to two other groups and it shows that the internet-based instruction had the most influence on the results of reading comprehension post-test and learners' scores.

### Discussion

Results of pre-test and post-test stages showed an improvement in overall learners' reading comprehension skill through instructions and strategies used during this study. However, the most important issue is the usefulness of both internet-based instruction and pre and post reading activities in order to obtain better results. Thus, the results will be discussed concerned with the two research questions.

#### 1. Does Internet-based instruction of digital stories improve Iranian young EFL learners' reading comprehension?

After analyzing data, the results showed that there was not a significance difference among students' performance in pre-test, but in contrast there was a significant difference among the performances of the three groups in post-test (see Table 4, 6). Also it could be observed that students who received the internet-based instruction got better marks and their performance was better than the group who received paper-based or conventional instruction. By looking at the groups' means in Table 4.8, the result of post-hoc Scheffe test revealed that internet-based instruction group had the greatest improvement in their reading comprehension post test. Based on the post test results and data, the scores obtained from internet-based instruction group were also much better in compare to other groups. It can be understood that the learners of the internet-based group after two weeks outperformed the two other groups. Therefore, the first research null hypothesis is rejected ( $p < 0.05$ ). The reasons behind this result could be discussed in terms of the effectiveness of digital stories in developing learners' reading comprehension.

Pre-reading and post-reading tasks also may be of great help in the internet-based instruction and learners' improvement in reading comprehension. Chatwrote (2003 cited in Thangyon & Chiramanee, 2011) suggested that the teachers could provide reading promoting activities, such as the activities that interest the learners. The activities should contain the reading objectives that suit the learners and teacher's interest. The teachers should provide the learners with various pre-reading activities that help them have certain amount of background knowledge about the reading text because the schema would help the reader get better comprehension (Graves, Watts & Graves, 1994).

The results of this study are compatible and in line with previous studies conducted by Busch (2003), Verdugo and Belmonte (2007), and Ghasemi and Hajizadeh (2011). Regarding the results of the delayed post-test, which showed that the digital stories may have better effect on memory and retention, the present study is compatible with the study conducted by Barth (1990) who found that interactive multimedia computer lessons resulted in an 80 percent retention rate.

## *2. Is there any difference between students' reading comprehension proficiency in conventional, paper-based, and internet-based instructions?*

Based on the result section, there are significant differences between the three groups. The results of immediate and delayed post test may show the difference between the three groups in case of recall and retention. The group of paper-based instruction outperformed the group of conventional instruction. It shows that the application of pre and post reading tasks might be of great help in approving the learners' reading comprehension. By comparing the delayed pos-test scores of the two groups of paper-based and conventional instructions it can be inferred that the difference may be due to the pre-reading and post-reading tasks applied by the teacher in the reading classes. These activities may cause better retention in case of reading comprehension. The lower scores of the conventional instruction group may be due to the teacher-centeredness of the instruction that may make the students bore. Also there is a great difference between paper-based instruction and internet-based instruction which shows the positive effect of digital stories on the learners' reading comprehension. The results of the descriptive statistics show that, after the post-test, the mean for internet-based, paper-based, and conventional instruction groups were different. These results might show at the application of the both pre and post reading tasks may impact and improve the learners' reading comprehension in the two instructions of digital story and paper-based in which pre-reading and post-reading activities was used. These findings are compatible and in line with the study conducted by Thongyon and Chiramanee (2011) which showed the positive effect of pre-reading tasks such as introducing new vocabulary, pre –reading questioning, or volunteering reading on the reading comprehension. It is also in line with Grave's (1983) study in which he compared the score of students who received previews in reading with those who had not any reading previews. The results showed that the first group's scores were 13 to 120 percent higher than the second group's score.

Therefore, based on the results of One-way ANOVA and the answer to the second research question above, the second null hypothesis was also rejected. There was not a significant difference between conventional, paper-based, and internet-based instructions concerned with improving reading comprehension.

## **CONCLUSION**

This study began with the assumption that applying digital story instruction could enhance the young EFL learners' reading comprehension. The three groups were taught reading comprehension through three methods of instruction .The participants had a course of English by the book "*Family & Friends 3*" simultaneously. The instructor explored to see if the application of digital stories and pre-reading and post-reading tasks have any effect on the Iranian young EFL learners or to investigate the effect of each approach.

Having administered the posttest and analyzing the data through specific statistical analysis of One way ANOVA, the results indicated that the instruction of using digital stories did affect the learners' reading comprehension the most. The results also showed that applying the pre and post reading tasks may improve the learners reading comprehension. On the basis of the results of the present study, the following conclusions may be made:

- a. CALL generally and synchronous digital stories specifically may influence EFL learners' reading comprehension skill.
- b. Exposure to language materials through synchronous approach is an influential factor for EFL learners.
- c. The online instruction of digital stories does have more significant impact on the learners' reading comprehension skill than conventional or paper-based instruction.
- d. In the internet-based instruction of digital stories, the learners listen and analyze the story independently and freely and thus comprehend it better.
- e. In digital stories instruction, pre-reading activities such as new vocabulary explanation, questioning can influence learners' reading comprehension ability.
- f. In digital stories instruction, post-reading tasks such as questioning and volunteering reading improve reading comprehension.
- g. Paper-based instructions, associated with pre and post reading tasks, in compare to conventional instructions have more positive impact on learners reading comprehension.
- h. conventional instruction which was based on reading and translating can also affect reading comprehension but its effect is much less than paper-based or internet-based instructions.

The following suggestions are drawn based on the limitations of the study. They may be applied in future researches. They are as follow:

1. As the study was only conducted at an institute, more research is needed in similar situations to support the findings and to find more about the effect of internet-based instruction of digital stories on Iranian young EFL students. It can also be applied at the schools or university for different range of ages.
2. This study was conducted to measure the improvement of reading comprehension ability. Future researches can be done regarding the effect of digital stories on other skills such as writing, listening or speaking.
3. The internet-based instruction in this study as associated with some limited pre and post reading activities. In future researches, other useful reading strategies and tasks such as note taking, or skimming and scanning can be examined.
4. In the present study, just the synchronous way of instruction in case of digital stories was used. Future research can cover asynchronous way of applying stories as the material of reading.
5. There are different websites containing effective digital story resources. Regarding learners' age and level of proficiency, other websites can be used instead of the "British Council" website used in this study.
6. Instead of using digital stories other kinds of literature such as songs, poem and novels or other kind of podcasts, videos, clips, or mp3 files can be used in future researches.

7. This study was an attempt to compare internet-based instruction to two other instructions (paper-based and conventional); other different kind of instructions can be compared to digital stories in future researches.

### ABSTRACT

Many factors (internal and external) are claimed to influence students' reading comprehension test performance. Among such factors one can refer to breadth of vocabulary knowledge which is classified as an internal reader variable. In addition to the limited literature, the existence of contradictory results highlights the necessity to conduct a survey with different participants and at a different setting. As a result, this research targets at finding the extent to which this factor influences English as a foreign language (EFL) learners' reading comprehension (RC) test performance. A total of 207 students (102 males and 105 females) participated in this study. They took an RC test from TOEFL: test of English as a foreign language and a vocabulary size test. The analysis of the gathered data was then conducted through running simple linear regressions. The results revealed that breadth of vocabulary knowledge is an influential factor in RC test performance and can be used to predict EFL learners' reading ability. These findings have implications for language instructors, EFL students, and curriculum organizers.

**KEYWORDS:** breadth of vocabulary knowledge, reading comprehension, influence

### INTRODUCTION

Reading is a composite of many abilities. It is an interactive process between the reader and the text resulting in comprehension which is its principal point (Carmine et al., 1997). The reader needs to be armed with a wide range of abilities in order to comprehend the reading material and to solve the possible ambiguities. Among the factors affecting reading comprehension one can refer to breadth of vocabulary knowledge. Although vocabulary knowledge can be divided into a good deal of aspects in knowing a word, some lexical researchers (Grave, 1986; Lessard-Clouston, 2006; Qian, 1999, 2002; Read, 2004) divided it into two main dimensions: breadth and depth. Breadth of vocabulary knowledge is the longitudinal dimension of vocabulary knowledge, which refers to "the size of vocabulary or the number of words the meaning of which one has at least some superficial knowledge" (Qian, 2002, p. 515). It is a dimension defined by how many words have meaning for the individual (Anderson & Freebody, 1981). On the other hand, depth of vocabulary knowledge is viewed as the latitudinal dimension which includes all word characteristics such as phonemic, graphemic, morphemic, syntactic, semantic, and collocation properties and refers to the richness of knowledge that the individual possesses about the words that are known.

### LITERATURE REVIEW

Nowadays, many reading teachers concede that when their students encounter an unfamiliar text in the foreign language, the first challenge seems to be its vocabulary (Grabe & Stoller, 2002). Lack of sufficient word understanding has been frequently stated as one of the major barriers to content comprehension in ESL/EFL reading. Indeed, Bernhardt (2005), Grabe and Stoller (2002), Nassaji (2003), and Segalowitz et al. (1991) claimed that the main difference between skilled and less skilled readers lies in slower and inefficient lexical access and semantic processing. Nassaji (2004) believes that one type of knowledge source that is intensively related to the learner's ability to read texts is vocabulary knowledge. Students with high levels of vocabulary knowledge will be able to decode and understand the reading passage better than students with low levels of vocabulary (Nation, Clarke, Marshall, & Durand, 2004). Zhang and Annual (2008) maintained that comprehension decreases whenever a text contains words that are beyond the learners' level of understanding, no matter how much the text is cohesive or how much background knowledge the students have. The more vocabulary students know, the better they can decode and understand what they read (Qian, 2002). This implies that having vocabulary knowledge could increase the overall performance of a reading comprehension test.

Anderson and Freebody (1981) have three hypotheses which interpret the relationship between the vocabulary knowledge and reading comprehension. These three hypotheses are: instrumental, general aptitude, and general knowledge hypothesis. The instrumental hypothesis suggests that vocabulary is the critical factor for text comprehension and that there exists a cause-effect relationship between them. The more word meanings the reader knows, the more easily he/she understands the text. General aptitude hypothesis states that vocabulary knowledge is the orientation of the general language ability, and the general language ability is the decisive factor on reading comprehension. Last but not least, General knowledge hypothesis confirms that vocabulary knowledge is one of the sources of the general knowledge which is fundamental for comprehension.

Obviously, researchers tend to agree that vocabulary knowledge is a major prerequisite and causal factor in comprehension and that there is a relationship between vocabulary size and reading comprehension. Some studies have used vocabulary size as a predictor variable for reading comprehension (Hu & Nation, 2000; Laufer 1992, 1997; Liu & Nation, 1985). Moreover, research on the role of decoding and vocabulary skills, as predictors of reading comprehension in young L1 and L2 language learners, proved that vocabulary is a critical predictor of the development of reading comprehension skills in both L1 and L2 learners (Lervåg & Aukrust, 2010). Empirical studies on the relationship between vocabulary size and L2 reading comprehension have consistently shown a strong correlation between them ranging from 0.50 to 0.85 (Laufer, 1992; Stæhr, 2008).

To understand text meaning, one must be able to decode the printed message (Adams, 2004; Alderson, 2000; Day & Bamford, 1998); however, the presence of high density of unknown words in a text may seriously hinder comprehension (Curtis, 1987; Nation, 2001). Laufer (1998) and Qian (1999, 2002, 2004) revealed that lexical issues prevent successful comprehension and that vocabulary familiarity correlates strongly with other linguistic skills in the target language. To estimate how many words the learners know in their L2 vocabulary, breadth/size tests have been developed and researchers have found that breadth test of vocabulary knowledge can very well predict success in reading, writing, general proficiency, and academic achievement (Laufer & Goldstein, 2004; Nation & Meara, 2002). A number of studies (e.g., Al-Nujaid, 2003, as cited in Alsamadani, 2011; Koda, 1989; Laufer, 1992, 1996; Qian, 1999) have used scores on vocabulary size to predict levels of academic reading comprehension. Al-Nujaid (2003 as cited in Alsamadani, 2011), for example, found that there is a strong and significant relationship between vocabulary size and comprehension level. In fact, the relation of breadth of vocabulary knowledge with reading comprehension is recently paid much attention and viewed as a striking point by numerous ESL/EFL lexical and reading researchers who believe that the more words the EFL/ESL readers know, the better their reading (e.g. Huang, 2001, 2004; Hu & Nation, 2000).

#### OBJECTIVES OF THE STUDY AND THE RESEARCH QUESTIONS

Taking a look at the studies available in the literature, one can come to the conclusion that the area of reading comprehension still requires further research, especially in EFL contexts. The main objective of the present study is to examine the effect of breadth of vocabulary knowledge as an internal or according to Samuels (1983) "inside- the-head" factor on reading comprehension test performance of Iranian EFL learners. The present research also endeavors to discover the difference between male and female Iranian EFL learners regarding the extent to which their RC test performance is influenced by the selected internal factor. Therefore, the present study seeks to answer the following questions:

1. To what extent does breadth of vocabulary knowledge influence students' RC test performance?
2. Is there any significant difference between Iranian male and female EFL learners regarding the extent to which their RC test performance is influenced by the selected internal factor? (Does any gender influence exist?)

#### METHODOLOGY

##### *Participants*

A total of 207 students (102 males and 105 females) participated in this study. They were Iranian EFL learners comprising students of an upper intermediate level at a private language institute (Navid English Institute, Shiraz branch). All students were native speakers of Persian, with the average age of 20 who had been studying English for almost 10 semesters.

##### *Instruments*

Two instruments were utilized in this study. The first one was the revised version of nation's 3000 vocabulary Level Test (VLT) (Schmitt, Schmitt, & Clapham, 2001), which was used to assess breath of vocabulary knowledge of the students. The vocabulary size test (VST), called the Vocabulary Levels Test (VLT), was originally designed by Nation (1983, 1990) and used to measure learner's size of vocabulary knowledge. Nation (2001) referred to the revised version as a major improvement on the original test made by Schmitt *et al.* (2001). Each level of the test includes 30 word-definition matching items and a total of 60 target words are used for testing; ten groups of six words on the left and three definitions on the right make up the test. Test-takers are required to match the words to the definitions.

The following example illustrates the test format of a noun cluster (Schmitt *et al.* 2001, p. 82):

1. business \_\_\_\_\_
2. clock \_\_\_\_\_ part of a house
3. horse \_\_\_\_\_ animal with four legs
4. pencil \_\_\_\_\_ something used for writing
5. shoe \_\_\_\_\_
6. wall \_\_\_\_\_

The second instrument was a reading comprehension test drawn from the TOEFL Actual Tests (2005, pp. 25-35) employed to assess the students' reading comprehension test performance. It was a standardized reading comprehension test composed of five passages. Regarding the validity and reliability of the test, as an established standardized language test, all of the official TOEFL tests have been carefully pretested for validity and reliability before being put into actual use.

##### *Procedure*

To neutralize the influence of the RC test, all students first took the vocabulary test and then the reading comprehension test. The tests took 20 and 55 minutes respectively. To carry out the statistical analysis, Statistical Package for Social Sciences (SPSS), version 21.0 was used. Scores gathered through selected instruments were calculated and arranged in different columns. Along with showing students' gender and age in the first two columns there were columns for each student showing his/her score in reading comprehension and breadth of vocabulary knowledge. The analysis of the data was then carried out through running simple linear regressions.

#### DATA ANALYSIS AND RESULTS

##### *Breadth of Vocabulary Knowledge vs. RC Test Performance*

The first aim of this study was to investigate the extent to which the students' breadth of vocabulary knowledge influences their RC test performance. To this end, a simple linear regression analysis was carried out. The hypotheses under investigation in this phase of research were as follows:

- $H_0: \beta_1 = 0$  (The independent variable does not affect the dependent one.)  
 $H_1: \beta_1 \neq 0$  (The independent variable affects the dependent one.)

Before conducting the analyses, the outliers were checked through Cook's and Leverage values and they were deleted from the data. Then normal distribution of the dependent variable (RC score) was assured through one-sample kolmogorov-smirnov test (Table 1, sig. = .09 >  $\alpha$  = .05).

Table 1: kolmogorov-smirnov test

		RC score
N		207
Normal Parameters <sup>a,b</sup>	Mean	25.77
	Std. Deviation	7.250
	Absolute	.086
Most Extreme Differences	Positive	.086
	Negative	-.048
Kolmogorov-Smirnov Z		1.241
Asymp. Sig. (2-tailed)		.092

The regression analysis was then run and the results (Table 2) show that regression line and the independent variable account for 33 percent of the variance in RC test scores ( $R^2=.33$ ).

Table 2: Model Summary<sup>b</sup> of regression analysis

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.579 <sup>a</sup>	.335	.332	5.925

a. Predictors: (Constant), vlt

b. Dependent Variable: RC score

Table 3 provides evidence for the significance of the results ( $\text{sig.} = .00 < \alpha = .05$ )

Table 3: ANOVA<sup>a</sup> (Significance of the regression results)

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	3629.948	1	3629.948	103.397	.000 <sup>b</sup>
	Residual	7196.922	205	35.107		
	Total	10826.870	206			

a. Dependent Variable: RC score

b. Predictors: (Constant), vlt

The results indicated that the null hypothesis was rejected and the alternative one (The independent variable affects the dependent one) was confirmed. Moreover, the following linear equation was proved to help predict the value of the dependent variable, RC test performance (Table 4, Figure 1)

RC test performance =  $3.82 + .92 * \text{vlt grade}$

Table 4: Coefficient<sup>a</sup> of the selected internal factor

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	3.822	2.197		1.739	.083
	Vlt grade	.919	.090	.579	10.168	.000

a. Dependent Variable: RC score

Figure 1: regression line and linear equation

#### Breadth of Vocabulary Knowledge and RC Test Performance in males vs. females

To investigate the relative influence of the selected internal factor on RC test performance of males versus females, the SPSS file was first split based on the participants' gender and then a simple linear regression was carried out.

According to the results of the regression analysis (Table 5), regression line and the independent variable accounted for 37 percent ( $R^2=.37$ ) of the variance in RC test scores in the male group, and 30 percent ( $R^2=.299$ ) of the variance in RC test scores in the female group.

Table 5: Model Summary of regression analysis

gender	Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
male	1	.613 <sup>a</sup>	.376	.369	5.246
female	1	.547 <sup>a</sup>	.299	.292	6.563

a. Predictors: (Constant), vlt

Table 6 provides evidence for the significance of the results ( $\text{sig.} = .00 < \alpha = .05$ ).

Table 6: ANOVA<sup>a</sup> (Significance of the regression results for males and females)

gender	Model		Sum of Squares	df	Mean Square	F	Sig.
male	1	Regression	1655.115	1	1655.115	60.142	.000 <sup>b</sup>
		Residual	2752.032	100	27.520		
		Total	4407.147	101			
female	1	Regression	1892.336	1	1892.336	43.935	.000 <sup>b</sup>
		Residual	4436.293	103	43.071		
		Total	6328.629	104			

a. Dependent Variable: RC score

b. Predictors: (Constant), vlt

As Table 7 indicates, the following linear equation can help predict the value of the dependent variable, RC test performance, in each group:

Males: RC test performance= 2.62+ .96\* vlt score

Females: RC test performance= 4.46+ .9\* vlt score

Table 7: Coefficients<sup>a</sup> of the selected internal factor for males and females

Model			Unstandardized Coefficients		Standardized Coefficients	t	Sig.
			B	Std. Error	Beta		
male	1	(Constant)	2.617	3.116		.840	.403
		vlt	.962	.124	.613	7.755	.000
female	1	(Constant)	4.458	3.181		1.401	.164
		vlt	.897	.135	.547	6.628	.000

a. Dependent Variable: RC score

Overall, the results of the linear regression (Table 5) indicate that there is difference between Iranian male and female EFL learners regarding the extent to which their RC test performance is influenced by their breadth of vocabulary knowledge (Figures 2 & 3).

Figure 2: regression line and linear equation for males

Figure 3: regression line and linear equation for females

### Discussion

The results of the present study lend support to many researchers. Alderson (2000), Qian (2004), and Read (2000), for instance, underscored the prominent role of vocabulary knowledge in reading comprehension. Bernhardt (2005), Fukkink *et al.* (2005), Koda (2005), and Zhang (2000, 2002a, 2002b) have also consistently indicated the importance of vocabulary knowledge in reading comprehension. Moreover, Read (2000), and Nation (2001) argued for the claim of significant function of breadth/size of vocabulary in reading comprehension.

In addition, the findings seem to be in compliance with Anderson and Freebody's (1981) general knowledge hypothesis according to which vocabulary knowledge is one of the sources of the general knowledge which is fundamental for comprehension. In this regard, Nation, Clarke, Marshall, and Durand (2004) also stated that students with high levels of vocabulary knowledge will be able to decode and understand the reading passages better than students with low levels of vocabulary. The findings are also in line with that of Joshi and Aaron (2000) who found that vocabulary knowledge is a predictor of reading ability. It is also supported by Hu and Nation (2000), Laufer (1992, 1997), and Liu and Nation (1985), who found that vocabulary size is a predictor variable for reading comprehension.

### CONCLUSIONS

The present study aimed at examining the effect of breadth of vocabulary knowledge as an internal factor on reading comprehension test performance of Iranian EFL learners. The results of linear regression analysis revealed that EFL learners' breadth of vocabulary knowledge influences their reading comprehension test performance to a considerable extent. Moreover, a linear equation was proved to help predict their RC test performance on the basis of their vocabulary test grade. It was also confirmed that the influence of breadth of vocabulary knowledge on RC test performance is more significant in males compared with females. These results will inform language instructors, EFL students, and curriculum organizers of the significance of vocabulary breadth in reading comprehension. Many EFL students approach reading passively, relying heavily on the bilingual dictionaries and spending long hours laboring over sentence-by-sentence translations. In spite of all the efforts they see no improvement in their reading comprehension. Moreover, according to several experimental studies (Alexander, 1998; Kaivanpanah & Alavi, 2008a; Nassaji, 2003), in reality, inferring word meanings from context is not reliable for EFL students, since the success rate of this strategy is not as high as we anticipate and the word meanings the EFL/ESL learners infer are often incorrect, misinterpreting or too general. Therefore, students' vocabulary assessment and instruction should be a focus of every English course. Vocabulary teaching should be regarded as a priority in the curriculum. In addition, although vocabulary instruction is very common in foreign language classrooms in Iran, most textbooks in English only provide explicit instruction of relatively basic English vocabularies. It is necessary for teachers to find ways to increase the student's vocabulary knowledge. For example, the teacher can encourage students to do extensive reading beyond the classroom requirements. When students do extensive readings, they will be able to build new vocabulary. However, vocabulary knowledge is just one of the factors that should be emphasized. Investigating all different factors in a single study is not feasible. As a result, this study focused on the role that one of many internal factors plays in reading comprehension. More research is needed to examine how other factors influence RC test performance of Iranians as well as other EFL learners.

**ABSTRACT**

This research was done at a non-profit school in Masjed-e-Soleyman (MIS) city in Iran. The aim of this research was to find the effect of using computer-assisted language learning (CALL) approach on the learners' recall and retention at the elementary level. In order to have homogeneous participants, the researcher used Nelson proficiency test (Fowler & Coe, 1976). 50 participants whose scores fell one standard deviation below the mean were chosen to take part in the research. The null hypotheses were proposed: CALL would not improve learners' recall and retention and there would be no significant difference between the mean scores of the students who were instructed traditionally and those who were instructed based on CALL regarding the recall and retention of vocabulary learning. The chosen participants were divided randomly into two groups of 25 students, one control, and one experimental group. Three sets of tests were designed by the researcher as the pre-test, immediate, and delayed post-test. Learners were taught ten units of Picture Dictionary (Nakata, Frazier & Hoskins, 2011) during ten sessions of treatment. Two groups took a post-test immediately after the treatment and a delayed post-test after a two-week interval. Paired samples t-test and independent samples t-test were used to compare the groups' means. The findings revealed that control group was good only at the recall of vocabulary items and the experimental group was good not only at recall but also at retention of vocabulary items.

**KEYWORDS:** Computer assisted language learning (CALL), context-based instruction Lexical Items

**INTRODUCTION**

The importance of learning English as a foreign language (EFL) cannot be overlooked. While many people have engaged in teaching and learning English and used different methods and instruments, they have needed to optimize the use of available resources to help the learners to become more proficient and fluent in using English. One of them is Computer Assisted Language Learning (CALL) which has, in particular, been used in pedagogy more frequently since 1960s (Levy, 1997). It has rapidly been spread through the world and used in all aspects of teaching. Nowadays, there are a lot of software and programs in teaching a foreign language. Some focus on one aspect of language learning such as Babylon dictionary that focus only on vocabulary, while others are more comprehensive like Longman Dictionary of Contemporary English (5<sup>th</sup> ed.), helps learners to develop not only their vocabularies but also their pronunciation. It provides some examples of vocabulary use, the origin of the vocabulary and its family. Nowadays, Language teachers have been taking advantages of CALL to teach a foreign language totally or its components such as teaching grammar, pronunciation, or vocabulary individually.

Learners used CALL to remember the vocabularies easier and faster. In a recent research, Jones (2004) examined the performance of the experimental group that was provided written forms and pictures when they heard the words with a group not provided these. She wanted to know whether there was any significant difference in their performance after the course of instruction or not. She concluded that the group who received pictures, spelling, and sounds through CALL simultaneously was better to remember the words.

Using English as a foreign language (EFL) has been spreading throughout the world. Therefore, everybody who is engaged in teaching English such as teachers, syllabus designers, and educational specialist should help them-no matter that they have different reasons. Due to the significant role of vocabulary learning, it has been regarded as an important research topic for investigation in the context of foreign language learning and teaching.

Students and generally people cannot speak if they do not know vocabulary. Research has shown that due to the lack of vocabulary knowledge, most Iranian students as (EFL) learners are either not interested to communicate, or if they initiate a communication, they would abandon it rapidly because introduced vocabulary items are not practiced in the exercises efficiently and effectively (Abdollahi-Guilani, SubakirMohdyasin & Hua, 2011). Therefore, it seems vital for teachers to find more effective methods to contribute to teaching and learning vocabulary.

Unfortunately, in Iran, textbook writers and syllabus designers have paid less attention to the role played by the CALL in the classroom. Teaching is not supplemented with modern technologies, specially CALL in teaching English. Students are forced to follow the teacher. The classes are teacher-centered and teachers do not want to give students autonomy and independence to decline their authority. Therefore, they use traditional ways (Abdollahi-Guilani, SubakirMohdyasin & Hua, 2011).

This study is crucial because it provides helpful evidence on the use of two approaches of CALL or context-based and non-CALL instruction. It will be necessary for teachers to equip themselves with up-to-date techniques if significant differences are found. The researcher hopes that the results of this study help teachers to teach vocabulary effectively and learners to recall and retain them easily and for a longer period. Also it is hoped that syllabus designers, textbook writers and the like take the advantages of it.

**REVIEW OF LITERATURE**

***The Importance of Vocabulary Learning***

Cobb, Spada and Zahar (2001) claim one of most important aspects of language learning is vocabulary development. They believe that as a new and interesting subdivision of applied linguistics and producing a lot of books and papers, there are a number of remarkable

unanswered questions about Second Language Vocabulary Acquisition (SLVA). Knowing a lot of words can help learners not only to communicate well but also to have control over their academic progress (Gorjian, 2008). After the decline of Audio-lingual Method, vocabulary has become dominant and it has taken the most important role in language learning (Nunan, 1999). He (1999) also found that the more we know vocabularies, the better we pull out the meaning from spoken and written texts. Although knowing grammatical points are important, it is impossible to communicate without vocabulary (Harmer, 1991). According to Celce-Murcia (2001), learning a foreign or second language involves the acquisition of two thousands of words. Meara (1995) maintained that, due to the importance of vocabulary in language learning, the students should not only try to learn vocabularies but also to focus on the more frequently occurred words in a language.

#### ***The Role of Computer in Language Teaching and Learning***

According to Holland and Fisher (2007), computer as tutor has been used to provide materials such as grammatical points and vocabulary items and language practices such as exercises in pronunciation, writing, listening, or reading for learners. It has also been useful for the teachers to analyze the learners' performance and test their knowledge. This has deeply rooted in behaviorist psychology which has focused on, as the key element in second language acquisition, extensive drill and practice (Meng & Hong, 2007).

Paying attention to the individual learner capabilities, cognitive goals and needs, has been the second role of computer in language teaching (Philips, 1987). Computer (via the Internet) has provided the opportunities for learners to access radio, television broad cast, Internet Websites, blogs, and advertisements and Consequently represented a wide range of written, audio, and visual materials. These materials have been used to provide "insight into the real-world contexts in which words and collocations occur across genres, registers, and language varieties" (Simpson, 2011, p. 201). Computer as the medium has been the broadest use of computer in language learning. It has given opportunity to the learners to introduce themselves to others and making interactions with other people (Danet & Herring, 2007).

Researchers have done a lot of researches related to these prominent roles of computers in language learning and especially in Second Language Acquisition (SLA) contexts. Some articles by researchers such as Kulik and Kulik (1987), McNeil and Nelson (1991) showed the positive effect of CALL on instruction. Providing the teachers with some training courses regarding to CALL not only improve the efficiency of computer in the classroom but also decrease the teachers' stress.

It can be said that there are two different views on the role of the teacher and CALL. According to the traditional view, the presence of the teacher is considered as an indispensable element in the classroom. Levy (1997) believes that albeit helping students in teachers' absence outside the classroom, computers do not replace the teachers permanently or for a long time. With regards to the role of CALL in language learning, Alatis (1986) and Secan (1990) pointed out that computers would not replace the teachers in the classroom. They (1990) focused on the unchangeable role of the teacher.

According to Fatemi Jahromi and Salimi (2013), both teachers' and students' attitudes towards CALL and their computer competence have a relationship with the use of CALL in Iran. They (2013) found that teachers have moderate computer competence with regard to CALL and more positive attitudes in the comparison with their students' in Iran and maintained that positive attitudes toward CALL, easy access to the computers at school and adequate training will be developing CALL factors in language education in Iran.

Kang (1995) carried out a research on the effect of a context-embedded approach to second language vocabulary learning at an elementary school in Seoul, Korea. This research was taken for six sessions. The learners were instructed five sessions successively and the long-term treatment effect was checked in the last session. Selecting four groups, the researcher chose four instructional approaches as follow: 1. a human instructor thought the paper and pencil group traditionally; 2. computer-based word-for-word which was incorporated the same approach used in the first group. In this group, the researcher replaced the teacher with a computer; 3. a computer and pictures were used to instruct the participants in the third group; 4. a computer-based context was provided for the learners.

The researcher used three types of tests to measure the learners' recall and retention include definition recall, listening comprehension, and knowledge transfer. Although the computer-based context group represented a slight improvement in recall phase, it showed higher performance than other three groups.

The researcher concluded that the context-embedded approach was most effective than other three approaches used for vocabulary learning. It was also added that vocabularies that were processed in an enriched context through images, associations, or meaningful elaboration can be retained for a longer period.

#### **RESEARCH QUESTIONS**

According to the above literature review, the researchers aims to investigate two main questions in this study. They are mentioned below.

1. Do CALL based instructions develop Iranian EFL learners' recall and retention of lexical items?
2. Is there any difference between non CALL and CALL-based instruction in developing Iranian EFL learners' recall and retention of lexical items?

#### **METHODOLOGY**

##### ***Participants***

This research was administered to participants attending a non-profit school in Masjed Soleyman (MIS) city in Iran. The researcher administered a proficiency test adopted from Nelson proficiency test (Fowler & Coe, 1976) not only to assess the students' level of proficiency but also to feel sure about the homogeneity of the participants. In order to generalize the research findings to a wider population, all participants at this school took this proficiency test and 50 participants whose scores fell less than one standard deviation below the sample mean were selected in terms of their performances on this proficiency test. Then the selected participants were randomly divided into two groups: the experimental and the control groups. All participants were females with their age range of 12 to 14.

##### ***Instrumentation***

##### ***Nelson Proficiency Test***

To homogenize the participants, the researcher administered Nelson proficiency test (Fowler & Coe, 1976). Being one of the most proficiency tests available in Iran and covering different English language elements such as vocabulary, grammar (phrases, clauses) were the most important factors in selecting that test. It is available in. This test included 50 multiple-choice

items. It was taken an hour to answer the questions. Each true response to the items was scored 1. The students did not get negative points for false answers. 50 students were considered the elementary level. The reliability of the test based on KR-21 formula was 0.73.

### *Three Tests Assessing Students' Progress*

The students faced three sets of multiple-choice questions included 30 test items. That was done in order to reduce test-retest effect. The content was kept consistent but the forms were different. The items were based on Picture Dictionary (Nakata, Frazier & Hoskins, 2011). Each set of items was piloted with a group of 20 homogeneous learners who did not take part in the research. The students did not get negative points for incorrect responses. The items standardization was considered in terms of item difficulty item, discrimination, and item distribution. Pre-test was done in order to show the students' initial proficiency and to help the researcher to make more precise conclusion at the end of the research. The reliability coefficient of pre-test based on KR-21 formula was 0.95.

In order to check students' progress, after ten sessions, the researcher tested students on vocabulary at the end of the course. It was done with the aim of measuring the students' recall of the vocabulary in two groups. The reliability coefficient of the immediate post-test was 0.90 through KR-21 formula.

The researcher administered a delayed post-test after two weeks. There was not any instruction in that period. It was done to measure the effectiveness of the use of CLL in students' retention. The reliability coefficient of the delayed post-test was 0.94 through KR-21 formula.

Also, there were a computer for the teacher and some computers for students, each for a couple of students, and some CDs. The CDs were prepared by the researcher. Students could play the CDs and see the pictures and spellings and listen to the pronunciation of the vocabularies successively. They did not need to click on every vocabulary. It was tried to design the CD which was utilized as easy as possible. There was a projector, too.

### *Procedure*

In this study, the materials were similar and at the same level of difficulty for experimental and control groups. The participants attended class twice a week in both groups. There was a question-and-answer session for both groups separately. In order to assess how much students knew about CALL especially in the experimental group, the teacher asked some questions and answered students' questions. The students were asked to maintain their attitudes to the training sessions during or after the treatment.

The participants in experimental and control groups were exposed to 10 units out of 55 extracted randomly from Picture Dictionary (Nakata, Frazier & Hoskins, 2011). This book is specialized for elementary level. Moreover, it covers everyday topics, high-frequency words, question-and-answer patterns, giving the students the opportunity to listen to native voices, providing contexts, and beautiful pictures. The extracted units were about parts of the body, feelings, kitchen, toys, fruits, vegetables, birthday party, descriptions, clothes, and school supplies. The number of vocabularies ranged from 16-20 in each unit. The teacher taught one unit in each session. Students attended the class twice a week. Each session lasted for an hour.

In the experimental group, the teacher used a computer, a projector, and a board. When the teacher played the CD, the students could listen to the pronunciation of the vocabularies that were pronounced by native speakers. At the same time they saw their pictures and spellings for three times. Vocabularies were pronounced in American. After doing that, the students were given a few minutes to take a look at the vocabularies while they had simultaneous access to the computers. Since then the teacher asked some questions. When students had some problem with pronunciation of vocabularies, the teacher stopped them and played the track for them again. When they had some difficulties remembering the meanings the teacher asked their classmates to help. Each student received a copy of CD, so they had the opportunity to practice over and over at home. In the control group, the students were given neither the opportunity to use CALL in the classroom nor the chance to play the CD at home.

The course was made up of ten one-hour sessions. One unit was taught every session. Carrying out an immediate post-test right after the end of the course, the teacher tested how well students could recall vocabularies in both groups. There were forty items in the post-test. Students did not have any instruction in a period of two weeks. Then she performed the delayed post-test to measure the students' retention in both groups. The items of the tests were covered the lessons that were taught during the treatment.

## **RESULTS AND DISCUSSION**

### *Descriptive Statistics*

Based on the Table 1 and 2, the significant value, .747 is greater than .050. The result does not show any significant difference between the two groups at the pre-test. That is, both groups are homogenous.

*Table 1: Results of the Pre-test*

Test	Groups	df	Std. Error Difference	t	Level of Significant (P)
Pre-test	Control Experimental	48	.738	-.325	.747

*Table 2: Results of Control Groups' Tests*

Control Group	N	Minimum	Maximum	Mean	Std. Deviation
Pre-test	25	8.00	18.00	11.84	2.687
Immediate Post-test	25	10.00	29.00	16.20	5.759
Delayed Post-test	25	9.00	28.00	15.72	5.784

According to Table 2, the mean of pre-test is 11.84 and the standard deviation is 2.68. The minimum score is 8 and the maximum one is 18. After the end of the training course, the participants were immediately tested on vocabulary recall. It was done to measure how well participants recall the meaning of the vocabulary items that they learnt during the treatment. The mean of the immediate post-test is 16.20

and the standard deviation is 5.75. The students' scores range from 10 to 29. After giving participants a two-week break, the teacher gave the participants a delayed post-test. The mean is 15.72 and the standard deviation is 5.78. The minimum and the maximum scores are 9 and 28.

*Table 3: Results of Experimental Groups' Tests*

Experimental Group	N	Minimum	Maximum	Mean	Std. Deviation
Per-test	25	6.00	18.00	12.08	2.531
Immediate Post-test	25	8.00	30.00	17.24	5.746
Delayed Post-test	25	11.00	29.00	18.20	5.338

The experimental group's performances are presented in Table 3. The minimum score is 6 and maximum score is 30 in pre-test. The calculated mean is 12.08 and the standard deviation is 2.531. The students' scores range from 8 to 30 in immediate post-test and from 11 to 29. The mean and standard deviation are 17.24 and 5.746 in immediate post-test. The mean is 18.20 and the standard deviation is 5.33854 in delayed post-test. It should be mentioned that the mean values of two groups are also shown by Figure 1.

*Figure 1: Sample Means for Three Tests of Two Groups*

The Tables 2, 3 and Figure 1 show that two groups had an improved performance in mean scores from pre-test to immediate post-test, from 11.84 to 16.20 in the control group and from 12.08 to 17.24 in the experimental group. They also show an increase from immediate post-test to delay post-test in experimental group from 17.24 to 18.20, but this increase is not observed in control group. In this group, the mean score decreased to 15.72.

As the descriptive statistics does not provide the researcher with sufficient information to sustain or reject the null hypotheses, the researcher cannot interpret the results meticulously; she went further and used the inferential statistics too.

*Table 4: Paired Samples t-test of Control Group (pre-test vs. immediate post-tests)*

Paired differences								
Pre-test & Immediate post-test	Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference		<i>t</i>	df	Sig (2- tailed)
				Lower	Upper			
	-4.160	3.300	.660	-5.522	-2.797	-6.303	24	.000

Table 4 shows that the observed *t* (6.303) is greater than the critical *t* (2.64). The results of paired samples t-test shows that is a significant difference between pre-test and immediate post-test of control at the significant level ( $p < .05$ ).

Table 5: Paired Sample t-test of Control Group (immediate vs. delayed post-tests)

Paired differences								
Immediate post-test & Delayed post-test	Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference		<i>t</i>		
				Lower	Upper		df	Sig (2-tailed)
	.480	1.294	.2589	-.054	1.014	1.853	24	.76

As the observed *t* (1.853) is less than the critical *t*, it can be conclude that there was no significant difference between the performance of learners in immediate post-test and delayed post-test of control group at the significant level ( $p < .05$ ). The mean is .480 and SD is 1.29.

Table 6: Paired Samples t-test of Experimental Group (pre-test vs. immediate post-tests)

Paired differences								
Pre-test & Immediate post-test	Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference		<i>t</i>		
				Lower	Upper		df	Sig (2- tailed)
	-7.240	3.031	.606	-8.491	-5.988	-11.941	24	.000

Table 6 shows that the observed *t* (11.941) is greater than the critical *t* (2.64). The results of paired samples t-test show that there is a significant difference between pre-test and immediate post-test of the experimental group at the significant level ( $p < .05$ ). The mean is 7.24 and the SD is 3.031.

Table 7: Paired Samples t-test of Experimental Group (immediate vs. delayed post-tests)

Paired differences								
Immediate post-test & Delayed post-test	Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference		<i>t</i>		
				Lower	Upper		df	Sig (2- tailed)
	-.960	1.540	.308	-1.595	-.3240	-3.11	24	.005

Table 7 shows that CALL instruction had an effect on learners' retention because the observed *t* (3.11) is greater than the critical *t* (2.06).

Table 8: Independent Samples t-test of the Groups (immediate vs. delayed post-tests)

Test	Groups	df	Std. Error Difference	<i>t</i>	Level of Significant (P)
Immediate post-test	Control	48	1.62714	-.639	.526
	Experimental				
Delayed post-test	Control	48	1.57429	-1.575	.122
	Experimental				

Based on the Table 8, with regards to the immediate post-test, the significant value, .52 was more than .05. The results did not show any significant difference between two groups at the immediate post-test. That is, both groups almost gave similar performance. In relation to the delayed post-test, the significant value, .12 was more than .05. That is, the difference between the two groups was not significant. Also, the observed *t* is less than the critical *t* in both immediate and delayed post-test, 0.63 and 1.57 less than 2.64, showed no significant difference between two groups at delayed post-test.

#### ***Discussion***

Generally speaking, the instruction in both groups was effective. That is to say, there was an increase in recall of vocabulary items not only in control group who were instructed traditionally but also in the experimental group who were instructed based on CALL. It can be concluded that both, traditional instruction and instruction based on CALL, were good at recalling vocabulary items. The results also showed the mean of the experimental group increased more than that of the control group.

On the other hand, the experimental group performed well in delayed post-test contrasting with the poor performance of the control group. It can be concluded that CALL could help learners to develop the learners' retention of vocabulary items or their long-term memory, therefore the first null hypothesis is rejected. That is to say, although both groups carried out the same in immediate post-test, CALL helped learners to retain vocabulary items or develop the learners' long-term memory. This development was not observed in the delayed post-test of the control group.

The reason for the better performance of the experimental group in recall and retention of vocabularies might be due to the advantages of using CALL over the traditional instruction that help learners to improve not only the recall but also the retention of vocabularies. The students in the experimental group expressed that the combination of pictures, sounds, and spelling helped them to learn and remember the vocabularies easier and better. Some of them maintained that CALL-based instruction was more interesting than the traditional one and they were more willing to play the CDs and learn the vocabularies rather than open their books and memorized the vocabularies, what they did before. The better results in the experimental group may be due to the fact that paying attention to the learners' individualized characteristics, computer provides the learners the opportunity to play the CDs repeatedly when and where they liked repeatedly. The students also mentioned that if they did not take part in the classroom for some sessions, they would not have some serious problems with the pronunciation and the meaning of the vocabularies.

The results of the study were confirmed by Duquette and Painchaud (1996). They believe that CALL, providing both video and audio clues, facilitates vocabulary learning. Akbulut (2007) arrived at the same results concerned with the objectives of this research. They noted that vocabulary learning was enhanced through using CALL (definitions, pictures, and short video clips) rather than those students instructed by definition only.

Two independent-samples *t*-tests were run by the researcher to show whether there is any significant difference between two groups performance in immediate and delayed post-test. The results showed although the mean score of the experimental group improved slightly from immediate to delayed post-test, there was not significance difference between students' performance in delayed post-test in both groups. The results showed that students which received CALL-based instruction were not significantly different than the group which received traditional instruction in delayed post-test. Based on the results, the second null hypothesis is sustained.

Now, a question can be raised of two groups' performance: why the group instructed based on CALL performed similarly comparing to the group who were instructed traditionally. It may be due to the fact that the students did not know how to use computer facilities concerned with both hard ware and soft ware issues. In case of hard ware facilities, we may name using key board, mouse, monitor, printer, and speakers. Soft ware facilities could be referred to the use of spelling and grammar checkers, Word soft ware, using various Web-sites, etc. Some of the students expressed that they did not have access to the computer at home. Therefore, many of the students rely on their teachers, especially at the primary levels for learning any topic in a face to face mode of instruction. Conditions were got worse due to the syllabus designers and teachers' performances. Most of the teachers had a habit of teaching traditionally. They were not eager to change their teaching styles. Furthermore, teachers are afraid that they may lose their authority. Additionally, they did not were proficient at using computers and both teachers confirmed these facts. It is obvious that an ignorant teacher about computer will not provide the students with more inputs such as pictures, sounds, and spelling. The principle also maintains that she did not have preference to allocate the limited budget for the purchase and maintaining the computers.

The findings of the research were matched with Atai and Dashtestani (2013) and Nepomuceno (2011). They believe that the students have not much knowledge of computer and internet and assert that it is essential for the students to take some training courses in Internet. The results of the study are in the line with Zou (2013) who focus on the teachers' difficulty in using the computer that comes from the teachers' insufficient computer competence.

#### **CONCLUSION**

The results of the immediate and delayed post-test showed that both groups were good at the recall of vocabulary learning and the means of the two groups increased after the treatment. The results of the delayed post-test also showed that there was no significant difference between the performance of the group who received CALL-based instruction and the group who received traditional instruction in spite of the fact that the experimental group's mean had an increase. Considering these results of data analyses, the researchers may conclude that CALL-based instruction has positive effect on the EFL learners' vocabulary recall and retention while traditional instruction has only positive effect on the EFL learners' vocabulary recall.

This section deals with the implications that the present study may bring out for material designers, language teachers, and language learners. Language studies in the domain of language learning and the use of CALL specifically in vocabulary learning are well advised to take the implications presented in this study. This study could be a striking inception of extensive investigations to be launched into discovering the advantages of using CALL over traditional instructions. The vocabulary learning and the use of CALL in promoting the recall and retention of vocabularies should be investigated by teachers as researchers for launching them for effective teaching of language and vocabulary specifically.

One the other hand, the EFL teachers may overlook the fact that the language learners have some difficulties at remembering these discrete vocabularies in their minds. In fact, they should keep in their mind that providing additional inputs help the students to remember the

vocabularies better and for a longer time. In language classrooms, it is suggested that language teachers also familiarize their language learners with applying computers to improve their vocabularies learning and retention. For the case of this study, language teachers are suggested to supply their students with interesting visual images, native language voices, and spelling introducing the most frequent English vocabularies. The teachers should realize knowing another language is not sufficient. The teachers should know how they can teach effectively to the students. One of the tools that help teachers to achieve this aim is the use of computers in the classrooms.

It is suggested that EFL learners who are intending to promote their recall and retention of vocabularies, use computer in which the vocabularies are presented with multidimensionality. Students are recommended to use computers because computers can be adjusted to the learners' needs and speed. Additionally, it is fruitful in helping students who are more instruction or the students that do not access to the teachers regularly.

The following suggestions may be carried out in the future research. They are: (1) this study was focused only female learners. Their ages were ranging from 12-14. This study can be replicated to male and female or male only. (2) in this study only elementary students. This study can be replicated to language learners at different proficiency levels to check what the findings will be. (3) this study investigated only the effect computers on EFL learners' recall and retention of high frequency vocabularies and does not consider the other techniques and strategies on EFL learners' recall and retention. (e.g., mnemonic devices).

## **ABSTRACT**

Teachers are regarded as the basic tools in education and curriculum implementations. So, teachers play a key role in changing schools and classrooms. This paper seeks to examine the relationships between teachers' beliefs about teaching with their educational background and gender. It also seeks to examine the relationships between teachers' beliefs about learning with their educational background and gender. Teachers' beliefs about teaching and Teachers' beliefs about learning questionnaires were administered. The study involved one hundred and twenty five teachers made up of sixty males that 30 of them were Bachelor of Arts and 30 were Master of Arts Sixty five females, that 30 of them were Bachelor of arts(B.A.) and 35 were Master of arts (M.A.). Two questionnaires were used to collect data for the study. The first questionnaire is the "Teachers' Beliefs Questionnaire about Teaching", and the second questionnaire is the "Teachers' Beliefs Questionnaire about Learning". The result indicated that there exists a significant relationship between teachers' beliefs about teaching and learning with their educational background. The result also indicated that there exists no significant relationship between teachers' beliefs about teaching and learning with their gender.

**KEYWORD:** Teachers' beliefs, teaching, learning

## **INTRODUCTION**

Teaching is a complex process which can be conceptualized in a number of different ways. Traditionally, language teaching has been described in terms of what teachers do: that is, in terms of the actions and behaviors which teachers carry out in the classroom and the effects of these on learners (Richards & Lockhart, 1996, p.34).

Teachers' beliefs, a term usually used to refer to teachers' pedagogic beliefs, or those beliefs of relevance to an individual's teaching. The areas most commonly explored are teachers' beliefs about teaching, learning, and learners; subject matter (i.e. EFL or language); self as a teacher, or the role of a teacher (Calderhead, 1996, p.716). Teachers' theoretical beliefs are thought to make up an important part of the prior knowledge through which teachers perceive, process, and act upon information in the classroom (Clark & Peterson, 1986, p.68). Johnson (1994) predicted that "research on teachers' beliefs would ultimately become one of the most valuable psychological constructs for teaching and teacher education" (p. 439).

Teachers' beliefs have impacts on their development and if it changes, it influences their beliefs. So, we should know whether to change our teaching plans or stay the same. Some researchers think that it is difficult to change the pre-service teachers' well-formed beliefs as they tend to teach the way they have been taught and implementing innovative approaches is a risk-taking act to them (Kagan, 1992; Pajares, 1992). Other researchers affirm that teacher beliefs tend to be static and resistant to change because they exist in one's personal understandings, premises or propositions about the world which are felt to be true (Richardson, 1996, p.116). ESL/EFL teachers' beliefs exert significant influence on how they teach, how they learn to teach, and how they perceive educational reforms (Borg, 2003, p.102). Beliefs are the best indicators of the decisions individuals make throughout their lives, or more specifically, teachers' beliefs affect their planning, decision-making, and subsequent classroom behavior (Pajares, 1993, p.48).

The different beliefs that teachers and students hold toward the process of language teaching can negatively influence the effectiveness of language program (Kern, 1995). According to Pajares (1999), beliefs of the teacher influence the way that they teach, the roles they assign to themselves and students, the way they perceive learning / teaching and their attitudes towards their students. The term here refers to teachers' pedagogic beliefs, which are related to convictions about language and the teaching and learning of it. These beliefs are manifested in teachers' teaching approaches, selection of materials, activities, judgments, and behaviours in the classroom (Zacharias, 2005, p.116).

## **LITERATURE REVIEW**

One difficulty in exploring the literature on pre-service teachers' beliefs lies in the multitude of definitions of beliefs (Pajares, 1992). In order to understand, it is important to clearly define and understand what is meant by belief. Researchers have defined the term, beliefs, in different ways. For example, Pajares (1992), in his literature review, defined belief as an "individual's judgment of truth or falsity of a proposition, a judgment that can only be inferred from a collective understanding of what human beings say, intend, and do" (p.316).

Unfortunately, there is a lot of confusion in the literature regarding both the labels and definitions used to describe teacher beliefs. Pajares, in his 1992 review, labeled teacher beliefs a "messy construct," noting that "the difficulty in studying teachers' beliefs has been caused by definitional problems, poor conceptualizations, and differing understandings of beliefs and belief structures" (p. 307). According to Calderhead (1996), teacher beliefs, as well as teacher knowledge and teacher thinking, comprise the broader concept of teacher cognition. Yet, Kagan (1990) noted that the term teacher cognition "is somewhat ambiguous, because researchers invoke the term to refer to different products, including teachers' interactive thoughts during instruction; thoughts during lesson planning; implicit beliefs about students, classrooms, and learning; and reflections about their own teaching performance " (p. 42). Upon entering teacher education, most pre-service teachers would have already possessed a well-developed set of beliefs (Joram & Gabriele, 1998). These beliefs and attitudes are constructed based on cultural and personal beliefs, some of which may be long standing (Reynolds, 1992), stable, deeply entrenched and resistant or difficult to change (Joram & Gabriele, 1998). Kagan (1992) confirmed that pre-service teachers enter teacher education programs with personal beliefs about images of good teachers, images of themselves as teachers, and memories of themselves as students.

Richards and Lockhart (1996, p.32-40) have mentioned different kinds of beliefs: 1) Beliefs about English 2) beliefs about learning 3) beliefs about teaching 4) beliefs about the program and the curriculum 5) beliefs about language teaching as a profession

Williams and Burden (1997) argued that teachers are highly influenced by their beliefs, which in turn are closely linked to their values, to their views of the world and to their conceptions of their place within it. They also suggest that teachers' beliefs may be divided roughly into three major groups: 1) beliefs about learners, 2) beliefs about learning, 3) beliefs about themselves. Research on teaching and teacher education and research on teacher change emphasize the importance of beliefs, thoughts, judgements, knowledge, attitudes and theories of teachers for teaching practice (Pajares, 1992). As researchers hope to find ways to adjust and refine learners' beliefs, studies about teachers' beliefs have become another interest of researchers in the field and are the focus of several studies. These studies are based on the assumptions that learners develop their beliefs about language learning from their learning experiences (Horwitz, 1987) and that teacher beliefs influence their classroom practices which, in turn, can affect their students' learning (Johnson, 1992, p.13). Teachers are viewed as important agents of change in the reform effort currently under way in education and thus are expected to play a key role in changing schools and classrooms. Paradoxically, however, teachers are also viewed as major obstacles to change because of their adherence to outmoded forms of instruction that emphasize factual and procedural knowledge at the expense of deeper levels of understanding. New constructivist approaches to teaching and learning, which many reformers advocate, are inconsistent with much of what teachers believe--a problem that may be overcome if teachers are willing to rethink their views on a number of issues. (Prawat, 1992, p.354). It has been long understood that some beliefs are more important than others to individuals, and the more important the belief is, the more difficult it is to change (Rokeach, 1968, p. 3). Bruner (1986) cited that the prior beliefs of teacher candidates can hinder learning about teaching. As found in Horwitz (1985), pre-service second language teachers enter teacher education programs with preexisting ideas about language and language learning, just like second language learners. Some ideas that the pre-service teachers possess may inhibit their learning of new approaches and techniques in the teacher education programs, which can limit their choices of instructional practices. Therefore, it is hoped that pre-service teachers, while they are in teacher education programs, refine their beliefs about language learning to enhance their own learning and development.

Goldhaber and Brewer (2000) reported that students taught by teachers with bachelor's degrees in science had significantly higher science achievement scores than teachers with a bachelor's degree in a non-science subject. Beliefs are often confused with other related concepts such as attitudes, values, judgments, concepts, and dispositions. Pajares (1992) explained that clusters of beliefs around a particular situation form attitudes, and attitudes become action agendas that guide decisions and behavior. In other words, people act upon what they believe. The connections among clusters of beliefs create an individual's values that guide one's life and ultimately determine behavior (Ajzen, 1996). Obviously, science teachers possess beliefs regarding professional practice. Since beliefs may affect actions, teachers' beliefs play a critical role in restructuring science education. (Tobin, Tippins, & Gallard, 1994, p.64). In general, stronger beliefs are those that are more central to an individual's identity (Rokeach, 1968), quite possibly because they were established during earlier experiences and thus, were used in the processing of subsequent experiences (Pajares, 1992). Teachers' belief systems are founded on the goals, values, and beliefs teachers hold in relation to the content and process of teaching, and their understanding of the systems in which they work and their roles within it. These beliefs and values serve as the background to much of the teachers' decision making and action, and hence constitute what has been termed the "culture of teaching." (Richards & Lockhart, 1996, p. 30). Pre-existing beliefs are so influential that attempts to change teaching styles are ineffective, unless these beliefs are directly questioned (Johnson, 1988). The earlier a belief is incorporated into the belief structure, the more difficult it is to alter (Pajares, 1992). Richardson (1996) highlighted three major sources of teacher beliefs: personal experience, experience with schooling and instruction, and experience with formal knowledge --both school subjects and pedagogical knowledge. Convincing research suggests that beliefs are the best predictors of individual behavior, and, in particular, that teachers' beliefs influence teachers' perceptions and judgments, which, in turn, affect classroom performance. Moreover, we know that beliefs are hardy and highly resistant to change, and we suspect that teacher education programs have a little impact on the entering perspectives of teacher candidates. If this is so, understanding the nature and role of the beliefs will bring to teacher education is essential to understanding not only the choices and decisions she will make as a pre-service teacher, but her future effectiveness as a professional in her own classroom (Pajares, 1993, p.45).

## RESEARCH QUESTIONS AND HYPOTHESIS

The present study focuses on the following research questions:

- 1) Is there any relationship between teachers' beliefs about teaching and their educational background?
- 2) Is there any relationship between teachers' beliefs about teaching and their gender?
- 3) Is there any relationship between teachers' beliefs about learning and their educational background?
- 4) Is there any relationship between teachers' beliefs about learning and their gender?

H01: There is no relationship between teachers' beliefs about teaching and their educational background.

H02: There is no relationship between teachers' beliefs about teaching and their gender.

H01: There is no relationship between teachers' beliefs about learning and their educational background.

H01: There is no relationship between teachers' beliefs about learning and their gender.

## METHODOLOGY

### *Participants*

The participants of this study were 125 teachers teaching English at different institutes in Neishabour and Mashad (two north-eastern cities in Iran). Majority (N= 65) of the teachers were female, with teaching experience of 5 to 10 years. 65 of the subjects were female and 60 were male. All of the teachers taught English at different levels. The majority held either a BA (male=32, female=33) as their highest degree, or an MA degree (male=30, female=30). The age of the participants ranged from 25 to 40, but the age of the participants were not considered in this study. They are all experienced teachers, who were graduated from different universities with different majors, including: English translation, English teaching, and English literature. All of them taught in different institutes.

### *Instrument*

#### *Teachers' Beliefs Questionnaire about Teaching*

The teachers' beliefs questionnaire about teaching was used in order to find out if there is any relationship between teachers' beliefs about teaching and their gender or their educational background. It is believed that these kinds of questionnaires can measure the teachers' beliefs about teaching. This questionnaire was made up of 15 items. The Belief Questionnaire about Teaching (Leu & Kinzer, 1991), contained 15 statements, five of which represented each of the methodological approaches toward second-language teaching. Each statement on the Beliefs Inventory was validated by the same two expert raters. Thirteen out of the 15 statements received 100% agreement by both raters and were incorporated into the Beliefs Inventory. Two statements were reworded slightly, recoded, and later incorporated into the Beliefs Inventory (Johnson, 1992, p.89). Teachers were asked to read all 15 statements and select 5 out of the 15 statements which most closely

reflected their own beliefs about second-language teaching. Teachers were assigned a percentage score based on the number of skill-based, rule-based, and function-based statements they selected. Skill-based (4, 6, 10, 12, 14), Rule-based (1, 3, 5, 8, 11), Function-based (2, 7, 9, 13, 15).

#### ***Teachers' Beliefs Questionnaire about Learning***

The teachers' beliefs questionnaire about learning was used in order to find out if there is any relationship between teachers' beliefs about learning and their gender or their educational background. It is believed that these kinds of questionnaires can measure the teachers' beliefs about learning. This questionnaire was made up 23 items. They are beliefs that some people have about learning foreign languages. The old version of BALLI (Beliefs About Language Learning Inventory) has 34 items, by Horwitz, 1987. This is a new version of BALLI which was used by Richards and Lockhart, 1996. The BALLI, a 23-item inventory on beliefs about language learning was used to collect data from the teachers. It is a 5-point likert-type scale, which teachers should read each statement and then decide if they: (1) strongly agree, (2) agree, (3) neither agree nor disagree, (4) disagree, (5) strongly disagree. There are no right or wrong answers. Questions 22 & 23 are slightly different and they should mark them as indicated. There are no clear cut right and wrong answers to the BALLI questions (Horwitz, 1987, p.119). The items on the BALLI assessed teachers' beliefs in four areas: 1) the difficulty of language learning (6 items), 2) foreign language aptitude (8 items), 3) the nature of language learning (5 items), 4) learning and communication strategies (4 items).

#### ***Procedure and Data Analysis***

We administered two questionnaires to 125 teachers who are selected from different institutes. We want to know if teachers' beliefs about teaching and learning have any impacts on their gender or educational background. The two questionnaires were given to teachers to do with 10-15 minutes, respectively. After the collected data was categorized and codified, the Statistical Packages for Social Sciences (SPSS) version 17.5 and the Minitab-15 were utilized for data analysis. Data derived from the questionnaire were analyzed by using descriptive statistical methods. Frequencies and percentages for all items of the questionnaires were obtained. Moreover, the techniques of Chi-square-test were performed. Means and standard deviations of each question were provided along with the descriptive statistics of rule-based, function-based and skill-based statements determined by Johnson (1992).

## **RESULTS AND DISCUSSION**

### ***Investigation of Research Question One***

To answer the first research question of this study which asked if teachers' beliefs about teaching have any relationship with their educational background, the responses of B.A. and M.A. participants were analyzed. The results are set forth in the following table and figure. The review of Tables 1, 2, 3, and 4 reveal that BA teachers chose different statements about teaching in comparison with MA teachers.

*Table 1:*  
*Descriptive Statistics of BA Teachers about Teaching*

	N	Range	Minimum	Maximum	Sum	Mean	Std. Deviation
Statement 5	65	1	0	1	31	.48	.503
Statement 4	65	1	0	1	30	.46	.502
Statement 10	65	1	0	1	28	.43	.499
Statement 7	65	1	0	1	28	.43	.499
Statement 14	65	1	0	1	26	.40	.494
Statement 11	65	1	0	1	25	.38	.490
Statement 9	65	1	0	1	23	.35	.482
Statement 8	65	1	0	1	22	.34	.477

Statement 1	65	1	0	1	8	.12	.331

*Table 2:*

*Descriptive Statistics of BA Teachers about Teaching*

	N	Range	Minimum	Maximum	Sum	Mean	Std. Deviation
Skill-based	65	4.00	.00	4.00	115.00	1.7692	.87979
Rule-based	65	3.00	.00	3.00	107.00	1.6462	.92586
Function-based	65	4.00	.00	4.00	103.00	1.5846	.93361

Table 3:  
*Descriptive Statistics of MA Teachers about Teaching*

	N	Range	Minimum	Maximum	Sum	Mean	Std. Deviation
Statement 7	60	1	0	1	36	.60	.494
Statement 4	60	1	0	1	26	.43	.500
Statement 10	60	1	0	1	25	.42	.497
Statement 8	60	1	0	1	25	.42	.497
Statement 5	60	1	0	1	24	.40	.494
Statement 14	60	1	0	1	22	.37	.486
Statement 2	60	1	0	1	22	.37	.486
Statement 13	60	1	0	1	21	.35	.481
Statement 11	60	1	0	1	20	.33	.475
Statement 12	60	1	0	1	18	.30	.462
Statement 3	60	1	0	1	16	.27	.446
Statement 9	60	1	0	1	15	.25	.437
Statement 6	60	1	0	1	13	.22	.415
Statement 15	60	1	0	1	10	.17	.376
Statement 1	60	1	0	1	7	.12	.324

Table 4:  
*Descriptive Statistics of MA Teachers about Teaching*

	N	Range	Minimum	Maximum	Sum	Mean	Std. Deviation
Function-based	60	4.00	.00	4.00	104.00	1.7333	1.05552
Skill-based	60	4.00	.00	4.00	104.00	1.7333	1.02290
Rule-based MA	60	4.00	.00	4.00	92.00	1.5333	1.15666

Since teachers holding MA and BA selected different statements and order of preferences (statements number 5, 4, 10, 7, and 14 by BA teachers, but 7, 4, 10, 8, and 5 by MA teachers in order of preferences) the first null hypothesis which predicted that there is no significant relationship between teachers' beliefs about teaching and their educational background was rejected. So, it can be asserted that there is a significant relationship between teachers' beliefs about teaching and their educational background.

#### ***Investigation of Research Question Two***

To answer the second research question of this study which asked if teachers' beliefs about teaching have any relationship with their gender, the responses of males or females participants were analyzed. The results are set forth in the following table and figure. The review of Tables 5, 6, 7, and 8 reveal that male teachers chose the same statements about teaching in comparison with female teachers.

Table 5:  
*Descriptive Statistics of Male Teachers about Teaching*

	N	Range	Minimum	Maximum	Sum	Mean	Std. Deviation
Statement 7	62	1	0	1	31	.50	.504
Statement 4	62	1	0	1	27	.44	.500
Statement 11	62	1	0	1	27	.44	.500
Statement 5	62	1	0	1	26	.42	.497
Statement 10	62	1	0	1	26	.42	.497

Statement 2	62	1	0	1	19	.31	.465
Statement 3	62	1	0	1	19	.31	.465
Statement 9	62	1	0	1	18	.29	.458
Statement 6	62	1	0	1	13	.21	.410
Statement 1	62	1	0	1	10	.16	.371
Statement 15	62	1	0	1	10	.16	.371

Table 6:  
*Descriptive Statistics of Male Teachers about Teaching*

	N	Range	Minimum	Maximum	Sum	Mean	Std. Deviation
Skill-based	62	4.00	.00	4.00	106.00	1.7097	.89419
Rule-based	62	3.00	.00	3.00	105.00	1.6935	1.06492
Function-based	62	4.00	.00	4.00	99.00	1.5968	1.07825

Table 7:  
*Descriptive Statistics of Female Teachers about Teaching*

	N	Range	Minimum	Maximum	Sum	Mean	Std. Deviation
Statement 7	63	1	0	1	33	.52	.503
Statement 5	63	1	0	1	29	.46	.502
Statement 4	63	1	0	1	29	.46	.502
Statement 14	63	1	0	1	28	.44	.501
Statement 10	63	1	0	1	27	.43	.499
Statement 2	63	1	0	1	24	.38	.490
Statement 8	63	1	0	1	24	.38	.490
Statement 9	63	1	0	1	20	.32	.469
Statement 11	63	1	0	1	18	.29	.455
Statement 3	63	1	0	1	18	.29	.455
Statement 15	63	1	0	1	17	.27	.447
Statement 12	63	1	0	1	16	.25	.439
Statement 13	63	1	0	1	14	.22	.419
Statement 6	63	1	0	1	13	.21	.408
Statement 1	63	1	0	1	5	.08	.272

Table 8:  
*Descriptive Statistics of Female Teachers about Teaching*

	N	Range	Minimum	Maximum	Sum	Mean	Std. Deviation
Skill-based	63	4.00	.00	4.00	113.00	1.7937	1.00256
Function-based	63	4.00	.00	4.00	108.00	1.7143	.90569
Rule-based	63	4.00	.00	4.00	94.00	1.4921	1.01398

Since male and female teachers selected almost the same statements and in order of preferences, 4 out of 5 (statements number 7, 4, 11, 5, and 10 by male teachers, and 7, 5, 4, 14, and 10 in order of preference), the first null hypothesis which stated that there is no significant relationship between teachers' beliefs about teaching and their gender was not rejected. So, it can be asserted that there is no significant relationship between teachers' beliefs about teaching and their gender.

#### *Investigation of Research Question Three*

To answer the third research question of this study which asked if teachers' beliefs about learning have any relationship with their educational background, the responses of BA and MA participants were analyzed. The results are set forth in the following table and figure. The review of Table 9 reveals that BA teachers chose different statements about learning in comparison with MA teachers.

Table 9:  
Group Cross Tabulation of BA and MA Teachers about Learning

			Group		
			0-2	2-2.5	2.5-3
Educational background	BA	Count	3	25	36
		% within Educational background	4.6%	38.5%	55.4%
	MA	Count	1	12	37
		% within Educational background	1.7%	20.0%	61.7%
Total	Count		4	37	73
	% within Educational background		3.2%	29.6%	58.4%

The results of Cross tabulation for testing the significant relationship between teachers' beliefs about learning and educational background showed a statistically significant *Sig.* for Pearson Chi-Square based on items number 1, 5, 7, 9, 16, 19, and 20 ( $p < .05$ ), however did not find a statistically significant *Sig.* for Pearson Chi-Square based on items number 2, 3, 4, 6, 8, 10, 11, 12, 13, 14, 15, 17, 18, 21, 22, and 23 ( $p > .05$ ). As a result, it can be stated that there is a significant relationship between teachers' beliefs about learning and their educational background according to items number 1, 5, 7, 9, 16, 19, and 20, but no there is no significant relationship between teachers' beliefs about learning and their educational background based on other 16 items (see appendix C and D for more details).

Table 10:  
Chi-Square Tests of BA and MA Teachers about Learning

	Value	df	Sig. (2-sided)
Pearson Chi-Square	12.765	3	.005
Likelihood Ratio	14.074	3	.003
Linear-by-Linear Association	11.018	1	.001
N of Valid Cases	125		

The results of chi-square for teachers' beliefs about learning showed that at 95 per cent confidence level, .05 alpha level, and the output above gave a Pearson Chi-Square value of 12.76, and  $p$ -value of .005, which is less than 0.05; accordingly, the third null hypothesis which stated that there is no significant relationship between teachers' beliefs about learning and their educational background was rejected (See Table 10). So it can be stated that there is a significant relationship between teachers' beliefs about learning and their educational background.

Figure 1:  
Descriptive Statistics of BA and MA Teachers about Learning

#### Investigation of Research Question Four

To answer the fourth research question of this study which asked if teachers' beliefs about learning have any relationship with their gender, the responses of males and females participants were analyzed. The results are set forth in the following table and figure. The review of Table 11 reveals that male teachers chose the same statements about learning in comparison with female teachers.

Table 11:  
Group Cross Tabulation of Male and Female Teachers about Learning

			Group				Total
			0-2	2-2.5	2.5-3	3-50	
Gender	Male	Count	2	13	40	7	62
		% within Gender	3.2%	21.0%	64.5%	11.3%	100.0%
	Female	Count	2	24	33	4	63
		% within Gender	3.2%	38.1%	52.4%	6.3%	100.0%
Total	Count		4	37	73	11	125
	% within Gender		3.2%	29.6%	58.4%	8.8%	100.0%

The results of Cross tabulation for testing the significant relationship between teachers' beliefs about learning and gender did not show a statistically significant *Sig.* for Pearson Chi-Square based on all items ( $p > .05$ ), except for item number 23 ( $p = .04$ ,  $p < .05$ ); accordingly it can be claimed that there is no significant relationship between teachers' beliefs about learning and their gender according to the majority of items ( $N = 22$  items), and there is a significant relationship between teachers' beliefs about learning and their gender according to just item number 23 (see appendix C and D for more details).

Table 12:  
Chi-Square Tests Male and Female Teachers about Learning

	Value	df	Sig. (2-sided)
Pearson Chi-Square	4.752	3	.191
Likelihood Ratio	4.813	3	.186
Linear-by-Linear Association	3.415	1	.065
N of Valid Cases	125		

The results of chi-square for teachers' beliefs about learning showed that at 95 per cent confidence level, .05 alpha level, and the output above gave a Pearson Chi-Square value of 4.75, and  $p$ -value of .19, which is greater than 0.05; accordingly, the fourth null hypothesis which stated that there is no significant relationship between teachers' beliefs about learning and their gender, was not rejected (See Table 12). So it can be claimed that there is no significant relationship between teachers' beliefs about learning and their gender.

Figure 2:  
Descriptive Statistics of Male and Female Teachers about Learning

## CONCLUSION

Teachers are viewed as important agents of change in the reform effort currently under way in education and thus are expected to play a key role in changing schools and classrooms. Paradoxically, however, teachers are also viewed as major obstacles to change because of their adherence to outmoded forms of instruction that emphasize factual and procedural knowledge at the expense of deeper levels of understanding (Prawat, 1992, p.354). Novice teachers' prior learning experiences were influential in shaping their initial beliefs. However, the majority of the teachers' beliefs were re-structured and strengthened, suggesting that beliefs are dynamic (Pajares, 1993, p.46). Teachers' beliefs also strongly influence their teaching behavior, methods, and learners' development. Determination of learners' and teachers' beliefs in language teaching/learning process will be helpful in forming effective learning/teaching methods (Buyukyazi, 2010, p.183). Labeled a "messy construct" by Pajares (1992), beliefs are still considered the "best indicators of the decisions individuals make

throughout their lives" (p. 307). Kagan (1992, p.76) cited significant evidence supporting the relationship between teacher beliefs and their decisions about classroom practice. The main concern of this study was to investigate this assumption whether or not teachers' beliefs about teaching and learning have any significant relationship with their gender and educational background. To assure and determine any significant relationship, the results of performance of each MA and BA including male and female teacher was analyzed through applying two questionnaires. In addition, the null-hypothesis 2 and 4 proposed in this study is supported; So, there is no relationships between teachers' beliefs about teaching and learning with their gender. But, the null hypothesis 1 and 3 proposed in this study is rejected. So, there is a relationship between teachers' beliefs about teaching and learning with their educational background. According to the result of chi-square which is used to determine the statistical significance of the difference between the means on two sets of answers, it could be concluded that there is no relationships between teachers' beliefs about teaching and learning with their gender. But there is a relationship between teachers' beliefs about teaching and learning with their educational background in both questionnaires. This research studied the relationships between teachers' beliefs about teaching and learning with their gender and educational background. It proved that teachers' beliefs about teaching and learning have relationships with their educational background, although teachers' beliefs about teaching and learning don't have any relationships with their gender. It is hoped that the results of this research would be beneficial for syllabus designer who are trying to design a syllabus in which teachers' beliefs is emphasized. English language teachers, and language learners, and pave the way for their investigation.

#### **Limitation/ Delimitation of the Study**

The present study, like any other studies, suffers from some limitations and delimitation. Limitations are those conditions beyond the control of the researcher that may place restrictions on the conclusion of the study. In this study, the researcher faced with some limitations and delimitation. Here the most important one is brought to light.

1. This research is exclusively done on Iranian language teachers, and the participants are confined to English institute teachers.
2. Teachers experiences are not considered
3. Teachers are graduated from different universities
4. Teachers' beliefs have various types and all of these varieties can't be covered thoroughly in this study.
5. This study was conducted only in Neishabour and Mashad and no other cities.
6. Teachers just teach in different institutes, not any other places.
7. Teachers teach in different levels.
8. Teachers ages are not considered.
9. We considered just BA and MA teachers (not PHD).
10. They are graduated in different majors: English translation, English literature, and English teaching.

#### ABSTRACT

One of the most important skills for language learners, especially in academic settings, is the oral presentation skill. The current study, which is unique in its own, tried to shed light on the interrelationship of English as a Foreign Language (EFL) learners' self-regulation, willingness to communicate (WTC), and their oral presentation performance. To achieve such a purpose, 90 advanced-level EFL learners were selected on the basis of random sampling procedure and were given a questionnaire on WTC and one on self-regulation. They were also required to give an oral presentation about their favorite topic. Having gathered the data and analyzing them through correlation, independent t-test, and descriptive statistics, the study revealed that first; there is a significant relationship between the self-regulation degree of language learners and their oral performance. Second, there is a strong, positive relationship between the WTC degree of learners and their oral presentation performance. And finally, the study showed a significant difference in the oral performance of language learners showing that females are better oral presenters than males. The findings of the paper may significantly contribute to the better understanding of the conditions leading to learners' more telling oral performance in different higher education setting including conferences.

**KEYWORDS:** Willingness to communicate (WTC); Self-regulation; Oral presentation; EFL

learners.

#### INTRODUCTION

People use language to communicate and also to get something done. For instance, they may intend to carry out some important functions in classroom such as having a good rapport with each other, or conveying their meaning by different ways like having a lecture, or having a small conversation or even having an oral presentation. Making a good oral presentation is an art that involves attention to the needs of your audience, careful planning, and attention to delivery. Clearly, the most obvious manifestation of learning a foreign or second language (L2) is the ability of learners to speak the language accurately and fluently in different contexts and also to be able to communicate their ideas clearly to other individuals who speak the same language. Therefore, in many situations knowing a language is equated with speaking that language impeccably. In addition, especially at advanced levels, oral presentation is one of the most fundamental prerequisites for many language courses or subject matters that are presented via the medium of L2. Consequently, many studies in the arena of teaching and learning L2 have focused on the oral performance of students in foreign or second language classrooms (Yu, 2003; Volle, 2005) and the factors affecting oral presentations (for example, Consolo, 2006).

Now a question that comes into mind is that what exactly an oral presentation is. A presentation can normally be identified by three main elements: (1) it is almost always prepared in outline form and spoken from aids or notes; (2) it normally involves visual aids or graphics; and (3) it usually is given to a participating audience, asking questions and engaging in dialog as in most classrooms. Oral presentations are a common requirement in many courses. They may be short or long, include slides or other visual aids, and be done individually or in a group which can be done by other people (Jing, 2009). Since in oral presentations, the aim is usually to convey information to audience, they can provide a real life context for communication in the second of foreign language and increase learners' interaction in the classroom.

Furthermore, it is axiomatic that English is an international language used by scads of people as a first, second, or foreign language for communication purposes (Strevens, 1992). The purpose of teaching English, as a result, has shifted from structure learning to the ability to use the language for communicative purposes. In other words, in the past, the aim of teaching English was the mastery of the structure of the language. However, in this age of communication, English seems to be playing a major role, and the purpose of teaching the language has shifted from the mastery of structure to the ability to use the language for communicative purposes. Thus, the communication aspect of teaching English has gained importance. Moreover, the ultimate goal of language learning is "authentic communication between persons of different languages and cultural backgrounds" (McIntyre, Clement, Dörnyei, & Noels, 1998, p. 559). Consequently, the issues of whether learners would communicate in English when they had the chance and what would affect their willingness to communicate gain importance. Recently, a "Willingness to Communicate" (WTC) model was developed by McIntyre et al. (1998) to explain and predict second language communication.

The concept of "Willingness to Communicate" (WTC) was first coined by McCroskey and his colleagues in relation to communication in the native language (McCroskey, 1992; McCroskey & Richmond, 1990; Zakahi & McCroskey, 1989). McCroskey and Richmond (1990) consider WTC as a personality feature and define it as "variability in talking behavior". WTC was originally introduced with reference to L1 communication, and it was considered to be a fixed personality trait that is fixed across situations, but when WTC was also stretched to L2 communication situations, it was propounded that it is not necessary to be playing a major role, since the use of an L2 suggests the potential for important situational differences based on wide variations in competence and inter-group relations (Macintyre, Clément, Dörnyei, & Noels, 1998). They claim that even though situational variables might have an impact on one's willingness to communicate, individuals exhibit similar WTC tendencies in different situations. Moreover, they identified introversion, self-esteem, communication competence, communication apprehension and cultural diversity as factors that lead to differences in WTC. Willingness to communicate (WTC) is also defined as "readiness to enter into discourse at a particular time with a specific person or persons using a L2" (McIntyre, Clement, Dörnyei & Noels, 1998, p. 547). WTC can also be understood as the probability of involving in communication when free to select to do so (McCroskey & Baer, 1985). As such, WTC shows a psychological readiness to speak a second or foreign language, and is based on much more than objective linguistic competence.

Besides, Self-Regulated Learning (SRL) has emerged as an important new construct in education. As the general picture of school to date is not a satisfactory one, the concept has been accepted by policy makers, teachers, educators and parents. With the emergence of this new construct, lots of debate about school reform appeared world-wide. Policy makers nowadays approve and support the basic principles of self-regulated learning and consider school reform as one of their main goals intending to change the status of the schools. In other words, educational psychologists and policy makers seek self-regulated learners. Self-regulated learning can also be described as an active process whereby learners construct goals for learning, monitor, regulate, and control their cognition, motivation, and behavior (Paris & Paris, 2001). They are guided and constrained by their own goals and the individual characteristics of a particular learning environment. Self-regulatory

activities affect individual students, their level of achievement, and the learning context. It is important for students to learn how to learn and take control of their efforts (Wolters, Pintrich, & Karabenick, 2005).

In addition, language learners learn a language because they want to acquire and use it to communicate with those who speak the language. They may also want to get to know the native speakers' culture and learn about the country where the language is spoken. However, what happens if a university requires students to learn a second or foreign language that the students do not wish to learn? It is obvious that students who do not want to learn the language will not be able to do well in class. Researchers believe motivation to learn is an effective factor in language learning.

Taking into account issues like the present one contribute significantly in the better and more telling teaching and promoting of a language. That is, by knowing whether there is any relationship among the above-cited variables, teachers can take the most suitable strategies to encourage learners to use the language for communicative purposes and to regulate their own learning process more effectively and without causing any negative feeling. Moreover, although several studies have been conducted in recent years on self-regulation, very few, if any, have specifically focused on exploring the relationship between Self-Regulation, WTC, and oral presentation. Besides, this study is significant in that it can provide valuable data to those who serve on the front line of education. The research results may serve as a guide for foreign language teachers in terms of helping them to increase their understanding of language learning from the learner's perspective and give them more insight into the advantage of self-Regulation in communication and thereby assist them in enhancing students' ability to communicate better English. Finally, no previous study has exclusively dealt with the interrelationship among these three issues; consequently, making the present study more important than before.

### BACKGROUND TO THE STUDY

Oral presentation is a practical device that if implemented carefully can provide many opportunities for language learners. Godev (2007), enumerating various benefits of oral presentations, believes that the oral presentation can give learners an awareness of new rhetorical devices that are specific to the rhetorical situation. It also provides the students with the opportunity to experience a creative process that is very similar to the writing process. In particular, Godev (2007) suggests that the oral presentation with an appropriate topic provides an enriched ground for students to use their oral skills and at the same time incorporating morpho-syntactic and discourse structures that are needed for intermediate and advanced proficiency levels. Furthermore, considering the increasing demands for a move from teacher-centered activities toward student-centered instruction (Wenden, 2002; Lee & VanPatten, 1995) It seems that oral presentation is extremely suitable for applying this principle since students have some freedom to choose a topic of their own interest, and they play the primary role during the oral performance while the teacher's role becomes secondary during the presentation.

However, to be more effective, oral presentations should follow an appropriate procedure. Godev (2007) suggests the procedure for delivering successful oral presentations should consist of: "(1) defining the topic, (2) providing information sources, (3) assisting the audience, (4) keeping track of the preparation process, (5) organizing the talk, (6) delivering the talk, and (7) obtaining the desired grade" (p. 2). In this line, the topic of presentation must be consistent with and covered in the syllabus. Teachers also should make accessible sources of information to the students in order to minimize research time. Furthermore, students must be instructed on how to interact with the audience and in order to monitor the process of preparation for oral presentations, students may be required to keep track of the preparation process in the form of various portfolios or self reports. In addition to the way students organize their talk and the way they deliver it to the audience, a grading criterion is needed to show the clarity, quality, organization of the ideas, etc. in oral presentations (Godev, 2007).

There have been many attempts to realize willingness to communicate (WTC) to expound a person's degree of readiness to take part in discourse in a second or foreign language (MacIntyre, Clement, Dornyei & Noels, 1998). Some researchers have discussed that a basic goal of second language education should be the construction of WTC in the language learning process (MacIntyre et al., 2002). It is proposed that higher WTC among learners translates into increased opportunity for practice in an L2 (Second Language) and authentic L2 usage (MacIntyre et al., 2001).

MacIntyre, Baker, Clément & Donovan (2002) in their studies investigated the role of gender regarding affective variables. Their findings espouse those of preceding studies (e.g., Gardner, 1985) which uncovered more desirable attitudes and motivation among female language learners. In the MacIntyre et al (2002) study, results revealed an increase in WTC and a decrease in anxiety among girls as they mature whereas boys remained constant throughout their middle school years (i.e., Grades 7-9; ages 11-13). Baker and MacIntyre (2000) reported that girls had greater levels of WTC inside the classroom whereas boys were more willing to use their L2 outside the school context. Another factor which may affect WTC is the channel of communication. In the past, research in computer-mediated communication (CMC) has implied that the computer might change a student's willingness to communicate. Freiermuth (1998, 2001), as an example, found out that when groups of language learners using CMC were presented with a task to solve, they seemed more willing to communicate than groups using spoken language. On the basis of Freiermuth, the discrepancies could be related to use of the computer rather than other variables. In other words, online chat gave students an opportunity to express themselves without being prevented by the teacher, other students or a surfeit of other elements that might reduce the effect of the experience.

Schunk and Zimmerman (1998) have pointed out that self-regulated learners are generally characterized as active participants who efficiently control their learning experiences in many different ways, including organizing and rehearsing information to be learned, and holding positive beliefs about their capabilities, the value of learning and factors that influence learning. SRL is also the ability to control and influence one's learning processes positively. The learners take personal initiative and apply powerful strategies to attain individually valued learning goals and monitor their understanding in order to detect and eliminate possible comprehension problems (Paris & Paris, 2001).

Self-regulated learning can also be described as an active process whereby learners construct goals for learning, monitor, regulate, and control their cognition, motivation, and behavior (Paris & Paris, 2001). They are guided and constrained by their own goals and the individual characteristics of a particular learning environment. Self-regulatory activities affect individual students, their level of achievement, and the learning context. It is important for students to learn how to learn and take control of their efforts (Wolters, Pintrich, & Karabenick, 2005).

Graham and Harris (1994) assert that self-regulated learning skills are indispensable at almost all levels of education. They then add that self-regulation assumes a prominent position in contemporary models of teaching and learning and is a major focus in the New Learning Environments (NLEs) approach. Working from a social cognitive perspective, Schunk and Zimmerman (1994) define self-regulation as a

process students use in order to activate and sustain cognitions, behaviors, and affects which are systematically oriented toward attainment of their goals" (p.309). Students who are self-regulated actively participate in their own learning, rather than relying solely on teachers, parents, or other external change agents to import knowledge (Alexander, 1997).

## RESEARCH QUESTIONS

In line with the above statements, the present study is an attempt to provide answers to the following question:

- 1) Is there any interrelationship between the self-regulation of EFL learners and their oral presentation performance?
- 2) Is there any interrelationship between the WTC of EFL learners and their oral presentation performance?
- 3) Which of the independent variables of the study is a better predictor of learners' oral presentation?
- 4) Does the gender of learners affect significantly their oral performance?

## METHODOLOGY

### Participants

All in all, 90 Iranian language learners, based on random sampling procedure, attending an English language institute in Shahrekord, Iran took part in the study. The participants, who were taking advanced-level courses, were 45 male and 45 female and aged between 21 and 38 years old. The reason for selecting advanced-level language learners was that in this level of proficiency much more communication is needed in classes than what is in elementary and intermediate levels.

### Materials and Data Collection

The first material employed in the present paper was a questionnaire on willingness to communicate. It was used to measure the participants' willingness to communicate. It comprised twelve items (Cronbach alpha = .83) from McCroskey (1992). The respondents chose the percentage of the time ranging from 0% to 100% that they would be willing to communicate in different contexts and with different addresses. As with the reliability of the questionnaire, the questionnaire was distributed among 25 learners, exclusive of the main participants. Calculating the Cronbach alpha formula, it turned out to be .81. Besides, the content and face validity of this instrument was examined by some professional experts of Shahrekord and Shiraz universities and was confirmed by them to be valid for the present paper purpose. Furthermore, to gain data regarding the self-regulation variable of learners, Language-Learners' Self-Regulating Questionnaire (LLSQ) were utilized. It consists of 12 subscales with a total of 36 items. Besides, for ensuring about the reliability of the questionnaire, a pilot study was conducted on 25 advanced-level language learners who were not included in the study sample. The reported reliability was about .78. Finally, as to the validity of the questionnaire, it was looked into by the above-mentioned professors and was approved by them to be valid for the study purpose. Finally, the language learners were also supposed to give an oral presentation on a topic favorite to them. The main reason for allowing them to choose their own topics was to diminish the negative effects of stress and other affective factors as much as possible. For evaluating their performance, a scheme was developed by the author (with the consultation of some seasoned professors and also reviewing a set of related books). The scheme consisted of a set of subsections, each assessing different aspects of learners' oral performance including their stress, fluency, structure accuracy, appropriate vocabulary, etc.

### Data Analysis

The gathered data was subjected to statistical analysis to explore the existence of any relationship between self-regulation of the language learners and their WTC and their oral performance. To be more exact, SPSS version 16 in general and two correlation analyses, along with a regression, and one independent t-test in particular were run to ascertain data regarding the above-mentioned questions.

## RESULTS AND DISCUSSION

To present the results of the study, the research questions of the study mentioned in the initial sections of the study are individually brought in and then by considering the related obtained findings of the study are answered. The first research question was:

- 1) Is there any interrelationship between the self-regulation of EFL learners and their oral presentation performance?

Regarding the first question in this research, it wanted to see if there is any relationship between the self-regulation of learners and their oral presentation performance. To gain knowledge on this point, correlation statistical analysis was run. Table 1 represents the results of the test.

*Table 1: Self-Regulation and Oral Presentation Correlation*

		Self-regulation	Oral presentation
Self-regulation	Pearson Correlation	1	.947
	Sig. (2-tailed)		.00
	N	90	90
Oral presentation	Pearson Correlation	.947	1
	Sig. (2-tailed)	.00	
	N	90	90

A set of interpretations can be made by considering this table. First, the table shows that there is a high correlation between the two factors of the study that is, self-regulation and oral presentation (Pearson Correlation = .94). Second, because the Pearson value is a positive value, it may be inferred that there is a positive correlation between the two variables. Finally, the coefficient of determination can also be obtained from the table. It is resulted by squaring the r value and converting the obtained value into percentage of variance (by multiplying it by 100).

The  $r$  value showed in the table is almost .94. Therefore, coefficient of determination will be approximately 88 percent; meaning that the two variables share a considerable amount of variance. Finally, a significant difference is observed between the variables ( $p = .00 < .05$ ).

- 2) Is there any interrelationship between the WTC of EFL learners and their oral presentation performance?

Having ascertained that there is a high, positive relationship between the self-regulation of the language learners and their oral performance, now in the second research question the interrelationship of WTC and oral presentation is addressed. Table 2 represents the pertaining results.

Table 2: WTC and Oral Presentation Correlation

		WTC	Oral presentation
WTC	Pearson Correlation	1	.87
	Sig. (2-tailed)		.00
	N	90	90
Oral presentation	Pearson Correlation	.87	1
	Sig. (2-tailed)	.00	
	N	90	90

The table shows that, like the previous case, there is a high correlation between the two variables (Pearson Correlation = .87). Second, because the Pearson value is a positive value, it may be inferred that there is a positive correlation between the two variables. Finally, the coefficient of determination will be approximately 75 percent; meaning that the two variables share a considerable amount of variance. Finally, a significant difference is observed between the variables ( $p = .00 < .05$ ).

- 3) Which of the independent variables of the study is a better predictor of learners' oral presentation?

Having proved the existence of a strong positive correlation between each of the two independent variables of the study (self-regulation and WTC), now the results of regression analysis is brought in to see which of the independent variables is a better predictor of learners' oral presentation performance. Table 3 presents the model summary findings of regression.

Table 3: Model Summary of the Variables

Model	R	R Square	Adjusted R Square	Std. Error of the Estimate
1	.915	.71	-.70	1.72

As the table reveals, 71 percent of the variance in the learners' oral performance is explained by the combination of the two independent variables namely self-regulation and WTC ( $R^2 = .71$ ). Besides, to see whether the coefficient of the regression demonstrated by  $R^2$  is significant or not, Table 4 is brought.

Table 4: ANOVA Results of Self-regulation and WTC Related to Oral performance

Model		Sum of Squares	df	Mean Square	F	Sig.
1	Regression	97.0	2	48.5	.513	.001
	Residual	7191.5	76	94.6		
	Total	7288.5	78			

The tables demonstrates that the coefficient reported by  $R^2$  is significant (Sig. = .001). Now to pinpoint which independent variable is a better predictor of writing performance, Table 5 needs to be examined.

Table 5: Coefficients of self-regulation and WTC

Model		Unstandardized Coefficients		Standardized Coefficients	t	Sig.
		B	Std. Error	Beta		
1	(Constant)	74.566	8.207		9.085	.000
	WTC	.053	.136	.47	.390	.02
	self-regulation	.103	.102	.21	-1.010	.04

The table indicates that of the two independent variables, it is WTC that is a better predictor of learners' oral presentation performance. In other words, by examining the Beta value reported in the same table it can be inferred that with regard to WTC, one standard deviation unit change in the score for motivation leads to .47 unit of change in the oral presentation performance. And as to the self-regulation variable, this unit of change would be .21. Therefore, WTC can better predict the writing performance of language learners.

- 4) Does the gender of learners affect significantly their oral performance?

Finally, to ascertain whether there is any significant difference in the performance of language learners in terms of their gender, the independent t-test findings in the form of Table 6 are revealed.

**Table 6: Independent T-Test of Gender and Oral Presentation**

	T	Df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
						Lower	Upper
Oral presentation	14.44	60	.00	.30	.46	1.36	.70

The table shows that the difference between the two variables is significant ( $t=14.44$ ,  $p=0.00$ ). Therefore, it can be inferred that the gender of language learners has a noticeable effect on the learners' oral performance. Now to see whether girls or boys outperform as far as oral presentation is concerned, Table 7, representing the descriptive statistics, is discussed.

**Table 7: Descriptive statistics of the Gender and oral performance**

	code	N	Mean	Std. Deviation	Std. Error Mean
Oral performance	Male	45	11.47	2.13	.36
	Female	45	25.23	3.44	.48

This table clearly indicates that the mean of females ( $M=25.23$ ) is remarkably higher than the mean of males ( $M=11.47$ ). It means that females are better oral presenters than males. Amid assorted studies about gender differences on different aspects of language, though no specific study has specifically dealt with the effect of gender on oral presentation, however, it has been several times asserted that educational research in the last several decades has proven that the gender differences manifestly influence students' academic interests, needs, and achievements (Halpern, 1986; Collins, Kenway & McLeod, 2000). A number of studies conducted in various contexts have confirmed the presence of gender-related differences in verbal ability and language use (Thorne *et al.*, 1983; Tannen, 1990). The consensus seems to be that females are superior to males in general verbal ability (Denno, 1982), but there is disagreement about which types of verbal ability shows gender differences. Moreover, MacIntyre, *et al.* (2002) in their studies investigated the role of gender regarding affective variables. They reported that girls had greater levels of WTC inside the classroom whereas boys were more willing to use their L2 outside the school context. From these findings it can be also concluded that females are more willing to have oral performance inside classrooms than males. One probable reason for this superiority can be, as Rua (2006) rightly states, girls' achievement in foreign language learning is enhanced by the interaction of neurological, cognitive, affective, social and educational factors.

## CONCLUSIONS

The present study was, in fact, an attempt to shed light on the point that if there is any interrelationship between the two independent variables of self-regulation and WTC of language learners and their oral presentation performance. If yes, the study also tried to ascertain which of the above-mentioned variables could account for the oral performance of learners. In addition, the examination of the effect of the gender of learners on their performance was also another purpose of the current study.

As it was afore-mentioned, the analysis of the gathered data led to the following conclusions: First, there is a strong, positive relationship between the self-regulation of language learners and their oral presentation performance. Second, there is also a strong, positive relationship between the WTC degree of language learners and their oral performance. Third, of the two intended independent variables, WTC is a better predictor of the learners' oral performance. And finally, the gender of language learners doesn't significantly affect the learners' oral presentation.

The study also enjoys three major implications. First of all, self-regulation plays a salient role in the oral performance quality of language learners; therefore, language teachers continually need to reflect upon their teaching strategies and activities in order to help language learners manage, control, and enhance their self-regulation abilities. Second, teachers should also consider the point that the more self-regulated the learners, the more is the likelihood that the learners achieve higher acceptable functions they are assigned. Finally, as a general implication, individual differences of learners (like WTC) play a crucial role in the effectiveness of teaching and learning process. Therefore, those who are involved in these processes (especially teachers) should be alert to the learners' individual differences.

Lastly, the study may suffer from a set of limitations. First and foremost, the number of the participants is not large so that the findings need to be approached cautiously. Likewise, since the study is unique in its nature and purpose, more studies are encouraged to be done so that more accurate and reliable findings and conclusions might be drawn. Furthermore, other researchers are called for doing the same topic with regard to other variables including self-esteem, motivation, and also for other skills such as listening, reading, and even writing performances.

## ABSTRACT

Critical Pedagogy (CP) is an approach in teaching methodology that basically derives from critical theory. This approach of teaching aims at empowering the students with abilities to think critically about their educational situation and allows them to recognize connections between their individual problems and experiences and the social contexts in which they are embedded. In this paper, the main building blocks and the opposing crumbling blocks of CP including the basic concepts of schooling vs. education, control vs. democracy, authoritarianism vs. authority, individualism vs. individuality, deskilling vs. reskilling, and traditional literacy vs. critical literacy are discussed. The aim of this paper is providing an in-depth analysis of CP tenets and clarifying its rubrics as means of consciousness raising among English as a foreign language (EFL) practitioners and students.

**KEYWORDS:** Critical pedagogy; education; democracy; authority; individuality; reskilling; critical literacy.

## INTRODUCTION

### *What does CP endorse?*

Critical pedagogy's tenets aim at equipping the students with necessary critical awareness needed to question and challenge domination, and the beliefs and practices that dominate. In other words, it is a theory and practice of helping students achieve critical consciousness. The application of some building blocks of CP in various educational systems means establishing a closer relationship between teaching and learning (Giroux, 1983). It is a continuous and active process of consciousness raising, learning, reflection, evaluation and the impact that these actions have on all the students in general, and the students who have been disenfranchised by traditional schooling in particular.

Different critical pedagogues have defined CP in quite various ways, stressing different aspects of this approach (Shor, 1992; McLaren, 1997; Freire, 1970, 1974). The main endorsements of CP provided by some pioneers critical pedagogues are presented below.

Giroux (1994), being an influential figure and one of the main contributors in the field of CP maintains that "[Critical] pedagogy signals how questions of audience, voice, power, and evaluation actively work to construct particular relations between teachers and students, institutions and society, and classrooms and communities. Pedagogy in the critical sense illuminates the relationship among knowledge, authority, and power" (30). Popkewitz (1991) is of the opinion that the primary preoccupation of critical pedagogy is with social injustice and how to transform inequitable, undemocratic, or oppressive institutions and social relations.

Douglas (2000) contends that CP considers the way education can equip the individuals with the tools to better themselves and strengthen democracy, to create a more egalitarian and just society, and thus to deploy education in a process of progressive social change. According to Burbules (1995) "a fundamental assumption of a critical pedagogy is that it is a broad educational venture which self-consciously challenges and seeks to transform the dominant values of our culture."

Likewise, Shor (1992) believe that CP is basically concerned with the kinds of educational theories and practices that motivate both students and teachers to consciously recognize the interwoven relationship among ideology, power, and culture which challenges us to recognize, engage, critique and finally take transformative action against any existing undemocratic social practices and institutional structures that produce and contribute to inequalities and oppressive social identities and relations.

McLaren (2000) maintain that transformative pedagogy focuses on social realities which are critically analyzed by students through a process of collaborative dialogue. Using the cultural capital of the students, classrooms become a forum in which students are able to voice opinions which have been silenced in traditional pedagogy's practices. This process can be both validating and empowering as students come to learn that their actions can enable change either at the micro- and/or macro-level.

## THE BUILDING BLOCKS VS. THE CRUMBLING BLOCKS

For any teacher to be able to act as a genuine critical pedagogue, it seems essential to know the distinctions between some basic keys and concepts in the field under discussion. These definitions provide an overview of how critical pedagogy is being compared and contrasted with the traditional schooling system. Detecting the points of departure between the two systems, creates awareness on the part of practitioners, and provides an insight on how to act in favor of a more democratic system of education for the aim of developing a more egalitarian educational system (Giroux, 1988). These include the differences between the categories of Schooling vs. Education, Control vs. Democracy, Authoritarianism vs. Authority, Individualism vs. Individuality, Deskilling vs. Reskilling, and Traditional Literacy vs. Critical Literacy (Freire, 1974). These concepts are discussed below.

### *Schooling vs. Education*

Critical pedagogy roots itself in the belief that every citizen deserves an education. The distinction between schooling and education is important here. Schools structure is a socially efficient system of management and control in which a rigid rule structure, standardized curriculum, and the like are dominated. Schools often ignore the role of an educated person and rely more on what is called schooling methods to secure a future for students. Schooling has some inherent features. The basic logic for schooling relies on preparing students for a market economy (Giroux & McLaren, 1994). This logic is also intensified both in and out of schools - parents signifying to their children that what is needed for a better job is an education, tracking systems in school that in hidden ways prepare students for differentiated social class divisions, and excessive competition to prepare students for the economy (standardized high-stakes tests). This rubric of market logic bases the students need to learn (Giroux, 1988).

Education, on the other hand, presupposes that the student is intrinsically motivated to learn and the teacher intrinsically motivated to teach. While grades and the like are an important element to school structures, the reason for teaching and learning are not fuelled by numbers, but by a sheer desire to attain knowledge for its own sake. In other words, education involves passion for one's subject matter, the ability to get

student to think critically, being creative about subject matter content, creating a classroom of an active community revolved around the learning of material, and the strong desire to teach and to learn. Moreover, education involves the teacher understanding the schooling structure that wouldn't allow education to develop. Thus, the ability to create an education involves the understanding of schooling mechanisms. Challenging presuppositions of schooling concepts requires both teachers as well as students becoming transformative intellectuals (Giroux, 1988). On the one hand, creating transformative intellectuals means being critical of all forms of schooling. On the other hand, it puts the teacher into a moral confusion. What kind of education can I give my students so that they can be critical citizens, so I can generate democracy in my classrooms, so I can open up options for them, given the pervasiveness and need for schooling to survive in this society?

It seems that the reason teachers want to become teachers is because they desire to educate their students. But, as they enter into the system, they are led to "school" their students, much like they were schooled both in their public school history as well as their teacher education departments.

#### ***Control vs. Democracy***

Under the rubrics of schooling, schools become control mechanisms which challenge the message of democracy. Purpel (1989) contends that schools have been captured by the concept of accountability, which means that schools need to be responsive and responsible to community concerns to one in which numbers are used to demonstrate that schools have enhanced the requirements. This induces a reductionist viewpoint in which priority is given to the need to control than to understand educational considerations. The need to control produces control mechanisms, such as standardized high-stakes tests, which are quality control mechanism. The curriculum, teachers and staff are all somehow controlled by this control mechanism.

Purpel further suggests that the concern of control is demonstrated when schools control the way the students act, feel and think. Control of ideas, values and stereotypes including race, class and gender, are usually manifested and practiced in schools.

Democracy, on the other hand, is manifested in the guise of education. Control mechanisms are challenged, negotiated and confronted. CP holds that democratic principles must become a way of life in all subject areas and all extra-curricular contents. Examples would encompass teachers and students in all subject areas creating limits for behavior control by writing class rules co-operatively, and teachers and students negotiating forms of testing, rather than taking the regular standardized type only.

Burbules (1995) contends that democratic education also involves fostering a challenge to all forms of individualism and negative competition. He further asserts that more co-operative learning, less stress on the value of success as the major reason for coming to school, and more individual student participation in different educational projects will pave the way for the possibility of student voices to be heard.

#### ***Authoritarianism vs. Authority***

Freire (1985) believes that within a schooling outlook, control mechanisms, a standardized curriculum, a rigid rule structure, and top-down hierarchy direct the authoritarian nature of schools. Authoritarianism is rooted in bureaucratic system. In such an authoritarian structure, clearly defined structural leaders and their subordinates form a hierarchical ladder of control and division of labor (teacher tasks, various male or female related student tasks, division of principal and vice-principal tasks, etc.). Based on Freire's standpoint, this notion of authoritarianism is implanted in what schools know as authority. It is usually defined and practiced rigidly and solidly.

A critical pedagogue will hunt for education by recognizing that authority has multiple meanings and can be democratically negotiated. First, the teacher educator is an authority over his/her subject matter. Second, the teacher educator is not the only authority in the classroom. Teachers and students share each other's knowledge. Learning this way becomes reciprocal and dialogical. That is, teachers learn as well - in particular about student cultures. In other words, students become authorities over their own cultures.

Under the rubric of authority and education, teachers will explore multiple ways through which authority can be redefined by establishing social relationships that are democratic.

#### ***Individualism vs. Individuality***

The progressive "educator," just like the transformative intellectual, has the ability to "see" through various oppressive school structures. For instance, the critical pedagogue obviously visualizes how schools promote the value of individualism over individuality. Individualism demonstrates the hunt for human domination, excessive and sometimes negative forms of competition, self and instant fulfillment, and egotism. Here, the belief is that the individual is the center of life. Standardized tests and the division of social class, the set-up of a reward system that merely promotes negative competition between peers, stereotypes based on one's personal achievement, gender bias, basing one's worth on achievement, gifted programs, university entrance exams, school cheating systems and merit systems that promote individual antagonism, and many other examples, becomes a part of this school structure. Schooling is a part of individualism but can be challenged where necessary.

The educated and critical teacher recognizes individual accomplishments, bases one's value on who he or she is rather than what he or she achieves, and listens to and empathizes with a student voice by understanding the student. The educated teacher, the one inclined to oppose individualism, will search for multiple ways of authentic assessment, various types of discipline, alternate rule making, and different forms of classroom management. This critical teacher will try to develop an understanding of what is being done via school is often negative ethic of competition. This is not to say that critical pedagogues should challenge every policy, but that the right times and issues must be chosen to seek the ethical responses to forms of the alienation, subordination and oppression that individualism raises.

As critical educators, it is crucial that we develop an understanding of other individuals who do not share the same ideological standpoint. To refute voices of ideological opposition contradicts the very premise of individuality. Besides, the nature of democracy is the promotion of the individuality that is so often suppressed by school structures. If we want to work within the structures of oppression, we also have to work with those people who promote those structures! And that becomes the essence of a struggle that critical pedagogues find themselves both in and out of the classroom.

#### ***De-skilling vs. Re-skilling***

The "schooled" teachers lack control over their own work. For instance, a schooled teacher doesn't make curricular decisions. Deskillling deals with teachers executing someone else's goals and plans. Teachers are taught the skills to teach at schools, for example to execute tasks, manage the classroom, develop discipline procedures, create assignments, make tests, evaluate tests, disseminate curriculum, build unit

plans, and vary teaching methodologies. These works all aim at deskilling teachers. This happens when the skills teachers are taught in teacher education are unusable in practice.

Deskilling is manifested when teachers lack autonomy over teaching and decision making processes. By making teachers accountable for pre-specified curriculum and by promoting competency-based education, system management, and employing rigid and dehumanizing forms of evaluation along with numerical rating scales, teachers are controlled and deskilled.

An educated teacher and a critical pedagogue understand and feels this deskilling process. The notion of reskilling refers to teachers being aware and critical of the multiple forms of deskilling. Reskilling occurs when teachers challenge stereotyping, find ways to go through alternative teaching methodologies, build curriculum with open and critical viewpoints, and form common understandings over issues of value.

In short, reskilling happens when teachers are able to move around forms of schooling, and ultimately find ways to educate. Acts of reflection on subject matter, on goals of educational transformation as well as searching for those values that challenge forms of personal and institutional oppression will serve the educated and critical teacher. On the practical side, this means that if social studies teachers are to teach about the tenets of democracy, democratic practice must occur in the classroom. Practically, teachers would have to get students to get beyond stereotypes and begin to create exercises that promote empathy. In other words, educator and critical pedagogue becomes a reskilled practitioner who is committed to justice particularly within the boundaries of the schooling structure. This makes the critical educator more literate.

#### ***Traditional Literacy vs. Critical Literacy***

Under the schooling rubric, traditional literacy holds schools morally accountable to provide a technical mastery of skills for students; to be functional in the basics of reading, math, and writing. More than that, schooling or traditional literacy also means teaching these functions on multiple levels, but with little creativity, no sense of purpose other than passing to the next grade, and little moral vision or insight as to a larger picture revolving around education (Freire & Macedo, 1987).

Critical literacy under the guise of education distinguishes itself from the traditional literacy in that it asks teachers to teach for analytical purposes, for multiple interpretations, and for moral reasoning. Under critical literacy, the educated teacher, as well as student, takes issues such as gender, class and race seriously both in classroom management as well as curriculum content. Critical literacy allows the teacher to connect curriculum to texts as well as to student experience, thus making knowledge more relevant and introspective for both teacher and student.

In short, the critical literate teacher with an educated attitude, while schooling her/his students in the technical sense (getting facts straight, partaking in standardized tests, etc.), adds a necessary skills to their teaching material, which is a committed and visionary understanding that critical pedagogy is a form of education that must be strived for as necessary acts of resistance to oppressive schooling structures.

#### **THE FINAL WORD: FROM DESPAIR TO HOPE (FREIRE, 1970)**

In Freire's (1970) words "to remain a teacher who relies on schooling is the despair that we all can fall into. School structures such as time, bureaucracy, hierarchy, curriculum, etc., have a way of deskilling the teacher and robbing her/him of the enthusiasm to proceed with their job creatively". Freire (1970) maintained that being critical means being reflective on how one is personally schooling themselves and their students, as well as theoretically and practically trying to move out of the schooling mentality.

Freire further asserted that the hope lies in educating our students by deciding when and where it is appropriate to resist schooling structures. In Freire's (1974) words "Hope lies in asking and answering this following question, and then, subsequently, taking action. To what end do I teach?" Providing answer to this question requires the critical pedagogue to understand that teaching is more than about transmitting the basics of schooling. It is about the importance and prominence of educating for democracy. Bringing about positive changes in the educational systems, and in the society at large, requires a lot of work to be done by teachers.

**ERRORS OR MISTAKES?  
INCORRECTNESS IN STUDENTS' ANSWERS  
IN A SUBJECT-MATTER EXAMINATION**

**Ekaning Krisnawati**

*English Department, Universitas Padjadjaran, Bandung Indonesia*

*Email: ekaning.krisnawati@unpad.ac.id*

**ABSTRACT**

Second Language Acquisition has included only error analysis. To date practically in the classroom, it is difficult to distinguish between errors and mistakes. Because Ellis (1997) states that a clear cut of errors from mistakes may not be possible, this paper discusses any incorrectness, be it an error or a mistake, students made in one of subject-matter examinations and attempts to categorize and seek causes of the incorrectness. The answers in a subject matter examination of seven students were selected to determine types of errors and mistakes they made in the examination. From the analysis it can be concluded that the errors and mistakes include omission, overgeneralization, and L1 transfer. Global incorrectness in terms of literally translated sentences from Indonesian language into English has resulted in hardly comprehensible sentences.

**KEYWORDS:** error, global error, local error, mistake, subject-matter examination

**INTRODUCTION**

The study of Second Language Acquisition has placed the importance of learners' errors in developing proficiency in L2. Learners' errors have been perceived to enhance the developmental stages in language learning. A research conducted by Abbot (1981) has revealed that error analysis is equally unreliable as contrastive analysis. He concludes that error analysis complements contrastive analysis. Due to this view, I argue that it is therefore, important to carefully investigate any incorrectness learners make in the classroom regardless of the term used academically. A study on exploiting learners' errors in Malaysia by Haded (1998) has revealed that interlingual errors and intralingual errors were made due to reliance on mother tongue. Error awareness in advanced students of EFL of Malaysian students has proved to yield insignificant results after a four-month instruction (Tahririan, 1986). As for advanced university students at the academic level in genre-based writing, Henry and Roseberry (2008) have concluded that raising student's awareness of usage types and patterns is far more crucial than instruction in grammar.

**ERRORS AND MISTAKES**

It is general to distinguish between errors and mistakes. Mistakes are caused by the learners not putting into practice something they have learned while errors are caused by the learner trying out something completely new and getting it wrong (Bartram and Walton 1991, p. 25). Ellis (1997) says that errors reflect gaps in a learner's knowledge; they occur because the learner does not know what is correct. Mistakes, on the other hand, reflect occasional lapses in performance because the learner is unable to perform what she knows. According to Ellis, to distinguish errors from mistakes is through consistency of learners' performance. In the classroom, however, the teacher cannot immediately identify if the learner makes an error or a mistake. In practice, what the teacher knows is that the learner make, in the end Ellis (1997) himself admits that "a clear distinction between an error and a mistake may not be possible".

Errors can have different sources, some of which can be universal which reflects learners' attempts to make learning L2 simpler. Universal errors include errors of omission and overgeneralization, irrespective of the learners' L1 (Ellis 1997, p. 19). Another error is called transfer, which denotes an attempt to make use of the learner's L1 knowledge.

Bartram and Walton (1991) state that mistake is wrong language which a native speaker would not usually produce, that is, something that only learners of the language produce (p. 21). This definition still raises a question from the teacher, "How does the teacher know that certain correctness is only produced by a learner and not a native speaker?" One basis to define a mistake may be based on our intuition of our mother tongue. In our mother tongue, it is unlikely that we misspell words; it is, therefore, a misspelled word is a mistake. But again, with reference to what Ellis has stated, in practice it is difficult to distinguish between an error and a mistake.

**CONTRASTIVE ANALYSIS AND ERROR ANALYSIS**

Prior to error analysis as studied in Second Language Acquisition, contrastive analysis (CA) was emphasized to denote similarities and differences in L1 and L2 and through the approach, teachers could predict problems faced by learners. The aim was more on effective teaching and testing. Language acquisition was sequenced along the process of stimulus-response-reinforcement. One assumption in the approach is that there will be transfer in learning from L1 to L2. The transfer is called positive (or facilitating) when the same structure is appropriate in both languages. However, the transfer is called negative (or interference) when the structure of L1 is inappropriately used in L2 (Saville-Troike, 2006 p. 45).

Error analysis as the first influential work was an article by Corder in 1967, which states that errors are not bad habits to be eliminated by learners. Instead, he says that learners' errors can provide insights into the learning process. Errors, then, can be perceived as a way toward improvement in the learning process. A good saying says that practice makes perfect and experience in the best teacher. It is expected that through errors learners make, they can better themselves in achieving a native-like proficiency. Saville-Troike (2006) states that error analysis "focuses on learners' creative ability to construct language". Her definition includes the phrase creative ability, which means that learners are self-motivated to create a structure that (s)he has not mastered. She further explains that error analysis is based on the description and analysis of actual learners' errors in L2.

A study conducted by Ney (1986) has stated that error analysis has the characteristics of structuralism, in which:

1. Error analysis is taxonomic in nature.
2. Error analysis creates theories by induction.
3. Error analysis relies on the corpus for its data.

He further explains that both theory of structuralism by Saussure and transformational by Chomsky study writing as a form of language. Transformational theory rejects the significance of corpus as data in error analysis. Chomsky (in Ney, 1986) argues that a learner can produce an unlimited number of sentences and errors made in a corpus do not reflect learners' ability to produce language. This claim is affirmative as a study by Schacter in 1974. She worked on relative clauses written by learners from Chinese, Japanese, Arabic and Persian whose English was not the native language. She concludes that Chinese and Japanese learners made fewer errors in relative clauses than the Arabic and Persian ones. This is simply the Chinese and Japanese learners avoided writing relative clauses because this clause does not exist in their native language. What can be exploited from her study is that learners simply avoid structures that does not exist in their native language and teachers should know what their learners avoid doing in learning a language. Her conclusion is contentious since languages differ structurally and learners should learn (or acquire) as many structures as possible to achieve native-like proficiency.

## RESEARCH QUESTIONS

The questions that are discussed in the study are:

1. What errors and mistakes were made by the students in the examination?
2. What are the causes of the errors and mistakes?

## METHODOLOGY

Qualitative method was employed in the study because the aim was to identify kinds of errors or mistakes students made during exam. The exam results of seven Indonesian students sitting on the course of Sociolinguistics academic year 2012/2013 were randomly selected based on the errors and mistakes identified in their answers. I adopted personal approach for the study to result in-depth analysis of errors or mistakes each student made and the analysis was conducted accordingly. Sub-classification of the data is based on modified types of errors put forward by Ellis (1997), in which he states local and global errors. Local errors affect only a single constituent in the sentence while global errors violate the overall structure of a sentence and it is difficult to process. In this article, I modified the sub-classifications from Ellis and the terms used are local incorrectness and global incorrectness.

## RESULTS AND DISCUSSION

### Student 1

#### Local Incorrectness

(1) For example: when we works in different community automatically we should understanding what people say.

Some incorrectness can be identified from this sentence: (1) the clause we works and (2) we should understanding. The first incorrectness contains the inappropriate verb works after the subject we. When we works is grammatically incorrect. The inappropriate use of the additional suffix -s may refer to the case of overgeneralization. She tended to add suffix -s after a verb, and the subject tended to be ignored.

Another incorrectness she made is the verb understanding after the modal verb should. This was made because she did not know that the modal verb should is followed by verb in the bare-infinitive form. Whether this is an error or a mistake remains vague as (in)consistency cannot be traced.

If we are to contrast the third clause (3) what people say with the other two clauses, we can see that the third clause was correctly written. She correctly aligned the subject-verb agreement; she used the verb say for the subject people.

From the analysis of the incorrectness she made, the conclusion is that she still lacked the competence of subject-verb agreement comprehension.

(2) Speech convergence is when people try to talks in differently and each community can understand what they say.

The data reveals that the writer made some incorrectness in the clause people try to talks in differently. According to English grammar, infinitive to is followed by verb-1 without any addition of suffix -s or -es. In this sentence, however, the student seemed to overgeneralize and add suffix -s after the verb try. This may happen due to her confusion of the subject being speech convergence.

Another incorrectness she made is the prepositional phrase in differently. One possible cause is that she realized that differently was used to modify the verb talk. However, she might have overlooked the preposition in, which can be omitted.

With regard to subject-verb agreement, data (1) shows that the student wrote correct subject-verb agreement when the subject is people as is the case in data (2). In another clause, each community can understand what they say, she correctly agreed the verbs with the subjects. For this reason, the incorrectness in subject-verb agreement in the sentences the student made is categorized as a mistake.

#### Global Incorrectness

(3) In Indonesian language if we wants to getting someone to sit down sometimes if doing for our parents.

Some complications occur in data (3). The first, and the fundamentally basic, is that it is a sentence fragment, which requires a main clause to attach to. Subordinator if is used twice and this apparently distracted her attention to finish her sentence. She literally translated her native language into English and this is called as L1 transfer. The second error is again the subject-verb agreement in the clause if we wants. As what has been identified in data (1), this particular student always added suffix-s after the verb although the subject is we. What can be drawn from the three data about subject-verb agreement, she overgeneralized that subject we is followed by verb plus suffix-s as is ruled for third person singular. However, it is not the case as data (4) shows.

(4) The context is we knowing who people talks and relationship is our family.

This data reveals the incorrect use of the verb knowing in we knowing and the verb talks in people talks. In the data, she put the verb into –ing form after the subject we, which is in contrast to the subject we in data (1) and (2). One possible reason why she wrote this is that there is the verb is and she might have thought that the verb is followed by –ing form. Thus, there is inconsistency in the subject-verb agreement. The verb talks in people talks exhibits subject-verb disagreement as she added suffix –s after the verb, which results in incorrect agreement. She tended to overgeneralize that verbs were added suffix-s regardless of the subject. As is shown in data (2), this learner did not add suffix-s for the verb; however suffix-s was added after the to-infinitive verb.

Data (3) and (4) signal that the incorrectness is inconsistent and, therefore, is categorized as mistakes.

Logic is apparently missing in the sentence she wrote. It can be identified from the whole sentence which does not reflect the proper semantic connection, particularly in the clause and relationship is our family. The illogical sentence is a result of L1 transfer because she literally translated Indonesian sentence into English. What she wanted to express is that the people we talk to is our family. Hence, an alternative of the sentence can be as follows:

The context is we know people whom we talk to and they are our family.

(5) The same way we use language to her is formal but relax not too serious.

Data (5) reveals literal translation from an Indonesian sentence into English. In this sentence, she correctly put the verb in the clause we use. An inappropriate word choice in relax attests that she did not know that relax is a verb. In Indonesian language, relax is translated into *rileks*, which is categorized as an adjective. It is emphasized through the phrase not too serious which is the English equivalent of *rileks*. Because she did a literal translation, she used the relax instead of relaxed. Besides that, this sentence is hardly comprehensible as what she wanted to express is unclear. The idea that rises a question is in we use language to her is formal but relax not too serious. The word phrase formal but relax not too serious does not clearly denote what her idea was. As this is L1 transfer and she literally translated this from Indonesian language, the revision that can be proposed is: In the same way we use language to her in a formal but relaxed situation.

From the five sentences this students wrote, two errors in sentences (1) and (2) are categorized as local incorrectness while sentences (3), (4), and (5) contain global incorrectness. These three sentences are hardly comprehensible and difficult to process.

#### Student 2

(6) Women use more standard forms than men points to the way society tends to expect better behavior from women than from men.

(6) In this sentence, the student put her focus on the verb points and might have forgotten about the initial verb she wrote. The initial verb is use, which exhibits subject-verb agreement, but she wrote another verb, points, which does not clearly show direct agreement with a subject. One likely possibility is she thought that the subject is the whole clause women use more standard forms than men and therefore the verb is added by the suffix –s. In this case, she should have a noun clause as the subject and come up with That women use more standard forms than men. It is unclear if this is an error or mistake since (in)consistency cannot be traced. Other sentences she wrote were grammatically correct. This student proved to possess good grammatical competence.

Omission is the type of incorrectness identified in the sentence. This student developed a local incorrectness due to the comprehensible sentence that does not impede communication.

#### Student 3

##### Local Incorrectness

(7) Speech convergence is one of the form of accommodation theory which occur when the speaker want to accommodate her/his listeners.

One of the form in this data is incorrect. She did not change the noun form into plural although noun is preceded by determiner one of. The determiner one of must be followed by a plural noun. Therefore, she should have put the noun form into forms.

Another error she made is the verb want in the clause when the speaker want to accommodate her/his listener. Due to the subject of the clause is the speaker, being a third singular person, the verb want requires suffix –s. She evidently lacked this subject-verb agreement understanding.

Consistency in subject-verb disagreement that the student made is demonstrated in the following sentence.

(8) When he talk to local tourist they promote Pangandaran using Indonesian, but when he face international tourist from everywhere, he used English.

In (8) she did not agree the verbs talk and face with the subject he. Thus, this is an error. The initial clause, when he talk to local tourist, lacked the determiner to quantify the noun tourist. As tourist requires a right determiner, the revision proposed can be either a local tourist or local tourists. In this sentence omission occurs. Yet, the context sets that there may be more than one tourist, and the best alternative is local tourists. Similar revision is applicable for international tourist in the clause when he face international tourist.

The final clause, however, signal a different tense. It is hardly comprehensible why she used a different tense in the final clause. It is a gap in her understanding of tenses with previous clauses she wrote. Because the first two clauses are in the present simple, there is no need to change the last clause into the past simple tense. The co-text of the question requires an example of any situation, which is most likely in the present simple tense.

The consistency in subject-verb disagreement is exhibited in the following sentence.

(9) He even greeting tourist with the tourist language that he know.

Sentence (9) indicates the student's error in subject-verb agreement. Contrasted to the final clause, that he know, the initial clause contains the verb in -ing form, which may due to the insertion of the adverb even before the verb greet.

Other inappropriate use of word can be identified in the noun tourist, which requires a determiner, and the tourist language, which needs a possessive adjective. Hence, an alternative to correct this is: He even greets a tourist in the tourist's language he knows.

From the four sentences the student wrote, all of them contain local incorrectness which still result in comprehensible sentences and are categorized as errors due to the consistency of the incorrectness. Omission is the type of incorrectness identified in the sentences.

#### Student 4

##### Local Incorrectness

(10) In this case, I try to match my language with people who allowed to talk to, so that it can called a situation that contain speech convergence.

In this sentence, the clause who allowed to talk to, signals that she formerly wished to make a passive voice, as is the case in the third clause, it can called. These two clauses require the verb be to create a passive voice. Thus, the revision is who are allowed to talk to and it can be called. Again, as what previous sentences have exhibited, subject-verb agreement is still a problem for this student. She did not put the verb into the correct form that might have been a result of ignorance of the subject being a situation and she made it in a relative clause.

(11) At this point, women usually speech with using words to express if they see something extraordinary.

The incorrectness in sentence (11) is the word speech. She did not adjust the verb to fill in the function of a verb in the sentence. The word speech seemed to be readily accessible to her so she used the word speech instead of speak.

Other incorrectness is the phrase with using words. With in Indonesian language is *dengan*, which can be followed by a verb, while in English, the preposition with can only be followed by an instrument or a circumstance. It can be concluded that the use of the preposition with is a matter of L1 transfer.

With regard to what have been analyzed, the two sentences this student wrote are categorized as local incorrectness and can be categorized as mistakes since consistency cannot be traced. However, they are comprehensible and messages are conveyed to the reader.

#### Student 5

##### Local Incorrectness

(12) Speech convergence is situation when the speakers converge they style of speak to the people they addressed.

The incorrectness in the sentence are (1) they style and (2) they addressed. In (1), the student used the pronoun they before a noun style. She could not recognize that the word style in (1) is a noun. In Indonesian language, there is no difference in subject pronoun or possessive pronoun, so she used the subject pronoun that was readily accessible to her. In (2), they addressed, contains the verb addressed, which is in the past simple tense. The use of past simple tense in this clause is incorrect since the introductory clause is in the present simple. To make the clauses parallel, the verb in the last clause has to be in the present simple as well.

She also missed a determiner before a noun situation. This may due to the absence of determiner in Indonesian language, so it is a matter of L1 transfer.

What needs revision is the incorrect use of the verb speak to follow the preposition of. She apparently had no idea that the preposition of is followed by a noun or a gerund. An alternative to correct this is either their style of speech or their speech style.

(13) "Sit down." It tend to use in general situation like when we ask to our friend to sit down.

The first clause in the second sentence begins with it tend to use to supposedly signal passive meaning. The verb tend should be followed by to be used to signal passive meaning. She could not denote passive meaning through passive construction, which requires verb be and verb past participle. Other incorrectness she made is the lack of indefinite article a, which has to precede the noun situation. The revised noun phrases are in a general situation. However, in the last clause, when we ask, she correctly agreed the verb with the subject. The word to follows the verb ask, which is considered incorrect. She literally translated the phrase from Indonesian language into English. For this reason, it is called L1 transfer.

(14) The participant of this utterance is possible come from a teacher to the students.

Some incorrectness can be identified from this data; the first is the participant of this utterance, and the second one is the verb phrase is possible come. At the beginning of the sentence, she used the word participant, which is incorrect since an utterance is not an event in which someone can take a part. The participant of this utterance is redundant; the phrase the participant of can be just deleted because what matters is the utterance. Other incorrectness is the verb is which precedes the main verb come and should be omitted. The last incorrectness is the incorrect use of the adjective possible that precedes the verb come. She might have focused on the phrase is possible and forgotten that the

following verb is a main verb that does require be (is). She may have overgeneralized the verb as the adjective possible is preceded by the verb is and it is correct if the verb come is omitted. From the analysis, the revision is This utterance possibly comes from a teacher to the students.

(15) For example, in the waiting room, the receptionist ask the guest who keep standing and walking that disturb or annoyed another guests.

In this sentence, the student did not pay attention to the tense of the sentence. If the sentence is to be written in the present simple, she should have added the suffix -s for the verb ask and keep. Another error she made is the clause that disturb or annoyed guests. This clause does not clearly refer to a specific antecedent, and the relative pronoun that should be omitted and replaced by a conjunction and followed by it as a pronoun reference to refer to keep standing and walking. The suffix -s, therefore, should follow the verb disturb. It seems that the student writing this sentence could access more immediately the word annoyed as an adjective compared to its verb, annoy. In Indonesian language, to state an annoying situation is *menjengkelkan*, and it is an adjective. Hence, it can be concluded that in that particular co-text, she translated the word *menjengkelkan* into annoyed.

The incorrectness in subject-verb agreement in the sentences signals inconsistency, and for this reason, they are categorized as mistakes. Local incorrectness is found in all four sentences the student wrote. Omission, overgeneralization, and L1 transfer are the types of incorrectness identified.

#### Student 6

##### Local Incorrectness

(16) Speech convergence included to a polite speech strategy because the speech speak to another person.

In this data, the verb included is in the past simple tense, which is inappropriate because there is no time signal to denote a finished action or a fact in the past. Therefore, the preposition to after the verb include in unnecessary. Another inappropriateness that can be identified is in the clause because the speech speak to another person. It is hardly comprehensible to write that the speech speak to since speech is a thing that cannot perform an action to speak. In this co-text if the word speech refers to speech convergence, the clause of reason is not logically related to the initial clause as the clause of effect. For this reason, the last clause is unnecessary.

(17) For example a relation between doctor and pasien.

This sentence contains the Indonesian word *pasien*, whose equivalent in English is patient. The student was unaware of the English word and used the Indonesian word instead. This is called a mistake because a native speaker of s English will be very unlikely to misspell the word patient. However, what she wrote is a sentence fragment that still requires a predicate. In Indonesian language, it is possible to write a fragment after for example. It indicates there is L1 transfer into what she wrote. Other incorrectness is the missing of articles before the nouns doctor and patient. She put an indefinite article a before the noun relation, but the article is missing in the other nouns. This indicates that this is inconsistent, and it can be categorized as a mistake.

(18) Women's speech use the form politeness than men, because women's is a group of subordinate until they can't offend men.

The words requiring revisions are the verb use, the noun phrase form politeness, and the conjunction until. The subject of the sentence is speech and, thus, requires suffix-s after the verb use. She mistakenly thought of the subject as women and not speech. The noun phrase, the form politeness, requires a correct head, which is form and not politeness. She focused her attention in Indonesian language in which the head precedes the modifier. Hence, she came up with the form politeness instead of the politeness form. It is L1 transfer.

She incorrectly used the conjunction until to actually signal a purpose. Instead of using the conjunction so (or so that) she chose to use until which semantically signals time. The second clause of the sentence, because women's is a group of subordinate, contains possessive form in apostrophe 's after the noun women, which is incorrect. From the analysis, one alternative to revise the sentence is Women use polite speech because women are a group of subordinate so that they cannot offend men.

##### Global Incorrectness

(19) As usual, doctor use the language of terminology it didn't known from the pasien.

Again, in this sentence, the student used the word *pasien*, which she also wrote in the previous sentence. The lack of determiner before the noun doctor signals that her competence in creating a noun phrase is low. The word it in the second clause, it didn't known from the pasien, does not clearly signal any reference. What she wrote in the literal translation of an Indonesian sentence into English. Hence, it is quite hard to revise the sentence because her mindset was in Indonesian language, and this is L1 transfer. One possibility is that the terminology is used by a doctor and the patient does not know it, and the revision may read like this: As usual, a doctor uses a terminology that is not known by a patient.

Four sentences this student wrote contain local and global incorrectness. The global incorrectness is identified in the fourth sentence, and it is difficult to comprehend due to the incorrect pronoun whose reference is not known. Omission and L1 transfer are types of incorrectness in these sentences. L1 transfer indicates that the student made errors and the misspelled word denotes a mistake.

#### Student 7

##### Local Incorrectness

(20) In some countries which has multilingual language with many varieties language people may accommodate to others by selecting the code that is most comfortable for their addresses.

The sentence in (20) lacks the subject-verb agreement at the initial clause. Has as the verb does not agree to the subject, some countries. The student did not focus on the subject when coming to the verb. Another incorrectness can be identified when she wrote the noun phrase many varieties language. In this noun phrase, the word varieties cannot modify the noun language, hence, the revision is varieties of languages. She also misspelled the word addresses, which should be substituted with addressees. By and large, we can comprehend the idea she tried to convey due to relatively logical word order in this sentence. In subject-verb agreement, she made a mistake because in other clauses she wrote the subjects and verbs agree correctly.

#### *Global Incorrectness*

(21) The different ways of getting someone to sit down in English and Indonesia occurs because of many factor tend to with who someone talk about, the social class factors, the social distance.

The initial clause contains the word Indonesia that is incorrectly used as she compared English as a language and Indonesia as a country. The word Indonesian language has to be used instead of Indonesia. In contrast with (20), sentence (21) is hard to understand because it is not clear what idea she wanted to communicate, particularly in the second clause, because of many factor tend to with who someone talk about. Besides the incorrect noun, factor, after the determiner many, the phrase of many factor tend to with who someone talk about is hardly comprehensible. She might want to say many factors that affect differences in getting someone to sit down in English and Indonesian language, and she literally translated her sentence in Indonesian language into English. For this reason, it is L1 transfer and the entire clause needs revising to clearly communicate the idea. One alternative is because of many factors such as who the addressee is, the social class, and the social distance.

Two sentences this student wrote contain a mistake in (20) and an error in (21). Student (7) wrote sentences containing both local and global incorrectness. Global incorrectness in the last sentence she wrote impede communication because the idea she wanted to convey is not expressed clearly in the sentence.

#### **CONCLUSION**

From the analysis and discussion of the data, the errors and mistakes in the exam papers include local and global incorrectness; however, most incorrectness is under local incorrectness as the sentences are comprehensible and the ideas are conveyed to the reader. The types of incorrectness include omission, overgeneralization, and L1 transfer. These three types of incorrectness are equally identified in the data. Regarding L1 transfer in the data, it denotes literally translated sentences from Indonesian language into English. L1 transfer, being categorized as global incorrectness results in hardly comprehensible sentences. It is, therefore, important to always check learners' competence in acquiring English all the way through many subjects, particularly in when dealing with subject matter. One assumption on the errors and mistakes students made may be due to the time constraint during the examination, thus, resulting in the students' focusing more on the content than structure.

The limited number of students involved as well as the sentences produced certainly do not generate a general conclusion on the competence of other students excluded from the research. A longitudinal research should be carried out to better map learners' competence in acquiring a second language, particularly in grammatical competence.

## EXPLORING EFFECTS OF EXPLICIT VS. IMPLICIT TEACHING OF COLLOCATIONS ON THE WRITING PERFORMANCE OF IRANIAN EFL LEARNERS

Marzieh Karami

*Islamic Azad University, Yasooj Branch*

### ABSTRACT

The methods and the strategies employed in classrooms by English as foreign language teachers (EFL) to enhance EFL learners' skills in L2 process is a disputable and controversial issue all over the world. In fact, it seems vital to employ a method which is simultaneously functional and effective in teaching and learning process. The purpose of this study was to investigate the effect of two different methods of teaching collocations, namely explicit and implicit, on the Iranian EFL learners' performance in using these collocations in paragraph writing. In order to conduct this study, 36 pre-university students were randomly selected, divided into two separate groups (namely explicit and implicit). In this study, the class following explicit method was called experimental group and the other group following implicit method was called control one. Both groups took a pre-test to evaluate their writing ability at the beginning of the term and after the class room treatment, the entire participants were given the same topics as post-test to write about them. This post-test was assumed as a summative evaluation. The participants' performance in pre-test had almost the equal mean score, while the performances of the both groups in post-test were significantly different. The result of the study indicated that the group receiving explicit method of teaching collocations (experimental group) outperformed in using collocations in paragraph writing.

---

**KEYWORDS:** Explicit, implicit, collocations, writing skill.

### INTRODUCTION

An important aspect in EFL learning is the collocational competence which involves knowing which words usually come together to convey a meaning structurally and lexically. Before 1960s, the writing classes were following traditional product view of writing in which only the final product of writing was taken into account and the cognitive processes through which the writers construct their ideas and their texts were totally neglected. In the late 1960s and the early 1970s, however, L1 writing researchers came to this understanding that composing is a non-linear process of meaning. According to Zamel (as cited in Fahandezh Sadi & Othman, 2012) writers discover and reformulate their ideas as they attempt to get meaning. To discover meaning, the writers employ different processes of planning, drafting and reviewing each other. The writers were found to use planning, for instance, from the beginning to end of writing. Natural languages are full of collocations; common forms of combinations of words that co-occur in individuals' utterances make the basic frame of collocations in a language. Recent work in lexicography indicates that collocations are pervasive in English. They are very general issue in various mode of writing involving the technical genres along with the nontechnical ones. Accordingly, a couple of new approaches have been suggested for retrieving different kinds of collocations by benefiting from the analysis of relatively high amount samples of data in textual mode. These techniques automatically produce large numbers of collocations intended to reflect the relevance of the associations. In fact association, combination and co-occurrence are the most significant features in collocations. However, most of the EFL learners fail to follow this association or co-occurrence correctly.

#### *What is collocation?*

As Martynska,(2004) mentions the term "collocation" was first introduced by Firth (1986) to define a combination of words associated with each other, for example, to take a photo. The term 'collocation' has its origin in the Latin verb "collocare" which means to set in order/to arrange'. Moreover, Skorupka (as cited in Martynska, 2004) defines collocation as a combination of words which does not convey the meaning individually. He points out that co-occurrence of some words can be determined and in some cases restricted by their meaning. In other words, replacing one or two elements of collocation with a limited number of words is possible while combining these elements with some others is not grammatically or lexically appropriate. In another definition, based on Oxford Collocations Dictionary (2009) collocation is the way words combine in a language in order to make a natural-sounding speech and writing. For instance, in English we say "strong wind", but "heavy rain". It is somehow strange to say heavy wind instead of strong rain. And as a result all aforementioned words can be noticed in the speaking of learner from pre-intermediate to even elementary level. As a matter of fact, it necessitates a far higher level of language competence to use these collocations correctly. For Yarmohammadi (2002, P.43) collocation is "habitual co-occurrence of individual vocabulary items." Woolard (2005) defines collocation as the grammar of words –how words go together with other words. In other words, collocation tells us which words can come before or after words." Tajalli (2007, P.30) has defined collocations as "fixed, nonidiomatic constructions which reflect the meanings of their components." Therefore, collocations are different from idioms whose meanings are not the combination of the meanings of the individual words in them."

#### *Why collocation is important?*

According to Oxford Collocations Dictionary (2009), collocation exists in nearly all domains of English. Relatively no one can speak or write naturally without benefiting from collocation. With regard to students selecting the appropriate collocation can enormously aid them to speech and writing way more naturally, and sound more native-like speaker and writer, even without considering their intelligibility degree. An EFL learner talking about strong rain may make him/herself understood, but it requires more effort on the part of the listener and ultimately creates a barrier to communication. Poor collocation in exams is also likely to lead to lower marks (But what is more significant than former issue is that, language which is replete with collocation can also be more precise. This is due to the fact that mostly using single words in the appropriate context in English - particularly those very usual ones- can have drastic influence in communication .The pinpoint meaning of a word can be identified by the words that surrounded and combined with the core word-by collocation. A student choosing the best collocations will express him/herself much more clearly and be able to convey not just a general meaning, but something more precise point in detail (Oxford Collocations Dictionary, 2009).

#### *Explicit vs. Implicit Method*

Nearly in every language of the world teacher would agree upon the different influence of explicit and implicit teaching has been an issue to be settled for decades. A group of researchers are in favor of explicit teaching method and advocate its benefits for learners, whereas some others ascertain that implicit teaching method is more fruitful for learners, some others claim that some aspects of both method should be used for optimal learning. To consider these issues more clearly, it incumbent upon researcher to denote and cast some lights upon these two methods in details; Explicit learning is defined as "conscious awareness and intention to learn" (Brown, 2000, p.217). Moreover, explicit learning includes "input processing to find out whether the input information contains regularities, and if so, to work out the concepts and rules with which these regularities can be captured" (Brown, 2007, p.291). In other words, explicit learning is an active process where EFL learners seek out the structure of information that is presented to them. By the same token, explicit learning is "a conscious awareness and

intention" (Brown, 2007, p.291). Stern et al (1992) make a distinction between explicit learning and implicit one. Also, he distinguishes different dimensions in language teaching which can be an additional aid for learner to clearly find out the division of implicit versus explicit learning, so here is his encapsulation:

Explicit; rational/formal/intellectual, conscious, monitoring, problem-solving, analysis, abstract, metacognitive, inferencing, and systemic study. (Stern et al as cited in Dash, 2003, p.5)

Implicit; intuitive, automatic, subconscious acquisition, unreflective, behaviorism, mimicry and memory, exposure to language in use. (Stern et al as cited in Dash, 2003, p.5).

#### ***The Significance of the study***

The history of L2 teaching and learning has alternated between two single-minded approaches. Those that focused on analyzing the language, i.e., language usage (focus on forms) and those that focused on using the use (focus on meaning). Though the second stance was considered to be more fruitful, and the researchers (Afshari & Oroujlou, 2012) noted that as a result of an exclusive concern with meaning-based activities, teaching method makes available to L2 learners input that lacks in quality. They proposed that learners need to do more than simply to engage in communicative language use; they also need to attend to form and focus on form would work better in which these forms follow a naturally combined forms and have a restricted framework. In other words they try to emphasize on integrated rather than segregated approaches. Based on the researcher's observations and experience in the field of English language teaching and learning, it seems that the little attention attached to writing a paragraph containing collocations in EFL composition classes in Iranian schools. Moreover, the researcher analyzed a random sample of pre-university students' composition papers and the results showed that most students were not able to come up with using correct, coherent and meaningful forms of collocations. In addition, the studies which were conducted in TEFL field called for creating a situation and using suitable technique to develop learners' language skills including collocational writing, are really few and it shows a sort of paucity in this subject. It can be claimed that this research and its result can cover some facets of this paucity and its results will be fruitful pedagogical implications in L2 teaching and learning process. This study was in attempt to apply two different methods of teaching vocabulary (in this case, collocation) in EFL namely implicit and explicit method. So in this survey the instructor aimed to teach collocational features of the words used in the texts through these two methods. So, to both methods of teaching in the classrooms, observe the participants' performance and improvement in writing and collect sufficient data.

#### **LITERATURE REVIEW**

Teachers should experience various aspects of teaching by effectively influencing the learning process. As cited in Rahimi (2011, 11) Korthagen, Loughran, and Russell, claim that "...the learning of student teachers is only meaningful and powerful when it is embedded in the experience of learning to teach". Teacher training process should provide enough room for teacher to boost knowledge by engaging in teaching experiences and actively leading the learning process rather than remaining passive recipients. A group of researchers in the experimental studies in classroom settings have investigated how the learning of collocations may benefit EFL students if they follow a suitable and functional method. As cited in Myers and Chang (2009), Hsu studied the direct emphasis on lexical collocations and discovered that explicit collocation teaching helped the Taiwanese college EFL students to learn new collocations and in learning them there was a positive connection between the students' use of lexical collocations and their proficiency. He concluded that direct collocation instruction helps EFL learners acquire new collocations in written and spoken discourses that in turn enhance their proficiency of language learners in all four skills. As it can be seen this study magnifies the role of the employed method in teaching collocations directly and comes to the EFL learners' background knowledge (proficiency). In another experimental study in Australia by Xudong, Cheng, Varaprasad, and Leng (2009) investigate that how time of teaching /learning and duration of practicing in the class or even out of the classroom significantly affect the EFL learning process. In other words, this study investigated what aspects of academic writing improved at the completion of one semester of studying an EAP course that was specifically designed for postgraduate students in Melbourne University. In their study, they examined texts written by 69 students at two separate times: in week 1 and in week 10 (as pre-tests and post-tests). The texts were subjected to analysis for language use and text structure. This study found that while no improvements were shown in terms of fluency for students' writing, the use of academic vocabulary showed great improvements over time. Moreover, the grammatical accuracy of students also boosted over time.

This study concluded that duration of practicing has improved the learners' proficiency and their performance in writing and grammatical collocations. Furthermore, from Deveci's perspective (2004) the context in which a collocation is used is important. Certain collocations or expressions are appropriate for certain contexts. Factors such as a difference in status or a social distance between the speaker and the hearer can affect the choice of collocational phrases. For example, we would not greet our boss by saying "How's it going?" however, it is all right to greet a friend that way. This example suggests that knowledge of connotation and formality is important in deciding which collocation to use. Collocations are of grave importance for language learners. Whenever learners benefit from collocations, the possibility of being understood would be enhanced. Mostly, Native speakers unconsciously reckon what is going to be said based upon the use of phrases. If a non-native speaker uses frequently-used patterns (collocations), it would be way easier for most native speakers to predict what the non-native speaker is saying and may help compensate for other language issues, such as pronunciation. When learners write and speak, if they use collocations central to their topic, their readers are more likely to understand their message. Fahandezh Sadi and Othman (2012) believed that one of the fundamental factors affecting Iranian EFL the learners' performance is the method employed by instructors in the class rooms and the drills and the evaluation that follow in teaching process while nobody can ignore the system of education. They conclude in their study that due to teacher-centered policy and educational system in Iran, the writers of this study were found to heavily rely on their teachers as their only reference. This is especially true for the poor writers who appeared to use certain rules and chunks in their writing which they had previously memorized in their classes. Their conception of writing was narrowed to the producing a set of error-free sentences arranged one after another on a piece of paper. This limited knowledge about composition besides lack of practice affects students' writing improvement since they would not learn the main purpose of writing which is its communicative purpose. These researchers add another point to the result and believe that due to employing a traditional method in the class lacking any creativity, productivities there is no interaction between teacher and learners.

The other problem is the use of L1 while writing in English. Native language is an effective element of writing in another language and can help writers in decision making and idea generations. However, as the study mentions, L1 use would be helpful only when the writer concentrates on the meaning and not the single word. Theoretical Perspectives on instructors are then suggested to teach the writers how to use this helpful way of using L1 strategy. We can say that in which the researchers mention the entire meaning not the single word in fact attempt to highlight the value of communicative method of teaching and learning. The study by Xu, Mao, and Liu (2012) makes clear

another point about collocations and the way of teaching and learning them as chunk forms. Their findings present that how awareness and psychological factors have an influential role on the EFL learners' vocabulary achievement and their performance at the productive level (writing). After employing lexical approach in the class, they have discovered that there is a positive effect of lexical chunks in their English learning. This study states that few learners were aware of learning collocations and expressions and there was no possibility for them to apply systematic lexis as learning strategies. Nonetheless, by the rehearsing of chunk identification and usage, students become more confident in English learning. The observation during the teaching practice was really considerable. The researchers in this study claim that how a method which can increase the learners' awareness and their confidence is able to improve the learners' competence and collocational knowledge meaningfully.

### ***Collocational Competence***

Mounya (2010) expounds that it is far better to teach vocabulary separately in order that learners can find enough opportunity to be exposed to as many words as possible. In this way, they can develop their lexical competence namely, both individual words as well as Multi-Word Units. Accordingly, foreign language learners would become more able to decode the meaning of word-combinations like collocations, idioms, phrasal verbs...etc. which still cause a major problem for them. Teaching collocations would help learners of Second/Foreign languages face the problem of mixing. They could at least reduce miscollocations in writing. This would direct learners towards proficiency in the Second/Foreign Language generally and Writing or speaking specially. According to various studies, in learning and teaching collocations gaining or having acceptable level of competence plays a crucial role. Among these competence elements using correct propositions before or after the stems are really disputable for EFL/ESL learners. Hill states (As cited in Koosha & Jafarpour, 2006) that lack of collocational competence can be a cause of EFL students' problems in learning English collocations. It may also be suggested that one reason for the EFL students' problems in learning English prepositions is that they usually try to learn the meaning and use of prepositions individually without paying sufficient attention to their collocational properties. Overly teaching collocations and their use seems imperative, as research suggests it cannot be taken for granted that foreign language learners, after years of English learning, will naturally develop an awareness of collocations. Some Similar investigations have been conducted by Lapkin and Biskup (as cited in Oskuee, Pustchi, & Salehpour, 2012) adds that raising learners' awareness of collocations by leading them through the whole pre-writing, in-writing and post-writing process helps them "learn to write" and "write to learn". In other words, there is a dichotomous feature in this process. They "learn to write" better when they understand that writing is a recursive process and they can make use of the collocation resources to prepare for writing, achieve better writing sophistication and to edit and revise their mistakes in collocation use. More importantly, they "write to learn" when the writing process drives them to actively search for suitable collocations. For instance, in the primary phase, pre-writing, learners frequently are participated in brainstorming, looking for information, and finding the outline (planning content). The use of the collocation awareness process encouraged learners to explore in language, looking for useful phrases for the particular genre and theme of the writing at hand. The collocations students noticed and recorded offered them more language learning input as well as adequate resources to aid in expressing their ideas.

As cited in Oskuee, Pustchi, and Salehpour (2012) Swain and Lapkin's output hypothesis, learners can promote their productive skill when forced to use what does not exist in their current repertoire. The results suggest that the process raises learners' collocation awareness throughout and after the writing process and the quality of student work increases with the use of collocation. Further, the process helped the learners "learn to write" and "write to learn," nurturing them reflectively, independently, and autonomously prepared for future learning. While the main aim of the course is to enhance students' academic writing skills, students seem to have also gained some 'added values' from the course. The most frequently mentioned 'by-product' is the improvement of their proficiency or their general English skills namely, speaking, listening, writing and reading. In addition to the benefits of improving students' general English language competence, students have also mentioned some other 'by-products' of the course, especially the social interactional function of the course.

To make clear the EFL/ESL learners' performance in writing ability, in an experimental study by Fahandezh Sadi, & Othman (2012) they attempted to divide the participants in two categories; good writers and poor writers. This categorization has been occurred based on the participants' performance in writing activity. The differences were found to be in using certain strategies including L1 use, rehearsing, rereading and repetition. As the result shows, poor writers restored to their mother language 150 times and good writers employed their first language for 180 times. Nevertheless there were several noticeable differences between these two groups of writers in the way they used their first languages. Given the fact almost all the ideas they produced were firstly rehearsed in Farsi, they had to translate them into English while composing. The first difference between the groups in the way they use L1 was found to be in the fact that, due to concentrating on only single words, low-leveled writers had numerous problems for translating their Farsi notions into English written discourse while good writers were found constantly juggle between English and Farsi. Good writers were found to focus on the idea they intended to get across while the poor writers limited their attention to the abstract Farsi words and by the time they intended to covert these Farsi words into English ones. They performed a direct translation which resulted in producing some unacceptable English. Moreover there were some sizable differences between the writers' performances in using rehearsal, rereading and repetition strategy.

### ***The importance of authentic materials***

As Chastain (1988) asserts, unlike most of their ESL peers, many EFL language learners do not have any access to native speakers for communicating authentically, speaking or writing. As soon as they leave the classroom, they delve into a world which is full of native speaker of their first language, leaving them with little opportunity to use what they've learned. Different approaches have done their best to deal with this problem, EFL practitioners have designed and implemented pedagogic strategies and internet based communicative activities. One aspect of a text which can present it as a native-like or authentic one is the discourse markers or the passage pattern used in a passage. If an EFL writer attempts to write an authentic text it is essential to observe the discourse markers fact. A study by Rahimi (2011) talks about frequency and the type of the discourse markers used in argumentative and expository writings of Iranian EFL learners and the differences that these two text types writing have among the learners. The results of the study displayed that a new hierarchy for the use of discourse and its markers are constructed in essay types along with elaborative markers (mainly "and") the most prevalent connectors benefited from in aforementioned essay types. Then contrastive along with inferential markers such as exemplifier, reason, and conclusive markers, which orderly were the least prevalent used connectors. The results, also, uncovered that, generally, the discourse marker benefited from in argumentative essays was far higher than discourse markers in expository essays in terms of mean. In terms of discourse marker and its categories, both contrastive and conclusive markers were benefited from more prevalently in argumentative essays than in expository ones. The results indicated that the use of discourse markers cannot be a significant predictor of the writing quality in argumentative and expository compositions of Iranian undergraduate EFL students. Moreover, the extensive use of elaborative markers may also be due to the fact that both expository and argumentative writing in general require explanation of ideas, which relies on a wide range of using those elaborative markers in order to establish a kind of parallel relationships between different sections of the written discourse. The results might also imply that Iranian students tend to include a large number of ideas while writing about a topic rather than elaborating on and discussing certain ideas. Werlich (as cited in Rahimi, 2011) states that different text genre require different relationships between the ideas and

elaborates that a description text in an authentic way entails cognitive properties of interrelation and differentiation of perceptions in space, whereas a narrative text requires relationship in time; or, exposition involves comprehension of general concepts through differentiation by analysis or synthesis, while argument needs evaluation of the concepts through extraction of similarities, contrasts, or transformations. If a writer is not able to consider these points in their his/her performance or does not regard these linguistic features, he/she normally goes astray and the text will lose its authenticity. This means that different text types do not necessarily cohere in the same way and require different textual links given the type of macrostructure they have (i.e. whether they are expository or argumentative in nature). So, we can expect to find different proportions of use of such markers in different texts as we found in this study.

## **RESEARCH QUESTIONS**

1. Does explicit teaching of English collocations improve the writing ability of Iranian EFL learners?
2. Does implicit teaching of English collocations improve the writing ability of Iranian EFL learners?
3. Is there any statistically significant difference between implicit and explicit collocation teaching?

## **METHODOLOGY**

### ***Participants***

The participants of this research were a population of 36 high school Iranian EFL learners divided into two groups. One of them was explicit group and the other one was the implicit group. There were eighteen students in each group. The participants were randomly selected and divided into two groups in this research: All members of the groups were pre-university students that were almost at the same educational background (pre-intermediate level), and at the same age group 18 to 19. Eighteen of them, in one class, were considered as experimental group and the second half were considered as the controlled group. It was assumed at the beginning that all of the participants were at the same level abilities on writing. It was the point that the pre-test was at the very beginning of the semester, after (classroom treatment) it and at the end of the term, they were given equal topics as post-test to investigate and make clear the effect of explicit and implicit teachings of collocations on the experimental group and the controlled group's performance in using collocations (lexical and grammatical ones) in their writing ability.

### ***Instruments***

The main instruments used in this study included piloting test, the pre-test and post-test. The piloting test was given to a sample group which was similar to these two groups (experimental and controlled). The participants took the pre-test at the very beginning of the study, while the post-test was given at the end of the semester.

### ***Materials***

The basic material for this study was the "English for Pre-University students" (By: Birjandi, Enanisarab, & Samimi, 2011)— which contained eight units and each unit contained a long text talking about an everyday life subject (authentic text). The texts of this book as the main pedagogical syllabus included some common lexical and grammatical collocations and the researcher expected the EFL learners to learn and somehow memorize them contextually and integratedly and use them in writing some communicative paragraphs. So the units of the book were covered during an educational semester separately in two different classrooms. Through teaching these texts two methods (explicit and implicit) were employed to decipher the effect of these two methods on the EFL learners' learning and using these lexical and structural collocations in paragraph writing. It was the point that this book which has been designed as the main pedagogical syllabus for Iranian EFL learners at pre-university level included different types of collocations (lexical & grammatical), different text types (descriptive, narrative, expository,...) and different discourse markers (passage patterns).

### ***Data Collection Procedures***

The process of data collection in this research included the following procedures and administration; In the pre-test step, the participants were asked to fill in the gaps of some paragraphs by writing some particular phrases or words that were namely lexical or grammatical collocations. It was a sort of controlled-productivity model of writing (as a cloze-passage) while in the post-test the participants were asked to write about three major topics which directly related to the syllabus contents. To evaluate the participants' performance and give a quantitative mark, the numbers of the collocations that have been used correctly and relevantly were counted. The final scores of both groups were compared and analyzed to investigate any effect of implicit and explicit teaching of collocations during a semester on the EFL learners' performance in writing skill so as to confirm or disconfirm the research hypotheses. (implicit and explicit teaching) and scoring procedures which included pre-test and post-test. Pre-test was as a test taken at the beginning of the semester, whereas the post-test was taken as summative evaluation to attain almost a complete data to get the precise effect of these two methods on Iranian EFL learners performance on using collocations in paragraph writing ability. To elaborate this procedure in detail we can state that the process of data collection was comprised of three steps, however it is essential to mention that at the very beginning as piloting process before selecting and categorizing the participants into two groups there were some sample participants asked to answer the tests that had been designed based on the appropriate methods. These participants had almost the same background knowledge in comparing with the participants in pre-tests process. More over some sample participants were asked to write some paragraphs about the topics that were related to the main source (the source mentioned previously). These three steps were as:

#### ***Pre-tests process***

At the beginning of the semester when the participants were selected and they were located in two groups namely controlled and experimental groups at this stage all the participants took an equal test (pre-tests) to evaluate their ability in writing collocational paragraph or using collocations in their writing. Of course we did not expect the participants to perform entirely or the researcher's expectation was not a perfect performance, but the result and collected data was exactly useful and meaningful.

#### ***Classroom treatment***

Employing and applying two educational methods (explicit & implicit) of teaching vocabulary in texts was the major target. In this study implicit method of teaching collocations was employed in the classroom called controlled group while the explicit method was employed in the classroom called experimental group.

#### ***Post-tests process***

These two different classroom treatments were employed in two classes separately during a semester. Based on the school time-table all the participants attended the class twice a week and after the last session, all the participants at the same time were given the same topics related to the texts which

had been covered during the term. The collected data through this step was as summative evaluation and the major data to evaluate and measure the participants' performance in using lexical and grammatical collocations in writing paragraphs. This collected data not only presented level of the participants' performance in writing paragraphs in both groups, but also it presented the effect of the methods of teaching collocations (explicit and implicit) on the participants' performance and advantages or disadvantages of these two methods in teaching and learning in EFL or ESL.

#### Data Analysis

So as to analyze the data collected, SPSS software (T-Test) was employed to gain the statistical result and the research conclusion. The result and performance of each group was collected and analyzed separately, and of course there were correlations between the both groups (explicit and implicit) to figure out the various relationships and effects of these two methods of teaching collocations in this research.

## RESULTS AND DISCUSSION

### Descriptive Statistics on the Pre-test

Thirty six students (implicit and explicit groups) who participated in the study were given a pre-test in the first week of the semester. The primary purpose of giving the pre-test was to measure these EFL learners' writing ability. After correcting and scoring the students' answer sheets in pre-tests step, the obtained data was subjected to T-Test. As it can be seen, Table 1 presents the obtained scores of the implicit group in pre-test step. This table contains N= number of students, Mean= mean score of the EFL learners in implicit group, Std. Deviation= Standard Deviation of implicit group and Std. Error = Standard Error of this group's performance in pre-test.

Table 1: Descriptive Statistics on Pre-test of implicit group

Pretest:	N	Mean	Std. Deviation	Std. Error
Implicit group	18	6.0556	2.23534	.52687

Figure 1. Graph of mean score of implicit group in pre-test

As it can be seen, Figure 1 presents the mean score of implicit group in pre-test. Mean= 6.0556.

Table 2: Descriptive Statistics on Pre-test of explicit group

Pre-test:	N	Mean	Std. Deviation	Std. Error
Explicit group	18	6.1667	2.50294	.58995

Table 2 presents the basic descriptive statistics scores of the explicit group on paragraph writing in pre-test. As we can see, Table 2 presents the number of the participants in this group (N=18), mean score of their performance in pre-test (Mean=6.1667), the Std. Deviation and Std. Error of the explicit group in pre-test step. Moreover, the following Figure (2) displays the explicit group's performance in pre-test.

Figure 2. Graph of mean score of explicit group in pre-test

### Descriptive Statistics on the post-test

This part of the study has attempted to present and describe the participants' performance in post-tests. The results that have been inserted into SPSS software have been divided in two separate groups, namely implicit and explicit groups. The participants of implicit group were

the students who attended the English class through a semester (twice a week) while they were following an implicit method in learning collocations. Consequently, they were given some relevant topics to write about them in a paragraph (available in appendix part). The following Table (3) and Figure 3 present their performance statistically:

Table 3: Descriptive Statistics for the implicit group on post-test

Post-test	Mean	N	Std. Deviation	Std. Error Mean
Implicit group	14.1667	18	6.20484	1.46249

Figure 3: Mean of implicit group on post-tests

The second group given the post-test was called the explicit group. This group as the previous group (implicit group) twice a week attended

Table 4: Paired Sample t-test for implicit group

	Paired Differences					t	df	Sig.(2-tailed)
	Mean	Std. Deviation	Std. Error Mean	95% Confidence Interval of the Difference				
				Lower	Upper			
Pair1 pretest-posttest	-8.11111	5.57187	1.31330	-10.88194	-5.34028	-6.176	17	.000

Table 5: Paired St-test for the explicit group

Post-test	N	Mean	Std. Deviation	Std. Error mean
Explicit group	18	16.0556	4.30420	1.01451

the English class, while the participants of this group were the students learning lexical and grammatical collocations explicitly. In other words, they got aware about the forms and features of English collocations. End of the semester, as the implicit group, the participants of the explicit group were given the same test (post-test) that the statistical results of their performance have been in the following Table (4).

Table 6: Descriptive Statistics for the explicit group on post-test

Post-test	N	Mean	Std. Deviation	Std. Error mean
Explicit group	18	16.0556	4.30420	1.01451

With comparing the Tables 4 and 5 , we can see that both groups' performance have been promoted, but the effect of explicit method as the classroom treatment on the EFL learners' performance in using collocations (lexical and grammatical) in writing ability is remarkable. In other words, these two tables show that the participants in explicit group have outperformed in the post-test, because their mean score in post-test is M=16.0556, while the mean score of the implicit group is M=14.1667.

Figure 4: Bar graph of the implicit group's performance in pre-tests and post-tests.

Figure 5: Bar graph of the experimental group's performance in pre-tests and post-tests

The first Table (4) shows the fact that the differences between pretest and posttest in experimental group are significant due to the fact that the 2-tailed significance value is less than .05, and the second Table (5) displays that the difference between pretest and posttest in control group is significant due to the fact that the 2-tailed significance value is less than .05.

Table 7: Descriptive Statistics

	Group	N	Mean	Std. Deviation	Std. Error Mean
pretest	Explicit	18	6.1667	2.50294	.58995
	Implicit	18	6.0556	2.23534	.52687
posttest	Explicit	18	16.0556	4.30420	1.01451
	Implicit	18	14.1667	6.20484	1.46249

According to the above tables we can conclude that although there is a differences in the value of mean in both pre-test and post-test but this value and the differences between the mean score pretests and posttest are not significant. Because the significance of Levene's Test for Equality of Variances in the above table in both pretest and posttest is more than .05 we resort to equal variance assumed. In other words, as the Table 7 shows, the differences between two groups (controlled & experimental) performance is trivial, but, so as to get the level of significance of the participants' performance.

*Table 8: Independent Sample Test*

		Levene's Test for Equality of Variances		t-test for Equality of Means						
		F	Sig.	t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
									Lower	Upper
pretest	Equal variances assumed	.841	.366	.140	34	.889	.11111	.79097	-1.49634	1.71856
	Equal variances not assumed			.140	33.574	.889	.11111	.79097	-1.49709	1.71931
Posttest	Equal variances assumed	1.907	.176	1.061	34	.296	1.88889	1.77992	-1.72835	5.50612
	Equal variances not assumed			1.061	30.285	.297	1.88889	1.77992	-1.74476	5.52254

Test for Equality of Variances in the above table in both pretest and posttest is more than .05 we resort to equal variance assumed . As it is clear the t-tailed significance of Levene's Test for Equality of Variances in the above table in both pretest and posttest is more than .05 which shows that the differences between mean of pretest and more importantly posttest is not that significant.

### **Discussion**

As the results of the study reveal, the participants in the both groups (implicit and explicit) performed similarly in pre-tests. In other words, no significant difference was found between the performance of the first group and second group at the beginning of the study. But after classroom treatment and employing two different methods (explicit and implicit) during a semester, the results show that the participants' performances in two groups were significantly different and the subjects of the explicit group outperformed in writing paragraph, because the mean score of the implicit group in post-test was 14.1667, while the mean score of the explicit group was 16.0556. So, according to the participants' performance in the both groups, the first and the second null hypotheses of the study: "Ho.1 Explicit instruction of English collocations does not affect Iranian EFL learner's writing ability and Ho.2 Implicit instruction of English collocations does not affect Iranian EFL learner's writing ability" were disconfirmed, whereas the third hypothesis was retained. As mentioned previously, the third hypothesis of this study: "Ho.3 Is there any statistically significant difference between implicit and explicit collocation teaching?" was confirmed. So we can claim that this study and its results coming from the participants' performance confirm the third hypothesis. This findings present that teaching collocations explicitly improves and promotes the Iranian EFL learners in using collocations in paragraph writing effectively versus the implicit method of teaching collocations.

The descriptive statistics presented earlier revealed that the mean and the maximum score of the explicit group that received explicit method of teaching collocations were a little bit higher than the other group (implicit group). This result was the matter that the following studies emphasized, too: The study by Myers and Chang, (2009) and Xu ,Mao, and Liu, (2012) had made clear this point about collocations and the way of teaching and learning them as chunk forms. In another words, these studies emphasized that the explicit method of teaching, direct emphasis on the lexical facets of the collocations in teaching and learning and awareness of the EFL learners in learning collocational types of English vocabularies are facilitative and play an effective role in teaching and learning process. In fact, their findings presented that how awareness has an influential role on the EFL learners' vocabulary learning and their performance at the productive level (In this case writing ability).

### **CONCLUSION AND IMPLICATIONS**

The results show that most of Iranian EFL learners have lack of collocational knowledge and they have many problems in productive level of language (in this case using collocations in paragraph writing), due to insufficient language competence. Furthermore, these EFL learners have different

achievement and reaction based on the employed methods in teaching collocations. So according to the findings, The EFL learners' problems can be concluded under the following headings:

- a- Lack of collocational knowledge
- b- Insufficient language competence
- c- Inability in productive level of language

The present study refers to the needs of collocations for the students of Iran and finds out that students are weak in using collocation in their writing ability. Their productive level of language in written form is very poor. At the same time the study has also proved that the teachers and teaching methods are mostly responsible for the students' poor proficiency in collocations. The problems of the students regarding the study are multifaceted and the study has tried to identify these problems and examine the nature of them in some detail. The study helps us develop insights in the modern approaches to teaching vocabulary (collocations). It is important for language teachers to enhance the learners' consciousness and awareness about the importance of collocations in EFL/ESL teaching process. A direct and simple way to do so is to teach them explicitly, as suggested by Nesselhauf (2005) the conscious-raising activities about the word combinations as chunks, collocations, or idioms is crucial in EFL process. In teaching collocations, language teachers may need to determine which elements of collocations deserve particular attention. Moreover, collocations are best taught to learners when they learn new words as learners need to know how to use the new vocabulary with other words in context, not in isolations. Teachers may introduce some common collocations associated with the new vocabulary to the learners. We can claim that collocations should be taught systematically and according to the degree of difficulty, from the most to the least difficult. Learners should be trained to use their existing lexicon to generate more collocations as learners who are "collocationally competent ... will also be far more communicatively competent" (Hill, 2000: 62).

The findings imply that pedagogical approaches to teaching collocations in Iran need special attention. Since this area of teaching English is very important in EFL/ESL process. Any change in writing activity in the class requires the EFL learners' engagement. Instead of teaching

vocabulary separately and out of texts, it is better to employ and follow a contextualized and explicit method in teaching collocations. Teachers can increase the students' awareness about the collocations and their structures through explicit method. It must be kept in mind that writing skill is a productive ability and requires a great level of language competence. Through this language competence and the employed method in the classroom, the EFL learners are able to get autonomous and come to the productive level.

To sum up the following points can be mentioned as the final result of this experimental study;

- 1- Teaching collocations is the major endeavor to reach proficiency in writing.
- 2- Teaching individual words come in the second position, and it is useful only if these words are taught in context.
- 3- Compared to vocabulary, grammar has a minor role in raising writing proficiency. As a result, it is ranked in a second position because too much grammatical rules could hinder communication.
- 4- Since communication is the main aim behind writing, the underlying meaning is more important than the surface structure. Consequently, lexical structures are not much emphasized except word combinations especially collocations that have an influence on the meaning. Thus, learners are encouraged to use collocations even if they write them incorrectly provided that this does not change its meaning.
- 5- In vocabulary, lexical collocations represent the most important part. Then, we have grammatical collocations.
- 6- Collocations should be taught explicitly through highlighting, noticing, consciousness-raising.
- 7- Collocation is included in the criteria of evaluating compositions.
- 8- Activities that enhance students' knowledge and use of collocations are required.
- 9- Textbooks and other materials (adapted, adopted or designed) of collocations must be used by both the teacher and the learner whenever needed.
- 10- A Lexical Notebook is very useful to store collocations that are recalled later.
- 11- Testing Collocations in composition implies testing language generally and writing specially.

## ABSTRACT

The purpose of this study was to investigate the effect of Task repetition on accuracy of Iranian EFL learners' speaking ability. In order to achieve this purpose, a null hypothesis was developed: There is no statistically significant difference between accuracy speaking ability in Iranian EFL learners by use of task repetition. It also seeks to examine the effect of task type on the accuracy gain through task repetition. The subjects consisted of 60 male and female students who were selected from among 88 intermediate EFL learners by applying the proficiency test, and 60 participants that received 73-84 out of 100 were selected. To examine the effect of task repetition and task type on accuracy, the researcher assigned 60 students to 3 groups; the narrative task performers, personal task performers and decision-making task performers. The first production of the subjects was measured for accuracy. Then after a week all the subjects did the same task again, and their second production was also measured for accuracy. The t-test results and the analysis of variance indicated that task repetition, and task type, as well as the interaction between these variables resulted in significant differences in subjects' speaking ability in term of accuracy. The findings of this research supported Bygate's (1996, 2001) claim that task repetition may help develop the process of integration of speech capacities. It is argued that integrating processing capacities must be important for language development, and that this can be promoted through the use of task repetition. ANOVA found statistically significant effect for task repetition.

**KEYWORDS:** Task; repetition; task repetition; speaking; accuracy

## INTRODUCTION

In recent years a number of researchers, syllabus designers and educational innovators have called for a move in language teaching toward task-based approaches to instruction (Prabhu, 1987; Nunan, 1989; Long & Crooks, 1991; Ellis, 2003). The rise of task-based language teaching has led to a variety of different interpretations of what exactly constitutes a task.

A number of studies have been made as to how some attention may be focused on form. It can be done through task design (Fotos & Ellis, 1991), pre-task and post-task activities (Doughty, 1991) and consciousness-raising activities (Willis, 1996).

In this research, it is approached the issue of attention from a different but related perspective. This study focuses on the ability learners have to utilize their L2 knowledge in production. It is investigated if there is evidence of target like production when the need to focus on meaning has been minimized through task repetition, thereby freeing learners to attend to form, not from input, but from their own internal system. For example, "we might expect performance to be more fluent in terms of pausing and speed of words per minute. This is because all things being equal we would expect that doing the task a second time would involve less planning work. Also it is likely to have a different form: because the task has already been formulated previously, we can expect fewer false starts and self corrections (Bygate, 1996, p. 138).

## REVIEW OF LITERATURE

Task-based language teaching refers to an approach based on the use of tasks as the core unit of planning and instruction in language teaching. It is a logical development of communicative language teaching, since it draws on several principles that formed part of the communicative language teaching movement from 1980 for example;

- Activities that involve real communication are essential for language learning.
- Activities in which language is used for caring out meaningful task promote learning.
- Language that is meaningful to the learner supports the learning process (Richard & Rodgers, 2002, p. 223).

Task-based language teaching is the use of task that serve to facilitate meaningful communication and interaction lies at the heart of various proposals for "task-based instruction" which is an attempt to apply principles from second language acquisition research to language teaching (Richard. & Renandye, 2002, P. 93).

Task repetition involves asking language learners to repeat the same or slightly altered tasks at intervals of for example, one or two weeks (Bygate and Samuda, 2005:43). In task repetition, the first performance of the task is regarded as preparation for (or a pre-task activity before), further performances (Ellis, 2005).

At first glance, this might seem reminiscent of behaviorist drills that are based on the assumption that language learning occurs via a process of habit information through repetition (for instance Paulston and Bruder, 1976:12) identified different types of repetition drills and defined them as "plain repetition of the cue". It involves repetition of familiar form and content (Bygate, 2006).

By repeating the same or similar tasks, therefore, learners might be able to build upon what they have already done in order to "buy time" not only to do mental work on what they are about to communicate but also to access and reformulate words and grammatical structures more efficiently, and accurately.

It has recently been proposed that task repetition is easier than task alternation because the appropriate task settings are already present in working memory, whereas during task alternation task settings must be retrieved from long-term memory (Mayr & Kliegl, 2000). This study tested whether the phonological loop is involved in keeping the relevant task settings active in working memory. It may then be expected that concurrent articulatory suppression would diminish the facilitation associated with task

repetition because the phonological loop could no longer maintain the appropriate task settings active in working memory. Both during task repetition and task alternation the relevant task settings should then be retrieved from long-term memory. Content repetition refers to carrying out several tasks that require different procedures to accomplish the communicative goal, but require the same content knowledge. Task repetition refers to carrying out the same task repeatedly, using the same procedure to accomplish the communicative goal and requiring the same content knowledge. Global accuracy is the ability to avoid error in performance, possibly reflecting higher levels of control in the language, as well as conservative orientation, that is, avoidance of challenging structures that might provoke errors (Skehan, 1996).

## RESEARCH QUESTIONS AND HYPOTHESIS

The following research questions were addressed in this study:

Question 1: what extent does task repetition lead to more accurate speaking ability?

Question 2: what extent task type have impact on the accuracy gain through task repetition?

In order to cope with the answers of the preceding questions, the following null hypothesis was proposed.

HO1. There is no statistically significant difference between accuracy speaking ability in Iranian EFL learners by use of task repetition.

Ho 2. Task type does not have any impact on the accuracy gain through task repetition.

## METHODOLOGY

### *Participants*

This study was conducted with 60 EFL students (boys and girls) selected among 88 students, who are majoring in English language teaching at Arad institute. They were 18-20 years old and at intermediate level. For homogeneity of the subjects, prior to research a proficiency test (PET) was given to 88 students and among them 60 participants who had received 73-84 were selected. These 60 students were divided into three groups randomly. Each group worked on a special task type and their performances on the first attempt and second attempt of the same task were recorded and scored. These learners were not aware of the research purpose. Their performances were recorded in language lab and later on the recordings were transcribed and scored according to some established criteria.

### *Instruments*

#### *Tasks*

This research included a range of tasks to explore whether different task types would have an impact on performance. Three task types were used in this study following Skehan and Foster (1999):

*Personal tasks:* (based on information that was well known to participants and that was therefore assumed to reduce the cognitive load of the task involved). *Narratives:* (which were supported by visual material, but which required some degree of organization of material to tell a story effectively). *And decision-making tasks:* (Which required the capacity to relate a set of reasons to a set of decisions that had to be made). These three types of tasks were chosen for a number of reasons.

First similar tasks have been used in other studies of task types (e.g. Foster & Skehan, 1996; Skehan & Foster, 1997; Skehan & Foster, 1999; Foster, 2000 cited in Foster, 2001) and thus comparison with the results of these studies would be easier.

Second, all of these tasks are monologue rather than dialogic, they afford a basis for deriving measures of learner performance that are not influenced by interactional variables.

Finally, we wished to insure that the task was reasonably demanding on the participants and previous researches indicate that this can be achieved by these types of tasks.

As a personal task the following topic was used:

Sending somebody back to turn off the oven (Foster & Skehan 1996). It is the afternoon, you are at the university, and you have an important examination in fifteen minutes. You suddenly think that you haven't turned off the oven after cooking your lunch. There is no time for you to go home. Explain to a friend who wants to help

### *Procedure and Data analysis*

The subjects involved in this study were randomly divided into three groups. Each group was assigned to perform a specific task. The implementation procedures were carefully designed, so that conditions for each task type were as close as possible to being identical for all of the participants, and on each occasion. The recordings took place in the language lab by the researcher and another language teacher.

Before performing the task, the participants in all three groups were instructed about the specific task and were told what they were supposed to do. Students were asked to think about the task they had to do. The material was not part of class work, and subjects had no exposure to the task types before. Each subject, after introducing himself or herself, started to perform the task and it was recorded on a cassette. When all of the participants finished their first performance, the second phase of the study began. Students hadn't been informed in advance about the repetition of the task in order to diminish the practice effect. After one week students were required to do the same task again. Their second performances were also recorded on separate cassettes. After collecting the data the most difficult phase of the study began. We had to transcribe the speeches in order to measure them. The transcripts were coded and evaluated by three raters individually.

## Results and discussion

To ensure the homogeneity of the two groups, the PET was administered among 88 EFL learners. Those students (N = 60) whose scores fell within the range of one standard deviation above and below the mean (score between 73 and 84) were chosen as homogeneous participants for this study.

Task repetition was considered as within-subject variable and task type (narration, personal, decision-making) was regarded between-subject variable. To obtain the goal, the researcher tested the null hypotheses stated on the basis of the research questions.

ANOVA found statistically significant effect for task repetition, which is the within-subject factor, ( $F(1, 57) = 158.72$ ;  $p = .000$ ,  $p < \alpha$ ) in which F ratio of 158.72 was greater than the F critical of 4/02, and p value was less than .05 level of significance. Consequently, the first null hypothesis of this study which predicted that task repetition does not lead to more accurate language use was rejected (Table 1).

Table 1: Repeated-Measure ANOVA for the Effect of Task Repetition for Accuracy (Appendix B)

Effect	Value	F	Hypothesis df	Error df	Sig.	Partial Squared	Eta
Task repetition	.264	158.772	1.000	57.000	.000	.736	
Task repetition * Task type	.508	27.614	2.000	57.000	.000	.492	

Figure 1: Below displays the graphical presentation of the results

We also need to evaluate the effect size of this result. The value we are interested in is Partial Eta squared. Based on result in Table 2, the value obtained in this study is .73, which is relatively high. Additionally, the interaction effect within-subject and between-subject factors, i.e. task repetition \* task type was also significant ( $F(2, 57) = 27.61$ ;  $p = .000$ ,  $p < .05$ , Effect size = .49).

Table 2: Repeated-Measure ANOVA: Tests of Between-Subjects Effects

Source	Type III Sum of Squares	df	Mean Square	F	Sig.	Partial Eta Squared
Intercept	400785.208	1	400785.208	13110.522	.000	.996
Task type	686.817	2	343.408	11.234	.000	.283
Error	1742.475	57	30.570			

ANOVA detected a statistically significant effect for task type as the between-subject variable ( $F = 11.23$ ;  $p = .000$ ,  $p < .05$ ) in which F ratio of 11.23 was more than the F critical of 4.02, and p value was less than .05 level of significance; therefore, the second null hypothesis of this study which stated that task type does not have any impact on the accuracy gain through task repetition was rejected.

Because we have gained a statistically significant result from the preceding analysis, this implies that there is a difference somewhere among the three task types. It does not tell us which type of tasks or set of scores differ from each other. As a result, Post-hoc Pair wise Comparisons was applied.

Post-hoc Pair wise Comparisons showed that the difference between personal task was statistically different from narration ( $p = .01$ ,  $p < .05$ ) and also was statistically different from decision-making ( $p = .01$ ,  $p < .000$ ). Narration was not statistically different from decision-making ( $p = .25$ ,  $p > .05$ ).

This study is part of a research project designed to help our understanding of the instructional choices when language learning tasks are used. The present study has focused on the impact of task repetition and then on three task types.

Using a range of measures, in this research, it was found some evidence that task repetition resulted in improvement in learners' speaking ability. The findings were supported by information processing theory that human beings possess limited capacity (Anderson, 2000) which did not allow the speaker to attend to all aspects of the language at the time of task performance. Second language learners with low level of proficiency do not have ready-made plans in their possession to facilitate language production under real time pressure (Farch & Kasper, 1986).

When first carrying out the task, the learners would be initially more concerned with planning the content of the message; on the other hand, having done the substantial conceptual work, the learners would be more concerned with paying attention to the formulation aspect of the task. It can be concluded that this can be an effect of highly contextualized cognitive rehearsal, releasing spare capacity on the part of the speaker to increase accuracy. The results of the present study are in line with findings of the previous studies (e.g., Bygate, 2001). So generally speaking, the results suggest that previous experience of a task is available for speakers to build on in the subsequent performance.

## CONCLUSION

The findings of this research supported Bygate's (1996, 2001) claim that task repetition may help develop the process of integration of speech capacities. It is argued that integrating processing capacities must be important for language development, and that this can be promoted through the use of task repetition. It is suggested that learners can help through repeated experience of the same tasks, and teachers may be able to use task familiarity to help learners' language to develop.

The account emerging from the results of this research, also suggests that repeated encounter with a task may make it possible for various processes to occur: information can be improved, reorganized, and consolidated; attention can be paid to different aspects of the language. Repeated encounters do not involve the learners in doing the 'same' thing, but rather in working differently on the same material. Repetition provides the students with inbuilt planning; it also provides a context for students and teachers to plan their subsequent language work.

### The limitations of the study

This study has following limitations:

- 1-The age of subjects is between 18-20 years and at intermediate level.
- 2- For homogeneity of the subjects, prior to research a proficiency test (PET) was given.

### ABSTRACT

This study investigated the effect of post-task Computer-Assisted Language Learning (CALL) approach on advanced Iranian learners' writing accuracy. Fifty-five MA students in Khouzestan Islamic Azad University, Ahvaz, Iran were randomly selected and divided into experimental and control groups. Before instruction, both groups were given a pre-test of writing an essay. Then, the control group was taught through using a traditional method of in-class writing instruction, while the experimental group was taught through using CALL approach. The experimental group also received some writing post-tasks via email correspondences. Four different types of tasks including description, explanation, cause, and effect, and opinion paragraph tasks were used. The experiment lasted for eight weeks comprising of ten sessions. At the end of the experiment, both groups took a post-test of writing an essay. An Independent Sample *t*-test was run to find if there was any significant difference between the two groups in the post-tests. Results showed that there was not a significant difference between the two groups' pre-tests. However, there was a significant difference between the two groups' post-tests in terms of gaining scores on writing accuracy. Results revealed that post-task CALL techniques did enhance English as foreign language (EFL) learners' writing accuracy. The CALL group achieved a higher degree of writing accuracy compared to the Non-CALL group ( $p < .05$ ). This significant difference between the two groups favoring CALL users was as an indication of the positive effect of post-task CALL approach on improving students' writing accuracy. Teachers may use the CALL approach to facilitate teaching writing accuracy in composing the essays. This study may provide useful hints for further research on using the CALL approaches in developing other language skills.

**KEYWORDS:** CALL, Task, Post-task phase, writing accuracy

### INTRODUCTION

Writing in a foreign language is one of the most challenging and complex tasks for language learners. It is a difficult skill that requires considerable effort and practice on the learners' part to reach an acceptable level of writing. Due to the complexity of this skill, many students find it very difficult to master all the mechanics of writing and to produce an adequate piece of writing; therefore they do not produce acceptable compositions. What makes writing a very troublesome task for EFL learners is the fact that it requires some criteria of acceptability relative to different aspects of writing which include content, organization, vocabulary, language use, spelling, punctuation and accurate capitalization and paragraphing (Hamadouche, 2010, p. 2). In writing, grammatical accuracy is essential to ensure the writer's intended meaning and to avoid communicative misunderstanding (Lush, 2002; Larsen-Freeman, 2003). According to Starkey (2004), an effective piece of writing is the one that is organized, clear, and coherent, with accurate language and effective word choice. In terms of skills, producing a coherent, fluent, extended piece of writing is probably the most difficult thing there is to do in language.

For many learners studying English as a foreign language, writing is considered boring. Learners find it hard to engage in writing activities. In order to eradicate the problem, CALL systems often use computer to engage learners more in the learning process. CALL as a multidimensional computer tool has been practiced by language teachers to facilitate learning and teaching processes (Cummins, 2008). Given the breadth of what may go on in CALL, a definition of CALL that accommodates its changing nature is any process in which a learner uses a computer and, as a result, improves his or her language (Beatty, 2003, p. 7).

In recent years, the rapid evolution of Information and Communication Technology (ICT) has made great changes in societies and education. The Internet, particularly, has become a useful tool for communication, a venue for experiencing different cultures and a mediator in diverse political, social, and economical situations. Along with the impact of the Internet worldwide, the extensive use of computers at schools has had a critical influence on educational environments (Park & Son, 2009, pp. 80-101). According to Garcia and Arias (2000), using CALL in a classroom has the following advantages: Increased motivation of the students, individualization of learning process, immediate feedback, non-linear access to the information, and the introduction of new exercise types in the classroom.

Lee (2000) further mentioned numerous reasons why computer technology should be used in second language instruction. CALL can (a) provide students with experiential learning practice, (b) motivate students to learn, (c) potentially increase student academic achievement, (d) increase available authentic materials, (d) encourage interaction between instructors and students and students and peers, (f) place emphasis on individual goals, (g) allow students to use multiple sources for information, and (h) create a sense of global understanding (Lee, 2000).

Teaching EFL writing accuracy is a headache for many teachers; they spend considerable time correcting their students' compositions only to find their corrections and comments ignored. Despite teachers' hard work, many students' written English remains non-idiomatic, poorly organized, insufficiently developed, grammatically awkward, devoid of sentence structure variety, and weak in vocabulary usage. One important reason for all this is that learners have not been helped to become motivated, involved in their own learning, or self-sufficient. The fact is that the students will not devote their efforts to learning a foreign language if they do not have a need or desire to learn it. However, when students are duly motivated, they will become involved in learning a foreign language and will learn it autonomously (Wang, 2004, p. 24).

One way to motivate learners, according to Ellis (1994, p. 516), is to design challenging tasks that present students with opportunities for communication and self-direction. Richards and Rodgers (2001) assert that "task-based language teaching refers to an approach based on the

use of tasks as the core units of planning and instruction in language teaching" (p. 223). Although the designs of task-based lesson have been proposed variously, they all include three common phases (Willis, 1996):

1) Pre-task: it concerns the various activities that teacher and students can undertake before they start the task; 2) Task: it centers on the task itself and various instructional options; 3) Post-task: it involves procedures for following up on the task performance.

The post-task phase has three major pedagogic goals: (1) to provide an opportunity for a repeat performance of the task; (2) to encourage reflection on how the task was performed; and (3) to encourage attention to form, in particular to those forms that proved problematic to the learners when they performed the task (Ellis, 2002, pp. 93-95). A number of efforts have been made to develop the students' writing skill, among others is by applying different approaches to the teaching of writing. In English classes we usually use pen and paper based procedures for teaching writing. In recent years, the advance in technology has made it easy to take advantage of modern facilities and it made great changes in societies and education. But in our classes we do not pay much attention to using this technology. Also, the role of post-task which provides an opportunity for repeating and following up on the task performance is neglected in writing instruction most of the time. Thus, shedding more light on the effectiveness of post-task CALL approach on EFL learners' writing development in Iranian EFL classrooms context at the advanced level seems to be necessary in developing MA students' writing accuracy.

## REVIEW OF LITERATURE

Many studies have attempted to assess the impact of CALL on learning. These studies focus either on the achievement of linguistic skills such as speaking, listening, writing and reading (Garrett, 1998) or on motivation (Skinner & Austin, 1999; Garcia & Arias, 2000). Concerning grammar teaching, while some studies find a significant advantage of these techniques, others find no significant difference between CALL and other teaching methods.

For instance, a positive impact of CALL has been found by Nutta (1998) investigating the effect of computer-based versus teacher-directed instruction on the acquisition of English as a second language. Nutta's study consisted of 53 students enrolled in an intensive academic ESL institute at a major university in Florida. It compared the method of grammar instruction, teacher-directed or computer-based. In this study, computer-based students reached better scores than teacher-directed students, leading the author to conclude that computer-based instruction can be an effective method of teaching L2 grammar. The results showed that computer-based students scored significantly higher on open-ended tests than the teacher-directed students. No significant differences were found between the computer-based and teacher-directed students' scores on multiple choice or fill-in-the-blank tests.

Other studies are less optimistic. Chen (2005) observed the impact of traditional class instruction with or without computer aid on the acquisition of parts of speech (nouns, articles, pronouns, verbs, adjectives, adverbs, prepositions, coordination, and subordination) by two groups of Taiwanese EFL learners. After a 16-hour instruction, both groups were asked to produce a written narrative. The dependent variable under consideration was the number of errors produced in each group and for each category of errors. Overall, there was no statistical difference between the control and the experimental groups. However, the experimental group performed better in the error categories of nouns and prepositions whereas the control group outperformed the experimental group for the error categories of lexicon and subject omission. The author fails to provide literature supporting those findings.

Finkbeiner (2001) administered a questionnaire to 100 undergraduate EFL learners and collected data from 82 learners to learn about learners' attitude and interest in CALL and cooperative learning. He showed that ESL undergraduate learners had positive attitudes towards CALL and suggested that a successful implementation of CALL required it to be put into everyday study life. Almekhlafi (2006) investigated the effect of CALL on elementary school students' achievement and their attitudes towards learning English in the United Arab Emirates. 83 elementary students in Al-Tamayoz Elementary school were selected and divided into experimental and control groups (43 and 40 participants respectively). The findings revealed that the students in the experimental group had a positive attitude towards CALL. The findings also showed that CALL affected students' achievement positively.

CALL approach through word processor offers grammar and spelling checker, both of which provide suggestions which can be accepted or rejected. This feedback may facilitate not only the correction process but also the potential to promote cultural awareness concerned with British and American spelling. It should be noted, however, as using computers to provide feedback in correcting written essays and assignments may not be as reliable as the feedback which comes from teachers, meaning that teacher supervision is both necessary and beneficial in providing grammatical and cultural feedback correction (Gorjian, 2008). According to the meta-analysis of 176 studies from 1990 to 1995 studied by Coley (1997), indicated that writing with the application of technology, especially word processor, makes editing easier and faster than writing with pen-paper and it also improve the quality of writing. Using technology for writing provides the opportunity for the students to share their accomplishments with other students through network.

Frizzler (1995) explored the potential impact of one application of computer-mediated communication on university level English for Speakers of Other Languages (ESOL) composition students and instructors. The participants were non-native speakers of English from non-English-speaking countries (Japan, Croatia, Finland, Republic of Korea, Brazil, Egypt, Russia, and Indonesia). They studied an online course at Frizzy University. This was a free, non-credit university-level course over an eight-week period during the summer of 1995. It was conducted online, via the Internet, through email. The students interacted with each other via email discussing essays and exchanging essays for peer review. The findings showed that the interactivity among students was the key to the successful online writing class. Using the Internet to teach ESOL requires changes in teachers' roles, approaches, and attitudes toward teaching. The Internet functions can be used not only as a means of classroom facilities but also as language learning tools. Frizzler concluded that the Internet technology should be integrated into the ESL classroom.

Braine (1997) investigated the effects of networked computers on ESL student writing at Brock University in Ontario, Canada. The researcher compared ESL students in first-year English classes writing in two contexts: a networked computer class and a traditional lecture-style class. The purpose was to determine which setting promoted writing, had more improvement in writing, and had more peer and teacher feedback. The first and final drafts of students' papers were scored, and the number of interactions during peer-review sessions was analyzed. The networked setting was shown to promote better writing and more peer and teacher feedback. The traditional setting was shown to promote more improvement in writing.

Yasin (2002) investigated the effects of computer-assisted instruction on the second graders learning English in the District of Bani

Kinanah. The participants in the study were fifty female second grade pupils randomly chosen from Hatem Basic School for Girls. The sample was divided into two groups, experimental and control. The experimental group was taught via computer, whereas the control group was taught with the traditional method. The software used was Action Pack 1. The findings of the study indicated that using CALL is very efficient in helping second graders learn English.

Abu-Seileek (2004) designed a CALL program and tested its effect on Jordanian students' writing ability in English. The study attempted to find any statistical differences between the mean scores on the writing task of the experimental and control groups. The participants of the study were first grade secondary students. The instrument of this study was a computer-based program Win Word 2002, whose main function was to check and correct spelling, style, and grammar errors. The study revealed that students who used the computer to learn writing skills achieved higher scores than those who studied by the traditional method.

In one study conducted by Gorjian (2009), the role of computer in instructing writing skills in Second Language Acquisition (SLA) was investigated. To discover the significant difference between learners' acquiring writing proficiency with or without using personal computers, he collected one experimental and one control group of 40 intermediate L2 learners and asked them to write 480 one-paragraph essays in 12 sessions. After analyzing the results, he found out that experimental group which received teacher feedback via e-mailing outperformed control group which was given instruction through pen and paper procedures.

Bani-Hani (2009) investigated the effectiveness of a computerized instructional program for teaching English as a foreign language in Jordanian basic stage schools. The study also investigated the teachers' and students' opinions about CALL. The sample of the study consisted of 73 sixth grade students in two sections and 100 basic school teachers. The researcher used an achievement test for both the experimental and control groups. He also used a questionnaire for both teachers and students in the experimental group to investigate their opinions towards using computers in teaching and learning English. The results of the study revealed statistically significant differences in the students' achievement in favor of the experimental group. The results also revealed that teachers and students had the inclination to use computers in teaching and learning English as a foreign language.

Most of these studies show that computer-assisted writing programs can positively affect language learning. In short, these studies stress the positive effects of using the computers on EFL students' writing achievements. It can be concluded that the use of the computer may produce higher achievement in writing accuracy of students than the current technique. It may result in positive students' attitudes towards technology and school.

#### ***Studies on Task-Based Instruction (TBI)***

The concept of TBI was developed in the 1980s by Second Language Acquisition (SLA) researchers and teachers who were discontented with teacher-centered, form-oriented language teaching practice. The rationale behind TBI is that key language learning processes take place in holistic rather than analytic language activities, and tasks are invaluable in achieving this (Samuda & Bygate, 2008). The primary unit for both designing a language programme and individual lessons should be a task because it creates opportunities for communication and noticing form/meaning/function relationships, which are the conditions essential for the development of communicative competence in an L2 (Willis & Willis, 2007).

Doughty and Pica (1986) reported the findings of the latest series of studies to determine the effects of task type and participation pattern on language classroom interaction. The results of this study were compared to those of an earlier investigation in regard to optional and required information exchange tasks across teacher-directed, small-group, and dyad interactional patterns. The participants in both the earlier and the present studies were adult students and teachers from six intermediate EFL classes (three classes in each of the two studies). The classes were selected according to the proficiency level. The students who participated in group- and dyadic-activities were chosen randomly with a variety of L1 backgrounds. The teachers were native speakers of English with several years of teaching experience. The findings showed that group and dyad interaction patterns produced more modification than did the teacher-fronted situation, which suggested that the participation pattern as well as the task type have an effect on the conversational modification of interaction (Doughty & Pica, 1986, pp. 305-325).

Post-task activities have also proved interesting. Examples of such activities are informing learners before they do a task that some of them will be required to re-do the task subsequently on front of the entire class. The rationale here is that the threat of a future public performance will induce learners, while doing the task, to concentrate on error avoidance, since they will more clearly see the connection between the task and how well they will later do, when more pedagogic norms will prevail. In addition, the future task will not compromise the naturalness and communicativeness of the actual task, since the teacher will not be present at that stage. An alternative post-task condition would be to record learner performance during a task (which is done anyway during research studies), and then give the tape to learners so that they have to transcribe some of their own performance. Once again, the intention is to focus learners' attention on form, since they will be drawn in working in detail with what they themselves have said. Skehan and Foster (1997) made the prediction that accuracy, selectively, would be advantaged in a post-task condition. In two studies, Skehan and Foster (1997) predicted that a post-task effect upon writing accuracy was confirmed, but only for interactive tasks. There was a higher level of accuracy with personal information exchange and narrative tasks, but this did not reach statistical significance. In addition, there was a significant practice effect: as time went on in the study, over 2 to 3 weeks, the effect on accuracy grew in strength.

#### **RESEARCH QUESTIONS**

RQ1) Do post-task CALL techniques affect EFL learners' writing accuracy?

RQ2) Do post-task CALL techniques make a difference among CALL and Non-CALL groups learning writing accuracy?

#### **METHODOLOGY**

##### ***Participants***

Fifty-five MA students ranging in age from 22 to 40 years-old among EFL learners in Khouzestan Islamic Azad University were randomly distributed across a control and an experimental group. Then they were divided randomly into two groups, one group was considered as the experimental group with 25 participants which received feedback via computer and another group as the control group with 30 students which received feedback face-to-face. The control group was exposed to the traditional in-class writing instruction that depended on the paper-based procedures only, whereas the experimental group was exposed to the computer-based writing instruction. In the pre-test and

post-test, the participants were required to write about four topics chosen for them by the researcher. Their essays were scored according to their writing accuracy.

#### Instrumentation

In the present survey two tests were used: (1) a pre-test to determine the learners' level of writing knowledge at the beginning of research period, (2) a post-test to determine the effect of treatment of post-task CALL approach on writing accuracy of EFL learners.

The instruments for this study are the writing topics and post-tasks which were chosen for students by the teacher. These topics and tasks were sent to the experimental group via email. Four writing topics were selected for the pre-test and four for the post-test besides four tasks for treatment sessions. Needless to say, the types of the topics and the time allocated for each one were the same for two groups. The time allocated for the pre-test and post-test was forty minutes, ten minutes for each writing topic. In order to assess the writings of the pre-test and post-test, the researcher and a rater were employed. The correction focus was the accuracy of the written products based on the checklist. The components of the writing program and the evaluation criteria were the following categories:

- A. Layout/Organization: (between 4 and 12 points)
- B. Development/Support: (between 3 and 9 points)
- C. Style: (between 2 and 6 points)
- D. Grammar/Mechanics: (between 3 and 9 points)

Scores for both the pre and post-tests were collected through estimating of the rates in the checklist. A correct answer was rated 1 for poor, 2 for good, and 3 for excellent. During the treatment in each session, a writing topic was presented to the students and they were required to write a one-paragraph essay about it in ten minutes, then their essays were corrected by the researcher. Later, the texts produced by the participants were scored by another rater and the inter-rater reliability was computed through the correlation coefficient between the set of scores the two raters marked for the writings. The recordings were evaluated through inter-rater correlation to arrive at the reliability value. The tests reliability coefficients are presented in Table 1.

Table 1: Inter-rater Reliability

Tests	N	Reliability Indexes
Pre-test (control group)	30	.903
Pre-test (experimental group)	25	.961
Post-test (control group)	30	.825
Post-test (experimental group)	25	.909

#### Materials

In the present study, the course book *College Writing* (Zemach & Rumisek, 2003) was used. The aim of the book was to develop the students' ability to write a cohesive paragraph that has a topic sentence and supporting details with minimal grammatical, spelling, punctuation, and indentation errors. Every time, we checked students' work, in addition to scoring, we wrote some points of this book in their essays and asked them to follow those writing rules in their next compositions. The first and the last composition written by the participants regarded as pre-test and post-test. That is, the learners of both control and experimental group first were required to write one-paragraph essays during the first session considered as a pre-test. The last essay, the topic of which again assigned by the instructors, was treated as a post-test.

#### Procedure

Before instruction, the experimental and control groups were pre-tested face to face in the classroom. They took the same pre-test that consisted of four essays. We asked them to write one-paragraph essays about topics given to them. The minimum and maximum essay lengths were specified (6 to 8 lines, about 100 words). We asked the control group to write their names, but we asked the experimental group to write their e-mails instead of their names. The first and the last composition written by the participants regarded as pre-test and post-test. The test consisted of four essays.

The procedure for the control group was followed a pre-test which is writing four one-paragraph essays, scoring their essays and marking their errors and turning them back to the students considered as feedback, and post-test administration which was writing essays with the same topics as written in pre-test. They were not provided with the correct forms, but a general content comment based on course book used was presented to them in the point of their errors at the end of their essays, and they were asked to look at content comments at home. So, the control group did not receive any special instruction. They just wrote four one-paragraph essays both for pre-test and post-test based on the topics given to them. The procedure for the experimental group was as follows. First they were given a pre-test in the classroom. After the pre-test, there was no face to face contact between instructor and learners in the experimental group. They were just connected via email. The experimental group wrote four one-paragraph essays during instruction. They received feedback via email. In addition, they did post-task activities after each writing task. Tasks were in the form of question and answer. Four different types of tasks were used which were description, explanation, cause and effect, and opinion paragraph tasks. The duration of treatment in the experimental group was 10 sessions. So, each session was allocated to one topic or task and the first and the last session for pre-test and post-test. In a separate session at the end of the course, the same post-test was administered for experimental group to measure the effect of post-task instruction via CALL in their writing accuracy. The post-test for the experimental group consisted of four essays that the students practiced in the online course. So, the essay topic was familiar and the students had enough background knowledge.

Grammar feedback was provided on the presence and location of errors, but no correct forms were provided to encourage self-editing. We marked their errors by using different colors. Red color used for omission, blue color for addition, and green color for correction. Other errors represented to them in the form of some points based on course book used as material. We wrote these points at the end of their essays. For assessment, students in both groups were tested every session. Essays were always graded, returned to the students with comments on strengths and weaknesses. The components of the writing program and the evaluation criteria were the following issues:

The pre-test and post-test essays of both groups were holistically graded based on a general impression of layout/organization, development/support, style, and grammar/mechanics. All essays were read once and a quality rating of excellent, good, poor was given to each paper. Essays were then read by the second rater and each was assigned a grade. The pre-test and post-test essays were double-scored by a colleague of ours who holds a master degree in English. He followed the same scoring checklist. Finally, inter-rater reliability index was calculated to be sure about the reliability of scoring. Data were analyzed through Independent Samples *t*-test to show the difference between the groups' means.

## RESULTS AND DISCUSSION

### Data Analysis

The data collected were analyzed through Statistical Package for Social Sciences (SPSS) 17. In order to determine whether using post-task CALL approach has any impact on Iranian advanced EFL learners' writing accuracy, once the scores of the pre-test and post-test were obtained, the mean and standard deviation of the scores of 55 participants were calculated. In this study, the data were analyzed by *t*-test to see if there was any significant difference between the control and experimental groups regarding their writing accuracy.

### Results of Descriptive Statistics of the Groups

As shown in Table 2, the mean score for the control group was (16.4667) in pre-test and (17.6333) in post-test. Their scores ranged from 13 to 25 out of 36. The mean score for experimental group was (17.8000) in pre-test and (22.9200) in post-test. Their scores ranged from 15 to 29 out of 36. There were close means between the two tests in the control group, so you can see the difference between the two means is not significant. But in the experimental group, the mean of post-test was about 5 points greater than pre-test. So there were considerable individual differences in writing accuracy before and after the post-task CALL approach used in the experimental group.

Table 2: Descriptive Statistics of the Groups

Groups	N	Minimum	Maximum	Mean	Std. Deviation
Control (pre-test)	30	13.00	23.00	16.4667	2.48
Control (post-test)	30	13.00	25.00	17.6333	2.98
Experimental (Pre-test)	25	15.00	28.00	17.8000	3.20
Experimental (Post-test)	25	18.00	29.00	22.9200	3.10

The results indicated partially equal performance on the two tests among control group but different performance on the two tests among experimental group, as they are presented in Table 2. Since descriptive statistics could not offer the researcher valid information to reject or sustain the null hypothesis, an Independent Samples *t*-test was run to see whether the observed difference between the groups was significant or not.

### Results of Groups' Pre-tests

This section includes mean statistics followed by *t*-test analysis to compare the pre-test of two groups of control and experimental. At the beginning of the study both control and experimental groups were given the pre-test of writing. Group statistics in the pre-test is presented in Table 3.

Table 3: Groups' Mean Statistics (Pre-test)

Groups	Variables	N	Mean	Std. Deviation	Std. Error Mean
Control (pre-test)	1.00	30	16.46	2.487	.454
Experimental (Pre-test)	2.00	25	17.80	3.201	.640

As can be seen in Table 3, the number of the students in the control group is 30, and in the experimental group 25. The standard deviation in the control group is (2.487) while in the experimental group is (3.201). The standard error of means in the control group is (.454) while in the experimental group is (.640). Finally, the means of the control group is (16.46) while the mean of the experimental group is (17.80). Thus, there were close means between two groups in the pre-test. The difference between the two means is not significant. Table 4.3 shows the results of the independent *t*-test comparing the control and experimental groups at the outset of the research. The level of significance was set at .05 ( $p < .05$  was significant). The results are as follows:

Table 4: Independent Samples *t*-test (Pre-test)

Groups	Variables	N	<i>t</i>	df	Sig. (2-tailed)
Control (pre-test) vs. Experimental (Pre-test)	1.00	30	-1.73	53	.088
	2.00	25			

As Table 4 shows the degree of freedom, the level of significance and the  $t$ -value of these tests are 53, .05 and -1.73 respectively. More importantly, the  $t$ -value did not exceed the  $t$ -critical. In other words, the observed  $t$  (-1.73) is less than the critical  $t$  (2.066). Consequently, the  $p$  is .088 which is more than the .05 level of significance. Therefore, it came to be known that the two groups were homogeneous. In other words,  $t$ -test analysis indicated that there was no significant difference between the scores of the writing skill of the two groups at the outset of the research.

#### Results of Groups' Post-tests

This section includes mean statistics followed by  $t$ -test analysis to compare the post-test of two groups of control and experimental. The following statistical procedure was carried out at the end of the course in order to figure out and compare the means, the standard deviation, and the standard error of means of the two groups. The results are presented in Table 5.

Table 5: Groups' Mean Statistics (Post-test)

Groups	Variables	N	Mean	Std. Deviation	Std. Error Mean
Control (post-test)	1.00	30	17.63	2.98	.545
Experimental (Post-test)	2.00	25	22.92	3.10	.621

As can be seen, the number of the students in the control group is 30 and in the experimental group 25. The standard deviation and standard error of means in the control and experimental group were respectively 2.98, 3.10; .545, .621. Unlike the pre-test, there was a significant difference between the means of the two groups in post-test. In other words, in the control group the mean was (17.63) whereas in the experimental group the mean was (22.92). So you can see the difference between the two means is significant. Table 6 shows the result of the independent  $t$ -test comparing the post-test of the two groups, which was carried out at the end of the research. Again the level of significance was set at .05.

Table 6: Independent Samples  $t$ -test (Post-test)

Groups	Variables	N	$t$	df	Sig. (2-tailed)
Control (post-test) vs. Experimental (post -test)	1.00	30	-6.415	53	.000
	2.00	25			

As Table 6 shows the degree of freedom, the level of significance and the  $t$ -value of these tests are 53, .05, and -6.415 respectively. As can be seen, unlike the  $t$ -value of the pre-tests in which the  $t$ -observed did not exceed the  $t$ -critical, in the post-test the  $t$ -value exceeded the  $t$ -critical. In other words, the observed  $t$  (-6.415) is more than the critical  $t$  (2.066). Accordingly, the  $p$  is .000 which is less than the .05 level of significance. Therefore,  $t$ -test analysis revealed that there was a significant difference between the scores of the writing skill of the two groups at the end of the research.

#### Results of Comparison of Writing Components

Four different types of writing components used in this study: layout/organization, development/support, style, and grammar/mechanics. Figure 1 shows the results of comparison of these categories in the control and experimental group.

Figure 1: Writing Accuracy Components

Note: Lay & Org= Lay out & Organization; De & Su= Development & Support

As can be seen in Figure 1, the experimental group had a better performance than the control group in all categories except in the first one which is layout and organization. Although in this category they almost had the same performance and their differences were not significant. So it can be concluded that the experimental group outperformed the control group in writing accuracy components.

### **Discussion**

To answer research questions, on which the present study has concentrated, the tests results of each group will be statistically and separately discussed in the following sections.

#### **RQ1) Do post-task CALL techniques affect EFL learners' writing accuracy?**

In general, the writing of CALL group improved. It indicated that the above mentioned strategy is effective in improving EFL writing of MA students at the advanced level of English. After analyzing our data, we observed significance difference between CALL groups' performance in two tests. This result can be more approved by this evidence that there was significance difference between the means of pre-test and post-test among CALL group. The mean of the post-test was higher than pre-test. The results showed that using post-task CALL techniques have more significant effect on students' writing accuracy. One reason for the better performance of experimental group in using post-task CALL techniques might be due to the fact that it is motivating for teachers and learners.

A task-based approach provides learners with interesting challenges and is clearly related to their language needs. Post-task phase provides a chance for students to repeat performance of the task. Post-task activities have also proved interesting. By using it students' writing accuracy will improve in a number of ways specially by focusing their attention to the main task again. Skehan and Foster (1997a) support the research results that accuracy, selectively, would be advantaged in a post-task condition. In their studies, they predicted that a post-task effect upon writing accuracy was confirmed.

Computers are helpful to motivate students. Garcia and Arias (2000) support our idea that using CALL in a classroom has the following advantages: Increased motivation of the students, individualization of learning process, immediate feedback, non-linear access to the information, and the introduction of new exercise types in the classroom. One of the main advantages of CALL programs is that they create the opportunity for autonomous learning. Students are able to learn when and how they want, as well as control the speed at which they are learning (Lasagabaster & Sierra, 2003). Findings of this study also supported the ideas of Lasagabaster and Sierra (2003). CALL programs could offer second language learners more independence from classrooms. Students can study more independently. Language learners do not need to go to a class at a fixed time and in a fixed classroom. They can even study at home. Computer technology can provide a lot of funny activities and reduce the learning stresses and anxieties. Thus, students do not get bored easily and they may become more active. Those abilities will promote second language learners' learning motivation (Skehan & Foster, 1999).

Another reason for the better performance of the experimental group in using post-task CALL techniques might be due to the fact that computer provides immediate feedback in some of students' writing mistakes. Learners receive maximum benefit from feedback only when it is supplied immediately. Classroom feedback is often delayed and at times denied. But computer has the advantage to provide immediate feedback in certain types of students' errors. A computer can thus analyze the specific mistakes the student has made. This leads to increasing students' interest and receptivity and understanding.

A word-processor in the computer can be very effective in teaching writing activities. Because word-processing program allows a wide range of formatting possibilities and make editing and revising much easier, they are of obvious use in teaching writing. Word-processors give writers the freedom to experiment with a text without making a mess. It means that one can make either major or minor changes in the text without retyping or rewriting the entire text (Brookes & Grundy, 2000). As one writes a word-processor will automatically format text; may enable one to check spelling, syntax, and grammar; may provide advice on the choice of words and on the use of words.

#### **RQ2) Do post-task CALL techniques make a difference among CALL and Non-CALL groups learning writing accuracy?**

The results of t-tests indicated a statistically significant difference between the experimental and control groups on writing achievement post-tests. The results of the present study revealed that though two groups had progress in writing, the students in the CALL group yielded a better performance. Results showed that there was not any significance difference among students' performance in pre-test, but in contrast there was a significant difference among the performance of the two groups in post-test. The results showed that CALL group who received feedback via computer and did some activities considered as post-task got better marks and their performance was better than Non-CALL group who did not receive such an approach. This result might be due to the fact that in Non-CALL group students might not have any motivation, while in CALL group they are more motivated as they have more time to think without any pressure or stress and they also can profit from some CALL programs such as Grammar Checker and Spelling Checker.

Computers can help writers in editing and setting layout and checking word such as spell checking and thesaurus. They can provide specialist tools such as grammar and reliability checkers (Seely, 1998). Typing a text word by word may help students to remember words or syntactic structures, spelling may improve and, it is probably more fun than copying a text using pen and paper (Sergeant, 2001). Coley (1997) supports our idea that writing with the application of technology, especially word processor, makes editing easier and faster than writing with pen-paper and it also improves the quality of writing.

The results of this study do not agree with Chen (2005). He observed the impact of traditional class instruction with or without computer aid on the acquisition of parts of speech by the two groups of Taiwanese EFL learners. After a 16-hour instruction, both groups were asked to produce a written narrative. Overall, there was no statistical difference between the control and the experimental groups (Foster & Skehan, 1996). Also, the findings of this study are against with those of Braine (1997) indicating that the traditional setting promotes more improvement in writing than using the networked computers. So, both Braine (1997) and Chen (2005) disagreed with our research results.

Many studies have attempted to assess the impact of computer on learning. Concerning writing, while some studies find a significant advantage of these techniques, others find no significant difference between CALL and other teaching methods. In spite of some disagreement mentioned above, all of the following studies support our research results.

The results of this study are in line with Gorjian (2009) who found that the experimental group taught via computer had a better performance than the control group taught in the traditional method. He investigated the role of computer in instructing writing skills in L2 acquisition. After analyzing the result he found out that the experimental group which received teacher feedback via e-mailing outperformed control group which was given instruction through pen and paper procedures.

This study indicates that the use of the computer may support the process of teaching and learning the writing skill. Moreover, it may enhance the students' writing level. The results of the study confirmed that writing accuracy could be improved through using post-task

CALL approach. It indicate that instruction of applying post-task CALL approach for advanced EFL learners was pedagogically effective as CALL group in this study performed almost better than the Non-CALL group on the post-test, regarding writing accuracy.

## CONCLUSION

Writing is an aspect that needs special attention and instruction. In order to provide effective instruction, it is necessary for teachers of EFL to carefully examine the factors, conditions, and components that underlie writing effectiveness. One of these factors is using specific strategies and using different kinds of tasks to increase students' motivation. By using computer and tasks students' interest and motivation will increase. It was pointed out that in spite of some limitations on using computers and tasks such as financial barriers which are the main outstanding problems, CALL-based writing lead to improvements, even in Iranian classrooms which were mostly rely on paper-based writing. Also, post-task provides a chance for students to repeat performance of the task. By using it students' writing accuracy will improve in a number of ways by focusing their attention to the main task again.

A task-based approach is motivating for teachers and learners. It provides learners with interesting challenges and is clearly related to their language needs. It is obvious to the learners that their classroom work will help them to operate effectively in English. The primary unit for both designing a language program and individual lessons should be a task because it creates opportunities for communication and noticing form/meaning/function relationships, which are the conditions essential for the development of communicative competence in an L2 (Willis & Willis, 2007).

It became clear that foreign language learners are different in language learning, their learning style, motivation, attitude, etc. Teachers should provide opportunities for students to raise their level of motivation and effort to do their best in writing skill. To help instructors in this field, this study used post-task CALL as an approach which will motivate learners. We observed that teacher feedback had an effect on students' ability in writing, but the effect of this feedback via CALL and by using post-tasks was most influential as CALL group outperformed and improved more than Non-CALL group in writing skill.

It is worth mentioning that applying this approach is fruitful for both teachers and learners. With this program students' learning history is recorded and their development is easily checked. Also, even less proficient students can find something interesting in it. Computer could help shy students to participate through sending messages via email to teachers. The computer could be a useful tool in EFL in teaching the writing skill. This also saves instructors' time and energy, because the only thing which remains for the instructors to do is to guide individuals from time to time and provide feedback for them without getting bored. Gruba (2004) refers to the teacher as a "mediator" between the computer and students throughout the learning process, serving the role of "keeping things running smoothly" (p. 637). One of the main reasons why EFL teachers use CALL is that computers can do some of the work of the teacher and provide great assistance to the learner even without the presence of the teacher (Pennington, 1989).

The results of this study can lead the future researchers to investigate other related areas. In this study only one skill investigated (writing accuracy) and other language skills (reading, speaking, and listening) did not consider, so we can compare two different skills and the effect of post-task CALL on them. By considering the subjects that take part in this study, we can conclude that most of them were girls and participants' gender was not the focus of the researchers, but we can compare the effect of post-task CALL approach between two different sexes, boys, and girls. Research on various proficiency levels is also strongly encouraged.

## ABSTRACT

The aim of this study was to identify the lexical and syntactic interferences which students make in translating newspaper headlines. Thirty male and female MA students who were studying teaching English as a foreign language (TEFL) at the Islamic Azad University, Science and Research Branch in Iran took part in the present research. They were given a test which included thirty Persian and thirty English headlines and were asked to translate them into Persian language. They were not allowed to use any dictionaries because their vocabulary knowledge was one of the exam criteria. All the students' translations were analyzed in order to investigate possible cross linguistic problems in translating headlines. Keshavarz' (1993) checklist was used to analyze data. Results showed that the participants faced grammatical and lexical interferences coming from their first language (L1). Then the interferences of L1 were classified in terms of morphological and syntactic taxonomy to give some implications for translation trainers and the students of translation in rendering English headlines into Persian language.

**KEYWORDS:** Interferences, error analysis, headline, translation, syntax, morphology

## INTRODUCTION

Many students of English find that newspaper headlines are especially difficult to understand. Obviously, it is not just a matter of vocabulary; even the style of writing is different from any other text they have met in their studies. The language of headlines is special and has its own characteristics on the lexical, syntactic, and rhetorical levels for its brevity, attractiveness, and clarity (Reah, 1998). These language features pose a great challenge to foreign learners of English when they begin to read English newspapers. This is hardly surprising for, as Waterhouse (as cited in Sanderson, 1999, p. 29) points out, "this genre is not one that people actually use in normal, everyday speech."

Conventionally, the headline serves several purposes: summarizing the whole story, attracting the reader in reading the story and beautifying the newspaper page. The headline is the single most important element of every print advertisement. It is more than a title or label for the message. It is the salesperson's opening line, the foot in the door and the first and most lasting impression. A headline wields the power to attract, repel or slip by readers unnoticed (Khodabandeh, 2004, p.45). Taking these notions in mind, this study attempts to identify the interferences which students make in translating newspaper headlines at syntactic and lexical level.

## REVIEW OF LITERATURE

Faghih's (1997) study is noticeable in terms of language transfer interferences. Focusing on Iranian students' difficulty in learning the English definite article 'the', Contrastive Analysis (CA) shows that in Persian, there is no single word corresponding exactly to the English definite article. The other study investigating interferences in writing is that of Olsen (1999), who used error analysis as a research tool to detect the number and nature of language problems encountered by Norwegian students in writing English.

In the field of syntax, recent studies are those of Noor (1996) and Kim (1998). While Kim presents a rationale for analyzing interferences and syntactic maturity to better understand strategies employed by students when writing in a second language, Noor's study is a review of the most common syntactic interferences made by native speakers of Arabic learning English as a second language. Reima's (2000) study is very much related to the present research as it tries to understand learners' transfer competence, the difficulties they face in first or second language (L1/L2) translation. Reima's study focuses on interferences in the system of grammatical agreement. The results of her study show that 62% of the interferences of grammatical agreement are interlingual and 38% intralingual.

Khodabandeh (2004) did a research on students' interferences in headlines. The participants' chief difficulties in translating English headlines into Persian sentences were grammatical followed by discursual and lexical types. As a whole, the finding from the participants' translations analysis is in line with the idea that native language interference is surely the most immediately noticeable source of error (Brown, 1994) from the translation of native language to the target one. Montazeri (2007, p.62) mention her goal, method of data collection and then results showed differences between English, Persian, and Persian-English advertisements were in the frequency of some rhetorical figures. These differences revealed that each language prefers specific devices; in other words, some rhetorical figures had a higher frequency in one corpus but not in the other. This preference might be due to various causes such as cultural/ personal differences/ so the averter should be aware of these differences on order to avoid possible problems.

## Error Analysis

Error Analysis, tries to account for learner performance in terms of the cognitive processes learners make use of in reorganizing the input they receive from the target language. A primary focus of error analysis is on the evidence that learners' interferences provide to an understanding of the underlying processes of second-language acquisition. It is now widely believed that language learning, like acquiring virtually any other human learning involves the making of interferences. The learner profits from his interferences by using them to obtain feedback from the environment and in turn use that feedback to test and modify his hypotheses about the target language. Error Analysis thus provides a check on the predictions of bilingual comparisons, and inasmuch as it does this, it is an important additional source of information for the selection of items to be incorporated into the syllabus.

### Sources of Interferences

Corder (in Allen & Corder, 1974, p. 130) identified three sources of interferences: Language Transfer, Overgeneralization or analogy, and Methods or Materials used in the Teaching (teaching-induced error). Interlingual interferences: result from the transfer of phonological, morphological, grammatical, lexico-semantic, and stylistic elements of the learner's mother tongue to the learning of the target language.

Intralingual and developmental interferences: are caused by the mutual interference of items in the target language, i.e. the influence of one target language item upon another. For instance, a learner may produce \***He is comes**, based on a blend of the English structures: **He is coming**, and **He comes**. Such interferences reflect the learner's competence at a particular stage of second language development and illustrate some of the general characteristics of language learning, i.e. they result from the learner's attempt to build up concepts and hypotheses about the target language from his limited experience with it.

Transfer of Training: Transfer of training or teacher-induced interferences are those which result from pedagogical procedures contained in a text or employed by the teacher. In other words, these interferences come about as a result of course design or teaching techniques.

### Significance of Second Language Learners' Interferences

Many scholars in the field of error analysis have stressed the significance of second language learners' interferences. Richards (1971), for example, remarks that interferences are significant and of interest to:

- 1) Linguists, because as Chomsky suggests the study of human language is the most fruitful way of discovering what constitutes human intelligence.
- 2) Psycholinguists, because by looking at children's speech and comparing it with adult speech, they have been able to examine the nature of the mental processes that seem to be involved in language.
- 3) Teachers, because by analyzing learner's interferences, they would be able to discover their difficulties and devise a method for comparing them.

## METHODOLOGY

### Participants

Thirty male and female MA students, who were studying English as a foreign language (TEFL) at the Islamic Azad University, Science and Research Branch in Iran, took part in the present research. The reason for selecting MA students is the assumption that they have already acquired general knowledge about media language. Also they were chosen on the basis of availability. Their age was ranging from 25 to 35.

### Materials

To carry out the comparison between the headlines, a sample of thirty English and thirty Persian headlines were randomly selected from among a larger corpus from two leading newspapers- for the sake of practicality-one English (NY daily news) and one Persian newspaper (Hamshahri). The headlines were about different topics such as politic, sport, education, health, crime, and music. They were hard copies and by referring to their front page we came to know that they enjoy a great circulation. The rationale for the selection of these materials was the availability and easy access to them. In order to avoid the variable of time affecting data collection, those English and Persian headlines that issued during a two-week period from November 30 to December 12, 2009 were selected.

### Procedure

For the analysis of the interferences extracted from the translated Persian headlines, the linguistic taxonomy of interferences provided by Keshavarz (1993) was taken into consideration and for the analysis of students' interferences drawn from the translated English and Persian headlines, the lexical and syntactic features of headlines were applied (Reah, 1998, Mardh, 1980, Khodabande, 2004).

## RESULTS AND DISCUSSION

### Analysis of the Translated Persian Headlines

Different kinds of syntactic and morphological interferences extracted from the participants' translations of the Persian headlines into the English are presented in Table 1.

Table 1: Observed Frequency of the Interferences (Frequency and Percentage of Wrong and Correct Answers)

Items	Variables	Freq. WA	Freq. CA	% WA	% CA
1	Omission of preposition	79	195	7.48	5.91
2	Redundant use of preposition	28	122	2.65	3.7
3	Wrong use of preposition	22	105	2.08	3.18
4	Redundant use of articles	103	212	9.76	6.42
5	Lack of concord within a verb group	20	98	1.89	2.97
6	Wrong use of the plural morpheme	10	20	0.94	0.60
7	Wrong use of quantifiers and intensifiers	12	48	1.13	1.45
8	Wrong use of part of speech	40	138	3.79	4.19
9	Use of typical Persian constructions in English	37	156	3.58	4.73
10	Omission of verbs	16	56	1.52	1.69

11 Redundant use of noun possessive's	58	187	5.49	5.70
12 Cross-Association	22	48	2.08	1.45
13 Language switch	8	52	0.75	1.60
14 Wrong translation of vocabulary	360	870	34.12	26.38
15 Skipping vocabulary	240	990	22.74	30.02
Total	1055	3297	100	100

Different types of syntactic and morphological interferences are given in the following section along with examples for each error type. It should be noted that the majority of the sentences may include types of interferences other than those in question.

### **Types of Interferences**

#### **A) Prepositions**

- a) Omission of preposition
  - \*importing illegal fuel  $\theta$  1388
  - \*Youtos-bayren, 90 minutes  $\theta$  stay
- b) Redundant use of preposition
  - \*Ordughan rejected *to* Obama
  - \*Coin reached *to* 2800000 Riallz
- c) Wrong use of preposition
  - \*Iranian vollybalists lose to Japanese *by* dignity
  - \*Uventus-Bayern; 90' *to* survival

#### **B) Redundant use of articles**

- \*The America: we stay in Afghanistan
- \* Yuventus-Bayern: A/ 90 minutes for survival

#### **C) Interferences due to lack of concord**

- \*disabled people is citizens not seen
- \* The historical places of Isfahan needs credit.

#### **D) Wrong use of the plural morpheme**

- \*Iranians volleyball team lost to Japan
- \*Iranians people experience backache, sore knee sooner

#### **E) Wrong use of quantifiers and intensifiers**

- \*Hen and egg the largest high in costs
- \*Old people should not exercise more than lot

#### **F) Wrong use of part of speech**

- \*Ahmadinezhad's four travel to Karakes
- \*Isfahan's history places want credit

#### **G) Use of typical Persian constructions in English**

- \*Rejection of Ordughan to Obama
- \*USA: Our decision on remaining in Afghanistan

#### **H) Omission of verbs**

- \* The nuclear issue,  $\theta$  selling of stocks
- \* The capital of Hakhamaneshiyan  $\theta$ , forget the army

#### **I) Redundant use of noun possessive's**

- \*Countries' schools trembles
- \*Isfahan's historical places want credit

#### **J) Lexico-semantic interferences**

The participants' translations were analyzed based on the interferences of the lexico-semantic subcategories.

#### **K) Cross-association interferences**

It includes the cases of error in which the choice of the lexical item is an equivalent for the Persian word.

- \*Iranians experience backache and *knee pain* early
- \* Chicken and egg received *biggest rises in price*

#### **L) Language switch interferences**

- \* *Irania* experience backache and sore knee soon
- \*Iranian *vollyballers* defeated by Japanese

#### **M) Wrong translation of vocabulary**

- \**Upper* under snow
- \**Authority* dialogue in Obama's foreign policy

#### **N) Skipping vocabulary**

- \*Fatemeh Bodaghi became Ahmadinejad's  $\theta$
- \*  $\theta$  under snow

In the third phase of the study, the chi-square test was utilized in order to find whether substantial differences existed between the ratio of the wrong English and Persian translations. Accordingly, the observed chi-square was higher than the critical value at the significance level of  $p < 0.05$ , indicating significant differences between the wrong English and Persian translations.

Table 2: Chi-square of Wrong Translation of Persian and English headlines  
 $X^2$                       df                      sig

Pearson Chi-square	6.671	1	.010
p<.05	Critical value=3.84		

Chi-square test determined the adequate p-value to Pearson Chi-square equals .01. As a result, the test is meaningful at .05 level and the ratio of wrong answer in the two languages is not the same. So, it can be claimed that the ratio of wrong answers in Persian translated headlines is more than the wrong answers in English translated headlines.

#### Discussion

Analyzing the participants' translations, lead to following results:

1. Generally, participants committed more errors in the translation of the English headline comparing to Persian ones.
2. The most errors which participants committed in English translation headline were related to grammatical and lexical interferences respectively. The research result shows that their grammatical interferences resulted from the translation of tense forms, i.e. wrong translation of the tense forms was the major problem which participants committed in their translations.
3. The analysis of the translated Persian headlines shows that the participants' chief difficulties were due to inadequate knowledge of the English vocabulary. The study also reveals that the participants translated the Persian headline into simple sentences by using the articles, noun possessive's and preposition, instead of omitting them.

The analysis of students' interferences either coming from their first language (i.e., L1 interferences) or second language (i.e., L2 interferences) known as intra and inter-lingual interferences can affect the learners' translation tasks. The results of this study show that the main problem is related to the translation from Farsi to English rather than English to Farsi. This may be due to two issues. First, Iranian learners are competent in Farsi rather than English since they have problems in full acquisition of English grammar and lexicon. Second, they have do not have enough exposure and exercises on translating from Farsi to English because the bulk of knowledge in their domain is coming from English sources rather than Farsi data. Thus they may master the translation of English to Farsi more easily than Farsi to English. In this case, teachers should pay more attention to translation activities from Farsi to English media headlines.

#### CONCLUSION

Students' interferences have always been of interest and significance to teachers and syllabus designers. Teachers can benefit from the findings of error analysis in different ways. Interferences provide feedback and they tell the teacher something about the effectiveness of his teaching materials and his teaching techniques and show him what parts of the syllabus he has been following have been inadequately learned or taught and need further attention. They enable him to decide whether he can move on to the next item in the syllabus or whether he must devote more time to the item he has been working on. An error-based analysis can give reliable results upon which remedial materials can be constructed. In other words, analysis of second-language learners' interferences can help identify learners' linguistic difficulties and needs at a particular stage of language learning. This can serve as a basis for remedial courses and programs in translation training and writing courses in English language.

## ABSTRACT

This study investigated the role of pedagogical films in developing Iranian pre-intermediate students' speaking skill among English as foreign language (EFL) learners. It also dealt with the role of pedagogical films on learners' motivation to participate in speaking activities interactively. Speaking skill is one of the challenges in Iranian classroom since teachers in EFL classes focused mostly on written cues rather than spoken tasks. Thus this research hypothesized that using interesting and short films may affect their speaking skill and also motivation. This issue has been somehow rarely explored in Iranian universities. The reason for this may have been the poor performance of pre-intermediate students in speaking EFL. To achieve this purpose, a proficiency test was administered to 120 university students. Then 54 pre-intermediate language learners who were homogeneous in terms of their rank scores were selected and randomly divided in two equal groups in size, i.e., as experimental and control groups. To assess their speaking proficiency at the beginning of the treatment period, both groups participated in a pre-test interview and scored based on a speaking checklist (Hughes, 2003) and filled in a motivation questionnaire (Dornyei, 2003; Dornyei, Csize & Nemeth, 2006; among others). Experimental group watched the pedagogical films and the participants in control group listened to the audio CDs of those films. After 10 sessions of treatment, both groups were interviewed on the similar topics covered in the pre-test and filled in the same questionnaire. The effect of pedagogical films on the groups' speaking achievement was evaluated through Independent Samples *t*-test analysis. Moreover, the learners' motivation on the post-questionnaire was assessed through Mann-Whitney U test. Results showed that experimental group outperformed control group since pedagogical films had a positive effect on developing speaking skill among pre-intermediate EFL learners ( $p < 0.05$ ) in the experimental group. EFL teachers may use pedagogical films to raise the learners' motivation which reciprocally affects their participation in classroom speaking activities.

**KEYWORDS:** Pedagogical films, EFL Learners, speaking skill, motivation

## INTRODUCTION

Speaking is an important skill in learning English as a foreign language (EFL). Since learners need it for communication (Nunan, 2001). According to Nakagawa (2011), there are different opinions about what successful speaking is. Bailey and Savage (1994, pp. 6-7) believed that "Speaking in a second/foreign language has often viewed as the most demanding of the four skills." Perhaps the most difficult aspect of spoken English is that it is almost always performed via interaction with at least one other speaker. This means that a variety of demands are in place simultaneously: monitoring and understanding the other speakers, thinking about one's own role, producing that contribution, monitoring its effects, and so on. This is one reason why many of second/foreign speakers are shocked and disappointed when they use second/foreign language for the first time in real interaction. In other words, they are not prepared for spontaneous communication and cannot cope with all of its simultaneous demands (Celce-Murcia, 2001, p.103). Most foreign language learners in Iran face difficulty in speaking in English (Dolati & Mikaili, 2011).

English is a foreign language in Iran. Iranian students, after studying English even at advanced levels face problems to express themselves. One reason may be that English is taught formally as a foreign language and only grammar and translation have been focused upon at schools. Therefore, many people have been complaining that Iranian students cannot speak English in spite of studying English for six years or more (Ohato, 2005). Since, "speaking in a second or foreign language has been viewed as the most demanding of the four skills" (Bailey & Savage 1994, P. 7). It is important for most of the instructors to equip themselves with up-to-date techniques and methods of teaching this skill. Most teachers are constantly looking for new ways to encourage students to practice their oral English and speak spontaneously (Essberger, 1998). When students attend English classes they seek for something more interesting, they want fun, a way for showing themselves and talk. They may be motivated through watching films to fill this gap. One of these ways is using pedagogical films related to the curriculum.

Nowadays, using pedagogical films, as audio-visual (A/V) aids, has taken into consideration in teaching EFL. This research seeks to do a comparative study to see the effects of pedagogical films on speaking. This goal can be achieved through the usage of pedagogical films in classrooms. Study in this area is essential for both teachers and students because it will indicate the values of films in EFL classrooms (Writers, 2012). The results of this study will give teachers good insights about using pedagogical films in classrooms. The results will be further significant for language learners to use the strategy. Furthermore, students' feelings towards this strategy will be discovered.

## REVIEW OF LITERATURE

Ellis (1994) states that a strategy contains a mental or behavioral activity associated with some specific stage in the overall process of language acquisition or language use. Also, leaning strategies are particular actions that performed by the learner to make learning faster, easier, more effective, more enjoyable, more self-directed, and more transferable to new situations (Oxford, 1990). On the whole, learning strategies consist of learning instruments for self-regulated learning (Oxford, 2002; Dornyei, 2005). Cohen (1990) believes that the learner is aware of the strategies, even if his full attention is not being given to them. Moreover, in second language learning, strategies are conscious moves made by second-language speakers intended to be useful in either learning or using the second language. According to Cohen, the learning strategies are different from one task to another, from one instance to another instance within the same task or even by different learners dealing with the same task. Effectiveness of strategy depends on the characteristics of the given learner, the given language structures, the given context, or the interaction of these (Cohen, 1998).

### ***Language Learning with Multimedia***

Educational researchers always attempt to find the ways to facilitate learning for the students. Recently they have attended to employ the multimedia materials as a source of activating the oral skill. Video technology plays a role as a major motivator for language development and help students in acquiring language skills. Accessing to friendly learning environment and espousing to a large amount of comprehensible speech are the other two major advantages of technology especially for EFL learners (Butler-Pascoe & Wiburg, 2003 p. 84). Dikilitas and Duvençi (2009) state using computers in classrooms helps teachers to add multisensory elements like picture, text, sound, video, and animation. Butler-Pascoe and Wiburg (2003) described video or picture as the three dimensional text. Stempleski (1990) believes that videos should be linguistically sound, ordered and clean rather than humorous skits where the focus is on the story instead of language so full length movies are out of question and they are not structurally driven, they are certainly not clean and there is no apparent linguistic order to the dialogue.

### ***Using Films in the Classroom***

Bahrani and Soltani (2011) studied the effects of listening to different TV programs on improving different components of speaking proficiency. The participants were 20 females and males language learners of English. A sample of speaking from International English Language Testing System (IELTS) test was used as a pre-test. During the study, the researcher provided the participants with different TV programs to work on in the classroom. Moreover, during the experiment and for each interval between every two sessions, the participants were asked to watch and listen to at least four hours TV programs outside the classroom and write down the summary of whatever was heard which was viewed and discussed later inside the classroom. After 3 months of exposure (four hours a week), all the participants took the same sample of speaking proficiency test from IELTS as a post-test to check if there was any change in different components of speaking proficiency. In order to score the interviews and have a better quantitative data for the components of speaking proficiency checklist was used. The checklist included six scales including fluency, comprehension, communication, vocabulary, accuracy, and accent. Each scale incorporates five levels (5 points). According to the results of the post-test compared with the pre-test, the participants improved the vocabulary and communication components more than the other components during the period of the study. Fluency was the other component which improved to some extent. However, accuracy, comprehension, and accent are the three components of speaking proficiency which remained steady with no improvement. On the contrary, accuracy improves less than the other components. Additionally, participants of the study showed great interest in watching different programs from TV during the study. The participants attended the class with low anxiety which led to the high motivation. Accordingly, it was showed that the use of various TV programs in general could facilitate vocabulary acquisition to a significant extent.

According to Mekheimer's (2011) research, it indicated that exposure to supplementary video material can be beneficial to whole language development. This study was set to measure improvement gains in aural/oral, reading, and writing skills using data from an experiment that was conducted over a period of one academic year. Following an intensive, concentrated exposure to authentic video material accompanying a language skills development remedial program and extensive videos of some selected dramatized famous literary works, participants in an experimental group (n=33) demonstrated statistically significant gains scores over their peers in the control group (n=31) across all skills. The research discovered that authentic video, inducing satisfactory viewing comprehension as well as presented in an integrated language skills instruction, is a valuable approach to whole language teaching.

## **RESEARCH QUESTIONS**

This thesis specifically attempts to reflect on the following research questions: (1) To what extent do pedagogical films affect Iranian EFL learners' development of speaking skill at the pre-intermediate level? (2) To what extent do pedagogical films affect the motivation of Iranian EFL learners in learning speaking skill at the pre-intermediate level?

## **METHODOLOGY**

### ***Participants***

The present study was conducted with the help of 54 students who were selected out of 120 EFL students. All of them were majoring in English Translation including males and females from Islamic Azad University of Abadan in Iran. Through their performance on proficiency test designed by Richards, Lesley, Hansen, Sandy, and Zukowski (2008) those participants whose scores fell between one standard deviation above and one standard deviation below the mean were selected as the participants of the study. Then, they were randomly divided into two of experimental and control groups based on the scores of the proficiency test. Both groups took a pre-test of speaking through interviewing on some specific topics extracted from their textbook (i.e., Top notch fundamentals). Experimental group was taught via pedagogical films (Top notch fundamentals) and the control group was taught based on the audio CDs of those films. Each group included 27 participants. Also, participants in experimental groups were 27. They were ranged from 18 to 29 with a mean of 22.

### ***Instrumentation***

Three testing instruments were utilized in the process of the development of the present research. Initially, a proficiency test (Richards, Lesley, Hansen, Sandy & Zukowski, 2008) was taken to determine the students' proficiency level which divided the sample population into two experimental and control groups. The test contained 50 multiple-choice items and the students answered them in 60 minutes. The reliability of this proficiency test was computed through KR-21 formula as ( $r = .801$ ). Then a motivation questionnaire, before and after the treatment, was given to measure the students' motivation level in learning English as foreign language. The questionnaire consisted of 37- Likert scale items. The students were supposed to answer them in 30 minutes. The motivation questionnaire extracted from Dornyei (2003), Dornyei, Csizs and Nemeth (2006), Clement and Baker (2001), Dornyei (2001), Gardner (1985), Noels, Pelletier, Clement, and Vallerand (2000). Also, the reliability of motivation questionnaire was computed through KR-21 formula as ( $\alpha = .743$ ). For analyzing the participants' results in motivation questionnaire the researcher used the Likert scale which measured the extent to which a person agreed or disagreed with each item. The highest mark in each item is 165 and each multiple choice includes five possible answers from strongly disagree to strongly agree. In the motivation questionnaire, the researcher coded the responses accordingly: Strongly disagree = 1, disagree = 2, no answer = 3, agree = 4, strongly agree = 5. Additionally, some questions about the films were asked to measure the students' level of speaking at the beginning of research period. It was a face-to-face conversation according to the level of the person being tested. All oral interviews were recorded for future verification.

Finally, a post-test was done to determine the effects of using pedagogical films on speaking skill. Moreover, post-test includes the same question in pre-test. The reliability values of pre and post-test were calculated through Kuder-Richardson 21 formula too. The reliability values of pre and post tests were ( $r = 0.97$ ) and ( $r = .80$ ) respectively. Furthermore, a checklist (Hughes, 2003) was used in both pre and post

tests to measure communicative abilities of students. Also, during the treatment, four types of techniques were used in both groups to found out the levels of students' speaking. They included note taking, question and answer, discussion, and description.

#### Materials

Considering 10 sessions for classes at the university, the teacher was able to select 8 episodes of topnotch film fundamentals. Every episode was about two minutes. Time of each class was 45 minutes. In every session, the teacher used one episode for each class. The selected films had to meet some criteria. The first criterion was vocabulary frequency and unfamiliarity. Existence of the variety in film's topics was the second criterion to select them. Thirdly, in selecting a pedagogic film we had to take into account the participant's social and religious norms and values as well as the relatedness of the film to the students' daily life in order to communicate well with them. Therefore, the researcher decided to select top notch films which more appropriate and fun to the students. These films have both pedagogical and fun criteria so they are suitable for using in classes to discover the effect of them on speaking skill. Films are selected based on the participants' proficiency levels. Moreover, other instructors assigned which level of top notch films is appropriate for teaching students based on the scores of their pre-test. As a result, Top Notch Fundamentals was selected as teaching materials of research.

#### Procedure

This study was conducted at Islamic Azad university of Abadan. The first step was to make sure of the students' homogeneity. To do so, a week before the instruction, the researcher administered a sample proficiency test to 120 participants in order to select 55 participants. Those with the highest scores were selected and randomly divided into two groups in two different classes. Control group includes 27 participants. Also, participants in experimental groups are 28. Before starting instruction, the groups were participating in a motivation questionnaire with 36-Likert scale items. It means that students answered to 36 items in 30 minutes. A pre-test was administered to discover the students' levels of speaking at the beginning of research period. It was a face-to-face interview. Each oral interview was scored according to the checklist (Hughes, 2003) for the sake of reliability. After selecting and dividing the participants on random judgment sampling, the instruction phase started. One class was required to watch a pedagogical films while the other one audio CDs of those films.

The treatment lasted ten sessions, 45 minutes a session, once a week. During the treatment, in each session, the researcher devoted times to watching the movie, practicing new words, and talking about that part of the movie. Each movie was presented to the students for 15 minutes in every session. Then, the teacher worked on that part of the movie. As mentioned before, during each session, four types of techniques including note taking, question and answer, discussion, and description were used to work on the pedagogical film. Most of the students took notes while they watched the film for reviewing it. After watching the film some questions were asked to discover students' comprehension of it and then they described it. In addition, the students discussed the movie and gave their opinion about the plot of the film. Also control group was conducted the same activities which were done in experimental group. The only difference between both groups related to using audio CDs of the pedagogical films instead of pedagogical films in control group. It means other activities between two groups are the same. For example, students in control group took notes while they listened to the audio CDs. Finally, after the treatment period, a post-test of speaking achievement covered all the materials were administered to two groups. Finally, the results of the tests were compared to each other to know the importance of movies

#### RESULTS AND DISCUSSION

Analysis of Independent Samples *t*-test was run in order to find out whether the differences between the two groups are statistically significant or not. Moreover, a Mann-U Whitney-Wilcoxon analysis was used to discover the effect of pedagogical films on Iranian pre-intermediate EFL learner's motivation before and after research period in both experimental and control groups. First, the data obtained through students' performance on a proficiency test designed by Richards et al (2008) was analyzed statistically. The first step used in analyzing data was determining the proficiency of the groups regarding their levels of second language proficiency. Thus, the students' overall scores on the test were collected from their records.

#### Results for the First Research Question

To test the first research hypothesis, the researcher dealt with comparing two groups based on the role of watching pedagogical films in speaking skill. To do so, students' speaking exam was conducted at the first and the end of the semester as the pretest and post-test of speaking. Two oral interviews were performed and participants' interviews were recorded for analyzing in both pre and post tests. It should be noted that oral performance test focused on the proficiency level of the students' oral interviews conducted face-to-face interaction.

The analysis went further to find out whether it affects on students' performance in speaking skill; two *t*-test analyses were applied in this section, for two groups' performances on speaking. Then an Independent Samples *t*-test was also performed to determine the rate of mean differences, if any, between two groups and this last *t*-test was used to show the role of watching pedagogical films on speaking skill. It is important to note that the researcher employed all the formulas with the level of significance set at 0.05 in all their applications. All the tests which were conducted separately were combined and considered as one single test, that is, the mean for the two tests scores of each student was calculated, and then the Independent Samples *t*-test was applied.

Table 1 provides the descriptive statistics of students' speaking pre-tests in terms of the number of participants (N), means, standard deviations (SD), and standard errors of mean.

Table 1: Group Statistics (Pre-tests of Speaking, Experimental vs. Control groups)

Pre-test of Speaking	N	Mean	Std. Deviation	Std. Error Mean
Control	27	13.62	4.53	.87
Experimental	27	13.76	3.64	.69

According to the Table 1, the mean scores of pre-test for control group and experimental group were 13.62 and 13.76 respectively. Descriptive statistics of students' speaking post-tests are summarized in the Table 2.

Table 2: Group Statistics (Post-tests of Speaking, Experimental vs. Control groups)

Post-test of Speaking	N	Mean	Std. Deviation	Std. Error Mean
Control	27	17.48	4.08	.78
Experimental	27	21.26	2.63	.51

The mean score of pre-test were 17.48 for control group and 21.26 for experimental group. Table 3 provides descriptive statistics of both pre and post tests of students' speaking.

Table 3: Descriptive Statistics (Pre and Post-tests of Speaking)

Groups	N	Minimum	Maximum	Mean	Std. Deviation
Audio pre-test speaking	27	7.00	22.50	13.62	4.53
Audio post-test speaking	27	10.00	26.50	17.48	4.08
A/V pre-test speaking	27	7.00	21.00	13.76	3.64
A/V post-test speaking	27	14.5	27.50	21.26	2.63
Valid N (listwise)	27				

The results showed that the pre-test speaking scores ranged from 7 to 22.5 out of 30 in control group and 7 to 21 out of 30 in experimental group. Also, the scores of post-test speaking ranged from 10 to 26.5 in control group and 14.5 to 27.5 in experimental group. According to Table 3, The mean scores of the experimental group ( $M = 13.76$ ,  $SD = 3.64$ ) were approximately similar to those of the control group ( $M = 13.62$ ,  $SD = 4.53$ ) in pre-test but the above table shows that the mean scores of the experimental group in post-test ( $M = 21.26$ ,  $SD = 2.63$ ) were significantly different from those of control group ( $M = 17.48$ ,  $SD = 4.08$ ). The result of the  $t$ -test of pre-test in both groups is summarized in Table 4.

Table 4: Independent Samples  $t$ -test (Pre-tests of Speaking, Experimental vs. Control groups)

Levene's Test for Equality of Variances										
Pre-test Speaking	<i>t</i> -test for Equality of Means									
	95% Confidence Interval of the Difference									
	Equal variances assumed							Std. Error	Lower	Upper
	Equal variances not assumed	F	Sig.	<i>T</i>	df	Sig. (2-tailed)	Mean Difference	Difference		
		1.87	.17	-.17	51	.86	-.19	1.12	-2.45	2.05

According to pre-tests of Independent Samples  $t$ -Test (Table 4), observed  $t$  (-0.17) was less than critical  $t$  (2.066) with df 51 in control group and also observed  $t$  (-0.17) was less than  $t$ -critical (2.066) in experimental group. Furthermore,  $t$ -test analysis shows significance value as 0.86 which is much greater than 0.05. This means that there is no statistical significance between mean performances of the two sets of scores in experimental and control groups in the pre-test. Moreover, the above table shows that the amounts of observed  $t$  are statistically not significant ( $t = -0.17$ ,  $p = 0.86$ ); therefore, it can be claimed that two groups were homogeneous at the beginning of the experiment regarding their prior knowledge. Table 5 shows the results of the  $t$ -test of the post-test in both groups.

Table 5: Independent Samples  $t$ -test (Post-Tests of Speaking, Experimental vs. Control groups)

Levene's Test for Equality of Variances										
<i>t</i> -test for Equality of Means										
Post-test of Speaking									95% Confidence Interval of the Difference	
		F	Sig.	<i>t</i>	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	Lower	Upper
	Equal variances assumed	4.02	.050	-4.09	51	.00	-3.88	.94	-5.78	-1.98
	Equal variances not assumed									

As presented in Table 5, the observed  $t$  (-4.09) in control group was greater than critical  $t$  (2.066) with df 51, and observed  $t$  (-4.13) in experimental group was greater than the same critical  $t$ . Also, computed significance equals .00 which is smaller than the significance level set for the study (0.05). Based on the results obtained, this strategy improved students' speaking skill. Hence, the first null hypothesis was rejected due to the greater value of means and higher amount of observed  $t$  than critical  $t$ . Thus the equality of mean of these groups was

rejected. This substantiated the fact that there was a statistically significant difference between the experimental and the control groups confirming the effect of pedagogical films on the EFL learners' speaking skill. As shown in the Tables 4 and 5, there were considerable individual differences in speaking before and after the treatment. In other words, the experimental group outperformed the control group on the post-test and this means that the null hypothesis was rejected. It proves that the treatment has increased speaking skill scores. In other words, pedagogical films have significant effects on speaking scores.

#### **Results for the Second Research Question**

A non- parametric statistics was used to analyse the results of the small sample size. Mann-U Whitney-Wilcoxon, which is a non-parametric test for comparing the performance of two independent groups, was utilized to see whether there was any statistically significant difference in the variables under study. It was used to find out if the differences in students' motivation between two groups were statistically significant. It is important to note that the researcher employed all the formulas with the level of significance set at 0.05 in all their applications. Table 6 shows the mean of groups in pre-motivation questionnaire.

*Table 6: Pre-Motivation Questionnaire (Experimental vs. Control groups)*

	Groups	N	Mean Rank	Sum of Ranks
Pre-Motivation Questionnaire	Control	27	29.00	783.00
	Experimental	27	27.04	757.00
	Total	54		

Table 6 shows that 27 participants in the control groups and also the 28 participants in the experimental group took part in this research. Based on the table, sum of ranks of pre-test of motivation in control and experimental groups were 783, 00 and 757, 00 respectively. The results of Ranks of post- motivation questionnaire are shown in the Table 7.

*Table 7: Ranks of Post- Motivation Questionnaire (Experimental vs. Control groups)*

	Groups	N	Mean Rank	Sum of Ranks
Post-Motivation Questionnaire	Control	27	20.87	563.50
	Experimental	27	34.88	976.50
	Total	54		

Based on the Table 7, post-test of motivation questionnaire shows that sum of ranks of control and experimental groups were 563.50 and 976.50 respectively. Table 8 provides the descriptive statistics of motivation questionnaire for two groups in terms of the number of participants (N), minimum scores, maximum scores, means, and standard deviations (SD). The results in both groups are summarized in Table 8.

*Table 8: Descriptive Statistics (Pre and Post Motivation Questionnaire)*

Groups Motivation Questionnaire	N	Minimum	Maximum	Mean	Std. Deviation
Audio pre-test question	27	117.00	156.00	139.963	8.41
Audio post-test question	27	125.00	161.00	141.25	7.56
A/V pre-test question	27	128.00	163.00	139.96	8.12
A/V post-test question	27	125.00	165.00	148.42	9.27

As Table 8 indicates, the students' scores in the motivation pre-test in audio group ranged from 117 to156 out of 165 and the mean score was 139.96. Also, the students' scores in the motivation pre-test in A/V group ranged from 128 to163 out of 165 and the mean score was 139.96. Also, the students' scores in the motivation post-test ranged from 125 to 161in control group and 125 to165 in experimental group. The Table 8 shows the mean score of control group in pre-test was 139.96 and mean score of experimental group was 139.96. It shows the mean scores in control and experimental groups were approximately similar in pre-test. Moreover, the mean scores of post-test motivation for audio group were 141.25 and 148.42 for A/V group. The mean for both groups increased from the pre-test to the post-test, although the experimental group showed a larger increase. The result showed that the mean score of the experimental group (M = 148.42, SD = 9.27) was significantly different from the control group (M = 141.25, SD = 7.56). Table 9 shows that the results of pre-test of motivation questionnaire.

*Table 9: Mann- U Whitney Test (Pre-test Motivation Questionnaire)  
(Experimental vs. Control groups)*

	Pre-test
Mann-Whitney U	351.00
Wilcoxon W	757.00
Z	-.455
Asymp. Sig. (2-tailed)	.649

According to the Table 9, the two-tailed significance score was greater than the alpha value of 0.05. This indicated that the control and experimental groups were not significantly different from each other relative to the hypothesized values ( $Z = -.455$ ,  $p = .649$ ). The results of post motivation questionnaire are summarized in Table 10.

Table 10: Mann-U Whitney (Post-test Motivation Questionnaire  
(Experimental vs. Control groups)

	Post-test
Mann-Whitney U	185.500
Wilcoxon W	563.500
Z	-3.245
Asymp. Sig. (2-tailed)	.001

According to the Table 10, the two-tailed significance score of .001 is less than the significant value of .05. There were significant differences between the EFL learners' motivation in two groups. This leads to a rejection of the second null hypothesis and provides support for the research hypothesis. Table 10 displays the results of the analysis of the effects of pedagogical films on EFL learners' motivation in learning English.

### Discussion

As shown in Independent Samples *t*-test, the speaking of two groups improved but there was a significant difference between them. As a whole, the study showed that the pedagogical films are effective in improving EFL learners' development of speaking skill at the pre-intermediate level of English. This result can be more approved by this evidence that there were significance differences between the means of pre-tests and post-tests. The means of the post-tests were higher than pre-tests. Also, *t* values were much greater than *t*-critical. That is to say, the learners who watched the pedagogical films may outperform the learners who listened to the audio CDs of those films. This is very much compatible with the results of the research conducted by Bahrani and Soltani (2011). They discovered that films improved speaking ability of the learners. Also, it showed that vocabulary and communication components of speaking enhance more than other components of speaking. Also, the results of this study are in line with the study that Mekheimer (2011) did. It was designed to indicate whether that exposure to supplementary video material is beneficial to whole language development. The study found that authentic video, is a valuable approach to whole language teaching.

The findings of this study are against with those of Dikilitas and Duvenci (2009). According to their research auditory/textual materials are more effective than films in terms of their effects on EFL learners' speaking skill. They reported that length of utterance and mean length of utterance are higher in students how use auditory/textual materials.

One possible explanation of such result is that correct use of pedagogical films in classrooms may help students to enhance their learning and speaking. This explanation is supported by Katchen (2003) who discovered that DVD films can be used as the major course material in a university level listening and speaking course for English majors. It also showed that students benefited from using DVD films. Combination of sounds and images in films may be one of the reasons that improve speaking. King (2002) in the same way stated that the great value of films lies in its combination of sounds, images, and sometimes text.

Based on the finding, creating a meaningful environment by use of pedagogical films may encourage students to speak. According to Canning-Wilson (2000), use of visuals, films, cartoons, and some other things help learners to clarify the messages and enhance understanding. Progoosh (1996) believed visual imaging systems have widespread among people and is an inseparable part of people's lives.

The purpose of this study was to determine the effectiveness of pedagogical on learners' motivation in improving speaking language. Based on the results of the Man- U Whitney Test in chapter 4, the results of the study confirmed that learners' motivation in learning and speaking English could be increased through watching pedagogical films. It showed that pedagogical films might provide strong motivation for students to learn English. This is compatible with Ardriyati (2010) that found that using films in teaching could be motivated and attractive. According to him (2010) films can make students become more motivated to learn and communicate in the language. The finding of the study conducted by Istanto (2009) support the use of films in classes and thus is consistent with the outcome of current study. According to Istanto, films provide strong motivation for learners to learn the target language and culture because they can learn in more interesting ways compared to traditional class activities. Moreover, it's in the same line with Jahangard (2007) who discovered that visual materials increase language learning in classrooms. Also, it is consistent with the finding of Ardriyati (2010) who stated that motivation plays an essential element when teacher use films in classrooms as a teaching material.

Based on the results, pedagogical films may arouse learners' curiosity and it can motivate learners to follow the films. It's consistent with the finding of Offner (1997) who states that students may be motivated through watching film to fill this gap. Also in the experimental groups, students showed that they want to speak more about the films may be due to the fact that films can affect students' attitude positively in learning process? Furthermore, EFL learners in this research had positive attitude toward improving speaking through watching films. One of the learners said "*It was fun and learning at the same time*". This outcome is similar to the Adiyaman (2002) who found that technological equipment like watching films effect on students' attitude so much.

There were less stress and tension in the class and it seemed that the learners were able to cope with the difficulties of speaking through various activities and putting them into use and finally activating them. The learners feel more comfort and this class was fun for them. One student mentioned "*I can't wait for the next session to watch the other episodes of the film*". Another learner stated that "*I feel more comfortable in this class than any other classes and it is fun for me*". The findings of this study also are in the same line with the findings of Bahrani and Soltani (2002) who concluded that learners show great interest in watching films and different program from TV during the study. The participants attended the class with low anxiety which led to the high motivation.

### CONCLUSION

Teachers, methodologists, and applied linguists are responsible to help teachers comprehend the value of A/V materials because it can create the motivation and enjoyment in learning speaking. Instructors should provide opportunities for students in classroom to enhance their level

of motivation and effort to participate in the classroom discussion. First, teachers should introduce the importance of using A/V materials in speaking to language learners. Then, they must raise their students' knowledge of them, as well as recommending them and give them some instructions on how and when to utilize pedagogical films for enhancing speaking. Moreover, the teachers should employ the suitable levels of pedagogical films in classrooms. In language classrooms, it is suggested that language teachers familiarize their pre-intermediate language learners with advantages of pedagogical films to improve their speaking ability. Since this survey demonstrated that using pedagogical films in classrooms were useful for pre-intermediate learners of English. It is recommended that language teachers explicitly instruct their pre-intermediate language learners in the use of them.

The study can bear implications for materials developers and compilers of instructional books. By taking insights from the present study, compilers and materials designers might include tasks following short pedagogical films. Also, they should consider that pedagogical films should be presented in a right time and at suitable levels that confirms to the learners' actual potential in learning, in order for them to speak better. Material designers are advised to acquaint pre-intermediate EFL learners with the substance and advantages of using pedagogical films in language classrooms so that language learners with pre-intermediate language ability may draw upon them. As revealed in the present study, material designers had better notify these learners of the value and significance which pedagogical films have.

The results of this research can lead the future researchers to investigate other related areas. This study attempted to find out the effects of pedagogical films on EFL learners' speaking skill and their motivation and did not take the other skills or factors into consideration. Since other skills such as listening comprehension or writing skills and even vocabulary or idiom learning and also other emotions and feeling like anxiety could be influenced by the use of pedagogical films in the classroom situations, researcher is recommended to pay attention to them. Both male and females took part in this study but the researcher can compare them or study the effects of pedagogical films on the same sex. Since the study has evaluated on pedagogical films, replication of the study with different kinds of films and movies in other genres for example documentary, comedy, and also animation or authentic films would also be advisable. Learners who studied English as a foreign language took part in this study. Also, the same study can be replicated in other situations such as ESL situations and even in native speakers' contexts. Furthermore, this research was conducted with pre-intermediate EFL learners at Islamic Azad university of Abadan. Other levels of language proficiency in different cities can also be the participants of further studies if researchers wish to make generalizations about language learners at different proficiency levels. Eventually, the study lasted for two months. Succeeding studies can allocate more time to the instruction of pedagogical films on EFL learners' speaking skill and motivation.

## ABSTRACT

This study aimed to investigate the role of reformulation tasks including comparison, paraphrasing, and copying activities concerned with developing writing accuracy in composing one paragraph essays in English as a foreign language (EFL) learners' writing accuracy. To achieve this purpose, a placement test was used to make sure of the homogeneity of participants. Accordingly, 100 participants were selected out of the student majoring in English translation at Abadan Azad University. Then they were assigned to three experimental and one control groups, each comprised of 25 participants based on systematic random sampling. The experimental groups received reformulation tasks, whereas the control group was taught traditionally. In other words, the control group received usual practice in writing essays with no explicit focus on the nominated tasks covered by the experimental groups. Group A received comparison task, group B received paraphrasing task and group C received copying task. The study continued for one semester. The participants took a pretest of writing one-paragraph essay, evaluating their proficiency in writing accuracy. After the treatment sessions, the four groups sat for the post-test of writing a one-paragraph essay. The topics for both the pre-test and post-test were the same. A standard checklist developed by Yang and Zhang (2010) was used to score the essays. For calculating the results, One-way ANOVA was used to measure the differences among the groups. Then a Post-hoc Scheffe test was used to determine the most effective task. The results showed that reformulation tasks such as comparison and copying were beneficial for improving accuracy among EFL learners. They are comparison and copying tasks which improved learners' writing accuracy. Thus this study may suggest that these two tasks could develop writing accuracy more effectively than the other tasks.

**KEYWORDS:** Reformulation tasks, EFL learners, writing accuracy

## INTRODUCTION

Writing is one of the four language skills and it could be very challengeable for EFL or English as second language (ESL) learners who need it as an instrument for employment and promotion (Graham & Perin, 2007). As Ting (2003) believes, writing in English has always been a demanding task for EFL/ESL learners. He states that this is because English writing, compared with English speaking, is the more formal mode of English production and therefore requires learners to be aware of the properties of English text. Harklau (2002) accepted the role of writing as a tool for communication and explained its key role in understanding how second language acquisition take place in elementary and secondary level classroom where literacy use for communication and transmission; it means writing is a way to understand how students learn a second language.

Celce-Murcia (2001) believes the ability to express one's ideas in writing in a second or foreign language with reasonable coherence and accuracy is a major achievement that even many native speakers of English never master. Writing is a complex activity, a social act which reflects the writer's communicative skills which is difficult to develop and learn, especially in an EFL context (Fallahzadeh & Shokrpour, 2008).

According to the benefit of reformulation, Yang and Zhang (2010) examined the effectiveness of reformulation and model text in a three-stage writing task (composing-comparison-revising) in an EFL writing class in a Beijing university; their findings showed that the students made more effort in finding the proper language to express their ideas at composing stage and were able to notice most differences between their original text and the reformulated one at comparison stage and their appreciation of having access to a native model text for a broad range of language input.

Various types of tasks are used as exercises for writing composition training at schools. Sometimes verbal materials are used for older children and series of pictures for developing transformational or representational knowledge that can be stored as information in memory for improvement in written composition used for lower learners (Pavio, 1990; Sølvsberg & Valås, 1995). But when learners finish school, they still cannot write in an appropriate way. This gap in writing research could be somewhat filled by task-based research. In the present study, the researchers use different reformulation tasks (comparison, copying, paraphrasing) to find role of these tasks in learners accuracy. Learners' exposure to native models and the opportunity of using them in writing make learners familiar by accuracy rules.

This study aims to find out the role of different reformulation tasks (comparison, paraphrasing, and copying) among Iranian students' writing accuracy who study at Abadan Islamic Azad University. Although several works have been done about different strategies and tasks to improve writing accuracy, to best of my knowledge, very few studies have been oriented to investigate the role of reformulation tasks in Iranian students writing accuracy. Promoting writing in general and writing accuracy in particular should be the main concern of not only Iranian learners but also those who want to learn English and improve their writing in and outside the academic settings.

Writing is one of the four language skills. It is necessary for language learners to obtain this skill for their goals and purposes. Accuracy and obtaining rules and grammar of English is one way to improve this skill. Reformulation is one way to improve this ability. Reformulation tasks including comparison, paraphrasing, copying are beneficial tasks for improving writing accuracy. By this study, we want to know how different reformulation tasks effect writing accuracy and compare and contrast tasks to know which one is beneficial for which part of grammar.

This study is important especially for Iranian English as foreign language (EFL) learners who want it for communication and pursuing the English for academic purposes (EAP). They do not use English extensively outside the classroom in educational setting to meet their needs. So, authentic texts for model texts, revision parts, and exposure to accurate texts during the term help students to have confidence and write like a native one.

## REVIEW OF LITERATURE

Writing is needed for higher degree of education, for writing research and be a member of scholarship. It is used to show one's thoughts and ideas (Diekelmann & Ironside, 1998). For these purposes and more than these, students required to learn this skill. They can practice different tasks. In writing courses, students are asked to complete writing assignments such as essays, summaries, reports, term papers, note taking, etc. Although they are hard activities, they are not always leads to learning without cognitive and metacognitive strategies (Hubner, Nuckles, & Renkl, 2010). Kormos (2011) argues that teachers can obtain information about how different task features work with the linguistic characteristics of foreign language written texts before choosing tasks.

Panofsky, Pacheco, Smith, Santos, Fogelman, Harrington, and Kenney (2005) believe the writing process and strategy includes four categories. First, students required to use process tasks. For example, outlining, composing, revising, editing and final writing. Second, argumentative writing which provides important information to support an idea. Third, students asked to arrange, criticize, evaluate, compare, and contrast opinions and information. Fourth, students take part in peer-editing activities.

### *Reformulation*

The first definition of reformulation was proposed by Levenston (1987). In this definition, learner's composition revised by native speaker. In this revision, original draft's ambiguity, awkwardness, lexical inadequacy, stylistic problems, syntactic and spelling mistakes, and grammatical errors are revised.

Cohen (1983, p.4) explains reformulation as "having a native writer of the target language rewrite the learner's essay, preserving all the learner's ideas, making it sound as native like as possible". He continued that Native speaker can change text to make it as native one; this change can occur in lexical, syntactic or style (Allwright, Woodley & Allwright, 1988). Some studies consider reformulation as a feedback tool which have often use by output and noticing in the context of L2 writing. The technique of reformulation has potential to affect some disadvantages of traditional feedback methods, which often target non-target like forms (Hanaoka & Izumi, 2012).

Reformulation is a useful technique for providing input in writing skill. In writing and speaking, sometimes learners cannot reach to their communicative goals as a result of lack of L2 knowledge. But in writing, learners have a chance to resolve their problems by different ways like: using model, reference sources, and asking teachers. By using reformulation technique, learners also can compare their text with new version of it and rewrite their text. So reformulation as an immediate input can help learners to solve their difficulties (Williams, 2012).

### *Paraphrasing and copying*

Sometimes copying in writing skill consider as plagiarism. Copying from source text considered necessary for academic writers to develop their writing. It can be a step before paraphrasing (Chandrasoma, Thompson & Pennycook, 2004; Hyland, 2001). Keck (2006) states that textual borrowing is not necessarily an ill-intention illustration of plagiarism since it can be a learning or developmental process. Researchers say there are differences among plagiarism, novice writers' citation, high level proficiency writers, and summaries (Wette, 2010).

Paraphrasing can be used as a strategy for avoiding plagiarism (Yamada, 2003). For avoiding plagiarism, students can use substantial paraphrases which are defined by Keck (2006) as including only main words that repeated in the text and related to the topic. Also they can use superficial paraphrasing in their writing. Keck (2010) said for using this strategy, L2 writers can add new words, delete words, or substitute with synonyms words. Abbasi and Akbari (2008) argued that many L2 students use superficial paraphrasing to avoid using their own words and this can be due to lack of confidence. Substantial paraphrase by using only main words doesn't guarantee good paraphrasing (Shi, 2012). Yamada (2003) believed on inferential thinking (deductive and analogical) for good paraphrasing.

Fathman and Whalley (1990) works on students' writing against four different feedback conditions: no feedback other than the grade awarded; grammar feedback consisting of underlining all grammatical errors; content feedback in which short, general comments were made about the text; and a combination of grammar feedback and content feedback, argue that only the grammar feedback and the grammar plus content feedback groups made development in grammatical accuracy at a statistically significant level.

Chandler (2003) conducted a study to find the role of error correction in improving accuracy in students writing. Author chose participant among students at an American conservatory. Students were asked to write about 25 pages of autobiographical writing and a book review over the semester. They divided to two groups but they were taught by the same teacher with the same method and both groups received error feedback. The difference between experimental and control groups was in treatment and receiving feedback. Students in the experimental group should revise each assignment and correcting all the errors underlined by the teacher before doing the next exercises. Nonetheless, the control group did corrections of their underlined errors after the first drafts of all five homework assignments had been written toward the end of the semester. The results demonstrate that the control group, which did no error correction between assignments, did not increase in accuracy while the experimental group showed a significant increase which was not accompanied by a decline in fluency. Yang and Zhang (2010) conducted a study to investigate the effect of exposing participants to both a reformulation and a model text in a three-stage writing task. Chinese EFL students participated in this study and narrative writing used for the purpose of this study. Researchers found that participants noticed to the differences between their composed text and reformulated text in comparison stage while they also use models as a good sample of native writing. So, researchers believed on using both reformulation and a model text to improve students' writing. They said by using reformulated text, students can be aware of their problems and learn native version of expressing their ideas; while by using model text which is free from constraints of the original writing, learners have a example of native at all levels consist of vocabulary, sentence structures, and discourse.

Shi (2012) conducted a study to find the role of rewriting and paraphrasing source texts in second language writing. Also this study tries to find how students and professors look at paraphrased, summarized, and translated texts. 48 students and 27 instructors in a North American university volunteered to participate in this study. This study contained 3 questions: 1. How do participating students and faculty across disciplines view the examples of paraphrasing in relation to the amount of copying and the use of one's own inferential thinking? 2. How do participating students and faculty across disciplines view the example of the summarized text in terms of how it should be acknowledged?

3. How do participating students and faculty across disciplines view the example of the translated text in terms of how it should be acknowledged?

Moore (1997) conducted a study at an Australia university in order to find how ESL student relied on copying in their summary writing. Findings showed that ESL students with an Asian background copied when writing summaries without citing. The researchers believed this kind of copying is related to cultural variation, not plagiarism because ESL students look at original text as a source of information so they copy. On the other hand native English speakers attribute the summarized positions to the original author because source text is an individual point of view for them. Johns and Mayes (1990) also examined summaries written by 80 ESL undergraduates, they reported that low levels proficiency students copied directly from the original text more than high levels of English proficiency.

### RESEARCH QUESTIONS

The current study aims to answers the following questions: (1) To what extent do comparison, paraphrasing, and copying tasks affect EFL learners' writing accuracy at the intermediate level? (2) Is there any difference among comparison, paraphrasing, and copying in developing accuracy in writing?

### METHODOLOGY

#### *Participants*

The participants for this study were students of Islamic Azad university of Abadan, majoring in English Translation. They were selected out of those students who had recently passed the course of simple writing at the university. To ensure the students' linguistic homogeneity, the researchers administered a proficiency test (Richards, Lesley, Hansen, Sandy & Zukowski, 2008) to 122 students. After the scores of proficiency test were obtained, 100 students whose scores were within one SD below and one SD above the mean were selected as the participants who gained the level of intermediate level. Then they were non-randomly divided into four groups of 25. They comprised of three experimental groups i.e., comparison group (A), paraphrasing group (B), copying group (C), and a control group (D).

#### *Instrumentation*

The following instruments were implemented in the study: (1) A proficiency test of English languages (Richards et al, 2008) which included 50 multiple choice items to assess learners' general knowledge of English grammar and reading comprehension at the intermediate level. Its reliability coefficient was computed through Cronbach Alpha formula as ( $\alpha=0.865$ ). (2) A pre-test and a post-test were designed based on IELTS topics for writing to measure the students' writing achievement before and after the treatment period. Each writing test included three topics and the participants should select one out of the three to write a one paragraph descriptive essay included 15 words. (3) A check list was extracted from Yang and Zhang (2010) which included 20 items on the accuracy of the students' writing such as mechanics of writing, style, grammar, spelling, etc.

#### *Materials*

Original model texts which were chosen from "Active skills for reading: Book 2", developed by Anderson (2007) were used for revision. This book includes 12 units and each unit contains 2 chapters. There are reading parts in each chapter which were used for our purpose as a model of native one. The book "Paragraph Development" by Arnaudet and Barrett (1990) was used for control group.

#### *Procedure*

In this study, participants were given an English placement test and then they were divided to four groups of 25. Groups were as follows: comparison group (A), paraphrasing group (B), copying group (C), and control group (D). All groups except control group were assigned the same materials but were expected to do different tasks. The reading parts of "Active skills for reading: Book 2" developed by Anderson (2007), was used for all the groups but control group was given the book "Paragraph development" by Arnaudet and Barrett (1990) as a course material. This study was conducted during one semester and each session took 30 minutes. For the pre-test, students were given three topics to write a paragraph of 150 words. Then the researcher explained to each group what they should do during the semester and elaborated more on their tasks. In comparison group (A), students should do what other participants do for reformulation task (composing, contrasting, and revising), they had topic to write about it. It was a kind of free writing and they could use which style that they knew and composed a text. After composing, they had a text about the topic which they had written recently. This text was prepared for them from the book and they could use it as a model text. This text was a kind of native one and acceptable one in accuracy. Students had their written text and model text about one topic. They contrasted their texts with the model in the structure and grammar, and then they wrote another text again or changed their written text. In paraphrasing group (B), students at first had a model text from the selected book by the researchers which was the same for all groups in each session. They read one or two paragraphs and then they composed a text by paraphrasing those parts. In copying group (C), student like previous group at first encountered by a text and then they composed and used copying for write a text. In Control group (D), students had a course book "paragraph development" and they were taught in a conventional way without the use of these tasks.

At the last session, to determine the effectiveness of applying reformulation tasks on EFL learners' writing accuracy, the four groups were given the similar post-test in which the topics were the same topics in pre-test and they should write about those topics. The pre-test and post-test were scored by using checklist and two scorers. Two scorers were used to make sure of subjectivity. According to checklist for each error except sentence structure, student lost 0.25 of total score of 20 and for sentence structure error 0.05. The obtained scores by the four groups were compared with the pre-test scores to see which group had more progress in writing accuracy. They were compared to know the differences in each group and among groups.

In order to determine if comparison, paraphrasing and copying had any impact on intermediate EFL learners developing writing accuracy, the collected data were analyzed by using One-way ANOVA to show the mean differences between the groups. Then a post-hoc Scheffe test was used to show the significant effect of the variables in developing writing accuracy of Iranian English foreign language learners.

### RESULTS AND DISCUSSION

Calculating the data which obtained from the pre-test was the next step in analyzing the data. Table 1 shows the descriptive statistics of the participants' performance in different groups on pre-test.

Table 1: Descriptive Statistics (Pre-test)

Groups	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean		Minimum	Maximum
					Lower Bound	Upper Bound		
Contrasting	24	17.9375	.82175	.16774	17.5905	18.2845	16.50	20.00
Paraphrasing	23	17.0870	1.52556	.31810	16.4273	17.7467	14.00	20.00
Copying	21	17.3214	1.19672	.26115	16.7767	17.8662	14.00	19.00
Control	20	17.3000	1.05319	.23550	16.8071	17.7929	15.50	18.50
Total	88	17.4233	1.20306	.12825	17.1684	17.6782	14.00	20.00

According to Table 1, mean and standard deviation of four groups are to some extent the same. Mean and standard deviation showed that the participants of four groups were performed similarly in pre-test. In order to find out the difference among the groups in the pre-test, One-way ANOVA was performed on the test scores of the four groups' writing essays. Table 2 shows the results.

Table 2: One-way ANOVA (Pre-test)

Variables	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	9.470	3	3.157	2.277	.086
Within Groups	116.450	84	1.386		
Total	125.920	87			

\*Significant at  $p < 0.05$

Based on Table 2 given above, since Critical  $F$  (4.04) is greater than observed  $F$  (2.277) with  $df=3/84$ , the difference between the groups is not significant at ( $p < 0.05$ ). Also based on obtained significant of 0.086 which was greater than 0.05, we could state that there was no difference between the groups in the pre-test. Therefore, all the groups were homogeneous at the beginning of the research. The next step in analyzing the results of the study was the calculation of the scores of students' performance after treatment period on the post-test. Like the pre-test, descriptive and inferential statistics were used for this purpose. The descriptive statistics of participants' scores on post-test are given in Table 3 below:

Table 3: Descriptive Statistics (Post-test)

Groups	N	Mean	Std. Deviation	Std. Error	95% Confidence Interval for Mean		Minimum	Maximum
					Lower Bound	Upper Bound		
Contrasting	24	18.3854	.85332	.17418	18.0251	18.7457	16.00	20.00
Paraphrasing	23	17.8152	1.30606	.27233	17.2504	18.3800	15.50	20.00
Copying	21	18.2024	.75257	.16423	17.8598	18.5449	17.00	19.50
Control	20	17.0875	1.25204	.27996	16.5015	17.6735	14.50	19.25
Total	88	17.8977	1.15634	.12327	17.6527	18.1427	14.50	20.00

By comparing the mean and standard deviation of each group in Table 3 with the mean and standard deviation of the pre-test in Table 1, differences among the groups' means were appeared. As it is displayed in Table 3, participants' performances in all groups were changed into high scores. To see whether the differences in the results of the pre-test and the post-test are significant, One-way ANOVA was used. Table 4 shows the results of this calculation.

Table 4: One-way ANOVA (Post-test)

	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	20.943	3	6.981	6.148	.001
Within Groups	95.386	84	1.136		
Total	116.330	87			

\*Significant at  $p < 0.05$

According to Table 4, Since Critical  $F$  (4.04) is less than observed  $F$  (6.148) with  $df= 3/84$ , the difference between the groups is significant at ( $p < 0.05$ ). The obtained significant (0.001) is less than significance level set for the study (0.05), so there is a difference between groups and they are not homogeneous on the post-test. Based on descriptive and inferential statistics participants performed better on the post-test. To find out where the difference exactly exist and compare the groups with each other a Post-hoc Scheffe Test was used. The results are presented in Table 5.

Table 5: Post-hoc Scheffe Test of Multiple Comparisons

(I) Groups	(J) Groups	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
					Lower Bound	Upper Bound
Contrasting	Paraphrasing	.57020	.31094	.345	-.3169	1.4573
	Copying	.18304	.31842	.954	-.7254	1.0915
	Control	1.29792*	.32263	.002	.3774	2.2184
Paraphrasing	Contrasting	-.57020	.31094	.345	-1.4573	.3169
	Copying	-.38716	.32163	.695	-1.3048	.5305
	Control	.72772	.32581	.181	-.2018	1.6572
Copying	Contrasting	-.18304	.31842	.954	-1.0915	.7254
	Paraphrasing	.38716	.32163	.695	-.5305	1.3048
	Control	1.11488*	.33294	.014	.1650	2.0648
Control	Contrasting	-1.29792*	.32263	.002	-2.2184	-.3774
	Paraphrasing	-.72772	.32581	.181	-1.6572	.2018
	Copying	-1.11488*	.33294	.014	-2.0648	-.1650

\*. The mean difference is significant at the 0.05 level.

Table 5 shows that the groups performed differently in gaining the writing accuracy scores. The multiple comparisons of the results showed that there was not a significant difference among comparison group, paraphrasing and copying groups, but there was a significant difference between comparison and control group. By comparing paraphrasing with other groups, no significant difference was observable. Comparing the copying group with comparison, paraphrasing and control groups, the results showed that there was a significant difference between copying and control groups; however, there was not a significant difference between the control group with comparison and paraphrasing groups.

Since the significance level was set at 0.05, it can be seen that there was a significant difference between comparison and control groups (sig=0.002). Thus it showed that the participants in comparison group performed better in the post-test. The same deduction was obtained for copying group compared with control group. Copying group performed better on the post-test (sig= 0.014); however, there was not a significant difference between this group compared with other groups.

Based on obtained results, we can see the first null hypothesis: "comparison tasks do not affect EFL learners' writing accuracy at the intermediate level" was rejected. Comparison task in this study was effective for increasing writing accuracy of the learners. The second null hypothesis: "paraphrasing tasks do not affect EFL learners' writing accuracy at the intermediate level", was not rejected. As it was hypothesized paraphrasing task which was one of the reformulation task, did not affect learners' writing accuracy. The third null hypothesis: "Copying tasks do not affect EFL learners' writing accuracy at the intermediate level", was rejected. It means copying task affect EFL learners' writing accuracy. The last hypothesis: "There is not any difference among comparison, paraphrasing, and copying tasks in developing accuracy in writing", was also rejected. Thus just two of three tasks (i.e., comparison and copying) were beneficial in developing writing accuracy. The numbers of errors were calculated based on the checklist and illustrated through a bar graph. Figure 1 shows the results.

Figure 1: Numbers of Errors in Writing Essays Made by Students in Each Group

Errors of students' performance recognized based on the checklist which is used for scoring participants written text on the pre-test and the post-test. Then items of the checklist comprised of five categories of punctuation, spelling, grammar, verb, and parts of speech. These items

included frequency of errors made by each group on the pre-test and post-test.

As Figure 1 shows, participants in each group performed differently regarding the errors made by them on the pre-test and post-test. In the control group, errors of punctuation, spelling, verb, and parts of speech were increased during the treatment period but participants' errors of grammar were decreased on the post-test. In comparison group, numbers of errors, made by the participants, were decreased in punctuation, spelling, and grammar after the treatment sessions; however, the errors of verb and parts of speech were increased. In paraphrasing group, errors of all items except verbs increased. In copying group, the improvement in punctuation, verb and parts of speech are visible; but the errors in spelling and grammar were decreased.

### Discussion

As One-way ANOVA of post-test in Table 4 showed, after treatment groups were not homogeneous any more. Results showed that the treatment for experimental groups were beneficial ( $\text{sig}=0.001$ ). By comparing comparison group with two others experimental groups and especially with control group, we can determine whether it was significant or not. Table 5, Post-hoc Scheffe test shows the results of comparing comparison group with other groups. Based on the results of the study, the difference between comparison group and control group was significant. Therefore, the difference is significant. It means that the participants in the comparison group performed better on the post-test. Comparison tasks did not affect EFL learners' writing accuracy at the intermediate level. So the first null hypothesis is rejected. Comparison task in this study was effective for increasing writing accuracy of the learners. In most of the studies about reformulation tasks, comparison strategy was used. It is named three stages task. Hanaoka (2007) used contrasting strategy to investigate what Japanese EFL learners spontaneously noticed in a multistage picture-description task. Results of this study showed that learners noticed to their linguistic problems and found solution to more than 90% of their problems based on model text on revision stage. The result is the same with what obtained in this study. Results showed that in the third stage (revision stage) when learners revise their text based on stage two (contrasting stage), less than half of their problems were solved. On the other hand Swain and Lapkin (2004) found that reformulation of learner's writing is an effective technique for stimulating noticing and providing tasks to engage learners.

The errors of spelling also increased in this group. By learning new text and rules of writing, learners should write more than what they wrote before. They should use new words which they used rarely before. This problem also can be the cause why errors of parts of speech and verb increased in this group. But this problem can be solved by using dictionaries or treatment of the teacher. The only error that decreased after treatment on post-test in this group is grammar. Participants of this group made 42 errors on pre-test and 37 errors on post-test. Following patterns of the book can be the cause of this change. Grammar was the only error in this group which showed positive change after treatment even if it is not significant change. The four other errors increased. We can conclude based on the results of this figure and this study that the traditional teaching was useful only for grammar.

Number of grammar errors decreased in all groups on post-test except in paraphrasing group. Other three treatments were beneficial for improving grammar but paraphrasing was not. In paraphrasing tasks students allowed to change the structure of words and use synonyms of words. Sometimes by changing structure, students cannot follow English rules of sentences or phrases, so it makes them to do errors. As a result of this change after paraphrasing task, that's better teachers don't use paraphrasing tasks for improving grammar of learners' writing.

Parts of speech errors include errors of preposition, adverb, noun, and adjective in this study. By looking at them separately, we can see some of them decreased after treatment period. But as it is observable at Figure 1, parts of speech errors increased in all four groups with different intervals. Control group had the most growth of parts of speech errors compared with other three experimental groups. It was 30 errors on pre-test and 49 errors on post-test in this group.

In summary, comparison tasks were beneficial for punctuation, spelling, and grammar errors. Paraphrasing tasks were helpful for verb errors. Copying tasks were useful for spelling and grammar errors. Traditional teaching was useful for reducing grammar errors. Comparison and copying tasks play somehow the same for lessening errors of the same type. Both of them share reducing spelling and grammar errors. As it was discussed in section four, comparison and copying group showed change after treatment and their change were significant. That obtained results can be due to their role of reducing the same type of errors.

### CONCLUSION

Writing is one of the four language skills which EFL learners need to obtain. To write acceptable text, learners should follow English rules. Accuracy is one of the important parts for writing appropriate and acceptable texts. This study investigated the role of reformulation tasks in EFL learners' writing accuracy. For achieving this purpose, three types of reformulation tasks were used in this study. Four groups of participants were considered in this study. Groups were: Comparison group (A), paraphrasing group (B), copying group (C), and control group (D). Participants in group D did not receive reformulation tasks. Finally, results of the post-test showed that two types of reformulation tasks are beneficial for improving writing accuracy. Based on the obtained results from the pre-test and post-test, participants in comparison group and copying group showed significant change on the post-test. In this study, students' errors on the pre-test and post-test were checked by a checklist (Yang & Zhang, 2010). The results obtained from this checklist presented in Figure 4.1 to show which tasks were helpful for which errors. Based on the research findings, this study gives the following implications and suggests some ideas to EFL learners and teachers and material designers to help EFL learners become proficient in foreign language.

Lack of focusing on a determined method or task in writing in a traditional way may be ineffective because learners cannot write in an appropriate way even after finishing English courses. Most of the times, students use translation for writing text. They think in their native language and translate it to target one. This use of Farsi translation makes many problems for students because rules of writing of each language are different from others. Checking student errors in their written text is not enough for improving writing skill. Teachers can help their students by using reformulation tasks, especially comparison and copying tasks. Results of this study showed that some types of reformulation tasks are beneficial for improving accuracy of learners' writing. So teachers can use these tasks in their classes. By using these tasks in writing classes, students may gain exposure to native model texts which are appropriate ones and by comparing their essays with the model text, students notice more on their problems.

### ABSTRACT

The present study investigated the effects of encoding and rehearsal strategies on the vocabulary development of Iranian English as foreign language (EFL) learners' recall and retention. The design of the research was based on pre-test and post-test experimental inquiry. To achieve this aim, Richards, Lesley, Hansen, Sandy and Zukowski (2008) proficiency test was administered to 120 male and female learners who enrolled in Islamic Azad University of Ramhormoz, Iran. They were non-English majors and selected English for General Purposes (EGP). The learners' scores in proficiency test were analyzed and 60 learners were selected as research sample of the study. They were 45 females and 15 males who were ranging in age from 19 to 30 years old. Then they were non-randomly divided into three groups of 20 participants (i.e., 15 females and 5 males). There were two experimental groups (i.e., encoding and rehearsal) who dealt with two strategies in learning vocabulary. They took a vocabulary pre-test at the beginning of treatment to measure their vocabulary knowledge. During treatment period, encoding group received treatment on learning vocabulary through learners should encoded new materials meaningfully and be able to retrieve them whenever needed while rehearsal group received tasks on rote repetition of items as the main part of their activity. Control group was taught vocabulary through conventional method of teaching such as translation, definition, etc. Finally, all the participants took vocabulary immediate and delayed post-tests and data were put into descriptive and inferential statistics. One-way ANOVA showed that both experimental groups outperformed the control group in recall and retention. However, there was not a significant difference between males and females' recall and retention in learning vocabulary. Findings of the present study for English teachers may suggest that using encoding and rehearsal strategies could be more beneficial than using conventional activities in teaching vocabulary recall and retention.

**KEYWORDS:** Encoding, rehearsal, EFL Learners, vocabulary, recall, retention

### INTRODUCTION

In the most of EFL context, second language learners feel successful EFL learner are those who know more number of words. So, for these groups of learners knowing great number of words is the first and the most important factor in learning another language. Learning vocabulary is considered as a crucial component of language learning process. As Wilkins (1972) states that "without grammar very little can be conveyed, {but} without vocabulary nothing can be conveyed" (p, 11). Wilkins statement proved the necessity of vocabulary knowledge as the first and most important component of language. As during second or foreign language learning, most of learner's errors are due to the lexical errors. For example understanding of non-grammatical sentence like: "My teacher taught me that talk" is possible; however it would not be comprehensible without enough vocabulary knowledge. Thus this language component is essential for English as second or foreign language learning. Hayati and Shahriari (2010) state "Vocabulary learning by far plays an important role in learning language, be it a first language, second language or a foreign language, It is, therefore, conceivable that the words are the building blocks upon which the second language learning is built" (p. 27). Due to the important of vocabulary knowledge, it is suggested learning a second or foreign language involves the acquisition of thousands of words (Celce-Murcia, 2001).

Vocabulary cannot separate from the language skills. As well as listening, speaking, writing also the clear relationship is between vocabulary and reading comprehension. Matsuoka and Hirsh (2010) state "there is a strong link between vocabulary knowledge and reading comprehension" (p. 56). This relationship is mutual that is not only having high word storage makes someone good reader, but only having high-level reading comprehension is effective to gain more vocabularies and retain them better. Through reading learner can benefit from this rich context to acquisition more new words. It is a way to enhance word knowledge. Tassana-ngam (2004) state "vocabulary directly affects reading skill; it may impede especially second language learners' comprehension of a written text if the learners have less vocabulary knowledge or below the threshold minimum of approximately 3,000 words" (p.48).

However, learning is not enough but retrieving of words is important. Another important issue in learning vocabulary is remembering Most the learners often have difficulty in remembering those words previously learned. There are so many reasons for this problem, but the ways learners choose for acquiring word is one of the their most problems. Learning happened just when a learner can be able to recall words. Thornbury (2002) said "the learner need not only learn a lot of words but also to remember them, In fact learning is remembering" (p. 23). Here, the question is: how learners can enhance their vocabulary ability? Is there a method or strategy lead to retention and recalling vocabulary? Using of the variety of strategies and techniques for vocabulary development should include into learning process. One possible answer to learners difficulties of learning vocabulary is using different ways to help learners in better maintaining words. Vocabulary learning strategy is one of the important ways by providing different methods in developing vocabulary knowledge to guide learners in selecting best methods for their learning. Nation (2001) asserted that VLS is a subcategory of language learning strategy, which in turn is a subcategory of general learning strategy. Schmitt (1997) defined VLSs as learning is "the process by which information is obtained, stored, retrieved and used... therefore vocabulary learning strategies could be any which affect this broadly defined process" (p.203).

In the present study, it is assume the subcategories of rehearsal and encoding strategies (word list and word structure) can be influenced in developing EFL learners' vocabulary. Learning second language included all language components; but Because of the importance effect of vocabulary on learning another language, it's known as the first things the learners need to develop the most important thing that help them to get the meaning, having more number of words knowledge. Since vocabulary is central to language learning and EFL learners (Lotfi,

2007), most of them do the best in learning vocabulary but actually do not get more. The question is that why students mostly cannot remember those vocabularies? They are not aware of suitable vocabulary learning strategies to increasing their own vocabulary knowledge, in this situation it's a the teacher duty to help language learners to come up with this problem by providing different strategies to place them in better position in teaching and learning vocabulary situation.

The strategy learners use in own learning vocabulary is one factor that may influence the extent of acquiring vocabulary. It is a great of significant that it not only helps learners developing their vocabulary abilities but also it can solve the problem of retrieving and remembering vocabulary. Learners spend times during the learning process and do everything to recall the words but in spite of devoting more times to learn new words, the result is awful because the learning would not happen and they could not remember and recall vocabulary when they need them. When the Learner fail to learn it make the disappointed and may giving the learning up. The present study used of two vocabulary strategies, encoding and rehearsal strategies to see how much may be applicable in promoting the retention and recall of vocabulary. Using word lists and word structure were two techniques of above strategies which used in this research project.

## **REVIEW OF LITERATURE**

### ***Theoretical Background***

Vocabulary is one of the important parts of language learning which has been neglected for several decades (Meara, 1980). Coady and Huckin (1997) claimed that after a long period of neglect "second language vocabulary acquisition has recently become an increasingly topic of discussion for researchers, teachers, curriculum designers, theorists, and others involved in second/ foreign language learning" (P. 1). As the result of the increasing demands of vocabulary, it has changed to one of the important parts of language which shifted to the first stages of language learning. Generally speaking, vocabulary plays undeniable role in the development of all language skills. Schmitt (2008) indicate "One thing that students, teachers, materials writers, and researchers can all agree upon is that learning vocabulary is an essential part of mastering a second language (p. 329)". Several studies and many books have been done on the great significant role of vocabulary on language learning development (Nemati, 2009).

As well as the importance of vocabulary in productive skills (writing and speaking), it is also important in comprehending of receptive skill (reading and listening). In the absence of grammar; knowledge of a passage of reading, a track of listening, a piece speaking or writing a latter is possible, unless it won't be comprehensible in the lack of enough vocabulary knowledge. As previously said, the knowledge of vocabulary directly related to all language skills.

Reading is one skill which interrelated to the knowledge of vocabulary and vice versa. Researchers have been agreed clear relationship between vocabulary knowledge and reading skill. According to Hassanvand, Gorjian and Hayati (2012) "Reading comprehension is an important skill and in fact one of the platforms in which a learner can show his ability in a foreign language" (p. 351). This skill is good source for vocabulary acquisition. A learner, who has more number of words storage, understands text better and might be a good reader. So in FLL classrooms, vocabulary plays most important roles and working on this component of language should come at the beginning of pedagogical process. However reading is a rich source for vocabulary development and the amount of vocabulary growth increase during reading classes but dealing with large number of unfamiliar vocabulary and difficulty in remembering or recalling of these hosts of words is main problem. There are so many reasons for this difficulty as affective factors (anxiety), pedagogical factors (methods of teaching) or individual differences (learner's level). According to Takac (2008), several factors that effect on the vocabulary learning are: linguistic factors of items, complexity of learning vocabulary itself, the role of L1 or other language as well as role of memory on the retrieving or forgetting items.

### ***Vocabulary Learning Strategies***

Generally speaking, Vocabulary is of great significance in language learning process. Since and most of learners errors come to vocabulary level It is the first and the most important step in learning another language. Meara (1980) indicates: "...Learners themselves readily admit that they experience considerable difficulty with vocabulary." (p. 221). According to Oxford and Scarcella (1994) vocabulary acquisition is a major challenge for beginner language learners since they have to store a large number of new words in their long-term memory in a short period of time. Since learning vocabulary is a challenge to foreign language learners through providing different VLSs, learners probably can help to becoming independent learners and make them to use most suitable strategies suited to their purposes (Lotfi, 2007). Because of the prominent role of vocabulary in developing knowledge of EFL learners, different approaches are proposed by researchers.

In the teaching and learning processes, providing some suitable strategies can help learners to better organization and memorization of new words into their mind. For example: word association can help learners to relate between what words they already know and what words should they learn, use of some contextual clues is also benefit to understand meaning of word. Word structure technique is another suitable way to comprehend the text and developing words knowledge through analyzing word parts. All of these techniques are known as a title of VLSs which is a component of language learning strategies which in turn are a component of general learning strategies.

### ***Studies Concerning Vocabulary Learning Strategies***

In 1996, Lawson and Hogben investigated the role of using a think-aloud procedure in learning 12 Italian new words among 15 Australian learners. They concluded that the learners who recalled more of the learned words later had used a greater range of learning strategies, and used them more often, than their poorer performing counterparts. However, the learners in this study tended to favor simple repetition strategies over more complex elaboration strategies, despite the fact that the latter are associated with higher recall. They concluded that if students are not aware of the advantages of these procedures for some vocabulary acquisition situations, there is a need to press this point more directly during language teaching.

Karami and Barkat (2012) conducted a study to determine the role of level of learner's proficiency on the use of vocabulary learning strategies. 36 Iranian EFL learners divided into three proficiency level of elementary, intermediate, and advanced. The results of analyzed data revealed that there was an association between proficiency level and strategy use. Advance learners were higher use learners of VLS than immediate or elementary learners. Among of social, memory, affective, cognitive, and metacognitive strategies; the cognitive strategies were the most preferred on among students (Make list of new words, take note or highlight).

It is also believed that learners' sex effect on the selection of appropriate VLS. Catalan (2003) found there was significant relationship between sex and selection/number of appropriate VLS. 581 Spanish -speaking students (male and female) were administered a questionnaire. The results revealed that females used great total number of strategies than male. It also found that female preferred to use of

formal rule strategies, input elicitation strategies, rehearsal strategies and planning strategies and male preferred to use image vocabulary learning strategies.

#### ***Experimental Studies on Rehearsal Strategy***

Among many available vocabulary learning strategies, rehearsal strategies are commonly used by teachers and learners as well. Banikowski (1999) explained rehearsal as Retain the information in working memory by repeating it again and again. He also said information would be transferred to long term memory through rehearsal. Based on this explanation it is clear that rehearsal related to short term memory ,that is through the rehearsal activates every information can transferred into long term memory, in another words retrieving of information is the action of short term memory and long term memory. According to Banikowski (1999), two types of rehearsal proposed as maintenance rehearsal and elaborative rehearsal. Maintenance rehearsal is just repeating information through rote rehearsing. In fact, retaining of information is depended to several rehearsing those items. In contrast to maintenance rehearsal, elaborative rehearsal provided a connection between new information and some existing information. This kind of rehearsal resulted into storing information into long term memory (Banikowski, 1999).

Some studies confirmed rehearsal strategies are important tools to develop learners' vocabulary knowledge. In one study, Fallahchai (2012) conducted a study to determine EFL learners' vocabulary learning through learning strategies training. 558 primary students divided into 4 groups which instructed by 4 different approaches of: (1) vocal rehearsal+ phonological awareness training : (2) sub -vocal rehearsal+ phonological awareness training : (3) vocal and sub-vocal rehearsal+ phonological awareness training : (4) no rehearsal+ phonological awareness training. One-way ANOVA analysis of pre-test and post-test revealed that the group which instructed by the third approach, developed vocabulary learning highly better than other groups. There were not significant differences between groups which instructed through the first and second approaches.

According to the results of above studies, word list as a subcategory of rehearsal strategy is not able to develop the retention of learners' vocabulary knowledge. One reason of rejecting word list as a good VLS is the absence of context. It is argued context is a means to help learners in developing and better understanding unknown words, so the existence of context is necessary and may lead to better retention of words (Hayati & Shahriari, 2010).

#### ***Experimental Studies on Encoding Strategy***

Encoding plays important roles on the retrieving items by shifting new information from short term memory to long term memory. It is known as a process of relating in new information to background information; this kind of relationship help to learned new items meaningfully. Vocabulary retention has been defined as "the ability to recall or remember things after an interval of time. In language teaching, retention of what has been taught (e.g. grammar rules and vocabulary) may depend on the quality of teaching, the interest of the learners, or the meaningfulness of the materials (Richards & Schmidt, 2002, p. 457).

Considering the role of VLSs on learning vocabulary, Tavakoli and Gerami (2012) compared two methods of keyword and pictorial on Vocabulary Learning and Retention among 60 adult female elementary students. Homogeneity test, immediate post-test and delayed post-test were used as the instruments of their study. At the end of the treatment period, immediate test administered to measure learners' short-term memory recall .After Two weeks intervals a delayed post-test was used to measure learners' long term memory retention of vocabularies. The results of One-way ANOVA analysis reveal that keywords method had significant effect on the vocabulary learning and retention as well. The learners who used keyword could restore and retrain vocabulary in the long-term memory better than those who used pictorial methods.

In a study reported by Sarcoban and Basibek (2012) investigated the role of mnemonic technique and Context method on vocabulary retention among 84 learners at upper intermediate level. The pretest, immediate recall test, and delayed retention test were the instruments of this study. The finding of data revealed that mnemonic group was better performed than context group in immediate and delayed posttest.

In another study by Nemati (2009), she investigated two memory strategies on the vocabulary retention of short and long term memory. The results show that teaching vocabularies through giving synonyms and mini-contexts positively effect on the long term and short term retention of learners vocabulary. She concluded that giving strategy awareness can positively improve the learning of the new vocabulary and learners are able to retrieve new information. In contrast to rote rehearsing strategy to vocabulary learning, Eshagi Sardroud (2013) conducted a study to explore the effect of deep strategies like contextual guessing, keyword, metacognitive strategy and semantic mapping on vocabulary retention. 32 post intermediate learners divided into two groups of experimental and control. After the treatment period, the analyzed data of teacher made vocabulary post-test revealed that experimental group achieved higher vocabulary retention; moreover it also revealed that female were more receptive for vocabulary training than male learners. Bowers and Kirby (2010) conducted a study on the morphological word structure on learner's vocabulary knowledge. Experimental used of morphological word structure as a vocabulary learning strategy and another one did not use. Results indicated that the experimental group made better use of vocabulary knowledge in learning new vocabulary through morphological word structure technique. All of the above studies had been proved the effects of VLS on the vocabulary acquisition. As well as learning, retention and recall of learnt items is important. In order to learn and better retention of words learners as well as teacher should use of VLS that can help learners to better comprehending a text as well as better memorizing new vocabularies and lead to retrieving learnt items.

### **RESEARCH QUESTIONS**

The present study aims to answers the following questions: (1) To what extent do encoding and rehearsal strategies influence EFL learners' vocabulary recall among pre-intermediate EFL learners? (2) To what extent do encoding and rehearsal strategies influence EFL learners' vocabulary retention among pre-intermediate EFL learners?

In the present study researchers will use encoding and rehearsal strategies which are subcategories of memory strategies, to help learner developing EFL vocabulary and lead to better retention and recall into their memories.

### **METHODOLOGY**

#### ***Participants***

A total of 60 pre-intermediated EFL students (15 males and 45 females) from Islamic Azad University of Ramhormoz, Khuzestan enrolled in the course of general English participated in this research project. They were selected among 120 EFL university students (mostly senior)

based on their availability and willingness. To determined participants' homogeneity, a sample of proficiency test (Richards et al, 2008) was administered. Those participants whose scores fell between one standard deviation above and one standard deviation below the mean were selected as the participants of the study. Based on the result of the homogeneity test sixty students (male, n=15 & female, n=45) who met the necessary condition were chosen for this study. The students non-randomly divided into 3 groups of 20 (two experimental groups and one control group) (male, n=5 & female, n=15). The ages of participants range from 19 to 30. They were selected on the basis of their availability and they had been studying English at least for five years up to the time of the study. They were in the second semester of their study. Through their performance on proficiency test those learners whose scores are one standard deviation above and one standard deviation below the mean were selected as a homogeneous group. A Pre-test and two post tests were given to the participants before and after instruction. The reliability of all tests was calculated through KR-21 formula.

#### **Instrumentation**

In this study, the data were generally collected through a number of instruments which are as follows: proficiency test, teacher made pre-test and two post-test. First of all, a sample of proficiency test (Richards et al, 2008) including fifty items in form of multiple-choice was administered to 120 participants to identify their homogeneity. During a month of treatment, the participants practiced eight passages of the textbook "Active Skills for Reading 1" developed by Anderson (2007). Finally, the post-test was administered immediately after the treatment period which took eight sessions to assess the participants' recall effects. Two weeks later, they were participated again in that post-test as a retention test. The time for recall and retention post-tests was about forty minutes. Their reliability indexes were met through Kuder-Richardson 21 formula as (0.759, 0.814, & 0.790) for homogeneity test, Pre-test, Post-tests respectively).

#### **Materials**

The materials in this study that presented to all participants consisted of eight reading text selected from unit one to eight of the textbook "Active Skills for Reading 2 developed by Anderson (2007). This textbook was used among the students at the pre-intermediate level. Before the beginning of the treatment, 40 vocabularies were selected from the first eight units of this book. The main criteria for vocabulary selection were based on the key words used in the exercises of each unit.

#### **Procedure**

In this study, 120 (male and female) at pre intermediate level of non-English majors' students that studied in the second semester of Islamic Azad University, in Ramhormoz, Iran- participated in this research. Participant's selection was based on their availability and willingness. In order to estimate their proficiency level, they took a proficiency test. A according to their performance on proficiency test, 60 participants (F=45, M=15) who their scores were one standard deviation above or below the mean with the same or near homogeneity were choose for study. Then they non-randomly divided into three groups, two experimental groups and one control group, each group consisted of five male and fifteen female. These three groups were equal in term of number and material. The instruction for this study lasted eight sessions, twenty minutes a session, twice a week, in a period of about one month. All three groups took 8 texts selected from the first eight units from Active Skills for Reading: Book 1 (pre-Intermediate level) developed by Anderson (2007). The total number of 40 words (five words per session) were selected and presented to learners of all three groups during the instruction period. The experimental and control groups were assigned the same materials, time of instruction and number. However, the techniques of teaching vocabulary were different. The first group was instructed through of rehearsal strategies that word list worked as a technique in the classroom, the second group was instructed through encoding strategy that word structure worked and the third group was not instructed by any strategies as rehearsal or encoding.

Before instruction, the researchers explained that it was part of a research project and participating to the end of month as well as use of specific strategy which worked in their groups were necessary for the final results. In order to determine participant's vocabulary knowledge all of them were took teacher-made test as a pre-test consisted of thirty five questions in the form of multiple choices about forty minutes. At the beginning of each session, all the participants were presented just five words because the focus of this study was on the effectiveness of two VLS on the learner's achievement not size or number of presenting new words. It also might motivated learners to leaning and decreased their problems came from facing host of unknown words.

In the first group, participants taught through rehearsal strategy. Word list as a subcategory of rehearsal strategies used as a technique in this group. A list of five new words in L2 and L1 equivalents as well as word pronunciation, and synonyms presented at the beginning of each session.

#### **Using Word Lists as a Part of Rehearsal Strategy**

- New words were thought through rote memorization, and repetition
- There was not the necessity use of context (reading passage) and direct instruction for this group
- Learners' drill were reading, repeating, reviewing, and using new words in sentence (make new sentence)
- L1 equivalents were used to better comprehending

For example: teacher asked learner to read words on the board L2 vocabulary: Competition L1 equivalent رقابت (translation)

Synonyms: (contestantion)

Use of new vocabulary in a sentence (Use in context) Speaking is a way of communication.

*Table 1: Example of using word list*

New word	phonetic	Part of speech	L1 equivalent	synonym	Use in sentence
producer	' prədju:sər	noun	تهیه کننده	maker	He is a producer
competition	Kam.pə'tlʃh.n	noun	رقابت	contestantion	My brother has a football competition
careful	keə.fl	adjective	بادقت	aware	Ali is a careful driver.

In Second group of participants taught through encoding strategy. Using word structure as a component of encoding strategy was used as an instruction technique in this group. The aims of this strategy was on analyzing word parts ,to identifying root and affixes which can attach to the base form of the word and change its meaning and increased the extent of vocabulary. In this group, direct instruction was needed as learners should determine the kind of vocabulary as a noun, verb, adjective, or adverb. Teacher did not present words in isolation learning new vocabulary was through reading passage so context is necessary. At first, teacher talked about part of speech and provided some example for each of them. Then a list of common prefixes and suffixes in English language presented to learners. While reading text passage, they learnt new vocabularies. The identification of vocabularies with same word structure was done individually or in pair work activities. Learners taught to analyze words into some meaningful parts as roots and its prefix or suffix. For the next session, learners were asked to provide some example of new vocabularies in sentence. They were actively involved in the learning process. This method could be useful for developing learners' autonomy. For example: develop and developments were two words in a text. During the instruction period participant learnt that *ent, er, tion* in the development, worker, collection are noun making ending affixes that can change part of speech (verb to noun).

#### *Using Word Structure as a Part of Encoding Strategy*

- Learning new word through analyzing its structure
- Specific instruction was given by teacher within context
- Learners find new word through the text
- Learning is not just root memorization (meaningful learning)

The third group as a control group did not use any specific strategies. All learners in control group taught through conventional way such as translation, definition, or dictation. After the instruction period, two post-test administered. Immediate post-test as a recall test administered immediately after the end of instruction. Two weeks later, all groups took another post-test as a retention test. Their reliability will be met through Kudor-Richardson 21 formula.

## RESULTS AND DISCUSSION

### *Data analysis*

The collected data was analyzed using Statistical Package for Social Sciences (SPSS 17). In order to determine whether using word list and word structure as two vocabulary learning strategies are effective on Iranian pre-intermediate EFL learners' vocabulary development, once the scores of the pre-test and two post-tests (immediate and delayed recall tests) were obtained, the means and standard deviation of the Scores of 60 participants were calculated. The One-way ANOVA was used to calculate the data. Post-hoc Scheffe test was used to indicate the potentialities of significant differences between the variables. SPSS Statistics were conducting to analyze the data. The level of significance was set to be .05. Descriptive statistics was conducted to pre-test and two post-tests to determine if there is any difference between the rehearsal group and encoding group regarding the recall and retention of newly learned vocabulary.

### *Results of the Pre-tests among Three Groups*

First, the data obtained through a sample of language proficiency test as a homogeneity test was analyzed statistically. In this analysis, the homogeneity of groups determined based on their levels of second vocabulary language knowledge. Thus, the students' overall scores on the test were collected from their records. The reliability of the tests was calculated by KR.21 formula for pre-test ( $r=0.759$ ), for immediate Post-test ( $r=0.814$ ) and delayed post-test( $r=0.790$ ).After the instruction period, participants took an immediate and delayed post-test consisting 35 multiple-choice items. Table 2 represents Descriptive statistics such as, means and standard deviations which computed to summarize the participants' scores on the pre-test.

Table 2: Descriptive Statistics for the Pre-test

No.	Groups	N	Mean	Std. Deviation	Min	Max
1	Rehearsal	20	18.3500	1.44154	16.00	21.00
2	Encoding	20	18.4000	1.36665	16.00	21.00
3	Control	20	17.5000	1.98773	14.00	21.00
Total		60	13.5714	1.60786	9.00	19.00

Table 2 displays the number of participants in each group, mean scores, and standard deviations for each group which administering on pre-test. As the data indicted the means for rehearsal, encoding and control groups respectively were 18.35, 18.40, and 17.50. So there were not significant differences in students' performances on pre-test among three groups.

Table 3: One-way ANOVA on Pre-test

Scores pre-test					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	10.233	2	5.117	1.617	.207
Within Groups	180.350	57	3.164		
Total	190.583	59			

One-way ANOVA was conducted to assess if there is a significant difference between the three groups regarding their vocabulary level before the instruction periods. The test was also used as a base to estimate the improvement of each group by comparing it with the post-test. As the data indicated in Table 3, the P value is .207, which is far above the 0.05 level of significance. Since the observed F (1.617) is less than critical F (3.118), therefore, there is not a significant difference among the participants of the three groups on the pre-test; and it indicates that they are homogeneous.

#### Results of the Immediate Post-tests among the Groups

The first research question of this study was whether encoding and rehearsal strategies influence on developing EFL learners' vocabulary recall among pre-intermediate EFL learners. To do this aim, an immediate post-test was administered to see the amount of vocabulary recall of students and to reject or confirm the first null hypothesis. Then students' scores on immediate post-test among three groups were analyzed statistically. Table 4 shows descriptive statistics regarding the three groups' performances on immediate post-tests as the students' recall test.

Table 4: Descriptive Statistics for the Immediate Post-tests

No.	Groups	N	Mean	Std. Deviation	Min	Max
1	Rehearsal	20	24.1000	2.04939	21.00	28.00
2	Encoding	20	25.1000	2.69307	21.00	31.00
3	Control	20	23.0500	2.30503	19.00	27.00
Total		60	13.5714	1.60786	19.00	31.00

As the data indicated in the above table, after instruction period, students performed better on immediate test than the pre-test. However, the means of immediate post-test were 24.10, 25.10 and 23.05 for rehearsal, encoding and control groups respectively. Encoding group with mean of 25.10 performed better than the other groups on the immediate post-test. The maximum scores for the immediate test are 28 for rehearsal, 31 for encoding, and 27 for control groups. The second One-way ANOVA was used to see whether there was any difference between means of the three groups after the instruction, and which of the three groups performed better on the immediate post-test which led to recall vocabulary easily. Table 5 shows the result of the One-way ANOVA for the immediate post-test of three groups.

Table 5. One-way ANOVA (Immediate Post-tests)

ANOVA					
Scores post-test					
	Sum of Squares	df	Mean Square	F	Sig.
Between Groups	42.033	2	21.017	3.761	.029
Within Groups	318.550	57	5.589		
Total	360.583	59			

Table 5 illustrates a significant difference among the 3 groups regarding the vocabulary Scores At the end of the instruction period on immediate posttest. Since Observed F ( $F=3.761$ ,  $p < .05$ ) is greater than the Critical F ( $F_c=3.118$ ), therefore the difference between the groups was significant. So, the first null hypothesis stating there is not any relationship between encoding and rehearsal strategies in developing EFL Learners' vocabulary recall is rejected and it is obvious that these two vocabulary learning strategies effect on the learners' vocabulary achievement.

\* The mean difference is significant at the 0.05 level.

Table 6: Post-hoc Scheffe test- Multiple Comparisons (Immediate Post-tests)

(I) groups	(J) groups	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
					Lower Bound	Upper Bound
A	B	-1.00000	.74757	.414	-2.8790	.8790
	C	1.05000	.74757	.379	-.8290	2.9290
B	A	1.00000	.74757	.414	-.8790	2.8790
	C	2.05000*	.74757	.029	.1710	3.9290
C	A	-1.05000	.74757	.379	-2.9290	.8290
	B	-2.05000*	.74757	.029	-3.9290	-.1710

A: Rehearsal group      B: Encoding group      C: Control group

The multiple comparison of the results show no significant difference between group A (rehearsal ) and the other 2 groups, i.e. group B (encoding ) and group C (control) respectively; but group B shows a significant difference from the other groups in which the level of significant was .029. Also the control group shows a significant difference from encoding group's level of significant.

#### Results of the Delayed Post-tests

The second research question of this study was whether encoding and rehearsal strategies influence on developing EFL learners' vocabulary retention among pre-intermediate EFL learners. The second post-test as a delayed post-test was administered to all groups to answer question and to reject or confirm the second null hypothesis. Table 6 illustrates the descriptive statistics in delayed post-test among three Groups:

Table 7: Descriptive Statistics for the Delayed Post-test

No.	Groups	N	Mean	Std. Deviation	Min	Max
1	Rehearsal	20	21.6500	2.04939	19.00	25.00
2	Encoding	20	23.1500	2.69307	20.00	30.00
3	Control	20	20.0500	2.30503	19.00	27.00
Total		60	13.5714	1.60786	16.00	25.00

Table 7 shows descriptive statistics of delayed post-test among three groups. The mean and standard deviations of three groups on delayed post-test was  $M=21.65$  and  $SD=2.04$ ,  $M=23.15$  and  $SD=2.69$  and  $M=20.05$  and  $SD=2.30$  for rehearsal, encoding and control groups respectively. It means that vocabulary development regarding retention of vocabulary in encoding group was significantly better than the other groups. By a mean's comparison of three groups' performances on immediate post-test, it is obvious that students' overall performance on immediate post-test was significantly better than delayed post-test. As the mean of rehearsal, encoding and control groups on immediate test was 24.10 25.10 23.05, in contrast to their means on delayed post-test that was 21.65, 23.15 and 20.50 for rehearsal, encoding and control groups respectively. However, in this two tests, encoding group performed better than other groups; that is encoding group was able to recall and retention of vocabularies better than rehearsal or control groups. The following Table illustrates the results of the third One-way ANOVA for delayed post-test among the three groups:

Table 8: One-way ANOVA (Delayed Post-tests)

Scores post-test					
	Sum of Squares	Df	Mean Square	F	Sig.
Between Groups	96.133	2	48.067	10.298	.000
Within Groups	266.050	57	4.668		
Total	362.183	59			

Table 8 shows the statistical analysis of One-way ANOVA on the three groups' Delayed post-test scores. As data indicate, Since Observed

Table 9: Post-hoc Scheffe test- Multiple Comparisons(Delayed post-tests)

(I) groups	(J) groups	Mean Difference (I-J)	Std. Error	Sig.	95% Confidence Interval	
					Lower Bound	Upper Bound
A	B	-1.50000	.68319	.099	-3.2172	.2172
	C	1.60000	.68319	.073	-.1172	3.3172
B	A	1.50000	.68319	.099	-.2172	3.2172
	C	3.10000*	.68319	.000	1.3828	4.8172
C	A	-1.60000	.68319	.073	-3.3172	.1172
	B	-3.10000*	.68319	.000	-4.8172	-1.3828

\* The mean difference is significant at the 0.05 level.

A: Rehearsal group B: Encoding group C: Control group

F (F=10.29, p<0.05) is less than Critical F (Fc=3.118), there is a significant difference between groups. Therefore, the second null hypothesis stating there is not any relationship between encoding and rehearsal strategies in developing EFL Learners' vocabulary rejected is rejected.

Table 9 shows the second multiple comparisons of the results for delayed post-test. As the data indicates no differences observed in group A and other groups. As it is observed in second row, such a difference is observed when comparing performance of the participants in groups B (encoding) with other groups (sig=.000). In the third row, the control group also shows a difference from encoding group's level of significant.

### Discussion

In order to determine the effect of the encoding and rehearsal strategies on retention and recall on the development of English vocabularies, two sets of post-test administered to participants. Moreover, it aims to examine if learners are able to retain and recall new words better by using encoding strategy or rehearsal strategy. The results of pretest, immediate and delayed post-tests indicated not only using of VLSs developed learners' vocabulary knowledge but also participants at the encoding group were better to retain and recall of material than other groups. The discussion of analyzed data it should be address to research questions and null hypotheses of this study.

a) To what extent do encoding and rehearsal strategies influence on developing EFL learners' vocabulary recall among pre-intermediate EFL learners?

All participants administered by an immediate post-test to identify their recall. Generally, all groups' vocabulary knowledge developed through instruction period. As shown in Table 3, the means of two experimental groups on the immediate test were greater than control group. Moreover, the results of comparison between groups' performances on pre-test and immediate post-test supported that after instruction period there was significance difference between the means of pre-tests and post-tests which led to developing learners' vocabulary knowledge. In another words, encoding and rehearsal strategies as the two VLSs effect on the developing learners vocabulary knowledge regarding recall of vocabulary. Therefore, the first null hypothesis of this study that claimed there is not any relationship between encoding and rehearsal strategies in developing EFL learner's vocabulary recall among pre-intermediate EFL learners was rejected.

Based on the finding of this study, it can be claimed using of two VLSs during instruction period was main reason for the better performance

of experimental groups and their effective vocabulary development. The encoding group performed better than rehearsal group but their difference was not great. However, some researchers rejected rehearsal strategy as an appropriate way to learn vocabulary especially for long time (Wei, 2007) but Many EFL learners frequently use of word repetition and memorization to learn vocabulary. One possible answer to applicability of rehearsal strategy might be learning vocabulary through memorization is common among language learners yet. Word repetition is a favorable condition in learning vocabulary (Nation, 2001). Vocabulary learning through lists of words is useful when a large numbers of vocabularies need to be learning in short periods of time especially in early stages of language learning (Nation, 1980).

The finding of this study is consistent with the results obtained from the research conducted by Baleghizadeh and Ashoori (2010) conducted a study to determine the impact of two subcategories of encoding and rehearsal strategies, keyword, and word list on the immediate retention of learners' vocabularies. The results of immediate post-test revealed that the keyword method performed better on recall compared to the word list method. However, the finding of research conducted by Herusatoto (2011) shown that learners who learning words in isolation (word list) retained the target words and the meanings better than those who learning through context (using contextual clue).

b) To what extent do encoding and rehearsal strategies influence on developing EFL learners' vocabulary retention among pre-intermediate EFL learners?

The delayed test was the second post-test of the current study that administered to determine the effect of encoding and rehearsal strategies on the learners' vocabulary development as well as retention of materials. Results of One-way ANOVA indicated statistically significant difference between the experimental groups performing on the delayed post-test regarding retention of vocabulary. It also reveals that the two experimental groups performed better than the control one. Moreover, encoding group performed highly better than the other groups. Therefore, the participants who were instructed through encoding strategies retained vocabularies better than those who used rehearsal strategies. Therefore, the second null hypothesis that claimed the relationship between encoding and rehearsal strategies in developing EFL learner's vocabulary retention among pre-intermediate EFL learners was also rejected.

The finding of this study is consistent with the results obtained from the research conducted by Baleghizadeh and Ashoori (2010) concerning the significant effect of key word method on immediate retention of learners' vocabularies rather than word list method. In another study conducted by Sadeghi, Nasrollahi, Mazandarani and Mesgar (2011), they concluded that that experimental group which trained through analyzing words to their functional and grammatical affixes positively performed vocabulary learning better than control one.

There are various reasons that could be attributed to the better performance of learners in the encoding group. First, as previously mentioned; the word encoding refers to some meaningful connection between what you have learned and what you already know, in other words learning through meaningful connection of past and new material is the main part of encoding. Chastain (1988) claims that "for longest retention, new knowledge must be associated with previous knowledge, that is, it must be tied up to existing information nodes in the cognitive network" (p, 42). So learning vocabulary is not matter of rote memorization such as rehearsal strategies. In this line Lawson and Hogben (1996) state "Rehearsal strategy is important for maintaining a particular item but not be very effective for long-term use" (p.104). Another reason of success of encoding material might be learner involvement and attention. In encoding group, after the first session of instruction through word structure method, all of participants actively involved in learning process. For example as soon as teacher wrote new word "Communication" on the board, learners were analyzed parts of word e.g., **compete** as a root and **ation** as the noun making suffix individually or pair work.

Context is another reason for superiority of encoding to rehearsal strategies in this study. Rehearsal group was presented a list of words consisting of words' definition, pronunciation, synonyms, and sample of new word in sentence. Everything was ready and learners were only to memorize vocabularies through repetition. Context (reading passage) was not important while in the encoding group, a text passage was read by teacher and learners focused on the new words which were bold. After the instruction they had to find other word which were making through affixing process.

As previously mentioned there are some factors affecting on the VLSs selection e.g., learning style, age, motivation, language proficiency, gender. In the current study, learners' age and their background knowledge were affected on learning in some way. Both in pre-test and post-tests performances, older learners did better than younger one. It seems that adult learners performed better in vocabulary learning than younger one. Another important factor was their background experiences on the language learning. In this study, the range of English language learning was 5 to 8 years. Those learners with more language learning experiences performed better either in encoding group or rehearsal one.

## CONCLUSION

Vocabulary is known as an important parts of language learning. Most the time, EFL learners are complained that learning host of words in a short time is really difficult. One way to learn vocabulary effectively is providing different techniques and methods for learners. VLSs are appropriate ways in presenting variety of suitable methods during vocabulary learning process. In the current study, we investigated the role of encoding and rehearsal strategies in developing vocabulary regarding the learners' retention and recall. After the analyzed data, it can be stated that two experimental groups that used of VLSs were shown to be more effective in L2 vocabulary development. Since, Both of them were affected on the retention and recall of learning vocabularies, Therefore two null hypotheses of this study were rejected. Moreover, the findings of current study confirmed that encoding group outperformed in vocabulary development concerning recall and retention than other groups. In addition to important role of VLSs on learners' vocabulary development, although we also need to stated that learning vocabulary is a very personal activity and learners' ability is important to their L2 vocabulary comprehension and development.

Many language teachers in EFL contexts teach vocabulary in a traditional way. In this situation, EFL learners have to learn in just passive way because teacher is responsible of the classroom, presenting of strategies or technique and materials as well. It is better that learners become responsible for their learning by participating in the selection and presenting of method and learning materials through use of VLSs. According to finding of this study, it can be claimed that use of VLSs can lead to effective vocabulary learning. Teachers are recommended to benefit from varieties of materials and techniques rather than just using of traditional ways of teaching vocabularies. Besides, the results of this study suggested those learners trained through encoding strategies learn vocabularies in term of recall and retention better than rehearsal group and control group. Therefore, it is recommended to incorporate this strategy into learners' vocabulary learning process. Before using VLSs, learners should be aware of the significant role of VLSs by their teachers. Finally, as previously said, some important issues related to selection of VLS should take into account such as age, gender, background knowledge, learning style or learning strategies.

One suggestion for further studies is that the current study can be done in other geographical areas because this study was conducted at Islamic Azad University of Ramhormoz. Also this study investigated the role of encoding and rehearsal strategies on vocabulary development through reading course among EFL learners at pre-intermediate level. In order to achieve generalizable results, the same studies can be done in other language skills such as writing, speaking or listening among other learners with elementary, intermediate or advance level of knowledge and other VLSs can be used as well. It also suggested taking into account the possible role of gender and its effect on vocabulary's development.

VERB AFFIXATION OF LAMPUNG LANGUAGE IN KUNTARA RAJA NITI BOOK AND TEXTBOOKS:  
A MORPHOLOGY STUDY

Farida Ariyani, Moh.Tadjuddin, Cece Sobarna, Wahya  
Faculty of Humanities Universitas Padjadjaran Indonesia  
Email: dulifarida@gmail.com

ABSTRACT

This research explains morphologically the verb affixation of Lampung Language in Kuntara Raja Niti book (1901) and textbooks. In the explanation, the data which contain verb affixes in Kuntara Raja Niti book and textbooks are collected, analyzed and determined in order to find the types of the affixes. As results, this research has found six prefixes, seventeen circumfixes and two infixes of Lampung language verbs.

**KEYWORDS:** Verb Affixation, Lampung Language, Morphology, Affixes, Qualitative

INTRODUCTION

Lampung language is one of the local languages in Indonesia, which is still used and maintained by Lampung people. Lampung language is one of the world languages which has their own letters called '*Had Lappung*' or Lampung alphabets. There are two main dialects found in Lampung language; there are "Abung" and "Pesisir." In the development, Van Royen cited in Hadikusuma (1988) has divided Lampung dialects into A and O dialects. It is called A dialect because the vocabularies ended with /a/ vowel whereas it is called O dialect because ended with /o/ vowel. This A dialect sometimes called 'Pesisir dialect.' This dialect is found and used in Belalau, Peminggir Teluk Semangka, Teluk Lampung, Way Kanan, Sungkai, Komering, Krui, Melinting, dan Pubian while O dialect is found and used in Tulang Bawang (Menggala), Northern of Lampung, Centre of Lampung, and Eastern of Lampung.

Research about Lampung language has been done by Walker (1976). He published a book title "*A Grammar Of The Lampung Language: The Pesisir Dialect Of Waylima*." In that book Walker describes words, utterance and morphological rules of Indonesia language which is freely used in the Lampung language contexts especially for a person who lives in Lampung or often having contact with Lampung people. Other linguists who have already done a research for Lampung language are Nazaruddin (1988) who describes about the syntax of "Pesisir" dialect, Sudirman (2006) who describes about geography dialect and found variations of phonemes in Lampung affixes and Wetty (1992) who describes the morphology of Abung dialect. In her research, Wetty describes the development of part of speech in Lampung language and she does not found any circumfixes in Abung dialect.

Based on the researches that have been done before, there is no specific research in morphology that concerned with verb affixation. This research tries to describe the affixation of verb in Kuntara Raja Niti book which contains original text of Lampung language and using middle school textbooks from Warsiyem (2007) as other reference for modern text of Lampung language.

This research will focus on morphemes. The area of grammar concerned with the structure of words and with relationships between words involving the morphemes that compose them is technically called morphology, from the Greek word *morphe* 'form, shape'; and morphemes can be thought of as the minimal units of morphology (Katamba, 1993; Aronoff and Fudeman, 2005; Carstairs and Mc.Charty, 2002). There are two kinds of morphemes. Morphemes that can stand on their own are called free morphemes, and ones that cannot are bound morphemes (Tadjuddin: 2003). However, a single word may constitute several morphemes for examples cited from Fromkin and Rodman (1998):

- One morpheme : *boy, desire*
- Two morphemes : *boy + ish, desire + able*
- Three morphemes : *boy + ish + ness, desire + able + ity*
- Four morphemes : *gentle + man + li + ness, un + desire + able + ity*
- More than four: *un + gentle + man + li + ness, anti + dis + establishment + ari + an + ism*

From the examples above, morphemes like *boy, desire, gentle* and *man* may constitute words by themselves. These are free morphemes. Other morphemes like *-ish, -ness, -ly, dis-, trans-* and *-un* are always parts of the words. These morphemes called bound morphemes or it can be called affixes.

The affixes can be separated into parts such as prefix, suffix, infixes and circumfixes. English language only has prefix and suffix. However, infix and circumfix occur in some language. Prefix is an affix that occur before a morpheme (like *en-* in *enlarge*), suffixes is an affix which occur following a morpheme (like *-ance* in *performance, -ness* in *whiteness*, and *-able* in *readable*), Infix is an affix which inserted into other morphemes (Bontoc morphemes, spoken in Philipines: *fikas* "Strong" which is a noun/adjective will change into *fumikas* "to be strong" in order to be a verb) and circumfix is an affix which attached to another morpheme both initially and finally (Chikasaw, a Muskogean language spoken in Oklahoma: *chokma* "he is good" as affirmative becomes *ik + chokm + o* as "he is not good" as negative). (Fromkin and Rodman, 1998; Aronoff and Fudeman, 2005; Carstairs and Mc.Charty, 2002). The process of affix attachment to a morpheme is called affixation.

In addition, many morphemes also have different pronunciations, called allomorphs Carstairs and Mc.Charty (2002), the choice between them being determined by the context. For example, *-s* addition for plural words in English has different sound such as: [s] (as in *cats* or *lamps*), [z] (as in *dogs* or *days*), and [ɪz] or [əz] (as in *horses* or *judges*). Verb affixation in Lampung language is the most productive affixation in Lampung language. Therefore, this research will only focus on that matter.

METHODOLOGY

This research uses Descriptive-qualitative method. The method has been seen by Bogdan and Taylor as a procedure that result descriptive data such as verbal or written words (Moleong, 1993:3). Descriptive terms suggest that this research conducted based on the facts or phenomenon which is textually noted. The data in this study were collected through observe and note methods. It is accordance with what is stated by Mahsun (2005: 90-92). This collecting method was called observe method because the way to collect the data was done textually by observe the verb affixation. Furthermore, the data were noted and then divided based on the their topic.

For data analysis, this research uses intra-lingual equivalence. In this step, the data of Lampung language verbs were compared with Indonesian Language verbs. In the presentation of the data, the analysis will be presented in two ways, namely: (a) formulation using

common words, including the use of technical terminology by describing the process of verb affixation, and the result of verb formation. (b) formulation that uses signs and symbols.

The examples of signs and symbols are: (1) curly braces ({}) which is used to mark the morphological unit in a morpheme. It usually a bound morpheme, (2) the square brackets ([ ]) indicates that the unit inside of the brackets is a phonetic unit and it is used in the field of phonology to symbolize a particular sound that does not have any status of phoneme, (3) arrow (→) is used to indicate changes in verbs form, (4) a plus sign (+) indicates the addition of the form, (5) single quotation marks (') indicates the meaning and (6) the symbol letters such as abbreviation like BL indicates Lampung language.

## **DATA ANALYSIS**

### **1. Prefixation of {N-}**

The research shows that prefixation of {N-} is commonly found in Lampung language verb. The prefix {N-} has five allomorphs: ng-, n-, ny-, m- and nge-.

#### **a. Prefixation of {N-} with ng- allomorph**

{N-} prefix becomes *ng-* is formed when {N-} joined the base that begins with vowels (a, i, u, e, o) and the vowels then assimilated. In addition, prefix {N-} becomes *ng-* formed when joining the base begins with consonant [k] then [k] is assimilated. For examples:

1. {N-} + ator → **ngator** 'to manage'  
(19/3) Pandai ngator Pengetuha, Penglaku.
2. {N-} + injam → **nginjam** 'to borrow'  
(11/1) Mak munsu nginjam bidak.
3. {N-} + unut → **ngunut** 'to find'  
(4/5) Jual beruang serta kajang, dan Penyimbang ni ngemik gerok, mak ngunut kekurangan di humbul barih. Tani sina ngulah pukandang jenong tani sinapun.
4. {N-} + emik → **ngemik** 'to possess'  
(4/5) Jual beruang serta kajang, dan Penyimbang ni ngemik gerok, mak ngunut kekurangan di humbul barih. Tani sina ngulah pukandang jenong tani sinapun.
5. {N-} + osegh → **ngosegh** 'to expel'  
(19) .... Belanda ngoseghia ...
6. {N-} + kunci → **ngunci** 'to lock'  
(4/5) Ngunci kahandak.

#### **b. Prefixation of {N-} with Ny- allomorph**

{N-} prefix becomes *Ny-* is formed when {N-} joined with the base that begins with consonant [s] and [c], both of the [s] and [c] consonants is assimilated. For examples:

7. {N-} + sahut → **nyahut** 'to reply'  
(13) Maka nyahut Temenggung Singa Pati : "Ya Gustiku sepatah kata Tuanku akan ku turut".
8. {N-} + cambuk → **nyambuk** 'to whip'  
(15/4) Sai nyutuk makkung tekas lengan ni mena nyambuk.
9. {N-} + cuba → **nyuba** 'to try'  
(53) Ngeramat nyuba baya jenong hukum sinapun sai kara nyau ni hati.
10. {N-} + sukak → **nyukak** 'to change'  
(60) Maka wat ngemaling di mahan mak kenebok, suwa debingi, makkung munsu nyukak hejongan sai kedau mahan sina begawoh atau hejongan mahan ni.
11. {N-} + sangka → **nyangka** 'to suppose'  
(68) Maka perkara sangka-menyangka, teduh meneduh, ki sai nyangka kalah ya dihukum kebalik tali reti ni ya nyukak di sai kakak.

#### **c. Prefixation of {N-} with n- allomorph**

{N-} prefix becomes *n-* is formed when {N-} joined with base that begins with consonant [t] and then [t] consonant is assimilated. Contoh:

12. {N-} + tayuh → **nayuh** 'do tayuh'  
(10/12) Mak dapok mak di ajak sai tuha lapah nayuh.
13. {N-} + tutu → **nutu** 'to pound'  
(13/6) Hun nutu gelebung mak ngurau ya.
14. {N-} + tenggalan → **nenggalan** 'to consider'  
(96) Nenggalan di tengah bingi
15. {N-} + terima → **nerima** 'to accept'  
(48/3) Jelesa miskin kira-kira haga nerima suduk.

16. {N-} + tinjuk → **ninjuk** 'to catch'  
 (59) Maka meranai ninjuk muli, sampai ditunggang ni kuruk pulan lebih sanga pungenahan, kejuju sampai ngebiyan anying ki muni-muni muli sina dibatok meranai sina, dan muli sina kira makkung cinta atau akil balikh sina ninjuk adok ni, sanga mahan muli sina lain kedau haga, atau makkung suka, ki tubas jadi, meranai sina ngebayar beli ni ngepih dan rega bedak lunuh ni rial sawik harung bah menurut pangkat muli sina, ya nyamporkon badan ni di kanca pereda ni.

**d. Prefixation of {N-} with *m-* allomorph**

{N-} prefix becomes *m-* is formed when {N-} joined the base that begins with vowels (a, i, u, e, o) and the vowels not assimilated. In addition, {N-} becomes *m-* is formed when {N-} joined with the base that begins with [h] and [p] consonants, [h] and [p] consonants is assimilated. For examples:

17. {N-} + *unggak* → **munggak** 'to raise'  
 (40/4) Maka Ratu Majapahit munggak di pusaban ...
18. {N-} + hinok → **minok** 'to stay overnight'  
 (15/4) ... dipa lagi rang minok
19. {N-} + pagas → **magas** 'to stab with a spear'  
 (84) Maka wat nyabut gegaman tajam mak permisi pai, maka hulun sai rados disan tekebas nyawa ni ki ya haga magas didenda siwa pitis Rp.36,-. Ngeramat nyirang baya jenong hukum sinapun.
20. {N-} + pisol → **misol** 'to slaughter'  
 (100) Tapi ki muli mak suka atau ahli waris ni mak suka nemu kon tian rua musti tian rua jaja-jama misol kibau hurik sai, serenta muli, ngemuli muloh merani rena munih, sebab liom malu tian rua, gegoh, cuman meranai tambah nyukak hejongan mahan sina bugawoh sina lebih kerugian ni meranai.
21. {N-} + pekik → **mekik** 'to scream'  
 (12) ... jama bunyi sai mekik

**e. Prefixation of {N-} with *Nge-* allomorph**

{N-} prefix becomes *nge-* is formed when {N-} joined with the base that begins with all of the consonants except [P, T, K, S, C] then the consonants is not assimilated. Furthermore, {N-} becomes *nge-* can also be formed with the base that begins with [h] (not only for {N-} prefix with *m-* allomorph). However, it differs with *m-*, in {N-} prefix with *nge-* allomorph the [h] consonant not assimilated. For examples:

22. {N-} + jaga → **ngejaga** 'to guard'  
 (10/10) Ngejaga rulung.
23. {N-} + lawan → **ngelawan** 'to fight'  
 (25) Ya mula ni kidah pun angguan ni Punyimbang, ngelawan adik wari dang kurang pinggung pikir angka jaman mak akhir dang kurang ati-ati angka ni makkung mati, dang kurang angok-angok angka ni lagi dapok.
24. {N-} + hapak → **nehapak** 'to guide'  
 (30) Sebab ki lapah nehapak jelema buta, napong jaoh bakal tejajan, sebab itu kita berjalan awas-awas, hiwon-hiwon.
25. {N-} + gudok → **negudok** 'to stir'  
 (40/4) Sungai bulok dibulok-bulok, Badak purang negudok kubang, tanoh dikukut ti cakak kon di hulu sina pantangan anak Ratu.
26. {N-} + maling → **ngemaling** 'to steal'  
 (51) Maka perkara maling kak wat bukti kak wat saksi ni dan sai ngemaling kak nerima salah, ya laju kilu hukum di Perwatin.

**2. Prefixation of *bu-* and *be-***

Besides {N-} prefix this research found *bu-* and *be-* prefixes. Below is the explanation of those prefixes.

**a. Prefixation of *Bu-***

*Bu-* prefix used with the base that begins with consonant and then the consonant is not assimilated. For examples:

27. *Bu-* + *sesat* → **busesat** 'to go astray'  
 (2/3) Mak busesat.
28. *Bu-* + *langgar* → **bulanggar** 'to have a mosque'  
 (2/4) Mak bulanggar atau musigit.
29. *Bu-* + *geduk* → **bugeduk** 'to have a drum'  
 (2/6) Mak bugeduk.
30. *Bu-* + *kahandak* → **bukahandak** 'to wish'  
 (2/8) Mak bukahandak.
31. *Bu-* + *balah* → **bubalah** 'to speak'  
 (10/3) Simah bubalah.

**b. Prefixation of Be-**

*Be-* prefix is used with the base that begins with consonant or vowel and then the consonant or the vowel is not assimilated. For examples:

32. Be- + *iman* → *beiman* 'to have faith'  
(96) ... jelemabeiman ...
33. Be- + *kawan* → *bekawan*. 'to have friend'  
(1) ... bughung sai *bekawan*...
34. Be- + *gughau* → *begughau*... 'to joke'  
(1) lagi *begughau*...
35. Be- + *kaca* → *bekaca* 'to use glass'  
(2) Niku *bekaca* di wai
36. Be- + *bunyi* → *bebunyi* 'to sound'  
(9) Mak beni bel *bebunyi*

**3. Prefixation of ti- and te-**

Besides {N-}, bu- and be- other prefixes found in this research are ti- and te-. Below is the explanation of ti- and te- prefixes.

**a. Prefixation of ti-**

*Ti-* prefix is used with the base that begins with consonant or vowel and then the consonant or the vowel is not assimilated. For examples:

37. Ti- + *urau* → *tiurau* 'called'  
(48) Tetapi kiwat jelema ngan ni nyawakon ya tengenah ni atau ya nengis ni, atau ditengani ni dapok *tiurau* mit Perwatin sina maka ya nemonkon cawa jelema 12 sudi jeno, ampai dapok diterima jadi saksi, maka wat saksi 12 pasal sina tiulah lagi ditaksir Perwatin, acak nyaksikon batu, kayu.
38. Ti- + *rerap* → *tirerap* 'cut'  
(54) Maka wat ngemaling bubuahan atau tinanaman, mak tiranting, mak *tirerap* dan mak tigelegai kejuju ni di pinggir rang.
39. Ti- + *gelegai* → *tigelegai* 'shaken'  
(54) Maka wat ngemaling bubuahan atau tinanaman, mak tiranting, mak tirerap dan mak *tigelegai* kejuju ni di pinggir rang.
40. Ti- + *ililik* → *tiilik* 'stepped'  
(74) Maka wat mupika kon hulun, taksir kedo kak bangat ni, dan *tiilik* pangkat sai bedusa sina mari ngitung tepung ni.
41. Ti- + *kejanguh* → *tikejanguh* 'revealed'  
(90) Maka wat *tikejanguh*, taksir pangkat ni sai dihayakni sina, danda mulai rua belas rial harung bah, dan pukakas ni akuk, kiya sai kedau ya sayang di pekakas ni beli ni muloh pira ya timpu ya ngebeli barang sina jono ni.

**b. Prefixation of te-**

*Te-* prefix is used with the base that begins with consonant and then the consonant is not assimilated. For examples:

42. Te- + *jajau* → *tejajau* 'lost'  
(30) Sebab ki lapah ngehepak jelema buta, nepong jawoh bakal *tejajau*, sebab itu kita berjalan awas-awas, hiwon-hiwon.
43. Te- + *tahan* → *tetahan* 'hampered'  
(64) Maka wat jelema ngemaling kena *tetahan* lambung darak, dipinggir rang atau pinggir huma atau randos dihulun burakal, hukum ni diulangkon ni kebelah di sai kedau tenahan sina, atau rega ni separo jelema makai tungga bugawoh.
44. Te- + *tutuk* → *tetutuk* 'carried away'  
(76) Maka wat nyerumah barang atau daw belanja atau binatang maka lebon atau luang atau cadang atau pupika, periksa munih api barang ngan sai nyerumah, sina *tetutuk* munih kelebonan, atau cadang atau luang atau pupika, diputus hukum suka ni nengah rinci jelema haga kecewa.
45. Te- + *liyu* → *teliyu* 'passed'  
(80) Maka wat jelema *teliyu* atau ratong nginjang derani, kejuju ki debingi hulun mak pandai disahaja ni, maka wat kepetenahan tiyuh sina sai mak ketentuan sebab ni, menurut kuntara pasal 79 hukum ni Tupai lalu kelapa jatuh.
46. Te- + *kebas* → *tekebas* 'thrown'  
(84) Maka wat nyabut gegaman tajam mak permisi pai, maka hulun sai randos disan *tekebas* nyawa ni kiya haga magas didenda siwa pitis Rp.36,-. Ngeramat nyirang baya jenong hukum sinapun

**4. Prefixation of di-**

*Di-* prefix is a prefix that is found in Lampung language. Below is the explanation of di- prefix.

**a. Prefiksasi di-**

*di-* prefix used with the base of word that begins with consonant or vowel and then the consonant or the vowel is not assimilated. For examples:

47. Di- + *tetok* → *ditetok* 'cut'

(1) Anak salah anak sai malah, culuk salah culuk *ditetok*.

48. Di- + anggu → **dianggu** 'believed to be'  
(6/3) Wajib juga *dianggu* ki pandai di ram bator.

49. Di- + lulih → **dilulih** 'asked'  
(10/8) Lika *dilulih* muli temui.

50. Di- + guwai → **diguwai** 'performed'  
(11/2) Mak *diguwai* hulun Penglaku.

51. Di- + penah → **dipenah** 'waited'  
(11/4) Mak *dipenah* hun mengan kibau.

## 5. Circumfixation of {N-} ...-ko/-kon/-i

On the last explanation, I have mentioned that {N-} has several allomorphs such as ng-, ny-, n-, m-, and nge-. To form circumfixes, those five allomorphs then joined with the base and ended with -ko/-kon/-i suffixes which result several circumfixes such as: ng-...-ko/-kon, ng-...-i, ny-...-ko/-kon, ny-...-i, n...-ko/-kon, n...-i, m-...-ko/-kon, m-...-i, nge-...-ko/-kon, nge-...-i.

### a. Circumfixation of Ng-...-ko/-kon

Ng-...-ko/-kon circumfix is formed when {N-} joined the base that begins with vowels (a, i, u, e, o) and the vowels then assimilated then added -ko/-kon suffix. In addition, prefix {N-} becomes circumfix ng-...-ko/-kon is formed when joining the base begins with consonant [k]; [k] is assimilated then added -ko/-kon suffix.

52. {N-} + kuat + -kon → **nguatkon** 'to strength'  
(46) Turunan anak Jawa sai *nguatkon* tata-titi, nangga bumi keraton.

53. {N-} + ingok + -kon → **ningokkon** 'to remember'  
(56) Maka wat barang tinggal, dihulu hulun, sai ngehalu ya rulus hati, mulang barang bugawoh, ram dang mak *ningokkon* hati kedua sai betik, maka sampai jadi pekara, ulah sai ngehalu ya saking piyot, wat saksi ni sai temon nunjukkan, jak sai budakwa maka dihukum barang mulang, dihapik ni kiri-kanan, dimuka dan belakang jadi kelima batang, ngejabok baya jenong hukum sinapun. Ya haga makai pintor jama kedua.

54. {N-} + intar + -ko → **ngintarko** 'to deliver'  
(143) Maka wat ngiring gegoh Kuntara pasal : 88 bedua ngelakuni, dan pok ngiring seperti kuntara pasal 105. Maka ya mulang cuma diterangkan Penyimbang ni bugawoh, sebab ya lapah pinangguran rua telu Penyimbang *ngintarko* ya, ganta ya kak mulang, Penyimbang sina nguraw sampai 5-6 nyawako bedua jara ulang tiyung, cabi ni kak ratong, dan perkara alat ni mak ngedok denda cuman Penyimbang sina ngeguwai hanekan kanan bugawoh, ulah ya haga nemuiko kanca pureda ni.

55. {N-} + ucak + -kon → **ngucakkon** 'to return'  
(124) Ngeramat ngelakung baya jenong hukum sinapun, *ngucakkon* tiyuh kedua, tiyuh kedua humbul atau kebun.

56. {N-} + kenal + -ko → **ngenalko** 'to command'  
(8) ... sai bakas *ngenalko* ...

### b. Circumfixation of Ng-...-i

Ng-...-i circumfix is formed when {N-} joined the base that begins with vowels (a, i, u, e, o) and the vowels then assimilated then added -i suffix. In addition, prefix {N-} becomes circumfix ng-...-i is formed when joining the base begins with consonant [k]; [k] is assimilated then added -i suffix.

57. {N-} + ubat + -i → **ngubati** 'to cure'  
(83) Maka wat hulun buhaban bedas atau laju mati di jenganan, anjak memenganan, lamon jadi perkara sapa sai kedau makanan atau memasak sina sai kena di hukum *ngubati* ya, atau ngebangun ya dan segala ongkos-ongkos hal sina.

58. {N-} + unyah + -i → **ngunyah** 'to mock'  
(3) ... muli guwai *ngunyah* ...

59. {N-} + aku + -i → **ngakui** 'to admit'  
(41) ... guwaingakui dusa ...

60. {N-} + kuruk + -i → **nguruki** 'to enter'  
(41) Maling sina *nguruki* nuwaku

61. {N-} + koret + -i → **ngoreti** 'to cut with sickle'  
(41) Bebai sina *ngoreti* huma

### c. Circumfixation of Ny-...-ko/-kon

Ny-...-ko/-kon circumfix is formed when {N-} joined with the base that begins with consonant [s] and [c], both of the [s] and [c] consonants is assimilated then added with -ko/-kon suffix. For examples:

62. {N-} + cawa + -kon → **nyawakon** 'to say'  
(9/5) ... nganninyawakon...

63. {N-} + saksi + -ko → **nyaksiko** 'to see'

- (48) Tetapi kiwat jelema ngan ni nyawakon ya tengenah ni atau ya nengis ni, atau ditengani ni dapok ti uraw mit Perwatin sina maka ya nemonkon cawa jelema 12 sudi jeno, ampai dapok diterima jadi saksi, maka wat saksi 12 pasal sina tiulah lagi ditaksir Perwatin, acak *nyaksikon* batu, kayu.
64. {N-}+ sani + -kon → *nyanikon* 'to tidy up'
- (65) Maka wat jelema ngemaling kena tinahan dilambung darak, tapi ngan ni ancun, lain gegoh sudi jeno, musti di ulohkon ni unyin atau *nyanikon* pepah ni tinahan sina.
65. {N-}+ sadang + -kon → *nyadangkon* 'to break'
- (133) Jumlah 15 pasal sai *nyadangkon* atau ngebinasakan Pepadun, tetapi ki hantara ..... atau gincing dapok diadilkon segala bagi dan segala tungguan ni ..... hejong ni ki lagi wat Pepadun lam buai sina sai barih.
66. {N-}+ cacak + -kon → *nyacakkon* 'to utter'
- (135) .... ni ya kilu ragam ngumbankon sai dia *nyacakkon* sai disuya ni sina musti diragami Perwatin.

**d. Circumfixation of Ny-...-i**

Ny-...-i circumfix is formed when {N-} joined with the base that begins with consonant [s] and [c], both of the [s] and [c] consonants is assimilated then added with -i suffix. For examples:

67. {N-}+ calak + -i → *nyalaki* 'to fool'
- (118) Cepala buha nahun, *nyalaki* anggopni, tapi ki pedom atau buhaban dang dihukum.
68. {N-}+ sahut + -i → *nyahuti* 'to reply'
- (118) Siti *nyahuti* urauan indukna
69. {N-}+ cuba + -i → *nyubai* 'to try'
- (121) Nyak *nyubai* kawai sina
70. {N-}+ cabut + -i → *nyabuti* 'to pull'
- (121) Nyak *nyabuti* uban indukku
71. {N-}+ sirang + -i → *nyirangi* 'to pass'
- (122) Ulat *nyirangi* tumbang...

**e. Circumfixation of n-...-ko/-kon**

n-...ko/kon circumfix is formed when {N-} joined with base that begins with consonant [t] and then [t] consonant is assimilated then added -ko/-kon suffix. For examples:

72. {N-}+ temui + -kon → *nemuikon* 'to found'
- (4/1) *Nemuikon* hulun tandang, atau himpun manuk.
73. {N-}+ temon + -kon → *nemonkon* 'to correct'
- (48) Tetapi kiwat jelema ngan ni nyawakon ya tengenah ni atau yenengis ni, atau ditengani ni dapok ti uraw mit Perwatin sina maka ya *nemonkon* cawa jelema 12 sudi jeno, ampai dapok diterima jadi saksi, maka wat saksi 12 pasal sina tiulah lagi ditaksir Perwatin, acak nyaksikon batu, kayu.
74. {N-}+ tunjuk + -ko → *nunjukko* 'to show'
- (56) Maka wat barang tinggal, dihulu hulun, sai ngehalu ya rulus hati, mulang barang bugawoh, ram dang mak ngingokkon hati kedua sai betik, maka sampai jadi pekara, ulah sai ngehalu ya saking piyot, wat saksi ni sai temon *nunjukkon*, jak sai budakwa maka dihukum barang mulang, dihapik ni kiri-kanan, dimuka dan belakang jadi kelima batang, ngejabok baya jenong hukum sinapun. Ya haga makai pintor jama kedua.
75. {N-}+ tegi + -kon → *negikon* 'to build'
- (123) Maka wat *negikon* linggis, cepala nyukak kepunggor, nuruikon linggis cepala nyukak kubor, ki sampai tekas anjak pungi ni di tengah tiyuh, hukum ni musti diakuk Penyimbang tiyuh sina linggis ni.
76. {N-}+ terang + -kon → *nerangkon* 'to explain'
- (134) Supaya gegoh sina mula didenda rasan ki mak mampu nyukak ya sina dilupukkon jadi padangan Batin Semerga, ahli waris ni busai lupuk dia cuma mesol kibau hurik *nerangkon* sai jadi padangan sina, pupadun ni tinggal sipa helau ni sina mak lungkap lagi, habis perkara ngampang.

**f. Circumfixation of n-...-i**

n-...-i circumfix is formed when {N-} joined with base that begins with [t] consonant and then [t] consonant is assimilated then added -i suffix. For examples:

77. {N-}+ timbak + -i → *nimbaki* 'to shot'
- (19) ... Belanda *nimbakirakyat* ...
78. {N-}+ tutu + -i → *nutui* 'to pound'
- (20) Hun *nutui* pari
79. {N-}+ timpa + -i → *nimpai* 'to press'
- (21) Dang *nimpai* kukut ku
80. {N-}+ tepuk + -i → *nepuki* 'to tap'
- (21) Ia *nepuki* pok pedom
81. {N-}+ tutuk + -i → *nutuki* 'to follow'
- (22) Ulun tuha selalu *nutuki* hagana sana

ganta

**g. Circumfixation of m-...-ko/-kon**

*m-...-ko/-kon* circumfix is formed when {N-} joined the base that begins with vowels (a, i, u, e, o) and the vowels not assimilated. In addition, {N-} becomes *m-* is formed when {N-} joined with the base that begins with [p] consonant, [p] consonants is assimilated then added *-ko/-kon* suffix. For examples:

82. {N-}+ putus + -ko → **mutusko** 'to decide'  
(9/5) *Mutuskon* perkara ya mak tesok.
83. {N-}+ perelu + -kon → **merelukon** 'to need'  
(9/5) Rincian kurang pandai mak *merelukon* badan, jenong Penyimbang sinapun.
84. {N-}+ pangkal + -kon → **mangkalkon** 'to initialize'  
(50) Maka wat hulun jubal ulah hutang piutang atau makanan, atau pekerjaan atau dandan pakaian, atau pukakas sahintiru, *mangkalkon* jubal ulah sai segabor di ingok ni tetapi saksi ni mawat, bukti ni mawat, maka di kain kon busumpah setih sesuatu, maka tian rua berani unyin, maka taksir tian rua sapa sai sayung kehidupan ni, sina sai besumpah labuh perkara ni menang.
85. {N-}+ perhati + -kon → **merhatikon** 'to observe'  
(14) ... *merhatiko* usulan ...
86. {N-}+ pati + -kon → **matikon** 'to kill'  
(19) ... Sultan ngarapat *matiko*...

**h. Circumfixation of m-...-i**

*m-...-i* circumfix is formed when {N-} joined the base that begins with vowels (a, i, u, e, o) and the vowels not assimilated. In addition, {N-} becomes *m-* is formed when {N-} joined with the base that begins with [h] and [p] consonants, [h] and [p] consonants is assimilated and then added *-i* suffix. For examples:

87. {N-}+ pungker + -i → **mungkeri** 'to deny'  
(51) Maka wat ngelagoki perkara radu putus diputuskon Perwatin rinci ni *mungkeri* dengki, musti didenda segera perkara.
88. {N-}+ hiwang + -i → **miwangi** 'to cry'  
(51) Dang *miwangi* nasib hore
89. {N-}+ patuh + -i → **matuhi** 'to be loyal'  
(52) Ya *matuhi* cawa ulun tuhonno
90. {N-}+ patuk + -i → **matuki** 'to bite'  
(53) Asu *matuki* daging
91. {N-}+ payung + -i → **mayungi** 'to cover'  
(53) Nyak *mayungi* niku

**i. Circumfixation of nge-...-ko/-kon**

*nge-...-ko/-kon* circumfix is formed when {N-} joined with the base that begins with all of the consonants except [P, T, K, S, C] the consonants is not assimilated and then added *-ko/-kon* suffix. For examples:

92. {N-}+ gantung + -kon → **ngegantungkon** 'to hang'  
(2/5) Mak *ngegantungkon* kelekup (kentong).
93. {N-}+ jalan + -kon → **ngejalankon** 'to do'  
(29) Mari jenong jelema pandai ya *ngejalankon* tilik tidai 5 perkara.
94. {N-}+ jamuk + -ko → **ngejamukko** 'to give'  
(93) Ngeramat ngelidung baya jenong hukum sinapun ya *ngejamukkon* sai mak betik haga di hun tekana, denda sina mulang di sai ngedakwa sina, Perwatin cuman ongkos perkara gawoh.
95. {N-}+ gampang + -kon → **ngegampangkon** 'to make easy'  
(102) Ngeramat ngepar baya nama hukum sinapun, ya *ngegampangkon* kehimpunan.
96. {N-}+ buntor + -kon → **ngébuntorkon** 'to make round'  
(130) Ngeramat ngungkor baya retini ya *ngébuntorkon* mahan keduwa tapi ki jelema handak pi'il pusanggiri dang dihukum atau didenda.

**j. Circumfixation of nge-...-i**

*nge-...-i* circumfix is formed when {N-} joined with the base that begins with all of the consonants except [P, T, K, S, C] the consonants is not assimilated and then added *-i* suffix. For examples:

97. {N-}+ lagok + -i → **ngelagoki** 'to suppose'  
(23) Maka wat *ngelagoki* ...
98. {N-}+ racun + -i → **ngeracuni** 'to poison'  
(23) *Ngeracuni* nama hukum...
99. {N-}+ cida + -i → **ngecidai** 'to break'

(24) ... wat sai haga *ngecidai* ia induh...

100. {N-}+ lindung + -i → **ngelindungi** 'to protect'  
(24) Ngeramat *ngelindungi* baya...

101. {N-}+ hadop + -i → **ngehadopi** 'to face'  
(26) ... niku *ngehadopi* nya...

#### **6. Circumfixation of be-...-an and bu-...-an**

This research found bu-...-an and be-...-ancircumfixes. Below is the explanation of those circumfixes:

##### **a. Circumfixation of bu-...-an**

*bu-...-an* circumfix is formed when *be-* joined with the base that begins with consonant and the consonant is not assimilated then added with *-an* suffix. For examples:

102. Bu-+ pekal + -an → **bupekalan** 'to have place'  
(2) Mak *bupekalan*ragah
103. Bu-+ peselok + -an → **bupeselokan** 'to insert'  
(100) Kuruk Batin, tanda ni meranai sina cakak mahan muli, makai bidak, busabuk, *bupeselokan*, buselikap, bulistar.
104. Bu-+ serah + -an → **buserahan** 'to surrender'  
(49) Kuruk Batin, tanda ni meranai sina cakak mahan muli, makai bidak, busabuk, *buserahan*, buselikap, bulistar.
105. Bu-+ tabrak + -an → **butabranken** 'to clash'  
(28) Mobil sina *butabranken* di ranglaya
106. Bu-+ kirim + -an → **bukiriman** 'to send'  
(28) ...meranai sina *bukiriman* surat jama muli

##### **b. Circumfixation of be-...-an**

*be-...-an* circumfix is formed when *be-* joined with the base that begins with consonant or vowel and the consonant or the vowel is not assimilated then added with *-an* suffix. For examples:

107. Be- + karet + -an → **bekaretan** 'rubberized'  
(25) Ani *bekaretan* dibuwokni
108. Be- + salam + -an → **besalaman** 'shake hands'  
(27) Dang lupa *besalaman* jama ulun tuha
109. Be- + timbal + -an → **betimbalan** 'to exchange'  
(27) Wat acara *betimbalan* delom gawi sina
110. Be- + iring + -an → **beiringan** 'together with'  
(28) Motor sina *beiringan* jama mobilku
111. Be- + sabai + -an → **besabaian** 'to be related to'  
(28) Ia *besabaian* jama maha niku

#### **7. Circumfixation of ti-/te-...-ko/-kon/-i**

As I explain before in Lampung language besides {N-}, bu-, and be- prefixes there are te- and ti- prefixes. In circumfixation, ti- or te- is ended with -ko/-kon/-i suffix. Below is the explanation of te- and ti- circumfixations.

##### **a. Circumfixation of ti-...-ko/-kon**

*ti-...-ko/-kon* circumfix is formed with the base that begins with consonant or vowel. The consonant or the vowel is not assimilated then added *-ko/-kon* suffix. For examples:

112. Ti- + uloh + -kon → **tiulohkon** 'returned'  
(62) Ki kak munsu tengemaling ni *tiulohkon* dihapikni kiri kanan, jadi ketiga batang dan hejongan seperti
113. Ti- + ucak + -kon → **tiucakkon** 'uttered'  
(5) ...daighahti*tiucakkon* ...
114. Ti- + siyap + -kon → **tisiyapkon** 'prepared'  
(44) ... ghaduti*tisiyapkon* ...
115. Ti- + cawa + -kon → **ticawakon** 'spoken'  
(60) Tiyan *ticawakon* ...
116. Ti- + lebon + -ko → **tilebonko** 'erased'  
(50) Motor ayah *tilebonkon* adik

##### **b. Circumfixation of ti-...-i**

*ti-...-i* circumfix is formed with the base that begins with consonant or vowel. The consonant or the vowel is not assimilated then added *-i* suffix. For examples:

117. Ti+ gelagh + -i → tigelaghi 'named'  
(57) ... luwaghtigelaghi ...
118. Ti+ gawang + -i → tigawangi 'cleaned'  
(77) ... ghiktigawangi ...
119. Ti+ sapon + -i → tisaponi 'cleaned'  
(78) Nuwa sina tisaponi anak muli
120. Ti+ pedom + -i → tipedomi 'to sleep on'  
(79) Pok pedom mahani dang tipedomi
121. Ti- + injam + -i → tiinjami 'loaned'  
(79) Ia tiinjami tapis

## 8. Circumfixation of di-...-ko/-kon/-i

There are two circumfixations of di- prefix. Both of them are di-...-ko/-kon or di-...-i. Below is the explanation of both circumfixes.

### a. Circumfixation di-...-ko/-kon

di-...-ko/-kon circumfix is formed when di- joined with base that begins with consonant or vowel. The consonant or the vowel is not assimilated then added -ko/-kon suffix. For examples:

122. di- + ungsi + -kon → diungsikon 'evacuated'  
(12) Diungsikon hulun nyangsang.
123. di- + urus + -kon → diuruskon 'managed'  
(49) Maka perkara kak wat saksi ni kak wat bukti ni dan ya kak nerima, musti diuruskon pai tanda buserah ni nurun jak kedua pihak, nimbang rega perkara sina tanda ni mak nyilor di segala putusan Perwatin.
124. di- + kayin + -ko → dikayinko 'asked'  
(50) Maka wat hulun jubal ulah hutang piutang atau makanan, atau pekerjaan atau dandan pakaian, atau pukakas sahintiru, mangkalkon jubal ulah sai segabor di ingok ni tetapi saksi ni mawat, bukti ni mawat, maka dikayinkon busumpah setih sesuatu, maka tian rua berani unyin, maka taksir tian rua sapa sai sayung kehidupan ni, sina sai besumpah labuh perkara ni menang.
125. di- + putus + -kon → diputuskon 'decided'  
(51) Maka wat ngelagoki perkara radu putus diputuskon Perwatin rinci ni mungkari dengki, musti didenda segera perkara.
126. di- + tarik + -kon → ditarikkon 'pulled'  
(57) Maka muli ditarikkon meranai, liwat anjak panjang telu, sina tekab jaba adok ni ki mak jadi telaju kahjong, meranai sina nurun petelu pak likor rik kibau sai rega 12 rial dan nyukak rega bedak lunnyuh ni muli sina pak likor rung bah nuruni pangkatni muli sina.

### b. Circumfixation of di-...-i

di-...-i circumfix is formed when di- joined with base that begins with consonant or vowel. The consonant or the vowel is not assimilated then added -i suffix. For examples:

127. di- + tangan + -i → ditangani 'organized'  
(48) Tetapi kiwat jelema ngan ni nyawakon ya tengenah ni atau ya nengis ni, atau ditangani ni dapok ti uraw mit Perwatin sina maka ya nemonkon cawa jelema 12 sudi jeno, ampai dapok diterima jadi saksi, maka wat saksi 12 pasal sina tiulah lagi ditaksir Perwatin, acak nyaksikon batu, kayu.
128. di- + marah + -i → dimarahi 'to be angry at'  
(54) Antak dimarahi bugawoh, sai dimaling ni sina dang diakuk laju kon dia gawoh.
129. di- + butong + -i → dibutongi 'to be angry at'  
(136) Maka muli atau bebai dibutongi Penyimbang ni baka cawa dan Penyimbang ni kilu ragam di Penyimbang-penyimbang barih, mesti diperiksa pai api ya ngandung, ulah capa, ki mak butantu retini ngampang.
130. di- + gheghing + -i → digheghingi 'liked'  
(42) ... mulani ia digheghingi ...
131. di- + alam + -i → dialami 'experienced'  
(41) ... api sai dialami ...

## 9. Circumfixation of ke-...-an

ke-...-an circumfix is found in Lampung language. This circumfix can be said a unique one because there is no ke- prefix used as a verb in Lampung language. In order to make a verb ke- prefix must be added with base and ended with -an suffix. Below is the explanation of ke-...-an circumfixation.

### a. Circumfixation of Ke-...-an

ke-...-an circumfix is formed when ke- joined with the base that begins with consonant. The consonant not assimilated then added -an suffix. For examples:

132. ke- + tengis + -an → ketengisan 'heard'  
(35) ... ketengisan mula ya ...

- |      |   |   |                                    |
|------|---|---|------------------------------------|
| 133. | ke- + rugi + -an<br>(69) ... kalah segala <u>kerugian</u>   | → | kerugian 'suffered financial loss' |
| 134. | ke- + hilang + -an<br>(76) <u>Kelebonan</u> atau cadang ... | → | kehilangan 'stolen'                |
| 135. | ke- + betong + -an<br>(78) Nyak radu <u>kebetongan</u>      | → | kebetongan 'saturation'            |
| 136. | ke- + betoh + -an<br>(79) Nyak radu <u>kebetohan</u>        | → | kebetohan 'famine'                 |

#### 10. Infixation of ...-en-...and ...-em-...

There are only found two infixes in Lampung language. Those two infixes are...-en-... and...-em-....Below is the explanation of those infixes:

##### a. Infixation of ...-en-...

...-en-... infix is formed when base which begins with consonant is separated by separating the first letters from the base then added ...-en-... infix. After the infix added then the rest of the letters joined in. For examples:

- |      |  |   |                   |
|------|--|---|-------------------|
| 137. | Kebok→K + -en- + bok<br>(53) Mangka perkara maling ya mak asing ni mak hurani hujan, rangok sangun mak <u>kenebok</u> , jenganan bangkang, ya munih tepak nerima di hukum Perwatin ya ngulangkon barang sai watas diakukni sina gawoh, dan saksi dapok mak busumpah.   | → | kenebok 'closed'  |
| 138. | Kuta→K + -en- + uta<br>(150) Anying ki wat sai kedau ya dihukum nyukak denda sina dan ngeganti kerugian sai dicadangkoni ni, anying sai cadang sina mak <u>kenuta</u> , mak tigelegai, denda sudi bugawoh dapok mak ngeganti kerugian sai cadang.  | → | kenuta 'fenced'   |
| 139. | Cecar→C + -en- + ecar<br>(159) Maka wat ngusi nuar sampai nyadang kon hasil pulan seperti hui, buluh, damar, tahi-tahi ni kayu sai radu ditanda kejuju ki ya sangun nyansat, nyadang kon ya atau ngakuk ya didenda rua belas rial Rp.24,- dan sai diakuk ni sina mulang tau disukak ni di sai kedau tinanda, seperti <u>cenecar</u> tinerap, tisingkil, tapi ki tian rua jejama ngaku kedau, ketahu periksa kuntara pasal 50 tapi periksa pai tian rua sapa sai randos disanjenganan ni musti sai jaoh kalah, ki gegoh jaoh ni tian rua berani sumpah unyin, mak ngedok saksi kuntara pasal : 50 sudi ngan ni putus. | → | cenecar 'cut'     |
| 140. | Panjal→P + -en- + ajal<br>(167) Dang <u>penanjat</u> nyak jama kukutmu   | → | penanjat 'kicked' |
| 141. | Pajak→P + -en- + ajak<br>(169) Kikim <u>penajak</u>  | → | penajak 'boiled'  |

##### b. Infixation of ...-em-...

...-em-...infix is formed when the base which begins with consonant is separated each other by separating the first letters from the base then added ...-em-... infix. After the infix added then the rest of the letters joined in. For examples:

- |      |  |   |                              |
|------|--|---|------------------------------|
| 142. | Pukem→p + -em- + ukem<br>(178) Pudana <u>pemukem</u>             | → | pemukem 'rounded'            |
| 143. | Guppo→g + -em- + uppo<br>(178) Tian <u>gemuppo</u> hagok masigit | → | gemuppo 'droves'             |
| 144. | Gatem→g + -em- + atem<br>(177) <u>Gematem</u> suara bedil        | → | gematem 'to keep on booming' |
| 145. | Gercik→g + -em- + ercik<br>(176) Way Batanghari <u>gemercik</u>  | → | gemercik 'crackling'         |
| 146. | Tebeng→T + -em- + ebeng<br>(177) Niat <u>temebeng</u> .          | → | temebeng 'straight'          |

#### D. CONCLUSION

This research has tried to answer the unsolved questions about the verbs affixation in Lampung language in Kuntara Raja Niti book and textbooks using morphology study. The finding of this study found that there are six types verb prefixes in Lampung language The six types of prefixes are {N-}, *bu-*, *be-*, *ti-*, *te-* and *di-*. Prefix {N-} has five allomorphs: *ng-*, *ny-*, *m-*, *n-*, and *nge-*. However, other prefixes such as *bu-*, *be-*, *ti-*, *te-* and *di-* do not have allomorphs. Moreover, there are 17 (seventeen) verb circumfixes. There are: *ng-...-ko/-kon*, *ng-...-i*, *ny-...-ko/-kon*, *ny-...-i*, *n...ko/-kon*, *n-...-i*, *m-...-ko/-kon*, *m-...-i*, *nge-...-ko/-kon*, *nge-...-i*, *bu-...-an*, *be-...-an*, *ti-...-ko/-kon*, *ti-...-i*, *di-...-I*, *di-...-ko/-kon*, *ke-...-an*. There are only two verb infixes found in this research. Two kinds of infixes are ...-en-... and...-em-.... However, there are no independent verb suffixes found in this research.

#### ABSTRACT

The aim of this research is to utilize the personal, cultural and historical information that students bring to the class in order to make a more flexible and dynamic teaching strategy, in literature classes. Based on the schema theory which assumes the construction of the meaning to reside in the interaction of the literary text and background knowledge of the students and by considering the issue of interpretive communities, the researcher tends to create a correlation between the students' knowledge and their shared assumption as a small community and directing it through literature to achieve a more flexible syllabus. Interpretive communities share the patterns of signifying meanings in a particular community. By considering the classroom as a community with certain background and interests, the teacher may evaluate the concerns of the students, in achieving a more flexible teaching strategy, in the class. In this method, class becomes a dynamic field to accomplish the objectives of the class; teacher must be alert to evaluate the collective interests of the class as a community, in order to promote certain language skills such as reading and listening, as well as aesthetic learning through what students demand, as a group and what is appropriate for the class. In this sense, this research attempts to challenge the pre-established literary canons which are employed, in the classes in order to facilitate the process of learning and transform it to a more challenging task, by providing the material based on the logical pleas of the class.

**KEYTERMS:** Flexible Teaching Strategy- interpretive communities- Literature Class- Schema Theory.

#### INTRODUCTION

Teaching literature has long been considered a challenging task, especially in literature classes, in which the aim of the instructors of the course is to educate not only aesthetic dimensions of a certain literary text, but also some particular skills, such as reading and writing. The complicated nature of these courses heightens with the heterogeneity of the classes; different classes would vary in number, race, gender and age of students. This would intensify the complexity of assumed educational objectives of the course. One of the best solutions for this problem is homogenizing the students, based on certain factors, such as age and gender and race. However, in the present multi-cultural societies, it appears to be impossible. Thus, utilizing the dynamic educational potential of students could be the answer. This research attempts to scrutinize a more dynamic teaching strategy by employment of pre-established collective knowledge of students, in presenting practical teaching techniques.

Many scholars have devoted their researches to scrutinizing different methods of literature teaching to optimize the outcomes of literature classes. Literature has emerged from the mere fictional presentation of events into a demanding field of educational contemplation, by endowing students with many other practical educational skills, such as reading, writing and listening skills. In this regard, literature transforms into a pragmatic educational domain that transcends its conventional role as a subject of entertainment. Thus, many teachers focus on literature, as an attractive educational realm; one that entertains and teaches, concurrently.

Among many approaches that investigate various methods of teaching literature, some are of pivotal significance. The postmodern tendency to locate the core of meaning in individuals is the one that appreciates the subjective interpretations of readers, as the major intention of literary texts. This involves glorification of pre-established insight that assists the readers to analyze the texts. Each individual brings a unique set of presumptions to the procedures of reading activity. However, there are many shared comprehensions by readers of a same book, based on their socio-cultural paradigms. In that case, evaluating the possible pragmatic methods of teaching literature simplifies by investigating the communal appreciation of a literary work. The issues which are going to be discussed in this research are the definition of schema theory, its affiliation with interpretive communities providing more flexible teaching approaches such as permanent evaluation of the student's interest based on teacher's objectives, in the class. Accordingly, the main aim of this study is challenging the classical traditional literary canon, in order to create a more fruitful educational goal. Some stratagems that could be applied in the class include the permanent evaluation of the student's mandates, employing the multiple intelligences of the students, participation of the students in achieving the class's objectives and involving the students, in the process of assessment.

#### THEORY

Texts are defined in the scope of the active interaction of the readers' perceptions and significations that are conveyed to them by complicated socio-cultural codes. There are numerous ongoing procedures that direct readers to the intended message of the text. However, these processes are not static and refashion continually, based on construction of pristine semantic knowledge of the readers.

According to Bartlett (1932) who has coined the term 'schema theory', this notion means that "meanings are not contained within the text but are constructed in the interaction between the text and the interpreting background knowledge" (p. 79). Therefore, there is always strife in construction of immaculate meanings, since, the text have no signification, in isolation; Perkins (1983) entitles this as "semantic constructivity". The most focal issue is that the schemas are dynamic and tend to modify by incoming experiences; it implies that they are "an active organization of the past reactions or experiences which must always be supposed to be operating in any well adopted organic responses" (p. 201). The fact that readers with different experiences might have different discernments of the same text transforms the reading activity and construction of the meaning, into a creative endeavor, varying from one reader to another.

According to Iser (1972) the meaning is generated by "meeting of the writer, text and the individual mind of the reader with its own particular history of experience, its own consciousness, its own outlook" (p. 189) and it is the "convergence of the text and the reader that brings the literary work into existence" (p. 196). This existence is materialized in the process of realization of text. Iser proposes that, "the written text imposes certain limits on its unwritten implications in order to prevent these from becoming too blurred and hazy, but at the same time these implications worked out by the readers' imagination, set the given situation against a background which endows it with far greater significance than it might have seemed to possess on its own" (p. 190). This provides a wide range of significations that are rooted in the original text. The process of the construction of the meaning or the 'destination' of text, then resides in the interpretive acts of the readers and not the writer; therefore, the origin of the unity in the process of the reading is embedded in the elucidations of the reader, as Barthes (1967) mentions (p. 150). There is a great emphasis on the reader's role, in creation of the meaning that takes place by bringing his

prior knowledge into the progression of the interpretation of the texts, in the phenomenological theories of reading by critics like Ingarden, Iser, and Fish. They all agree that there are some gaps that must be filled up by the readers; this constitutes the act of reading as an individual process that is related to the past experiences of the readers, as well as being shaped and constructed by their present social affairs. This research aims to create a sense of affiliation between the issues of semantic theory and the idea of interpretive communities of Stanley Fish, in order to find more flexible strategies for teaching literature, as a second language.

The concept of schema is correlated to another idea, introduced by Stanley Fish (1980), interpretive communities'. The signification of a specified text is based on the policies that readers utilize in reading; it implies that it is not the text but the knowledge or schemas of the readers that determines the act of signification or construction of the meaning. According to Fish, these policies may be shared by many readers of the same text and these strategies "exist prior to the act of reading and therefore determine the shape of what is read" (p. 219). It signifies that the schema knowledge of the readers is not stable and its dynamicity is a good proof that schemas are not only fashioned, in the course of reading but they are shaped by past experiences, too. According to Fish, reading patterns modify, as the individuals of a society amend their assumptions about the issues around them. By employing a progressive model of reading stratagems, these tactics transform into not an everlasting and accepted but learned and artificial sets of techniques. In this way, the meaning is not "extracted but made and made not by encoded forms but by interpretive strategies that call forms into being" (p. 220). Semino (1995) believes that from a cognitive point of view, the perception of the reader results from "the application of certain portions of the reader's background knowledge (schema) to the interpretation of the text" but this schemata is not a fixed entity but it is a flexible perception which "depends on the extent to which the existing schemas of the readers are confirmed or challenged during the process of interpretation" (p. 79). Just like the notion of interpretive strategies of Fish, the schemas are considered to be "prior knowledge" of the reader, constructed by socio-cultural paradigms of members of a community (p. 82). Considering the point that a classroom could be considered a small community where the members may share the reading tactics, the teacher of a literature class may find a mutual ground in the class, in order to structure a more flexible course syllabus. By fusing the concepts of schema theory and interpretive community the researcher attempts to implicate a term which will inclusively attribute to both of the theories, defined as **Group Schema** or **Collective Schema**. The next section of this research is dedicated to schema theory and its correlation with literature. In this part, the process of reading literary texts and creation of new schema knowledge is reviewed.

### *Schema Theory and Literature*

Schema theory could be applied to almost all documents as well as literature, in order to assist researchers in articulating educational approaches, for a better cognition of learning materials. More than any type of document, a literary text is capable of deconstructing the existing significations, in the process of reading, due to its polyphonic quality. This heterogeneous nature of literature is the key to developing numerous teaching techniques, based on students' responses, in the classroom. Thus, the major responsibility of the teacher resides in appreciating the wide range of presumptions and directing them toward the appropriate meaning.

Semino (2001) believes that the relation of schema theory and literature is that, "literary texts tend to challenge and modify the readers' existing schema" and if readers "apply different schemas or different variants of the same schema; they will end up with different understandings" (p. 346). Having this in mind, then the goal of teaching should be generating appropriate responses by students, by motivating them about the literary texts. Britton (1968) puts this as, "to refine and develop responses the children are already making rather than instructing them with the responses"; therefore, in the literature classes the teacher must act as the "mediator to help students to take knowledge and make sense of the text" (p. 183). The most important issue is that the schemas are dynamic and tend to remold, by coming experiences; it implies that they are "an active organization of the past reactions or experiences which must always be supposed to be operating in any well adopted organic responses" (Bartlett, 1932, p. 201). Thus, the ongoing performance of appreciation of meaning resides not in the text alone, but dwells in the unique responses of the readers.

A critical debate, raised by critics against the schema theory is that "it seems to assume a very rigid division of background knowledge into separate compartments, thereby failing to do justice to the flexible, creative and tolerant way in which we apply our knowledge of old experiences to new ones" (Semino, 1995, p. 83). Guy Cook (1990) suggests that the most significant role of schema theory is that despite the Russian formalist's assumption that rigidly limits the text to its linguistic devices with certain key concepts such as de-familiarization and de-automatization, the schema theory provides a dynamic frame for active participation of readers' knowledge of the text (pp. 212-13). In literary texts, this confrontation of the readers' prior schemas and the present ones may result in violation of the existing schemas of the readers and eventually leads to "schema refreshment"; and that is why the literary texts offer the readers an opportunity to experience new situations and create new schema knowledge. Sometimes, schema knowledge is reinforced by a text and sometimes it is interrupted and altered by new coming information in the texts. Literary texts challenge the confirmed assumptions and therefore would formulate diverse results, ranging from authenticating the schemas of the text to rejecting the presented schemas. The discursive quality of literary texts would reinforce the process of generating polyphonic assumptions, by readers of the text. This explicitly advocates the existence of multiple numbers of elucidations, in reading process.

### *Teaching Literature, Significance, Objectives and Material*

The first step in determining the strategies of teaching literature is that the teacher must have a clear idea of why he/she is teaching literature; according to Nojournian (2007), one thing must be taken for granted in teaching literature,

First and foremost, teachers of English literature should primarily explain this idea that literary texts are not primarily intended to get across a particular moral, philosophical, or political message. Of course, these implications could always come as the final stages of reading process. Many writers by treating their own material as nonjudgmental do not expect the reader to come to a particular message even in the final stages. Reading literature for them is supposed to share a particular experience (p. 121).

Hence, literary texts would be classified among other texts which are designed for certain educational aims. This quality is fortified by a communal appreciation of literature. Students would react more positively to the texts that have a shared meaning for them. This would formulate a new pattern for reading literary materials that promotes the desired objectives of the teacher.

According to Tarakcoiglu (2003), studying literature involves not only reading certain literary works, but objectives of the literature classes differ from other courses. It indicates that while the student in an EFL literature class employs the structures of a certain language, he/she is,

Supposed to acquire and store the conventions and traditions about literature as well as getting

acquainted with the authors, texts, nature, history and culture of the target language. At the end of this process, the student is assumed to become an expert or authority that is equipped with the necessary and enough knowledge to analyze, criticize, and write about literature, literary history, literary theories, periods, authors and literary works (p. 214).
